We understand that during the first few nights that this sign was alight, large crowds assembled in front of the public house to watch the operations, and it is said that the sign has not been a help to the temperance cause, judging from the increase in takings.

#### Instanta Adjustable Rise-and-fall Pendants.

A new rise-and-fall adjustable pendant, illustrated in fig. 6, has recently been designed by MESSRS. F. A. WILKINSON & PARTNERS, LTD. By its use the lamp can be raised or lowered to any desired degree by simply pressing the spring attached to the vulcanite

FIG. 6.—INSTANTA ADJUSTABLE PENDANT.

head. At the same time all the advantages of reflected or indirect lighting can be obtained from an ordinary lamp pendant.

The fitting can be attached to an ordinary pendant in a few moments without any rewiring or disconnection, and by its use the usual counterweights and pulleys are dispensed with.

#### A New Folding Scaffold.

We illustrate in fig. 7 an invention of MR. HEATHMAN, of Parson's Green, Fulham—a handy scaffold, for use in premises where every inch of storage space is a consideration. The "Shorolds" pattern telescopic folding scaffold trestle can be stored in a very small space, and easily carried to the position where it is desired to set it up for use. The trolley base is upon castors, so that it may be of service to move goods upon with a box or basket made to size for daily ware-house service, while it is available for the trestles for decorating purposes out of the usual business hours. The trestles are rapidly set up and fixed to the carriage by set screws, and the sliding section is easily adjusted to the height requisite to reach the work to be done. Two sets can be used conjointly with scaffold boards and protection rails, or one scaffold can be used separately as varying circumstances necessitate. The whole can be carried upon a barrow or

FIG. 7.—HEATHMAN SCAFFOLD.

cart, and is made in three or four sections (as well as the two sections illustrated) so that they may be used for very low as well as high rooms; the ladders can be used quite independently of the trolley base to lean against walls, as three separate ladders to each set, or as self-supporting trestles. These trestles are made with larger wheels for road and street service.

The Electric Grate.

A novel design of electric fire, illustrated in fig. 8, has been placed on the market by MESSRS. F. A. WILKINSON & PARTNERS, LTD., of Hatfield, Herts. Composed throughout of polished copper, with brass facings, it is extremely handsome in appearance, and in keeping with the most luxurious surroundings. The total power consumption of the grate is 2.8 units per hour, and heat regulation is effected by means of the two switches. There are four self-contained heating elements, each having a capacity of

FIG. 8.—ELECTRIC FIRE-GRATE.

700 watts. In design and appearance they are similar to ordinary incandescent lamps, but are mounted on mica bases and fitted with pin plug connections, the elements thus being instantly replaceable.

An imitation of an ordinary coal fire is arranged within the grate, and when working glows with a cheerful appearance and gives out an intense heat. The dimensions of the grate are 24 in. high, 20 in. deep and 18 in. wide. It can easily be carried about and used anywhere.

Porcelain Fuse Handles.

MESSRS. A. REYROLLE & Co., LTD., of Hebburn-on-Tyne, have sent us particulars of their latest type of porcelain fuse handle, which is illustrated in fig. 9. In the earlier design of self-aligning

FIG. 9.—PORCELAIN FUSE HANDLES.

fuse handle, the bolt which secured the contact to the porcelain was carried through to the front of the porcelain, and a porcelain button was screwed over the shank. There was a possible disadvantage in this design, inasmuch as there was always the danger

of the porcelain button being broken, although the makers never had a case brought to their notice. In order to obviate any objection on this account, they now make the porcelain solid, and the bolts securing the contacts are screwed into nuts let into the porcelain, even in the smaller sizes there is not less than about  $\frac{1}{2}$  in. of porcelain between the hand and the live metal.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

AMENDMENTS.

ECUADOR.—The Board of Trade has received a copy of a decree revising the tariff and tariff laws, with effect from January 1st, 1913. Amongst other things, it has been decided to impose a surtax of 17 per cent. *ad valorem* at all Customs Houses, where parcels are received by post, on all goods, with the exception of certain foodstuffs, agricultural implements and cotton goods. As regards incorrect declaration of the weight of imported goods, it has been decided that all excess of weight of 10 per cent. or more between the real weight and the weight declared in the Consular invoice manifest or application for clearance shall be penalised with a surcharge of 100 per cent. on the duties leviable; when the difference is less than 10 per cent., duty will be payable on the actual weight of the goods. A provision has been added to the valuation regulations to the effect that the value of the goods which is to be declared in the Consular invoice is that of the goods at the place of origin. The declaration for clearance of goods from the Customs, which must be presented within eight days after the arrival of the vessel carrying them, must specify, among other particulars, the net and gross weight of each imported package.

The following modifications of the Customs treatment of certain goods have also been made:—

	Previous rate.	Present rate.
"Focoa" for electric lamps ... ..	not specified	1 centavo per kg.
Lifts ... ..	5 centavos per kg.	free

NOTE.—100 centavos = 2s.

RUSSIA.—An arrangement has been made with the United States Government that goods of American origin imported into Russia shall be given the benefits of the lower rates of duty leviable under the "Conventional Tariff" which is applicable to goods imported from countries having most-favoured-nation arrangements with Russia. As a result of this arrangement, certificates of origin will no longer be required for goods imported from countries other than the United States in order to prove their non-American manufacture.

SPAIN.—It has been decided that English gold coins and Bank of England notes will be accepted by the Spanish Customs at their full value in payment of Customs duties. Bills of exchange or cheques on London, provided they are drawn in pounds sterling, are duly guaranteed and can be cashed at the exact equivalent in gold of their face value, will also be accepted.

UNITED STATES.—The Customs authorities have decided to grant free entry of articles imported in order to be exhibited at expositions to be held in New York by the Merchants' and Manufacturers' Exchange of that city.

MEXICO.—The Board of Trade has received information from Mexico that the proposal of the Mexican Government, recently referred to in the ELECTRICAL REVIEW, to increase the Customs duties by 7 per cent., has been approved by the House of Representatives. It will, however, still have to be approved by the Senate before it becomes law.

ST. VINCENT.—The Government of St. Vincent has decided to continue to levy the surtax of 10 per cent. of the duties levied on all goods imported into St. Vincent from January 1st last until March 31st next.

HOLLAND.—The Dutch Customs authorities have issued the following decisions as to the duties to be levied on certain electrical and similar goods:—

Fully finished copper bonds for electric tramway rails, dutiable as "finished copper goods" at the rate of ... ..	5 % ad val.
Steel pins belonging to the above, as "Steel goods," at the rate of ... ..	5 % ad val.
Switchboards—	
Belonging to, and imported at the same time as, dynamos or duty-free electric motors ... ..	Free.
In other cases—dutiable as "instruments," at the rate of ... ..	5 % ad val.
Marble slabs and slate slabs for switchboards, not furnished with any fittings ... ..	Free.

FRANCE.—The French Customs authorities have decided that current limiters (automatic switches to prevent the excessive consumption of electricity) are to be dutiable as electrotechnical apparatus at rates varying from 20 fr. to 110 fr. per 100 kg., according to weight and nature. Detached parts of these current-limiters will be dutiable as "detached parts of electrotechnical apparatus," at rates varying from 25 fr. to 110 fr. per 100 kg., according to weight. It has also been decided that steam or water turbines imported without their shafts are to be treated as incomplete apparatus.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

996. "Electric heating apparatus." M. J. RAILINO and C. H. ANCHER. January 15th.
992. "Telegraphically transmitting signals by means of a perforated strip." SIEMENS BROS. & CO., LTD. (Siemens & Halske Akt.-Ges., Germany.) (Addition to 8,103 of 1908.) January 13th. (Complete.)

- 1,496. "Time switches." H. F. J. THOMPSON and J. H. BOWDEN. January 19th. (Complete.)

- 1,501. "Magneto-electric machines for combined ignition and illuminating purposes." F. P. SIMMS. January 18th.
- 1,505. "Electrically-operated steering gear." BRITISH THOMPSON-HOUSTON CO., LTD. (General Electric Co., United States.) January 18th.
- 1,512. "Regulators for dynamo." O. E. VON KIRCHHOFF. (Convention date, February 3rd, 1912, France.) January 18th. (Complete.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

## 1911.

- ELECTRIC LOCKING DEVICES FOR LOCKS. G. Salmier. 26,311. November 24th. (Addition to No. 15,991 of 1909.)
- ELECTRIC SWITCHES. J. H. Whyman. 27,254. December 5th. (July 5th, 1912.)
- ELECTRICAL EQUIPMENT OF ROUNDABOUTS, SCENIC RAILWAYS AND THE LIKE. L. A. HACKETT and E. W. Whittam. 28,899. December 22nd.
- MAGNETIC SEPARATORS. Fried. Krupp Akt.-Ges. Grossenwerk. 29,201. December 25th. (January 12th, 1911.)
- APPARATUS FOR THE MAGNETIC SEPARATION OF ORES AND OTHER MATERIAL. G. Ullrich. 29,230. December 28th. (Addition to No. 14,082 of 1908, January 17th, 1911.)
- ELECTRIC SAFETY LAMPS. G. A. Dickie. 29,321. December 30th.

## 1912.

- STORAGE BATTERY LAMPS. C. B. Bartley. 71. January 1st.
- PORTABLE UNSPILLABLE ELECTRIC BATTERY LAMPS FOR USE IN MINES, SHIPS AND LIKE PLACES. T. Sparkes. 78. January 1st.
- WIRELESS TELEGRAPH RECEIVERS. G. Marconi and G. S. Franklin. 86. January 1st.
- ELECTRIC BATTERIES. P. L. Liney. 181. January 2nd.
- ELECTRIC HEATING ELEMENTS. E. Townshend. 387. January 5th.
- TELEPHONE RECEIVER HOLDER. H. Brown. 416. January 5th.
- ELECTRIC CONTROLLER REGULATORS. H. Sefton-Jones. (American Automobile Co.) 523. January 6th.
- AERIAL CONDUCTORS USED IN WIRELESS TELEGRAPHY. Marconi's Wireless Telegraph Co., Ltd., and C. E. Prince. 2,456. January 30th. (Cognate application No. 2,457 of 1912.)
- ELECTRIC ARC LAMPS OF THE TYPE IN WHICH CARBONS IMPREGNATED WITH CHEMICALS ARE CONSUMED IN A CHAMBER SUBSTANTIALLY AIRTIGHT. B. A. Quint. 3,065. February 7th.
- LOCOMOTIVES. British Thomson-Houston Co. (General Electric Co.) 8,231. February 8th.
- MEANS FOR SUPPORTING ELECTRIC LAMPS. Byng & Collings. 7,157.
- POWER TRANSMISSION SYSTEM FOR DRIVING A DYNAMO WHOSE ELECTRICAL ENERGY IS SUBSEQUENTLY UTILISED FOR THE ELECTRIC PROPULSION OF MOTOR VEHICLES, BOATS, AIR SHIPS OR THE LIKE. P. Marino. 13,780. June 12th.
- INDUCTION ELECTRIC FURNACES. J. Bally. 16,040. July 9th. (July 11th, 1911.)
- ELECTROMAGNETIC TRACK BRAKES. Magnet Bremsen G.m.b.H. 26,295. November 15th. (January 9th, 1912.)
- CONNECTION APPARATUS FOR ELECTRIC CIRCUIT CONDUCTORS. T. E. Murray. 26,337. November 16th. (Divided application on No. 19,535 of 1912, August 26th.) (February 9th, 1912.)
- LIVE RAILS OF ELECTRIC ROUNDABOUTS, SCENIC RAILWAYS AND THE LIKE. L. A. Hackett and E. W. Whittam. 27,046. November 25th. (Divided application on No. 28,899 of 1911, December 22nd.)

**Manchester Electro-Harmonic Society.**—The fourth concert of this excellent Society was held at the Albion Hotel, Manchester, on Friday, January 24th, when there were close upon 200 members and friends present. The programme included a good deal of highly classical music, and the performance was exceptionally well received. The next of these concerts will take place on Friday, February 21st, when the artists will be as follows:—Solo violin, Mr. J. Sedgwick Bridge; solo cello, Mr. J. H. Foulds; soloist (bass), Mr. Hamilton Harris; entertainer, Mr. Wilfrid Ludlow; pianist and accompanist, Mr. E. Bennett North.

Mr. H. Clifford Palmer writes as follows respecting the evening:—"The Manchester Electro-Harmonic Society bids fair to become the equal of its London parent, if not in numbers, at any rate in quality of entertainment. It was my privilege on Friday evening last to attend one of these functions—to be exact, the fourth of their first season—and right merrily did the evening go. Mr. Dorman (of Dorman & Smith) officiated in the chair. Amongst others, the following well-known electrical men were present:—Alderman Walker (deputy-chairman of the Manchester Electricity Committee), Mr. F. Sells (director of the G.E.C.), Mr. Cramp (H. Simon & Co.), Mr. Marlor (Manchester Corporation), Mr. H. B. Leach, Mr. Shaw, Mr. Eckstein, Mr. W. J. Smith, Mr. J. Gibson, and Mr. J. Hill (hon. sec. of the Society). An excellent programme was provided, including Mr. Albert J. Holt (solo tenor, Manchester Cathedral), Mr. Harold Jones (solo violin), Mr. T. Stanley Greenwood (humorist), Mr. Jacques Fortescue (musical monologues), and Mr. H. A. Palmer (entertainer). "The programme in general was so thoroughly enjoyable that it is hardly fair to mention one item without referring to all, but it might be said that Mr. Harold Jones's rendering of 'Canzetta' and 'Hejre Kuti' were well worth going many miles to hear. He quite 'brought the house down.' At the conclusion of the evening, Mr. F. Sells, in a few well-chosen words, proposed a vote of thanks to the chairman, which was seconded by Mr. Leach, and responded to in a very cordial manner. These evenings, I was given to understand, have become very popular, and I could testify to the extremely hospitable nature of our worthy electrical confreres in Manchester. These institutions in the provinces are calculated to promote amongst all sections of the industry that *esprit de corps* which, after all, is highly desirable if we are to foster the spirit of co-operative effort, the seeds for which are now being sown. It is to be hoped that the other large industrial centres in the provinces will follow suit."

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGREKAY, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 15s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION

Ready Next Week.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

IN the January issue of the *Review of Reviews*, Mr. H. E. Morgun pleaded for the building of a half-way house between the University and the city office, to serve the purpose of a sort of superior Labour Exchange for introducing budding talent to remunerative employment in trade and commerce. The article has given rise to some newspaper comment of a very similar character to that which was made a short time ago in consequence of the observations of the chairman of one of our large electrical companies. In all these discussions, it seems to be accepted that there is some special virtue in University training, and some special repugnance to embarking in commercial work on the part of those who have received such training. Clearly there is a contradiction here. If the latter be true, there must be something defective in the training, and the Universities have not advanced with the times in teaching the dignity of labour, or the estimation of merit by results, rather than by inheritance or environment. Cobbett cannot be regarded as one quite capable of expressing the general opinion of his day, but his own opinion, recently republished, found utterance in the phrase: "I know what your college gentlemen are. They always have, and will have, the insolence to think themselves our betters; and our superior talents and industry and power and weight only excite their envy." English public schools and Universities have a fine record, but the raw material can go through both without acquiring either strength or finish. In consequence, the mere fact of University training is no proof of fitness for a business or any other career, and it is high time the idea that tone and character may be bought by an expensive education should be abandoned. But it is more than high time to recognise also that higher education is now a necessity in any branch of bread-winning. In the prevailing deprecatory attitude of the average English mind, it is the foreign example which is held up for comparison; but it is doubtful whether the appreciation of education in Germany to-day is higher than it was in Scotland a century ago, or even in England three centuries earlier, when Gresham, the founder of the Exchange which Queen Elizabeth proclaimed as "Royal," was sent to Cambridge to acquire the education then considered suitable for a merchant of London. It is, however, true that the English University for generations has been the favoured resort of the wealthy, or the necessary qualifying ground of the serious student who was unable to pass into the Church, the Law, or other profession, except through its portals. In other words, the University has been expensive and exclusive. Small wonder, then, if some old-time prejudices still remain. But what shall be said for the manager of an Employment Agency, who suggests in the *Standard* that the office hand from the University should be given special privileges over his less favoured colleagues?

Such a suggestion is, in itself, a reflection on University training, for it indicates a reliance on the source of an education rather than on the education itself. If the University man is not, as a result of his training, capable of proving his superior ability, it is folly to encourage him into any new path by holding out inducements in the form of special privileges. He must take his chance with the rest, and rise or fall in accordance with his capacity and character.

Some further comments on this question would almost lead to the impression that the educated business man is the exception rather than the rule. In fact, the business men of England differ but little from the business men of other countries, except, perhaps, in one respect—in comparison with their Continental fellows they have been too often content to limit their linguistic attainments. This is to be traced to the simple fact that the English language carries further than any other, but the international relationship of British commerce requires that a greater attention should be given to this matter, and the education of the day is tending to remedy the undoubted defect. The successful business man is as varied in other countries as in Great Britain. There are types everywhere of the cultivated and of the less well-educated, but shrewd and capable men, whose progress may be ascribed to instinct rather than to culture, to perception of an opportunity rather than to the absorption of knowledge from books.

The University man in business is, as we have seen, no new feature at home, even if, as probably is the case, other countries have in recent years outstripped us. Men of middle age will remember an inquiry in Parliament in the seventies regarding the appointment of a head to the Stationery Office, which was regarded as a "job" because the appointee had no previous experience of the work. They will remember, too, the vindication by a member of the Government, who was then Mr. W. H. Smith, and who related that he had placed at the head of his own immense business a gentleman from one of the Universities who was entirely new to the work, but carried it out with results which were eminently satisfactory. Business generally has grown so that in all departments a wider outlook is necessary. Experience in a particular groove is still of value, but the changes are more frequent, and there must be such mental culture as will enable the operative in a business house to acquire in a short time by observation what has hitherto been acquired in a long time by experience. Whether this mental culture is obtained in a University or elsewhere is immaterial, so long as it is there.

We doubt whether any exceptional agencies are needed to bring together the office and the man. If the student from the University directs his steps to the professions, it is because he sets his hopes upon their rewards. "It is written in the unalterable laws of human nature that no trade shall continue to be at the same time lucrative and easy." Widen the meaning of "trade" to include what are known as the learned professions, and the explanation of the trend of students is simple enough. True, not all exponents of the professions find lucrative employment, but those who strive to enter think not of the average but of the fortunate exceptions. Commerce is becoming more complex, it requires in its votaries a broader culture. The market price will rise and the stream of talent will tend without artificial assistance to fill the vacant places.

Of far greater importance is it that the need for higher education should be recognised, that its acquirement should be within the reach of the many and not limited by reason of its cost to the few. International competition is influenced largely, but not entirely, by education. May we not say that our endowments or our opportunities have stood us in good stead in spite of our tardy recognition of education's advantages? When it is remembered that compulsory education in England dates only from the Act of 1870, it will be seen how much we are behind our active competitors, and how important it is to give every possible encouragement to those who seek to redress the balance. In technical education we have made remarkable strides largely by reason

of the developments in electrical and general engineering. The City and Guilds and other similar institutions in London, and their counterparts in the provinces, have done, and are doing, educational work of the highest importance. The qualifying examinations require a fairly liberal general education, and the courses of instruction ensure to any capable and industrious student a training which fits him to embark upon any engineering enterprise. The standard has been raised, and there is no longer any chance for the incompetent or untrained in such work. There are evidences also that this standard of culture is overflowing into the commercial ranks, so that the opportunities for University men to feel any marked superiority, if they ever existed, are becoming less and less. One other change is going on also in commercial circles. It is the endeavour to promote by merit. The tendency may be accelerated with advantage, but it would be a great misfortune if the old-time promotion by seniority were replaced by a favouritism for the product of a particular school. The University man must establish his position, if at all, by his "superior talents and industry and power and weight."

---

## MINING MATTERS.

---

IN the House of Commons recently the Prime Minister said, in reply to a question, "Prices of coal have, no doubt, risen since the passing of the Coal Mines (Minimum Wage) Act," and he might have further said, had he been aware of the fact, that some wages had gone down while others had gone up, the latter, of course, at the expense of the former. As a matter of fact, individual good workmen who had the confidence of the management are, in many cases, earning less wages than they might otherwise have been paid, whilst others have had added to their actual earnings each week a certain sum to make them up to the minimum wages. The minimum wage set up by Act of Parliament forms a standard, and as this can be demanded by the workman, the management cannot be blamed for doing all in their power to see that he gets no more. Wages don't grow on trees, and they must be earned by someone, or they cannot be paid, hence the actual working of the Act results in the good man having to suffer for his poorer mate. We do not think it is likely to be continued after the end of the three years' period fixed by the Act, and there will be, in all likelihood, local disturbances when the rules and rates fixed under the Act come up for revision at the end of the first year.

The Minimum Wage Act was, of course, brought in to cobble up the consequences of the Eight Hours' Act, which was the immediate cause of the men earning less wages. With shorter hours of labour, less coal was produced by the individual workman, and in order to maintain the same output more men had to be employed, but naturally there was—with the same output—the same amount of money to be divided amongst the workmen, and as there were more of the latter, the "portions" were less—which, to say the least, was very disappointing and not at all anticipated by our friend the miner. Hence the Minimum—or "minium," as it is more commonly designated—Wage Act. Really, when one considers the fallacies upon which these two Acts are based, one cannot help thinking that there must be something after all in the pitman's plan for remedying the evils arising from a first "levelling" day, by "levelling" again. The next step in the miner's propaganda is

"five" working days per week, which will have the effect of further raising the price of coal, and following this is "nationalisation" of the coal mines, which latter is fully expected to yield good wages for very little work, if, in fact, any work at all is found to be necessary.

In the report of the Chief Inspector of Mines (Part II) we are told that the Eight Hours' Act is working *fairly* satisfactorily, even in Northumberland and Durham, with the exception that "the cessation of work late in the day on Saturdays still constitutes a grievance in some parts of Durham, and especially in the Cleveland ironstone mining district of North Yorkshire." This, however, is very far from the true state of the case, and it is perfectly well known that the "three-shift system," which is being worked at some of the collieries in Northumberland, is anything but satisfactory to the workmen, and at the present moment the whole county is being "stumped" by the miners' leaders to instigate a strike of all the miners against the system. A ballot is to be taken shortly, and there is a very grave fear that it will be in the affirmative. Durham is expected to follow the lead of Northumberland, so that both counties are involved in this question. The owners affirm that the pits cannot be worked profitably unless there are three shifts of hewers, as the hewers of these two counties only work from 6½ to seven hours, as against the full eight hours in all other districts—hence the difficulty in arranging the working of the mine to suit the difference between the hours worked by the hewers and by those engaged in removing the coal from the workings to the surface, who work eight hours. The owners have offered to do away with the multiple-shift system if the hewers will conform with the Act and work an eight hours' shift, but this reasonable demand they will not for a moment entertain. The Government were fully cognisant of the difficulties in connection with these two counties, as the law did not take effect there until six months after it had become operative in all other districts. The only advantages—if they can be termed such—were the reduction of the hours of the "lads" and "off-hand" men, who, previously to the introduction of the Act, worked from nine to 10 hours, but if they started at six in the morning they left off at four in the afternoon, and every day was the same. Under the Act it is true they work two hours less, but some start at six and finish at two, others start at two in the afternoon and finish at 10 at night, whilst the hewers may be on either day shift or night shift, and the whole of their social and home life is dislocated. The "lads" would readily agree to go back to the 10 hours' shift if they were allowed to do so. What will be the outcome none can say, but certainly the outlook for Northumberland, with its old and nearly worked-out mines, depending solely upon an export trade for its existence, is anything but bright at present. Such is the effect of "pitiful" legislation.

As regards the use of electricity in mines, we are glad to note that this is steadily increasing. Under Rule 15 of the Electricity Special Rules (1905) notices have to be given, when electricity is newly introduced into a mine, to the Inspectors of Mines for the different districts, and 46 such notices were given in 1911, as against 40 in 1910. It is also interesting to note that Scotland takes the lead with 20, and South Wales follows with 13. These rules merely require that notice of its introduction shall be given without any particulars of the plant being asked for, and, as a rule, none are given, but under the new Coal Mines Act, 1911, full particulars are to be given, so that a complete classification of the different systems of distribution, together with a measure of the growth of the use of electricity in mines, will be possible. Such particulars as have been given show that high-pressure alternating-current has been introduced into five mines, medium-pressure alternating-current into 11 mines, medium-pressure direct-current into 13 mines, and

low-pressure direct-current into four mines. In the last-named case, however, the current was only used for lighting purposes. The number of electrically-driven coal-cutters in use at the end of 1911 was 998, being an increase of 125 over those in use at the end of 1910.

As regards accidents due to electricity, it is regrettable to notice that 14 fatal accidents were reported to the Inspectors, causing in all 15 deaths. Two of these accidents causing three deaths, however, though reported to and investigated by the Inspector, had, strictly speaking, no connection with electricity in or about mines. There were, therefore, 12 deaths, as against 21 in the previous year, which is very satisfactory indeed. As we propose to deal with these accidents in some detail in a separate article shortly, we need not enter into this question further now, beyond noting that, with one exception which was due to burns following an ignition of gas in a motor room, all the accidents were due to electric shock. The Electrical Inspector of Mines also points out that "the provision of proper connections to earth might have been the means of preventing six of the accidents, or two-thirds of the total number." There were also 41 non-fatal electric shock accidents, many of which were trifling in their results, but in four of the cases the victims were unconscious for some time.

Three underground fires were caused by electricity, exactly the same number as in 1910, fortunately without loss of life, and in another case an explosion of coal dust in a coal crusher house on the surface was traced to the short-circuiting of one of the armature coils, which resulted in excessive sparking. Fortunately, no one was hurt, the building was fire-proof, and no great amount of damage was done. With the introduction of the new electricity rules which came into force on March 9th last in all coal mines, and on September 29th in all metalliferous mines, and which require more care and attention in the installation and use of electricity, a proper earthing system, and a sound mechanical construction of all apparatus, we hope to see electrical accidents—fatalities, at any rate—reduced to *nil*. The number for 1911 is far too great, but it will afford some little satisfaction to know that it represents only *one* per cent. of the fatal accidents in mines due to all causes during the year 1911.

**Ghent International Exhibition.**—Those responsible for the arrangements for the Ghent International Exhibition have seen to it that fire risk will be at an absolute minimum. They have profited by the lessons learnt from the disastrous fire at the Brussels Exhibition of 1910. There the disaster was largely due to the failure of the water supply, so at Ghent a powerful supply has been installed quite distinct from all other water supplies, and the grounds are mined in all directions by water mains, the largest of which are 300 millimetres, while the greater number are 200 and 150 millimetres in diameter. These mains serve the hydrants scattered throughout the grounds and pavilions. In no part of the whole Exhibition, the authorities state, are two adjoining hydrants more than 50 metres apart, the average distance being considerably less. The water supply is derived from the River Scheldt by means of large automatic pumps at a pressure of five atmospheres, and the hydrants will consequently be capable of throwing water to the top of any of the buildings. That the supply will be adequate in quantity is vouched for by the fact that these pumps can supply 600 cubic metres of water per hour. But the greatest safety from fire lies in the fact that all buildings are isolated, and in no place less than 10 metres apart, while in practically all cases they are much more. A special fire brigade station is also being installed by the municipal fire brigade in the centre of the Exhibition, and equipped with motor fire engines and a staff of 25 men. This brigade will be able to reach all parts of the Exhibition owing to the space between the buildings, and will also be independent of the water supply from the mains owing to the artificial lakes in the grounds. A supply of electric fire alarms connecting with the fire station will also be in operation just as in the London streets, while hand extinguishers will be placed in all buildings. The British Section will have yet another safeguard—and one of the greatest—in the fact that the floors are laid direct upon the ground and all platforms packed with earth, preventing the spreading of fire in the space below the flooring and confining a fire to where it can be reached at once.

**Canadian Inquiry.**—Among the inquiries relating to Canadian trade recently received at the office of the High Commissioner for Canada, 17, Victoria Street, London, S.W., was one from a Montreal importer, who desires to receive quotations from United Kingdom manufacturers of high-class machinery, iron and steel pipes, and all lines used by steam and electric railways, municipal and other engineers.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## Testing the Continuity of Earth Conductors.

Replying to "Continuity" re the testing of earthing conductors and the metallic coverings for continuity, the method of testing depends somewhat upon the arrangement of the earthing system. I presume the metallic covering would be bonded together to give continuity throughout, and the size of the earth conductor would be such as to meet the particular requirements, in accordance with the Home Office rules. Therefore, the only difficulty is in establishing a good "earth" connection, with facilities for testing the same from time to time.

The metallic covering would be connected to a main earth plate at the surface, and also to earth plates or an earth wire at several points in the mine, according to local conditions.

For testing purposes, a second earth plate should be provided at the surface, at a convenient distance from the first. The same should also be done in the mine. Every care should be taken to see that a good earth connection is made.

A bridge test can now be made between the auxiliary earth plates and various points of the earthing system, as

shown on the diagram. If a water pipe is convenient at the surface, a further check can be made.

When making tests, see that all connections are good, and also allow for resistance of lead. The arrangement also allows of a more rough and ready method of testing.

When a good earth has been established, the resistance between the earth plates can be taken periodically, and any rise in the resistance should be noted.

The metallic coverings should have copper bonds across all joints or junctions in the cables, and all connections to the earthing system should be well made.

When permissible, bad joints and connections can be detected by the use of a portable battery and sensitive instrument, taking the drop across the connection.

B. T. Davies.

Swansea, February 2nd, 1913.

## The Case of the Sub-Man.

I should like to say a few words in connection with the controversy at present waging in your columns between sub-men and wiremen, also re the formation of the A.E.S.E.

Primarily, what would happen if all the present sub-men were to deliver an ultimatum to their chiefs, to the effect that, unless they got a better living wage, they would resign their positions? Supposing their chiefs refused to consider this, which is more than probable, I think the sub-men would find their places filled up almost immediately by competent, well-educated men, whether they be college men or wiremen, well able to adequately carry out all the necessary duties required of them.

Secondarily, on examination of the modern power station and the duties required of sub-men, we find that modern running plant, if kept clean and well oiled, needs practically no attention. Should a fault in it chance to develop, all the education in the world would not prevent it. If of a mechanical nature, then the sense of hearing would probably give the first indication of trouble; by this means also it

could be located and then, if possible, rectified. If, on the other hand, the fault is of an electrical nature, then the only means of detecting this would be by daily testing the ohmic resistance of the insulation, this not being a very intricate matter, as it only requires a good sense of seeing, as the ohms and megohms are usually printed accurately on the instrument employed. This may prevent a fault developing, but in the majority of cases does not, as faults have the bad habit of happening unexpectedly.

Now these two senses of hearing and seeing are, as a rule, developed in one man as much as in another, be he a college man or a wireman. After all this comes the ability of the sub-man to keep logs, which, even to the working out of load factors and the plotting of load curves, is not such a very brainy matter. Do not think I am running down the fact of a sub-man having brains; I am only trying to expose the want of scope to employ such brains in such duties. Consequently, my advice is, "If your situation suits you, keep it; if not, you know the remedy."

To put the whole matter in a nutshell, electrical engineering in this country is overcrowded and becoming more so every day, there not being an equivalent outlet in the erection of power stations to hold the surplus.

*Transformation.*—The A.E.S.E. have, I think, solved the crux of the situation. By forming this association they may eventually improve existing matters considerably; at any rate, at present they will fill a want which is much felt, by allowing an outlet for a considerable amount of surplus brains and energy in the compiling and the discussing of interesting and instructive papers, and thus should go a long way in upholding the subman's welfare and status. Wishing the Association every success,

W. G. R.

## Electricity in Agriculture.

You recently published an account of successful results following the application of electricity to farm crops on a farm at Petrovic, near Prague.

It may interest your readers to know that this installation is arranged on the system introduced by ourselves, and that the apparatus used was supplied by us to Messrs. Elektrizitatis Aktien-Gesellschaft (formerly Kolben & Co.), of Prague, who erected the plant, and to whom we are indebted for a confirmation of the report which you have published. They also promise to send us a more detailed report of the results in a short time.

The Agricultural Electric Discharge Co., Ltd.

J. E. NEWMAN, General Manager.

Gloucester, January 31st, 1913.

## The I.E.E. Discussions.

I was interested to read the letter from "Battery" on the above subject in your current issue, and I can quite endorse his remarks.

I was not present at the meeting to which he refers, but I remember an occasion last year, when a member (unknown to me) was speaking, when suddenly the President rose and requested him (I had almost said "ordered" him) to reserve the rest of his remarks till the next meeting, and declared the discussion adjourned. The time was 9.30 exactly, and from the speaker's remarks I think it must have been evident to anyone that another 2 minutes at the outside would have enabled him to finish what he had to say. The member was evidently rather disgusted, and I think it very doubtful whether those remarks were ever concluded.

Personally, I considered the President's abrupt interruption not only very tactless and discourteous, but absolutely rude, as I could not, and cannot, see why he should not have waited a minute or two longer, and adjourned the meeting at the end of the member's remarks.

I have attended a good many meetings of other Societies and Institutions besides those of the Electrical Engineers, both in London and the provinces, but have never seen anything quite the same.

Why this cast-iron "Curtain at 9.30 sharp"?

There is only one conclusion, but those whom we honour placing in the chair, if bored by the discussion of a subject which does not interest them, might surely ask some other member to take their place.

Omaga.

[Without expressing any view as to whether the discussions should be closed at 9.30 or not, we must, in justice to the Presidents of the Institution, emphatically state that in many years' experience of the I.E.E. meetings, we have never known the occupant of the chair to be wanting in courtesy to speakers in discussions. On the contrary, the latter have often been allowed to exceed their fair allowance of time, owing to the reluctance of the chairman to interfere, and we have witnessed many instances in which the speaker, after receiving a gentle hint that his time was up, has continued his remarks in open disregard of the chairman's warning. The discourtesy is on the other side.—Eds. E.R.]

## PROCEEDINGS OF INSTITUTIONS.

### Independent Steam Condensing Plants.

By W. A. DEXTER.

Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Leeds, January 15th, 1913.)

THE author proposes to consider a few of the later forms of surface and jet condensing plant, such as are used in connection with steam turbines driving electrical machinery; he will also deal with various types of air-pumps, both reciprocating and rotary.

From entropy diagrams we find that for the non-condensing engine with steam at 165 lb. absolute pressure, we shall obtain 73 B.T.H.U. per lb. of steam; for the engine working condensing we obtain 248 B.T.H.U., and where the steam is expanded to a vacuum of 28 in. we should obtain 334 B.T.H.U. per lb. of steam, showing a gain of 43 per cent. and 93 per cent. respectively over the non-condensing engine. These figures represent the theoretical gain, and show the value of expanding steam below atmospheric pressure, and also the great gain in useful work which can be obtained by working an exhaust steam turbine in combination with a non-condensing steam engine.

For reciprocating engines of the low-speed type, such as are very

FIG. 1.—DIAGRAM OF TEMPERATURE DIFFERENCE FOR SURFACE WORK.

FIG. 2.—DIAGRAM OF CIRCULATING WATER RATES FOR SURFACE WORK.

common in the textile mills of this district, there is no doubt that the attached condenser and air-pump is the most efficient type; a high vacuum is not required, say 26 in. at the condenser. For high-speed engines a vacuum of 26 in. to 28 in. is quite sufficient for economical working. For steam turbines, and especially the low-pressure type, a high vacuum is really essential; but even here it is possible to aim at too high a vacuum for overall efficiency where there is not a good natural supply of cooling water at low temperature.

The most practical and efficient condensers for general conditions are the counter-current surface condenser, the low-level jet condenser, and the elevated self-draining "barometric" jet condenser with air-pump.

The surface type of condenser possesses many advantages over other types, though its initial cost is generally higher. The cost

of operating the air and water pumps is lower, due to the fact that the condensing water is kept out of the vacuum chamber of the condenser.

A point which requires careful consideration before deciding on a surface type of plant is the liability to corrosion or pitting of condenser tubes. This may be caused by local electrolytic action, stray electrical currents, &c., and it requires only very slightly acidified condensing water to convey these electrical currents from one part of the tube to another. The author has found this trouble most prevalent where cooling towers are used. In certain cases the first analysis has shown the water to be almost pure and good for drinking purposes, but there has been a very slight acidity, quite sufficient to convey local electrical currents between the different metals forming the alloy of the tubes. Many different mixtures of tubes have been tried with only partial success, and the trouble has in certain cases only been overcome by periodically adding a certain quantity of lime to the water in the cooling tank, sufficient to produce a neutral solution. This corrosion and pitting trouble is also very prevalent where sea water is used for condensing. Zinc and sometimes mild steel plates are fitted into the water chambers of the condenser and connected by mild steel studs to the tube plates, the idea being that these plates will be of negative polarity

FIG. 3.

to the metal of the tubes, and thus be gradually decomposed instead of one of the metals of the tubes.

The most efficient condenser is one in which the condensing water leaves the condenser at a temperature equivalent to the temperature of the exhaust steam; at the same time the condensed water should be withdrawn at as high a temperature as possible.

In practice it does not pay to aim at so high a discharge temperature for the water, and the best temperature difference between the exhaust steam and discharge cooling water will depend on the inlet temperature of the water. Where there is a plentiful supply of cold water a greater temperature difference should be allowed than where cooling towers are used; also for lower degrees of vacuum, the temperature of the steam being correspondingly high, a greater temperature difference should be taken than for a high vacuum.

The curves in fig. 1 indicate what may be taken as fairly good allowances for temperature difference for various inlet water temperatures and vacua. Thus for 28-in. vacuum, inlet water temperature 75°, the temperature difference would be 8° F., and with water at 50° it would be 19° to 20° F. Fig. 2 is a series of curves showing the ratio of condensing water per pound of steam condensed for different degrees of vacuum and inlet water temperature based upon the temperature differences given in fig. 1.

For a given cooling surface the cheapest form of condenser is certainly one of circular section, relatively small in diameter and long between the tube plates; but it will probably be found that a greater heat transmission per sq. ft. of cooling surface can be attained by a condenser of different shape and design.

The velocity of the steam as it passes through the condenser should be maintained as near as possible to the velocity at the inlet branch. Anything which will retard the flow of steam or cause eddies should be avoided.

The volume of air entering the condenser with the steam is but a small proportion of the total volume of the steam and air, but as the fluid passes through the condenser the steam becomes condensed until at the air pump suction branch or outlet of the condenser, the air forms a very large proportion of the air and vapour mixture, and as the pressure throughout the condenser should remain nearly constant, the area of the path of flow near the outlet may be considerably reduced, leading to a condenser whose cross-section is of wedge or pear-shape.

The steam on entering the condenser should be directed equally over the whole surface of the upper row of tubes, and in its passage through the condenser each square foot of tube surface should condense an equal volume or weight of steam. To obtain this the steam inlet branch should be of large dimensions, following closely the contour of the top part of the condenser body. Plates may be fitted into the distributing chamber to direct the steam equally over the whole surface of the tubes. Except for comparatively small installations, separate air and water pumps give the better efficiency. A condenser approximating to the above-mentioned con-

ditions is shown in fig. 3. In this case the tubes are divided into four nests, and the condensing water is arranged to travel four times through the full length of the condenser.

Three-quarters of an inch outside diameter is the standard used by most manufacturers for the tubes, but where the water is more or less dirty, it may be necessary to increase the diameter to 1 in. or even more.

Where the cooling water contains a large amount of foreign matter liable to choke the tubes of a surface condenser, or contains salts which would form a scale on the tubes, and thus retard heat transmission, or is of a nature which may cause corrosion or pitting of tubes, or where it is not desired to collect the condensed steam

FIG. 4.

FIG. 5.—JET CONDENSERS: RATIO OF COOLING WATER TO STEAM CONDENSED AT 4° TEMPERATURE DIFFERENCE.

for boiler feed, it would be advisable to adopt a condenser of the jet type. It is a cheaper type of plant as regards initial cost than the surface type, but, generally speaking, requires more power for the operation of the pumps.

In the low-level type, the injection water is usually drawn into the condenser by the vacuum, but it is necessary to withdraw the water from the condenser by means of a pump against a suction resistance equivalent to the vacuum, say, from 28 to 32-ft. head. A separate pump should be used for dealing with the air and incondensable gases. Unless certain precautions are taken, there is a risk of flooding the turbine or engine with this type of plant.

In the barometric type, except in very rare cases, it will be neces-

FIG. 8.

FIG. 9.

The air pump should therefore be of such a capacity and efficiency that it will effectively deal with the amount of air passing through the condenser, in a highly attenuated state or at low absolute pressure, thus closely reaching an absolute pressure in the condenser equal to the vapour tension of the condensed water. The pressure of air in a surface condenser greatly reduces the rate of heat transmission.

The amount of air passing through a surface condenser will be that due to leakage at glands, pipe joints, &c., and to the small amount present in the boiler feed-water which will pass over with the steam; there will be a much greater amount in the case of a jet condenser, as, in addition to the above, there is the amount of air present in the injection water, which latter may be from 30 to 60 times the volume of the feed-water. The amount of air present in the feed or injection water may be anything from 1½ to 5 per cent. of the volume of the water. Particular care should be given towards eliminating air leakage. All pipe joints should be as carefully made as though they had to stand a steam pressure of 300 lb. Low pressure engine glands should be very carefully packed, turbine glands should be water or steam sealed, the latter being preferable and for high vacuum it is better to have all valve spindles water sealed. The exhaust mains, if of cast-iron, should be of close grained metal, and care should be taken in the fixing of chaplet when casting; piping built of mild steel plates, if well made, makes the best job.

In a high-pressure turbine installation kept in good condition with the condenser fixed close to the turbine, the air leakage should be within, say, 6 lb. per 10,000 lb. of steam, or the equivalent of what would pass through a 3-mm. diameter expanding nozzle per 22,000 lb. of steam condensed. For a plant connected to a single reciprocating engine, the weight of air allowed for should be the equivalent to what would pass through a 4 or 5-mm. diameter nozzle. Exhaust steam turbine installations require careful attention. The pressure in the engine low-pressure cylinder and the

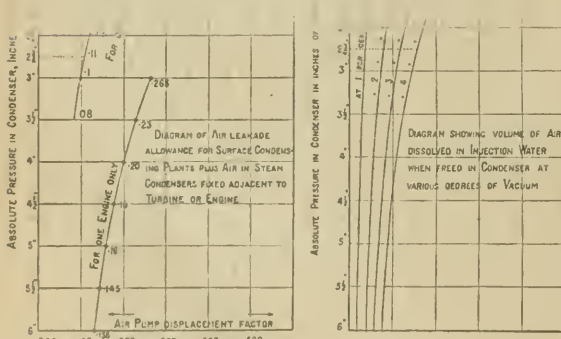

FIG. 6.

FIG. 7.

ary to pump the water into the condenser, but no pump is required to extract the water, as the condenser, being fixed at a barometric height, will be self-draining. The air pump will be the same as for the low-level plant. The pumping power will be smaller for the barometric than the low-level type, as the full effect of the vacuum can be utilised in raising the water to the condenser. It is a safer and easier plant to operate, as, if properly designed, there is no risk of water flooding the exhaust pipe and thence getting back to the turbine or engine. It is more expensive than the low-level type on account of the longer length of steam, air and water pipes required; also, on account of the long exhaust main,

haust main up to the turbine should always be kept 1 to 2 lb. above atmospheric pressure.

In fig. 6, which applies only to surface condensers, curves are drawn representing the actual volume of air to be allowed for at different degrees of vacuum, expressed in cubic feet per pound of steam. The upper curve refers to turbine plants with directly-connected condenser, and the lower curve to an engine with directly-connected condenser. If two or more turbines or engines are connected to a central condensing plant the allowances will require to be increased.

The curves are based on a 3 per cent. volume of air in the feed-water and an air leakage equal to a 3-mm. diameter nozzle per 2,000 lb. steam per hour for a single turbine, and a 5-mm. diameter nozzle for one reciprocating engine at the same steam duty. Where more than one turbine or engine is connected to one condenser it is advisable to allow for an extra air capacity in the pump, say 10 per cent. extra for each turbine, other conditions remaining the same.

Referring to the curves, it will be seen that for a single turbine and attached condenser for a vacuum of 27 in., barometer 30 in., an actual air displacement of 0.1 lb. ft. per lb. of steam should be allowed, whereas for a vacuum of 28½ in. it would require 0.2 lb. ft. or a reciprocating engine at 26 in. vacuum it requires 0.2 lb. ft., and for 27 in. vacuum, 0.265 lb. ft. per lb. of steam.

Fig. 7 shows the cubic feet of air to be allowed for at different degrees of vacuum for the air contained in the injection water, and is, of course, applicable only to jet condensers. Four curves are shown for 1, 2, 3 and 4 per cent. volume of entrained air; the horizontal scale is based on cubic feet of air per pound of injection water.

To fix up the size of air-pump for a jet-condenser on the lines indicated, we will take the following example:—

Duty 10,000 lb. steam per hour: vacuum, 28 in. (bar. 30 in.); at 80° F.  
 From fig. 5. Injection water = 60 times the steam.  
 From fig. 7. 2 per cent. curve  
 at 2 in. abs. ... .. = 0.0054 cb. ft. per lb. water.)  
 Volume of air in injection water  
 (per lb. steam condensed) ... = 0.324 cb. ft.  
 Volume of air by leakage (same  
 as for surface plant), fig. 6 = 0.15 cb. ft.

Total per lb. steam condensed 0.474 cb. ft.

$10,000 \times 0.474 = 4,740$  cb. ft. per hour required, or, say, 24 lb. air per hour.

It must not be overlooked that this figure is the actual volume of air which must be discharged by the pump, and full allowance must be made for the volumetric efficiency of the type of air pump employed.

The reciprocating wet air-pump with foot, bucket, and delivery valves has mostly been used in the past in connection with low-speed reciprocating engines, and driven directly from the piston rod or cross-head, and has in recent years been almost superseded by the Edwards valveless suction-pump. The principal objection to the former pump is the complication of valves, and especially the accessibility of the valves in the bucket. The most notable example of this type of pump is the Weir dual air-pump.

The Edwards pump is so well known that it is unnecessary to describe it. Its main feature is its simplicity, there being only one set of valves, and these being in the delivery plate, they are easily accessible for attention and replacement. The volumetric efficiency of this pump falls rapidly at high vacuum when the air is very attenuated; similarly it drops very much when the speed increases.

Much attention has recently been given to rotary auxiliaries, and especially to air-pumps. In general, the rotary air-pump consists of a centrifugal water-pump which is made to deliver water in jets or sheets through an ejector, the air and gases immediately surrounding these jets being carried along with the water by reason of the friction between the surface of the water and the air in contact with the same. In other cases jets or sheets of water are projected intermittently through passages in the pump casing, entrapping air between the intermittent plugs of water, the whole being discharged against atmospheric pressure by the energy due to the velocity of the water. Experiments have shown that a greater volume of air can be discharged by a given quantity of water when the air is entrapped between plugs or sheets of water than when it is drawn into the ejector by skin friction between the water and air. The velocity of the water being one of the main features of this system, it is essential that it be obtained with the least possible expenditure of power. The features above-mentioned are embodied in the well-known Leblanc pump, invented by Prof. Maurice Leblanc, of Paris, about eight years ago.

The author has, during the past few years, carefully investigated a number of the best known forms of rotary air-pumps, the result being that his firm have now taken up a licence for the manufacture of the Leblanc pump, both for land and marine purposes. There are over 12,000 Leblanc installations now at work. They are in successful use connected to steam turbine units of 15,000 kW. capacity. They have been taken up by several of the Continental and foreign navies, and in the French Navy they have practically superseded the reciprocating pump.

A Leblanc pump is essentially a high-vacuum pump, and where very large volumes of air have to be dealt with, the reciprocating type as last described would be the better, but for the very high vacuum required for turbines, it is a most suitable form of air-pump. The characteristic of the Leblanc air-pump is a water ejector, in which the necessary kinetic energy of the water is reduced in the apparatus itself by a reversed turbine of partial section.

Fig. 8 shows a portion of the turbine wheel. The water enters in

the turbine with a velocity  $w$ , and as the wheel is moving in the direction of the arrow, this velocity, combined with the peripheral velocity  $U$ , gives the relative velocity  $v$ . This velocity becomes  $v_a$  at the discharge of the turbine, and, combined with the peripheral velocity  $U_a$ , gives an absolute velocity  $w_a$ , with which the water leaves the blades. The angles of the blades are such that the velocity  $w_a$  is about 130 ft. per second. In an ordinary water ejector a head of about 265 ft. would be necessary to produce this velocity. It is, therefore, quite clear that the kinetic energy will be transmitted to the water with a higher efficiency than if this necessary pressure were produced by a centrifugal pump and then transformed into velocity. Also in this arrangement the wheel is running in vacuum, thus reducing the friction losses to a minimum.

Fig. 9 shows a sectional arrangement of the Leblanc pump, which works as follows:—Sealing water is introduced through a suitable branch on the casing into a central chamber  $n$ , from which it passes through the water guide nozzle  $C$ . On leaving this the water is caught up (or chopped off) by the blades  $p$  of the air-pump wheel, or impeller, and ejected into the collecting cone  $k$  in the form of thin sheets, which travel with the velocity  $w_a$  until they meet the sides of the collecting cone, and thus form absolutely tight water-pistons, which entrap the air and non-condensable gases coming from the condenser or other apparatus through the suction  $F$ , and carry them out against the atmospheric pressure. The estimated thickness of these water-sheets is only from 4 to 8/1,000 of an inch. These sheets have the tendency to enlarge as the water particles are ejected divergently, and, as previously stated, they are concentrated in the collecting cone, forming a compact plug when passing through the smallest diameter into the diffuser, the energy of velocity being converted into pressure, and the plug, consisting of air, gas and water, being discharged against the atmospheric pressure. The great advantage of rotary air-pumps is their extreme simplicity and the small number of moving parts, usually only an impeller and shaft, and being adaptable for direct driving from electric motor, high-speed engine or turbine, all usual gearing troubles are eliminated.

There is no need to dwell in detail on circulating or injection water pumps of the centrifugal type. It is now possible to obtain high efficiencies W.H.P./B.H.P. with this type, and they lend themselves admirably to direct driving from electric motors or small steam turbines.

Steam-driven auxiliaries have a distinct advantage over electrically driven, in that they are not in any way affected by a disturbance of the electric supply. In the case of a single-unit plant the pumps can be started up before the turbine, and a full vacuum obtained in the condenser ready for the starting up of the turbine. This, of course, does not usually apply to a large central power station where there are always one or more generating sets at work.

#### DISCUSSION.

The chairman (MR. WILSON HARTNELL) said that what Mr. Dexter really meant when he said a vacuum of 30 in. was a pressure of 2½ in. above absolute vacuum. The absolute pressure in inches of mercury could be easily obtained by having a small manometer, instead of measuring the difference of pressures outside and inside the condenser as they usually did.

MR. R. H. CAMPION said he had beautiful water for drinking purposes, but which played great havoc with condenser tubes. There were a good many bad tubes on the market. The trouble was due to the aerated condition of the water which in passing through the cooling tower absorbed acids which were present in the air. They had earthed the condenser to get rid of electrolysis, and now they were fitting a special arrangement with the same object in view. His experience with the surface condenser suggested that they must not rely on any of these new ideas to do away with tube surface; there was nothing like tube surface. He had plant of the low-level type, which was described as rather unsafe on order, and he did not fear the bad results which the author foretold. As to the risk of flooding, they had two arrangements to prevent that.

MR. DEXTER said that corrosion of the tubes was a very serious matter indeed; he did not agree that it was due in any way to bad tubes. His own firm had had that trouble in many cases. In one case in Glasgow they found the water from the cooling towers was slightly acidified, and the trouble was got over entirely by adding periodically a certain quantity of lime to the cooling water. He had recommended this to a number of people, with very beneficial results. In many cases he had found that the more expensive tubes—particularly those which had been tinned—had given worse results than the inferior tubes had, and he thought it was mostly due to electrolytic action. The neutralisation of the water had the best results. In one case at Liverpool there was a centrifugal pump in which the impeller had been reduced 25 per cent. in weight in less than two months from the pump being installed. When he opened up the pump he noticed a deposit of copper at the bottom of the cast-iron casing in four places diametrically opposite. The pump casing was distinctly magnetised. He found quite a big difference of potential between the pump casing and the spindle, and came to the conclusion that the pump was running like a dynamo. They got over that case by making the whole pump and impeller and spindle all of gun-metal, and of the same mixture of gun-metal, too. They made tests before that, and found that with two different kinds of gun-metal they got quite a rapid corrosion with this water, which was pronounced by the city analyst to be splendid drinking water, and to have nothing wrong with it. They found slight acidity in the water, and since lime had been added to the cooling tower tank they had had no trouble, and they were running the same station with cast-iron pumps and impellers. The

station was divided in two, and the turbines and condensing plant were exactly the same on each side of the station; yet on one side a very large corrosion took place, and on the other side there was no corrosion at all. It was well to remove as much oil as possible before it got to the condenser, as otherwise it would coat the condenser tubes and the cooling towers, and they would soon have a loss of efficiency. The Leblanc type of plant was so safe that he had no fear whatever of using that type either with reciprocating engines or with turbines. If the vacuum dropped the pump did not give up lifting if the sealing tank was placed on the same level as the pump, so that the pump was always primed. 'Til about 2½ years ago that was a defect in the Leblanc pump.

MR. A. E. LEIGH SCANES said that he noticed a very large temperature difference was given for a low vacuum. In his own opinion, it was never necessary to exceed 15° F.; it meant a quite unnecessary amount of pumping of the water and consequent increase of power. His firm (the Westinghouse Co.) had found, like Mr. Dexter, that the cheapest form of condenser was the circular shell, and he could not agree that any other form was advantageous in the long run, because of the higher initial costs. They found that with that they could obtain results better than, or equal to, certainly any make of condenser on the market of any shape whatever. One of the plants they made recently could condense 22 lb. of steam per sq. ft. with water at 60° F. and a 28½-in. vacuum. Mr. Dexter suggested that directing plates should be fixed under the steam inlet of the condenser. His own firm had found that if that was done there was an appreciable loss of vacuum in the condenser itself, and they found that a large steam inlet, as was also suggested by Mr. Dexter, was quite sufficient in ordinary practice. As to the safety of the low-level jet plants, they had never up to the present had an accident from that cause. They had found that under any conditions where it was possible to put in these Leblanc air pumps they could compete on a commercial basis with the best types of reciprocating pumps. He admitted that the presence of air in the condenser affected the vacuum, but he did not think it affected the heat transmission. Undoubtedly where the air was equally mixed with the steam it did affect the transmission, but it was not equally mixed in a surface condenser. Mr. Dexter suggested that steam-sealed turbines were preferable, but his own opinion was exactly the reverse; whenever they had the steam-sealed plant to deal with they always allowed a ratio of air in the proportion of four to three for what they allowed for water-sealed glands. The great point of the Leblanc rotary pump was that they could get a much higher hot-well temperature, which varied from 5 to 10° F. above that obtained with a reciprocating pump.

MR. DEXTER said he did not quite agree with Mr. Scanes about limiting the temperature differences. When they were working with high-temperature cooling or injection water to obtain a certain vacuum, it was policy to work at a very much closer temperature difference than they need do for a very low water temperature. With regard to directing plates, in one case he found a great improvement made by dividing up the main exhaust pipe, which was of large area, into sections by ribs and carrying these right through to the condenser, and then in the condenser continuing them, so as to direct the steam well towards the end of the condenser, and better results were got thus than by simply fitting the directing plates—much better than without directing plates, and also better than directing plates without the sectioning of the exhaust pipe. He believed there had not been any flooding accident so far with a Leblanc pump. He had been able to get results on low-level type condenser reciprocating pumps showing a temperature difference within one degree, and on several surface condensers he had got to within 1½ or 2 degrees, but these were under exceptional circumstances. In the case of plant where a reciprocating pump was dealing with dry air and a separate pump extracting water, he did not think there was much difference in the hot well temperature compared with that obtained with the rotary plant. He would like to mention the importance of engineers knowing what air capacity was being given to them when they were buying plant. It was very easy to ask for the square feet of cooling surface in a condenser, the quantity of cooling water circulated and power required, &c., but until quite recently he scarcely knew of any specifications issued where the weight or quantity of air which was provided for by the air pump was asked for. It did not matter to the purchaser whether he was getting 3,000 or 4,000 sq. ft. of cooling surface in the condenser unless the condensers were of the same power and of the same design. He had found that in many cases it had paid to give extra cooling surface and go in for a very simple type of condenser. He differed with Mr. Scanes about the air affecting the heat transmission. He thought the results of tests his firm had recently carried out at their works were conclusive on that point.

MR. McLAY said that the obviously commonsense way was to bring the steam in at the bottom, and let it pass up through the condenser, the air being taken off at the top, and the condensed steam at the bottom. They should keep the upper tubes as dry as could be, so that no moisture was taken from the air, and the air would pass over to the pump practically dry. The condenser should be made of a shape suitable to deal with the volume which was going through it, and should be alongside the turbine. If they put their pumps into the basement they got no attention.

MR. DEXTER agreed with the principle of bringing the steam to the bottom and taking it out at the top, but said that did not fit in well with turbine arrangements. He had tried it many times, and it was very difficult to arrange. They had to have foundations; that in itself made a basement in most instances, and they found it was better to put the plant in the basement. Then they could get a much greater output from the same floor space. The basements were as well looked after as the main engine room.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"CONSULTING ELECTRICAL ENGINEER" writes:—"I should be glad if you would kindly let me know in what position the local authorities stand in the following case: The urban council in question has no electrical powers, and it is questionable whether it will attempt to obtain them. There are several works within the area of the Council, and it is proposed to put an electrical plant in one of them, and transmit power to one or more works about 250 yd. away. An overhead cable would be more direct; but it is deemed best to put an underground cable down along the footpaths with two road crossings. The streets are side streets, and the roads and footpaths unmade and unattached. An application has been sent to the Council for permission to carry this cable as suggested; it is believed that the Council is going to object. Would you kindly state whether it is entitled to object, seeing that it has no powers, nor is it likely to acquire them in the immediate future. If the roads are unattached and the owners of the roads be agreeable, could a cable be laid in spite of the Council? The writer would be obliged for an early reply to these and any other points which may cover the case.

"\* \* This query would appear to raise a question under Sec. 23 of the Electric Lighting Act, 1909, which, so far as is known, has not yet been considered by any court of law. A glance at that section, however, shows that it confers no right upon a local authority to interfere with the private supply of electricity unless that authority is itself supplying electricity under licence or provisional order. Moreover, although it enables a supply authority, being a local authority, to interdict the supply of electricity, it does not "prevent any company or person from affording a supply of electrical energy to any other company or person, where the business of the company or person affording the supply is not primarily that of the supply of electrical energy to consumers." It would therefore seem that so far as the Act of 1909 is concerned, the Council has no power or authority to interfere. A more serious question arises, however, with regard to the laying of underground cables. By the exercise of its powers in this respect, the local authority may effectually check the proposed enterprise. The Public Health Act, 1875, Sec. 148, vests "all streets, being, or which at any time become, highways repairable by the inhabitants at large within any urban district, and the pavement stones and other materials thereof in the urban authority." A similar provision applies to the Metropolis; and where an electric lighting company had illegally broken up the surface of a street within the district of a Vestry in the Metropolis and placed their pipes and wires at a depth of about 2 ft. below the surface, it was held that the Vestry was not, by virtue of Sec. 96 of the Metropolis Management Act, 1855, the owner of the soil of the street at that depth, and that, although the company had acted illegally in breaking up the street, and an injunction was granted restraining them from doing so again, the Vestry was not entitled to a mandatory injunction to compel the company to remove their pipes and wires, there being no continuing trespass upon, or interference with, any right of the Vestry (Vestry of St. Mary, Battersea v. County of London, &c., Co., Ltd., (1899) 1 Ch. 474). For the unwarranted breaking-up of the street, however, the company were summoned at the police court and fined. The suggestion may be thrown out that if the soil of the streets in question does not belong to the Council referred to, there will be nothing to prevent wires or cables being suspended at such a height as not to interfere with the traffic. If, therefore, the necessary wayleaves from frontagers and others can be obtained, there is no reason why an overhead system should not be adopted, provided the Public Health Acts Amendment Act, 1890, (if it has been adopted in the area in question) is complied with. Before embarking upon this course, however, a solicitor should be consulted, because the question whether the "soil" of the streets is vested in the Council is highly technical, and cannot be answered without a much fuller statement of the facts than that which is given in the query.

## British and American Electrical Machinery Exports.

—In Saturday's Parliamentary Papers Mr. Arnold asked the President of the Board of Trade to state what were the values of the exports of electrical machinery from the United Kingdom and from the United States from 1903 to 1911, inclusive; and what were the values of the imports of electrical machinery of United States manufacture into the United Kingdom during the same years.

Mr. Sydney Buxton, in reply, furnished the following statement:—

Year.	Exports of "electrical machinery of all kinds" to all destinations.		Imports into the United Kingdom of electrical machinery of all kinds from the United States of America.
	From the United Kingdom.	From the United States of America.	
1903	£437,000	£1,064,000	£306,000
1904	523,000	1,391,000	290,000
1905	644,000	1,544,000	203,000
1906	842,000	1,724,000	259,000
1907	996,000	2,028,000	186,000
1908	1,354,000	1,449,000	161,000
1909	1,432,000	1,242,000	162,000
1910	1,603,000	1,491,000	153,000
1911	1,791,000	1,739,000	195,000

## BUSINESS NOTES.

**The Edison Car Lighting System.**—In connection with our recent article on the subject of car lighting dynamos, as shown at the Olympia Motor Car Exhibition in November last, Mr. JOHN F. MONROE, of 11, Great Portland Street, W., the sole concessionaire for the Edison battery, has brought to our notice an electric lighting system for motor-cars which he has introduced, in which the necessary supply of current is furnished by a battery of Edison accumulators, the use of a dynamo being dispensed with. The lighting set comprises a small Edison nickel-steel storage battery, two side lamps, a tail lamp, and a two-way switchboard. Four sizes are being made, the No. 1 set, which is intended for small cars, comprising a 40 ampere-hour 4-volt battery, three lamps, switchboard, and three 4-volt 4-C.P. metallic-filament bulbs, and being designed to give 13 hours' continuous lighting on one charge. The No. 2 set is also for small cars, and differs only from the former in having an 80 ampere-hour battery, for 26 hours' continuous lighting. The No. 3 set is for medium cars; the battery in this case is of 40 ampere-hour capacity at 8 volts, 4 C.P., 8-volt bulbs being used. The largest set is adapted for big cars, and is able to furnish current for 50 hours' continuous lighting on one charge, the battery having a capacity of 80 ampere-hours at 8 volts. In addition to lighting the lamps, the battery may be used for the operation of an electric horn. The different sets are neatly arranged, and where a supply of current for charging purposes is readily available, they will be found a much simpler and certainly less costly car electric lighting equipment than where dynamos are used. At the same time, the latter have the advantage that no special battery charging is necessary, this being automatically effected.

**Catalogues and Lists.**—**MESSRS. GENT & CO., LTD.**, Faraday Works, Leicester.—Two pocket leaflets; No. 510 illustrates and gives prices, &c., of bells for power circuits, while No. 511 deals similarly with the "Electromatic" C.B. interphones system, and contains a diagram. Contractors can have quantities of either with their names printed thereon.

**THE STERLING TELEPHONE AND ELECTRIC CO., LTD.**, 200, Upper Thames Street, London, E.C.—The company have, owing to the demand, decided to reinstate in their catalogue, and to stock in London, their cream and gold "Twencen" domestic telephone No. 1100, which they withdrew when issuing the eighth edition of their catalogue. They have now prepared for insertion in this catalogue a suitable priced leaflet relating to the instrument.

**THE "SAFETEE" CONTROLLING APPLIANCES CO., LTD.**, Luton, Beds.—Six-page illustrated price list, with particulars of parts of the "Safetee" combined switch fuse for 1 to 500 amperes and for 250 and 500 volts.

**THE UNIVERSAL ELECTRICAL MANUFACTURING CO.**, 14, Station Road, Queen's Road, Peckham, London, S.E.—Folding pocket card with calendar for the first quarter of the year followed by particulars and illustrations of the "Poplar" street lighting fitting.

**THE STURTEVANT ENGINEERING CO., LTD.**, 147, Queen Victoria Street, London, E.C.—New catalogue, No. 1,071 (32 pages), containing a full description of the Sturtevant system of mechanical draught for steam boilers. The pamphlet is fully illustrated with half-tone views of the system applied to a number of power stations and other works; also line drawings of typical arrangement of the economiser and system.

**MESSRS. VERITYS, LTD.**, London and Birmingham.—Publication No. 682, consisting of 16 pages of illustrations, notes and prices of "Aston" watertight fittings for outside and industrial service, ship installations, porcelain acid-proof fittings, inverted reflector fittings, &c.

**MESSRS. J. WADDINGTON & SON**, builders and electrical fitters, 6 and 7, Creed Lane, Ludgate Hill, E.C., have sent out a useful little desk calendar, with framed monthly slips, a complete year appearing on the back.

**THE RECORD ELECTRICAL CO., LTD.**, Caxton House, Westminster, London, S.W.—Twelve-page catalogue (M 10), containing a full and illustrated description, and table of prices, of their new moving-coil instruments for direct current. Also a collection of illustrated price lists in binding cover, particularising their auto-battery cut-in and cut-outs, circuit-breakers, moving-iron and moving-coil instruments for A.C. and D.C., and switchboard and portable shunts.

**MESSRS. BEDFORD, STEER, END & CO., LTD.**, 78 to 84, Long Lane, Borough, London, S.E.—Price leaflet relating to asbestos woven wire resistance nets.

**THE GENERAL ELECTRIC CO., LTD.**, 67, Queen Victoria Street, London, E.C.—Leaflet (S 1,514) giving prices of Osram candle lamps (plain and twisted flame, and "Spearhead"). Eight-page catalogue (No. F 1,660) containing illustrations and prices of a number of designs of Holophone pendants for direct, indirect and diffused lighting.

**THE ARMORDUCT MANUFACTURING CO., LTD.**, Farringdon Avenue, London, E.C.—A two-colour folder, showing by means of outline maps the extent of an order recently received from the Postmaster-General of New South Wales for Armorduct vulcanised rubber cable (1,115 miles).

**THE WESTMINSTER TOOL AND ELECTRIC CO.**, Suffolk House, Laurence Pountney Hill, London, E.C.—Illustrated price leaflets relating to the Westminster electric grill, No. 6 electric cooker (oven, grill and boiling plate), and the No. 3 cooker.

**MR. C. M. SIMPSON**, Canada House, Baldwin Street, Bristol.—Neat little calendar for 1913, with monthly slips.

**MR. H. C. SLINGBY**, 142-146, Old Street, London, E.C.—Large sheet of illustrations showing a marvellous collection of a thousand different ladders, trucks, tower wagons, hand-carts, and other such things.

**THE EDONESTOS MANUFACTURING CO.**, 127, Pomeroy Street, New Cross, London, S.E.—Advance copy of a new catalogue of moulded insulators. Considerable additions have been made to the number of standard sizes of bushes and handles, all of which can be delivered from stock. The firm have made considerable reduction in the prices of most of their standard articles. In order to encourage the trade to keep to as small a number of standards as possible, a selected number of bushes printed in black are offered at greatly reduced prices. The catalogue opens with particulars of tests, and the following sections, which are separated by a thumb index, contain dimensioned full-size sketches of bushes of different kinds, handles, sleeves and washers, caps, terminals and brushholders, and hand wheels. A loose list shows and prices insulated lampholders, and a £50 free insurance against death from electrical shock is available for anybody who may be using inferior insulators.

**THE WANDSWORTH ELECTRICAL MANUFACTURING CO., LTD.**, Imperial Works, Ludgate Hill, Birmingham.—Seventy-two-page catalogue containing descriptive notes, prices, and very clear illustrations of a variety of switchboards, tumbler switches, ornamental switch-covers, secret switches, combination switches and plugs, two-pin floor and wall sockets and plugs, adapters, cut-outs, fuseboards, main fuses, spring-contact switches, knife switches, ironclad switches, and so forth.

**SIEMENS BROTHERS DYNAMO WORKS, LTD.**, Caxton House, Westminster, S.W.—Twelve-page pamphlet containing a list of their lantern slides that are held in stock. Since the first issue of this list it has been revised and considerably increased by the addition of many interesting and up-to-date slides, and now consists of 238 different views. The slides are kept in stock at Caxton House, and are loaned free of charge to lecturers, schools, &c.

**MESSRS. SIEMENS BROS. & CO., LTD.**, Woolwich.—New catalogue (No. 529) of eight pages and cover, giving full descriptive notes, with prices and illustrations, concerning their small and large electric motor syrens for ordinary and for sharply defined signals.

**Trade Announcements.**—**MESSRS. STEINBACH AND HORN**, 669, Mansion House Chambers, Bucklersbury, London, E.C., have been appointed sole agents for the United Kingdom for Messrs. Lindner & Co., of Sondershausen, manufacturers of electrical porcelain ware and fittings.

**THE M.A.N. MASCHINENFABRIK AUGSBURG-NÜRNBERG A.G.** announce that owing to increased business they are this week moving from their offices in the East Block of Caxton House to a larger suite of offices on the first floor of the West Block in Caxton House.

**MR. E. ALLEN**, formerly manager of the Central Electric Co., has started in business for himself under the title of E. Allen & Co. electrical engineers and contractors, at 138B, Newington Butts, London, S.E. Lists and catalogues from the trade are asked for.

**MESSRS. GRANT & EVANS**, electric bell fitters, &c., of 41, Bridge Street, Berwick-on-Tweed, have opened a branch establishment at Market Place, Coldingham.

On Monday last **MESSRS. MANX, EGERTON & CO., LTD.**, of Norwich, removed their electrical offices from 82, Victoria Street, Westminster, to 379-381, Euston Road, London, where they have taken extensive premises for their motor-car and electrical staff. The firm obtained additional accommodation owing to the increase in their electrical and motor-car business in London.

**MR. S. J. BRADWALL**, electrical engineer, of Macclesfield, has removed from Duke Street to more commodious premises at Lowe Street, Park Green.

**MR. L. A. WELLS**, late electrical contractor, of 19, St. Margaret's Street, and Paradise, Canterbury, has disposed of his business, and is leaving for Sydney by the *Orama* on the 14th inst. He will be pleased to receive all correspondence, especially catalogues from sign specialists, at G.P.O., Sydney, New South Wales.

**THE DISTRICT IRON AND STEEL CO., LTD.**, Smethwick, have appointed **MR. F. S. RIPPINGILLE**, of Winchester House, Birmingham, as their representative for the specialties manufactured in their electrical conduit department, which comprise close-joint conduit and electrically-welded screwed conduits, clips, saddles, couplers, &c.

**Private Arrangements.**—**HAMMOND & CHAMPNESS**, LTD., Alfreton Street, Old Kent Road, London, S.E. The creditors interested herein were called together on Tuesday, at the Great Eastern Hotel, Liverpool Street, E.C., when a statement of affairs was presented, which had been prepared by Messrs. Henry J. Burgess & Co., 14, St. Mary Axe, E.C., showing the position as at January 17th last. This disclosed liabilities of £7,655. The assets were valued at £4,525. Mr. Burgess reported that he had been appointed to act as the voluntary liquidator of the company, and also as the Receiver on behalf of the debenture-holders. The assets had not been taken on a realisation basis, and at a forced sale they might not realise the amount at which they were set down. All the debentures were issued for cash. The company was registered in March, 1910, with a nominal capital of £4,000, divided into 3,700 preference shares of £1 each, and 6,000 ordinary shares of 1s. each. The total number of shares taken up was 603 preference shares, and the 6,000 ordinary shares of 1s. each had also been issued. All those shares were fully paid up. A creditor said he understood that the cash claims were in respect of moneys advanced to the partnership by the partners,

and the debts were taken over by the company. The liquidator replied that there were cash creditors who had never been partners in the concern, while the directors were now creditors for a larger amount than at the formation of the company. A solicitor, who appeared for the cash creditors, intimated that all those claims would be withdrawn, and a document to that effect was produced at the meeting. In answer to questions, the liquidator stated that the first balance-sheet prepared was at September, 1910. It covered a period of 15 months' trading, including nine months of the trading of the business before the company was registered. During that period there was a loss of £292, while in the succeeding 12 months there was a loss of £1,450. During the 12 months to September, 1912, the debit balance was increased to £2,100. Mr. E. H. Hawkins pointed out that ever since the company had been formed it had carried on business at a loss. In answer to questions, it was stated that in the last balance-sheet the goodwill of the company was set down as £700, but in the statement of affairs no value was placed upon it. Mr. Burgess added that he had been carrying on the business and had completed some small contracts. He could offer the business for sale as a going concern, and if that was not successful he could attempt to dispose of the assets under the hammer. The opinion was expressed by certain creditors that application should be made to the Court for the appointment of an independent liquidator. A motion to that effect was, however, defeated, and it was decided to appoint a committee of six of the principal creditors to act with Mr. Burgess in the liquidation of the company. The following are the principal creditors:—

Adams British Oil Co. . . . .	416	General Electric Co. . . . .	£36
Aston Construction Co. . . . .	154	Hoffmann Manufacturing Co. . . . .	50
Auto Machinery Co. . . . .	40	Knights, H. Newton & Co., Ltd. . . . .	174
Aldous & Smith . . . . .	45	Lift and Hoist Co. . . . .	16
Bergthell & Young, Ltd. . . . .	40	Macnamara, J. J. . . . .	28
Buckley, S. . . . .	48	Marrat & Place . . . . .	28
Brotherhood, P., Ltd. . . . .	49	Mawdsleys, Ltd. . . . .	197
Bellows, J. . . . .	40	Mosers, Ltd. . . . .	112
Butler & Jordan . . . . .	20	Nash, W. . . . .	82
Balmforth, T., & Co. . . . .	126	Nettlefold & Sons . . . . .	30
Brotherton Tubes and Conduits, Ltd. . . . .	31	Oliver Arc Lamp Co. . . . .	46
Croogon & Co., Ltd. . . . .	16	Potter, P. W., & Co. . . . .	55
Couldray, W. . . . .	15	Redpath, Brown & Co. . . . .	100
Cohen, J., & Co. . . . .	21	Reid Gear Co. . . . .	65
Dixon & Corbitt and R. S. Newall & Co., Ltd. . . . .	50	Rodney Foundry Co., Ltd. . . . .	147
Electric Control, Ltd. . . . .	55	Russell, J., & Co., Ltd. . . . .	22
Geipel, Wm., & Co. . . . .	63	Smith, A. J., & Co. . . . .	241
		Swell, Edwards & Nevill . . . . .	28
		Varley Magnet Co. . . . .	30

**Bankruptcy Proceedings.**—SAMUEL LORD, director of a limited company, 18, James Street, Liverpool.—This debtor attended at the Court House, Government Buildings, Victoria Street, Liverpool, on January 27th, for his adjourned public examination, before Mr. Registrar Howarth. The Official Receiver said he had no further questions to ask. Although he was not satisfied with the information he had obtained from the debtor, he did not think he could carry the matter further. Mr. Ross, solicitor, said that the debtor had given all the information in his power, and as no good purpose would be served by keeping the matter open, he asked that the public examination should be closed. The Official Receiver said he would not oppose the closing, as he was not prepared to proceed further at present. The examination was ordered to be closed.

WESLEY SUTTON, 62, Dale Street, Liverpool.—This debtor also attended on January 27th, before Mr. Registrar Howarth, for his adjourned public examination. The Official Receiver made the same observations as in the above case, and the examination was ordered to be closed.

CHAS. LEWIS, electrical engineer, lately licensed victualler, Old Trafford.—Receiving order made at Manchester on January 29th, on debtor's own petition. First meeting, February 12th; public examination, February 21st.

**Patents Applications.**—THE ECONOMIC ENGINEERING AND CONSTRUCTION CO. have applied for the restoration of patent No. 8,328, of 1907, granted to E. M. Bassler, for "Improvements in and relating to Conveyors."

An order has been made restoring patent No. 22,968, of 1904, granted to H. H. Lake for an invention communicated by the Oil and Waste Saving Co., of U.S.A., for "Improvements in Centrifugal Machines."

**Finding Lost Pipes.**—We regret that in our issue of January 24th the address of the English makers of the wireless pipe locator was incorrectly stated. The firm is that of MESSRS. EDWIN A. MANSFIELD & CO., 12, Bokenham Road, New Brighton, Cheshire, and all applicants will receive full particulars on application.

**Dissolution.**—WHEELER & MURPHY (J. E. Wheeler and W. Murphy), electrical engineers, Northwood.—Partnership dissolved; Mr. Wheeler attends to debts.

## LIGHTING and POWER NOTES.

**Aberdeen.**—In view of the proposal to supply electricity to Banchory and Ballater and intermediate places on Deeside, Mr. Bell has been authorised to visit districts where overhead transmissions are in use.

The Electric Lighting Department is to apply to the Secretary for Scotland for borrowing powers for £80,000.

**Accrington.**—An application has been received by the Electricity Committee from Messrs. Peebles & Co., of Rishton Paper Mills, for a minimum electrical supply of 1,000,000 kw. hours per annum. This has been referred to the sub-Committee for consideration, with power to agree to terms. A contract has been entered into for a supply of electrical energy to the Accrington Brick and Tile Co. for a period of three years.

Alderman Higham, the chairman of the Electricity Committee, last week forecasted an early reduction in the price of current for lighting. The experiment of generating electricity by the Mond gas system, said Alderman Higham, was proving a success, and the tabulated results would doubtless be eagerly awaited and keenly criticised by electricity experts throughout the country. Quite a number of people interested in the cheap production of electricity had visited the electricity works since the plant was started.

**Athenry.**—The proposed improvements to be effected in this town include an electric lighting scheme, to cost £2,000.

**Bewdley.**—At a meeting of the T.C. on Monday, it was announced that negotiations were proceeding for the establishment of electric light works in the town by a private company, who would give the Corporation the option to purchase the undertaking at stated intervals. The Mayor stated that the negotiations, although not yet completed, were in a very forward state, and there was every likelihood of the scheme being carried through.

**Bolton.**—An inquiry was held on January 30th, on behalf of the L.G.B. relative to the T.C.'s application for sanction to borrow £130,000 for carrying out a big extension scheme in connection with the electricity undertaking, including the erection and complete equipment of a generating station on a site known as Back-o'-th'-Bank. The town clerk said that the land had already been acquired. In consequence of alterations made in the scheme, the actual amount now estimated to be required was £122,000.

The scheme, for which the borough electrical engineer, Mr. A. A. Day, is responsible, has been deemed necessary by reason of the fact that the existing power station at Spa Road has become inadequate. The initial capacity of the plant proposed is two 4,000-kw. turbo-alternators generating three-phase current at 50 cycles and 6,500 volts. Coal will be delivered from the L. & Y. Railway siding direct on top of the boiler house, and on the other side of the site is the River Tonge, the water of which will be available for condensing purposes. In addition to the river, there will be extensive reservoir capacity for condensing purposes.

The Inspector said if the Board approved the general scheme, subject to future details being satisfactory, it would fix a limit to the expenditure.

**Canada.**—The Carillon Falls, on the Ottawa River, 35 miles from Montreal, will be the source of power of the National Hydro-Electric Co., with a capital of £1,000,000, which will seek a market in Montreal for the 148,000 h.p. which could be developed from them.

The immense water-power of the river St. Lawrence, above Montreal, is a source of great temptation to speculators and others on both sides of the Canadian border. Another attempt is to be made to convert the possibilities of the river into an electric development proposition. The promoters of this scheme are the Canadian Light and Power Co. Application has been made some time ago to the Government at Ottawa for authorisation to build dams across the river near Coateau, at the head of the rapids, and at the entrance to the Cedars. Works involving from \$15,000,000 to \$20,000,000 are projected, in addition to those already under construction at the foot of Beauharnais Canal. The scheme, it is understood, will provide for the production of close to a half-million horse-power within easy reach of Montreal.

**Caton (Lanes).**—An effort is being made to establish an electric light undertaking at Caton. Efforts are being made to ascertain the probable number of consumers, and if there is a sufficient demand, steps will be taken to supply it.

**Christchurch.**—The B. of G. has decided to take a supply of current from the Bournemouth and Poole Electricity Supply Co., for at least five years, at 3½d. per kw.-hour for lighting, and 1½d. per kw.-hour for power and heating.

**Continental Notes.**—BELGIUM.—La Société Belge Popp (Traitement des Métaux par l'Electricité) is the name of a new company which has just been formed in Brussels with a capital of £50,000, to establish a plant for the electrical treatment of metal in accordance with certain patented processes.

SPAIN.—The municipal authorities of Sarria (province of Lugo) have just invited tenders for the concession for the electric lighting of the town during a period of 10 years.

GERMANY.—The Ostharz Ueberland Zentrale Gesellschaft is the name of a new company which has lately been formed at Dessau, with a capital of £50,000, to establish a central electricity generation station for the supply of current for lighting and power purposes to a number of small towns and villages in the East Hartz district.

SWEDEN.—The new Swedish budget makes provision for the following electrical works and acquisitions for the State railways and power stations, &c.:—For the frontier railway, additional electrical equipment £30,555, and £22,222 for 1914; continuation of the works at the new Trolhattan canal, £166,666, including £5,277 already voted from the widening of the Stallback canal; extensions at the Trolhattan power station, for a first and second outbuilding, £7,222, and for a third building £8,888, with £7,222 for extras; for electrical plant at the Trolhattan power station £8,883; continuation of works at Porjus

power station, £44,000; and for increasing the water storage capacity of the Store Lule river £4,000; for the Alfkarleby station £159,000, besides a like amount for the transmission network from stations.—*Affarsnärlden*.

**Derby.**—The E.L. Committee of the T.C. has recommended an application to the L.G.B. for a loan of £13,500 for additional plant, &c., viz., 2,000-kw. turbine set, with condensing unit and foundations, £9,000; rotary converter and transformer, 1,000; motor-generator, £2,500; switchgear, £750; cable work and sundries, £250.

**Douglas.**—At a special meeting of the T.C. it was decided by a majority of 3 votes to secure an estimate for a scheme of decorative electric lighting for the promenades of South Douglas, the cost not to exceed £12,000. An amendment to obtain a report on a similar scheme at half the cost was defeated. Another motion rescinding the previous decision empowering the Council to take a plebiscite of the town on an enlarged scheme to cost £28,000 was carried. It was pointed out that no Act provided for a plebiscite on electric lighting, and the Council would be liable to be surcharged with the cost.

**Dover.**—The sanction of the L.G.B. is to be obtained to the borrowing of a further £300 for transformers.

**Dudley.**—The Electric Lighting Committee is making necessary recommendation to the Council for the purpose of carrying on the generating station until such time as the works are handed over to the Electric Traction Co. and co-operating firms, in accordance with the deed of sale. Mr. C. E. Savage, the electrical engineer, has accepted another position near Dudley, but the Committee advises the Council to ask him to devote half or two-thirds of his time to the work of station engineer at the rate of £25 per month until the transfer. It is further recommended that the services of Mr. Savage be retained after the date of the transfer, at an annual fee of £21, for the purpose of inspecting the cost and quantities consumed on the street lighting contract, and for the examination of the tramway plant under the lease.

**Dundee.**—Messrs. Mather & Platt are fitting a factory in the centre of the city with three-phase motors, and those already connected to the Corporation mains are giving every satisfaction. Individual drive on the Schorch system has been adopted at a factory in the Loches district, which is connected to the Corporation mains.

**Durham.**—The R.D.C. has decided to have the electric light installed at Houghal Hospital, where oil lamps are at present in use.

**Edinburgh.**—At a meeting of the Corporation Electric Lighting Committee, it was agreed to advise the T.C. to give a direct electric supply to Redford Barracks, conditional upon the consent of the county authorities being obtained. A proposal to give a supply to Duddingston was remitted to the engineer for report, and a Sub-Committee was appointed to consider the question of opening showrooms for the purpose of exhibiting electrical fittings and apparatus, and demonstrating their utility.

**Eccles.**—At a recent meeting of the E.L. Committee, particulars were given as to the annual amount of electrical energy which the Salford Corporation would agree to take for its tramways, and its willingness to agree to a "coal" clause, whereby a rise or fall in the price of coal would be reflected in the price of energy.

**Glasgow.**—At the last meeting of the Electricity Committee, the engineer reported that the consumption of coal at the generating stations, and the output of electricity had largely exceeded his estimates, and a special sub-committee has been empowered to purchase such additional quantity of coal as may be considered necessary.

The T.C. at its first meeting is to be asked to approve of a proposal by the sub-committee for the holding of an exhibition of electrical apparatus in the city at a date probably in the late autumn, and to empower the committee to make the necessary arrangements. Mr. James Freer, who managed the last two smoke-abatement exhibitions, is proposed to manage the latest venture, which was brought about on the invitation of several manufacturers and agents.

**Gloucester.**—The B. of T. has granted a licence to enable the T.C. to supply electricity to the Children's Hospital at Longford.

**Hertfordshire.**—Petitions are to be lodged by the C.C. against the following Electric Lighting orders:—Watford (Extension), Barnet (Extension), Colne Valley, Rickmansworth, Chorleywood and District, and the Northwood and Ruislip (Extension).

**Heston-Isleworth.**—In respect of mains and house services, two further loans of £1,200 and £800 are to be applied for by the Council.

**Hornsey.**—To-morrow the Council's new plant at the generating station is to be inaugurated. This consists of a 750-kw. Belliss-E.C.C. direct-current set, with a speed of 250 R.P.M. The engine is of the triple-expansion type, and exhausts to a Mirrieles barometric condenser with two Rees-Roturbo pumps driven by a Bruce Peebles motor for supplying condensing water. A Baker oil separator is provided, and the hot well water is passed through a softening apparatus to the boiler feed tank, in connection with which a Rees-Roturbo electrically-driven boiler feed pump has been

installed. A Babcock water-tube boiler was installed about 12 months ago, and a further boiler of the marine type, with electrically-driven stoker gear, coal bunkers, &c., has been added, while the engine room has been extended sufficiently to accommodate two further large sets, in addition to that just installed. The work has been carried out under the direction of the Borough electrical engineer, Mr. Norman Staniland.

**Ilford.**—Application is to be made to the L.G.B. for sanction to borrow £10,000, being the estimated expenditure on mains extensions during the next three years. The amount is made up as follows:—Private mains, £5,500; public mains, £1,000; house services, £3,500; legal and loan charges, £100. A supply is to be given to the Omnibus Co., at its new garage at Seven Kings, on the two-rate system.

**Kislingbury (Northants).**—A meeting of the rate-payers has passed a resolution supporting a proposal to obtain a supply of electricity from Northampton through the Electric Light Co., and pledging them to become consumers when a supply is available.

**Lewes.**—An 80-ft. chimney stack fell on Monday night on to the local electricity works, doing considerable damage.

**Liverpool.**—Applications are to be made to the Board of Trade and the L.G.B., for sanction to the borrowing of £8,000 and £10,000 for the provision of additional tramway cars and electric mains, respectively.

**London.**—HAMMERSMITH.—The Mayor and members of the Council last week paid a visit to the electricity works in Fulham Palace Road. Particular interest was taken in the last turbine installed, which was supplied by Messrs. Richardson, Westgarth & Co. It has a capacity of 3,000 kw., with 3,750 kw. in case of emergency for two hours. In the works there are now nine machines, viz., four turbines and five high-speed reciprocating generators, the total capacity of the whole being 10,300 kw.

The sum of £3,000 is to be taken up from the L.C.C. for electricity purposes, viz., £1,239 for mains, repayable in 25 years; £138 for switchgear, within 15 years; £1,321 for house services within 12 years; and £299 for meters within 10 years.

**Maidstone.**—The T.C. has adopted the recommendation of the Electricity Committee to extend the plant and buildings at the electricity works at an estimated cost of £5,620.

**Middlesex.**—With the view of protecting the county interests, a petition is to be lodged against the Metropolitan Electric Tramways (Railless Traction) Bill, 1913. Objections have been lodged against the Colne Valley Electric Supply Prov. Order and the Wood Green Electric Lighting Prov. Order.

**Newport (Mon.).**—As an experiment, the Borough Education Committee has decided to have the electric light installed in the Bolt Street and Ereswell schools.

**Oldham.**—A point in connection with the proposed new plant at the electricity works was raised at a meeting of the Corporation Electricity Committee last week. Councillor C. Hardman said that a local firm had asked if the Committee could let them have 1,000 H.P. The Committee had intended to get a 1,500-H.P. set, and that might be too small in view of the many applications. The engineer (Mr. Newington) said a 2,000-H.P. set was slightly more economical than the 1,500 H.P. set. The working cost was practically the same, and the present boiler power would be sufficient. It was decided that the Committee should put a 2,000-H.P. set in the application for borrowing powers which is to be made, instead of the 1,500 H.P. set, as first suggested; also to ask permission to supply a Royton firm, which is just on the border.

**Plymouth.**—The Electricity Committee of the T.C. has decided to extend and alter the plant and mains at the electricity works, at an estimated cost of £7,500. Of this £2,000 for alterations will be met out of the reserve fund, and a loan will be applied for, for the balance of £5,500.

**Rickmansworth.**—The U.D.C. has decided, for certain reasons submitted to the B. of T., not to support the application for a prov. order for electric light of Mr. R. E. H. Fisher, who had asked the B. of T. to dispense with the Council's consent. The Watford R.D.C. has also taken a similar attitude, and has informed the B. of T. that it cannot support the application of any particular electrical company.

**St. Albans.**—The B. of G. has appointed a Committee to go into the whole question of lighting the workhouse at present lit by gas.

**Salford.**—An agreement has been entered into with the Calico Printers' Association for supplying energy to them, subject to a minimum payment being guaranteed, and to the payment of £1 per quarter per H.P. demanded, and 1d. per kw.-hour. A contract is being entered into with the Lancashire Electric Power Co. for supplying energy in bulk; the Manchester Corporation also tendered for this supply. The sanction of the L.G.B. is to be obtained to the borrowing of £12,000 for the installation of rotary converters, transformers and switchgear required at the Frederick Road station in connection with the taking of the above bulk supply.

**Scarborough.**—The Corporation has appointed a Sub Committee to consider the question of the taking over of the Scarborough electric supply undertaking. The Corporation has the option of doing so, if it thinks such a step desirable, at stated

ntervals. The Sub-Committee has been instructed to report generally upon the question of purchasing the undertaking.

**Shipley (Yorks.).**—The Shipley District Council contemplates extending its scheme of electric street lighting, and has issued instructions for the preparation of a scheme and estimates of the cost of lighting both by electricity and by gas.

**Staveley.**—Several influential residents are interesting themselves in a scheme for obtaining a supply of electricity for the parish. Energy could be supplied from the Devonshire works of the Staveley Coal and Iron Co., Ltd., and it is understood that efforts will be made to secure a supply.

**Sunderland.**—The estimates for the Corporation Electricity Department for the year ending March 31st show an income of £67,912 and an expenditure of £61,218, leaving an estimated credit balance of £6,724—a substantial increase on the figures of last year. Of the net profit, it is intended to take £1,200 for the renewal of mains, and place the remainder to the credit of the renewals fund.

**Sutton (Surrey).**—The South Metropolitan Electric Tramways and Lighting Co. has decided to supply current to consumers at Sutton for heating at 1½d. per kW.-hour on a minimum quarterly consumption of 100 kW.-hours.

**Wednesbury.**—The Electricity Committee has recommended that application be made to the L.G.B. for sanction to borrow £2,000, for sundry electric mains, and a further sum of £1,000 to cover estimated expenditure on service connections.

**Westhoughton.**—It was announced recently that the D.C. had decided to approach the Lancashire Electric Power Co. as to whether it would be prepared to discuss terms for an extension of the lighting of the district by electricity.

**Whitstable-on-Sea.**—The electric light question, referred to in the last issue of the ELECTRICAL REVIEW, was again discussed by the U.D.C. on January 28th, when Mr. A. A. Kemp proposed that the resolution of September 1st, relative to the application of the Council to the B. of T. for a prov. order, be rescinded. On this being carried by 6 votes to 5, Mr. Kemp moved that the Council consider the establishment of an electric light undertaking by a private promoter, and this was adopted by 6 votes to 4.

**Wood Green.**—As recently stated in these columns, the U.D.C. has decided to sell its provisional order to the Tottenham and Edmonton Gas Co. for £500, subject to terms of supply, repurchase, &c. The Gas Co. is, therefore, seeking the necessary Parliamentary powers to supply electric light. On the other hand, the North Metropolitan Electrical Power Distribution Co. is applying to the B. of T. for an order empowering it to supply Wood Green. At a meeting on January 30th, arranged by the local Chamber of Commerce, the Chamber adopted the unusual course of inviting the heads of both the Electricity and Gas Co.'s to attend, and in response, Mr. Broadberry (manager of the Gas Co.), Mr. Devonshire (chairman of the Electricity Co.), and Mr. Ruthven Murray (the Electricity Co.'s expert), together with Mr. Spencer Hawes (the District Council's expert adviser), were present. Each was invited to express his views, after which they withdrew, and the traders—who will be the principal consumers, apart from the public lighting—voted upon the Council's action.

Mr. Broadberry, for the Gas Co., said his company was binding itself to a maximum price of 5d. per kW.-hour, and undertaking to supply within one year. The Order which the Power Co. was to obtain now fixed the maximum price at 8d., and did not undertake a supply for two years. His company would install gas engines of a new type, which would be almost as silent as sewing machines. It was not securing the Order to stifle it. With both gas and electricity in the hands of one concern, there would be no overlapping of canvassing, and it mattered not to the Gas Co. whether its gas was being used with incandescent mantles, or for the purpose of creating electricity.

Mr. Devonshire, for the Electric Power Co., said the Wood Green ratepayers owed the Power Co. a debt of gratitude, for in 1904 it saved them from what at one time appeared to be a very foolish expenditure, when about to embark upon the huge outlay of £45,000 upon electric lighting. Happily the scheme was abandoned, and he estimated that the Power Co. thus saved the ratepayers an annual expenditure of £12,000. From that time onwards, the Power Co. submitted various schemes for the supply of electricity in bulk, realising that with its enormous plant it could generate far more cheaply than the Council could ever hope to do it. In one bulk supply scheme that came near to adoption, the Council wanted an indemnity clause, to which the company could certainly not agree, so that the scheme was dropped. In 1907 another scheme was presented but never proceeded with. The Power Co. had endeavoured to do business with the Council, but it seemed as if it would not meet with success, and now it had had enough of it. Although the methods of procedure adopted by the respective companies to get the powers were different, they would both meet in Parliament, and he trusted that the Power Co. would be able to convince that high tribunal which was the better of the two schemes.

Mr. Ruthven Murray, the Power Co.'s expert, derided little gas stations, and said they were being scrapped. The maximum of 8d. was merely protective, and was seldom, if ever, reached.

Mr. Spencer Hawes, the Council's expert, emphatically declared himself in favour of the Gas Co.'s scheme, and assured the Chamber of Commerce that the Council had acted in the best

interests of ratepayers and possible consumers in agreeing to dispose of its order to the Gas Co., which had treated it most fairly in the matter.

Mr. F. G. Holmes, the only member of the Council against the scheme, said the Council would be at the mercy of the Gas Co. if the scheme were sanctioned by Parliament. He estimated that the total turnover on gas at Wood Green was £50,000 a year, yet the Council was giving the company a monopoly for £500. He believed in competition.

A resolution was carried that the Council's action in agreeing to sell the order to the Gas Co. was not in the best interests of the district. This decision is regarded in the neighbourhood as an important weapon with which to strengthen the hands of the electric light company.

**York.**—A report shows that the total income of the York electricity undertaking for the nine months ended December 31st, 1912, was £19,901, as compared with £15,944 during the corresponding period of 1911, an increase of £3,956. The expenses were £9,610, having grown from £6,904. The cost per unit during the period was '53d., as compared with '80d. The increased demands and the expected requirements of the next winter have resulted in the Electricity Committee recommending the Corporation to apply for power to borrow £30,600 for the purposes of extensions of plant and mains.

The loan is to be applied for, for the following purposes:—3,500-kw. turbo-alternator with condenser, £14,257; two water-tube boilers, with superheater and chain-grate stokers and steam pipes, £4,170; H.T. cables, £6,551; battery room and battery, £4,722; sheds for locomotive and main stores, £600; contingencies, £300.

A poll of the ratepayers was taken on Friday last to determine the future of the proposal to obtain Parliamentary powers to purchase the Gas Co.'s undertaking. Curiously enough, the proposal appears to have been largely supported by the members of the local Electricity Committee, but nevertheless the ballot resulted in a majority of 2,067, out of 8,629, against the proposed Bill.

## TRAMWAY and RAILWAY NOTES.

**Belfast.**—The extension of the tramways system was opened on the 28th ult., and since then there has been a substantial traffic on the new roads—Bloomfield, Donegal Road, Oldpark Road, Ligonell, Stranmillis Road and Ravenhill Road. The B. of T. inspection was carried out the day before.

**Blackpool.**—The T.C. has approved of the Tramways Committee's proposal to borrow £10,000 for extensions, including the purchase of six additional "toast-rack" cars.

**Brighton.**—The T.C. has rejected a proposal of Messrs. Tilling to run a service of petrol-electric buses.

**Cannock.**—The R.D.C. has decided to support the application of the Great Wyrley P.C. to the Walsall Corporation for motor-bus or tramway facilities between Great Wyrley and Walsall. The P.C. has received a communication from the Corporation stating that the matter will receive consideration by the Tramways Committee, but that the latter could not embark upon any scheme which would not provide 8d. per mile for every car-mile run.

**Continental Notes.**—**AUSTRIA.**—An extensive scheme for the enlargement of the tramway network is projected at Trieste, by which some 27 public thoroughfares will be intersected and served by tramway lines. The official authorisation for the preliminary studies has been granted. At Prague the Advisory Committee of the Tramways Co. has recommended the construction of six new lines in that city and its suburbs.—*Elektrotechnik und Maschinenbau.*

**Edinburgh.**—On condition that the Corporation aids substantially the proposed Zoological Gardens for Edinburgh, and that the gardens will be opened within the next 12 months, the Tramways Co. is prepared to contribute £1,000 to the undertaking.

**Glasgow.**—At its last meeting the T.C. instructed the Tramways Committee to proceed with negotiations with the various local authorities and other parties interested along the line of route, in connection with a considerable extension of the line of tramways, which, if carried out in its entirety, will add about 20 miles of double track to the system. It is expected that the negotiations will take up the better part of the spring and summer, and upon their success or otherwise will depend the future action of the T.C. in seeking for Parliamentary sanction for the extensions. In submitting the proposals, Bailie Kirkland, the convener, spoke at some length of the great congestion of traffic in the centre of the city. He admitted that the tramways were to a very considerable degree responsible for this, and suggested that in the near future the question of a central relief route would have to be considered. This would probably involve the construction of another bridge over the River Clyde, but if the Corporation approved of the erection of such a bridge as would suit the needs of the tramways department, the latter might be looked to for a large contribution, if not the payment of the whole cost. As to

the extensions, which are, with three slight exceptions, all into the country, and link up villages and populous centres, it was contended that such routes had paid as well as, if not better than, the crowded city lines.

With the extension of the half-penny stage distance on the T.C. tramway cars the four at first was expressed that there would be a considerable falling-off in the revenue derived. This fear has now had the edge taken off it by the report from the department that the income for the present financial year has exceeded that of 1911-12 (up to the end of February), by over £1,000. The figures are from June 1st to February 1st, 1912-13—£666,617, and June 1st to February 1st, 1911-12, £665,612. While, through 1912 being Leap Year, the last 12 months had one more working day than the present year (and a day's drawings, which will not be included in 1912-13, are averaged at £2,400), it is confidently expected that the record in the income created last year will be eclipsed on the present occasion. So far as passengers carried are concerned, the totals already far exceed those of any previous similar period of nine months, and are nearly 26 millions more than in the corresponding spell of 1911-12.

**Goldthorpe.**—The U.D.C. has under consideration a scheme for the establishment of a service of railless cars between Bolton, Goldthorpe and Barnsley.

**Hertford.**—The County Council has decided to abandon the Watford-Bushey tramway scheme, which has been on the boards for 12 years. The introduction of the motor-bus is considered to account for the decision.

**Hythe (Kent).**—The T.C. at a special meeting on Saturday decided to support the Bill of the Tramway Co., which is being promoted by Mr. Cownie.

**Japan.**—The Aichi electric railway is about to commence the construction of a light electric railway about eight miles in length.

**London.**—CENTRAL LONDON RAILWAY.—The work of reconstructing the permanent way has been commenced. This is being carried out at night, three 42-ft. sections being hauled from the depot where they are built, to the desired position on a special train consisting of bogie trucks, which are motor-driven from Edison batteries. Two of the latter, each with 220 cells, are installed on each truck, and the latter are also provided with cranes for lowering the track into position.

**Newcastle-on-Tyne.**—The estimates for the ensuing year of the Corporation tramways have been presented to the committee. The income is put at £10,000 more than in the past year, but the estimated expenditure is put a like amount higher; the increased expenses being attributed to higher wages of drivers, conductors, &c., £3,000; street repairs, £2,000; and increased cost of coal, &c. It was reported that several works were urgently needed, including the renewal of lines in Shields Road, Jesmond Road, and Grainger Street, &c., the total cost of which was put at £61,000, which would be met out of the reserve fund.

**Northampton.**—The Tramways Committee has had under consideration the advisability of adopting a motor-omnibus service or extending the tramways to Far Cotton. It has been decided to take the latter course and construct a double track throughout, with the exception of a portion which will cross the L. & N.W. Railway, at an estimated cost of £17,340. Tenders are to be obtained for carrying out this work, and also for the doubling of certain track, estimated to cost £5,090. With regard to the motor-buses, the Committee expressed the opinion that 'buses cannot, either as regards reliability or comfort, compete with modern tramcars, and their working expenses were greater than would justify the Town Council in adopting this method of traction.

**Salford.**—In default of the proposals of the Salford Corporation being accepted as to the terms for the future supply of energy by Eccles to Salford for working the tramways in Eccles by the Salford Corporation, application is to be made to the B. of T. to appoint an arbitrator to settle the question.

**Sandgate (Kent).**—The U.D.C. has decided to proceed with the petition against the Bill of the Tramway Co. for power to construct and operate a railless traction system in the district.

**Scarborough.**—The Scarborough South Cliff Tramway Co. proposes to introduce pumping by electricity.

**S.E. & C. Railway Electrification.**—Speaking at the meeting of the South-Eastern and Chatham Railway recently, Mr. Cosmo Bonser, who presided, stated that the directors had not abandoned the idea of electrifying the railway. At the present moment, they were having a report made by an eminent engineer as to the wisdom of the proposal. The system, the chairman added, was a difficult one to deal with, for they must either electrify it throughout or leave it alone altogether. The question was entirely one of money.

**Sunderland.**—The estimates for the year ending March 31st next show an income of £68,769, a slight decrease on the figures for the preceding year. The net profit is put down at £11,076, and of this £6,076 is to be placed to the reserve fund, and £5,000 to the borough fund for the relief of the rates. The slight decrease in income is attributed to the bad weather, which caused a reduction in the traffic to the seaside.

## TELEGRAPH and TELEPHONE NOTES.

**Australia.**—The Federal Government has accepted tenders for the installation of automatic telephone exchanges on the Strowger system in the Glebe, Newtown and Balmain suburban areas of Melbourne. The contract price is about £37,000. The system has already been installed at Geelong, at a cost of £14,293. —*Sydney Morning Herald.*

The report of the Postmaster-General for 1911 shows that the revenue of the Commonwealth from the telephone service increased by £233,674, and from the telegraphs by £10,473. The total length of wire in use for telegraphic purposes was 97,053 miles; the number of telephone instruments in use was 102,654, an increase of 16½ per cent. The number of telephone exchanges rose from 678 to 927. The telephone trunk lines aggregated 39,088 miles.

**Imperial Wireless System.**—On Wednesday last week the cross-examination of Mr. W. R. Lawson by Mr. Falconer before the Select Committee occupied the whole sitting. Mr. Lawson admitted that at the time when the contract was drawn up there was no company in the same position as the Marconi Co. to carry out the work. He had said that the effect of wireless telegraphy in naval warfare had not been thoroughly tested or thought out, and that there was no mention of the subject having ever come before the Cabinet, but he withdrew the latter statement. He admitted that the rates to be charged by the Post Office for messages would not be affected by the amount at which the Marconi companies were capitalised, and that if the market value of the shares was excessive, that was not the fault of the company. Regarding his statement that the State had associated itself with a huge Stock Exchange gamble, he said he had never been able to verify the rumours that Ministers had been interested in the speculation.

On the following day, Mr. Lawson withdrew the allegations that wireless telegraphy had never been considered from the point of view of its effects on naval warfare, and that the Post Office had shut itself out from the services of all other patentees. He admitted that the cable companies had been granted landing rights without payment, while the Marconi Co. had been refused a licence in 1910, and that there was no analogy between the position of the cable companies and that of the Marconi Co., and he therefore withdrew his statement that the treatment of the former was in striking contrast to the favour accorded to the Marconi Co. He agreed also that there was no analogy between the positions of the National Telephone Co. and the Marconi Co. He further withdrew his statement that the affiliated companies of the Marconi Co. were all heavily loaded, and modified other passages in his previous evidence.

On Monday Mr. Lawson's cross-examination was continued. The witness protested against the mode of cross-examination adopted by Mr. Falconer, and expressed a wish to take out the whole of his evidence with regard to the Government being tied to the Marconi Co. by the agreement. He agreed that the company was financially in a position to carry out the contract, had a system capable of trans-Atlantic communication, and had a large and highly-qualified engineering staff, a more important consideration than that of patents. The company had great financial influence, but he admitted that the Government were absolutely independent of the company.

A letter was read from Mr. Marconi, stating that he was compelled to go to the United States before March 1st in connection with certain patent actions brought by his company, and must absent himself from London for 10 or 14 days before sailing. He therefore requested to be heard by the Committee as soon as possible. The chairman said they could not break off the journalists' evidence at present; and as the House of Commons would rise on February 14th, the Committee could not call Mr. Marconi till after Easter.

The Committee sat again on Wednesday.

The Committee appointed by the Postmaster-General to advise on the existing systems of wireless telegraphy requests any person desiring to be heard by the Committee to apply to the Secretary, Mr. E. H. Rayner, National Physical Laboratory, Teddington, Middlesex.

The Select Committee, to which the Postmaster-General referred the request of the Marconi Company to be released from the contract, has replied that it cannot advise on the matter until the inquiry is concluded. Mr. Samuel therefore has refused to release the company, pointing out that a provision was embodied in the contract that it should not take effect until approved by the House of Commons.

**Telephonic Control of Trains.**—The Rhymney Railway Co. have put into operation over their system, which extends from Cardiff into the eastern and western valleys of Glamorgan-shire, a new train control system making use of the telephone, the first of its kind that has been installed in Great Britain. It was provided by the Western Electric Co., of North Woolwich. By means of a system of telephones to all signal-cabins, junctions, and stations on the line, the whole of the train working can be completely and directly controlled from the head office at Cardiff. It is believed that as the result of the new installation much time will be saved. —*Standard.*

**Wireless in the Antarctic.**—Several messages have been received from Dr. Mawson, leader of the Australian Antarctic Expedition, who is now in Adelle Land, but, so far, the Australian station has not been able to make him hear any reply.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdeen.**—February 10th. One 3,000-KW. turbo-alternator, with surface condenser and air pump, for the Corporation. See "Official Notices" January 24th.

**Arbroath.**—Tenders are invited for the electric lighting work for the reconstructed Sheriff Court House. Mr. P. C. Smith, arch engineer.

**Ashton-under-Lyne.**—February 19th. H.T. switchgear, water-softening plant, steam, exhaust and feed pipes, tanks, &c., for the Corporation. See "Official Notices" January 31st.

**Australia.**—VICTORIA.—February 21st. Four 1,500-KW. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" January 10th.

February 27th.—Buildings and boiler-house equipment, turbo-alternators and rotary converters, for a Government power station Perth. See "Official Notices" January 24th.

**SYDNEY.**—March 17th. Motors for the City Corporation.

**SOUTH AUSTRALIA.**—March 5th. One section of a common-trolley switchboard, for the P.M.G.'s Department. See "Official Notices" January 31st.

**Austria.**—VILLACH.—March 1st. Tenders are invited for the supply of three portable 13-H.P. rotary current motors, a 1-H.P. rotary current motor, and a 7-H.P. rotary current motor; also for a large number of machine tools for the railway workshops. Forms of tender (2d.) and conditions of delivery (1s.), and her particulars, may be obtained of Abteilung IV, k.k. Staatsbahn-Direktion Villach, Austria.

**KRAKAU.**—February 19th. Tenders are wanted for the supply of three electric hand-boring machines, three ditto air, the equipment for a 60-ton wagon hoist, a 20-ton electrically-driven movable crane, a movable electric boring machine, a ditto screw-cutting lathe, two electric Universal hand-boring tools, an electric polishing machine, an electric quick-borer and a rotary transformer. Particulars and tender forms from Abteilung IV, Staatsbahn-Direktion Krakau, Austria.

**INNSBRUCK.**—February 21st. Tenders are required for the supply of a shaping machine with electrical equipment, an electrically-driven table boring machine for holes 15 mm. diameter, an electric hand-boring machine, the electric equipment of a 40-ton wagon hoist, an electrically-driven hammering machine, and other tools for the railway workshops. Particulars and forms of tender enclosing 2d.) of Abteilung IV, k.k. Staatsbahn-Direktion Innsbruck, Austria.

**Beckenham.**—February 10th. Arc lamp carbons (flame) and electrical house cut-outs and service boxes, for the U.D.C. the Offices, Beckenham.

**Belfast.**—February 24th. Stores and materials for one year, for three years, for the City electricity department. See "Official Notices" January 31st.

**Belgium.**—February 17th. The Belgian Department of Bridges and Roads in Brussels (52, Boulevard du Regent) are inviting tenders for the necessary installation for the supply of electricity for lighting purposes at the Royal Palace at Laeken.

**Birkenhead.**—February 11th. Continuous-current electricity meters and house service fuse boxes, for the Corporation. See "Official Notices" January 24th.

**Blackburn.**—February 15th. Materials for a year, for the Corporation Electricity Department. See "Official Notices" January 31st.

**Bolton.**—February 13th. Turbo-alternators with condensing plant, water-tube boilers, economisers, switchgear and steam feed pumps, for the Corporation. See "Official Notices" January 24th.

February 24th. Materials and stores, for the Corporation Tramways Department. See "Official Notices" to-day.

**Bridlington.**—February 8th. One 600-KW. turbo-alternator, with switchboard and pipework extensions, for the Corporation. See "Official Notices" January 24th.

**Bristol.**—February 14th. Arc lamp carbons, joint, junction and fuse boxes, A.C. wattmeters, and D.C. mercury type ampere-hour meters, for the City Electricity Department. See "Official Notices" January 31st.

**Cardiff.**—February 14th. One steel chimney, with mechanical draught plant, for the Corporation. See "Official Notices" January 31st.

**Cheltenham.**—February 12th. Electric wiring, Montpelier Baths, for the T.C. Borough Engineer, Municipal Offices.

**China.**—February 10th. Six 625-K.V.A. three-phase oil-cooled transformers, for the Shanghai Municipal Council. See "Official Notices" January 24th.

**Colchester.**—February 10th. Duplicate motor-driven air-compressor plant, with pipework, cables, switchgear, &c., for the Committee of Visitors, Essex and Colchester Asylums. See "Official Notices" January 24th.

February 15th.—Rubber and fibre insulating materials, cables, electrical fittings (lighting), electrical equipment (cars), overhead equipment, car fittings, &c., for the Corporation tramways department. Mr. R. C. Bullough, General Manager and Engineer.

**Darlington.**—February 17th. One 1,000-KW. steam turbo-alternator, one 750-KW. and one 250-KW. rotary converter, and one water-tube boiler, for the Corporation. See "Official Notices" January 31st.

**Derby.**—February 19th. One 2,000-KW. turbo-alternator, for the Corporation. See "Official Notices" to-day.

**Dublin.**—February 13th. Water-tube boilers, economisers, pumps, conveying plant, pipework, &c., also boiler seatings and flue work, for the Corporation Electricity Supply Committee. See "Official Notices" January 24th.

February 13th. Arc lamp carbons, for the Corporation. See "Official Notices" to-day.

**Edmonton.**—February 26th. Electric lamps for the B. of G. Mr. F. Shelton, clerk, The Grange, White Hart Lane, Tottenham.

**Egypt.**—March 31st. Section des Municipalités invites tenders for electric light installation at Damietta. For further particulars see this column for January 24th.

**Finchley.**—February 17th. One 300H.-H.P. oil engine, coupled to a 200-KW. E.C.C. generator, for the U.D.C. See "Official Notices" to-day.

**France.**—PARIS.—February 14th. Tenders are invited by the Administration des Chemins de Fer de l'Etat for the supply of 500 electric connections for bearer rails, 60 metres of naked copper cable of section 200 square millimetres, and 700 metres of naked copper cable of 400 square millimetres section. Particulars may be obtained from Bureaux du Service-Electrique (1st division), 43, Rue de Rome, Paris.

**NANTES.**—Orders are about to be placed by the Chamber of Commerce of Nantes for three electric cranes. Particulars of the Chamber.

**Glasgow.**—It is recommended by the T.C.'s Committee on Electricity that it is advisable to proceed with the erection of a new generating station on ground recently acquired for the purpose in Dalmarock Road, and the engineer (Mr. W. W. Lackie) has been authorised meantime to prepare forms of tender of specification for the erection of one pumping station for the purpose of pumping water from the River Clyde for condensing purposes, at an estimated cost of £3,000.

**Grimsby.**—February 11th. One 1,000-KW. mixed-pressure turbine and continuous-current dynamo, with condensing plant, for the Corporation. See "Official Notices" January 24th.

**Halifax.**—February 17th. Stores and materials for a year, for the Corporation electricity department. See "Official Notices" January 31st.

February 17th.—Stores and materials for tramways department for 12 months. Tramways Engineer, Tramways Office, Skircoat Road.

**Hornsey.**—February 24th. Electricity meters, cables and cable stores, for the T.C. See "Official Notices" to-day.

**Ilford.**—February 25th. Stores for a year, for the U.D.C. electricity department. See "Official Notices" to-day.

**India.**—February 18th. High and low-tension switchboards, for the Bombay, Baroda and Central India Railway. See "Official Notices" January 31st.

**Leeds.**—February 19th. Coal and general stores for a year, for the Corporation electric lighting department. See "Official Notices" January 24th.

February 17th.—The City Tramways Committee invites tenders for electrical sundries and engineers' furnishings and other goods for the tramways during the 12 months ended March 31st, 1914, and also for the reconstruction of certain portions of tramway track, in respect of which tenders may be for six, nine or 12 months. General Manager, Tramway Offices, City Square, Leeds.

**London.**—BERMONDSEY.—February 17th. Stores for a year, for the B.C. Electricity Department. See "Official Notices" January 24th.

**L.C.C.**—February 11th. The tramways department is inviting tenders for 584 tons of special section mild steel bars for magnetic brake shoes. Specifications and form from Mr. A. L. C. Fell, Chief Officer of Tramways, 62, Finsbury Pavement, E.C.

**L.C.C.**—February 25th. Electric wiring of the Camberwell and Cressy Road car-sheds. See "Official Notices" January 31st.

**FULHAM.**—February 19th. Electrical and engineering stores for a year, for the B.C. See "Official Notices" to-day.

**ST. PANCRAS.**—March 4th. Arc lamp carbons, for the B.C. See "Official Notices" to-day.

**SHOREDITCH.**—The B.C. Lighting Committee is to invite tenders for economisers for Whiston Street generating station.

**MARYLEBONE.**—February 26th. Stores and materials for a year, for the B.C. Electricity Department. See "Official Notices" to-day.

**MARYLEBONE.**—February 12th. Converting plant, for the B.C. See "Official Notices" to-day.

**Manchester.**—February 18th. General stores for a year, for the Corporation tramways department. See "Official Notices" January 31st.

**Morocco.**—March 27th. 15,000 insulators for the Post and Telegraph service. Tenders to M. le Président de la Commission Générale des Adjudications et des Marchés, Dar-En-Ninba, Tangier. Deposit, 1,000 fr. *Board of Trade Journal.*

**Newcastle-on-Tyne.**—Messrs. C. A. Parsons & Co., Ltd., Henson Works, are inviting tenders for a 10-ton single-motor electrically-driven travelling jib crane, 1 ft. 3½ in. gauge, with travelling, lifting and slewing motions, about 16 ft. radius, fitted with overhead trolley collectors, all for 110 volts D.C. supply.

**Oldham.**—February 21st. Two 500-KW. motor-alternators, for the Corporation. See "Official Notices" to-day.

**Portsmouth.**—February 10th. Arc lamp carbons (Conradtys), for the Corporation Electricity Department, for a year Electric Light Station, Gunwharf Road.

**Prague.**—February 28th. Tenders are invited for the supply of machine tools, with electric equipment, to the Bohemian Northern Railway. Particulars (enclosing 2d.) from the Direktion der Böhmisches Nordbahn, Abteilung IV, Prague.

**Rochdale.**—Engine room extension, new boiler house, &c., turbo-alternator, condensing plant, motor-alternator, water-tube boilers and boiler house equipment for the Corporation. See "Official Notices" to-day.

**Sheffield.**—February 8th. The Corporation Tramways Committee is inviting tenders for 1,000 tons of steel tramway rails. Specifications, &c., £2 2s. (returnable), from Mr. W. J. Hadfield, Surveyor of Highways, Town Hall.

**South Shields.**—February 17th. Uniforms, for the Corporation tramways department. See "Official Notices" January 31st.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Walthamstow.**—February 28th. Four double-deck tramcars complete with magnetic-brake equipments, for the U.D.C. See "Official Notices" to-day.

## CLOSED.

**Admiralty.**—The Walsall Electrical Co., Ltd., has received an order from the Admiralty for 1,000 switches and sockets.

**Australia.**—The *Australian Mining Standard* states:—"With reference to the acceptance of the tender of Australasian Wireless Ltd., Sydney, for the installation of wireless telegraph stations at Sydney and Fremantle, it is notified that the price covered by such acceptance has been increased to £6,150 in the case of the station at Sydney."

One lamp signalling trunk-line switchboard of nine sections, one three-position recording desk and one chief operator's desk, for £2,079, has been ordered by the P.M.G., Melbourne, from the Western Electric Co. (Aust.), Ltd., Sydney.

The same contemporary states that Messrs. W. G. Watson & Co., Sydney, have received an order for 11,000 Helleren dry cells, which completes a total of 33,000 supplied for the Sydney Post Office.

The Prahran-Malvern (V.) Tramways Trust has accepted the tender of Messrs. Siemens Bros., Melbourne, for an automatic reversing booster and switchgear, at £971.

**Bradford.**—The Board of Guardians has accepted the offer of Messrs. C. A. Parsons & Co. of a new commutator for one of the turbo-generators of the workhouse plant, at a cost of £75.

**Cheltenham.**—The Borough Education Committee has accepted the tender of Messrs. R. E. & C. Marshall for the electric light installation at Haunton Park Centre, at £31; and that of Mr. F. H. Bastin for the electric light installation at Marlborough House, at £26.

**Dover.**—The tender of Messrs. J. Wright & Sons, at £42, has been accepted by the T.C., for wiring the St. Martin's Schools.

**Eastbourne.**—The T.C. has accepted the tender of the British Westinghouse Electric and Manufacturing Co., for a 1,500-KW. turbo-alternator, without condensing plant, running at 3,000 R.P.M. for £5,236. The turbine is to be of the pure impulse type. Fifteen other tenders were received.

**Eccles.**—The tender of Messrs. Joseph Chapman & Sons, Patricroft, is to be accepted for the erection of the extension to the boiler house at the electricity works, for £518.

The T.C. has accepted the tender of Messrs. J. and G. Weir, Ltd., at £80, for the provision of an additional feed pump at the electricity works, and that of the British Electric Transformer Co., Ltd., at £115, for the installation of a 150-K.V.A. transformer.

**Glasgow.**—The Electricity Committee has recommended the acceptance of (1) an offer by Messrs. Willans and Robinson, Ltd., for one set of Curtis-Parsons turbo-alternators and condensing plant, at £16,064, and (2) an offer by the British Westinghouse Electric and Manufacturing Co., Ltd., for one set of Curtis-Rateau turbo-alternators and condensing plant, at £16,721.

**Gloucester.**—The Electricity Supply Committee has accepted the tender of the Phoenix Dynamo Manufacturing Co., Ltd., for two new armatures for No. 6 generating set, at £590, and that of Messrs. Simon & Co., at £35, for alterations to the governors &c. The engine will be able to run at full load at reduced speed after these alterations.

**Haslingden.**—Mr. A. M. Cramp, of Haslingden, has secured the contract for electric lighting, power, bells, telephones and vacuum suction plant for Springfield Lodge, Haslingden, the new residence of Councillor R. Waddington, chairman of the Electricity Committee. Mr. Cramp is also carrying out the electrical equipment of Messrs. S. S. Stott & Co.'s Lancashire Foundry and Elevator Works, Haslingden.

**Ilford.**—The U.D.C. has accepted the tender of Messrs. W. T. Henley's Telegraph Works, Ltd., at £87 10s., for the supply and delivery of 100 yd. of cable for switchboard connections.

**Ipswich.**—The B.G. has accepted the tender of the Chloride Electrical Storage Co., Ltd., for the maintenance of the storage battery at the Workhouse for five years.

**Leyton.**—The U.D.C. has accepted the tender of the Paterson Engineering Co., Ltd., at £150, for installing a cold process water softener at the electricity works.

**Liverpool.**—The following tenders have been accepted by the T.C.:—

Jas. McKelvie & Co.—Annual supply of about 1,500 tons best Arley gas slack to the electricity department.

Halley's Industrial Motors, Ltd.—Chassis for motor tower wagon.

Sutton Heath and Lea Green Collieries, Ltd.—Annual supply of steam slack to the Lister Drive power station.

The following have also been accepted for plant for the Lister Drive power station:—

Babcock & Wilcox, Ltd.—Six boilers with chain grate stokers, stoker gear and steel up-take flues; induced draught fan, complete with motor; gravity bucket coal conveyor and motor; overhead coal bunkers and floor for supporting economisers, flues and fans.

E. Green & Son, Ltd.—Six economisers.

Jos. Crawford.—Four induced draught fans and control panels, motors and platform.

**London.**—SHOREDITCH.—The B.C. Lighting Committee has contracted with Messrs. Harrison, Tidswell & Co. for up to 2,000 tons of Whitwick deep seam slack, at 14s. 5d. per ton, delivered free alongside Whiston Street power station.

STEENEY.—The B.C. Electricity Committee has accepted the offer of Messrs. W. Geipel & Co. for 28,000 Henrion flame arc lamp carbons, at 14s. 6d. per 100, less 50 per cent. discount. It also recommends the acceptance of the tender of Messrs. Strachan and Henshaw, Ltd., Bristol, for the extension of the telfer track at Limehouse station, for £2,722. Messrs. E. Wood & Co., Ltd., Manchester, tendered at £2,752.

POPLAR.—The tender of Messrs. M. Keenan & Co. has been accepted by the B.C. at £91, for lagging the main steam, feed, and blow-down piping in the extension at the generating station.

**Manchester.**—Messrs. Higginbottom & Mannock have received an order for the supply of six 2-ton electric cranes for No. 9 dock.

**Mersey.**—The Mersey Docks and Harbour Board has accepted the tender of Messrs. Geo. Russell & Co., Ltd., for 30-cwt. movable electric roof cranes for the double-storey shed on the south side of the Brocklebank Branch Dock.

**Morecambe.**—The Corporation has approved the acceptance by the Tramways Committee of the tender of Messrs. Hill and Smith, Wolverhampton, for the supply of an unclimbable iron fence at Bare in connection with the new tramway sheds.

**Newport.**—February 22nd. General stores for a year, for the Corporation electricity and tramways department. See "Official Notices" to-day.

**Salford.**—The T.C. has accepted the tender of the A.E.G. Electric Co., for the supply of 500 electric lamps at 30s. per doz., less 27½ per cent., also the tender of W. T. Henley's Telegraph Works, Ltd., for an annual supply of wire to the tramways department. Two overload circuit breakers are to be purchased from Mr. Bertram Thomas, for £90. The tender of Messrs. Mather and Platt, Ltd., has also been accepted, at £635, for the supply and delivery of filtration plant at the electricity works.

**Walthamstow.**—February 28th. Annual stores for the electricity and tramway departments. See "Official Notices" to-day.

**Willenhall.**—The U.D.C. has accepted the tender of the Rees Roturbo Manufacturing Co. for the pumping plant in connection with the new sewage disposal works.

## FORTHCOMING EVENTS.

## NOTES.

**Association of Mining Electrical Engineers.**—Friday, February 7th. At 8 p.m. At the I.E.E., Embankment, W.C. Paper on "Cables for the Shafts of Mines," by Mr. I. K. Scott.

(West of Scotland Branch).—Saturday, February 15th. At 4.30 p.m. Meeting at the Royal Technical College, Glasgow.

**Royal Institution.**—Saturday, February 8th. At 3 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture I.) Saturday February 15th. —Lecture II.)

**Association of Engineers-in-Charge.**—Saturday, February 8th. At St. Bride's Institute, E.C. Social. Dance.

Wednesday, February 12th. At 8 p.m. At the St. Bride's Institute, E.C. Paper on "The Control of Alternating-Current Motors," by Mr. J. T. Mould.

**Salford Technical and Engineering Association.**—Saturday, February 8th. At 7 p.m. At the Royal Technical Institute, Salford. Lecture on "Our Annual Trip Round the Sun," by Mr. C. M. Dorman, M.I.E.E.

**Institution of Post Office Engineers (Metropolitan Section).**—Monday, February 10th. At 6 p.m. At the I.E.E. Paper on "Loading Coils," by Mr. S. A. Pollock.

**Institution of Electrical Engineers (Newcastle Section).**—Monday, February 10th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "The Special Application of Electricity in Warships," by Mr. A. P. Fyne.

(Manchester Section).—Tuesday, February 11th. At 7.30 p.m. At the University, Manchester. Paper on "Advertising Electricity," by Mr. H. C. Palmer.

(Scottish Section).—Tuesday, February 11th. Meeting at 8 p.m. At Princes Street Station Hotel, Edinburgh.

Saturday, February 15th. At 7.30 p.m. At the Grosvenor, Glasgow. Annual smoking concert.

(Birmingham Section).—Wednesday, February 12th. At 7.30 p.m. At the University, Birmingham. Paper on "The Parallel Operation of Alternators," by Mr. A. R. Everest.

(Yorkshire Section).—Wednesday, February 12th. Meeting at the University, Leeds. At 7.15 p.m. Lecture on "Some South American Electric Plants," by Mr. T. Harding Churton.

(London).—Thursday, February 13th. At 8 p.m. Paper on "Parallel Operation," by Mr. A. R. Everest.

(Dublin Section).—Thursday, February 13th. Meeting at 8 p.m. At the Royal College of Science, Dublin.

**Junior Institution of Engineers.**—Thursday, February 13th. At 2.30 p.m. Visit to the works of the Osram Lamp Works, Ltd., Hammersmith.

Friday evening, February 14th. At 39, Victoria Street, S.W. Paper on "Electrical Installations in Metal Conduit, with Special Reference to Earthings," by Mr. F. H. Taylor.

Saturday, February 15th. At 6.30 p.m. At the Hotel Cecil. Annual dinner.

**Institution of Mechanical Engineers.**—Friday, February 14th. At 8 p.m. Annual general meeting. Paper on "Modern Condensing Systems," by Mr. A. E. L. Scanes.

**Birmingham and District Electric Club.**—Saturday, February 15th. At 6.30 p.m. At the Swan Hotel, Birmingham. Annual dinner.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer.—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, February 10th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, February 11th.—"B" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Thursday, February 13th.—"C" Company. Company training, 7 to 10 p.m.

Friday, February 14th.—"D" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Saturday, February 15th.—Headquarters will be open from 10 a.m. till 12 noon for regimental business.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj.,  
For Officer commanding L.E.E.

**The Electrical Trades Benevolent Institution and Life Insurance.**—We have received from Mr. Hawes, the secretary of the above Institution, particulars that are being issued by the Provident Clerks' and General Mutual Life Assurance Association respecting life and endowment insurance. This office undertakes to afford to members of the Institution an opportunity to effect life insurance on easy terms. Weekly payments can be made through the Institution's properly-appointed representatives. Full information as to scales for whole life, limited premium, and endowment policies can be obtained either from Mr. F. B. O. Hawes at 18, Park Mansions, Vauxhall Park, S.W., or the secretary of the Assurance Association named, at 27 and 29, Moorgate Street, London, E.C. It is hoped that the arrangement will form an inducement to many of the younger men in the industry to become members of the Benevolent Institution (minimum subscription 10s. per annum). Ten per cent. will be added by the Institution to the amount assured when the same becomes payable.

**Glasgow International Exhibition.**—There is a movement on foot for holding an International Exhibition in Glasgow in 1915 or 1916.

### Parliamentary Notes.—UNDERGROUND TRAMWAYS.—

Last week Mr. Kellaway asked the representative of the First Commissioner of Works whether, with a view to diminishing the existing congestion of London streets, his department had at any time discussed with the London County Council the possibility of allowing underground tramways to be made under thoroughfares and land within the jurisdiction of the Office of Works in such a manner as not to interfere with the amenities of any street or path beneath whose surface such tramways might be run. Mr. Benn replied that the possibility of allowing subways for tramways under land, &c., in the control of the Department was discussed with the London County Council in 1906. The First Commissioner was prepared to consider any further representations which the Council might make on the subject.

**SHEFFIELD CORPORATION BILL.**—According to the *Times* Parliamentary report, the House of Lords had under consideration the Commons' reasons for disagreeing with certain of the Lords' amendments. Lord Southwark moved that the House do not insist upon their amendments, but he also moved the insertion of a new sub-clause restricting the right of the Corporation to supply electrical fittings. This, he said, was an agreed compromise, and after a short discussion the motion was agreed to.

The following is the new sub-clause to Clause 90 in lieu of sub-clause 2:—

"The Corporation may enter into contracts for the execution of any of the powers of this section, including the wiring of private property. The Corporation shall not under the powers of this section sell any such electrical fittings (other than electric lines, fuses, switches, ceiling roses, and such other electrical fittings as are used in connection with the wiring of private property from the distribution main as far as the ceiling, wall or floor outlet only), except through a contractor carrying on his business independently of the Corporation."

Lord Southwark said that the new sub-clause practically meant that the Corporation would now have the power to carry wiring as far as the walls and the ceiling, and that the traders would have the rest of the work in connection with electric lighting.

**Inquiries.**—A correspondent wishes to get into touch with the makers of self-starting synchronous motors, British or Continental. The name of makers or agents of the "Leanda" lamps is asked for.

**Newcastle Contractors' Dinner.**—The Newcastle-on-Tyne Branch of the Electrical Contractors' Association held their annual dinner in that city on the 1st inst. The chair was occupied by Mr. W. Fletcher, and there was a fairly numerous company present.

The chairman proposed the toast, "The Electricity Supply Authorities." He said that the relations between the supply authorities and the contractors in that district were of a very friendly character. An evidence of this good feeling was to be found in the recent Electrical Exhibition in Newcastle-on-Tyne, where the contractors and the supply companies worked together with great success, and, he thought, to their mutual benefit.—Mr. C. Turnbull (electrical engineer, North Shields), in replying, referred to the relations between the wiring contractors and the supply companies, and said he thought the trouble was that everybody wanted something cheap. It was a difficult position, and it appeared to him that the chance of getting prices up was remote. It was a young industry, and one in which there was room for more efficiency. In looking over the details of gas companies' undertakings, he was struck with the large percentage of residuals of commercial value that were left over; if they could do something of that sort in regard to electricity, they might get down to 2d. per unit, and the day would not be far distant, as indeed he hoped it was not, when the consumer would be willing to pay a reasonable price for his installation. He thought that the way to do this was by co-operation between the wiring contractors, the supply authorities, the manufacturers and everyone in the trade, in order that they might be able to get cheaper materials—copper and rubber, for instance. Copper was one of the dearest metals in the market, and rubber as a commercial material was extremely expensive. He believed that many of their wires could be made of some cheaper material than copper, and that insulation might be made at a quarter the cost of rubber; but if they were to experiment in this direction, they should have some kind of testing authority which would examine all materials put forward, and would not pass any material to come into general use until they were satisfied that it would be good. By co-operation they could do much for the benefit of everybody. Commenting on the advance they were making in electrical machinery, he mentioned that Messrs. Parsons were constructing a turbine of 25,000 kW., and expressed the hope that in the not very far distant future they would see machines like that in use throughout the district.

Mr. J. Gledson gave the toast, "The Electrical Contractors' Association," the principal object of which was, he took it, the maintenance of a proper status in the profession, and to ensure the recognition of their rights.—Mr. R. Robson (the hon. secretary) responded to the toast, and said that the Association had devoted much of its time to opposing Bills in Parliament, and had been very successful in that respect and in getting clauses altered in favour of their trade. Perhaps, if their energies had been expended in other ways, they might have increased their membership. He thought it was about time that the Association, instead of devoting all its energies to fighting Corporations and municipal trading, devoted some of its time to fair trading. Mr. Cross had done an enormous amount of work in trying to make arrangements with the Manufacturers'

Association for fair trading by allowing the buyer to have a legitimate profit over anybody else for the same quantity of material purchased.

Mr. A. Andrews proposed the toast of "Kindred Electrical Trades." He said the electrical contractors were in that unfortunate position known as middlemen, but he thought that they could ask the Manufacturers' Association to grant them preferential tariffs. One of the originators of the Manufacturers' Association was Mr. Byng, who had written very largely upon preferential tariffs, and he suggested to Mr. Spence, who had to respond to that toast, that he should use his endeavours to get the contractors some preferential tariff as compared with the ordinary trader.—Mr. J. Spence acknowledged the toast, and said the delicate points put forward by Mr. Andrews required careful consideration. With regard to preferential tariffs, the manufacturers, as they knew, were in a most peculiar position. Although rather late in the day, the electrical manufacturers in this country had formed themselves into an Association, not for their own benefit altogether, but also for the benefit of the whole industry. The chief gain was mutual, since it came through standardization in every department. Questions relating to treatment, tenders, time guarantees, and public bodies could be much better dealt with by an Association. The manufacturers had no desire to injure any other interest, least of all that of the contractors, upon whom they looked as their very best friends. The question of preferential treatment, however, was a very difficult one to discuss. He had been at a number of meetings of manufacturers, and he knew what was going on inside, and he could assure the contractors that this matter was receiving very serious consideration.

During the evening an interesting musical programme was provided.

**Annual Socials and Dinners.**—NEWCASTLE-ON-TYNE.—On Friday evening last at the Central Exchange Hotel, Grey Street, Newcastle-on-Tyne, the staff dinner of Messrs. J. H. Holmes & Co. was held, Mr. Alfred Holmes presiding over a goodly company, which included several engineers engaged in electrical business in the Tyneside district. After the usual loyal toast, Mr. T. W. Wallis, London representative, proposed "The Firm." This was drunk with great enthusiasm, and Mr. A. Holmes, the senior partner in the firm, responded. There was an excellent programme of music and song. In addition to the customary printed programme, there was a second, which was in distinctly humorous vein, and was distributed after the tables had been cleared. It occasioned a good deal of merriment.

**WARRINGTON.**—The staff of the St. Helens Cable and Rubber Co., Ltd., held their annual whist drive and dance on Friday evening last, from 7.30 p.m. to 2 a.m., at Winmarleigh Café, Warrington. An invitation card of special design was issued in connection with the event.

**DUNDEE.**—The manager, Mr. D. Fisher, presiding at the annual supper and dance of the employés of the Dundee and Broughty Ferry Railway Co., said the company had had a successful year, and they had been throughout loyally supported by the staff. Mr. Wm. McGill, the secretary, congratulated the company and the employés on their immunity from accidents during the year.

**ACCRINGTON.**—Fifty-six Accrington Corporation tramway men, including the Haslingden staff, sat down to dinner, on January 30th, and afterwards adjourned to the Central Conservative Club. Mr. Billing, the general manager, presided, and was supported by Mr. Day, the Haslingden general manager, and Mr. Calvert. During the evening, the presentation of a clock was made to Mr. A. Duffy, in recognition of his services in connection with the benevolent fund for men who have been off work through sickness or accident while on duty.

**BLACKPOOL.**—The employés of Blackpool, St. Anne's and Lytham railways Co. held their seventh annual dinner and entertainment, on January 30th. Mr. H. W. Laing, general manager, presided and was supported by Mr. Wood, traffic manager, Mr. Partington, carshed foreman, and other heads of departments.

**LONDON.**—The Mazda-Gems held a very successful Bohemian concert at the Talbot Restaurant, London Wall, E.C., on Monday evening. Mr. E. Coote presided with much geniality over a gathering which taxed the holding capacity of the hall to its fullest extent. An excellent programme was provided and was enthusiastically received, number after number being encored. Clever caricatures of the heads of departments on the programme, and the general get-up of the latter, reflect credit on the firm and on the designer. The evening was most successful throughout, and everybody present left eagerly looking forward to the next B.T.H. event of the kind.

**Copper.**—Messrs. Merton's statistical circular for January last, 1913, shows a reduction in European visible supplies of 2,161 tons, made up of 2,343 less in English ports and 118 less at Havre, against an increase of 300 tons in the quantity afloat. Rotterdam (not included in the above) shows 400 tons better, and Hamburg 621 tons, so, if these were included, the reduction during January could be only 141 tons.

Arrivals from North America are well up to average; from Spain and Portugal, fairly high at 1,983 tons, the average being about 750 tons. Shipments from Chile are well up at 4,800 tons, a figure not reached since 1908; the average shipments from this country over the past 12 months are good, and the country appears capable of a steady output. Australian shipments are also strong and well maintained. The total deliveries are 46,067 tons, the highest figure since last June. The stocks in American Producers' hands (American Producers' Association) at the end of December are given as 47,014 tons, an increase of 8,548 tons over the quantity on November 30th, the total visible supply, including Holland, Germany and the United States, for the end of December, 1913, stood at 90,225 tons, an increase of 8,478 tons over the previous return.

**The Cortesey Steam Turbine.**—We have been able to gather further information concerning this proposal for a turbine without blades, and we find that it consists practically of a rotating annular drum, that is to say, the rotor and the casing are attached and rotate together, and steam is admitted by a nozzle or nozzles into the annular space in the direction of rotation. The drum thus rotates inside a whirl of steam. The length of the drum is divided by ring plates or diaphragms into several divisions of increasing cross-section and passes from one division to the next by a series of nozzles. At present we only seem to see in these division plates a means of imposing on the steam a path of sufficient length. For the rest our sketch of last week stands good. It only remains, therefore, to effect a proper joint at the first end of the turbine and a suitable connection to a condenser, in order to demonstrate what this smooth turbine will do. That it is unexpectedly powerful can be readily believed, and its value will be great if it only succeeds in being nearly as efficient as a bladed turbine. All that remains to be done is, therefore, to prove its efficiency in commercial sizes. Needless to say that though both casing and rotor are moving with the steam, their motion relative to the steam is small, and the action depicted in our figure will take place with so much better efficiency seeing that both surfaces of impact are in motion. The proposal is of extreme interest if it can be proved far enough.

**Treatment after Electric Shock.**—The Highways Committee reported to the L.C.C. at Tuesday's meeting that they had arranged for lectures and demonstrations to be given to those employés in the tramways department whose work may bring them into contact with electrically-charged apparatus, in order that they may receive instruction in the treatment of persons suffering from electric shock. The number of men affected is about 300, and they will be divided into classes of about 15 each. The total expenditure will amount to about £12.

**L.C.C. Turbine Repairs.**—The Highways Committee reports that an accident occurred in July, 1912, to the generator coupled to No. 8 turbine at the Greenwich generating station, which necessitated the provision of new windings and other repairs. The work was put in hand at once by the makers of the machine, the British Westinghouse Electric and Manufacturing Co., Ltd. The cost of the work amounted to £2,010.

**Post Office Engineers.**—The ninth annual dinner of the Engineering Department, London, was held on January 29th, at the Connaught Rooms, Kingsway, W.C., the chair being taken by Mr. William Slingo, Engineer-in-Chief to the Post Office.

After the loyal toasts, in proposing the toast of "The Engineering Department," Mr. Herbert Samuel said there never had been an occasion when the Department was more deserving of toasting; the year 1912 had been a most arduous one for the engineering branch, which had been concerned with vast changes—the inventory of the National Telephone Co.'s plant, and the transfer of that great undertaking to the State; the amalgamation of the two systems, and of the two staffs; the arbitration, the greatest arbitration of its kind that had ever taken place in this country; and the readjustment of their engineering districts. One other event had happened which they might wish to see continued and repeated in future years—the introduction of higher scales of pay for certain of the classes. The efficiency of the telephone business depended to a large degree upon the way in which it was worked by the engineering staff of the Post Office, and he trusted that they would do their best to see that the public got a really efficient and satisfactory service. The development of the service was likely to be rapid. In the present financial year they would spend on construction, renewals, and maintenance, a sum of about 5½ million pounds. The money had been available before, but the staff had had so much to do that they had not been able to spend it. The future development of the telephone service was greatly bound up with the introduction, to a continuously increasing degree, of automatic systems. The experiments that had been made had been very successful, and the Department was taking steps to extend the use of automatic appliances. The late Engineer-in-Chief, Major O'Meara, was still assisting the Department, as special commissioner, and was investigating telephone systems on the Continent. They proposed to make an experiment of a very interesting kind; in some small towns, with less than 50 subscribers, an automatic installation was to be provided which would look after itself entirely. It would merely enable the subscribers to get into touch with the exchange in the nearest large town, and also enable the operators in that exchange to ring up the subscribers in the small place. One other development was the provision of a tube railway for the exclusive use of the Post Office in London. The scheme was well advanced, and the Post Office would before long have a tube of its own for the carriage of its mails and parcels from one end of London to the other. It was a great pleasure to him to toast their new Engineer-in-Chief, Mr. Slingo, who had risen in the Engineering Department from the lowest ranks up to the top.

Mr. W. Slingo, in reply, referred to the wonderful strides which the Engineering Department had made and the very great impression which he was sure the Department had made upon the heads of the Post Office. The importance of the work and the honour and credit of the Department were undoubtedly on the mind of every man on the staff; they were alive to the great interests entrusted to them and to the great work they had to do. The Department was increasing rapidly. Their expenditure this year was twice as much as it was last year, but they had done more than twice as much work for the double expenditure. The staff increased during the year by the acquisition of the National Telephone Co.'s staff from 9,000 to 16,000 men. The staff had under-

gone a reorganisation, and a largely extended benefit had resulted. He did not want a contented staff. A contented staff was a staff without ambition, and could never progress. He hoped no one would imagine that because there were to be no examinations there would be no selection. He was prepared to make the selection as keen as ever it was. The inventory had almost been forgotten; he wondered if anyone realised how much work there was in the inventory operations. The valuation, which succeeded the inventory, and to some extent proceeded concurrently with it, was another big work. Only those who went through that mill would ever know the extent of the grinding, and the time would come when credit would have to be given to some of the officers who so zealously threw themselves into this work. It was an honourable fight. They had been more than 74 days in Court, and at the end of that time there was hand-shaking all round, proving that there was the utmost good feeling.

Mr. W. Noble, on rising to propose the toast of "The Visitors," said they had with them not only the *élite* of the Post Office service but also the *élite* of the allied engineering professions outside the service, to whom they gave a very hearty welcome. He first referred to the "officially dead," namely, their veterans. Sir John Gavey would always have a very hearty welcome. It was only a few days since Mr. Kempe left them; recently, when he delivered a very interesting address at their Institution, one gentleman made the shortest speech on record: "Mr. Chairman and gentlemen,—Can you wonder that we all love Kempe?" With regard to their "officially live" guests, it was the universal opinion of all officers of the Post Office that they never had a more able Postmaster-General, nor one who had obtained such a grasp of the work of the great Department over which he presided.

Mr. A. M. J. Ogilvie and Mr. W. Duddell replied to the toast, and Mr. A. W. Martin proposed the toast of "The Chairman," who briefly responded.

**Institution and Lecture Notes.**—ASSOCIATION OF MINING ELECTRICAL ENGINEERS.—At a joint meeting of members of the Association and of the Yorkshire Branch of the National Association of Colliery Managers, at Leeds, last week, Mr. David Bowen, acting head of the Mining Department of the Leeds University, gave an illustrated lecture on "An Account of Experiments on Safety Devices in Connection with Electrical Machinery for Coal Mines," with many details of experiments carried out at the University by himself and Mr. Walter C. French. He referred to the experiments carried out in Germany several years ago by Prof. Heise and Dr. Thiem, and continued by Messrs. Beyling and Goetze in Germany, and said that they had since been proved by himself and Mr. French to be unacceptable.

**THE IRON AND STEEL INSTITUTE.**—The annual meeting will be held at the Institution of Mechanical Engineers, Storey's Gate, Westminster, on Thursday and Friday, May 1st and 2nd. The Bessemer Gold Medal will be awarded to Mr. Adolphe Greiner, general director of the Société Cockerill, Seraing, vice-president of the Institute. The annual dinner will be held at the Hotel Cecil on Thursday, May 1st. The autumn meeting will be held at Brussels, at a date to be announced later.

**ROYAL SOCIETY OF ARTS.**—On Wednesday evening, a paper on "The Economic and Hygienic Value of Good Illumination" was read by Mr. Leon Gaster.

**THE SOCIETY OF ENGINEERS (INC.).**—On February 3rd, a paper on "The Bus or Tram Controversy, and Other Aspects of the London Traffic Problem," was read by Mr. Wm. Yorath Lewis, who endeavoured to awaken Londoners to the seriousness of the present situation, urging that the traffic facilities should be controlled by Government. The formation of a "London Transport Association" was suggested, for the purpose of studying the problems, educating the public, and using all possible means to secure cheap and effectively rapid transport. At present, he said, the London County Council was balked in every direction, and its tramway undertaking was excluded from the lucrative short-journey traffic which would be ensured by inter-connections through the central area. The author then investigated whether motor-omnibuses adequately filled the needs of the central area and the connections with the immediate surroundings, concluding that if they did so, which was not by any means the case, it was only at enormous cost to the traveller using them, although they operated under conditions of unmatched freedom, conditions which could not be justified. The "door to door" speed possible with buses within the central areas was on the average only 4 miles an hour. The average amount paid per passenger-mile ridden was at least 1d., and of every penny taken 58 per cent. was clear profit. In comparison with this, on the Glasgow tramways the amount paid per ridden mile was under a halfpenny, and on the L.C.C. tramways the amount paid per ridden mile was as low as 1d. The huge profit made by buses in the central area enabled the omnibus company to make big average profits, even if the suburban traffic was run at such rates as left in some cases little, if any, margin. Mr. Lewis concluded that the Adkins-Lewis system of continuous transport was superior to motor omnibuses and tramways for the central area.

**Lamp Standards for Motor-Car Electric Lighting Installations.**—At a recent meeting of the Standards Committee of the American Society of Automobile Engineers, in New York, a report was presented by the Division on Lamp Standards. The relative advantages of the earthed and unearthed returns for lighting systems commanded attention on account of the rapid development in car electric lighting recently. It was brought out that the earthed return provided bigger contact points and better insulation of the lamp receptacles. Further, with earthed returns there were fewer connections at the switch; an ordinary system involving head, side and tail lamps had 11 connections with the earthed, as against 14 with the unearthed system.

As to the advantages of the unearthed return, they all hinged on the fact that accidental earthing on the battery side of an earthed return system short-circuited the current and damaged the battery; whereas, in the unearthed return system it would be necessary to earth both sides of the circuit simultaneously. With earthed systems horns and other dash electric devices must be carefully insulated from the metal parts of the body. No definite recommendation was made on this point.

The report recommended that standard electric light bulbs be known as 7-volt bulbs, and have an efficiency of 1.1 watts per candle at voltages between 6.5 and 7 volts. Standard electric headlights are to be  $2\frac{1}{2}$  in. in diameter, and capable of being focused in a reflector of 7–8 in. or greater focal length. An effort is being made to get data from battery makers from which to specify standard dimensions of batteries and plates, giving three standard plate sizes from which batteries of any capacity can be made by increasing the overall battery length.

**Electricity Supply Rifle League.**—On Saturday last the first annual dinner of the League was held at the Talbot Restaurant, London Wall; the president, Sir Alexander Kennedy, occupied the chair, and there was a large gathering of members and guests, numbering over 100.

After the toast of "The King," Mr. L. L. Robinson, electrical engineer and manager to the Hackney Borough Council, proposed success to the League, remarking that the Hackney staff were the prime movers in forming the League early last year, and that they had a most energetic secretary in Mr. E. Matthews. Westminster had won all their matches, and scored 20 points, Central being second with 14. All managers, he said, were anxious to encourage the League, which had proved a splendid thing; they would endeavour to promote shoulder-to-shoulder matches, so as to get acquainted with one another at the different works. Hackney had an excellent range of 100, 50 and 25 yards, and they hoped to hold a gala day there next summer.

Mr. Matthews, who received an ovation, said that in addition to the undertakings already enrolled, those of Brompton, St. James's, Poplar, Bermondsey and Hampstead were coming along this year.

Mr. S. T. Dobson, of the St. James's Co., briefly proposed the health of the President, who, in responding, said he was more concerned with the 13.5-in. gun, having a range of 20,000 yd., than with the rifle. He was pleased to see that the shooting men were drawn from every branch of the staff; that was an ideal condition. He conveyed a challenge to the League from the Railway Rifle League to a match (which was at once accepted), and offered to present a disappearing target apparatus to the League if they would devise one. He then presented souvenir medals to the members of the Westminster team:—Messrs. H. A. Pearnan (average 96.2); Foster (95.4); Neville (95.3); Winchcombe (94.86); Partridge (93.9); W. A. Pearman (92.0); Horley (91.8); Litt (90.0); and White (89.87).

Mr. C. Newton Russell, proposing the "Visitors," said that all the sports clubs that had been formed at Shoreditch had proved failures with the exception of the rifle club, which was thriving. Mr. G. Spencer Hawes replied with a humorous speech, and Mr. L. Wilde proposed "The Aristies," for whom Mr. J. H. Heathman responded. Mr. Heathman was in charge of the excellent musical programme, which was rendered by members of the League, and proved that the latter were no less efficient as musicians than they were as riflemen.

**Educational Notes.**—An announcement is made in our advertisement pages regarding a course of 12 lectures on "The Design of Turbo-Generators," to be delivered by Prof. Miles Walker at the City and Guilds (Engineering) College, South Kensington, commencing on February 12th.

A site for the proposed Engineering Laboratory at Oxford has been obtained outside the park. The original proposal to erect it in the University Park met with strong opposition.

**Fatality.**—A correspondent writes:—"While Edward Blanche was engaged, on Tuesday night, wheeling a motor-car into a shed, the car touched a live wire, and the man received such a severe shock that he died on the way to the hospital."

**Osram and Robertson Social and Athletic Club.**—The Fancy Dress Dance of this club was held at Brook Green, Hammersmith, on Saturday last, and was a great success. Dancing commenced at 7 o'clock, and despite the inclement weather, about 300 people were present. The music was rendered by Mr. F. Windett's scarlet orchestra. The M.C.'s were Messrs Pluck and Minson. Prizes were offered for the best fancy costume, and the judging resulted as follows:—

Ladies.—First, Miss Palombo, "Lady Gainsborough"; second, Miss Brayshaw, "Indian Lady"; third, Miss Bignell, "Charles I"; fourth, Miss Ritchie, "Pompadour."

Gentlemen.—First, Mr. Woodward, "Skipper"; Mr. Cook, "Cowboy."

The prizes were presented by Mrs. C. Wilson, to whom a hearty vote of thanks was accorded, and Mr. Wilson, on behalf of Mrs. Wilson and himself, suitably replied. Amongst the company were:—Mr. and Mrs. H. Hirst, Mr. M. Railing, Mr. F. Sells, Mr. and Mrs. Sheppard. The party broke up about midnight, after having spent a very enjoyable evening.

**Royal College of Physicians.**—*Nature* states that the Goulstonian Lectures, to be delivered by Dr. A. J. Jex-Blake on February 26th and 27th and March 4th, will deal with "Depth of Lightning and Electric Currents."

## THE POWER STATION OF LIENFOS, NORWAY.

[BY OUR BERLIN CORRESPONDENT.]

WHILE the abundant water power of Norway is used extensively for the supply of light and power, and more

THE POWER STATION OF LIENFOS.

recently for railway operation, many of the large waterfalls situated in the interior of the country would have had to remain idle but for the extraordinary industrial developments brought about by the advent of new processes for the production of calcium carbide, the fixation of atmospheric nitrogen and the manufacture of iron and steel in the electric furnace. In Telemarken, in particular, where local conditions are especially favourable, a large number of plants have already been installed. A natural lake, the Mjös vand, situated at an altitude of 902 metres, and having an area of 41 sq. km., forms a gigantic reservoir which is capable of supplying up to 50 cb. metres of water per second continuously throughout the whole year. The water flows through the power stations Rjukan I, Rjukan II (under construction), Svaelfos, Lienfos, Tinfos and Skaatfos, so that one reservoir supplies six power stations, a number to be even increased later on by the use of other falls. These favourable local conditions can be expressed in figures by stating that the cost of electrical energy, including the purchase of the site and the building of the station, only amounts to 100-125 marks per H.P.-year.

It is intended in the following to give a short description of the electrical equipment of the Lienfos works, situated 3 km. above Notodden, on the River Tin, which was supplied by the A.E.G. This power station, like the Rjukan works and Svaelfos power station, belongs to the Hydro-Electric

Nitrogen Co. (Hydro-Elektrisk-Kvælstof-Aktielskab), which manufactures nitre and by-products in its factories at Notodden and Snaheim.

In the Lienfos power station, high-pressure current at 50 cycles is produced directly by the generators and passes on to the transmission lines without further conversion. The electrical equipment comprises two continuous-current exciters driven by small turbines, four large three-phase generators, cables leading to the switchgear, the switchgear itself with the apparatus and oil switches for the four generators and four transmission lines, the bus-bars and the lightning arrester plant, as well as the switchboard and the lighting installations. Further, in the switchgear, branches have been provided to the Svaelfos sub-station of the Tinos railway, as well as to the station transformer. The connections are so designed that each machine can work separately on the transmission line to which it belongs or in parallel with the other machines on to the transmission lines over the bus-bars. For this purpose the bus-bars are so arranged that they can be cut off by isolating switches from the junction points of the machines and transmission lines. Each pair of three-phase transmission lines is carried on one row of poles. The main conductors are arranged in a

hexagon, above which a smaller neutral wire is led which is earthed at the receiving station. This wire can carry the neutral wire currents of two adjoining machines, but two neutral wires can also be connected up in parallel by means of special bus-bars. They are only provided with isolating switches and not with oil switches.

INTERIOR OF LIENFOS POWER STATION.

Each exciter has an output of 300 kw. at 230 volts and 400 R.P.M., and suffices for the excitation of all four generators. By switching out the shunt regulator of the exciter which happens to be running, the excitation can be cut off from the power station in the event of a dangerous breakdown.

The four generators, coupled to the turbines by flange

couplings, are each designed for an output of 6,600 K.V.A. at  $\cos \phi = .6$ , and for a pressure of 10,000 to 11,000 volts

action is very powerful and sets up an appreciable partial vacuum in the dynamo-room when the windows are closed, so that a single door leading into the open air can only be opened with difficulty. The regulating shutters placed in the air passages are completely closed in winter: the air then re-enters the dynamo-room for heating purposes, through gratings above the air passages and also through openings in the backs of the stators.

The field regulators are fitted with remote control, and by means of a contact arrangement can be controlled both separately and simultaneously in parallel by a single manipulation. The controlling gear works in such a manner that the contacts can only remain stationary with the broad surfaces covering one another. In order to avoid burns, the contacts are provided with additional sparking contacts and magnetic blow-outs. The controlling gear is switched

FIG. 1.—ARRANGEMENT OF GENERATING PLANT AT GLENQUAY RESERVOIR (See p. 225).

at 50 cycles and a speed of 187.5 R.P.M. The rotors, which are tested up to excess speeds of 80 per cent., have cast-steel

the contacts are provided with additional sparking contacts and magnetic blow-outs. The controlling gear is switched

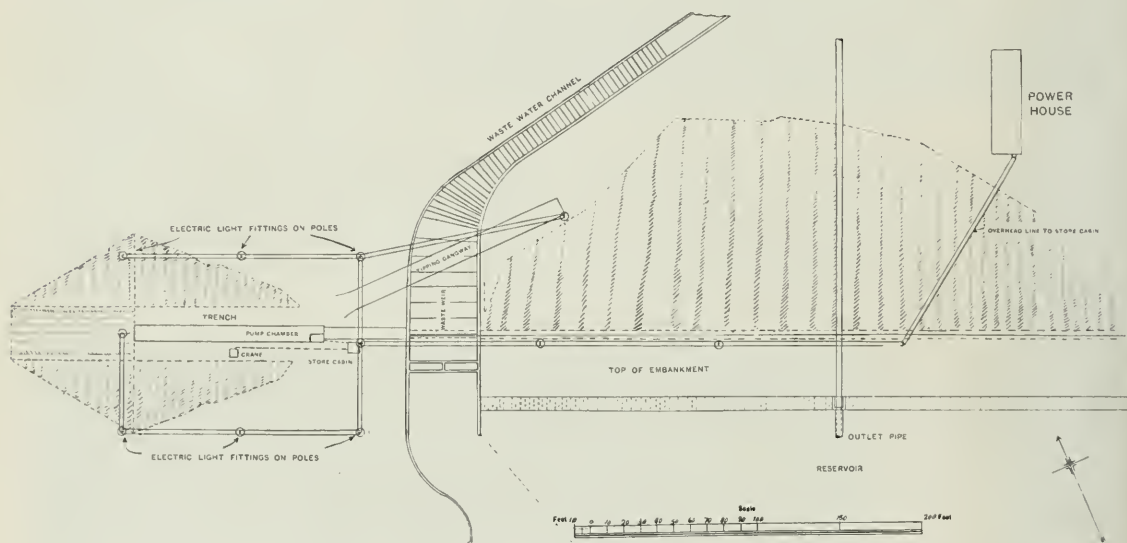

FIG. 2.—PLAN OF WORKS AT GLENQUAY RESERVOIR (See p. 225).

rims into which the poles are dovetailed; the latter have bare copper windings and oblique pole shoes. The semi-enclosed stators are constructed in four parts with removable feet, and have former-wound coils laid in open slots in three layers. The stators are mounted in the pits on four rollers on which they can be turned completely round. A maximum temperature rise of 40° C., a test voltage of 22,000 volts and an efficiency of 93.5 per cent. were guaranteed. The cooling air, driven into the machine radially by means of fan rings on both sides, is led through the back of the stator to the generator pit, which is covered in. From here it passes into the open air through two air passages each having a section of 1 sq. metre, which are provided with regulating shutters. The ventilating

out automatically in the end position. It should also be mentioned that the exciter switches of the generators are electrically interlocked with the field regulators, so that

FIG. 3.—VIEW OF WORKS, GLENQUAY.

they can only be opened when the regulators are switched out and the generators are not excited.

Two four-core cables arranged in parallel lead the three

phases and the neutral wire from each generator to the end sealing boxes of the switchgear, whence the conductors are carried on in the form of bare copper rod. The phases are kept separate throughout the entire switchgear. The oil switches each consist of three remote-control separate switches coupled by chains. Smooth insulators and concentric terminals are employed everywhere, and impart a very pleasing appearance to the installation.

Tests made on delivery gave very favourable results. Although the area of the air outlet is very much reduced in winter, the guaranteed temperature rise was adhered to. The efficiency was found to be 1.3 per cent. better than the guaranteed figures, and amounted to 94.8 per cent. at  $\cos \phi = .6$ , so that the high efficiency of 96.8 per cent. was attained with phase coincidence.

## ELECTRICITY IN CONSTRUCTIONAL WORK.

THE supply of labour is of vital importance in the carrying-out of constructional work, and will often decide whether a contract shall prove profitable to the contractor or not, and whether he will be enabled to adhere to the specified time of completion. In this article we do not intend to disparage the substitution of mechanical power, which has hitherto advantageously superseded manual labour to a considerable extent with the aid of comparatively small and inefficient steam plant, but, as a general rule, we consider the application of electricity obtained from a central source of power by means of connection to the mains of a supply authority in the neighbourhood, or by the equipment of a power station to suit requirements, to be much preferable as regards both convenience and economy in working.

No better results in this connection have been obtained than in the working of pumps—results, indeed, unattained by any other method of transmission, because of the steady load

THE CRYSTALATE MANUFACTURING CO.'S WORKS, TONBRIDGE  
(page 227).

on the motor. A further recommendation for this duty is the mobility of the pumps and motors, as, the energy being transmitted by cables, it is obvious that very little work is

involved in removing the pumps to new positions as found necessary.

One of the most recent instances of the use of electricity in contracting is to be found in the work now being completed at Glenquay Reservoir, in Perthshire. This undertaking was carried out three or four years ago to provide storage for the water supply to the Southern District of Fifeshire, and particularly in anticipation of the increased demand likely to be created by the Naval Base at Rosyth. About 18 months ago it was found necessary to extend the

puddle trench of the retaining bank into the hill at the east side, with a view to increasing the capacity of the reservoir, which has been planned to provide double storage at any future time by raising the existing bank by 11 ft.

The enterprising contractors—Messrs. Wilson, Kinmond and Marr, Ltd., of Glasgow—were entrusted with the extension, and on the advice of their consulting engineers, Messrs. James E. Sayers and Caldwell, of Glasgow, decided to provide generating plant in a position accessible for the easy delivery of fuel, the power being supplied to the pump, crane, &c., by means of an overhead transmission line.

The position of the power house in relation to the work can be seen in fig. 2, on the opposite page, while the plan, fig. 1, shows the general arrangement of the generating plant.

The gas engine and suction-producer plant were manufactured by the National Gas Engine Co.; the engine is capable of giving 75 B.H.P. maximum and 68 B.H.P. constant working load on suction gas of 135 B.T.H.U., when running at 210 R.P.M. The engine is provided with magneto ignition and compressed-air starter.

TURNING AND POLISHING SHOP, CRYSTALATE CO.'S WORKS (page 227).

VIEW IN PRESS SHOP, CRYSTALATE CO.'S WORKS (page 227).

Owing to the continuance of operations night and day during the execution of the contract, double producers and scrubbers were provided, which are connected together: but

A CORNER OF THE PRESS ROOM IN THE CRYSTALATE CO.'S WORKS.

as each is capable of taking three-quarter duty, they are so arranged that either plant can be disconnected to allow of the other producer being relined with firebricks at intervals. A motor-driven fan is fitted to one producer for starting.

The dynamo, of 40-kw. capacity, manufactured by the Edison & Swan Co., is compound wound to generate 135 amperes at 300 volts and 800 R.P.M., and is connected by belting to the engine pulley.

A circular saw is accommodated at the end of the power house building, and is driven by belting from the engine fly-wheel.

The supply of electrical energy is transmitted to the bank workings by overhead bare conductors, supported on insulators fixed to poles and entering buildings through porcelain

As the growth of water was uncertain, one pump was supplied in the first instance, and has proved sufficient to deal with the amount of water in the trench.

The centrifugal pump and motor combination, manufactured by Weise & Monski, will deliver 300 gallons of water per minute against a total varying head of from 50 to 190 ft. The pump delivery to the 5-in. rising main pipe column, fitted with a retaining valve, is throttled at the sluice valve as required to keep the quantity of water normal during sinking operations at reduced head. The 25-h.p. motor, running at 1,700 R.P.M., is of the shunt-wound protected type for operating at 250-300 volts, and suitable for driving the pump at full load without destructive heating. Although the pump was used intermittently, spare impeller parts and a motor armature were available to ensure continuity of service, but it is particularly gratifying to know that neither have so far been necessary.

A 3-ton electric derrick crane, by Messrs. Butters Bros., lifting at the rate of 80 to 120 ft. per minute, is fitted with a 60-ft. steel lattice jib, made in two portions for convenient delivery and erection. A 12-B.H.P. motor of the enclosed

THE ROLLING AND MIXING DEPARTMENT, CRYSTALATE CO.'S WORKS (p. 227).

reversing type, series-wound for 250-300 volts at 700 R.P.M., is fitted to this crane, and a tramway type controller with magnetic blow-out and suitable resistance is mounted alongside. The crane has handled fully 10,000 cb. ft. of earth and rock excavations, besides the necessary timbering, &c.

Aerial conductors for electric lighting are supported on porcelain insulators fixed to cross-arms on poles spaced about 20 yards apart, the connections being taken from these conductors to 24 electric lamp fittings fixed to poles by clamping rings underneath.

The erection of the plant and wiring was carried out by the Harland Engineering Co., and Messrs. Telford, Grier and MacKay.

During the 18 months the plant has been in operation only 55 tons of Polmaise anthracite (washed singles), costing £56 12s., including delivery charges, was consumed by the producer plant.

The above instance of the application of electricity to contracting work is sufficient to warrant the special consideration of its further development by firms who carry out the erection of large buildings, the driving of tunnels, the excavation of sewers, and other large public works necessitating the operation of lifts and hoists, concrete mixers, derricks, and other contracting appliances.

VIEW IN THE TOOL SHOP, CRYSTALATE CO.'S WORKS.

tubes. Separate cables radiate from distributing boards in a store cabin adjoining the excavations for the supply of the pump, crane and lighting.

## CRYSTALATE IN THE MAKING.

It is probable that very few of our readers require a lengthy introduction to Crystalate, a substance which has been widely applied during the past few years, both industrially and for sporting and other purposes. In the industrial sphere, its electrical uses are very numerous; in the world of sport and pastime its use for billiard and bagatelle balls is too well-known to need description, while it is also largely employed in the making of gramophone records, dominoes, &c.

The Crystalate Manufacturing Co.'s works are situated about five miles from the old town of Tonbridge, Kent, amidst surroundings which certainly do not suggest manufacturing operations, although some 300 workpeople are employed there. Broadly speaking, the company's product is divided into Crystalate, a material which has as many as 30 different compositions and can be made in any colour, and Crystalate Star Grade, a fireproof black or white insulating material specially produced for electrical purposes. Both classes of material are very largely used for switch handles, bases, covers, bushes, conduit fittings, telephone mouthpieces, receivers and similar things, all over the world, but particularly in Germany.

The Star Grade is a new material only recently put on the market, and an expensive plant has been installed for its production, the company having the sole manufacturing rights for the whole of Europe. It is made in several grades for moulding, machining and sheets, and differs from nearly all other insulating materials of the kind, in that it is unaffected by high temperatures, non-hygroscopic, has a high insulation resistance, and is both tough and strong.

A Faraday House test, for instance, gave a specific resistance of 113,000 megohms; a breakdown voltage of over 7,000 volts on a sample '351 cm. thick; a percentage absorption of water after 48 hours' immersion of '44; and showed that heating in a Bunsen flame, and in a crucible, to 680° F. had no effect on it.

A special department is given up to the preliminary mixing of the raw constituents of the Star Grade Crystalate, which subsequently passes to a hydraulic press room, where it is measured preparatory to moulding, an operation carried out in special dies, and under considerable pressure. A number of large and small presses are employed in this work, the largest being a 1,200-ton press used in the manufacture of slabs, &c., and these are worked from a hydraulic pumping plant with two 100-ton accumulators.

From the press room the moulded articles pass to gas-fired furnaces, where, placed in racks, they are subjected to a very high temperature for periods up to 24 hours, and emerge practically fireproof.

The next step is "finishing," the rough fired pieces being machined, ground, polished, &c., as required for the trade.

The mention of dies reminds us that the company has a special tool shop for the production of the various dies, moulds, &c., required in the works. This department is fully equipped with machine tools, &c., for the cutting and working of the steel slabs from which the dies are produced; this class of work is a speciality of the company, which has, of course, had considerable experience both as a maker and user of dies.

So far we have not referred to the manufacture of ordinary grade Crystalate, the better known product of the company, which differs in process from that described. In this case the preliminary mixing of the raw ingredients is followed by calendering, four sets of steam-heated calenders being employed in this work; the resulting product passes to a press room where upwards of a hundred presses are continually in use, moulding the numerous articles for which ordinary Crystalate is employed. These, of course, include a great variety of electrical parts, as well as billiard and bagatelle balls from  $\frac{1}{2}$  in. to 3 in. in diameter, gramophone records, dominoes, bottle stoppers, &c. The company's record business has developed very much recently, and considerable extensions are now being made to cope with it. In the course of our visit we were shown the depositing shop, where the matrices are obtained from the original wax records; these, after being soldered on to copper plates and nickelled, form the dies for use in the Crystalate moulding process, which subsequently takes place in the press shop.

The billiard balls, after leaving the press shop, are subjected to very high pressure in enclosed cylinders, and subsequently are turned and buffed preparatory to packing, &c., the latter department being provided with a box-making plant.

The finishing process, of course, also applies to ordinary Crystalate electrical goods, which are scraped and buffed and take a very high polish; in the case of small turn switches, such as are used on the Continent, the thumb piece is moulded on to the spindle, and in the same way Crystalate is moulded on to brass screw threads, where these are desired.

The various operations carried on demand a considerable amount of power, and three steam and three suction-gas engines, varying from 50 to 250 H.P., are in use. The works are lighted electrically, and in several of the shops the Cooper-Hewitt mercury vapour lamp is in use.

In conclusion, we are indebted to Mr. Chas. Davis, managing director of the company, for an instructive visit, affording us an insight into an industry which, though of itself little known, is relatively of great interest to electrical engineers. On pages 225 and 226 we give a number of views of the workshops.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Owing to the termination of the electrical engineer's (MR. C. E. SAVAGE) contract, at the end of last month, temporary arrangements have been made by the Dudley T.C. for the continuation of his services as electrical engineer, giving not less than one-half or more than two-thirds of his time, payment to be made at the rate of £25 per month. These terms are to be continued until the day of the transfer of the undertaking takes place. Mr. Savage being retained afterwards for the purpose of inspecting the cost and quantities consumed on the street lighting contract, and for the examination of the tramway plant under the lease, at an annual fee of £21.

The assistant borough electrical engineer of Poplar (MR. W. INNES) has resigned his position as from January 31st last in order to enter private business. As a consequence the Electricity Committee have decided to discontinue this office and to give more prominence to the managerial side of the department. It is proposed that there should be four departmental officers directly responsible to the chief engineer and manager, viz., assistant manager, station engineer, mains engineer and sales manager. MESSRS. TATE, managerial clerical assistant, V. H. CRICKSHANK, station superintendent, and E. R. INGRAM, mains superintendent, have been appointed to the three first mentioned positions at salaries of £250, rising by annual increments of £12 10s., to £300 per annum, in the case of F. Tate, and £212 10s. per annum, rising by annual increments of £12 10s., to £300 per annum, in the case of the two other appointments.

MR. SAMUEL WILLIAMS, late burgh electrical engineer in Motherwell, has been appointed to a similar position in Wishaw. There were 46 applicants for the vacancy. Mr. S. Williams resigned the post of burgh electrical engineer for Motherwell in May, 1911, since when he has been suffering from acute rheumatism and unable to attend to business of any kind. We are glad to learn that he has now sufficiently recovered to take up the Wishaw appointment.

The salary of MR. J. W. SPEIGHT, station superintendent to the Leyton undertaking, is to be increased from £200 to the maximum of £250, by annual increments of £10.

The salary of the deputy borough electrical engineer of Salford is to be advanced by £30 from April next, in lieu of £25 from April, 1914, and the salary of the mains engineer by £30 instead of £10.

At the Barrow T.C. meeting on Monday, after some discussion, the salary of the borough electrical engineer, MR. H. R. BURNETT, was increased from £500 to £550 per annum. The salary of MR. J. ATREY, chief clerk and storekeeper, was increased from £125 to £135 per annum, with two further annual increases of £10 and £5 respectively up to £150 per annum. MR. H. R. BARNWELL, works superintendent, was advanced from £180 to £190, with a further increase of £10 twelve months hence to a maximum of £200; and MR. J. F. HESLOP, mains superintendent, had his salary increased from £165 to £180 per annum, with further increases of £10 per annum to a maximum of £200.

Todmorden T.C. has now appointed MR. JOS. BOYCE, for 12 years assistant electrical engineer to Darwen Corporation, as chief electrical engineer and manager of the destructor department. There was a large number of applicants. Mr. Boyce served six years' apprenticeship with Messrs. Charlesworth, Hall & Co., electrical and general engineers, of Oldham. Subsequently he was with Mr. G. St. J. Day, an electrical engineer in private practice at Oldham, and Messrs. G. L. Adamson & Son, of Rochdale, where much experience was gained in the application of electric power for driving mills, works and mines.

MR. FRED RILEY, of Rawtenstall, has declined the appointment of electrical engineer to the Todmorden Corporation.

MR. DUNROSE, of the Stoke-on-Trent electricity staff, has been presented by his colleagues with a case of outlery on his marriage.

Newport (Mon.) Education Committee has appointed the borough electrical engineer, MR. A. NICHOLS MOORE, as teacher of electrical engineering at the Technical Institute, in place of Mr. Whitehouse, who has resigned.

MR. C. E. SAVAGE, chief electrical engineer to the Dudley Corporation, has accepted a position under the Earl of Dudley at Baggeridge Wood Colliery.

The General Purposes Committee of Blackburn Corporation have adopted a scheme involving an increase of £1,178 in the salaries of Corporation employes, with further increases, when the maximum is attained, amounting to £1,457. In the case of employes other than clerks, there is an advance in the first year of £730, including the electricity department, £75; tramways department, £538. The increase in the tramways department includes a farthing per hour all round for motormen, conductors, and depot employes over 21 years of age. In all cases where holidays with pay have been less than five days, it is recommended that they be increased to that number.

MR. JOSEPH S. AINSWORTH, who was chief assistant at the electricity works of the Monmouth Corporation, and in a similar position with the Brynamman and District Electric Light and Power Co., South Wales, has resigned from the staff of the electricity works of the Gloucester Corporation, so as to accept an important position in New Zealand in connection with a new water-power scheme. On behalf of the staff of the Gloucester electricity works, Mr. Corson, the city electrical engineer, presented MR. AINSWORTH with an oval-shaped glass-sided travelling timepiece in leather case. Mr. Ainsworth sails on February 14th.

The Electricity and Tramways Committee of the York T.C. has appointed MR. L. M. JOCKELL, of Middlesbrough, as fourth engineer-in-charge at the electricity works.

On the occasion of his leaving Ilkeston to take up a similar appointment at Bexley Heath, MR. H. P. STOKES was entertained to dinner on January 22nd, by a number of the members of the Council and prominent townspeople. After the dinner, and between items in the programme, the Mayor (Councillor F. P. Sudbury) presented Mr. Stokes with a silver tea urn, and spoke of the very high esteem in which he was held, of the hard work he had done, and of the satisfactory state in which the two departments were, as compared with the time when he took over the management. At a meeting of the employes, the chief inspector asked Mr. Stokes, on behalf of the employes, to accept a silver cake basket.

**General.**—At the annual social of Darwen tramway employes on January 30th, MR. R. W. SMITH SAVILE was presented with a silver rose-bowl by the Corporation tramway staff upon his retirement from the post of engineer and manager. Alderman James Tomlinson made the presentation, which was given in recognition of the cordial relations which have existed between the recipient and the staff during the past 12 years.

The *Australian Mining Standard* states that MR. C. H. MERZ, before leaving for England, was entertained at luncheon by the Victorian Premier, MR. WATT, and speeches were made. Most of the members of the Ministry, several members of both Houses, and officers of the Railway Department, were present.

We are officially informed of the following changes in the boards of the following companies:—

**Central London Railway.**—Lord Knollys, Lord Rathmore and Mr. Robert Fleming have resigned, and Lord George Hamilton, Colonel Sir Herbert Jekyll, and Mr. A. H. Stanley have been appointed in their places. Mr. A. H. Stanley will be appointed managing director of the company. Mr. H. F. Parshall has tendered his resignation as a director. Mr. A. H. Stanley has been appointed managing director. Hon. Sydney Holland will be elected to fill the vacancy. Lord George Hamilton will become chairman of the board.

**City and South London Railway.**—Mr. J. F. S. Gooday, Mr. S. Barclay Heward and Mr. Edwin Tate have resigned, and Admiral Sir Cyprian Bridge, Mr. T. C. Jenkin (who has resigned as general manager of the company), and Mr. A. H. Stanley, have been appointed in their place.

**London Electric Railway.**—Lord George Hamilton resigns as chairman of the company, the resignation taking effect after the half-year meeting held last Friday, when Lord Farrer was appointed in his place. Lord Knollys has been elected to a seat on the board.

Messrs. T. L. Miller, H. W. Wilson, and H. V. Pegg (Miller, Wilson & Pegg, consulting mechanical and electrical engineers, Liverpool and Belfast) have dissolved partnership. Mr. T. L. Miller will attend to debts at Tower Buildings, Water Street, Liverpool.

Congratulations to Past-President DR. ZIANI DE FERRANTI and Mrs. Ferranti on the birth of a daughter on January 29th, at Baslow, Derbyshire.

MR. E. J. ARNOLD, until recently fittings department manager for the General Electric Co. in Liverpool, has severed his connection with the company, in order to start in business upon his own account in partnership with MR. I. E. POYSER, as the Liverpool Fittings Co., at 55, Renshaw Street, Liverpool.

The *Times* says that SIR HENRY NORMAN has been elected an Associate of the Institution of Electrical Engineers.

The wedding took place at St. John's Church, Blackpool, on January 30th, of MR. C. J. NICKSON, an electrical engineer, younger son of the late Ald. John Nickson and Miss Ethel Eyre.

MR. W. C. JEARY, the general manager of the Magic Appliances, Ltd., has been elected to a seat on the board.

MR. GEO. H. GYTON having secured an appointment with Messrs. J. M. Doughty & Son, Ltd., of Clerkenwell, is resigning his position with Messrs. D. H. Bonnella & Son, for whom he has acted as London representative.

MR. ALVIN E. LOE, who has been manager of the General Electric Co.'s Telephone Department (Glasgow Branch) for several years, has resigned his position. Mr. Loe will continue to place his specialised knowledge on telephony and allied subjects at the service of his friends at (for the present) 13, Apsley Street, Partick, W. Glasgow.

**Obituary.**—THE EARL OF CRAWFORD.—We deeply regret to record the death, which occurred on January 31st at Cavendish Square, London, of the Earl of Crawford and Balcarres, Kt., F.R.S., at the age of 66 years. On Tuesday a memorial service was held at the Chapel Royal, St. James', on Tuesday, 4th inst., when the Institution of Electrical Engineers was represented by Mr. Walter Judd (vice-president), Mr. Robert Hammond (honorary treasurer) and Mr. P. F. Rowell (secretary). The late Earl, who was one of the founders of the Institution, was, at the time of his death, the oldest surviving officer of the Institution, having been, as Lord Lindsay, the first vice-president of the Institution, holding that office for three years—1872-3-4—during the presidencies of Sir William Siemens, Frank Ives Scudamore and Sir William Thomson. On the occasion of the special meeting of members of the Institution on June 30th, 1908, when the purchase of the present home of the Institution was sanctioned, the following letter from the deceased Peer was read to the members:—

I regret that I shall not be able to attend the meeting called for the 30th. I must, however, write a line of congratulation to the Institution on their acquisition of so fine a home, especially when I think of the first thoughts of its formation in my old laboratory in a mess behind Green Street, Park Lane, all now swept away, and of the first source which was held in my laboratory in Greek Street, Soho. I believe that now I am the senior surviving officer of the Society, as I was Vice-President to Sir William Thomson (one of our first Presidents), and as such I offer my congratulations.—Very faithfully yours, CRAWFORD.

The February number of the *Faraday House Journal*, which has been issued this week, contains an article on the deceased peer, from which we gather that he had been closely associated with Faraday House for the last 23 years. It is stated that as far back as 1869, Lord Lindsay (as he was then called) had an electrical laboratory in Eaton Place, where he continued many of Faraday's researches. "Some of his original apparatus is still in everyday use in the laboratories at Faraday House. It was at Eaton Place that in the first inception of the Society of Telegraph Engineers was made, a society which is now called the Institution of Electrical Engineers. Lord Crawford has told how he and Cromwell and Alfred Varley first discussed the project, and how anxious they were that Prof. Sir William Thomson (Lord Kelvin) should be their first President. . . . In 1878 he was elected a Fellow of the Royal Society, and became for the first time President of the Royal Astronomical Society—a post which he filled with great distinction. In the same year (1878), he and Lord Rayleigh were elected Honorary Members of the Institution of Mechanical Engineers." For very many years, and until the time of his death, he was closely identified with the London Electric Supply Corporation, Ltd., as chairman, but he was constantly engaged in a battle against ill-health.

DR. GUSTAF DE LAVAL.—We regret to record the death which occurred at Stockholm last Sunday of DR. G. de Laval, the inventor in 1889 of the well-known high-speed turbine which bears his name, and which may be described as laying the foundation of the impulse part of the modern turbine which is a combination of the inventions of de Laval and Parsons. The de Laval turbine is used for small and moderate powers in various electrical and other works abroad, and for a number of private works installations in this country. The English rights were held by Messrs. Greenwood & Batley, Ltd., of Leeds, whose works installation comprised a number of these turbines. The deceased gentleman was 67 years of age.

MR. THOS. BLANE passed away, on January 30th, at his residence at Blackpool, at the age of 62 years. Deceased was chairman of Blackpool, St. Annes and Lytham Tramways Co., and a director of other concerns.

A correspondent says that much regret was felt in Newport (Wife) at the death in Winnipeg, of a well-known native, MR. DAVID C. JACK, an electrical engineer and a partner in the Hub Welding Co., Winnipeg. Mr. Jack was only 30 years of age.

## NEW COMPANIES REGISTERED.

**Portable Electric Light Co., Ltd. (126,782).**—This company was registered on January 27th, with a capital of £10,000 in £1 shares, to carry on the business of dealers in electrical and mechanical novelties, &c. The subscribers (with one share each) are:—M. Goddellow, 6, Shaftesbury Avenue, New Barnet, secretary; A. Herrmann, 39, Norfolk Avenue, Stamford Hill, N., clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Solicitors, J. and M. Solomon, 58, Finsbury Pavement, E.C. Registered office, 120, Shaftesbury Avenue, London.

**Baldar Engineering and Supply Co., Ltd. (126,901).**—This company was registered on February 1st, with a capital of £6,000 in £1 shares (3,000 preference), to carry on the business of gas, electrical and mechanical engineers, manufacturers of and dealers in gas and electrical fittings, accessories, conveniences and apparatus, &c. The subscribers (with one share each) are:—G. A. Hattin, 51, Morland Buildings, Earl Street, Westminster, clerk; A. G. Ferris, 104, Torrian's Avenue, Camden Road, N.W., clerk. Private company. The number of directors is not to be less than two or more than five; the first are J. T. Grein (chairman) and H. C. Cayley (both permanent); qualification, £50 shares; remuneration of chairman, £50 per annum. Registered by Strong & Co., 70, Gracechurch Street, E.C.

**Arden Vulcaniser Syndicate, Ltd.** (126,762).—This company is registered on January 27th, with a capital of £1,000 in £1 shares, to take the benefit of certain inventions relating to electric heating apparatus, and to carry on the business of manufacture of and sales in vulcanisers, electric heaters, &c. The subscribers (with one share each) are:—R. K. Hearn, Netherton, The Downs, Wimbeldon, engineer; J. F. Hearn, Netherton, The Downs, Wimbeldon, gentleman. Private company. The first directors are:—R. K. Hearn and E. F. Hearn (both permanent). Directors: Stanley Evans & Co., 20-22, Theobalds Road, W.C. Registered Dec. 31st, King Street, Banquet Smith.

**Pritchard, Foxcroft & Co., Ltd.** (126,838).—This company is registered on January 25th, with a capital of £1,000 in £1 shares (500 20 p. nt. cumulative shares), to carry on the business of electrical, telegraph and telephone engineers, scientific and optical case makers, electricians, advertising agents, manufacturers of cinematograph films and apparatus, &c. The subscribers (with one share each) are:—H. Pritchard, Empress Works, Ackwell Lane, Dalston, N.E., engineer; B. H. Guttenberg, 60, Grosvenor Road, Canonbury, N., jeweller. Private company. The number of directors not to be less than five; the subscribers are to appoint the first; no qualification required; remuneration according to profits. Registered by H. G. Campion & Co., 23, Old Broad Street, E.C. (solicitors).

**Gerog, Ltd.** (126,852).—This company was registered on January 30th, with a capital of £3,000 in £1 shares, to carry on the business of electricians, engineers, suppliers of electricity, manufacturers of and dealers in clocks and time-registering and automatic machines and appliances, &c. The subscribers (with one share each) are:—E. H. Campion, B.A., 23, Old Broad Street, E.C., solicitor; E. R. Baines, Green Street Green, Orpington, accountant. Private company. The number of directors is not to be less than three more than seven; the subscribers are to appoint the first; no qualification required; remuneration according to profits. Registered by H. G. Campion & Co., 23, Old Broad Street, E.C. (solicitors).

**Pernambuco Tramways and Power Co., Ltd.** (126,734).—Registered January 24th, by Norton, Rose, Barrington & Co., Ltd., Old Broad Street, E.C. Capital £1,000,000 in £1 shares (400,000 preference). Objects:—acquire or construct, develop and extend any tramways, railways, or light railways, to equip, work, and maintain the same with electrical, steam, kinsol, or other power, &c. The signatories (with one share) are:—E. T. Ashington, 100, Westmount Road, Eltham, Kent, clerk; J. A. J. Scott, 85, Spring Road, S.W., clerk; H. L. Hamlyn, 80, Bostrevere Road, Fulham, S.W., clerk; H. Harper, 10, Pennerley Road, Catford, S.E., accountant; F. H. Eustath, 18, Egerton Gardens, Hendon, N.W., buyer; C. M. Plumtree, 68, Bradford Road, East Dulwich, S.E., clerk; M. P. Hewell, 15, Culverden Road, Balham, S.W., registrar. Minimum cash subscription, seven shares. The first directors (to be not less than three or more than seven) are: Eugene de Jandari, Rio de Janeiro; Follett Holt, 6, Sussex Square, W.; Louis G. Lho, Pernambuco; H. K. Heyland, 174, Gresham House, E.C.; Wm.iggins, Gensliff, Wimbeldon, S.W.; Sidney Jones, Paris; and Henri Archal. No qualification required for first directors; qualification of subsequent directors, £1,000; remuneration, £1,300 per annum, divisible.

**Roberts Bros. & Holloway, Ltd.** (126,786).—This company is registered on January 27th, with a capital of £1,500 in £1 shares, to carry on the business of electrical engineers carried on as "Roberts Bros."—Bradford, and to adopt an agreement with Mary Agnes Roberts and A. Roberts. The subscribers (with one share each) are:—Mrs. M. A. Roberts, Cottage, Rawdon; A. Roberts, Cottage, Rawdon, electrical engineer; E. R. Holloway, 145, Bradford Road, Fizinghall, Bradford, electrical engineer; G. F. Holloway, 145, Bradford Road, Fizinghall, Bradford, shier. Private company. The number of directors is not to be less than two more than five; the first are A. Roberts and E. R. Holloway; qualification, £1 shares. Registered office, 9, Nurser Place, North Parade, Bradford. Director, H. H. Duncan, 14, Piccadilly, Bradford.

**Price Adjustable Reamer, Ltd.** (126,783).—This company is registered on January 27th, with a capital of £1,000 in £1 shares, to take the benefit of improvements in adjustable reamers, taps and the like, to carry on the business of mechanical, electrical, motor and general engineers, manufacturers of and dealers in cycles and motors, &c., and to adopt an agreement with F. Price. The subscribers (with 10 shares each) are:—W. Williamson, Cornwell House, Earlsdon Avenue, Coventry, manufacturer; E. L. Roberts, Gosford Street, Coventry, cycle engineer. Private company. The number of directors is not to be less than two or more than five; the first are F. E. Price, W. Williamson and E. L. Roberts; qualification, £10. Registered by Brad & Sons, Ltd., 115-117, Chancery Lane, W.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Brown, Boveri & Co., Ltd.** (89,167).—Capital, £50,000 in shares (1,500 "A" and 3,500 "B"). Return dated December 11th, 1912 (end December 17th). All shares taken up, 15s. per share called up on 8,500 "B," £6,375 paid, £7,500 considered as paid on £1,500 "A." Mortgages and charges: Nil.

**South London Electric Supply Corporation, Ltd.**—Issue January 21st, 1913, of £1,400 debentures (sold to brokers at 99 per cent.) of a series of which particulars have already been filed.

**Electrical Installations, Ltd.**—A memorandum of satisfaction the extent of £200 on January 16th, 1913, of debentures dated December 5th, 1912, securing £2,000, has been filed.

**Blackpool and Garstang Electric Light Railway Co., Ltd.** (150,150).—Capital, £10,000 in 25 shares; return dated January 6th, 1913 (end date); 361 shares taken up; £1 per share called up; £1,707 paid (including 23 received on application for further shares not allotted); £10 remains in cash. Mortgages and charges: Nil.

**Isaacson & Brown, Ltd.**—Particulars of £800 debentures, dated January 23rd, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Oriental Telephone and Electric Co., Ltd.** A memorandum of satisfaction to the extent of £1,450, on January 22nd, 1913, of trust deed June 28th, 1905, and supplemental deed of acknowledgement dated Dec. 12th, 1907, securing £200,000.

**British Insulated and Helsby Cables, Ltd.**—The directors have declared a dividend on the 6 per cent. cumulative preference shares to December 31st.

## CITY NOTES.

### Yorkshire Electric Power Co.

The directors' report for the year ending December 31st 1912, to be submitted at the half-yearly meeting at Leeds on February 10th, states that the gross profit on the revenue account for the three years ending December 31st, was as follows:—1912, £12,719; 1911, £12,572; 1910, £11,308. The net profit, after payment of mortgage interest for the same periods, was—£7,361, £7,741, £6,503. The accumulated profits up to the end of 1911 enabled the company to write off administration and development expenses amounting to £11,017, and to pay the dividend due on the cumulative preference shares, leaving a balance to carry forward of £339 which, added to the profit for the year 1912 of £7,361, gives a total of £7,691; and, deducting the dividend paid on the preference shares to June 30th, 1912, of £2,323, leaves a disposable balance of £5,368. The directors recommend that the balance should be dealt with as follows:—Dividend for the half-year ending December 31st, 1912, at the rate of 6 per cent. per annum on the cumulative preference shares, £2,803; write off the special expenditure during 1911 in connection with generating plant, £1,921, carrying forward £645. The supply for power and light was fully maintained throughout the coal strike, though the additional cost to the company was very considerable. That strike, and the partial breakdown of plant last July, referred to in the last half-yearly report, have greatly retarded the progress of the company and affected its profits by delaying connections to the premises of new consumers from whom important increases of revenue would have accrued in the second half of 1912. Considerable additions have been made to the generating plant at Thornhill to meet the normal increase of business, and that which is expected from agreements already made and others in process of negotiation. During the year there has been considerable capital expenditure on the extension of the distributive system, and the company is now giving a supply over a large area in the West Riding. There has again been an increase in the amount paid for rates, and the company is now paying these in 56 parishes and townships. In accordance with the resolution passed at an extraordinary meeting held on September 17th last, an issue of £50,000 6 per cent. cumulative preference shares has been offered to shareholders, and up to the end of 1912 applications had been received for £20,535 of this capital. On May 20th, 1912, the Yorkshire Waste Heat Co., Ltd., was incorporated under the Companies' (Consolidation) Act, 1908. A generating station is now being erected at Barugh, near Barnsley, and to construct this station an issue of £25,000 of 5½ per cent. first mortgage debenture stock was in November offered to the shareholders of the Power Co. Of this issue £10,460 has been applied for up to December 31st last. The directors anticipate that the whole of both issues will shortly be taken up.

**Company Registrations in 1912.**—In the course of its usual annual review, the *Investors' Guardian* gives the following among its other statistical returns:

	1910.	1911.	1912.
English registrations			
No. of companies	6,707	5,960	7,095
Electric	2,408,457	3,168,645	7,570,740
Engineering and hardware	5,889,442	8,424,102	8,845,737
Gas	1,013,362	838,125	407,900
Motor, cycle and carriage	3,293,050	2,721,345	7,253,679
Oil	34,302,337	15,840,320	23,633,152
Railways and tramways	9,352,860	5,161,265	3,161,200
Rubber	41,046,045	9,438,775	3,200,965

**Torquay Electric Tramways Co., Ltd.**—The annual report for 1912 gives the following figures:—Traffic revenue, £28,112, as against £22,635 in 1911; advertising, £278; total receipts, £28,438; expenditure, £17,008; profit balance, £11,735; passengers carried, 4,207,619, compared with 3,591,317 in 1911; car-miles, 626,478, last year 494,468; receipts per car-mile, 10.77d.; 1911, 10.99d.; receipts per passenger, 1.60d.; 1911, 1.51d.; energy per car-mile, 1.97d.; 1911, 2.41d. After paying debenture interest and providing for sinking fund for prior lien debentures, there is a balance, with a "carry forward" of £883 from 1911, of £5,988. A dividend of 3 per cent. on the ordinary shares will absorb £3,599; £1,500 will be allocated to the reserve and renewals fund, and £37 will be carried forward. The year's profit is £2,860 in excess of that for 1911. Considering the wet weather which prevailed last year, the result is regarded as satisfactory. Mr. W. B. Cowrie, who has been a director since the formation of the company, has been appointed managing director. The annual meeting was held in London on Wednesday.

**Consolidated Diesel Engine Manufacturers, Ltd.**—In a report dealing with the progress made by the company since its incorporation, the directors state that many important contracts have been booked, both by the company and its associates, Messrs. Usines Cereles Freres. The construction of the Ipswich works has not progressed as fast as was anticipated, owing to various obstacles having to be overcome during the preliminary stages. The activity in the steel trade has caused a certain delay in the delivery of material, but the contracts for steel work were placed before the present inflated prices came into operation. The greater part of the foundations for the buildings is completed, and the structural work is in course of erection. One section of the shops will be built first, and as soon as this is ready a number of the staff will be transferred to Ipswich to carry on the preliminary work upon which they are now engaged either in London or Ghent.—*Financial News*.

### LANARKSHIRE TRAMWAYS CO., LTD.

THE meeting of the shareholders of the above company was held on Tuesday at the offices, 83, Cannon Street, London, E.C., Mr. A. R. Monks presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 147), said that the capital expenditure for the half-year had only amounted to £726, which had been met to the extent of £500 by the issue of further debentures. The traffic receipts showed an increase for the first half of the year of £568, and for the second half an increase of £1,891, a total of £2,459. The receipts for the first half of the year were largely affected by the coal strike, and they estimated that but for the strike they would have shown a further increase of about £2,500. Advertising and other sundry revenue items were a few pounds in excess of the previous year, which gave them a net gain in the gross revenue of £2,462. Taking the expenses, the power costs showed an increase of £177, all of which was due to higher prices ruling for coal. Traction expenses were £2,287 more than for the previous year, nearly £2,000 of which was due to increased maintenance charges for permanent way and electrical equipment of line. The net increase in expenses was £4,002, so that the gross profits were £1,600 less than for the year 1911. This was offset to the extent of nearly £1,200 by the reduction of their payments to local authorities. For 1911 the payments amounted to £2,892 (this was on a 6 per cent. dividend basis), but as they could only pay 5½ per cent. for 1912, their payments were reduced to £1,704. The expenses in connection with the Act promoted by the Lanark County Council amounted to £818. They had written this amount off, also £137 for repair shop equipment, loose tools, &c. £9,500 had been transferred to reserve for depreciation, making, with interest, a total addition for the year of £11,448, increasing the reserve to £63,263. The balance of profit available allowed for payment of a 6 per cent. dividend for the half-year, making 5½ per cent. for the full year, and after reserving £307 for additional remuneration to the directors, they had £1,577 to carry forward to the current year. Having in mind the adverse effects of the coal strike, he thought they would agree that the results for the year were very satisfactory. They had invested during the year £4,987 in trustee securities, making a total investment to date of £21,134. The two matters in dispute with the Lanark County Council, namely, the utilising of money paid by the company for road widenings in building the new road known as Coronation Road, New Stevenston, and the application for Parliamentary powers for the immediate purchase of their undertaking, had been satisfactorily disposed of during the year. The County Council had been granted powers to construct the uncompleted lines authorised by their 1903 order. By an agreement between the County Council and the company, these new lines would be proceeded with shortly, and would be leased to the company on the terms of their paying to the County Council the interest charge on the amount expended on the construction. Under the agreement, the Council, with the other local authorities interested, had an option to purchase the undertaking at any time before 1928 at a price to be agreed upon between the local authorities and the company. If the local authorities did not buy them out within two years from the date of the opening for public traffic of the new lines, they were to purchase from the County Council the new lines at the cost price. No wayleave would be payable in respect of the new lines during the first two years of their operation. To meet the traffic on the extensions, they were ordering 12 additional cars and had also to extend their car-sheds, repair shops, &c. The directors had also decided to run motor-omnibuses, and services would be inaugurated in the near future.

MR. G. FRANKLIN seconded the motion, and the report was adopted.

### METROPOLITAN DISTRICT RAILWAY CO.

THE ordinary general meeting was held on Friday last at the Westminster Palace Hotel, London, under the presidency of Lord George Hamilton.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 168), said that the six months under review showed progress and some expansion of traffic, but the profits upon the expansion were to a considerable extent neutralised by the rise in the prices of certain articles, notably in that of coal. The amount expended on capital for the half-year was £255,000. The estimate of further capital expenditure was £205,000, and included the following provisions:—New rolling stock—30 additional cars, £67,000; extension to Charing Cross sub-station, including additional converters, £10,400; additional converters in Victoria, Earl's Court, Ravenscourt Park, Acton Town and Hounslow sub-stations, £10,000; flying junction at Earl's Court, £62,000; and electrification of section of District Railway between West Kensington Junction and Earl's Court Junction, £4,000. The gross receipts amounted to £346,655, being an increase of £23,840, or 7.39 per cent. over the receipts for the corresponding half-year. The passenger receipts amounted to £327,236, an increase of £26,611, or 8.35 per cent., while the average receipt per passenger was 1'82d., or an increase of 0'01d. compared with the corresponding period. The expenditure for electric train working amounted to £66,806, as compared with £78,510 in the corresponding half-year, being a difference of some £11,700. The total expenditure for the half-year was £166,200, as against £152,600 for the six months of the corresponding last half-year, showing an excess of £13,600; £6,000 of which was the extra cost of train working, due principally to the increased cost of coal. They consumed about 3,000 tons of coal per week, and the rise of a few shillings in the price per ton caused a substantial increase in this

item of their expenditure. The price of coal materially affected their working expenses, and he was afraid there was every indication that during the current year the price of coal would continue to be high. The car-mileage had increased by 403,058, or 5.20 per cent., notwithstanding which the passenger receipts per car-mile were 9'625d., or an increase of 0'323d. over the corresponding period. The percentage of operating expenses to gross earnings was 43 per cent., compared with 41'94 per cent. for the corresponding period. The same sum had been reserved for renewals, namely, £10,000, as for the corresponding period of last year. The balance available for the dividend was £85,694, which was practically the same as that available for a similar purpose last year. This balance they proposed to distribute as follows:—On the 4 per cent. guaranteed stock at the rate of £4 per cent. per annum, £28,714; on the first preference stock at the rate of £4 10s. per cent. per annum, £33,750; and on the 5 per cent. second preference stock at the rate of £2 per cent. per annum, £14,700. This would leave a balance of £8,528 to carry forward. The accounts would have permitted a slight increase in the dividend on the second preference stock, but the directors were of opinion that it was preferable that no increase to their dividends should be made this half-year, but that the carry-forward to the current year should be increased. There were two Bills referred to in the report, one by their company, and the other by the Wimbledon and Sutton Railway Co. The first one provided for the widening of their Fulham extension railway, consisting in the provision of two additional lines of track for a distance of about three-quarters of a mile, and of two island platforms at Parson's Green allowing of the passing of slow and fast trains, which extension when constructed would improve the train working on this branch. The Bill also authorised the Metropolitan Co. and their company to lengthen the platforms of the Aldgate East Station on the City lines so as to allow of the running of longer trains, the Aldgate East platforms being at the present time the shortest on the railway. The important part of the Bill was in connection with the Wimbledon and Sutton Railway. They would remember that this railway was authorised by Act of Parliament in 1910, but no portion of the railway had been constructed. The directors were of the opinion that this railway would serve a very desirable residential district close to London, and that a through service of trains direct from the City to Sutton would be the means of rapidly developing the latter district, and ultimately be to the advantage of the District Railway. The Bill took powers on behalf of the Wimbledon and Sutton Co. for an extension of time for the purchase of lands and the construction of the railway, as well as for additional capital and borrowing powers. Certain changes in the personnel of the staff had occurred during this period. The District Railway was by far the oldest of the various undertakings controlled by the Underground Co. They had the advantage of this maturity in possessing an experienced staff and personnel, many of whom had spent much of their lives in the service of the company, and who took an inherent and genuine interest in the work and well-being of the company. On the other hand, age, time, and death caused greater gaps amongst the heads of departments than was the case with younger companies. Having referred to the retirement of Mr. Whittle, who had been the accountant of the company for 42 years, and to the death of Mr. Soar, an old servant, the chairman concluded by saying that the past six months showed the same steady and continuous expansion which had been characteristic of the reports of the District Railway during the last six years. It was true that high prices, especially those of coal, had interfered with and marred the increased profit which they otherwise would have been able to show. The railway from its small mileage and from the complicated and hampering conditions which old Acts of Parliament had imposed upon it could not be expected to show in any half-year, or even in any full year, a revenue advancing by leaps and bounds. Such performance were outside its capacity and limitation, but it had shown an would, he thought, continue to show progress, which though slow was steady and unbroken, a progress not very noticeable in one half-year, but which by continuous accumulation over number of years would steadily increase the aggregate dividend and the value of the property of its stockholders.

MR. ERNEST LAW seconded the resolution, and the report was adopted.

**Stock Exchange Notices.**—Applications have been made to the Committee to allow the following securities to be quoted in the Official List:—

British Columbia Telephone Co., Ltd.—10,000 6 per cent. cumulative preference shares of \$100 each, fully paid (Nos. 1 to 10,000).

Compania Hidro-Electrica de Tucuman.—£300,000 5 per cent. first mortgage debentures of £100 each.

Mexico Tramways Co., Ltd.—Further issue of £1,288,000 general consolidated first mortgage 50-year 5 per cent. gold bonds.

The Committee have ordered the undermentioned securities to be quoted in the Official List:—

Cordoba Light, Power and Traction Co., Ltd.—Further issue of 127,500 ordinary shares of £1 each, fully paid (Nos. 472,448 to 600,000).

Rhondda Tramways Co., Ltd.—Further issue of £40,000 5 per cent. first mortgage debentures (registered) of £100 each (Nos. 2,001 to 2,400).

**Consolidated Gas, Electric Light and Power Co. of Baltimore.**—The directors have declared a dividend of 1½ p. cent. on the common stock for the quarter ending March 31st, at 3 per cent. on the preferred stock.

**Calcutta Electric Supply Corporation, Ltd.**—The number of units delivered to consumers during the four weeks ended December 27th, 1912, amounted to 806,132, compared with 656,441 units in the corresponding four weeks of 1911.

### Central London Railway Co.

directors' report for the half-year ending December 31st, states that the amount of capital expended during the half-year was £53,148. The following are the financial results of the year's working:—

	1912.	1911.	Increase.
Railway receipts .. ..	£181,028	£128,806	£52,222
Miscellaneous receipts ..	11,427	12,746	1,319
Less receipts .. ..	£144,465	£138,562	£5,903
Less working expenses ..	70,328	70,086	2,432
Balance to Ltd revenue account	£66,127	£18,558	£47,569

After providing for interest on the debenture stock and other items, the net revenue account shows that, including the amount brought forward from last half-year, there is an available balance of £85,420, as compared with £83,170 in the corresponding period. After deducting £6,739 for interest on the 4½ per cent. preference stock, there remains a balance of £78,680, out of which the directors recommend the declaration of the following dividends:—Undivided ordinary stock at the rate of 3 per cent. annum for the half-year; preferred ordinary stock at the rate of 2 per cent. per annum for the half-year; deferred ordinary stock at the rate of 2 per cent. per annum for the whole year. The payments will require £51,462, leaving a balance of £27,218. The number of passengers carried, including season tickets, through tickets and the cheap return tickets issued before 7.30 a.m., follows:—

Year.	Half-year ending June.	Half-year ending December.	Total.
1910 .. ..	20,664,880	19,995,860	40,660,740
1911 .. ..	20,006,287	18,076,996	38,083,283
1912 .. ..	17,249,169	18,690,033	35,939,202
Total carried .. ..			510,962,053

The extension of the railway to Liverpool Street was opened for traffic on Sunday, July 28th last, and the Broad Street booking offices on Thursday, October 10th last. The number of passengers using this extension, and the receipts derived therefrom are considered satisfactory. The proposals of Underground Electric Railways Co. of London, Ltd., referred to in the chairman's circular letter of December 14th last, having been accepted by the holders of over 75 per cent. in the aggregate of the ordinary, preferred ordinary, and deferred ordinary stock, offer has now become binding on the Underground Co. The directors propose, in future, to submit accounts yearly, and to hold an ordinary general meeting in January or February in each year. Interim dividends will be declared in the month of July or August.

The Right Hon. Lord Esher retired from the board in October and Sir Henry Babington Smith was elected in his place. The meeting was called for yesterday, 6th inst.

### Great Northern and City Railway Co.

The half-yearly general meeting of the shareholders of the above company was held on 29th ult. at the Westminster Palace Hotel, Earl of Lauderdale presiding.

The CHAIRMAN, in proposing the adoption of the report, said they would see by the accounts a falling-off in the traffic. Consequently their working expenses which, at the corresponding half-year of last year, were 51.50 per cent., had been for the last half-year 54.11 per cent., though actually in money only £155 up. They were this year to contend with the competition of motor-buses and omnibuses, which accounted for there being no set-off against the increase by the usual normal increase of travellers. A working expense of £5,086 appeared as the result. That sum, however, had not been provided, as in past years, from outside sources. He would mention what perhaps was an open secret, that the friends of the company, who had provided over £28,000 of those recurring deficiencies by means of free gifts to the company out of their own pockets, had been Messrs. S. Pearson & Son, Ltd., who constructed the railway, and who were large shareholders and creditors of the company. Had it not been for that ready and continuous support, the concern would, he thought, have long since passed into the hands of a receiver. A fresh issue of preference stock to the amount of £85,000 had been made to Messrs. Pearson, which, as they were all, no doubt, aware, had been made to them for some years past. They would also see that whilst the company's bonds had increased by £40,000, the loan due to the contractors had been reduced by a like amount. The cross-action between the Regent's Canal Co. and the railway, in reference to the water supply, had been settled on fair and satisfactory terms, and the railway company would, in future, obtain its feed water from other sources than the canal, and would also make a reduced payment to the canal company in respect of water supplied by the latter for other purposes. They must all be conscious of the fact that the history of the company had been one of continuous disappointment; and it had not been for the fact that the directors entered into a competitive struggle with other lines, the company would quickly have succumbed. As it was, they had carried on for nine years a struggling existence, and one made more difficult year by year, owing to the unexpected arrival of the motor-bus and the electrification of the tramways, &c. That had all tended to make it extremely difficult for that little disconnected railway to hold its own. Some time ago the directors thought it advisable to link up the line with a main-line system, so that the value of its large tunnels might be utilised, and various negotiations took place, but until a

few months ago without success, when the matter was taken up by the Metropolitan Co. The latter company now had a Bill before Parliament which provided for the revival of the extension of the railway to the Bank, which that company only allowed to lapse through sheer inability to show any prospect of being able to finance it. In addition it was proposed to extend the railway to a junction with the Waterloo and City Railway, so that it would be possible to journey under cover all the way from the South-Western stations to the North of London. Other extensions were also proposed which, in short, meant that the Metropolitan Railway proposed to take over their line and develop it as it required to be developed. They had to congratulate themselves upon the fact that a total loss of their capital was not to be their fate. So far as the debenture-holders were concerned, they would receive £ for £ an equal amount of Metropolitan 3½ per cent. "A" debenture stock, and the "A" shareholders were receiving 75 per cent. of the face value of their shares in Metropolitan ordinary stock, with dividends slightly restricted. The "B" deferred ordinary shares would get 50 per cent. of the face value. As it was, their line was earning nothing for its shareholders, and by itself had no prospect of earning a dividend, as part of a large and energetic railway, however, it promised to become a profitable feeder, and with its success their prospects would also be improved. It was true they would have to submit to a reduction of ½ per cent. of their interest, but, on the other hand, they would secure an easily salable stock of unquestionable security. Out of all the debenture-holders 87½ per cent. had sent in consents to the scheme. Some comment had been made on the fact that whilst the preferred, ordinary, or "A" shares got 75 per cent., the "B" shares received only 50 per cent. in stock. It was only right to explain that both the preferred and deferred were ordinary stock, and as a matter of strictness on a division, each share, whether "A" or "B," was entitled to receive the same amount of stock. Inasmuch as the arrangement with the Metropolitan Co. had got to be carried through by agreement, and each class of share was dependent on the vote of the other to secure the acceptance of the agreement, it had been thought right that the "A" shareholders, who were entitled to a preferential dividend, should, as some compensation, get a larger amount of stock, and so the "A's" got 75 per cent., and the "B's" only 50 per cent. A special meeting of the "B" shareholders would be held later on, when they would be asked to waive their strict rights to an equal distribution and to agree to the acceptance of the smaller proportion. As regarded the directors, he (the chairman) and his colleague, Sir Clarendon Hyde, would join the board of the Metropolitan, and the other directors would resign. He thought that whilst recognising that the Metropolitan Railway had made a fair bargain in the matter, it had, at the same time, saved them all from a very unsatisfactory position. Not one proxy had as yet been sent in against the scheme. He proposed that the report and accounts be adopted.

MR. CHARLES STEEL (deputy chairman) seconded, and the motion was carried.

After the auditors, &c., had been re-elected, the SOLICITOR to the company explained briefly the object of the amalgamation, and the proceedings closed.

### Mersey Railway Co.

The directors' report for the half-year ended December 31st, 1912, states that the train mileage run during the half-year was 276,733 miles as compared with 301,685 during the corresponding six months of 1911. The number of passengers conveyed during the half-year was 6,622,684, as against 5,914,743 for the corresponding period of 1911, exclusive of season ticket holders. The total receipts from all sources for the half-year were £59,651, as compared with £54,150. The working expenses, exclusive of the charges for pumping, ventilation, and lifts were £27,427, equal to 45.97 per cent., as against £27,065, equal to 49.98 per cent. These charges for pumping, ventilation, and hydraulic lifts, for the past half-year amounted to £3,818, equal to 6.40 per cent., as compared with £3,125, or at the rate of 5.77 per cent. Under the scheme of agreement scheduled to the Mersey Railway, 1900, as extended by the Mersey Railway Acts, 1906 and 1910, the payment of interest on the following debenture stocks, viz.:—1866, 1871, 1882/3/5 and B, was contingent on the revenue of the company available therefor in each separate year. The auditors had certified that the revenue available for this purpose for the year ending December 31st, 1912, amounted to £18,061, which was accordingly being distributed to the debenture-holders as follows:—Interest at 4 per cent. on the 1866 debenture stock, £4,664; interest at 3 per cent. on the 1871 debenture stock, £3,000; interest at £2 17s. 9d. per cent. on the 1882/3/5 debenture stock, £10,395; balance carried forward, £1 12s. 7d. The interest on these debenture stocks was duly paid to the debenture-holders on February 1st, 1913. The meeting is to be held in London on February 11th.

### South London Electric Supply Corporation, Ltd.—

The directors recommend, subject to final audit, a dividend on the ordinary shares for the year 1912 at the rate of 8½ per cent. per annum, as compared with a 5 per cent. for the previous year.

**Metropolitan Electric Tramways, Ltd.**—An extraordinary general meeting will be held at Electrical Federation Offices, W.C., to-day, Friday, to consider a resolution approving the Bill intituled, "A Bill to empower the Metropolitan Electric Tramways, Ltd., to provide and work vehicles by means of railless traction; and for other purposes."

### City and South London Railway Co.

The report of the directors shows that the receipts from all sources for the half-year ended December, 1912, amounted to £83,877, and the cost of working was £42,941, leaving a profit of £40,936. Inclusive of the balance brought forward, the net revenue account shows an aggregate total of £43,130. After making provision for the debenture stock interest, rent charge, and the transfer to the renewal fund of £1,500, a balance remains available for dividend of £27,538. Out of this the directors recommend that the full dividend of 5 per cent. per annum be paid on the preference stocks, 1891, 1896, 1901 and 1903, and that a dividend at the rate of ½ per cent. per annum be paid upon the consolidated ordinary stock for the half-year, leaving £2,588 to be carried forward to the next account, as against 1½ per cent. per annum and £2,815 carried forward last year.

Half-year.	Passengers, inclusive of season tickets.	Receipts, including season tickets.	Dividend per cent. per annum.
June 30th, 1910 ..	12,357,324	£83,413	1½
December 31st, 1910 ..	12,600,719	£86,103	1½
June 30th, 1911 ..	13,318,622	£87,591	1½
December 31st, 1911 ..	12,940,839	£85,817	1½
June 30th, 1912 ..	12,510,728	£81,656	1½
December 31st, 1912 ..	12,018,874	£78,839	5

The decrease in traffic receipts was spread very generally throughout the line, and about one-fourth of the whole amount was in bookings with other companies. The directors attribute it mainly to the extensive and general development of motor-omnibuses, which, by direct competition and by intersecting routes, have diverted much of the traffic which formerly came to this system. The directors, foreseeing that the reduction in the receipts had not reached its limit, decided that the interests of all classes of stockholders would be best served by arriving at an arrangement with a larger company, and after anxious consideration and some delays, a scheme was negotiated with the Underground Electric Railways Co. of London, Ltd. The full details of this arrangement were submitted to the ordinary stockholders. Approximately 99 per cent. of the consolidated ordinary stock of the company has, in pursuance of this scheme, been transferred to the Underground Electric Railways Co. of London, Ltd. The directors who have resigned in accordance with the terms of the scheme are Messrs. J. F. S. Gooday, S. Barclay Heward and E. Tate, and in their places have been appointed Mr. A. H. Stanley (managing director), Mr. T. C. Jenkin, and Admiral Sir Cyprian A. G. Bridge, G.C.B. In intimating these resignations, the chairman desires to place on record his regret at parting with colleagues much esteemed on personal grounds, whose counsel and co-operation had been at all times of the greatest value to the company. The appointment of Mr. Jenkin to a seat on the board involved, and was preceded by, his resignation of the office of general manager. This office he had held since May, 1890, and had displayed therein a degree of vigilance, courtesy, and organising capacity which it would be difficult to overpraise. It is satisfactory to be able to announce that in his new capacity Mr. Jenkin's devotion and experience will still be at the service of the company. The company are promoting a Bill in the ensuing session for enlarging the tunnels, for raising the necessary capital for this work, for new rolling stock and electrical equipment, and for other purposes, which will be submitted to the proprietors at a special meeting to be held at the conclusion of the ordinary general meeting. The London Electric Railway Co. are promoting a Bill, which will also be submitted to the special meeting, to authorise a physical junction near Euston, between this company's line and the Charing Cross, Euston and Hampstead Tube. This junction will enable up-to-date trains to run from Edgware, Golder's Green, Highgate, &c., through this company's enlarged tunnels to Euston, King's Cross, the City, London Bridge, and Chappam Common.

The meeting is to be held on February 11th.

### London Electric Railway Co.

The ordinary general meeting of the shareholders was held on Friday last at the Westminster Palace Hotel, London, Lord George Hamilton presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 168), said that the capital powers of the company had been increased by £700,000 additional capital, and £200,000 additional borrowing powers authorised by the London Electric Railway Act, 1912, and by £600,000 additional capital and £200,000 additional borrowing powers authorised by the Edgware and Hampstead Railway Acts, 1902 and 1912. The amount of preference stock created had been increased by £23,670 for which an equivalent amount of ordinary shares of the Edgware and Hampstead Railway Co. was received in accordance with the terms of the London Electric Railway Act, 1912. During the half-year £235,056 of debenture stock was issued, the proceeds of which were being used for paying the cost of the Golder's Green, Paddington and Charing Cross extensions. The amount spent on capital account was £279,322, of which £159,251 was expended on the extension from Golder's Green, £39,830 on the Paddington extension, £35,223 on the Charing Cross extension, and £41,518 on Earl's Court escalator. The gross receipts had amounted to £376,710, being an increase of £10,520 for the corresponding period of the preceding year. There had been an increase in expenditure of about £8,300 compared with the corresponding period, of which £4,000 was increase in cost of train working, due principally to the increased cost of coal, and there was every indication that the price of coal would continue to be

high during the current year. The car-mileage showed an increase of 351,210, or 3·85 per cent., while the passenger receipts per car-mile were 8·87d., compared with 9·01d. for the corresponding period. The percentage of operating expense to gross earnings was 43·19 per cent., compared with 42·12 per cent. for the corresponding period. There were two Bills referred to in the report, one by their company and the other by the City and South London Railway Co. The powers sought in the company's Bill were to enable them to construct a physical connection between the City and South London and their Hampstead and Highgate railway at Euston, so as to allow of a through service of trains into the City. In order that this might be done, it was necessary for the City and South London Co. to enlarge its tunnel, which was of a smaller diameter than their company's, and that company was promoting a Bill seeking powers for that purpose. The work on the Paddington and Charing Cross extensions involved many complicated engineering problems, but it was progressing satisfactorily, and it was hoped that both those extensions would be opened for traffic either in the late summer or the early autumn of the present year. The contract had also been made for the installation of escalators at Oxford Circus Station, and this work had commenced. This was the last occasion upon which he would act as chairman. He was sorry to leave the company; his relations with all concerned had been most pleasant and harmonious. He was especially sorry to leave it at a time when it was embarking into a larger system of co-operation with other companies and in extensions of its own. The Underground Co. had been forced, not by any desire to create a monopoly, but by the pressure of the circumstances with which it had had to deal, to extend its operations and to enter into arrangements with other enterprises similarly engaged. The huge and ever-growing daily passenger traffic throughout London could not otherwise be handled, if the convenience of the traveller had to be consulted and proper facilities afforded for the increasing number of persons requiring daily, constant, continuous, and rapid transport to and from all parts of the metropolis and its suburbs. This class of traffic could not have its necessities adequately met if London was arbitrarily divided into artificial and self-contained sections. The Underground was, therefore, forced to become a very large concern, and that being so, it was desirable to so adjust and shape every part of the co-operation thus necessitated so as to ensure smooth and harmonious working throughout. In the opinion of those whose judgment he trusted, it was thought that he might be more usefully engaged elsewhere. He bowed to that decision and took leave of them all with regret. He was consoled by knowing that his successor, Lord Farrer, was a director of exceptional experience in railway management. He came from a family distinguished in many walks of life, and he had no doubt that these railways would prosper under his direction. His experience as chairman, and the constant examination and revision of the figures brought weekly under his notice, had made it clear that it was only by a closer interchange and linking up with existing systems that an adequate return could be secured upon the great outlay of those underground undertakings. During the last two years, excluding the exceptional period of the Coronation festivities, the growth of traffic receipts was almost entirely derived from terminal and exchange stations. The intermediate stations held their own, but no more. For short distances, especially in fine weather, the motor-buses were their most formidable competitors. They had in hand a number of extensions and improvements which could not fail to largely augment their present traffic. The Paddington extension would bring them into direct physical connection with the Great Western system, whilst the further extension from Paddington to Queen's Park would enable them to co-operate with the London and North-Western Railway in bringing passengers from their lines straight through to lines operating on the south of the Thames. The Golder's Green extension would run through a rapidly increasing residential neighbourhood, a large proportion of whom were daily conveyed to and from the Metropolis. Under the Bills promoted this session by the City and South London Railway Co., their railway would be so connected with their lines as to become an integral part of their system. The Charing Cross improvements which were approaching completion would, when finished, provide a consolidated station which would afford full facilities for a thorough exchange of passengers between the Bakerloo, the Hampstead, and the District Railways. Those and other developments had not been promoted piece-meal or at haphazard, but they were part of a general policy carefully thought out, by which they hoped out of the isolated and scattered lines they originally started, to establish a compact and ubiquitous system of underground travel throughout the Metropolis. He should watch with interest and attention the development and realisation of this great utilitarian idea.

SIR ALGERNON WEST, G.C.B., seconded the motion, and the report was adopted.

**Underground Electric Railways Co. of London, Ltd.**—The directors have declared a dividend at the rate of 6 per cent. per annum on the income debentures, and at the rate of 6 per cent. per annum on the income bonds.

**London General Omnibus Co., Ltd.**—The directors recommend, subject to audit, the payment of a dividend on the ordinary shares of the company for the period ended December 31st, 1912, of 8 per cent., free of income-tax.

**South London Electric Supply Corporation, Ltd.**—The directors recommend, subject to final audit, a dividend on the ordinary shares for the year 1912 at the rate of 5½ per cent. per annum. This compares with a 5 per cent. dividend for the previous year.

### Liverpool Overhead Railway Co.

THE directors' report shows that the gross revenue receipts for the half-year ended December, 1912, amounted to £43,985, and the working expenses to £28,869.

The number of passengers carried during the last two years is as follows:—

	Half-year June, 1911.	Half-year Dec., 1911.	Half-year June, 1912.	Half-year Dec., 1912.
First class .....	579,328	617,007	628,852	674,460
Third class (including trams)	3,113,073	3,398,069	3,323,291	3,648,008
Workmen (spec. ret. tickets)	1,701,196	1,734,940	1,919,696	1,976,079
Total .....	5,893,597	5,738,506	5,871,339	6,297,546

In consequence of ill-health, Sir W. B. Forwood has resigned his position as chairman of the company. He will retain his seat on the board, and, it is hoped, will, ere long, be able to take his usual keen interest in the working of the railway. The meeting of shareholders will, in future, be held only once in each year, in the month of February. The directors intend, when possible, to declare and pay interim dividends in the month of August, as heretofore. The receipts from passenger traffic amounted to £42,566; miscellaneous receipts and interest, £1,419 = £43,985; less working expenses and transfer to renewal fund, £28,869 = £15,116; less interest on mortgage debentures, and on calls paid in advance, £1,329; also less provision towards cost of adjustment of loan capital, £500, and written off for depreciation of investments, £300; leaving £9,986, plus £4,852 brought forward. This leaves available for dividend £14,839, out of which the directors recommend dividends at the rates of 5 per cent. per annum on the preference shares, and 2½ per cent. per annum on the ordinary shares, leaving £4,913 to be carried forward.

### Metropolitan Railway Co.

THE half-yearly meeting was held on Wednesday, January 28th, at the Great Eastern Hotel, E.C., Lord Aberconway presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 189), said that on the expenditure side of the revenue account there was a saving in expenses of £1,239. Locomotive and generating expenses showed an increase of £1,751. Like all other railway companies, they were suffering from a serious increase in the price of fuel and also from an increase in the price of materials generally, and but for these circumstances, they would have shown a very considerable saving on this account, because their new generating machines at Neasden were enabling them to produce the current they required at a much smaller consumption of coal than under the old conditions. During the half-year they had burnt in the power house 31,089 tons of coal, as against 37,341 tons in the corresponding period, the decrease being 6,252 tons, or 17 per cent., while the output of current had been practically the same. On the receipts side of the account the disappointing feature was the first item, which showed that the receipts from the conveyance of passengers, apart from season ticket holders, showed a decrease of £1,444. The longer distance and the season ticket traffic both showed substantial advances, the falling off having been in the short-journey traffic, where they had a very severe competitor in the motor-bus. Their losses on the working of the Hammersmith and City Railway and on the East London Railway were both less than in the corresponding period, and their proportion of the profit from the working of the City lines and of their joint lines with the Great Central Co. north of Harrow showed a substantial increase. The net result was that they had available for dividend £171,778, as against £164,677. That would enable them to pay the dividend on the whole of the preference stocks as usual, and to pay at the rate of £1 15s. per cent. per annum on the ordinary stock, carrying forward £9,496. Put shortly, the effect of the accounts was that they paid the same dividend as 12 months ago on the ordinary stock, notwithstanding that the amount of that stock had been increased by £729,000; they put £7,500 to their electrical renewal and depreciation fund, as against £5,000 in the corresponding period; and they were carrying forward £280 more than on the previous occasion. Having referred to the progress being made with various alterations and widenings, the chairman said that at Neasden the whole of the five new sets of machines had been installed, though they were not all yet out of the contractors' hands. From their experience of them up to now, he might say that they were quite satisfied that they would effect all the economy in working that they intended they should do. They were putting up some additional sheds at Neasden for the housing of their rolling stock, and they hoped thereby to reduce their maintenance costs, as a great part of the stock had at present to remain in the open at night. They were laying an additional high-tension cable between Neasden and Moorgate Street to meet the increased call for current necessitated by the increased train services which they were now running, and which they had in prospect. In view of this they had placed an order with the Metropolitan Carriage, Wagon and Finance Co. for the building of 36 new cars which they required for working the electrified East London Line, the Hammersmith and Richmond Line, and for other purposes. The proprietors would be aware that in November last they issued an official statement through the Press in reference to the relations of the company with the Underground Co., which was a virtual amalgamation of most of the tube lines, the District Co., and the London General Omnibus Co. He had referred to this question at one or two previous half-yearly meetings, and they thought it right, in view of certain unauthorised statements having appeared in the newspapers on the subject, to issue an authentic announcement. He would like to state frankly and fully the reasons that led the board to the decision that it was not in the

interests of the company that there should be a financial fusion between the Metropolitan and the Underground group. In the first place, he must remind them that the very serious and increasing competition of the motor-omnibuses with the whole of the underground lines in London was the main factor in determining those who had control of the majority of the tube lines to acquire the control of the Omnibus Co., and that they acted wisely in doing so there could be no question whatever. The motor-bus had introduced a new and formidable element in competition. The old horse bus competed with the underground lines to a certain extent in the old steam days, but it could not compete effectively after these lines were electrified. The motor-bus, on the other hand, could compete with them in the matter of speed for short distances, and the very great convenience it offered to the public in picking up people and setting them down at any point they desired, rendered it a very formidable competitor. Under these circumstances, and as the tube lines were dependent for practically the whole of their earnings on traffic for which the motor-buses were competing, a common control of the two interests was undoubtedly desirable from every point of view. The Metropolitan Co.'s position, on the other hand, was quite different. Less than one-half of their total revenue was derived from traffic for which they were in competition with the motor-buses, the main part of their receipts being from their longer distance traffic, from their goods traffic, and from their exchange with various trunk lines, where, for obvious reasons, they need not fear competition from the source he had named. That they had suffered and were still suffering seriously from the diversion of traffic to the motor-buses within the London area was undoubtedly a fact, and though they were doing, and would continue to do, everything that lay in their power to attract short-distance traffic to the line by affording every possible facility, he had no hesitation in saying that they must not expect any growth in that section of the business. On the other hand, their longer distance traffic was capable of large expansion, and their policy during recent years had been to encourage and develop the traffic in their outlying districts. The board gave very careful, and indeed anxious, consideration to the whole matter before deciding to discontinue the negotiations with the Underground Co., and he hoped he had said sufficient to satisfy them that the possible sacrifice of future prospects that would have been involved in an amalgamation with the group in question would have been greater than the circumstances justified. He considered it would have been a mistake to have exchanged the prospects that they undoubtedly had for such immediate benefits as might have come to them by throwing in their lot with the underground group. Their discussions with the Underground Co. were carried on throughout in a most friendly spirit, there being an earnest desire on both sides to make the best arrangement possible for the respective undertakings. It was finally recognised on both sides that it was practically impossible to devise a scheme that would be mutually satisfactory, and it was thought that, so far as the working of the undertakings was concerned the objects in view could be accomplished without a financial union. As regarded the East London line, where they were joint lessees with several other companies, the work of electrification was approaching completion, and they expected the line would be ready for electrical operation in the course of about two months. They would then resume the running of through trains between New Cross and their system, which was previously a source of considerable profit to them.

MR. PAUL SPEAK seconded the motion.

MR. POWNALL, in a lengthy speech, criticised adversely the proposal of the directors to purchase the Great Northern and City Railway Co. That company was, he said, an unsuccessful and bankrupt concern. Having given the figures of the actual results shown by the line, as compared with the estimates in the prospectus and pointed out that only on two occasions had the company earned sufficient to pay the interest on the debenture stock, Mr. Pownall gave it as his firm opinion that the future prospects were not more encouraging. They were, he said, told that if they did not buy the line the Great Northern Railway Co. would do so, and if that was so, he would rather that company bought it than the Metropolitan.

The CHAIRMAN said that in the opinion of the board they had the opportunity of purchasing the Great Northern and City Co. on very favourable terms, and they were satisfied that if it came into their hands, and they extended it as they proposed, it would put the earning value of the line upon a footing that it had never yet occupied by reason of its short length. He reminded the shareholders that the Metropolitan Co. had a power station at Neasden capable of turning out a very much larger quantity of electrical power than they could now consume, and it was proposed to use this surplus energy to run the new line, and to use the station of the Great Northern Co. for other purposes.

After a long discussion, the report was eventually adopted.

A Wharnclyffe meeting was subsequently held, at which the CHAIRMAN proposed a resolution approving the Bill providing for the purchase of the Great Northern and City Railway. In the course of a long speech defending the proposal, he explained the various extensions which they proposed to make, and said it was their intention to take over the line as from July 1st next.

Considerable discussion ensued, in which various shareholders urged the desirability of delay in order to give further time to consider the matter, and in the end it was decided to adjourn the consideration of the question to a special meeting, to be held on February 12th. In the meantime it is proposed that a number of the largest shareholders shall confer with the board on the matter.

### Smithfield Markets Electric Supply Co., Ltd.

The directors' report for the year 1912 shows that the gross profit amounted to £4,005, compared with £3,869 last year, and the net profit to £1,525, compared with £1,383. A further sum of £400 has been placed to the debenture stock redemption fund, making a total of £1,282 at the credit of this account, and £500 to depreciation and general reserve fund accounts. The available balance, including £629 brought in from 1911, is £2,154, which the directors propose to deal with by paying a dividend at the rate of 2 per cent. per annum on the ordinary shares (£1,200), and carrying forward £954. The output of current for lighting has been maintained, but the demand for power has been rather less, probably due to the abnormal conditions prevailing during the summer months. The plant and machinery have been efficiently maintained and a reduction in generating costs per unit effected. The installation of the new generating plant is proceeding satisfactorily and will be completed very shortly. The vacancy, caused by the death of Sir J. H. Morris, K.C.S.I., one of the trustees for the debenture-holders, has been filled by the appointment of Sir Herbert Leon, Bart., as a trustee.

The annual meeting takes place to-day (Friday).

## STOCKS AND SHARES.

Tuesday Evening.

MARKETS in the Stock Exchange have called something of a halt pending the war developments in the Balkans. Opposed to the idea which existed, even up to Monday night, that the two combatants would not come to blows after all, was the hope that they would fight out their differences once and for all, and so settle the matter. For a great deal too many years the Near Eastern Question has been a constant thorn in the side of the Stock Exchange; and its extraction, even if a painful process during the operation, would be welcomed by financial circles the world over. Business, meantime, is very quiet, and the liveliest feature this week amongst electrical sections have been the movements in Marconi shares.

The Home Railway market was greatly cheered by the declaration of unexpectedly good dividends by some of the Northern lines. Prices of steam stocks improved generally, and this had a good effect upon Metropolitan and Districts, the quotations of which improved. Metropolitan, allowing for deduction of the dividend of 17s. 6d. per cent., are  $\frac{1}{4}$  up; while Districts have recovered 1s. The eagerly-expected report of the Underground Electric Railways Company showed that the earnings were sufficient to pay the full 6 per cent. on the Income Bonds, but the carry forward did not come up to hopes which had been expressed about it previously, and was not large enough to justify some of the extravagant talk recently heard in connection with the company's Ordinary shares. The price of the latter, therefore, eased off  $\frac{1}{2}$  to regain it later, while the 1s. shares fell  $\frac{1}{8}$ , and the Income Bonds themselves at 95  $\frac{1}{2}$  showed a fall of  $\frac{1}{2}$ . Confidence in all these issues, however, remains strong; and unless holders come in to realise their shares more eagerly than they have done so far during the past week, there might be a recovery, provided the meeting is a satisfactory one.

Central London Ordinary and Deferred both shed a point: but the Preferred is 1 up, in consequence of the good return which the stock shows at the present price, included in which, of course, is the recently-declared dividend of £2 per cent. Great Northern and City Preferred fell 10s. to 2  $\frac{1}{2}$  on the opposition manifested at the meeting of the Metropolitan Railway shareholders to the scheme for the absorption of the Tube line by the Metropolitan. When the project was first announced, the wonder was expressed here why the older railway should want to acquire the Great Northern and City, and evidently some of the Metropolitan proprietors are still unsatisfied on the point.

British Electric Traction 6 per cent. Preferred stock has receded to 11  $\frac{1}{2}$ , but Potteries Preference are better, and there is a vague notion that the Company's Ordinary shares may be worth picking up as a gamble that ought to be kept. In view of the very small market that there is in the shares, it would seem to require some courage to buy these, even for the purpose of putting away.

Dividend announcements have already begun to appear from the English electricity supply Companies. The Westminster Company announces a distribution at the rate of 11 per cent. per annum, making the regular 10 per cent. for the year; while the St. James's Company is paying 5s., also as usual, making a similar percentage.

The list of prices has been rectified to some extent, and brought more into line with the actual conditions of supply and demand in the market. Chelsea, London Preference, Metropolitan Ordinary, and County Ordinary and Preference have been marked up  $\frac{1}{2}$  in each case. Westminster and St. James's have both declined, in spite of their dividend declarations. The principal change is a rise of 15s. in City of London Ordinary, the market being strengthened by recurrence of the demand from the same group whose operations started the previous rapid improvement. The market is none too supplied with shares of any of the best London Electricity Supply Companies, but there is not a great deal of inquiry to stimulate prices, and the National Telephone Arbitration award is not yet far enough away to remove a certain feeling of doubt as to how the electric undertakings will be treated in 1913.

Remark was made here in our last report upon the way in which the manufacturing shares were being picked up by people who knew how busy quite a number of the companies are at present.

This movement has gone further. Electric Constructions have followed up their advance of a week ago by a gain of  $\frac{1}{8}$ . British Aluminium Ordinary and Preference have both improved, and the Prior Lien Debentures gained  $\frac{1}{2}$ , a similar advance being secured by British Thomson-Houston Debenture. Castner-Kellner Debenture stock recovered  $\frac{1}{4}$  of its dividend deduction, while Edison & Swan 4 per cent. Debenture stock rallied a point after its drop of last week, although the Ordinary shares (partly paid) have been marked down to the lugubrious figures of nothing to  $\frac{1}{2}$ . No doubt the readers of these Stock Exchange notes are better conversant with the amount of work which manufacturing companies have in hand, than a mere financial writer can expect to be, since he is but the wax upon which are stamped the impressions of those more fully informed. Babcock & Wilcox rose  $\frac{1}{16}$  to 3  $\frac{7}{8}$ , but in Willans and Robinson there are no changes.

The Marconi market, as noted above, is one of the most active in the Miscellaneous section. The price of the shares has spurted strongly, touching  $\frac{1}{2}$  on Monday, and finishing on Tuesday night at  $\frac{1}{4}$ , leaving a rise of  $\frac{1}{8}$  on the week. The cross-examination of Mr. W. R. Lawson, one of the journalistic critics of the Marconi agreement, is followed with particular interest in the Stock Exchange, because Mr. Lawson is a member of the House. With the parent shares, the prices of Canadian, American and Spanish Marconis have advanced in sympathy. The market is a very difficult one to read, and it is largely at the mercy of a comparatively small clique, whose extensive deals bring about these violent fluctuations.

National Telephone Deferred has quieted down again, and the price shows a fair recovery after its very steep fall. So many conflicting calculations are being made even yet as to the price at which the stock will be paid off that no good purpose can be served by reproducing these guesses. American Telephone Capital stock fell  $\frac{1}{4}$  for the same reason as mentioned on a previous occasion, namely, that it is feared the United States Courts may declare the Company to be an illegal combination in restraint of trade. The same contention applies—more indirectly, of course—to the Anglo-American Telegraph Company, now under the wing of the Western Union Company. But the prices of the Anglo group are unaffected, because it is taken for granted that, even in the event of the so-called trust being dissolved, the Anglo could keep up its own end perfectly well. Mackay Common shares fell 2. Cuba Telegraphs are a good spot, with a 10s. rally; but West India and Panamas continue to sag, and the price has lost another  $\frac{1}{8}$ . The Eastern group keeps very steady, and there is not a change worth mentioning beyond a point decline in Eastern Ordinary stock.

The unpleasant flavour left in the mouth by the Georgia Light and Power incident continues to militate against this department. Georgias themselves have recovered to 4  $\frac{1}{2}$ , and the Mexican group is a little better. Brazil Traction recovered the  $\frac{1}{2}$  per cent. deducted for dividend, and another  $\frac{1}{2}$  in addition; while British Columbia Electric stocks are just steady, the Deferred losing a point, which the Preferred picked up. Rio First Mortgage Bonds are better. Barcelona Trams rose from 47 to 50, and reacted to 49. United Electric Tramways of Monte Video shares are a shade easier, but there is not much doing in them, and the prices of the pre-ordinary issues remain very firm. Mexico Trams are harder, and in the Mexican Light and Power group the only alteration is a partial recovery of the coupon on the company's 5 per cent. First Mortgage Bonds.

**Rail Welding.**—MESSRS. THERMIT, LTD., London, have contracts in hand—or shortly to be started—for the welding of the tramway rails on the following, among other systems:—Ayr, Bolton, Birmingham, Dublin, London County Council, Manchester, Portsmouth, Salford, York, &c. The number of joints welded on new and reconstruction work during 1912 amounted to over 15,000, which is equivalent to nearly 30 miles of single track, 60-ft. rails.

## NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

THE writer of these notes has just received the ELECTRICAL REVIEW of January 3rd, which contains the report of Mr. C. Hamilton Wickes on the Chicago Laboratories.

Mr. Wickes has carefully gathered his facts and marshalled them well, for he sets out the existing state of affairs very accurately. The most noteworthy of his statements are the following:—

I. The third paragraph of the report, relating to the "... other difficulties appertaining to the position ..."

II. The last paragraph under the heading "British Manufacturers v. the Operations of the Underwriters' Laboratories, Chicago."

III. Also Secs. 2, 4 and 5 under the same heading.

The statements referred to in I are self-evident truths to anyone acquainted with this Continent, and need no comment.

The question of danger to life (Sec. 2) is an important one, as neither the U.L.C., nor any of the bodies associated therewith, are in a position to enforce rules on this point; the only thing that they can do is to make recommendations. The sole means which the Underwriters possess of enforcing their rules is to raise the insurance rate or refuse insurance altogether; manifestly, then, as they do not insure lives they are quite powerless where life hazard comes in, except in so far as this may be introduced through fire. Even in respect of the fire risk, if this be not excessive and the business is good, the rules are frequently winked at.

From this it is plain that, if a person cares to take the risk of being without insurance, or of insuring with a company outside the Fire Underwriters' organisation, he can please himself what he does. As for the electric supply companies, some of them will connect up to any pair of terminals without much question as to what is on the side remote from their mains.

It seems a great pity that the U.L.C. are not supported by the Life Assurance companies as well, because, if this were so, proper safeguards against shock would immediately be taken and enforced. Even this arrangement, however, would fall a little short of the ideal, as some people do not insure at all.

Mr. Wickes refers (Sec. 3) to "the intolerable state of affairs" which necessitates British-made products, intended for "a portion of the British Empire," being approved or rejected by a foreign corporation.

This is exactly the view of the situation taken by the writer and already set forth in these "Notes" some little time ago.

Secs. 2, 4 and 5, referred to in III above, are all closely related, and may be considered together.

The Imperial Trade Commissioner remarks: "I think he" (the British manufacturer) "should be supported in this objection, unless, indeed, we are prepared to concede that the United States engineer is the repository of all the wisdom of the world ...". It would be one thing for a Britisher to refrain from conceding such a point, but quite another to induce the "United States engineer" to join in the *refrain*, at least so far as this continent is concerned.

The statement that "the introduction of new methods or fresh standards might meet with considerable opposition" is very much too mild, for it may be confidently predicted that the "opposition" from the "manufacturing," and some of the "other Mercantile Associations," would be of a very determined character, if any such step as that recommended by Mr. Wickes were under contemplation.

It is not to be denied that the U.L.C. have done practically all the pioneer work and are efficiently performing a duty not undertaken on this side by any other body. This is all very well for the States, but when one turns to Canada it is regrettable to find the British manufacturer practically shut out from certain lines.

Mr. Wickes, in discussing the suggestions at the end of his report, thinks that the adoption of his third proposal "would throw open to our British manufacturers not only the Canadian, but the American, market."

Supposing that the American manufacturer came to the same conclusion—would he supporting the U.L.C. as he does,

quietly submit and allow his markets to be thus thrown open, or would he not rather rise up and, in every way possible, strenuously fight the matter—there seems to be only one answer to this; he would also have the strong, and not-to-be despised, co-operation of the electrical contractors and jobbers who are naturally in close touch with the manufacturers.

If the American market cannot be "thrown open" (to say the least the task would be difficult), what about the Canadian one? If the Canadian fire underwriters be willing to forgo the U.L.C. inspection and specifications, and accept those of a British laboratory, this might be done. If, however, this latter be merely an "offshoot" (or, shall we say, an "adjunct") of the U.L.C., it may be taken for granted that practically no new methods or standards would be introduced over here; the matter would, therefore, resolve itself into the British manufacturer being compelled to get out new drawings, tools, jigs, &c., in order to make apparatus and fittings which would comply with the American standards. To some extent this procedure is inevitable if any Canadian trade is to go to Great Britain, but the situation might be mitigated were the problem of securing this trade for the home country attacked in a somewhat different way from that recommended in the report now being criticised. In view of the, as yet, comparatively small size of the Canadian market, the British manufacturer must ask himself seriously—"Will it pay to go to the expense of getting out new standards, tools, &c., for the sake of obtaining a *share* of the Canadian trade if, as seems likely, no American trade can be looked for?"

Of course, it pays him to supply material and goods of his own standards, and, in regard to meters, motors, large cables, &c., he is allright in this country now, but when it comes to small switches, lampholders, fuses, ceiling roses, &c., the design of which is covered in the specification of the U.L.C., the case is very different.

Mr. Wickes's suggestion to extend the policy to other parts of the Empire is a very good one, but it must be remembered that in most, if not all, other parts of the Empire, except Canada, British, and not American, standards and designs are predominant. Canada's position is quite unique in this respect, as was pointed out in the columns of the REVIEW a little while ago.

In the opinion of the writer, the best way of dealing with this problem would be to combine Mr. Wickes's first and second proposals, *i.e.*, that laboratories should be established both in Canada and in England, these, of course, to work in conjunction with each other, and be independent of the U.L.C., though not essentially antagonistic thereto.

Probably it would be difficult to establish a fully-equipped laboratory here for some years, so that elaborate tests, when required, might be carried out in England (if need be, at the National Physical Laboratory), under the supervision of both Canadian and British engineers. Mere inspections, labelling, &c., could readily be done both here, for the Canadian manufacturer, and in England, for the British manufacturer.

The system established in the U.S.A., and at present operative here, of having all fittings, &c., made to the standard specifications of the U.L.C., is an excellent one, and as all municipalities, &c., adopt the one set of rules, *viz.*, the National Electric Code, the training of wiremen and the ordering of material are very much simplified as compared with English practice.

Many of the devices used and methods adopted are eminently suited to the conditions of the country, and it would be both unnecessary and unwise to alter them, but the British manufacturer labours under great disadvantages at present, even though he be prepared to supply goods in strict accord with U.L.C. requirements.

The Imperial Trade Commissioner for Canada is to be heartily congratulated for having grasped the situation so well in the short time he has spent in the Dominion, but your correspondent takes issue with him on the method which he recommends for the removal of the disadvantages just referred to. The work of a British laboratory, which was merely an "off-shoot" of the U.L.C. would not, in the opinion of the writer, help the British manufacturer much in his trade relations with this continent; rather would it tend to "throw open" the markets of the Empire to the American

manufacturer, as, with a laboratory in England practically subordinate to one which is in constant touch and already thoroughly acquainted with his own products, every possible influence would be exerted to enable him to introduce his wares into other British possessions with the object of making them standard there in place of designs of British origin.

If the British manufacturer wants to strike in his own interests let him strike off his own bat, and, as the captain of a certain eleven is said to have told a batsman who was not quite sober, "hit with the *middle* bat," too, *i.e.*, with the real bat, not a visionary one. It would be far better to leave the American market alone, if the attempt to secure it (success being very uncertain) means that the markets of the Empire will be thrown open to the American manufacturer.

## GRAPHS IN A CABLE-SHIP DRUM-ROOM: NOTES FOR JUNIOR ASSISTANTS.

By EDWARD RAYMOND-BARKER.

(Continued from page 154.)

63. Fig. 6 shows a complete cable-slack-per-cent. calculator board\* dealing with all cable values—whether in N.M. or in knots—in a manner involving no converging origins.

64. One of the main features of these calculator-board graph-sheets (figs. 6 and 7) is the use of *Morse-code figures* for vertical and horizontal co-ordinates and *percentage diagonals*.

As far as the writer has been able to ascertain, this application of Morse figures as a means for quick differentiation of any number of sectional lines, diagonals, curves, or lines of any kind where easy and rapid identification is desirable, is quite new. This system will commend itself to draughtsmen, hydrographers, chart-makers and others, embodying as it does a simple way of drawing any number of lines in as many different ways, thus facilitating identification of a given line, from one part of a large chart to another, without any irksome following of a line throughout its entire length.

65. In figs. 6 and 7 every fifth vertical and horizontal line is continuous, whilst intervening lines in all cases severally are "1" to "4" in Morse figures of *dots* and *dashes*. Similarly, the diagonal *percentage* lines are in Morse figures from "1" to "20" inclusively, so that where rectangular intersection of *taut wire* and *cable* co-ordinates takes place on any diagonal, the *cable-slack percentage* indicated by that diagonal is at once recognised in the Morse figures composing the diagonal. There is no need, therefore, to follow the diagonal line up to the percentage figures at the top of the graph sheet.

66. In fig. 6 the *taut-wire* vertical-scale divisions range from 2 to 5 on the left of the sheet, and from 5 to 10 on the right.

67. The corresponding *cable* horizontal-scale divisions range from 2 to 6.5 from left to right and from 5 to 12, right to left.

68. The respective two corresponding sets of *slack-per-cent.* diagonals incline opposite ways and lead up to slack percentage figures clearly inscribed at the top of the sheet.

69. For *taut-wire* values between 2 and 5, a single diagonal thread is used, moving radially from a pin attachment at the point of origin.

70. For like use between 5 and 10, a transparent celluloid radial arm moves with its base in a curve so formed as to cause the arm to move radially on an inferred origin—that is, on that common point of origin towards which the diagonals tend to converge. Movement of the radial arm causes its straight-edge to coincide successively with the various percentage lines. In fig. 6, this coincidence is not absolute, because, when the photograph was taken, the upper end of the radial arm was not close up to the board, but must have been hanging away slightly from it.

\* Maker: W. H. Harling, 47, Finsbury Pavement, London, E.C.

71. So much for *length* and *speed* values between 2 and 5, and between 5 and 10. What provision, then, is to be made for values between *zero* and 2? As far as values 0 to 1 are concerned, these naturally will be the same as those from 0 to 10, any difference depending merely on the position of a decimal point. What *are* wanted are the values between 1 and 2.

72. Hence, on the calculator board shown in fig. 6, which, to facilitate the verification of co-ordinates, is fitted with horizontal and vertical cursor threads, an *extra set* of vertical and horizontal axes, also diagonals, have been provided on an extended scale.

*Taut wire* vertical scale: 1 to 2.

*Cable* horizontal scale: 1 to 2.6.

The corresponding diagonals are seen, in fig. 6, to the right of the others.

73. On the other hand, supposing that with a *taut wire* rate of 7.5 knots, it be desired to lay about 6.5 per cent. of cable slack.

(1). Horizontal cursor is placed at 7.5.

(2). The radial arm is then moved on its curved base till the straight-edge lies about half-way between the 6 per cent. and the 7 per cent. diagonals.

(3). The vertical cursor, on being brought to the intersection of radial arm and horizontal cursor, is found to indicate the required cable rate, viz., eight knots.

76. Thus it is seen that the calculator-board, fig. 6, fulfils all percentage conditions between 0 per cent. and 20 per cent., without any converging origins.

77. After what has gone before, fig. 7 will be found self-explanatory. It shows a calculator board\* specially designed by the writer for paying-out purposes, and for giving, at a glance, for all types of cable on board a ship, the required

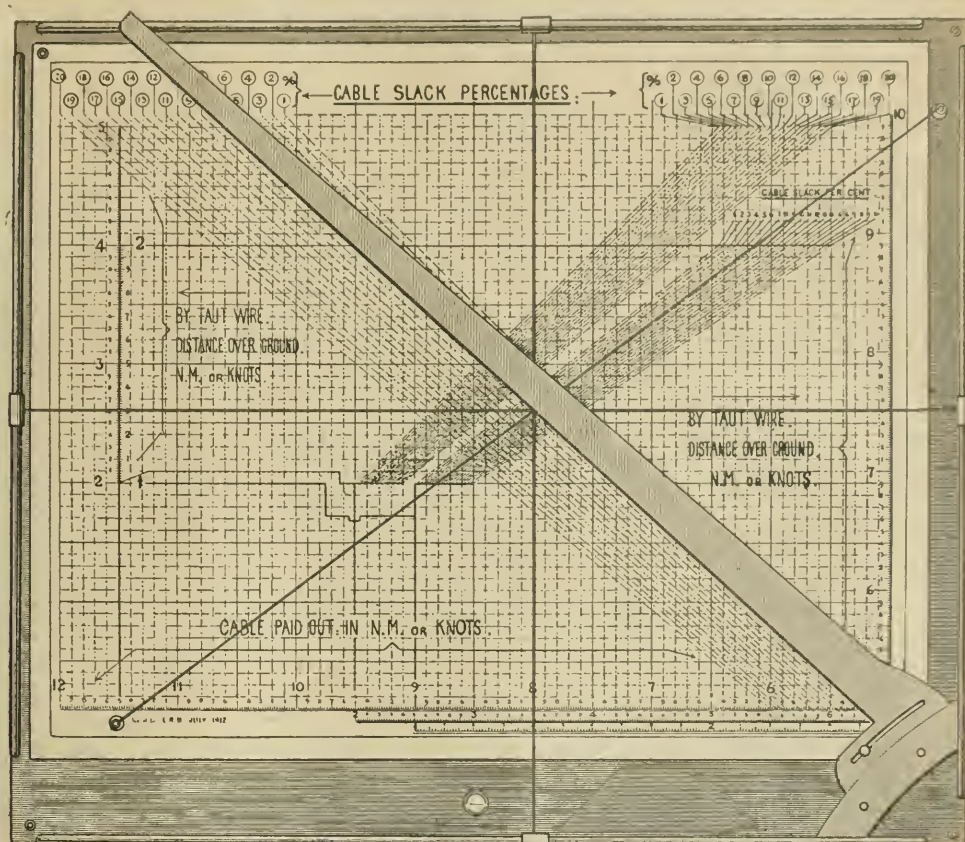

FIG. 6. (Sectional sheet, reduced from 700 mm. x 500 mm.)

73. In connection with these last, an example may be cited.

Supposing *taut wire* paid out = 130 N.M.

Horizontal cursor placed at 1.3 (see fig. 6).

Supposing *cable* paid out = 140 N.M.

Vertical cursor placed at 1.4.

Radial thread caused to cut the two cursors at their point of intersection is found to lie between the 7 per cent. and 8 per cent. diagonals. Actual slack = 7.7 per cent.

74. Second example (see fig. 6).

Let *taut wire* be going out at 7.5 knots.

Horizontal cursor placed at 7.5.

Let *cable* be going out at eight knots.

Vertical cursor placed at 8.0.

Straight-edge of radial arm brought to traverse point of intersection is found to coincide with a position a little over half-way between the 6 per cent. and the 7 per cent. diagonals.

Actual slack = 6.6 per cent.

cable-drum *revs. per minute* corresponding with any likely rate of laying that might be adopted.

78. Below the horizontal cable scale is a space into which, for any cable-laying expedition, may be pinned a fresh table of corrected drum *revs. per minute* values, so written, and arranged, that the several sets of values for the various cable types on board, lie in line with the corresponding graduations of the cable knots horizontal scale.

79. The afore-mentioned table would be based on a formula developed from data given in 36 and 37—

$$\text{Drum revs. per minute} = \frac{\text{cable N.M. per hour}}{1 \text{ drum-rev. in N.M.} \times 60}$$

(all values corrected, see 36 and 37).

80. In fig. 7 (on the extra slip of canvas paper pinned in afresh for each expedition) there are *drum-revs. per minute* columns given for *eight* different cable types.

\* Made by W. H. Harling, of 47, Finsbury Pavement, London, E.C.

81. The positions (as shown in fig. 7) of the thread-cursors afford an example of the general working of this calculator board.

Wire going out at 118.3 measuring-wheel revs. per min. = 7.1 knots : speed of ship.

Horizontal cursor at 7.1.

Cable type B going out at 15.7 drum revs. per min. = 8.1 knots. Vertical cursor at 8.1.

The two cursor threads are then seen, at a glance, to intersect on the cable-slack diagonal of 14 per cent.

82. Conversely, if with wire going out at 7.1 knots, it be desired, for certain reasons, to lay over a particular part of the cable route, slack to the extent of 14 per cent., the wire horizontal cursor is placed at 7.1 and the cable vertical cursor is brought to the point of intersection between the horizontal cursor and the 14 per cent. diagonal. The vertical cursor then automatically indicates not only the necessary cable rate in knots, for any cable type, but also, the corresponding drum-revs. per min. necessary to produce that same paying-out rate.

83. If the graph method involved in fig. 4 be used (see 38) the 1 drum-rev. in the formula (see 79) is left

where along the cork strips let into the calculator-board frame.

85. With the scales, sectional lines, figures, and data available, innumerable changes may be rung by means of these calculator boards, in the manipulation of percentage and other figures.

(To be continued.)

## LEGAL.

### INTERESTING TRAMWAY CASE AT BRADFORD.

At the Bradford City Police Court on Friday, the Stipendiary Magistrate (Mr. H. W. Wilberforce) delivered judgment in a case in which a man travelling on a Leeds Corporation car was summoned for using obscene language. The Stipendiary Magistrate said: "This summons alleges a breach by the defendant of one of the Tramway By-Laws of the Bradford Corporation, in using obscene language upon a tramcar. The facts are not really in dispute, but the question arises whether the by-laws apply to a particular tramcar

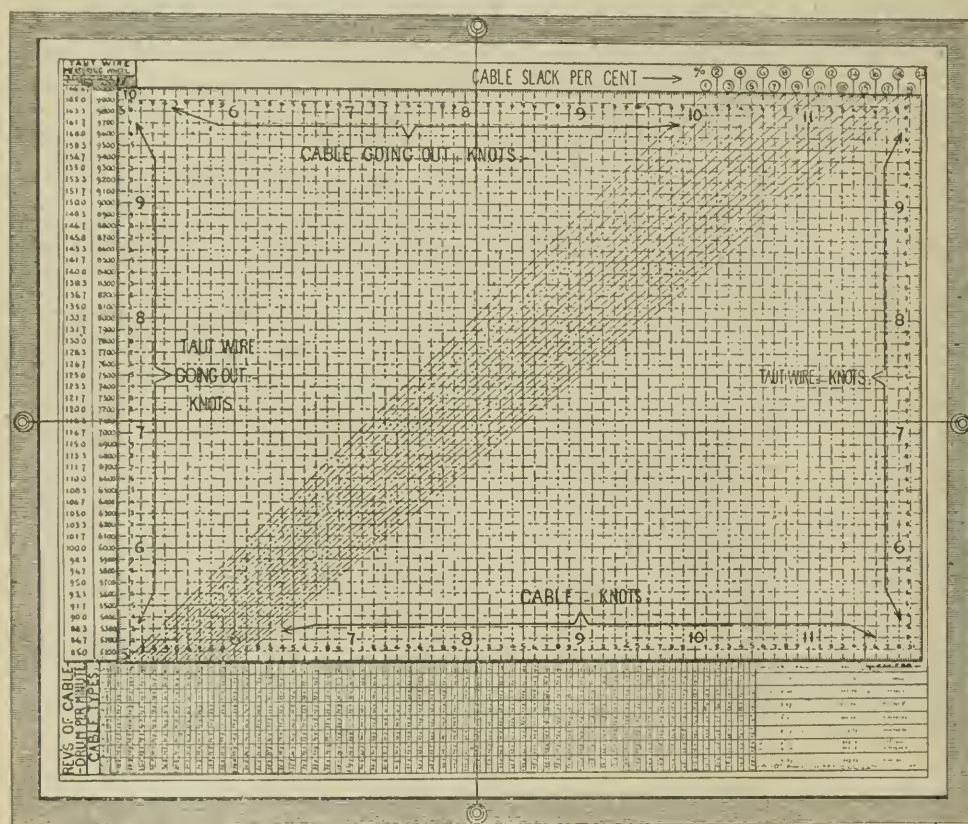

FIG. 7. (Sectional sheet reduced from 700 mm. x 500 mm.)

uncorrected for cable circumference, and the formula becomes:—

$$\text{Drum-revs. per min.} = \frac{\text{cable N.M. per hour}}{1 \text{ drum-rev. in N.M.} \times 60}$$

One single table, in that case, would suffice for all types of cable (see 80) the correction for cable circumference being applied at the final stage, by means of data obtained from the curve in fig. 4, in the manner shown in 38 and 43.

84. In practice the cursor threads are best made of the finest red-silk-covered elastic.

In fig. 6 the cursor threads are adjusted by brass attachments sliding along rods.

A preferable and more simple method of adjusting the cursors is shown in fig. 7. The threads are attached to glass "photographic" pins easily inserted, at pleasure, any-

upon which the obscene language was used. The car was the property of the Leeds Corporation, and was running upon Bradford tramlines in pursuance of an agreement between the two Corporations entered into under the authority of Sec. 12 of the Bradford Act, 1899. (Sec. 12—"The Corporation on the one hand, and the owner and lessee of any trains or light railway in any adjacent district which can be worked with any of the Corporation trams on the other hand, may from time to time enter into and carry into force contracts and agreements with respect to the purchase, sale, lease, working or management and maintenance by the contracting parties, of all or any of their respective tramways, light railways and works, or any part or parts thereof respectively; the making of all necessary junctions, the supply under any agreement for all or any of the respective tramways or light railways of the contracting parties being worked by the other of them as aforesaid, and rolling stock, plant, machinery and electrical energy or power necessary for the purpose of such agreement; the appointment and removal of officers and servants the payments to be made and the conditions to be performed in respect of such working or management and maintenance; the interchange, accommodation, conveyance, trans-

mission and delivery of traffic, coming from or destined for the respective undertakings of the contracting parties, and the diversion and apportionment of the revenue arising from such traffic and the payment of any fixed or contingent rent.") The point was, therefore, can this tramcar, although the property of the Leeds Corporation, be said to be a carriage belonging to the Bradford Corporation, within the meaning of the section of the Act of 1870. It need hardly be said that it would be the height of absurdity that a tramway passenger in Bradford who finds himself in a car which happens to be the property of the Leeds Corporation running in Bradford, should therefore be able to commit nuisances with impunity. Still, this absurdity, if it existed, would not be due to the Act of 1870, which neither contemplated nor authorised the subsequent development of municipal enterprise, but to omissions in the various private Acts, which sanctioned this development. This consideration, accordingly, is irrelevant to the interpretation of the language of the section. Now, looking to the words themselves, it is to be said that in their ordinary use "belonging to" may bear a variety of meanings, ranging from absolute ownership to a connection or relation of a very much slighter kind, and in this particular section the meaning cannot, I think, be limited to absolute ownership. For instance, if a car were hired, whether on a hire-purchase agreement, or for a period, by the Bradford Corporation from the makers, and not bought outright, such a car would, I take it, be within the meaning of the section. So, too, if a car is lent on approval to the Corporation. Considerations of this kind seem to me to give to the words a meaning in this section rather of possession and control than of ownership, and accordingly it becomes necessary to inquire what was the position of the Bradford Corporation in reference to this particular car. Broadly speaking, the result of the agreement between the two cities as to cars, the property of Leeds, running in Bradford, is that Bradford pays the working expenses of the car, receives the fares, and has control of the car and the men in charge of it. I do not lose sight of the fact that these cars are alluded to in the agreement as "belonging to Leeds," and that claims for damage caused by the cars, or those in charge of them, are to be satisfied by Leeds. Looking, however, to the agreement as a whole, the possession and control of this car was, in my opinion, clearly with the Bradford Corporation. That being so, although my opinion has wavered, and I regret that the case has not been argued on the other side, I come to the conclusion that this possession and control brings the tramcar in question within Sec. 46 of the Act of 1870, and therefore within the similar, though not identical, words of the Corporation by-laws. There will, accordingly, be a conviction. Defendant will be fined 2s. 6d. and 13s. costs.

#### BARNESLEY CORPORATION v. BARNESLEY MOTOR OMNIBUS CO., LTD.

At the Barnesley County Court last week, the plaintiffs sued defendants for £25 damages done to an electric switch-box. The case occupied considerable time. It appeared that on the night of October 24th last a taxi-cab belonging to defendants collided with an electric pillar-box. The street was 27 ft. wide. The cab struck the box in avoiding a tramcar. Immediately the box, which contained the electric main for the town's lighting system, was struck, the wire fused, and the whole town was plunged into darkness for a time. The defendants had maintained that the cause of the mishap was the state of the tramway. It was stated, however, that the borough engineer had examined the site and found that the condition of the tramway was such that it could not even be a contributing cause to the accident. The defendants pleaded that the affair was a pure accident, owing to the greasy state of the road, and the onus was on the Corporation to show that there had been negligence. At this point, near a dangerous corner, it was the practice of motor-drivers to drive in the middle of the road, and very properly so. They maintained that the wheels of the taxi-cab caught in the tramline, and the cab skidded into the pillar-box. His Lordship eventually gave judgment for the defendants, with costs.

#### THE GRAETZIN LAMP AGENCY JUDGMENT.

In our summary of the judgment in this case last week, an error occurred in the first five lines on page 176. What should have been reported will be gathered from the following extract which we have made from a *verbatim* copy of the judgment that we have since seen:—

"If I should be wrong in holding that the interpretation of the contract is governed by German law, I should have held at English law that the defendants had no right to cancel the first contract of Krupka & Jacoby, so as to avoid paying the plaintiff commission on the guaranteed sums; that they had no right to make the contract of February, 1912, without the plaintiff's consent."

#### COLLISION BETWEEN TRAMCAR AND MOTOR-CAR.

In the King's Bench Division on January 31st, Mr. Justice Bucknill and a special jury concluded the hearing of an action in which Mr. Leslie Montague Sarll, formerly of Richmond and now of Chelsea, claimed damages from the London United Tramways, Ltd., for injury to his motor-car by a collision with one of the defendants' tramcars. The accident happened on February 10th of last year, under a railway arch which crosses the Kingston and Malden Road in Surrey, the roadway under which is not sufficiently wide for

ordinary vehicles to pass a tramcar, and each party contended that the other ought to have given way.

The question was entirely one of liability, the amount of damage done having been agreed between the parties at £207 in respect of the plaintiff's motor-car, and £1 13s. in respect of the tramcar, for which the defendants counterclaimed.

The jury, in the result, found for the plaintiff on both claim and counterclaim, expressing an opinion that the motor-car was under the archway before the tramcar.

#### OSHAM LAMP CO., LTD., v. THE ORO LAMP CO., LTD.

In the Chancery Division on Friday, January 31st, Mr. Justice Swinfen Eady had before him a motion in this action.

MR. GRAY stated that it was a motion to restrain an alleged infringement of patent rights. The parties, however, asked for a week's adjournment, defendants undertaking not to commit the acts complained of during that time.

His Lordship: Very well.

#### THE SINGAPORE ELECTRIC TRAMWAYS, LTD.

On a petition by this company, Mr. Justice Joyce in the Chancery Division sanctioned a reduction of its capital from £100,000 to £100,000. It was stated that the difference between those two sums was the amount of capital lost or unrepresented by available assets, and the reduction was to be accomplished by reducing the £1 shares to shares of 5s. each.

Mr. Hughes, K.C., and Mr. J. W. H. Holmes appeared in support of the petition, and there was no opposition.

#### SMITH v. STANTON IRON WORKS CO. COLLIERIES, LTD.

THE Master of the Rolls and Lords Justices Buckley and Hamilton heard an appeal by the defendants of Wilfred Smith, a boy of 15, from the refusal of the Judge of the Mansfield County Court to make an award against the company in respect of the boy's death, on the ground that the accident causing death did not arise out of, or in course of, his employment.

MR. WARD (for appellants) said that the lad was employed as "electric motor driver," and had to work in a shed 27½ ft. long: at one end was a motor switchboard, which the boy worked according to signal. Another part of his duty was to oil and clean an engine in the shed when it was at rest. The boy was found dead on the cog-wheel of the electric motor. Counsel submitted that it ought to be presumed that he met his death in the course of his employment, either in oiling or cleaning the engine.

The Court dismissed the appeal without calling on the other side, and the MASTER OF THE ROLLS said that no fact had been found in the case which would justify the inference that the unfortunate accident arose out of the boy's employment. The explanations put forward on behalf of appellants were mere guesswork, and that was not enough.

#### POST OFFICE TELEPHONE CHARGES.—CUSTOMERS' COMPLAINTS.

In the City of London Court, on January 30th, the Postmaster-General sued the British Motor-Cab Co., Ltd., Pimlico, for £4, balance for removing a switchboard from one room to another.

MR. L. C. BULLOCK, defendants' solicitor, said that one of the Postmaster-General's responsible officials obtained an undertaking from the defendants under misrepresentations. A verbal price of £2 to £3 was given, and yet the Postmaster-General charged £7.

MR. MACINTYRE, for the Postmaster-General, said there was no doubt that an estimate of £2 to £3 was given, but before the work was done defendants were required to give an undertaking to pay the charges, whatever they were, as they could not be determined before the work was done. It was a large switchboard that had to be removed. In the ordinary course the cost would have been £17, and the Postmaster had charged £7.

MR. BULLOCK said that the engineer to the Post Office specified that the cost would be £3 at the outside.

MR. WEYMAN, the engineer, said that the work was delayed at the request of the defendants, and that increased the cost. There was no standard price for removing a switchboard. An undertaking always had to be given to prevent the public having to pay for the delays of subscribers. At first they charged £9, and then reduced it to £7.

JUDGE RENTOUL said it was a question whether the defendants had not been misled unintentionally as to the amount.

MR. BULLOCK said they would not have had the work done had they known it was to cost £7. They had paid £3.

MR. MACINTYRE urged that the Crown was not bound by what a servant chose to say. The engineer was pressed to give a figure, and said £3. He had no authority to quote a price. That was why the undertaking was required.

JUDGE RENTOUL said he had never known Mr. Macintyre to be wrong before. He was on that occasion.

Judgment for the defendants, with costs, with leave to appeal.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### New G.E.C. Balancer Starter.

THE GENERAL ELECTRIC CO., LTD., have recently designed a special type of starter which possesses several original features, and avoids the use of a no-volt release. The new arrangement consists

FIG. 1.—G.E.C. PATENT BALANCER STARTER.

of a main switch which is interlocked with a starter, so as to ensure the following sequence of operations:—

1. That the starter must be in the "off" position before the main switch is closed.

2. If the main switch is opened when the starter is in the full "on" or any intermediate position, it cannot again be closed until the starter arm is moved to the "off" position.

It will thus be seen that the dangers connected with the "no-volt" type of balancer starter will be obviated.

### Distribution Boxes.

We illustrate in fig. 2 one of a line of distribution boxes, which has been developed by MESSRS. A. REYROLLE & CO., LTD., Hebburn-on-Tyne, to meet the Home Office Regulations. The boxes are of stout cast iron, fitted with latched doors, and the range of sizes runs from a single-way 25-ampere box up to a nine-way 400-ampere box. The fuse handles are of the firm's well-known patent self-aligning type, and, as we recently explained, these are not now

FIG. 2.—REYROLLE DISTRIBUTION BOX.

fitted with buttons on the front, thus removing what might have been a source of danger in the event of a button breaking. The space between the porcelain of the individual fuse handles is fitted with insulating screens, and, where different poles or phases are brought into the same box, vertical screens are fitted.

### New Wandsworth Switches.

THE WANDSWORTH ELECTRICAL MANUFACTURING CO., LTD., of Ludgate Hill, Birmingham, have recently introduced a new switch—the A1—which is shown in the "on" and "off" positions in fig. 3. The movement of this switch is new in principle, and

unique in construction and design. The main feature is a spring-influenced cam with a double-fly action. The springs are in tension during the initial movement of the dolly in either direction, and then re-act through the cam, to force the switch-arm into or away from the contacts, irrespective of any further movement of the dolly. These springs also serve to lock the switch in both "on" and "off" positions. The switch has an easy action, and it is impossible to get an intermediate position. The switch cannot be held in partial contact by the operator. The action of the switch has been covered by letters patent.

FIG. 3.  
NEW WANDSWORTH SWITCH AND SWITCH-PLUG.

FIG. 4.

A further combination of switch A1 with an ordinary plug and socket, fig. 4, is so arranged that the action of pushing the plug into, or withdrawing it from, the socket automatically moves the switch to the required position. As in switch A1, it can never be held or left in such a position as to make only partial contact. There is no intermediate position between "on" and "off." The circuit is automatically made and broken by the switch and not by the plug. It can be fitted with an earthing device if required. This combination switch plug has also been patented.

### The "Indra" System of Lighting.

The "Indra" patent system of light distribution, which is being introduced by the ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., 109-111, New Oxford Street, W., is a mode of lighting whereby a very high general illumination can be secured, or the light can be directed to illuminate brilliantly a given area without the eye strain consequent upon the use of naked lamps and reflectors. In the "Indra" system the actual source of light is not seen, yet the bulk of the light is directly reflected through clear glass. A simple fitting consists of a combination of specially

FIG. 5.—SECTION OF "INDRA" FITTING.

designed upper reflector and lower distributor. The upper reflector is preferably of opal glass, but where the whole of the light is required in a downward direction, an aluminium reflector is supplied. The lower plate (fig. 5) is provided with alternating rings of clear and etched glass.

As is well known, the bulk of the rays of light from metal-

filament lamps are emitted at right angles to the filament. These rays (*b*) strike the reflector, and are directed through the clear glass rings of the distributor. The rays (*a*) which strike the distributor direct are diffused through the translucent or etched glass rings, so that a very high general illumination is secured without eye strain. From photometric tests which have been carried out, it is found that the illumination is much greater when the "Indra" fitting is used than that from an ordinary lamp with reflector, the eye is not blinded by the brilliant glare, and the general illumination is far superior.

The fittings are arranged to meet all possible requirements of lighting; they can be supplied to focus the light on a given spot or to spread it over a desired area, or to give a general illumination, and are made up in designs suitable for all applications. They are supplied in various sizes, from 8 in. to 20 in., and are suitable for metal-filament lamps ranging from 50 to 1,000 c.p.

#### Automatic Change-over Switch.

Half the benefit of a duplicate supply of electricity to a theatre or other public building is lost if an appreciable interval of time elapses between the failure of one and the switching-on of the other system, and, where the change-over is effected by hand, such an interval is inevitable—it may be of several minutes' duration if there is no switchboard attendant. An automatic device should, therefore, be provided in all such cases, capable of acting instantaneously and transferring the load to the sound supply with no more than a flicker of the lamps at the most. Such a device has been developed and patented by the ADAMS MANUFACTURING CO., LTD., of Bedford; it consists essentially of two magnetically-operated main switches controlled by a magnetic relay, and is applicable to all cases in which both supply systems are at the same voltage, D.C. or A.C. With suitable modifications, cases where the voltages or systems are not identical can be dealt with. As the conditions vary in each case, the apparatus cannot be standardised to meet all cases, but is made up according to requirements.

## REVIEWS.

*The Energy Diagram for Gas.* By F. W. BURSTALL.  
London: Constable & Co., Ltd. 1912. Price 5s. net.

This is a novel presentation of the energy diagram, with special reference to nitrogen, because the specific heat of this gas varies directly with temperature, and that of other gases can be found by the formula  $k$  times molecular weight = constant. The units are English, except for temperature, and so it happens that the bastard figure of 1,400 is favoured for  $J$ .

Everyone knows the ordinary  $p-v$  diagram for gas. It is easy to explain, especially with the indicator as an aid, for the ordinates so obviously mean pressure, as drawn by the instrument, and the engine draws in its own volumetric abscissæ. But the energy curve is too much of an abstract idea for most men, and it almost seems that the men who could profit by this book are those who could have written it. It has involved an immense amount of work, and will doubtless be of service to those who can use it, but those will be comparatively few. But possibly they will be as many as the author looks for. To the academic variety of author accustomed to the daily use of the higher mathematics, the ignorance of mathematics of the average engineer, and his clumsiness in using it, is either an unknown quantity, or it is beneath contempt. One of these mental attitudes possibly stands behind the fact that there is no list of symbols. The reader is supposed to know what is meant by all those which are employed. If this book was intended to be used by engineers generally, every symbol ought to have been defined. Instead, the first page starts off with the symbol  $\kappa_p \kappa_v$ , only to be known by inference.  $p$ ,  $v$  and  $T$  are more obvious, but what of  $a$ ,  $b$ ,  $s$ ,  $s$ ? Why define  $p$ ,  $v$ ,  $v$ , and omit  $r$ ?

The fact is that these energy diagrams are outside the unassisted ken of ordinary mortals, and authors will not assist such.

The ordinary engineer can understand the indicator diagram, and knows that the hyperbola is so near to the actual steam expansion curve that an engine will do a little more work than hyperbolic false theory teaches. He knows that adiabatic expansion falls below the hyperbola, and he can find out pretty closely what is really going on in an engine. Cannot the present author state in plain language just how the energy diagram is applicable to practical conditions?

How does the applier need to take cognisance of cylinder effects in the steam engine or the worse jacket cooling effects

of the gas engine? If the diagram is to come into real use, it must be fully explained for the benefit of those who, if not mental gymnasts, are sound enough engineers, for steam engine economy has not been brought about by mathematics, but by the application of simple observation. The diagrams with which the book is illustrated are not too easy to read, being a mass of curves and figures. Yet the author places the description of fig. 4 on one page and the diagram on the back of that page. The reader cannot even tear the page out for convenience. Fig. 5 is on page 13, its description on pages 14 to 17. Fig. 6 on page 16 faces the description, as all should. These diagrams should all be plates to lie wholly beyond the book when opened out. Without such an aid no student can follow either diagrams or description without eyestrain and worry. If it be argued that the book is not intended for such as cannot follow its matter with facility we may cease complaint.

Let it be added that the value of the specific heat of nitrogen is that of Holborn and Henning, as given by the formula  $\kappa_p = 0.2246 + 0.000038 T$  and  $\kappa_v = 0.1541 + 0.000038 T$ . The connection between pressure, volume and temperature is  $p v = 98.86 T$ .  $T$ , of course, is absolute. The energy chart has been constructed so that all calculations in connection with the internal-combustion engine can be made with a pair of compasses.

The indicator diagram is transferred to the energy diagram by multiplying the volumes of the indicator diagram by a factor which is the reciprocal of the charge weight. To explain his book, the author considers a series of heat-engine cycles that have been employed and some of which are still employed. He also explains the large diagram for nitrogen which is folded in a pocket in the back cover. This large diagram carries the adiabatic curves from  $T = 300^\circ \text{C. to } 1,600^\circ \text{C.}$  There is a curve of specific heat and scales of velocities, thermal units and absolute temperatures, and also a curve of velocities. An excellent little work, but quite insufficiently explained to the man who perhaps wants it most, while clear enough to him who could have written it, like the author himself.

*Primer of Scientific Management.* By FRANK B. GILBRETH.  
1912. London: Constable & Co., Ltd. Price 4s. net.

This book has been written as a reply to the enormous number of inquiries following the publication of "The Principles of Scientific Management," by Dr. F. W. Taylor, in the "American Magazine"; and it is arranged in the form of answers to representative questions concerning the methods put forward by this well-known authority. It is practically a defence of Dr. Taylor's system, and, we may add, a very convincing one; at any rate, such will be the case as regards the employer. To convert the British workman, the subject will have to be dealt with in simpler language.

General principles only are considered, and they are applicable to any industry in which piecework is practicable.

The opinion that the details of the American system of management are needlessly complex is widespread in this country, but that the general principles are correct and worthy of study will be freely admitted by all who have followed Dr. Taylor's investigations regarding cutting speeds and other features of production.

Under the old system of works management a drawing was sent into the machine shop showing the finished part, but no instructions were issued as to how the work was to be done or what tools were to be used. This system was improved upon by the introduction of jigs, and some attempt to provide tools of the best form for cutting various metals at the highest speeds, but the workman still had to rely upon the foreman and his own ingenuity to turn out the job in the quickest way. Then followed the recording of the times taken, which enabled a specialist to forecast, to some extent, the correct allowance of time for new work. This was all very good in its way, but the results were not accurate enough for the fixing of piecework rates, and the men systematically limited their output to prevent the cutting-down of the prices.

Under the Taylor system not only is the time for each machine operation very carefully studied, but also every motion made by the operator in setting up the work. This

timing of each motion by stop watches very naturally engendered suspicion amongst the men, who looked upon it as preparatory to a crusade of "nigger-driving" which only the strongest could survive, while employers condemned the methods as being needlessly costly and complex.

The results where the Taylor system has been tried have proved that the cost of finding out the quickest way to do each job is far more than recovered by the time saved, while the workmen are enabled to earn much higher wages year in year out, without the slightest injury to their health, in fact their condition has been actually improved. As regards this feature, one aim of the system is to ascertain the amount of rest needed to enable a workman to keep up the speed without any possibility of wearing himself out.

Every employer who reads this book, and Dr. Taylor's works on the same subject, will be easily convinced of the advantages attaching to the system; the difficulty is to make the *men* understand the benefits accruing to *them*. This will be a slow process in the early stages, but there is little doubt that scientific management on these lines will extend and eventually become universal. In any case it is a subject which no manufacturer can afford to ignore, and we believe that Dr. Taylor's methods have already been very carefully studied by a large number of manufacturing firms in this country.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & CO., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

- 1,562. "Holders for electric ironing-irons." H. SAMUEL. January 20th. (Complete.)
- 1,563. "Reverse current or power cut-outs." J. ROTHMAN, J. DENHAM and FERANTI, LTD. January 20th.
- 1,579. "Electric vulcanisers for tires." B. KISSHAZY. January 20th. (Complete.)
- 1,591. "Electric motor-control systems." SIEMENS BROS. DYNAMO WORKS, LTD., F. LIDALL and A. M. DUKE. January 20th.
- 1,592. "Electrical distance-control systems." SIEMENS BROS. DYNAMO WORKS, LTD., F. LIDALL and A. M. DUKE. January 20th.
- 1,598. "Electric measuring instruments." BRITISH THOMSON-HOUSTON CO. LTD., and A. P. YOUNG. January 20th.
- 1,599. "Electric switches." BRITISH THOMSON-HOUSTON CO., LTD., and H. C. HEATH. January 20th.
- 1,600. "Electric measuring instruments." BRITISH THOMSON-HOUSTON CO., LTD., and A. P. YOUNG. January 20th.
- 1,617. "Semi-automatic winding machines." WESTERN ELECTRIC CO., LTD. (Western Electric Co., United States.) January 20th. (Complete.)
- 1,686. "Manufacture of chrome-alum by electrolysis." H. CHAUMAT. (Convention date, January 24th, 1912, France.) January 20th. (Complete.)
- 1,688. "Process of and means for forming clay solids employed in the manufacture of insulators and other articles." W. PODMORE. January 21st.
- 1,692. "Electric bell-pushes and the like." E. G. HARCOURT. January 21st.
- 1,716. "Telephone systems." E. A. GRAHAM. (Addition to 10,577, 10.) January 21st. (Complete.)
- 1,735. "Circuit controlling device." WESTERN ELECTRIC CO., LTD. (Western Electric Co., United States.) January 21st. (Complete.)
- 1,745. "Method of and means for electro-plating certain articles." G. P. M. LEE and H. A. HARVEY & CO., LTD. January 22nd.
- 1,756. "Means for the control of electric pressure and current regulators." W. J. POOLE. January 22nd. (Complete.)
- 1,776. "Arc-light carbons." H. AYTON. January 22nd.
- 1,776. "Apparatus for detecting and estimating certain substances by virtue of their polarising or depolarising action on an electrical couple." E. K. RIDGAL and U. R. EVANS. January 22nd.
- 1,780. "Two-line electric plug and sockets and the like." J. J. CLIFFORD and C. E. BUELL. January 22nd.
- 1,796. "Means for intermittently indicating or displaying the names of stations or stopping places in trains or other vehicles, or other situations or other devices or matter in such vehicles or other situations." C. J. EVANS and J. M. CATER. (Addition to 26,450, 1911.) January 22nd.
- 1,801. "Construction of incandescent electric lamps." O. SCHALLER. (Addition to 16,195, 1911. Convention date, August 23rd, 1912, Germany.) January 22nd. (Complete.)
- 1,812. "Production of gases by electrolytic processes." KNOWLES OXYGEN CO., LTD., and R. W. GRANT. January 22nd.
- 1,843. "Process and devices for producing in a continuous manner Röntgen rays, having any desired degree of hardness which can be adjusted at a moment's notice." J. E. LILIENTHAL. (Addition to 23,169, 1912.) January 22nd. (Complete.)
- 1,856. "Electric measuring instruments." BRITISH THOMSON-HOUSTON CO., LTD., and A. P. YOUNG. January 22nd.
- 1,857. "Automatic regulators for level-compounding or over-compounding on alternating-current circuits." A. M. TAYLOR. January 22nd.
- 1,896. "Switch for electric lighting on a small scale." ELEKTROMECHANISCHE INDUSTRIE G.M.B.H. and F. HERMANN. January 23rd. (Complete.)
- 1,899. "Insulating sectional iron masts." SIEMENS BROS & CO., LTD., and G. W. PERRY. January 23rd. (Complete.)

- 2,027. "Telephone or like apparatus and telephone systems." W. K. L. DICKSON. January 24th.
- 2,070. "Mechanism suitable for use in connection with electric switches or for other purposes." A. H. F. PERL. January 25th.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & CO., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 3d. (in stamps).

### 1911.

- ELECTRIC PRINTING TELEGRAPHS. A. T. M. JOHNSON, F. H. VARLEY, MICHAELIS, Power and Johnson Secret Wireless Telegraph and Telephone Testing Syndicate. 22,079. October 6th. (Cognate application, 10,749 of 1912.)
- ELECTRIC CLOCKS. C. VOGT. 27,291. December 6th.

### 1912.

- DEVICE FOR THE TRANSMISSION OF SIGNALS UPON POWER TRANSMISSION LINES AND LIGHTING MAINS. Soc. Industrielle des Téléphones. 412. January 5th. (January 5th, 1911.)
- TELEPHONE SYSTEMS. W. H. DERRIMAN. (Automatic Electric Co.) 687. January 9th.
- ELECTRIC LAMP HOLDERS. G. ST. J. DAY. 750. January 10th.
- ELECTRICAL APPARATUS FOR TRANSMITTING AND RECEIVING SIGNALS. Sir A. T. DAWSON and G. T. BUCKHAIN. 777. January 10th.
- APPARATUS FOR THE ELECTROLYTIC MANUFACTURE OF ALLOYS OF LIGHT METALS WITH HEAVY METALS AND THE CONTINUOUS TREATMENT OF SUCH ALLOYS FOR OBTAINING FINAL PRODUCTS. E. A. ASHCROFT. 1,001. January 15th.
- APPARATUS FOR THE ELECTROLYTIC MANUFACTURE OF LIGHT METALS AND REACTION PRODUCTS THEREOF. E. A. ASHCROFT. 1,003. January 15th.
- APPARATUS FOR THE ELECTROLYTIC MANUFACTURE OF CAUSTIC ALKALIES IN PURE ANHYDROUS CONDITION. E. A. ASHCROFT. 1,001. January 15th.
- CIRCUIT INTERRUPTORS FOR THE TRANSMITTERS OF ELECTRIC TELEPHONES. W. A. LEGG. 1,168. January 15th.
- OPERATION OF DIRECT-CURRENT ELECTRIC MOTORS. J. S. FOCK and S. ECKMANN. 1,365. January 17th.
- ELECTRIC METALLURGICAL FURNACES. V. STOBIC. 2,061. January 26th.
- ILLUMINATED SIGNS ADAPTED TO BE SUPPORTED ABOVE THE GLOBE OR LIKE PART OF AN INCANDESCENT ELECTRIC LAMP. W. J. BEVILLE. 2,566. January 31st. (Addition to 229 of 1912.)
- TREATMENT OF METALS. British Thomson-Houston Co. (General Electric Co.) 8,762. February 14th.
- ELECTRIC TELEPHONES. L. G. HAMMER. 4,358. February 21st.
- CONSTRUCTION OF TWO-WAY ELECTRIC SWITCH. G. MARK. 4,498. February 22nd.
- ELECTRIC PHOTOGRAPHIC COPYING MACHINE. J. B. HALDEN. 5,278. March 2nd.
- MEANS FOR DECREASING THE INJURIOUS EFFECTS DUE TO CAPACITY IN ELECTRIC CONDUCTORS. F. A. BECKER. 4,061. March 11th. (March 11th, 1911.)
- ELECTRIC CONTROLLERS. British Thomson-Houston Co. and H. C. HASTINGS. 7,704. March 23rd.
- GRIPPING AND SHEARING GRAPNEL FOR RAISING SUBMARINE TELEGRAPH CABLES. W. HENSIMAN. 7,966. April 2nd.
- ELECTRIC LIGHTING APPARATUS. F. DUSSEND. 8,057. April 3rd. (April 6th, 1911.)
- ELECTRIC IGNITION DEVICE FOR INTERNAL-COMBUSTION ENGINES. H. BAUER and M. ECKMEIER. 9,492. April 22nd.
- METHODS AND APPLIANCES FOR OBTAINING INSTANTANEOUS RADIOGRAPHS. SIEMENS and Halske Akt.-Ges. 9,459. April 22nd. (April 21st, 1911.)
- ELECTROMAGNETIC SEPARATOR FOR THE WET SEPARATION OF ORES. Elektro-magnetische Ges. 10,619. May 4th. (May 4th, 1911.)
- REGULATION OF ELECTRIC INSTALLATIONS. H. D. EARL. 11,671. May 18th.
- SPARK PLUGS. H. J. C. FORTGEISTER. (Marshalltown Motor Material Manufacturing Co.) 12,689. May 31st.
- ELECTRICAL SWITCH CONTACT DEVICES. W. S. HICSFORD. 13,442. June 7th. (September 30th, 1911.)
- AUTOMATIC ELECTROMAGNETIC CUT-OUTS. P. WESSEL and T. GYSLER. 14,120. June 17th.
- APPARATUS FOR THE PRODUCTION OF HIGH-FREQUENCY OSCILLATING CURRENTS. V. F. FEENEY. (National Wireless Telephone and Telegraph Co.) 14,725. June 24th.
- ELECTRIC IGNITION APPARATUS. S. ROTHEBILD. 14,738. June 24th. (November 16th, 1911.)
- METHODS FOR COMPENSATING FOR THE FLUCTUATIONS IN THE LOAD OF ELECTRIC MOTORS. Siemens-Schuckertwerke Ges. 15,669. July 2nd. (July 8th, 1911.)
- MAGNETO-ELECTRIC MACHINES. C. W. BINKEMAN. 15,704. July 5th.
- OVERHEAD CONTACT CONDUCTORS OF ELECTRIC RAILWAYS. Bergmann Elektricitäts-Werke Akt.-Ges. 16,130. July 8th. (August 23rd, 1911.)
- ELECTRIC TRANSFORMER BOILERS. J. DALLY. 16,043. July 9th. (July 20th, 1911.)
- REVOLVING ELECTRIC FURNACE INTENDED (SPECIAL) FOR THE MANUFACTURE OF ALUMINIUM NITRIDE. Soc. Générale des Nitrures. 16,406. July 18th. (August 4th, 1911. Addition to No. 29,239 of 1910.)
- ROTARY MAGNETS. O. T. BLADTHY. 16,658. July 16th. (August 24th, 1911.)
- ELECTRIC IGNITERS. J. G. COOK. 16,664. July 17th.
- DEVICE FOR AUTOMATICALLY ADJUSTING THE TIME OF IGNITION IN INTERNAL-COMBUSTION ENGINES USING MAGNETO-ELECTRIC IGNITION. Robert Bosch (Firm of). 17,029. July 22nd. (September 2nd, 1911.)
- PORTABLE ELECTRIC HAND LAMPS. A. H. HUNT. 17,850. August 1st.

THE inherent difference in the treatment, from the point of view of unification, of such things as steel girders, rails, rolling stock, cement, &c., and of those which may be properly said to come under the heading of electrical machinery and apparatus, is not always as fully appreciated as it might be.

In regard to the former, it will be noticed that in the majority of cases concrete figures, chemical analysis, and even actual designs, have been agreed upon between buyer and seller, as representing the best up-to-date practice, and it is undeniable that manufacturers have thereby reaped much benefit, through the lowering of the cost of production; on the other hand, combinations upon these lines, if carried too far into detail, may develop into trusts which tend to rob the consumer of the benefits which healthy competition brings, even if prices are not raised.

In regard to the latter, generally speaking, unification is brought about through agreement as to the tests which a machine or apparatus intended for any particular purpose shall fulfil; that is to say, in matters electrical unification is usually based on results, and not upon the means by which those results are obtained. On this principle neither dimensions nor design are touched upon, and whilst on the one hand a real basis of comparison is established, on the other hand invention and progress are in no way hampered, and commercial enterprise has free scope for development.

The difficulties surrounding international agreement as to engineering specifications generally, may, to a large extent, be traced to these fundamental differences; yet international co-operation in engineering affairs is certainly coming to the front more and more, and, in spite of many obstacles, is succeeding. It is, however, one thing to attempt, internationally, to draw up a specification for steel, and a very different problem to agree internationally upon the rating and tests for electrical machinery.

In the case of steel, the very fact that the question of chemical analysis must form the basis of any specification shows that the whole subject bristles with commercial difficulties and rivalries.

Manufacturers, as well as users, however, can only welcome the establishment of international rules for guidance in specifying electrical machinery, and many are the difficulties and annoyances, from the point of view of foreign trade, which will undoubtedly be obviated when such rules are promulgated by a recognised authority.

In its early stages it appeared to some that the Electro-technical Commission was not likely to prove of much utility or even practical interest to the electrical industry as a whole. Its programme of work, including, as it then did, only symbols and nomenclature, seemed somewhat too far removed from the domain of practical politics and its organisation too cumbersome to effect much solid achievement.

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "A0EEKAT, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION

Ready.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

The report, however, which we publish elsewhere in this issue, will show that the formation of the small International Committees has had the fortunate effect of overcoming this initial inertia, and from what we have been able to gather, the work of the Zürich meetings, when printed and issued by the Central Office, should prove of more than ordinary interest. From the British point of view, it is particularly gratifying to see that the B.E.A.M.A. was officially represented; the spirit of intimate co-operation displayed by the various bodies interested should certainly result in work of much practical utility. When, therefore, this first chapter, as we may be permitted to call it, is ratified at Berlin next autumn, it is to be hoped that it will be widely disseminated, and at a very moderate charge.

If the recommendations are added to year by year, and, by periodical revision, kept abreast of progress, the time and money expended will have been well justified.

---

## APPRENTICESHIP SYSTEMS.

---

THE *personnel* of a works is of a scarcely less importance to its success than the quality of the plant and machinery; and a great steel maker once gave it as his conviction that a fire which should destroy his works would be preferable to the loss of the services of his trained staff. The one may be rebuilt and equipped with equal or better machinery than before, but the *personnel* of the other can never be the same, and it may take years to train men up to fill satisfactorily all the old positions.

Works, like individuals, cannot stand still, they must either develop or decline, so that in every well-organised establishment there must be a continuous system of training recruits to fill new positions of responsibility rendered necessary by the natural expansion of the business, or to fill vacancies due to resignations, death or other cause.

This system of training in engineering works is known generally as the apprenticeship system, a system which has had to be considerably modified in recent years to meet the changes which in workshop practice have been brought about by the ever-increasing use of labour-saving tools.

In the days preceding the machine-tool era, when handicraft and manual dexterity were of prime importance, the apprentice system had become regularised, and a youth could enter a works with the certain knowledge that he would at least have an opportunity of becoming a skilled artisan in a definite or specific trade, and he might reasonably expect to have in due course a general knowledge of the details and construction of the machines manufactured. He would be able to make practically every part and to assemble and fit them together and set the machine to work.

Nowadays, a boy may be set to watch or mind a machine while it repeats day in and day out, with monotonous regularity and precision, a stereotyped operation; his foreman will keep him at this occupation as long as he will stand it, and when he at length gets a change, it will be to watch another machine go through another set of mechanical operations.

The problem of recasting the apprenticeship system in a form suitable to modern workshop conditions has been attacked both by educationists and by engineering employers, but whilst many suggestions have been made, no regularised or standard system has been evolved, and it is at present left to individual employers to work out their own schemes in

detail to suit the conditions existing in their particular works.

In general, however, the new apprenticeship embraces not only the service of a specified number of years in a workshop, but also the attendance at day or evening classes in a technical school. We have from time to time given in our columns details of the conditions of apprenticeship adopted by various engineering firms, and we give below the chief points from a notice recently issued by Messrs. Mather and Platt, Ltd., of Manchester, regarding apprentices. Three classes of apprentices are taken, viz.:—

*Class 1.*—This class consists of boys of not less than 15 years of age, who desire to become artisans or “tradesmen” on reaching the age of 21. They must produce proofs of having had a satisfactory elementary education, and have passed Standard VI. They must attend evening classes at the Manchester or Salford Schools of Technology, or other approved schools. In some cases those who can show that they will derive full benefit therefrom, may be granted the privilege of attending the special day courses for apprentice engineers at the Manchester School of Technology, no deduction being made from their wages for the time so spent.

*Class 2* consists of a limited number of youths not under 17 years of age, who can give proof, by examination or certificate, of having had a good general education at a secondary or public school; those who have had a recognised course of technical training, or have obtained distinction at a public school. A knowledge of French, German, or other modern language, is considered an additional qualification. This class is for youths who desire a practical training in different branches of engineering, and they are transferred from department to department as circumstances permit, so as to obtain as wide an experience as possible. The departments included in the curriculum are: the foundry, machine tools, fitting and assembling, and either the test room or drawing office. A probationary period of six months without wages must first be passed through, after which apprentices in this class receive 10s. a week up to the end of their apprenticeship. All second-class apprentices must continue their technical education at an approved technical school, or at the University, and as in the case of Class 1 the special day classes for apprentices may be attended if permission be obtained from the works manager.

*Class 3* is for young men of not less than 20 years of age who desire to acquire a practical workshop training. They must have passed through a complete course of technical training or obtained an engineering or science degree at a University. Admittance to this class depends upon the educational qualifications a candidate is able to submit, and great importance is attached to a thorough knowledge of modern languages. A probationary period of six months without wages is necessary, at the end of which there is no obligation on the part of either probationer or firm to continue the employment. If, however, it is continued, a written agreement is entered into for a definite period, and although the firm cannot undertake that men in this class shall spend a specific time in any particular department, the management will, as far as possible, select such departments as shall be most suitable to the attainments and capabilities of each man.

*General.*—No entrance fee or premium is charged, nor is any apprentice indentured, nor is there any obligation to continue the employment of any apprentice.

Shop hours must be kept, and the usual works regulations observed by all classes.

---

### A Visit to Paris.

READERS who are members of the I.E.E. will be interested to learn that the Société Internationale des Electriciens has invited the Institution to Paris for a few days in May next. During recent years great developments have taken place in the electrical world of Paris; railways have been electrified, new electric railways have been built, large power stations have been erected—there is much to see, of the greatest electrical interest, and we are sure that those who take part in the visit will have a thoroughly good time.

### Artificers in the Royal Navy.

A REMARKABLE pamphlet, accompanied by a letter from the secretary, has recently been sent to us from Devonport by the Royal Naval Artificer-Engineers' and Engine-Room Artificers' Benevolent Fund, in regard to which it is necessary to have reluctantly to confess that, although we have always listened attentively and sympathetically to any supported expressions of opinion of men within the Service touching matters of importance to the efficiency and well-being of the engineer branch, the statements put forward in the present instance seem to call for other treatment, as they are singularly lacking in force and justification. It has to be explained that this communication has little, if anything, in common with the old trouble concerning engineer officers. It is a plea put forward by certain discontented chief and engine-room artificers, entered at full age as fully qualified engineering mechanics, chief and artificer engineers promoted from chief and engine-room artificers, and a few engineer-lieutenants promoted from chief artificer engineers. Under existing conditions, the Navy is, in effect, a secret service, and it is impossible to determine the merits of an alleged grievance of this kind by direct question and answer. All that can be done is to examine the scanty information available, and to endeavour to test whether it is in agreement with such facts as have been published officially regarding the organisation of the Navy. The demand made is for increase in pay, increase in pension, openings to rise to the higher ranks in the engineering branch of the service, the opening of the Royal Naval Reserve to members of the corps of royal naval artificer engineers and engine-room artificers, and the retention by them of the engine-room watch keeping. As abstract propositions these are all legitimate, and, if made to the proper authorities, they would, no doubt, receive careful consideration; but the attempt to force them upon the public, through the Press, upon the questionable grounds stated in the above-mentioned letter and pamphlet, must entirely alienate the grumblers from the sympathy of those who have more than a superficial knowledge of service matters, and, incidentally, of those who have the best interests of the corps at heart. It may be asked: Then why take any notice of such statements? The answer is that—in justice to the great body of artificer engineers—it is desirable that the public should have the means of checking the statements of a misguided few.

The letter declares that "we are rapidly drifting towards the serious position of a steam Navy minus engineer officers." It states, moreover, that it is notoriously difficult to get candidates to enter for the engineer branch at all. It suggests also that for five years not a single engineer officer will have been added to the Royal Navy. These loose and inaccurate statements are made the lever for a demand of 7s. a day as starting pay for the Corps, and a minimum pension of £100 a year for chief artificer engineers. The argument is based upon the fact that Keyham College was closed in 1910, and that the first batch of the new engineer officers, under the new scheme of education and training for naval officers, cannot have specialised until the end of 1915. Nevertheless, anyone who cares to consult a *Navy List* will see that there is not likely to be a disappearance of engineer officers in 1915, and although there must necessarily be questions arising for adjustment between the old and the new schemes of entry, it is an entire misrepresentation to ask the public to believe that we are drifting towards the position of a steam Navy without engineer officers. There will be similar matters for adjustment in regard to new-scheme officers for the navigating, torpedo, gunnery and Royal Marine branches; and are we to be told that these branches will also be depleted until the end of the first term of specialisation in each branch? Again, the suggestion that it is notoriously difficult to get new-scheme candidates to enter for the engineer branch is difficult to reconcile with the assertion that the first batch of the new engineer officers "cannot have specialised until the end of 1915," for how is it possible, early in 1913, to contend that there is difficulty in getting

them to enter, say, a year hence? The contingency has not yet arisen, and is not likely to arise.

It is most unfortunate that the question of linking-up the artificers with the commissioned ranks of the Engineer Branch of the Navy should have been put forward in this misleading manner, for we are firmly of opinion that, in the future, that branch will be greatly strengthened by a healthy system of promotion of men of ability from the lower deck. It is scarcely practicable to carry out such a reform in a hurry, and it must necessarily take effect upon those who have entered the service as boys and youths, rather than upon those who have entered later in life from a variety of mechanical trades, some of which are only remotely concerned with naval engineering. Again, it is difficult to see how those who are promoted can hope to qualify for the higher commissioned ranks; for the standard of education and training required for commanders, captains and admirals tends ever to become more exacting. The way may, nevertheless, be left open, so that those who can climb may climb. The general course of events will probably be that, instead of adding greatly to the accommodation at Dartmouth College to meet the future demands of the technical branches of the Navy in respect of watch-keeping lieutenants, the lower commissioned ranks will, of an increasing extent, be replenished from among the most deserving of the warrant officers, and the result will be to the advantage of the whole service.

### Storage in Electricity Supply.

THE important paper read by Mr. Whysall before the I.E.E. last month brings the question of storage on the large scale prominently forward once more.

Our readers will recollect that in 1908 Mr. A. M. Taylor dealt with the subject very fully at the I.M.E.A. convention, and advocated the installation of very large batteries on the grounds of reliability and, above all, economy, bringing forward very cogent arguments in support of his views. On that occasion we expressed our cordial agreement with the author, having maintained for many years that engineers responsible for the design of central stations showed a regrettable lack of appreciation of the important advantages to be gained by the use of *adequate* storage—not the half-hearted, hesitating installation of a battery having an output of, say, 10 per cent. of that of the generating plant, though that at least ensured the maintenance of the station lighting and the excitation of the generators in time of emergency, but really *adequate* storage. What we mean by this may be exemplified by the policy of the four American undertakings cited by Mr. Taylor, which, even in 1908, possessed storage batteries of more than 130,000 kw. output, at the one-hour rate. The present paper, giving the actual results obtained with a big battery, and showing an important saving even when Mr. Pearce, to avoid undue optimism, discounted the results to the utmost possible extent, will arouse renewed interest in the matter, and encourage those who are considering the advisability of providing storage on a large scale.

We are impelled to enlarge upon this topic by the fact that during the past year there has been a deplorably large number of total or partial shut-downs of electricity works, and we are anxious to invert the order of the two qualifications of the storage battery to which we have referred. We want to urge station engineers to put down large batteries on the grounds of economy, and, *above all, reliability*. There is a grave risk that electricity supply will get a bad name for its lack of reliability unless station engineers not only *talk* about the extreme importance of reliability, as they often do, but also *do* something towards ensuring its achievement. Our rivals the gas suppliers are doing all they can to stem the tide of electricity supply, and they make the greatest possible use of every reported breakdown to back up their arguments.

The fact that important economies can be effected with storage batteries ought alone to suffice to ensure their adoption; the reliability thus obtained should be a still more potent argument, and when these two considerations are combined the case is irresistible.

## ARC LAMPS FOR THE OUTSIDE LIGHTING OF SHOPS, &c.

By W. FENNELL, A.M.I.E.E.

THE situation at Wednesbury six months ago with regard to the out-side lighting of shop premises was as follows :—

From its commencement about seven years ago the electricity undertaking had been making very good headway, and in the centre of the town, at least, the majority of the business premises used electricity extensively, and in many cases there were outside arc lamps. These lamps were such as might be usually met with in a medium-sized town—chiefly enclosed lamps in pairs across 230-volt mains. Two adjoining shopkeepers had combined to run a series of 5 flame arcs, using metal-cored carbons, and there was one large consumer with a similar series; but, generally speaking, two enclosed lamps in series were usual, the shops not being large enough to justify the expense of a series of four or five low-voltage flame lamps. There were the usual complaints of burnt carbon holders, broken globes, badly adjusted lamps, and other troubles incidental to arc lighting, but still one could feel satisfied that electricity had practically outclassed gas, until high-pressure gas appeared. News was received one day that a notice had been deposited with the surveyor

metal-filament lanterns were also out of the question; they cannot compare with high-pressure gas.

The writer decided that the only way to meet this competition was immediately to offer a better light on the same terms. Not a very startling or original proposition; but it involves many side issues, some of which are important, and require courage to force through. A recommendation was made to the Committee to carry out the following scheme, which was adopted, and which is probably the first of its kind :—

Consumers were offered a 7-ampere flame arc lamp, giving about 1,500 c.p., at £5 per lamp per annum, including hire, trimming, cleaning and current. All the facilities given by the gas authorities were provided at the same price, and, in addition, more light.

In order to give this supply, a low-pressure 50-volt three-wire main would be run in the principal shopping centre, so that any consumer could have one, two, or more lamps. This circuit was to be supplied by a motor-generator, the generator being fitted with balancing slip rings and transformers.

The works are in this case very close to the centre of the town, so the machine is at the works, but it could be placed in a basement, or, indeed, in a balancing station if required.

In order at once to demonstrate the advantages of the proposal, temporary overhead mains were run and connected to some of the battery regulators, and two sample lamps, one with yellow and the other with white carbons, were exhibited. These lamps were fixed on shops adjoining the one which had deserted to the "enemy," and were lighted on the opening day of the high-pressure gas supply. A circular was issued calling attention to the demonstration and stating the competing terms.

The proceedings were hardly dignified, but the result was magical. The gas authorities have not secured a second consumer for their high-pressure gas up to the present. The circular caused several who had intended to use high-pressure gas to draw back, and applications were received from consumers quite away from the high-pressure gas area. It was originally proposed to confine this special main to the area served by the high-pressure gas main, but it has already extended rapidly. In the six months which have elapsed, over 40 lamps have been connected, most of them new business, *i.e.*, they have replaced gas lanterns, or there

had been no outside lighting, and there are several consumers with single arc lamps, some of them quite small shops. It is curious to note that those consumers who had series flame lamps have not changed over to the new circuit, although they were on the point of going in for gas six months ago. These are the occupiers of larger premises, of course, but there is no doubt they would have "deserted" if high-pressure gas light had made headway as in neighbouring towns.

In the first place, it was not claimed that the scheme would be very profitable—it was put forward as a necessary measure to retain the advertisement of outside lighting. The gas authorities were prepared to lose money on high-pressure gas, just as they are on street lighting. To be able to say that "So and so" has gone back to gas, or that shopkeepers are replacing electric lamps wholesale, is not only very gratifying to the gas interest, but it creates an "atmosphere" which is worth a great deal in hard cash. Its influence extends to every street in the town. One may perhaps be excused for saying that it cannot be easily understood how electrical engineers (or is it the Committee or directors?) can stand idly by while the gas authorities regain their old superior position, yet this is the state of affairs in many towns. Criticism was advanced by a few who said that to spend money without an assurance of a profitable

OUTSIDE ARC LAMPS IN A SIDE STREET, WEDNESBURY.

to open the roadway to lay a high-pressure gas main in the Market Place, and the next day it was stated that one of the largest users of arc lamps had signed an agreement to take the new gas supply, and that negotiations were in an advanced state with others to change over from electricity to high-pressure gas.

On making a visit to a large town a few miles off, it was obvious that these same high-pressure gas lamps had swept the principal shopping streets of arc lamps within a few months. One was astonished at the swiftness of the change, and felt it would be disastrous if such a thing happened in Wednesbury. An inquiry as to the terms and conditions revealed the cause of the stampede. The gas authorities were offering to fix and maintain a 1,000-c.p. high-pressure lamp at £5 per annum, such lamp to be used during ordinary business lighting hours. Consumers were attracted by the low charge, and by the assurance of its being the first and last expense. Shopkeepers and their assistants hated messing with carbons and gas mantles. It had already been proved that they would not pay an extra for skilled attendance, and they grudged the expense of flame carbons. Again, and this is the most important point in a small town, shopkeepers did not want four or five lamps each, and two enclosed lamps cost more to run and gave less light than two high-pressure gas lamps. The various

return was madness, and was not business; but these critics were silenced by those who were accustomed to spend money on advertisements and on selling below cost, if necessary, in special cases to secure a market. Nothing is heard from these critics to-day.

The great advantage of the special arc circuit is that it can be controlled, and the Early Closing Act has assisted in this respect. The circuit is only alive during the proper hours and on business days, so it is not necessary to watch the consumers, or to put in time switches or meters.

Using a three-wire circuit, lamps may be wired very simply and cheaply by running the outers only through a double-pole switch, and tapping the lamps off alternately.

The lamps are of the General Electric Co.'s magazine flame type, burning 60 to 70 hours. The trimmer goes round at fixed intervals, fills up the magazine, and cleans the lamp. Single-carbon lamps are at a disadvantage, because it would not pay to call at irregular intervals to see if lamps needed trimming.

Lamps must be used which will give either a white or a yellow light at will—consumers must have the choice, and they change their minds occasionally.

The lamps must be very good; an unsteady light or a sticky mechanism would be fatal to success.

The steady resistance should be inside the lamp. On a 50-volt circuit it is quite small. In the lamps adopted, it consists of a resistance wire wound round a porcelain rod, and it supports itself.

The single burning lamp is very simple, no substitutional resistance or cut-out is required, and it is cheaper for that reason. This saving goes some way towards paying the cost of the special cables. It is also a steadier lamp than the series burning type, in which one lamp may affect another.

In considering the financial side of this question, it will be convenient to take all the standing charges, and after deducting them from the revenue, see what price is available per unit for the electricity. It is assumed that a 50-volt lamp installation, running 700 hours per annum, is to be taken.

	Capital cost.	Life.	Annual capital charges—int. 3½ % and repayment.
25-KW. motor-generator...	£150	15 years	£14
Mains—allow ...	300	25 "	21
Lamps (50 magazine type) ...	387	7 "	64
Wiring, 50 lamps...	50	10 "	6
<b>Total capital charges</b> ...			<b>£105</b>
Running charges, carboning and cleaning (assuming magazine arcs) 10s. per lamp per annum ...			£25
Repairs, say ...			10
Carbons, 700 hours at 15d.—8s. per lamp ...			20
			<b>55</b>
			<b>£160</b>
Revenue—50 at £5 ...			<b>£250</b>
<b>Balance for energy</b> ...			<b>£90</b>

This allows for 14,500 units at 1½d., which is not a very high price, it is true, but it must be considered that this price has only to cover generating costs and feeder costs, and has to bear no share of distribution expenses, as the cost is dealt with right from the motor-generator to the lamps, including mains and wiring. If one had even 1d. per unit for the electricity, it would pay to take the matter up, on the ground that a small loss or profit is of little importance compared with the advertisement.

At Wednesbury the cost of a motor-generator has been saved; a battery booster, used for charging the regulating cells, has been brought into use. It is not often that the battery is charged to gassing during shop hours, so that the one machine carries out the two operations. The booster armature has been provided with slip-rings and middle-wire gear, this being used only on the arc lighting circuit. The estimate allows for an entirely separate machine.

The illustration on p. 248 shows the effect of running the special low-voltage main in a street off the Market Place. It will be noticed that the shops are quite small, and are not of the kind which usually go in for arc lamps. Of the six shops illustrated, there is only one with two lamps, and it is safe to say that without the special main not one of these

shops would be using arc lamps, or, indeed, any outside lighting. The writer, of course, might have shown a view of important shops in the Market Place, but thinks this side street is far more eloquent testimony to the advantages of the low-voltage main for outside lighting.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Screw Caps for Radiator Lamps.

As the use of radiators is extending so rapidly, it is most important that every detail of their design should be entirely satisfactory before it is standardised. Is this not a matter, therefore, for the B.E.A.M.A. to decide, by common action between the leading radiator manufacturers and possibly the supply authorities, what type of lampholder they should be fitted with in future? It is evident that any lampholder with springs must sooner or later give trouble, and the points of contact on the plungers of the B.C. holder are too small for the necessary heavy current that passes through them.

The above authorities could easily decide then what was the best lampholder to be fitted, and standardise it accordingly; whether an improved form of B.C. holder like the "Mumps," or a good Edison screw holder, or any other more suitable type. I hope, therefore, that you may be able to persuade the powers that be to take some prompt action in this matter.

Johhcr.

### Costs of Running Small Generating Station.

Would any of your readers be kind enough to give me information as to the running costs and upkeep of a 500-H.P. suction gas or crude oil electric generating station, or of one of somewhere near this capacity?

E. B. Gray.

Maldon, February 6th, 1913.

### Testing the Continuity of Earth Conductors.

In reply to the letters of "Continuity" and Mr. B. T. Davies on the subject of Mines Regulations, Rule 8 (b) and Rule 14 (c), if "Continuity" henceforth orders his cables as recommended by the Engineering Standards Committee, and in conformity with Rule 12 (e), he will have no difficulty.

If he intends earthing cables installed previous to the regulations coming into force, Rule 8 (b) points out plainly what to do.

The easiest way out of the difficulty would be to install a bare copper conductor of half the sectional area of the cable to be earthed, if he is dealing with two-core or multicore cables. This could be fixed to all the apparatus on the cable, and to the cable-itself at intervals, and latterly brought to the surface and earthed. Of course, if "Continuity" had an armouring already on his cables which was not up to the standard, he could calculate the resistance of one of his main conductors against that of the armouring, find the deficiency in the latter, and make up with copper, so that the resultant would conform to the 50 per cent. regulation. In this case he would save the expense of putting in a conductor of half the capacity of his cable. At joints or distribution boxes, where a break in the main cable takes place, a bonding cable equal to 50 per cent. would be used to join the armouring. I use heavy brass split glands for this purpose, the cross bond being sweated directly into a hole in one lug of a half-gland, no sockets being necessary.

I think, however, that the best method is not to consider the armouring of an old cable, but to go right ahead with a proper earthing system. It is surprising that there are not more accidents with some of the so-called earthing systems in use to-day. I say at once that proper earthing is the

factor of safety governing a mining installation, and it can be made a very efficient and material one at that. I find no difficulty, and do not scruple in this respect.

The new regulations are easily complied with, and call for a standard of material and work that not only gives safety, but efficiency and immunity from breakdown. Undoubtedly they might be more explicit on some points, but what about the Insurance Act?

Mr. Davies, to my mind, does not interpret Rule 14, Sub-sec. (c) (i), properly—the thorough examination of all apparatus (including the testing of earth conductors and metallic coverings for continuity). This does not call for a “bridge” test, or for any definite measurement at all. A continuity test can be taken by joining one of the copper conductors to the armouring at the far end of the cable, and testing by “megger” or galvanometer from the same conductor to the armouring at the near end.

Obviously the “megger” would read zero, all being correct (unless it was a “bridge” megger), or the galvanometer would give a full scale deflection.

I do not think an expensive insulation testing ohmmeter and generator would be improved by this work, as it practically amounts to testing through a “short circuit.”

Mr. Davies tests the “earth” itself. Although I fully agree with him that this is necessary, the rule does not call for it. It only calls for the testing of the earth conductors.

The earth plates may have any value to ground. It is evident that if these are deficient in continuity to the general mass of earth, they are worse than useless—a source of very great danger indeed. Again, how many colliery electricians of the old school, the men in charge of plants varying from 100 to 300 kw., can take a “bridge” test? Simple in itself, the human element is a big factor in the case of taking accurate and sensible data. I may go further, and ask, “How many collieries, using electricity on the old basis, have such an instrument?” The average small colliery electrician is a man of resource. He is often “up against it” very hard, and generally pulls through; but “bridge” testing is probably without his sphere of knowledge.

Then, again, I wonder where he would get the time. I reckon a “bridge” test would be taken at the expense of a few thousand gallons of water, or perhaps a few tons of coal. Coal is surely our first consideration (not forgetting safety to life, of course), and I know of some instances where a “tester” could be continuously employed, and one section or another of a large “group” installation would be off daily for this purpose. Even then it would take the individual concerned all his time to comply with the rules if “bridge” tests were called for.

Mr. Davies shows a very good method of testing the efficiency of his earthing conductors, but he does not comply with the regulation, inasmuch as he does not test the continuity of the earth conductor. If the cable in his sketch was bare wire armoured, having an average resistance to earth for every foot of its length of, say,  $1\frac{1}{2}$ , due to its lying in a damp roadway, he could actually have a break in the earth conductor—the armouring—which would not be shown by his method of testing.

Then, again, it is not applicable where cables are installed in accordance with Rule 12, Sub-sec. (e) (v)—that is, in conformity with Rule 15 (i).

When cables are installed in fiery mines, open sparking must be prevented (in case of roof falls, &c.). The manufacturer gets over this by making double wire-armoured cable, with a heavy layer of jute or lapping between the armourings, and the whole covered with a layer of jute. This is the class of (three-core) cable that should be installed everywhere; it pays in the end. Now where this class of cable is used, it would be useless to fix a local earth plate in the mine to the outer armouring only, and it is obvious that to open the outer armouring to get to the inner defeats the purpose for which the cable was made, to say nothing of destroying the waterproof and fireproof qualities of the cable, and adding to the resistance of the armouring by the insertion of a more or less perfect mechanical joint if installed where Rule 15 applied.

My idea would be to test the continuity of the earth conductors by the method I put forward. There is nothing to prevent a rapid “bridge” test being taken by “shorting”

one end, as before mentioned. Taking the resistance of the cable conductor plus the armouring, and subtracting the former, which could be known from calculation or a previous test, then I would apply the following method for testing the earth itself:—

Place two earths,  $E_2$  and  $E_3$ , equidistant from earth to be tested,  $E_1$ , say 20 ft.

Let  $E_1$  = earth to be tested;  $E_2$  and  $E_3$ , two auxiliary earths;  $l_1$ ,  $l_2$ ,  $l_3$ , the leads from the bridge.

Consider for simplicity that  $a = b$ , and that  $l_2$  and  $l_3$  are included in  $E_2$  and  $E_3$ : if—

$$R_1 = l_1 + E_1 + E_2,$$

$$R_2 = l_1 + E_1 + E_3,$$

$$R_3 = E_2 + E_3, \text{ then}$$

$$\frac{R_1 + R_2 - R_3}{2} - l_1 = E_1.$$

It will be noticed that the values  $l_2$  and  $l_3$  are not required separately. I should like to see some correspondence on the rules under discussion from other mining electrical engineers. With apologies to Mr. Davies, and thanking you for publicity.

John P. C. Kivlen.

Uddingston West, February 8th, 1913.

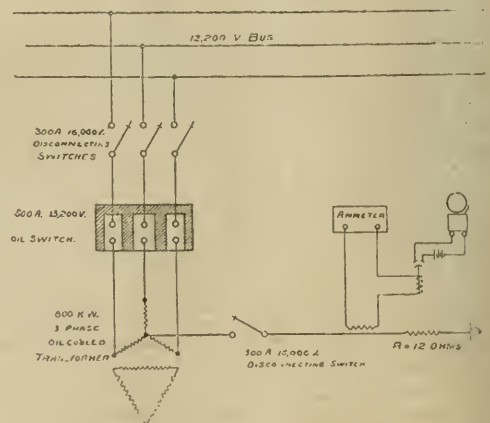

### Earthing the Neutral.

In your issue of January 3rd, page 6, we are very much interested in the correspondence covering the earthing of neutral, particularly because of the fact of the similarity of the scheme shown with that which we have had in use on our system since 1907. Our power system consists of:—

(a) 7,000-kw. water-power station, with 3,450-volt three-phase generators and delta-delta step-up transformers, with ratio 3,450 to 13,200.

(b) 9,000-kw. water-power station, with 13,200-volt three-phase generators, star connected.

(c) 40,000-kw. steam station, with 13,200-volt three-phase generators, star connected.

In view of the fact that some of these units are not star connected, and also the multiplicity of units, we considered it undesirable to earth the neutral of the generating sets.

Therefore, the system which we show on the enclosed diagram was proposed in 1906, and was actually installed in 1907, and has been working very satisfactorily ever since. The oil switch on this equipment is of a non-automatic type. The 600-kw. transformer is specially wound to withstand the mechanical strains due to excessive overloads for short periods. The resistance in the ground leg consists of cast grids, and is proportioned to withstand a current of 500 amperes for one-half minute without undue heating. The 13,200-volt outgoing feeders are all equipped with triple-pole relays at the sending and receiving ends. The underground cable system has a charging current of 60 to 70 amperes per leg. The alarm relay is adjusted to notify the operator when this ground current exceeds 40 amperes. As our load is entirely a balanced one, you will see that ringing of the ground bell gives the operator warning of impending trouble on the system.

Before the installation of this neutral transformer, we had a considerable amount of trouble on our underground high-tension cable system, due to surges. In one case five separate burn-outs occurred at widely separated points on the system. Since that time we have been remarkably free from such trouble, for ordinarily we are able to detect the trouble before a serious ground or short circuit occurs.

J. C. Vincent,

Assistant engineer, Minneapolis Street  
Railway Co.

Minneapolis, U.S.A., January 29th, 1913.

In your issue of January 31st Mr. Fedden is good enough to fall in with my request, and gives some figures taken under actual working conditions with the special earthing transformers installed at Sheffield.

The figures show clearly that the neutral point of the transformer coincides more or less closely with the neutral point of the system, even when one of the phases is earthed and a current of some 50 amperes is flowing through the fault. In his letter published in your issue of January 3rd, Mr. Fedden suggested that not only was this the case, but that the neutral point of the system would itself be kept at earth potential under similar conditions. That this cannot actually be the case when one of the phases has broken down to earth is, I think, clear, when it is remembered that the point marked *E* in Mr. Fedden's diagram is separated from

earth by a limiting resistance through which 50 amperes is flowing, whereas the point marked "3" is assumed to be dead earth through the fault. From this it follows that the point *E* must be raised considerably above earth.

It should be noted that in Mr. Fedden's diagram the resistance is shown in the line *F* (which presumably represents an artificial fault), whereas it should, I think, be shown between earth and the point *E*.

The state of affairs on the occurrence of an earth would then be as shown in the accompanying figure, from which the mesh-connected secondaries of the transformer have been omitted for the sake of clearness. Under these conditions, the point *E* must be raised above earth potential by an amount equal to the phase voltage of the system.

The net result, therefore, would be almost precisely the same as if an earthing resistance had been joined up between the neutral point of the generators or transformers and earth in the usual way, and while, under the special conditions prevailing in Sheffield, the arrangement had doubtless many advantages, it would hardly seem as though the greatly increased cost would be warranted in the majority of cases. This being so, it may be of interest to see how far the various advantages enumerated by Mr. Fedden, in his first

letter, are shared by the earthing resistance arrangement. Taking them in order, we have:—

1 and 2. With the neutral points of the generators connected to an earthing bar, and thence through a resistance to earth, no trouble is experienced in practice from triple-frequency currents, so that it is unnecessary, in the majority of cases, to take any special precautions with a view to preventing more than one generator being earthed at one time. Should trouble be anticipated from this cause, a resistance between each of the neutral points and the earthing bar will limit the triple-frequency currents to any desired extent.

3. The earth current can equally well be limited to the minimum value necessary for tripping any of the well-known earth current discriminating devices, and by this means the faulty feeder alone is cut off from the bus-bars.

4. In both systems—that is, with the earthing resistance or earthing transformer—the neutral point of the generators will always coincide with the neutral point of the system, and on the occurrence of a dead earth, the latter will be raised above earth potential by the phase voltage.

5. The fault current necessary to trip the breaker on the faulty feeder can be kept as low as may be thought desirable without interfering in any way with the overload settings of the relays or breakers.

6. The power taken by the earthing resistance method is, under normal conditions, *nil*, and the total cost of a Brazil carbon powder resistance would be something like one-fifth of that of the Sheffield transformer.

Kenelm Edgcombe.

London, S.W., February 11th, 1913.

## THE USE OF ELECTRICITY AND ELECTRICAL ACCIDENTS IN MINES.

THE general report of the Chief Inspector of Mines for the year 1911 (Part II) contains a report by the Electrical Inspector of Mines, in which he says that electricity was newly introduced into no fewer than 46 mines in 1911, as against 40 in 1910. Under Rule 15 of the Electricity Special Rules, notice of the intention to introduce electricity must be given to the district inspectors, and 46 such notices were received. Of these 20 were in Scotland, four in the Newcastle district, two in Durham, two in Liverpool and North Wales; 13 in South Wales, and five in the Midland and southern district. Unfortunately, no particulars of the installation are required to be given under this rule, but from such particulars as are available, it appears that high-pressure alternating current was introduced in five mines, medium-pressure alternating current into 11 mines, medium-pressure direct current into 13 mines, and low-pressure direct current into four mines. In the latter cases the current was introduced for lighting purposes only. Under the new rules, however, which came into force on March 9th, 1912, full particulars of the installation must be given so that "a complete classification of the different systems of distribution, together with a measure of the growth of the use of electricity in mines, will be possible for the future." The fact that 46 mines newly introduced electricity is most satisfactory, and we are of the opinion that the new rules—which insist upon more attention being given to the design, installation, and use of electrical machinery than has hitherto been the case—will so far improve matters and lessen the number of accidents, that all the old objections as to its being a serious danger in a mine will be entirely removed and its progression will be by leaps and bounds. The most dangerous employment of electricity is admittedly that of coal-cutting, but in 1911 there were 998 electrically driven coal-cutters at work, an increase of no less than 125 over the year 1910. We will return to this question later on, and in the meantime it will be interesting to briefly review the inspector's reports of accidents due to electricity.

During the year 1910 there were in all 21 fatal accidents causing 21 deaths, but for the year 1911 there were in all only 14 fatal accidents causing 15 deaths. Of these, how-

ever, two of the accidents had, strictly speaking, no connection with the use of electricity in or about mines, though they were reported to, and investigated by, the inspector of the district. In one which occurred at New Great Rocks Quarry (Derbyshire) the deceased—who was a labourer—was on the roof of a building with the foreman deciding what repairs were required, when he either fell against or took hold of two live wires and was killed. In the other, two men each received a fatal shock from a live stay wire supporting the poles of a 3,000-volt three-phase transmission line about half-a-mile distant from the Lower Duffryn Colliery in South Wales. It appears that additional poles were being erected between the original poles in order to carry larger conductors, and the night before the accident an intermediate pole had been fixed adjacent to a pole where a line took a turn at right angles, in such a way that an undue strain came upon the cross-arm which canted, causing one of the insulators to be drawn from its support and allowing the conductor to come in contact with a stay wire supporting the pole, and by way of cradle—or we suppose guard wires—made a metallic connection with the next post where the men were killed. The leakage caused the pole to char, and the smoke being observed by some men engaged excavating lower down the mountain side, the foreman sent one of the men to investigate, and this man evidently came in contact with a live stay wire and was killed. Shortly after, another of the workmen, going for tools, had to pass the place, and he, too, received a fatal shock—no doubt while trying to rescue the first man. Evidently the great strain due to overhead wires had been under-estimated by the colliery people, and this accident may at least serve to draw their attention to the necessity of having these particularly strong—with braced corner poles, and as few stay wires as possible. Overhead lines are, and will be more so in the near future, an important part of the colliery installation, and they deserve more attention than they have hitherto received. The other overhead transmission lines of the company were all fitted with the Merz-Price leakage cut-out apparatus, and this device has since been applied to this line. We would strongly recommend other colliery proprietors who have important overhead transmission lines, to fit this really useful piece of protective apparatus if they have not already done so.

Although these accidents, as already stated, cannot be said to have any bearing upon the use of electricity in mines, yet they were quite rightly reported and investigated. If, however, we leave them out, the figures for 1911 directly comparable with the figures for 1910 are: 12 accidents, resulting in 12 deaths, or nine fewer fatalities in 1911 than in 1910, which is a distinct improvement, though the number is still regrettable, when one considers that most of them at least might have been prevented had the installation been laid down and worked with that care and attention which its importance demands.

Of the 12 fatal accidents then, 11 were due to electric shock, whilst the remaining one was due to ignition of fire-damp by electricity in an underground motor room. According to districts, five occurred in Scotland, two in Newcastle, three in Durham, one in South Wales, and one in the Midland and Southern district.

In the Scotland district four of the accidents were underground and one on the surface, and, in addition seven persons were injured (six underground and one on the surface). As compared with 1910, the Inspector for the district, speaking of underground accidents only, says:—"This is a decrease of one fatal and six non-fatal accidents," but adding the fatal "surface" accident, the number of fatalities is exactly the same. The Inspector fully bears out the views we have repeatedly expressed when dealing with colliery electrical accidents, for he says:—"Several of the accidents, if certain means had been taken by the officials, or more care had been exercised by the persons in charge of and working the machinery, would, in all probability, have been prevented, and I, therefore, give a . . . detailed description of them . . . so that the suggested precautions may be fully considered. Such precautions will, I trust, be adopted where they apply by those in charge of electric installations."

Two of the accidents were in connection with coal-cutting machines, and raise the question as to "whether a pressure

which would be unlikely in case of accident to have fatal results, should not be used for all portable motors wherever it is possible."

We have previously expressed the view that all portable motors, such as are fitted to coal-cutters, should be of low-voltage, and it is encouraging to find an Inspector supporting this view. He (the Inspector) says: "Both accidents took place on medium pressure alternating current systems, and in both cases had the pressure been transformed to, say, 200 volts at the nearest convenient point to the portable motors, and if the neutral point of the transformer windings on the secondary side had been earthed, the persons who were unfortunately killed could not have received shocks of more than 130 volts to earth, and, therefore, would probably not have been killed. The two fatal shocks were, in fact, received from three-phase alternating-current systems of 550 volts in one case and 500 volts in the other. Mr. Nelson (Electrical Inspector), when making inspections in the division, has recommended the system, and I have also suggested that it should be adopted at several collieries, but objections have been raised that the size of the coal-cutting machines would be increased, and that the trailing cables would be so heavy as to become unwieldy."

These objections were, however, mainly imaginative, for careful inquiries put to the makers of coal-cutting machines elicited the reply that the increase of size would be trifling, and that the height—which is the chief point to be considered in a coal-cutter, would *not* be increased; and as regards trailing cables, the weight due to the increase of size could be met by making them shorter, and using a larger number of junction or "gate-end" boxes for a given length of face. And, as the Inspector points out, "This latter would, in many cases, be an advantage rather than the reverse, as, instead of a long length of trailing cable dragging along the pavement of a face, a greater length of cable would be in the gate roads, where it could be properly suspended," or at least, properly protected. "I venture to think that it behoves everyone connected with the use of electricity for portable motors in mines to give this suggestion their careful consideration. If the system were given a trial, it would, I feel sure, be found that the supposed objections do not exist, with the great advantage, from a safety point of view, that very few, if any, fatal accidents would occur on portable machinery." The italics are ours, and we hope that both colliery managers and manufacturers will give these words the serious attention they deserve.

As to the accidents, one occurred at Bredisholm Colliery and the other at Bardykes Colliery. In the first the supply is on the three-phase system, at a pressure of 3,000 volts, and from a sub-station at the top of No. 2 pit the current is carried below ground to a transformer at the shaft bottom, where it is reduced in pressure to 500 volts, and carried in by a distance of about 600 yards to a coal-cutting machine. The deceased was killed by an electric shock received probably from the coal-cutter of the haulage rope. At the time of the accident, there were two faults on the 500-volt distribution system, (a) a fault on one phase due to a breakdown of insulation a few feet from the transformer, (b) a second fault on a second phase due to the same cause at the coal-cutter. The frame of the latter was earthed by means of armouring of the trailing cable, and that of the main cable to earth-plates sunk at the surface, and there was a set of fuses at the gate end box in the coal-cutter circuit set to blow at about 80 amperes. The resistance of the armouring of the trailing cable was, when tested after the accident, found to be 6 ohms. The first of the two faults probably accelerated the appearance of the second by making the system temporarily a system with one phase at earth potential, as this made a connection to earth of some resistance probably very low. The fault at the coal-cutter caused another phase to be earthed, and the resistance between the two faulted phases would be made up of the resistance to earth of each of the faults plus the resistance of the armouring of the trailing cable and the main cable. Thus the resistance in the armouring of the trailing cable alone was such that to pass a fault current of 50 amperes a pressure of 300 volts or more may have arisen on the coal-cutter frame, a condition of things which clearly explains the accident.

At the Bardykes Colliery the current is also generated on

the three-phase system at 500 volts, and armoured cables are used throughout, except the trailing cables, which are provided with a fourth core for the purpose of earthing the frame of the coal-cutter to the armouring on the main cables. A coal-cutting machine had been left standing for about 15 minutes with the end to which the trailing cable was attached directly under a break in the roof from which a small stream of water was falling on to the trailing cable plug or attachment to the machine. This caused a breakdown of the insulation of the leads, and the frame of the machine to become "live," and the deceased man who was in contact with it, received a fatal shock. On investigation it was found that the pin which was provided with a collar for the purpose of making the "earth" connection when screwed into position, was too long, and the collar could not be screwed tight, and the earth connection was therefore not efficiently made, and as soon as the fault developed the accident occurred.

We are inclined to think there is an impression in connection with colliery working, that anything will do for an earth connection, and we are afraid that too much reliance is being placed upon the armouring of cables—and more especially when long lengths are considered—as necessarily they must fail if any heavy current is to be passed. It would have been interesting to know in the case of the Bredisholm accident, if the resistance of the trailing cable alone was 6 ohms, what the total resistance was. As we have frequently pointed out, it does not follow that because the armouring may be in contact with the walls of the mine, it is, so to speak, making by these contacts paths for the easy dispersal of leakage current through the strata to the "earth plates" which are sunk at the surface, but the armouring itself may—and in most cases we venture to think it does—form the only path for leakage current, and, consequently, if this should be high in resistance, as was the case in this instance, naturally it cannot be looked upon as a perfectly safe method of "earthing" any system. As the Inspector says: "It is obvious that if the resistance of the earth wire to the coal-cutter had been a fraction of an ohm, say, 0.6 ohm instead of 6 ohms, the fuse protecting the circuit would have been called into operation, and, almost certainly, without danger to the men, as the fuse would have blown before the pressure on the coal-cutter frame could have become dangerous."

As regards the other accident, it is not, we think, the first time an accident has occurred through a fault in the connecting bolt, or, at any rate, in the "efficiency" of the connection; and then, as the Inspector points out, "the plug should not have been allowed to be under the stream of water. Any unearthed machine frame not perfectly water-tight would become alive in these circumstances, and those in charge should have taken steps to protect the machine from the water by temporary means, or, if that were impossible, they should at once have switched the current off," and as regards the defect in the clamp pin, "these are matters which should be constantly inquired into by the higher officials and electricians," with which we agree, but it is just one of these little things which the "higher" officials have no time to deal with, and it would be much more satisfactory to instruct the man in charge of the machine not to put it to work unless every little detail was in perfect order, or if something goes wrong not to start the machine again until it is put right.

At Devon Colliery, where a road repairer was killed, three-phase current is generated at 650 volts, and the system is entirely insulated from earth. The current is carried underground by an armoured cable, and from a distribution box near the shaft a three-core unarmoured Dialite cable is carried into the seam to a distribution and switch-box, and from this box three single-core unarmoured Dialite cables are carried to two gate end boxes into two districts where coal-cutting machines are in use. The coal-cutter frames were earthed through a fourth core in the trailing cable to the gate end boxes, and from these 7/16 galvanised iron wires with soldered joints were carried from each district and joined together near the distribution box, and from thence continued by only one wire to a copper earth plate 2 ft. x 2 ft. x 1/4 in., to which it was bolted by a lug. The plate was placed in a clear water hole 6 ft. by 4 ft. by 3 ft. deep, and a good flow of water passed over it on its

way to the shaft. In moving the cables to carry out some repairs, one of them by some means or other "was hanging on top of the earth wire," and deceased was seen "twisted with his arm over the earth wire." Evidently the insulation of the cable had broken down, as "on the day following, or two days after the accident, Mr. Masterman found the cable had a hole 3/4 in. x 3/4 in. deep in it, the copper was pitted, and the insulation was also burned. A galvanometer test on the earth wire gave continuity, but the galvanised wire which was in the water-hole at the earth plate was extensively corroded. There were 5 ft. of wire under water, and some parts were worse corroded than others. He broke off one strand in bending the wire, the length of which was about 3 in., but the worst and, I think, the vital part was close to the lug, as four of the strands were eaten through and the remaining three looked less than 1/8 in., one of them being nearly half eaten away." Again, "the accident was due to the earth wire not being of sufficient capacity to disperse the leak without danger. The earthing system would have been more satisfactory if the earth cables had had greater conductivity . . . and if in addition to the earth plate below ground, the cables had been taken to a plate sunk at the surface." The italics are ours, and here again the impression that anything will do for an earth wire seems to have existed, and we may suppose that by putting the earth plates in running water, certainty of perfect "earth" would be doubly assured. To bury plates in a pond, whether of still or running water, is not necessarily ensuring good earth conditions, but often the reverse, and whatever was the reason for putting the earth plates below ground? And why should they mix up their cables with (1) an armoured shaft three-core cable; then (2) an unarmoured three-core cable; and (3) finish up with three single-core cables?

(To be continued.)

## LEGAL.

LITHOLITE, LTD., v. TRAVIS.

IN this case, Mr. Justice Joyce heard a motion in the Chancery Division on Friday, February 7th, to restrain the defendant from disclosing trade secrets or secret processes which came to his knowledge while in the employ of the plaintiffs as their works manager at Hackney Grove, and to restrain him from infringing plaintiffs' copyright in their catalogue or price-list of standard litholite and litholite articles.

MR. HUGHES, K.C., on behalf of the plaintiffs, said this was a serious case. The plaintiff company made electric fittings of a substance known as litholite. This was not a patent, but was made by a process known only to themselves, and they had a very large trade in bushes, handles, and other insulating appliances. In October, 1908, they employed Mr. Thos. Travis, the defendant, as their works manager, and a formal agreement was entered into in November, by which Mr. Travis agreed "to make over any new processes discovered by him during the time of his service or three years afterwards, and not to disclose any (of the plaintiffs) trade secrets, or secret processes of manufacture, or to use them apart from the company." Under that agreement, Mr. Travis worked for three years—until, in fact, he had acquired a full knowledge of the plaintiffs' business. That he had no such previous knowledge was shown by a letter written when applying for the post in 1908. In that, Mr. Travis said, "As I do not possess experience practically in your business, I would be the more zealous to acquire full and early competence." In January, 1912, Mr. Travis left the plaintiffs' employ, and it would appear that it then occurred to him to form or promote a company for the purpose of taking advantage of the knowledge he had acquired. Accordingly, in May, 1912, Insulators, Ltd., was incorporated, with a nominal capital of £2,000, of which Mr. Travis held £1,250 or £1,350, and two Manchester men named Carney and Smith held the rest. The office of the company was Hyde Road, West Gorton, Manchester. With that company, Mr. Travis entered into an agreement to act as manager, and to disclose all knowledge he had of the manufacture of electrical apparatus and details of manufacture. It was clear from the evidence that the company had manufactured electrical apparatus of the same substance as plaintiffs' manufacture, and which they called litholite. Further than that, the defendant company had copied the catalogues or price list of the plaintiff company and made use of the copies.

HIS LORDSHIP: What do they say about that?

MR. HUGHES: What is said is that the knowledge Travis is making use of on behalf of Insulators, Ltd., is not knowledge acquired in the service of the plaintiffs, though I think, that can hardly be true in view of his letters.

An affidavit by Mr. Alexander Russell, of Faraday House, was read, in which the deponent said that on chemical analysis he found the litholite made by Insulators, Ltd., to be made of the same ingredients, in substantially the same proportions, as that produced by the plaintiffs.

Proceeding, MR. HUGHES also read an affidavit filed by the defendant Travis, in which he said he had not disclosed any secret process, and it was not true that litholite was manufactured by the plaintiffs by a secret process; further, that litholite had been used by one Charles Heese, who had described it in a posthumous work as made of sawdust, dried blood, and bichromate of potash; and that in a catalogue issued by the plaintiffs themselves, litholite had been described as made of earthen, resins, and fossil gums. Further, that recipe of litholite was contained in a book published as early as 1886.

An affidavit in reply by Mr. Walter Theodore Hunt, of the plaintiff company, was also read by Mr. Hughes. In this Mr. Hunt said that plaintiffs' insulating material was not made of sawdust, dried blood, and potash, nor of earth's resins and fossil gums, as Mr. Travis inaccurately asserted to have been stated in a catalogue. The catalogue in question showed, said Mr. Hunt, that the insulating material made by his company was compounded of silicas carefully selected, fossil resins, &c., and the recipe did not appear in the book referred to.

MR. SHAW COOPER, on behalf of the defendant, argued that the process of manufacturing litholite was common knowledge such as he was entitled to use; and with regard to such a matter the agreement was not binding since it would be in restraint of trade if defendant should be restrained from using any process which was common property.

HIS LORDSHIP: Why? You are taken in to work certain processes for your employer, and you promise you won't use them apart from the employment. However, that may be a question for the trial.

MR. SHAW COOPER said that in the Technico Chemical receipt book published in 1886 and reprinted in 1895, there was a recipe for litholite used, in fact, by the defendant. This gave the components as mineral wax, asbestos, and tar. It was admitted that both the litholites were made by the same process, but this process was not a secret. In the letters of 1908, no doubt, Mr. Travis said he had no practical knowledge, but he had chemical knowledge which he might always make use of. There was no inconsistency between these statements.

HIS LORDSHIP: He has stolen part of his late employer's catalogue.

MR. SHAW COOPER denied that this was stolen; all that the man had done was to copy to save himself expense. However, he would not resist an injunction as to the catalogue. As to the other things, no injunction should be granted.

HIS LORDSHIP, in giving judgment, said, in his view, Mr. Travis was a very clever and unscrupulous person, and on the evidence the plaintiffs had proved quite enough for an interlocutory injunction. Defendant had certainly stolen part of the plaintiffs' catalogue, and, he believed, had violated the plaintiffs' secrets. On the usual undertaking as to damages in case his Lordship should prove to be quite wrong in his opinion (as he might be), and in case the defendant might succeed at the trial, he would grant an injunction.

#### THE OSRAM LAMP WORKS, LTD., v. THE ORA LIGHT CO.

In the Chancery Division on Friday, February 7th, Mr. Justice Swinfen Eady had before him a motion in this action.

MR. GRAY said it was a motion for an injunction. The parties had agreed that the motion should be treated as a trial of the action, and there should be an injunction by consent.

HIS LORDSHIP: An injunction for what?

Counsel for defendants said that he was instructed to agree to an injunction during the continuance of the letters' patents in the terms of the notice of motion, restraining defendant company from selling any lamps which were infringements of plaintiffs' patents, the motion to be treated as the trial of the action.

HIS LORDSHIP: That is an end of it then. Defendants pay the costs?

Counsel: Yes.

HIS LORDSHIP: Very well, treat the motion as the trial of the action; a perpetual injunction, and defendants to pay costs. Also an inquiry as to damages.

#### THE OSRAM LAMP WORKS, LTD., v. LOUIS SCHLOSS & CO.

In the Chancery Division, on Friday, February 7th, Mr. Justice Swinfen Eady had before him a motion in this action to restrain infringement of plaintiffs' patent rights in regard to electric lamps.

MR. GRAY appeared for the plaintiffs, and said that he understood the defendants wanted a fortnight's adjournment to get evidence from abroad.

HIS LORDSHIP: Where from?

MR. FROST, for the defendants, said they desired to obtain evidence from Brussels and Italy. The defendants in this case were not the manufacturers of the lamp complained of, "The Edna." They were under the impression that the filament of the lamp was manufactured by a firm in Brussels, but they had since discovered that it was in fact made in Milan. He (counsel) was assured that the filaments in question were made by a process quite outside the plaintiffs' patents.

HIS LORDSHIP allowed the matter to be adjourned for a week.

#### EDINBURGH TRAMWAY ACCIDENT VERDICT SET ASIDE.

In the First Division of the Court of Session, judgment was given in the application for a new trial by the Edinburgh and District Tramways Co., Ltd., in the action against them by a domestic servant for damages in respect of injuries. When the case was tried by Lord Hunter and a jury, a verdict was returned for pursuer, and the damages were assessed at £350. The First Division held that the verdict could not be allowed to stand, and assailed the defenders.

The LORD PRESIDENT held that it was pursuer's own negligence that led to the accident. On the question of expenses, the Court appealed to the company not to move for expenses, and counsel for the company agreed.

#### GLASGOW TRAMWAY ACCIDENT CLAIMS.

LORD DEWAR, in the Court of Session, has approved an issue for the trial by jury of an action by a vanman against Glasgow Corporation for £500 damages for personal injuries. Pursuer, whose van was run into by a car, attributes fault to the driver, while defenders deny liability, and allege that pursuer was not keeping a proper look out. In another action brought by a Govan riveter, the Corporation is sued for £1,000. The contention is that the car which knocked him down was going at an excessive speed.

#### HUGHES v. HOBART ELECTRIC MANUFACTURING CO.

JUDGE ALLEN, at Nottingham County Court, gave judgment for the defendants in an action brought by Mr. H. K. Hughes, of Nottingham, against the Hobart Electric Manufacturing Co., of America and London.

Plaintiff, who claimed £4 3s. 8d. for goods delivered, stated that he was formerly the tenant of a shop in St. Peter's Gate, Nottingham. He intended to leave the premises at the last March quarter-day, and the defendant company desired to enter the premises a fortnight before quarter-day. Mr. Forbes Leith, who described himself as the northern manager of the company, told Mr. Hughes that they wanted to take the shop as soon as possible, and plaintiff said he would forgo the fortnight's rent if Leith would give him the order to execute the lighting. To this Leith agreed, and the lamp, which was the subject of the present claim, was fixed, but when plaintiff sent his invoice to the company, they repudiated it, and referred him to Mr. Leith.

For the defence, MR. WRIGHT, the European manager of the company, stated that Leith was never their northern manager, and had no authority to order goods on behalf of the company. He was their district sales agent, and when witness found he had put up a plate describing himself as manager, he instructed him to take it down. He had no authority to pledge the company's credit.

#### WINDING-UP PETITIONS.

THE Rapid Magnetizing Machine Co., Ltd., petitioned in the Companies' Court, before Mr. Justice Swinfen Eady, on Tuesday, for the compulsory winding up of the Polack Manufacturing Co., Ltd. As there was a possibility of plaintiffs being paid, his Lordship allowed the petition to stand over for a month.

On Tuesday, in the Companies' Winding-up Court, Mr. Justice Swinfen Eady had before him the petition of the British Westinghouse Electric and Manufacturing Co., Ltd., for the compulsory winding up of the Garnant Anthracite Collieries, Ltd. Mr. Copping, for the respondent company, said the directors were in Paris, and they had hopes of reanimating the company. The petition was dismissed, without costs.

## BUSINESS NOTES.

**Fifty Years' Success in New Zealand.**—The story of the experiences of pioneers who went out to seek their fortunes in other lands many years ago, meeting privation and difficulty, and having to rough it, subsequently climbing over their difficulties, seizing opportunities, and building up a big fortune, always affords absorbingly interesting reading. And in these days of foreign and Colonial trade expansion, when nearly every other man appears to think that in order to get "on" he must get "out" of the country, interest in such achievements is not likely to lessen. We confess to feelings of admiration and almost envy at the progress of one of these pioneers and his associates, which we have been privileged to read in a brochure, "1862-1912," telling the story of the rise and progress of the firm of A. & T. Burt, Ltd., of New Zealand, which was issued on the occasion of their jubilee. Mr. Alexander Burt, the present chairman of the concern, went out from Scotland to Victoria in 1859, when 19 years of age, and after vicissitudes of many kinds, including gold-fever intervals, he started in New Zealand a small 15 ft. x 20 ft. workshop (plumbing and zinc working), being joined shortly after by a brother. The brochure tells of the advances, works extensions, new branches, engineers' shops, copper shop, lead-pipe making, core winding, iron-moulding shops, fitting shops, and so on, leading on to, or forming part of, the widespread business that the firm has to-day in Dunedin, Auckland, Wellington, Christchurch, Timaru

Invercargill, Port Chalmers and London. The directorate consists of five "Burtas," including the founder already named. The capital of the concern is £100,000. The firm are the New Zealand agents of Messrs. Siemens Brothers Dynamo Works, Ltd., to whom we are indebted for the loan of this interesting book, and for whom Messrs. Burt secured the Auckland Corporation electrical contract (£33,000), which is now in hand. The firm's electrical department was opened 10 years ago, and our readers who know something about the electrical development that has been and is proceeding in New Zealand, will not be surprised to learn that this department has gone ahead by leaps and bounds. The firm's workshops at Dunedin, of course, have their own electrical power installation.

**Italy.**—According to *Il Sole*, a Venetian financial group, at the head of which is Commendatore Nicolo Spada, has completed the studies for the construction of an electric tube railway under the lagoon, with the view of uniting the city of Venice with the Lido—the long belt of lowland separating the lagoon from the Adriatic. The object of the scheme is to relieve the congestion of population in the city and counteract the constant rise in price of land, by the utilisation of the building land, which will be rendered available on the Lido. The course taken by the tunnel will be in the direction of the Giudecca, the largest of the islands in the lagoon, connection with which will also afford an opening for the expansion of the population outwards. When realised the tube will necessarily lessen the navigation dues now paid by shipping crossing to the Lido, but this will be set off by the increased demand for energy from the city's generating station at Cellius, which will ensue.

**Reduction of Capital.**—MILLER & SONS, LTD.—A petition for confirmation of reduction of capital from £30,000 to £18,447 has been presented. Notice appears in our advertisement page.

**Book Notices.**—*Manuel Pratique de Soudure Autogène.* By R. Granjon and P. Rosenberg. Paris: Office Central de l'Acetylene. Price 5 fr.—Naturally, this book deals only with acetylene welding, but it does so in a very complete fashion. The nature and properties of the blow-pipe flame, the various applications of autogenous welding, the manipulation of gas bottles and acetylene generators, the welding characteristics of the different metals, welding machines, &c., are all fully treated of, with numerous illustrations of the wonderfully clever work that is regularly accomplished with the oxy-acetylene flame. Anyone who is concerned with welding or cutting with the blow-pipe will find this book both interesting and instructive, and our only regret is that it is marred by a brief, but wholly unjustifiable and untrue, attack on electric welding.

*Annuaire International de l'Acetylene.* 1912. Price 3 fr.—This annual, by the same authors and publishers as the foregoing, contains a mass of information relating to acetylene and calcium carbide, in all their varied applications. The use of acetylene for lighting purposes is very fully dealt with; owing to the keen competition of electricity and coal gas, not a score of examples of public supply of acetylene exist in the United Kingdom, and the places named in the list given in the *Annuaire* are almost all villages of one or two thousand inhabitants. Our consumption of carbide for all purposes in 1911 was about 16,000 tons, an increase of 2,000 tons; the only factory making carbide in this country is that at Thornhill, with a production of 2,000 tons per annum. The principal producers of the world are Sweden and Norway, with a joint output of 52,000 tons a year, and the United States, 50,000 tons; next come France, 32,000; Switzerland, 30,000; Italy, 28,000; Austria-Hungary, 22,500; Spain and Portugal, 18,000; and Canada, 12,000 tons a year. The world's production in 1910-11 was 258,700 tons, exclusive of carbide for the manufacture of cyanamide, of which 20,000 tons was produced. A table of costs of various illuminants is given, accompanied by the remark, regarding electric lamps, that the candle-power falls off rapidly, and that this is an important consideration in view of the high cost of metallic-filament lamps. The writer of this libel ought to be aware that the candle-power of metallic-filament lamps falls off very little indeed, and that of arc lamps not at all.

*Annuaire du Bureau des Longitudes pour l'Année 1913.* Paris: Gauthier-Villars. Price 1 fr. 50.—This year the *Annuaire* contains, in addition to the astronomical data, tables relating to geography, statistics, metrology, &c., but not physics and chemistry, which will appear next year. One of the special articles is by Commandant Ferrie, on the application of wireless telegraphy to the transmission of time, which has in recent years assumed great importance. By this means comparisons of time at different places can be made to an accuracy of one or two hundredths of a second.

*Recherches sur la Commutation dans les Dynamos à courant continu.* By A. Mauduit. Paris: Dunod & Pinat. Price 9 fr.—In this work the author embodies a critical discussion of the theory of commutation together with the details and results of his own investigations. The first part deals with the development of the theory, from the work of Reid to the Arnold equation, and the successive steps in the elucidation of the numerous problems and difficulties met with in the endeavour to reconcile the phenomena observed in practice with the conclusions derived from theoretical principles. In the second part the author shows how he has endeavoured, by separate investigation of the many variable factors met with in the complex operation of commutation, to arrive at definite laws governing the relations of these and to deduce working formulae for the guidance of the designer. He finds that contact resistance plays a much less important part in commutation than is generally supposed, and that consequently the accepted theories, based upon inaccurate hypotheses, lead to results of no great practical value.

*The Arbitration Clause in Engineering and Building Contracts.* By E. J. Rimmer, Barrister-at-Law. London: Constable & Co. Price 2s. net.—This little book states that the powers of an engineer under a contract for engineering or building works have been seriously undermined by recent decisions in the Court of Appeal and the House of Lords. The author considers the effect of these decisions, and suggests modifications which may be made in engineering contracts for the better security of the settlement of disputes by arbitration.

*Electric Power Transmission by Aluminium Conductors.*—By issuing this pamphlet, which brings together in convenient form a mass of information relating to the electrical uses of aluminium, the British Aluminium Co., Ltd., have benefited not only themselves and their clients, but also all engineers who are concerned with overhead transmission lines. The cost of aluminium conductors at present prices is about 10 per cent. less than that of copper conductors, and consequently the use of aluminium is extending in all parts of the world; the development of water-powers, which are usually situated far from large centres of population, tends to increase the importance of the subject, and many concerns of the first magnitude have adopted the metal for very extensive transmission undertakings. Particulars regarding the physical characteristics of aluminium wire, very fully detailed and compared with those of copper, are followed by tables of standard sizes, resistance and weight. The regulations laid down by various Governments for overhead lines are then given, and the restrictive effect of an excessive factor of safety is referred to, a value of three being recommended (used in France, Germany and Austria), instead of five, as specified by our Board of Trade; a factor of safety of two is often used in the U.S.A. and Canada, where probably more aluminium lines are used than in any other part of the world. The torsion-sleeve joint is recommended. Other tables are given which facilitate the calculation of transmission lines, as well as charts and diagrams, and data are included showing the relative costs of copper and aluminium lines, complete with towers and insulators, &c. The pamphlet will prove to be a valuable work of reference.

*Abstract Bulletin of the Physical Laboratory of the National Electric Lamp Association, Cleveland, Ohio, U.S.A.* Vol. I, No. 1. From the Laboratory.—This is the first published collection of abstracts covering all the researches carried out in the Laboratory from its inception, in 1908, to the summer of 1912, under the supervision of the director, Mr. E. P. Hyde, and is intended to bring together the principal results that have been obtained, the abstracts being fairly lengthy and fully illustrated. References are given to the various journals in which the original papers (28 in number) were published *extenso*, so that those who desire more complete information will have no difficulty in obtaining it. The researches deal with a wide range of phenomena in connection with light and radiation in general, visual acuity, photometry and other matters relating to light and illumination, and represent a vast amount of original investigation of the highest order. The issue of this useful summary of the results obtained cannot fail to be of great service to those interested in illuminating engineering.

*L'Année Electrique, Electrotherapie et Radiographie.* By Dr. Foveau de Courmelles. 1913. Paris: Ch. Béranger. Price 3 fr. 50.—This annual review is now in its thirteenth year, and constitutes a summary of all the new facts and developments which have occurred during the past year in the electrical field. It is divided into chapters, each of which deals with a separate subdivision of the science, covering all its domestic and industrial applications, as well as the uses of electricity in therapeutics, references being given to the publications from which the information is derived, so that those who desire further details on any point can readily obtain them. Its scope is cosmopolitan, and as a handy record of the year's progress, it certainly fills a niche of its own, its popularity being attested by its arrival in its "teens."

*The Engineer's Year-Book of Formulae, Rules, Tables, Data, &c., for 1913.* By H. R. Kempe, M.Inst.C.E. London: Crosby Lockwood & Son. Price 12s. 6d.—Some things are never appreciated at their true value until one is deprived of them, and from personal experience we can apply this saying to "Kempe's Year-Book," for having recently suffered the loss of our office copy, we have had it borne in upon us, more than ever before, that we cannot do without it. That we are not alone in this conviction is shown by the fact that the year-book is now in its 20th year of publication: it is quite a bulky volume, containing nearly 1,600 pages and over 1,250 illustrations. Much matter has been cut out, but still more has been added, and the process of division into sections, begun two years ago, has been continued, although it has involved, for instance, the rearrangement of the whole of the "Steam" section, which now consists of six parts. The part which relates to steam turbines has been entirely rewritten by Mr. H. L. Guy. There are new sections on Roads, Marine Diesel Engines and Legal Notes for Engineers, all by specialists, whilst very many existing sections have been revised and some have been largely extended. A novel feature is a summary of engineering progress during 1912, and, by special permission of the Engineering Standards Committee, abstracts of a large number of the Committee's specifications have been included.

To review the contents of this standard work would be as arduous as it would be superfluous; clearly it needs no recommendation. We shall be content, therefore, with saying that we give a hearty welcome to the new issue.

*Sell's Directory of Registered Telegraphic Addresses.* London. 25s.—As many of our readers know, this work is published annually, and is compiled from Official Lists supplied by the authority of the Postmaster-General. The 1913 edition contains 2,500 pages of names, postal addresses, telegraphic addresses, trades and telephone numbers. This year it contains the first Official List of the new "Indicator" words for London Telegraphic Addresses. In

addition to ordinary changes in style and in addresses of Registrants, there are about 20,000 "Indicators" added, necessitating the alteration of as many telegraphic addresses. An Alphabetical Index of the Registered Telegraphic Addresses in use throughout the United Kingdom forms Section II of the volume, and each address bears a reference to Section I where the names, postal address and full business particulars will be found. A useful division of the book is that containing a classification of trades for the whole country. There are over 3,000 separate Trade Headings, under which are arranged in alphabetical order about 100,000 British firms according to their respective trades or professions. The publisher has also added a representative list of Colonial and foreign firms, arranged by countries and towns, with their trade and cable address. The preliminary pages contain notes on Business Prospects for 1913; and one on the Post Office, 1911-12. To the business man the recital of the list of contents of the book is sufficient without any further commendation.

*The South African Mining Directory and Monthly Handbook of Chief Officials of the Mines.* Johannesburg: The South African Mining Directory, Ltd. No. 1. November, 1912. 7s. 6d.—The usefulness of this publication must be obvious from its title. To all interested in electrical and engineering trade with South Africa a frequently revised list of names of mine buyers, managers, engineers, electrical engineers, secretaries, &c., can hardly fail to be of value, in view of the changes that are taking place every month. There is an alphabetical list of mines on the Rand, also of "Outside" Transvaal and Natal gold mines, Natal collieries, copper companies, South African railways, Johannesburg municipalities, industrial concerns, and their chief officials. We notice a full list of the engineering officials and staff of the Victoria Falls and Transvaal Power Co., Ltd.

We have received a copy of the first number of a new American monthly contemporary, *The Lighting Journal*, which is edited by Norman Macbeth, and published at 10 cents per copy by the Lighting Journal Co., of 50, Church Street, New York. A number of useful articles relating to electrical and gas illumination—"everything between the meter and the eye"—appear in this number (January).

"Characteristics of Induction Type Alternating-Current Watt-hour Meter." By A. Ohya and R. Mitsuda. 1912. Tokyo: The Electro-Technical Laboratory.

"Mine Fires and How to Fight Them," by James W. Paul; "Accidents from Falls of Roof and Coal," by G. S. Rice; "Coal Mine Accidents in the United States, January to August, 1912," by F. W. Horton; "Training with Mine-Rescue Breathing Apparatus," by J. W. Paul; "Smoke Abatement and City Smoke Ordinances," by S. B. Flagg; "Ignition of Gas by Standard Incandescent Lamps," by H. H. Clark; "Methods for the Determination of Water in Petroleum and its Products," by I. C. Allen and W. A. Jacobs; "An Investigation of Explosion-Proof Motors," by H. H. Clark; "Comparative Fuel Values of Gasoline and Denatured Alcohol in Internal-Combustion Engines," by R. M. Strong and Lauson Stone. Washington: Government Printing Office.

"Journal of the American Society of Mechanical Engineers." February, 1913. New York: The Society. Price 35 cents.

"Bulletin of the American Institute of Architects." Vol. XIII, No. 3. October, 1912. Washington: The Institute.

"Atti della Associazione Elettrotecnica Italiana." Vol. XVII, No. 2. January 31st, 1913. With index to Vol. XVI. Milan: Stucchi, Ceretti & Co. Price L. 1.50.

"Bulletin of the Imperial Institute." Vol. X, No. 4. December, 1912. London: John Murray. Price 2s. 6d. net.

"Charter, Bye-Laws and List of Members of the Iron and Steel Institute, 1913." London: The Institute. Price 1s.

"The New Steam Tables." By C. A. M. Smith and A. G. Warren. 1913. London: Constable & Co., Ltd. Price 4s. net.

"Annual Report of the International Electrotechnical Commission, 1911." London: Waterlow & Sons, Ltd.

"Journal of the South African Institution of Engineers." Vol. XI, No. 6. January, 1913. Johannesburg: The Institution. Price 2s.

*Proceedings of the American Society of Civil Engineers.* Vol. XXXIX, No. 1. January, 1913. New York: The Society.

*Bulletin de la Société Internationale des Electriciens.* Vol. II, No. 20. December, 1912. Paris: Gauthier-Villars. Price 2 fr. 50.

*Boletín de Ingenieros.* Vol. III, No. 4. December 16th, 1912. Mexico: Departamento de Ingenieros de la Secretaría de Guerra.

"Science Abstracts." Sections A and B. Vol. 16, part 1. January 31st, 1913. With indexes to Vol. 15. London: E. and F. N. Spon, Ltd. Price 1s. 6d. each.

**Electrical Manufacturing in Japan.**—The Shibaura Seisakujo Ironworks, at Shiba, Tokio, which doubled its capital to £200,000 in 1911 by combining its interests with those of the General Electric Co. of the United States, at the same time devoting itself to the manufacture of electric appliances, has met with such a heavy demand for its productions that the directors have now thought it necessary to increase the company's capital to £500,000.

**Mazda Lamps for Stage Lighting.**—The initial strength and long life of the Mazda lamp under most severe conditions of service are well shown by an incident which recently occurred at the Theatre Royal, Elephant and Castle; many of the drawn-wire lamps supplied by the B.T.H. Co. to the theatre are still in use after two years, burning an average of three hours a day, in spite of great vibration. The manager had 88 put in a stage batten some time ago, and in fixing it the whole iron frame was accidentally dropped about 10 ft. Only one bulb of seven filaments was broken. A similar incident occurred

some months ago at the Prince of Wales Theatre, Birmingham. One of the scene-lighting battens containing 100 Mazda lamps was being raised, when the ratchet on the winch slipped. One side of the batten dropped a distance of about 5 ft., and then the ratchet re-engaged with a jerk. The lamps were unlighted at the time, and were, therefore, in their most fragile condition; but when they were switched on, it was found that not one had been injured.

**Installation Contracts.**—The following are some of the works that are being executed by MESSRS. HELLYAR & SONS, LTD., of Barnes, S.W.:—

The "Firs," Chesham Bois.—Electric lighting installation. St. James's Vicarage, Bury St. Edmunds.—Extensions to electric light installation.

Alterations to electric light plant at Rowallen, Haslemere, Surrey. Temperature control, for the United Newspapers, Ltd., 12, Salisbury Square, E.C.

Two switchboards, for Messrs B. S. Lloyd & Co., King Street, E.C. The "Beaufort Arms" Hotel, Monmouth, Wales.—Complete plant, lighting, heating and bell installation.

Electric light installation in the Church, North Camp, Aldershot.

**Catalogues and Lists.**—THE BRITISH ALUMINIUM CO., LTD., 109, Queen Victoria Street, London, E.C.—Four-page illustrated list relating to the casting of aluminium and the properties of metal for foundry work.

THE ELECTRIC CONSTRUCTION CO., LTD., 9, New Broad Street, London, E.C.—Four-page illustrated list No. B/317, containing description and tabulated prices of E.C.C. cinematograph motor-generators for C.C. and A.C. supply.

MESSRS. RIEHLE BROS.' TESTING MACHINE CO., Philadelphia, Pa., U.S.A.—Illustrated and other leaflets concerning the Riehle testing machines for chains, cement, road materials, &c.

MESSRS. CARSON & EVANS, 3, Fenchurch Buildings, London, E.C.—Postal card relating to their ebomite and vulcanite; also a folder giving particulars of a new and cheaper material known by the name "Carvanite," for meeting requirements where a lower priced material than ebomite or vulcanite is wanted.

MESSRS. EASTMAN & WARNE, 241, Acton Vale, London, W.—Small leaflet describing the "Belenus" electrically-heated branding irons.

THE ELECTRICAL CO., LTD., 122-124, Charing Cross Road, London, W.C.—New 20-page illustrated price list of their "Aegma" drawn wire lamps. Some notes on lamp manufacture are given. Also a folder entitled "Under Association Rules," stating a number of points in favour of the "Aegma" lamp. Wall showcard (approximately 10 in. x 15 in.) to advertise their "Aegma" drawn-wire lamps.

THE LEA RECORDER CO., 32, Deansgate, Manchester.—Two illustrated circulars: W1, giving a description of Lea's patent integrator for totalising the flow of water over V notches and weirs and W2 showing one of these apparatus supplied to the New South Wales Government for measuring up to 20,000 gallons per hour.

THE BRIMSDOWN LAMP WORKS, LTD., Kingsway House, London, W.C.—We have received a set of eight picture postcards illustrating the various uses of "Wirum" lamps—including street, shop, ship and dock lighting, train and tram lighting, also private house and public building illumination.

THE BRITISH L.M. ERICSSON MANUFACTURING CO., LTD., Beeston, Nottingham.—40-page catalogue (Section "H") in expanding binding cover. It contains excellent half-tone illustrations, descriptive notes, dimensions, weights, and code-words, of intercommunication telephone instruments of all types and sizes. Relay boxes, junction boxes, and cable are also particularised. A section of eight pages in the front of the book gives, in neat tabular form, prices of the different items listed. A line to which special attention is directed is the type H K 100 secret intercommunication table telephone for metallic circuits.

MESSRS. M. K. COOPER & CO., 27, Oswald Street, Glasgow.—A number of illustrated folders and leaflets relating to the following: The "Regina" electric cleaner, the "Regina" pneumatic sweeper, the "Thor" electric home laundry machine, and the "Shaler" electric stove and electropad.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—New publicity literature in their standard form and style as follows:—No. 397 (40 pages) fully illustrating and particularising a variety of overhead line material; No. 393 (eight pages), starting rheostats for C.C. motors; No. 394 (four pages), A.C. prepayment watt-hour meter (single-phase house service); No. 396 (four pages), overhead trolleys; No. 391 (four pages), electric flat-irons; No. 390 (four pages), brake magnets; No. 392 (four pages), electric soldering, branding and burning tools. Advance proof of new price list describing very fully, with illustrations, the B.T.H. hand-operated starting compensators.

MR. H. MOSS, 116, Horton Grange Road, Bradford.—Folder, (with 1913 calendar on front page) giving hints to electricity users; also a leaflet relating to country house lighting, describing the two-cylinder "Pelapone" lighting set.

THE BIRMINGHAM MANUFACTURERS' SUPPLY CO., 17, Easy Row, Birmingham.—The firm are wholesale distributing agents for Messrs. F. J. Bayley & Co. (Mr. F. Sumner Bayley is a principal in the firm), and they have issued a brochure giving some particulars of "Susub" (suet and tallow substitute), and its applications as a lubricant, also testimonials from users. Any reader can, by applying, have a 10-lb. tin free for trial purposes.

THE STELLING TELEPHONE AND ELECTRIC CO., LTD., 200, Upper Thames Street, London, E.C.—Illustrated revised price list relating to their Sterling "permitted exploders" for shot-firing in coal mines, quarries, &c.

THE METALLIC SEAMLESS TUBE CO., LTD., "Meta" House, Corporation Street, Birmingham.—Postal card showing, and giving prices of, "Meta" electric irons.

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., 38 and 39, Upper Thames Street, London, E.C. Twelve-page list containing full technical description, illustrations, prices, &c., of their new double enclosed flame arc lamps for the lighting of large areas, such as streets, docks, or works.

**Edmundson's Showrooms.**—The showrooms of EDMUNDSON'S ELECTRICITY CORPORATION, LTD., in Tolhill Street, Westminster, form a good example of what can be done by the actual suppliers of electrical energy to popularise the use of electricity. We understand that practically every reliable device for heating and cooking is on view, and can be demonstrated on circuit to customers, while lamps, fittings and glassware for electric light installations are shown in great variety. In the cooking section there are various types of electric ovens. The individual electric kettle, with detachable heating element, is shown in several styles, whilst electric irons of various weights may be seen and handled. There is a fine selection of radiators on view, embodying practically every available design of luminous, hot bar and convector types, a specially cheap radiator known as the "Edmund," being on sale at a very low price, proving that the production of electrical apparatus is being cheapened. An interesting part of the display at the present time is the collection of fittings and shades, from the purely

EDMUNDSON'S SHOWROOM.

decorative type with silk shades, to the more modern varieties in which beauty and efficiency are combined by the use of Holophane glassware. Many examples of this are shown in a special window display which has recently been arranged. Holophane reflectors are shown, with a card demonstrating their efficiency, stating the reflected candle-power given at various angles. In addition, a 10-in. reflector and a bank unit direct their light directly into the eyes of the passer-by, demonstrating both light intensification and effective direction. A number of "Household" types of Holophane are also shown, as well as the new Holophane inverted fitting, with a 100-C.P. "Wotan" lamp. Another item of interest is a semi-direct lighting unit which has a Ceonix bowl, an opalescent glass richly marked in amber, giving, when lighted, a delicate rose tint to the lighting. This set has a high lighting efficiency, as the bowl reflects a large proportion of the light, and is accurately shaped to ensure even distribution. There is also a show of "Wotan" and tantalum drawn-wire lamps, which is made all the more effective by an illuminated tower lent by Messrs. Siemens Bros. Dynamo Works, Ltd., Dalston, which demonstrates the complete range of "Wotan" lamps in bell-shaped bulbs, from  $\frac{1}{2}$  to 100 C.P. We reproduce a photograph of the interior of the showroom.

**Trade Announcements.**—THE BALDWIN ENGINEERING SUPPLY CO., LTD., have opened offices and stores at 39, Victoria Street, Westminster, for the supply from stock of electrical accessories, wires, carbons, conduits and fittings, &c.

THE LIVERPOOL FITTINGS CO. have recently fitted up and opened a showroom at 55, Renshaw Street, Liverpool, for the sale of electric light fittings, heating and cooking apparatus, Holophane glassware, vacuum cleaners, &c.

MESSRS. JULIUS SAX & CO., LTD., of 24A, High Street, New Oxford Street, London, W.C., announce that their telephone numbers are now Regent 2101 and 2102.

**Bankruptcy Proceedings.**—W. LONGDON and V. G. COBB (trading as Longdon & Cobb), electrical engineers, 101A, Derby Road, Nottingham. The first meeting of creditors herein was held at the Official Receiver's office, 4, Castle Place, Park Street, Nottingham, last week, when the statement of affairs showed liabilities amounting to £291, and assets estimated at £45, leaving a deficiency of £246. The failure was attributed by the debtors to want of capital and bad debts. It appeared that the debtors started

trading in partnership towards the latter end of March, 1912, at the above address. Their capital consisted of stock and book debts and other assets of the business formerly conducted by Longdon, which were valued at about £350, less outstanding debts, about £300, leaving a surplus of £50 to be credited to Longdon as his share of the capital. The debtor, Cobb, put in a capital of £150 in cash, and a sum of £30 cash was put in by a relative of Cobb. The drawings of the partners were to be 40s. and 30s. a week respectively for the first 12 months, and afterwards an equal share of the profits. Until February, 1908, the debtor, Longdon, worked as a journeyman electrical engineer, but at that date he started trading on his own account in Cromwell Street. He removed three months later to 101A, Derby Road. A private meeting of the creditors was held in November, but negotiations for the payment of a composition fell through, as the debtors were unable to find the necessary security. Several creditors questioned the debtors regarding the disposal of furniture and effects, and the meeting then terminated.

CHARLES SPENCER NORTHCOLE, electrical engineer, 67, Stanthorpe Road, Streatham, London.—Receiving order made December 10th, on a creditor's petition. First meeting of creditors February 19th, at 132, York Road, Westminster Bridge Road, S.E. Public examination February 27th, at Court House, Wandsworth.

**For Sale.**—The Aberdeen Royal Asylum has for disposal two Crossley gas engines, Dowson gas-producing plant, and two dynamos. The Sunderland Corporation has for disposal a quantity of steam-driven generating plant. See our advertisement pages in this issue.

**Dissolutions and Liquidations.**—PROVINCIAL ELECTRICAL CO. LTD.—This company is winding up voluntarily, with Mr. T. B. Scattergood, Edmund Street, Birmingham, as liquidator. A meeting of creditors is called for February 11th.

ELECTROLYTIC APPARATUS SYNDICATE, LTD.—A meeting will be held on March 10th, at 34, Norfolk Street, Strand, W.C., to hear an account of the winding up from the liquidator, Mr. W. Renison.

LUMB ELECTRICAL BLEACHING CO., LTD.—A meeting is called for March 18th, at Prudential Buildings, Queen Street, Nottingham, to hear an account of the winding up from the liquidator, Mr. W. B. Winnicott.

## LIGHTING and POWER NOTES.

**Atherton (Lancs.).**—The B. of T. has formally approved of the placing of overhead lines for the supply of electrical lighting to various large residences in the Westhoughton district.

**Australia.**—The W.A. Government having bought the Perth tramways, and the City Council having purchased the Electric Lighting Co.'s undertaking, an agreement has now been arrived at for establishing a Government power plant for both purposes. A 9,000-kw. plant for three-phase generation is proposed, at a cost of £162,000; working independently, a new tramway station would cost £100,000, and a new electric lighting station £132,000. A report on this scheme is being prepared by Mr. C. H. Merz and Mr. Wilson.

**Balderton (near Newark).**—The Parish Council of the village (population, 2,824) proposed to proceed with a scheme to light the streets with electricity from a supply provided by Messrs. Simpson, Ltd., ironfounders. This was last March, and the electors sanctioned an expenditure of £650. Meantime, the price of trade materials has gone up 25 per cent., and the Council proposed to substitute aluminium for copper wire, and wooden standards for steel, in order to effect a saving. A parish meeting was then demanded by a requisition of ratepayers, and a resolution protesting against the Council's action in altering the original scheme, was passed last week. The L.G.B. has written stating that it will raise no objection to the altered proposals. It now remains to be seen whether the Parish Council will carry out the scheme before the election is held in March.

**Bath.**—At the meeting of the Surveying Committee on Monday, the Street Lighting Committee submitted three schemes for the further conversion of gas lamps to electric lighting, and it was decided to carry out one scheme, costing £140 immediately, and to provide in the estimates for the others, costing £127 and £94 respectively.

**Birmingham.**—The B. of T. has made an order for cesser of powers of the Shropshire, Worcestershire and Staffordshire Electric Power Co. as to the part of the area which has been included in the enlarged Birmingham city area. The portions include Handsworth U.D., Yardley R.D., and a portion of the U.D. of King's Norton and Northfield.

**Bolton.**—The Electricity Committee has received applications for supplies of electric current to the following mills:—Messrs. Slater & Co., Little Bolton Bleachworks; Messrs. R. Eatwistle & Co., Lincoln Mill; the Victoria Mill, Nelson Street; and Messrs. Winder & McKean, Bradford Mill.

**Burton-on-Trent.**—A sub-committee has been appointed to prepare and bring up a final report as to the establishment of an electricity showroom.

**Canada.**—The preliminary report of the Hydro-Electric Commission for the working during 1912, shows a total revenue of \$511,801.88, and expenditure amounting to \$466,635.43; the surplus has been set aside as depreciation reserve. The loads during the quarters of the year were: 43,149 H.P., 58,326 H.P., 64,306 H.P., and 80,723 H.P. The total capital expended was \$4,168,824, including \$2,256,129 on transmission lines, \$1,322,806 on transformer stations, \$542,088 for right-of-way, and \$17,803 on distributing stations.

**Continental Notes.**—**GERMANY.**—The Kreis Council of St. Gear has empowered the Committee to sign a contract with the A.E.G. for the electric lighting of the whole district. Extensive enlargements of the power station at the State salt mines at Bleichrode are to be carried out, and the Prussian Budget disbursements include a fresh instalment of £10,000 for the purpose. The power station at Memel, which is the property of the Memel Light Railway Co., is to be converted into a bulk supply station, with a view to supplying light and power to the whole of the district, including the City of Memel. A high-pressure network is to be installed.—*Elektrotechnische Nachrichten.*

**NORWAY.**—The Norwegian Government has raised a loan of 365,000 kroner for the improvement of the Port of Narvik; among the improvement works contemplated is the erection of a power station. The occasion affords opportunities for the supply of electrical material, including probably electric cranes, &c.

It is proposed to build a hydro-electric station with a capacity of over 200,000 H.P., which will be worked by the State, and will supply current to Christiania and Western Norway. The station, which will be situated in Numedal and will utilise the Nore Falls, 420 metres high, will be equipped with 11 20,000-H.P. and two 10,000-H.P. turbines. The current will be employed to work the railways, in the first place, and for lighting, &c.—*Journal Pratique de l'Electricité.*

**Darwen.**—Speaking at a meeting last week, Councillor Jepson said that during the year to meet increased local electricity demands, new plant had been installed at the works. A large number of consumers had been connected requiring current chiefly for power purposes, and the inquiries were coming in freely. New consumers connected during the year would mean an increase in units sold of 1,150,000 units per annum, and the output for power purposes had been trebled during the last 12 months.

The Darwen Spinning Co. has made application to the Corporation for a supply of electricity for motive power.

**Derby.**—Considerable discussion took place at a meeting of the T.C. on a request of the E.L. Committee for a grant of £13,500 for the purchase of certain plant required in connection with the rearrangement of the electric power station. The Committee proposed to scrap two small machines of 100 kw. and install one that would bring the capacity up to 7,450 kw. It was anticipated that the new machinery, after allowing £800 for interest and sinking fund, would effect a saving of £2,000 per annum. Councillor Green characterised it as only half a scheme at the best, and the works as a white elephant. The site was unsuitable. Any private firm could compete with the Corporation in making electricity, and he himself was beating it in the prime cost of production. Aldermen Hart and Fisher both condemned the idea of raising the money required by means of a loan. The former pointed out that the outstanding debt on the undertaking was £230,000, of which £50,000 was in respect of machinery. The Council rejected amendments directed against the suggestion to obtain a loan for the plant. The Committee's recommendations were approved, and the question was referred to it of the best means of dealing with the money.

**Dundee.**—The new sub-station at Larch Street will be in operation in a few days, and the excavations on the site for Carolina Port main generating station extension are well in hand, and pile driving will be started immediately.

**East Sussex.**—The C.C. has decided to oppose the Bills of the Mid-Sussex Electric Light Co. and the Crowborough District Gas and Electric Light Co.

**Epsom.**—The U.D.C. has agreed to supply current to the B. of G. for the workshop buildings at 1d. per kw.-hour for power, with a minimum quarterly consumption of 3,000 units, and  $\frac{1}{2}$ d. per kw.-hour for all over 12,000 kw.-hr. per annum; for lighting, a flat rate of 3d. on a guaranteed annual consumption of 10,000 units, will be charged.

**Galashiels.**—A Committee of the T.C. has had a meeting with a deputation of manufacturers interested in the introduction of electricity for power purposes. The question of the T.C. taking up the matter, or consenting to the installation being undertaken by a local company, was discussed. The whole question was remitted to a Special Committee for further consideration.

**Gillingham (Kent).**—The T.C. has decided to give a supply of current to the proposed new cement works to be established in the town at 625d. per kw.-hour for the first million kw.-hr. per annum and 6d. per kw.-hour beyond; the amount of energy to be supplied is to be not less than 2½ million kw.-hours per annum, and the contract is to be for five years. The new cement works are being erected by Mr. J. R. Featherby.

**Grimshy.**—We have received from Mr. W. A. Vignoles, the borough electrical engineer, a copy of the second edition of his 'Electricity Consumers' Guide,' an 18-page booklet in five sections, giving such information as the inquiring consumer may want, bearing on systems of charging, probable cost, wiring,

suggestions for lighting, heating, cooking, &c. We congratulate the author on paragraph 16, which reads, "Great care should be taken to get rid of old gas pipes . . . this will entirely prevent any chance of a leakage of gas occurring."

**Harrogate.**—The T.C., on Monday, decided to apply to the L.G.B. for a loan of £6,250 for extensions to the electricity plant.

**Hastings.**—The manager of the Gas Co. having disputed the alleged saving of £91 during 1912 by the substitution of electric light for gas at the Hastings Workhouse, the chairman of the Electricity Committee was questioned at a meeting of the Corporation. He said the profit to the ratepayers by laying the mains to the workhouse was at present not less than £140 a year, that in five years' time, when the Guardians have paid off their loan for installation, the net saving to the ratepayers will be at least £230 a year.

**Hove.**—According to the *Express*, the voting in connection with the Bill for acquiring the local electricity undertaking resulted in 1,384 for and 1,015 against proceeding with the matter.

**Kendal.**—The Electricity Committee has decided that the manager be instructed to prepare an estimate for the installation and fittings for street lighting in the borough.

**Kettering.**—The Management Committee of the Kettering and District General Hospital has decided to have the electric light installed at the institution at a cost of about £200.

**Liverpool.**—The report submitted by Mr. Harold Dickinson, city electrical engineer, at the meeting of the Corporation, on January 5th, states that during the past year the reconstruction of the Lister Drive No. 1 station, consequent on the replacement of the high-speed engines by turbines, had made fairly satisfactory progress, and during the latter part of the year two sets of direct current turbo-generators, each of 2,000-kw. capacity (British Westinghouse), and one 3,500-kw. turbo-alternator set (British Thomson-Houston) had been put into commercial service. The remaining 3,500-kw. turbo-alternator on order would shortly be delivered, thereby increasing the capacity of No. 1 station from 8,000 to 11,000 kw. Dealing with the second portion of the reconstruction scheme, involving increased boiler plant to deal with the increased size of generating units, Mr. Dickinson advocated water-tube boilers, and said it would be possible to lay down four generating sets of 5,000 to 6,000-kw. capacity each, instead of two of 3,500-kw. each, and by this means postpone the necessity for erecting a new power station. The estimates included the displacement of two batteries of Lancashire boilers (seven boilers to each), which would cover half the reconstruction scheme; but the Committee would probably prefer to commence with only one battery, which would provide ample steam for 1913 for the No. 1 station, the cost being approximately £24,500. With the provision suggested, there would be ample capacity of plant to provide for the load during 1913; but further generating plant should be provided of 5,000 to 6,000 kw. capacity for the winter of 1914, and in view of the long period taken by the contractors for delivery, he considered that the order should be placed for the plant as early as possible. Regarding Pumpfields Station, which was being run less efficiently, Mr. Dickinson recommended that transforming plant supplied with high-tension energy from Lister Drive, should be installed, which would enable Pumpfields to be shut down for the greater part of the year.

The annual accounts of the electricity department show a total revenue for the year ended December 31st last of £285,803, and a balance carried to net revenue account of £169,292, which, with interest accrued, amounted to £172,363. Interest and sinking fund absorbed £65,615 and £55,628 respectively; £1,048 was transferred to reserve and £20,000 to renewals, and the balance of £30,071 was contributed to the general rate. The reserve fund amounts to £178,508, and the unexpended balance of the renewals fund to £120,000. The outstanding capital expenditure amounts to £1,560,000.

**London.**—**WESTMINSTER.**—The Works Committee reports having had under consideration the question of the Council's contract with the Charing Cross Electricity Supply Co., for lighting the parish of St. Martin-in-the-Fields, under which the Council has the option to determine the contract at the end of the fourteenth year of the contract, viz. on September 17th next, provided notice be given on or before March 17th; and if the option is not exercised the contract will run for the full period of 21 years. The Committee states that the termination of the contract in the fourteenth year would, by Clause 14 of the contract, entail the purchase by the Council of lamps, fittings, conduits, mains, service lines and all other apparatus then in use, but not distributing mains used for general supply. 124 lamps are lighted and maintained by the company under the contract, and the payment per lamp is as to 101 lamps, £28 per annum, and as to 23 lamps, £27 10s. per annum, these rates being inclusive of all capital charges, except for the columns, which are the property of the Council. The price now paid by the Council for lighting and maintaining (exclusive of capital charges), 1,800-c.p. gas lamps is £15 10s. per lamp per annum, and for 3,000-c.p. gas lamps £22 per lamp per annum, under a five years' contract. The company has offered to improve the lighting of the area by substituting flame arc lamps, provided the Council contributes one-half of the cost, estimated at £1,488. The purchase price for the property is £10,726, and the company has been asked to furnish further details of this price. Concluding, the Committee states that before considering further, it has directed that competitive tenders for the public lighting of the streets now lighted under the contract be invited

from the electric light companies having powers of supply in those streets, and from the Gas Light and Coke Co.

**Lewisham.**—The B. of G. on Monday decided to install the electric light at the infirmary in place of the present gas. A report of a special Committee, stated that experimental lighting of certain wards by the South Metropolitan Gas Co., and the South Metropolitan Electric Light and Power Co., had resulted in its coming to the unanimous opinion that the electric light was far preferable upon the grounds of better lighting, cleanliness, healthiness and general convenience. During last year, £83 had been expended in the infirmary on mantles, burners, globes, &c. The present system of lighting by gas necessitated the whole of the wards, rooms and offices being whitewashed every year, and the wages alone paid to labourers for this work amounted to £160 odd. The chairman of the Sub-Committee, in his observations on the subject, said that in the wards lighted by gas the lights were turned on by means of switches attached to the walls, and worked similarly to the electric switches. This plan seemed at first to be a very excellent one, but in practice they were very disappointing, and probably a source of danger, for it was found that often when the light was switched on, or supposed to be switched on, all that happened was an escape of gas and no light, owing to the by-pass having gone out. On one occasion no less than 15 lights were out. This was, no doubt, owing in a great measure to the draughts which were unavoidable in such institutions. The system was an untried one in large institutions, and has the disadvantage that the light must be full on or not at all. The cost of the electric current, though a little more than gas, compared favourably. The chairman pointed out that the system of gas lighting tried was the best the gas experts could suggest. A test was made under equal conditions, lasting just three hours, the number of lights in each case being 24. The cost of the gas was at the price at present charged, and the electric current was 3d. a unit. The cost of gas used in three hours was 5'2d., and that of the electricity was 5'55d., a difference of '35d. It might be questioned if this could be correct. It was true that the gas company had stated it was prepared to quote special terms for gas, but had made no definite offer. The Board had also to consider the cost of mantles, which last year was over £83. The cost of installing electric light would be £800. The question of lighting the workhouse by electricity was adjourned to the next meeting.

**Battersea.**—The electrical engineer advises a further extension of plant at the central generating station in order to cope with next winter's demand. Accordingly, an additional boiler with mechanical stoker, pipework, gearing, &c., and a condenser circulating water pump is to be provided at an approximate cost of £3,275, and tenders are to be invited therefor.

**Manchester.**—On behalf of the ratepayers in Cavendish Street and Stretford Road—two important shopping thoroughfares—representations have been made to the Lighting Committee of the Corporation in reference to a better method of lighting such thoroughfares by means of an electric installation, and the Committee has instructed Messrs. Newbigging & Pearce to prepare and submit a joint report on the subject of the public lighting of roads, streets, courts and passages in the city.

A section of the central area was deprived of electricity from about 9.30 to 11 o'clock last Friday night. Two of the principal newspaper offices were affected. According to an official statement by Mr. S. L. Pearce, the chief engineer, made on Saturday, the fault occurred on only one of the 16 sections into which the whole of the central area is divided. Apart from the two newspaper offices, not a single inquiry was received from any consumer until an hour after the trouble arose. Mr. Pearce stated that the division of the area was made about eight years ago, and Friday's occurrence had shown how wise the policy was.

**Nelson.**—A Sub-committee of the Electricity Committee has interviewed representatives of four firms of cotton manufacturers on the question of a supply of current from the Corporation mains for loom-driving. The firms in question would be prepared, subject to satisfactory tests, to accept the terms offered by the Committee. What the terms were did not transpire, and Mr. Dinsdale said the proposed step was so important that if he were chairman of the Committee he would not like to accept the responsibility of letting it go through without open discussion. The chairman replied that the Committee was unanimous, and the only question at issue was one of price. Applications had been received in respect of 1,760 looms, and it was essential to get the business through without delay.

An inquiry was held on the 6th inst. by the L.G.B. relative to the proposal to borrow £2,000 for electricity purposes. No opposition was raised.

**Newport (Mon.).**—In connection with the report which is being prepared by the electrical engineer upon the subject of the extension of the generating plant, the different types of plant in operation in other parts of the country are to be inspected. The engineer has submitted a scheme for the improvement of the lighting of Caerleon Road. This scheme provides for 14 500-c.p. lamps, each consisting of five 100-c.p. lamps, and showed that the annual revenue, if the same amount were paid as for existing arc lamps, viz., £16 per lamp, would be £224. The lighting would be done from overhead wires, and the tramway standards would be utilised instead of erecting lamp columns. The gas company also submitted a scheme for improving the gas lighting of the portion of Caerleon Road in question, using the "Parkinson lamp" with twin inverted burners, which, if adopted, would make the approximate cost. £65 per annum, as against £42 for the existing gas lamps. The cost of the lanterns would be £2 3s. for

each lamp. The Electricity Committee has instructed the engineer to provide a series of four electric lamps, and asked the Gas Co. to demonstrate with four of the improved type of gas lamps suggested by it.

**Orsett.**—The L.G.B. has intimated to the B. of G. that, speaking generally, it is not disposed to approve of the installation of plant for the production of current for lighting the Workhouse buildings. The Guardians, however, have decided to reply that the Workhouse is isolated from any large town, that there are no means of obtaining electricity without it being generated on the premises, and that they believe that electricity is the cheapest and best system of lighting.

**Osulton Broad.**—The U.D.C. has, by 8 votes to 4, declined an offer to purchase the undertaking of the Electric Lighting Co. for £2,000; £1,100 for inside and outside plant, meters, goodwill, &c., and £900 for outside mains, meters, goodwill, &c.

**Peterborough.**—The T.C. has received the sanction of the L.G.B., to a loan of £1,000 for mains.

**Rochdale.**—In December last the Corporation sought the sanction of the L.G.B. to loans of £15,000 and £30,000 for extensions at the electricity works. On Wednesday, last week, the Gas and Electric Committee decided to ask the L.G.B. to sanction the borrowing of an additional £30,000 for extensions to the building, and boiler and general plant. The necessity for the extension is urgent, and the Committee decided to advertise for tenders straightaway, in order that no time should be lost.

**Rotherham.**—The electrical engineer has been instructed to report upon the question of providing additional generating plant. Sketch plans have been approved for extending the tram-car sheds in Rawmarsh Road.

**St. Helens.**—The L.G.B. has forwarded to the T.C. sanction to a loan of £3,873 for excess expenditure on mains, £1,133 for similar expenditure on services, rotary converters, boilers, &c., £500 for sub-station buildings, £3,800 for cables, £600 for sub-station equipment, and £1,900 for transformers.

**Salford.**—Improvements which are being effected at Salford Docks, include the installation of six electric cranes to lift 2 tons. One of the new cranes was tested last week. The order has been given to Messrs. Higginbottom & Mannock, who are also supplying eight 30-cwt. electric cranes for No. 8 Dock.

**Sheffield.**—The Electric Lighting Committee recommends the T.C. to apply to the L.G.B. for a loan of £130,860 for extensions. The sum includes £62,800 for buildings, &c., and £58,800 for boilers, pipework, turbo-alternators, and switchboard.

**Shipley.**—Messrs. G. A. White & Co. have asked the U.D.C. to supply current for power to their proposed new shed on the Shipley Fields estate, but the Council has replied that at present it cannot undertake the supply.

**South Shields.**—Mr. Ellis, the borough electrical engineer, informs us that energy for outside arc lighting will in future be charged 2d. instead of 4d. per kw.-hour, and for domestic power (1½d.) will be charged at the heating and cooking rate of 1d. per kw.-hour. Also that practically the whole of the street lighting has been brought up-to-date, by the adoption of 12-ampere Exello arcs in place of the 94 old type arcs—four 12-ampere Metroflam magazine lamps being also in use at points distant from the arc lamp routes, in order to save attendance costs; 475 incandescent lamps have been fitted with 32 instead of 16-c.p. metal lamps, and in a number of other cases 50-c.p. metal lamps have superseded 32-c.p. lamps. The headquarters of the electricity department will shortly be removed to new offices directly opposite the municipal buildings, and a showroom will be provided there.

**Stockport.**—Mr. J. Welsh, speaking at the T.C. meeting on February 5th, drew attention to the decision of the Electricity Committee to supply electricity at a flat rate of 1½d. per kw.-hour, less 5 per cent. for lighting and power purposes, and expressed the hope that the question of reducing the general price for electric lighting (3½d.) to the ordinary consumers would receive consideration. Alderman Hopkins said he hoped the Committee would consider the question of giving special treatment to seven-day consumers of electricity, to those people who used electricity all the year round. Alderman Ball (chairman of the Electric Committee) said the questions raised would be considered in March. He agreed that people who used electricity for long hours, seven days of the week, were entitled to consideration.

**Stoke-on-Trent.**—The T.C. is considering the advisability of having the Market at Tunstall lighted by electricity. The estimated capital cost of the scheme is £550, and the annual cost of lighting and upkeep about £150.

**Tasmania.**—The City of Hobart is now lighted by electricity, supplied from a temporary steam station pending the completion of the hydro-electric company's scheme: gas lighting having been superseded.

**Tunbridge Wells.**—The Corporation has referred the report of the borough electrical engineer with respect to the replacement of the small generating sets, to its consulting engineers, Messrs. Horace Boot and Partners.

**Walsall.**—The position of the Corporation's electricity undertaking is causing grave anxiety at the present time, and the matter was discussed at Monday's meeting of the T.C. The loss on the concern last year amounted to no less than £3,853. The reserve fund is only £1,594, and assuming this amount is utilised for the reduction of the deficit, it still leaves considerably over £2,000 to come out of the pockets of the ratepayers. Recently the Council appointed a Committee to thoroughly investigate the position of the undertaking and to report as to the best means of placing it upon a sound footing. It was then found that, for some time, the department had been completely disorganised, owing to alterations, extensions, repairs, &c. The Committee also found that the plant was working altogether inefficiently, that the fuel consumed was inferior, and that, generally speaking, the coal strike had had a great deal to do with the unsatisfactory working. In order to maintain supplies, fuel had to be purchased at an increased price, whilst the inefficient working of the plant was attributable to the fact that there had been delay in completing the alternating-current plant and making it ready for use. Furthermore, it was discovered that, as a result of the reduction in price of current for traction purposes, there had been a decrease in revenue of over £800. The outcome of the whole matter is that, at Monday's meeting of the Council, the members were recommended to call in an electrical and mechanical expert to report fully upon the undertaking. They were also recommended to take into consideration the advisability of increasing the price of electric current. After receiving the report of the consulting engineer, the recommendations were adopted by the Council.

**Warwickshire.**—The C.C. has decided to oppose the Bill of the Coventry T.C. for powers to supply electricity in the parishes of Ellesley, Binley, Coundon, Keresley, Stoneleigh, Walsgrave-on-Sowe, Willenhall and Wyken.

**Wolverhampton.**—The following figures show the growth of the Corporation's electricity works during the past three years:—The output has increased from 7,072,114 units to 11,544,636 units; the capacity of the additional generating plant installed amounts to 3,500 kW.; the station costs have decreased from 176d. per unit to 134.5d. per unit; the gross profit has increased from £16,891 to £24,042; and the net profit has increased from £3,401 to £7,079.

**York.**—The recommendation of the Electricity Committee to extend the electricity works and plant, at a cost of £30,000, has been confirmed by the City Council. It was stated, in reply to critics who complained that Messrs. Rowntree were favoured with special terms, and that the extension was needed for the latter's convenience, that the firm took more electricity than all the other consumers, including the tramways, put together, and that they were prepared to take another 750 kW. per annum with a guarantee. They had had a contract for a year, the result being that the undertaking was £3,000 better off than in the previous year.

## TRAMWAY and RAILWAY NOTES.

**Abertillery.**—The U.D.C. has decided to oppose in Parliament the Western Valleys (Monmouthshire) Railless Electric Traction Bill.

**Australia.**—The Cabinet has approved the underground electric railway project for Sydney (N.S.W.), and the work is to be started immediately.

**Batley.**—A deputation from the Dewsbury Electricity and Tramways Committee is to meet a Committee of the Corporation, on the 20th inst., to discuss the question of the proposed line of tramways to Staincliffe.

**Bolton.**—The new Corporation tramways repair sheds were opened on February 5th by the chairman of the Tramways Committee. The works include the following departments: Wheel and truck shop, fitted with an overhead travelling crane capable of lifting 7½ tons, a wheel lathe, wheel press, and two hydraulic jacks; electrical repair shop, with pits over the whole area; paint shop; body shop, with basement for the suction pipes to the pneumatic dust-removing installation; turning and fitting shops, with an overhead runway and trolley tracks; smithy, offices, &c. A traverser has been laid down to serve the wheel and truck, electrical, paint and body shops, and an overhead runway and trolley tracks have been laid along the main passages. The whole of the machinery is electrically driven. Dining, billiard and club rooms have been provided for the staff. The work has been carried out under the superintendence of the borough engineer. In opening the building, Alderman Miles mentioned that the estimated cost was £20,000.

**Royton and Crompton.**—Subject to the approval of the B. of T., the Oldham T.C. has agreed to lease the tramways in the urban areas at Royton and Crompton for 21 years. Oldham will pay Royton U.D.C. a rental of £3,677 per annum and Crompton U.D.C., £1,294 a year.

**Bradford.**—The tramway tracks in several sections of the system are to be renewed, at an estimated cost of £21,836. This sum includes the doubling of the track at Great Horton, for

which the sanction of the Board of Trade is to be obtained. Tenders are to be invited for carrying out the foregoing work, including the provision of steel poles for the equipment of trolley vehicle routes.

**Bournemouth.**—The T.C. has confirmed a proposal to introduce a Sunday service of tramcars, from 2.0 to 10 p.m., and to pay the employees engaged on such work at the rate of time and a quarter.

**Brighton Railway Electrification.**—Speaking on the advantages of electrical working on the Brighton Co.'s suburban railways, Lord Bessborough, chairman of the company, at the recent general meeting, said: Prior to the establishment of electrical services there were 496 trains working in and out of Victoria Station in the day. At the present time 739 trains a day were worked. At London Bridge the steam trains working in and out prior to electrification numbered 663 a day, but now 901 trains a day passed in and out. The average number of passengers carried each year on the South London line since electrification was over 4½ millions more than the number carried in the last year of steam working, or 14,000,000 more passengers during the whole period. The Victoria and Crystal Palace electrical services began 18 months ago, and in that period there had been an increase of nearly 4,000,000 passengers. The London Bridge and Crystal Palace services had been in operation for six months, but even in that time they had obtained an increase on this section of over 319,000 passengers. The cost of the maintenance of the whole of the overhead equipment, since it was first erected, had been £2,927, which worked out at the low figure of £21 per mile per annum, and the other conditions of maintenance were equally satisfactory. He went on to refer to the company's decision to extend the electrical working to the greater portion of its remaining suburban lines, particulars of which were given on page 176, and stated that the contracts will shortly be made with the Metropolitan Carriage Co., for the motor coaches, and with Messrs. Blackwell, for the overhead construction. The works will take four years to complete, but it is anticipated that an important part will be in use within 18 months.

**Bristol.**—It has been decided to request the Tramways Co. to remove the centre tramway poles between Bath Bridge and St. Augustine's Bridge, on the ground that they constitute an obstruction to traffic in their present positions. The cost of carrying out the work is put at £1,700.

**Continental Notes.**—GERMANY.—In connection with the projected electrification of the Berlin municipal and suburban railways, 26 members of the Budget Commission of the Prussian House of Deputies recently made a visit of inspection to the Bitterfeld-Dessau electric railway and the power station at Muldenstein, which is undergoing enlargement for the purposes of the projected electrification.—*Elektrotechnische Nachrichten.*

RUSSIA.—The town of St. Petersburg proposes to issue a £7,000,000 loan, half this amount being required for electric tramway extensions in the city.

**Croydon.**—The Tramways Committee recommended the B.C. on Monday to seek powers to extend the Addiscombe tramway to South Norwood, via Woodside, at an estimated cost of £28,102. The scheme provided for a double track over nearly the whole route, and for the purchase of five cars. Powers were obtained for this extension in 1905, but were allowed to lapse. The chairman of the Committee contended that the great growth of the neighbourhood justified the expansion, which would follow the principle adopted by the L.C.C. of linking up various dead ends. Addiscombe was their best paying route, and he was sure of further profit. The widespread talk about motor-buses being about to "wipe out" tramcars he attributed to party motives in connection with the L.C.C. elections. All the information that he had pointed to tramcars being run more cheaply than motor-buses, even if the price of petrol came down by two-thirds. However, it would take two or three years to carry out the scheme if adopted. If, in the meantime, motor-buses came over the route—and he believed there would not be enough traffic to maintain both services—the Council could reconsider the position. Councillor Hussey moved the reference back. Strong fears of motor-bus competition were expressed by several members, and one described the chairman's attitude as a direct invitation to motor-bus companies. Councillor Umney advocated railless traction, estimating that the cost would not be more than £10,000. The voting was a tie of 24 votes on each side, and the Mayor (Councillor S. Rogers) gave his casting vote for the reference back.

**Dewsbury.**—The General Purposes Committee of the Corporation has recommended that the Parliamentary Committee apply for a prov. order for powers to construct a tramway from the present terminus of the Dewsbury and Ossett tramways across the Market, and a junction with the Spen-Valley Light Railway, with running powers over the respective lines, for the purpose of linking up the proposed Shaw Cross and Westborough tramways. It was also decided that, subject to the approval of the Batley Corporation, powers should be obtained for carrying the Westborough tramway system from the borough boundary at Dewsbury Moor to Staincliffe.

**Doncaster.**—The Rural District Council has decided to oppose the Mexboro' and Swinton Tramways Bill, which is to provide for the establishment of a railless traction system, the ground of objection being that the cars are injurious to roads.

**Folkestone.**—The T.C. has sealed a petition against the Folkestone and District Railless Traction Bill. A similar course has been taken by the neighbouring Urban Councils at Cheriton and Sandgate.

**Glasgow.**—At an early date the T.C. will be asked to consider a recommendation by the Statute Labour Committee for the erection of a new bridge—making four in all—over the River Clyde, in the centre of the city. For years back, since the inauguration of the trolley-car system, in fact, the congestion on the main thoroughfares has become very marked, and is yearly increasing through the lengthening of car routes and the augmentation in the number of cars. The proposed bridge, if the Committee's recommendation is approved, will be immediately to the west of the present Jamaica Bridge, over which the heaviest of the north and south traffic passes, and will be utilised as a relief to several of the routes converging near that point. The convenor of the tramways, in a recent speech, promised a handsome contribution, if not the whole cost of a relief bridge, if such a structure was erected to the satisfaction of his committee.

**Hastings.**—On Friday the Corporation passed formal resolutions adopting a petition to Parliament in opposition to the Hastings Tramways Bill which is being promoted in Parliament, and authorising the expenditure of the necessary money for opposing the measure. The object of the promoters of the Bill is the substitution of overhead wires along the entire front of the town and Robertson Street (the chief business thoroughfare) for the existing Dolter system, which has for some time past been considered unsatisfactory. At the instance of the Corporation, a B. of T. Inspector has been down and made certain suggestions to the company. Frontagers are practically unanimous against overhead wires, which they contend would effectually ruin the Front line. The resolutions to oppose were carried by 30 votes to 5.

**London.**—HACKNEY.—The Woolwich B.C. has been informed that the Hackney Council will co-operate with it and with the Lewisham B.C. in opposing the L.C.C. Bill so far as it has reference to running railless trolley vehicles.

**Manchester.**—The Tramways Committee has decided to construct a double track along Slade Lane, Levenshulme, a growing suburban district. The Tramways Committee is also in the market for a number of motor-buses.

**Midland Railway Electrification.**—According to the *Daily News*, the Midland Railway Co., since the acquisition of the Southend and Tilbury line, with joint use of Fenchurch Street Station, has taken up consideration of the development of its London suburban traffic. The company is bound by the Act permitting the taking-over of the Tilbury and Southend line to equip the latter for electric working within seven years. The first step in this direction will be the extension of the present electric train service from Barking to Upminster and the running of through electric trains to that point from the underground system. Consequently on this alteration the company now contemplates the electrification of the line formerly known as the Tottenham and Forest Gate Railway, running from Kentish Town to East Ham, where the main line between Tilbury and London is joined. The main line from Kentish Town to St. Pancras will also be equipped for electric working. At the same time it is proposed that the line to St. Albans, passing through Mill Hill, shall also be electrified, and a junction made with the extended Golder's Green tube at Colin Dale, just beyond Hendon.

**Newport (Mon.).**—On various grounds the T.C. will oppose the Western Valleys Railless Electric Traction Bill.

**N.-E. Railway Electrification Schemes.**—The North-Eastern Railway Co. is about to electrify the section of line from Shildon, in Durham, to Middlesbrough-on-the-Tees, a distance between 18 and 20 miles, and embracing 50 miles of track. Energy will be supplied by the Newcastle-on-Tyne Electric Supply Co., in conjunction with the Cleveland and Durham County Electric Power Co. The contract for the electrical equipment for the first 10 locomotives, which are to be constructed at the N.-E. Railway locomotive works at Darlington, has been placed with Messrs. Siemens Bros. The contracts for the sub-station plant are said to have been placed with the British Thomson-Houston Co., and the cables with the British Insulated and Helsby Cables, Ltd. The line is largely used for mineral traffic, and the trains to Newport average over 900 tons in weight; the reverse traffic consists principally of empty trains of 350 tons weight.

**North-Western Railway Electrification.**—The new local line between Willenden and Watford was opened for traffic on Monday, with a temporary steam service, pending the carrying-out of the electrical scheme, in connection with which considerable progress is being made. The contract for the power station at Stonebridge Park is about to be let, and the tunnel work in connection with the extension of the Bakerloo tube to Queen's Park has been commenced.

**Oxford.**—The T.C. has passed a motion authorising the Tramways Committee to make application for the payment of fines and penalties due to the Corporation, by reason of the failure of the National Electric Construction Co. and the City of Oxford Electric Tramways, Ltd., to carry out the electrification of the tramways.

**Sheffield.**—The highways surveyor has been instructed to put in hand the work of doubling the length of single tramway track near Woodbank Crescent on the Woodseats section as early as practicable. The track in Flat Street is to be extended to the bottom of Sycamore Street. Tenders are to be obtained for two negative boosters for the Kelham Island power station and for 1,000 tons of tramway rails. In connection with the alteration of the road levels at the junction of Spring Vale, Howard Road, and Upperthorpe, part of the tramway track is to be renewed.

**South Lancashire.**—At a meeting of the Worsley District Council, held on Monday, a plan was submitted by the South Lancs. Tramways Co. for a short length of tramway in Manchester Road, Walkden, connecting with the proposed new tramway through Little Hulton.

**South Shields.**—At a meeting of the T.C. on the 5th inst., the question of extending the tramways from Laygate to the low entrance to Tyne Dock was dealt with in a report of the Tramways Works Sub-Committee, which, after considering a report from the tramways manager, stated that it was unable to recommend the extension along the route suggested. The Tramways Committee recommended that the Sub-Committee's decision be confirmed. The Mayor, in moving the adoption of the report, said that no undertaking could afford to put down a service for working men only, and he, after making a study of the suggested new route at all times of the day, could testify that it was practically deserted after 5 p.m. Mr. Sykes commented on the importance of tapping the traffic in the Corstorphine district, and moved that the matter be sent back to the Committee for further consideration. Eventually the amendment was negatived, and the report was adopted.

**Stockport.**—At the T.C. meeting on February 5th, consideration was given to a report made by the tramways manager upon the effect of the alterations of tramway fares. The report showed that, compared with the corresponding period of the preceding year, the aggregate increase of revenue for the period under review was £2,049 on the sections concerned. Alderman Sharples, the chairman of the Tramways Committee, said there was no doubt there had been a loss. Traffic had increased on all sections, but the reduced fares had resulted in a loss. He hoped this circumstance would not be taken as an inducement to reduce fares further without consideration of what the result might be.

**Walsall.**—The working of the Corporation's tramways for the past year shows a net profit of £3,392, which is to be carried to the reserve fund after a payment of £500 to the borough fund in aid of the rates. The Tramways Committee has also notified the Finance Committee that it is proposed to make a contribution from the estimated profits of the tramway undertaking in relief of the rates for 1913 to the amount of £1,000 (in addition to the £500 mentioned), to be paid in two instalments before December 31st next.

**West Hartlepool.**—A statement which has just been prepared, for the information of the members of the West Hartlepool T.C., shows that the total capital expenditure by the Corporation on the tramways is £66,943. The arbitration expenses in connection with the Foggy Furze lines amounted to £1,858, of which counsel's fees were £1,124, and expert witnesses £636. The costs of the case in the King's Bench Division regarding the purchase of the same were returned at £112, and in the Court of Appeal £136.

## TELEGRAPH and TELEPHONE NOTES

**Australia.**—A correspondent of the *Times* says that wireless stations are now operating in the six State capitals, as well as on Thursday Island and at Port Moresby.

**Hong Kong.**—The Government has sanctioned the installation of wireless telegraphy at Hong Kong, and as stations will also be erected at Singapore and in North Borneo, ships equipped with wireless will be able to maintain communication with the land at all points within these limits.

**Ice Dangers in the Atlantic.**—It is reported that negotiations are passing between the Government and the principal Atlantic steamship lines with a view to stationing in the ice region a vessel which will have a very powerful installation of wireless telegraphy, and will report to stations on the American coast and to Atlantic liners crossing the ocean the positions of icebergs or other dangers to navigation.

**Imperial Wireless System.**—On Wednesday last week the Select Committee on the Marconi contract further examined Mr. W. R. Lawson, who communicated to the Committee the names of the brokers and dealers most largely concerned with transactions in the company's shares, and discussed methods of identifying the persons for whom they had acted. The witness said there was no doubt that the largest transactions had been foreign. He said that his articles in the *Outlook* and the *National Review* were written at the request of the editors, and that his references to Ministers in the former were not intended to constitute charges against them. He thought some of the expressions he had used were unfortunate.

He held that Mr. Godfrey Isaacs, by reason of his relationship to the Attorney-General, was able to get better terms than other companies, though he did not suggest that the Attorney-General interfered with the negotiations in any way. He had found no definite grounds for making any charges against Ministers.

On the following day Mr. Lawson said that if he were writing the articles again he would not employ the same language in regard to Ministers. He made no effort to find out whether there was any foundation for the rumours connecting Ministers with dealings in the shares, and he agreed that the charges should not have been made without evidence.

On Monday the Hon. W. Guinness, M.P., chief proprietor of the *Outlook*, and the editor of that paper, Mr. E. Oliver, were examined. The former expressed regret if anything in the articles could be taken as suggesting improper financial conduct on the part of Ministers. He considered that certain sentences were very regrettable. He had not the slightest doubt as to the personal honour of the Postmaster-General. Mr. Oliver denied that he ever looked upon the articles as charging Ministers with personal corruption. He thought they were a most valuable series. If he had foreseen the appointment of the Committee, he would not have published the articles.

On Wednesday, the examination of Mr. Oliver was continued and concluded; Mr. L. J. Maxse, editor and proprietor of the *National Review*, was then called, and on his refusal to divulge the names of persons from whom he obtained information regarding the rumours that Ministers were financially interested in the Marconi contract, because it would be a breach of confidence, the Committee resolved to report him to the House of Commons. No further sittings will be held until the next session.

Mr. Godfrey Isaacs addressed a letter to the Secretary of the Post Office, in reply to that of the Postmaster-General, stating that the Marconi Co. felt morally entitled to ask that the agreement should be considered as no longer binding on either party. In addition to the other matters to which he referred in his previous letter, the company had been obliged to reserve, for nearly a year, the sum of £300,000 to enable it to carry out the work. Having taken counsel's opinion, the company was advised that it was now entitled to intimate that, unless the Postmaster-General was in a position to confirm the contract by March 1st next, the company would treat the contract as at an end. The company, however, was reluctant to take this course, and requested further consideration of its letter of January 15th.

**Italy.**—A scheme has been submitted to the Consigli dei Ministri, for the expenditure of £4,500,000, spread over several years, on the systematisation and extension of the Italian telephone networks. The projected operations comprise the building of many new up-to-date exchanges, great additions to the network in each city, and its entire conversion to the underground system. The automatic and semi-automatic systems are also to be largely introduced. — *Telegrafia e Telefonica*.

**Japan.**—The negotiations for the purchase by the Government of the submarine cables between Nagasaki and Shanghai, and between Tsuruga and Nagasaki, are reported to have been completed.

**Norway.**—The Marconi Co. has consented to the prolongation from March 1st to July 1st of the period during which Norway must decide with regard to the proposed contract for the establishment of a wireless service to America.

**Suffragist Outrages.**—On Friday and Saturday last week, telegraph and telephone wires between Coventry and Birmingham, near Dumbarton, and between Glasgow and London were cut by suffragists, and the underground cables to Glasgow were also put out of order.

**The Telephone Transfer.**—The Postmaster-General is appealing against the award of the Railway and Canal Commissioners with regard to the cost of raising capital, which was assessed at £247,189, and on minor matters.

**Underground Cables.**—In reply to a question in Parliament, Mr. H. Samuel stated that the total length of the main underground routes was 1,197 miles in England, and 133 miles in Scotland. The total expenditure under the Post Office votes, and the telephone capital account, had been about £2,100,000. The expenditure on the routes in the two countries had been approximately proportionate to the mileage.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdare.**—March 3rd. Service materials, for the U.D.C. electricity department. See "Official Notices" to-day.

**Ashton-under-Lyne.**—February 19th. H.T. switch-gear, water softening plant, steam, exhaust and feed pipes, tanks, &c., for the Corporation. See "Official Notices" January 31st.

**Austria.**—PILSEN. — February 21th. Tenders are required for one 30-H.P. three-phase motor with accessories, one 5 H.P. ditto, two electric nut-grinding machines, two portable electric drilling machines for holes up to 50 mm. diameter, two ditto for holes 30 mm. diameter, one portable circular saw with electric drive, one electric polisher, and other machinery. Particulars, forms of tender, &c. K.K. Staatsbahndirektion, Pilsen, Austria.

**Australia.**—VICTORIA.—February 21st. Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" January 10th.

February 27th.—Buildings and boiler-house equipment, turbo-alternators and rotary converters, for a Government power station at Perth. See "Official Notices" January 24th.

**SYDNEY.**—March 17th. Motors for the City Corporation.

**SOUTH AUSTRALIA.**—March 5th. One section of a common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" January 31st.

**COMMONWEALTH GOVERNMENT.**—Darwin power station, about 2,000 kw. Equipment to comprise Diesel oil engines and accessories and overhead travelling crane, alternators and exciters, and switchboard.

**NEW SOUTH WALES GOVERNMENT RAILWAYS.**—March 5th. Twelve single-phase transformers, and one 12½-kw. generator. Specifications 388 and 389 (2s. 6d. each) from Electrical Engineer's Office, 61, Sydney.

**Balearic Islands.**—February 18th. The municipal authorities of Vallamos are inviting tenders for the concession for the electric lighting of the town during a period of five years.

**Belfast.**—February 24th. Stores and materials for one or three years, for the City electricity department. See "Official Notices" January 31st.

**Bicester.**—Electrical installation for the U.D.C. area. See "Official Notices" to-day.

**Blackburn.**—February 15th. Materials for a year, for the Corporation Electricity Department. See "Official Notices" January 31st.

**Bolton.**—February 24th. Materials and stores, for the Corporation Tramways Department. See "Official Notices" February 7th.

**Bournemouth.**—February 20th. Stores for a year, for the Corporation tramway department. Mr. I. Bulfin, General Manager, Lansdowne.

**Bradford.**—The Chairman and Deputy Chairman of the Corporation Electricity Committee have been authorised to purchase an electrical photo-copying apparatus, for reproduction of plans, &c., at a cost of £60.

**Brussels.**—February 19th. Tenders are invited for the supply of train lighting material for the State railways, as per Cahier des Charges Special No. 758. Particulars, Salle de la Madeleine, Brussels.

February 25th.—Tenders are required for the supply of electric meters required for the public service. Particulars, Maison Communale, Ixelles-les-Bruxelles, Belgium.

**Canada.**—The Hydro-Electric Power Co. of Ontario, propose shortly to call for tenders for the materials for the construction of 125 miles of double-circuit 110,000-volt transmission line, and the necessary equipment for sub-stations for the transforming of 20,000 H.P. from the line to 13,200 volts. Various types of apparatus will be considered. The tenders will be called for in March. Address, Continental Life Building, Toronto.

**Croydon.**—February 24th. Sinking artesian well and supply of pump, for the Corporation electricity works. See "Official Notices" to-day.

**Darlington.**—February 17th. One 1,000-kw. steam turbo-alternator, one 750-kw. and one 250-kw. rotary converter, and one water-tube boiler, for the Corporation. See "Official Notices" January 31st.

**Derby.**—February 19th. One 2,000-kw. turbo-alternator, for the Corporation. See "Official Notices" February 7th.

**Durban (Natal).**—February 24th. Corporation Tramways. Supply, f.o.b., of six miles of B.S.S. flat-bottom Vignoles tram rails, together with fish-plates, bolts and nuts, copper bonds and dog spikes. Specifications and forms of tender, £2 2s. returnable, from the agents, Messrs. Webster, Steel & Co., 2, East India Avenue, Leadenhall Street, London, E.C., to whom tenders have to be sent.

**Edmonton.**—February 26th. Electric lamps for the B. of G. Mr. F. Shelton, clerk, The Grange, White Hart Lane, Tottenham.

**Egypt.**—March 31st. Section des Municipalites invites tenders for electric light installation at Damietta. For further particulars see this column for January 24th.

**Finchley.**—February 17th. One 300-B.H.P. oil engine, coupled to a 200-kw. E.C.C. generator, for the U.D.C. See "Official Notices" February 7th.

**Gloucester.**—Stores for a year, for the Corporation Light Railways Committee. Mr. L. Johnston, General Manager, Bristol Road.

**Halifax.**—February 17th. Stores and materials for a year, for the Corporation electricity department. See "Official Notices" January 31st.

February 17th.—Stores and materials for tramways department for 12 months. Tramways Engineer, Tramways Office, Skircoat Road.

**Hornsey.**—February 24th. Electricity meters, cables and cable stores, for the T.C. See "Official Notices" February 7th.

**Ilford.**—February 25th. Stores for a year, for the U.D.C. electricity department. See "Official Notices" February 7th.

**India.**—February 18th. High and low-tension switchboards, for the Bombay, Baroda and Central India Railway. See "Official Notices" January 31st.

**Leeds.**—February 19th. Coal and general stores for a year, for the Corporation electric lighting department. See "Official Notices" January 24th.

February 17th.—The City Tramways Committee invites tenders for electrical sundries and engineers' furnishings, and for the reconstruction of certain portions of tramway track.

**London.**—BERMONDSEY.—February 17th. Stores for a year, for the B.C. Electricity Department. See "Official Notices" January 24th.

L.C.C.—February 25th. Electric wiring of the Camberwell and Croydon Road car-sheds. See "Official Notices" January 31st.

February 25th.—Two 8,000-kw. turbo-generators, with condensers, &c., three 1,500-kw. rotary converters, nine transformers for rotary converters, and two starting transformers. See "Official Notices" to-day.

February 26th.—Electrical installation at Leipsic Road Elementary School, Camberwell, S.E. See "Official Notices" to-day.

The Highways Committee is to invite tenders for the supply of 2,200 track insulators and 3,200 porcelains in connection with electrical repairs and renewals of tramway lines, from selected firms.

**FULHAM.**—February 19th. Electrical and engineering stores for a year, for the B.C. See "Official Notices" February 7th.

**ST. PANCRA.**—March 4th. Arc lamp carbons, for the B.C. See "Official Notices" February 7th.

**MARYLEBONE.**—February 26th. Stores and materials for a year, for the B.C. Electricity Department. See "Official Notices" February 7th.

**SHOREDITCH.**—February 24th. Two economisers (Green type), for the B.C. electricity department. See "Official Notices" to-day.

**STEPNEY.**—March 17th. Boilers and boiler house accessories, turbo alternators, condensers, accessories and switchgear, for the B.C. See "Official Notices" to-day.

**Manchester.**—February 18th. General stores for a year, for the Corporation tramways department. See "Official Notices" January 31st.

February 18th.—Motor-buses complete, for the Tramways Committee. Mr. J. M. McElroy, manager.

February 19th.—Providing and fixing electric light fittings at George Leigh Street Municipal School, Ancoats. Returnable deposit £1 ls. Mr. C. H. Wyatt, Director of Education, Education Offices, Deansgate.

**NEATH.**—March 3rd. One 400-kw. high-speed engine, direct-coupled to a two-phase alternator, and accessories, for the R.D.C. See "Official Notices" to-day.

**Newport (Mon.).**—March 4th. Electric light fittings for the B. of G. Mr. A. H. Rees, Clerk, Queen's Hill.

February 22nd. Stores for a year, for the Corporation Electricity and Tramways Committee. See "Official Notices" to-day.

**Oldham.**—February 21st. Two 500-kw. motor-alternators, for the Corporation. See "Official Notices" February 7th.

**Rochdale.**—Engine room extension, new boiler house, &c., turbo-alternator, condensing plant, motor-alternator, water-tube boilers and boiler house equipment for the Corporation. See "Official Notices" February 7th.

**South Africa.**—A new electric main hoist is required for the Village Deep gold mine. The Cape Town Municipality will be purchasing for suburban extensions during the next six months, 33 miles of aerial braided wire, 15 miles of vulcanised rubber wire, one mile of concentric high-tension cable, and 1,100 yd. of three-core high-tension cable.—*British and South African Export Gazette*.

**South Shields.**—February 17th. Uniforms, for the Corporation tramways department. See "Official Notices" January 31st.

**Stockton-on-Tees.**—February 19th. Stores for a year, for the Corporation Electricity Department. Electrical Engineer.

**Swansea.**—Electric light installation at new Y.M.C.A. premises. G. Moxham, architect, 18, Castle Street, Swansea.

**Swindon.**—March 8th. General stores and materials for a year, for the Corporation electricity and tramways departments. See "Official Notices" to-day.

March 10th.—One 500-kw. mixed-pressure turbine and condensing plant, boiler feed pump and pipework, and one switchboard panel and cables, for the Corporation. See "Official Notices" to-day.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Walthamstow.**—February 28th. Four double-deck tramcars complete with magnetic-brake equipments, for the U.D.C. See "Official Notices" February 7th.

**Warlingham.**—February 24th. Electric light sundries for the Mental Hospital, for Croydon T.C. for a year. Mr. F. C. Lloyd, Town Clerk, Town Hall, Croydon.

**Warrington.**—March 5th. Motors and transformers for a year, for the Corporation. See "Official Notices" to-day.

**Wigan.**—February 24th. High-tension, three-core feeder cable, transformer and switchgear, for the Corporation. See "Official Notices" to-day.

**Wimbledon.**—March 5th. Stores and materials, for a year, for the Corporation Electricity Department. See "Official Notices" to-day.

**Wrexham.**—March 1st. Stores for a year, for the Borough Electrical Engineer's department. See "Official Notices" to-day.

## CLOSED.

**Australia.**—According to *Tenders (Mining and Engineering Review)*, the following contracts have been placed:—

P.M.G.'s DEPARTMENT, QUEENSLAND.—Five tons hard-drawn copper wire £97 16s. for iron.—British Insulated & Helsby Cables, Ltd.  
N.S.W. PUBLIC WORKS DEPARTMENT.—Electric passenger lift at Mr. Robinson's shops, George Street, North Sydney, £500.—Flanders-Waygood, Ltd.

**Belfast.**—The Harbour Board has accepted the tender of Messrs. George Russell & Co. Ltd., amounting to £8,725, for the construction at Alexandra Wharf, of an electric derrick crane capable of lifting 120 tons.

**Bradford.**—The Corporation Electricity Committee has accepted the offer of Messrs. Electromotors, Ltd., to supply two 10-h.p. direct-current slow-speed motors required for the starter drive at Valley Road electricity works.

**Burnley.**—The Tramways Committee has accepted the tender of the United Electric Car Co., at £153 per car, for the conversion of 14 wind-shield cars to top-cover cars.

**Canterbury.**—The T.C. has accepted the tender of Mr. S. Terry, Canterbury, for electrical engineering work for the ensuing half-year.

**Colchester.**—The T.C. has accepted the tender of Messrs. H. G. Merry & Co. for 300 tons of Shirebrook nutty slack for the electricity works, at 15s. 0½d. per ton.

**Dewsbury.**—The Electricity and Tramways Committee has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for new boilers.

**France.**—After comparative trials of a number of types of motors, the Compagnie des Tramways de l'Est Parisien has placed an order with the Société Anonyme Westinghouse for 100 50-h.p. No. 307 type motors; also for the new type of Westinghouse non-automatic multiple control equipments.

**Hemsorth.**—The R.D.C. has accepted the tender of Messrs. R. Farr & Sons, of Doncaster, for the installation of telephones at the Isolation Hospital, at £47.

**Horsham.**—The U.D.C. has accepted the tender of Messrs. Heenan & Froude for mechanical hoppers for the refuse destructor, at £122.

**Italy.**—The Ganz Electricitäts Gesellschaft, of Budapest, has secured a contract for the construction of an electric railway about 20 miles long, between Angera, on Lake Maggiore, and Varese.

**Liverpool.**—The Corporation has just placed an order with Halley's Industrial Motors, Ltd., for a petrol motor-tower wagon chassis for use in connection with the maintenance of tramway conductors.

**London.**—The following tenders have been accepted by the Metropolitan Water Board for the undermentioned supplies:—

British Insulated and Helsby Cables, Ltd.—Aluminium cable, £51.  
Hensley's Telegraph Works Co.—Paper-insulated lead covered cable and joint boxes, £88.  
Edison & Swan United Electric Light Co. Ltd.—500 drawn-wire metal-filament lamps, at 1s. 7½d. each.

L.C.C.—The Highways Committee has accepted tenders of the British Insulated and Helsby Cables, Ltd., and Messrs. Brecknell, Munro, & Rogers, Ltd., at £123 and £113 respectively for overhead fittings.

The following tenders were received for number plates for indicating the routes of cars on the Council's tramways:—

Venner's Signs, Ltd. .. .. (accepted) £3.85  
Brush Electrical Engineering Co., Ltd. .. .. 6.0  
Hurst, Nelson & Co., Ltd. .. .. 7.46

A contract has been entered into with Messrs. Quilliam Bros. for five Collins electric point turners, for £425, "subject to no payment being made until the saving in expenses effected by their use is equivalent to the cost of the machines." This is in place of a contract placed last October with Messrs. S. Stone & Co., who are agents only.

During the Christmas recess the Education Committee received tenders as below:—

**CAMBERWELL, N.—L.C.C. Camberwell School of Arts and Crafts.—Ex-tension—Electric Lighting—**

A.E.G. Electric Co., Ltd.	.. ..	(withdrawn)	£908
Tredegar & Co.	.. ..	(accepted)	912
G. Weston & Sons, Ltd.	.. ..	.. ..	938
E. Lawrence & Sons, Ltd.	.. ..	.. ..	1,061
C. H. Cathcart & Co.	.. ..	.. ..	1,345

**KENNINGTON.—Vauxhall Street School—Electric lighting—**

Tredegar & Co.	.. ..	.. ..	£434
G. Weston & Sons, Ltd.	.. ..	.. ..	454
A. F. G. Electric Co., Ltd.	.. ..	.. ..	484
W. C. Tackley & Co., Ltd.	.. ..	.. ..	499
E. Lawrence & Sons, Ltd.	.. ..	.. ..	580
C. H. Cathcart & Co.	.. ..	.. ..	570
British Equinomial Lamp Co., Ltd.	.. ..	.. ..	770

**Manchester.**—Various committees of the Corporation have accepted the following tenders:—

**Manchester Steam Users' Association.**—Periodical inspection and insurance of four water-tube boilers, superheaters and economisers at Stuart Street station.

**Tudor Accumulator Co., Ltd.**—Testing battery at the cable stores, Ardwick.

**British Electric Transformer Co., Ltd.**—Requirements of a.c. balancers during the period ending December 31st, 1913.

**British Insulated and Helsby Cables, Ltd.**—Requirements of additional sizes of fine boxes during the period ending June 30th, 1914.

**Siemens Bros. & Co., Ltd.**—Paper-insulated cable.

**Newcastle-on-Tyne.**—A contract for tramcar meters for Newcastle-on-Tyne tramways, has been received by Messrs. Ferranti, Ltd.

**Newcastle-under-Lyme.**—The T.C. has accepted the tender of Callender's Cable and Construction Co., Ltd., for cables for extensions.

**North-Eastern Railway.**—Messrs. Siemens Bros. have secured the contract for the electrical equipment (motors, gears, control equipments, &c.) for the ten electric freight locomotives to be used in connection with the electrification of North-Eastern Railway Co.'s mineral line between Shildon and Newport (Middlesbrough).

**Nuneaton.**—The T.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for a water-tube boiler for the electricity works, at £800.

**Rotherham.**—The T.C. has placed an order with the R.E.T. Construction Co. for the supply of two trolley vehicles, at £765 each. The tender of Anderton & Beaton has been accepted, at £298, for installing electric light at Kimberworth Schools, plus 12s. 6d. each for any extra points required.

**Salford.**—The Corporation Electricity Committee has authorised the purchase of two overload circuit breakers for the new battery, from Mr. Bertram Thomas, at £90.

**Sheffield.**—The T.C. has accepted the tender of Messrs. John Brown & Co., Ltd., for 600 steel tramcar tires, at 26s. per tire. The tenders of the Staveley Coal and Iron Co., Ltd., for 10,000 3-in. cast-iron cable pipes, at £6 10s. a ton, and of Messrs. W. Marlow & Sons, at £1,780, for foundations for three new boilers, chimney base, &c., at the Neepsend power house, have also been accepted. The contract with Messrs. Marsh Bros. for the maintenance of the internal telephone system at the Council's hospitals is to be extended for a further period of 12 months.

**Stone (Staffs.).**—The U.D.C. has accepted the tender of Messrs. Blackburn, Starling & Co. for the electric light installation at the sewage works, at £108.

**Stretford.**—The tender of Messrs. Veritys, Ltd., has been accepted by the U.D.C. for a 15-H.P. totally-enclosed interpole motor

**Sunderland.**—The T.C. on Wednesday accepted the following tenders:—

**British Insulated and Helsby Cables, Ltd.**—580 yd. of L.T. cable and 5,000 yd. of T.T. cable.

**Ferranti, Ltd.**—60 meters.

**Tonbridge.**—The U.D.C. has accepted the tender of Messrs. Switchgear & Cowans, Ltd., for alterations and additions to the switchboard at the electricity works, at £147.

**Walsall.**—The T.C. has placed an order with Messrs. Babcock & Wilcox, Ltd. (£290), for a mechanical stoker at the generating station.

**West Ham.**—An offer of the Glasgow Railway Engineering Co., Ltd., has been accepted by the T.C. for the supply of 200 cast-steel tram wheels and tires, at £4 1s. 6d. each. The Council's contracts with the Fuller Electrical Co. for semi-enclosed a.c. motors, and Messrs. Baxter & Caunter for Credenda conduit, are to be extended for a further period of 12 months, as is also the contract with the Armorduct Manufacturing Co. for wires and cables, at the present price up to 7/14 size, and above at from 5 to 15 per cent. advance, according to size.

**Wolverhampton.**—Owing to a breakdown, No. 1 motor-generator is to be repaired by the Electric Construction Co., Ltd., for £400, and No. 2, by the same company, for £57. A new canal boat is to be purchased at an estimated cost of £75.

## FORTHCOMING EVENTS.

**Physical Society.**—Friday, February 14th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Annual general meeting.

**Junior Institution of Engineers.**—Friday evening, February 14th.—At 39, Victoria Street, S.W. Paper on "Electrical Installations in Metal Conduit" with Special Reference to Earthing," by Mr. F. H. Taylor.

Saturday, February 15th.—At 6.30 p.m. At the Hotel Cecil. Annual dinner.

**Institution of Mechanical Engineers.**—Friday, February 14th. At 8 p.m. Annual general meeting. Paper on "Modern Condensing Systems," by Mr. A. E. L. Scanes.

**Association of Mining Electrical Engineers (West of Scotland Branch).**—Saturday, February 15th. At 4.30 p.m. Meeting at the Royal Technical College, Glasgow.

**(Newcastle Branch).**—Wednesday, February 13th. At 7 p.m. At the Armstrong College, Newcastle. Lecture on "The Development of Mechanical Power in the Mines of the North-Eastern Coalfield—a Comparison and a Contrast," by Mr. R. Nelson (H.M. Electrical Inspector of Mines).

**Institution of Electrical Engineers (Scottish Section).**—Saturday, February 15th.—At 7.30 p.m. At the Grosvenor, Glasgow. Annual smoking concert.

**(Western Section).**—Monday, February, 17th. At 4 p.m. At the Merchant Venturers' Technical College, Bristol. Address on "Some Uses of the Stroboscope," by Prof. D. Robertson. At 6.30 p.m. At St. Stephen's Restaurant, Bristol. Dinner.

**(Manchester Students' Section).**—Tuesday, February 19th. At 7.30 p.m. At the Municipal School of Technology, Manchester. Paper on "Time Limits," by Mr. H. R. Constantine.

**(Students' Section).**—Wednesday, February 19th. At 7.45 p.m. At the Institution, Embankment, W.C. Paper on "Some Problems of Electricity Supply," by Mr. G. W. P. Page.

**Birmingham and District Electric Club.**—Saturday, February 15th. At 6.30 p.m. At the Swan Hotel, Birmingham. Annual dinner.

**Illuminating Engineering Society.**—Tuesday, February 18th. At 8 p.m. At the Royal Society of Arts. Paper on "The Use of Shades and Reflectors," by Messrs. J. G. Clark and V. H. Mackinney.

**North-East Coast Institution of Engineers and Shipbuilders.**—Friday, February 21st. At 7.30 p.m. At the Lido and Phil, Newcastle. Lecture on "Surface Combustion," by Prof. W. A. Bone.

**Royal Institution.**—Saturday, February 22nd.—At 3 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture III.)

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, February 17th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, February 18th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, February 20th.—"C" Company. Company training, 7 to 10 p.m.

Friday, February 21st.—"D" Company. Company training, 7 to 10 p.m.

Saturday, February 22nd.—"A" and "B" Companies (Right Half Battalion).

Week-end training at Dover. Dress:—Service dress, putties and great-coats. No arms will be taken. Parade at Victoria Station, L.C. and S.E. line, at 1 p.m.

"C" Company—Week-end lorry run. Parade at Headquarters at 2 p.m. Dress:—Service dress, putties and great-coats.

Headquarters will be open from 10 a.m. till 12 noon for regimental business.

(Signed) J. H. S. PHILLIPS, Major,  
For Officer commanding L.E.E.

## NOTES.

**Parliamentary.**—SHEFFIELD CORPORATION BILL.—As stated in the ELECTRICAL REVIEW of last week, the House of Lords passed a new sub-clause in the Sheffield Corporation Bill dealing with electrical fittings. Lord Southwark, who moved the new clause, stated that it was by way of a compromise.

On Monday the Bill again came before the House of Commons, when Mr. Maclean proposed that the House should agree with the Lords in the amendment.

Mr. Pointer said that since the matter was last before the House there had been the usual negotiations, and, ultimately, driven by force of time, the Corporation agreed to the clause as it had been read. He did not know whether what it meant was fully appreciated. It meant that while it appeared on the surface that the Corporation had agreed to the compromise, in reality they had given everything away. Let any member of the House judge what he would do in the circumstances. If he were going to have electric light installed in his house, and had the idea of employing the Corporation to do the work, the Corporation could only carry the wires so far as the ceilings and walls, and then he would have to call in a private trader to finish the task. Every one of them would be inclined to give the order to the man who could complete the transaction right through. Therefore, while, on the face of it, it looked like a compromise, in fact, the Corporation had undoubtedly given all the work to private traders. He viewed that with

regret, but they were driven right to the tail end of the session, and if they disagreed with the Lords' amendment, and the Bill went back again to the Lords, it would be lost, and the Corporation would sacrifice improvements to the value of over £100,000, because of the exigencies of time, therefore, he proposed to offer no opposition to the amendment. The question was then put and agreed to.

**PARLIAMENT AND WAR OFFICE CONTRACTS.**—In Saturday's Parliamentary Paper Mr. Touche asked the Secretary of State for War if he would say whether the German cable used at Tidworth and Bulford camps was being insulated with re-manufactured rubber or partly so. Col. Seely replied that it was understood that a certain amount of re-manufactured rubber was used in the outside vulcanised covering of the cable, which was mainly for mechanical protection for the pure rubber inner covering. The rubber used was subjected to mechanical tests and found quite satisfactory. Replying to Mr. Touche on Tuesday, Mr. Baker said that there had been no other War Office contracts given out in respect of other works, besides those at Tidworth and Bulford, in which German cable had been used.

Mr. Touche then asked the Secretary of State for War to say whether the inspectors representing the War Office were present throughout the manufacture at Eschweiler, Germany, of the cable for the Army camps at Tidworth and Bulford, or did they merely inspect and test the completed cable; and was the former practice followed in respect of cable manufactured for War Office use in this country?—Mr. Baker said the inspectors tested the cable during the course of manufacture, and again on completion. The same practice was adopted in respect of cable manufactured in this country.

Mr. Touche further asked whether there was any clause in the specifications for the work at Tidworth and Bulford Camps in which the German cable was employed, requiring the use of pure Para rubber only and excluding the use of re-manufactured rubber?—Mr. Baker replied that there was no such clause, but it was specified that the layer next to the conductor was to be of pure rubber, and the other two of vulcanised rubber. The quality of the whole was covered by a mechanical test.

**Manchester Electro-Harmonic Society.**—The next concert of this society is to be held on Friday next, February 21st, at the Albion Hotel, Manchester, with Mr. S. L. Pearce in the chair. We have received an advanced copy of the programme, from which we gather that those present will be regaled with a splendid selection of items—violin, cello, vocal solos and humorous selections, the artists being as follows:—Solo violin, Mr. J. Sedgwick Bridge; solo cello, Mr. J. H. Foulds; soloist (bass), Mr. Hamilton Harris; entertainer, Mr. Wilfrid Ludlow; pianist and accompanist, Mr. E. Bennett North. It is expected that there will be present quite a large attendance of local gentlemen who are intimately connected with the electrical trade, and we would urge our readers in and around the Manchester district to make arrangements to support the society on this occasion. Seeing that during the evening there will be five intervals of ten minutes or more each, between 7.30 and 11 o'clock, in which one can fraternise and converse to his heart's content, there will no doubt be a large company present, and the event should be a very popular one.

**Annual Socials and Dinners.**—**NORWICH.**—On Friday last the employés of Messrs. Laurence, Scott & Co. were entertained at dinner, the chair being taken by Mr. Cecil Wilson, who apologised for the absence of his co-directors, Mr. R. Laurence and Mr. W. H. Scott. The vice-chair was occupied by Mr. W. Alcraft, who proposed "Success to Laurence, Scott & Co., Ltd.," and took the opportunity of welcoming Mr. Gilbert Scott. Mr. Alcraft congratulated the directors upon the large amount of business in hand, and said that 1912 had been the hardest year so far experienced at the works. A kindly feeling existed between the directors and the employés, and half wages had been paid to those who had been unable to work during the Norwich August flood. The chairman, in responding, said recent coal and transport strikes had caused great concern to the directors, who had, however, at considerable difficulty and expense, managed to obtain a sufficient supply of coal and materials to keep the works going. Business had scarcely recovered from the effects of the strikes, when the works were disorganised by the August flood. Fortunately, the actual damage done was relatively small, but there was much loss of time and consequent delay in the completion of orders. The firm had now an extraordinary amount of work in hand, including orders for the British Admiralty and the Navies of Spain, Chile, Brazil, Turkey and Japan. Other toasts followed.

**LONDON.**—The fourth annual dinner of the Admiralty Superintending Electrical Engineers' staff took place on Saturday last at the Café Monico, Piccadilly, W. The toast of "The Chairman" was entrusted to Mr. W. McClelland, who referred to his sterling qualities and his long and pleasant association with him. The toast was received with acclamation, and drunk with musical honours. The chairman, Mr. C. H. Wordingham, M.I.C.E., replied in a humorous speech. During a pleasant evening the vocal abilities of some of the staff were "unearthed." The arrangements were carried out by a Committee, consisting of Messrs. Green, Shaw, Mortimer, Graham, Broomfield and Skinner (hon. secretary).

**KIRKCALDY.**—About 300 employés and friends of the Kirkcaldy tramway and electric lighting departments were present at the tenth annual social and dance on 5th inst.

**LONDON.**—The second annual dinner of the Central Electric Athletic Club was held at the Eyre Arms Hotel, Wellington Road, N.W., last Saturday evening. In the absence of Mr. F. J. Walker,

owing to slight indisposition, the chair was taken by Mr. S. T. Dobson, supported by Messrs. D. T. Powell, W. E. Rowland, F. Napier, W. J. D. Partridge, T. Brice, W. Burgess, W. Puminell, S. Green and H. Stephens. The hall was well filled by members of the staff and their friends, numbering about 70. The chairman alluded to the regrettable absence of Mr. H. P. Gaze, who was recuperating in Switzerland, and gave the toast of "The King," which was suitably honoured. The prizes were then distributed, H. P. Gaze being again the winner of the "Leat Challenge Cup," and A. W. Law, the runner-up. The Donagel Badge was won by J. K. Wells, S. G. Rhodes and H. Cope being second and third respectively. The concert which followed was arranged by Mr. H. Morton, and was much enjoyed, the artists being Miss Winifred Mansfield, Mr. Dick Dudley, the Concannon Trio, Messrs. H. Morton and J. Clayton, D. T. Powell, W. Cornell, H. Puminell, D. Edwards and F. Lawson, the accompanist being Mr. James Swift.

**LONDON.**—On Saturday last Messrs. Rawlings Bros. entertained about 400 of their employés and their wives and friends at their annual social gathering. We have it on very good authority that everyone present realised that the true democratic spirit reigned supreme and, as Mr. W. R. Rawlings, who presided, stated, the success of the firm in all its various departments was attributable to the loyalty of the employés. During the evening refreshments were served and a high-class entertainment was provided, Mr. Arthur Hill with his "marionette" and "wally" shows, and also his son of less than seven years of age, gave a very fine entertainment. Fine renderings on the piano and violin were given by Mr. W. Hazel and Mr. Conrad Benjamin respectively. Mr. Bert Finch and Mr. Bert Russell amused the audience with humorous songs, and Mr. Frank Heritage again appeared with his cello. Miss Margaret Ward Smith, contralto, and Mrs. Rowden, wife of one of the directors, gave a fine rendering of sentimental songs, while Miss Gladys Ely held the audience spell-bound with clever character sketches. Miss Evelyn Key acted as accompanist.

**CHESHIRE.**—At the Brooklands Hotel, Cheshire, on Saturday, 8th inst., the employés of the Record Electrical Co., Ltd., held their first annual dinner. The master was exceedingly good, including as guests the London office staff and the directors of the company. The chairman of the company, Mr. C. W. von Roemer, toasted "The King," being followed by Mr. A. James, who proposed "The Company." For the latter, Mr. Record, in replying, expressed his great pleasure at the good feeling shown by the invitation given to the directors to be present at the works dinner. The chief of the testing department, Mr. J. H. Care, toasted "The Directors," and advised all to work for collective benefit rather than for individual gain. Mr. von Roemer, in replying, referred to the advance and success which had attended the company's efforts since its incorporation. The "Star" turn of the evening was introduced when the works superintendent, Mr. W. G. Dymont, toasted "The Office Boy." The concert which followed afforded much amusement, members of the staff and works showing their talent in various directions: the entertainment finished with a quintette rendered by "Sam Sparkes." A few words from Mr. T. J. Boorne, the commercial manager and director, brought the proceedings to a close.

**LEICESTER.**—The works and office staff of Messrs. Gent & Co., Ltd., Faraday Works, Leicester, held their third annual social and dance on Tuesday last week at the Queen's Hall. An excellent concert programme, provided by the works "artists," was followed by dancing, and over 200 of the employés and their friends spent a most enjoyable evening. The "Shop Social," originally held to celebrate the firm's commencement upon the construction of the largest electric clock in the world, now shares with the "Shop Holiday" the distinction of being an annual fixture.

**Foreign Trade in January.**—Compared with the figures for January, 1912, the trade returns for last month show a continued advance, both in imports and exports. The former increased in value by 4½ millions sterling, or 63 per cent., the exports by over 5 millions sterling, or 12½ per cent., and the re-exports by about 1½ millions sterling, or 11½ per cent. The figures relating to electrical trade in comparison with those for the corresponding month of 1911, are as under—

IMPORTS.		
Electrical goods and apparatus (other than machinery and uninsulated wire) ...	...	£136,192, a decrease of £3,804
Machinery ...	...	£673,727, an increase of £158,780
EXPORTS.		
Electrical goods and apparatus (as above) ...	...	£368,618, an increase of £93,627
Machinery ...	...	£3,112,474, an increase of £445,832

**Fatalities.**—**ST. JUST.**—An inquest was held on 6th inst. into the death of a boy named Wallis, aged 15, of Botallack, who was killed on the previous evening by catching hold of a live wire on the Botallack mine property. He was employed in the carpenter's shop at Levant mine. From the evidence given it appeared that near the Nineveh section of Botallack, the overhead wires crossed the road near a stile, and one of the wires had sagged to within 2 ft. of the ground. Wallis was seen to catch hold of it and move it out of his way, and he dropped to the ground immediately. Another boy (Maddern) went to his assistance, and he likewise fell. The path was a public one, and there was no fence under the wires to prevent their falling to the ground. The supply was at 440 volts, received from the Hayle power station.

Mr. A. Climas said that when he arrived on the scene the boys were unconscious, and artificial respiration was applied, with success in the case of Madden, but it was applied for an hour in the case of Wallis without effect. The coroner said that he could not understand why the Urban District Council did not have the public path protected from the wires, and Mr. Climas, in reply, said that he understood that such a protection had not to be placed over an ordinary path. The mine wire was down, because some telephone wires passing beneath it had become entangled with it for some unaccountable reason. That caused a short, and burnt the wire through. A verdict of "Accidental Death" was returned.

**DEATH.**—On the 6th inst. an inquest was held in Dublin on the remains of Edward Blance, 43, who was killed by contact with an electric wire in the works of Messrs. Dennehy, motor engineers. It appeared that Blance was assisting in putting a motor into the garage when it came into contact with an electric wire which was hanging down from the supply leads to a lamp. The wire, which was insulated to within  $\frac{1}{2}$  in. of the end, touched the brass of the wind screen. Blance fell down unconscious. It seemed that on other occasions the end of the wire had been lapped up and insulated. The jury found that Blance died from shock caused by the wire, and added that the wire was not properly protected.

**Electricity on the Rand.**—Mr. J. W. Kirkland, President-Elect of the South African Institute of Electrical Engineers, in proposing a toast at the annual dinner of the Institute last month, said: It must be admitted to be a fact that electricity has at last come into its own on these gold fields. As evidence of this, we have at present serving the greatest gold mines in the world with electric power what is destined to be, in the near future, the largest electric power supply company in the world. Within a very short time the output of the Victoria Falls and Transvaal Power Co. will be greater than that of any other single power company, the second being the Commonwealth Edison Co., which, in Chicago, serves a population of almost 3 million people. The men connected with the Victoria Falls and Transvaal Power Co. have been, and are now, the backbone of our local Institute. Later, according to a report in the *South African Mining Journal*, Mr. Kirkland said: "Electricity is being called upon here to work larger hoists and larger air compressors, and to be led more extensively underground than anywhere else, and the difficulties attendant upon these new problems will be met here locally, and, to a very considerable extent, by the men who are, or at least who ought to be, members of our Institute."

**A Large Electromagnet.**—It is proposed to provide the Sorbonne with the largest electromagnet in the world. It is claimed that an electromagnet of the kind described will permit of discoveries of the highest importance for the future of humanity.

**Electrical Trades Union.**—On Tuesday, February 18th, at 9 p.m., a lecture will be delivered by Mr. John Potter (London District Secretary of the E.T.U.) at the Princes of Wales, corner of Belsize Road and Abbey Road, N.W., under the auspices of the North-Western Branch of the Electrical Trades Union. Subject, "Foreign Policy from a Worker's Point of View." Questions and discussion will follow. All electrical workers are invited.

**Electrolytic Copper in Rhodesia.**—According to the *South African Mining Journal*, a copper smelting plant on the Simonsa and Halse electrolytic process is to be installed in Northern Rhodesia, which will ultimately be capable of dealing with 200 tons of ore per day. Enormous quantities of high-grade ore have been located in the mines concerned, and the process has been experimentally proved suitable for dealing with it.

**A Loughborough Celebration.**—A Loughborough correspondent informs us that a number of the office staff of the Brush Co., who have recently been suddenly dismissed, held a dinner and smoking concert on 6th inst., to celebrate the event, at the Central Hotel. We have received a copy of the unique menu card prepared for the occasion.

**Football.**—The undefeated football team of the Witton Works of the General Electric Co., Ltd. successfully upheld its reputation against the G.E.C. London Head Office team, in a match played last Saturday, February 8th, at Nestanglo Sports Club Grounds, Elmer's End. The weather conditions left nothing to be desired, and the large number of enthusiastic supporters of both teams who turned out were treated to a quick, snappy game, which called forth cheers and applause for many of the players. The resulting score was:—Witton, 5 goals; G.E.C. Head Office, 3 goals. In the evening, an enjoyable dinner and entertainment were provided, at which the "boys from Witton" were guests. The festivities took place at "The Mitre" Restaurant, in Chancery Lane, under the chairmanship of Mr. Balchin. About 70 gentlemen were present. Members of both teams, as well as other members of the G.E.C. staff, furnished the vocal and instrumental music; amongst these were Messrs. Jones, Hall, Balchin, Knight, Plumley, Haughton, Mace, Copley, Bryman, Hudson, Orton and others. Mr. Muir, the honorary secretary of the G.E.C. Football Club, laboured diligently to make the occasion a success.

**Manchester Engineers' Club.**—A general meeting of the members of the Manchester Engineers' Club was held on Wednesday, the 5th inst. The chairman (Mr. Daniel Adamson) presided, and there were about 100 members present.

The Committee presented a report comprising a statement of the business done, with proposals for the future. The chairman stated

that at the present time 570 members had been enrolled, and that applications had been received from about another 100 persons. The funds in the bank standing to the credit of the club were £2,600. The number of members who had guaranteed payment of their subscriptions for a further term of four years ensured an income sufficient to pay the rent of the club premises for the same period. The response from life members had been very encouraging.

To get over any difficulty in connection with the licensing laws, it was resolved that a limited company be formed with a capital of £3,000 in £1 shares, which should have power to borrow money upon debentures. The company will sub-let the furnished premises to the club through trustees for the club appointed by the Committee, the rent charged by the company to be sufficient to pay the rent as stated in the lease, interest on debentures and on share capital, and the small expenses of the company. In order to utilise the available funds of the club, it is proposed that the club shall, through their trustees, take up shares or debentures in the company to the extent of about £1,500. This will leave about £1,500 to be provided by means of subscriptions for shares and debentures, and members will have an opportunity of subscribing for these.

The premises which the Committee has agreed to take are situated in Bridgewater Buildings, in Albert Square. The premises have been used in the past as a club, but they are to be entirely refurbished and suitably decorated.

It was resolved, on the recommendation of the Committee, "that the time limit for admission of original members without entrance fees be extended at the discretion of the Committee, so long as not more than 600 members (exclusive of losses by resignation or otherwise) are so admitted, nor the time for such admission made later than the formal opening of the club premises." It was intimated that if the share capital of the proposed new company was forthcoming at an early date, the club would be opened in May next.

**Inquiries.**—A correspondent asks for the names of makers of the Hailwood No. 1 miner's electric lamp, and the Oldham emergency electric lamp. Makers of the "Sterling" organ-blowing fan and of the "Century" A.C. motor are asked for.

**Institution and Lecture Notes.**—ASSOCIATION OF ELECTRICAL STATION ENGINEERS.—The second general meeting was held at 69, Fleet Street, London, E.C., on Thursday, February 6th, and the attendance exceeded 50. The secretary reported that excellent progress had been made since the previous meeting, and that arrangements were being made for similar meetings in other important centres in the United Kingdom (which would be duly advertised). Application forms had been circulated to all inquirers, and were being steadily returned, filled in and with application fee. The latter, the secretary stated, was of great importance, as the "Association" was very short of funds, and the quick return of all application forms with fee would be much appreciated. The interest aroused by the forming of the A.E.S.E., he said, was now world-wide, and inquiries from British electrical engineers abroad wishing to become members were being received, even from as far off as Brazil. After receiving the report of the secretary, the meeting proceeded to appoint a committee of 20, and it was agreed that it should be only provisional, and should meet as soon as possible to examine application forms and to institute propaganda work. It was agreed that the annual subscription should be 10s. 6d., payable half-yearly, with an entrance fee of 2s. 6d. The question of qualification of members led to a very long discussion, and as it was found difficult to define exactly what constituted the training and experience of a qualified man for the various positions covered by the A.E.S.E., it was decided to let the Committee judge each application on its merits. With regard to provincial branches, the secretary stated that already a few gentlemen had undertaken the duties of district secretaries (*pro tem.*) in some important centres. It was agreed that funds should be supplied to branches for propaganda purposes, &c. The Committee is to make arrangements at once with a chartered accountant with regard to the finances of the A.E.S.E. A meeting of the Committee was to take place on Tuesday, February 11th.

A meeting was held on Friday, February 7th, at the Grosvenor Hotel, Dublin (at which 20 gentlemen were present) to consider the advisability of forming a branch of the above "Association" in Dublin. A number of suggestions were made, and were forwarded to the central organisation in London, and a meeting is to be held to-day, February 14th, to consider the replies from London; subject to these being satisfactory, it was decided to form a branch at once.

**SOUTH AFRICAN INSTITUTE OF ELECTRICAL ENGINEERS.**—Last month Mr. J. W. Kirkland was appointed president of this Institute. Mr. J. H. Rider, in his valedictory address (as reported in the *South African Mining Journal*) urged members to come forward and read papers and take part in discussions. Unless they were prepared to do so, the value of such institutions was greatly reduced. Every engineer should disseminate his knowledge and experience, and he (Mr. Rider) was convinced that an engineer gained much more than he apparently lost by a free exchange of ideas with his fellows. Further, experience had taught him that he who kept his ideas strictly to himself seldom rose in his profession. If all members of scientific societies freely exchanged experiences, and were neither afraid nor ashamed to get up in a discussion and speak of their difficulties and troubles, the result would be that each individual member would only "give away" his own little bit, and he would receive in exchange the "little bits" of all the other members, and surely the whole was greater than its part. In conclusion, Mr. Rider gave the following advice to electrical engineers:—"Take every opportunity to improve your knowledge and experience, accommodate yourself to the circumstances in

which you find yourself placed, and, above all, be absolutely loyal to your employers and those who may be your official superiors. Do not try to get on too quickly, and, when the opportunity comes, do not be slow to seize it. Don't slacken off your energies because your reward seems to be a long time coming, and, if it should never come in the manner in which you desire, you will have the best of all rewards—the satisfaction of having done your duty."

THE INSTITUTION OF ENGINEERS AND SHIPBUILDERS in Scotland and the INSTITUTION OF NAVAL ARCHITECTS have arranged a joint summer meeting, to be held in Glasgow on June 21th, 25th, 26th and 27th. The details of the programme have not yet been arranged, but the majority of the meetings will be held in the rooms of the Scottish Institution.

INSTITUTION OF ELECTRICAL ENGINEERS (MANCHESTER SECTION).—A meeting of the Section was held on Tuesday evening last, when a paper was read by Mr. H. Clifford Palmer on "Advertising Electricity." A discussion followed, to which Mr. Palmer replied.

On Wednesday, at Leeds, a paper was read by Mr. T. Harding Churton on "Some American Electric Plants." A discussion followed.

At the Institution dinner, on February 6th, M. Grosselin, President of the Société Internationale des Electriciens, conveyed to the members an invitation from his Society to visit Paris next May. The invitation has been accepted by the Council of the Institution, and, as soon as sufficient details are available, a circular on the subject will be sent to the members. At present it is proposed that the visit should take place during the last week in May, and that it should last three days, the time being given partly to the reading and discussion of papers and partly to visits to works and places of interest, and a banquet.

INSTITUTE OF METALS.—The annual general meeting will be held at the Institution of Mechanical Engineers, Storey's Gate, S.W., on Tuesday and Wednesday, March 11th and 12th. Among the papers to be read on the latter date are the following:—Dr. G. H. Bailey on "Corrosion of Aluminium"; Mr. Alexander Siemens on "Metal Filament Lamps."

In the course of a paper on "Electricity in Relation to the Architect's Practice," read by Mr. R. N. Tweedy before the ARCHITECTURAL ASSOCIATION OF IRELAND last week, Mr. Tweedy said that in the Dublin shops the lighting arrangement was so atrocious that they only saw the light and not the object.

**Protection from X-Rays.**—It has long been known that silk can be loaded with various metallic salts, and advantage is taken of the fact in commerce to sell silk which is sometimes weighted with as much as 150 per cent. of tin salt. A more legitimate use of this absorptive power of silk is described by Mr. C. Ainsworth Mitchell, in *Knowledge* for February, who says that M. L. Droit has found that by using certain lead salts for the weighting, a silk fabric may be rendered opaque to the passage of X-rays. For example, a material thus prepared by treatment of the silk with lead phosphotannate and other salts contained 68 per cent. of mineral matter, including 34 per cent. of lead oxide, 24 per cent. of tin oxide, 8 per cent. of phosphoric anhydride, and 2 per cent. of lime and alkali. Slight discharges of X-rays were practically arrested by two layers of this fabric, while six layers were found a sufficient protection to the skin against the action of an ordinary discharge of medium strength. This fabric had the same protective effect as a sheet of copper 0.041 mm. in thickness, and had the great advantage of flexibility, even when used in a thickness of several layers.

**An Oil Turbine.**—A description was recently published in *The Syren* of a turbine invented by Messrs. Gavan and Leon Inrig, which is of the internal-combustion type, and is fed with oil. The turbine is of the double-flow pattern, with an admission port at the centre, the drums and casing taking the form of two truncated cones united at their narrow ends by a short cylindrical portion. Compressed air at high temperature and 960 lb. per sq. in. is forced in through the port, followed by a charge of oil, which ignites as in the Diesel engine; water is then sprayed into the combustion-chamber, and is immediately vaporized, the hot gases and steam expanding through the blading. It is stated that owing to the use of steam the blading is not exposed to an excessively high temperature; in fact, the casing is lagged to retain the heat. A turbine of 65 H.P. is under construction.

**Educational Notes.**—Gifts amounting to £150,000 have been presented to the Bristol University for extensions by Messrs. G. A. and H. H. Wills and £20,000 by Mr. W. M. Wills. Their father, Mr. H. O. Wills, gave £100,000 to the University in 1908.

**Business Announcements.**—Messrs. Berry, Skinner and Co., of Oozells Street, Birmingham, will represent Messrs. Nalder Bros. & Thompson, Ltd., in the Midland district in future, and, for the convenience of local customers, they will shortly hold a stock of instruments in current demand.

**Transmutation of Matter.**—Recent researches conducted by Sir W. Ramsay, and by Prof. N. J. Collie and Mr. H. Patterson, indicate that, under certain conditions, helium and neon are produced by the electric discharge in an X-ray bulb containing hydrogen at low pressure. The experiments have been carried out independently with extreme care, and the investigators express confidence in the results. On the other hand, Prof. Sir J. J. Thomson, who has been engaged in similar work, considers that the neon and helium are derived from the glass or the electrodes employed, as the production ceases after a few days, but recommences if the electrodes are changed.

**Appointments Vacant.**—Junior assistant engineers, for the Newcastle-upon-Tyne Electric Supply Co. Ltd. (10s.) see our advertisement pages in this issue.

**Remote Control of Street Lamps.**—In a communication to the Institution of Electrical Engineers, by Mr. W. Duddell and Messrs. Handcock & Dykes, a new system for the control of public and private lamps, meters, transformers in sub-stations &c. by means of tuned selective relays actuated by resonance with a "ripple" of alternating current injected into the distributing mains, is described. To-day the system is to be demonstrated in operation on the mains of the Egham and Staines Electricity Co.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—On the recommendation of the Wolverhampton Corporation E.L. Committee, the following advances in salaries are being made to members of the technical staff: Mr. STUBBS, technical and general assistant, from £160 to £200 per annum; Mr. DUDLEY, maintenance engineer, £156 to £160; Mr. BELLHOUSE, boiler house superintendent, £125 to £150. Mr. FORDER, engine room superintendent, £120 to £150; and Mr. PLATT, junior assistant, £85 to £101, such increases to be retrospective, as from October 1st last.

West Hartlepool Council has appointed MESSRS. RENDLE and LINDSEY, at present acting as shift engineers, as joint station engineers.

Gillingham (Kent) T.C. has appointed Mr. F. TUTT, of Gravesend, and Mr. F. KNELL, of Sheerness, as shift engineers at the electric lighting works.

**Tramway Officials.**—The Tramways Committee of the Sheffield T.C. has recommended that the salary of Mr. A. R. FEARNEY, general manager, be increased from £800 a year to £900 forthwith, with four subsequent annual increments of £25 to a maximum of £1,000.

The recommendation of the Oldham Tramways Committee that the salary of Mr. DUGDALE, the general manager, be increased from £350 to £400 per annum, was adopted by the T.C. on February 5th by 20 votes to 13.

**General.**—Mr. H. F. PARSHALL, stated at the half-yearly meeting of the Central London Railway last week that he was retiring from the board to accept the position of consulting engineer to the whole of the Underground interests. During the period in which he has occupied the chair of the Central London Railway, he has acted not only in the capacity of chairman to the railway, but also as managing director and consulting engineer, having, in fact, absolute control of the railway from every point of view. The operating expenses have been largely reduced, and the efficiency of the railway greatly increased. Mr. Parshall, in resigning his position as chairman and accepting the position of consulting engineer to the Underground interests as part of his general practice, is now enabled to give, as formerly, his whole time to his private consulting practice, and to give his undivided attention to the numerous railway and power projects with which he is associated.

Mr. J. W. BUCK, late of Messrs. Siemens Bros. Dynamo Works, Ltd., Upper Thames Street, E.C., has been appointed sales manager to the Baldur Engineering and Supply Co., Ltd., of Westminster.

COUNCILLOR JAMES LINDSAY has intimated his resignation from the co-sponsorship of the Leith Corporation E.L. Committee. Mr. Lindsay, it is stated, disapproved of the Committee's action in forming a management sub-committee.

Mr. BERNARD L. MYER has resigned the position of chief electrical assistant with Messrs. Sloan & Lloyd-Barnes, consulting electrical engineers, of Liverpool, which he has held for the past nine years, and has taken over the management of the electrical and engineering department of Messrs. Fred. Wilkins & Brother, Ltd., 27-35, Duke Street, Liverpool, who specialise in the electrical, mechanical and fire equipment of theatres and picture-dromes, and also carry on a large general electrical engineering business. Mr. Myer invites firms to send him new catalogues and price lists for wiring accessories, motors, cables, conduits, &c.

We learn that the Shanghai municipal electrical engineer will be in this country in June next in connection with orders for two additional 5,000-kw. turbo sets.

At the Tramways and Light Railways Association's convention at Swansea last year, Mr. DE TURCKHEIM, the secretary of the Association, was presented with a clock. We are informed that a plate has now been fixed to this clock, bearing the following legend:—

Presented to A. DE TURCKHEIM, by the members of the Tramways and Light Railways Association, as a token of esteem and an appreciation of his organising genius.

Swansea, June, 1912.

On Monday evening a gold hunter watch was presented by the staff of Messrs. Crompton & Co., and one or two old Cromptonians, to Mr. ALAN WILLIAMS, upon the occasion of his leaving the company's service and starting business for himself. The presentation, which took place at Salisbury House, E.C., in the presence of the staff, was made by Mr. E. Reeves, the joint manager of this company, who wished Mr. Williams all success in his future career. Mr. Williams stated that the handsome present would always remind him of the happy relationship which had existed between himself and the other members of the staff for so many years.

MR. JAMES MEIKLE, electrical engineer, recently of the Glasgow Corporation Electricity Department, has now become associated, as a partner, with the firm of Robert Semple & Co., mechanical and electrical consulting engineers, 30, Buchanan Street, Glasgow, and will be pleased to receive particulars, catalogues, &c., from electrical manufacturers.

MR. H. S. KENNEDY has been appointed to the position of manager of the marine department of Messrs. Siemens Bros. Dynamo Works, Ltd., and will now be stationed in Glasgow. He has been with the firm for a number of years.

**Obituary.**—MR. GEORGE F. HARDEN.—We deeply regret to learn of the death of Mr. George F. Harden, which occurred on Thursday, the 6th inst., at the very early age of 34. After serving his apprenticeship with Messrs. Scott & Mountain, Mr. Harden joined Messrs. Crompton & Co., Ltd., in 1901, and was later on sent to Glasgow in charge of the firm's branch office there. Subsequently he was moved to a position in the sales department at the head office at Salisbury House, E.C., and finally took over the sales department for the London district. In the beginning of 1912 he was attacked by tuberculosis, and after undergoing open-air treatment, he eventually placed himself in the hands of a specialist in Scotland, under whose care he made a wonderful recovery. Unfortunately, shortly after Christmas he took cold, which went to his lungs, and owing to his power of resistance having been so very much weakened after a year's illness, he was unable to fight the inflammation which was set up in his lungs, and gradually sank and died after three weeks' illness. He leaves a widow and small boy. Both at Glasgow and in London Mr. Harden made a very large circle of friends owing to his genial and breezy manner, and we are sure that this intimation of his death will be received by them with a sincere sense of loss.

A correspondent writes:—"By the death of Mr. Oliver Firth, of Horsforth, Yorks., a gentleman has been removed who was once well known in electrical circles by reason of his connection with the engineering trade and in the manufacture of dynamos."

## NEW COMPANIES REGISTERED.

**International Cold and Power (Charles Tellier Processes) Co., Ltd.** (126,868).—This company was registered on February 4th, with a capital of £24,000 in £1 shares (12,000 preference), to carry on the business of mechanical engineers and constructors, electricians, suppliers of electricity, liquid air, motor or motive power, and artificial cold, ice merchants and manufacturers, refrigerating storekeepers, &c., and to adopt an agreement with E. L. Hieulle. The subscribers (with one share each) are:—W. P. Vethereid, 41, Russell Road, Kensington, W., chairman; E. F. Doune, 56, Margaret Street, E.C., manager; E. Leary, Spencer House, South Place, E.C., secretary; G. A. M. Evans, Woodstock, Broadstairs, retired banker; E. S. M. Perowse, 5, Guildhall Chambers, E.C., solicitor; G. F. Heard, Holmwood, Devonshire Road, Merton, managing clerk; J. Cooper, Rushmore, Godmaysa Vale, Muswell Hill, N., clerk. Minimum cash subscription, seven shares. The number of directors is not to be less than three or more than 12; E. L. Hieulle is the first director; qualification (except first directors), £100; remuneration, 5 per cent. of the surplus profits remaining after payment of a dividend on preference shares, divisible. Registered by E. S. M. Perowse, 5, Guildhall Chambers, E.C.

**City of Las Palmas Water and Power Co., Ltd.** (126,916).—Registered February 8th, by Ashurst, Morris, Crisp & Co., 17, Throgmorton Avenue, E.C. Capital, £125,000 in £1 shares. Objects: To supply the port and town of Las Palmas and neighbourhood with water and electricity, to acquire the concession granted to Bernardo de la Torre by the Municipality of Las Palmas, Grand Canary, and to adopt an agreement with the Las Palmas Syndicate, Ltd., and the Bernardo de la Torre. The signatories (with one share each) are:—J. Barnes, 7, Walcot Gardens, Kensington, S.E., accountant; W. R. Tompkins, Morecroft House, 10, Brompton Road, St. Albans, clerk; C. Anning, Ellerslie, Sylvan Road, Snarborough, clerk; W. R. Smith, 6, Lawley Street, Lower Clapton, N.E., clerk; A. G. Mount, 88, Narford Road, Clapton, N.E., clerk; E. J. Burrows, 44, Herchem Road, South Tottenham, clerk; S. A. Sharpe, 205, Friern Road, Dulwich, S.E., cashier. Minimum cash subscription, two shares. The first directors (with one share each) are:—T. P. Taylor, 24a, Oriel Road, Bootle, electrical engineer; D. Brown, 41, Pembroke Road, Bootle, ironfounder and engineer. Private company. The number of directors is not to be less than three or more than five. The first are T. P. Taylor, D. Brown and R. Tilley; qualification, 50 shares. Registered office, 24a, Oriel Road, Bootle. Solicitors, Ashby & Clothier, 8, Cook Street, Liverpool.

**Buttle Electrical Co., Ltd.** (126,985).—This company was registered on February 6th, with a capital of £1,500 in £1 shares, to take over the business carried on by T. P. Taylor, at 24a, Oriel Road, Bootle, as the "Buttle Electrical Co." The subscribers (with one share each) are:—T. P. Taylor, 24a, Oriel Road, Bootle, electrical engineer; D. Brown, 41, Pembroke Road, Bootle, ironfounder and engineer. Private company. The number of directors is not to be less than three or more than five. The first are T. P. Taylor, D. Brown and R. Tilley; qualification, 50 shares. Registered office, 24a, Oriel Road, Bootle. Solicitors, Ashby & Clothier, 8, Cook Street, Liverpool.

**Leeds Private Telephone (New System) Co., Ltd.** (126,997).—This company was registered on February 5th, with a capital of £1,000 in £1 shares, to carry on the business indicated by the title. The subscribers (with one share each) are:—F. T. Jackson, 143-5, Great Portland Street, W., agent; T. H. Walker, 57a, Holborn Viaduct, E.C., printer. Private company. The first directors are F. T. Jackson (permanent chairman and managing director) and T. H. Walker. Registered office, 2, Basinghall Square, Leeds.

**Refrillments, Ltd.** (127,002).—This company was registered on February 5th, with a capital of £3,000 in £1 shares, to carry on the business of manufacturers and producers of electric filament lamps, &c. The subscribers (with one share each) are:—W. Lee, 23, Blenheim Road, Bedford Park, land agent; C. B. James, Holme House, Norbury, accountant. Private company. The number of directors is not to be less than two or more than eight; the first are not named; qualification, £100; remuneration as fixed by the company. Registered office, 60, Haymarket, S.W.

## CITY NOTES.

### Mersey Railway Co.

THE half-yearly ordinary general meeting was held on Tuesday, at the offices, Worcester House, Walbrook, E.C., Mr. J. Falconer, M.P., in the chair.

THE CHAIRMAN, in proposing the adoption of the report (see *ELEC. REV.*, page 231), said it was a great satisfaction to the board to be able at the end of the half-year to again record that substantial progress had been made by the company as regarded its volume of traffic, its receipts, and also its net revenue. That steady increase in those three particulars had been maintained ever since they had adopted electrical traction for the line. It was now practically 10 years since they first commenced electrical working, and during that time the receipts had increased practically to the extent of £60,000 per annum. Their receipts during this last year were practically £60,000 more than they were in 1902, which was the last complete year of steam working. Comparing the last half-year of steam working with the half-year under review, it would be found that the number of passengers carried had increased from 3,500,000 to 8,111,000, an increase of 4,750,000, or 141 per cent. The receipts had increased from £29,470 to £59,651, an increase of £30,000, equal to 102 per cent. It was interesting to compare the figures for the past year with the corresponding period of 1911. It was true that there was a strike in 1911, but it was satisfactory to note that the passengers carried, apart from season ticket-holders, were 12,715,000, as against 11,940,000, which was an increase of about 672 per cent. The receipts had increased from £109,947 in 1911 to £115,926, equal to about 5'44 per cent. The expenditure had only increased from £59,115 to £60,765, an increase of £1,315, which was almost entirely due to an increase in the price of coal. The net revenue had increased from £50,532 in 1911 to £55,158 in 1912, an increase of £4,626, or 9'15 per cent. The important question for the debenture-holders was as to the amount available for payment of interest upon the debentures. After providing the full payment of the interest on the first debenture stock amounting to £26,774, there remained £18,060. That was sufficient to pay the interest on the 1866 stock in full, and also on the 1871 stock and to pay £2,179 per cent. upon the 1882-3-5 3 per cent. stock, or within 2/3 per cent. of the full amount to which that stock was entitled. He thought the shareholders and debenture-holders would agree that it was gratifying that they should have been able to pay the interest upon those debenture stocks in the way they had. They still had the "B" debenture stock to face before they reached payment upon the preference shares. The amount of that stock was £282,354, and the amount required to meet the interest, which was 3 per cent., was £8,470. The length of time which it would take before they were in a position to pay interest upon that stock would, of course, depend upon the rate of progress they made in the future. It had never been their habit to attempt to prophesy—all he could say was that every year had confirmed the board in the view that there was a great volume of traffic to be served by the railway, and that they had adopted the right policy in giving what they thought was the best railway service in the United Kingdom.

THE HON. R. C. PARSONS, M.A., seconded the motion.

Replying to questions, the CHAIRMAN said that during the month that had elapsed since the accounts were closed, the returns showed further reasonable expansion. They had no reason to believe that the limit of expansion had been reached, and the shareholders were in quite as good a position as the board to form a judgment on that matter. They could do a very largely increased traffic with comparatively very little additional capital expenditure. The generating plant was more than ample for any expansion of traffic which was likely to come for a considerable time.

The report was adopted.

**W. T. Henley's Telegraph Works Co., Ltd.**—Subject to audit, the directors have decided to recommend a dividend payable on March 31st next, on the ordinary shares at the rate of 15 per cent., free of income-tax, including the interim dividend of 5 per cent. paid August 31st last.

**South Metropolitan Electric Light and Power Co., Ltd.**—The transfer books and register of members will be closed from February 15th to 28th, for the preparation of warrants for dividends payable on 28th inst.

**Newcastle and District Electric Lighting Co., Ltd.**—The directors recommend a final dividend of 3 per cent. for the last half of 1912, making 3 per cent. for the year.

**Underground Electric Railways Co. of London, Ltd.**

THE directors report that for the half-year ended December, 1912, the net revenue from investments and properties (including general interest), after deducting general expenses and including balance brought forward, amounted to £278,007, and the interest charges on £1,730,000 4½ per cent. bonds of 1913, absorbed £11,336, leaving a surplus of £236,671. Out of this will be paid on March 1st, 1913, interest at the rate of 6 per cent. per annum on £1,273,000 6 per cent. first cumulative income debenture stock for six months ending December, 1912, £38,190; interest at the rate of 6 per cent. per annum, plus income-tax, on £6,136,050 6 per cent. income bonds of 1918 for six months ending December, 1912, £195,486, carrying forward £2,996. The income for the half-year shows an increase of £122,671 over that for the corresponding half-year of 1911, but a true comparison is not possible on account of the substantial alteration in investments.

The Metropolitan District Railway Co. continues to show a steady expansion in receipts, with a slight increase in working expenses, due largely to the increased price of coal and to increases in the wages of the staff.

The London Electric Railway Co. shows an increase in earnings and also in working expenses, the latter due to higher prices of coal and increase in the wages of the staff. The construction of the Charing Cross and Paddington extensions is progressing rapidly, and it is expected that both will be opened for traffic in the autumn. Work has also been commenced on the Queen's Park extension, and on the installation of escalators at Oxford Circus Station.

The London General Omnibus Co., Ltd., has substantially increased its fleet of motor-omnibuses, and shows a satisfactory expansion in earnings.

The Associated Equipment Co., Ltd., has been formed for the purpose of manufacturing equipment and repair parts for the various undertakings allied with the company. It owns a large factory at Walthamstow, to which extensive additions are being made. It also owns all the debenture stock and ordinary shares of the Metropolitan Steam Omnibus Co., Ltd.

The annual report and accounts of the London United Tramways, Ltd., for 1912 are not yet published, but it is not expected that the results of the year's working will show much, if any, improvement over the previous year.

After giving particulars of Parliamentary Bills, the report goes on to refer to the amalgamation or consolidation schemes entered into with tramway and omnibus companies, and certain underground electric lines.

In the balance-sheet "stocks, shares, and other property," stand in the books at £13,502,622, and consist of stocks and shares in associated companies, as well as lands and buildings.

The item "calls unpaid," which formerly appeared in the balance-sheet, has been eliminated, as all of the capital has been paid up. Most of the securities and shares of the company are now held by British investors. In view of this fact, the American directors have come to the conclusion that the management of the company should in future be wholly in the hands of the board of directors residing in Great Britain. They have therefore resigned their seats, and Mr. W. M. Acworth and the Right Hon. C. B. Stuart-Wortley, K.C., M.P., have been elected to the board. In parting from their American colleagues, the directors desire to express their high appreciation of the valuable services rendered by them to the company in the past.

The meeting is called for February 24th.

**Central Electric Supply Co., Ltd.**—In their annual report, the directors state that an agreement for the supply in bulk under the London Electric Supply Act, 1908, has been entered into with the Chelsea Electricity Supply Co., Ltd. Energy has been supplied to the Westminster Electric Supply Corporation, Ltd., the St. James's and Pall Mall Electric Light Co., Ltd., and the Chelsea Electricity Supply Co., Ltd., to an amount of 24,328,750 units. After making a full allowance for sinking fund and depreciation, the net balance for 1912 is £4,999, plus £5 brought forward, leaving to be dealt with £5,004. A dividend at the rate of 5 per cent. on the ordinary shares for the year absorbs £5,000, leaving £4 to carry forward. A 3,000-kw. high-pressure turbo-generator has been added to the plant during the year. Mr. Marlborough R. Pryor has been appointed a director of the company.

**The Promotion and Flotation of Limited Companies.**—According to a lecture delivered on the 11th inst. in the City by Mr. H. W. Jordan, F.I.D., an advance print of which was sent to us, it would appear that out of 138,000 companies registered under the 1862 Act, some 80,000 have become defunct, leaving, approximately, 58,000 with a paid-up capital of about £2,450,000,000. In 1912, 7,666 companies were registered representing a capital of £173,819,037. Commencing with a brief sketch of the history of companies, the lecturer discourses pleasantly upon various matters under such titles, *inter alia*, as "purpose of formation," "freak companies," "invalid articles," "formation" (steps to be taken on the registration of a company), but the paper is obviously not intended for the professional secretary, whose varying and onerous duties and responsibilities, by the way, are ever on the increase. Though many improvements have been effected in the Companies' Acts, now codified under the name of "The Companies' (Consolidation) Act, 1908," there seems, in many cases, to be room for a greater pressing home of the all-important element of responsibility in accepting and dealing with public money.

**Electrical and Industrial Investment Co., Ltd.**

THE report of this company for the seven months from June 1st to December 31st, 1912, as published in the financial press, states that the company was capitalised mainly by debenture-holders and shareholders of the City of Birmingham Tramways Co. subscribing for debenture stocks and shares in this company, under a scheme of conversion by which this company acquired the investments of that company, comprising, among others, a large proportion of trustee securities. A reserve was provided in securities by that company to meet the depreciation of the trustee securities and of some of the other investments taken over. All the trustee securities and some of the others have since been realised, and the loss on realisation has been borne by the reserve. The directors have acted on, and propose to adhere to, the principle of adding to the reserve any profits made on sales of any of the company's investments, and of charging against the reserve any losses on realisation. The balance account at December 31st, 1912, was £23,195. The directors have power to issue debenture stocks to an aggregate amount not exceeding the subscribed share capital of the company, and they propose to issue further debenture stocks of the company accordingly. The revenue account shows a profit, after paying all administration expenses, of £11,325. The interest on the debenture stocks amounts to £2,970, and the dividend on preference shares to £3,411, leaving £1,943. This balance would admit of a dividend on the ordinary shares at the rate of 4½ per cent. per annum. The directors, however, are of opinion that it is better to strengthen the company by defraying the whole of the preliminary expenses, amounting to £1,629, out of the first profits, carrying forward the balance of £3,314.

**Mather & Platt, Ltd.**—The directors announce a dividend at the rate of 10 per cent. per annum, with a bonus of 2 per cent., both free of tax, less the interim dividend of 5 per cent. already paid.

**Stock Exchange Notices.**—Applications have been made to the Committee to allow the following securities to be quoted in the Official List:—

Manoas Tramway and Light Co., Ltd.—300,000 ordinary shares of £1 each fully paid, Nos. 1 to 300,000 (special application).

Pacific Power and Light Co.—\$5,005,000 5 per cent. first and refunding mortgage 20-year gold bonds, International series, Nos. 1 to 5,295 and 5,301 to 5,610 of \$1,000 each.

Sao Paulo Electric Co., Ltd.—£1,880,000 5 per cent. 60-year first mortgage bonds, in lieu of the scrip.

The Committee have appointed a special settling day as under:—

Wednesday, February 19th.—Universal Cheap Cables, Ltd.—20,000 shares of £1 each fully paid, Nos. 1 to 20,000.

And ordered the undermentioned securities to be quoted in the Official List:—

Commercial Cable Co.—£14,146 additional sterling 500-year 4 per cent. debenture stock.

**Chloride Electrical Storage Co., Ltd.**—The directors recommend, out of the undivided profits, an interim bonus of 7s. 6d. each on the ordinary shares, to be satisfied by the issue and *pro rata* allotment of 19,344 new shares, making 73,250 of these shares outstanding.—*Financial Times*.

**Telegraph Construction and Maintenance Co., Ltd.**—In addition to the interim dividend of 5 per cent. paid in July last, there is announced a further dividend of 10 per cent., together with a bonus of 12s. per share, making 20 per cent. for the year. This compares with 17½ per cent. for 1911.

**Blackpool and Fleetwood Tramroad Co.**—The half-yearly meeting was held at Manchester on Tuesday, Mr. Geo. Richardson presiding. The chairman said that the result of the half-year's working was very satisfactory, especially considering the state of the weather.

**Willans & Robinson, Ltd.**—The report states that the accounts for the year to June 30th show a balance against profit and loss of £52,191, of which £31,310 represents book adjustments, the result of a special scrutiny of fluctuating assets instituted by the directors when the bank loan was arranged. The balance of £20,881 represents the trading loss for the year after including provision of £8,337 for depreciation, £9,378 for debenture interest, and £892 for the upkeep of Queen's Ferry Works, a total of £18,607.—*Financier*.

**Dublin United Tramways Co. (1896), Ltd.**—The directors report that the accounts for the half-year to December 31st show available for dividend £63,852. It is recommended that dividends be paid for the half-year at the rate of 6 per cent. per annum (less income-tax) on both the preference and ordinary shares. £10,000 is to be set aside towards the renewal of permanent way, £2,000 to accident insurance reserve, and £5,000 to reserve and renewals fund, leaving £11,257 to be carried forward.

**Prospectus.**—*Hydraulic Power and Smelting Co., Ltd.*—There has been offered for subscription this week (the list was to close last Tuesday) an issue of £475,000 5 per cent. first mortgage debentures at 95 per cent. in this company, which was formed in 1911 to acquire the share capital of the following companies:—Aktieselskabet Tysefaldene; Norsk Elektrisk Metallindustri Aktie selskap; Trollhättans Elektrothermiska Aktiebolag.

### St. James's and Pall Mall Electric Light Co., Ltd.

THE directors' report for 1912 shows that the connections have increased from 13,975 kW. to 14,609 kW., and 11,044,768 units were supplied to consumers. The Central Electric Supply Co. Ltd., has declared a dividend of 5 per cent. on the ordinary shares, in respect of which a sum of £2,500 will in due course be payable to this company. As stated in last year's report, it is intended to continue the equipment of the Carnaby Street works with transformers and accumulators to deal with an increase in H.T. supply from the Grove Road works. To meet the consequent obsolescence of steam generating plant, special provision for depreciation has again been made in 1912, and the directors have also carried a sum of £4,500 from net revenue account to the credit of contingency fund. The net profits for 1912, applicable to dividends on shares, amount to £26,946, plus £2,294 brought forward, less interim dividend paid in August last for half-year ending June 30th, at the rate of 7 per cent. on preference shares, £3,500, and 10 per cent. on ordinary shares, £10,000, leaving £15,740 to be dealt with. It is proposed to pay a dividend at the rate of 7 per cent. on the preference shares for the second half-year, requiring £3,500, and a dividend on the ordinary shares for the second half-year of 5s. per share, making, with the interim dividend paid in August last, a total of 10 per cent. for the year, £10,000, leaving £2,240 to carry forward. The directors regret the death of Sir John H. Morris, K.C.S.I., and they have elected Mr. F. J. Walker to a seat on the board, and have appointed him managing director of the company. The meeting is called for February 18th.

Units generated and purchased	13,909,052
Quantity utilised—Private supply	11,044,768
Used on works	372,353
Total	11,417,121
Expended in distribution	2,491,331
Total connections in kW., December, 1912	14,609

### Central London Railway Co.

THE meeting of this company was held on February 6th at the Holborn Restaurant, Dr. H. F. Parrshall presiding.

THE CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 231), said that during the half-year the expenditure on capital account had been £63,148, chiefly in connection with the Liverpool Street extension, which alone had amounted to £37,941. The estimated expenditure on the Liverpool Street extension during the present year was £44,000, and for subsequent years £1,000. On the Ealing and Shepherd's Bush extension, the estimated expenditure for the present year was £61,000, and for subsequent years £30,000, and that together with the provision for additional rolling stock £6,000, and an amount for subsequent years of £69,000, gave a total of £211,000. To meet the anticipated capital expenditure, they had unissued debenture stock, amounting to £160,000, and a balance at the credit of capital account of £112,978, a total of £272,978. They had carried 18½ million passengers, which, as compared with the same period of last year, showed an increase of 613,000, and the increase in receipts amounted to £5,222. That, together with the increase in miscellaneous receipts, gave a total increase in receipts of £5,903. Against that, there was an increase in working expenses of £2,632, principally accounted for by the extra cost of working the Liverpool Street extension. It would be seen, therefore, that the net revenue showed an increase of £3,271. It was very satisfactory to note that the Liverpool Street extension, which was opened on July 29th last, had contributed mainly to that increase in passengers and receipts. The actual bookings at Liverpool Street for the five months preceding the date of the balance-sheet accounted for 1,626,000 passengers, with £10,200 receipts. The Broad Street portion of the extension, which was opened on October 10th last, had contributed 161,000 passengers, with £1,184 receipts. That gave a total for the extension of £11,384. A great increase in the Broad Street traffic was anticipated as soon as the lifts were ready for use. They had already been tested, and would be expected to be running in ten days. The gross receipts for the half-year amounted to £144,455, as against £138,552, and after deducting working expenses, which amounted to £76,328, there was a balance of net revenue of £68,127. That compared with £64,856 for the corresponding period of the previous year. The amount brought forward from last half-year was £23,776, general interest amounted to £6,530, and the amount reserved from the last half-year to meet the dividend of the deferred stock was £6,462, giving a total net revenue of £104,895. After providing for debenture interest and other payments amounting to £19,475, there was an available balance of £85,420, as compared with £84,170 last year. The interest on the 4½ per cent. preference stock amounted to £10,800, less amount charged to capital under the Act of 1909, £4,060. There was, therefore, a total balance available of £78,680, and from that sum dividends on the undivided ordinary stock at the same rate as last year, namely, 3 per cent., and of 4 per cent. on the preferred ordinary stock and 2 per cent. for the whole year on the deferred stock, were recommended, absorbing £51,462. That left a balance to be carried to the next half-year of £27,218, as against £26,151. The whole of the permanent way was being renewed, and a system of automatic signalling was being installed; all of this work was well in hand and was being proceeded with as rapidly as possible. Proceeding to refer to the recent proposals of the Underground Electric Railways Co. of London, Ltd., which were fully explained at a meeting of shareholders in December last, he said that holders of over 75 per cent. in the aggregate of the ordinary, preferred ordinary, and deferred ordinary stocks, had accepted that offer, and the Underground Co. had intimated that

the offer was now binding upon them. Under the trust-deed between the Underground Co. and Messrs. Glyn, Mills, Currie and Co. and two of their directors, namely, Viscount St. Aldwyn and Sir H. Babington Smith, remained on the board to represent the interests of the guaranteed stockholders; the Hon. A. H. Mills also remained as a director. Mr. R. Fleming, Lord Knollys and Lord Rathmore, had retired, and Lord George Hamilton, Sir Herbert Jekyll and Mr. Albert H. Stanley, having been nominated by the Underground Co., have been elected in their places. In accordance with the new arrangements, his own resignation had been tendered to take place after the meeting, when it was proposed to elect Lord George Hamilton as the new chairman.

VISCOUNT ST. ALDWYN seconded the motion, and the report was adopted.

### Smithfield Markets Electric Supply Co., Ltd.

SIR H. S. LEON, Bt. (chairman), presided on Friday at Winchster House, E.C., over the fifteenth ordinary general meeting of the above company.

THE CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 234), said that £2,847 had been spent on capital account during the year. This included a part of the cost of the new generating plant, and since their report had been issued, three of these new machines had been brought into use, so that the balance of the cost when the fourth one was erected would be charged to the capital account of 1913. Last year he alluded to what were termed physical difficulties on account of the Diesel engines, but those difficulties had been surmounted, and it was hoped that, if all went smoothly, their income would be considerably increased as the result of this heavy expenditure. Turning to the revenue account, it showed a small increase in the gross profit. There had been some money spent out of revenue on improvements of a special nature in connection with their installations entirely for the benefit of their customers, which had already proved itself very well spent. The gross revenue showed a slight falling off, almost entirely due to a smaller demand for power, perhaps on account of the cold summer. It would also be remembered that the Dock strike of last summer dislocated trade and injured the particular business from which they derived some part of their revenue. Their competitors, the gas company, had been very active in the markets, and it spoke well for the popularity and manifest advantages of electric lighting that they had so far been able to hold their own. It seemed to him remarkable that anyone could prefer gas to electricity, even if they had to pay double the price for electricity. The net profit was equal to 6 per cent. more than last year, after having placed £400 to the debenture stock redemption fund, and £500 to depreciation account, while the amount available for dividend was £2,154. The board, therefore, recommended the payment of a 2 per cent. dividend, the same as last year. They might have to borrow a little money to pay for the new plant, but the board intended this debt to be only of a temporary nature, and repayment of it would be made as the company could afford to do so. He desired to emphasise the importance of having a considerable sum in cash as working capital, for they must be in a financial position to face the gas competition as well as to effect any improvements which might come along, so as to reduce the cost of generation. As a matter of fact, they had had an increase in the number of lamps installed last year, in spite of the gas competition, but the revenue from them was not so large, owing to the varying conditions of trade in the market. The electric lighting bills of their customers were much more closely examined than they used to be, and while the aggregate of trade was larger, the profit was smaller. He thought that was the general tendency of trade in every branch throughout the country, and in the long run he did not think it would do any damage to them or anybody else.

MR. E. SCHENK seconded the motion, and the report was adopted without discussion.

**Official Announcements re Companies.**—The following are to be struck off the register within three months, unless cause is shown to the contrary:—

Bartitsu Light Cure Institute, Ltd.  
Carnarvonshire Electric Traction Syndicate, Ltd.  
Empire Electric Light and Power Co., Ltd.  
Improved Electric Supplies, Ltd.  
Osmision Syndicate, Ltd.

**National Gas Engine Co., Ltd.**—The directors report that for the year 1912 the net profit, after providing amply for depreciation of buildings, tools, &c., and allowing for management salaries and income-tax, was £91,238. An interim dividend for the six months to June 30th, amounting to £28,500, being at the rate of 5 per cent. per annum on the preference shares, and 7½ per cent. per annum on the ordinary shares, was paid on July 31st, 1912, leaving £62,738 plus £5,769 brought forward, making £68,506 to be dealt with. The directors recommend a final dividend at the rate of 5 per cent. per annum on the preference shares, and 7½ per cent. per annum on the ordinary shares, both less income-tax, for the six months ended December, 1912. This will absorb £28,500, and leave £40,006, out of which the directors propose to place £21,200 to the reserve fund (making it £30,000), to write off the formation expenses £8,867, and to carry forward £9,939. Mr. Kenneth S. Prescott has been elected to the board.

**Bristol Tramways and Carriage Co., Ltd.**

THE directors' report for 1912 shows that the gross receipts were £369,614, and the working and general expenses and renewals £301,412, leaving a net revenue of £68,202. From the net revenue the following have been distributed, viz. interest for the year on 4 per cent. and 4½ per cent mortgage debenture stock, and on deposits and bankers' interest, £23,860; interest (carried to reserve fund) on investments realised for capital outlays, £2,693; dividend on 4 per cent. preference shares for the year (subject to income-tax), £18,833; interim dividend at the rate of 4 per cent. per annum (subject to income tax), for the half-year ended June 30th, £9,417; and it is proposed to appropriate the balance as follows—Final dividend for half-year at the rate of 4 per cent. per annum (subject to income-tax), £9,417; addition to reserve fund for contingencies and renewals, £4,083. The interest on investments, and amounts from income-tax claims adjustment, have been carried direct to the credit of the reserve fund, which totals £241,289. With the addition now proposed of £4,083, the reserve fund will be further augmented to £245,372. The receipts from the tramways department show an increase of £5,390, or about 2½ per cent., whilst those of the carriage department have increased by £27,666, or 26 per cent. The total number of passengers carried during the year on the company's cars and motor-omnibuses was 52,370,515, as compared with 49,561,001 in the previous year, an increase of 2,809,514.

The expansion of the company's general motor carriage business is continuous. The business at the branches in Bath and Weston-super-Mare is increasing daily, and further developments are intended; moreover, the branch established during the past year at Cheltenham has succeeded in fulfilling the public requirements so admirably, that another one will be forthwith opened in the adjoining city of Gloucester. The company have recently been appointed by H.M. Postmaster-General as contractors for the carriage of the mails by motor vehicles for three services, between Gloucester and Bath, Cardiff and Birmingham respectively, and a further service between Bristol and Clipping Sodbury. This is in addition to the contract for Bristol local mails held for years past by the company. New motor-omnibus routes will be opened in and around Bristol, whilst the daily excursion traffic for Bristol and the West of England will be further developed in the ensuing summer. Fifty high-class cars for private hiring are being built at the company's works, and will shortly be added to the stock. An additional number of commercial vehicles will also be provided to meet the increasing demand. The motor building and repairing works at Brislington (covering upwards of four acres) are partially occupied, and will be completed in June next. The installation, comprising machinery and automatic tools of the most recent invention, is designed to yield an output of about 300 new motor-omnibuses, cabs and other vehicles each year, as well as to enable all repairs to the company's rolling stock and privately-owned cars to be executed under most economical conditions. During the past year the directors have purchased, for the sum of £1,600, the undertaking of the Clifton Rocks Railway Co., constructed at a cost of £30,000. The railway can be profitably worked by the company and made available as a convenient link for the passengers who travel by the vehicles now or at any future time to be worked by the company in and around Clifton and Hotwells.

The recent Insurance Act received much consideration by the directors, who found that if the company elected to carry out the literal requirements of the Act, the employees would be injuriously affected, and placed in a much inferior position to that they had occupied under their provident society, which had been fostered by the company for many years past. The directors, therefore, formulated a scheme for an "Approved Society," embracing only the company's employees, and this received the immediate and hearty approval of the Insurance Commissioners. Occasion was taken to still further enlarge the benefits so that the employees are now secured such advantages as are enjoyed by few, if any, similar employments in the kingdom.

The Employees' Superannuation Fund, wholly subscribed by the company and its directors, now amount to £29,115. The substantial provision now existing, and which will continue to be made for old age or other incapacity, is much appreciated by the employees.

The meeting is called for February 19th.

**Paisley District Tramways Co.**

THE directors' report for the half-year ended December 31st, 1912, shows that the revenue was £30,056, and the expenses were £17,622, leaving £12,433; less general interest, £265; interest on debentures, £1,600; debenture sinking fund, £750, leaving £9,818, plus £1,996, brought forward, making a balance of £11,814. Out of this, £3,000 has been placed to general reserve account; £3,750 to dividend for the half-year on the 5 per cent. cum. pref. shares; £1,000 to preference share sinking fund; £1,620 to dividend at the rate of 2 per cent. per annum for the half-year on the ordinary shares; £2,444 being carried forward. The traffic receipts show an increase of £1,113 and the expenses an increase of £1,794, as compared with the receipts and expenses for the corresponding half-year of 1911. The increase in expenses was mainly due to running additional services, heavier charges for maintenance and for local rates. Four additional cars were purchased during the half-year.

Half-year ended.	Miles open.	Passengers.	Traffic receipts.	Average fare.	Car. mileage.	No. of cars.

**City of Buenos Ayres Tramways Co. (1904), Ltd.**

THE directors' report states that the annuity payable by the Anglo-Argentine Tramways Co., Ltd., has been received, and the net revenue for the year to December 31st amounted to £66,592. Interim dividends have been paid for the nine months ending September 30th, absorbing £46,500, leaving a balance of £20,092. The directors recommend (says the *Financier*) that a final dividend of 1s. 3d. per share (making 5s. per share—5 per cent. per annum—less income-tax) be paid for the year, absorbing £15,500; that £4,500 be transferred to general amortisation fund, and £92 carried forward.

**Northampton Electric Light and Power Co., Ltd.**

THE report for 1912 says that the company's undertaking is making satisfactory progress. Lamps and motors have been added (to the equivalent of 20,426 32 watt lamps), making a total equal to 105,887 lamps. The increase in n.r. of motors is 563, making a total of 2,725 n.r., and of this 2,280 are hired from the company. The mains added were 1 mile 671 yards in extent, making a total of 29 miles 1,618 yards. In addition to this, new feeder ducts have been laid in various directions, the increase amounting to 2 miles 311 yards. The output of electricity has been 3,108,113 units compared with 2,497,871 in the previous year, being 25 per cent. increase. The maximum load on plant was 1,956 KW. (25 per cent. increase) and the load factor 181. The coal strike occasioned some additional expenditure for fuel. There has been a reduction in the price of current for lighting. Eight cottages in Fetter Lane, adjoining the company's property, have been purchased. A considerable addition to the generating plant will be made during 1913, and to meet the cost of this a further issue of debenture stock is contemplated. The general depreciation account has been increased by £5,200 (out of which certain specific items have been written down, as shown by the balance-sheet), also £375 has been written off motors, and £1,500 added to reserve. The sum of £750 will be required for the dividend on the 5 per cent. preference shares, and the directors propose that 7 per cent. per annum should be paid on the ordinary shares for the half-year (making 5 per cent. for the year), absorbing £2,450, leaving £2,045 to be carried forward.

**Electrical Distribution of Yorkshire, Ltd.**

THE directors report that the accounts for the year 1912 again show steady and satisfactory progress. The net profit for the three years ending December 31st is as follows:—1912, £1,903; 1911, £1,317; 1910, £515. The profits up to the end of 1911 enabled the company to write off formation, preliminary and working expenses amounting to £128, to pay a dividend at the rate of 4 per cent. per annum, and to carry forward £319, which, added to the profit for 1912 of £1,903, makes a disposable balance of £2,232. The directors recommend a dividend, free of income-tax, for the year 1912 at the rate of 6 per cent. per annum on the ordinary shares, amounting to £1,101, putting to reserve £600, making it £1,000, carrying forward, subject to any remuneration voted to the directors, the balance of £518.

Applications were made to the Board of Trade for provisional orders for electric lighting in Ardsley, Darton and district, Goole and district, Rothwell and district, and Wombwell and Worsborough. All these Orders have now been confirmed by Parliament. During the year there has been a steady growth in the use of the company's supply, and a large number of consumers have been added, and further demands for energy continue to be received.

Applications for 3,135 ordinary shares of £1 each have been received during the year. Only £4,865 of the authorised capital remains unapplied for. In order that shareholders may have the first opportunity of taking this up, an application form is enclosed with the report. In order to provide for extensions in the districts in which a supply is now being given, and to commence the development of the new districts before referred to, further capital is required. An extraordinary meeting will be held on February 25th for the purpose of increasing the nominal capital of the company from £25,000 to £50,000 and the borrowing powers from £5,000 to £10,000.

The directors report the death of Mr. John Nevin, a director from the inception of the company.

The meeting will be held on February 25th at Leeds.

**STOCKS AND SHARES.**

Tuesday Evening.

It is certainly true to say that there is very little business doing round the Stock Exchange as a whole. None of the markets are anything like active, and what trade comes in is mostly of the patchy order. Dear money; new issues; foreign politics; booming trade; these are some of the considerations which militate against the Stock Exchange, and for the time being there seems to be little indication of conditions altering. The first relief is expected to come from the Near East, but even there the belligerents are putting up a more strenuous fight than anybody thought they would do.

Amongst the new issues which fall naturally into the markets these notes are concerned with, is one that will, perhaps, make its appearance within a few days—if it is not already out before we are. The emission will probably take the shape of 5 per cent. debentures in the Las Palmas Water and Power Company; and the last proof prospectus which we saw of this bears date September 2nd, 1912. Particulars are available of the coming issue of the Cedar Rapids Manufacturing and Power Company, which is to be offered to the holders of the Montreal Light, Heat and Power and the Shawinigan Water undertakings. Eight and a-half million dollars of 5 per cent. Cedar Rapids bonds are to be offered at 90, with a bonus of 25 per cent. in common stock.

The Railway market suffers from neglect. A good deal of attention is being turned to the stocks of the trade lines in consequence

of the unexpectedly good dividends just declared, and interest in Undergrounds has abated correspondingly. Metropolitans are  $\frac{1}{2}$  higher; Districts  $\frac{1}{2}$  down. London United Tramways Preference dropped to  $\frac{1}{2}$ , and a rally to 5 leaves them 10s. down on the week. Underground Electric ls. shares braced up to 14s.  $\frac{1}{2}$ d., which is not quite so good as they were a fortnight ago. The Ordinary fell to  $\frac{1}{2}$ , the report, out this week, being considered rather disappointing. Great Northern and City Preferred shares recovered  $\frac{1}{2}$  after their fall of  $\frac{1}{2}$  last week, for it is now supposed that the scheme for absorption of the Tube by the Metropolitan Company will be duly confirmed. Shrewd opinion looks for the Great Western to enter into a much closer working alliance with the Metropolitan than is already the case; and should this come about, it would naturally add strength to the position of the Underground Railway. Central London issues are unchanged, and City and South London remains at 38. The City Company's Preference stocks have all shed 2 points, while the 4 per cent. Debenture crumbled to 98, these movements being in company with a variety of falls that have taken place amongst Home Railway pre-ordinary stocks during the past week.

British Electric Traction stocks have eased off to some extent, and Metropolitan Electric Trams Ordinary are flat at the nominal price of 31 32. There is little market left in these, for the Company is becoming merged virtually into the London and Suburban, the Ordinary shares in which are quoted at 7s. 6d., while the Preference are 13s. East London Ordinary stock is a better market at 9s.

English Electricity Supply shares are somewhat featureless, but it is worth noticing that City of London Ordinary are up a further 5s. to 17 $\frac{1}{2}$ , the rise being accompanied by rumours—as vague as ever—that something was “up” besides the price of the shares. The tip goes round that Cities are remarkably cheap at 18 $\frac{1}{2}$ , but we heard the same thing repeated with, if anything, rather more emphasis when Cities stood at 23. St. James's Ordinary eased off  $\frac{1}{2}$  on the report, which shows the net profit to be a little less than that for the previous 12 months. Smithfields have been offered, and the price slumped from 32s. 6d. to a sovereign, the dealers being anything but anxious to buy the shares. Several lines of South London Ordinary shares have changed hands within the last few days, and there are speculative investors who regard the shares as cheap, having regard to the position of the Company and the return which is available from the shares.

Mexico City is said once more to be in the throes of revolution, and, by reason of this, most of the stocks and shares which have any connection with Mexico have given way. Mexican Light and Power Common stock fell 2, Monterey bonds 1, Mexico Trams  $\frac{1}{2}$ , the bonds  $\frac{1}{2}$  to 1, and so on. There was not a great pressure to sell, quotations being marked down more as a measure of precaution than as a reflection of sales. Rio Seconds are lower to the extent of  $\frac{1}{2}$ . Brazilian Traction Common shares dropped to par. British Columbia Deferred is a point lower; and Shawinigan Water, now that the Cedar Rapids scheme is out, fell 4 points to 146 middle, Montreal stock retaining its high figure. The Anglo-Argentine group is steady, but the First Preference, at any rate, can be bought more cheaply than the official quotation would seem to indicate: since the actual price at the time of writing is 4 $\frac{1}{2}$ —4 $\frac{3}{4}$ , it appears an absurdity to quote it as 4 $\frac{1}{2}$ —5 $\frac{1}{2}$  in the Stock Exchange Official List. City of Buenos Ayres Trams are a shade harder, and Para Debenture stock improved slightly.

The excitement in connection with Marconis has been less evident, though there is plenty going on still in the shares. The price keeps most of its last week's rise, and Canadians shot up to 18s. 6d. bid before reacting a few pence. Americans and Spanish have been better in sympathy. So far as can be ascertained, the market impression prevails that if the Company were able to nullify the agreement with the Government, it would be in a position more favourable for securing good terms. Meanwhile, the evidence being given before the Commissioner is followed with the keenest interest.

National Telephone Deferred shrinks continually, last week's recovery being but a check to the steady fall. The price has dipped to 92 $\frac{1}{2}$ , and as the Company's books close finally on the 25th inst., the time should not be far off when all doubts are set at rest as to what proprietors of National Telephone Deferred stock are likely to get in exchange for their present holding. The secretary wrote to the Stock Exchange authorities the other day, however, saying that he could assign no definite date when the information would be available. The matter, of course, rests in the hands of the Post Office, because the latter has appealed against part of the recent award. Outside Marconis and National Telephones, the market is idle and stagnant. Anglo-American Deferred fell  $\frac{1}{2}$ , and Commercial Cable 4 per cent. Debenture has moved on to a basis of 5 per cent. return to the investor. Beyond this, there are no quotable changes.

The chief movement amongst Manufacturing Companies' issues is a drop of 7 in Brush  $\frac{1}{2}$  per cent. First Debenture stock, lowering the price to 42 $\frac{1}{2}$ . This drop is based on the offering of a small parcel, and it will be noticed that the yield on the stock now amounts to 10 per cent. on the money, while the company's Second Debenture returns over 14 per cent. It is scarcely necessary to say that this observation is not made with the idea of inducing staid investors to buy Brush Debenture of either class to put away with their gilt-edged securities. Henley's Ordinary are  $\frac{1}{2}$  up, and Telegraph Constructions rose 1 $\frac{1}{2}$ s.; while Aron Preference put on  $\frac{1}{2}$  upon notice being drawn to the manner in which these manufacturing companies are flourishing, and to the substantial percentage that the Aron shares yield to a buyer at the present figure. Rubber shares are dull, and the putting up of about 900 tons at the auctions this week in Mincing Lane had the effect of depressing to a slight extent the price of the commodity.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, February 12th.

**W. T. Glover & Co., Ltd.**—The directors (says the *Financier*) have declared a dividend for the year of 5 per cent. per annum on both the cumulative preference shares and the ordinary shares, and in addition a bonus of 2 $\frac{1}{2}$  per cent. on the ordinary shares. They also recommend the allocation of £6,500 to the debenture redemption fund and the transfer of £5,000 to the reserve fund, carrying forward about £8,000. The first mortgage debenture redemption fund will then stand at £33,000, the second mortgage debenture redemption fund at £24,000, and the reserve fund at £20,000.

**Continental.**—FRANCE.—A new company has lately been formed in Paris (24, Boulevard des Capucines) with a capital of £48,000, and the title La Société des Ateliers de Constructions Electriques de Delle.

### THE LOWEST TENDER.

THE usual system, almost invariably adopted, of placing contracts with the lowest tenderer, though doubtless the simplest, is often not the best either for the customer or the contractor. A small but recent example of its defects is characteristic. A small country-house job, comprising a 5-B.H.P. oil engine of specified make, dynamo, 350-a.h. battery, switchboard, main cable, and wiring in screwed conduit for some 120 lights, was tendered for by four firms. Three were firms of repute, specialising in country-house work; and their tenders were respectively £458, £122 and £397—keen competitive prices. The fourth tender was sent in by a local firm of "electrical contractors," and their price was £280. And they went one better than the specification by offering a larger battery and a direct-coupled instead of a belt-driven set.

It is obvious that the successful tenderers—needless to say, the local firm got the contract—have either made a big mistake which will result in a serious loss, or it is their deliberate intention to scamp their work and hoodwink the consultant—not a difficult thing to do, as a rule. Such is the case too often, when contracts are placed with the lowest tenderer, who finds himself faced with the alternative of a loss on the job or a profit at the expense of his employers' interests.

A better system is not inconceivable. Each tender submitted is necessarily nothing more than the tenderer's approximation to the true cost, plus a definite profit. It is a mathematical axiom that the average of a number of approximations will tend to be more correct than any individual approximation. Obviously, then, if, instead of placing a contract with the lowest tenderer—who, as often as not, is the lowest tenderer because he has made a mistake—it were given to the tenderer whose price was closest to the average of all the prices submitted, the chances are it would be secured by the tenderer whose price was the fairest for the work required. He would thus gain a reasonable profit, and would have no incentive to save money on the quality of his work at the expense of the employer. At the same time, prices would be no less competitive than at present, as clearly the man who quoted an inflated price would stand as little chance of success as he who quoted too low a figure. Indeed, prices would tend to become more reasonable in all cases. The "cutter" would not cut, because he would know it would be useless, and the man who now submits a high price rather than risk getting the job at an unprofitable figure, would be inclined to quote lower than he would otherwise, knowing that, if he got the job at all, it would be at a fair figure.

In the example given above, the sum of the four tenders is £1,552, which, divided by the number of tenderers, gives an average of £388. The successful tenderer, had the method outlined herein been adopted, would have been he who quoted £397, which, on the face of it, is a fair price—albeit not a "fat" one—and one which would enable him to give the employer better value for his money than he is likely to get from the lowest tenderer.

To take another instance: an asylum wiring job recently advertised for public tender. The results were published in the technical papers. Thirty-two firms competed, comprising some of the best known London firms, with others of less repute. Prices ranged from £2,304 to £987, and the contract was given to a firm whose price was £993.

The average of these tenders is £1,398, and the nearest tender to this figure was one of £1,400. Twenty-two out of the 32 tenders were within 20 per cent. of the average. The architect's estimate was £1,270. The highest tender was nearly £1,000 more than the average, and the lowest more than £500 less.

Clearly it is unreasonable to suppose that the figure which secured the order was the correct one, and that the 22 firms who quoted figures approximating to the average—£500 higher—were all wrong. It is more probable that the lower tenders represent mistakes as great in one direction as those made by the tenderers who submitted prices of £2,000 and more. Consequently it is more than likely the successful contractor has found himself faced with the usual deplorable alternative, of either suffering himself, or making the employer suffer.

It is too much to hope that such an equitable system of choosing tenders as that herein outlined will be adopted by public bodies, who are notoriously conscienceless. It would be something if they could be induced to rule out those tenders which are so much less than the average as to show they are based on either a mistake or a deliberate intention to evade the specification. As it is, contracts are too often placed on obviously erroneous prices, the soulless public body caring nought for the loss which the contractor must inevitably suffer if their engineer, on whom they rely to see that the specification is properly carried out, is successful in enforcing it. Which he very rarely is.—H. R. T.

### AN APPARATUS FOR SIGNALLING THUNDERSTORMS.

[BY OUR BERLIN CORRESPONDENT.]

THE first attempt to investigate atmospheric discharges by a method related to radio-telegraphy—viz., by means of a Branly tube or coherer—was made as far back as 1895-6 by the Russian physicist, Prof. Popoff. An insulated aerial wire directly connected to one pole of the coherer was used in this connection, the other pole (in accordance with a practice later adopted by Marconi) being joined to the ground. Prof. Popoff thus was able to ascertain that atmospheric discharges, on account of their oscillatory character, would excite the coherer, thus enabling thunderstorms to be recorded by means of a Morse apparatus or bell signal.

On the same principle is based the storm indicator designed by the Telefunken Co., but the arrangement of connections differs considerably from the original plan.

As seen from fig. 2, a spark gap *F* and a coil *S* connected up to the earth conductor *E* are inserted into the aerial wire *L*. The coherer *F* *r* and a blocking condenser *C* are arranged in parallel with the coil, the relay circuit, which comprises the cell and the relay coils *s* *r*, being branched off, as usual, from the condenser. The secondary circuit

FIG. 1.

FIG. 2.

of the relay contains a battery *B*, which, on the relay contact being completed, actuates a tapper *K* and a recording apparatus (in the present case a single-stroke bell *G*).

The spark gap having been adjusted to a spark distance of a few tenths of a millimetre, a series of sparks will pass, thus exciting the coherer and sounding the bell as soon as there are any charging phenomena in the atmosphere. Feeble atmospheric accumulations, that is to say, far distant thunderstorms, will result in a slow charging of the aerial wire, and accordingly in the passage of sparks at considerable intervals. Since the signal bell is sounded in the very rhythm of spark discharges, the sequence of sound allows the distance of the thunderstorm from the recording apparatus to be gauged. In the place of the single-stroke bell, a Morse recorder with self-disengaging paper tape can be connected up to the apparatus, thus marking each passage of a spark by a point on the tape. If the speed at which the paper is unwound be known, the distance of the thunderstorm can be gauged by measuring up the paper tape and counting the number of points recorded thereon.

GRAPHS IN A CABLE-SHIP DRUM-ROOM:  
NOTES FOR JUNIOR ASSISTANTS.

BY EDWARD RAYMOND-BARKER.

(Concluded from page 240.)

86. When the writer contrived a device which, by means of the relative movements of two co-adjacent logarithmic scale lines, would indicate cable slack percentages straight

centre is utilised for—*inter alia*—a useful table at once recognised as relating to matter dealt with in 49, viz., taut-wire measuring-wheel *revs. per min.*, and equivalents in N.M. *per hour*.

88. An over-lying movable logarithmically-scaled disc of transparent celluloid, with all graduations and figures inscribed in bright *red*, moves concentrically over a lower cardboard disc similarly graduated and figured in *black*.

89. Thus, the *black* figures and scale lines on the lower disc are seen through the upper and transparent disc, which is inscribed with *red* figures and scale lines. This

FIG. 8A.

FIG. 8B.

off, he naturally found that it developed, in the main, into an ordinary logarithmic disc calculator, though one with novel constructional features.

87. Figs. 8A and 8B show a home-made hand-inscribed experimental form of transparent disc calculator (13 in.

facilitates quick coincidence of any scale-division on the upper disc with any on the under-lying disc, the upper-disc *red* figures contrasting sharply with the lower-disc *black* ones.

90. Also, the relation of one set of scale divisions to the

FIG. 9A.

FIG. 9B.

diameter); 8A shows the upper and transparent disc, with its index set to *unity*; 8B shows index set to 10 per cent. The spare space between the working parts and the disc

other can be observed, not only between the outer and inner divided scales, as is ordinarily done, but—owing to the transparency of the upper disc—right *through* the upper set

of red figures and scale divisions, to the black scale-lines of the under-lying cardboard disc on which the upper disc is superimposed. In this case, therefore, comparison is made between circular logarithmic scales of equal circumference, instead of between an outer circle and a smaller inner circle.

91. The black figures on the lower disc represent cable values; the red on the upper transparent disc, the *taut-wire*.

Example.—(See fig. 8A.)

By turning the upper disc on its centre, let, say, 7.6 (*taut-wire* knots) be set to 8.36 (*cable* knots). The red index on the upper transparent disc will then point to 10 per cent. cable-slack, shown in black figures on the underlying cardboard disc.

92. Conversely, granted the necessity for, say, 10 per cent. cable slack over any particular distance, on the index

due to the great difficulty experienced in printing red on celluloid.

97. Figs. 9A and 9B show respectively the lower (opaque) and the upper (transparent) working discs.

98. Fig. 10 shows the entire transparent disc calculator mounted in a wooden case, opened out on hinges, to expose the calculator and some tabulated figures already referred to. (See 87.)

99. Experience goes to show that a very reliable calculator of this kind could be made with its upper disc of glass. The engraved lines would be on the lower surface, so as to be in close contact with the underlying opaque disc, to the avoidance of parallax. Unfortunately, glass work of this kind is very costly.

100. There remains celluloid. This material, however, under the heat attending the process of printing is not free from molecular changes conducive to a greater or less degree

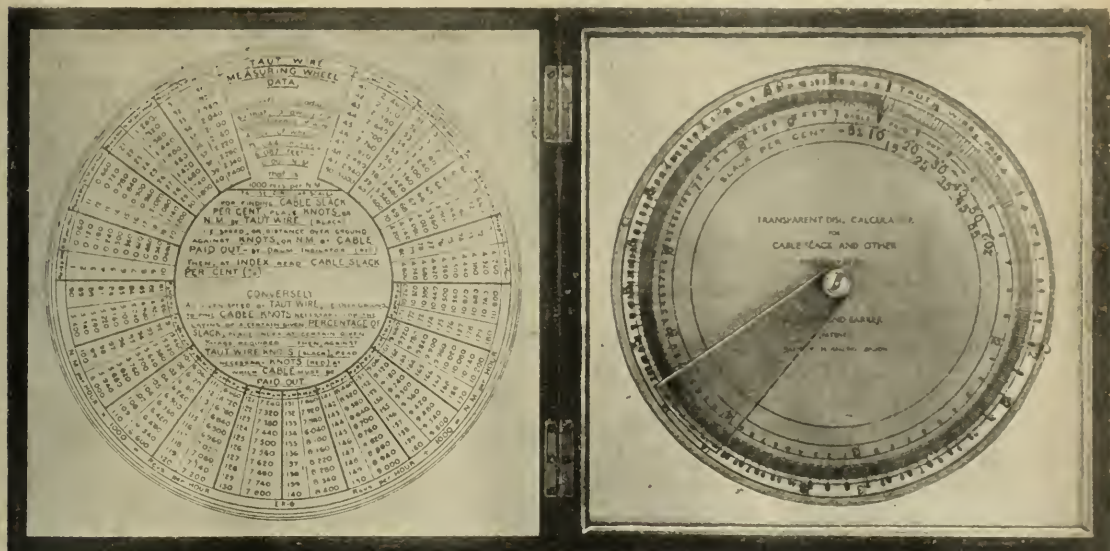

FIG. 10.

being set at 10 per cent., all relative *taut-wire* and cable speed-rates—for 10 per cent. slack—will be found set severally to each other. For instance—

8.5 knots <i>taut-wire</i> is set to 9.35 <i>cable</i> .
7.6 " " " 8.36 "
5.5 " " " 6.05 "

93. The transparent-disc calculators here illustrated are not seen to advantage, as the prints, of course, do not show the striking contrast between the black and the red scales and figures.

94. A transparent-disc calculator may be made with inner and outer circular spaces respectively for *taut-wire*—wheel revs. per min. and *cable*—drum revs. per min. These equivalents would be in line with their several scale-divisions, as in the calculator board, fig. 7. The said circular spaces would be of white matt-surface celluloid, so that temporarily required *revs. per min.* could be pencilled in, to be erased, when done with, at the end of an expedition.

95. Or, if graph methods be preferred throughout, a disc calculator for, say, all three drums on a given ship, may have the *revs. per min.* equivalents permanently recorded; radiating in line with the corresponding scale-divisions. In that case, the correction percentages for various cable circumferences would be obtained from the curve in fig. 4, applied by slide-rule, and addition to the drum-revs. per min. values. (See 38, 48 and 83.)

96. Figs. 9A, 9B and 10 severally show the detail and the general appearance of a transparent-disc calculator of more or less standardised form. The relative positions of the black and the red series of scale-lines and figures are the reverse of those in figs. 8A and 8B; this circumstance being

of warping; so success in this direction has not exactly reached finality.

101. Enough has been written to show some points of interest pertaining to graphs, &c., in the drum room. The writer hopes, at some not long-distant date, still further to develop this subject in fresh directions.

### Aluminium in European Electrical Undertakings.

—According to a report by M. E. D'Hoop, Director of the Technical Service of the Brussels Tramways Co., presented to the Christiania Congress (1912) of the Union de Tramways et de Chemins de Fer d'Intérêt Local, the use of aluminium cables in Europe is developing; eight undertakings have them in use, namely, Copenhagen Municipal Tramways, Geneva Tramways Co., Lausanne Tramways, Lyons Tramways and Omnibus Co., Nuremberg Municipal Tramways, Nogentais (Paris) Co., the Paris General Omnibus Co., and the Société Nationale des Chemins de Fer Vicinaux, of Belgium. Some of the cables used for low pressure exceed 1,000 sq. mm., the maximum mentioned reaching 1,700 sq. mm. section. The Siemens-Schuckert firm report the installation of a cable with a single aluminium conductor for single-phase current at 60,000 volts, on the Muldenstein-Bitterfeld section of the Prussian State Railways. All who have adopted these cables state that they are satisfied with them, and no practical drawbacks have been experienced: the making of the joints and connections, however, necessitates the exercise of special care. There is an advantage in using aluminium for cables of large section for continuous current; in some instances the economy thus secured exceeds 14 per cent. According to a formula worked out by the Copenhagen tramways, the use of aluminium is advantageous when the price of aluminium in £ per ton is lower than 2.08 × price of copper — 30. This formula evidently assumes equality of the price of the other materials used in the manufacture of cables. Independently of the question of price, aluminium cables have the advantage, in the case of very high pressures, when it is necessary to augment the section of the conductors in order to increase the dielectric rigidity,

PROCEEDINGS OF INSTITUTIONS.

The Use of a Large Lighting Battery In Connection with Central Station Supply.

By F. H. WHYSALL, A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, January 28th, and London, January 23rd, 1913.)

THIS paper is, for the most part, based on the results obtained over two complete years' working of the 12,000 ampere-hour battery installed at the Manchester Corporation Electricity Works, Dickinson Street, in March, 1910. This battery was at the time of its installation the largest ever constructed, and has a maximum discharge capacity of over 15,000 amperes.

Before so large a battery could be recommended, the saving to be effected by its use had to be most thoroughly and carefully examined.

The object of the present paper is to show to what extent the predictions as to its use have been fulfilled, and what relief has been obtained in the cost per unit supplied. The battery has thoroughly justified itself during this period, and the figures in this paper should tend to encourage other engineers of central stations to go and do likewise.

The battery consists of 210 cells, each cell containing 38 positive and 39 negative plates 20½ in. wide x 29 in. deep. The positive plates are of the Planté formation, 0·4 in. thick, cast in one piece, but the negative plates are of the improved box type, 0·31 in. thick, composed of half grids securely riveted together, the spaces between them being filled with active material. Specially treated wooden separators are employed between adjacent plates, and a free space of 8 in. is left at the bottom of the cell for the accumulation of deposit.

The cell boxes are of pitch pine lined with lead, the outside dimensions of each box being as follows:—Length, 6 ft. 1½ in.; width, 2 ft. 2½ in.; height, 3 ft. 4½ in.

The following are the guaranteed performances of the cells:—

- Maximum discharge rate, 15,000 amperes.
- One-hour discharge rate, 8,400 amperes (3,000 kW.).
- Charging rate, 4,100 amperes.
- Maximum charging rate, 6,500 amperes.
- " voltage, 2·75 volts per cell.
- Ampere-hour efficiency, 90 per cent.
- Watt-hour efficiency, 66 per cent. at 1-hour rate (8,400 amperes).
- " 75 per cent. at 3-hour rate (3,900 amperes).
- Final voltage per cell, 1·67 volts at 1-hour rate.
- " 1·78 volts at 3-hour rate.
- Weight of each cell and acid complete, 2 tons 19 cwt.
- " complete battery, 620 tons.
- Floor space occupied, 5,966 sq. ft.

The chief advantage attached to the use of regulating cells is that the output of the battery is not limited by the capacity of the boosting plant; and in cases where a battery is used as stand-by, regulating cells have distinct advantages over boosters. On the other hand, with large batteries the switchgear for regulating cells becomes, with its connections, a very cumbersome piece of apparatus.

The chief duty of the Dickinson Street battery is to take 3,000 kW. off the lighting peak. It is also looked upon as a stand-by. But its chief duty is load-leveling; and it was, therefore, decided to have three hand-regulated reversible boosters, and to run them in parallel at times of maximum discharge. At other times, one or two would be used as required. It may be noted, however, that such importance is attached to the question of overload in emergency, that it is the universal custom on the Continent to use regulating cells in all central station batteries.

Short-circuiting switches are provided for all booster bus-bars, these switches being used to cut out the boosters under breakdown conditions, or when boosters are not required—for instance, on Sundays, when the battery does the whole of the lighting load for the greater portion of the day. The lighting load is much bigger than the traction load, and for some time it has been found more economical for that reason to confine the use of the battery to the lighting load.

The boosters are of the Turnbull-McLeod automatic reversible type, and were manufactured by the Lancashire Dynamo and Motor Co. They have equalising rings to every turn of the armature windings, on account of the heavy circulating currents, and the yokes of the boosters are laminated. Each booster is capable of a maximum boost of 5,600 amperes at 80 volts for a few minutes.

A diagram of connections is shown in fig. 1.

Two substantial circuit-breakers are inserted in the main cables as close as possible to the battery house. These circuit-breakers are of the magnetic blow-out type, and are capable of carrying 15,000 amperes continuously. Each is enclosed in a separate concrete cubicle, so as to entirely shield it from all other parts of station, and each is electrically and independently operated from the switchboard by means of solenoids. The circuit-breakers are non-automatic, and are provided with a suitable controller to show by means of signal lamps on the operating panels whether the circuit-breaker is closed or open. The large circuit-breakers on the main switchboard are of a similar type, but mechanically operated from the front of the panels. The circuit-breakers themselves,

however, are also enclosed in concrete cubicles. The switchboard circuit-breakers are automatic.

Bus-bars of aluminium have been employed throughout.

In a typical winter-load curve at the time of the installation of the Dickinson Street battery, the load-factor works out at 32 per cent., and was expected to be improved to 43·5 per cent. In figs. 2 and 3 we have typical summer and winter-load curves since the installation of the battery; it will be noted that the load factors obtained are actually much greater than those anticipated, and are respectively 67·5 per cent. and 49·1 per cent.

In fig. 4 a chart is given showing the effect of load factor on coal consumption and works costs at Dickinson Street and Bloom Street works.

Dickinson Street is now considered an old station, and the largest units in Dickinson Street and Bloom Street stations are of not more than 1,800-kW. capacity. The observed coal consumption per unit—of the combined stations—has been down to the low figure shown on the chart. The lowest figure for a monthly observation per unit generated since the installation of the battery is 2·66 lb., and per unit sent out 2·79 lb., the difference being accounted for by units used at the works and units lost in the battery. The commercial efficiency of the battery was for the first year 70·6 per cent., and for the second year 71·1 per cent.

FIG. 1.—DIAGRAM OF BATTERY BOARD CONNECTIONS, DICKINSON STREET.

It is quite unfair to consider a battery capable of saving only the standby represented by its one-hour rating capacity. In a storm-load the maximum demand (ignoring traction) was 44·5 per cent. greater than the boiler capacity at the commencement of the darkness; and the battery was able to take care of the rising load ahead of the extra boilers which had to be got into commission. Without the battery it would have been impossible to get these extra boilers up in time, and would have meant practically a total failure of supply unless some portion of the load could have been cut off. The actual costs came out as follows:—

3,000-KW. BATTERY AT 1-HOUR RATE OF DISCHARGE, INCLUDING BOOSTERS AND SWITCHGEAR.

Storage battery	...	...	£15,034	7 years.	Loan period.
3-motor booster combination	...	...	2,776	15 "	"
Switchgear	...	...	1,757	15 "	"
Buildings	...	...	2,000	20 "	"

Total ... £21,567

Estimated expenditure required to provide equivalent steam plant	...	...	£51,000
Actual cost of battery plant	...	...	21,567
Difference in capital expenditure...	...	...	£29,433

Steam plant: £51,000 to be repaid in, say, 20 years:—	
(Interest, 3½ per cent., sinking fund, 3½ per cent.)	£3,698
Battery plant: £21,567 to be repaid in 10 years:—	
(Interest, 3½ per cent., sinking fund, 8½ per cent.)	£2,642
Saving in capital charges per annum in favour of battery	£1,056

COMPARISON OF COST PER KILOWATT OF CAPACITY.

	Estimated.	Actual.
Generating plant	£17 0 0	£16 16 6
Battery	6 13 4	7 3 9

In these days of turbo-driven units, the capital cost might be taken at a lower figure.

Costs compiled from the latest actual figures available are estimated by the author as follows:—

	Total cost per kw.
Land ... ..	£0 5 6
All buildings (including offices) ... ..	3 13 0
Land for railway, railway complete and locomotive ... ..	1 9 0
Coal and ash plant ... ..	0 1 0
Marine boilers with superheaters, including economisers, coal and ash chutes, scraper and stoker driving ... ..	2 13 0
Foundations and flues for marine boilers ... ..	0 9 0
High-pressure steel pipes and covering, including valves (main range not included) ... ..	0 2 6
Turbo-alternator and condensing plant, pipework for con- densing plant and motor-driven fans ... ..	3 5 6
Foundations for turbo-alternator and air ducts ... ..	0 4 0
Pipework for turbo-alternator, including circulating water pipes, atmospheric exhaust pipes and valves ... ..	0 5 0
Natural-draught cooling towers ... ..	0 13 0
Foundations for cooling towers ... ..	0 5 0
High-tension cable ... ..	1 8 0
Converting plant, including switchgear ... ..	2 0 0
<b>Total ... ..</b>	<b>£16 16 6</b>
<b>Total plant installed ... ..</b>	<b>56,500 kw.</b>

Mr. Snell's figure of £12.26 per kw., given in his book on "Power House Design," does not include items in the author's estimate, amounting to £5 4s., which would bring up the cost per kw. on his estimate to £17.16.

It would seem, therefore, that, for peak-load duty of two hours (which averages out at the 1-hour rate of discharge for the battery)

FIG. 2.—SUMMER LOAD CURVE.

the cost per kilowatt can be safely estimated at £17, which leaves a margin of £9 16s. 3d. in favour of the battery.

It is necessary when considering the cost of generation of peak-load units to take into consideration the fact that the most uneconomical units are reserved for this duty, and quite rightly so, also

FIG. 3.—WINTER LOAD CURVE.

that these peak-load sets will not be run at their most economical load; consequently, the steam consumption will be high. Bare fuel cost per 1,000 kw. standby for this peak-load duty the author has estimated at £1 8s. per day. But we have seen that it is unfair to credit the battery with standby savings on its bare capacity only. Our 3,000-kw. battery gave a yearly standby saving of £1,564.

There is an actual saving on running fixed charges on the station when a battery is put in; at Dickinson Street there are now 22 fewer men for an increased demand since the installation of the battery. Comparing bare fuel cost per unit generated, and crediting the battery with a commercial efficiency of 70 per cent., we get a

cost per unit (reckoning 2.5 lb. of coal per unit at 12s. 6d. per ton) of 0.237d. against a cost of 1.65d. taken from the actual results shown on the load-factor curve for 8 per cent. load factor. The peak-load units discharged by the battery since its installation, calculated at the rate of five complete discharges per week—March 31st, 1910, to March 31st, 1912—are 1,560,000, and represent an annual saving of £8,531. This takes no account of the morning discharges and load levelling duty during the rest of the day, commonly called "buffering," whereby each set on load is kept running at its most economical output.

The improvement in load factor on the units generated, observed monthly over two years, is approximately 71 per cent., and the value obtained from the chart is 0.08d. on 303 million units, this represents a saving of £10,166. This is the actual improvement due to the battery, and should cover both the other estimates and include the saving due to the buffering effect as well.

Curve C.—Pounds of coal per unit generated (by formula).

FIG. 4.—EFFECT OF LOAD FACTOR ON COAL CONSUMPTION AND WORKS COSTS.

for the sum of £1,250 per annum, which is 8.3 per cent. per annum on the purchase price. This maintenance is included in the works costs.

A recording ammeter and voltmeter are essential in order to see that overcharging or overdischarging does not take place. Charging is continued under normal conditions at Dickinson Street 10 minutes after gassing point is reached, before both daily discharges, and for 2 hours once each week, generally on Saturday, and preceding the day (Sunday) when a complete discharge at the 10-hour rating is usually taken out of the battery.

The efficiency of the battery for the day is units output ÷ units input, including booster units, which we term the "commercial efficiency."

The daily load curves are considered the most important records taken, because the value of a battery depends more on the way it is used than on anything else. A special battery book is kept, giving details of cell defects and their treatment (for which a 1,000-ampere portable "milking" booster is used), daily gassing, weekly overcharge, and all specific gravities and voltages of individual cells once each week after the weekly overcharge. Three pilot cells are used to serve as a guide to the state of charge, and the specific gravities of these cells are taken every half-hour for the station log sheet, which is the general record of the working of the station usually found in use at most central stations.

The capacity of the battery varies at various rates of discharge, and without these pilot-cell readings it would be exceedingly difficult at times to gauge the exact state of the battery.

It is now being recognised that, provided the battery is installed to reduce generating plant, it is a sound commercial proposition when considered in connection with a large lighting load.

Too much has been made in the past of the supposed inefficiency of batteries: as a matter of fact, 70 per cent. to 75 per cent. commercial efficiency can be maintained with care; and if this were not so, efficiency is the least important attribute of peak-load plant, and especially so in the case of a battery. In effect the battery is charged at power rates and discharged at lighting rates. If some of our large consumers on public supply mains only realised this, they would install batteries of their own, buy

current at power rates, and cheapen their own lighting supplies by arranging with the supply authorities for a "restricted-hour" supply, i.e., they would take no current from the mains at peak-load time.

It does not matter how short a period of time during the day or the year a supply is demanded, there must be plant installed to meet it, and it has been found that for all duty of less than 8 per cent. daily load factor, i.e., of less than two hours' demand during the 24 hours of the day, it most certainly pays to make storage battery provision. Beyond this point we must look to advantages other than direct saving in capital cost and running charges to justify the extension of the principle.

The author tenders his best thanks to Mr. S. L. Pearce, the City Electrical Engineer of Manchester, for facilities allowed and permission for the inclusion in this paper of data from official reports, and for the publication of facts and figures concerning the Manchester Corporation electricity works; also to Mr. E. A. Hilton for assistance in getting out the diagrams. The author would also like to make it quite plain that the opinions expressed in the paper are his own personal opinions.

#### DISCUSSION AT MANCHESTER.

MR. S. J. WATSON said it was worth considering whether large batteries should be put in the generating station, or in connection with the distribution system. In connection with polyphase transmission schemes, the sub-stations where the A.C. supply was converted to D.C. would be the places in which to put the batteries. He thought the fairest system of rating a battery was on the basis of a two-hour rating, because the primary use of a battery was in connection with peak loads; the ordinary peak in the winter months lasted about 1½ hours, and a two-hour capacity would last through any peak that was likely to occur. The battery in Manchester had been installed at a cost of about £17 per kw. on the basis of a two-hour rating. On the score of cost the generating plant and the battery were almost identical. With the battery there were no standby losses; it was in this connection that the principal saving on a battery arose. Regarding the question of using boosters or regulating cells, the use of a regulating switch enabled one to deal promptly with any sudden emergency which required heavy discharges; if the battery were floating on the bars without the use of boosters, the pressure dropped when a heavy discharge occurred, and it would be almost impossible to switch the boosters in, whereas with regulating cells the operation was very simple. Wherever a large battery was in use it should undoubtedly be always kept on the bus-bars, so that in emergency there was the full capacity to rely on. He considered that a battery at its two-hour rating should have the capacity of the largest unit in the station. The efficiency of a battery really mattered very little, because the load which was supplied from it was only a percentage of the total.

MR. ALDERMAN WALKER said the period allowed for repayment of loans on large turbo-generator sets was being reduced from 20 years to 17 years; the difference was to the good of the battery. With regard to the question of consumers having a battery on their own premises and having it charged at power rates, he thought the author perfectly justified in this idea.

MR. E. C. MCKINNON said one American company had individual contracts with the largest supply companies to maintain their batteries for 10 years, and during that period the battery might be discharged 150 to 200 times, but not more than 40 times during any one year. The loan period for a battery (seven years) was altogether unreasonable. The battery at the end of its life was still worth 25 per cent. of its original price as scrap metal. The commercial efficiency of the Manchester battery was rather low, indicating that the battery was overworked, and that possibly the charge was stinted. With a new battery it was possible to obtain a falsely high efficiency, but only at the expense of the plates. Maintenance should be based on the amount of work that the battery was called upon to do, and this was the system employed in the States.

MR. P. P. WHEELWRIGHT said that in rushing up boiler plant a considerable amount of smoke was thrown out, which was very liable to cause trouble in the city, whereas if a battery were in use a greater time could be taken to bring up the boilers and so reduce this tendency. He had had three batteries before the one now in use, which was the only one that had ever done any honest work. The previous batteries had always to be nursed until the time when they were required, and when this time came the batteries would not work. When the present battery was installed, the makers told them to do their worst with it, and it would always work well. They had done this, and for the past four years the maintenance of this battery had been very low, and it had experienced the roughest time a battery ever had.

MR. S. L. PEARCE said he took it that, generally speaking, they agreed that the scheme was sound, and that the conclusions drawn by the author in his paper had been justified. There had been an undoubted saving in the cost of coal consumed, viz., £3,348. There was, in addition, a saving of £1,056 on capital as between the steam scheme and the battery scheme. This gave a total of £4,404. If, from this figure, the capital cost incidental to the battery itself were deducted, there was still a saving of £2,000, which, if it had been the only saving, would still have justified the scheme. The losses incurred in the battery and booster were more than covered by the coal saving. The total units lost were approximately 700,000, and the coal saving to cover those losses was more than four times greater. With present-day knowledge, the figures of capital for Stuart Street were possibly on the high side; they were drawn up at the end of 1907. Taking the battery on a two-hour rating, and reducing the estimates on the steam plant, there was practically no saving on capital. The question of switchgear gave

rise to more anxiety than anything else in connection with the battery. It was decided that this switchgear should be treated as a high-tension board, and therefore, as the author had pointed out in his paper, the cubicle construction was adopted, and the isolation of all leads where possible. They had a system of remote-controlled circuit-breakers, which were fitted in the battery room alongside the battery. With regard to the loan periods, the L.G.B. seemed to be drawing the strings tighter and tighter. Seven years only was allowed for this storage battery, and to-day they only got 15 years for generating and sub-station plant; the term for boilers had also been reduced from 17 to 15 years.

MR. C. L. E. STEWART, referring to Mr. Wheelwright's remarks, said that he also had a small battery which had a very rough time, and it was doing remarkably well. It ran on traction load, the efficiency was very good, and it was in very good condition after being in use for four years. It was working up to its full one-hour rating either way every two or three minutes. With regard to the record of overdischarge, the easiest way of judging it was for the switchboard attendant to watch the voltmeter chart. Records were well worth keeping.

MR. E. THOMAS said it was interesting to see that apparently it was not appreciated until comparatively recently that a battery had very great advantages from a cost point of view when considering large stations like Manchester. Seeing what the Americans gained by using very much larger batteries, it seemed that it might be advantageous for us to go further than we had already done.

MR. W. CRAMP said he noticed that the makers had signed a contract to maintain the battery at its rated capacity for 15 years. In dealing with batteries he had found that makers objected to maintain a battery at its rated capacity throughout the maintenance period, but they would guarantee 85-90 per cent. of its rated capacity at the end of the maintenance period. The load factor improvement was estimated to save £10,166, whereas the estimated saving from standby value, and in cost of generation, was given as £5,821. Was the difference between these two figures due to the "buffering" effect?

MR. F. H. WHYSALL, in reply, said that in the case of a large D.C. system the advantage was in favour of putting a large battery down at the generating station. In the case of a three-phase system with sub-stations, the best place was the sub-station. He considered that a one-hour rating to carry over the peak was sufficient. The stand-by boilers were not under steam at all. With regard to the difficulty in all paralleling boosters under breakdown conditions, there was a large margin, and, failing this, arrangements were made whereby the battery could be put on load without boosters. Integrating wattmeters were fitted to register the input and output of the battery, but they were only used to indicate the state of the charge. A recording voltmeter was also in use as recommended by another speaker for the same purpose. A quicker method of estimating the residue was wanted than running a planimeter over the chart; the pilot cell reading gave the information at once. The author believed that the oftener a battery was charged and discharged, the better it was for the battery, provided the operations were carried out with due care. The proposal that the maintenance charges should be based on the number of charges and discharges in a given time was another innovation, and he did not think that would be suitable for the requirements of his station. Mr. Pearce had shown that even putting the problem at its lower level, they could expect £2,000 saving. He was perhaps too optimistic in crediting all the saving shown to the battery; the circumstances at Dickinson Street were peculiarly favourable to a battery. The cutting down of loan periods by the L.G.B. influenced the figures shown in favour of the battery.

#### DISCUSSION IN LONDON.

MR. J. S. HIGHFIELD, in opening the discussion, referred to the importance of the battery, in view of the security it gave to other sources of supply. It relieved other plant and mains, and represented a saving in capital; in most cases a good case could be made out for it. The use of a battery on peak loads was rather opposed to the stand-by idea, and a compromise was necessary; but even then it was worth adopting. The best method of control was to use a hand-controlled booster for charging and discharging, with a short-circuiting switch to save the booster from destruction. Booster construction was a matter of careful design, as the machines had to stand large overloads. He agreed with the author's figures for efficiency; he always took 74 per cent. himself. He thought that a better system of charging users for maintenance could be introduced, as the present method penalised the careful user.

MR. E. C. MCKINNON suggested that people would be too optimistic after reading the paper; it should not be thought that the author's efficiencies could be repeated everywhere. Engineers were realising the usefulness of the battery, and adopting it for this reason.

MR. A. M. TAYLOR said he disagreed with the figures taken for interest and sinking fund, since in the case of a large station like Manchester it should not be necessary at all to go to the Local Government Board for a loan on behalf of the battery, but the same might be paid for out of surplus profit; then, again, as regards maintenance, he was satisfied that it was distinctly cheaper for the Corporation to maintain the battery itself, provided that it was not going to be worked too heavily. He fully agreed with a saving of £4 4s. per day for the five summer months on account of the boilers which had not to be kept under steam on the chance of a storm-cloud, but he was not quite sure whether an additional £4 4s. credited on account of the regular peak available from the battery should be added to the above £4 4s. Supposing, however, that this was not included, the saving on the first heading was only reduced by £460, and as regards the other

sum of £630, he (Mr. Taylor) quite agreed with this. So that in any case under the most unfavourable estimate he had £460 + £630 = £1,090, with a possible figure of £1,551. As regards the next stage in the coal bill, the cost per unit turned out by the steam plant during the peak load was 1'55d., and the cost of each unit put into the battery at night time (to be used for the peak on the day following) was only 0'237d., the saving therefore being 1'31d. on every unit turned out during the peak. Taking the number of units turned out during the peak as 1,560,000, the author obtained the tremendous annual saving of £8,534. (Mr. Taylor ventured to think, however, that the author had made a slip as to the number of units, which would appear to be those taken for two years instead of one year.) The saving was really prodigious, because adding to the sum of £8,500 (the author's figure) the additional sum of £1,090, there was a total of over £9,500, saved in coal alone. This sum capitalised at 5 per cent. was equivalent to an investment of £180,000. In the present case, the capital cost was approximately £22,000, and the interest, sinking fund, and maintenance of this investment would be of the order of £3,800, whereas the coal saving *alone* is shown to be at least £9,000, in addition to which there should be added the saving on the capital cost of generating plant, representing £1,000 per annum, and a saving in the wages at the generating station representing another £1,500 per annum, besides increased efficiency of generation during the day. The value of the battery as a standby could not be overrated. On a three-minute rating it could be taken as £2 10s. per kilowatt, and the floor space on the same rating at one-twentieth of a square yard per kilowatt. Some engineers had recently expressed the opinion that storage batteries would be of very little use in the future on account of the large development of the alternating-current load. From the figures given it was clear that the battery would well bear the handicap of the additional cost of the inverted rotary, and still show a very large margin of saving. This applied more to the case of a large A.C. system, where numerous rotary converter sub-stations were employed for supplying direct current into the feeder networks. In such a case, a failure of the A.C. supply caused a tremendous overload upon any D.C. generating plant on the system. As regards the question of the employment of boosters, as against regulating cells, Mr. Taylor believed that it would be found that boosters provided with automatic short-circuiting switches, would permit of rapid discharge rates being regularly employed, and of any emergency discharge rate being taken care of with safety. It must be borne in mind, in comparing boosters with regulating cells, that in any case a booster had to be provided for the charging of the battery, so that one had to balance the cost of boosters, on the one hand, as against that of boosters plus regulating cells on the other, with the additional disadvantage that some parts of the battery were discharged at different rates to others, and the heavier the discharge rate employed, the worse this disparity became, with consequent additional trouble in maintenance.

MR. E. S. JACOB disagreed with the method of comparing capital charges on batteries and steam plant; in the case of the former these charges would be reduced to nothing after ten years, and this was equivalent to a double saving after that in comparison with steam plant, the cost of which was spread over 21 years. Then the battery had a scrap value of 25 to 30 per cent. of its original value, while steam plant had practically none. In regard to maintenance contracts, everybody said they used their battery well, and all would ask for low rates.

MR. W. FENNELLSaid a small battery was as large proportionally in a small plant as a large one on a big system. The short loan periods allowed by the L.G.B., and having to write off the capital cost in seven years, often killed a battery scheme; the makers would contract for the maintenance of the full battery output for ten years. It was difficult to understand the home preference for boosters as against automatic regulating switches. In his own station they had been running all their gas engines on full load, owing to shortage of plant, and on one or two occasions when a set came off suddenly the automatic switch in connection with the battery operated so smoothly that the consumers were unaware of the occurrence.

MR. P. V. MCMAHON showed some curves of a battery sub-station on the City and South London Railway, in which the batteries took 50 per cent. of the sub-station load.

MR. ROGER T. SMITH said the author referred to batteries with steady charge and discharge over periods of hours; it might be of interest to refer to their use on traction loads where rapid charge and discharge occurred over periods of minutes. The Great Western Railway supply from Park Royal station was to two sub-stations, each with a battery in parallel with motor-converters. At the time of heavy load (6 p.m.), the maximum load at the power station with the battery in use was 2,720 kW., and without it, 3,870 kW., three generating sets being in use in the former case and five in the latter. The improvement in the daily load factor on the steam plant, comparable with the author's figures, was some 17 per cent., but it depended on the amount of the total load going through the battery, which should be 15 or 20 per cent. The variation in the traction load was 300-3,000 kW., and the lighting load variation was very much less. The batteries allowed of a machine load factor of 85 per cent., and during periods of heaviest load of 95 per cent., being obtained; although the traction load varied 1,000 per cent., there was no difficulty in keeping a plus or minus 4 per cent. variation on the lighting bus-bars. The battery had for six years been considered a stand-by to the A.C. side, as suggested by Mr. Taylor. It would need 66 per cent. more steam plant if the batteries were dispensed with, and entail a greatly increased steam consumption.

MR. C. P. SPARKS thought it was a difficulty that batteries were

so soon outgrown with increasing loads. The railway sub-station referred to by Mr. McMahon took a steady load of 400 kW., although 800-1,000 kW. loads were dealt with; the plant load factor was about 95 per cent.

MR. A. HURT referred to the heavy current battery regulating switch, and showed views of typical switches in use on the Continent. One of these having 29 contacts, was motor-operated and designed for a normal current density of 500 amperes per sq. in. on the brushes, with large overload capacity. Such switchgear could be automatically controlled from a distance. (Mr. A. M. Taylor, interposing, said Continental makers appeared to be reluctant to supply such switches for really large currents; in Birmingham they were offered a switch for 6,000 amperes instead of 17,000 amperes, but a booster could be short-circuited with impunity.)

MR. WHYSALL, replying, said the battery at Manchester was partly regarded as an emergency battery, and they found usually that when it was most fully discharged the load was falling rapidly. The excellent results shown during the first year were obtained when the battery was quite new. During a sudden storm the battery held the load until the steam plant was got running, and in this way its usefulness was much more than its size indicated. The 10-year period was to the disadvantage of the battery; its life was much longer than that, and the Manchester maintenance contract was for a period of 15 years. In his opinion, an emergency battery should have a regulating switch, but a peak-load battery should have a booster combination. As regards Mr. Sparks's remarks the battery should be extended as the load grew.

### Physical Society.

At the meeting on January 24th, 1912, a paper, entitled "The Resistance of Electrolytes," by Messrs. S. W. J. Smith and H. Moss, was read by the former.

Some experiments upon this question were exhibited before the Society in 1911. In these a modification of Wien's method was used—the optical telephone being replaced by a vibration galvanometer—and the conclusion was drawn from them that the resistance of an electrolyte varies to an easily perceptible degree with the frequency of the alternating currents to which it is subjected. It is, however, unsound to use the method unless it is shown that the effects of leakage through the electrolytic condensers can be neglected or allowed for.

The authors have used a method which depends upon simultaneous measurement of the voltage between the ends of a tube containing the electrolyte and of the current passing through it. The former was measured by means of an Ayrton-Mather electrostatic voltmeter connected to auxiliary electrodes, and the latter by means of a Duddell thermo-galvanometer.

In the cases examined it was found that the resistivity of the electrolyte was constant within 0'05 per cent., whether steady currents or currents of any frequency up to 2,300 alternations per second were used.

A paper on "The Electrical Conductivity and Fluidity of Strong Solutions" was read by Mr. W. S. Tucker.

The author carried out a series of experiments to determine if there were any definite relation between conductivity and fluidity in the case of calcium chloride solutions. The feature of these determinations was the simultaneous observation of viscosity, electrolytic resistance and temperature.

The results obtained suggest that no reliance can be placed on ionisation data derived from electrical conductivity observations.

### Institution of Electrical Engineers.

#### ANNUAL DINNER.

ON Thursday, last week, the annual dinner and reunion of the Institution was held at the Hotel Cecil; the president, Mr. W. Duddell, F.R.S., occupied the chair, and the company included nearly 400 members and guests. Unfortunately, a number of the latter, including Vice-Admiral Prince Louis of Battenberg and Sir Alfred Keogh, were prevented from attending.

After the loyal toasts, Mr. HERBERT SAMUEL, M.P., the Postmaster-General, proposed "The Institution of Electrical Engineers," claiming that he was at the head of probably the largest electrical enterprise in this country. The Post Office, he said, owed much to electrical engineers, and was grateful for the assistance rendered to the development of electrical science by the Institution; the Post Office, however, possessed a highly qualified staff of its own, which had developed many ingenious devices, and occasionally accomplished the remarkable feat of transmitting two conversations simultaneously over one telephone wire. His department was indebted also to the Institution for the loan of its stately building on the Embankment for the Conference on Wireless Telegraphy last year, which had made a deep impression on the delegates.

The electrical engineers had built up a great and growing industry; it was stated recently in the House of Commons, in answer to a question, that in 1903 our exports of electrical machinery were valued at £437,000, while those of the United States were worth £1,064,000; in 1911, our exports had increased to £1,791,000, and those of the United States to £1,739,000, showing that we had made remarkable progress. If capital represented the pocket and labour the hand, the professional men were the brains of the electrical industry. When recently the Government were engaged in the difficult task of forming a technical Committee to inquire into the merits of the various systems of wireless telegraphy, the first name that occurred to them was that of the President, Mr. Duddell, whose colleagues included two ex-presidents

of the Institution, and one ex-president of the two sister bodies. Mr. Duddell was himself the inventor of the "singing arc," which formed the basis of one of the systems, but so great was their confidence in his impartiality that their only fear was lest, through excess of conscientiousness, he should be biased against that system.

MR. DUDDELL, in responding, reminded his hearers that when the Institution was founded in 1871, the only important application of electricity was that of telegraphy. Since that date, electricity had invaded the domain of all the sister sciences, and had become intimately interwoven with our daily life and every department of industry; it was involved in the vital processes of our bodies, and it was now thought that even "mass" was only a manifestation of electricity in motion. That day their membership was 7,300, a development of one hundredfold in 41 years, and that was not the limit. In 1907 there were half a million people employed in the electrical industries in this country, or 14 per cent. of the whole number engaged in engineering. When the results of the new census were published next year, he believed a great increase in these figures would be recorded.

PROF. JOHN PERRY proposed the health of "The Guests," alluding to the tremendous amount of practical intellect and successful achievement which they represented. He would like the guests to know that the scientific engineer always talked shop and thoughtshop—he had other interests, but that was his predominating interest. The study of history was important as a guide to the future, but now they had applied science which must be taken into account as an important factor in making history. He urged the guests to encourage a scientific spirit in their subordinates and to oppose the inertia which existed in all Government departments. Remarking that no sign of electrical knowledge in olden times had been discovered by the archaeologists, Dr. Perry said it was certain that our ancient forerunners had no big engines—if they had had any, they would not have left us an ounce of coal.

SIR H. B. BUCKLEY, Lord Justice of Appeal, in responding, briefly commented on the vast developments of electrical science in connection with commerce, agriculture, and other industries. Within the last 50 years, he said, the spread of knowledge had been prodigious; and in that branch of knowledge which was concerned with industry, no study had had more influence on the development of human society than the study of electricity. Probably it would be found that at the root of all things lay one simple law which gave rise to all the various phenomena of Nature—perhaps the law of vibration. They knew how to catch electricity and how to use it, but who knew what it really was?

The PRESIDENT invited the representatives of foreign institutions to address the company, and M. GROSSELLIN, President of the Société Internationale des Electriciens and of the Société des Ingénieurs Civils de France (6th Section), said that in the past the French presidents had rarely been able to accept the invitations of their English *confreres*; in France it was not customary for societies to give annual dinners, so that the French presidents could not return the hospitality offered them. It would be of great benefit if they could hold together a meeting of English and French engineers to exchange ideas; this year the Société Internationale hoped to hold such a conference in Paris in May, for which a programme of visits to works, &c., would be arranged, and he hoped that many of the members of the Institution would be able to be present—they would be heartily welcome.

HERR GEHEIMRAT CHRISTIANI, President of the Verband Deutscher Elektrotechniker, and past president of the Elektrotechnischer Verein, Berlin, conveyed the best wishes of those societies for the development and prosperity of the Institution. He referred to the visit of Dr. Kapp to Germany, when he presented a portrait of Faraday to Dr. Budde, President of the International Electrotechnical Commission, and expressed the gratitude and good wishes of Dr. Budde to the Institution. He concluded by remarking that the Verband was about to enter into similar close relations with the Austrian and Swiss Societies, and that such international relationships could not be too highly valued; he hoped their friendship would prove lasting.

The company then adjourned to another room, where friends foregathered and conversation was maintained up to a late hour.

Music was provided during the evening by the "Imperial Orchestra." The programme was closely adhered to, the speeches being comparatively few and brief, and thus there was ample time for the reunion, one of the principal social events of the Institution's year, and one which is highly appreciated by the members.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### "Chain-Pull" Switch Lampholders.

THE GENERAL ELECTRIC CO., LTD., have brought out a "chain-pull," switch lampholder with a movement which is extremely gentle and reliable. The construction of the lampholder differs considerably from that of any other on the market. Ease of pull is secured by means of a spring ratchet movement. A seatite holder is provided for the chain, which is detachable, and permits longer or shorter lengths to be used as required. The movement is surrounded by a protecting porcelain wall. Barrel terminals are provided, which facilitate wiring. The plungers are particularly massive. These holders are supplied in a variety of styles, and are very inexpensive.

THE BRITISH THOMSON-HOUSTON CO., LTD., of Mazda House, Upper Thames Street, E.C., are also supplying a chain-pull holder of similar design.

### Adjustable Eccentric.

The accompanying illustration, fig. 1, shows an adjustable eccentric, which MR. JOHN JARDINE, of Nottingham, is now offering. The eccentric has been used in connection with the various classes of machinery made by Jardine's for over 20 years, but hitherto has never been offered as a separate item by them.

FIG. 1.—JARDINE ADJUSTABLE ECCENTRIC.

Through several inquiries and orders for it, they have now decided to place it on the market. Any throw can be obtained from zero to the maximum, and can be adjusted to a nicety by the set-screw. It will be seen that the eccentric is a useful piece of mechanism, and is suitable for a variety of applications.

### Fixing Contacts in Springs.

Fig. 2 shows a simple, but effective, device invented by MR. S. E. SRAWLEY, of 67, Ronald Street, Old Swan, Liverpool, for cutting off contacts for springs and simultaneously inserting them in the latter. The little bits of wire are easily lost, and are difficult to handle, causing loss of time; by this method, however, waste of material and time is avoided, and a considerable saving of cost is effected, which is not to be lightly regarded, in view of the immense numbers of spring contacts that are called for nowadays. In the figure A is the punch holder, B a steel cutting-off plate, C a steel guide plate, D a steel die, E a pin for the wire to rest on with spring, F a steel ram, which is pressed against the plate H by the rod G to

FIG. 2.—DEVICE FOR FIXING CONTACTS IN SPRINGS.

tighten the wire in the spring N, with the aid of the bush shown, which makes a ring in the spring round the wire. If a double-headed contact is required, a hole is made in the ram F, as indicated in the inset. The wire is put through C and H, the spring is placed on the wire, and the press is then pulled down, when F pushes the wire into position, B cuts it off, and at the same time the wire is fixed in the spring. The advantages of this method, compared with that of cutting the wire into little bits, picking up those that are not lost with tweezers and putting them in a die, and then riveting the wire in place with a hammer, are obvious.

### Westminster Electric Cookers.

We illustrate in fig. 3 the No. 3 electric cooker of the WESTMINSTER TOOL AND ELECTRIC CO., Suffolk House, Laurence Pountney Hill, London, E.C. It comprises a complete equipment for a family of eight persons, consisting of three boiling plates, grill, oven and hot cupboard. The overall dimensions are 25 in. width x 21 in. length x 36 in. height, the oven measurements (internal) being 14 in. width x 13 in. length x 21 in. height. The design of this cooker is understood to embody the results of a large experience. The sides and back of the cooker are porcelain-

enamelled—looking like tiling. The oven is enamelled inside and thoroughly lugged. The top plate is of polished steel, fitted with two 8-in. diameter and one 6-in. diameter boiling plates, each with three heats. The grill is 12 in.  $\times$  8 in. The hot cupboard on the top of the oven is fitted with a drop-down door, forming a shelf. The oven door is fitted with a ventilator and a glass panel, enabling

FIG. 3.—No. 3 WESTMINSTER ELECTRIC COOKER.

the contents of the oven to be examined without opening the door. All connections are brought to a connection box at the back of the cooker.

The power consumption is stated as follows:—Oven, 2,200 watts; 8-in. diameter boiling plates, 1,200 watts; 6-in. diameter boiling plates, 800 watts; grill, 1,100 watts; all with three regulations.

#### Electrical Window-Cleaner.

MR. O. E. FOX-ADAMS, of 125, Constantine Road, Hampstead, has devised and patented a rotary brush for cleaning windows, which should be of considerable use for shops, warehouses, hotels, railway trains, &c. It resembles the electric hair-brush, in that it consists of a cylindrical brush or swab, driven by an internal electric motor, the armature shaft being held in a fork, while the field magnet system rotates, carrying with it the brush. A diagrammatic section

FIG. 4.—ELECTRICAL WINDOW-CLEANER.

and end view are given in fig. 4. The inventor's chief difficulty was to find a motor combining sufficient strength with the necessary lightness; having accomplished this, and adopted aluminium as far as possible in the construction of the framing, &c., to reduce the weight to the minimum, he has succeeded in producing a tool with which windows and similar surfaces can be quickly polished with the least expenditure of labour.

**Electrical Treatment at Bradford Hospital.**—At the last quarterly meeting of the Bradford Hospital Fund (Incorporated), held on Thursday at the Infirmary, it was reported that the work of the electrical department was on the increase. In 1,243 cases electrical methods had been used to locate various fractures of limbs and other ailments of patients who came to the infirmary. Dr. Mitchell had charge of the electrical department, and he had attended to 3,582 cases during the past year.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENT.

**ST. VINCENT.**—In connection with the recent Canadian-West Indies reciprocity arrangements, the Government of St. Vincent have drafted a new tariff differentiating between goods from foreign countries and goods from the United Kingdom, Canada and Newfoundland, and giving preferential rates of duty to the latter. This new tariff is to come into force at a date which will subsequently be notified; meanwhile the following information will be of interest to our readers:—

	Preferential rates.	General rates.
Lamps ... ..	10 % ad val.	12½ % ad val.
Electric machinery and electric dental appliances of all kinds not specifically exempted from duty ...	10 % ad val.	12½ % ad val.
Wire ... ..	10 % ad val.	12½ % ad val.

The following goods are to be admitted free of duty, irrespective of their origin:—Machinery, and any parts or fittings thereof not imported for sale, which the Governor in Council may consider to be likely to further the introduction of any new industry or the improvement of any existing industry; medical and surgical instruments, appliances and apparatus imported by any duly qualified medical practitioner for his own use in the exercise of his profession; telegraph wire, telegraphic, telephonic and electrical apparatus and appliances of all kinds for communication or illumination, including all material for the use of the West India and Panama Telegraph Co., and any telegraph company (wireless or otherwise) recognised by the Government.

**BRAZIL.**—The new Consular invoice regulations for goods shipped to Brazil laid down in the Budget for 1912, have been repealed.

**ST. LUCIA.**—A new ordinance passed by the Government of St. Lucia provides that no person shall establish any wireless telegraph station or install or work any apparatus for wireless telegraphy in any place or on board any ship registered in the Colony, except under, and in accordance with, a licence granted for that purpose by the Governor. Also no person shall work any apparatus for wireless telegraphy installed on any merchant ship whether British or foreign, while that ship is in the territorial waters of the Colony, otherwise than in accordance with prescribed regulations.

## INTERNATIONAL ELECTROTECHNICAL COMMISSION.

CONSIDERABLE practical progress has resulted from the meetings of the Special Committees of the I.E.C. held in the Town Hall, Zürich, from January 13th to the 19th.

The meetings, to which about 12 nations were invited to send special delegates, were presided over by Dr. W. Wyssling (Symbols), M. E. Huber-Stockar (Rating), and Dr. H. Zoelly (Prime Movers), three Swiss being chosen, as the Commission adopts the plan of choosing, as the president of the Committee, one of the members of the National Committee of the country in which the meetings happen to be held. Symbols were first dealt with, and a long discussion took place as to the relative importance of distinguishing between vector and scalar quantities and between electric and magnetic quantities. The Germans urged very strongly that the whole of the script alphabet should not be taken up for the sake of a very few magnetic quantities; if these were made to differ, in the actual symbol, from the corresponding electric quantities the script characters would be set free for vectors which they say will, to an increasing extent, be employed for the practical solution of alternating-current problems. The majority of the delegates, and especially the French were, however, against the German proposal, being of opinion that, from the point of view of electro-technics alone, it was imperative to be able to distinguish between electric and magnetic quantities. It may be that this subject has not received as much consideration in the National Committees as it merits. With a few additions and notable modifications, such as Maxwell's  $D$  for electrostatic flux-density instead of  $R$ , the Paris proposals of last May were agreed to. Should, therefore, the proposals of the Pan-German Society, the A.E.F. (Anschluss für Einheiten und Formelgrößen) find favour ultimately, generally speaking, the symbols proposed would not be confused, as the letters would not be identical for electric and magnetic quantities.

The rating question occupied three whole days of strenuous but most amicable discussion. The British views were ably put forward by Dr. Gisbert Kapp and Dr. R. T. Glazebrook, C.B., the latter especially interesting himself in the proposal for an international standard for copper, the exact form of which is to be decided, in consultation, by the four National Laboratories of America, France, Germany and Great Britain: the result will form a special publication of the I.E.C. Dr. Kapp was much assisted by Mr. A. R. Everest, the official representative of the B.E.A.M.A., and the co-operation of the British manufacturers was duly appreciated.

Modifications and new proposals had been received from several National Committees, and, although occupying much time, their consideration has rendered the present proposals more complete, and much more likely of acceptance by the industry, as a whole, than were the Paris proposals of March last; it should not, however, be forgotten that at Paris nothing concrete was before the Committee.

Several interesting proposals have been made which differ from the rules as at present adopted by different countries, but seeing that the delegates are also members of the local Committees that are responsible for the national rules, there is every likelihood of the proposals, finding their way gradually into the local rules. I.E.C. proposals, the basis of rating is to be the ultimate temperature. For instance, the basis of rating is to be the ultimate temperature, and not the temperature rise, the former being the damaging factor; the "cooling air" is to be recommended instead of the "surrounding air," as, under modern methods, what really has to be taken into account is the air going into the machine, which is not necessarily the surrounding air. Then the maker is not to be held responsible for the proper working of a machine if it is made to carry a continuous overload, so that if a man orders a 1,000-kw. machine, he must not expect it to carry 1,500 kw., without paying for it; of course, momentary peaks, as they do not materially affect the temperature, are not included under overloads. A basis of comparison of various tenders is also proposed on the principle of an extra 10° C. permissible temperature.

Detailed reports will be issued by the central office of the I.E.C. without delay, and it should be noted that the proposals of these Committees are to be submitted for the consideration of the various National Committees with a view to ratification at the next plenary meeting of the Commission, to be held in Berlin from September 2nd to 6th this year.

The Italian Society of Electricians has decided to adopt the recommendations of the I.E.C., as and when promulgated and to recommend their employment in all international specifications for electrical machinery, and to suggest that when the necessity arises in international contracts for an arbitrator, he shall be chosen by the president for the time being of the I.E.C.

The general arrangements for the comfort and entertainment of the 25 delegates were admirably attended to by the Swiss Committee and the Swiss Society of Electricians, the president of which, Prof. Jean Landry, came from Lausanne to preside at the official banquet.

The wisdom of the Turin meeting in appointing these small international committees to discuss actual details and formulate definite proposals has amply justified itself. The work of the Zürich meetings will undoubtedly be of real practical value to the industry, for when finally adopted at Berlin it will form the basis of international specifications for machinery to be used in all foreign trade.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this Journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

- 2,125. "Electric lighting." M. S. OKUN. (Convention date, January 26th, 1912, United States.) January 27th. (Complete.)
- 2,128. "Electrically-controlled gas valves." A. St. J. COORE. January 27th. (Complete.)
- 2,136. "Control of electric motors for driving screw propellers." SIEMENS SCHUCKERTWERKE G.M.B.H. (Convention date, January 27th, 1912, Germany.) January 27th. (Complete.)
- 2,139. "Combined automatic locking device and detachable lamp-cap for locking bayonet-type electric lamps and the like, to their holders." H. T. WOBALL. January 27th. (Complete.)
- 2,146. "Terminal connections for aluminium and similar conductors." L. W. CHUBB. (Convention date, February 16th, 1912, United States.) January 27th. (Complete.)
- 2,152. "Devices for electrocuting animals." H. SMITH. (Convention date, February 3rd, 1912, United States.) January 27th. (Complete.)
- 2,165. "Methods and apparatus for producing elongated electric arcs." F. H. A. WIELGOLASER. January 27th. (Complete.)
- 2,170. "Electromagnet typewriters." J. SCHNYDER. (Convention date, January 29th, 1912, Germany.) January 27th. (Complete.)
- 2,184. "Receiver for submarine signalling." SIGNAL G.S. M.B.H. (Convention date, November 30th, 1912, Germany.) January 27th. (Complete.)
- 2,185. "Receiver for submarine signalling." SIGNAL G.S. M.B.H. (Convention date, December 18th, 1912, Germany.) January 27th. (Complete.)

## THE SETTLEMENT OF TRADE DISPUTES.

At a time of piping industrial peace when both trade unions and employers appear to be content to live in harmony, the Government has thought it wise to consider what steps may be usefully taken to prevent the outbreak of war in the future. The longer a truce of this kind endures, the more bitter is war likely to be when it does, in fact, break out. When the crest of the wave of prosperity has fallen, and it becomes necessary for employers to retrench, we may expect the strike to become the order of the day—and the disputes which may then occur will be all the longer and all the more strenuously fought, if the war-chests have been filled to repletion.

With a view to seeing whether there is anything to be gained by tearing a leaf out of the Canadian book, the Government recently sent Sir George Askwith to the Dominion, in order that he might inquire into the working of the Lemieux Act (The Industrial Disputes Investigation Act of Canada, 1907.)

The simple purpose of the Act is to ensure the recognition of the interests of the public, as a third party, in trade disputes, and the insistence that that third party, through the Government, shall have a voice in regard to a dispute affecting its interests, and, according to the Act, before a stoppage of work takes place. In practice the recognition extends to cases arising before or after a stoppage of work. The actual interference with the parties in the settlement of their differences is sought to be reduced to a minimum by the Act being confined to industries whose uninterrupted continuance is of high importance to the well-being of the nation (mining, railways, shipping and other public utilities); and to a brief suspension of the right to stop, as distinct from a complete prohibition of stoppage.

The Act requires that any dispute arising in connection with the class of industries named shall be submitted to a board of conciliation and investigation, with a view to arriving at a settlement before a strike or lock-out can be legally brought about. It also stipulates that at least 30 days' notice of an intended change affecting conditions of employment with respect to wages or hours shall be given, and that pending the proceedings before the Board, in the event of such intended change resulting in a dispute, the relations to each other of the parties to the dispute shall remain unchanged, and neither party shall do anything in the nature of a lock-out or a strike.

It will be seen that this is not a measure for compulsory arbitration; it only endeavours to postpone a stoppage of work in certain industries for a brief period and for a specific purpose. It does not prohibit a strike or lock-out if it is found that no recommendation can be devised which is acceptable to both sides. Since the Act was passed 132 disputes have been referred for adjustment, and in only 15 of them were strikes not averted or ended.

The Act, it appears, was originally very much opposed by the Western coal miners and railway men. It is still

(J. A. Ber's).

# 1913 EDITION

Ready.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

opposed by the miners and their Unions, but the railway men now approve of it. The employers in Canada also seem to approve of it. Indeed, the figures above mentioned are the best possible evidence that the Act has caught on in the Dominion.

Having examined a number of persons in Quebec, Vancouver, Ottawa, and Montreal, as to the working of the Act, Sir G. Askwith is of opinion that it might be applied in some form or other in this country. In his report, which has been published as a Parliamentary paper, he writes:—

I consider that the forwarding of the spirit and intent of conciliation is the more valuable portion of the Canadian Act, and that an Act on these lines, even if the restrictive features which aim at delaying stoppage until after inquiry were omitted, would be suitable and practicable in this country. Such an Act need not necessarily be applied in all cases, but neither need it be confined to services of public utility. It could be generally available in cases where the public were likely to be seriously affected. Without the restrictive features, it would give the right not only to conciliate but fully to investigate the matters in dispute, with similar powers in regard to witnesses, production of documents and inspection, as are vested in a Court of record in civil cases, with a view, if conciliation fails, to recommendations being made as to what are believed to be fair terms. Such an Act, while not ensuring complete absence of strikes and lock-outs, would be valuable, in my opinion, alike to the country and to employers and employed.

While we frankly admit that there are few men better qualified to form an opinion on these questions than Sir George Askwith, we are of opinion that with him the wish is father to the thought. The stubborn attitude of the English Trade Union, which brooks no interference with the alleged right of the worker to throw down his tools as and when he chooses, appears to militate against the prospects of successful legislative interference.

It is difficult to express much more than a pious hope that the Act which has proved serviceable in Canada would be of any use in this country. No foundations for such a structure have ever been laid down in England. So far from penalising those who break their contracts, the tendency appears to be to tolerate and condone every violation of the usual obligations which exist between employers and employed, and to extend the right of free speech to every protagonist who can catch the ear of the mob. Here is an extract from Mr. Keir Hardie, speaking at South Shields on December 22nd, 1912:—"The Parliamentary Committee of the Trade Union Congress was considering proposals. . . . One proposal was that on a given date every organised worker in every trade should stop working when the eight hours were up. *No strike. . . . Simply at the end of the eight hours down tools. If that came to a lock-out, well and good.* It is an important non-resistive proposal which the employer classes would find it very difficult to resist." Our Canadian brethren have apparently examined the down-tool policy, and have found it wanting. The tree of Conciliation has been planted, and is found to flourish, in the virgin soil of our great Dominion; but so long as the Keir Hardie type of man is at large to advocate the policy of the sudden strike and to stir up strife between employers and employed, legislation to enforce industrial peace will continue to be futile.

Ever since the year 1875 the trend of all legislation which affects trade unions has been in one direction: complete emancipation of the unions from every kind of legislative and ministerial control. They have already secured a partial reversal of the Osborne judgment. Is it likely that the demagogue, who makes his living by fomenting strife between employer and employed, will consent to any new legislation which will tend to prevent those disputes which are the be-all and the end-all of his existence?

## TRAMWAY LABOUR CONDITIONS IN AUSTRALIA.

THE end of last year saw what was practically the close of the greatest labour fight in which electric tramway employees have been engaged. Although a strike formed one of the side issues in the early stages, the main interest centred in a trial in the Australian Commonwealth Arbitration Court

lasting 93 days, in which no lawyers took part. The battle was for improved conditions of service, and although the men have not obtained, by any means, all that they desired or asked, they have been awarded terms which for any undertaking in this country would have been deemed fatal to commercial stability. In one respect the case promises to be historic. It is, we believe, the first time that a duly authorised court has embodied the principle of preference to Unionists in a legal award.

The case has been argued with great ability by the representatives of both employers and employees, though what the fight has cost in the withdrawal of managerial supervision on one side, and the preparation and prosecution of their case on the other, the balance-sheets of the respective organisations alone can show. The principal features of the fight have been from time to time summarised in our columns. The passing of the Australian Arbitration Act was followed by the establishment of a Men's Union having branches in all the different States. Members of this Union claimed the right to wear their membership badges while on duty. This caused trouble at Brisbane, where the right was disputed by the Tramway Co., and led to a strike which eventually spread to all trades, and a sort of general deadlock prevailed for a time. Matters settled down, and the company resumed work, employing non-unionists. A lawsuit was commenced against the company, and it was eventually decided that the men were within their legal rights in wearing their Union badge. As at the time when the decision was given the company had none of the members of the Men's Union in their employ, it was a rather fruitless victory.

Meantime the Union formulated a long list of demands, not merely covering increased wages, but practically claiming control of the manner in which the undertakings should be worked, and presented this list simultaneously to the 11 principal undertakings in the Commonwealth. Sydney being under Government control was not concerned in the dispute. Naturally the claims were refused. On the ground of there being a dispute extending beyond the bounds of a single State, the case came before the Federal Arbitration Court at Melbourne, Mr. Justice Higgins presiding. Lawyers do not appear in this Court, the cases being presented by the parties concerned. For 93 days, extending from March 4th to December 21st, the case went on, and the results are now to hand. In nine cases the parties finally arrived at arrangements outside the Court, which have since been embodied in binding agreements. If these have not been completed, awards on the basis of the principal agreement have by this time come into operation.

In the case of the remaining two undertakings—Adelaide and Brisbane—no agreements could be arrived at, and awards have been made by the Judge, which, under the Act, are binding on the parties. It should be said that the jurisdiction of the Court to decide this dispute has been questioned, and may yet be the subject of further proceedings. The men asked for a wage of 11s. per day of eight hours for all drivers and conductors, with percentage increases of 10 per cent. and 15 per cent. for various States. They have been awarded 8s. 6d. per day for the first year of service, 9s. for the second year, and 9s. 6d. for subsequent years. They asked that only 10 per cent. of the total number of drivers and conductors should be employed on broken shifts; the award has fixed the percentage at 20 per cent., or such proportion as may be decided by a Board of Reference, consisting of representatives of both sides. The men asked for 21 days' holiday per year on full pay; they are awarded 14 days on 12 days' pay. The men demanded preference for members of their organisation in all undertakings; it has only been granted in one case, namely, at Brisbane. These terms vary in the case of the agreements, but are common to the awards, which in themselves differ in other minor points.

It would be interesting to know what would be the effect on the financial position of prominent British undertakings, if the awards were operative in this country. At Adelaide the tramways belong to a trust, composed of the local municipal authorities, and by law a certain sum has to be set aside annually for sinking fund. The fares are at present so high that increases are inadmissible. The present deficiency is about £15,000 per annum, and the new con-

ditions impose about a further £11,000, or additional rates in the various townships of from 2d. to 4½d. in the £.

The terms of the awards seem to us to be so severe that to a large extent they defeat their object, and, inasmuch as they interfere with the proper function of the manager, to be positively mischievous.

As regards the insertion of legal preference for the members of the Union, we cannot too strongly condemn the principle. It seems to us to introduce a new weapon of oppression into our industrial life. It is true that the Judge tried in the phrasing of the award to limit its objectionable features, and it is also true that every opportunity was given the company to avoid its insertion by agreeing not to discriminate against the Men's Union, but these facts do not, in our opinion, justify its adoption. We do not think it will bridge the gulf which in the last few years has appeared between the company and its workers, and we feel that it sets a precedent which will increase rather than lessen the friction which so often exists between employer and employé, and which it is the duty of the State to minimise by holding the scales of justice evenly between the parties. We hope, in the interests of the peaceful industrial development of the Commonwealth, that our fears may prove groundless.

**Standardisation of Electrical Apparatus.** WE are fully aware of the danger of standardisation in any growing industry, owing to its tendency to prevent the adoption of improvements, but the electrical industry cannot be referred to, even by its bitterest enemy, as being still in its infancy.

A number of things in the electrical world have been standardised with great benefit to all concerned, but there is, in our opinion, need for further standardisation, especially in connection with domestic appliances. Electricity has invaded the home, and is doing far more than gas could ever do to minister to our comforts.

The manufacturer, contractor, supply authority, and the consumer, are all affected by the present lack of uniformity which exists in almost all electrical apparatus. The cause is to be found in the immense improvements that have been made in design. The manufacturers have no definite rules to go on; each one acts as he thinks best, and everyone suffers to a certain extent. The general public feel that electrical repairs are expensive, for a complete new apparatus has generally to be bought, instead of its being easily possible to replace the actual part broken. It is because one maker's fuse-clip or plug will not fit another maker's fuseboard or socket that so many electricity consumers allow their installations to get into a deplorable condition before going to the expense of completely new apparatus.

A short article elsewhere in this issue points out some typical cases of electrical apparatus that could with advantage be dealt with by the British Engineering Standards Committee and the Manufacturers' Association.

Electric lighting has benefited largely, for example, by the fixing of definite standards for lampholders, and we regret that it has not been possible in the case of electric lighting and power to fix the pressure of supply and the periodicity at one or two figures that would meet all conditions.

**The Association of Electrical Station Engineers.** ONE of the most useful and important functions of a newspaper, whether technical or otherwise, is to facilitate the free and open discussion of all subjects which lie within its scope, and thus to enable its readers publicly to commune with one another with a view to the common welfare. By no other means is it possible to open up communications between persons who do not know one another, and are often not even aware of each other's existence, but who nevertheless possess interests in common and desire to find their fellows.

It has, therefore, been a source of pleasure to us that

with the aid of our "Correspondence" columns, as the result of a discussion arising out of a letter on an allied subject from a chief engineer, and extending over some three months—a discussion often somewhat irrelevant and sometimes bitter, but always turning on the grievances of the junior staffs of electricity works—the members of those staffs have been brought into touch with one another, and a new Association has been formed to voice their views and to safeguard their interests. An excellent start has been made. Within a few weeks of the first announcement of an address to write to, which appeared only in our columns, some 4,000 replies were received by Mr. Ebben, the enthusiastic and energetic hon. secretary, and a large number have already intimated their intention of joining the Association. The main objects of the latter are to raise the status of the staffs of electricity works and to improve their wages and prospects. The Association is in no sense hostile to the chief engineers, some of whom, we believe, have already signified their approval of its aims and have promised their support, and we trust that, under wise and discreet management, it will soon establish itself on a sound basis and become a prosperous and beneficent institution.

This is now the third Association which has originated directly from correspondence in our pages, its elder brothers being the Electrical Contractors' Association and the Association of Mining Electrical Engineers, both of which have amply justified their existence and have done work which could have been accomplished by no other agency; and we look to the new Association to follow in their footsteps.

#### Limited Partnerships.

NOR much advantage appears to have been taken of the Limited Partnership Act since it was passed in 1907, as, during the five years of its existence, only some 491 firms have been registered, limiting the liability on £1,335,597 of capital. Its suitability to small trading businesses or concerns indicates, perhaps, its principal advantage, and the slow progress of the Act is no doubt due, to some extent, to certain imperfections therein and to the facilities for the registration of private companies. As is well known, every partner is liable jointly with the other partners, and in Scotland, severally also for all debts and obligations of the firm incurred whilst he is a partner, and in England he is also severally liable in certain events. The Act of 1907, which was framed upon the Continental law, confers the benefit of limiting the liability of a limited partner in a business to the contribution which he makes to the partnership in either money or property, just as the liability of a shareholder in a limited company is limited to the amount payable on his shares. Such a partner is thus enabled to participate in the profits of a business without being liable (beyond the extent specified) as a partner.

**April 16th—The Benevolent Dinner.**—The annual festival dinner of the Electrical Trades Benevolent Institution will be held at the Trocadero Restaurant on Wednesday, April 16th. Mr. George Sutton, of W. T. Henley's Telegraph Works Co., Ltd., will preside, and it is hoped that there will be a very large gathering of those interested in the welfare of the electrical trade benevolence movement. We trust that our readers will keep the date free, and in these "better times," of which we hear so much, will prepare to ensure a record "collection."

**The National Insurance Act.**—The Bradford Chamber of Trade has occasioned considerable stir among shop assistants by issuing to all the retailers' associations of the city copies of a form of agreement, by which the assistants signing it expressly relieve their employers of any legal liability for payment of wages during "absence due to sickness or any other cause." The position taken up by the Chamber is that it has been advised that, in the absence of such an agreement, employers are legally liable to pay full wages during absence due to sickness, notwithstanding the provision made for employed persons by the National Health Insurance Act and the Workmen's Compensation Act—until they have formally terminated the engagement by giving the customary notice, and that it would be a most unpleasant task to have to give notice to a sick or disabled person. The shop assistants, however, object to the agreement in question, and, upon advice from the headquarters of the National Shop Assistants' Union, are resisting it.

## BRITISH ANTARCTIC EXPEDITION TELEPHONES.

THE following brief description and photographs of the telephone equipment taken to the Antarctic by Capt. Scott's Expedition will be of interest to our readers.

The installation was supplied by the National Telephone

INSTRUMENT NO. 1, SHOWING INTERIOR.

Co., in order to enable communication to be maintained between the winter living quarters and the outside

INSTRUMENTS NOS. 1 AND 2.

stations of the expedition. Five stations were provided for—the Living Hut, Instrument Hut, Hut Point, and two

TELEPHONE APPARATUS, SPARES, AND ONE DRUM OF ALUMINIUM WIRE.

Aurora Stations—and the instruments for these stations were numbered respectively from 1 to 5. The Aurora Stations were to be set up for observations of the Aurora Australis, and for this reason were required only to intercommunicate, while the living quarters were required to communicate with both Hut Point and the Instrument Hut.

On account of the extremely low temperatures to which the instruments would be exposed, it was impracticable to use any form of dry cell for local batteries, and after several experiments it was decided to make use of a 24-volt battery, forming part of the scientific equipment of the expedition, as a common battery for the different speaking circuits, in which the receivers and transmitters were in series in the line. This arrangement had the advantage of great simplicity, and with Ericsson hand-microtelephones was found to

CONNECTIONS BETWEEN STATIONS.

give good transmission. The ringing was by magneto-generators. Each instrument was self-contained in a stout wooden case, to obviate the necessity of packing for transport.

The line wire was of bare hard-drawn aluminium, No. 19 S.W.G., supplied by the British Aluminium Co. The question of weight was of great importance, and as the conductivity and strength of the wire would be improved by the temperature conditions of the polar regions, this material was selected. The total length of wire carried was about 75 miles, wound upon six iron drums, suitable for mounting on sledges, from which it would be laid direct on the ground. The go and return wires were specified to be not less than 6 ft. apart, and it was considered that the clean, dry snow would be an excellent insulator, even on the longest lines. For jointing the wire aluminium McIntyre sleeves were provided.

## NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

AMONG the news items from Western Canada are the following:—

In Saskatchewan the town of Prince Albert will probably spend about £40,000 on a new electricity works of an up-to-date character; the purchase of two 300-H.P. boilers has already been authorised as an extension to the existing plant.

It is likely that the Government of the aforementioned province will set aside a considerable sum of money for the purpose of carrying out further research work on the subject of the utilisation of the lignite deposits for power purposes.

The town of Saskatoon is considering the establishment of a municipal electricity works.

At Brandon, in Manitoba, the civic power committee is considering the erection of an electricity works, presumably water-driven, at some few miles outside the city.

In an article on the "Engineering Outlook for 1913," the *Canadian Engineer* gives, among other things, information substantially as follows:—

The London and Port Stanley Railway, which is owned by the City of London, Ontario, will probably be electrified at a cost of \$900,000.

The town of Souris, Manitoba, anticipates installing an electric-light plant, at an estimated cost of \$10,000.

Two new units are to be erected at the Winnipeg hydro-electric plant at Point du Bois, and a new transmission line is to be built thence to the city. The total cost will be about \$1,000,000.

Extensions to the tramway system in Lethbridge, Alberta, are contemplated; the cost is estimated at \$15,000. At Medicine Hat, Alberta, it is proposed to spend \$75,000 on extension of the electric lighting and power plant.

During January, Owen Sound, North Bay, Beaverton, Clinton, Elmira, Goderich, Peterboro, Stayner and Winchester all voted in favour of obtaining power from the Hydro-Electric Power Commission of Ontario, and collectively authorised the spending of \$347,000 for the purpose of erecting sub-stations and constructing their own overhead distributing systems for street and house lighting and power supply.

This Commission is now calling for tenders for materials required for 125 miles of 110,000-volt transmission line and the sub-station plant required for transforming 20,000 H.P. from this voltage down to 13,200 volts.

Particulars of the former may be obtained, the writer understands, from the Board of Trade Offices in London.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Electrical Engineers in India.

I read with much interest the letters which appeared in recent issues of your valuable paper. May they be a warning to those who apply for positions in India and the Far East.

Your correspondents, like myself, must have been "had." It can hardly be expressed in milder terms, as I signed a contract and came out here on Rs. 250 per month (£16 13s. 4d.) plus free quarters.

At home one often hears of cheap living in India, but I can assure you that even a bachelor on the above salary cannot associate with the European population and keep out of debt. Those who emigrate are generally men whose ambition cannot find enough scope in the Old Country, and these are the men who sign the contracts placed before them, little knowing their poverty-stricken fate. A little advice like that given in recent issues of your paper cannot but be appreciated, and should act as a warning.

No engineer should ever come to India under £30 per month.

### Another Engineer in India.

### Arc Lamps for the Outside Lighting of Shops, &c.

I must say Mr. Fennell's article on flame arc lighting from low-voltage mains has given many engineers food for thought; this system I consider a good way out of the difficulty of fighting the "shops across the road," if one's Committee can be persuaded to launch out in such a non-productive scheme.

It evidently meets the object it was intended for—namely, to retain the outdoor lighting; but why should he be so generous as to supply 1,500 C.P. against his competitor's 1,000 C.P. at the same figure, when it is common knowledge that the efficiency of a mantle drops considerably? Again, his capital cost of a 25-kw. motor-generator (£150) is, I consider, far below the prices of to-day.

Perhaps it would be interesting for me to detail the system I have adopted without any capital charges. This being but a small town, under 10,000 population, and having a progressive gas company to contend with, I am supplying three shops from one series of five flame lamps, and in another case two shops using five flame lamps across 250 volts.

The shops in the first instance are: Gents' mercer, using two out, one in; grocer, one out; china shop, one out. In the second instance the two shops are owned by the same man, but are about 50 yards apart, one shop using two out and the other two out, one in. By this means I am able to get a good revenue at 5d. per unit, and I do not supply or maintain the lamps or carbons.

The lamps are of the "Excello" type, by the Union Electric Co., single pair of carbons type, taking 6 amperes each. They were not all erected at the same time; in fact, only recently I added one to make up the series of five.

It is, of course, essential to select your shops, as all do not close at the same time, or on the same day. For instance, a butcher closes his shop on a Monday instead of in the middle of the week, and tobacconists', sweet, paper, chemists', and cycle repair shops do not close for a half holiday, or are not compelled to by the Early Closing Act, therefore these shops and their like must be avoided.

I must say the system here is overhead throughout, which simplifies matters considerably.

A. Preston.

Ammanford Electric Supply,

February 17th, 1913.

### Testing the Continuity of Earth Conductors.

With reference to the difficulty encountered by "Continuity," I beg to suggest the following method of comparing the resistance of the earth conductor and metallic covering with the resistance of the conductor.

For example, we will take an underground three-core feeder with the armour as the earth conductor.

Disconnect at each end, and then couple one core to the armour with a well-applied bond and earth the connections at this point.

Proceed as in taking a loop test and find the ratio of the armour to the core resistance.

Instead of earthing to existing earth plates or other connections, one of the other cores can be used to represent earth during the test.

A simply constructed bridge will answer this purpose well.

Rotor.

In reply to Mr. Kivlen and others on this interesting subject, they seem only to question the continuity of cable armouring. That is not the only important point; other things, such as pumps, haulages, starters, oil switches and short-circuiting appliances in constant use and usually earthed to the armouring are a better subject for discussion, especially as regards testing Rule 14 (c) (i). I am not "up against it"; I have all the latest appliances for detecting and testing for leakages, and I know how to use them.

I should like to give Mr. Kivlen an instance: I have a 3,000-volt A.C. plant, and use it at 2,000 volts underground and on the surface. I have an armoured cable from the sub-station on top buried in damp soil for 300 yards before reaching the mouth of the slant; down the slant it travels for 500 yards, wet all the way, and usually covered by a few "falls" at the bottom: here you supply pumping motors, carry your earthing from the armouring to the motor frame, starter, oil switch, pump, then on to another and another pump, and more starters and switches. Every pump is dead earth in itself by reason of its suction pipes, delivery pipes, and damp surroundings; you go on with your cable to an electric haulage mounted on iron girders in damp masonry, this haulage drawing trams (iron) with steel rope on iron rails, with always 6 in. of water on the roadway, and in many places the tar cord is gone off the armouring.

Now, Mr. Kivlen, how would you test my earthing system for continuity, and how would you prove that my earthing system is effective, when you already have a dozen or two, what we will call, natural earths? You cannot put your pumps or pipes up on insulators to test the continuity of your own system, or get an independent test on your haulage earthing, and yet one day you may be disconnecting your pipes, &c., for some reason, and find your pump "alive," because your earth was not effective, and you could not test it, owing to having so many natural earths. If you have two pumps, both pumping from the same sump, they will be connected by pipes, water, &c., and you will get continuity without earth wires: so when you put on earth wires, how are you going to test them? The resistance is never two hours alike.

Last week I had a pillar oil switch frame "alive," and thanks to the "earth," it knocked my switch out. But was it my earth, or as the pillar stands in a wet place, did it have its own earth? These are the plain facts an ordinary colliery electrician has to face, and an answer to these may be very beneficial to many, as we all like to comply with the Act in every detail.

H. Field.

South Wales, February 15th, 1913.

#### Association of Electrical Station Engineers.

As the formation of the above Association has created general interest amongst electrical station engineers all over the United Kingdom and abroad, an account of what has been done and future arrangements would no doubt be of interest.

At the last general meeting a provisional organising committee was appointed with Mr. Chas. F. Wade as chairman, and Mr. W. A. Jones, A.M.I.E.E., vice-chairman. This Committee has examined all applications for membership received prior to February 11th, instituted some enormous propaganda work, and has endeavoured to put the Association on a sound financial and business-like basis.

A number of very enthusiastic and energetic gentlemen in the provinces are forming branches, and have been very successful; full reports are not yet to hand, but preliminary details are very encouraging. There is still scope for those gentlemen who have plenty of spare time and surplus energy to devote them to obtaining members and forming branches in those districts where there are none at present.

According to the last published Government census of production (taken in 1907) there were about 22,000 men employed in the electric supply business in the United Kingdom. Estimating roughly that about one-third (7,333) of these would be eligible for membership of the A.E.S.E., and allowing for increase to 1912, there should be about 10,000 men available for membership.

Of these we are in touch with about 4,000; a few, however, have decided on the policy of "wait and see" how the Association shapes. Now, if all of these 4,000 men would become members, and also the majority of them would obtain only two more members each, then . . . . but, perhaps, I am too sanguine.

As soon as a good number of branches are formed it will be arranged that each shall appoint representatives (proportional to number of members) to attend a conference to draft rules and make general arrangements, &c., agreeable to the majority; the expenses of this conference will be paid from the central fund of the A.E.S.E.

The information bureau is to be an important section of the "Association," the business of which will be to compile and give information to members with regard to situations and conditions prevailing in the various districts; also it is hoped to assist employers who wish to obtain *qualified men*, provided, of course, that they are prepared to pay a salary compatible with the qualifications necessary for and the responsibility of the position. This section has aroused great interest, especially amongst British electrical engineers abroad, and a good number of these men have expressed a wish to become members of the Association.

Some question has been raised as to the attitude of employers, &c., to the A.E.S.E., but a perusal of the electrical Press of the last few months will show that they (the employers, &c.) have been advocating co-operation and com-

bination at every possible opportunity. The result has been conferences, &c., between the British Electrical and Allied Manufacturers' Association, Municipal Electrical Association, Institution of Electrical Engineers, and the Electrical Contractors' Association. The object of all these associations is the betterment of the condition of the electrical industry, and it seems that they are agreed that it can only be done by co-operation between manufacturers, contractors, and electric supply engineers, &c.

This is a good example to those of us who have not yet become chief engineers, and imitation is the sincerest form of flattery.

Considering that active steps to form the A.E.S.E. were only taken during the Christmas week of 1912, the results (about 4,000 inquiries to date) are astounding; but, like Oliver Twist, I ask for more, and hope the other 8,000 gentlemen who have not yet taken an active interest in the A.E.S.E. will do so at once, and thus we shall be able to better the conditions of that section of the electrical profession for which the A.E.S.E. has been formed.

W. J. Ebben,

Hon. Sec., Association of Electrical Station Engineers.

7, Vernon Road, London, E.,

February 17th, 1913.

#### Screw Caps for Radiator Lamps.

Referring to the letter in your issue of February 14th signed "Jobber," with reference to the standardisation of lampholders for radiator lamps, I note he suggests that the B.E.A.M.A. should take the matter in hand. We, as the originators of the lamp radiators, very early discovered the very inefficient contact of the ordinary spring lampholders, and, in 1901, we patented an improved form of lampholder (illustrated herewith), using split pins which enter into sockets fitted in the stem of the lamp, thus ensuring a very much increased area of contact. We

have sold many thousands of these holders, which have proved absolutely satisfactory in every way, and we never get a failure.

In our opinion, the reason why these holders have not been universally adopted, is that the lamp requires a special cap to fit in the holder. The illustration we enclose will fully explain the principle, which, however, must be well known to large numbers of your readers, who, no doubt, use this lamp and holder.

We should be pleased to send a sample holder to any station engineer or to others who may wish to inspect same.

The Dowsing Radiant Heat Co., Ltd.,  
H. J. DOWSING, Managing Director.

London, W., February 18th, 1913.

### Heavy Service Lampholders and Adapters.

Having made exhaustive tests on the average lampholders and adapters now on the market, I have come to the conclusion that special holders should be made suitable for use where a temporary connection is needed for a small radiator, cooking utensil, or other form of apparatus taking more current than an ordinary lamp. Some firms are guaranteeing that the ordinary holder will do this, but tests made with them show that the springs of the contacts quickly deteriorate when a current of 2 amperes is passed through them. To be really useful they should carry from four to five amperes without unduly heating. If any manufacturer could meet this long-felt want, some thousands of holders could readily be sold in the city to which I belong.

Sales Superintendent.

### Cost of Running Small Generating Station.

Referring to Mr. Gray's query, the cost of running the small Diesel electricity works, where the supply has to be maintained continuously, and where the output does not exceed 315,750 units per annum, with a maximum load of 160 kW., works out at .709 of a penny per unit.

The information, however, given by your correspondent is too meagre to get a reliable figure, as the cost so much depends upon the load factor.

The figure given above is taken from the last return of the Chichester Electric Light and Power Co., who operate the small works for the supply of power and light to the City of Chichester, which works we designed and of which we are the retained consulting engineers.

Horace Boot & Partners,  
Consulting Engineers.

London, S.W., February 17th, 1913.

### ELECTROCHEMISTRY IN 1912.

In the use of the electric furnace for steel refining the United States Steel Corporation has taken a leading part, especially with respect to large-tonnage products, such as rails. The long list of breakages of rails, resulting in disastrous railway accidents, has become a very serious matter, and credit is due to the United States Steel Corporation for having undertaken to determine what can be done with the electric furnace to relieve the situation. From Mr. W. R. Walker's authoritative statement, made for the corporation in the paper before the American Iron and Steel Institute, the following sentences are significant:—"At the present time (May, 1912) there are approximately 5,600 tons of standard electric steel rails in service in the United States. These rails have been in the track about two years. During the past winter some of these rails have been subjected to very low temperature—in some cases as low as 52° F. below zero—and are being exposed to all the possible conditions of severe service. . . . Up to the present time we have not heard of any basic electric rails in use in this country being broken in service." It will be remembered that the steel for these rails is basic Bessemer converter metal transferred while in the molten state to the electric furnace for refining. Mr. Walker's statement augurs well for the future of the electric steel rail. But it is evident that before transportation companies will be willing to pay somewhat higher prices for electric steel rails for general use the experience of more years must be available. Although the commercial development will be necessarily slow, the outlook is bright.

The electric furnace for refining steel for high quality products (tool steels, &c.) is proceeding quietly and very satisfactorily. Several new furnaces have been erected. The electric furnace has been introduced into foundry practice for high quality castings. A special type of electric furnace for heating bars, billets and forgings is finding particular favour at present, as a result of the recent considerable increase in the cost of crude oil, which puts oil-firing very much on the defensive.

The use of the electric shaft furnace for iron ore reduction on a large scale (in competition with the blast furnace) is still restricted to the Scandinavian countries and California, where specially favourable conditions prevail. Under ordinary conditions the blast furnace has little to fear from its electric competitor. One result obtained with the electric iron ore reduction furnace is noteworthy. By reducing the amount of carbon and running the furnace at a low temperature, a metal is produced containing 2.2 per cent or less of carbon, a very small amount of manganese and silicon, and one low in sulphur and phosphorus. Being produced directly from iron ore in the electric furnace, it is called "pig steel," as it contains fewer impurities than pig-iron, and therefore requires less refining for making finished steel. This is

probably the most hopeful feature of the evolution of the electric iron ore reduction furnace.

Any progress that promises to cheapen aluminium is of particular interest to the electrical industries in view of the competition between aluminium and copper, especially for line construction. The electrolytic production of aluminium from alumina is now so far developed, that little saving may be hoped for in this step of the process. The trend of invention is, therefore, to cheapen the cost of the raw material—the alumina—and there is at present a large activity in this field. Besides several processes which are being kept carefully secret, two loom large in the limelight. The first of these is a new process of Mr. Alfred H. Cowles, for obtaining alumina, hydrochloric acid, caustic alkali, and white hydraulic cement from clay, salt and lime. The cheapness of the starting material, clay, and the production of the various by-products, are to result in a much reduced cost for alumina. A plant for developing the process on a commercial scale has been erected at Sewaren, N.J. The second, or Serpek process, which has been in use for a longer time on an experimental scale in a plant in France, produces aluminium nitride as an intermediate product, and finally yields pure alumina and ammonium sulphate. It, therefore, represents a combination of the production of alumina with the fixation of atmospheric nitrogen. The production of the by-product, the ammonium sulphate, reduces the cost of alumina. Both processes are interesting in another respect. Mr. Cowles hopes to make his process available for the extraction of potash, and thus to found an American potash industry which should make this country independent of Germany. In the process the ammonium sulphate by-product is also a fertiliser. Both processes, therefore, also afford an indication of the marvellous present activity in fertiliser chemistry.

Among the electrochemical processes for the production of fertilisers the two largest are utilised in the production of nitrates from atmospheric nitrogen by electric discharges through air, and in the production of calcium cyanamide. Both are commercially successful. Concerning the wonderful growth of the Norwegian nitrate industry, using the Birkeland-Eyde process, it is noteworthy that in less than 10 years this industry has grown to be one of the largest in Norway, utilising that country's enormous available water-powers, which can be developed at a very low cost, while the electrical energy could not be utilised in full for other purposes under local conditions.

As to the progress of calcium cyanamide, it is interesting to note that the Niagara Falls works are to be largely increased. Finally, it may be mentioned that the synthesis of ammonia from elementary nitrogen and hydrogen gases is now an accomplished fact, as a result of the commercial development of the Haber process by the Badische company. While it is not an electrochemical process itself, it is likely that the hydrogen gas needed as raw material will be made electrolytically.

Thus in the wonderful present growth of fertiliser chemistry—one of the greatest developments undertaken by science for the welfare of mankind—electrochemistry is taking properly a prominent part.—E. F. ROEBER, in the *Electrical World*.

### LEGAL.

JOSEPHSON v. METROPOLITAN ELECTRIC SUPPLY CO.

MR. JUSTICE JOYCE in the Chancery Division last week heard a motion by the defendants in this action, asking that it might be dismissed as disclosing no cause of action, that it was frivolous and vexatious, and an abuse of the process of the Court.

MR. WILBRAHAM, in support of the motion, said the plaintiffs Joseph Josephson and the Cosy Cinema, Ltd., claimed specific performance of an agreement to sell to them the defendants' lease of land in Amberley Road, Harrow Road, for £150. They relied upon letters passing between the parties between November, 1911, and June, 1912, but he (counsel) submitted that those letters disclosed no concluded agreement, and he further argued that the contract, if any, depended upon the plaintiffs securing the freehold, which they had not done.

The defendants were not represented, and his Lordship, holding that there was no contract, dismissed the action with costs.

WESTERN ELECTRIC CO., LTD., v. GREAT EASTERN RAILWAY CO.

In the City of London Court on February 13th, before Judge Lumley Smith, K.C., plaintiffs sued defendants for £35 damages for breach of duty in regard to the carriage of 10 cases of telephone accessories from Antwerp to North Woolwich.

MR. BALLOCH, for the plaintiffs, said that the case was of much importance to all senders of goods by railway. The defendant company carried telephone accessories for the plaintiffs at 20s. per ton from Harwich to North Woolwich, and they became damaged by fresh water on the journey and were spoilt. The goods were carried under an owner's risk note; but the plaintiffs' case was that that exemption of the defendant company was unreasonable.

MR. BRUCE THOMAS, defendants' counsel, argued that the defendants were not liable for the damage which had occurred.

JUDGE LUMLEY SMITH, K.C., in a considered judgment, said the damage had occurred through neglect on the part of the defendants' servants, and not through wilful misconduct. The goods were

carried at a reduced rate at owner's risk under conditions exempting defendants from liability for damage arising from negligence (other than wilful misconduct) of their servants. The contention for the plaintiffs was that the contract was not just and reasonable within the Railway Canal Traffic Act, 1854, Sec. 7. *Prima facie*, a contract containing exemption from liability for negligence was not just and reasonable. The burden of proving that it was just and reasonable was on the defendants, and the fact that the plaintiffs had for a long time taken advantage of the contract was in favour of its being so, but the Courts had adopted the crucial test of whether the plaintiffs had an option to send their goods at a reasonable rate with liability of the company as common carriers. In his judgment, plaintiffs did not have an alternative option of sending the goods on the terms of the defendants having the ordinary liability of common carriers. The result was that, in his opinion, the defendants had not shown that the special contract which they relied on was just and reasonable. He thought the contract must be treated as for the whole journey, and not as divisible into separate contracts for land and sea carriage. Judgment for the plaintiffs, with costs.

BRITISH ECONOMICAL LAMP CO., LTD., v. EMPIRE, MILE END, LTD., AND A. BERNSTEIN.

BEFORE a Divisional Court of the King's Bench Division, composed of Justices Lawrence and Lush, on February 14th, this case came before their Lordships on the appeal of the plaintiffs from the judgment of the Recorder in the Mayor's Court on December 19th.

MR. GEORGE WALLACE, K.C., who appeared for the appellant company, said that the appeal was against a decision of Sir Forrest Fulton, K.C., at the Mayor's Court, in a case tried with some despatch without a jury, and the question was raised in the appeal whether the movable bulb lamps used for electric light are part of the house. The Recorder had held that they were fixtures, and had given judgment against the plaintiff company. The action was brought by the British Economical Lamp Co. for the return of certain lamps that they had supplied to the Yiddish Theatre. The plaintiffs' business was that of letting out lamps to theatres and hotels upon agreement, a weekly rental being paid, and the plaintiffs supplied to the Yiddish Theatre Co. a number of electric bulb lamps. The landlord did not receive his rent—apparently (said counsel) nobody was paid—and he took possession of the theatre. The plaintiffs heard of this, and when they went round to the theatre to get the money due for the hire of the lamps or take them away, the landlord took the attitude that he was in possession, and that these goods were affixed to the freehold. When the case was before the Recorder, the plaintiffs called only one witness, who proved the supplying of 1,100 lamps. In cross-examination he said that there were about 800 holders for the lamps, so that there must have been 300 out of the 1,100 that were left lying loose on the premises, and were not affixed at all. The Recorder had held that the plaintiffs' lamps were fixtures, and if a thing was affixed to the freehold it became part of the house, and as long as they were part of the house the landlord taking possession took possession of everything that was part of the house. His (counsel's) contention was that these things were not part of the house. Counsel read the evidence given at the trial by an inspector of the plaintiff company to the effect that the lamps were let out on agreement at £3 per week, that rent became due for the first week, and that none had ever been paid. Mr. Wallace submitted that the decision that these lamps were fixtures and part of the house could not be supported, or there must be something in the nature of a permanent annexation to make a thing part of a house at all. These things would not be so permanently affixed as a carpet. Mr. Wallace, in reply to their Lordships, said there had been no claim to disstrain. The freeholder had determined the tenancy, and in the pleadings the defence was that if the lamps claimed were on the premises, they were affixed to and became part of the premises, and were now the property of the defendants. Counsel proceeded to detail the agreement by which the lamps were let out, and MR. JUSTICE LUSH said there was no doubt that as between the plaintiff company and the theatre company the plaintiffs remained owners.

MR. WALLACE said the case was one of great importance to the plaintiffs, because if they were liable to hand the lamps over to the landlord taking possession, they would often be in the predicament in which they now found themselves.

MR. RANKIN, for the other side, argued that the decision of the Recorder, on the decided cases, was correct, and that they were fixtures, and after considerable argument the Court said judgment would be reserved.

## AUSTRALIAN TRAMWAY COMPANIES AND THEIR EMPLOYEES.—X.

(Continued from page 194.)

THE hearing of the case against the Brisbane Co. was continued, Mr. Frew continuing his address on their behalf. He submitted that no grievances had been submitted on behalf of the men's Union to constitute an inter-State dispute, and that consequently the Court had no jurisdiction. Holidays the company regarded as a luxury, not a necessity; but on this matter they had received no complaints. They did not think they should be called on to provide watches for the men. As to the wearing of the Union badge, the company could not agree to it. The company were not prepared to give the undertaking asked for by the Judge that in making future appointments they would not discriminate between Unionists and non-unionists. They had 680 members of another Union in their employ which were not in any way connected with the claimant Association, and the company did not feel it would be fair to this new Union to give the undertaking. The Judge pointed out that this decision would mean that in his award he would order preference to be given to Unionists, but the company would not alter their decision.

A day or two later, the Judge, Mr. Justice Higgins, handed to the representatives of the Brisbane and Adelaide Companies a draft of his proposed awards, and a day or two later heard objections to them both from the companies and the secretary of the men's Union. Two days afterwards, on December 21st, the Judge gave his final award.

The principal points in the Brisbane award are:—

Minimum wages to be paid to members of the men's Union—Motormen and conductors, first year 8s. 6d. per day, second year 9s., third year 9s. 6d.; signalmen 10s. (signalman includes any man who regulates tramway traffic at intersections); point boys 6s., lamp trimmers 8s. 6d., electrical mechanics (if electrical fitters) 11s., pitmen 9s. 6d., pitmen's assistants, 8s. 6d., car-washers or cleaners, 8s. 6d., overhead wiremen, first or leading, 10s. 6d., assistant 9s., horse car wagon drivers 8s., engine drivers 12s. 6d., boiler cleaners 8s. (with 6d. per hour extra when working inside boilers), greasers 9s., firemen on four fires 10s., on less than four fires 9s. 6d., trimmers or fuel men 8s. 6d., track gangers 9s. 6d., fettlers and trackmen (otherwise called maintenance men) 9s., track cleaners or sweepers 8s. 6d., horse dray drivers 8s., night watchmen 8s., lavatory men 8s., labourers not otherwise specified 8s.

A day to mean eight hours' work, overtime to be counted for first hour per day at time and a quarter, afterwards as time and a half for motor men and conductors. For other employes, week's time to be 48 hours, with time and a quarter for first two hours excess and time and a half afterwards. Between certain hours double time to be paid. For Sunday work time and a quarter to be paid, and on holidays time and a half. Holidays to be Christmas Day, Boxing Day, New Year's Day, Good Friday, Easter Monday, Eight Hours' Day, Anniversary Day and King's Birthday. All employes to have one day off per week without pay. After 12 months' service to have 14 consecutive days off with 12 days' pay, and to be given 7 days' previous notice of date of holiday. There are certain small exceptions to this rule.

The ordinary spread of hours not to exceed nine hours per day, except for 20 per cent. of the whole number, or such other proportion as may be allowed by the Board of Reference who may work in broken shifts with a spread of hours not exceeding 12 per day. Ten minutes to be allowed to motormen and conductors for signing on, and a similar period for signing off. No motorman or conductor to be on duty longer than five hours without meal relief, or to be liable to be called on to resume duty at a shorter interval than 10 hours, or to work more than six consecutive night shifts. When required to attend by roster, an employe is not to be paid for less than four hours, unless he has two hours' notice. Every motorman or conductor signing on for duty to have a full day's pay. Promotion to be governed by efficiency, and, in the event of equal efficiency, by seniority. Efficiency means special qualifications and aptitude for the discharge of the duties of the office to be filled, together with merit and good and diligent conduct. When employed on different duties, the employe to be paid the highest rate for any of his duties. Time spent in making written reports to be paid for. Time occupied at the request of the company in attending inquiries—unless for employe's own misconduct—to be paid for. The company to supply conductors with sufficient change.

In view of an appeal to the High Court on the question of the wearing of the Union badge, the award on this question was reserved. Officers of the men's Union are to be allowed to collect subscriptions and transact the business of the Union providing they do not interfere directly with the working of the tramway, or, if they are employes, fail in their own duties. A list of employes with order of seniority as to service shall be exhibited at each depot. All cars to be fitted with seats for motormen within six months, for use by the motormen as approved by the Board of Reference. All cars within the same period to be fitted with suitable side and end guttering to carry off water. The most important section of the award related to preference, and as it was the first time in which this principle had been embodied in an award it is advisable to quote it in full:—

"As between members of the claimant organisation and other persons offering or desiring service or employment at the same time, preference shall, in the manner hereinafter specified, be given to such members, other things being equal. Before making the appointment, the company shall satisfy itself that the proposed

**Platinum.**—As is pointed out in an article in the *Chicago Mining and Engineering World* for January 25th, most of the world's platinum still comes from the Ural Mountains, a small quantity being recovered in the United States from the gold places of northern California and western Oregon. This production, from a table furnished by the United States Geological Survey, was highest in 1906 with 1,439 oz., and now amounts to 800 oz., valued at £6,960. The estimated Russian output for the past year is 310,150 oz. Columbia produced 11,750 oz., and Australia and Canada contributed small quantities, not estimated.

appointee is a member of the Association, or that there is no member of the Association applying who is equally suitable for the appointment, apart from the fact of his membership."

The rest of the award states that complaints against employes shall be given them in writing, and that the accused shall be allowed to call witnesses on his behalf, and shall, if possible, be confronted with his accuser. If the charge is not sustained, the employe shall be paid for his time, and reasonable charges allowed for his witnesses. If the men's Union disagrees with the company's finding, the matter shall be referred by either party to the decision of the Board of Reference.

Provision was made for the constitution of the Board of Reference.

The new rates of wages were to be retrospective from October 1st, and the provisions as to spread of hours, from February 28th.

In making the award, the Judge referred to the length of the case, as it had occupied the Court for 93 days, or longer than any case he had had to deal with. This, in his opinion, was partly due to the difficulties of the case, and partly to defects in the Act.

He then gave a long and detailed account of the Brisbane dispute, which had done so much to impart acrimony into the whole question. He felt that the attitude of Mr. Badger, the manager, was unjustifiable and autocratic. In the Judge's opinion, the Arbitration Act encouraged the formation of employes' unions; in Mr. Badger's opinion they were very objectionable. He felt, therefore, that he must condemn the position taken up by Mr. Badger and his company, and as they would not agree to discontinue discriminating between non-unionists and Unionists, to the disadvantage of the claimant Association, he felt it necessary to award preference for the men's Union.

He had tried, in wording this clause, to so phrase it as not to curtail the efforts of the manager to get efficiency in his service. He regretted the necessity for taking this course; it was the first time he had done so, but the action of the company had rendered it necessary.

The company had raised the question of an Act recently passed by the Parliament of Queensland, which limited his powers to grant preference to members of the men's Unions. If such a point were seriously raised he should, as a member of the High Court which would have to decide it, preserve an open mind.

The position with regard to the other awards was gone into at the same time.

(To be continued.)

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"INQUIRER" writes:—"It is proposed to form a small private company to supply current for private lighting in a small town. The local (parish) council have no intention to apply for powers, and would offer no objection to overhead mains, the road authority being the County Council.

"What powers are necessary in order that the company may be in a legal position to supply current, and in order that their interests may be protected at any future time in the event of opposition by any other company or body, and how could these powers be obtained most easily and cheaply? Would a licence from the B. of T. be sufficient? In what way could the local gas company offer effective resistance (if any) to the powers being obtained?"

"If the local authority of a district are not supplying electricity, it is competent for any person or persons, whether they are a company or not, to fulfil the rôle of supply authority. The Electric Lighting Act of 1909 made no difference in this respect, it being there provided by Sec. 23 that where in any area a local authority, company or person is authorised to supply electricity under Act of Parliament or under licence or provisional order granted under the Electric Lighting Acts, it shall not, after the passing of this Act, be lawful for any other local authority, company or person to commence to supply or distribute electricity within the same area, unless such supply or distribution is authorised by Act of Parliament or by licence or provisional order granted in terms of the Electric Lighting Acts: provided that this section shall not prevent any company who at the passing of this Act are empowered by their memorandum of association to generate electrical energy, from affording a supply to a railway company for purposes incidental to that company's undertaking, other than the conveyance of public traffic.

As to the second half of the query, a company may get to work either under licence or provisional order. The form of that provisional order will be found in the schedule to the Electric Lighting Clauses Act, 1899. But even if they do not work under provisional order, they cannot be prevented or interfered with by the local authority in the future, nor would the opposition of the gas company be successful.

**International Congress of "Cold."**—The third International Congress, organised by the Association Internationale du Froid, will meet in the United States from September 14th to 24th. The Congress will open at Washington on September 15th, and the actual sittings will take place at Chicago. Particulars can be obtained from the Association, 9, Avenue Carnot, Paris.

## BUSINESS NOTES.

**Trade Press Exhibit at Ghent.**—The trade and technical Press of this country is to play an important part in the British Section at the Ghent International Exhibition, which opens at the end of April, for a collective display is being organised by the Exhibitions Branch of the Board of Trade. A number of papers (including this journal) have already arranged to participate, and, under the scheme which has been adopted, it is expected that the display will attract much attention. The exhibit will take the form of a large reading room and library, where current numbers of the papers will be found on reading tables and bound volumes on the shelves which line the walls. A visitor will consequently be able, not only to see the latest copies of the papers which interest him, but also to refer to back volumes to see the range of subjects dealt with. The library has been specially designed by Mr. Frank Brangwyn, A.R.A., and the work is being carried out under his personal direction. It has been found possible to allot one of the best positions in the British Section to the library. On one side it opens direct on to the main avenue through the Exhibition grounds, and a large proportion of the visitors entering the British Pavilion must pass through it; on another side it communicates with the offices of the British Section. It also leads out of the gallery devoted to Arts and Crafts. This is the first occasion that such an exhibit has been made by British trade papers, and it is hoped that it will create great interest among Continental business men, who will thus have an opportunity of becoming familiar with not only our trade papers, but also their advertisements of British manufacturing firms. The Exhibition will remain open for at least six months, and during that time a great deal may be done to advance British trade interests. The Exhibitions Branch of the Board of Trade have arranged for an official of the British Chamber of Commerce in Belgium to be in charge of the library in order to answer all questions and furnish daily reports to the proprietors and editors of the papers taking part.

**Exhibition in Sweden.**—An international exhibition is to be held at Malmö in 1914, under the auspices of the Swedish Government. It is styled the "Baltic," and the participation of the States bordering on the Baltic have been specially invited, but other countries are not necessarily excluded. Machinery, especially electrical, will be strongly represented.—*Elektrotechnik und Maschinenbau.*

**Consular Notes.—Spain.**—The American Consul at Barcelona reports that there is a good and increasing demand in Spain for foreign electrical supplies such as electric motors, dynamos, &c. The use of electricity is greatly increasing in all parts of the Peninsula, not only in the principal centres of population, but also in the country where water power is chiefly used in the factories and for lighting purposes. In fact, there is a surprising number of small and relatively unimportant towns lighted by electricity. To meet this increasing demand for electrical supplies of all descriptions, Spain is obliged to purchase considerable quantities of these goods abroad, the total imports of electric apparatus in 1911 amounting to about £730,000, as against about £600,000 in 1910, and about the same in 1909. Only a small part of these imports came from the United States, and apparently very little effort has been made to introduce American electrical goods into the country. German manufacturers, on the other hand, are extensively represented in the important industrial centres, and it is as a result of this, that Germany succeeds in supplying about two-thirds of all the electrical machinery and apparatus imported. Relative cheapness also gives German products an advantage over those of other countries. In 1911 the total imports of electric motors, dynamos, regulators, and transformers, amounted to about £436,000, as against about £368,000 in 1910, and about £365,000 in 1909. No statistics are at present available showing the imports for 1911 by countries, but in 1910 Germany was the chief supplier of these goods, sending £136,000 worth of electrical machinery weighing from 880 lb. to 11,000 lb. and upward. France, England, and Switzerland were next, with £18,000; £18,000, and £28,000 respectively. The United States supplied £2,750 worth of this class of machinery. Germany also sent £103,000 worth of electrical machinery weighing 880 lb. and less, followed by France, Great Britain and Sweden with much smaller amounts. Imports from the United States in this line amounted to £2,000. There is an especially good demand for this class of machinery, which is evidenced by the fact that the imports nearly doubled in the past three years. The importation of electric accumulators and batteries is not important, amounting to only £65,000, which is almost entirely supplied by Germany, France and Great Britain, in the order named. On account of the increased home production, imports of electric cables and wires are gradually declining. Germany again holds the first place in this line, importing in 1910 £33,300 out of a total of £50,000. There are four factories for electric cables in the Province of Barcelona, and various others in different parts of the country. A steady increase is observed in the imports of telephone and telegraph apparatus and electric meters, which the Spanish tariff classifies under one heading. Imports amounted to £50,000 in 1909, £57,000 in 1910, and £68,000 in 1911. Germany is the chief supplier of these articles, furnishing in 1910 118,146 lb., valued at £33,000; but these imports consisted, for the largest part, of telegraph apparatus. Telephone apparatus is almost exclusively supplied by Sweden and France, imports from these countries amounting to £6,600 and £8,600 respectively. The

United States supplied 32,568 lb., valued at £900, but it is difficult to say just what articles are included therein. Electric meters are manufactured locally, there being two factories for this article in the city, the output of which is estimated at over 100 meters of various kinds daily. Imports of arc lamps are on the decline, the total imports amounting to £9,000 in 1911, as against £13,500 two years ago. Over two-thirds of the imports are of German manufacture. A surprising increase is noted in the imports of incandescent globes (mounted ready for use), which amounted to £81,000 in 1909, £95,500 in 1910, and £135,000 in 1911. There are now 10 factories for this article at Barcelona alone, but, notwithstanding their increased output and the constant erection of new factories, imports continue to rise. Again Germany is the principal supplier, furnishing in 1910 about £80,000 worth of incandescent globes. France and Austria-Hungary are also in the market, but with much smaller amounts. The actual wholesale price of globes manufactured in the country is 37s. 6d. per hundred, and imported globes sell at 70s. per hundred, payable at 90 days.

A new movement now on foot in the district of Catalonia to utilise water-power for the production of electricity has brought about a decrease in the price of electricity for both power and lighting purposes. Consequently many manufacturers at present using steam are considering the installation of electricity, and the demand for electrical machinery and supplies is expected to increase considerably in the near future. Barcelona and Bilbao are important receiving points for all kinds of electrical supplies, the latter port especially for electric cables.

**Paraguay.**—The American Consul at Asuncion reports that with the completion of the Asuncion electric light and power plant in 1913, there will arise a demand for motors and other electrical utilities, opening up a new field for manufacturers, provided they are ready to compete with the concessionaires of the plant who are connected with German sources of supply. As indicating the failure of American firms to grapple with conditions adequately the Consul states that soon after the concession was granted, he reported opportunities for certain electrical appliances for which an agency was needed in Asuncion. Replies were received from leading manufacturing concerns in the States, but led to no result, chiefly for the reason that definite estimates could not be made without much trouble from the price lists obtained. In one instance it took a fortnight to figure out an estimate for 15,000 electric lamps, fixtures, &c., on account of the variation in discounts. If there had been one discount for a whole list or a discount for a page, say, of classified articles, the American house would have stood on a more equal footing with its competitors. Some manufacturers made no offer to establish a direct agency, but offered to deal through their Buenos Ayres agents, apparently not realising that there are competitors dealing directly with this territory. Prices were often quoted f.o.b. at the factory, perhaps some interior point in the United States, leaving the prospective purchaser quite in the dark as to what he could offer the goods for here. Prices should at least be f.o.b. port of embarkation. Better still would be prices c.i.f. Monte Video or Buenos Ayres, but, best of all, c.i.f. Asuncion. Transportation companies and forwarding agents should make this possible.

**Guadeloupe.**—The American Consul at Guadeloupe reports that the concessions granted to Hubert Anclin, of Basse Terre, for the electric lighting of Point à Pitre, Basse Terre and Sainte Claude, put up for sale in the middle of 1912, have been taken over by the Société Anonyme d'Electricité de la Guadeloupe, composed of local capitalists. The stock of the company has been fully subscribed and one-half paid in. It is the intention to build only the Basse Terre plant at present. This plant will have a capacity of 18,000 O.P. of incandescent lights, of which 1,500 c.p. is to be furnished for lighting the Colonial Government buildings, and 2,000 c.p. for lighting the streets and municipal buildings; the balance is for private subscribers.

For the light furnished to the Government and municipality, a subsidy of approximately £1,200 per year is guaranteed under the terms of the concessions, and, under certain conditions, additional payments may be obtained. The amount which can be charged private subscribers is fixed at 5d. per c.p. per hour, but this is modified by a clause which permits the company to make private contracts; the use of meters for measuring the current furnished is optional. In private installations, it is provided that the current shall be brought free of charge to each building, but that the subscriber shall pay all costs within the building, all materials to be furnished by the company at the catalogue prices of French dealers in such commodities, plus 25 per cent. at the highest. Orders for the necessary equipment will be placed with the Thomson-Houston Co., Paris, and work was to begin in the early autumn. The high tariff on electrical supplies precludes orders being placed elsewhere than in France. The life of the concessions is 10 years, and at the end of that period the entire plant becomes the property of the Government and municipality.

**Osrams in Shanghai.**—Recent advices from the General Electric Co., of China, Ltd., shown that the Osram drawn-wire lamp is becoming very popular there. At the company's Shanghai branch, orders are frequently received for the lamps in lots of thousands. Indeed, during a fortnight in last November, orders aggregating 13,000 Osram lamps were secured from cotton mills in Shanghai alone. Furthermore, the Shanghai Tramways have ordered 1,000 Osrams.

**New Map.**—Mr. Edward Stanford has issued his usual map for the Parliamentary Session, 1913, showing the proposed railways, tramways and other schemes affecting London in connection with Bills where plans have been deposited with the L.C.C. The price is 2s.

**Strike.**—We are informed that the strike which is in progress at the works of MESSRS. EVERSHED & VIGNOLES, LTD., came about in consequence of a workman being discharged for neglecting his work. The men consider that he was harshly dealt with, and demand his reinstatement—a demand which the company, in view of all the circumstances, are not prepared to concede. We understand that the employes in the stores, packing department and winding and lacquering rooms are fully at work; further, that every member of the staff throughout the works is doing his utmost to help the company, and a considerable amount of work is thus being completed.

**The N. T. Journal.**—The liquidator of the National Telephone Co., Ltd., is disposing of the back numbers of our now defunct, but always excellent, contemporary, *The National Telephone Journal*. There were 70 monthly numbers, and only three are out of print, and any reader requiring a set can have same for a comparatively nominal charge by addressing, Mr. V. Baldwin, Room 37, Telephone House, E.C.

**Sweden.**—It is reported from Stockholm that a new subsidiary company has been formed by the A. B. Ljungström Steam-turbine for the purpose of erecting special workshops for the manufacture of the Ljungström turbine. Up to the present there has been no workshop suitable for building these engines commercially, and those turbines that have been completed have all been made for experimental purposes. The new company has a capital of £77,777, and it has already purchased suitable factory buildings in the small town of Finspong. The orders for turbines already booked are said to amount to a total capacity of 27,000 H.P., and there are in addition a number of engines that the company has been unable to deal with.

Our Swedish contemporary *Aftonsvärlden* has made an inquiry of the Nya Elektriska A.B., of Stockholm, with regard to the electrical industry in 1912 and the prospects for 1913. In reply, the company states that the demand for all kinds of electrical goods has been far more lively than in 1911, and the customers have increased in number. The number of electrical power stations projected or under construction, however, has been declining somewhat, a fact which is attributed to the uncertain conditions which will prevail until the policy of the Government in regard to the future has taken shape. The prospects for 1913 are very favourable, and the year will no doubt be one of increased activity, provided only that the Balkan war does not cause any greater disturbances. A large number of extensions are going to be made in the course of 1913, and the new plants to be erected are also numerous.

**Dissolutions and Liquidations.**—**RENARD ROAD AND RAIL TRANSPORT CORPORATION, LTD.**—A meeting is to be held at 82, Victoria Street, London, S.W., on March 18th, to hear an account of the winding up from the liquidator, Mr. H. A. Grimsdick.

**NATURAL GAS AND POWER CO., LTD.**—A meeting will be held on March 19th, at 11, Ironmonger Lane, London, E.C., to hear an account of the winding up from the liquidator, Mr. W. B. Peat.

**PREMIER BITUMEN AND ASPHALTE CO.,** Stratford, London.—Messrs. H. Levin and C. R. Berry have dissolved partnership. Mr. Berry will attend to debts and continue the business under the same style.

**J. STIFF & SONS,** High Street, Lambeth, London, S.E.—With reference to the purchase of the goodwill and connection of this business by Messrs. Doulton & Co., Ltd., last December, the partnership of S. J. Stiff, J. A. Stiff, and W. F. Stiff, as J. Stiff & Sons, was dissolved as from December 31st, and accounts against the firm should be sent to them without delay.

**KEVAN ELECTRIC CO., LTD.**—Liquidator (Mr. H. de V. Brougham) released February 11th, 1913.

**Book Notices.**—*The Universal Electrical Directory* (J. A. Berly's). 1913. London: H. Alabaster, Gatehouse & Co. Price 21s. ("A" edition, containing "British and Colonial" sections only, 12s.).—This very useful directory of electrical men and electrical trades, has now reached its thirty-second annual issue. It contains between 1,500 and 1,600 pages of closely packed directory matter, which everybody having relations with electrical men, either at home or abroad, ought to have within easy reach. In the first section it contains alphabetically arranged names and addresses, and where possible, the telegraph addresses and telephone numbers, of all electrical men and concerns in and around London. A similar provincial section comes next, a full British Classified Trades Section following. The usual handy British Geographical Section, Colonial and General Foreign Alphabetical and Classified Sections, Continental and U.S.A. Alphabetical and Classified Sections, then appear in the order stated. The Electricity Works Sections, both for Home and for the Colonies and many foreign countries, contain invaluable information respecting chief engineer, character of current, voltage, and so on, and in the alphabetical sections for both London and the provinces, financial information regarding companies is given. Produced, as the work is, in its present form as the result of very lengthy experience, and embodying alterations which changing years and the needs of users have proved to be necessary, we anticipate that it will be required in most business houses where communicating with electrical men is a daily necessity. Knowing only too well the importance of having reliable and full information respecting Colonial and foreign addresses, in these days of growing export electrical and engineering trade, the publishers and compilers have incurred heavy expense in their endeavours to ensure completeness and accuracy in this respect. To thousands of offices this information alone should be worth many times the cost of the book.

*Japanese Register of British Trades.* London: Far Eastern Advertising Agency, Ltd.—This volume has been printed and produced in Japan with native labour. It has been compiled consequent upon the need for such a publication by leading manufacturers in Japan who wanted to get into direct business relationship with manufacturers in this country. We hope that the book will be the means of increasing our trade connections with the enterprising business spirits in Japan. A large number of British names and addresses are given in classified trade sections. We understand that the work of revision and addition is being taken in hand for a 1914 edition.

"*Transactions of the Institution of Engineers and Shipbuilders in Scotland.*" Part IV, 1912-13. Glasgow: The Institution.

"*Transactions of the Illuminating Engineering Society.*" Vol. VII, No. 9. December, 1912. New York: The Society. Price 75 cents.

"*Proceedings of the American Institute of Electrical Engineers.*" Vol. XXXII, No. 2. February, 1913. New York: The Institute. Price \$1.

"*Proceedings of the Engineers' Club of Philadelphia.*" Vol. XXX, No. 1. January 1913. Philadelphia: The Club.

"*Bulletin Mensuel de la Société Belge d'Electriciens.*" Vol. XXIX, No. 11. November, 1912. Brussels: E. Bruylant. Price 1 fr. 75 c.

"*Calculs Techniques et Economiques des Lignes de Transport et de Distribution d'Energie Electrique.*" By C. Le Roy. 1913. Paris: Hermann et Fils. Price 6 fr.

"Bells, Indicators, Telephones, Fire and Burglar Alarms, &c." By J. B. Redfern and J. Savin. Price 1s. 6d. net. "Iron and Steel." By O. T. Hudson and Guy D. Bengough. Price 6s. net. London: Constable & Co., Ltd.

"*Transactions of the University of Toronto Engineering Society.*" Vol. VII, No. 3. January, 1913. Toronto: The University.

"*Journal of the Western Society of Engineers.*" Vol. XVII, No. 10. December, 1912. Chicago: The Society. Price 50 cents.

"*La Théorie du Rayonnement et les Quanta.*" By P. Langevin and M. de Broglie. Price 15 fr. "Sur les Effets Physiologiques des Courants Electriques." By Dr. G. Weiss. Price 5 fr. Paris: Gauthier-Villars.

"*Essentials of Electricity.*" By W. H. Timbie. 1913. London: Chapman & Hall, Ltd. Price 5s. 6d. net.

Heartly congratulations to our contemporary the *Financial Times* on the celebration of its twenty-fifth birthday. Advantage was appropriately taken of the event for the publication of a bumper issue on February 13th, in which many interesting special articles and illustrations appeared, giving a mass of information of particular interest to all who are concerned with finance and commerce.

**Bankruptcy Proceedings.**—WILLIAM LONGDON and VERNON GEORGE COBB (trading as Longdon & Cobb), electrical engineers, 101A, Derby Road, Nottingham.—The public examination of the above-named debtors was held at the County Court House, St. Peter's Gate, Nottingham, last week, when the liabilities were put at £291, and the assets were estimated to realise £45, leaving a deficiency of £246. In answer to the Official Receiver, the debtor, Longdon, said he had been connected with the electrical engineering trade for over 30 years, and started trading on his own account about four years ago. The work had increased considerably, and in March, 1912, needing assistance, he took Cobb into partnership, the latter introducing a capital of £150. The business had not proved a success, and creditors began to press them as soon as the partnership was entered into. The case was adjourned so that the debtors might furnish a cash and goods account for a certain period prior to the date of the receiving order.

J. W. LEWSLEY, electrician, Nottingham.—Receiving order made February 14th on debtor's petition.

HARRY THORPE, electrician and engineer, 11, Bartholomew Villas, Kentish Town Road, London, late of High Holborn and Holloway.—Adjudication annulled on February 3rd, "it appearing to the satisfaction of the Court that all the debts herein have been paid in full." Date of adjudication, April 7th, 1905.

**Catalogues and Lists.**—MESSRS. WALTON & CO., Newton Street, Birmingham.—Advance copy of price list, with illustrations, of leather fillets, brass dowels, iron dowel plates, birchwood dowels, steel spring washers and leather washers for pattern shop and other purposes. This forms the first section of a price list which is intended to cover the requirements of the works manager.

THE ARMOURD MANUFACTURING CO., LTD., of Farringdon Avenue, London, E.C., have issued a card with map showing how their premises may be quickly and conveniently reached from the principal suburbs.

MESSRS. COOKSON & CO., 25, New Oxford Street, London, W.C.—New lists of C. and C. ignition and car-lighting accumulators, traction accumulators, india-rubber corks and collars, and hydrometers for accumulators, also cheap engineer's watches.

THE DEROME STANDARD PULLEY BLOCK and CRANE MANUFACTURING CO., 78, Southwark Street, London, E.C.—32-page booklet (No. 78) containing revised prices and illustrations of their various cranes and pulley blocks.

A.E.G., Berlin.—Nos. 1 and 2 of "Mittellungen aus dem Kabelwerk Oberspree," dealing with insulating materials, and armoured flexible cables for portable tools.

THE PARAGON WIRE MILLS, 10-12, Norman's Buildings, St. Luke's, London, E.C.—Price leaflets of silk and cotton-covered copper wires, bell flex, bell wires and braided wires.

THE SLOAN ELECTRICAL CO., LTD., 12, Golden Lane, London, E.C.—New catalogue of 40 pages, containing illustrations and clearly tabulated prices of various types, shapes and sizes of

metallic and carbon-filament lamps, namely, Aerlys, Foster, Mazda Osram, Philips "U.K.", Tantalum, Wotan, Z. and Tubolite. Each section begins with a reprint in colour, and on a small scale, of the lamp-maker's poster. The company holds large stocks of all the lamps mentioned.

MESSRS. VERITYS, LTD., 28, King Street, Covent Garden, London, W.C.—New list (eight pages) giving illustrated particulars and prices of the "Aston" automatic lighting sets, also several types of fans (Typhoon, Delhi, Rangoon, and Ceylon).

MESSRS. JOU DAY & SONS, LTD., Ellersby Lane, Leeds.—Illustrated leaflet giving notes regarding the design and construction, &c., of their high-speed vertical engine.

**Trade Announcements.**—THE COUNTY ENGINEERING AND LIGHTING CO., LTD., of 10, Colonnade, New Street, Birmingham, announce that they have now given up contracting work and are taking up the business of engineers' agents. They have just been appointed sole agents to the Sun Electrical Co., for Birmingham and district.

For "Baldwin" Engineering and Supply Co. under this heading last week read *Baldur*.

MR. R. H. JOHNSTON has resigned his position of London manager for the Rees Rotorbu Co., Ltd., of Wolverhampton, and has entered into partnership with Mr. P. B. Down, also of the same company. The firm of Down & Johnston have their offices at Craven House, Kingsway, and are carrying on business as manufacturers' agents in plant, machinery, centrifugal pumps, and steam turbines. They desire to receive catalogues from makers of other specialities.

THE MIDLAND MANUFACTURING CO., LTD., of Rea Street South, Birmingham, will, in future, operate two telephone lines with a private branch exchange, Nos. 671 and 672 Midland.

## LIGHTING and POWER NOTES.

**Barwell.**—The P.C. has decided to submit to a meeting of parishioners a scheme of public lighting proposed by the Leicestershire and Warwickshire Electric Co., which offers to light the streets from August to April until 11.30 p.m. each day with 50-C.P. lamps at £2 10s. per lamp per season.

**Belfast.**—A special meeting of the Tramways and Electricity Committee has given further consideration to the question of the proposed extension of the electrical undertaking. Prolonged discussion took place on the reports of the city electrical engineer (Mr. Bloxam), and in the result the Committee passed a resolution expressing the opinion that an extension of the electrical undertaking was necessary. It instructed Mr. Bloxam to submit some further information at a special meeting to be held on 26th inst.

**Bingley (Yorkshire).**—The District Council has decided to enter into an agreement with the Keighley Corporation for the supply of electricity in bulk, and to apply for powers to borrow £5,500, the estimated cost of cables, sub-station and machinery; the agreement with Keighley is to be for ten years. In reply to a letter which had been received from the local Property Owners' Association, the chairman of the Council said much consideration had been given to the possibility or otherwise of Bingley generating its own supply by means of its own water power facilities, and an expert on the subject had given advice that such a scheme would not pay for several years even if there was sufficient water power, which there was not.

**Cardiff.**—In the electric lighting department, Mr. Arthur Ellis estimates for the year an expenditure of £52,200, as against an estimate of £45,714 for last year, and an income of £55,268 as against £50,750, thus allowing for an estimated surplus of £3,067, as against an estimated surplus of £5,035 last year, and an actual surplus of £2,458 in 1911-12.

**Carlisle.**—The Public Lighting Committee has decided to erect flame arc lamps in several parts of the borough, and has requested the Electricity Committee, along with the Gas Committee, to consider the question of reducing the charges for public lighting as and from the end of the present financial year.

**Chatham.**—An installation of electric lamps in the High Street, carried out by the Kent Electric Power Co., Ltd., was inaugurated on Monday, the current being switched on by the Mayor.

**Chesterfield.**—The T.C. has decided to supply current to the Chesterfield Tube Co., Ltd., at 75d. per kw.-hour for the first 100,000 kw.-hours per annum, this price to be reduced by '005d. per kw.-hour for each additional 10,000 kw.-hours, until the minimum price of '65d. is reached for a supply of 300,000 kw.-hours. The company is to pay a minimum of £500 each year.

In order to economically meet the large and increasing demand for current on the south side of the town, high-tension transforming machinery and transmission lines are to be provided, at an estimated cost of £3,040, to be met out of revenue.

**Christchurch (Hants).**—At the last meeting of the B. of G., an agreement was sealed with the Bourne-mouth and Poole Electricity Supply Co. to light the workhouse with electricity.

**Colwyn Bay.**—At a meeting of the Council last week, the manager of the electricity works reported that he had gone into the question of lighting the Cayley Promenade. As the work could not be done temporarily, it was decided that the matter should be postponed.

**Continental Notes.**—GERMANY.—A new 10,000-kw. steam turbine and alternator is to be added to the plant at the municipal central station at Chemnitz.

The Frankische Überlandwerke Gesellschaft is the name of a new company which has just been formed in Nuremberg, with a capital of £200,000 to establish a large central generating station for the supply of current for lighting and power purposes in the Mittelfranken Province. The Schuckert Co. and the Mittelfranken provincial authorities are both financially interested in the new undertaking.

It is reported from Cologne that the Rhenische-Westfälische Electricitätswerke Gesellschaft has decided on the establishment of a large new electricity generating station on the left bank of the Rhine near the Rodder Colliery. The plant, it is said, will comprise two 25,000-H.P. steam turbines.

FRANCE.—A company has just been formed at Orleans, with a capital of £18,000 and the title La Société l'Electrique de l'Orleanais, to establish a small central station for the supply of electrical energy for lighting and power purposes in the town and district of Orleans.

A hydroelectric scheme of some magnitude, concerning as it will the four departments, Bouches-du-Rhone, Var, Vancluse and Basses-Alpes, is now under the consideration of a special Commission nominated by the Minister of Agriculture. The scheme proposes to utilise the waters of the Fontaine de l'Evêque, the construction of two dams, and the building of a canal, 58 km. long, to Pourcieux, where water will be distributed by two branches to Var and the Bouches-du-Rhone. The Commission has already formulated a variety of modifications of the original scheme, and joint deliberations are now taking place previous to its final adoption by the Government. This scheme is one of a number submitted, at the invitation of the Minister of Agriculture, by various bodies for dealing comprehensively with the water resources of this part of France.

An understanding has been come to between the Usines de Creusot and the Forges d'Allevard with regard to the establishment at Pontcharra (Isère) of a hydroelectric station and steel works of a large capacity.—*La Lumière Electrique.*

SPAIN.—La Sociedad Energia Electrica de Cataluna has applied for a concession to establish an electric transmission line between Villafrañca del Panade and Perafort, at a pressure of 80,000 volts, and for a similar line at 11,000 volts from Perafort to Tarragona and Reuss, to transmit the current from the Casa Barba central station.

**Cromer.**—The referendum taken by the U.D.C. on the question of the transfer of the electric light undertaking to Messrs. Edmundsons, has resulted in 314 votes being cast in favour of the transfer, and 273 against, a majority in favour of 41. The replies received numbered 613, of which 26 were invalid, and 403 ratepayers declined to vote. A special meeting, which was called to consider the position on Monday, decided by eight votes to five to proceed with the agreement to transfer the undertaking.

**Douglas (Isle of Man).**—The Tynwald Court has held an inquiry into the application of the T.C. for a loan of £3,000 for an electric light installation at the Villa Marina. There was no opposition.

With reference to the proposed electric supply for the town, the Corporation has decided to obtain particulars of a scheme from experts, the cost not to exceed £12,000.

**Epsom.**—Subject to the following amendments, the Highways Committee resolved that consent be given to the prov. order which is being applied for by the Leatherhead and District Electricity Co.: (1) That the mains to be laid within two years should be extended at certain points in Cobham, Oxshott and Great and Little Bookham; (2) that the amount of the deposit (Electricity Act, 1899) be £400; and (3) that the charges should be 6d. and 3d. instead of 8d. and 4d. The company agreed to the extensions, with the exception of Bookham, but refused to agree to a larger deposit than £200, and to a reduction in the charges. A further communication from the Committee to the company was made, but no other negotiations had taken place. Eventually the Council passed a resolution consenting to the order being granted.

**Eynsford.**—Sir Wm. Hart Dyke is having the electric light installed at Lullingstone Castle.

**Grange.**—The U.D.C. has decided to inform the Electric Lighting Co. that it will be prepared to give reasonable facilities for the erection and maintenance of electric lighting plant in Grange, and is negotiating for the purchase of a site which it would be prepared to lease for the erection of an electric lighting station.

**Hereford.**—Electricity is to be substituted for steam for pumping at the waterworks, and a loan of £1,600 is to be applied for by the T.C. for the necessary mains and plant.

**Huddersfield.**—The local Chamber of Trade has written to the Corporation Electricity Committee calling attention to the Chamber's previous resolution protesting against the profits of the Electricity Department going to the relief of the rates. It contends that the charge for lighting purposes should be reduced.

**Kearsley.**—The U.D.C. has asked the Lancashire Power Co. upon what terms it would be prepared to supply electricity for the lighting of Kearsley Hall Road and Slackey Brow, in substitution for the present oil lamps.

**King's Lynn.**—At a recent meeting of the T.C., the engineer submitted an alternative scheme for extensions to the electricity works, embodying the conversion of the gas engines into oil engines to be used as a standby; the extension of the building for additional boilers, and the provision of a boiler and economiser, and necessary pipes, &c., at an estimated cost of £2,000. The engineer's proposals were adopted, and tenders are to be obtained for carrying out the work.

**Leith.**—The Dock Commissioners have approved of the electrification of the pumping machinery at Alexandra Dry Dock, at a cost of £1,797.

**Leyburn.**—Two applications for permission to supply current by means of overhead lines at Leyburn have been made to the R.D.C.; one by the Leyburn Mutual Gas Co., and the other by a private company being formed by Mr. Peter Dobson. The Council on Friday last, decided to ask each of the applicants for plans showing where the proposed overhead lines are to be erected.

**London.**—WOOLWICH.—The Electricity Committee reports regarding negotiations with the Erith U.D.C., with a view to giving the latter a supply of energy in bulk, that it has decided to consult Mr. J. F. C. Snell in the matter and report further. The Committee has also decided to purchase oil switches in connection with the centralisation of the switchboards, which is to be carried out by direct labour, and the electrical engineer has been authorised to accept quotations for all other apparatus that may be necessary to complete the work. The L.C.C. has sanctioned the borrowing of £19,000 on account of the Council's application for £40,000 for the extension of the electricity undertaking at the Globe Lane Works, on the condition that the period of three years, proposed for the repayment of the outstanding debt of £9,228 on obsolete plant, should not commence to run until the extension scheme is completed. Further application is to be made to the L.C.C. for sanction to the borrowing of the following amounts in connection with the undertaking: General mains extensions, £1,500, repayable in 25 years; meters, £630, repayable in 10 years; services, £1,100, repayable in 12 years; and hire-purchase, £2,000, repayable in 10 years.

STEPNEY.—The Electricity Committee has decided to reduce the price of current to consumers whose total accounts for electricity supplied do not exceed £60 per half-year, from 8d. to 7d. per unit for the first 30 hours' use of the maximum demand during each of the six months ending March, and for the first 20 hours during each of the six months ending September, and 1d. per unit for all further consumption in each month. Representatives have been appointed to take part in the conference for the linking up of undertakings in East London in the manner adopted by Poplar and Stepney.

FULHAM.—An expenditure of £40 has been authorised for the purchase of a stock of electric irons, kettles, toasters, &c., to be left on trial with consumers.

**Manchester.**—The fog last Friday was responsible for a record output from the electricity stations. For the 24 hours ended Friday night the output was 563,092 units, compared with the highest previous record of 550,420 units on December 10th, 1912.

**Lowestoft.**—The T.C. has referred back for further consideration a recommendation by the Electric Lighting Committee, that to meet the increased cost of materials and coal, and the decreased consumption of current by metallic-filament lamps, the charge for current for lighting be increased from 4½d. to 6d. per unit, with 5 per cent. discount for payment of accounts within a month.

**Newport (I. of W.).**—The T.C. has accepted the tender of the Isle of Wight Electric Lighting Co., for public lighting for five years, at an annual cost of £390. The arc lamps are to be replaced with four-light lanterns.

**Oldham.**—The new mill to be erected by the Belgrave Mill Co., Ltd., is to be driven by electric power supplied by the Oldham Corporation.

**Paisley.**—The electrical engineer has reported that it is desirable that the sub-stations in connection with the works should be enlarged, and that additional transformers up to 200-kw. capacity be installed.

In connection with the electrical supply to the new works of the Seedhill Finishing Co., it is learned that the offer of the General Electric Co. for the necessary transformers and switchboards has been accepted.

**Radcliffe.**—A new weaving shed belonging to the Co-operative Wholesale Society of Manchester has just been started. There are 500 Northrop automatic looms and some 50 circular-box looms, each having its own motor attached.

The U.D.C. has applied to the B. of T. for an order to permit it to supply current to mills at Ainsworth, in the area of the Bury R.D.C.

**Salford.**—In a report in regard to the electricity undertaking, the supply of electricity in bulk, and the installation of rotary converter plant, the Electricity Committee informed the T.C. last week, that, having recommended the acceptance of the offer of the Lancashire Power Co. for supply in bulk, it would be

necessary to advertise for tenders for transformers and rotary converters at once. The cost of the machinery and erection would be as follows:—Three rotary converters and transformers, £8,000; high-tension switchgear, £2,000; cable connections and work in connection with installing, £2,000. The Committee recommended that sanction should be sought for borrowing powers. The report was adopted.

The terms under which the Electricity Committee has agreed to purchase energy from the Power Co., are for a one year's supply, £6 per KW. of maximum demand, plus 1d. per KW.-hour; for two or more years' supply, £3 per KW. of maximum demand for the first 1,000 KW., and £2 per KW. for additional demand up to 3,000 KW., plus 1d. per KW.-hour. The Corporation requires a minimum of 1,000 KW., an additional 1,000 KW. on 15 minutes' notice, and may want another 1,000 KW. on a month's notice. The company will have over 17,000 KW. of plant installed by the autumn, and it proposes to supply three-phase current at 10,000 volts, 50 periods, over duplicate 2,500-KW. cables to a motor house on the borough boundary, from which place the Salford authorities will deal with it. A lengthy Council discussion took place on the proposal on February 12th, at which Sir William Stevens expressed the opinion that the Manchester terms (which have not been disclosed) would, if understood, be found very similar to those of the company.

**Shipston-on-Stour.**—The B. of G. has entered into a fresh agreement with Messrs. Brown & Parsons, of Leamington, for electric light at the workhouse. The firm will supply 95 lamps with current for five years at an annual charge of £35, and undertakes to keep the lamps and fittings good for one year. It will lay the supply on free, and will be paid £58 for wiring work and fixing lamps.

**Silsden (near Keighley).**—Subject to the ratepayers' approval, the U.D.C. has decided to allow the Airedale Shed Co. to produce and sell electrical power to the tenants of Airedale Shed, a proposed new shed company, and any other firms willing to rent power from the company.

**South Africa.**—Our Cape Town correspondent sends some particulars of an extraordinary occurrence at the Durban power station, where recently an escaped monkey made its way on to the switchboard. The attendants engaged in a cautious but fruitless chase, and finally left the monkey to settle its own difficulties, which it did suddenly by touching some live switch terminals. The monkey was practically burned up, but fortunately the supply was not interfered with.

On January 25th a faulty and condemned H.T. switch was responsible for a 20 minutes' stoppage in the Johannesburg electricity supply to the city and suburbs. The tramways were unaffected.

A meeting of Wellington (Cape Province) ratepayers was held on January 24th for the purpose of discussing an electric lighting scheme. Mr. C. G. Trevett, electrical engineer, was also present, and gave an elaborate explanation of the proposed schemes, one using Diesel oil engines being estimated to cost £9,375, and the other with suction gas engines, £8,780. It was estimated that the annual working costs would be £2,410, and revenue £2,834, leaving a profit of £424. The latter scheme was approved by the meeting.

**Swindon.**—The T.C. has decided to have the pumping plant at Rodbourne Sewage Works worked by electricity.

**Swinton.**—The Council has agreed to the Salford Corporation supplying Messrs. Bayley & Craven's Printworks, Pendlebury, with electricity for power and lighting for a period of five years, subject to the supply being turned over to the Council at the end of the term if so desired.

The question of an extension of the use of electricity for street lighting and the improvement of the lighting of roads on the South Lancashire Tramways route by means of metallic-filament lamps on the tramway standards, which has been receiving the attention of the Highway and Lighting Committee of the Swinton and Pendlebury Council, has now been referred to sub-committee.

**Troon (Ayrshire).**—The T.C. has discussed a proposal to introduce a system of electric lighting for the burgh. In view of the increasing demands made upon the Corporation's gasworks, it is probable an electric lighting scheme will be adopted. Meanwhile, a Committee has charge of the matter.

**Tynemouth.**—The electrical engineer has been instructed to report as to what reduction in tariffs it will be possible to make, provided not more than £600 of revenue is sacrificed. A scheme by the electrical engineer for electrically lighting the sheds on the Fish Quay is under consideration.

**Walsall.**—The Corporation has retained the services of Mr. E. M. Lacey, consulting engineer, to report on the electricity undertaking at a fee of 200 guineas.

**Whitworth (near Rochdale).**—The U.D.C. has decided, on the recommendation of the Tramway Committee, to apply to the L.G.B. for formal sanction to the borrowing of £5,000 by the Council for electrical purposes.

**Woking.**—As the local Gas Co. has erected three high-pressure lamps, each of 1,500 C.P., and is maintaining these at its own cost, the Council has given permission to the Electric Supply Co. to put up three lamps for the purpose of comparison.

**Worsley.**—The Lancashire Electric Power Co. has intimated that it will this month undertake the work of extending the supply cables for the lighting of the district, and will therefore shortly be in a position to supply the current for the Brook Oak Park extension. Before this latter work can be proceeded with, however, an inquiry will have to be held by the L.G.B.

**Wrexham.**—The R.D.C. has decided to have the new offices lighted by electricity.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—It is reported from Tucuman that work on the electric tramway from that city to Quebrada de Lules will be commenced in February.

It is expected that the first section of the electric tramways in the city of Salta will be opened to service this month.—*Review of the River Plate.*

**Australia.**—The tramway authorities have decided to introduce the railless electric traction system into Sydney. Two routes have been selected for trial purposes, and negotiations are proceeding with the agents of the Brush Co. in regard to the equipment, &c.

**Barnsley.**—A considerable scheme for linking up by railless trolley cars the mining townships of South Yorkshire, is in course of negotiation between the Barnsley Corporation, neighbouring District Councils and West Riding Tramway undertakings. The reason for the scheme seems to be the stubbornness of the railway companies in refusing to give satisfactory facilities for the district, and the places affected are Barnsley, Thurnscoe, Bolton-on-Dearne, Hoyland, Birdwell, Wombwell, Darfield, Cudworth, Grime-thorpe, Smithies, Carlton and Royston.

**Bingley.**—The District Council, on the recommendation of the Finance and General Purposes Committee, last Monday approved of terms of agreement, announced some weeks ago, with the Bradford Corporation for the leasing of proposed electric tramways between Nab Wood terminus of the Bradford routes and Bingley.

**Bolivia.**—A law has been passed authorising the Government to contract with the Electric Light and Power Co. of Cochabamba, for the following electric railway lines:—(1) The extension of the company's existing Vinto-Arani line to Totora; (2) the construction of a line from Cochabamba to Sacaba; and (3) the extension of the Cochabamba-Vinto line to Sipesipe.

**Bradford.**—Owing to the great variation in working hours, and the consequent difficulty in issuing passes, the Corporation Tramways Committee has recommended to the City Council that, in lieu of the present system of allowing school children and juvenile workers to travel, between certain specified hours, at half-fares, all young persons between the ages of five and sixteen years shall travel half-fares, and that children under five shall travel free as before.

**Brighton.**—The Watch Committee has declined to license 12 new petrol electric buses, belonging to a private firm, to ply in the borough.

**Bristol.**—At the meeting of the Council, a thoroughly representative Committee was appointed to consider the desirability of exercising an option to purchase the tramway undertaking within the city.

**Continental Notes.**—**HOLLAND.**—Plans are being prepared in respect of a projected electric tramway between Arnhem and Vepl, and also for a proposed line between Oosterbeek and Arnhem.

**RUSSIA.**—A preliminary concession has been granted in respect of a projected electric railway between Tiflis and Vladikavkaz.

**SWITZERLAND.**—An electric railway of some international importance is projected from Nyon to Morez by the way of Arzier, Saint Cergue and La Cure, towards the cost of which the Grand Council of the Canton of Vaud has just voted the sum of £33,391. The line will be worked on the overhead trolley system, and will be 40 km. long, but by a junction with the French railway network at La Cure will have a development of 24,000 km., serving a large and populous area on both French and Swiss territory.—*La Lumière Electrique.*

**Dundee.**—Reporting on the proposed extension of the railless trolley system from Clepington Road to Lochee, Mr. P. Fisher, the tramway manager, said he did not think the installation would be self-supporting in the early stages, but it certainly would act as a feeder to existing services, and on the whole it would not be a serious burden to the tramway undertaking. Regarding a proposal to call upon the tramways department to contribute towards the maintenance of the road, Mr. Fisher pointed out that in every case where Parliamentary powers had been applied for to work this form of traction outside the boundaries of the authorities making the application, attempts had been made to get clauses introduced for the purpose of compelling the promoters to contribute towards the maintenance of the roads. Parliamentary Committees in every

case refused to look upon the running of railless cars of the passenger type as extraordinary traffic. This form of traction did less damage to a roadway than any form of mechanical traction where the prime mover was carried on the vehicle. Mr. Johnston, convener of the Tramways Committee, claimed at a meeting of the Committee that the railless cars had proved a convenience to the public. While the return per mile was not very high, the expenses were not great. Another member held that the experience of the past four months had shown that the trackless trolley car had come to stay. The extension was approved of, but it was decided to delay it until the question of road maintenance had been settled.

The tramway manager has been instructed to report upon the Craig Pier route, it being alleged that there is an annual loss on this branch of about £1,200.

**Cardiff.**—Notwithstanding the fact that the estimated expenses of the tramways department show an increase of £3,163 over last year's estimate, chiefly owing to the rise in wages, an increase of £7,175 is anticipated in next year's income, and an estimated surplus of £13,280, as against an estimated surplus of £9,268 in 1912-13, and an actual surplus of £11,218 in 1911-12.

**Dutch East Indies.**—The Samarang Joana Steam Tram Co. is making arrangements to improve its system of tramways in the town of Samarang by electrifying them. Particulars in regard to the contracts to be issued for carrying out the work have been submitted for the approval of the communal authorities.—*Board of Trade Journal*.

**Great Yarmouth.**—The T.C. has decided to double the tramway track in the Market Place, at Theatre Plain, and through Regent Road, at an estimated cost of £8,750.

**Halifax.**—The receipts in connection with the working of the Halifax tramways since April 1st last, the commencement of the municipal year, have shown an increase on those of the preceding year of £2,683, though the period has only been one of 317 days, as against 319 days. The figures, up to the latest report for year, are £91,639, as against £88,956.

**Ilford.**—It has been decided to abandon the idea of extending the tramway system, and of running railless trolley vehicles, in favour of using motor-buses. The question of removing the centre tramway columns in the High Road is under consideration.

**London.**—According to the *Evening Standard*, a Bill is to be introduced shortly for the construction of underground railways for the conveyance of mails and parcels in London. The original scheme was outlined in these columns at the time of the Departmental Committee's report on the matter. It contemplated 6½ miles of 7 ft. 6 in. diameter double track tube to be electrically operated and automatically controlled: the estimated cost is £530,000.

**Oldham.**—A proposal, by no means new, has been put forward that greater use might be made of the tramways for the carriage of goods during the night. If the suggestion could be carried out, the great industrial areas round Oldham, Rochdale and Manchester could be linked up, and goods could be conveyed to the docks of the Manchester Ship Canal. It is claimed that by this means business men would not meet with the frequent and long delays now suffered in the carriage of goods on the railways.

At a meeting of the Tramways Committee, the tramways manager, referring to the equipment of the long saloon bogie cars with four motors, said statistics showed that with four motors the car consumed 240 units per mile, and with the new equipment, the 40 H.P., it was only 146. Taking all things into consideration, he thought it would pay them to abandon all the four motor equipments and go to the single motor. They would save nearly half the current consumption for a start. To alter the cars to the single motor would cost about £245 per car. It was decided that in regard to six of the saloon cars the manager's suggestion should be carried out.

**Salford.**—The Corporation is appealing against the assessment of its tramways within the Barton Union, and litigation is pending on the subject. It is understood that the difficulty is upon the method of assessment.

**Southport.**—The Council has decided to take a referendum vote of the ratepayers on the question of Sunday running of the Corporation cars; the local company's cars already run on Sunday.

**Tynemouth.**—The local tramway company has again approached the T.C. to reopen the question of providing an extension to Preston; the Parliamentary Committee has expressed its willingness to consider the matter.

**Uruguay.**—It is reported from Monte Video that construction will shortly commence on the electric railway from Monte Video to Maldonado and Puento del Este. There will be a double line, and it is hoped to maintain a speed of about 100 km. an hour. The line will be built at a distance of 1 to 2 km. from the coast, and will go through a district susceptible of cultivation. It will pass near the Pirapolis seaside establishment. The generating station is to be at Maldonado. The line will afterwards be prolonged to La Paloma and Rocha.—*Review of the River Plate*.

**Worsley.**—The South Lancashire Tramways Co. has deposited with the U.D.C. a plan of a length of tramway in Manchester Road connecting with the proposed new line through Little Hulton.

## TELEGRAPH and TELEPHONE NOTES.

**Australia.**—The Commonwealth Government has published the specifications for the power generating plant for the wireless station to be erected at Darwin, of 1,500 to 2,000 kw., to communicate with Singapore, and thus to connect Australia with the Imperial wireless chain.

The new cable of the Pacific Cable Board between Auckland and Sydney is now open for public business.

**Canada.**—The Province of Manitoba will spend £205,000 on extensions to the Government telephone lines this year.

**France.**—It is intended to erect a wireless station at Bouin, on the island of that name, lying off the Department of the Vendée.—*La Lumière Electrique*.

**Glasgow.**—The T.C.'s Special Committee on Telephones, having considered the question of junction fees between exchanges in the city telephone district and suburban telephone districts, has instructed the town clerk to write to the Postmaster-General and urge upon him the desirability of having these fees abolished and of having the city, as extended by the Glasgow Boundaries Act of 1912, embraced within one telephone district.

**Hull.**—The Corporation Telephone Committee, after negotiations with the Postmaster-General, has passed a resolution to the effect that, subject to terms being agreed upon, the Corporation is prepared to purchase from the Post Office the plant acquired by the latter from the National Telephone Co. in its area, and to apply for a new licence. It is understood that the Postmaster-General will not grant a new licence unless this is done. The price to be paid for the undertaking is that which the Government paid to the company, with allowance for depreciation.

**Imperial Wireless System.**—In reply to Major Archer Shee in the House of Commons, the Postmaster-General stated that the Scientific Committee had informed him that after consideration of the statements of representatives of firms who had been invited to give evidence as to the capabilities of their systems of long-distance wireless telegraphy, it had decided to treat the evidence as confidential.

The second interim report of the Select Committee on the Marconi contract was to the effect that the Committee had not had time to complete the inquiry, and recommended that a committee should be re-appointed next session. At the last sitting, on Wednesday last week, Mr. Oliver was again examined with regard to the sources of the rumours which he had heard, connecting members of the Government with dealings in Marconi shares. The witness said he could not recollect the names of any of the persons who gave him the information. He could not name any person who, to his knowledge, had benefited to a considerable extent by Marconi shares. Mr. L. J. Maxse, editor and proprietor of the *National Review*, was then called, and stated that when his attention was called to the matter in July, 1912, and he began to make inquiries, everything he heard went to show that there was something curious about it. The gambling in the shares of the company indicated leakage from somewhere, and the evasive replies of Ministers to questions in the House of Commons added to the mystery. Hundreds of thousands, perhaps millions, of pounds changed hands, to the immense advantage of those who were "in the know." The Postmaster-General could have stopped it if he had frankly stated the facts. There was nothing to explain the action of the Post Office in surrendering to Mr. Godfrey Isaacs. Ministers were primarily responsible for any suspicions that had been rife. Mr. Isaacs should not have taken part in the negotiations while his brother was Attorney-General. The rumours about particular Ministers (not the Postmaster-General) were persistent, and the public were uneasy about the matter. Several people, some of whom were Members of Parliament, had called the witness's attention to the subject. He was willing to state the purport of their communications, but he refused to divulge their names, as to do so would be a breach of confidence. The information he had received showed that there was strong ground for suspicion that Ministers had been gambling in Marconi shares: but he had no actual evidence.

The Committee, after long consideration and discussion, decided to report the witness to the House of Commons. This was done, but in view of the late stage of the session the Government decided to take no immediate action in the matter.

The Postmaster-General has again refused the Marconi Co.'s application for release from the contract.

**The Sounder in Submarine Telegraphy.**—It is announced in the annual report of the Commercial Cable Co. that Mr. John Gott, their chief engineer, has invented a device which enables the ordinary Morse signals to be sent over long submarine cables with the ordinary landline key and received on the Morse sounder, the invention thus constituting an immense advance on present conditions. The company has acquired the rights to manufacture the device, which is patented in all countries.

It is reported that the essence of Mr. Gott's system is the use of successive currents of alternate polarity in transmitting the signals, the four dots in the letter II, for example, being produced by two positive and two negative currents acting alternately; the discharge from the cable is used for effecting the reversal of the current after each signal, and the apparatus required is inexpensive.

Messages have already been transmitted from London to New York on the new system, and the use of automatic repeating relays rendered possible by the adoption of the new system has greatly increased the speed of transmission, whilst eliminating errors due to manual repetition.

**The Telephone on Board Ship.**—The three great liners of about 50,000 tons each, which have been ordered by the Hamburg-America line, are going to be fitted out with telephone exchanges of the most modern type, to which each cabin will be connected. The order for the installation has been given to Messrs. Siemens & Halske, of Berlin.

**Trans-Pacific Wireless.**—The *Electrical World* states that the Marconi Wireless Telegraph Co. has placed contracts with the J. G. White Engineering Corporation, of New York, for the erection of eight wireless stations, two pairs for Atlantic and two pairs for Pacific service. Receiving and sending stations, 30 miles apart, will be erected at Oahu, in the Sandwich Islands; Tamales Bay and Bolinas, California, near Belmar, N.J.; and in eastern Massachusetts. These stations will form part of a globe-girdling system, which will continue to the East by way of Japan, and thence ultimately to India. Twelve towers, 400-450 ft. high, will be spread out over a semi-circle covering a square mile at each station, and it is estimated that the range of each station will be from 4,000 to 6,000 miles.

**United States.**—The fast scout cruiser *Salem* has been ordered on a voyage across the Atlantic to test the transmitting capacity of the United States Government's new wireless telegraph station at Fort Myer, near Washington, D.C. Continuous tests are to be made throughout a radius up to 4,000 miles, although it is expected that even this range will be exceeded. Eventually it is hoped that this powerful new station will be able to communicate with any ship of the United States Navy, using intermediate vessels as relays for distances above 3,000 miles.—*Electrical World*.

The *Electrical World* states that the Telefunken station at Sayville, Long Island, N.Y., is in daily communication with ships on the Atlantic, and South American ports, having a range up to 5,800 km. The longest distances are covered with a 35-kw. plant, using a wave-length of 2,800 m.; for the shorter distances a 5-kw. plant with a wave-length of 600 m. is used.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdare.**—March 3rd. Service materials, for the U.D.C. electricity department. See "Official Notices" February 14th.

**Aberaman.**—March 10th. Electrical goods, for the directors of the Powell Duffryn Steam Coal Co., Ltd. Stores Manager, Aberaman, near Aberdare.

**Argentina.**—April 15th. Tenders will be received at the Dirección General de Minas, Geología e Hidrología, Buenos Ayres, for the supply of motors, cables, dynamos and kindred material required for the generation of motive power.—*Board of Trade Journal*.

**Australia.**—WESTERN AUSTRALIA.—February 27th. Buildings and boiler-house equipment, turbo-alternators and rotary converters, for a Government power station at Perth. See "Official Notices" January 24th.

SYDNEY.—March 17th. Motors for the City Corporation.

SOUTH AUSTRALIA.—March 5th. One section of a common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" January 31st.

COMMONWEALTH GOVERNMENT.—Darwin power station, about 2,000 kw. Equipment to comprise Diesel oil engines and accessories and overhead travelling crane, alternators and exciters, and switchboard.

NEW SOUTH WALES GOVERNMENT RAILWAYS.—March 5th. Twelve single-phase transformers, and one 124-kw. generator. Specifications 388 and 389 (2s. 6d. each) from Electrical Engineer's Office, 61, Sydney.

**Barrow-in-Furness.**—March 3rd. Electrical stores for a year, for the T.C. Borough Electrical Engineer.

**Bedwas.**—March 5th. Electrical goods for a year, for the Bedwas Navigation Colliery Co., Ltd. (Form 4). The Secretary.

**Belfast.**—February 24th. Stores and materials for one or three years, for the City electricity department. See "Official Notices" January 31st.

**Birmingham.**—March 1st. Electrical stores for a year, for the Birmingham, Tame and Rea District Drainage Board. Mr. John D. Watson, engineer, Tyburn.

**Bolton.**—February 24th. Materials and stores, for the Corporation Tramways Department. See "Official Notices" February 7th.

**Bulgaria.**—SOFIA.—March 3rd. Tenders are invited for 100,000 insulators and 100,000 kg. galvanised iron wire. Particulars, Post and Telegraph Direction Sofia, Bulgaria.

**Colchester.**—March 10th. Sundry stores for the Corporation Electricity Department. Mr. W. Frisby electrical engineer, Osborne Street.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" to-day.  
February 21th.—Sinking artesian well and supply of pump, for the Corporation electricity works. See "Official Notices" Feb. 14th.

**Dinas (near Porth).**—Refuse destructor and electrical generating works, Appletree, for the Rhondda U.D.C. Messrs. Robert Hammond & Son, 61, Victoria Street, S.W.

**Dukinfield.**—Electrical work required for the new Primitive Methodist School, Dukinfield. Messrs. J. H. Burton and J. A. Percival, architects, 150A, Stamford Street, Ashton-under-Lyne.

**Dundee.**—The Corporation Tramways Committee invites tenders for supply of stores for a year. Mr. Peter Fisher, general manager.

March 7th.—Two water-tube boilers, &c., mechanical stokers, economiser, steel bunkers and coal-handling plant, for the Corporation electricity department. See "Official Notices" to-day.

**Edinburgh.**—The Corporation invites offers for works and supplies, including upholding house telephone and electric bell installations at City Hospital, electrical material for interior wiring and jointing, and insulating material for electricity supply cables. Resident Electrical Engineer, Dewar Place.

**Edmonton.**—February 26th. Electric lamps for the B. of G. Mr. F. Shelton, clerk, The Grange, White Hart Lane, Tottenham.

**Erith.**—March 6th. Electrical work for three years, under U.D.C. assisted wiring scheme. See "Official Notices" to-day.

**G.C.R.**—March 4th. The Great Central Railway Co. are inviting tenders for stores during the year ending April 30th. 1914. (15) Electric light wires and cables; (16) electric light globes and shades; (17) electric light carbons; (18) casing, accessories and lamps; (60) telegraph materials. Samples may be seen, up to March 3rd, at the Conservative Club, Gorton Lane, Gorton, Manchester, and specifications and forms of tender can be obtained from Mr. W. Williams, Stores Superintendent, Gorton, Manchester. Applications, stating number of specification, should be accompanied by an addressed foolscap envelope, properly stamped.

**Germany.**—February 28th. The Finance Deputation of Hamburg is inviting tenders for the supply and erection of a 30-ton electric crane.

March 10th.—The lighting and water supply authorities of Bremen are inviting tenders for several heavy-oil engines and dynamos for the Hastedt central electric lighting station.

**Glasgow.**—February 26th. The T.C. invites offers for the various works required in connection with the erection of a dispensary at St. Rollox. Specifications, &c., from the Town Clerk, City Chambers.

**Heston and Isleworth.**—March 8th. Stores and materials for a year, for the U.D.C. electricity department. See "Official Notices" to-day.

**Hornsey.**—February 24th. Electricity meters, cables and cable stores, for the T.C. See "Official Notices" February 7th.

**Ilford.**—March 1st. Council Education Committee. Tenders for the electric lighting installation at the South Park School extension, Water Lane, Ilford. Mr. C. J. Dawson, architect, 11, Cranbrook Road, Ilford.

February 25th.—Stores for a year, for the U.D.C. electricity department. See "Official Notices" February 7th.

**India.**—March 14th. Motors, transformer and motor-generator, for the B.B. and C.I. Railway. See "Official Notices" to-day.

March 4th.—Starting and controlling pillars, for the Bombay, Baroda and Central India Railway. See "Official Notices" to-day.

**King's Lynn.**—March 1st. Lancashire boiler, economiser and pipework, for the Corporation Electricity Department. See "Official Notices" to-day.

**Liverpool.**—February 24th. Two steam engines and dynamos (30 kw.), switchboard, motors, wiring for 1,500 lamps, motors, &c., in connection with the electric light and power installation at the Toxteth Union Workhouse and Infirmary, Smithdown Road. Mr. T. L. Miller, consulting engineer, 709, Tower Buildings, Liverpool.

**London.**—L.C.C.—February 25th. Electric wiring of the Camberwell and Cressy Road car-sheds. See "Official Notices" January 31st.

February 25th.—Three 1,500-kw. rotary converters, nine transformers for rotary converters, and two starting transformers. See "Official Notices" February 14th.

February 26th.—Electrical installation at Leipsic Road Elementary School, Camberwell, S.E. See "Official Notices" Feb. 14th.

March 4th.—Two 8,000-kw. turbo-generators, with condensing plant, &c. (extension of time). See "Official Notices" to-day.

March 5th.—Electrical installation at the Curtain Road Elementary School. See "Official Notices" to-day.

ST. PANCRAS.—March 4th. Arc lamp carbons, for the B.C. See "Official Notices" February 7th.

MARYLEBONE.—February 26th. Stores and materials for a year, for the B.C. Electricity Department. See "Official Notices" February 7th.

SHOREDITCH.—February 24th. Two economisers (Green type), for the B.C. electricity department. See "Official Notices" February 14th.

STEPNEY.—March 17th. Boilers and boiler house accessories, turbo-alternators, condensers, accessories and switchgear, for the B.C. See "Official Notices" February 14th.

**Manchester.**—Corporation. Steel girder tramway rails. J. M. McElroy, manager.

**Neath.**—March 3rd. One 400-kw. high-speed engine, direct-coupled to a two-phase alternator, and accessories, for the R.D.C. See "Official Notices" February 14th.

**Newport (Mon.).**—March 4th. Electric light fittings for the B. of G. Mr. A. H. Rees, Clerk, Queen's Hill.

February 22nd.—Stores for a year, for the Corporation Electricity and Tramways Committee. See "Official Notices" Feb. 14th.

**Pontypridd.**—March 5th. Stores and materials for the U.D.C. electric light and tramways department. See "Official Notices" to-day.

**Swindon.**—March 8th. General stores and materials for a year, for the Corporation electricity and tramways departments. See "Official Notices" February 14th.

March 10th.—One 500-kw. mixed-pressure turbine and condensing plant, boiler feed pump and pipework, and one switchboard panel and cables, for the Corporation. See "Official Notices" February 14th.

**Swinton and Pendlebury.**—March 10th. One 25-kw. transformer and switchboard, main along Chatsworth Road, and annual supply of materials, for the U.D.C. Electricity Department. See "Official Notices" to-day.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Wallasey.**—March 15th. Fuel oil (400 tons) for a year, for the Corporation electricity department. Mr. J. A. Crowther, electrical engineer, Seaview Road, Liscard.

**Walthamstow.**—February 28th. Four double-deck tramcars complete with magnetic-brake equipments, for the U.D.C. See "Official Notices" February 7th.

**Warlingham.**—February 24th. Electric light sundries for the Mental Hospital, for Croydon T.C., for a year. Mr. F. C. Lloyd, Town Clerk, Town Hall, Croydon.

**Warrington.**—March 5th. Motors and transformers for a year, for the Corporation. See "Official Notices" Feb. 14th.

**Wigan.**—February 24th. High-tension three-core feeder cable, transformer and switchgear, for the Corporation. See "Official Notices" February 14th.

**Wimbledon.**—March 5th. Stores and materials, for a year, for the Corporation Electricity Department. See "Official Notices" February 14th.

**Wrexham.**—March 1st. Stores for a year, for the Borough Electrical Engineer's department. See "Official Notices" February 14th.

**York.**—March 10th. One 3,000-kw. turbo-alternator, with condensing plant, pipework and switchboard, water-tube boilers with chain-grate stokers, &c. storage battery and H.T. cables, for the Corporation. See "Official Notices" to-day.

## CLOSED.

**Aberdeen.**—The Corporation Electricity Committee has accepted the offers of the Oerlikon Co. and Messrs. Bruce Peebles and Co., for additional generating plant. The cost of the new plant is £11,000.

**Atherton.**—The Electricity Committee of the U.D.C. has accepted the tenders of the W. Rose Hose Co., Ltd., and Messrs. F. Reddaway & Co., Ltd., for new fire hose.

**Austria.**—The adjudication on the tenders for glow lamps for the North, South, State and other Austrian railways for the current year has resulted again in favour of the latest pattern of the Westinghouse tungsten-wire lamp.

**Barnsley.**—For the Corporation electricity station Messrs. E. Bennis & Co. have received an order for two of their stokers and self-cleaning compressed-air furnaces.

**Bolton.**—The contract for an electric light installation at shop premises at 134, St. George's Road, is being carried out by the Charleson Accumulator Co., of Bolton.

The Corporation electricity department has ordered a "Bennis" ash elevator and bunker.

**Bewsbury.**—The T.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for new boilers for the electric light works, at £1,782.

**Ealing.**—The B.C. has accepted the tender of Messrs. Ferranti, Ltd., at £1,978, for a new generator switchboard.

**France.**—There has just been placed with Messrs. E. Bennis & Co., Ltd., by the Mines de Dourges electric station, a contract for 16 "Bennis" high-duty coking stokers and self-cleaning compressed-air furnaces. This is a second repeat order, the machines having given every satisfaction in dealing with low-grade coal abroad.

**Glasgow.**—The Electricity Committee had divisions in connection with the placing of the contracts for the supply of boilers for Port Dundas and St. Andrew's Cross stations. In the former case it was proposed that the offer of Messrs. Howden & Co., Ltd., for four water-tube boilers, at £13,120, be accepted, while the amendment was that the offer by Messrs. Babcock & Wilcox, Ltd., amounting to £13,748, be agreed to. A second amendment proposed to give two boilers each to the competing firms. On a vote, it was decided by a clear majority to accept Messrs. Babcock and Wilcox's offer. So far as the St. Andrew's Cross offers were concerned, the proposal was the acceptance of Messrs. Babcock and Wilcox's offer to supply four small boilers, at £7,158, while the amendment was that Messrs. Babcock & Wilcox's offer and that of Messrs. Howden—the latter amounting *in toto* to £6,910—be accepted for two boilers each. The proposal was adopted.

At its last meeting, the T.C. remitted back to the Electricity Committee the proposals in connection with the placing of contracts for two turbo-generators and condensing plant, and a report by the engineer (Mr. W. W. Lackie) has been considered by the Committee. The original recommendation, as published in the REVIEW, was that an offer by Messrs. Willans & Robinson, Ltd., for one set of Curtis-Parsons turbo-alternators and condensing plant, amounting to £16,064, and an offer by the British Westinghouse Electric and Manufacturing Co., Ltd., for one set of Curtis-Rateau turbo-alternators and condensing plant, amounting to £16,721, be accepted. The engineer gave an exhaustive opinion, based on experience, in which he reviewed all the tenders submitted. It having been decided in committee to proceed with the selection of the offers, it was proposed that the offer made by (a) the British Westinghouse Electric and Manufacturing Co., Ltd., for one set of Curtis-Rateau turbo-alternators and condensing plant, amounting to £16,721, and (b) Messrs. Howden & Co. for one set of Rateau-Zoelly turbo-alternators and condensing plant, amounting to £17,793, be accepted. The amendment, that the former recommendation be reaffirmed, was carried by 15 votes to 6.

It is recommended by the T.C.'s Committee on Tramways that the following contracts be accepted:—

Steel plates for manholes.—William Baird & Son.  
Section pillar castings.—Walter Macfarlane & Co.  
P.B. flanged lampholders.—Edison & Swan United Electric Light Co., Ltd.  
Insulated and bolts.—W. C. Yuille & Co.

**Government Contracts.**—The following tenders have been accepted during the past month by the Government departments named:—

### ADMIRALTY: CONTRACT DEPARTMENT.

Incandescent lamps.—General Electric Co., Ltd.; Edison & Swan United Electric Light Co., Ltd.  
Switches and sockets, &c.—British Insulated and Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Edison & Swan United Electric Light Co., Ltd.; India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.; Hawkers, Ltd.; McNeill & Co., Ltd.; Player and Mitchell; Walsall Electrical Co., Ltd.; Westminster Engineering Co., Ltd.

### WAR OFFICE.

Rawinding generators.—British Westinghouse Electric and Manufacturing Co., Ltd.

### INDIA OFFICE: STORES DEPARTMENT.

Batteries.—Tudor Accumulator Co.  
Dynamoes.—J. Stone & Co.  
Engines.—Lancashire Dynamo and Motor Co.  
Insulators.—Bullers, Ltd.  
Lamps.—J. Stone & Co.  
Switchboards.—Eckstein, Heap & Co.  
Wireless telegraph apparatus.—Marconi's Wireless Telegraph Co.

### OFFICE OF WORKS.

Carbons for arc lamps.—General Electric Co., Ltd.

## GENERAL POST OFFICE.

Protective apparatus and telephonic apparatus.—British E. M. Ericsson Manufacturing Co., Ltd.  
 Telephonic apparatus.—Western Electric Co., Ltd.  
 Telegraph cable.—British Insulated and Helsby Cables, Ltd.  
 Telephone cable.—British Insulated and Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; J. C. Fuller & Son, Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; London Electric Wire Co. and Smiths, Ltd.; Peel-Connell Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.; Western Electric Co., Ltd.  
 Stone-ware ducts.—Albion Clay Co., Ltd.; Doulton & Co., Ltd.  
 Telegraph ironwork.—Bullock, Ltd.; Gust, Keen & Nettlefolds, Ltd.; Wallis, Ltd.; D. Willems Ltd.  
 Bronze wire.—T. Bolton and Sons, Ltd.; British Insulated and Helsby Cables, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (Incorporated in the London Electric Wire Co. and Smiths, Ltd.).  
 Flame-proof wire.—C. Macintosh & Co., Ltd.  
 Electrically lighting Birmingham Stores, Block "C."—Pinching & Walton.  
 Electric lifts.—Waverley Station S.O., Edinburgh.—Waygood & Co., Ltd.  
 Telephone exchange equipment, Regent Exchange, W., and Dalston, N.E.—Western Electric Co., Ltd.  
 Telephone Exchange equipment, South Shields Post Office.—Peel-Connell Telephone Works, Ltd.

**Gravesend.**—The T.C. has accepted the tender of Messrs. Harrison, Tidswell & Co. for 1,000 tons of coal for the electric light works, at 16s. 6d. per ton.

**Hereford.**—The extension to the electric lighting installation in the County Surveyor's Department at the Shire Hall is being carried out on the Henley H.V.S. system using Holophane bowl fittings, by Messrs. Walker & Co.

**Heywood.**—The Electricity and Tramways Committee has contracted with the Tudor Accumulator Co. for repairs to the accumulators (£80 to £90).

**Ilford.**—The U.D.C. has placed an order with Messrs. Watlington & Co. for bracket arms for the Tramways Department, at 8½d. per foot.

**Ipswich.**—The T.C. has accepted the tender of Messrs. Sulzer Bros. for a Diesel oil engine coupled to a high-lift centrifugal pump, at £2,370.

**Keighley.**—The Keighley and Bingley Joint Hospital Board has accepted the tender of Mr. H. Spencer for electrical work at the hospital.

**London.**—BERMONDSEY.—The Electricity Committee reports having had under consideration the necessity of improving the arc lamp lighting of the borough, and, with this purpose in view, had been testing all the best known makes of arc lamps, with the result that the following tenders have now been received:—

Crompton & Co., Ltd.—(a) 170 arcs erected complete, so that same are in every respect ready for working, £1,280 (slight reduction if existing line resistance is used); (b) five spare arcs, £29 10s.; (c) one year's supply of carbons, £16 18s. per 1,000 pairs; (d) price to be allowed for existing arc lamps, £137.  
 Engineering and Arc Lamp Carbons, Ltd.—(a) £1,362; (b) £37 15s.; (c) £9 9s. 6d.; (d) £87 10s.  
 Johnson & Phillips, Ltd.—(a) £1,615; (b) £17 10s.; (c) £4; (d) 15s. each.  
 General Electric Co., Ltd.—(a) £1,568; (b) £15; (c) £5 6s.; (d) 10s. each.  
 Oliver Arc Lamps, Ltd.—(a) £1,249; (b) £35; (c) £3 15s.; (d) £108 6s.  
 Jandus Arc Lamp and Electric Co., Ltd.—(a) £1,224; (b) £35 10s.; (c) £81 17s.; (d) £181.

The Committee has decided to accept the offer of Messrs. Johnson & Phillips, Ltd.

**HOLBORN.**—The B.C. has accepted the tender of Messrs. Barlow Bros. & Co., at £55, for wiring the public mortuary. Other tenders were received from Messrs. Rashleigh, Phipps & Co., at £64 15s.; Messrs. Willats & Son, at £62 10s.; and Messrs. Duncan Watson and Co., at £66 8s.

**WOOLWICH.**—The B.C. has accepted the quotation of Messrs. Ferranti, at £74, for oil switches.

**Paisley.**—We understand that Messrs. James Kilpatrick and Sons have secured the contract for the electrical work required in the proposed church at Walneuk.

**Salford.**—The Electricity Committee has accepted the tender of Messrs. Mather & Platt, Ltd., for filtration plant at the electricity works, Frederick Road, for £635.

**South America.**—Messrs. Gillespie & Beales, London, buying engineers for Messrs. Martin Bros., Valparaiso, have recently placed the following order with Messrs. Lindsay, Burnet and Co., Govan:—For ss. *Taltal*, two main boilers, complete with tanks and oil-burning apparatus on the Korting system, complete with all accessories; one donkey boiler, fitted for coal or, alternatively, oil burning.

**Wakefield.**—The T.C. has accepted the tender of Messrs. Dick, Kerr & Co., Ltd., for reinsulating an alternator at the generating plant, at £163.

**Yarmouth.**—The T.C. has accepted the tenders of Messrs. Bradbury, Son & Co., Ltd., for 500 tons of hard steam coal, and Messrs. Wm. Cory & Son for 650 tons of Digby and Pooloy Hall slack coal, for the Electricity Department.

## FORTHCOMING EVENTS.

**North-East Coast Institution of Engineers and Shipbuilders.**—Friday, February 22nd. At 7.30 p.m. At the Lit. and Phil., Newcastle. Lecture on "Surface Combustion," by Prof. W. A. Bone.

**Royal Institution.**—Saturday, February 22nd.—At 8 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture III.)

Saturday, March 1st.—At 8 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture IV.)

**Institution of Electrical Engineers (Newcastle Students' Section).**—Monday, February 24th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "A Single Phase Traction System," by Mr. V. O. Haddock.

(Manchester Section).—Tuesday, February 25th. At 7.30 p.m. At the University, Manchester. Paper on "Recent Developments in the Manchester Street Lighting," by Messrs. S. L. Pearce and H. A. Ratcliff.

(London).—Thursday, February 27th. At 8 p.m. Fourth Kelvin Lecture on "The Ohm, the Ampere and the Volt—a Memory of Fifty Years, 1862-1912," by Dr. R. T. Glazebrook.

(Students' Section).—Wednesday, February 26th. At 7.45 p.m. At the Institution, Embankment, W.C. Adjourned discussion on paper on "Some Problems of Electricity Supply," by Mr. G. W. P. Page.

**Electro-Harmonic Society.**—Tuesday, February 25th. At 8 p.m. At the Holborn Restaurant. Ladies' night.

**Physical Society.**—Friday, February 28th. At 5 p.m. At Kine's College, Strand, W.C. Papers on "Interference by Röntgen Radiation," by Prof. C. G. Barkla and G. H. Martin; "Alternating Current Magnets," by Prof. E. Wilson; and "A Graphical Method of Optical Imagery," by Mr. W. R. Bower.

**Salford Technical and Engineering Association.**—Saturday, March 1st. At 7 p.m. At the Royal Technical College, Salford. Lecture on "Wireless Telegraphy," by Mr. J. McKeever.

## THE ELECTRICAL ENGINEERS

(LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAP.

The following orders have been issued for the current week:—

Monday, February 24th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, February 25th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, February 27th.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Saturday, March 1st.—(Left Half Battalion). "C" and "D" Companies. Week-end training at Dover. Dress:—Service dress, puttees and great coats. No arms will be taken. Parade at Victoria Station, S.E. and C. Railway, at 1 p.m.

Headquarters will be open from 10 a.m. till 12 noon for regimental business.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj. For Officer commanding L.E.E.

## NOTES.

**Electric Drive in the Wood-working Yard.**—Referring to the article on this subject published in our issue of January 24th, we are informed that a clerical error was made in quoting the cutting speed of the horizontal reciprocating saw of Messrs. John Pickles & Sons' make. The saw was mentioned as being driven by a 15-H.P. motor, and it was stated that it was "capable of making one cut up to 48 in., cutting at the rate of 2 in. per minute." This should have been 2 ft. per minute.

**Parliamentary Notes.**—ADMIRALTY ELECTRICAL ENGINEER.—In Friday's Parliamentary Papers, Major Archer Shee asked the First Lord of the Admiralty whether the services of the chief electrical engineer had been lent to the Leeds Corporation; and if so, why this gentleman's services could be spared, in view of the Admiralty statement that it was not desirable that they should undertake the erection of wireless stations, as they could not spare their staff. Mr. Churchill replied that the circumstances referred to had not been previously brought to his notice. He was informed that the services of the superintending electrical engineer had not been lent to the Leeds Corporation, but that he had accepted an invitation unofficially to give an opinion on certain points connected with their electrical undertaking on which the advice of an impartial expert was desired. The acceptance by a servant of the Crown of employment such as this, which did not interfere with the performance of his official duties, was not actually prohibited by the regulations. The position of scientific experts in the service of the State presented special features, and he saw no reason to interfere with the arrangement made in this particular case. At the same time, he had given instructions that in future the consent of the head of the department must be obtained by an officer before undertaking any service of this character.

**ELECTRICITY IN MINES.**—On the motion for the adjournment of the House of Commons on Friday night, Sir A. Markham called attention to the Rufford Colliery disaster, which resulted in the death of 14 men. The disaster was caused by a hoppet, which broke through the headgear of the colliery, and a barrel containing some tons of water was precipitated down the shaft on to the men. Not a single man was struck by the hoppet but the deaths were caused by drowning. When the hoppet came down all the lights

in the shaft were put out, and the hon. member said that if electric lamps had been provided in the mine he felt sure that the majority, if not all, of the men would have been saved.

**STANDING ORDERS.**—The whole of the 112 private Bills deposited in the Private Bill Office for consideration by Parliamentary during the forthcoming session have now been before the Examiner and dealt with, with the exception of three, which have been postponed till March 4th. One of the postponed Bills is the London County Council Tramways and Trolley Vehicles Bill. Four Bills will not be proceeded with, one of which is that of the Halifax Corporation for powers to construct about 12 miles of new tramways, at a cost of about £200,000. In six cases, the promoters have failed to show proof of having complied with Standing Orders, and these Bills will accordingly have to go before the Standing Orders Committee, who will decide whether they shall be allowed to proceed. One of these is the Ely Valley Gas and Electricity Bill, where it was held that the notices did not sufficiently and accurately define the area proposed to be supplied with gas and electricity by Clauses 25 and 53. By Clause 58 it was proposed that the company should be under obligations similar to that provided for under Sub-Sec. 1 of Sec. 21 of the Schedule in the Electric Light Clauses Act of 1899, to lay down distributing mains in certain streets and roads mentioned in the second Schedule of the Bill, but as such streets and roads were not specified, it was held that the promoters had failed to comply with the standing orders. It was also held that the Leeds Corporation had failed to comply with the Standing Orders by not having the consent of the West Riding County Council, who are the road authorities, in respect of Tramway No. 6 in the Bill. This proposed tramway was one of 1 mile 5 furlongs to be constructed in the city and in the township of Temple Newsam, in the rural district of Hunslet.

Amongst the Bills dealing with electrical matters which have successfully passed the Examiner, and will go for second reading, are the following: Bradford Corporation, Brighton Corporation, Central London Railway, Chesterfield Corporation Railless Traction, City and South London Railway, Cleveland and Durham County Electric Power, Crowborough District Gas and Electricity, Folkestone, Sandgate and Hythe Railless Traction, Hastings Tramways, Herne Bay Gas and Electricity, Huddersfield Corporation, London Electric Railway, Metropolitan District Railway, Metropolitan Electric Tramways, Metropolitan Railway, Mexborough and Swinton Tramways, Northern Counties Electric Supply, Rhondda Tramways, Western Valleys (Monmouthshire) Railless Electric Traction, and Westgate and Birchington Gas and Electricity.

**The Batti-Wallahs.**—We are informed that the informal meeting of the Batti-Wallah Society, on Wednesday, February 12th, was, as usual, exceedingly well attended. "It was strictly informal, the programme ranging from the telling of stories to a wrestling match." The members were asked to note that the date of the annual dinner, which was to have taken place on March 8th, is unavoidably altered to March 15th, owing to the proximity of the former date to the annual general meeting, which takes place on March 3rd.

**Educational Notes.**—On Saturday (15th inst.), the Clyde Model Engineering and Electrical Institute was opened in Govan, Glasgow; it has been established for the purpose of enabling apprentice engineers and other young mechanics to study their trades and develop ideas by experimenting with models. A well-equipped workshop has been provided, and already about 200 members have been enrolled.

The Education Committee of the London County Council has issued a report on eight years of technical education and continuation schools—mainly evening work.

**New British Westinghouse Club.**—On Saturday last the British Westinghouse new club premises in Moss Road, were formally opened. The Club is now open to all male employees of the British Westinghouse Electric and Manufacturing Co. The building has been constructed with a view mainly to convenience, and consists, on the ground floor, of a large hall capable of seating 300 persons, a dining room, and a spacious billiard room containing two tables. The remainder of this floor is occupied by the stewards' living rooms, &c. Upstairs are a number of committee and retiring rooms. The basement is mainly devoted to the rifle range, for which a sound-proof room has been constructed, giving a range of 25 yards and accommodation for four people to shoot at once. As regards the outdoor section, there will be five tennis courts, three grass and two hard, and a bowling green, and although these are not yet quite complete, it is expected that they will be in good working order by the commencement of the season. Mr. Peck, chairman of the Committee, opened proceedings by voicing the satisfaction of all present that the time had come when the difficulties of inception and organisation had been overcome, and the proud moment of inauguration had arrived. This had been made possible by the financial support of the directors and the members of the staff, but was mainly due to Mr. Lange, managing director, for his support throughout.

Mr. Longworth, the architect, presented a golden key to Mr. Lange, and Mr. Lange, in accepting, expressed his thanks. He said that it was his opinion that a turning-point in the history of the Club and the British Westinghouse Co. had been reached, and this had only been possible on account of the hearty co-operation of the staff. It was his pleasant duty to declare the Club open, and in doing so he outlined the history of the organisation. The forerunner of the present club had been primarily devoted to the engineering side of the firm and had been inaugurated as a means of transmitting to the younger employees, the apprentices in

particular, the knowledge possessed by the older engineers, and he wished to emphasise the fact that that object should always be kept in mind, and he appealed to the older members to foster the spirit of co-operation and watch over the well-being of the younger members. He wished to express his appreciation of the various interests now gathered under the one name, the British Westinghouse Club, such as the Social and Improvement Society, the Foreman's Association, and Apprentices' Section, who had so loyally subordinated their individual interests to the well-being of the Club as a whole. He referred to the great interest that Mr. Carlton, a previous managing director of the company, had in the Club and to the strongly educational lines on which he considered that it should be run, and that although the management of the company had modified this view somewhat, it was hoped that that primary object would always be kept in view. Mr. Lange also made special reference to the invaluable work of Mr. Tearle and his friends. In conclusion, he wished the club all possible success.

Mr. Tearle, chairman of the House Committee, regretted that the club was not in a more advanced state of completion, but said that it had been the feeling of the committee that in view of the large membership, it was advisable to open the premises at the earliest possible moment. It was some considerable time since Mr. Peck and Mr. Bisset conceived the idea and sketched out rough plans. The club was indebted to Mr. Derwent Simpson, solicitor to the company, for his help in suggesting methods of raising the necessary funds. On his recommendation, it was decided to issue

NEW BRITISH WESTINGHOUSE CLUB.

debentures to the extent of £3,000, of which £1,500 had been taken up by the company, who had also cancelled an existing debenture of £675, the interest on which was being paid by the club. The rest of the debentures have been taken up by members of the staff with the exception of about £150. He wished particularly to refer to the great kindness of Mr. Lange, not only in the gift of the three tennis courts, which would be a permanent record of such kindness, but for his advice and enthusiasm throughout.

Sir W. H. Bailey offered his congratulations, and mentioned that as a director of the Trafford Park estates, he was one of the first to discuss with Mr. George Westinghouse the question of purchasing a plot of land in Trafford Park for the company.

The remainder of the evening was devoted to the social side, and an enjoyable entertainment was given by the "Limits." An opportunity for the inspection of the premises was also afforded.

**Possibilities of a Tidal Electricity Works.**—Plans for utilising the tidal motion of the sea have often been suggested, without coming to anything. However, the first serious attempt to use it for the production of energy will shortly be made at Husum, on the Schleswig-Holstein coast of the North Sea, where, between the Isle of Nordstrand and the mainland, a reservoir of 4,000 acres is to be created by means of embankments. This reservoir will be subdivided by another embankment into an upper and a lower tank, communicating by sluices with the shallow inland sea on one hand and the turbine plant on the other.

The scheme is based on the assumption of a uniform tidal amplitude of 3 metres, the lowest ebb and highest flood each time reaching the same level, and their difference of level always being 3 metres. Under this assumption the working of the plant will be as follows:—When the water in the sea is higher than in the upper reservoir, this will be filled through the sluices; if, on the other hand, the water in the upper reservoir be at a higher level, this will flow off through the turbines, thus actuating the latter. This would commence some time after the beginning of low tide, and cease shortly after the beginning of high tide. An opposite process is to take place in the lower tank; when the water in the sea is higher than in the tank, it will flow in through the turbines, thus starting these some time after the beginning of high tide, and stopping them some time after the beginning of low tide. If the water in the sea be lower than in the tank, water will flow from the latter through the sluices into the sea.

The promoters of this scheme, on the hypothesis of a regular return of tidal amplitudes, presume that the operation of the turbines from one of the tanks may begin at the very moment the operation from the other tank ceases, thus ensuring a continuous service; they are reckoning on a level difference of 1½ to 2 metres between the sea and the tank actually in operation, the water in both tanks rising and falling about 1 metre during each tide.

The turbines are to yield 5,000 H.P., driving dynamos which will work without any accumulators, thus communicating their output directly to the supply system. The cost of construction is estimated at 5,000,000 marks, of which about 3,500,000 marks is allowed for the embankments and about 500,000 marks each for the turbines

and sluices, the buildings and the electrical part of the plant. The cost of the kw.-hour as produced in the tidal electricity works has been calculated in the first instance at 14d., but in the event of a large consumption it will be reduced considerably (down to 4d. and less). Even should the electrical enterprise fail, the promoters would in any case recover the value of the land reclaimed from the sea.

In an article recently published in a German daily paper (*Hamburger Korrespondent*), Mr. L. Benjamin severely criticises this scheme. He draws attention to the fact that the levels reached by the high and low tides are subject to considerable fluctuations, often unexpected and abrupt. When calculations are based on the actual tide curves, the hypothesis of an immediate transition between the working periods of the two tanks is seen to be inadmissible. In the most favourable case the dynamo would work during a period of about four hours, followed by a standstill of two hours, after which the next working period would begin. The working periods of four hours each would, according to the beginning of high tide, occur at changing times of day or night, so that the energy produced by the turbines, far from being always utilised immediately, would have to be stored, to be distributed to consumers at the right moment. No regular operation would thus be possible without the aid of expensive accumulators. Moreover, the district to be supplied would be by no means suitable for a rural power transmission plant, the enormous length of conductors and numerous transformer stations increasing the cost of electrical energy at the place of consumption far beyond the figure at which it could be produced by properly-designed steam electricity works.

The figures allowed for the cost of the reservoir are likewise criticised. As the ground at present lies at 1½ to 2 metres above normal low level, the formation of two tanks of so enormous a size would entail the excavation of at least 25,000,000 cb. metres of soil, which, if feasible at all, would greatly increase the estimated cost. The embankments, about 12 km. in length, would likewise entail an enormous expenditure on account of the muddy ground they would have to be built on.

In planning the machinery, the effective head has simply been taken as identical with the level difference between the sea and each tank. However, the water, in order to get from the remoter parts of the reservoir to the turbines, requires a sufficient head, while the water discharged from the turbines necessitates some additional head to avoid any back-pressure. When these heads are deducted from the level difference, the head actually available for the turbines is reduced considerably, beginning at most with 1 metre and falling to zero in the course of a working period. Now, while there are no turbines working under heads approximating zero, turbines suitable for a head of 1 metre are necessarily unsuitable for use with heads of less than ½ metre. In order to make up for this defect the number of turbines would have to be multiplied.

As, finally, the foundations of the turbine plant on the muddy soil of the sea coast would be extremely costly, the installation of the contemplated tidal electricity works would seem to entail a prohibitive expenditure, while its chances of success would be anything but satisfactory.

**Annual Socials, &c.—BLACKPOOL.**—Employees of the Blackpool Corporation Electricity and Tramways Department held a successful whist drive and dance on February 12th. The effort was in aid of an institute which the employes propose to organise for recreative purposes. Mr. C. I. Baker, the tramways traffic superintendent, was M.C. Alderman J. Brodie, J.P., chairman of the Tramways and Electricity Committee, assured the men that the Committee would do its best to assist them with their proposed institute. The Mayor rejoiced that the feeling of union amongst the tramway employes was so thorough. Mr. C. Furness, the general manager, said this was the first united whist drive the Electricity and Tramways Department had organised. When they considered that the two departments consisted of some 500 men, and most of them had families, he thought the time was opportune when they should have an institute of their own in which they could have social gatherings.

**LONDON.**—Some 60 members of the staff of Electrical Installations, Ltd., held their sixth annual dinner at "The Horns," Kennington, on the 15th inst., Mr. Stanley C. Russ being in the chair, who, after the usual toasts had been drunk, in a short speech alluded to the satisfactory growth of the business of the company. Advantage was taken of this opportunity to enroll a large number of new members for the E.I., Ltd., Athletic Club. After the dinner, various members of the staff entertained the company with a variety programme.

**MANCHESTER.**—On Friday last, February 14th, at the Midland Hotel, Manchester, 200 members of the staff of Ferranti, Ltd., held their annual dinner, which was followed by a musical entertainment, to which some of their number contributed.

**Institution and Lecture Notes.**—**INSTITUTION OF ELECTRICAL ENGINEERS.**—At a meeting of the Scottish Local Section in Edinburgh, last week, Mr. W. B. Hird, Glasgow, read a paper on the "Electric Arc," an electrically propelled vessel, which was built and put on the Clyde in 1911, for the purpose of demonstrating a particular method of electric propulsion.

**JUNIOR INSTITUTION OF ENGINEERS.**—The twenty-ninth annual dinner of the Institution was held on Saturday last at the Hotel Cecil, Sir A. Trevor Dawson, the President, occupying the chair.

After the loyal toasts, Rear-Admiral Arthur W. Waymouth (Director of Naval Equipment in the Admiralty) gave that of the "Profession of Engineering," which he claimed to be the most important in the world, because its purpose was the adaptation of

the forces of nature to the service of man. Since the old days of the hansom cab and the sailing ship, steam and the internal combustion engine had brought about wonders. The latter especially had made flight in air and submarine work possible, and would probably lead in the future as a motive power in engineering works. In naval construction, so extensive was the use of machinery in battleships to-day that every Naval officer was an engineer, and was proud to be one. In conclusion, the speaker recalled his close association with Sir Benjamin Baker on the Board of Ordnance, and paid a tribute to the value of the work accomplished by that great engineer. Capt. H. Riall Sankey, in reply, said that engineering was the only profession we could not do without. It was cosmopolitan and knew no bounds. He referred to the "Socialism of intellect" shown by Sir A. Trevor Dawson in his presidential address, in proposing that likely laids should be taken up and educated by the State.

The toast of the "Junior Institution of Engineers" was submitted by Major E. H. Hills (President of the Royal Astronomical Society) who, as a representative of one of the oldest scientific societies, extended the hand of fellowship to one of the youngest. To the astronomer, the work of the engineer in the mounting of telescopes, and in other ways, was vital and important. The differences between them were great, the work of one being speculative and that of the other practical. The engineer's sphere was "to do things," that of the astronomer "to know things," and those who would criticise the latter must remember that the useless things of one generation became the practical things of the next. The researches of Clerk Maxwell in one generation gave to the succeeding one wireless telegraphy, and enabled the wealthy merchant on the *Mauritania* to be kept daily in touch with—the price of lard. The desire to know things marked off the Western mind from the Oriental and the savage mind and placed it in the forefront of civilisation. As an instance of this desire for knowledge, the speaker referred to the life of Dr. Wilson, the naturalist to the Scott expedition, "whose loss had thrown a nation, and indeed the whole world, into mourning." One of the problems Dr. Wilson set himself to solve was that of the nesting and embryology of the emperor penguin, a bird which laid its eggs on ice in the middle of winter. Two years ago the doctor and two companions set out on a five days' journey, and on arrival at the desired locality, made a snow hut, but hardly was it finished before a fierce blizzard blew the roof away, together with their tent and other belongings. For 48 hours they lay in their sleeping bags without food. When the storm ceased, a consideration of the direction of the wind enabled them to recover their tent, and they were successful also in finding the eggs, for the possession of which they had risked so much. Curiosity was one of the highest characteristics of our race, and without it we were poor creatures of no value. We had still some chance of salvation if we did not commit the unpardonable sin of a blind worship of the useful.

Mr. S. Bylander (chairman of the Institution), in response, spoke of their hope of being able to secure a building of their own in the near future, and of the several advantages of membership. Their motto was "no standing still."

Later, Mr. W. A. Tooke (vice-chairman of the Institution) in giving the toast of "The President," referred to the services Sir A. Trevor Dawson had rendered them, and particularly to the value of the first Canet lecture, which he delivered four years ago, on "The Engineering of Ordnance."

An excellent musical programme was provided and was greatly enjoyed by all present.

**THE CONCRETE INSTITUTE.**—A paper was read by Mr. S. Bylander, entitled "Steel Frame Buildings in London," at the meeting on February 13th. The next meeting of the Institute will take place on February 27th, when Mr. J. A. Davenport will read a paper entitled "Economy in Reinforced Concrete Design."

**THE INSTITUTION OF ELECTRICAL ENGINEERS (STUDENTS' SECTION).**—Mr. D. Betts (vice-chairman) has been transferred to the class of Associate Members, and his office is now filled by Mr. G. W. P. Page, who vacates the hon. secretaryship. The newly-elected hon. secretary is Mr. E. T. Driver, 24, Bradgate Road, Catford, S.E. The discussion on Mr. Page's paper has been adjourned to February 26th.

**MANCHESTER UNIVERSITY ENGINEERING SOCIETY.**—At a meeting of the Society on February 12th, Mr. S. L. Pearce, chief electrical engineer to the Manchester Corporation, gave a lecture on the Manchester electricity undertaking, illustrated with maps and lantern slides.

**INSTITUTION OF MECHANICAL ENGINEERS.**—The annual report of the Council was presented to the members at the meeting on Friday last week. It shows that the total membership at December 31st, 1912, was 6,160, an increase of 332. The total revenue for the year was £16,950 and the expenditure £13,344, leaving a surplus of £3,606, of which £710 was carried to capital account as entrance fees and life compositions. The net capital of the Institution amounts to £64,237. In an appendix to the report, full particulars are given of the scheme of examinations for Graduateship and Associate Membership as adopted by the Council. The next summer meeting will be held in Cambridge at the end of July.

**THE ASSOCIATION OF ENGINEERS-IN-CHARGE.**—A most enjoyable social evening and dance was held in connection with the above Association on Saturday, February 8th, when a company of upwards of 200 members and friends were present in the St. Bride's Institute, E.C. There was a good selection of dancers with five extras, including a flirtation and card dance, and Mr. Hardy's Bijou Orchestra, which was engaged for the occasion, provided an excellent musical programme. The special dances created much amusement, and at the same time added materially to the sociability of the evening. Messrs. H. E. Neal and W. T. Pickett (chairman and vice-chairman of the Association respectively) supported the efforts

of the committee by attending the function, and the arrangements made for the entertainment of those present left nothing to be desired. Messrs. W. H. Ball and M. C. White acted as M.C.s for the evening, and they carried out their duties in a very effective manner.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS.**—Mr. A. B. Muirhead recently lectured at Musselburgh, on the subject of "The Handling of Electric Plant in Collieries," before the Eastern Branch of the Association.

An examination for competency in mining electrical engineering will be held on March 8th and 15th, at 10 centres in the United Kingdom. The subjects are A.C. and D.C. theory and practice, the special rules, distribution of electrical energy, electric lighting and signalling, &c. Full particulars can be obtained from the general secretary of the Association, C. St. C. Saunders, Bank Chambers, London Road, Derby, or any of the branch secretaries. Candidates must be on the register of the Association.

The Council announces that the following prizes are offered for papers for the present session:—An Association prize of Five Guineas for the best paper read at any branch; a prize of Two Guineas, given by Mr. Carlow, for the best paper by a member of the East of Scotland Branch; a prize of Four Guineas, given by Mr. Alex. Anderson and Mr. Matthew Brown, for the best paper by a working colliery electrician who is a member of the West of Scotland Branch; and a premium of Two Guineas, given by Lord Joicey, for the best paper by a member of the North of England Branch. Further particulars can be obtained from the General Secretary of the Association, Bank Chambers, Derby, or any of the branch secretaries.

**The Electro-Harmonic Society.**—The next concert (ladies' night) will be held at the Holborn Restaurant (King's Hall) on Tuesday, February 25th, at 8 o'clock p.m. The artists are as under:—Vocalists: Miss May Huxley (soprano), Miss Violet Oppenshaw (contralto), Mr. Hubert Eisdell (tenor), and Mr. Ivor Foster (baritone); violoncello, Mr. W. H. Squire; recitations, Miss Elsie Fogarty; entertainer at the piano, Miss Haidee Hamilton; entertainer, Mr. Thornley Dodge; solo pianoforte and accompanist, Mr. Bernard Flanders, A.R.A.M.

**Fatality.**—The death took place on Sunday at the Bolton Infirmary, of Albert Blakely (22), of Everett Street, Bolton, a tramcar conductor in the employ of the Corporation. On the previous day, whilst in charge of a car in Bradshawgate, Blakely, by some means, was struck by a passing tramcar, sustaining injuries which proved fatal.

**Coal Stacking and Firing.**—A paper by Mr. Kendrick was recently read before the Manchester District Institution of Gas Engineers. He endeavoured to explain the fires that had happened to stacks of coal during some months. At his works at Stretford they have had three serious fires in four years, and many cases of overheating. No. 1 store held 1,800 tons, and was an old retort house partly roofed, with and partly without louvres. No. 2 store holds 1,400 tons and has no louvre. No. 3 holds 800 tons, and has a two-span roof of corrugated iron. In the first two, coal is delivered by conveyors. In No. 3 it is hand-stacked, 14 ft. high. In the other stores it is piled in pyramids 24 and 20 ft. high, the top of the cones being 8 ft. across. No. 1 shed had given most trouble. The finest slack is usually sent direct to the retorts, but much fine stuff still gets into the store and fills the middle part of the piles, and to this dust and small coal the fire trouble is due.

As a result of what was observed, after each boat had been discharged, the fine dust was dug out and spread over the heap, and pipes were put in at intervals to enable the interior of the pile to be watched. Three years of immunity led to laxity, and the small stuff had not been fully dug out, and a fourth fire occurred. It was again the small coal which heated, but was not the immediate cause. Some old screened coal was buried under the new coal, and the store was filled, in about six weeks, to its utmost capacity. On emptying the shed, the rough coal under the slack was quite carbonised and fire was creeping under the slack. Apparently air had reached the new coal through the old tongue of open rough coal. The temperature in the tubes rose slowly to 90°, then quickly to 110°, with a quick jump to 300°, and it required a week to reach the fire, which had then spread considerably. As this coal was stored in the hot month of May, 1912, and was stacked quickly and was dustier than usual, these causes appear to have been active in producing fires.

The colliery agents attribute the numerous fires of that year to the fact that after the strike, coal was much crushed at the face, and was very small, and it was not clean, being hurried away quickly for use, and more probably fresher coal than usual was stacked. Freshly-wrought coal is more prone to heat, especially if fine.

Coal as received is warmer than the atmosphere, as much as 2° to 12° in summer, and 4° to 20° in winter. Since a pit may have a temperature of 90°, coal must start from the pit fairly warm, and if stacked too soon, too high, or in too large mass, it is prone to heat. Also, coal mined first after the strike would be damper than usual, and dampness seems to engender fire.

Coals absorb from one to three times their volume of oxygen, and this produces heat, and if it can occur in a thick mass the heat accumulates. Stacking in cone shape from a conveyor causes the fines to accumulate at the apex, and these are apt to fire. This system of storage is thus to be regarded with suspicion. Coal owners suggest 11 to 15 ft. as the height of coal stacks, or a mean of 13 ft. Gas-

works practice is to stack 10 to 30 ft. Since coal under cover cools less slowly, it should be stored in less depths than when out of doors, whereas the reverse is the usual practice. The question of ventilation is a disputed one. Some men say ventilate freely and carry off the heat. Others say keep out all air and no heat can be generated. If this is so it would be quite safe to store in closed bunkers, exhausting the air at the top and admitting CO<sub>2</sub> at the base to fill the voids between the coal. In practice it appears that coal will be reached by air enough to make it become hot. Therefore, supply ample air to carry off the heat, for the oxidation will be less if the coal is cold. Yet in mines ample ventilation to remove gas has caused heating in the gob, and the checking of the air current has stopped the heating.

If a heap fires, very much water is needed to quench it, for water sets up air currents to fan the fires. At Stretford they treat affected coal with strong ammoniacal liquor and only put water on unaffected coal. The summing up is that coal from different seams should not be mixed, nor should coal of different classes.

Fine slacks should not be stacked at all, nor damp coal under cover. Large heaps are the more dangerous. Lumps, nuts and fines should be well mixed in stacking. Limit heights to 20 ft. in the open, and 16 ft. under cover. Avoid external sources of heat, leaking roofs, &c. Keep temperature records of coal as received and in stock, and if the heat rises to 90° or 100°, remove the top layers and watch carefully. Do not disturb a fired heap by pushing in bars. Do not apply water to a fire, but ammoniacal liquor. Remove and use heated coal promptly.

From remarks made during the discussion, it would seem that if coal is screened and stacked it does not become hot. This indicates the smalls as the cause of trouble. But it also indicates the need for good air circulation, for it is the fines that prevent this. It seems impracticable, as a rule, to gain safety by excluding all air, as that would undoubtedly prevent fire, for to produce fire there must be oxygen. The question is, can coal absorb oxygen, as oxygen which shall only begin to work when the coal is stacked? With present, day large stacks of coal, the subject becomes important.

**Mr. C. S. Northcote's Bankruptcy.**—Charles Spencer Northcote, 67, Stanthorpe Road, Streatham, London, electrical engineer.—The receiving order herein was made on creditors' petition, the act of bankruptcy being the failure of the debtor to comply with the requirements of a bankruptcy notice duly served upon him. The debtor appealed from the receiving order, and an order was made staying all proceedings thereunder pending the hearing of the appeal, which had now been dismissed. According to the statement of affairs, the liabilities are expected to rank at £1,709 12s. 10d., and the assets are estimated to produce £33 6s. 6d. The debtor became London manager to a firm of electrical engineers, and the firm having become a limited company in 1903, he was appointed a director. Three years later he left the company and sold his shares therein for about £4,000, opening an office at 2, Queen Anne's Gate, Westminster, on his own account. He traded there under the style of the Wholesale Electric Traders, and, at the same time, he was honorary secretary to an association, in which capacity he organised and managed the Manchester Electrical Exhibition of 1908. In 1909 he gave up his offices, and has since had no office and earned practically nothing, although he has tried to develop various electrical schemes, and he has lived on his capital. He purchased a frechold house at Forest Hill some 10 years ago for £3,000, and spent £1,000 on improvements. He had an overdraft at the bank, but gave them a fixed mortgage on the house for £1,500 about two years ago. He left this house in April, 1912, and it was unoccupied until last November, when the mortgagees sold it by auction for less than the mortgage money. When he left this house he instructed the petitioning creditors to sell by auction the bulk of his furniture, and they did so; but being dissatisfied with the way in which the sale was conducted, he consulted a solicitor with a view to bringing proceedings against them. The petitioning creditors alleged that certain letters written by the solicitor so instructed were libellous, and they thereupon commenced proceedings against the debtor for libel, the action coming on for trial at the end of last June, when judgment was given by default, and the case referred to the Sheriff to assess the damages. Debtor instructed other solicitors, who appeared at the Sheriff's Court, but a verdict was given against him for £400, and costs. An appeal, which was entered by the debtor, was dismissed, and the petitioning creditors thereupon brought the present proceedings. No books of accounts had been kept by the debtor, who ascribed his failure to the verdict obtained against him by the petitioning creditors for damages for an alleged libel and the costs of the action.

At the first meeting of creditors, held last Tuesday at 132, York Road, Westminster Bridge Road, S.E., it was decided to leave the matter in the hands of the Official Receiver.

**Appointments Vacant.**—Charge engineer, for the Corporation Electricity Works, Crewe (£80). Chief draughtsman, for Provincial Cinematograph Theatres, Ltd. (£182). Electrical fitters, for H.M. Dockyard, Portsmouth (36s.). Fitter-driver for the Severalls Asylum, Colchester (36s.). See our advertisement pages in this issue.

**A South London Exhibition.**—This week, at Raleigh Hall, Effra Road (opposite Lambeth Town Hall), the South London Electric Supply Corporation, Ltd., is running an exhibition of electric heating and cooking. Demonstrations are given daily at 3.30 and 7.30 p.m. To-morrow (Saturday) night the Exhibition will close.

## SELF-STARTING SYNCHRONOUS MOTORS.

THE Lancashire Dynamo and Motor Co. has recently constructed a number of self-starting synchronous motors, some particulars of which we are enabled to publish herewith.

The "Lancashire" self-starting synchronous motor has been designed to overcome the great drawback of the synchronous machine, viz., that it requires skilled attention

The motor then comes into synchronism and runs as a synchronous motor, the field excitation being adjusted to suit the power factor which is required.

This type of motor is specially suitable for installing in a works and driving machines such as pumps or air compressors, on which the load is fairly constant. The excita-

FIG. 1.—750-H.P. SELF-STARTING SYNCHRONOUS MOTOR DRIVING TRAMWAY GENERATOR, ALTERNATOR AND EXCITER.

and synchronising before it can be put on the circuit. The "Lancashire" type of machine starts up like a wound-rotor induction motor, and when it is up to speed, and the exciting current is switched on, it pulls itself into step automatically, thus enabling the motor to be used for all sorts of industrial purposes where a synchronous motor of the ordinary type would be inadmissible.

tion can be adjusted to raise the power factor of the works to something in the neighbourhood of .9, which is about the most economical value.

The motors are of the revolving field type with cylindrical rotors; the stator windings are former-wound, embedded in

FIG. 2.—MOTOR-DRIVEN AIR COMPRESSOR FOR LONDON, ONT.

The current is switched on to the stator by the stator switch, and a resistance is put across the slip rings in parallel with the field winding. The motor then starts up, and as the resistance is cut out the speed rises until it gets close to synchronism. At this point, the rotor is put across a buffer resistance, and the switch being moved one step further puts the exciter across the slip rings, with all the resistance in series with the field.

FIG. 3.—RATEAU TURBO-BLOWER WITH 250-H.P. SYNCHRONOUS MOTOR DRIVE.

partially-closed or open slots, and insulated in micanite troughs, which project some distance from the core and provide against breakdown at the point where the windings leave the slots. The end connections also are clamped to the end plates when necessary.

The rotor is constructed with numerous ventilating ducts, and a fan of full rotor diameter is provided on either side of it, which, in conjunction with the stator end shields, provides an excellent ventilating arrangement, the constructive features of which are shown in the views of the Erindale frequency changer mentioned later.

FIG. 4.—STARTER CONNECTIONS FOR SELF-STARTING SYNCHRONOUS MOTOR.

The rotor coils are wound with flat copper strip and afterwards taped. Standard ball bearings are fitted to the journals, and a double ball thrust bearing is provided to keep the rotor in position, the other bearings being free. These motors have been used for a variety of driving purposes, and some of these we illustrate: they have also been supplied to run idle and act as rotary condensers.

Our first view shows a 750-H.P. combination, one of two similar sets supplied to the city of Guelph, Canada, each consisting of a 750-H.P. self-starting synchronous motor direct-coupled to a D.C. traction generator and alternator with exciter; the latter machine is used to change the periodicity of supply from 25 to 62½ cycles, and the set runs at 750 R.P.M. from the 2,200-volt three-phase mains; the other views of similar motors in use are self-explanatory.

We further illustrate in figs. 6 to 9 a frequency changer recently supplied to the Erindale Power Co., Canada. The set consists of a synchronous motor direct coupled to an alternator, supported on two beam bed plates with three bridge type pedestal bearings, the starter motor and the exciter being carried by the end pedestals. The synchronous motor capacity is 1,150 K.V.A. at 12,500 volts, three-phase, 25 periods, and a speed of 300 R.P.M., and the alternator develops 1,000 K.V.A. at 13,200 volts, three-phase, 60 periods. The exciter is shunt wound, and generates 320 amperes at 125 volts. The starter motor is of the wound rotor type, running off 2,200 volts, and is controlled by a special oil immersed rotor starter in which the last five or six contacts are suitable for regulating the speed when synchronising. Fig. 6 gives a view of the above set taken on the Lancashire Dynamo Co.'s test bed.

From the rotor view of the 25-period machine, it will be seen that the field system is built up with salient poles, which are bolted to the periphery of the plate type cast-steel fly-wheel. The poles are built up of mild steel stampings, in order to reduce the eddy current losses to a minimum. The construction of the field system facilitates the removal of the poles when this is desired for inspection or repairs.

The field coils are wound with copper strip on edge; this arrangement prevents the layers rolling under centrifugal

force. Each coil is insulated and securely bolted between the spigots of two bronze clamping plates; afterwards it is placed on the pole and fixed against the pole tip by means of set screws. The pole tip prevents the coil flying out under the action of centrifugal force.

The machines are fitted with a system of forced ventilation to ensure cool running, fans being fixed on either side of the field system, as shown in our view of the rotor. The cold

FIG. 5.—200-H.P. SELF-STARTING SYNCHRONOUS MOTORS DRIVING PUMPS.

air is drawn in and forced by the fans against the stator end-connections and along the field coils. The stator end-shields provide an effective guide to direct the air to the desired portions of the machine, and the hot air is expelled through holes in the stator case.

## ELECTRICAL APPARATUS AND STANDARDISATION.

By W. A. TOPPIN.

A CERTAIN amount of standardisation is necessary in every industry. There are two ways by means of which it may be

FIG. 6.—1,000-K.V.A. FREQUENCY CHANGER BY THE LANCASHIRE DYNAMO & MOTOR CO.

brought about. One is for the manufacturer to obtain the monopoly of manufacture of any particular article, as has been the case in the wood-screw industry; the other and much more satisfactory way, is for a committee of experts to issue rules that all the manufacturers agree to abide by. Fortunately for the growth of electric lighting, lamp caps have been standardised. Now that the public are beginning to find out that electricity can be used for so many purposes

besides lighting, wall plugs and a number of other things should be made of one standard pattern, so as to make electricity as cheap and as easy to use as possible.

I propose in this article to deal only with such electrical accessories as may be found in any house or office. If the Cable Manufacturers' Association could only arrange some means whereby anyone could at once say that a particular wire was association or non-association grade, it would save

A consumer A breaks a clip and goes to a contractor B for a new one, who finds he does not stock this particular pattern. A goes back, ties a piece of lemonade wire round the fuse terminals, and after one or two more fuse clips break tells B to fix a new fuseboard.

The distance apart and the width of the fuse clip contact should be settled for certain definite pressures.

An example of lack of uniformity between four five-ampere

FIG. 7.—STATOR, SHOWING END SHIELDS.

FREQUENCY CHANGER FOR THE ERINDALE POWER CO. (see page 306).

FIG. 8.—25-PERIOD ROTOR, SHOWING VENTILATING FANS.

the poorer contractors from taking such care of the labels from coils of association grade wire so as to make them last out a few coils of the other grade.

The screw thread for tubing should be standardised. At present contractors are put to considerable trouble through a tube from one maker not screwing into a T box bought somewhere else.

The number of types of main switches is legion, but this is not of such moment as the fuse question. Main and sub-fuses have to be frequently replaced, and it is essential that

250-volt porcelain clip fuses: the distances between fuse terminals were  $2\frac{1}{2}$  in.,  $2\frac{3}{8}$  in.,  $2\frac{3}{4}$  in., and  $2\frac{1}{2}$  in., and the thicknesses of the contact clip varied from  $\frac{1}{16}$  in. to  $\frac{3}{8}$  in.

A large firm are specialising in fuses of the screw-in Edison plug type. If these become popular other firms must be prevented, if possible, from making similar fuses having different screw threads. Switches do not give much cause for complaint, but wall plugs are most urgently in need of standardisation.

An example of the differences found between three five-amp. plugs by different makers: the distances between the centres of the contact pins were  $\frac{7}{16}$  in.,  $\frac{3}{4}$  in., and  $\frac{5}{8}$  in., and the diameters of the pins also varied. The use of wall plugs for irons, kettles, radiators and the like is increasing so rapidly that the lack of uniformity becomes very important.

Although the Edison type of screw lamp is not much used in this country except for battery work, the diameter and screw threads should be fixed. Attention was called to radiator lamps and their attachment by a prominent central station engineer a few weeks ago. He advocated a special

holder. Certainly the ordinary bayonet socket type suitable for a 50-C.P. Osram lamp is not suitable for carrying 1 ampere continuously. A screw-in connection similar to a "Zed" fuse seems very suitable, and should be standardised.

The connecting pins for electric kettles, irons, heaters, &c., all vary. An iron bought one year from a very prominent firm has a totally different sized connecting pin from

FIG. 9.—FREQUENCY CHANGER SUPPLIED TO THE ERINDALE POWER CO., CANADA (see page 306).

any non-electrical man should be able to do this, and make a good job of it with no risk to himself. For this reason I am a strong advocate of the spring clip type of fuse. The wire is visible, it can be replaced without fear of shock in the minimum of time. Now these clips vary: buy six fuse-boards from six different makers and specify the same voltage and current in each case, and the chances are that not one of these clips will be interchangeable. What is the result?

an iron of the same size made two years later. A customer has therefore to state when ordering a new connector in what year his iron was made.

The time has undoubtedly now come when the electrical industry can standardise without anything but good resulting.

### THE NEW WORKS OF MESSRS. ECKSTEIN, HEAP & CO., LTD.

RECENTLY, through the courtesy of Messrs. Eckstein, Heap, we were enabled to inspect the new premises, known as the Lancashire Switchgear Works, in Caroline Street, Broughton, Manchester, into which they have moved, with a view to providing for a considerable extension of their business. It may be remembered that the concern was recently turned into a limited company, with Mr. Eckstein as managing director.

The new premises consist of three spacious floors, subdivided into various departments adapted for the firm's switch, fuse and instrument business.

The ground floor contains a machine shop fully equipped with capstan and other lathes, milling, grinding, drilling machines, &c., and adjacent to it an erecting shop for switchboards and mining switchgear, the latter being a recognised speciality with the firm.

A section of the ground floor is reserved for the packing department, and on each floor suitable stores are provided for the particular class of work carried on there.

The test room equipment includes motor-generators and transformers for giving up to 10,000 volts pressure and several thousand amperes, but heavy material is tested in the shops by means of portable equipments on trolleys, which

THE DRAWING OFFICE, MESSRS. ECKSTEIN, HEAP'S NEW WORKS.

will give the necessary current and pressure range desired, and can be plugged into the local supply at convenient points.

Amongst our views are some of typical productions turned

Auto-transformer Motor Starter.

Controller for Auto-starter.

Auto-transformer Starter with fuses.

Liquid Starter.

#### SOME ECKSTEIN, HEAP SPECIALITIES.

The feature of the first floor is the extensive accommodation provided for the drawing office and estimating staffs, the counting house, board room and various private offices.

Elsewhere there are provided a shop for tool making and press work, an inspection room for small work, and depart-

out by the firm, which it will be seen builds a very substantial type of switch for heavy service, such as in mines and factories, and pays particular attention to interchangeability of parts and ease of adjustment and renewal. In the case of mining switchgear, switches of 100 to 600 amperes

MINING SWITCHGEAR ARRANGED AS AN IRONCLAD SWITCHBOARD.

ments devoted to the construction of medium size switchgear, controllers, &c., coil winding and testing. The top floor is naturally reserved for the lighter class of work, such as knife switches, switch fuses, circuit breakers, fuses, &c., but it also contains pattern and instrument making shops, and an enamelling shop.

A CORNER OF THE MACHINE SHOP.

capacity are standard lines, while switches for use on switchboards ranging from 15 to 4,000 amperes capacity are also made. The firm always employs a toggle action in its switches, also standard contact units, which can be varied

in number as required, and nowadays the porcelain insulators in oil switches are readily replaceable, the older grouted-in insulator having been superseded.

During our visit many examples of mining switchgear for both low and high pressures were shown to us, and we illustrate an ironclad switchboard built up of mining units, and including bus-bar chambers, isolating links, trifurcating boxes, instruments, &c.

It may be noted that the overload and no-voltage trip coils are oil-immersed, as well as the current and potential transformers where these are necessary, thus providing perfect insulation; also that the switch parts and tank lowering gear are interlocked with the isolating links in order to ensure the operation of the oil switch prior to interference with the former gear.

We also illustrate two types of auto-starter; these are built for either star-delta or auto-transformer control, and can be fitted with automatic trips as required.

The firm does a large business in direct-current circuit-breakers, of the loose handle laminated brush type, fitted with carbon break and magnetic blow-out, for switchboard use, as well as in instruments for the same purpose.

In conclusion, it will be seen that the new company commences business under excellent conditions and well equipped to meet the exigencies of present day trade.

## COPPER.

THE sudden and heavy fall in price continues to be the subject of constant discussion. As is pointed out by the writer of an article in the *Times* (February 10th), the price at the beginning of last month for standard was £76½, while it is now little above £66, and touched this figure during the past week. The Balkan war is, of course, responsible for a general depression, but besides this the writer alludes to the stocks accumulating in the United States, and the fact that production has increased considerably. Production in that country is considerably ahead of the home consumption. In Europe, there is still a considerable margin between supplies and deliveries. Three-quarters of the European supply coming from United States, this must naturally be so. To the increased production and running ahead of consumption, the writer of the article attributes the reduction of the price by the American copper producers, from 17½ cents to 16½ cents per lb., which was the determining factor in the present fall.

In view of the fluctuations which affect the price of commodities when the greater part of the production is under one control, it is always good news to hear of fresh sources of production not yet tapped by the combines. A pamphlet is to hand containing reports of discoveries in the Russian Island of Nova Zembla, which, without claiming to be final so far as quantity is concerned, shows that considerable native outcrop copper is present in the district investigated. It claims to have proved the existence of two cupriferous veins of an average thickness of 1½ to 2 metres each, and that these veins extend over a length of more than 2 kilometres; also that deposits of chalcopryite ore are present in the district (Miedny Peninsula). Concessions have been granted to a company in course of formation. Apparently, though in latitude 71° 8' north the climate is naturally severe (average winter temperature - 15° to - 20° C.), yet there are settlements on the same island even further north which are inhabited the whole year round. The veins are under a kilometre from the coast.

So long as the United States continues to produce more than half the copper consumed in various parts of the world, it will naturally remain the dominant factor in any consideration affecting the copper market. The time when other parts of the globe will produce quantities allowing them to measure themselves with the United States in this respect does not, apparently, approach any nearer; on the contrary, the present policy of the United States producers appears rather to be one of holding back than of putting forth more effort to increase production. The usual annual summary of copper production figures appearing in the *Mining and Engineering World of Chicago* for January 25th, gives a useful and exhaustive summary of copper statistics for last year (1912). The present rate of consumption, we learn, may be largely increased by the use of copper in steel rails, on which experiments are being made. The presence of 1½ per cent. of copper appears to increase the useful life considerably. The use of copper for ornamental purposes is referred to, and even watch dials run into some hundreds of tons annually.

The increase in output of 1912 is the largest yet recorded, amounting to 230 million pounds (from estimates, final figures not being yet available).

In 1912 the United States produced 550,000 tons, against 490,000 in 1911. This is out of a world's production estimated at 977,000 tons. Against this production other figures show small, though many of them are quite healthy. Mexico is second with

68,000 tons, Japan shows third with 58,000, Australasia has 47,000, Canada 32,000, Russia 29,000, Germany 24,000 and Africa 20,000. The increases (over 1911), provided these figures are sufficiently near, are United States 15 per cent., Japan 5 per cent., Australia 7½ per cent., Canada 30 per cent., Germany 10 per cent. and Africa 15 per cent. Spain and Portugal alone show a decrease of 60 tons in an output of 50,000.

A table of the proportionate production of the United States to that of the globe is also given. This shows the percentage 16½ in 1890, rising very steadily till 1895, when it was 60·8 per cent., then jumping to 55·0 for two years, afterwards declining, but attaining a maximum of 58·1 per cent. in 1906, and now being, according to the above figures, 56 per cent. As the figures assumed such large proportions the increase in the world's production fell off slightly, being 6 per cent. per annum for the latter half of the last century; in the present one it has been nearer 8 per cent. Variations have, of course, occurred, as in 1907, when the output was less than in the preceding year, but, taking the increase over the 12 years, the average will be found near this amount.

The leading territory in the United States for copper production is Arizona, which passed Montana in 1907. Its last year's output is estimated at 160,000 tons. Montana comes second with 138,000, Michigan third with 104,000, and Utah fourth with 65,000.

The Porphyry mines in Utah, Nevada, Miami, &c., are estimated to have produced 114,000 tons of the total. In Montana only one property—the North Butte—has deteriorated in producing ability and reserve of ore. In Lake Superior district, Calumet and Hecla mine shows a decrease of some 2,000 tons.

Coming to stocks, the beginning of the new year shows an increase of 7,000 tons over the end of the preceding one. Stocks were lowest in July, falling off since the commencement of the year, with heaviest drop in January. Production was highest in August and lowest in February—the difference between the two 12,000 tons, on an average of about 45,000. Domestic deliveries were highest in October and lowest in February.

Export deliveries were highest in January and lowest in April. Production increased 10 per cent. over 1911, domestic deliveries 15 foreign deliveries fell 1 per cent., and total deliveries gained 6 per cent.

The world's stocks as on December 31st were about 5,200 tons less than for the same date in the previous year.

On the financial side, 14 companies increased their dividends during the year, and four commenced paying dividends.

The lowest price for Lake Superior copper was in January 14½ cents. The highest was 17½, which appeared several times in June, August, September, November and December.

Electrolytic advanced pretty steadily throughout the year, being 14½ cents (low price) in January, and standing at 17½ (high price) from June onwards. Consumers, it appears, still refuse to carry heavy stocks of the metal, and thus refrain from stimulating the market with heavy orders. At the same time, the writer of the article considers that indications point to the first quarter of 1913 as a satisfactory one so far as dividends are concerned.

The influences on this market are at present so numerous that figures relating to it are of especial interest. In England the market is waiting for a clearer European outlook, and better conditions generally; in the United States the situation is affected by the Mexican war, by the question of production, and by the rumours concerning the health of one of the owners. The figures given by Messrs. Merton in their mid-monthly circular show an increase in the European visible supply for February 15th of 1,561 tons over the figures for January 31st. French stocks have increased 499 tons, and Dutch 1,430; Germany (Hamburg) is estimated to have increased 885 tons. English stocks, on the other hand, are 853 tons less.

Supplies from North America are heavy, though, of course, the half-monthly figures cannot be taken as being necessarily half the month's supply. Spain and Portugal's contribution is very small, Chile shipments are slightly low, Australian well maintained. The quantity afloat from Australia is large, 6,000 tons. The total deliveries are very fair at 22,993 tons, if the same rate be maintained. The average per month is 42,700 tons, and a 50,000-ton month is not often recorded, though last February exceeded that quantity.

**More New Terms.**—The proposal of a Standards Committee, composed of representatives of German and Austrian technical societies, to adopt the appellation "Neupferd" (new horse) for the unit of power (102 mkg/sec. = 1 kW.), has not met with general favour. In consequence, the Committee now puts forward alternatively "Grosspferd" (great horse), a term which of itself indicates that it is a unit of greater magnitude than the old (in the ratio of 102 to 75 mkg/sec.). What success awaits this new creation (says the *Zeit. für Ost. Ing. u. Ark.*) remains to be seen.

For our part, we shall simply go on calling it the kilowatt.

**The Electric Smelting of Copper Ore.**—It is stated that the Union Minière du Haut Katanga, which is the Belgian company engaged in the production of copper ore in the Katanga district of the Belgian Congo, and which placed a large quantity of raw copper on the Antwerp market for the first time in 1912, proposes to form a subsidiary company for the electro-metallurgical treatment of copper ore. The scheme contemplates the utilisation of waterfalls for this purpose.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—MR. H. T. BATES, who until recently occupied the position of resident engineer to the South Metropolitan Electric Tramways and Lighting Co., has been presented with a marble clock by his late colleagues. Mr. A. V. Mason, the general manager, in making the presentation, regretted Mr. Bates's resignation, and congratulated him on his appointment as resident manager to the Rotherhay Tramway Co., wishing him every success in his new sphere.

The Torquay T.C. has increased the salary of MR. KEENAN, chief assistant engineer at the Electric Light Works, from £166 to £180 per annum.

The Barrow-in-Furness T.C. has increased the salary of the borough electrical engineer, MR. H. R. BURNETT, from £500 to £550 per annum.

The Dewsbury T.C. has increased the salary of MR. R. W. GRUBB, assistant electrical engineer, from £170 to £180 a year, rising by £10 per annum to a maximum of £200.

MR. J. MARTIN BLAIR, who was the Acton Council's electrical engineer from the inception of that authority's electricity undertaking until the transfer of the business to the Metropolitan Electric Supply Co., Ltd., has now severed his connection with the company, by whom he was engaged as local representative after leaving the Council's employment.

The St. Helen's T.C. has increased the salary of MR. J. W. WARR, outside superintendent at the electricity works, from £180 to £200 per annum.

BAILIE SMITH and MESSRS. P. G. STEWART and HANNAY, have been appointed, along with MR. W. W. LACKIE, chief engineer, by the Electricity Committee to represent Glasgow T.C. at the 18th annual conference of the Incorporated Municipal Electrical Association to be held in London in June.

The Bristol T.C. has increased the salary of MR. C. M. DAVIS, commercial engineer, to £200 per annum, and that of MR. A. J. NEWMAN, distribution superintendent, to £225 per annum.

The Electricity Committee of Bermondsey B.C. has decided to increase the salary of the electrical engineer (MR. W. E. J. HEENAN) by two annual increments of £50, to £625 per annum; also the salary of MR. L. A. LAWS (mains superintendent) from £185 to £200 per annum.

The salary of MR. J. H. BOWDEN, electrical engineer to the Poplar undertaking is, subject to the usual sanction, to be increased from £600 to £700 per annum, as from January 1st last. It is stated by the Council's responsible Committee that the salaries paid to the engineers of other electricity undertakings in London with similar outputs are considerably higher than that paid to Mr. Bowden, and under the circumstances they think that he is fully entitled to the increment.

On Friday evening last, at Bexley Heath, MR. CHAS. MITTELHAUSEN, late electrical engineer and tramway manager to the Bexley U.D.C., was presented with a pair of binoculars and a clock by the members of the various municipal departments. Councillor E. J. Reid presided, and the new electrical engineer, Mr. P. J. Stokes, was among those present. Councillor Reid, who had been for four years chairman of the Electricity Committee, said he had always found Mr. Mittelhausen the soul of courtesy and loyalty, and he congratulated him upon the results of his labours. Mr. Mittelhausen replied in suitable terms, and a few words from Mr. Stokes followed. The arrangements were made by Mr. S. Stone. On the following day, at a concert, the employés of the lighting and traction departments presented their late chief with a silver cigarette case.

**General.**—We have received a cutting from the *New York Herald*, reporting that last Saturday week at Halifax, N.S., Capt. Larnder, R. D. Legatte, watch officer, and James Himmelman, boatswain's mate, all of the cable steamship *Mackay-Bennett*, were honoured by the Dominion Government for a gallant rescue at sea. A handsome loving cup was presented to Capt. Larnder, a pair of binocular glasses to the watch officer, and a gold watch to the boatswain's mate. "It was just a year ago on the Georges Bank that between heavy snow squalls and heavy weather the officer of the watch on the *Mackay-Bennett* thought he saw a vessel flying a signal of distress. A search was made, and at last the schooner *Caledonia*, heavily coated with ice, leaking, and her pumps choked, was observed. A boat in charge of Himmelman put off to the rescue, and the crew of six men were taken off the disabled vessel. The *Caledonia* was taken in tow, but when 60 miles from Halifax she capsized because of the tremendous weight of ice on her rigging and sides."

The *Times* states that in consequence of the absorption by the Underground Railways, Ltd., of the Central London Railway, MR. CECIL PARTRIDGE, general manager of the latter company since 1911, has accepted an offer of compensation, and will shortly retire.

Our readers will be interested to learn that MR. J. H. RIDER is leaving South Africa for a short holiday in the course of a month or two, and he will be in this country before Midsummer.

MR. R. H. CRIDGE, formerly of Messrs. Siemens Bros. Dynamo Works, Ltd., has been appointed by the Electrical Apparatus Co., Ltd., as their London representative for motor control and switchgear.

MR. CHARLES J. CLOSE has been appointed to represent the Marconi International Marine Communication Co., Ltd., in the North-Eastern Counties. Offices have been acquired at Milburn House, Newcastle-on-Tyne. The registered telegraphic address of the North County branch is "Expanse, Newcastle," and the telephone number is "Central 1125."

MR. H. R. KEMPE, who, as our readers are aware, recently retired from the position of principal staff engineer and electrician to the Post Office, was on Monday last presented with a silver tea and coffee service by Mr. W. Slingo, engineer-in-chief, on behalf of his colleagues and friends at St. Martin's-le-Grand.

MR. C. D. CROMPTON has recently severed his connection with the Post Office Telephones, Manchester, and has taken up a position on the staff of Messrs. L. E. Wilson & Co., 20, Cross Street, Manchester. Before leaving he was presented by his late colleagues with a fountain pen.

MR. O. L. REMINGTON, manager of Messrs. W. McLean & Co., electrical merchants, of Melbourne, has arrived in London, and his address is at the Hotel Cecil. He is open to confer with firms and others who have special lines of manufacture for introduction to the Australian market.

**Obituary.**—MR. GEORGE MATTHEY, F.R.S.—We regret to record the death of Mr. George Matthey, which occurred on 14th inst. at Eastbourne. The deceased gentleman was 87 years of age, and he had been practically all his life a member of the well-known firm of Johnson, Matthey & Co., Ltd., of Hatton Garden, London. He joined it at the early age of 19, and a few years later became a partner. He relinquished his active association with the business some seven years ago. The *Times*, in alluding to Mr. Matthey's career, mentions his early interest in the development of platinum for commercial purposes, including chemical apparatus and electric lamps. "The iridio-platinum of which the standard metre was made was manufactured by his firm under his direct superintendence." He was decorated with the Legion of Honour, and in 1879 was made an F.R.S.

## NEW COMPANIES REGISTERED.

**Teleca Co., Ltd. (127,163).**—This company was registered on February 18th, with a capital of £2,000, in 1,750 participating ordinary shares of £1 each, and 5,000 deferred ordinary shares of 1s. each, to carry on the business of engineers, contractors, &c., and to acquire certain patents for an invention relating to a telephone cord attachment. The subscribers (with 100 participating ordinary shares each) are:—E. V. Cheese, 1, Albemarle Street, W., merchant; P. C. Anderson, 9, Goutfield Gardens, S.W., accountant. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first; qualification, 100 shares; remuneration, £50 each per annum, after 5 per cent. is paid on the participating ordinary shares. Registered by E. Anderson, 329, High Holborn, W.C.

**London Commercial Electrical Stores, Ltd. (127,131).**—This company was registered on February 12th, with a capital of £1,000 in £1 shares, to take over the business carried on at 65-7, Knightbridge Street, E.C., as the "London Commercial Electrical Stores," to carry on the business of electricians, manufacturers of and dealers in all kinds of electrical apparatus and sundries, &c., and to adopt an agreement with F. Taussig. The subscribers (with one share each) are:—H. H. Kemp, 35, Alexandra Park Road, Muswell Hill, N., clerk; F. Taussig, 65-7, Knightbridge Street, E.C., electrical engineer. Private company. The number of directors is not to be less than two or more than three; the first are F. Taussig (governing director), and P. J. White; remuneration of governing director £350 per annum. Registered office, 65-7, Knightbridge Street, E.C.

**Electricity Meters Patent Development Syndicate, Ltd. (127,175).**—This company was registered on February 14th, with a capital of £800 in £1 shares, to acquire British and Canadian patents granted to A. M. Billington and W. H. Johnson relating to electricity meters, and to adopt an agreement with the Johnson-Billington Electricity Meters, Ltd. The subscribers (with one share each) are:—H. B. Spiller, 28, Hastings Road, Ealing, W., stockjobber; H. Harrison, 11, Victoria Street, S.W., electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are H. B. Spiller, H. Harrison and C. W. B. Bridson; solicitor, J. T. Goddard, 5-6, Clement's Inn, W.C. Registered office, 155, Salisbury House, London Wall, E.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Varley Magnet Co., Ltd.**—Particulars of £2,500 debentures, created January 21st, 1913, filed pursuant to Sec. 93 (b) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £1,400. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Bryant Trading Syndicate, Ltd.**—Mortgage debenture, dated January 23rd, 1913, to secure £5,000, charged on company's undertaking and property, present and future. Holder: J. T. Bentley, Dovercourt, Essex. This debenture ranks subject to debentures already issued by the company to Messrs. Jagard & Golding, but in priority to the debenture issued to C. B. James for £21,000.

**C. H. Hare & Co., Ltd.**—Present capital £16,000 in £1 shares (8,000 pref.); original capital, £12,000 in £1 shares (4,000 pref.); increased to present amount February 26th, 1912. Return dated December 30th, 1912; 5,200 pref. and 8,000 ord. shares taken up; £1 per share called up on 5,200 pref. and 502 ord.; £5,702 paid; £7,493 considered as paid on remainder. Mortgages and charges: £3,500.

**X. L. Electric Co., Ltd.**—Debenture dated January 15th, 1913, to secure £400, charged on the general assets. Holder: Capt. C. Wiener Ewell.

**Electricity Supply Co. for Spain, Ltd.**—Particulars of £250,000 debentures, created November 8th, 1898, and having the benefit of a trust deed of same date, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £6,000. Property charged: The company's undertaking and property, including uncalled capital. Trustees: A. R. Monks, 123, Cannon Street, E.C., and C. Hill, 88, Leadenhall Street, E.C.

**Alfred A. Secrett, Ltd.**—Debentures dated December 31st, 1912, to secure £105, charged on the company's undertaking and property, present and future. Holder: F. W. Laves, 75, Waddon Road, Croydon.

**Blackpool, St. Anne's and Lytham Tramways Co., Ltd.**—Particulars of £20,000 debentures, created by resolution of January 12th and March 13th, 1905, and December 23rd, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £5,000. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Sykes & Sugden, Ltd.**—Mortgage dated January 22nd, 1913, to secure £720, charged on leasehold land in Spring Place, Huddersfield, with the Spring Place Works thereon, and machinery, shafting, &c., therein, also leasehold land in George Street, Huddersfield, with dwelling house, &c., thereon. Holders: Huddersfield Equitable Permanent Benefit Building Society, Huddersfield.

**Filaments, Ltd.**—A memorandum of satisfaction in full of debentures, dated February 11th and January 1st, 1910, securing £220, has been filed.

**G. H. Turner & Co., Ltd.**—Issue on January 28th, 1913, of £100 debentures, part of a series of which particulars have already been filed.

**Strode Co., Ltd.**—Particulars of £15,000 debentures, created January 20th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £12,500. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**I.T.C., Ltd.**—A memorandum of satisfaction to the extent of £1,500 of debentures, dated July 26th, 1910, securing £3,000, has been filed.

**New System Private Telephone Co., Ltd.**—A memorandum of satisfaction to the extent of £1,000 on January 8th, 1913, of debentures dated January 7th, 1908, securing £3,000, has been filed.

**United Electric Car Co., Ltd.** (formerly Electric Railway and Tramway Carriage Works, Ltd.)—A memorandum of satisfaction to the extent of £20,000, on January 1st, 1913, of mortgage dated November 28th, 1901, securing £50,000, has been filed.

**Magneta Time Co., Ltd.**—Debenture dated February 3rd, 1913, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: M. D. Fox, 103, Phinbeach Gardens, S.W.

**Amazon Telegraph Co., Ltd.** (44,532).—Capital, £250,000, in £10 shares. Return dated December 2nd, 1912. All shares taken up. £250,000 paid. Mortgages and charges: £285,800.

**Douglas Southern Electric Tramways, Ltd.** (45,701).—Capital, £50,000 in 30,000 pref. and 20,000 ord. shares of £1 each. Return dated December 17th, 1912, filed January 8th, 1913. 25,873 pref. and 15,472 ord. shares taken up. £1 per share called up on 12,566 pref. and 5,804 ord. £18,370 paid. £3,075 considered as paid on 13,107 pref. and 9,668 ord. Mortgages and charges: Nil.

**Costa Rica Electric Light and Traction Co., Ltd.** (56,447).—Capital, £130,000 in £1 shares. Return dated January 3rd, 1913. All shares taken up. £7 paid. £129,993 considered as paid. Mortgages and charges: £267,700.

**Foster Engineering Co., Ltd.**—Issue on February 7th, 1913, of £2,000 debentures, part of a series of which particulars have already been filed.

**Accumulator Industries, Ltd.** (67,180).—Capital, £40,000 in £1 shares. Return dated January 14th, 1913: 37,006 shares taken up; £1 per share called up on 26,506; £26,484 paid, leaving £22 in arrears; 10,500 shares considered as fully paid. Mortgages and charges: Nil.

**Electromobile Co., Ltd.**—Issue on January 30th, 1913, of £309 15s. debentures, part of a series of which particulars have already been filed.

**James Keith & Blackman, Co., Ltd.**—Issue on February 12th, 1913, of £1,000 debentures, part of a series of which particulars have already been filed.

**Foreign and Colonial Lighting Co., Ltd.**—Charge on company's undertaking, property and rights of all kinds, dated February 12th, 1914, to secure £210. Holder: A. B. Reikett, Kenmore, Highlands, St. Leonards-on-Sea.

**Pontelec Welding Patents, Ltd.** (107,935).—Capital, £30,000 in £1 shares (20,000 ord. and 10,000 pref.), return dated January 2nd, 1913: 20,000 ord. and 5,000 pref. shares taken up; £5,000 paid on the pref., £20,000 considered as paid on the ord. Mortgages and charges, £1,800.

## CITY NOTES.

### Late City News.

JUST as we are going to press there has arrived a batch of company reports, from which we extract the following. The full reports will be referred to further next week:—

**Bruce Peebles & Co., Ltd.**—Results less satisfactorily than 1911. Adverse balance, £1,594. Trading seriously affected by strikes and consequent disorganisation. Prospects now better, owing to improving prices and demand. Meeting, Edinburgh, February 28th.

**British Electric Transformer Co., Ltd.**—Satisfactory results. Available balance, £24,714; reserve, £9,000: preference dividend, £2,597; 10 per cent. dividend on ordinary shares, £7,895; directors' extra remuneration, £1,106; carry forward, £1,117. Meeting, February 28th.

**W. T. Henley's Telegraph Works Co., Ltd.**—Profit, £92,069, less fees, debenture interest, depreciation, &c., £23,986 = £68,083 + £36,862 brought forward and £4,011 Bahama Florida securities. Total, £108,987. Put to depreciation of securities, £1,219; to reserve, £15,000; bonus distributing Bahamas Florida fund, £4,000: preference dividend, £9,000; dividend on ordinary shares (15 per cent.), £30,000; carry forward, £45,017. Meeting, February 28th.

**Para Electric Railways and Lighting Co., Ltd.**—Revenue, less expenses, £133,038. After providing for interest and sinking fund, preference dividend, depreciation (£15,000), contingencies (£15,000), 5 per cent. is paid on ordinary shares, and £9,870 carried forward. Operating expenses decreased; difficulties overcome. Meeting, February 28th.

**Telegraph Construction and Maintenance Co., Ltd.**—Net profit £109,619 + £106,658 brought forward = £216,277. Interim dividend, 5 per cent., £22,410; further dividend, 10 per cent. and bonus of 12s. per share, require £67,230; reserve fund, £20,000; carry forward, £106,637. General business of the year satisfactory. Meeting, February 27th.

**London Electric Supply Corporation, Ltd.**—Profit £68,670, compared with £61,412. Available after debenture interest and sinking fund £40,983. Preference dividend, £26,952; 2½ per cent. on ordinary, £8,325; contingencies, £1,000; carry forward, £4,706. New reserve fund opened in form of sinking fund account, to receive £12,000 annually for redeeming debenture stock in 1931. Supply for traction 75 per cent. increase, and for industrial purposes 26 per cent.; units sold advanced from 20½ to 28½ millions; total costs reduced by 20 per cent. To meet L. B. & S. C. demand new capital (£250,000) will have to be raised. Meeting, February 27th.

**Mackay Companies.**—The report states (says the *Financier*), that the profit and loss account for the past year shows the following results: Receipts.—Income from investment in other companies, \$4,136,009. Disbursements.—Dividends paid on the Mackay Companies' preferred shares, \$2,000,000; dividends paid on the common shares, \$2,069,020; operating expenses, \$31,323; leaving to be carried forward \$37,665. The most notable event of the year in connection with the Mackay Companies is an invention by Mr. John Gott, who has been the chief engineer of the Commercial Cable Co. since its organisation in 1881. He has invented a device by which the Morse dot-and-dash signals can be used on long submarine cables—that is to say, messages can be sent by the ordinary landline Morse key and read on a Morse sounder. The far-reaching effect of this invention on all kinds of telegraph transmission, both by land and sea, cannot at this time be definitely stated, but the Commercial Cable Co. believes that, by this invention, it will be possible to transmit, through automatic repeaters, telegraph signals around the world. The Commercial Cable Co. has acquired the rights to this invention, and has taken out patents all over the world.

**African Trans-Continental Telegraph Co., Ltd.**—The liquidator (Mr. P. J. Baird), presiding at a meeting held at 2, London Wall Buildings, E.C., on 13th inst., referred to the impracticability of realising an undertaking of this nature by sale in the ordinary way. There were matters difficult to overcome consequent upon terms arranged for the extensions into Portuguese, German, and other territory. They hoped that present negotiations with the Imperial and the German Governments might result in the adjustment of these difficulties and the continuation of the service. They were now waiting for the reply of H.M. Government to proposals submitted last October, and meanwhile the service was being continued under a guarantee by the British South Africa Co. against loss on working. The meeting is reported in the *Times* of February 14th, from which we gather that "under no conceivable circumstances" will there be any return to the shareholders "who must . . . write off their shares as valueless."

**Continental.**—SWITZERLAND.—La Société Franco-Suisse pour l'Industrie Electrique, of Geneva, is declaring a dividend of 5 per cent. for the last financial year, as compared with only 4½ per cent. in the preceding 12 months.

**HUNGARY.**—The Felten und Guillaume Ungarische Kabelfabrik Gesellschaft, of Budapest, reports a profit of £29,647 for the last financial year, as compared with only £27,454 in the preceding 12 months. The dividend is being increased from 16½ to 17½ per cent.

**Gateshead and District Tramways Co.**—The directors have resolved to recommend (subject to audit) that a dividend at the rate of 7 per cent. per annum be paid on the ordinary shares for the half-year ended December 31st, 1912, making with the interim dividend at the rate of 5 per cent. per annum for the half-year ended June 30th, 1912, paid on September 20th last, a total of 6 per cent. for the year 1912, and that in addition a bonus of 1 per cent. be paid on the ordinary shares. The annual meeting is called for March 13th.

**Stock Exchange Notice.**—Application has been made to the Committee to allow the following securities to be quoted in the Official List:—Rio de Janeiro Tramway, Light and Power Co., Ltd.—Further issue of £33,000 5 per cent. 50-year mortgage bonds of £100 each

### German Electrical Companies.

**THE Deutsche Glühlampen Fabrik of Plauen**, which was formed in 1910, with a share capital of £100,000, has just decided to reduce the capital to £50,000. At the same time, preference shares of from £12,500 to £25,000 are to be issued to provide working capital.

The **Berlin Elektromobil A.G.** has terminated the financial year 1911-12 with a deficit of £149,000, which is practically the same as in the preceding year, the share capital being £150,000. When the Halensee depôt has been sold, and certain actions for damages have been settled, the liquidation can be closed. The depôt is booked at £37,000, whilst mortgages of the same amount are in operation.

The **Helios, Elektrizitäts A.G., of Cologne**, the liquidation of which is occupying several years, disposed of Roumanian investments at Braila and Bucharest in 1911-12, as well as the holding in the Altona-Blankenese Railway. Further payments were made to creditors, and the debenture-holders have now received 75½ per cent. in cash, and the banks 80 per cent. An interest is still held in two supply works and one tramway. The deficit remains at £419,000, as in 1910-11.

The **Moore Licht, A.G., of Berlin**, which was formed in 1910, and has already been subject to one scheme of financial reconstruction, has now convened an extraordinary meeting to consider a further reorganisation in view of the fresh loss of £13,000 incurred in 1911-12. It is now suggested that the preference and ordinary share capital of £70,000 should be reduced to £9,500, and that a further issue of preference shares of £3,000, having a prior right over existing preference capital, should be made. The patents for the Moore light for France and Belgium are to be sold.

The **A.E.G.-Lahmeyer Werke, of Frankfurt-on-Main**, which took over the dynamo works of the Felten & Guilleaume Co. two years ago, report gross profits of £35,500 for 1911-12. After meeting general expenses and placing £2,340 to depreciation, as against £2,380 in 1910-11, the net profits are returned at £31,900, as compared with £28,800 in the six months forming the previous and first financial year. A dividend of 6 per cent. has been declared on the share capital of £500,000, this being the same rate as in 1910-11 for six months.

The liquidation of **E. H. Geist, Elektrizitäts A.G., of Cologne**, reporting on the year 1911-12, states that manufacturing operations were continued until January 1st, 1912, when the works were taken over by the Colonia Electricity Co., which then completed the unfilled orders on the books. The accounts show gross profits of £9,600 in 1911-12, as compared with £7,200 in the previous year, the former sum being absorbed by general expenses and depreciation. The debit balance remains at £24,000 on a total share and loan capital of £55,000. It is stated that the Colonia Co., which was granted an option for five years on the works, plant and site, has not exercised the right as yet.

The **Bergmann Elektrizitäts Unternehmungen A.G.**, which was formed to financially promote railway construction and central stations on behalf of the parent company (Bergmann Electricity Works Co.), has closed the year 1911-12 with a fresh loss, which amounts to £17,000, as compared with a loss of £15,000 in 1910-11. The directors' report states that further progress was made in the business of the railway department, but activity in the central station department was suspended, and the work restricted to the completion of the undertakings in hand. The limitation in this direction is in accordance with the programme decided upon some time ago.

**Mather & Platt, Ltd.**—The directors' report, as abstracted in the *Times*, states that the net profits for 1912, after charging depreciation and directors' remuneration and expenses, amounted to £144,749. The directors have transferred to the works removal account £30,000, leaving £114,749, plus the balance brought forward, making a total of £147,506. The directors recommend a dividend of 10 per cent. per annum, free of tax, on the ordinary shares (less the interim dividend), together with a bonus of 2 per cent. free of tax, and propose to transfer to reserve account £20,000, and to carry forward £35,506. The large extensions at the company's Park Works referred to in last year's report have been carried out. The directors do not anticipate that any further allocation from profits will be necessary in respect of works removal.

**Underfeed Stoker Co., Ltd.**—The directors (according to the *Financier*) have declared a dividend at the rate of 2½ per cent. per annum.

**City of London Electric Lighting Co., Ltd.**—The directors have decided, subject to completion of audit, to place £50,000 to reserve, and to recommend dividends of 12s. per share (at the full rate of 6 per cent. per annum) on the preference shares, and 16s. per share (at the rate of 8 per cent. per annum) on the ordinary shares. On account of these dividends, 6s. per preference share, and 6s. per ordinary share, was paid in September, 1912, and the balance remains to be paid. After payment of the dividends and other appropriation, there will remain about £24,000 to be carried forward. In addition, the directors have also decided to recommend a bonus of 2s. per ordinary share (less income-tax) out of the amount standing to the credit of the dividend equalisation fund.

**Metropolitan Railway Co.**—At an extraordinary general meeting, held on 12th inst., the proposal to acquire the G.N. and City Railway Co.'s undertaking was approved by an overwhelming majority.

### St. James's and Pall Mall Electric Light Co., Ltd.

MR. M. R. PRYOR (chairman) presided on Tuesday at the office, Carnaby Street, S.W. over the annual meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 270), the CHAIRMAN referred with regret to the absence of Mr. Leaf, the chairman, who had an attack of influenza. He also asked the shareholders to join with the board in sympathetic regret at the death of Sir J. H. Morris, who was the senior member of the board. They would, doubtless, know that Mr. F. J. Walker became the manager and secretary of the company at a time of very great anxiety, and it was due, in the first place, to his efforts, that the present situation of the business—second to none, he ventured to say, for soundness and success amongst the electric companies of London—was due. The board had considered that Mr. Walker's exceptional services deserved exceptional recognition, and they had, therefore, invited him to take the vacant seat on the board, but with the title of managing director. They had appointed him to the post for a period of five years, during which he would not be subject to the condition of retirement imposed on the other directors. He trusted that was entirely in accordance with the shareholders' wishes, and he need hardly say he looked on it as a very important benefit to the company to secure the services of Mr. Walker in the dual capacity. On reading through the accounts, they must have been struck with the similarity they showed to those of the previous year. The sale of electric current, although still showing the effects of the metallic-filament lamp, and by no means so elastic as they could have hoped it would have been, showed some improvement. Connections had increased by no less than 634 kw., and the units sold had gone up a little more than 300,000. The gross revenue from the sale of current had increased by £2,300. There had been an almost similar increase in the cost of generation, viz., £2,100, and the ultimate result arising from various differences too small to call attention to, although they were kept well in view by the board, was that the balance available for dividend was £54 less than last year. In view of a fact, to which he would refer later, this result was, in their opinion, very satisfactory, and it was a good deal better than they had dared venture to hope for a year ago. He would like to draw attention to the fact that this did not involve any difference in the sums put aside for depreciation and contingencies. Last year the chairman told them they had in view the replacement of some old and obsolete units at Carnaby Street station by new transforming generators and accumulators. They had steadily pursued the policy of keeping the station up to date, and the first stage in the improvement would be carried out in the summer. The appearance of quietude which the figures seemed to show was really illusory. The outstanding feature of the year was the great coal strike, which they were anticipating when they last met, and the storm burst a fortnight later. Their assurance that they had made sufficient provision for any period of time over which the strike could reasonably be expected to last was justified by events, and the store they had accumulated at Grove Road carried them through without the necessity of stinting the supplies in any way, a result of which they ventured to feel somewhat proud. But although the most obvious difficulty was thus averted at the cost of continuous vigilance and anxiety on the part of Mr. Walker and Mr. Dobson, yet the strike left a legacy in the shape of the increased cost of coal, and this he feared they must consider permanent, although part of the increase was due not to the strike, but to the great industrial activity which was characteristic of the past year, and so far showed no sign of decrease. It might interest them to know that the cost of Midland bituminous coal which, at the time of the strike was, on a four years' average 11s. 4d. a ton, rose after the strike to 14s. 9d. per ton, which was a 30 per cent. increase. In view of this great rise, it reflected the highest credit on their engineer, that the total cost of generation had not increased beyond the additional revenue. This had been done by increased efficiency at Grove Road station, on which they relied for the whole steady load, using their Carnaby Street station only to help on the peak. The new 3,000-kw. turbo-generator, of which the chairman spoke last year, had proved of inestimable value, and they had to take into serious consideration on the board of the Central Co. the need of adding more plant of a like character before long. That was not the immediate problem for them there, but he mentioned it as a fresh argument for their policy of converting Carnaby Street from a generating to a transforming station. In the absence of the chairman, he hesitated to analyse the accounts, but they were exceedingly simple and did not contain any points on which he could advantageously dwell.

MR. B. FITCH seconded the motion, and the report was adopted.

On the motion for the re-election of the retiring directors, proposed by the CHAIRMAN, Mr. W. H. Ash and Mr. Patchell congratulated the board on having elected Mr. Walker to his new position.

MR. BOURN proposed a vote of thanks to the chairman and board, and also to Mr. Dobson and the engineering staff.

The motion was carried, and the CHAIRMAN, in reply, heartily reciprocated the words of Mr. Bourn as to the loyalty and hard work of Mr. Dobson and his staff.

MR. WALKER, in acknowledging what had been said regarding himself, remarked that he fully appreciated the high compliment which had been paid him, and would devote the same care and attention, coupled with the same enthusiasm, to the affairs of the company as in the past.

**Bournemouth and Poole Electricity Supply Co., Ltd.**—The directors have declared a final dividend on the ordinary shares at the rate of 7 per cent. per annum for the half-year ended December, making 6 per cent. for the year, less income-tax

### Rand Mines Power Supply Co.

THE *South African Mining Journal* contains a report of the fourth annual meeting of this company, held in Johannesburg last month. Mr. F. D. P. Chaplin presided, and said that the report and accounts showed the rapid progress which the company had made since entering the revenue-earning stage, and indicated that there was every prospect of a considerable growth in the company's business in the immediate future. Notwithstanding the fact that they were still partly in the construction stage, they were able to earn a profit of close upon a quarter of a million during the financial year ended August 31st last. This satisfactory result would have been even better but for the unfortunate breakdowns, which involved not only the payment of penalties, but also a considerable loss of revenue, as well as increased expenditure in bringing the plant again into commission. The company's experience in regard to breakdowns appeared to be one which was inseparable from the entry of large generating units into commercial service, especially when, as in this case, the commencement of operations was accelerated on account of urgent and increasing demands for power before sufficient reserve plant was available. However carefully the machine was designed and constructed, reliability could only be secured through experience gained in actual operation. There could be no question, however, that the policy adopted enabled the company to derive the greatest possible advantage in the shape of revenue from the full output of the plant, and at the same time furthered the interests of the consumers by the provision of the available supply of power at the earliest possible date. Adequate arrangements had been made for the extension of the company's generating stations and transmission and distribution systems. Everything possible was being done to provide a sufficient supply of power to meet notified future demands, and provided that the manufacture of plant and the progress of the extension works were not hampered by delays due to strikes in Europe, and other causes, which had been their unfortunate experience in the past, there was every reason to believe that the company would soon be provided with the full complement of plant and equipment, inclusive of reserve plant necessary to meet all requirements. After the company had commenced operations, experience soon indicated that there were several defects in the agreement between the company and the Rand Mines, Ltd., which would have to be remedied, and certain alterations would have to be made before the contract could be regarded as a workable instrument and satisfactory to the parties concerned. The decision to draw up a new agreement and form of contract was no light undertaking, and not only entailed very difficult negotiations between the representatives of the board, acting with the Victoria Falls and Transvaal Power Co., Ltd., and the representatives of the Rand Mines, Ltd., but also involved an immense amount of labour and care in the preparation of such important documents. This new contract, although not yet finally agreed, was now in the hands of the representatives of this company and the Rand Mines, Ltd., in London, and they expected very shortly to hear that the document has been completed. As the result of the very close relations which had been found to exist between this company and the Victoria Falls and Transvaal Power Co., Ltd., it had been thought advisable to arrange the accounts upon a basis which was not originally contemplated. As a part of this arrangement, it was found advisable that one firm of auditors should audit the accounts of both companies, and it had consequently been arranged, in order to bring this about, that a change should be made in the auditors of this company.

The report and accounts were adopted.

### Electrical and Industrial Investment Co., Ltd.

The first ordinary general meeting of this company was held on Monday at Electrical Federation Offices, Kingsway, W.C., Mr. C. Shirreff Hilton, the deputy chairman, presiding in the absence, abroad, of the chairman, Mr. E. Garcke.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 269), said he believed the shareholders would consider the balance-sheet thoroughly sound and satisfactory. During the seven months with which the accounts dealt, they had made a profit, after meeting all administration expenses, of £11,325. That profit was derived from interest and dividends on investments and from fees and commission on financial services. After paying interest on the debentures and the dividend on the preference shares, there remained a balance of £4,943. Out of that it was proposed to write off the whole of the preliminary expenses, amounting to £1,629, and to carry forward the balance of £3,314. There would have been no difficulty in recommending the declaration of a dividend on the ordinary shares, but the large holders of those shares agreed with the directors in the view that the better course was to strengthen the position of the company by building up a large carry-forward in the early history of the company's career. The shareholders could well afford to go without a dividend on the ordinary shares on this occasion, because they received a very handsome return on the liquidation of the City of Birmingham Tramways Co.; and they were receiving a dividend on the preference shares which they held, which was a substantial return on the cash capital they had invested. Of course they were not losing the undivided profits—they were still there, and they would serve to improve the value of the ordinary shares. The company was formed last May, to take over the investments of the City of Birmingham Tramways, Ltd., and the capital was subscribed for the main part by shareholders and debenture-holders of that company. The securities which they took over amounted to over £604,659, but the issued

capital of the company amounted to £381,808, so that securities to the extent of about £222,000 had to be realised. That surplus of securities was represented by investments which had been made by the trustees for the debenture-holders of the City of Birmingham Tramways, Ltd., and were made in trustee securities. The nominal value of those securities was £211,400, and they had cost the trustees £219,591. As the yield on those securities was only 3½ per cent., there was no advantage in raising capital for the purpose of holding them, and they were, therefore, realised. Unfortunately, gilt-edged securities during the last few years had suffered serious depreciation, and the losses suffered on the realisation of those securities by the company amounted to £22,456, or about 10½ per cent. of the capital amount. It was well, however, that they were sold, for those high-class securities had undergone a still further depreciation, and the losses would undoubtedly have been greater had they been retained. The loss had been charged against the reserve, which had been created to meet depreciation. A part of that reserve was provided by the old company, but a further addition to that fund had been made, and would continue to be made, by adding to it any profit which the company had made, or would make, by the realisation of investments. On the other hand, any loss that might be made on the realisation of investments would be borne by that reserve. By dealing with profits and losses in that way they hoped to establish the company in a strong position. Their policy was to keep the capital account distinct from the revenue account, and to hold all investments at their actual cost—they did not propose to write them either up or down. The present investments amounted to £485,866, and they were spread over 179 investments. Of those the larger proportion were quoted securities, and taking them at the middle price at December 31st, and taking the other securities at cost, the aggregate value was more than the net figure at which they stood in the balance-sheet. The major part of the investments—£261,000—were in the form of debentures and debenture stocks; £126,000 were in preference shares, and only £86,000 in ordinary shares. The board had special facilities which enabled them to gauge the value of electrical investments, and as most of the investments were made by the City of Birmingham Tramways, Ltd., whose powers of investment were limited to tramways and kindred securities, a large number were in electric power and traction undertakings, electric lighting, tramways and railways. It was desirable that they should raise a little further capital by the issue of ½ per cent. debentures so as to reduce the average cost of their capital, and as opportunity offered, the directors proposed to issue further debenture stock.

Mr. J. A. CHRISTIE seconded the motion, and the report was adopted.

### Kensington and Knightsbridge Electric Lighting Co., Ltd.

THE directors' report to the end of 1912 shows that the renewal and reserve fund account now stands at £115,361, being an increase of £8,746. After providing for the amount placed to that account, and paying the dividends on the 6 per cent. first preference shares to June 30th, 1912, on the 5 per cent. second preference shares to September 30th, 1912, and an interim dividend at the rate of 8 per cent. per annum on the ordinary shares for the first half of the year, the balance standing to the credit of the net revenue account for the year 1912 is £9,159. Out of this £1,500 has been appropriated to the payment of the first preference dividend to the end of the year, and £625 has to be set aside to meet the portion of the dividend on the second preference shares accrued to the same date. It is proposed to pay out of the balance of £7,034 a further dividend on the ordinary shares at the rate of 10 per cent. per annum, for the past half-year, making, with the interim dividend paid on August 16th, 9 per cent. for the year. This will leave a balance of £1,784 to be carried forward.

The meeting is called for February 27th, at 148, Brompton Road, S.W.

**Crossley Brothers, Ltd.**—The directors report that for the year ended December, 1912, the amount to the credit of revenue account is £56,322, out of which a dividend has been paid on the preference shares, at the rate of 5 per cent. per annum, for the first half of the year, amounting to £10,035. It is proposed to pay a further dividend for the second half of the year at the rate of 5 per cent. per annum on the preference shares amounting to £10,035, and to carry forward £36,153. The decrease in profits is due to the serious reduction in the normal output caused by the prolonged strikes at the Openshaw works during the months of January, February, and September. The meeting is called for February 26th, at Manchester.

**Chelsea Electricity Supply Co., Ltd.**—The directors recommend a dividend for the half-year to December 31st, 1912, at the rate of 6 per cent. per annum on the ordinary share capital, making 5 per cent. for the year 1912, after paying debenture interest and placing £13,626 to depreciation fund, £704 to debenture premium redemption fund, writing off £1,089 from the cost of extinction of founders' shares, £1,000 from cost of purchase of Cadogan Electric Light Co., and £1,352 off cost of investments; carrying forward £2,832, subject to audit. The dividend is the same as for 1911, and will be payable on and after March 15th.

## Westminster Electric Supply Corporation, Ltd.

THE directors' report for 1912 shows that the total power of the lamps, motors and apparatus connected to the company's mains had increased from 35,337 kw. to 37,710 kw. The length of roadway in which continuous-current mains have been laid now exceeds 93 miles, making about 377 miles of ways, into which upwards of 280 miles of copper (strip and cable) have been drawn. In addition six miles of trunk mains (35 miles of ways) are laid in the company's area to connect the stations with the Central Electric Supply Co.'s station at St. John's Wood. An interim dividend at the rate of 9 per cent. per annum on the ordinary shares, and the dividend on the  $\frac{1}{2}$  per cent. preference shares, for the half-year ending June 30th, 1912, have been distributed. After allowing for depreciation, sinking fund and other charges, the net balance is £17,840, from which must be deducted the second half-year's dividend on the preference shares, which absorbed £11,653, leaving £36,188. Out of this the board recommend the payment of a dividend at the rate of 11 per cent. per annum, less income-tax, for the past half-year, making 10 per cent. for the year, carrying forward £7,703.

The meeting is called for February 26th.

Units sold	18,638,125
Used on works for lighting, meter testing, &c.	496,376
Total	19,134,501
kw. on circuit	37,710

## South Metropolitan Electric Light and Power Co., Ltd.

THE report of the directors for 1912 states that the revenue account shows a credit balance of £33,933, which, with £3,067 brought forward, makes a total of £37,001. After deducting £12,423 for interest on debenture stock paid and accrued, and for other interest, and £6,504 for interim dividends paid on the preference shares, there remains a balance of £18,073; out of this there is to be paid a final dividend upon the 7 per cent. cumulative first preference shares, requiring £5,004; a final dividend upon the 6 per cent. cumulative second preference shares, absorbing £1,500; there is placed to credit of depreciation account £4,000, to credit of preliminary expenses £2,000, to credit of showroom account £100, and the balance (£5,470) is to be carried forward.

The following figures show the progress of the business:—

Year.	Lamps (35-watt). Connected at end of year.		In-crease.	Consumers.	Gross revenue.	Expendi- ture.	Net revenue.
	1909	1910					
1909	191,302	13,674	3,916	£11,847	£16,465	£25,882	
1910	208,046	16,744	4,305	44,437	17,678	27,608	
1911	230,191	22,145	4,697	51,614	20,541	31,072	
1912	258,872	28,681	5,268	66,604	22,670	33,933	

The new consumers and lamps connected show a greater increase than in any previous year, and the company's showroom continues to be of material assistance to the development of its undertaking. During the year the plant at the power house has been increased by the addition of one 1,500-kw. turbine, which will be put into service shortly. Further connections have been made in the area of the West Kent Electric Co., Ltd. A further £20,000  $\frac{1}{2}$  per cent. first mortgage debenture stock has been issued during the year.

The meeting is called for February 26th at Winchester House, E.C.

## Liverpool Overhead Railway Co.

THE forty-ninth half-yearly general meeting was held on February 11th, at Liverpool, Mr. Harvey C. Woodward presiding over a good attendance.

THE CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, p. 233) regretted that ill-health had compelled Sir William Forwood to resign the chairmanship of the company, and the directors had appointed him (Mr. Woodward) to fill the vacancy. Sir William had been chairman of the company from its inception, and had always taken the keenest interest in its successful working. His colleagues on the board missed his presence greatly, but hoped that he might yet be able to take some part in their deliberations. With the kind assistance of his co-directors and the faithful co-operation of the manager and staff, he hoped to see their little railway steadily improve its position. The directors were gratified at being able to place before the shareholders more encouraging accounts. There had been a considerable boom in the trade of the port, in which that railway had fortunately participated, and which was reflected in their increased earnings. They had carried during the half-year 559,040 more passengers, which yielded an increased revenue of £3,245, at an increased expenditure of £1,181. He could assure the shareholders that they had not neglected the up-keep of the undertaking, but had steadfastly adhered to their policy of maintaining its efficiency. The railway had now been opened 20 years, and it was to-day structurally in as good a condition as ever. The coal strike imposed upon them the necessity of carrying reserve stocks of coal; they obtained a suitable position near their generating station, where they had stocked a good supply. Their traffics were keeping up well, and they had already made three records this year in the number of the cheap workmen's return tickets. It was anticipated that his Majesty the King would open the new Gladstone Dock at Seaford in July. When that dock was in operation many of the big liners would, no doubt, be transferred to it from Canada Dock, and that, together with the new repair yard of Messrs. Harland & Wolff, adjacent to the railway, should increase their receipts still further in future. The traffic during the past half-year was the best they had had since December, 1900 (an exceptional year, owing to transports for the South African war), and, taking into consideration the serious competition which they had encountered since that date, the result was satisfactory. But he did not wish to make the picture too rosy. They were still exposed to keen competition. The cost of fuel and all materials had steadily increased, and concessions to their staff were a heavy item in increasing their expenses; while the Government, following on the Workmen's Compensation Act, had added a new burden in the shape of sickness and unemployment insurance. In the face of these obstacles to good dividends, their earnings per passenger tended rather to diminish, and last year averaged only 1'67d. per passenger, against 1'93d. in 1904. These fractions did not convey much to a general audience, but on the workmen's cheap tickets the reduction in fares practically amounted to carrying fully 1,000,000 more passengers in 1912 than in 1904 for about the same return in actual money, and they could only rely upon increased traffic for further improvement in their receipts. With regard to the debenture issue, the advance in the Bank of England rate to 5 per cent., and the European war, rather tended to hinder its success, but they succeeded in placing nearly three fourths of it on the terms of the prospectus. They had still a few thousands to dispose of, and if any of the shareholders or their friends would like a good home investment in a railway earning over three times the interest on its debenture, with the additional guarantee of the Mersey Dock Board, a kind of security that they could sleep over comfortably, they would be pleased to allot their requirements. The directors would hold one meeting a year, which would be in February, but that did not debar them from paying an interim dividend in July or August, when they considered that their traffics justified that being done.

MR. J. E. ANDERSON seconded the adoption of the report, and the motion was carried unanimously.

## City of Buenos Ayres Tramways Co. (1904), Ltd.

THE meeting of this company was held on Thursday last week, at Winchester House, E.C. Mr. J. HEATON, in proposing the adoption of the report, said that it was in precisely the same form as they had adopted ever since their fusion with the Anglo-Argentine Co., and the result which they showed was even more satisfactory than in any previous year. The annuity of £70,660 from the Anglo-Argentine was a fixed one, and had been duly received, and the shareholders had received the three quarterly dividends up to September 30th last. Ever since the fusion, it had been a great satisfaction to him as chairman of the company, and as a director of the Anglo-Argentine Co., to refer to the increased revenue of the latter undertaking. For the year 1912 that company would again show an increased revenue, and their annuity of £70,660 would be the first charge upon a sum, roundly speaking, of a million sterling. Their amortisation funds had been fully maintained, but for the past year they had been able to increase the amount placed to the general amortisation fund to £4,500, as against £3,650 for 1911. He explained last year that such would be the case, because they had been able to make new leases of their farm property at figures considerably in excess of the former rents.

MR. E. H. WOODS seconded the motion, and the report was adopted.

## Cambridge Electric Supply Co., Ltd.

THE directors' report for 1912 shows that during the year 1912 there have been connected 198 additional consumers, having the equivalent of 6,286 (30-watt) lamps, making a total to date of 82,580. The number of units supplied during the year has been 810,703, an increase of 110,116 units. £3,279 has been transferred from the depreciation account for the purpose of writing off plant which has become obsolete. The accounts show a total profit for the year of £10,172, which, added to £904 brought forward from 1911, makes £11,076. After deducting debenture and other interest £1,927, placing £3,500 to depreciation fund account, there remains a balance of £5,649. An interim dividend of 2 per cent., absorbing £1,696, has already been paid, and the directors recommend the payment of a further dividend of  $\frac{3}{4}$  per cent., making  $\frac{5}{4}$  per cent. for the year. This will absorb £2,968, leaving to carry forward £984. The directors have decided to issue the 577 shares shown in the accounts as the balance of the authorised and unissued capital. They will be in the first instance offered to the existing shareholders and an application form was enclosed with the report. The premiums will be added to the depreciation fund account or reserve as the directors may determine and the capital paid up to reduction of the bank loan. Dr. P. W. Latham has found it necessary to resign his seat on the board owing to his leaving Cambridge. He had served the company as a director for 18 years. Mr. S. R. Ginn has been appointed to the vacancy. The meeting is called for February 25th.

**Metropolitan Electric Tramways, Ltd.**—An extraordinary general meeting is called for February 24th, to confirm the resolution passed on 7th inst., approving of the new Bill now being applied for.

**Newcastle-upon-Tyne Electric Supply Co.**—Dividend on ordinary shares for the year, 5 per cent., including 2 per cent. interim paid in July.

## Tyneside Tramways and Tramroads Co.

The directors report that for the half-year ending December 31st, 1912, the surplus of receipts over expenses is £4,486, plus £724 brought forward, making £5,210, and after deducting interest on debentures, loans, &c., amounting to £1,006, there remains an available balance of £4,204. A dividend on the preference shares at the rate of 5 per cent. per annum (less income-tax) absorbs £601; a dividend on the ordinary shares at the rate of 2½ per cent. per annum (less income-tax) (the same rate as for the corresponding half-year of 1911), requires £1,674; there is to be placed to the credit of reserve for renewals, depreciation and other contingencies, increasing it to £13,245, £1,400; writing down consols to £75 per cent. absorbs £102, leaving to be carried forward £427. The dividend paid on the ordinary shares for the whole year is an increase of ½ per cent. as compared with the year 1911. The traffic receipts show a decrease of £51 as compared with the corresponding half-year of 1911, but for the whole year there is an increase of £819. The whole of the track, overhead line, and rolling stock, has been kept in thorough repair out of revenue.

	1910.	1911.	1912.
Car-miles (Tyneside Tramway Co.'s cars)	697,218	705,120	717,567
Passengers carried (Tyneside Tramway Co.'s lines)	4,475,721	5,306,241	5,619,301
Total traffic receipts	£23,087	£26,070	£26,488
Gross profit	6,678	8,875	9,466

The half-yearly meeting was held at Newcastle-on-Tyne on 11th inst., Dr. J. THEO. MERZ, who presided, said that the traffic receipts for the past year were £26,888, which was an increase on the previous year of £792. That increase was realised in the first half of the year, for there had been a decrease during the second half, owing to the very poor holiday traffic. That latter item was £174 less than in the previous year. Workmen's traffic showed an increase of £200, it was most satisfactory, however, to see that on the whole the increase was on the ordinary traffic. There was an increase in the mileage run mostly on workmen's traffic, which yielded only a small revenue, and also on some experimental services in districts where the local authorities had asked for increased facilities. Those experiments did not pay, and they had lost money by increasing the number of cars. The cost per mile had gone up from 5'6d. to 5'9d. owing to repairs to lines and cars. The repairs to lines would be very heavy, but that expense would be met out of the reserve fund, upon which they had not yet drawn. He referred to the dividends recommended in the report, and said that 2½ per cent. was the largest they had paid. As to the current year, it had opened well, the receipts being slightly more than in the corresponding period of last year.

Mr. G. E. HENDERSON seconded the adoption of the report, which was agreed to.

## City and South London Railway Co.

THE fifty-seventh ordinary general meeting of the shareholders of the above company was held on the 11th inst. at the offices, 71, Finsbury Pavement, E.C., the Right Hon. C. B. Stuart Wortley, K.C., M.P., in the chair.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 232), said their minds were all occupied with the one dominating and unprecedented fact that the passenger receipts for the half-year were less by £6,522, and the balance to net revenue was down by £6,812. This was an even greater fall than he anticipated in November 26th, 1912. It represented the equivalent of a diminution in dividend on the ordinary stock for the half-year at the rate of more than ½ per cent. It was an effect of the same cause as that which he had in mind when, a year ago, he pointed to the then recent amalgamation between omnibus and railway companies as an example of an arrangement which they ought not to reject should it be offered to them. Its apprehended realisation as the year went on, was what made them enter into the negotiations which he described on November 26th, and approve the terms that on that day they advised the ordinary stockholders to accept from the Underground Railways Co. It had led to their recommending that day a dividend on ordinary stock at the rate of less by 1 per cent. than that which they were able to recommend a year ago. All these facts were part and parcel of a newly emerged state of affairs, which began to affect their traffics in February, 1912, and had since developed into a serious menace to their prosperity as a passenger-carrying industry—he referred to the systematic and determined increased provision of motor-omnibus travelling facilities. He knew of only two ways in which they could contend with an adverse influence such as this. They could level up the attractiveness of their own service, so as to outbid their competitor, or they could come to terms with their competitor in such a way as to make him a partner instead of an enemy. The board claimed that the arrangement that they had made with the Underground Co. combined the advantages of both these policies, and that the application to Parliament, which they recommended them to make, was a necessary part of the necessary policy of improving the attractiveness of the service. The service had fallen behind in the race for public favour because, if judged by modern standards, the trains did not go fast enough and the carriages were not roomy enough. Had the railway been built in 1900, instead of during a series of years ending with 1890, the tunnels would have been made of

11 ft. 6 in. diameter, instead of 10 ft. 6 in. And in respect of speed, as well as of other factors, higher standards could and would have been attained. The chairman entered in some detail into the circumstances that had led up to the present proposals. Not long before the apprehended fall in their traffics became a realised fact, a big combination embracing the District Railway, the three West End tubes, and the London General Omnibus Co., had just been brought about on the principle of replacing cut throat competition by co-operation and mutual assistance in the service of the public. An offer came their way, which they thought it good enough to give their provisional acceptance; and the result had been that it was accepted by no less than 99 per cent. in value of their ordinary stockholders, and that to a corresponding extent the Underground Electric Railways Co. of London, Ltd., were at this moment owners of the City and South London Railway. That great organisation was now to that great extent interested in seeing to it that their prosperity should not stagnate, that their receipts should no longer fall away, that their line and plant should be modernised and improved, and that they should be linked up physically with, and made comparable in respect of the attractiveness of the service they would offer, with the more modern tube railways that now ran between Hammersmith, Highgate and Finsbury Park in the north, right away to Hammersmith in the west, and Elephant and Castle in the south. They would perhaps desire him to describe and justify the proposals they made in the Bill, which they would shortly ask them to approve, rather than that he should make a second speech when the proceedings of the ordinary meeting were over. They proposed to ask Parliament to sanction their enlarging their tunnels wherever necessary from their present small diameter to that of 11 ft. 6 in., which was approximately the diameter of all the four tube railways built since their own. They proposed also to seek power to equip their system with all the useful rolling stock; that was with motors of the desired speed, and carriages of the desired height and width, to bring their service into line as regarded speed and quality with the best and most comfortable of those other systems. That they asked for power to do with capital money. Wonderful as it seemed, their consulting engineers told them that this operation of reconstructing the tunnels could be carried out by very short lengths at a time without important interruptions to traffic. Still, they thought it desirable to ask Parliament to protect their preference stockholders by a provision that any loss of dividend to them, arising from whatever cause, during the reconstruction process, might be made good to them out of the capital money to be raised under the Bill. The authorised but unissued capital that they had power to raise was £1,150,000 of stock or shares, and £413,363 in debenture stock or other form of loan. The £1,150,000 of stocks or shares might be as to £600,000 in ordinary stock, and as to £550,000 in preference stock. As things now stood under their existing powers, the borrowing powers could not be exercised to any amount above a mere £30,030, except as and when corresponding amounts of share capital had been issued and had produced in money not less than 50 per cent. of their face value. At the present market price of the ordinary stock it would be impracticable to raise money by that means. Consequently in the opinion of the board, the only course to be adopted was to raise the necessary funds by the issue of the £550,000 available preference stock, which would rank *pari passu* with the existing issued preference capital under the Act of 1905, amounting to £200,000. The issue of this preference stock would not prejudice the holders of the preference stock issued under the Acts prior to 1903. Parliament would be asked to allow them unrestricted power to raise the whole of this £413,363 of loan capital without reference to the price or amount of share capital issued. That undoubtedly meant that a sum of £413,363 debenture stock was to be sought to be issued in front of the preference stocks, which, but for the special power sought, could not have been so issued. It would be disrespectful and therefore impolitic for him to enter fully then, and by anticipation, upon the facts and arguments whereby they hoped to commend to Parliament their financial as well as their other proposals. What he might do, and ought to do, was to satisfy their preference stockholders that it was to their interest that these proposals to Parliament should be made. He submitted to them, with all respect, that for that purpose little could be needed in the way of argument. Were they going to remain in all respects as they were a year ago, or two years ago? They might object to taking the risks of adding to prior charges. But they could not remain as they were then, and they did not stand where they stood then. They were neither getting the same traffic nor making the same money. Could anyone doubt that it was better to rehabilitate and improve in good time the earning power of the system so as to make it such as the experience of other systems had shown to be remunerative even against surface competition? And though for this purpose they had to put in front of them an added interest charge of some £16,500 a year, let them look at the weekly traffics, not only as regarded their amounts, but as regarded also their movement and tendency, and judge whether to stay as they were, unimproved, and with shrinking margins, was not a prospect more menacing than that presented by the policy they offered, namely, that of two alternative risks they should take the one which instead of inertia and stagnation gave them that adaptation to their surroundings which was the surest condition of either renewed or continued vitality. Add to this that if the Underground Co., as the owners of the ordinary stock, were interested in improving the dividend on the ordinary stock, they were *a fortiori* the friends and protectors of the preference stockholders.

Mr. C. S. GRENELL seconded the motion, which, after a short discussion, was adopted.

Subsequently, at a special meeting, the Bills to which the chairman referred in his speech, were approved.

### Notting Hill Electric Lighting Co., Ltd.

THE directors report that during the year ended December, 1912, the expenditure on capital account was increased by £2,201 to £249,608, and it now exceeds the receipts by £40,265. The cost of the joint station at Wood Lane to date has amounted to £224,340, and joint debenture stock amounting to £227,500 has been issued. This stock is subject to cumulative sinking funds, which now amount to £52,607 invested in trustee securities. The following table shows the progress of the company:—

	Equiv. of 8 c.p. lamps.	Profit.
1909 .. .. .	180,908	£20,839
1910 .. .. .	189,885	22,002
1911 .. .. .	190,156	23,557
1912 .. .. .	211,838	24,436

The number of consumers is now 3,771, and, with the exception of 31, they are supplied at 200 volts. The gross revenue for the year was £44,780, an increase of £1,721. From the available net profit of £25,056, there have to be deducted the following:—Depreciation, renewal and reserve fund, £3,000; debenture and other interest, £2,424; Kensington and Notting Hill joint debenture stock—interest, £2,439; sinking funds, £1,473; to be distributed to staff under co-partnership scheme, £286; leaving a balance available for dividend of £15,433. Both classes of 6 per cent. preference shares have already received their full dividend, which absorbs £8,136, and leaves a balance of £7,297 available for dividend on the ordinary shares. The directors, therefore, recommend the payment of a dividend of 5s. per share, less tax on the ordinary shares, absorbing £6,368. The balance carried forward is £929, compared with £619 in 1911. The scheme of co-partnership with the company's staff, foreshadowed by the chairman at the last general meeting, was brought into operation during the year. Under this scheme, as shown above, £286 will be distributed to the staff, being an addition of 8 per cent. to their wages.

Units generated and purchased .. .. .	8,341,191
Units sold—Public lamps .. .. .	103,958
Private consumers by meter .. .. .	2,978,456
Total sold .. .. .	3,082,414
Units used on works .. .. .	26,922
Total accounted for .. .. .	2,509,336
Expended in distribution transformers and accumulators .. .. .	831,855
Public lamps .. .. .	53
Total maximum supply demanded .. .. .	1,691 kW.

### Newcastle and District Electric Lighting Co., Ltd.

THE directors' report for the year ending December 31st, 1912, states that the number of units sold was 14,789,149 as against 13,599,294 sold in 1911, being an increase of 8.75 per cent. The result of the year's working was—Gross profit of £27,933, plus £9,898 brought forward, making £37,831, less interest on 4½ per cent. first debenture stock, 6 per cent. second mortgage debentures, temporary loans, &c., £11,965; directors', trustees', and auditors' fees, income-tax, leasehold redemption fund, &c., £1,471; leaving £21,395, less interim dividend paid August 16th, 1912, £4,199; leaving an available balance of £17,195. Out of this there is to be paid a dividend at the rate of 3 per cent. per annum (less income-tax) for the half-year ended December 31st (making, with the interim dividend paid in August, 3 per cent. for the year), £4,200; £1,900 is to be transferred to second mortgage debenture redemption fund; writing off second debenture issue expenses absorbs £400, transfer to reserve fund £2,000, and £8,695 is to be carried forward. The profits for the year have been affected by the National Coal Miners' strike and other labour troubles, but notwithstanding this the gross receipts have increased. Contracts for the supply of coal over the whole of the present year were made before the great rise in the price took place, and the directors do not anticipate that the total expenditure per unit under this head will be greater than for 1912. Work is proceeding in connection with the Newburn Tramways, and they will be open for traffic in May. The company under an agreement made with the Corporation of Newcastle-upon-Tyne will supply all the electrical energy required for working the cars for a period of ten years. At the end of that time negotiations may be entered into for renewing the contract. In the early part of last year £150,000 6 per cent. second mortgage debentures were offered to the public, and practically the whole of this amount was taken up; £2,000 of these debentures have been redeemed. The whole of the property owned by the company, including plant, machinery, mains, &c., has been maintained in a high state of efficiency out of revenue during the year. Reference is made to the death of Mr. James Patterson, who had been secretary of the company since its inception. The meeting is to be held to-day (Friday).

## STOCKS AND SHARES.

Tuesday Evening.

THE Stock Exchange markets have been steeped in gloom and depression. At the root of the troubles lies the tightness of money—due in no small degree to the prosperity of the country, so that we are presented with the anomaly of excellent trade playing havoc with securities of all kinds in the stock markets. Amongst

the issues with which we deal, the most noticeable are those in the Mexican group, substantial falls having taken place in nearly everything connected with that country. The shares and bonds of the utility undertakings in Mexico have been affected even more than the rest.

The slump lowered Mexican Light and Power descriptions very materially, the Company's first mortgage bonds shed no less than 5 points, while the seconds dropped about as much to 8½. The Common stock is 3 down on the week, and the Preferred 4½. The great fear, of course, is lest the revolutionaries—or the Federals, for that matter—may blow up the Company's stations, either by design or accident. The street fighting is also responsible for a fall of 4 points in Mexico Tramway Common shares, this Company's bonds of both classes being down about 3 points each. These movements, of course, follow upon earlier falls, and the decline since the beginning of the year is now assuming serious proportions.

Going back a couple of months, it may be recalled that Mexico Trams stood at 110, against the present price of 106½. Mexican Light and Power Common were 84½, and now are 79, the first Mortgage bonds being 96 against the current quotation of 90½. The flatness has spread to Monterey Fives, which are down 3; while Pachuca bonds are dull at 9½—the latter guaranteed, of course, by the Mexican Light and Power Company. The various trust and financial undertakings which in normal times can be depended upon to support the market by taking bonds such as those of the Mexican utility companies are holding their hand in view of the state of the country; and individual holders, more or less alarmed by the outlook, have been persistent sellers during the past two or three weeks. No doubt the sanest view to take is that the revolution is bound to come to an end before long, and that as the utility companies have excellent businesses, their re-establishment will naturally follow, so that the position of the first mortgage bondholders should be tolerably secure. But it is not surprising that the proprietors of the junior stocks should feel uncomfortable, and it is to be devoutly hoped that the turmoil will be appeased as rapidly as permanently.

Other Latin-Canadian shares and bonds have suffered in sympathy with the Mexican slump. Shawinigan Water, and Montreal Light, Heat and Power, for instance, are as much as 6 and 7 points down respectively. Kaministiquia bonds are ½ lower. Rio Trams First Mortgage and Sao Paulo Trams First Debenture have given way 1 and ½ respectively. British Columbia Railway issues are weaker. Brazil Traction Ordinary lost 1½ on top of their fall last week.

Notwithstanding this welter of weakness, a few exceptions stand out which redeem the list from being entirely one way. For instance, Winnipeg 4½ per cent. Debenture is ½ higher; Perth Debenture improved to the same extent; West Kootenay Sixes are 1 up. The improvements, however, certainly require a good deal of searching for, the market, as a whole, being very unstable.

English Electricity Supply shares are upheld by the declarations of their dividends, and the City of London announcement, with its bonus on the Ordinary shares, caused the price to gain another 10s., bringing it up to 18½. Kensington are better at 8 middle, and there has been some inquiry for certain of the Preference shares, in the course of which Metropolitan Preference and St. James' Preference both gained fractions. The market, as a whole, is steady, without much interest being displayed by the public; and not even the fogs of last week caused so much as a ripple of bullishness amongst the price list.

Home Rails have been flat; from North-Westerns to East London the dismal tale was repeated day by day, the foreign outlook and the tightness of money combining to make these stocks a target for bear attacks at the same time that the tired bulls were closing their commitments. The Undergrounds have suffered with the rest. The Central London trio, *ex* dividend, show comparatively small falls, but City and South London Preferences, also *ex* their 2½ per cent. dividends, were marked down 5, showing a drop of 2½ on balance. Metropolitan has fallen sharply, but Great Northern and City Preferred Ordinary braced up to 2½ on the ratification of the agreement by the Metropolitan to take over the line. Districts went back below 40, and there has been a sharp drop in Underground Electric Railways Ordinary shares, while the company's 1s. shares also gave way. These falls were associated with the issue of the report, which, as we were remarking last week, was considered rather disappointing. It seems to show that the payment of dividends on the Ordinary and the "A" shares is still some way off; and holders who have been looking for news as to a probable distribution in the near future are inclined to wonder whether this will be made as soon as they had expected.

The Telegraph market is amongst the few to resist the flat tendency noticeable elsewhere. Rises have taken place in Anglo-American Ordinary, Commercial Cable Debenture, Eastern Telegraph Ordinary, Eastern Extension Debenture, Globe Ordinary, Great Northern, and Western Telegraph Debenture—a highly satisfactory list, having regard to the weakness in the rest of the markets. Amongst the few declines which have taken place, there is one of ¾ in West India and Panama, which, of course, are held by a speculative division; while Direct Spanish Preference eased off to 6½. The Telegraph market is steady, without special feature. As the books of the National Telephone close finally on the 25th inst., dealings are now transacted either for cash or for settlement when the ultimate award is made; and, obviously, there is not much temptation to gamble in the stock in these circumstances.

The Manufacturing group has been distinguished by a rise of three-eighths in British Insulated and Helsby Cable shares, which carried the price to 8½ middle. The greater part of this improvement, however, was subsequently lost. Telegraph Constructions are £1 better, and the rest of the shares in this group are quietly firm.

**The Electrical Production of Ferro-Silicon and Potash.**—It is reported from Gothenburg that a Swedish engineer (Axel Lindblad), who is known through his work in connection with the electric smelting of iron, is experimenting with a trial plant in which felspar, which contains up to 18 per cent. of potash, is electrically smelted with coal and iron. The main product resulting is ferro-silicon, whilst easily soluble potash salts are in the slag. A quantity of 100 tons of fertilising potash is said to have been made already with the experimental plant, and it is now proposed to erect a large installation. It is stated that the economic question of manufacturing will depend upon whether it will be possible to find a market for the large tonnage of ferro-silicon which must be produced, without depressing the price of this alloy.

## THE USE OF ELECTRICITY AND ELECTRICAL ACCIDENTS IN MINES.

(Continued from page 253.)

A FOURTH accident, which occurred at Auchengeich Colliery, and caused the death of a miner, was also due to a fault in the earthing system. The current, which was three-phase at 440 volts, was used for coal-cutting purposes. The main and trailing cables were armoured and the earthing was intended to be effected by means of the armouring connected to an earth plate at the surface, but it transpired afterwards that owing to a mistake on the part of a workman, and a lack of supervision on the part of the officials, no efficient earthing system existed. A fault developed at a joint in one of the cables, and, in consequence, the armouring became alive. Deceased, who was pushing a loaded tub, came in contact with it and was killed.

On investigating the accident, it was difficult at first to discover why the earthing system did not carry away the leakage, and thus prevent an accident. It was, however, afterwards found that a workman when cutting a drain had come across a wire or cable, and as it crossed the path of the drain he cut it with his shovel. This cable was the earth wire for the whole system at the colliery; after it was cut the safeguard of earthing ceased to exist, and this accident was the result.

We have mentioned on other occasions the tendency to practical joking with electricity amongst the employees at collieries, but one would scarcely think it possible for anyone to go to such a length as the victim of the following accident, who, as the Inspector says, "paid the penalty of his folly with his life." The accident took place at Polton Colliery, and caused the death of an engineer's labourer on the surface while he was attempting to make a connection between the cables of a lighting circuit and a lathe in the fitting shop, in order that the man working it should, on the following day, receive a shock. It appears that deceased went into a loft about 10½ ft. above the lathe at the close of the day's work, where he was unseen, and he was not missed. Inquiries were made about him the next morning, and his body was found by the engineer lying on the floor face downwards, with his head close to the edge of the loft overlooking the workshop, but partly hidden by some belt pulleys. The engineer touched him and received an electric shock, and therefore had the current cut off. The deceased's right arm and the left side of his face were severely burned; his right arm had made contact with a live zinc plate and his face with an iron bracket connected to a girder and thus to earth. He was quite cold, and had apparently been killed outright on the previous night. His intention clearly appears to have been to make a connection between a live lighting wire and a bracket carrying the belt pulleys, so that the man who worked the lathe and oiled the machinery would get a shock when at work next day. It is almost inconceivable that a workman should be so foolish, and no doubt had this man not been killed, the intended victim of the practical joke might have been seriously if not fatally injured. As we have said, this is not a solitary instance of this sort of thing, and the Inspector further goes on to say: "Recently it has come to my knowledge that a man employed at a coal-cutting machine underground had been giving men shocks by switching the current on at the gate box, and then placing the trailing cable in contact with the frame of the machine, and thus causing men working near it to receive a shock. Fortunately, no one was hurt. The special rules do not provide for the punishment of offences of this kind, and it was not possible to do anything except dismiss the man in question from his employment at the colliery."

The following are briefly details of the non-fatal accidents which occurred in this district:—

1. A brusher was sent out from the face to bring in a trailing cable from a gate-end box to a coal-cutter, and instead of taking it in and returning to switch on the current, he, in order to save himself the trouble of the double journey, switched it on at the gate-end box, and was carrying the live cable in. The terminals came in contact with the pavement, and the resulting flash burned his hand. He was lucky to

escape with such slight injuries, as he might have been fatally injured. It is difficult to understand why men will be so foolhardy. The only reasonable explanation is that they do not realise the serious risk they run by such recklessness. "Such work as bringing in trailing cables should only be done by the *machinememen themselves*, as they have, or should have some knowledge of the danger of electricity, and would not, I trust, be guilty of such conduct."

2. A coal-cutter driver received a severe shock from a coal cutter driven by D.C. at 500 volts, with concentric cable and earthed outer. The circuit breaker on the surface was thrown out by an overload on the coal-cutter, and when the machine stopped, he leaned forward to switch off and received the shock. An examination of the machine afterwards showed that the *negative connection was 2½ turns slack and loose*. This was tightened up, and there was no trouble afterwards. The cause of the shock was, no doubt, this bad negative connection. Mr. Masterton, one of the junior inspectors, in investigating the accident, found that the negative connection between the gate-end box and cable was *unsatisfactory*.

3. A pumper was putting in a switch which required to be put in smartly, but he put it in slowly, with the result that an arc was formed, which burned the back of his hand. The current was A.C. at 500 volts. *He had no duty in the switch room and should not have touched the switch.*

4. A coal-cutter chageman was burned on the back of his neck, owing to the machine becoming charged, and an earth connection not having been made by the injured man. The gate-end box was earthed to a water pipe, and the coal-cutter to the box by an additional wire in the trailing cable attached to the box by a lug and screws, and he failed to attach this wire. The leads ran along the bottom to the opposite side of the coal-cutter, and as they were liable to be damaged, the manager had them put into an iron pipe, and this necessitated a large hole being made into the controller box. This hole *had not been bushed*, and the vibration of the machine caused the edge of it to cut through the insulation of the leads, resulting in a short. It is fortunate that the neglect to bush the hole properly did not result in fatal injuries. The defect was at once remedied, and *it will be a lesson to everyone concerned not to overlook such a necessary precaution in future.*

5. A coal-cutter machinemane received a shock owing to a small spring of a switch breaking and allowing the live tongue of the switch to come in contact with the casing of the machine and make it "live." The machine was not earthed, and the current was at once switched off. The injured man was unconscious, and it was not until artificial respiration had been kept up for three-quarters of an hour that he regained consciousness. The current was A.C. at 400 volts; at the time of the accident preparations were being made to earth the frames of the machines to the surface, and the neutral point of the system has also been earthed. It is a miracle that this man was not killed, and but for the praiseworthy manner in which the men at hand kept up artificial respiration he would have died. The accident shows the necessity of efficiently earthing the frames of all apparatus, and, further, of maintaining artificial respiration for a long period in cases of supposed death from electric shock.

6. An assistant electrician on looking at an underground motor noticed that the brushes were sparking slightly, and, in order to remedy this, he turned the rocking gear, but pushed it too far, and the flash thus caused burned the back of his hand.

"A non-fatal accident injuring a motor attendant also occurred on the surface. The motor driving the screening plant had been changed over from a direct-current one at 500 volts to a three-phase at 3,000 volts, a week before the accident occurred. The D.C. switchboard was allowed to remain, and it was intended to change it at the week end. The fuses were withdrawn and the switch was opened, but two live terminals on the board, 4 ft. from the floor and 2½ in. apart, were unprotected.

"The injured man was the only one who had access to the motor room, which he kept locked. He stated that he was sitting on a box in front of the board having a meal, at the end of which, as he was getting up, his sleeve caught an enamelled 'danger plate,' which projected sideways from

the board, and a flash resulted which burned the back of his hand. His story does not appear to be a very likely one, and I fear he had been placing something across the terminals, and that when facing the board a short flame burned his hand; he, however, adhered to his statement. In any case he should not have been sitting so close to a switchboard as to touch the danger plate, and I do not for a moment think he would do so with a 3,000-volt current. *Terminals should not be left exposed in this way, and I am surprised that it should have been allowed.*"

An underground fire caused by the failure of the electrical plant took place at East Parkhead Colliery. The supply of electricity at this colliery is on the concentric system at 500 volts, and the installation was an old one, predating the Electricity Special Rules. The origin of the fire was traced to fusing in a four-way junction and fuse box, which was nailed to two props on the side of a haulage road about a quarter of a mile from the shaft bottom. An examination of the junction box after the occurrence showed it was a very probable cause of fire. There were clear signs of frequent arcing both on the side of the box, and inside the cover, and it is likely that an arc caused by the blowing of a fuse was formed to the side of the box, and that this was maintained until the insulation of the cable, and then the supporting timber, caught fire.

One of the cables was damaged by a fall of stone on the in-bye side of the junction box, and also on the in-bye side of a fuse, which was inserted in the cable nearer the gate-end box, just before the fire was noticed. It is probable that this fall caused the fuse in the junction box to blow. The fuse on the in-bye side of the junction box should have protected the latter, and that it failed to do so points to its having been the heavier fuse of the two. When Mr. Nelson made his inspection and investigation it was estimated to be  $\frac{2}{18}$  and, if so, was about 300 per cent. in excess of the working current, whereas the special rules require that it should not be more than 200 per cent. The fire in all probability would have been prevented if the fuse had not been too heavy for its circuit. This is a matter of importance, as arcing may continue for some time before causing the means provided to open the circuit to operate, as apparently happened in this case, if the means provided are slower in action than is required.

(To be continued.)

## APPLICATIONS FOR SITUATIONS.

By "WHISTLEFIELD."

ROBERT BURNS, the Scottish poet, wrote—

"O wad some Power the giffie gie us  
To see ourselves as others see us"

but if he had had to read through the numerous applications which are received in reply to jobs advertised in the ELECTRICAL REVIEW, he would probably have implored "Some Power" to give the applicants the ability to read their applications through the eyes of the wretched engineer or manager who is endeavouring to separate the good from the bad, and form a list for the purposes of an interview.

It is sometimes declared that if a man have plenty of assurance and cheek, he can get a job more easily than one who is lacking in these qualities, but does it occur to the man who knows that he is capable and has good qualifications that he may throw away all these advantages and have to yield place to another who is not so qualified, because he has relied too much on his conscious superiority, and has forgotten that the employer who is reading the applications does not know all that the applicant knows, and is forming his opinion from what is actually written, so that the man who can state his real or supposed qualifications in a convincing manner, emphasising the special qualifications which are required for the job, will stand far more chance of getting an interview than one who is careless in the arrangement and wording of his application?

The chief point which should be borne in mind by anyone

who writes an application is the fact that, for every job advertised there are not only a large number of applicants, but the standard of qualifications of the applicants is invariably high, and there are always several who are quite capable of filling the post with credit; therefore it is not only necessary to show that one is capable of filling the post because of training and past experience, but the very manner in which the application is drawn up should show that, besides technical knowledge and practical experience, the candidate has common sense and is capable of appreciating what is important and what is trivial, of realising that managers are busy men who want facts and data clearly and tersely expressed.

It is little things like these which turn the scale for or against a man in a great many cases, since all employers appreciate men who have their wits about them and who think for themselves.

It is want of thought which allows a man to send in his application written on half a dozen sheets of paper, none of which are numbered, and which have not been fastened together, and very often the fault is aggravated by the fact that the testimonials are on a different kind of paper from the application, so that when they have got mixed it is not an easy matter to collect all the sheets relating to the one application, and find in what order they should be arranged.

An even worse habit, and one that is very prevalent, is to use ordinary notepaper written on every side, so that it is not only necessary to pin the sheets together when they are received, but they must be unpinned every time they are looked at. The worst cases of this kind are applications which are written on notepaper commencing on page 1, then going to page 4, then to page 2 and page 3, the same thing being repeated through three or four sheets without a single number to denote how the pages and sheets follow one another. It stands to reason that a man who is so careless and thoughtless with regard to his own concerns will not be considered a suitable person to put in any responsible position by an engineer or manager, especially when other men equally good but not so careless are available.

Another form of thoughtlessness is exhibited in the long rambling application which leaves one confused at the end, without any clear idea of what the applicant has done. An application of this kind running into a number of sheets of closely and often badly-written foolscap receives scant attention when it is one of a large pile that have to be waded through.

A moment's thought would show that when selecting a man for a post it is necessary to know his age, his present position, and the positions which he held previously. These facts could quite easily be tabulated on one page, so that at a glance it could be seen if a man was in the running or not; then on subsequent pages the information could be amplified under different headings.

The usual method of writing a continuous letter detailing the whole history of the candidate from the time he went to school to the time he made his application, leaves the reader annoyed at having to read so much to find the essential facts, and this is prejudicial to the candidate's chances.

If such information as classes attended or certificates gained seem to be essential, let them be tabulated under the heading of classes attended or certificates gained; then, if the information is not required by the man who is selecting the candidates, he can pass over that section and lose neither time nor patience. The same method could with advantage be adopted when dealing with all the data and particulars submitted, and the result will be an application in which all information required can be quickly and easily found, and which will leave a favourable impression of the applicant's method of work.

While it is not desirable that an application should be too long, it is possible to make it too brief. The following which was received in reply to an advertisement of an important post in a power station is typical of many that are sent:—

"Dear Sir, I beg to make application for the post of ——— advertised in the ELECTRICAL REVIEW of ———. I have had good experience in power station work, having held a similar post for four years; if there is any other information that you desire, or if you wish to see my testimonials, I shall be glad to call on hearing from you, yours ———."

This information might have been sufficient if the applicant had stated in what power station he had worked during those four years, or had given some indication of the plant in use; as it was, no information was given, there were plenty of other good men, and this application was thrown aside. The following extract from another application is a gem in the art of compression:—

"I have had over ten years' experience in the electrical business with contractors, manufacturers, consulting engineers and supply authorities. During this period I have been engaged on, and have been in charge of, the erection, running and repairs of motors, generators, boosters, rotary converters, switchgear, control gear, high and low-tension cable laid solid, drawn-in and armoured, the lay out of static and rotary sub-stations with gear; I am familiar with the economical running of plant and with all tests applicable to fault localisation, and have had a good works as well as theoretical training, and am accustomed to the control of men."

Unfortunately this applicant mentioned later that his age was 24, so he was promptly classed "with the goats."

Another application was one that was a model of all that an application should be; it tabulated in a clear and concise manner all the information that one desires on the front page, and on the following pages was a brief well-drawn-up letter stating the applicant's experience. The surprising thing was that another application drawn up in exactly the same manner came for the same job from a man in another part of the country; the data given were, of course, different, but the style and method of arrangement were identical. It left one wondering by how much the candidate's natural desire to present his qualifications in a favourable light had been improved on by a professional hand, and how big a pinch of salt was necessary before accepting the statements submitted.

Some candidates have all their testimonials printed, as well as tabulated statements of their training and experience; then the application takes the form of a covering letter drawing attention to the special points in their testimonials, &c., which have a direct bearing on the job advertised. This seems to be quite a good method, but some carry it to an extreme, and one comes across printed applications with blank spaces left for filling in the particulars suitable for the occasion, as—"Dear Sir,—Having noticed in this week's — that you are advertising for —, I herewith make application for same." The impression which such an application leaves is that a number of these forms must be filled in and sent off each week to justify printing a form which ceases to be up to date within a few months.

The use of the firm's official paper and envelopes shows a lack of sense, for, naturally, the manager or chief to whom one applies will think that, if paper and envelopes are taken, other of the firm's property might be taken also if occasion offered, and the candidate is prejudiced in his eyes.

No one can lay down the law as to how an application should be drawn up. It must vary with individuals and circumstances, but perhaps these few lines may make intending applicants think a moment before writing, and so prevent them from making those blunders which are due principally to want of thought, but for which a heavy price in disappointment may have to be paid.

## PROCEEDINGS OF INSTITUTIONS.

### Starting and Speed Control of Induction Motors.

By F. C. ALDOUS.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, January 14th, 1913.)

IN the following paper two and three-phase motors only are considered, which may be taken as having the same characteristics for starting and speed control. Single-phase motors are started on light load, and, being only to a limited extent suitable for speed regulation, are not dealt with in this paper.

The type of motor which is most suitable for any particular service is determined by the conditions of the load, which may be classed as follows:—

1. Constant speed, where after being started the motor has to run at one speed only.

2. Variable speed, where the motor may operate at more than one speed.

For constant speed, many engineers are strongly prejudiced in favour of the slip-ring induction motor, as opposed to the squirrel-cage motor. The latter has many advantages not possessed by the slip-ring motor, and can be used in many cases where the slip-ring motor would be impossible.

It can be used in practically all cases where it normally runs at a constant speed, and up to a size such that the starting current shall not cause undue disturbance to the voltage of supply.

As a rough rule it may be said that when running off the mains of a supply company, the horse-power of a squirrel-cage motor which has to start on heavy load should not exceed 5 per cent. of the K.V.A. of the total minimum generating plant, or 10 per cent. if it starts on light load. On a large power system lower figures than the above would have to be taken. On a self-contained system, such as a group of collieries with their own generating plant, these figures may be easily doubled, since the permissible voltage drop will be greater. A mill which is group driven by squirrel-cage motors can be started up with the generator; power is supplied to the motors at a very low frequency, so that the starting conditions are very good and the whole mill is run up together. In a case like this the motors are provided with starters, so that if it is necessary to shut down a group it can be started again without shutting down the whole mill. The horse-power of any individual motor may in this case be as high as 20 per cent. of the K.V.A. of the turbo-generator.

For variable-speed work the slip-ring motor is generally preferred to the squirrel-cage motor, but where the motor operates at low speeds only for short periods, or where the use of slip-rings is objectionable, squirrel-cage motors may be used with advantage, especially in small sizes.

If good speed regulation is required at several speeds, as for machine-tool driving, or if full-load torque is required for long periods at reduced speeds, a multi-speed motor, which is generally of the squirrel-cage type, is preferable. For two-speed motors with a ratio of speeds 2:1 this can be done by using a winding which is connected for one number of poles for the low speed, and for half that number for the high speed. For other ratios, or for more than two speeds, it is necessary to use two windings, which might, for instance, be connected for 6, 8, 12, or 16 poles, giving a very useful range for variable-speed work. Where suitable speeds cannot be obtained by the use of multi-speed motors, this can often be done by means of "cascade" control, or the cascade motor of Mr. L. J. Hunt can be used.

If the torque required at low speeds is very much reduced, as in the case of fan-driving, a normal slip-ring motor with rheostatic control generally gives the best results. The input to the motor is reduced about in proportion to the square of the speed. The simplicity of the slip-ring motor with rheostatic control and its low first cost render it preferable to the different complicated systems which are now put forward, showing a high efficiency at all speeds.

Squirrel-cage motors of small size can be started by switching full voltage on to their terminals. In this case about six times full-load current is taken momentarily, which current is independent of the load to be started, though its effect on the supply voltage is, of course, more noticeable when starting a heavy load than when starting a light load. The torque developed may be about twice normal torque. Above a certain size, say, 5 to 10 H.P., the starting current is usually considered excessive, and an auto-starter or star-delta starter, or in the case of two-phase motors a series-parallel starter, is used.

If different voltages are thrown on to the terminals of a motor, the current varies directly as the voltage, whereas the torque varies as the square of the voltage; so that a motor which with full voltage on its terminals gives twice normal torque, and takes six times normal current, will, when 50 per cent. of full voltage is thrown on its terminals, give half normal torque and take three times normal current. If this is done by means of an auto-starter with a 2:1 ratio, then when the current in the motor is three times normal, the current in the line is 1½ times normal, since the K.V.A. on the primary and secondary of the auto-starter are equal. In the same way it is found that with a tapping giving 70 per cent. of full voltage, three times normal current is drawn from the line, and full-load starting torque is developed.

With the star-delta starter the motor is designed to run connected in delta. Leads are brought out from both ends of each phase, and by means of a double-throw switch the motor is started in star connection, and when up to speed is switched over to delta connection. By this means rather less than 60 per cent. of full voltage is thrown on to each phase at starting, corresponding to an auto-starter with a 60 per cent. tapping. The series-parallel starter used with two-phase motors in which the windings are connected in series for starting, and in two parallel circuits for running, is seen in the same way to have the same effect as a 60 per cent. tapping. The total energy absorbed during starting is not reduced by using a reduced voltage at starting. When a squirrel-cage motor starts against a load consisting entirely of inertia, the total energy absorbed and the heating of the motor during starting are independent of the starting voltage. If the load consists partly of a friction load, the energy absorbed and the heating of the motor are reduced if the starting voltage be increased.

A high starting voltage is preferable where there is no objection to the consequently heavy starting current.

Sufficient starting torque can usually be obtained by taking a normal slip of 4 or 5 per cent., though on motors of large size this value of slip can generally be somewhat reduced. High-speed motors especially, for pump driving, requiring a comparatively

small starting torque, are generally designed with a normal slip of not more than 2½ to 3½ per cent., giving an increase of efficiency at normal load and a reduced starting torque.

When specially heavy starting torque is required, as for crane motors and motors for operating sluice valves or small compressors, squirrel-cage motors are built with rotors of much higher resistance, giving a slip of 8 to 10 per cent. at normal load. The rotors are specially built to withstand the heat developed in them without deterioration, and the motors are generally started by switching full voltage on to their terminals, or, in the case of crane motors, are controlled by varying the terminal voltage by means of an auto-transformer provided with different voltage tappings.

In fig. 1 are shown the speed-torque curve, A, and current-torque curve of a motor of 10-H.P., three-phase, 50-cycle, 400 volts, 950 R.P.M., having a normal current of 13½ amperes per phase and a normal torque of 55.3 lb. at 1 ft. radius. This curve shows that the torque at starting is just twice normal, increasing to a maximum of 3½ times normal at 670 R.P.M. and coming down to normal torque at 950 R.P.M. Curves B and C are drawn for motors having the same stator winding, and rotors of respectively two and three times the resistance of the first motor. The other curve shows the stator current, which is the same for the different motors at the same torque. Fig. 2 shows the rate at which the above motors speed up and the current curves during starting. Curves A and A<sub>1</sub>, fig. 2, refer to the above motor A, fig. 1, when starting on full voltage against a friction torque equal to full-load torque, the load having a fly-wheel effect of 100 lb. at 1 ft. radius. Curves B, C, B<sub>1</sub> and C<sub>1</sub>, fig. 2, give respectively the speed and current for motors B and C when started under the same conditions. Curves D and E refer to the first two motors A and B, still starting against the same load; but, in this case, the motor is started with an auto-starter giving 75 per cent. of full voltage on the motor.

It will be seen from these curves that a motor with a good overload capacity and with a normal slip of 5 per cent. will give a good starting torque without taking an excessive current. By carefully comparing these curves with those drawn for a rotor of high resistance, it is seen that with 10 per cent. normal slip a higher

if the design and workmanship were very carefully carried out, and the only thoroughly satisfactory design is one in which all the contacts are brazed or welded.

#### DISCUSSION.

PROF. MILER WALKER said that with regard to variable-speed control, he was partial to the use of auxiliary machines generating a back E.M.F. Of course large machines were referred to, and in all probability the use of a booster in the rotor circuit would be extensively employed in the future. The booster arrangement was very simple, the rotor of the induction motor being connected in series with the armature windings of a small D.C. generator excited from a special small exciter. The whole arrangement could easily be controlled by automatic switchgear, and one of the simplest methods of varying the speed was to rock the brushes on the D.C. generator. This arrangement seemed to have a wide future for rolling mills.

MR. FAYE-HANSEN said that with slip-ring motors of modern design, especially for low periodicity, the rush of current if switched on to the full voltage might be as large as, or larger than, the current taken by the squirrel-cage motor starting from an auto-transformer. This kick, however, only lasted for a very small part of a second, and if required could be greatly reduced by using a switch having an auxiliary contact which at the first step put a resistance in series with the motor. The speed control of squirrel-cage motors had the disadvantage that the maximum torque was reduced as the square of the voltage applied, so that if a large torque was required at low speeds, the motor might get unstable. It shared also with the slip-ring motor the disadvantage that if run at low speeds, the speed changed very much with an alteration in load. This and the low efficiency of these motors at low speeds justified in many cases the use of pole-changing motors or cascade control of some kind, notwithstanding the increased cost and complication. Regarding the control of pole-changing squirrel-cage motors, it must be remembered that as a rule it would not be allowable to switch the motor directly over from one speed to the other, as the rush of current might then be nearly as great as if the

motor were started from rest at full voltage. In going over from one speed to another, therefore, the tappings on the auto starter would, as a rule, have to be used. In some cases multiple-point starters were called for, but this was very seldom justified, as nearly always the rush of current to start up the motor was very much greater than the rush of current in switching over from the starting tap to full voltage. An important drawback to the use of multiple-point starters was that fairly heavy currents would have to be broken, while in a two-point starter, as a rule, only comparatively small currents were switched out. The current density in the motor at the moment of switching in was, approximately, 26,000 amperes per sq. in. The author was rather too severe in condemning riveted, screwed and soldered joints in all squirrel-cage motors, though he was justified in doing so in all cases

where such heavy starting conditions occurred. There had also been made some short-circuited rotors without any joints at all, the winding being punched out of sheets, pulled into shape, and then placed in the slots. A winding having independent short-circuited turns had the advantage that the tendency to creeping speeds due to higher harmonics in the field form was reduced.

MR. W. CRAMP said the example of constant-speed drive in a mill, as quoted by the author, might be applied with advantage to many cases where a large number of line shafts or machines had to be started together, but he thought it much better to excite the alternator separately at starting. The statement that the rotor of a squirrel-cage induction motor would run synchronously with the magnetic field of the motor at no load was quite erroneous. Whilst discussing the question of speed variation the speaker referred to a type of squirrel-cage rotor having two windings, one at the surface of the rotor as usual, and the other embedded in the rotor close to the shaft. The effect of this arrangement was that when starting, the frequency being high, only the outer winding would be affected, but as the frequency diminished the inner winding would come into play, thereby reducing the rotor resistance. Some years ago, a repulsion-induction motor had been built by him along these lines with very satisfactory results. In this case, the repulsion motor winding was in slots around the rotor periphery, and this winding carried most of the current at starting. Below this winding was a squirrel-cage rotor winding, which as the motor approached synchronism, carried more and more current. The result was a machine having an excellent starting torque, a small commutator with short-circuited brushes, excellent commutation and a general characteristic load-speed curve like a compound-wound direct-current motor. It was made originally for single-phase circuits and for fan driving. It could be thrown straight on to the line without a starter as all necessary regulation could be obtained by rocking the brushes.

MR. B. THOMAS said the examples of constant-speed driving and method of starting up were very interesting, but it was doubtful whether the system could be adopted in cases of friction load. Some friction loads were very great, a case in point being that of a motor-driven air-compressor. When single-cylinder machines had

FIG. 1.—SPEED-TORQUE AND CURRENT-TORQUE CURVES.

FIG. 2.—SPEED AND CURRENT CURVES DURING STARTING.

torque and a considerably lower current are obtained at starting, and of course a lower efficiency at normal load, but that there is not much advantage in increasing the slip above 10 per cent. In these curves the rotor resistance is assumed to be unaffected by temperature.

The heating of the motor is dependent upon the starting voltage. In order to give an idea of what this heating may amount to, an example is given of the starting of a squirrel-cage motor which drives by a belt a heavy mining fan. These fans, owing to their great inertia, are well known to impose very severe starting conditions upon squirrel-cage motors. The fan delivers 100,000 cu. ft. of air per minute against 4½ in. W.G. Its runner has a weight of 1 ton and a radius of gyration of 3 ft., and its speed is 415 R.P.M.

The motor is of 100 H.P., three-phase, 50-cycle, 500 volts, 720 R.P.M., and starts on a 70 per cent. voltage tapping. It has a starting torque with the rotor cold of 1.75 × normal with full voltage, and a normal slip of 4 per cent.

The rotor is heated up during starting far more than the stator. It cools off very rapidly, and after about 1 minute almost attains its normal temperature.

When the motor is first started, the rotor heats up so rapidly that though the current is diminishing the rate of heating increases, owing to the fact that the resistance of the rotor is increasing. After 30 seconds, when the motor is nearly up to speed, the rotor still has a temperature rise of 95° C., corresponding to an increase in slip of nearly 40 per cent. above its slip when cold. On switching over to full voltage the motor comes up to a speed of 712 R.P.M., and gradually creeps up to its normal speed of 720 R.P.M. as the rotor cools off.

The rotor has a maximum temperature rise of 126° C., meaning an actual temperature of perhaps 150° C. This is not excessive, since a rotor of good design and construction can stand temperatures far in excess of this without deterioration. When running at normal load the rotor has a temperature rise of less than 20° C., and the heating which occurs during starting is entirely local, since there is not sufficient time for heat to be transmitted to the stator.

Though the temperature of 150° C. is not sufficient to melt solder, it would certainly be undesirable to use solder on a rotor which operates under such severe conditions. Any screwed or riveted contacts would be liable to deteriorate under such conditions, even

to be dealt with, a starting device operated in conjunction with the compressor valves had been found necessary.

MR. J. FRITH said that partial insulation of the rotor winding on squirrel-cage machines was no good at all. The windings should either be thoroughly well insulated or connected to the core at every point. Rotors of solid cast-steel had been used with great success in crane work. They started well, and owing to their high power factor, the current was comparatively small.

PROF. MARCHANT said that, in the case of one motor in his laboratory, there was quite a strong seventh harmonic in the flux wave, which caused the motor to run fairly steadily under certain conditions at one-seventh synchronous speed. It was sometimes quite difficult to get it to run through this speed when starting. This phenomenon was found mostly in motors with a small number of slots per pole per phase, and seemed to be particularly marked in motors which were fitted with pole-changing devices. From this point of view, the wound rotor had an advantage over the squirrel-cage rotor.

THE AUTHOR, in reply, said that six times normal was the usual figure for the starting current of squirrel-cage motors. Some motors, particularly high-speed machines, took more than this, but if the starting current was reduced much below the figure quoted, trouble would probably arise. He wished to emphasise the desirability of aiming at a good starting torque. The scheme explained by Prof. Walker was particularly interesting, as some system of that kind was essential for variable speed control. It was a difficult matter to decide what system to install in rolling mills, as variable speed control was essential in addition to a heavy torque. Regarding Mr. Faye-Hansen's remarks, what he (the author) referred to expressly was the current which flowed for a second or so after switching. The determination of the short-circuit current was far more difficult than that of the no-load current. In the case of the short-circuit current, it was necessary to determine the size, number and shape of slots together with details of the end connections, and altogether it was a complicated business, and if there was any doubt about calculating the value, a good margin should be allowed. Concerning the heating of the rotor winding, he maintained that in certain types of windings there was no time for the heat to be transferred to the core. In many cases it had been found that the heating of the part of the winding inside the core was greater than that at the ends of the core. The figures given in the paper formed a rough idea of what to expect, and it was necessary to calculate the heating of the windings as independent of the core. Experience had shown that it was best to eliminate joints where possible, especially in small machines. The rotor of a squirrel-cage motor did not exactly run synchronously with the magnetic field, but the difference was so small as to be immeasurable. The energy absorbed by a squirrel-cage motor exceeded that absorbed by a slipping motor at starting. Regarding the question of saturation, all calculations had been made assuming the current proportional to the voltage, and this seemed a very true estimate. Squirrel-cage motors were admirably suited to operating small air-compressors.

### Some Methods of Magnifying Feeble Signalling Currents.

By S. G. BROWN.

(Abstract of discourse delivered at the Eighth Annual Exhibition of Apparatus, held by the PHYSICAL SOCIETY, on December 17th, 1912.)

TELEGRAPHY over long submarine cables is continually on the increase, and it is a fairly accurate statement that the number of messages sent doubles itself every 10 years. It is therefore important that, besides the increase in the number of the cables laid down each year, means should be devised to increase the carrying power.

The instruments which I have invented and am about to describe were designed primarily for cable work, but they are easily applicable to recording many other kinds of signalling impulses.

Lord Kelvin invented the siphon recorder about 45 years ago; he designed it so carefully that no improvement in its sensitiveness has been brought about until now.

The ordinary siphon tube is about  $2\frac{1}{2}$  in. long and from 8 to 12 mils in diameter. The moving coil consists of 500 turns of 2-mil wire at a mean radius of  $\frac{1}{8}$  in. The coil and siphon are mounted on separate axes and are connected by silk fibres so that the angular movement of the siphon is about two to three times that of the coil. By reducing the length of the siphon to  $\frac{1}{2}$  in. and substituting a narrower coil it is possible greatly to increase the sensitiveness of the recorder.

In order to make the inertia effects of the moving system a minimum, it is advisable to make them equal for the coil and the siphon. Even a narrow coil of 300 turns has about 100 times more inertia than the siphon, so that it is necessary to move the siphon through  $\sqrt{100}$  times the angle moved by the coil. By reducing the number of turns on the coil and increasing the field it is possible to reduce the natural period for a given sensitiveness and back E.M.F., but in practice it is inadvisable to reduce the turns on the coil below 50 or 100. Means of magnifying the motion of the coil and transmitting it to the siphon have to be used. In this instrument (Fig. 1) it is accomplished by means of a fine fibre, E, which is kept in tension by flat springs at each end. The fibre is attached to an arm carried by the moving coil A, and to a vertical fibre, F, on the siphon suspension.

The siphon is carried on an aluminium carrier to which a single central fibre is attached at the top and two parallel fibres, F, 0.2 in. apart below. One leg of the siphon lies on the axis of the suspension and dips into a small opening in a pipe extending from the ink-pot.

In order to produce an ink line on the paper without introducing friction, the siphon must not touch the paper even momentarily, and arrangements have been made to jerk the ink in fine drops on to the paper. To accomplish this the whole of the siphon suspension is vibrated rapidly up and down between the springs V and K

FIG. 1.

by means of the spring V, which is attached to a vibrator. To impart a jerk to the siphon, a stop, H, is fixed directly under the axis of suspension, and two little dash-pots, D, D, on either side prevent the spring bouncing on the stop.

When the instrument is adjusted to have a natural frequency of 10.5 per second, with a 300-ohm 300-turn coil, a current of 50 micro-amperes gives a full-sized signal corresponding to a deflection of

FIG. 2.

0.1 in. on the paper. Under these conditions the back E.M.F. of the coil is only about one-quarter to one-fifth of that of the ordinary recorder coil.

Trials with this instrument have shown an increase of speed of 30 per cent. on the longest Atlantic cables.

In the thermo-electric magnifying relay, fig. 2, the power in the relay circuit is generated by means of five thermo-junctions at different temperatures. The heat is supplied by two little flames, C, C, and a

FIG. 3.

very light thermopile, N, is suspended so as to swing in and out of the flames, and is coupled to a moving coil through which the received currents pass. The thermopiles consist of alternate junctions of platinum and platinum + 20 per cent. iridium, wires being used of 1 mil. diameter. The wires are melted on to a fine glass tube about 10 mils diameter. For moving the thermopile in the flames similar arrangements to those just described for the siphon recorder are employed.

An alternative arrangement which gives greater sensitiveness and enables heavier thermopiles to be used is to fix the thermopiles

and vary the flames by means of a valve or shutter actuated by the coil movements.

As the thermopile current depends on the difference of temperature between the junctions, a certain time is required to heat the wires. It is found that for cable work, where the frequency seldom exceeds 10 per second, the lag is inappreciable, but for considerably faster movements it becomes important. In duplex working, when the sending current has to be balanced so as not to affect the receiver, quick "jarry" movements are very difficult to eliminate, but the lag in the thermo instrument reduces these movements very considerably and is a valuable property.

When a thermopile with seven junctions on each side was deflected 0.075" the current sent through a resistance of 42 ohms (equal to its own resistance) was 0.81 milliamperes. With the natural period of the coil equal to 8.7 per second and a 480-ohm 480-turn coil, a current of 0.03 milliamperes through the coil gave a current of 0.81 milliamperes from the pile through an external resistance of 42 ohms. For slowly changing currents this corresponds to a magnification of power of about 27 times, and, of course, this can be greatly increased by reducing the period of the coil. For quickly changing movements the power magnification is not so great, owing to the back E.M.F. of the coil. Trials of this instrument on an Atlantic cable have shown an increase in speed of about 40 per cent.

The instrument just described is a magnifying relay—that is to say, it multiplies the impulses received in exact proportion to their strength. This form of relay is quite distinct from an ordinary make-and-break relay, which delivers a constant current for any impulse over a certain strength. For very many purposes it is essential that received impulses should be magnified without altering their shape, and this can only be done by an instrument with a constant magnifying power.

This property I will now illustrate in an entirely mechanical relay in which movements operated by very small forces are largely increased in strength without affecting their motion. The relay consists in principle of a rotating spindle around which are wound one or more turns of a flexible cord. The spindle is revolved in such a direction as to pull away from the magnified forces and towards the small forces that control the movement. Suppose a heavy weight has to be raised by a force of one-tenth of the amount, it will obviously be necessary to supply 90 per cent. additional energy, and this is supplied by the motor driving the spindle. The magnification of force and energy depends on the number of turns which the cord makes round the spindle and follows a compound interest law.

Fig. 3 shows an application of the principle to cable work, in which the small forces operating the coil A are intensified sufficiently to work the coarse relay arm R. The spindle rotates away from the relay arm R and towards the coil, and produces a much greater tension in the fibres *t* than in *s*. When the coil swings on its axis the tension is increased in one of the fibres and diminished in the other and a similar change in a magnified degree takes place in the fibres *t*.

By using means of this sort it is possible to work an ordinary siphon direct writer (which normally requires some 3 milliamperes) by a current of 10 microamperes.

### American Electrical Installations.

At a meeting of the YORKSHIRE SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on Wednesday, the 12th inst., Mr. T. Harding Churton delivered a lecture on "Some American Electric Plants."

MR. CHURTON dealt first with the generating stations deriving their water power from Niagara. Tracing the history of the Niagara Falls Power Co., he stated that the three present stations of the company had a total capacity of 160,000 H.P. The two stations on the American side had in operation 21 generators, each capable of delivering continuously 5,000 H.P., whilst the station on the Canadian side had five generators of 10,000 H.P. The three stations were interconnected so that either power house could act as a reserve for the other two. The turbines in the American power house No. 1 were Fourneyron inverted twin turbines designed by Faesch & Piccard, of Geneva, those in power house No. 2 were Francis single turbines, equipped with draught tubes, and designed by Escher, Wyss & Co., of Zurich; and the turbines in the Canadian plant were Francis double inward discharge turbines, with draught tubes, designed by the same firm. All the generators ran at a speed of 250 R.P.M. Speaking of the Electrical Development Co., of Ontario, and the Ontario Power Co., he described their machinery in detail, and mentioned that from the transformers at one of the sub-stations of the latter company, the voltage was stepped up to 60,000 volts, at which voltage energy was transmitted as far as Syracuse, New York State, 160 miles away. The line consisted of aluminium conductors 1½ in. in diameter, carried on steel towers, 55 ft. high to the top wire, with an average span of 500 ft., the insulators being of porcelain and weighing 35 lb. each. In the immediate vicinity of the station the current was sent out untransformed at 12,000 volts, and delivered to the transformer station of the Hydro-Electric Power Commission of the Province of Ontario for transmission and distribution at 110,000 volts. The system of transmission lines of this Commission was 300 miles in length, and included municipalities within a distance of about 150 miles from Niagara, embracing the City of Toronto. The current was at 25 cycles, and he noticed that in large rooms where there were many lamps the flicker due to the low frequency was quite perceptible, particularly from lamps not directly in the line of vision. Mr. Churton went

on to describe two hydro-electric plants in British Columbia—one, that of the British Columbia Electric Railway Co., Ltd., and the other, that of the Western Canada Power Co.—the water for which was derived from Lake Hontzen and Lake Stave respectively. In the case of the British Columbia Electric Railway Co., he said that the company also supplied light and power, and a notable increase in the consumption at private residences had been observed, which was due to the adoption of electrical cooking and heating appliances. Here, also, the use of electricity for illuminated signs for advertising purposes had been developed to a most wonderful extent. Among the special features at the Vancouver sub-station of this company might be mentioned the installation of three six-phase 60-cycle rotary converters, which were among the largest of their kind in the world. Speaking in regard to two steam-driven plants which he had visited—the Delray plant of the Detroit Edison Co. and the Fisk Street plant of the Commonwealth Edison Co., Chicago—he said the features that struck him particularly were the large size of generating units adopted, the compactness of the plants, the great extent of the labour saving devices and the excellent organisation and appointments everywhere observed. At the Delray station the coal consumption was equal to about 2.23 lb. per K.W.-hour delivered, the thermal value of the coal being 14,000 units, and the cost delivered about 10s. a ton. The Fisk Street station plant already contained 10 14,000-K.W. sets, but the demand was so great that an extension was now in progress which, when completed, would embrace four additional sets of 25,000 K.W. each; the first of these sets was being built at Messrs. C. A. Parsons's works at Heaton-on-Tyne. This generator would be capable of giving continuously 25,000 K.W., but its most economical load would be 20,000 K.W.; it would generate three-phase current at 25 cycles, 4,500 volts, at a speed of 750 R.P.M. The lecture was very fully illustrated by means of lantern slides.

In the course of a discussion which followed, many questions were asked, and Mr. CHURTON, in reply, said he thought the reason for using 25 cycles was that it afforded greater facilities for long-distance transmission than higher-frequency current did. As to charges for power, the price in Toronto was 2½d. per unit for the first 50 units used in a month, 4d. for the second 50 units, and 4d. for the third 50 units. At Vancouver for power there was a charge of 4s. per H.P. on the rated load per month, plus 4d. per unit used, up to 100 H.P., over that 4d. per unit up to 200 H.P., and over 200 H.P. 4d. per unit. At Toronto, for lighting the charge was 4d. per unit for the first 25 units, and a reduction of 1½d. per unit for all over that. At Vancouver the charge for lighting was 5d. for the first 50 units and a sliding scale down to 1½d. per unit for all over 1,500 units per month. In regard to a question as to liability to accidents, he thought that the construction was so very strong that the liability there was rather less than it was here, and, of course, the high voltage made no practical difference to the risk of shock. In regard to generating costs, he took it that the prices at which the energy was sold were a fair indication, but it should be remembered that the generating costs of water-power plants were made up in a totally different way from those of steam plants. The cost of running a water-plant station must be fabulously less, because the labour bill was next to nothing. In a power house with 50,000 or 60,000 H.P. there would be one man walking about the place with practically nothing to do. In regard to wayleaves, the lines that went from Niagara to Toronto were over private ground all the way, and to a large extent that would apply to the others; where public roads were crossed there were additional protections and safeguards.

### CONTROL OF METERS AND LAMPS FROM THE CENTRAL STATION.

ON Friday last we took part, on the invitation of Messrs. Handcock and Dykes, in a visit to Staines to witness a demonstration of a new system of controlling apparatus connected with a network of distributing mains, without the use of pilot wires and without affecting any other consuming apparatus on the mains in any way. The new system is the joint invention of Mr. W. Daddell, President I.E.E., and Messrs. Handcock & Dykes, and was described in a recent communication to the *Journal* of the Institution of Electrical Engineers, from which we abstract the following particulars:—

The underlying principle is to control relays, which may be inserted anywhere on the general system of mains, by means of a superposed current impressed on the main current flowing in the system. If the main current be continuous, then the control current may be alternating, of any desired frequency. If the main current be alternating, then the impressed current must be of a different frequency, the relay in either case being so designed that, while it instantly responds to the impressed current, it is unaffected by any alteration of the main current or pressure.

As long as the feeder bus-bar voltage is kept constant the amount of power supplied to consumers is practically unaffected by the ripple. The output of the main generators is simply reduced by an amount equivalent to the power produced by the "ripple generator."

In direct-current systems the solution is simple. The relay is connected as a shunt across the mains and in parallel with the lamps and with the meter to be controlled. If a condenser be placed in series with the relay, it is obvious that as long as there is only a continuous voltage on the mains, no current passes through

the relay. As soon, however, as an alternating voltage is impressed on the mains a current passes through the relay and causes it to actuate the particular mechanism required.

When the main supply is alternating the problem is not so simple, inasmuch as the condenser will allow a current to pass through the relay from the main 200-volt 50 cycle supply as well as from the small superposed ripple. The relay must in this case be made "selective," so that it will operate only when a current of the selected frequency is impressed on the line. Such a selective relay is also to be preferred for a direct-current supply as it enables several relays adjusted for different frequencies to be employed, any one of which can be brought into action as required.

In order to achieve this result, the inventors take advantage of the principle of resonance, and so choose the self-induction of the relay  $L$ , and the capacity of the condenser  $K$ , that at the frequency  $F$ , at which the relay is intended to operate, they are in resonance, whilst at the normal frequency they are not. That is to say, neglecting resistance, the following relation is established:— $L \times K \times (2\pi F)^2 = 1$ .

When this relation holds, the potential differences between the terminals of the relay and of the condenser are much greater than the applied potential difference, and, consequently, the current passing through both the relay and the condenser is much greater

FIG. 1.

FIG. 2.

than that due to the applied voltage. The two potential differences are out of phase with each other, and their vector sum is equal to the applied voltage. In practice they find the potential difference between the terminals of the relay coil at the resonance frequency to be some 10 times the applied potential difference.

It is found best to adopt, on alternating circuits, frequencies comprised between the third and fifth harmonics of the supply.

A satisfactory value for the R.M.S. value of the superposed voltage is 5 per cent. of the supply voltage, whether direct or alternating. That is to say, on a 100-volt circuit, direct or alternating, the R.M.S. voltage of the ripple is to be 5. The simple resonance circuit described above works perfectly in the case of a D.C. supply, and has many advantages over the non-resonant relay; but in the case of an A.C. supply, unless the resonance be made unduly sharp, or there be a large difference between the frequencies, the condenser  $K$  and relay  $L$  will let through sufficient current at the supply frequency to attract the armature of the relay.

To get over this difficulty the inventors add a compensating circuit to the relay, as illustrated in fig. 1, where  $L$  is the relay coil, the armature and core being omitted for the sake of clearness. On top of this coil is wound a second coil,  $L_1$ , which may have, roughly, the same number of turns, and this coil is connected in series with a choking coil,  $L_2$ , having a high self-induction. The current through the condenser  $K$  and relay coil  $L$  due to the supply frequency, say 50, leads almost  $90^\circ$  on the applied potential difference. The current through the choking coil  $L_2$  and compensating windings  $L_1$  is made to lag about  $90^\circ$ . If these two currents be adjusted to approximate equality, their action on the core of the relay can be made very small. A compensated resonance relay of this sort will work with certainty at 5 volts at 200 frequency and will take no notice of 100 volts at 50 frequency. This relay would only operate when it should not if the voltage of supply were allowed to rise from 100 to somewhat over 200 volts, so there is no fear of failure from this cause.

Failure takes place when the superposed voltage is reduced to about 3.5 volts. If the superposed voltage be maintained at its normal value of 5 volts a variation of some 5 per cent. can be made either way in the frequency before the relay fails to act.

The relays are adjusted for use on a 100-volt 50-frequency supply. The capacity of the condenser  $K$  is 2 mfd., and the self-induction of the relay winding  $L$ , 0.3 henry. The compensating winding  $L_1$  is wound closely on top of  $L$ , and has approximately the same number of turns. The choke coil  $L_2$  is adjusted until the force acting on the armature produced by the 50-frequency current is a minimum. Under these conditions there flow through  $K$  and  $L$ , and also through  $L_2$  and  $L_1$ , two currents, each approximately 0.06 ampere, and having a phase difference of somewhat less than  $180^\circ$ . The current taken from the mains is the vector sum of these two currents and only amounts to 0.02 ampere. The true power taken at 50 frequency and 100 volts is 0.7 watt. At 200 frequency and 5 volts, the currents through the two circuits are no longer equal, that through  $K$  and  $L$  being 0.15 ampere and that through  $L_2$  and  $L_1$  0.01 ampere. The current through the relay winding is nearly in phase with the applied potential difference between the mains, whilst the current through the compensating winding  $L_1$  lags about  $90^\circ$ . Hence, the ampere-turns on the two windings of the relay are nowhere nearly equal, and consequently there is a force acting on the armature. The actual power taken at 200 frequency and 5 volts is about 0.7 watt.

These figures are given as an example. It is of course quite easy to modify them by slight alterations in the windings of the coil. The windings on the relay coil are arranged so that the current would flow round the core in the same direction if a continuous current could be passed through the two circuits as connected up, that is to say, if the condenser were short-circuited. This means that the two windings can be converted into one, and the arrangement illustrated in fig. 2 can be used, which is electrically identical with that in fig. 1.

In order to superpose the ripple on the supply, whether D.C. or A.C., the simplest way is to put a small high-frequency alternator in series with the main generators. Where high voltages are employed, and also in the case of direct-current supply, the secondary of a transformer can be placed in series with the main generators and the primary be connected to the high-frequency alternator. Several relays adjusted for different frequencies can be connected to the same supply and be brought into action by varying the speed of the high-frequency alternator.

By inserting relays in the bases of the lamp-posts, street lighting can be switched on or off from the station, either as a whole or in sections as may be desired. Arc lamps or high-power lamps can be switched off at any desired time and smaller lamps substituted for them. Transformers in sub-stations can be cut in and out exactly as required. Effective control can be maintained over the main switch on the premises of consumers who are taking current at special rates during restricted hours. In return for a small payment shopkeepers can have lights burning for window display or for advertising purposes till any agreed hour, when they can be switched off from the station by means of a relay fixed on the premises. In many residential districts public clocks are either absent or so unreliable that a ready means of setting the domestic clocks would be very desirable, and there are a number of people who would be very willing to pay a small sum per annum to have installed on their premises a relay which would be actuated from the station, and would give an audible signal daily at, say, 8 a.m. Greenwich mean time.

The compensated resonance relay should be of considerable assistance in electric track signalling on railways.

The increasing use of electricity for various domestic purposes other than lighting has increased the need for some simple system of charging. Every one can understand selling current at one price when the station is busy, i.e., at peak load, and at a much lower price at slack times, when otherwise some of the plant would be more or less idle. It does not matter in the least to the station for what purpose the current is used. In some A.C. stations in residential districts the two-rate system has been introduced as an alternative to a flat rate, and by far the greater number of consumers have elected to take the two-rate system despite the increased meter rental entailed by the necessity of having two separate meters and a clock switch. In such districts where the plant is always running, one can obviously afford to sell current at a low rate off the hours of peak load.

It will be seen that the "two-rate system" presents many advantages, but the necessity for constantly altering the setting of the clocks and winding and keeping them in order is a serious drawback. Where two-rate meters are already installed, a simple relay, as described above (to which the name of "Handyell" has been given, pronounced "handle"), can take the place of the clock switch, thus effecting a considerable saving in first cost and in cost of upkeep. It has, moreover, the advantage that the time of operation can, if desired, be adjusted each day to suit the variation in the time of peak load.

This dispenses with the clock, but the inventors propose to go further and make the ordinary meter serve the purpose of a two-rate meter. At Staines, on the system of the Egham and Staines Electricity Co., Ltd., to which Messrs. Handcock & Dykes are the consulting engineers, electrical energy is sold at 7d. per unit; it was found that there was a lively demand for a supply off the peak at 2d. per unit, with two-rate meters, and the engineers, observing that if a consumer's meter were stopped for five minutes and allowed to run for two minutes, the result would be the same as that given by a two-rate meter, decided to adopt this method of charging. A small alternator is installed at the generating station, with a synchronous motor to drive it, and an automatic arrangement of cams and switches is used to break the field circuit of the alternator for two minutes out of every seven. During the other five minutes the alternator, which has a frequency of 200 cycles and voltage of 140 volts, and is connected in series with the 2,000-volt mains, supplies the "ripple" superposed upon the 50-cycle supply; each meter to be controlled is provided with a resonance relay, which breaks the shunt of the meter while the ripple is flowing, with the aid of a small mercury switch of the type widely used in sign flashers, and therefore of proved reliability. It should be mentioned that the supply is given through house transformers at 100 volts, so that the actual voltage of the ripple on the secondary circuit is about 5 volts, allowing 2 volts for drop in the mains.

During the peak, the high-frequency alternator is shut down and short-circuited, so that the meters work full time. The system has been in successful operation for some months, and no difficulty has been met with in explaining it to consumers.

The continuous consumption of power is 0.7 watt per relay at 50 cycles: when the ripple is in operation, a further 0.7 watt is consumed, at 200 cycles, making 1.4 watts per meter, but during this period (5 out of 7 min.) the shunt loss of the meter, say, 1.5 watts, is cut off. During the remaining two minutes, the shunt loss and the relay loss are added, so that, on the whole, there is a slight net loss due to the use of the relays.

In such a case as the above, the high-frequency alternator must

be capable of carrying the whole of the supply current continuously, and of generating the pressure necessary for the ripple, but the power required to drive it is only a fraction of its K.V.A. rating thus derived. At Staines, the mains are single-phase concentric with the outer earthed, and the high-frequency generator is connected in series with the earthed conductor; but it is important to observe that the "Handyell" system is entirely independent of "earth," and is, obviously, equally applicable to a wholly insulated system. It will undoubtedly prove a valuable aid to the central-station engineer.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### New Pattern "Stannos" House Zed-Fuse Box.

Messrs. Siemens Bros. & Co., Ltd., are placing a new house fuse box on the market which is exceptionally compact, neat in appearance, and, we understand, low in price. Fig. 1 shows an open fuse box (half size) wired with "Stannos" wire on the concentric system. The continuity of the "Stannos" sheathing is

FIG. 1.—STANNOS HOUSE ZED-FUSE BOX.

FIG. 2.—B.T.H. PULL-CHAIN SWITCH HOLDER.

maintained by means of "Twiston" connectors terminating at the left-hand corner, efficient contact being ensured by means of the screw, as shown. The box is also eminently suitable for use with ordinary braided wires. It has a capacity up to 15 amperes. Further particulars can be obtained from the makers.

### B.T.H. Pull-Chain Switch Holder.

We referred briefly in our last issue to the ingenious pull-chain switch holder recently placed on the market by the BRITISH THOMSON-HOUSTON Co., LTD. We are now enabled to give a more detailed description, with illustrations (fig. 2). The stiff, jerky action of the ordinary key-switch holder has always been recognised as a serious demerit, because of the risk of lamp breakage. The new B.T.H. Pull-chain Switch-Holder has a horizontal rotary action, controlled by a beaded chain hanging from the top of the holder. This action is so "sweet" and easy that the lamp can be switched on and off without the slightest vibration. Twelve inches of chain are supplied with each holder, so that if it is attached to ceiling fittings, the switching can easily be done from the ground. The contractor who fits a B.T.H. Pull-chain Holder to a table standard, and keeps it standing on his counter, is sure to make sales to many people who pull the chain out of curiosity, and then want to buy the whole equipment.

### The "Fors" Car Lighting Dynamo.

The latest dynamo designed for electric lighting purposes on motor-cars, is that which has just been put on the market by Messrs. RICHARD PAPE, LTD., Belvedere Works, Belvedere, Kent. The machine, which is electrically self-governing, is designed for use with the well-known "Fors" 12-volt storage battery. The dynamo, inclusive of the auto-switch, measures less than 10 in. long  $\times$  8 in. wide and 6½ in. high, and weighs 20 lb. complete as illustrated (fig. 3). The normal speed is 2,000 r.p.m. and the maximum output is 150 watts. The makers claim the following, among other advantages, for it:—Accessibility of the brushes and commutator, dust-proof joints, absolutely constant voltage by a special design of field magnets, and absence of mechanical complexity.

The brush casing can be readily detached by removing a locking

FIG. 3.—"FORS" CAR LIGHTING DYNAMO.

stud, and the position of the brushes may be varied to obtain the best result. The magnetic switch is bracketed to the carcass so that the whole is self-contained. The voltage regulation is effected by means of supplementary pole shoes, in conjunction with the field magnet, their purpose being to divert part of the flux of the main magnets. When the voltage of the dynamo is sufficient, the automatic switch closes the circuit between the dynamo and the battery, and when the speed is too low it disconnects the battery from the dynamo. A 12-volt battery of 40 amp.-hours capacity is intended to be used with this installation, but preferably a 75 amp.-hour battery is employed when the vehicle is required for constant use at night with fairly long periods of intermittent use of the engine. A neat switchboard forms part of the installation.

### New Westinghouse Oil-Break Switch.

THE BRITISH WESTINGHOUSE Co. has recently brought out a small oil-break switch suitable for switchboard mounting on A.C. three-phase, 50-period circuits up to 125 amperes and 650 volts. It is constructed on the well-known metal and mica principle and has one or two unique features. The switch is simple in design and sound in construction, as will be recognised from fig. 4, which shows the switch with tank removed. It will be seen that the

FIG. 4.—SMALL WESTINGHOUSE OIL SWITCH.

connections to the stationary contacts pass out through the side of the slate or other insulating material, this arrangement making it most convenient for connecting up.

Above the slate slab, on the left-hand side, the overload coils are shown, and these operate the tripping bar in the ordinary way. On the right-hand side of the switch, the no-volt release coil is fitted.

The switch is fitted with a loose handle arrangement, and it is impossible to close it when there is no voltage on the circuit.

The three moving contacts are mounted on a steel bar, insulated with moulded mica. The rods which connect this bar to the operating mechanism are of steel, and pass through guides secured to the base of the switch, thereby ensuring that the moving contacts have a parallel motion. It will be noticed that spiral springs are fitted, thus giving a quick break action to the switch.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

VERY encouraging reports have reached us regarding the rapid rate at which electrical advance is taking place in Shanghai. The municipal electricity supply department is giving a very strong lead, and, with the display of spirited enterprise in the provision of facilities, there is a growing disposition on the part of the public to avail themselves of electrical supply for lighting, heating and power purposes.

The new Riverside power station is now nearing completion, and in about three weeks' time it will start running. This station is designed to accommodate a plant of 14,000 kw. capacity, and the first instalment, which was put in last year, amounts to 4,000 kw. Already the engineer has laid before his Council the necessity for putting in further extensions, and it has been decided to call for tenders in the course of a few months for two 5,000-kw. turbo-alternators and condensers, together with the necessary boiler plant.

It is interesting to learn that the Department is taking a very live interest in electric vehicles. Its present equipment consists of a fleet of five petrol motor-cars and a 2-ton motor-lorry, but owing to the enormous increase of business and the large area to be covered—10 miles from end to end—it is considered more efficient, in order that the staff may get about more rapidly, to increase the number of cars by four or five more, while there is also to be added a 5-ton motor-lorry, with a crane attached, for handling heavy goods. The prevailing conviction there seems to be that it is the business of an electricity undertaking to use "everything electrical" as much as possible, so it is more than likely that the new cars will be electric and that the replacement of the existing petrol cars with electric will follow. Certainly the latter should possess greater electrical advertising value than would petrol ones, and the adoption of electric cars by the public, as well as an extension of everyday electrical applications, should also ensue. It is not surprising that the remarkable development of the electric vehicle in the United States should have turned attention in that direction. We have again and again had to deplore in these columns how backward we in this country are in this respect, though we admit that there are other causes responsible beside apathy. It is practically certain that if we are behindhand with the use of a class of requirement, we are in danger of being behindhand also in its manufacture, and somebody else may profit because he has advanced more progressively than we. We do well if we weigh up the electric vehicle question with this additional possibility in our minds.

In Shanghai, which is perfectly flat and has good roads, an effort to push the electric vehicle is thought certain to be followed by a great success, provided that the battery and electric equipment are looked after by competent people, and

we should say that the good example of the Electricity Department would count for much with the public. One result of so excellent a move would doubtless be that before long there would be several hundreds of electromobiles in Shanghai, all of which would naturally take their current for charging purposes from the municipal supply department, and, may be, they would be "after the pattern" of those used by that Department. Supply can be given to charge batteries for such a purpose at 7d. per unit or even less, and as the price of petrol is going up all the time this should form an added electrical inducement. The number of the "Point Fives" in this country is, as our readers know, small at present, but it is not the fault of the municipal electrical engineer of Shanghai that he is not already among their number. As a matter of fact, the Electricity Committee has twice passed a suggestion emanating from him that a flat rate of 1·7 candareens per unit, which is equivalent to 3d., should be introduced for all energy used for heating and cooking. It was the Council that did not see its way to let Shanghai have the credit of adding to the membership of the enterprising Point Fives Club, for it was not prepared to confirm its Committee's recommendation at the first time of asking, while at the second it compromised by authorising a reduction to 7d. Perhaps the club will recognise the qualifications of Mr. Aldridge, and duly fête him during his stay here in the coming summer.

It may be more or less of a revelation to our readers to learn what admirable advance is taking place in the adoption of electric radiators by Chinese consumers on the Shanghai circuits. During the past winter these westernised gentlemen have given us an illustration of what we may be able to do among others of their colour as we try to develop our radiator business in this Far-Eastern world. The total connections of heaters and cookers in Shanghai now aggregate over 500 kw.

But it is not only in lighting and heating that there is gratifying electrical enlightenment in this international municipal community. Our electrical firms who do not already know it, should take note that the cotton industry there is at the present moment booming. One small mill of 10,000 spindles has already been electrified, and there is in contemplation the electrification of an additional 30,000 spindles in the same mill. At another mill the electricity department has a contract for a supply of 500 kw., and at yet another for about 450 kw., both of which consumers will go on to the mains within a few months; while, still further, there is a 50,000-spindle new mill in prospect. Knowing what we do of events in the textile industry at home and in some other countries, we are justified in anticipating that the electrification of several of the older Shanghai mills, and the adoption of electricity by a new one, will ultimately result in bringing into line numerous other factories of the same class which have been running for a great number of years. While all this is most gratifying and encouraging from the purely electrical point of view, it has a distinctly unfortunate side, at the moment, from the purely *British* standpoint, for we gather that German firms, displaying that enterprise which we have so often felt it our duty to refer to in relation to their Chinese electrical business, are securing the bulk of this work. We have again and again discussed reasons for their successful competition with us in this market, and while it is not our

present intention again to go over that ground in detail, we should be shirking our responsibility did we not mention it here, seeing that it is one of the great factors that must not be lost sight of in our rejoicing at the unhindered progress of electricity.

Observers who are well qualified by long experience and close association with the market and its conditions, have no difficulty in explaining our relative backwardness. They say now, as they have said in our pages on previous occasions, that our Continental friends succeed readily because they co-operate willingly with prospective customers. They get out special motors suitable for cotton spinning, such as those for variable speed on ring frames, and also small loom motors. These they put in experimentally free of cost, and the low rate charged by the electricity department assists them in their effort to secure a satisfied power-user. It will be to our enduring shame and regret if the great bulk of the Shanghai mill motor equipment work falls into the capacious lap of the Fatherland. But there it is. Such is feared to be a correct impression of the prospect. Our manufacturers cannot say that they do not know. What are they going to do to meet the situation? Can they—will they—do nothing? Obviously it is the work of the Electricity Committee to sell electricity, and to encourage anybody who will assist it to that end, and an international municipal council can hardly be expected to be swayed either by British or German influences where merit and enterprise (which cover, we suppose, both price and quality considerations) must be the deciding factors.

One—indeed *the*—outstanding feature of the position seems to be that upon which so much stress has been laid here—our need for organisation and combination. If our information be correct, and we believe that it is largely so, while most of the big English firms are represented in Shanghai and other cities by merchant houses—who, it is said, do very little for the people whom they represent—the large German manufacturers have their own representatives on the spot (sometimes Germans, sometimes Englishmen—as has happened in some of our Colonial markets) who are most highly trained engineers and men well qualified to discuss matters in technical and commercial detail, and are armed with that full measure of authority which enables them to settle matters direct without referring things home to the Fatherland.

In opposition to this trump card in competition, what do we produce?—English engineers who are so versatile that their duties embrace quoting for anything from a steel bridge to a power station, and who cannot therefore be expected to possess that detailed experience in all the branches of engineering in which they are called upon to do business. Consequently, instead of being able to enter into a contract right on the spot without waste of time, they have to refer the matter to—"the dear Homeland"! That there are difficulties in the position we fully recognise, difficulties that are not lessened by the fact that there are a number of conflicting interests and competitors, while with our Teutonic rivals the competition is practically limited to three or four big combinations. But to sit and sigh and let the work pass by is not generally like the British race. Let us, at least, continue to attend to this setting up of more suitable and efficient British representation abroad—especially in China—that so many authoritative voices have urged upon us in the last four or five years. A little has been done, but in the words of Cecil Rhodes, "So much remains to do!"

#### Advertising Electricity.

We report this week a paper on this subject, read before the I.E.E. by Mr. H. C. Palmer, in which a definite scheme of organised publicity is put forward, having for its aim the education of the public to a better appreciation of the advantages to be derived from the use of electricity for domestic purposes. This is a matter which has occupied a prominent position in the proceedings of the Institution during the past year or two, and which, as the outcome of the recent reforms, will doubtless command more and more attention

in the future. That there is an urgent need for action in this direction can hardly be questioned; that need has existed for some years, and has grown continuously more insistent. The aggressive and enterprising policy of our rivals, embodied in the British Commercial Gas Association, has greatly increased the urgency of the question, and has at the same time shown what can be done even in this country by organised and co-operative effort.

There is nothing new in the idea: as long ago as 1906 we published a series of articles by an expert, Mr. R. B. Matthews, with the express purpose of arousing our central-station managers to a due appreciation of the possibilities before them, and the best means of realising those possibilities. Other articles of a similar nature have appeared in our pages from time to time during the past decade, but the result has been far from satisfactory. We believe that this is not wholly the fault of the engineer-managers, many of whom are strongly in favour of an active policy of advertisement: the difficulty is due rather to the control of the great majority of our electricity supply undertakings by inept committees, often composed largely of small tradesmen and professional men who have no conception of the meaning of organised publicity, and whose hands are tied by the restrictions imposed by the Local Government Board's auditors. It must be said, however, that at the present stage of development of the business, which is gradually being evolved from the condition of an engineering problem to that of a commercial undertaking, the first element of the compound engineer-manager is in many cases the controlling one, and the tendency in such cases is to regard the supply of electricity rather in the light of a profession than in its true aspect, that of a trade. We wish here to emphasise the latter view to the utmost, and to point out that, to an important trade such as this, well-organised publicity and bold advertisement are an absolute necessity. True it is that the merits of electricity are such that, as a correspondent recently pointed out, the trade is bound to make progress, even without the aid of such a scheme; but this in our opinion is a feeble excuse for inertia, and an unseemly one to emanate from a purveyor of *electrical energy*, of all things. Moreover, the enemy have already embarked upon a campaign of activity which puts to shame the advocates of a policy of *laissez-faire* in electricity supply, and which, if the latter do not wake up, may work much mischief.

One of the difficulties to be contended with is the argument that *all* will benefit by such a scheme, including those who do not contribute to its support. This is true enough, but as a serious objection it is not worth a moment's consideration. Putting aside the ethics of the question, and disregarding the jaundiced complexion of those who cannot bear to do good to their neighbour without making him pay, it stands to reason that if all are benefited, those who object will also benefit—why, then, do they object? As for the difficulties imposed by the auditors, which prevent direct contribution to the funds of a publicity association—that is one of the obstacles which ought to be removed, and which could be removed if the Institution of Electrical Engineers and the Incorporated Municipal Electrical Association took the matter in hand.

We have said nothing regarding the merits of the particular scheme put forward by Mr. Palmer; but, as it runs on lines similar to those which we have so long advocated, it will suffice for us to express our approval of it in the main. The great thing, however, is to get the subject forward, and to keep it prominently in the forefront as the question of the day, so that the Industrial Committee of the Institution and the other bodies directly concerned may have the necessary support of public opinion, and may be kept up to the mark and alive to the real need for vigorous and sustained action. For that purpose we shall welcome all such papers as aids to the realisation of an effective scheme of publicity.

THE criticisms which we offered two weeks ago, regarding a pamphlet and a letter sent to us from the Royal Naval Artificer-Engineers' and Engine-Room Artificers' Benevolent Fund, have elicited a number of replies, which will be found in

our "Correspondence" columns. It scarcely need be explained that the article did not raise any objection to legitimate claims being brought to public notice through the Press upon fair and proper grounds, but it did denounce "the attempt to force them upon the public, through the Press, upon the questionable grounds" stated in the pamphlet and the letter. A correspondent asks us why we demur to these statements of claims, and the answer is that we find them in important details to be unsupported by the facts. To illustrate this, it suffices to examine the declaration that "we are rapidly drifting towards the serious position of a steam Navy minus engineer officers," and the further inexactitude that "it is notoriously difficult to get candidates to enter for the engineer branch at all." Another correspondent, presumably also a member of the Benevolent Fund, asks us to believe "that, from 1910 to 1915, not a single engineer officer will have been added to the Royal Navy."

Are we rapidly drifting towards the serious position of a steam Navy minus engineers? The current *Navy List* supplies a sufficient answer to that question. We find that in 1911 no fewer than 48 ratings were promoted to the rank of warrant officers as engineers. In 1912, there were 79 similar promotions, and in January of the present year 15 more were added, or a total of 142 since 1910. These are warrant engineer officers promoted from the rating of chief E.R.A. and E.R.A., and also from the rating of mechanic to fill vacancies as they arise on the established list. It has to be remembered that these warrant officers have received a considerable amount of marine training, and they are admirably suited for the duties which they are called upon to perform. The *Navy List* contains a very substantial number of engineer captains, engineer commanders and engineer lieutenants, and the new-scheme officers will next year begin their specialist courses in engineering. In all these circumstances, therefore, we feel obliged to reject the assertion that "we are rapidly drifting towards the serious position of a steam Navy minus engineers."

It is difficult to infer anything of value from the statement of a correspondent to the effect that the present and the past naval cadets loathe and detest the dirt and grease inseparable from the engine room of a ship, and that they dislike marine engineering. Presumably not even a member of the Benevolent Fund has a craving for dirt or a hankering after grease. If the statement is intended to convey that the cadets and midshipmen are adverse to engine room duties, it is not in accordance with the opinions expressed by officers serving afloat, nor is there any valid reason why a cadet trained at Dartmouth and in cruisers should be less attracted to those duties than a cadet trained at Keyham. Again, it is difficult to find argument in the suggestion that "the prospects of internal combustion engines and the probable absence of stokers in the near future call for concentration on the subject of marine engineering," for the question of indecision on the part of cadets in the selection of a branch for specialisation has not yet arisen. A young officer who has passed through the new scheme of education and training may be expected to know at least as much about internal-combustion engines as a member of the Benevolent Fund who may have entered the service as a copper-smith, and he will probably be as well informed concerning them as the average officer of the mercantile service. In other words, the members of the Benevolent Fund would be well advised if they stated their claims upon their own merits, without attempting to prejudice a scheme of training naval officers which has not yet developed sufficiently far to enable them to judge of its results. They plead for sympathy and fairness; they will not secure these virtues by prejudice, and they will but injure what may be a good cause by overstating their case. The artificer of to-day is better trained and better educated than his predecessors, and he must expect, therefore, to have placed upon his shoulders a greater burden of responsibility, in proportion to the increase of power and complexity of ships and armaments. This principle extends to all ranks and ratings, and it is not to be expected that the commissioned ranks of the engineer branch can be indefinitely increased in numbers while there are capable petty officers and warrant officers well able to lend a hand in supervisory duties.

## THE USE OF ELECTRICITY AND ELECTRICAL ACCIDENTS IN MINES.

(Continued from page 321.)

In the Newcastle district there were two fatal accidents, one caused by a countersunk screw working up and coming into contact with a metal covering, and the other by a broken ammeter carrying current to the casing. "Neither of these accidents would," says the inspector, "have occurred had the apparatus been properly earthed." In one case the earth wire had been accidentally removed, but in the other case the installation being new no earth wire had been attached.

In the Durham district there were two fatal accidents underground, resulting in the death of two persons and injury to a third, and one on the surface.

Of the underground accidents the first occurred at Sherburn Mill Colliery, where direct current at a pressure of 550 volts is used for working a coal-cutter, the current being conveyed in two ordinary insulated cables, which were carried to the switchbox, and then to the coal-cutter. Height had been made in the cross-gate way to within two yards of No. 9 gateway, and at this point where the cables were carried past the gate-end the height was only about 3 ft. As soon as height was made, the usual practice was to carry the cables across the gate-ends in wood boxes, so as to be well clear of the tubs. At the time of the accident this had not been done, although the wooden box was lying ready. It is probable that when a putter named Ashworth (the injured person) came out of No. 9 gateway with a full tub, a large coal on the tub caught one of the cables and dragged it slack, and that shortly afterwards as Ashworth was pulling his empty tub by the in-bye end into the gateway, it came in contact with the slack cable and jammed it against a projecting portion of the gateway, resulting in an abrasion of the insulation, and the core of the cable came in contact with the iron tub he was engaged with. He was knocked down and found with one foot lying across one of the rails. At the same moment another putter named Laverick, who was sitting on one of the tramrails in the cross gateway about 10 yards distant, also received a shock, and was severely burnt about the head and bare parts of his body, and in spite of continued efforts to restore him, was found to be dead. Ashworth recovered after about 40 minutes' treatment. A pony was standing attached to the full tub which Ashworth had brought out, but it took no harm, as the tub was not in contact with the tramrails, all four wheels being off the way. The tubs were of iron, and evidently Laverick received a shock, the current passing through the tub Ashworth was pulling, and then through the tramrails. The cables were suspended by leather slings secured to props, or by wooden supports. The obvious remedy to prevent such an occurrence is to provide more height at gate ends where cables are carried across, and the latter should be laid in boxes, where they cannot come in contact with tubs or ponies. Special Rule (of the code of rules recently superseded) 28 appeared only to apply to the protection of cables on main haulage roads, but the principle is the same, as an insulated cable in such a cramped position is more likely to suffer damage than on a roomy engine plain.

The second accident occurred at Lumley Third Pit, in connection with a coal conveyor. The conveyor in question was a Blackett conveyor, driven by a  $\frac{1}{2}$ -H.P. motor of the squirrel-cage type. The current supplied was three-phase, the pressure at the terminals of the supply transformer being 400 volts. On the day of the accident a deputy received a slight shock about three-quarters of an hour after the motor had been started. It was accordingly stopped, and a message sent to the surface for an electrician, who found on examination that at the point where the trailing cable was connected to the motor a loose strand of wire from one of the leads at the terminal block had worked through the insulating tape, and was making contact with the frame of the motor. This was rectified, and the motor restarted. Four hours afterwards the deputy, as he was going along the mothergate, heard a humming noise on approaching the motor, and at once shut off the current at the gate-end box. He then found the conveyor attendant lying

unconscious and face downwards between the tramrails at the delivery end of the conveyor. He at once gave an alarm, and artificial respiration was tried for  $1\frac{1}{2}$  hours until a doctor arrived and pronounced life extinct. Provision was made to earth the conveyor to bank, and subsequent tests showed that the earth provided was fairly good. The earth wires also were found on inspection after the accident to be efficiently attached. The accident is thus most difficult to account for, and one possible explanation appears to be that the conditions when the accident occurred, and afterwards when the tests were made, were not the same. A loosely attached earth-wire would explain the occurrence; or it might be that the earth connection, though good, was not good enough, and the motor frame was therefore enabled to assume a potential sufficiently high above the surrounding ground (which was wet) to cause the accident.

The surface accident took place on the screens at Trimdon Grange Colliery, and caused the death of a screenman. The current was three-phase at 220 volts, and was used for lighting purposes. At the time of the accident, the deceased was in the act of using his handkerchief to clean the thick protecting globe, which surrounded an incandescent light bulb. The wires to the lamp were carried in an iron tube, at the end of which was an iron lamp shade. As the deceased was cleaning the globe he suddenly fell backwards, and on being asked what was the matter, he said he had "touched that globe," evidently associating in his own mind the action of touching the globe with the state of his sudden collapse. He immediately became unconscious, and efforts to restore him by artificial respiration were persevered with for  $1\frac{1}{2}$  hours without success. A post-mortem examination showed that the cause of death was a diseased mitral valve, but there was no direct evidence to prove that the deceased had received an electric shock. An exhaustive investigation of the accident did not afford any satisfactory result, as no actual leakage could be afterwards discovered, though the insulation of the whole circuit was low. No mechanical damage of the wires could be found, which would have accounted for the iron pipes which contained them becoming live. The pipes were supposed to be earthed by an earth wire connecting them to some cast-iron piping of a coal-washer, but it was evident the connection to earth was not a good one. The accident happened after some heavy rains, and the conditions existing at that time were more favourable to leakage than they were when the tests were made by Mr. Nelson, H.M. Electrical Inspector. It is probable that death was due partly to the fact that the deceased had a diseased heart, and was therefore unable to withstand a shock which might not have proved fatal to a person with a normal heart, and also to the fact that the damp conditions existing at the time were favourable to a temporary breakdown of the insulation.

Three ponies were killed by electric shock by two accidents. On the first occasion two ponies were electrocuted, the initial cause being the breakage of one of the armature-end connections in the motor of a Morgan-Gardner coal-cutter, thus rendering the framework of the machine alive. The current was 500 volts continuous, and the trailing cable contained the earth wire. Unfortunately the person in charge of the machine had neglected to tighten up the screw of the earth wire by which it was connected to the metal frame of the reel. The reel had been left standing across the tramrails, and a pony coupled to an iron tub received a shock and moved towards the reel, and is supposed to have got on to one of the cables and pulled the connection plug out of the reel. Another pony on reaching the gateway also received a shock through the rails, tub and gears, and was also killed. An earth wire was afterwards continued from the earth wire of the out-bye armoured cable and taken into the switchbox and joined on to the short earth wire from the reel to an iron rod. This additional earth wire afterwards was the means of conveying a fatal electric shock to another pony within a fortnight owing to the parting of the out-bye armoured cable. The coal-cutter motors were subsequently altered and overhauled, and the installation, which was by no means of recent date, put into a more reliable condition.

There were no fatal accidents in the Yorkshire district, but (says the late Mr. Pickering) it is too early to decide whether this is happy chance or whether the potential dangers

of electricity are better realised. Several underground fires originated by arcing of electric cables. Of the latter, one is described, and it might have had serious consequences, as 411 men had to be brought to the surface, 140 of them through smoke. It is thought that the cause of the fire was "arcing at the point where the three-core cable was separated for connection to the switch and fuses. The cable was paper covered, lead coated and armoured with steel tape. As the Inspector says, "Paper is a hygroscopic material, and the lead sheath of cables insulated with paper is designed to keep out moisture. When the cable is split, a proper "dividing" box should be provided to effectively seal the ends. A wrapping of tape was used instead of a box, and it is probable that this was not moisture proof, and that, therefore, the paper became damp and lost its insulating properties."

(To be continued.)

## KENT COAL.

By G. LLOYD JONES, A.M.I.E.E., M.I.M.E., Principal of  
West Ham Testing Laboratory.

A FEW days ago, by the courtesy of Mr. Arthur Burr, managing director of the Kent Coal Concessions Co., the writer was enabled to take samples from the Beresford 4 ft. 8 in. seam, at Snowdown Colliery.

The Beresford is the first workable seam uncovered, and to many central station engineers—those especially in neighbouring districts—it must be of the greatest interest to have put before them data upon which they may judge as to the value of the coal from this new field for steam raising purposes, which is already being put on the market in considerable quantity.

The proximate analyses given relate to run-o'-mine samples taken from the actual working faces. The one was taken from above, and the other from below the 6-in. shale band, which splits the seam midway in the horizontal plane:—

	Above shale band.	Below shale band.
Volatile matter ... ..	27.98	28.26
Coke ... ..	70.34	69.76
Ash ... ..	7.20	6.11
Fixed carbon ... ..	63.14	63.65
Moisture (hygroscopic)...	1.68	1.98
Sulphur (separately determined)	1.32	1.29
Calorific value (as dried) ...	13,990 B.T.U.	14,180 B.T.U.
Net effective calorific value (as fired) ... ..	13,316 B.T.U.	13,454 B.T.U.
Evaporative power (as fired) ...	13,779 lb. of water from and at 212° F.	13,922 lb. of water from and at 212° F.

The results obtained show the coal to be of exceptionally high thermal value, and since the hygroscopic moisture is comparatively low, having regard to the other general characteristics of the coal, it will be noted that its net effective evaporative power, which takes into account the negative value of the moisture existing as such, and that produced by the combustion of the hydrogen in the volatile matters, is but little less than the evaporative power of the dry coal. On the other hand, the coal was extremely tender and would suffer severely through breakage in transit. Its structure is columnar, the columns being of short length, determined by the lines of natural stratification. When broken transversely to the axes of the columns a crystalline fracture was shown with a suggestion of tarriness. The coal taken from above the shale band disclosed heavy lime salt impregnations due to percolation of water carrying these salts through the interstices. Below the shale band the interstitial impurities were markedly less due no doubt to the protection afforded by the hard shale. The volatile matters were readily liberated, and burned with a long, bright, sturdy, somewhat smoky flame, giving sooty deposits. The coal is of a very agglomerative nature, and produces a silver grey, hard, compact, close-grained coke of excellent quality. The ash is of dark purple brown colour and considerable density.

The utility of this coal for general central station purposes must be severely discounted by its friability. The percentage of "fines" must necessarily be very great, even were the coal screened at pit, as it crumbles under the slightest pressure between the fingers, and riddling through the grate bars would be inevitable in spite of its caking properties. For coking stokers it appears almost ideal, and the great density of the ash means that frequent cleaning out would be unnecessary, as the bulk would be proportionately small. If hand-fired, smoke production must result, and frequent levelling of fires would be required to prevent the formation of blow-holes, which would accentuate the trouble.

Although touching upon a rival industry, it may be of interest to mention that the gas analysis shows the coal to be exceptionally rich, giving a yield of 11,566 cu. ft. per ton of 15.1 C.P. by No. 2 Metropolitan burner, or equivalent sperm value 595.4 lb.

The friability of the coal is not detrimental to its value for gas making.

It will be understood that this article merely relates to the Beresford seam, and it may very possibly be that the seams at greater depth, which aggregate no less than 130 ft. in thickness to the 3,000-ft. level, may prove to be harder and less susceptible to damage in transhipment. Several of the shafts being sunk by other companies subsidiary to the parent company, the Kent Coal Concessions Co., are already in the coal measures, and the day is now near at hand when the present staple Kentish industry—hops—will be overwhelmed by coal from the new Black Country, with sunny Margate transformed into the Blackpool of the South.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

### Artificers in the Royal Navy.

In the current issue of your journal there appears a leading article dealing with the claims put forward by the chief and artificer engineers and engine room artificers for better pay, accelerated promotion, and a minimum pension of £100 per annum for chief artificer engineers. Your method of discussing these claims is, to say the least of it, unsympathetic, if not unfair, and seeing that the ELECTRICAL REVIEW is an engineering magazine, your remarks call for a rejoinder from someone that has an intimate knowledge of the subject, and such knowledge the writer of this letter claims to possess.

You state at the outset of your article that the subject which you discuss has nothing to do with "the old trouble concerning engineer officers." Well, it has, and it hasn't. In so far as the old trouble was the offspring of class prejudice and arrant snobbery, the grievances of the engine room artificer class are of the same order, but to pursue that aspect of the question would encroach too much upon your space.

You state that the "plea put forward by certain (italics are by the writer) discontented, &c." Why, may I ask, do you set out to weaken the plea by making it appear that a mere handful, and these a "discontented" handful, are pushing their claims for further recognition, when further on your article claims to speak for the "great body of artificer engineers"? There is only one organised body of chief and artificer engineers and engine-room artificers, and it is this organisation which issued the plea which you have fallen foul of. It must be assumed that these responsible men know where the shoe pinches, and so suggest a remedy so that conditions of service for them may be readjusted and modified. You admit that the several points enumerated in the plea are "legitimate" ones, but demur to them being forced upon the public through the Press. Why? may I ask again. A few weeks ago, columns upon columns of special articles appeared in the Press advocating higher pay

for lower deck ratings, and it is to the everlasting credit of the Press that it took such an altruistic attitude on behalf of an overworked and underpaid body of men as those included under the general term of lower deck ratings.

After admitting that the grievances put forward in the plea which you criticised are, as abstract propositions, "legitimate" ones, you proceed to state that the pamphlet "must entirely alienate the grumblers from the sympathy of those who have more than a superficial knowledge of service matters." Here again you emphasise what I must describe as prejudice against the large body of men whose views and aspirations are voiced in the plea with which you dealt so caustically.

There are grumblers and grumblers, and there is an offensive way in which the adjective can be used, which makes its use so dangerous. Its use in a professional organ, and on such a subject, is to be regretted.

But to more serious points in your indictment. You describe the statement:—"We are rapidly drifting towards the serious position of a steam Navy minus engineer officers" as a "loose and inaccurate statement," but you fail to show wherein is its inaccuracy. A more generous-minded critic might have passed what is condensed into the broad generalisation about a steam Navy minus engineer officers. It may be crudely worded, but in essence it is true. The last Keyham-trained engineer officers joined the Navy as sub-lieutenants in 1910 (there were 10 of them); and, according to your own showing, it will be 1915 before any of the common entry officers are sufficiently specialised in engineering to be drafted into the service for engineering duties. What of the five years' hiatus? Where are the engineer officers to supply wastage and the normal expansion of the Navy? Further, will there be a sufficient number of these "specialised" (I hope you like the word, though it doesn't sound engineering) officers to go round—i.e., to relieve chief and artificer engineers who are now doing the duties formerly carried out by Keyham-trained engineer officers? Yes, *actually* doing those duties.

So much for your charge of looseness and inaccuracy. You further state that it is misleading to link up the artificers with the commissioned ranks. In fact, you say that it is "unfortunate." May I again put the query mark after the word why? The Admiralty has no hesitation in linking them up. At the present moment there are 23 engineer lieutenants who at one time were artificers, and 636 chief and artificer engineers who served in the same humble but responsible capacity. There is little differentiation amongst ranks and classes when duty is being performed, and it is only sticklers for gradation that refuse a place in the sun for the engine-room artificers. However, your article finishes on a sound note by stating that you think that the lower commissioned ranks will be replenished from amongst the most deserving of the warrant officers. In conclusion, it appears to the writer of this letter a great pity that the engine-room artificers should have received a blow in what, it was hoped, was the house of a friend. Society, and other flippant and irresponsible organs can criticise as they like, but when an engineering magazine takes to that genial art in an ungenial manner, it causes sorrow and disappointment amongst those who expected different treatment.

W. Stoddart,

*Ex-Chief E.R.A.*

Southsea, February 18th, 1913.

I have read your criticisms on "Artificers in the Royal Navy," and I should be glad if you would allow me to reply.

You state that if the artificers forward their application for increase of pay, promotion, &c., to the proper authority, it will receive attention. Well, Sir, since 1882, the artificers have been asking for this *same* rise in pay and prospects, without success, and therefore in justice to the great body of artificers, is it not time an appeal was made to the general public?

With regard to the shortage of engineer officers, it cannot be denied that from 1910 to 1915 not a single engineer officer will have been added to the Royal Navy, and at the same time a very large number of engineer com-

manders will have retired (this year 28 are due to retire). This, in conjunction with the large and powerful ships being newly commissioned, proves beyond any dispute the serious shortage of engineer officers.

As to the lack of volunteers for specialising in engineering, anyone with the slightest acquaintance with the present or past naval cadet knows how much they loathe and detest the dirt and grease inseparable from the engine room of a ship, and if you heard the remarks that are made by them regarding marine engineering, I venture to think you would feel doubtful as to the success of the scheme.

I must confess it is a surprise to me to read an article in a technical paper upholding a system which can only produce a jack-of-all-trades; surely there is sufficient to study and master in the profession of engineering without introducing such subjects as navigation, gunnery, &c. The complication of modern warships, the prospects of internal combustion engines and the probable absence of stokers in the near future call for concentration on the subject of practical marine engineering, and if the young cadet is only undecided as to what he shall specialise in, it will not tend to produce the best or most efficient engineers.

Might I point out that the whole of the mercantile engineers are exactly the same class and type of men as the artificer engineers and engine-room artificers of the Royal Navy? It is only since this scheme has come along that commissions in the Royal Naval Reserve have been refused to valuable officers of the mercantile marine, and it is curious that, although some 300 were considered to have sufficient professional knowledge to receive commissions, now it is impossible for any mercantile engineer to receive a commission, while, on the other hand, upper-deck officers of the merchant service are being made lieutenants on the active list.

The fact remains that the engineering profession is looked down upon by large numbers of officers in the Royal Navy.

As an engineer in the Reserve, holding an extra first-class engineer's certificate, with some experience in the Navy, I say that, in the artificer engineers and engine-room artificers, the country has sufficient practical engineers to take complete charge of the engine rooms of the whole of the ships in the Navy, and I feel confident that, should the time arrive for them to prove their worth as engineers, they will acquit themselves with credit to their cause and their country.

R.N.R., M.I.Mar.E., A.M.I.M.E., &c.

Your leader on "Artificers in the Royal Navy," in the issue of February 14th, calls for some comment from those you unfairly designated "certain discontented ones, and misguided few."

I say unfairly, because the implication is that the contents of that "remarkable" pamphlet, so adversely criticised by you, were not approved by the great body of those ranks and ratings enumerated therein. It may, however, interest your readers to know that the Benevolent Fund members number not less than two-thirds of the total of artificer engineers and E.R.A.'s in H.M. Navy—a number which is considered fairly representative of the corps, and sufficient at least to warrant the formulation of demands for their special benefit, yet of great importance also to the general efficiency of naval service.

Moreover, the "abstract propositions that are all legitimate" have been duly made to the proper authorities, and received careful consideration. But more than that is necessary to ensure success, and the Navy, being "in effect a secret service," only leaves one other method available for pushing demands and interesting public opinion, viz., the Press, which, generally speaking, is favourable.

The impracticability of sending out an accompanying explanatory volume of detail will be recognised, and it is sufficient here to say that the facts stated are unimpeachable. A reference to the official current Navy list will at once show that there are no officers—except artificer engineers—available to even fill up the ranks of engineers retiring every month; and all that is asked is that consideration may be given to the claims of those who are already performing the duties of, and are borne in lieu of, engineer lieutenants in many ships.

"Artificer engineers and E.R.A.'s will be quite content if, as you suggest, the way is left open for "those who can climb to the higher ranks," and are quite prepared to fulfil any conditions to that end, outside of the monetary qualification imposed on cadets.

Trusting you will give publicity to this addition to "the scanty information available" hitherto, and thanking you in anticipation.

C. J. W.

Devonport.

[This correspondence is referred to in our leader pages.—Eds. E.R.]

#### Fixing Contacts in Springs.

In your issue of February 14th, 1913, I noticed under the above heading a device by Mr. S. E. Srawley, of Liverpool, which, indeed, is a great improvement on the old method of cutting the wire into bits and inserting them by means of a pair of tweezers.

Your contributor could, of course, not have been aware that a similar tool of my design, also for a small handpress, has been working in a London factory this last six years very successfully—producing 2,500 to 3,000 springs per day, of any kind.

This tool includes piercing the hole, feeding in and cutting the wire, forming a single point, double point, single flat and double flat contact, as required, and finally throwing out the spring automatically into a box by the side of the press, each spring being picked up once only.

A second and much improved tool for the same purpose is now also at work in another London factory.

Should any firm be interested in the above, I shall be pleased to furnish further particulars.

M. W. F. Petmeky.

London, N.W., February 20th, 1913.

#### Testing the Continuity of Earth Conductors.

With reference to my letter of the 3rd inst., in reply to "Continuity," kindly grant me further publicity in reply to Mr. J. P. C. Kivlen.

In my reply to "Continuity," I simply dealt with a method of testing an earthing system for continuity to the earth connection.

As regards the class of cable and the arrangement of the earthing systems, before dealing with this matter, it would be necessary to consider the circumstances of each individual case. I presumed the regulations in regard to the conductivity and continuity of the earth conductors were fully understood, and there should be no difficulty in complying with the rules. Provided this is done, all that remains is to maintain the efficiency of the system by careful inspection and tests from time to time.

Now, with regard to the method of testing. Mr. Kivlen seems to look upon the "bridge" test with awe, and I do not quite follow him when he refers to the expense of a few thousand gallons of water and a few tons of coal; but I assure him that the tests are easily made, and even the cost of a single life may be avoided.

Referring to Rule 14, sub-Sec. (c) (i), Mr. Kivlen states that this does not call for a "bridge" test, or any definite measurement at all; he further states that a continuity test can be taken by joining one of the copper conductors to the armouring at the far end of the cable, and testing by "Megger" or galvanometer from the same conductor to the armouring at the near end. I say that to rely upon a test of this description is simply asking for trouble, and I would much prefer to risk inspection only.

The "Megger" or galvo. would, no doubt, show perfect continuity, but 5 or 10 per cent. of his load current on the earth conductors would probably show some serious defects in the continuity of his earthing system. This is an important point, and, I believe, has been the cause of several fatal accidents.

With regard to an expensive insulation testing ohmmeter and generator, no damage need be feared, but the instrument is practically useless for such a test.

A more reliable test can be taken on similar lines,

which is practically a conductivity test, by applying current to the cable and armouring with voltmeter and ammeter in circuit. Then the fall of potential across the ends of the conductors will give the resistance by Ohm's law, viz.—

$$r = \frac{\text{drop in volts}}{\text{current}}$$

This is a simple method, and should appeal to the "Small Colliery Electrician" referred to by Mr. Kivlen.

Mr. Kivlen states that my method does not test the continuity of the earth conductor. I take it he means the whole length of conductor. This can easily be done when the arrangement of the system is known, and may be applied in his case as follows:—

Thus the total res.  $r$  of the line and earth is  $x = r a/b$ .

If the cable be used as a second line the res. of the earth conductor can be determined separately from that of earth, as well as the res. of earth.

Let  $r$  = res. of first line,  $r_1$  = res. of second line,  $r_{11}$  = res. of earth.

Connect the far end of  $r$  and  $r_1$  together to get the total resistance  $R$ ; connect  $r$  and  $r_{11}$  and measure res.  $r_1$ .

Connect  $r_1$  and  $r_{11}$  and get the total res.  $R_{11}$ .

$$\text{Then if } T = \frac{R + R_1 + R_{11}}{2}$$

$$\begin{aligned} r &= T - R_{11} \\ r_1 &= T - R_1 \\ r_{11} &= T - R \end{aligned}$$

I note that Mr. Kivlen agrees that it is necessary to test the earth itself, although he states that the rule does not call for it. The rules, however, refer to the Board of Trade Regulation, which requires two earth-plates to be laid and maintained, so as to secure electric contact with the general mass of earth, and so that, if possible, an E.M.F. not exceeding 4 volts shall suffice to produce a current of at least 2 amperes from one earth connection to the other, through the earth—a test to be made once every month.

It was pleasant to find Mr. Kivlen finally coming over to my side by means of a "rapid" bridge test. But why "rapid"? A continuity test may be taken on the earth conductors at any time without disorganising the system, provided, of course, there is no serious leakage disturbance.

I am glad to have had the opportunity for discussing the subject with Mr. Kivlen, and hope to see further correspondence on the subject.

B. T. Davies.

Swansea, February 17th, 1913.

In further reference to the subject of mines regulations and the continuity of earthing conductors, the point I wished to emphasise, but which, perhaps, I did not quite make clear, appears to have been lost sight of by most of those taking part in this interesting correspondence—that is, the 50 per cent. conductivity at all joints, as required by Rule 8 (b). My object in writing was to open a controversy on this subject with a view to an exchange of opinions on this important matter.

I take it for granted that a modern colliery installation is provided with armoured cables that comply with the recommendation of the Engineering Standards Committee, so that the question of continuity and conductivity of the actual armouring is assured.

I cannot agree with Mr. Kivlen where he says: "This does not call for a 'bridge' test or any definite measurement at all." Rule 8 (b) clearly states that some definite measure-

ment is required to prove that there exists the required 50 per cent. conductivity. The question arises, is the connection between the armour or clamp at each side of a junction box sufficient to ensure a 50 per cent. conductivity? I am confident, provided a clean and tight connection is made, that it does, but what is required is a ready method of testing to prove this beyond doubt.

The galvanometer or "megger" test does not necessarily prove continuity if the armour is in a damp place, and conveys no idea of the conductivity of the earthing system.

To ensure the best possible earth at the surface of the mine, I have sunk two earth plates at a distance of 25 ft. apart in wet clay, surrounded by small coke, but I cannot get above a 25 per cent. conductivity between the two plates, although I agree that a good earth at the surface is most desirable. I think it quite as important to provide

additional earth plates or connections to pump suction in the mine, although I can only get a 25 per cent. conductivity between my two surface plates, I can get 100 per cent. between my earthing system and absolute earth taken off the surface water supply pipe.

I should like to suggest a method of testing the continuity and conductivity of joints in the earthing system that does not require any interference with the line conductor and does not interrupt the supply, namely, the one referred to in the memorandum on Rule 8. This method may be open to criticism, but I think as it meets the requirements of the Light Railway orders and merits mention in the memorandum of testing earth plates, it might be usefully applied for periodically testing the conductivity through junction boxes, &c.

I should like to see the merits or demerits of earthing the mid-voltage point of a medium-pressure direct-current system discussed through the medium of your columns.

Norton, February 24th, 1913.

#### Continuity.

Mr. H. Field's communication is, perhaps, just a little inconsistent. If he follows the correspondence closely he will find that I replied to a question that had a direct bearing on cable armouring, and on nothing else, Rule 12 (c). I later proceeded to interpret Rule 14 (c) (i), and, in this instance, I did not deal with cable armouring as the predominating factor, as your correspondent states. I dwell on the importance of testing the "earth," the one "earth" that the Home Office recognises—the proper discharging device at the surface. Both taken conjointly give the best means of complying with the rule.

He has a cable to the bottom, and goes in by hanging on pumps, haulages, &c., showing no distributing system to speak of. The conditions, of course, might allow of nothing else. Under certain conditions it is bad practice, and does not allow of proper discriminating devices being installed. Now, Rule 14 (c) (i) tells him to examine the apparatus, &c., and surely, if he has proper bonding devices, he can do this with the sense of sight and feeling, and discover a fault if one exists. If he has 50 natural earths in the pit it does not prevent him from testing the continuity of his armourings from one or all of his machines right to the surface. Then let him, if he will, disconnect his main earth cable, the one running to the earth plates at the surface, and test the value of his plates with the surrounding soil by the method I have shown. The Home Office give his earth conductors

an absolutely definable resistance, and he should know this value. This applies, no matter what the conditions, in three-phase work. It is theoretical, of course, but with joints, &c., if it is not more than 100 per cent. higher, he will do very well.

I could test 50 natural earths in the pit by a little discrimination, either by the method put forward by Mr. Davies or myself. The point is, how can you stop the plant to do this or any of the tests? If he now tells me whether his neutral point is earthed or clear, I will point out to him a means of defining the earth that tripped his switch.

John P. C. Kivlen.

Uddington West,

February 22nd, 1913.

#### The Use of Electricity in Mines.

The article dealing with "The Use of Electricity and Electrical Accidents in Mines" in your last two issues was both instructive and interesting, and I note the recommendations put forward. It would further interest me, and I believe a great many other readers, if the writer of the article would give a general outline as to how he would carry out the following scheme:—

Incoming supply from supply company at 11,000 volts carried down shaft 300 fathoms to sub-station at bottom, with four coal-cutters which operate at the same time at 200 volts in a 22-in. seam, 1½ miles from the bottom. Power not being used elsewhere in the mine.

J. S. Walker.

Tollcross, February 26th, 1913.

#### "Life Understood."

I have always had a warm corner in my heart for the ELECTRICAL REVIEW, and those connected with it, dating from the time when, as a young man, I used to read it through regularly every week, including such advertisements as were new to me. I am, therefore, writing a letter dealing with the review that recently appeared in your paper on a book called "Life Understood," of which I am guilty of being the author, hoping that the letter may be of the use to your readers that many letters and articles in the ELECTRICAL REVIEW were to me in the days gone by.

The main point made by the reviewer was that the point of the book was elusive. I am not quite sure what he took as the main point of the book, for different readers might choose different points according to that in which they were interested, as the book claims to have cleared up all occult phenomena and put them on a scientific basis. I think we may, however, take the main point to be "What is Life?" I point out clearly in "Life Understood" that every man appears to be a material being liable to sin, suffering and sickness, but that he is really a perfect being in a perfect world governed by a perfect God, and that he is being humbugged and fooled and hypnotised to believe that the material being is him, whereas the real spiritual man is the only real man, and he has life eternal, the matter having no life but being merely illusory phenomena, like a series of cinematographic pictures.

In the Bible we are told in many places that we are Sons of God, and yet Jesus said, "Ye are of your father the devil." I point out that, mathematically speaking, Heaven is a world of four dimensions, and that we see only three dimensions of it, and therefore see it all wrongly. The love, the life, the wisdom, the joy, the knowledge, in fact, everything good that you see about a man is heavenly, part of the real spiritual four-dimensional man; whereas the sin, sickness, troubles and sorrows are of our "father the devil," and are merely a series of cinematographic pictures that flash by in front of the real man and hide him from us. It is for this reason that the psychometric and prophetic results are obtained, as it is possible for the human being to get in mental touch with these cinematographic pictures, and see what is about to happen or what has happened. When you know how to think rightly you can destroy the evil in these cinematographic pictures, and it will not be manifested.

The above facts are capable of proof, and no one need

take what I say, as they can prove for themselves the facts set forth in "Life Understood."

Another objection is that I deal with "things metaphysical." This is true, because I point out that metaphysics, science and religion must all agree when their mistakes are corrected.

We have until recently believed that matter is an indestructible thing. If this be so, matter, and therefore sin, sickness and trouble must exist for ever. Now, I point out in "Life Understood" how matter, being electricity, can be caused to appear and disappear scientifically in two different ways, and I show the two ways in which this can be done, one by altering the electrical tension, which can be done hypnotically, the other by the action of God, the principle of good which short circuits the lines of force of which the ether is composed. These lines of force are identical with what are called "thoughts"; thought being a high-tension electrical current, and matter, from a metaphysical point of view, a manifestation of thought.

The reviewer says:—"The author has certainly written a book that is unique. He deals with a vast array of subjects, but not always with the pen of a specialist. For instance, hypnotism, according to his idea, is everything that is bad and useless. He does not seem to be aware of the wonderful mental cures that are being effected every day by means of this truly extraordinary science."

I dealt with a "vast array of subjects," as they all confirm the statements put forth and show that when a man really knows what the facts of life are, such results as are obtained by sorcery, spiritualism, hypnotism, faith healing, thought reading, clairvoyance, and last, not least, how Jesus did his miracles, become easy to understand.

With regard to hypnotism, which is merely the power of one human mind over another, if the reviewer had been able to give more time, he would have found not only that in "Life Understood" do I deal fully with hypnotism, mentioning that there are "five different forms of hypnotism, all of them wrong," but that I show the reason why, to use his words, it is "bad and useless," and further show the proper method of mental working whereby evil and matter can be always destroyed, and not only the person helped that a man was endeavouring to help, but the one mentally working, instead of being harmed, as in the case of hypnotism, is improved mentally, physically and morally. I can deal best with this one point by saying that the man who is probably the leading medical authority in the world on the human mind, asked me not long ago whether I would help one of the three leading hypnotic doctors, who by his work had got himself into a very bad state of health, and he thanked me sincerely when I promised that I would do this.

In "Life Understood" I point out that hypnotism and its results have been known for centuries, and that the results obtained by witches and sorcerers in olden days were merely hypnotic. To-day these results are said to be due to hypnotism and mental suggestion. I deal fully with psychotherapy, and also give a list of results obtained through hypnotism, and the names of some 30 of the leaders from Kelmont up to the present time.

With regard to spiritualism, I do not think that "the treatment is somewhat general," as I give not only the scientific reasons for the results obtained, but show in detail the different classes of results that can be obtained by so-called spiritualism, and also point out that it has nothing to do with departed spirits in any shape or way, but is merely due to the action of the sub-conscious mind of the medium.

It is quite true that in the book there are "weird terms," but the reason for this is that it is always difficult to explain metaphysical matters clearly, until one knows the way in which an author employs his words, and special terms, which in every case have been explained, have had to be used—not coined—in order to prevent confusion.

F. L. Rawson.

P.S.—Since writing the above, I see an article in the *Daily News* in which it deals with some recent statements by Dr. Stenson Hooker in a lecture by him on hypnotism. I have often discussed mental effects with Dr. Hooker, who has come to me for advice at various times, and it will be seen that he clearly draws attention to the dangers and abuse of hypnotism.

If it is capable of abuse, and everyone must admit this, it is fundamentally wrong. Working mentally in the proper way, no harm can possibly accrue to the healer or patient, and good must always be done.

## THE SOUNDER IN SUBMARINE TELEGRAPHY.

By EDWARD RAYMOND-BARKER.

UNDER the above heading, the *ELECTRICAL REVIEW*, in its issue of February 21st, drew the attention of its readers to a matter which—through the medium of practically the whole British daily Press of February 17th—had already riveted the notice of an important section of the public. Reference is here made to the news cabled over from New York Press agencies, relating to the success attending the adoption, by the Commercial Cable Co., of our countryman Mr. John Gott's new principle of telegraph-working: a principle enabling the ordinary Morse, with its attendant automatic-translation facilities, to be worked on long submarine cables.

Before offering further comment, the writer seizes the opportunity to convey to Mr. John Gott whole-hearted congratulation on the success of his invention: one based on a principle which—whatever various means may henceforward be devised or may have been devised by other experimenters—will, throughout future history, remain, and ever will be recognised as wholly and entirely his.

Any one of Mr. John Gott's large circle of friends will rejoice in the realisation of his ideas, and in the overcoming of difficulties ever present in the practical carrying-out of instrumental details.

The concept of utilising the cable discharge, after each dot or dash of a Morse signal, to cause a switch-over to a reverse battery polarity, is simple as well as ingenious, and it is a combination of these two attributes which marks the true genius. The consequent close succession of signals, whether dots or dashes, of alternate + and - polarity, not only tends, during the progress of a letter or of a word, to keep a cable in an electrically neutral condition, but discourages distortion.

Now that, through the Press, the nature of the Gott principle has been disclosed, various experimenters out of sheer personal technical interest will bring out other devices for the carrying-out of the Gott principle. The writer had two of his own, one of which was suggested to him by mechanism devised by a friend for a "wireless" steered submarine torpedo. One of these is a purely mechanical "step-over"—to and fro—action. The other is electromagnetic. But whatever may be the device by which the current is automatically reversed on the coming to rest of the Morse key after the transmission of any one dot or dash, the principle—and it is that which matters—is covered by the patents taken out, so the Press informs us, in all countries.

The writer would not have ventured to discuss technical details, had not matter sufficient to warrant discussion already appeared in the technical Press.

So far the writer has dealt with this subject solely in its bearings on the distinguished inventor. One may rest assured that Mr. John Gott is in no way responsible for the wording of the messages emanating from New York Press agencies. The same applies to the gentlemen who, under their eminent President, control in New York the business of the Commercial Cable Co. From these gentlemen, all and individually, the writer has received kindnesses and acts of hospitality that he will never forget. At the same time he has been in New York quite often enough to know how easily exaggerations get afloat.

In this mention of exaggerations, the writer is prompted by the fact that one great point in the Press notices has been the alleged discovery of effective cable Morse, that is to say, of a device enabling a common Morse inker or sounder to be used on a long submarine cable at a good commercial speed. The question instantly arises: "Is cable-Morse quite

unknown?" The writer here refers to cases where the Morse has supplanted the Kelvin recorder.

A highly respected contemporary, the *Electrician* (February 21st) in a leading note, and an interesting descriptive article, gives much the same information as that to be found in the *ELECTRICAL REVIEW* (February 21st), and, elsewhere, indulges in a joke about the advent of cable Morse. On page 166 of the esteemed contemporary's current supplement, emphatic denial is given to a rumour that a magnate (named) in the "wireless" (financial) world, on reading of Mr. John Gott's system, remarked . . . Well, on second thoughts, the writer prefers not to repeat the words. These may be read in the columns of the contemporary. They evince keen regret on the part of the speaker that the business likely to accrue from the new system had not come his way.

To return, however, to the question as to the progress already made in cable Morse—a method of working, according to practically all the Press notices, now for the first time rendered feasible. Is it just, then, that we should ignore the work of the late M. Pierre Picard, of the French Government Telegraph Service? Mr. John Gott would be the first man to give an emphatic negative to this question.

According to the *Comptes Rendus de l'Académie des Sciences*, of Paris, on December 21st, 1903, a Commission nominated by the Académie unanimously voted the "Prix Hughes" to M. Pierre Picard for telegraphic improvements, resulting not only in a greatly increased signalling speed on the cables, but in rendering feasible, on the French Government Marseilles-Algiers cables, the use of rapid Morse, and of the Hughes and the Baudot printing systems. Hitherto siphon recorders had been used. On the Oran-Tangiers cable, too, Picard-Morse had been adopted with—when press of traffic required it—Wheatstone auto-transmission.

The writer begs leave to quote from the *ELECTRICAL REVIEW* of September 11th, 1903, certain statements of fact as to M. Pierre Picard's work—work still in full swing between Paris and Algiers, with auto-relay at Marseilles.

" . . . Direct communication between Paris and Algiers by means of the Baudot apparatus. The total length of the line was 1,800 km., of which 900 km. were cable. . . M. Picard has devised a most ingenious method of employing the periods of rest between the emitted currents to produce the signals. The 'tail' of the current, hitherto considered the enemy of the submarine telegraphist, has now been made his best friend. Instead of the length of the current forming the dots and dashes, the signals are made by the length of time between the currents. The currents are all of equal length and strength. In the picturesque language of a French engineer: 'On parle, pour ainsi dire, avec des silences.' Each signal is composed of two currents of equal duration, one positive and one negative. Between these two currents, the positive and the negative, a period more or less long distinguishes the dash from the dot. The system can also be applied to printing telegraphs with equal success. . . The transmissions from Paris to Algiers direct were effected by means of translating relays at Marseilles. Paris can employ a four-armed set to Algiers; the arms unemployed at Paris are used at Marseilles. The Central Office at Paris can on occasion give up two arms to the Elysée Office, and the Central Office at Algiers can on its side give up two arms to the palace of the Governor-General, thus establishing direct communication between the offices of the President of the Republic and the Governor-General."

Much more detailed information regarding the Pierre Picard principle of cable working may be obtained from the valuable illustrated articles written by M. le Dr. A. Tobler (Professeur à l'Ecole Polytechnique de Zurich), and published in *Le Journal Télégraphique* de Berne, for December 25th, 1903, and January 25th, 1904.

From this source we learn that, in 1898, when still the Kelvin recorder was worked on the three Marseilles-Algiers cables, increase of traffic appeared to necessitate an additional cable. However, the adoption of the Baudot, made possible on the cables by Picard's method of transmitting incipient impulses of alternate polarity without earthing the cable at the sending end, obviated the necessity for a fourth cable. In fact, since the adoption of the Picard-Baudot, the three cables have largely sufficed for all purposes, and the public receives its telegrams in print, direct from the Paris-Algiers apparatus.

Again, very clear notes on the Picard principle are given in *Le Journal Télégraphique* of December 25th, 1906, by M. A. Carletti. He shows that Picard sought to arrive at absolute sign-alternation, combined with equality in the strength and duration of actual electrical charges, and this without any reference to the duration of an actual signal—that is to say, to the duration of the interval between the first impulse of a given sign and the following impulse of opposite sign. What differentiates Picard's principle from all others employed, or tried up to his time, has been his absolute abandonment of any idea of bringing back the electrical condition of the cable to a neutral condition after the application of each charge. Picard has brought about that each transmitted impulse finds the cable in a symmetrically neutral electrical condition. In other words, a + charge finds the cable influenced by a - charge of known value; a - charge finds in the cable a + charge equal to the preceding - charge, and so on.

On cables of "great length," M. A. Carletti remarks, Picard insulates the line after each momentary charge impulse and, according to the nature of the cable, he substitutes, in certain cases, an earthing period of given time value, followed by a "freeing."

The writer has attempted, in figs. 1 and 2, to summarise matters.

Fig. 1 compares the Picard and the Gott transmission principles, and shows the word "Picard" in conventional

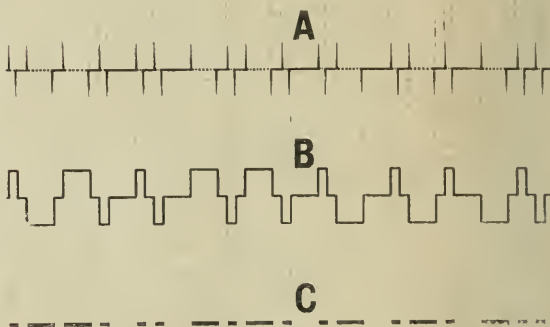

FIG. 1. —PICARD (A) AND GOTT (B) COMPARED.

graphs illustrative of the two principles, and in corresponding Morse.

Fig. 2 shows what may be termed the master device of Pierre Picard, applicable to hand Morse or to Wheatstone auto, to the Hughes or to the Baudot.

In fig. 2 a simple cable Morse circuit is shown. Continuous lines = main circuit; interrupted lines = local circuits;  $R_1$  and  $R_2$  are two polarised relays;  $L B_1$  and  $L B_2$  are local batteries.

FIG. 2.—PIERRE PICARD'S CABLE MORSE.

Owing to the presence of the local condenser LC, any depression of key K causes a momentary "kick" of relay tongue  $T_1$  up against its stop contact on the + pole of the sending battery  $SB_1$ .

Again, each time K comes to rest after each dot or dash, the relay tongue  $T_1$  makes a momentary contact against its stop contact on the - pole of  $SB_1$ .

During the interval between the two relay tongue kicks caused respectively by the depression and the raising of K, the sending end of the cable remains insulated on the electrically connected tongues  $T_1$  and  $T_2$  at rest.

A graphic presentment of the working of the momentary + and - impulses is shown by "A" in fig. 1, which does not pretend to represent the real electrical conditions in the cable.

At the receiving end of the line is seen, a suspended-coil relay specially designed by M. Pierre Picard. The coil has no self-retractive force, but is absolutely free to respond, in its movements, only to cable impulses.

FIG. 1.—SIMPLEX GIRDER BOX.

FIG. 2.—GOTTSCHALK TRANSMITTER WITH BACK CASING REMOVED, AND COMPLETE.

Between the relay and "earth" is the receiving condenser R C.

It will be seen that in Picard's system, + and - momentary impulses cancel out, whether in a signal, a letter, a word, or 1,000 words.

The Gott system of transmission, illustrated in B (fig. 1), if subjected to similar analytical treatment, gives interesting results, showing a certain + percentage of overcharge in some cases, and - percentage in others, but balancing out very evenly on the whole.

Results are here given of electrical analyses applied to the following sentences transmitted on the Gott principle. In each case a start has been made with the + current. The dot has been taken as unit.

"The Commercial Cable Co., of New York, United States of America."

(+) units = 151, (-) units = 126, overcharge = 19.8 (+) per cent.

"The Telegraph Construction & Maintenance Co., of Greenwich."

(+) = 131; (-) = 133. Overcharge = 0.75 per cent. (+).

"Siemens Bros. Dynamo Works, Ltd., Stafford and London, England."

(+) = 129; (-) = 113. 10.9 per cent. (-).

"The India-Rubber, Gutta-Percha & Telegraph Works Co., Ltd."

(+) = 133; (-) = 121. 9.9 per cent. (+).

The simple alphabet without accented letters, &c.

(+) = 87; (-) = 71. 22.5 per cent. (+).

Figures 1 to 0 inclusive :-

(+) = 45; (-) = 55. 22.2 per cent. (-).

Taking the sums of the foregoing :-

(+) = 679; (-) = 649. Overcharge = 4.6 per cent. (+).

The question remains: To what extent is the Picard principle—so successful in the Mediterranean—applicable over average Atlantic and Pacific cables? Here, at any rate, lies an untrammelled line of legitimate investigation open to all.

It has been shown how Pierre Picard was honoured by the Académie des Sciences of his country. May the writer be allowed to express the hope that equivalent or greater distinctions will be conferred in London and in New York, on John Gott, the British inventor of the London-New York cable Morse.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Conduit Girder Box.

In a supplementary sheet (T 3), MESSRS. SIMPLEX CONDUIT LTD., of Charing Cross Road, W.C., give particulars of two new conduit accessories—their patent girder clip and girder box. The

latter, which we illustrate, is a neat arrangement for carrying conduits around girders in factories, &c. Where it is required to drop a light from the girder, the box can be provided with a porcelain connection piece and a cord grip at a small extra charge. It is stated that the box itself is practically equivalent in cost to the two inspection bends which in the ordinary case would be used. The box has a cast base, which projects over the sides of the cover, preventing any moisture draining off the girder from penetrating inside the box. A rubber or leather washer should be used between the underside of the base and the lock nut.

### The Gottschalk Telephone Transmitter.

Practically all the commercial types of telephone transmitter have employed the same type of diaphragm as was found in the very first instruments designed. The Gottschalk transmitter, however, is the result of over five years' careful investigation of the

FIG. 3.—GOTTSCHALK TRANSMITTER, AND DIAPHRAGM.

properties of vibrating diaphragms. Instead of employing a loose diaphragm made of some dead metal, such as aluminium, which is commonly used for the purpose, phosphor-bronze is employed, which is rolled to produce an initial tension. The diaphragm is then formed, without drawing the temper, into a pan-shaped disk, the projecting edge of which is securely clamped, leaving the central portion free to vibrate like a drum-head.

A resistance cell of the ordinary type is connected to the centre of the diaphragm by means of a spider-shaped member having a number of feet, which are soldered to the inner surface of the diaphragm (fig. 3). These feet being equi-distant from the centre, pick up the sound vibrations at the point of maximum amplitude, and it will be noted that this method of connection is entirely different from the ordinary method, wherein the cell is connected to the diaphragm at the centre. The cell with the diaphragm is placed in a back casing, the various parts being illustrated in the accompanying figures. A connection is made between the front electrode of the cell and an insulated terminal carried on the casing, in such a manner that the circuit is confined to the electrodes and granular carbon, so that no part of the casing or diaphragm is in circuit.

Certain other details of construction result in an instrument which is absolutely watertight, as it may be immersed in water for hours, or even days, without any damage whatever. The casing being of brass and the diaphragm of phosphor-bronze, there is no corrosion such as commonly occurs in transmitters where aluminium diaphragms are employed.

As the sensibility of the instrument is considerably increased by the improved diaphragm construction, it is possible to dispense with the usual mouthpiece. Telephone companies figure, especially in the case of desk sets, that the annual maintenance cost for mouthpiece replacement is as high as 2s. per telephone. The Gottschalk instrument eliminates this charge, as the mouthpiece consists of a flat perforated metal guard, which is practically indestructible (fig. 3).

The mouthpiece can be thoroughly cleaned, and as it is flat, it will be often wiped, which is not the case with the usual funnel-shaped mouthpiece. With the Gottschalk instrument the user unconsciously gets close to the flat guard as there is nothing to repel him, and better average transmission results.

**Inquest.**—The funeral took place last Friday at Acton cemetery of Mr. Charles Ellis, an electrical engineer, employed by the Great Western Railway Co. Deceased was 50 years of age, and a member of the London Railway A.A., to which he had rendered assistance by the erection of a special telephonic service for the facilitation of the meetings at the Stadium and at Castlebar Park, Ealing. The deceased died suddenly, and at the inquest the medical evidence showed that he was in the early condition of pneumonia, and there was dilatation of the heart, which produced syncope. A verdict of death from natural causes was returned.

The shell of the instrument is provided with a large drain hole, so that water and moisture can drain off the diaphragm. The latter has no holes or seams whereby moisture can penetrate to the interior.

From tests made in several University laboratories and by Mr. H. R. Van Deventer, this instrument, in its commercial form, was found to average from 3 to 7 miles better in terms of standard cable than transmitters of ordinary construction.

### Ferro-zincing or Ironising.

In a new process for protecting iron and steel surfaces from corrosion, of which we have received particulars from MR. SHERARD COWPER-COLES, an alloy of zinc is electrolytically deposited on the surface of the iron or steel to be protected, which is more durable than coating with zinc alone. The great drawback to zinc is that it is so readily attacked by weak alkalies or acids. The resisting power to corrosion of zinc-iron alloy has already been established in connection with the process of "Sherardising," which consists of forming an alloy of zinc and iron on the surface by bringing iron or steel in contact with zinc dust or powder at a temperature considerably below the melting point of metallic zinc. The new process of ferro-zincing or ironising has the advantage that articles of almost any size can be coated, and it is cheaper and more efficient than hot galvanising; as the process is a cold one, there is no distortion.

## BUSINESS NOTES.

**Book Notices.**—*Deutscher Kalender für Elektrotechniker* (Uppenberg's). Edited by G. Dettmar. Thirtieth year. Munich: R. Oldenbourg. Price 5 M.—This handbook, one of the very oldest-established, is issued in two parts, one neatly bound in leather for the pocket, the other in paper covers. The former contains tables, units, elementary principles, measurements, and treatises on electrical machinery D.C. and A.C., batteries, generation and distribution, lighting and power, regulations, &c., with a diary at the end. The second part covers electric traction, telephony and telegraphy, electrochemistry, physics and mathematics. The two together constitute what is practically an encyclopaedia of information on electrical and allied subjects in compact form, and must be highly prized by their users.

"The Design of Alternating-Current Machinery." By James R. Barr and R. D. Archibald. Price 12s. 6d. net. "The Bandöt Printing Telegraph System." By H. W. Pendry. Price 2s. 6d. net. "A First Book of Electricity and Magnetism." By W. Perren Maycock. Fourth Edition. Price 2s. 6d. net. London: Whittaker and Co.

"Journal of the Franklin Institute." Vol. CLXXV, No. 2. February, 1913. Philadelphia: The Institute. Price 50 c.

"The Physical Review." Vol. I, No. 1. January, 1913. Lancaster, Pa.: The American Physical Society. Price 60 c.

"Atti della Associazione Elettrotecnica Italiana." February 15th, 1913. Milan: Stucchi, Ceretti & Co. Price L. 1'50.

"Einfluss der Scheinenspur auf die Eisenbahn und Kleinbahn-Wagen." By James Sutherland Warner. London: The Warner International and Overseas Engineering Co., Ltd. Price 1 M.

**Dissolutions and Liquidations.**—THE GILBERT ARC LAMP CO., LTD.—This company is winding up voluntarily, with Mr. W. A. Henderson, 3, Fenchurch Street, E.C., as liquidator. A meeting of creditors is called for to-day. We are asked to state that this liquidation is merely for the purpose of completing the transfer of the assets to Engineering and Arc Lamps, Ltd., of Sphere Engineering Works, St. Albans, Herts.

CRATHORNE & GREEN MANUFACTURING CO., electrical engineers, Wagner Street, Old Kent Road, S.E.—Messrs. J. L. Crathorne and F. J. Green have dissolved partnership. Mr. Green attends to debts, &c., and will continue the business.

HARTLEPOOL ELECTRIC TRAMWAYS CO., LTD.—A meeting will be held on March 28th at Electrical Federation Building, Kingsway, W.C., to hear an account of the winding up from the liquidators, Messrs. H. W. Davis & H. A. Staggs.

LIGHT RAILWAYS SYNDICATE, LTD.—A meeting is called for April 2nd at the offices of the New General Traction Co., Ltd., 8, Crosby Square, E.C., to hear an account of the winding up.

**Osram Lamp Patents.**—On Friday, February 7th, 1913, in the High Court of Justice, Chancery Division, Mr. Justice Swinfen Eady granted an interim injunction to the Osram Lamp Works, Ltd., restraining the Oro Light and General Supply Co., Ltd. ("Oro" lamps) their servants, agents and workmen from selling lamps infringing Osram Patents Nos. 23,899 of 1904 and 18,622 of 1906. We are informed that the lamps in question were made by the Wolfram Co., Augsburg, Bavaria.

**Catalogues and Lists.**—MESSRS. LAING, WHARTON, LTD., 7, Great Newport Street, London, W.C.—English and French editions of Messrs. Vedovelli, Priestley & Co.'s catalogue of high and low-tension switchgear, for which the firm are sole agents in the United Kingdom.—The English edition consists of 44 pages, and contains excellent illustrations, descriptive particulars, and tabulated prices of various switches, fuses, relays, switch fuses, lightning arresters, limiters, resistances, &c. The French edition

(of 72 pages) deals with the same and many additional lines, and contains half-tone illustrations of overhead high-tension lines, electric railway overhead construction work, electric luminous fountains, &c.

MR. GEORGE ELLISON, Victoria Works, Warstone Lane, Birmingham.—Illustrated sheet, No. 500/1, containing a full description of their new drum type controllers for cranes, hoists, &c. They are now manufacturing controllers, both for D.C. and A.C. circuits, and several new features are embodied in the present design, one being the very large space allowed for connecting up.

MESSRS. AITON & CO., Derby.—Catalogue of between 30 and 40 pages, containing a great deal of information useful to engineers, relating to flanged pipes and accessories. Tabular prices and diagrams are given of cast-iron pipes, wrought-steel pipes, expansion bends and steam separators, table and hanger brackets, automatic exhaust relief valves, and high-pressure steam traps. Tables are included of the flow of steam and water in pipes, also a standard specification. It is claimed that by the use of this catalogue an engineer can decide the sizes of pipes which will be required for certain duties, and can work out their cost, including the usual accessories.

MESSRS. ALDOUS & CAMPBELL, LTD., Lower Bland Street, London, S.E.—Blotter card, showing one of their switch control electric passenger lifts.

MESSRS. MITCHELLS, ASHWORTH, STANSFIELD & CO., LTD., 23 and 24, Old Bailey, London, E.C.—24-page illustrated catalogue concerning "Mascolite," a material for reducing and correcting shocks and vibration and for deadening sound. Mascolite "P" (single thickness), is a special mixture of fibres which is used for permanent-car chair pads, and is used by tramway companies for lining the car underframes, &c.; "B U" (built up) is of the same material but with prepared cork between each layer, and it is used as packing for permanent-way chairs, engine foundations, &c.; a third-class is the "I.R." (with rubber insertions). The purposes of the material in connection with electrical machinery are well illustrated, and many testimonials are given.

MESSRS. PETERS, LTD., 63, Queen Victoria Street, London, E.C.—Two finely prepared catalogues; one describes and gives a specification and tests of the firm's patent semi-Diesel crude oil engines, with a table of sizes and prices; the other deals equally well with their stationary and portable oil engines, combined engines and pumps, and electric lighting plants. Shipping weights and dimensions, prices, and a long list of users, are given. Both publications are beautifully illustrated.

**Bankruptcy Proceedings.**—SAMUEL BROOKES (trading as Netherton Tube Fittings Co.), Chapel Street, Netherton, and Star Tube Works, Primrose Hill, Netherton.—Receiving order made February 19th on debtor's petition. First meeting, March 6th; public examination, March 18th; both at Dudley.

C. O. McMILLAN, electrician and cycle dealer, 15, High Street, Portmadoc.—Trustee (Mr. L. H. Jones, Chester) released November 4th, 1912.

CHARLES SPENCER NORTHCOPE, electrical engineer, 67, Stanthorpe Road, Streatham, London. The following are creditors:—

Benton, C., London	£200	Faton, T., Wimbledon	£20
Bourne & Hollingsworth, Ltd., 24		"Bankers" (London City and	
Chalk & Cox, London	40	Midland Bank, London	600
"Bankers" (Capital and		Osborn & Osborn, London	50
Counties), London	110	Robinson, Peter, London	31
Debenham & Storr, London	548		

CLIFTON ROBINSON, Keith House, Porchester Gate, W.—Before Mr. Registrar Linklater, on Tuesday, an application on behalf of bankrupt for the variation of an order of 1911 suspending his discharge for four years, was heard. It appeared that debtor had been unable to obtain an appointment since he applied for his discharge, and he had been supported by his mother, Lady Robinson. The trustees of certain family funds had now considered the position, and had decided to provide £2,500 for the creditors if the Court would vary the order and grant the discharge straightaway. This would enable an additional dividend of 3s. 6d. in the £ to be paid to creditors. A claim by the father's executors for £18,000 would be released. It was stated that creditors for £12,000 approved of the application, though two small creditors thought the offer should be increased to 7s. 6d. The Registrar granted the application, and made the order of discharge, subject to judgment of £2,500.

J. W. LEWSEY, electrician, Nottingham.—First meeting, March 6th; public examination, March 14th; both at Nottingham.

**Ebonite Manufactures.**—At the factory of the NEW ECCLES RUBBER WORKS, LTD., at Eccles, a new shop, with special plant, has been devoted to the production of ebonite pipes, &c., required for the conveyance and storage of acid and other corrosive liquids. Lead and other materials previously used have been largely superseded, as ebonite is found to withstand successfully the action of even the strongest acids, and pipes made of this material are capable of standing enormous pressure. We are informed that in a test for a required strength of 30 lb. per sq. in., it was found that a pressure of nearly 80 lb. was resisted. At the works mentioned, pipes of all sizes are turned out, the more usual being from 2 in. to 6 in. bore. Stop cocks, bib cocks, valves, pumps, and all accessories are also made of ebonite. The company manufactures ebonite-covered rollers for textile purposes.

**Clyde Tape.**—We have received from MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., a piece of cable insulated with vulcanised bitumen, on which a joint has been made and insulated with "Clyde" tape. We recently drew attention to the fact that this tape, when warmed with a blow lamp after the joint had been lapped with it, became one with the insulation on

the cable, and the specimen joint before us fully bears this out, for on slitting it open it is difficult to tell where the tape ends, and the original coating of bitumen begins. Such a joint should be found perfectly waterproof and of high insulation resistance.

**Trade Announcements.**—MR. JOHN HARGROVE, late of Messrs. H. Simon, Ltd., of Manchester, has taken over the management of the London office of the Rees Rotarbo Manufacturing Co., Ltd., manufacturers of rotary pumps and condensers. THE BRITISH CENTRAL ELECTRICAL Co. announce that, owing to increased business, they are moving to larger premises, and from March 1st their new address will be 6 and 8, Rosebery Avenue, E.C. (near Holborn Town Hall). Telephone number: "Holborn, 6848" (two lines); telegraphic address: "Briticent, Holborn, London."

## LIGHTING and POWER NOTES.

**Argentina.**—It is expected that the electric light station at Merlo (Buenos Ayres), will be completed and ready for service in about three months' time. Public lighting will consist of 50 arc lamps.

It is reported that the Cia. Orlando Americana, which has the contract for the public lighting of Campana, intends to suspend the service as the Municipality is owing it \$5,000, and it sees no prospect in getting the money.—*Review of the River Plate*.

**Atherton.**—The U.D.C. has adopted the recommendations of Mr. Miller for improving the system of electricity supply in the district, and instructed him to prepare the necessary plans and estimates for carrying out the scheme and report further. Inquiries are to be made for a suitable site for the proposed new sub-station.

**Australia.**—The Sydney (N.S.W.) City Council supply to Merrickville, recently inaugurated, will include shortly, in addition to street and private lighting, a supply of about 3,000 H.P. for power purposes, to the Sydney Steel Co. and others.

With reference to the proposed North Sydney Municipal Council supply from a private concern, efforts are being made to induce the Lord Mayor of Sydney to use his influence with the North Sydney authorities to take a bulk supply on new terms from the Sydney Council, and thus maintain the municipal service.

**Barnes (Surrey).**—The U.D.C. has decided to supply current to the hospital on a flat rate of 2½d. per kW.-hour, or 3½d. per kW.-hour, subject to the usual discounts, for 2,000 kW.-hours during the winter quarters, and 750 kW.-hours during the summer quarters, and 1½d. per kW.-hour beyond.

**Bath.**—The Electric Lighting Committee of the T.C. has decided to apply to the L.G.B. for an additional loan of £5,000 for mains and services for three years.

**Bedford.**—The T.C. has decided to proceed with the lighting by electricity of the streets in the Queen's Park district, at a cost of £1,151.

**Chester.**—Mr. S. E. Britton, the city electrical engineer, has effected a much-needed improvement in the lighting of Foregate Street, and incidentally conferred a boon on users of the thoroughfare. The old system of lighting was by arc lamps in series, which necessitated a number of standards down the centre of this important street. These poles have now been removed, and the lamps are suspended on the "Barrow" system, while the overhead tramway wires are supported from the premises or from standards erected inconspicuously near to the buildings.

**Colne.**—A firm of manufacturers erecting a new shed is in negotiation with the local Electricity Committee regarding the driving of looms by electricity. Provided satisfactory arrangements can be made, a trial will be given to a motor on each loom. This will open out a new development where hitherto this kind of loom-driving has been unknown.

**Continental Notes.**—FRANCE.—Representatives of 40 communes in the region between Ay and Epernay, in the Marne Department, have formed themselves into an intercommunal conference, with a view to the installation of an electric light and power service. A committee, consisting of nine mayors, has been nominated to draft the plans of the proposed installation.—*La Lumière Electrique*.

**BELGIUM.**—La Société de l'Electricité de l'Escaut has secured a 10 year's concession for the supply of the electrical energy required in connection with the new docks in the north district of Antwerp.

**Darwen.**—The Mayor started the new steam turbine at the electricity works on February 19th. The turbine has been installed at a cost of nearly £6,000. The Mayor congratulated the Electricity Committee upon the progress of the electricity department. At present there were half a dozen industries in the town relying upon electricity, and whereas they consumed 130,000 units a few years ago, they now consumed one million units. Councillor Thornley said there was a small loss on the electricity undertaking in 1911, but in 1912 the working showed a profit of more than £400.

**Dover.**—The electrical engineer has been instructed to report upon the desirability and cost of providing automatic time switches for the public incandescent lamps.

**Ealing.**—The chairman of the B.C. Electricity Committee has made inquiries into the proposals of the Fixed Price Light Co. relative to the B.C. entering into a contract with it for the fitting, wiring and lighting of small houses, under the scheme, now in force at Wimbledon and other places in or near London; and, in company with Alderman Green and the borough electrical engineer, he has visited Wimbledon and inspected a number of the houses there to which current is supplied under the company's scheme. Before coming to any decision on the subject, the Electricity Committee has requested the engineer to procure certain additional information and submit it at the next meeting.

**Edinburgh.**—The Corporation Electricity Committee has agreed to recommend that the minimum charge for light should be 10s. per annum, and for power £1. It was also agreed that, should the minimum in either case for lighting or power not be used, to allow of a combined charge of 30s. per annum for lighting and power.

**Finchley.**—Application is to be made to the Local Government Board for sanction to a loan of £15,000, made up as follows:—Mains, £7,500; consumers' connections, £6,000; and meters, £1,500.

**Fleetwood.**—The chairman of the Electricity Committee and the electrical engineer have been deputed to inspect plant made by the three firms which have tendered for machinery, boilers, &c., required in connection with the extensions to the electricity works.

**Galashiels.**—It is stated the majority of the T.C. favour the idea of a municipal electricity scheme. A suggested site for the power station is on the town's property at the refuse destructor, and a siding from the railway could be conveniently laid. The probable capital cost of the scheme has been put at £30,000. The power is wanted chiefly for the mills. A deputation from the T.C. visited Glasgow to consult experts and obtain information to report to the Council. The question may be submitted to the decision of the ratepayers by plebiscite.

**Ham.**—The Highways Committee of the District Council reports the receipt of an application from the Twickenham and Teddington Electric Supply Co., asking for permission to place overhead wires across Ham Fields. It was agreed that the required consent be given on the company entering into an agreement to alter the position of the overhead lines, or place them underground if and when required by the Council.

**Harrogate.**—The T.C. has applied to the L.G.B. for a loan of £6,250 for the provision of additional plant for the electricity works.

The Council has decided to loan, free of charge, to consumers for a month's trial, electric irons for domestic use.

**Hornsey.**—At the February meeting of the B.C., it was decided to invite tenders for a new cooling tower. It was reported that delay in erecting the barometric condensing installation had resulted in the contracting company paying £65 as liquidated damages. A recommendation that application should be made to the L.G.B. for sanction to the borrowing of a further sum of £3,000 for house services was referred back.

The North Metropolitan Electric Power Distribution Co. wrote referring to the Bill promoted by the Tottenham and Edmonton Gas Light and Coke Co., Ltd., and suggesting that the Council should oppose the Bill, and that evidence from representatives of the Council might be forthcoming in the first instance at the ensuing Board of Trade inquiry, in favour of the company which was applying for a Wood Green electric lighting prov. order. It was decided not to adopt the suggestion. A petition is to be presented against the Bill promoted by the Metropolitan Electric Tramways, Ltd., authorising them to provide and work trolley vehicles on certain routes in Wood Green, Tottenham, and Walthamstow, with a view to linking up districts served by existing tramways. It is considered that local authorities should be consulted when power for construction is sought.

**Huddersfield.**—The financial statement relating to the electricity undertaking for the year ending December 31st last showed that the income had been £45,078, compared with £39,592 for the previous year, the chief items being single-phase lighting, £24,962; single-phase power, £4,614; and three-phase power, £11,123. The expenditure amounted to £28,511, against £23,978 for 1911, leaving a surplus balance of £16,566. Interest on loans absorbed £6,960, redemption of debt £5,352, and the amount repaid to the Public Works Loans Board was £1,653. The sum of £600 was transferred to the depreciation and contingencies account, which now stands at £5,818, and the balance of £2,000 was carried forward.

**India.**—The Nagpur Electric Lighting Co. has been started to provide the chief city of the Central Provinces with electric light and power. Work has already been commenced, and it is expected to have some of the engines and dynamos running by next hot season. An arrangement has been come to with the local Government, whereby a minimum load is guaranteed; current is required for 14 miles of street lighting, private bungalows, and railways and lighting. In time to come, the local cotton mills might be induced to buy power in bulk from the company. The machinery is to be provided by Messrs. Crompton and Co.—*Indian Textile Journal*.

**London.**—Last week the South London Electric Supply Corporation, Ltd. held a five days electric heating and cooking exhibition at Raleigh Hall, Brixton, S.W. A representative selection of apparatus for domestic purposes was shown, including breakfast cookers, toasters, kettles, flat irons, radiators, convectors, &c., many of which bore labels stating the cost of running per hour. A "Belenus" water heater, several portable vacuum cleaners, and choice lighting fittings were also in evidence. The *pièce de résistance* of the exhibition was the "Eclipse" cooker, comprising large oven, grill and two boiling rings. This apparatus was most ably demonstrated to full assemblies twice daily by Mr. Miller, of the Electric and Ordnance Accessories Co. Visitors who wished to put Mr. Miller's statements to a practical test were enabled to do so in the electric café, which adjoined the main hall. We note that the South London Co. has now introduced the "assessment" system; the fixed charge per annum is 12½ per cent. on the net assessment, payable in four equal quarterly payments, and ½d. per unit is charged for all current consumed. Or alternatively, and for the convenience of those consumers preferring to be charged through a separate meter for current used for heating and cooking purposes, the following flat rates have been introduced for apparatus installed up to 1 kW. capacity, 2d. per unit; over 1 kW. to 2½ kW., 1½d. per unit; over 2½ kW., 1d. per unit. All apparatus is supplied on the hire-purchase system, and is installed by the Corporation's own contracting department. We understand that up to Friday last, the "Sales Department" had received a great number of inquiries from prospective consumers, and it is expected that good business will result. The Corporation has our best wishes in this connection.

**MARYLEBONE.**—The Electric Supply Committee states that Mr. J. F. C. Snell has now presented his full report upon the question of extensions of plant necessary to enable the Council to meet next winter's supply. In this report Mr. Snell urges the necessity of the plant being installed at once. There are, he continues, five possible methods of dealing with the problem:—(1) Continuous-current extension on similar lines to the existing plant; (2) Three-phase alternating-current plant at the power station, and high-tension transmission cables to converters (to continuous current) fixed at the sub-stations; (3) Diesel engine generators at the sub-stations; (4) Battery extensions at the sub-stations; and (5) bulk supply, i.e., the purchasing of current in bulk from some outside source, and of these he recommends the second. With regard to the converting plant, the scheme recommended provides that 1,000-kw. machines should be used and standardised; and that four such machines be installed at present, namely, one at the station, two at Manchester Square sub-station, and one at Rathbone Place sub-station. So far as the transmission system is concerned, it is proposed to use three 15 sq. in. three-core E.H.T. cables from the station to Manchester Square sub-station, and two similar cables from Manchester Square to Rathbone Place sub-station. As to the condensing plant, British-made condensers are recommended, one to be worked in conjunction with the canal water and one with the cooling towers. The present equipment of boilers is ample for some time to come, so far as steam-raising plant is concerned. The cost of this scheme, based upon one turbo-alternator and on actual tenders, is put at £32,612. The losses in transmission and conversion would not exceed 10 per cent., and the available amount for distribution would be 2,700 kw. (normal) and 3,375 kw. (overload). The annual capital charges would be £3,195, or £17.17 per kw. (normal rating), and the running cost per unit available for distribution, including wages for extra staff, 168d. With the addition of the second alternator the capital outlay is raised to, say, £42,000, to allow for contingencies, the corresponding annual capital charges being £4,195, or £12.5 per kw., taking the maximum output of one set only, and counting the other wholly as reserve. Mr. Snell does not advise the entire change of system of generation and supply to alternating current which would involve considerable alterations both at the works and on the mains, and recommends that the present plant be unaltered, and used only for peak load purposes and as a reserve to the three-phase plant during lighter loads. After considering this report the Committee recommends the adoption of the scheme, and that application be made to the L.C.C. for sanction to a loan of £42,500, and that contracts be entered into with the Oerlikon Co. for the supply, in addition to the turbo-alternators authorised, of condensing plant to be manufactured by the Worthington Pump Co., at a cost of £8,964, making, with the £8,600 already authorised, a total of £17,564; Messrs. Ferranti, Ltd., for the supply of switchgear, &c., at a cost of £2,384; the Oerlikon Co. for the supply of condenser motors and control switchgear, at a cost of £1,709; British Westinghouse Electric and Manufacturing Co., Ltd., for the supply of four 1,000-kw. converters, &c., at a cost of £8,908.

At the meeting of the Council last week these recommendations were opposed on the ground that, as the matter had only been in the hands of the Committee about 24 hours, there was not time enough for the matter to be mastered. Alderman Debenham, supporting the Committee's recommendations, said that it was very necessary to have the new plant, as the business was increasing much more rapidly than was supposed. The saving in coal alone would practically pay all the capital charges.

Councillor Maude asked for more information about the £42,500, and about the actual liabilities of the undertaking. It was over two millions in debt, though they had been paying off for seven years and now there was this fresh loan. It was a very serious matter for Marylebone to consider. Councillor Warren protested against the Committee going to Switzerland for plant. Councillor Garrould said it was impossible to give the order to a

British firm. The machinery could only be obtained from one particular firm. Councillor O'Brien thought the need for the new plant had been shown very clearly. In 1907 they only sold seven million units, but last year they sold 13 million, and in 1916 they would be selling 16 millions or more. In the result the recommendations were carried.

**LEWISHAM.**—At a meeting of the B. of G. on Monday, the General Purposes Committee reported it had considered the question of lighting the workhouse by electricity, and recommended the board to take the necessary steps for the installation of the electric light throughout the workhouse and offices. The board has already decided to install the electric light in the infirmary. A letter was read from the L.G.B. stating that it would be prepared to consider favourably the granting of a loan for a definite scheme for the electric lighting of the infirmary and workhouse. Letters had also been received from the South Metropolitan Gas Co. submitting a scheme for providing and erecting a gas-driven electricity generating plant, and instructions were given for application to be made to the company for a list of authorities, &c., where such a scheme was in force. The board decided to install the electric light in the workhouse, and to call in an expert for advice.

The L.C.C. on February 20th, 1912, appointed a special committee to consider and report on the whole question of electricity supply in London and to confer with Government Departments and local authorities and companies generating or supplying electricity in London.

Sixteen meetings have been held and a preliminary survey of the question has been made, but no conclusions have yet been arrived at, and the committee makes no detailed report at this stage. It is suggested that a committee should again be constituted to complete the inquiry.

**ST. PANCRAS.**—The Electricity Committee, reports with reference to the tender of the Brush Co., which was accepted by the Council for the supply of a 5,000-kw. Ljungstrom turbine, that the company has asked that the penalty of £40 per week, for any delay that may occur in the supply of the turbine, should be deleted, inasmuch as the 1,000-kw. Ljungstrom turbine, which in the meantime is to be supplied on loan, may be retained for use by the Council without extra charge in the event of the delivery of the 5,000-kw. machine being delayed. It has been decided to comply with this request. Application is to be made to the L.C.C. for sanction to borrow £15,000 in connection with the turbine in question.

**SOUTHWARK.**—The Electric Light Committee of the B.C. has had under consideration a report from the electrical engineer embracing a scheme of extension in connection with the undertaking, which is required to be carried out at a very early period. Having regard to the importance of the subject, and the expenditure involved, it has been decided to engage expert advice at a cost not exceeding 150 guineas.

The North Metropolitan Electrical Power Co., at its Winchmore Hill sub-station on Wednesday, last week, held a very instructive gathering to fittingly inaugurate the new system of electric lighting in Green Lanes, Southgate. Many Councillors and officials from neighbouring authorities were present, the idea being to exhibit what could be done. Mr. Devonshire, the managing director of the company, presided in an informal sort of way, and referred to the high ideals which the electrical experts had set before themselves. Mr. Ruthven Murray, the company's engineer, gave a short address upon the scheme, the technical details of which aroused much interest. After votes of thanks had been passed, the party boarded a special tramcar and were taken for several miles along the main road to see the new lighting, which is on the "Barrow" system.

**LOUGHBOROUGH.**—At a meeting of the T.C. in committee on Monday last week, a report was presented from the Gas and Electricity Committee, in which it was stated that owing to the embarrassing position arising from the many changes made from time to time by the Brush Electrical Engineering Co., and the delays in negotiations for giving it a bulk supply of electricity, the Committee felt bound to report that several questions of vital importance still remained unsettled, one being as to the time required by the company for the delivery of the plant to be supplied by it. The company now intimated that it declined to be bound to give delivery in less than nine months, which the Committee regarded as a prohibitive period, having regard to the general demand on the undertaking for next winter. The Committee, therefore, recommended that the negotiations with the company be postponed for the present, and that the Corporation proceed without delay to make extensions of the plant, to be available for the ordinary supply next winter. The approximate cost was estimated at £10,000. The report was adopted.

**PENDLEBURY.**—Messrs. Andrew Knowles & Sons, Ltd., are about to introduce electric power for haulage purposes in the Pendlebury and Clifton Hall mines. The announcement was made at the shareholders' meeting last week. Current will be delivered from the Lancashire Power Co.'s mains to a sub-station, where it will be reduced to a suitably low voltage. The electric haulages will supersede the compressed air engines which have hitherto been used for haulage purposes. The installation will probably be commenced about Easter.

**PETERBOROUGH.**—In the course of a report to the Council, presented on Tuesday, the electrical engineer, Mr. J. C. Gill, drew attention to the probably overloaded condition of the station plant next winter, and urged the necessity of purchasing additional plant. He proposes that two extra boilers (£1,230) and a 500-kw. turbo-generator (£3,400) should be installed. The Electric Lighting Committee has approved the engineer's report, and recommends the borrowing of £7,000 for carrying out the scheme, which would complete the equipment of the existing station.

**Plymouth.**—The Electricity Committee has approved of a resolution that the Embankment Road should be lit by electricity.

**Rawtenstall.**—The borough electrical engineer and the borough surveyor have been requested to consider and report upon the proposed lighting by electricity of the workmen's dwellings to be erected on Carr Farm estate.

**St. Mary Cray (Kent).**—A large new power house is being erected at St. Mary Cray Paper Mill, by Messrs. Joynton and Son.

**Siberia.**—According to the *Board of Trade Journal*, a complete project for equipping the port of Vladivostok with cranes, elevators, repair shops, refrigerating and electrical plant has been drawn up, and some £15,000 has been allotted for the building of an electric power station.

**Silsden.**—The application of the Airdale Shed Co. for permission to lay an electric cable to serve the proposed shed has been withdrawn.

**Skipton.**—To celebrate the completion of a rearrangement of premises and installation of electrical driving and lighting, the directors of Messrs. John Dewhirst & Sons, Ltd., dyers and spinners, of Skipton, have invited the whole of their employes, numbering about a 1,000, to a series of entertainments and socials on March 7th. The work of addition and reconstruction has occupied about four years. The whole of the machinery is driven by a newly-installed Westinghouse 1,250-kw. turbine and generator. The 40 motors in the works are of British Thomson-Houston make.

**Southport.**—The General Purposes Committee of the T.C. on February 24th passed a recommendation to the Council that the management of the tramways and the electricity undertakings should be separated, and not a joint affair as at present.

**Swanage.**—The Dorset Electricity Supply Co., which has been promoted by Dr. Purves, of Exeter, in order to provide an electricity supply for the town, has approached the U.D.C. on the question of public lighting. The company offers to light 60-c.p. lamps until 11 p.m. at a charge of £2 10s. 6d. per annum, 100-c.p. lamps at £2 17s. 6d., 200-c.p. lamps at £4 10s., with a minimum yearly payment of £150.

**Swinton.**—The L.G.B. has given sanction to the Swinton and Pendlebury District Council for the borrowing of £600 for laying cables for the supply of electricity to Broad Oak Park.

**Walkden.**—A number of looms which have been put down in the Boatshed Mill, Walkden, by Messrs. E. Lane & Sons, of the Hope Mills, are to be electrically driven.

**Wednesbury.**—The profits of the Corporation's electricity undertaking amounted last year to only £23. In consequence of this, it is stated that the charges to consumers are to be raised, and that an increase of 15 per cent. may be anticipated.

**West Ham.**—The electrical engineer suggests that, owing to the continued increase in connection with the supply of current, arrangements be made with Messrs. Babcock & Wilcox to extend their present contract for two boilers to three. The amount which it will be necessary for the Council to raise for this purpose is £7,363, of which £4,785 represents the amount of the quotation for boiler and accessories to complete the pair already in hand. The electrical engineer's suggestions have been agreed to.

**Willesden.**—In connection with the Council's decision to erect a sub-station in Barret's Green Road, application is to be made to the L.G.B. for sanction to borrow £3,318, of which amount £2,545 will go towards the cost of the new plant required.

**Worsley.**—The Lancashire Power Co. will shortly open a new sub-station at the Crescent, Worsley, established in connection with a big lighting scheme for Worsley district.

## TRAMWAY and RAILWAY NOTES.

**Canada.**—A company has just been formed at Walkerville, Ont., under the name of the Tate Electric Co., to establish works for the construction of electric motor-cars for the Canadian market.

**Continental Notes.**—**SWITZERLAND.**—The Commission d'Etudes charged by the Federal Railway Administration to study the electrification of the St. Gothard Railway, has submitted its last report. It advises the adoption of single-phase traction at 15 periods and 15,000 volts. To obtain the power required, it is proposed to construct a station on Lake Ritom in the south and stations at Göschenen and Amsteg in the north, which will furnish an aggregate of 96,000 h.p. The installations to be carried out include works for the production and distribution of energy (29,000,000 fr.); supply and distribution mains (9,770,000 fr.); rolling stock, depôts and repair shops (21,900,000 fr.); conversion of power-stations (3,500,000 fr.). The Commission has again considered what power will be necessary to supply the whole

of the Swiss railways, on the assumption of double the traffic of the year 1904. The five Federal networks and the private lines will need yearly from 1,000 to 1,300 million h.p.-hours at the turbines. The generating stations should, therefore, be built for a total output of 500,000 h.p. According to expert calculations there exist a dozen falls still unappropriated or reserved for the use of the Federal railways, which, in combination, could supply 1,800 million h.p.-hours per year at the turbines; the generating stations might therefore be built for a maximum capacity of 625,000 h.p.

**FRANCE.**—The Conseil Général has voted a sum of 30,000,000 fr. for the construction of the third network of local railways in the Département of the Pas-de-Calais, of an aggregate extent of 611 km., divided into four groups, two of electric lines and two of steam.—*La Lumière Électrique.*

**RUSSIA.**—The "Telephon" Co., of Moscow, has secured a concession for a proposed electric railway between Vaulograd and Bachmut.

**ITALY.**—The plans for an electric railway between Aosta and Pré-St. Didier having been approved by the local authorities concerned, application for a concession to the Consiglio Superiore dei Lavori Pubblici is being made. The line will prove a benefit to the forestry industry, and supply transport facilities to the collieries of Cogne and La Thuile.—*Giornale dei Lavori Pubblici.*

**GERMANY.**—A concession has been granted in respect of a projected light electric railway between Niederursel and Königstein, near Frankfurt-am-Main.

**East Ham.**—The electrical engineer and manager has been instructed to report upon the question of duplicating the tramway track in High Street North.

**Edinburgh.**—A report by the burgh engineer on the subject of the double-decked tramway cars in the city, and suggesting that a request might be made to the tramway company to increase the number, was before a meeting of the Tramway Committee, and it was agreed to communicate with the company.

**Hong-Kong.**—Recently the Chinese community have systematically boycotted the tramways, the reason given being the decision of the company to accept only Hong-Kong money. As it was found that the real reason was a political one, the Government passed a special Ordinance imposing penalties for improper interference with business. It is stated that these measures have already had a salutary effect on the Chinese community.

**Huddersfield.**—The Tramways Committee has decided to double the tramway from Salendine Nook to Mount.

**Leeds.**—It is anticipated that the extension of the Corporation tramways from West Park to Lawnswood will be completed within a few weeks. The track has been laid over the greater part of the route, and it is probable that the extension will be ready for opening by Easter.

The tramways authorities have decided to try, as an experiment, the system of fare collecting on the platforms of the cars. For a long time this system has been actually in practice in an irregular manner, the observance of the rule against it having been very much relaxed.

**London.**—The L.C.C. tramways department has decided to enlarge the capacity of the Camberwell, New Cross, Stockwell, Tooting, Camden Town and Clapham sub-stations, by substituting three large rotary converters for six small motor-generators at present in use at the Shoreditch sub-station, and transferring the small machines to the other stations. The cost of the converters, transformers, switches, crane, &c., is estimated at £14,000, and the work of transferring the plant, &c., at £4,000.

The Council has introduced an innovation in the form of numbered cars for denoting the different services; the system has been divided into nearly 90 services.

As a result of the strong protests, the scheme for a tramway subway along the east of St. Paul's Cathedral has been withdrawn, necessitating the abandonment of the proposed tramway across the suggested new St. Paul's Bridge.

With reference to the L.C.C. (Tramways, Trolley-Vehicles and Improvements) Bill, the Kensington, Hammersmith and Westminster Councils have decided to call the attention of their Parliamentary representatives to the matter, and ask them to resist any proposal for the equipment of any overhead system of traction which dispenses with the necessity of the County Council first obtaining the approval and consent of the local highway authority concerned. Southwark, Wandsworth, Hammersmith and Kensington Councils have decided to express their objection, in a similar manner, against the Metropolitan Electric Tramways (Railless Traction) Bill, Clause 16 of which apparently authorises the Board of Trade to grant provisional orders to the company to run railless cars on any routes which it thinks convenient, a power which might be exercised over the head of any local authority, if, in the opinion of the Board, such consent was unreasonably withheld.

Speaking at the meeting of the North London Railway Co., Lord Rathmore said that the passenger traffic receipts were the worst they had ever experienced and were the result of the competition of the tube railways and motor-buses, a competition which seemed to grow stronger and more destructive every day. He was afraid that they must make up their minds that they would not have any effective means of fighting that competition until their line had been electrified, in conjunction with the London and North-Western Railway to Watford. He thought they might reasonably hope that when that had been done they would receive constantly increasing receipts from passenger traffic coming over their line, and especially from the Willesden and Watford districts.

**Mexborough.**—The U.D.C. has petitioned against the preamble of the Mexborough and Swinton Tramways (Railless Traction) Bill. The petition calls attention to the statutory limitations of the company concerned in the scheme, with respect to capital powers, and the Council maintains that it is better able to carry out such a scheme if it is necessary, having already an up-to-date electrical station, &c., and being at present supplying current for lighting purposes at 3½d. per unit, which is cheaper than in any other place in Yorkshire.

**Midland Railway Electrification.**—At this company's half-yearly meeting, the chairman, referring to the question of electric traction, said the company would have to go to Parliament next year for powers to electrify the Tilbury line.

**Newcastle-on-Tyne.**—At a meeting of the Tramways Committee, on February 21st, a deputation was received from the Gosforth U.D.C. urging that no extra fares should be charged for running cars to Gosforth and Gosforth Park, while the race meetings were being held and on other special occasions. Counsel's opinion had been taken, and it was said that the Committee had no power to increase the fares. The Committee decided to call a special meeting of the members in a fortnight's time to consider the matter. The ordinary fare to Gosforth is 2d., and to Gosforth Park 4d., but on the occasions to which attention is drawn, special cars are put on with an upstanding charge, usually of 1s. The contention of the Committee is that the Corporation would lose money if the fares were not increased on the occasions referred to. Extra cars, they claim, had to be brought into requisition, and the Tyneside Tramways and Tramroads Co. had to have a share of any balance left after paying expenses.

**Plymouth.**—The Tramways Committee has instructed the town clerk to interview the representatives of the Plymouth, Stonehouse and Devonport Tramways Co. with respect to its request for the reconstruction of the track in Union Street. It has also been resolved that books of 12 tickets of face value be issued on the tramways.

**Southport.**—On Saturday a poll of ratepayers was taken as to whether the Corporation should run cars on Sundays, and the result was:—For, 1,763; against, 2,242; majority against, 479. This is the second plebiscite on the matter, the previous one in 1903 resulting as follows: For, 1,843; against, 3,639; majority against, 1,805. For some time there has been a loss on the running of the Corporation cars, and some of this is ascribed to the absence of a Sabbath service. Strong opposition to Sunday running was offered by the local Free Church Council and other religious bodies.

**Stirling.**—Another step forward has been taken in the movement to provide the town with an up-to-date system of electric tramways. For some time past, the T.C. has had the matter in hand, and the town clerk has been instructed to write to Mr. George Balfour, London, informing him that the Council is anxious to secure an electric tramway system, and inviting him to look into the matter with the view of such a tramway being undertaken by the parties whom he represents. It has also been agreed to make inquiries as to the railless system of traction, and with this in view the town clerk and burgh surveyor are to ascertain the experience of the towns where the system is in operation.

**Tipton.**—A letter has been received from the Birmingham and Midland Tramway Joint Committee intimating that it was of opinion that there would not be sufficient traffic between Great Bridge and Ocker Hill to justify the heavy expenditure of laying a tramway along this route, but if the Council had reason to believe otherwise, and would obtain the powers and build the tramway, the company would be prepared to provide the necessary rolling stock, and run a service of cars on terms to be agreed. The matter has been referred to the Tramways Committee for consideration.

## TELEGRAPH and TELEPHONE NOTES.

**Imperial Wireless System.**—The Postmaster-General has informed the Marconi Co. that he does not share the company's view that it is entitled to retire from the contract for the Imperial wireless chain, and will hold himself free to enforce all his rights against the company.

A report of the Select Committee to the House of Commons was published on Tuesday, embodying resolutions which the Committee agreed to report to the House. The resolutions are to the effect that the Committee proposes to retain the conduct of the inquiry entirely in its own hands, but asks leave to hear counsel when necessary; and that the Committee invites any person in possession of evidence bearing upon the negotiation and completion of the agreement to communicate with the clerk.

**Liverpool.**—The Mersey Docks and Harbour Board has adopted a recommendation of the Marine Committee that the Board should enter into an arrangement with the B. of T. and the Post Office for the establishment of several wireless stations, on lightships and at the dock office, for the benefit of navigation at the mouth of the Mersey.

**Long-Distance Telephony.**—The trans-Continental telephone circuit between New York and San Francisco, to be built by the American Telephone and Telegraph Co., will be equipped throughout with Pupin coils, two coils per 8 miles. The copper wire will weigh 940 lb. per mile of route, and as the distance is 3,500 miles, the total weight will be 3,290,000 lb. There is a difference of three hours in time between New York and San Francisco, so that the business day will be limited to about five hours.—*Telegraph and Telephone Age*.

**New Zealand.**—The Government will shortly put into operation in New Zealand regulations making it compulsory for passenger ships to carry wireless apparatus.

The Government has decided to adopt the full automatic telephone system for centres requiring new equipment, and has been calling for tenders for full equipments for Auckland, Wellington, Hamilton, Masterton, Blenheim and Oamaru. The original intention was that switchboards carrying 10,000 lines each should be installed in each of the four cities, and smaller systems in the provincial towns. Ultimately the Auckland and Wellington exchanges will be enlarged to a capacity of 15,000 lines. It is estimated that the new system will be completely installed in the two largest cities by the end of 1913. Meanwhile the pressure on the existing manual systems in Auckland and Wellington is to be relieved by the installation of small switchboards carrying 400 or 500 lines, which will be adapted for use with the present switchboards.—*Australian Mining Standard*.

**Suffragist Outrages.**—On Saturday morning a large number of telegraph wires in Chester Moor Dene, a mile south of Chester-le-Street, near Newcastle, were cut, and during the week-end the wires in four public telephone boxes in Birmingham were cut, and the instruments rendered useless. Similar outrages are reported from Belfast.

**Trans-Atlantic Communication.**—Tests made with a temporary antenna 400 ft. high, at the new Telefunken tower at Nauen, in Germany, on January 11th, showed that there was no difficulty in communicating with the station at Sayville, U.S.A., and messages transmitted from the latter station with 45 H.P. were clearly received at Nauen.

Mr. H. Bredow, managing director of the Telefunken Co., is in New York with a view to establishing a wireless service between Europe and the U.S.A.—*Telegraph and Telephone Age*.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdare.**—March 3rd. Service materials, for the U.D.C. electricity department. See "Official Notices" February 14th.

**Aberaman.**—March 10th. Electrical goods, for the directors of the Powell Duffryn Steam Coal Co., Ltd. Stores Manager, Aberaman, near Aberdare.

**Argentina.**—April 15th. Tenders will be received at the Dirección General de Minas, Geología e Hidrología, Buenos Ayres, for the supply of motors, cables, dynamos and kindred material required for the generation of motive power.—*Board of Trade Journal*.

April 15th.—The Ministry of Agriculture of the Argentine Republic in Buenos Ayres is inviting tenders for plant, including three-phase alternators and motors, switchboard, mains, &c., for a new electricity generating station.

**Australia.**—April 14th. H.M. Trade Commissioner for Australia reports that tenders are invited for plant required to generate three-phase current for the high-power radio-telegraph station at Darwin, Northern Territory, and for lighting and power purposes in the neighbourhood:—Four Diesel oil engines, two to drive a 500 kw. alternator each, and two to drive a 250-kw. alternator each; an air-compressor set; an overhead travelling crane of 20 tons capacity; four alternators and exciters, two of 500 kw. capacity and two of 250 kw. capacity; and a switchboard. The earliest date of delivery must be stated. Tenders to the Secretary, Postmaster General's Department, Melbourne. Deposit 5 per cent. on the first £1,000, and 2½ per cent. on the amount above that sum. Specification and form of tender obtainable from the Australian High Commissioner in London, 72, Victoria Street, S.W., where also preliminary deposits may be paid. Specification and form of tender may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.—*Board of Trade Journal*. The matter is referred to in our "Official Notices" to-day.

**Ayr.**—The Town Council invites tenders for advertising on the tramcars for five years. Mr. P. A. Thomson, Town Clerk.

**Barrow-in-Furness.**—March 3rd. Electrical stores for a year, for the T.C. Borough Electrical Engineer.

**Bedwas.**—March 5th. Electrical goods for a year, for the Bedwas Navigation Colliery Co., Ltd. (Form 4). The Secretary.

**Belfast.**—March 12th. The Harbour Commissioners are inviting tenders for four 5-ton electric gantry cranes for the Queen's Quay and Abercorn Basin Quay. Specifications, &c., from the Harbour engineer, Mr. W. Redfern Kelly, Belfast.

**Birmingham.**—March 1st. Electrical stores for a year, for the Birmingham, Tame and Lea District Drainage Board. Mr. John D. Watson, engineer, Tyburn.

**Bosnia.**—LIVNOI.—March 20th. Tenders are required for the erection of a power station and public and private electric light installations, according to a special programme. Particulars of the Municipal Administration, Livnoi, Bosnia.

**Bridgend.**—March 21st. One 100-K.V.A. steam alternator and accessories, for the U.D.C. See "Official Notices" to-day.

**Brighton.**—March 10th. Storage battery (800 amp.-hours) for the T.C. See "Official Notices" to-day.

**Colchester.**—March 10th. Sundry stores for the Corporation Electricity Department. Mr. W. Frisby, electrical engineer, Osborne Street.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" Feb. 21st.

**Dundee.**—March 7th. Two water-tube boilers, mechanical stokers, economiser, steel bunkers and coal-handling plant, for the Corporation electricity department. See "Official Notices" February 21st.

**Eastbourne.**—March 10th. Combined coal elevator and conveyor for the Corporation Electricity Department. See "Official Notices" to-day.

**Edinburgh.**—The Corporation invites tenders for arc lamp globes, cast-iron pavement boxes, underground conduits for electricity cables. Mr. F. A. Newington, engineer.

**Egypt.**—July 1st. Egyptian Government Public Works Ministry. Machinery and pumping plant for Baltim pumping station, including 15 Diesel or 12 steam engine plants and electric lighting and power plant, workshop equipment, cranes and weigh-bridge, boiler plant, fuel economisers, steel chimneys, coal and ash handling apparatus. Particulars (£1 per copy) at Office of Public Works Ministry, Cairo, or of Sir A. Webb, Queen Anne's Chambers, Westminster.

**Erith.**—March 6th. Electrical work for three years, under U.D.C. assisted wiring scheme. See "Official Notices" Feb. 21st.

**France.**—PARIS.—March 8th. Supply of copper wire covered with gutta-percha and cotton. March 11th.—Supply of extensible telephone switch tables. March 12th.—Supply of electric cables. Particulars of cahier des charges, &c., from Bureau des Postes et Télégraphes, 103, Rue de Grenelle, Paris.

March 6th.—Supply of electric cable for the service of the Postes et Télégraphes de l'Indo-Chine. Guarantees: provisional, 550 fr.; final, 1,100 fr. Particulars of the Ministère des Colonies, 57, Boulevard des Invalides, Paris.

**DUNKERQUE.**—March 15th. Tenders are required for the supply and erection of the mechanical and electrical appliances to work a 61-metre swing bridge to be erected in the Freyanet Docks at Dunkerque. Particulars of M. Bourgeois, ingénieur-en-chef, Dunkerque.

**G.C.R.**—March 4th. The Great Central Railway Co. are inviting tenders for stores during the year ending April 30th, 1914. For further particulars see this column last week.

**Heston and Isleworth.**—March 8th. Stores and materials for a year, for the U.D.C. electricity department. See "Official Notices" February 21st.

**Hungary.**—SZÖD.—Tenders will be received for a concession to establish an electric installation and supply public and private lighting and power current, for a period of 50 years, to Szöd and ten neighbouring districts. Guarantee deposit, 10,000 kronen. Particulars of the Gemeindeamt, Szöd.

**Ilford.**—March 1st. Council Education Committee. Tenders for the electric lighting installation at the South Park School extension, Water Lane, Ilford. Mr. C. J. Dawson, architect, 11, Cranbrook Road, Ilford.

March 1st.—Stores for a year, for the Tramways Department of the U.D.C. Mr. L. E. Harvey, manager, Ley Street dépôt.

**India.**—March 14th. Motors, transformer and motor-generator, for the B.B. and C.I. Railway. See "Official Notices" February 21st.

March 4th.—Starting and controlling pillars, for the Bombay, Baroda and Central India Railway. See "Official Notices" February 21st.

**King's Lynn.**—March 1st. Lancashire boiler, economiser and pipework, for the Corporation Electricity Department. See "Official Notices" February 21st.

**Liverpool.**—OXTON.—Electric light installation at St. Saviour's Church, for the Vicar and Wardens.

March 10th.—Electrical fittings for a year, for the Select Vestry Mr. C. W. Coster, clerk, Brownlow Hill.

**London.**—L.C.C.—March 4th. Two 2,000-kw. turbo-generators, with condensing plant, &c. (extension of time). See "Official Notices" February 21st.

March 5th.—Electrical installation at the Curtain Road Elementary School. See "Official Notices" February 21st.

March 12th.—Electrical installation at Hawley Crescent School, St. Pancras. See "Official Notices" to-day.

It is also proposed to put in hand at an early date, the electric lighting of the following schools:—North Camberwell (Leipsic Road); Walworth (Victory Place); and Woolwich (Avery Hill Training College Hostels). Tenders are being advertised for, and a sub-committee is to be authorised to accept tenders during the recess.

The Fire Brigade Committee recommends that tenders be invited from selected firms for two electrically (one petrol-electric) driven motor fire escape vans and two motor turntable ladders.

Tenders are to be invited by the Highways Committee for the erection of the Leighton Road, Kentish Town, tramways permanent way dépôt.

The Committee also recommends that three rotary converters, transformers and accessories, switchgear and cabling be substituted for other plant at present in use at Shoreditch tramway power station.

ST. PANCRAS.—March 4th. Arc lamp carbons, for the B.C. See "Official Notices" February 7th.

STEPNEY.—March 17th. Boilers and boiler house accessories, turbo-alternators, condensers, accessories and switchgear, for the B.C. See "Official Notices" February 14th.

BATTERSEA.—March 19th. One water-tube boiler, mechanical stoker, superheater and pipework, and one motor-driven centrifugal pump and pipework, for the B.C. See "Official Notices" to-day.

**Macclesfield.**—March 11th. Electrical goods for the Cheshire County Asylum, Parkside. Mr. Wm. Tingay, clerk of the Asylum.

**Merthyr Tydfil.**—March 3rd. Electrical accessories for a year, for the B.G. The Workhouse Master.

**Morecambe.**—March 19th. 2,500 tons of coal or slack for the Corporation Electricity Department. See "Official Notices" to-day.

**Morocco.**—March 27th. Tenders are invited for the supply of 15,000 insulators and brackets. Particulars from Monsieur le Président de la Commission générale des Adjudications et des Marchés, Dar-en-Niaba, Tangiers.

**Neath.**—March 3rd. One 400-kw. high-speed engine, direct-coupled to a two-phase alternator, and accessories, for the R.D.C. See "Official Notices" February 14th.

**Newport (Mon.).**—March 4th. Electric light fittings for the B. of G. Mr. A. H. Rees, Clerk, Queen's Hill.

**Pontypridd.**—March 5th. Stores and materials for the U.D.C. electric light and tramways department. See "Official Notices" February 21st.

March 17th.—Tramway men's uniforms for the U.D.C. See "Official Notices" to-day.

**River Plate.**—April 5th. The Municipality of La Paz (Entre Rios) is calling for tenders for the erection of an electric light station.—*Review of the River Plate.*

**South Shields.**—March 10th. Stores for a year for the Corporation Electricity Supply Department. Mr. H. S. Ellis, electrical engineer, Mill Dam.

**Swindon.**—March 8th. General stores and materials for a year, for the Corporation electricity and tramways departments. See "Official Notices" February 14th.

March 10th.—One 500-kw. mixed-pressure turbine and condensing plant, boiler feed pump and pipework, and one switchboard panel and cables, for the Corporation. See "Official Notices" February 14th.

**Swinton and Pendlebury.**—March 10th. One 25-kw. transformer and switchboard, main along Chatsworth Road, and annual supply of materials, for the U.D.C. Electricity Department. See "Official Notices" February 21st.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Wallasey.**—March 15th. Fuel oil (400 tons) for a year, for the Corporation electricity department. Mr. J. A. Crowther, electrical engineer, Seaview Road, Liscard.

**Walthamstow.**—February 28th. Four double-deck tramcars complete with magnetic-brake equipments for the U.D.C. See "Official Notices" February 7th.

**War Office.**—Cables, electrical stores, iron telegraph poles, &c. See "Official Notices" to-day.

**Warrington.**—March 5th. Motors and transformers for a year, for the Corporation. See "Official Notices" Feb. 14th.

**Waterford.**—The Asylum Committee has decided to invite tenders for the installation of an electric plant, in accordance with the estimate of Mr. Lawless, which amounted to £3,929.

**Wimbledon.**—March 5th. Stores and materials, for a year, for the Corporation Electricity Department. See "Official Notices" February 14th.

**Wrexham.**—March 1st. Stores for a year, for the Borough Electrical Engineer's department. See "Official Notices" February 14th.

**York.**—March 10th. One 3,000-KW. turbo-alternator, with condensing plant, pipework and switchboard, water-tube boilers with chain-grate stokers, &c., storage battery and H.T. cables, for the Corporation. See "Official Notices" February 21st.

### CLOSED.

**Barnsley.**—The T.C. has accepted the tender of Mr. Jas. Taylor, of May Day Green, for telephone fittings for inter-block communication at the hospital, at £49.

**Belgium.**—Several Belgian and German concerns submitted tenders last week for the supply and laying of two lots of telephone cables in the Brussels district, for the Belgian Post and Telegraph authorities, the lowest offer in both cases being that of the Deutsche Kabelwerke Gesellschaft, of Lichtenberg, Berlin.

**Chase Town.**—The Staffs. Education Committee on Saturday accepted the tender of the Electric Construction Co., Ltd., for electric plant and machinery for the Mining Institute at Burntwood, at £365.

**Colwyn Bay.**—The U.D.C. has accepted the following tenders for extensions at the electricity works:—

Browett, Lindley & Co., Ltd.—Steam set, £650 (dynamo by Messrs. Dick, Kerr & Co., £323), and field coil, £18.  
Bertram Thomas.—Extension of switchboard, £125.  
R. Hughes-Williams.—Engine room extension, £167.

**Douglas (Isle of Man).**—The Tramways Committee of the T.C. has accepted the tender of Messrs. Milns, Voss & Co. for a single saloon tramcar with improved lighting, at £251.

**Durham.**—The Education Committee of the Durham County Council has accepted the tenders of Messrs. F. Reid, Ferens and Co., Sunderland, for the electric light installations at its schools, viz., New Training College and Hostel for Women, at Durham, Easington Schools, Fatfield Schools, Wingate School, Wheatley Hill School, Newbottle School, and Peases West.

**Glasgow.**—With reference to our note under this heading last week, we learn that the contract placed with Messrs. James Howden & Co. was for a set of "Howden-Zoelly" turbo-alternators, not "Rataan-Zoelly." Further, orders for four boilers each were placed with both Messrs. Howden and Messrs. Babcock & Wilcox—not two each.

**Harrogate.**—The T.C. has accepted the tender of the British Thomson-Houston Co., Ltd., for a 1,250-KW. horizontal turbo-alternator, at £4,279. The tender of the same firm to reconstruct and rewind the generator of the present vertical set, at £612, has also been accepted.

**Horsham.**—The U.D.C. has decided to obtain all sizes of meters from the Electrical Apparatus Co., Ltd., for the next 12 months.

**Huddersfield.**—The Markets and Fairs Committee has accepted the tender of Messrs. E. Brook, Ltd., for a three-phase electric motor for the cold stores.

**London.**—HAMMERSMITH.—The Electricity Committee received the following tenders for cable ducts:—

Builders' Material Association	..	..	..	..	£284
H. R. Mansfield	..	..	..	..	(accepted) 281
Sharp, Jones & Co.	..	..	..	..	238
Oates & Green, Ltd.	..	..	..	..	234
Seasons & Sons	..	..	..	..	234
J. Woodward, Ltd.	..	..	..	..	234
Albion Clay Co.	..	..	..	..	234
Domlon & Co.	..	..	..	..	234
John Knowles	..	..	..	..	234
J. R. Fyfe & Co. (plain joint)	..	..	..	..	151

Arc lamp globes are ordered from Messrs. Johnson & Jorgensen, Ltd., and electric light sundries from the B.T.H. Co.

For cable joint boxes and fuse boxes, the prices quoted were:—

W. Lucy & Co.	..	..	..	..	(accepted) £166
Sykes & Sugden, Ltd.	..	..	..	..	533
B.I. & Helsby Cables, Ltd.	..	..	..	..	647
Callender's Cable & Construction Co., Ltd.	..	..	..	..	682
Siemens Bros. & Co., Ltd.	..	..	..	..	757
W. T. Glover & Co., Ltd.	..	..	..	..	1,284

The tender of Messrs. Chamberlain & Hookham, Ltd., for ordinary meters from 3 to 500 amps. has been accepted, also that of the Electrical Co., Ltd., for meters (hour).

The General Electric Co., Ltd., is to supply insulated wires for £147; there were four higher tenders ranging up to £216.

**Mexborough.**—The Electricity Committee has accepted the tender of Messrs. G. H. Smith & Sons, for extensions to the electricity works, at £3,891.

**Peterborough.**—Messrs. Callender's Cable Co. have secured the contract for the cable for the lighting of the new bridge over the Great Northern main line at Peterborough, for £187.

**Redditch.**—The Worcestershire Education Committee has accepted the tender of Messrs. J. Andrews & Son (£94) for installing electric light at the new school.

**Southend-on-Sea.**—The T.C. has accepted the tender of the British Thomson-Houston Co., Ltd., for a switchboard, at £81; that of Mr. Geo. Waller, of Stroud (Glos.), for screening and elevating machinery, at £831; and those of Messrs. Dawson and Manfield, of Manchester, for new refuse destructor cells, at £1,760.

**West Ham.**—The T.C. has accepted the tender of Messrs. Leslie & Co., at £1,235, for pipework, &c., in connection with the river service. The tenders of Siemens Bros. Dynamo Works, Ltd., and Messrs. Chamberlain & Hookham have also been accepted for an annual supply of house service A.C. wattmeters.

### FORTHCOMING EVENTS.

**Royal Institution.**—Saturday, March 1st.—At 8 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture IV.)

Friday, March 7th. At 9 p.m. Discourse on "Photography of the Paths of Particles Ejected from Atoms," by Mr. C. T. R. Wilson.

Saturday, March 8th. At 8 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture V.)

**Salford Technical and Engineering Association.**—Saturday, March 1st. At 7 p.m. At the Royal Technical College, Salford. Lecture on "Wireless Telegraphy," by Mr. J. McKeever.

**Society of Engineers.**—Monday, March 8th. At 7.30 p.m. At the I.E.E., Embankment, W.C. Presentation of premiums by Mr. J. Kennedy. Presidential address by Mr. A. Valon.

**Institution of Mechanical Engineers.**—Tuesday, March 4th. At 8 p.m. Paper on "City Passenger Transportation in the United States," by Mr. G. D. Snyder.

**Institution of Electrical Engineers (London).**—Thursday, March 6th. At 8 p.m. Paper on "Recent Developments in the Street Lighting of Manchester," by Messrs. S. L. Pearce and H. A. Ratcliff.

(Manchester Students' Section).—Tuesday, March 5th. At 7.30 p.m. At the Municipal School of Technology, Manchester. Paper on "Practical Testing of Transformers," by Mr. W. Parry.

(Glasgow Students' Section).—Tuesday, March 4th. At 8 p.m. At the Royal Technical College, Glasgow. Annual general meeting. Paper on "Illumination," by Mr. N. McCaskill.

(Students' Section, London).—Wednesday, March 5th. At 7.45 p.m. At the Institution. Paper on "Electrical Heating and Cooking Apparatus," by Mr. S. M. Hills.

**Charing Cross, West End and City Electricity Supply Co., Ltd.**—Friday, March 7th. At 8 p.m. Staff Smoking Concert. The Pillar Hall, Victoria Station (S.E. and C. Railway).

**Association of Electrical Station Engineers.**—Friday, March 7th. At 8 p.m. At Exeter Café, Deansgate, Manchester. Meeting to form Manchester branch.

### THE ELECTRICAL ENGINEERS

#### (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, March 8th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, March 4th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, March 6th.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Friday, March 7th.—"D" Company. Company training, 7 to 10 p.m.

Saturday, March 8th.—Headquarters will be open from 10 a.m. till 12 noon for regimental business.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj't.  
For Officer commanding L.E.E.

**The Post Office Railway Scheme.**—The *London Gazette* for February 25th contains the full particulars of the scheme proposed by the Postmaster-General for the construction of electric underground railways for the service of the Post Office, which is to form the subject of an application in the 1913 Parliamentary Session.

## NOTES.

**British Manufacturers in Australia.**—The Australian Association of British Manufacturers and their Representatives held its annual meeting on February 7th, at Melbourne. The report for 1912 then submitted showed a balance in hand amounting to £148. The Association is preparing for distribution among buying houses, &c., throughout Australia, a directory of members of the Association. Seven thousand five hundred copies will be circulated, and it is believed that both members of the body, and British trade in general, will be benefited by purchasers being enabled to ascertain with the minimum of trouble where their requirements may be procured from British sources. It is also hoped that the Association membership will be added to in consequence of the greater publicity thus given to its doings, and if additions to the membership are found to justify such a course, the publication may be issued annually. The following other matters are referred to in the report:—

**Tariff.**—It was expected that a revision of the tariff would be undertaken by the Commonwealth Government during the year, but such has not been the case. With the approaching Federal elections, it is impossible to forecast whether or not anything in this direction will be done during the ensuing year, but representations have been made by the Association regarding a large number of items in which members urge for alterations in the present tariff, and have been promised by the Minister "careful consideration when the tariff is next under review."

**Government and Municipal Tenders.**—The matter of putting up a cash deposit on tendering for Government and municipal contracts, and increasing same in the event of acceptance, has been receiving the attention of the Executive Council, and expressions of opinion have been obtained from members interested; but as there appears to be a considerable difference in members' views, it is proposed to call a meeting at an early date to decide what steps should be taken.

**Statistical Information.**—During the year statistical tables, relating to the trade of the United Kingdom with the Commonwealth in items in which there is competition with foreign countries, for the years 1910 and 1911, have been prepared by H.M. Trade Commissioner in Australia, and distributed by the Association to members and others. These figures have been found of considerable value and interest to members, and it is intended to supply members with similar figures annually. It may also be mentioned that more detailed figures relating to the particular trade of individual members may be obtained from the secretary.

Many matters have been and are being dealt with to the benefit of British trade, the details of which it is not advisable to make generally known. A system has been inaugurated whereby early information is obtained from the Department of Trade and Customs regarding tariff decisions, rulings and alterations, and all such information is passed on to members interested at the earliest possible moment. The Executive Council feel very pleased with the progress which has been made by the Association, and with its reception in official and other quarters, and feel confident that, given the support of representatives of British manufacturers and of their principals in the United Kingdom, much useful work will be accomplished and the Association will become a powerful factor in connection with trade between the United Kingdom and the Commonwealth.

Mr. Percy Rosling, the president, was up for re-election. Mr. R. H. Butler, the secretary, if addressed at the new permanent offices of the Association—430, Little Collins Street, Melbourne—will be only too pleased to forward to principals in this country information relating to membership, &c. There are now 195 members, 105 of these being British manufacturers, and 90 representatives of British manufacturers, and the annual subscriptions amounted to £348.

**The E.T.B.I. and National Insurance.**—The Secretary of the Electrical Trades Benevolent Institution (Mr. F. B. O. Hawes) recently laid before the Committee a report regarding the bearing of the National Insurance Act on such persons as benefit by the Institution. The position of the working classes is, of course, different, and for the sake of brevity, the benefits to women, which, in nearly all cases are less than those conferred upon men, are not dealt with.

"As the unemployment portion of the Act will affect practically no members of the staff of electrical firms, its bearing need not be considered. The following observations, therefore, only refer to the health insurance portion of the Act:—

"The monetary benefits in the case of sickness conferred under the Act as regards men briefly are as follows: 'If the contributions have been paid continuously, 10s. a week is paid for a maximum period of 26 weeks, provided the insured person is under 50: if over 50 the amount is 7s. a week, and if over 60 6s. a week. When the contributions are in arrear these amounts are considerably reduced, for instance, in the case of a man who is ten contributions a year, on an average, in arrear, the sickness benefit will only be 6s. 6d. a week. Besides, other reasons may cause the insured person to receive sickness benefit only counting from some days after the commencement of the illness.

"The above figures all relate to insured persons who are members of a friendly society, and whose incomes do not exceed £160 per annum. Persons whose health is bad may be unable to get into a friendly society, and in such an event become deposit contributors. Speaking generally, the person of bad health who is a deposit contributor obtains practically no monetary benefits from the National Insurance Act, owing to the fact that a very small irregularity in the payments of the contributions prevents such

benefits being given, and a person in bad health is certain to be irregular in his payments.

"It will be seen that the benefits mentioned above are far too small to meet the requirements of the average person employed on the staff of an electrical concern, and it may be taken for certain that in the case of an extended illness, assistance of some other kind would be absolutely necessary in spite of the fact that the employer and the employee had both been compelled to pay the Insurance contributions.

"The grants made by this Institution are those which the Committee considers are required to meet the individual wants of each case.

"Persons who apply to this Institution for assistance have generally been outside the scope of the Insurance Act for several years, and consequently their position is in no way altered by the existence of the Act. They are generally people who have lost their capital through misfortune of some kind or another, or persons who have been receiving good salaries, but have lost their appointments owing to ill-health, and are unable to obtain employment.

"The advantage of this Institution as regards the employer who has come to grief, needs no demonstration. The Insurance Act, of course, will never do anything for him.

"The above observations relate only to temporary relief. In considering the whole subject, it is frequently forgotten that the principal object of the Electrical Trades Benevolent Institution is to grant pensions. This is a matter which the Insurance Act mentions as a possibility, but there is nothing in it to indicate that pensions will ever be paid, or to indicate whether they are likely to be of a sufficient amount to be of any practical use to anyone who has been in the position of a member of a staff of an electrical concern.

"In view of the fact that the payments by employers and employed under the National Insurance Act will probably always be insufficient to meet the ordinary sickness benefits, the matter of pensions is left in a very uncertain state, and this Institution merits the support of those who would place pensions on a firm basis, even if they are already paying under the National Insurance Act.

"The time is undoubtedly drawing near when pensions will be required for members, and the invested funds must be very materially increased in order to meet such demands.

"In the above the position of members of the Institution has been considered, but there is a still further very important duty of the Institution, namely, pensions to the widows of members and assistance to the children. The National Insurance Act does nothing for such persons.

"In conclusion, I would ask everyone who is considering this subject to bear in mind that the Institution does not exist merely for the purpose of granting assistance during sickness or other difficulties, but that larger duties, which, up to the present, have not been exercised, are far and away beyond anything which is contemplated in the National Insurance Act. These duties can only be properly carried out by larger increases in the invested funds."

**Electrical Wages in Belfast.**—A local correspondent writes:—"The efforts of Belfast electricians, assisted by their organiser, Mr. Thomas Stewart, to have the wages of their fellow-workers employed in the building trade raised to £2 per week, have been successful. On Saturday last the employers concerned, with one exception, granted the increase, and electricians working for building contractors are now on the same level as electricians serving in other branches of employment."

**Institution and Lecture Notes.**—**BIRMINGHAM AND DISTRICT ELECTRIC CLUB.**—The fourth annual dinner of the Birmingham and District Club was held at the Swan Hotel on Saturday, the 16th inst. Mr. Roberts presided, supported by Mr. J. L. Morgan (treasurer of the club and secretary of the local section of the Institution of Electrical Engineers), Alderman David Shanks, the vice-presidents, Messrs. E. R. Phillips and V. D. Green, the assistant secretary, and others. Mr. Fell (of the Wednesbury Electricity Department), Councillor Lench, and others were present as guests of the club. Mr. J. Hill (past president) proposed the toast of the club, which had been in existence nine years: some of the founders, he said, were present that night. That interest in the club had never been allowed to flag was proved by the fact that over 40 papers had been given relating to the electrical industry. Mr. H. Roberts, in responding, said he thought the present competition between gas and electricity was likely to die out before long, and instead of each striving to adapt its method of illumination or power to every case, it would be acknowledged that each had its special field. For instance, in view of the present protests against the rapid rise of the Birmingham rates, there was one step, at any rate, which might be made towards economy—the substitution of electric street lamps for the present gas lamps. There were 219 lamp-lighters employed in the greater city, and they had to light and extinguish daily 22,000 lamps. Here was a case in which the advantages of electricity were manifest. Mr. V. D. Green proposed "The City of Birmingham," giving a humorous sketch of its history and recalling its associations with Boulton, Watt and Murdoch, the birth of electroplating, and other notable events. Alderman Shanks, responding, referred to the cry for economy in the City Council. Was it economy to grant £15,000 to the University and at the same time refuse an increase in teachers' salaries? Economy was not necessarily a matter confined to finance. It also bore upon another matter, as to how far the portion of the community as represented by that gathering of manufacturers and contractors was affected. It might be good to grant a sum to the University, to raise the teachers' salaries and to be progressive in all other activities and civic life. Yet they would find this meant

a still further increase in the rates, and that raised the question whether the time had not come for a very serious alteration in the methods of rating local manufacturing concerns. Manufacturers got an undue share of the burdens, and it was for them to consider whether the time had not come to put a stop to those burdens. Ground rents, for example, were not paying as heavy a share of the rates as factories. Other toasts were "The Electrical Industry," proposed by Mr. Brewerton, and responded to by Mr. Stevenson, and "The Visitors," proposed by Mr. W. Y. Anderson, and responded to by Councillor Lench. Songs and recitations were given by Messrs. H. Smith, A. Whatmore, Willett Raine and F. N. Dowling, and the evening proved to be a very entertaining and enjoyable one.

**INSTITUTION OF ELECTRICAL ENGINEERS (BIRMINGHAM SECTION).**—On Wednesday last, papers were to be read by Mr. W. E. Milns on "The Economical Use of Electric Power," and by Mr. T. P. Wilmshurst on "Electrical Power, Heating and Cooking." After the meeting a demonstration of heating and cooking apparatus was given by Mr. Milns.

**MANCHESTER SECTION.**—At a meeting of the Section on the 25th inst., a paper was read by Messrs. S. L. Pearce and H. A. Ratcliff on "Recent Developments in the Street Lighting of Manchester." A discussion followed, which was replied to by the authors.

**YORKSHIRE SECTION.**—On Friday last the annual dinner of the Yorkshire Local Section took place at the Hotel Metropole, Leeds, the chairman of the Section, Mr. Wilson Hartnell, presiding. Representing the Council there were present the President (Mr. W. Duddell), Messrs. J. F. C. Snell, W. Judd, J. E. Kingsbury, Robert Hammond, and the secretary, Mr. P. F. Rowell, and amongst others well known locally one may mention Mr. Harold Dickinson (late city electrical engineer), Mr. A. G. Lupton, Pro-Chancellor (Leeds University), Mr. John McLaren, Mr. E. Kitson Clarke, Mr. A. S. Keith, Mr. J. B. Hamilton (Corporation Tramways Department), Mr. W. B. Woodhouse (Yorkshire Power Co.), and Mr. W. C. Mountain, Chairman of the Newcastle Section, I.E.E.

After the loyal toasts, Mr. A. G. Lupton briefly proposed "The Institution of Electrical Engineers," referring to the world-wide use of electricity and its influence on progress generally. It seemed to him that the Institution was a descendant, in theory, of the spirit which carried on the old trade guilds, but on a more extended scale.

The President, in responding, referred to the efforts of the Institution on behalf of its members, and the pleasure which it gave him to meet and keep in touch with the members of the Local Sections. There were 73 members 41 years of age, and now some 7,300, with whom it would be impossible to keep in touch were it not for the Local Sections. The latter also facilitated the extended discussion of matters brought forward. After referring to the work of the Electrotechnical Commission and the friendly intercourse which arose therefrom with Continental engineers, he said he hoped many of the members would take part in the forthcoming visit to Paris, the details of which were being arranged.

Mr. Robt. Hammond, to whom fell the toast of "The Yorkshire Local Section," remarked that the Institution, being flush with money, had invested £3,000 recently, and was in a flourishing condition. Yorkshire had four record works costs amongst its central stations, and the average price of electricity in Yorkshire was lower than in any other county. The chairman, in replying to the toast, dwelt on the rapidity of electrical progress, pointing out that steam engineering had required about 150 years to arrive at a similar stage of development; this might be due to the scientific study devoted to electrical matters.

In proposing the toast of "The Electrical Industries," Alderman Smithson said he had been accused of hindering the development and extension of the Leeds Electricity department, but he thought they would look at the matter from a broader point of view. In his opinion it would be established on a firmer basis, and would certainly benefit from industrial electrical work, when the trade boom was past and the local manufacturers had time to think over things. After referring to local traction developments, and the introduction of railless traction, he said he believed that they were entering on an era of railway electrification. Messrs. J. E. Kingsbury and W. B. Woodhouse responded; Mr. Kingsbury remarked that the electrical industry needed no monument, it was only necessary to look round to gain some idea of its importance. He recalled an early paper by Mr. (now Sir) William Preece on the application of electricity to domestic purposes, which discussed the question of electric bells: if one compared that with the present day use of electricity, he asked what would be the future in view of the rapid development now taking place. It was a characteristic of electricity that it had to replace other methods; in every direction this was taking place, and he saw no reason for the pessimism which one found amongst electrical men. One could not overlook the fact that there had been some retardation due to legislative causes, and the item of goodwill was not always included when electrical undertakings were compulsorily transferred: he thought the electrical industry could do with some goodwill, and was entitled to it. Mr. Woodhouse said it was very generally considered that the electrical industry was on the eve of a boom in all departments, modestly adding that he had thought that it might be due to the work of the power companies.

Mr. Walter Emmott proposed "The Guests," remarking (with an eye on the clock and the extended toast list) that it was their one occasion for speech making in the year. Mr. J. F. C. Snell and Mr. E. Kitson Clarke replying.

At the conclusion of the speeches, Mr. Harold Dickinson was the recipient of a pair of silver candlesticks, presented by the Yorkshire Section of the I.E.E. of which he had been hon. secre-

tary for some years. Mr. Dickinson, in thanking his late colleagues for their gift, referred to his connection with the Leeds Section since its inauguration, and to the great interest and ready assistance of the Council of the Institution in connection with their work.

Orchestral selections and topical songs, in the intervals of speech-making, assisted towards a pleasant evening, for which all credit is due to Mr. J. D. Bailie, the hon. secretary, and those associated with him.

**PHYSICAL SOCIETY OF LONDON.**—At the annual general meeting held on February 14th, the officers for the ensuing year were elected as follows: President, Prof. A. Schuster; Secretaries, W. R. Cooper and S. W. J. Smith; Foreign Secretary, Prof. S. P. Thompson; Treasurer, W. Duddell.

At the 1913 congress of the AUSTRALASIAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, which was opened on January 7th at Melbourne University, about 550 delegates were present, representing the various States of the Commonwealth and New Zealand. A paper was read on the domestic uses of electricity, especially for cooking, by Mr. W. H. Alabaster, assistant electrical engineer to the Melbourne City Council.

**TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION.**—The dinner of this Association took place last night at the Trocadero.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS.**—At a meeting of the East of Scotland branch, held at Dunfermline, on Friday last, a paper was read by Mr. E. Kilburn Scott, London, on "Electric Cables for Shafts of Mines."

The monthly meeting of the West of Scotland branch was held on Saturday last at Glasgow. Mr. James McLean read a paper on "The Electrical Coal-Cutter; its Installation and Manipulation." The author said that there were two points which would reduce the saving effected by the use of coal-cutters. These were:—(1) That a very bad roof made cutting dangerous and expensive, sometimes impossible; and (2) the saving must be small where the coal was easily won by hand. He gave a series of hints for the benefit of machinemén:—Don't switch on too quickly, give the machine time to gradually attain full speed. If the load is very heavy, switch on slower, not faster. Don't increase the size of fuses because they blow often. It is easier to change a fuse than an armature. Don't raise or lower the cutting level in quick steps when driving a disk or chain machine; the only machine that will do this is the bar. Don't force the machine through a hard holing with blunt picks; it is quicker, not slower, to change picks. Don't neglect such trifles as a loose screw or a broken spring, because it is a small detail; either repair it or report it, because a stitch in time saves nine; and don't bury the machine in the cut because of cutting by contract. Work out the costs properly, and see if it does not pay better to cut with crown wheel clear.

**FARADAY SOCIETY.**—On March 12th there will be a general discussion on "Colloids and their Viscosity"; Dr. R. T. Glazebrook will preside, and a number of papers will be read. The meeting will be open to members of the Institution of Electrical Engineers and of the Physical Society of London.

**Annual Socials and Dinners.**—**HANLEY.**—The eighth annual dinner of the British Electrical Friendly Society (Potteries District) was held at Hanley on February 14th, Mr. F. W. Chanter, a director of the Potteries Electric Traction Co., presiding. A watch and chain were presented to Mr. C. Shorthouse, in appreciation of his work as contributors' Central Committee man for 11 years.

**MAIDSTONE.**—On Tuesday evening, last week, the employés of the Maidstone Corporation Tramways held a very successful concert, promoted by the members of the Sports Club. The room was tastefully decorated, and during the interval refreshments were served. The general manager furnished the company with tobacco and cigarettes. After a few remarks by the chairman (Mr. A. T. Lambert, general manager), a programme of music and song was carried out in an excellent manner. We understand that motorman W. Hayes "simply brought the 'depôt' down with his patter song, 'The Inquisitive Kiddy.'"

**Large Continental Turbo-Alternators.**—The Rheinisch-Westfälische central station, which was the first in Germany to employ 10,000-h.p. turbines, now possesses three 30,000-h.p. turbo-alternators, each of which is rated at 21,500 k.v.a.—i.e., about 15,000 kw. at 0.7 power factor. The overload capacity of the turbines and generators is 25 per cent. Two of these sets have been in satisfactory operation at Dusseldorf-Reisholz since last summer, and the third set is to be placed in service at Essen. The Dusseldorf station is interesting in that its generating equipment is entirely driven by turbines, and includes three 7,150-k.v.a. units (5,000 kw. at 0.7 p.f.), and the two new units mentioned above. There is, therefore, available in five sets, 60,000 k.v.a. or 45,000 kw. at 0.7 power factor. The power house measures 80 x 180 ft. The various auxiliary pumps are driven by steam turbines or electric motors, and for these auxiliary services each 15,000-kw. set requires 250 kw. and 1,100,000 gallons of water per hour. Generation is at 5,250 volts, three-phase, and excitation at 220 volts. Comparing the dimensions of the new sets with those of the 5,000-kw. units, the remarkable advances embodied in the construction of the former may be realised:—

—E.T.Z.

## TWO EUROPEAN SINGLE-PHASE RAILWAYS.

*The Mittenwald Electric Railway.*—This railway system between Innsbruck - Scharnitz - Garmisch - Partenkirchen-Griessen and Rentte is sub-divided into four lines; the eastern line from Innsbruck to Scharnitz, 33 km. long, is frequently referred to as the Karwendel Railway, and, like

TYPICAL VIEW, MITTENWALD RAILWAY, SHOWING POWER TRANSMISSION LINE.

the western line, 32 km. long, from Rentte to Griessen, passes through Austrian territory; between these lines comes the Scharnitz-Griessen section, which runs through Bavaria and has a length of about 40 km. This curious inter-connection of the sections lying in different countries is, of course, emphasised in the electrical equipment and the arrangement of the service.

On the Austrian sections there are 18 tunnels with a total length of 4,305 metres, one of which alone is 1,787 metres long. In addition there are numerous viaducts and bridges.

The constructional difficulties formed one of the reasons for the selection of electric traction. This, in fact, allowed the railway track to be better adapted to the nature of the ground and permitted a gradient of 36.4 per mille to be used on a large scale; the railway reaches a height of 1,185 metres above sea level at Seefeld, so that in a distance of 21.2 km. a difference of 600 metres has to be overcome. The adoption of steam traction would have necessitated the lengthening of the line by at least 4 km. just at the most difficult part, and the saving effected amounted to more than the total cost of the electrical equipment. Another factor making electric traction more economical is the cheap water power, the Tyrol occupying a still more unfavourable geographical position as regards coal supply than the adjoining country of Bavaria.

The Mittenwald Railway possesses a power station of its

own, which is situated about 6 km. to the south of Innsbruck in the vicinity of the Sill Works, and utilises the power of the Ruetzbach, a river close to the Sill.

In the Ruetz Works two 1,000-h.p. Voith-Pelton turbines have been installed for the time being, which are direct-coupled to single-phase generators with continuous outputs of 3,000 K.V.A. and maximum outputs of 4,500 K.V.A. The turbines and generators have been designed with due regard to the special conditions involved in railway operation, so that the plant cannot be endangered by heavy short-

LOCO. TRANSFORMER, WITH TANK REMOVED.

circuits or sudden alterations of load. The generators, which ran at a speed of 300 R.P.M., have six poles corresponding to the frequency of 15 cycles per second, which entails a somewhat higher cost as compared with the four-pole type, but enables the pole cores to be fixed with absolute rigidity

GENERATOR FOR THE RUETZ POWER STATION IN THE SHOPS.

to the rotor hub. The generators are wound for a pressure of 3,000 volts, and are self-ventilated, the magnet wheel being fitted with fan blades, and the stator enclosed by covers.

ROTOR FOR 800-H.P. MOTOR.

On entering the power station, one is struck by the perfectly noiseless running of the generators. The energy from each generator is led to a transformer which raises the pressure to 50,000 volts; from the point of view of the switchgear, each generator forms a separate unit with its transformer. As there are, therefore, no bus-bars or switches for 3,000 volts, extreme simplicity in switching operations is ensured.

Each transformer has the same maximum output as the generator, the continuous rating, however, is 1,800 k.v.a. The transformers are of the core type with disk windings and have oil and water cooling. The core with its windings is 23 tons in weight. Each transformer is placed in a separate fire-proof compartment provided with an effective air circulation; the 50,000-volt switchgear is also enclosed in concrete cells, so arranged that the switchroom, in the event of a breakdown, may be entered from two sides without danger. Switches are only provided on the

50,000-volt side: for the transmission line these switches are doubled.

All switches have electromagnetic remote control operated from the switchboard in the engine-room: they are fitted with automatic overload releases which can be adjusted for a time limit and are also arranged for hand operation. Lightning arresters, excess pressure dischargers and choking coils for checking short-circuits are provided.

The energy generated at the power station is carried by a 50,000-volt line to two transformer stations where it is stepped down to the contact line pressure of 15,000 volts. The transformer stations, which will also supply current to the Bavarian line pending the completion of the Walschensee Works, are situated at Reith, 19 km. from the Eastern, and at Schanz, 3.3 km. from the Western boundary of Austria.

The transmission line, which is carried mainly on the poles for the overhead contact line, consists of two wires, each having a section of 35 sq. mm. Only the connection between the power station and the railway track (about 6 km. in length) is carried on a separate line of poles.

The first important section of the 50,000-volt line is situated in a desolate district, which is difficult of access in winter; increased care was, therefore, required in its design and construction. On this account, the line in this part

consists of three wires, two of which are usually in service, the third serving as reserve to replace a defective wire.

As a protection against atmospheric discharges, a copper earthing wire is mounted above the H.T. line on the tops of the poles, and is carefully earthed to the depth of ground water at each pole. Lattice poles are employed exclusively for carrying the line, and are erected at distances of 80 metres apart; every fourth or sixth pole will stand firm, even

800-H.P. LOCO.-MOTOR ON TEST-BED.

LOCOMOTIVE AND TRAIN, MITTENWALD RAILWAY.

when the line breaks on one side, the intermediate poles being flexible. The 50,000-volt line, for the section from 8.8 km. to 16.3 km. on the Innsbruck-Scharnitz line, has also been erected on a special row of poles, the number and length of tunnels in this section being too considerable for the line to be laid out on the contact line supports.

On account of the transmission pressure of 50,000 volts, which is rather high for Continental practice, special care had to be taken in choosing a suitable type of insulator, as far at least as its mechanical strength was concerned. The overhead line follows a series of sharp curves, and the poles have to stand the jerks produced by the swift motion of the current collectors. Investigation showed that only chain-link (disk) insulators would stand this heavy stress, no part of these insulators being exposed to traction or inflection strains. The type of insulator ultimately developed by the A.E.G.-Union Co. possesses a breaking strength of 7,800 to 8,000 kg. with a weight of only 2.8 kg. Moreover, it also possesses excellent insulating qualities.

An essential difference between this insulator and those used by American engineers is that the channels are not of circular cross-section, and instead of a wire rope exposed to rusting, steel bands applied throughout their width on the porcelain (so as not to injure the enamel) are used to fix it. After fitting the insulators in position, the channels are filled in, thus preventing any water from entering and freezing within the insulator. Another distinctive feature is the flexible armature of the insulator, which absorbs all shocks, thus preventing any damage to the enamel.

Chain suspensions, without any automatic tightening devices, are used for the contact wire, which is exclusively carried by lattice poles.

The rolling stock of the Mittenwald railway at present comprises nine locomotives, each of a normal output of 800 H.P. As previously mentioned, the maximum gradient of 36.4 per mille is found extensively on this railway; each locomotive will haul over this gradient a gross train weight of 124 tons at about 30 km. per hour, which corresponds to a tractive effort of about 7,500 kg. What this performance really means will be gathered from the fact that the locomotives during several months' experimental work on the Dessau-Bitterfeld Railway hauled goods trains of 1,100 tons in schedule time over the level track.

Each locomotive, inclusive of the driver and the oil and sanding tanks has a weight of 53 tons in working order.

The current is taken off the overhead wire by two bow

collectors each having two sliding sections, and is conducted by a bare high-tension wire arranged above the roof, to a lightning arrester choking coil, and thence into a transformer room where the line is connected up to the H.T.

CONTACT LINE AT SHUNTING STATION, MITTENWALD RAILWAY.

THE RJKUAN SINGLE-PHASE RAILWAY.

ARRANGEMENT OF CONTACT LINE, SAAHEIM STATION: RJKUAN RAILWAY.

oil switch. The latter has a quadruple break, and includes an extra resistance for reducing any strain produced in switching in the transformer. From the front driver's platform the oil switch is operated directly by the switch lever; from the rear platform it is switched out by a button fed through a series resistance from the controller coil, while a lever system is used for switching in. Between the lightning arrester coil and the oil switch there is inserted a grounding

switch operated automatically as soon as the protective cap of the oil switch is removed.

The driving motor is a 12-pole single-phase commutator machine of 800 h.p. normal output, at a speed of 30 km. per hour. It is designed on the A.E.G. system, in accordance with which (contrary to directly-fed pure series motors), the

SINGLE-PHASE LOCOMOTIVE, RJKUN RAILWAY.

current in the armature is induced by transformer effects. The rotor winding is, in fact, closed by short-circuiting brushes, thus obtaining the secondary winding of a transformer, the primary winding of which is the field winding of the stator.

Excitation is effected from the rotor, current being supplied to the armature through another pair of brushes from a special exciter transformer connected up in series with the stator winding. The armature slots are nearly closed, and are arranged slanting to the direction of the axis.

Regulation of the motor speed is effected by altering the supply pressure by means of contactor switches, which are connected up to tapings of the power and exciter transformers, and are actuated by the controlling current. The controlling current is derived from a special (300-volt) coil of the power transformer.

Each of the two controllers has two separate switch-drums, one of which operates the contactor switch of the power transformer, and serves to regulate the power consumption, whereas the other operates the exciter switches, thus controlling excitation. The exciter drum moves the reverser into its proper position in a preliminary stage to "forward" and "backward" respectively. Each of the two switch-drums is entirely self-contained, so that any position of one can be combined with any position of the other, thus obtaining a minimum K.V.A. consumption for each speed of the motor.

The contactor switches are electrically interlocked by auxiliary contacts, so that the working of any one group interrupts all the remaining switch coils.

SHOWING ARRANGEMENT OF BOGIE TRUCK.

Provision is made for two locomotives to be joined up in multiple connection for hauling train weights of up to 250 tons. This arrangement allows both locomotives to be controlled by a single driver. The conductors for the motor-compressor and the lighting and heating of the locomotives are connected up to the same switchboard with the controller

circuit and are fitted with hand switches. All these circuits are fed from the 300-volt controller coil, which has a 19-volt tapping for the lighting circuit. The motor-compressor, which supplies compressed-air for the Westinghouse and Henry brakes, as well as for actuating the current collectors, sanders and signal whistles, is thrown into and out of circuit automatically.

Each of the radiators provided for heating the locomotives has an output of 1 kw. Heating sockets are provided at the ends of the locomotives for heating the train, which are connected up to the cars by coupling cables.

*The Rjukan Railway.*—This is the first standard gauge

TUNNEL ON THE RJKUN RAILWAY, NEAR NOTODDEN.

electric railway in the South of Norway to be installed on the single-phase system. It comprises two sections separated by the Tinn Lake, the northern section (from Saaheim to the Tinn Lake) being the Vestfjorddals Railway, 16 km. in length, and the southern section, about 30 km. long, the Tinnos Railway, running from Tinnoset to Notodden, along the Hitterdals Lake. A ferry across the Tinn Lake will connect the two sections.

The Rjukan Railway is mainly intended for the transport of the artificial saltpetre manufactured in Saaheim, to Notodden. Trains with a maximum trailer weight of 290 tons are drawn on the section from Notodden to Lilleherred, which has a constant gradient of about 2.7 per cent. by two locomotives, and on the remaining sections by a single locomotive.

The rolling stock comprises three four-axle, and two two-axle locomotives. The former have two bogie trucks, and are fitted with four alternating-current motors, each having an hourly rating of 125 h.p., and weighing approximately 46 tons. The two-axle locomotives have two motors of the same size, and weigh about 23 tons. The locomotives are constructed for a line pressure of 10,000 to 11,000 volts, 15 to 16 cycles, and are designed for contactor control.

The track equipment consists of a single catenary suspension overhead contact line, the distance between the poles

being about 60 metres. On some sections bracket suspension is used, while on others cross-suspension is employed. We illustrate the form of suspension adopted for the overhead line in a tunnel.

The power supply is derived from a separate converter station for each section of the line, only 50 cycles, three-phase current at a pressure of 10,000 to 11,000 volts being available; the converter station feeding the northern section is situated at Vestfjordalen, and contains two converter sets. Each of these comprises a three-phase transformer which steps down the pressure from 10,000 to 5,000 volts, and feeds an asynchronous motor driving an alternating-current generator with an output of 400 K.V.A., which supplies the line. The converter station receives its energy from the Rjukan power station, which is about 5 km. distant.

The southern section is fed from the Svalgfos converter station, which is situated in the same building as the power station and consists of three converter sets similar to those above described.

Both the railways described were equipped by the A.E.G.

## NOTES.

(Continued from page 348.)

**Wholesale Traders' Association.**—We have received a copy of the report which was adopted at the annual meeting of this Association, which watches over the interests of the hardware, furnishing and metal industries (and has an Electrical Trades Section), at Birmingham on Monday. The number of inquiries as to status of customers handled during the year was 127,846. In regard to "long firms" who are continually defrauding the trading community, it is remarked that "in most instances these frauds could be checked in their earlier stages if only victims would at once lay the circumstances before the Association and co-operate with its officers in bringing the offenders to justice." In the debt recovery department, there were placed in its hands for collection during the year 34,500 debts, amounting in all to £283,341, out of which no less than £174,873 was recovered without legal proceedings. A speciality is made of collection of debts in Scotland, Ireland, and abroad. Mr. T. Cumberland is the chairman of the Association, and Mr. C. G. Poppleton is secretary. The offices are at 26, Corporation Street, Birmingham.

**The Manchester Electro-Harmonic Society.**—We congratulate this Society on its most successful concert, held on Friday evening last. We understand that it was undoubtedly the best of the season. The large audience, something like over 300 being present, was a very gratifying feature, and further members were enrolled. The programme consisted of classical music for strings and piano, interspersed with high-class songs, while we have it on the best of authority that, perhaps, the finest item was Mr. Hamilton Harris's rendering of Schubert's "The Wanderer." Amongst the audience were Alderman Walker (vice-chairman of the Electricity Committee), Mr. Eckstein, Mr. Bruce Anderson and Councillor Westcott. In the unfortunate absence of Mr. Pearce, Mr. William Cramp took the chair, and his masterly control of the meeting assisted in a very great measure to make the success of the evening. A vote of thanks was accorded to the musical director (Mr. W. J. Smith) and Mr. J. Hill (secretary) with great acclamation. Mr. J. W. Rook (of London) proposed, and Mr. T. Cartwright (of Glasgow) seconded, a vote of thanks to the chairman, which was equally well received, and carried with musical honours. The next concert, and the last of the season, will be held on March 28th, when Mr. T. S. Sells will be in the chair.

**New Associations.**—The inaugural meeting of the Production Managers' Association was held yesterday (Thursday) evening, at the Holborn Restaurant, when, after various proceedings had been carried through relative to the formation of the association, it was intended to have a discussion, introduced by Mr. J. W. Stannard, on "American Methods *v.* British Conditions." The secretary *pro tem.* is Mr. Chas. F. Warren, of 42, Queen Anne's Chambers, S.W.

We have received a lengthy communication from Mr. J. Sutherland Warner, with reference to "The Associated Manufacturers of Tramway and Railway Material," of the Council of which he is chairman. He says that: "Having regard to the enormous annual purchases made by tramway and railway officials, and the well-known difficulties experienced in framing specifications and suitable standard clauses governing conditions of tender, acceptance and completion of contracts, those officials who act as purchasers have every right to expect of the manufacturers some authoritative expression upon standard forms of clauses, acceptable alike to both buyer and seller. In almost every industry to-day the work of association for the concrete expression of views is being performed." The writer states that it is only by a recognised association that such work as the settlement of acceptable standard clauses, &c., can be arranged for and maintained, and occasional special

references on extraordinary points receive representative consideration leading to smooth working, and the avoidance of disputes.

"The subject of exhibitions, their support and encouragement, will receive consideration from time to time.

"Exhibitions, for the manufacturer, invariably involve a very appreciable burden of direct expenditure, not alone in money, but of time and energies, usually of their most able officials; so that however beneficial exhibition gatherings may be to buyer or to seller, there is a limit beyond which the disadvantages outweigh the good which the industry may effectively derive. Furthermore, many of the large International Exhibitions are a comparatively worthless burden upon manufacturers of tramway and railway material, and it is necessary that the decision of the Association should be issued advising manufacturers whether to partake in any particular exhibition or not. The Council having been influenced by the fact that manufacturers other than British do actually take their part in the supplies of tramway and railway material purchased in Great Britain, they have decided to admit to the Association, and thereby control, foreign manufacturers. The Council have noted with admiration the well-recognised work of the British Electrical and Allied Manufacturers' Association, to whom they will probably look, not without avail, for advice and assistance in relation to the particular electrical specialities enumerated in the publications of that Association; but in regard particularly to the enormous quantities and kinds of manufacture for tramways and railways other than electrical, it is felt that a purely British policy would be narrow to a decidedly detrimental degree. 'An examination of the lists of membership of Associations which are avowedly "British" reveals the prominent position taken by members who can by no proper construction be lending their aid out of an enthusiasm for the British, unless it be taken to mean the British buyer.'"

We learn that many influential manufacturers are already members; the subscription is £2 2s. annually, and further particulars may be obtained from Mr. Wm. Hopkins, Hon. Sec. of the Association, Westminster Palace Hotel, Westminster, S.W.

**A Siemens Concert.**—The directors and staff of Messrs. Siemens Brothers & Co., Ltd., and Siemens Bros. Dynamo Works, Ltd., are holding a smoking concert in the King's Hall, Holborn Restaurant, on Wednesday, March 19th, at 7 p.m. Mr. Alexander Siemens will be in the chair. The artists are as follows:—Mr. Harry Gooding's Imperial Orchestra; Miss Annie Bartle, Miss Olive Fox, Mr. Ivor Walters, Mr. Thomas Howell, Mr. Will Edwards, Mr. Ernest Hastings, Mr. J. P. Ling, Mr. Jock Walker and Mr. Mansell Stevens. Mr. George Lakeman, of the "Owls" Musical Society, is honorary musical director. From the foregoing it will be obvious that the evening should be a most enjoyable one. With feelings of regret, be it stated, the stern necessities of editorial life will compel us at the hour of King's Hall to be correcting proofs while the printer's representative waits imperiously at our elbow. However, may there be a good time for everybody, and if we can by any chance escape the printer's leash, we'll be there.

**Educational Notes.**—SOUTH-WESTERN POLYTECHNIC INSTITUTE, CHELSEA.—Sir C. Alfred Cripps, K.C.V.O., will present prizes and certificates to students of evening classes and day College on March 14th, at 8 p.m. The laboratories and workshops, including the new building, will be open to public inspection at about 9.15 p.m.

**Appointments Vacant.**—Fire wire lineman, for the Leyton U.D.C. (32s.); rolling stock and works superintendent, for the Liverpool Corporation Tramways (£350); correspondence clerk for the Corporation Electricity and Tramways Department (Swindon) (£58 10s.) See our advertisement pages in this issue.

The Newcastle-upon-Tyne Electric Supply Co., Ltd., are now advertising vacancies for junior assistant engineers, and the pay for the first year has been increased by 5s. per week, making the terms now 15s. per week for the first year and 20s. per week for the second year. The area of supply of the Newcastle-upon-Tyne Electric Supply Co., Ltd., and its associated companies, now covers about 700 square miles. At the present time large extensions are taking place.

**Inquiry.**—The makers of the "Oldham" coupling are asked for.

**Business Announcement.**—THE BRITISH THOMSON-HOUSTON CO., LTD., announce that the telephone numbers of their Birmingham branch office have been altered from "1016 Midland" to "Midland 2401 and 2402."

**Profit Sharing and the Workman.**—One of the greatest difficulties in dealing with workmen, says a correspondent, is the curious and multifarious complexity of the minds of working men. "Those who have had much to do with this branch of the human family will agree that there are peculiar modes of thought. One of the particularly curious cases which came directly under the writer's notice was that of one of his own men, who had been at one time a soldier in India. He could, amongst other things, set bricks in cement mortar as well as a regular bricklayer, and would do so to get his employer out of the hands of the Union on such few minor jobs as came along necessitating any brickwork. But he could set, or did set, many times more bricks per day than the Trade Union bricklayer would, or could. His regular wage was 35s. per week, and his work was of a special kind, which has usually been done by men of the labouring class who have shown special aptitude, and have drifted into the work more or less casually. The rate at which the man worked was very much less than what he could easily manage, and, con-

vinced that more work could easily be done, the same man was promised one penny per unit for every unit he did. This was to be additional to his wages, which still remained at 35s. even if no units of work were accomplished, as might happen if a breakdown occurred. The first week on the new system showed 48 units of work done, and the man received 39s. The next week only 24 units were done, owing to some special difficulty. His pay was, therefore, 37s. This began the trouble. He had "been done out of 2s." and was miserable and discontented, and declared he would have no more of it, but would go back to his regular pay of 35s., and would not have any bonus. Now, in two weeks he had averaged over 8 per cent. additional pay, and he was upset by it. He could not stand an irregular rate of pay, though he was never to have less than his old 35s. It seems incomprehensible, but the above are the facts, and there was nothing said to the man to cause discontent.

"The same man having one week to receive 39s. 11d. for wages and certain expenses was given a couple of sovereigns, and asked for the change of 1d. Nothing could get it from him. He could not give back a penny without feeling injured; and when it was pressed for, he finally parted with a curious bit of elliptical copper bar bearing an Indian device, and collected by him years before. This is still in the writer's possession, and serves as a reminder of what a workman will do.

"Recently a man came literally begging for a job. He was given one. By luck he got another job before the next day, when he was to have made a start. He did not even inform the man who had given him the first job, but left him to find it out by not turning up to the job. Thus, the employer was left in the lurch. The same man, only a few days ago, was begging again for a job from the very man he had served so badly.

"Thus, these two men afford three instances of the workman's ways of thought, and probably every employer could add numbers of cases equally curious and puzzling. Schemes for profit sharing only upset great numbers of the men to whom they are offered, and are better left alone. Many men on receiving a bonus will go and spend it forthwith on a fiery fuddle, and then curse the man who has brought them to this state by disturbing the regular stream of wage-earning life. When sober again they will curse their careful fellowmen who have saved the bonus. Now, the Trade Unions appear to be dominated by men of a curious twist of mind, and the fairest systems of profit sharing stand a poor chance of success. One would like to know how Sir Geo. Livesey succeeded.

"Piecework, of course, will not always answer, for it is too usual to cut the price when a man earns "too much." As part of this question, the writer has been informed on credible authority that there is a black list system in nearly every town, and men against whom there is no real fault to be found, will be driven out of the town by this black listing. It is more particularly rife in the machine-tool shops."

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Appreciative reference was made last week by the Mayor of Darwen (Mr. Fritz Hindle) to the work of MR. BOYCE, the assistant electrical engineer, who is about to leave the town to take up the management of the electricity works at Todmorden.

MR. PERCY TAYLOR will be appointed to succeed MR. JOSEPH BOYCE (now of Todmorden) as chief assistant engineer at the Darwen Electricity Works. Mr. Taylor has been a member of the works staff for some years.

MR. J. D. SPARK, assistant mains superintendent at the Croydon Electricity Works, has been appointed mains superintendent to the Swansea Corporation Electricity Department.

On Friday, February 14th, the staff at the St. Pancras Borough Electricity Works presented to MR. W. E. RUSSELL, shift engineer, an engraved silver cigarette case, on his leaving to take up the position of shift engineer at the Davies Street station of the Westminster Electric Supply Corporation.

MR. H. T. BATES, resident engineer at Sutton (Surrey) to the South Metropolitan Electric Tramways and Lighting Co., who has been appointed resident manager to the Rotheay Tramway Co., has been presented by his colleagues with a marble clock.

MR. J. PHILLIP, assistant manager of the Fife Electric Power Co. at Dunfermline, has received an important appointment under the Derby and Nottingham Power Co. He went to Dunfermline from Dundee.

On the occasion of his leaving to take up the post of senior switchboard attendant at Salford Corporation, MR. S. R. HOWARD, of the Kilmarnock Electricity Works staff, was on February 12th presented by the members of the staff with a Masonic seal and travelling bag. Mr. W. C. Bexon, chief engineer, made the presentation, referring to Mr. Howard's long connection with the works. On February 22nd MR. D. SINCLAIR, accounts clerk, was presented with a set of books and a fountain pen, on the occasion of his leaving Kilmarnock to take up a better position at the Workop U.D.C. Electricity Works. Mr. Bexon also made this presentation, and said he was sorry to lose Mr. Sinclair's services. Mr. Sinclair has been in the Kilmarnock offices for the past five and a-half years.

**Tramway Officials.**—The L.C.C. Highways Committee recommends the following annual revisions of tramways department staff:—MR. J. TERRY, district traffic superintendent, increase from £325 to £350 a year; MR. R. E. FARRIDGE, assistant accountant, increase from £325 to £350 a year; the salary (£140) of MR. T. R. IERLAND, assistant in Section (a) of the fourth class in the tramways department, is to be increased to £150 a year. Special duty pay is to be granted to MR. H. VOULEY, accountant (£52 10s.), and MR. H. HOLLAND, assistant in the first class (£10).

**General.**—MR. STAFFORD SINCLAIR has relinquished the Scottish representation and management of Messrs. Ward & Goldstone, and for the present all correspondence should be addressed care of the Ideal Electrical Co., 26, Alexandra Park Street, Glasgow. He will shortly take up the representation of a well-known manufacturer, and will be back at 50, Wellington Street, Glasgow.

On February 20th, a dinner was given to MR. WALTER FINLAY, W.S., by the electrical trade of the City of Edinburgh. Mr. Alex. Pratt, vice-president of the Electrical Contractors' Association of Scotland, was in the chair. Presidents of several allied trade associations were present. The toasts included "The Corporation of the City of Edinburgh," proposed by Mr. Basil A. Pilkington, and responded to by Councillor F. J. Robertson; "Our Guest," proposed by Mr. Geo. Wishart, and, of course, replied to by Mr. Finlay; "The Electrical Trade," proposed by Mr. R. K. Hill, and replied to by Mr. Thomas Wright; "Kindred Associations," proposed by Mr. J. Plunkett and responded to by Mr. Peter Dick; and "The Chairman," moved by Mr. R. Graham. About 50 gentlemen were present, and during the evening a presentation was made to Mr. Finlay in recognition of his services to the Association. In the course of some of the speeches, a hope was expressed that there was a good time coming, when the Edinburgh Corporation would help rather than hinder the efforts of local firms.

MR. C. H. GASSON has recently left the firm of Messrs. Siemens Bros. Dynamo Works, Ltd., Dalston, and is now representing the Imperial Lighting Co.

## NEW COMPANIES REGISTERED.

**International Telephone Co., Ltd.** (127,301).—Registered February 20th, by W. E. Hart, 3, Mincing Lane, E.C. Capital £100, in £1 shares. Objects: To acquire in any part of the world any concessions, grants, decrees, rights, powers, and privileges, for the construction and working of a telephone system or systems, to establish, control and regulate telephones and works for the supply of electric light, heat and motive power, to transmit and facilitate the transmission of telephonic and telegraphic communications and messages, &c., provided that no telephonic or telegraphic business within the exclusive privilege conferred upon the Postmaster-General by the Telephone Acts shall be carried on in the United Kingdom without his previous licence or consent. The signatories (with one share each) are:—A. H. Harris, 55, Brookville Road, Waltham Green, S.W.; clerk; J. A. Hewitt, 180, Trundley Road, Deptford, S.E.; clerk; A. E. Hurdle, 32, Cromorne Road, Cheyne Walk, S.W.; clerk; A. Morrison, 21, Duckett Road, Harringay, N.; clerk; R. J. Cocks, 37, Littlehall Road, Clapham, S.W.; clerk; H. Foyle, 21, Belhurst Road, South Norwood, S.E., cashier; H. E. West, 19, Kay Road, Stockwell, S.W., clerk. Registered without articles of association. The first directors are G. Franklin and J. E. Kingsbury.

**Scott's Starter Syndicate, Ltd.** (127,256).—This company was registered on February 18th, with a capital of £5,070 in £1 shares (5,000 preference) to acquire the benefit of certain existing inventions, and to accept agreements (1) with Laurence, Scott & Co., Ltd., and Wm. H. Scott and (2) with Laurence, Scott & Co., Ltd., relating to the manufacture of electric starters. The subscribers (with one preference share each) are:—W. H. Scott, Oaklands, Thorpe St. Andrews, Norfolk, engineer; G. N. Cornwallis Mann, Roselands, Althorpe Road, Norwich, engineer; F. W. Doggett, Hill House, Hetherst, Norfolk, engineer. Private company. The number of directors is not to be less than two or more than five; the first are Wm. H. Scott, G. N. Cornwallis Mann, F. W. Doggett, and E. Cozens-Fardy, Laurence, Scott & Co., Ltd., may, while holding 50 shares, appoint a director, in place of E. Cozens-Fardy; qualification, 50 shares. Registered office, Gothio Works, Thorpe, Norwich.

**Kine Appliances and Repairs, Ltd.** (127,323).—This company was registered on February 21st, with a capital of £1,000 in £1 shares to carry on the business of manufacturers of and dealers in photographic, cinematographic projection and scientific apparatus and requisites, electric lamps, &c. The subscribers (with one share each) are:—B. S. Dunning, 45, St. George's Square, S.W., gentleman; A. B. Allen, 20, Endell Street, W.C., instrument maker. Private company. The number of directors is not to be less than two or more than three; the first are B. S. Dunning, A. B. Allen and W. Smith (all permanent); qualification, £10. Registered by F. B. Smith, 17, Burrey Street, W.C.

**Cremer Lamp and Engineering Co., Ltd.** (127,273).—This company was registered on February 19th, with a capital of £3,000 in 25 shares to carry on the business indicated by the title. The subscribers (with one share each) are:—R. Cremer, Highfield, Mootown, Leeds, mining engineer; J. M. Servaes, 13, Rumlford Place, Liverpool, merchant; R. L. P. Bell, 79, St. George's Place, Glasgow, iron and steel merchant. Private company. The number of directors is not to be less than two or more than five; the first are R. Cremer, J. M. Servaes and R. L. P. Bell. Registered by Jordao & Sons, Ltd., 116-117, Chancery Lane, W.C.

**Lux Lamp and Engineering Co., of Glasgow, Ltd.** (8,543).—This company was registered in Edinburgh on February 14th, with a capital of £2,000 in £1 shares to carry on the business of lighting, heating and heating engineers. The subscribers (with one share each) are:—A. H. Schow, 27, Renfrew Street, Glasgow, merchant; J. H. Broadfoot, 27, Renfrew Street, Glasgow, engineer. Private company. The number of directors is not to be less than three or more than seven; the first are A. H. Schow and J. R. Broadfoot. Registered office, 27, Renfrew Street, Glasgow.

**De Coster & Co., Ltd.** (127,343).—This company was registered on February 22nd, with a capital of £500 in £1 shares (200 preference), to carry on the business of electrical, gas, hot water and general engineers, smiths and machinists, makers and patentees of and dealers in electrical, gas and hot water machinery and appliances, &c. The subscribers (with one share each) are:—J. F. de Coster, 8, Elm Grove, Cricklewood, N.W., electrical engineer; Louisa A. de Coster, 120, Boundary Road, St. John's Wood, N.W., draper; C. de Coster, 951, Fulham Road, S.W., draper. Private company. The number of directors is not to be less than two or more than three; the first are J. F. de Coster and C. de Coster; qualification, one share. Registered by Scott-Lawson & Palmer, 22, Essex Street, Strand, W.C.

**Smith Electrical Co., Ltd.** (127,353).—This company was registered on February 22nd, with a capital of £1,000 in £1 shares, to carry on the business of electrical, mechanical and general engineers and merchants, cable makers and contractors, &c. The subscribers (with one share each) are: J. H. Smith, 10, Rose Mount Terrace, Kelghley, electrician; F. W. Dowhirst, The Limes, Kelghley, solicitor. Private company. Table "A" mainly applies. Registered office, 7, Cavendish Street, Kelghley.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Westinghouse Cooper-Hewitt Co., Ltd.** (89,947).—Capital £80,000 in £1 shares. Return dated December 10th, 1912. 10,000 shares taken up. 5s. per share called up. £2,500 paid. Mortgages and charges: Nil.

**Pontelec Welding Patents, Ltd.** (107,735).—Capital, £30,000, in £1 shares (20,000 ord. and 10,000 pref.). Return dated January 13th, 1913. 20,000 ord. and 5,000 pref. shares taken up. £5,000 paid on the pref. £20,000 considered as paid on the ord. Mortgages and charges: £1,800.

**Salerno Syndicate, Ltd.** (111,301).—Capital, £8,300, in 4,000 first series "A" and 4,000 second series "A" shares of £1 each, and 6,000 "B" shares of 1s. each. Return dated January 13th, 1913 (filed January 23rd), 1,480 first series "A" and 6,000 "B" shares taken up. £1 per share called up on 1,430 first series "A," 1s. per share on 640 "B," and 6d. per share on 5,460 "B." Mortgages and charges: Nil.

**Traffic Indicators, Ltd.** (107,237).—Return dated January 14th, 1913. Capital, £7,500 in £1 shares, 4,750 shares taken up, £500 paid, £4,250 considered as paid. Mortgages and charges: Nil.

**Corona Lamp Works, Ltd.**—Issue on February 5th, 1913, of £4,050 debentures, part of a series of which particulars have already been filed.

**Foster Engineering Co., Ltd.**—Issue on February 14th, 1913, of £2,000 debentures, part of a series of which particulars have already been filed.

**X.L. Electric Co., Ltd.**—Debentures dated February 8th, 1913, to secure £300, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Capt. C. Wiener, Ewell Castle, Ewell, Surrey.

**Insulators, Ltd.**—Particulars of £300 debenture, created by resolutions of December 6th, 1912, and February 3rd, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's property, present and future, including uncalled capital. No trustees.

**Electrical Distribution of Yorkshire, Ltd.**—Mortgage on company's undertakings, authorised by Provisional Orders granted under Electric Lighting Act 1882 to 1909, and its other assets, including uncalled capital, dated February 17th, 1913, to secure all moneys due or to become due from the company to Barclay & Co., Ltd., 54, Lombard Street, E.C., not exceeding £5,000.

## CITY NOTES.

### Mansfield and District Tramways, Ltd.

MR. A. R. HOLLAND presided on 17th inst. at the meeting held at Mansfield. The directors, he said, had recommended an increase of 1 per cent. in the dividend, making 5 per cent. in all. Last year could not be fairly considered a normal year, for in the early part they were face to face with terrible labour troubles, and the disastrous coal strike must have affected to a great extent many of the people who would otherwise have patronised the tramways. In spite of this the company had not only held their own, but had done a little better. According to their manager's calculation, the coal strike had, however, lost the company in net profit certainly £1,000. A tramway service must be kept running whether the receipts went up or down. The traffic receipts during the year showed the slight increase of £640, which would doubtless have been much larger but for the strike. They had spent £2,393 on repairs and maintenance, and the depreciation account had been increased by £200, making £1,400 in all. The traffic expenses were slightly in excess of those of 1911, and power alone had cost £3,084. All sections of the system continued to show a fair development, and given freedom from serious labour troubles, coupled with the development of the great natural resources of the district, there was no reason whatever why the system should not continue to enjoy a steady measure of success. In 1912 the cars ran over 500,000 miles, and carried 3½ million ordinary passengers and nearly 700,000 workpeople.

MR. A. H. BEATTY seconded the adoption of the report.

### Westminster Electric Supply Corporation, Ltd.

MR. J. BROWNE MARTIN presided on Wednesday at the offices, Eccleston Street, Belgravia, S.W., over the annual meeting of this company.

In moving the adoption of the report (see ELEC. REV., page 314), the CHAIRMAN said they must expect him to give them some idea of the work of the company and of the outlook for the next few years. They had a thoroughly sound and growing business, new lines were constantly opening out, and it was their aim to

foster these in every way. For instance, the increase in the cost of petrol had turned some people's thoughts towards electric vehicles, and it was possible they might hear more of these before long. If so, they were ready to do their part. They were one of the earliest undertakings to realise that electric cooking was bound to supersede older methods. There were already a fair number of stoves in use, many others were proposed, and they were now making arrangements to hire out cooking ranges, and maintain them. But they did not confine themselves merely to encouraging new developments; they also supported the efforts which were being made to improve the older methods of utilising electricity. Their showroom had been open since May, 1910, and had been of great assistance to them in getting new business by giving consumers an opportunity of seeing for themselves the new apparatus which they wished to bring to their notice. They would see a system of lighting in that room, and downstairs in the showroom others might be inspected. In place of direct lighting, reflecting or semi-reflecting bowls were now being used which got rid of shadows and gave a much more pleasing effect for a small increase in cost. Heating by electricity was becoming better known, and was more used. There were new types of heating stoves which were more effective and pleasing than the older makes, and they might see the best of them in the showroom. Electric lifts were now considered almost as a necessity in large houses, and as regarded electric power, the gas and steam engines in their area were slowly but surely being supplanted by electricity. The old argument that "electricity is too expensive" had completely died out now that the metal lamp had been introduced, and he was sure they might be satisfied they were keeping abreast of the times and that they might anticipate continued and increased prosperity. They would see from the accounts that the receipts for the year showed an increase of £900 and the costs a decrease of £1,100. They were thus £2,000 to the good in their trading as compared with 1911. They should have done better had it not been for the coal strike a year ago, which cost them nearly £3,000, and for the subsequent rise in the price of coal, which amounted, on the average, over the various qualities they used, to about 15 per cent.

THE RT. HON. W. HAYES FISHER, M.P., seconded the motion.

MR. W. J. FISHER asked how the company stood with regard to the Special Committee appointed by the London County Council on the electric lighting undertakings. Had they been called on to give evidence, or was the Committee doing anything which the shareholders might advantageously know?

MR. W. HAYES FISHER said the company had been asked to give evidence, and had done so; but the present London County Council came to an end on March 6th, and the Special Committee had reported, merely advising that it should be reappointed by the new Council to continue its deliberations, which must occupy a considerable period.

MR. W. J. FISHER: At present they are only deliberating, and have not outlined any scheme?

MR. HAYES FISHER: None whatever in their report.

The report was then adopted.

THE CHAIRMAN, in reply to a question, said the coal situation was in a much happier position than it was a year ago. He could not say anything very definite about it, because these things varied from time to time, but they felt much more confident than they did a year ago.

**Yorkshire Electric Power Co.**—This company held its half-yearly meeting, on 18th inst., at Leeds. In referring to the report (see ELECTRICAL REVIEW, page 229), the chairman (according to the *Financial News*), said that the expenditure during 1912 on capital account (£53,036) had been made principally in strengthening the system of the company and in providing generating plant to meet the increasing demands for current, rather than upon new mains in search of customers. In spite of this conservative policy there had been an increase of 25 per cent. in the sale of current, the revenue from which had risen from £34,269 in 1911 to £43,480 in 1912. Under ordinary conditions this would have resulted in a satisfactory margin of profit; but the coal strike of March last and the abnormal conditions under which their business had been carried on in the latter half of the year, owing to the large turbine being out of commission, had so raised the works costs as to absorb the profit which the directors should otherwise have hoped to put before the meeting.

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in and to grant a quotation to:—

Mexico Tramways Co.—Further issue of \$9,512,600 common stock, in shares of \$100 each.

Tilling (Thomas), Ltd.—£200,000 5½ per cent. cumulative participating convertible income debenture stock.

Toronto Power Co., Ltd.—Scrip, fully and partly paid, for a further issue of £616,438 4½ per cent. consolidated guaranteed debenture stock.

And to allow the following securities to be quoted in the Official List:—

Adelaide Electric Supply Co., Ltd.—£25,000 additional 5 per cent. debenture stock.

Birmingham District Power and Traction Co., Ltd.—£51,433 additional 4½ per cent. first debenture stock.

**Mirrlees Watson & Co., Ltd.**—The *Times* reports that the directors announce a dividend of 10 per cent. and a bonus of 5 per cent., less tax—the same as a year ago.

**Bristol Tramways and Carriage Co., Ltd.**—Sir George White presided at the annual meeting held at Bristol on 19th inst., and the report, as already published, was adopted.

### Underground Electric Railways Co. of London, Ltd.

The half-yearly meeting was held on Monday, at Westminster Palace Hotel, S.W., Sir Edgar Speyer, Bart., presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 269), said it was again his pleasure to point to further considerable progress made during the half-year. The important events during that period—viz., the acquisition of a controlling interest in the Central London, and City and South London Railways, and the consolidation of the interests of the London United Tramways, Ltd., and the Metropolitan Electric Tramways Co., Ltd.—and the public statement he then made with regard to these developments, were of so recent a date that he had little to add to what he then said. All these schemes had since been satisfactorily carried through, and it remained now to develop and co-ordinate that great system of railways, tramways, and motor-buses, which force of circumstances more than anything else had brought and welded together. He could only repeat and emphasise that in their opinion the only hope for the shareholders to get a return on their capital, and for the travelling public to get the best possible service, lay in the combination of these various transport agencies which ministered to the transit requirements of London. The fear had been expressed in some quarters that the concentration of the transport facilities of London would tend towards an increase in fares and a reduction in service. His reply to this suggestion was that a true safeguard against any possible abuse was to be found in the fact that the interests of the shareholders and the travelling public were identical. There was a second and not less important reason for their policy of concentration, and that was that large sums of money would be required from time to time for extensions and improvements to the system, and it was easier, and probably cheaper, to raise these amounts with the combined credit of all the companies than by individual effort alone; and this was all the more emphasised if it was borne in mind how poor the return on the capital invested in all the underground lines of London still was. The capital so invested amounted to the huge sum of nearly £60,000,000, on which the return to-day was 2½ per cent. This was for the entire underground railways, including the Metropolitan and the Great Northern and City Railways, which did not belong to their system. If they took their own railways the result was practically the same. On the District it was only 2½ per cent., on the London Electric 2½ per cent., on the City and South London 2½ per cent., on the Central London 3½ per cent.—in the aggregate only 2½ per cent. The yield on the cost of the company's holdings of London Electric ordinary shares which it had received for construction, and of those District second preference and ordinary stocks which it had received for electrification, was only 1½ per cent. and 1½ per cent. respectively. The total capital of all the companies now identified with the company was £48,550,000, divided as follows:—Railways, £39,700,000; tramways, £5,700,000; omnibuses, £3,150,000. The total mileage was 520, made up of 60 miles of underground railways, 112 miles of tramways, and 348 miles of omnibus routes. For the year ending December 31st, 1912, the combined undertakings carried a total of 893,000,000 passengers, of which the railways carried 247,000,000, tramways 153,000,000, and the omnibuses 193,000,000. The combined properties employed a staff of nearly 25,000 men. Regarding the various companies comprised in the system, he could only refer them to the speeches of the respective chairmen which had been made at their recent shareholders' meetings. He could summarise the situation by saying that they showed continued progress and gave good hope for the future. The railways showed consistent improvement, and with the completion of the various extensions now under construction—namely, Paddington, Charing Cross and Queen's Park—this progress should be more marked in the future. With regard to the City and South London Railway, they could not hope for much better showings until the tunnels had been enlarged and the train service modernised. This would take at least two years after the necessary Parliamentary powers had been obtained. The Central London Railway was benefiting from its Liverpool Street extension, and when the Ealing extension was opened further increases in earnings should be shown. These factors, together with various economies which it was hoped could be effected, should substantially reduce the apparent deficiency upon the guaranteed stock. The fusion of the interests of the London United Tramways and Metropolitan Electric Tramways and the motor-bus service, which would be run in conjunction with them, should prove a source of considerable profit to the London and Suburban Traction Co., Ltd., although the best results would not be obtained until the full number of new buses was running. The chairman of the London General Omnibus Co., in his speech, mentioned the considerable increase of the fleet and the inauguration of new routes, which it took some time to develop. It was, therefore, natural that the earnings per bus in the interim should show a decrease, for it took time for the new routes to become remunerative. But there was nothing discouraging in this. On the contrary, the business stood on a very sound basis. Reference was made in the report to the Parliamentary Bills which had been promoted by the various railways. The schemes embodied in these Bills, if sanctioned by Parliament, would greatly add to the travelling facilities of London. The City and South London Railway Co.'s Bill sought power to enlarge its tunnels to a diameter similar to that of the other tube railways. The scheme was of special importance, and involved engineering problems of considerable magnitude. The widening of the tunnels would enable the company to use rolling stock of modern design, and thereby greatly increase its capacity and efficiency. The London Electric Railway Co.'s Bill provided for a physical junction with the City and South London Railway at Euston, so as to give a through service of trains

from the North to the South of London *via* the City. It also provided for a physical junction with the London and South-Western Railway at Hammersmith. This was for the purpose of running a through service of trains to Richmond. The Central London Railway Co.'s Bill provided for an extension from Shepherd's Bush to Gunnersbury. This extension would serve a thickly-populated district, and should improve the company's position. The District Railway Co.'s Bill provided for a widening of a section of the Putney line, which would considerably add to its facilities and assist in dealing with its rapidly growing traffic. Powers were also sought to enter into agreements with the Wimbledon and Sutton Railway. The Metropolitan Electric Tramways, Ltd., in which the company now had an interest through their holdings of the shares of the London Suburban Traction Co., was promoting a Bill to provide for railless traction on certain routes in the urban districts of Wood Green, Tottenham, and Walthamstow, for the purpose of connecting with the Walthamstow tramway system. A word of explanation regarding the Associated Equipment Co. might not be out of place. The share capital amounted to £500,000, all of which was owned by the company. As stated in the report, the company owned large works at Walthamstow. It also owned the Metropolitan Steam Omnibus Co., which was now running a fleet of 100 modern petrol buses. The works at Walthamstow were of modern design, and completely equipped for the manufacture of chassis, and also for certain repair parts required by the several companies, and all indications were that they would be fully occupied. The revenue from this company should prove a source of continuing profit to the company. The revenue accounts showed total receipts of £279,220, as against £156,549 for the corresponding half-year of 1911. The latter item, however, included £15,918 income from the operation of the power house then owned by the company. Deducting this item there remained an increase of £163,589, of which £154,540 was due to the income from the company's holdings in London General Omnibus ordinary shares and Associated Equipment Co. shares acquired in 1912. The net revenue, including a balance of £2,676 brought forward, but before providing interest on income bonds, was £198,480, a gain of £144,465 over the corresponding figure for 1911. This increase enabled the company to pay for the first time the full interest on the 6 per cent. income bonds of 1913, carrying forward a balance of £2,996. This compared with 2 per cent. per annum paid on the income bonds outstanding at December 31st, 1911. The total net revenue available for distribution amongst the income bondholders for the whole year of 1912 was £328,251, as compared with £93,511 in 1911, and the rate of interest paid on the income bonds in the two years was 5 per cent. and 1½ per cent. respectively. He thought he was justified in congratulating the security holders on the fact that they were for the first time in their history paying the full interest upon the 6 per cent. income bonds. This had been accomplished notwithstanding the conservative financial policy pursued by the various enterprises under the company's control. They were all making full provision for depreciation and reserve, and were in a sound financial condition, and he need hardly add that they should not have paid the full rate unless they felt reasonably certain of maintaining this distribution. They had made very rapid strides in the last few years, and he did not think he was going too far if he expressed the hope that the shareholders would, before long, begin to receive some return on their capital after having patiently waited so long.

LORD GEORGE HAMILTON seconded the motion, and the report was adopted without discussion.

**National Electric Supply Co., Ltd.**—At the annual meeting held in Preston, last week, Mr. John Booth, chairman, in moving the adoption of the report, said there was a substantial increase in the profits, and the prospects were brighter than for several years past. Prices of coal had increased since the strike, and they were paying 40 per cent. more than a few years ago. Regarding taxes, they were the most highly rated electric lighting company in the kingdom. They appealed, and, after a long fight, agreed to a compromise, the result of which was a reduction of about 15 per cent. On the credit side they had about £500 more for lighting, and about £1,000 more for power, notwithstanding the increased use of the more economical metallic-filament lamps. The net result was a profit of £14,017, which was £1,243 more than last year. They were getting new consumers, and they now had more than made up for the loss of revenue caused by the metallic lamps. Dividends at 4 per cent. for the year on preference shares, and 4s. 6d. per share on the ordinary shares for the half-year, making 7s. 6d. per share for the year, also £1 7s. 2d. per share on the founders' shares, were declared.

**The Bastian Meter Co., Ltd.**—In their report for the year ending December 31st, 1912, the directors show a slight improvement in the trading results as compared with the previous year. The sum of £600 having been written off patents and goodwill, the net amount of profit for the past year as shown in the balance-sheet is £276, plus £587 brought forward, making £863. The directors recommend the payment of the 6 per cent. dividend on the cumulative preference shares, amounting to £121, and also a 4 per cent. dividend on the ordinary shares amounting to £397 for the year, absorbing £517, leaving £345 to be carried forward.

**Calcutta Electric Supply Corporation, Ltd.**—The number of units delivered to consumers during the five weeks ended January 31st, 1913, amounted to 1,021,662, compared with 857,647 units in the corresponding five weeks of 1912.

## Charling Cross, West End and City Electricity Supply Co., Ltd.

THE directors' report for 1912 first expresses regret at the death on the 18th inst. of Mr. H. C. Pulley, who joined the board as recently as 1910. The result of the year's working has been very satisfactory.

**West End Undertakings.**—The gross earnings of these undertakings from sales of current, rents, &c., were £146,676 in 1912, as compared with £140,922 in 1911; the expenses, excluding depreciation, were £66,686, as compared with £69,408; and the net earnings were £79,990, as compared with £71,514. After bringing in the balance of £15,919 from 1911, and £1,915 for interest accrued in 1912, paying interest on the debenture stock, and making £15,000 provision for depreciation as against £11,000 last year, there is a balance on net revenue account of £65,054, out of which have been paid the dividend for the year on the preference shares, amounting to £18,000, and an interim dividend for the first half-year at the rate of 5 per cent. per annum on the ordinary shares, amounting to £10,000, leaving a balance to be dealt with of £37,054. The directors recommend that a final dividend be paid on the ordinary shares for the second half-year at the rate of 5 per cent. per annum, making 5 per cent. for the whole year, absorbing £10,000; that there be carried to general reserve (income) account £9,054; carrying forward £18,000, as against £15,949 last year. The company has now connected to its West-end mains a total equivalent of 687,593 8 c.p. (30-watt) lamps. The total is made up as follows: 452,092 in lighting, 26,066 in heating, and 209,435 (8,406 H.P.) in motive power.

**City Undertaking.**—The gross earnings of this undertaking from sales of current, rents, &c., were £148,513 in 1912, as compared with £145,062 in 1911; the expenses were £81,959, as compared with £84,356; and the net earnings were £66,554, as compared with £60,716. After bringing in the balance of £36,158 from 1911, and paying interest on the debenture stock, loans and advances, there is shown a balance on net revenue account of £68,821, out of which has been paid the dividend on the preference shares amounting to £18,000, leaving £50,821, as compared with £36,158. The directors have transferred £32,821 to general reserve (income) account, and propose to carry forward £18,000. The company has now connected to its City mains the total equivalent of 651,488 8-c.p. (or 30-watt) lamps. The total includes 312,947 in lighting, 47,610 in heating, and 290,931 (11,701 H.P.) in motive power.

The chief engineer certifies that the plant and machinery at the several stations of the company have been maintained in a high state of efficiency.

The annual meeting is called for March 4th, at the offices.

## Bath Electric Tramways, Ltd.

THE annual report for the year ended December 31st, 1912, states that the traffic and other receipts show an increase of £2,164. Owing to the coal strike, the greatest rise in the price of petrol, as well as the advance in price of all materials, the benefit of the additional traffic has been more than absorbed. The following are the earnings for the past five years:—1908, £38,395; 1909, £40,136; 1910, £42,372; 1911, £43,834; 1912, £45,998. The traffic receipts for the first six weeks of 1913 show an increase of £303, compared with those of 1912. During the year certain special repairs and alterations have been effected, principally in the improvement of the fleet of motor vehicles, while four new torpedo-type cars have been purchased and brought into service. The above expenditure amounted to £3,772, which has been reduced to £1,772 by the appropriation of the reserve for depreciation (£2,000), shown in last year's accounts, is not directly applicable to the year 1912, but has been charged against the accumulated revenue of previous years, thus providing for depreciation in a most effective form. The foundry acquired by the company, and referred to in former reports, has been improved by the addition of certain extra plants, and has given excellent results. After charging the expenses of operation and administration for the year ended December 31st, 1912, there remains a balance of £14,649, to which is added the amount brought forward after deducting £1,772 net expenditure referred to above £8,366, making a total of £23,015. From this is to be deducted interest on the 4½ per cent. first mortgage debenture stock paid and accrued to date, £8,973; fourth instalment of sinking fund for the first mortgage debentures, £1,000; interest on loans, £1,085; dividend on preference shares for the year to December 31st, 1912, paid July 1st, 1912, and January 1st, 1913, £3,750, a total of £11,809, leaving a net amount of £11,207. Of this there has been appropriated for contingencies and renewals account £8,000, leaving a balance of £3,207, which the directors recommend should be carried forward pending the completion of arrangements which are being made for meeting the loan standing in the balance-sheet of £21,150. No dividend is recommended for payment to the holders of ordinary shares, but the company is improving its position. The reserve account and the reserve for depreciation have been amalgamated into one fund, and it now stands at £10,000. By a

sinking fund, £5,854 of the debentures has been purchased and cancelled, and, as indicated, a useful reserve fund has been built up with the surplus of past years.

## Newcastle and District Electric Lighting Co., Ltd.

THE annual meeting was held in Newcastle on February 21st.

DR. J. B. SIMPSON, the chairman, in moving the adoption of the report (see *ELEC. REV.*, page 316), said that at the last general meeting attention was drawn to the fact that the directors had under consideration the most advantageous method of making an issue of £150,000 second mortgage debentures, and it would be observed from the report that they had been offered to the public, and that practically the whole of the amount was taken up. That had enabled them to pay off the bank overdraft, certain temporary loans, &c. The reserve fund stood at £8,778, and the directors recommended that £2,000 be transferred to this account. On the other side of the accounts the increase under the heading of stores was represented by the increased stock of coals which experience showed to be necessary to carry in order to provide against strikes and labour troubles. He drew attention to one item in the profit and loss account under the heading of stores, fuel, water, &c. At the time of their last general meeting the coal miners' strike had been in existence nearly a month, and it was expected daily that an agreement with the men would be arrived at; when, however, the termination of the strike became very uncertain, the directors thought it wise—although events proved it unnecessary—to make arrangements for a further stock of coal in order to make quite sure of keeping their customers fully supplied with electrical energy, and that, of course, increased their expenses. The weekly half-holiday under the Shops Act had affected their revenue to some extent, but, notwithstanding this and the effect of these labour troubles on the profits of the company, the gross receipts had increased considerably. With regard to the agreement with the Newcastle Corporation to supply the electrical energy for the Newburn tramways, good progress was now being made with the laying of the lines, and they were informed that the first section would be opened to the public in May this year, so that some benefit would accrue during the latter half of the year.

MR. ARTHUR SCHOLEFIELD seconded the motion, which, as well as the dividend and re-election resolutions, was carried.

## Launceston and District Electric Supply Co., Ltd.

THE first annual meeting was held recently. MR. R. B. ROGERS, who presided, said that the report showed that the company had had a good start, there being 3,800 lamps connected, while fresh connections were being made. Since December 31st, 1912, the remainder of the issued shares had been taken up, the number now issued being 6,400. He paid a warm compliment to Mr. Willey, the resident engineer, and his assistants, and to Mr. W. Vosper, the secretary.

The report, which was adopted, showed that the company had paid its way from the first working year. A contract for a portion of the street lighting for a period of three years had been entered into. The directors had thought it necessary to purchase a second suction engine from Messrs. Crossley.

**Lancashire United Tramways, Ltd.**—The directors report, says the *Financier*, that the result of the working of this and the operating companies comprised in this company's system, worked out as though they were one combined undertaking, is as follows:—Traffic receipts, £71,465; miscellaneous receipts, £4,631; total, £76,096; less working expenses, £47,847; general charges (including direction, management, interest, &c.), £5,356; rent of leased lines, &c., £4,961, leaving £17,932; and dividend on holding in the New St. Helens and District Tramways Co., Ltd., £1,534; profit of combined undertaking, £19,466. The receipts, compared with those of the previous year, show an increase of £1,390, which includes an increase of £738 from the sale of electrical energy. The traffic earnings per car-mile amounted to 8'21d. The expenditure has increased by £1,109, largely due to the coal strike and the advance in the price of coal. The interest and dividends received by this company from the operating companies, together with sundry receipts, amount to £13,853. After deducting interest on the prior lien debenture stock and expenses, there remains the sum of £59, which has been carried to depreciation account. The undivided surplus of the operating companies, after payment of the interest and dividends before mentioned, is £6,905. The depreciation and renewal accounts and amounts carried forward in the combined companies amount to £16,429.

**Scarboro' Electric Supply Co., Ltd.**—The annual report of the directors, to be presented to the meeting on March 5th, states that during the past year there has been connected to the mains the equivalent of 4,142 (30-watt) lamps, making 116,329. The number of units supplied during the year, including the 300,000 minimum supply to the tramways, has been 939,120, an increase of 79,268, or over 9 per cent.; the number of consumers has also increased by 16 per cent. The accounts show that after placing £1,000 to depreciation account, there is a balance on revenue account of £3,402. The directors recommend that a dividend be paid, free of income-tax, at the rate of 3 per cent. for the year, which will absorb £3,000, leaving to be carried forward £402.

### Para Electric Railways and Lighting Co., Ltd.

THE directors' report for the year ended November 30th, 1912, shows that the revenue, after providing for all expenses in London and Para, was £133,038, plus £1,442 brought forward, and difference in exchange, and interest on deposits and transfer fees, £2,090, making a total of £136,570. Deducting interest and sinking fund on debenture stock, £38,500; and interim dividends paid on the preference and ordinary shares, £24,100, there remained £68,970. Out of this there is to be placed to depreciation and renewals reserve, £15,000, and to contingencies reserve, £15,000; final dividend on the 6 per cent. cumulative preference shares absorbs £4,600, and a final dividend of 5 per cent., less income-tax, on the ordinary shares for the half-year to November 30th, 1912 (making 10 per cent. for the year) requires £19,500, leaving to be carried forward, £9,870. A new D.C. unit of 600-KW. capacity, and a new large boiler, have been installed in the power station, displacing a smaller old unit and a smaller old boiler, of the value of £4,654, which amount has been charged against the renewals reserve and credited to construction capital account. Other minor improvements have also been carried out. A charge of £20,639 has been made against contingencies reserve, representing a balance of certain debts and charges, which have been settled during the current year. This reserve account has in the past been maintained at a high figure in view of the possibility of large reserve being required to offset these charges which have now been cleared up. The operating expenses have been considerably decreased during the year, the difficulties referred to in last year's report have been overcome, and the operating conditions generally are greatly improved.

### Notting Hill Electric Lighting Co., Ltd.

SIR W. CROOKES presided on Tuesday at Winchester House, E.C., over the annual meeting of this company.

The CHAIRMAN, in moving the adoption of the report (see ELEC. REV., page 316), said that they were still progressing satisfactorily, showing increasing profits year by year. The only money spent on capital account was for mains and meters, and this outlay was compulsory so long as they were able to obtain new customers, and they showed no sign of falling off at present. The total capital receipts amounted to £209,352, which was only about £10,000 less than the expenditure, the balance being provided by using the reserve fund in the business, instead of issuing new capital upon which dividends would have had to be paid. With regard to revenue account, it would be seen that the net profit increased from £23,557 to £24,436. The directors believed this to be a very satisfactory result, especially taking into consideration the increasing cost of fuel. Nearly the whole of the increase in the cost of producing the current was due to the higher price of coal, and, unfortunately, this rise in price was likely to be permanent. The credit side of the account was most satisfactory, and showed an increase of about £1,700, the total revenue being £44,780, against £43,059 in the year 1911. On the net revenue account, after allowing £3,000 for depreciation, and over £6,000 for interest on debentures, &c., a balance remained of £15,718 for division, against £14,486 the previous year. The balance of the depreciation, renewal and reserve fund account had now reached a total of £40,189, which they thought was sufficient to cover the depreciation to date on the plant, mains, &c., of the undertaking, kept as they were in an efficient condition out of revenue. Their contribution to the Kensington and Notting Hill joint debenture stock sinking fund now amounted to £14,302. As this fund was being invested at compound interest, it was increasing rapidly, and the total was over £52,000. The only item in the balance-sheet he need refer to was the deposit on the sale of property, £400. It appeared that their undertaking would never require to utilise some of the surplus property at present let on rental, and the directors accepted a satisfactory offer to purchase it. The amount appearing in the accounts was the deposit, and they expected that the sale would be completed shortly. The number of consumers had increased since last year from 3,513 to 3,771, representing the equivalent of an additional 12,000 8-c.p. lamps. The profit had steadily risen, and he believed would continue to do so in the future. Last year he mentioned that the directors had under consideration a scheme of co-partnership for the company's staff. The idea was heartily received by many shareholders, and during the year the directors had been able to bring it into operation. The scheme was very much appreciated by the staff, and the men showed a keenness in their work, and continued their loyal attitude to the company, which was a great advantage in case of any difficulties arising. As an example of the economies effected, he might mention that, although the total units sold increased by 145,565, the number of units used in transforming and distributing the current decreased by over 60,000. The scheme was fixed on such a basis that the bonus to the staff rose or fell according to the increase or decrease in the amount of profit available for distribution to the shareholders. The amount of bonus to be divided this year was £286, which would give the men an additional 8 per cent. on their wages. A man who got 30s. a week would receive £6 4s. After paying this bonus, there remained a balance of £7,297 for dividend on the ordinary shares, and the directors recommended the payment of a dividend of 5s. a share on the ordinary shares, which was a record in the history of the company. This would leave a balance of £928 to carry forward, being some £300 more than last year. Mention was made at last year's meeting that the London County Council had appointed a special committee to consider the question of the electric lighting of London, and they had been invited to give evidence, and would do their best to assist the committee in their deliberations. They

still felt to a large extent the result of the introduction of the metal-filament lamp, but, happily, their continual increase in consumers had more than compensated for the lower consumption of current by these more economical lamps. There was no reason to take anything but an optimistic view of the future, and he looked forward to maintaining their steady rate of progress. The higher price of coal was almost bound to continue, owing to the increased cost of production since the strike, but he hoped the other materials they used would remain at their normal level.

SIR R. B. MARTIN seconded the motion.

MR. DAWES expressed his pleasure at the amount of money the directors had been able to give to the men, and he considered the co-partnership arrangement was one of the happiest things they had ever done. He did not consider it was altogether an altruistic thing, because all connected with the company benefited from it as much as the employes, who would naturally take a greater interest in their work. He thought the shareholders must be satisfied with the position of the company.

The motion was carried.

MR. DAWES next moved that the remuneration of the directors be increased from £1,100 to £1,500 per annum, and remarked that it was merely a tardy act of restitution on the part of the shareholders, because year after year in the past the directors had surrendered a large proportion of their fees. He gathered that the total amount they had surrendered up to 1907 was £5,249.

MR. MCMAHON seconded the motion.

MR. BUSH suggested whether it would not be a better way to remunerate the directors by giving them their present remuneration and also a percentage on the profits above a certain sum.

This was not seconded, and accordingly the resolution of Mr. Dawes was carried.

The CHAIRMAN, in acknowledging the vote, said he thanked Mr. Bush for his suggestion, which the directors would consider, and, perhaps, at the next meeting, it might be brought up for discussion.

The meeting closed with a vote of thanks to the board and staff.

### London Electric Supply Corporation, Ltd.

THE directors' report for the year ended December, 1912, shows that the profit on working was £68,670, against £61,412 last year. Adding the amount brought forward, viz., £4,186, less interest on temporary loan and balance of expense of issue of debenture stock, viz., £2,380, makes a total of £70,477. From this there have been paid interest on debenture stock, £17,494; sinking fund for redemption of debenture stock in 1931, £12,000; leaving to be appropriated £40,983; dividend of 6 per cent. on the preference shares absorbs £26,952; a dividend of 2½ per cent. on the ordinary shares, £8,325; there is put to contingencies account £1,000, and £4,706 is carried forward. It will be noticed that the board has opened a new reserve fund in the form of a sinking fund account. £12,000 will be invested in this fund annually (the first payment, being shown above), and the accumulation of these payments, with interest, together with the fund shown at the bottom of capital account, will be sufficient to redeem the whole of the existing debenture stock in 1931. The supply has been efficiently maintained during the year. The number of units sold amounted to 28,409,755 as against 20,476,982 last year; the total costs per unit sold being '66d., as against '82d. last year—a reduction of 20 per cent. The power supplied for traction purposes shows 75 per cent. increase, while the power supplied for industrial purposes shows 26 per cent. increase over last year. The plant and machinery have been maintained out of revenue and are in efficient condition. The L.B. and S.C. Railway have decided to electrify the whole of their suburban system. To meet the large demands which this will entail, the directors recommend the creation of £250,000 new capital, and a resolution to this effect will be proposed at the meeting. The death of the Earl of Crawford, K.T., is deplored by the board, and Viscount Duncannon has been elected in his place.

### W. T. Henley's Telegraph Works Co., Ltd.—The

directors' report shows a profit of £92,069 for the year 1912. From this are deducted directors' and auditors' fees, debenture interest, income-tax, and amount written off for depreciation on buildings and machinery, £23,986, leaving £68,083, to which have to be added the amount brought forward, £36,862, and the value of securities received in respect of the Bahamas-Florida Cable Repairing Fund, £4,041, making £108,987. The following are deducted: Transfer to reserve in respect of depreciation of Consols and other trustee securities £4,219, transfer to reserve account £15,000, bonus paid to shareholders in distribution of the Bahamas-Florida Cable Repairing Fund £4,000, dividend on preference shares £9,000, interim dividend on ordinary shares £10,000, leaving an available balance of £66,767, out of which the dividend on the ordinary shares of 15 per cent., free of income-tax (of which an interim dividend of 5 per cent. has already been paid) will require £20,000, income-tax on total ordinary dividend £1,750, leaving to be carried forward £45,017. Ordinary share dividend warrants are to be posted to-day.

### Aberdeen Suburban Tramways Co.—The

directors have been considering as to the extension of the company's business, either by the use of motor-buses or by cars run on the trackless trolley system. They hope before long to submit formal proposals to the shareholders with reference to the matter. For the half-year ended January 31st, 1913, the profit earned amounted to £1,404.

**Paisley District Tramways Co.**

MR. O. H. SMITH presided on February 20th at the offices, 83, Cannon Street, E.C., over the meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, p. 271), the CHAIRMAN said that the share capital stood as at June 30th last. The loan capital had been reduced by a further £800—making £2,300 to date—being the amount of debentures purchased during the half-year by the trustees for the sinking fund. General reserve account had been increased by £3,000 transferred from revenue and £653 for interest—an increase for the half-year of £3,653. The reserve created by the sinking funds stood at £6,237 as compared with £4,350—an increase for the half-year of £1,886, the debenture sinking fund being increased by £838 and the preference share sinking fund by £1,048. Sundry credit balances were £180 less than at June 30th. On the other side of the balance-sheet the capital expenditure had been increased by £1,700 during the half-year. This, with the expenditure in the first half of the year, was mainly expended on the four additional cars. Their investments in trustee securities stood at £12,950, and it was very gratifying to note that the market value of these securities at December 31st was above the cost price. The amount of £3,937 against the trustees for the sinking funds compared with £2,851 at June 30th. This item was, of course, increased each half-year by the contribution of £1,000 for the preference share sinking fund and by the accrued interest and dividends on the investment made by the trustees. Sundry debit balances were £323 in excess of the figure at June 30th. The traffic receipts for the half-year were £1,113 in excess of the receipts for the corresponding half-year of 1911. Unfortunately their expenses were very heavy, and the gross profit showed a reduction of £670. The additional services run during the half-year involved increased charges for electrical energy and for traffic wages, and the cost of maintaining the rolling stock was heavier than in the corresponding half-year of 1911. Local rates were also £250 in excess of the amount for the second half of 1911.

MR. JOHN YOUNG seconded the motion, and the report was adopted without discussion.

**Oxford Electric Co., Ltd.**

For the year ended December, 1912, the revenue account shows a profit (including £1,145 brought forward) of £15,832. After providing £2,000 for debenture interest, and writing off £1,072 on account of hire-purchase installations, the balance available is £12,760, which the directors propose to appropriate as follows:—Dividend at the rate of 7 per cent. per annum, less income-tax, on the ordinary share capital (whereof 3 per cent. was paid in September), £7,000; dividend at the rate of 5 per cent. per annum on the preference share capital ranking therefor (whereof 2½ per cent. was paid in September) £2,414, to credit of reserve and renewal of plant account £2,500, leaving to be carried forward £846. Reserve and renewal of plant account has been charged with the cost of plant replaced. The lamp, heating and motive-power connections continue to increase satisfactorily. The plant has been maintained in thoroughly efficient order. The supply mains of the company have been extended in Hill Top, Cowley, and Charlbury Roads, also in Princes and St. Aldate's Streets. The directors record the death of Sir Irving Courtenay, and to the vacancy on the board, Prof. Thomas Lowndes Bullock, M.A., has been appointed. The annual meeting is called for Friday, March 7th.

**Bruce Peebles & Co., Ltd.**—The directors' report for the year ended December 31st, 1912, states that the results for the year are not as satisfactory as those for 1911. The profit from manufacturing, trading, &c., after appropriating £4,138 for maintenance, amounts to £3,865; but after deducting expenses of administration, the interest paid on the mortgage debentures and accrued on the unsecured debentures, there is an adverse balance of £4,594 for the year. The trading for the year has been seriously affected by labour strikes and consequent disorganisation of business. The prospects for the current year are better, owing to the recent improvement in prices and in the demand for the company's manufactures. All buildings, machinery and plant have been properly maintained during the year. Mr. C. H. M'Euen retired from the Board in December last, and Mr. Lee Murray who resigned the post of general manager at the end of the year, has been elected to fill the vacancy.

**British Electric Transformer Co., Ltd.**—The directors report that they consider the result of operations in 1912 satisfactory. The accounts show, after paying all manufacturing costs and expenses of administration, a net profit of £21,552, plus £3,162 brought forward. There is to be placed to reserve account £9,000. Preference dividend of 6 per cent. absorbs £2,597; a dividend of 10 per cent. on the ordinary shares requires £7,895, extra remuneration to the directors £1,106, and £4,117 is to be carried forward.

**Erith's Engineering Co., Ltd.**—The annual general meeting was held at 70, Gracechurch Street, E.C., on February 20th, when the directors' report was adopted, and the dividends for 1912, of 6 per cent. on the preference shares, and of 10 per cent. on the ordinary shares (as in previous years) were authorised.

**South Metropolitan Electric Light and Power Co., Ltd.**—The annual meeting was held on Wednesday. Our report will appear next week. Warrants for dividends payable to-day on the preference shares have been posted.

**Waste Heat and Gas Electrical Generating Stations, Ltd.**

THE directors' report for the year ended January 31st, 1913, states that the profits earned, after deducting administration expenses, amount to £36,610 (£25,071 last year); less transferred to credit of reserve account, £9,000 (£7,500 last year); making £27,610 (£17,571). Adding the balance brought forward, £7,955, and deducting further remuneration voted to the directors at the last annual meeting £100, the profits available are £31,565, as compared with £23,619. The directors propose to declare a dividend at the rate of 8 per cent., absorbing £25,650, of which an interim dividend of 2½ per cent. was paid in August, 1912, amounting to £8,000. Last year the dividend was at the same rate. The balance to be carried forward is £8,965, as compared with £7,953. The balance of dividend is payable on March 15th, less income-tax. The total of the reserve account now amounts to £33,351, and the funds for the redemption of plant supplied under hire-purchase agreements amount to £2,493. The construction of the company's new generating stations at Port Clarence and Ayresome was finished during the course of the year, and the stations are now running satisfactorily and have added to the revenue; some retention moneys under the contracts for construction have yet to be paid to the contractors. The Bankfoot Power Co.'s new station at Bowden Close was put into operation in September, 1912, and is working satisfactorily. The new shares which the company subscribed in the Bankfoot Power Co., Ltd., have lately been called up to the extent of 10s. per share, making 12s. 6d. per share called up; the directors have also paid the balance of 7s. 6d. per share in advance at interest. The company suffered a considerable loss in revenue during the period of the coal miners' strike in the early part of the year, most of the stations being completely closed down for a period of some weeks. The company's plant has been maintained in thoroughly efficient repair by the electrical power companies in accordance with the terms under which the stations are operated. The directors have under consideration some proposals for the erection of further plant in the North-Eastern district for the utilisation of gas to be produced from coke-ovens.

**London Electric Wire Co. and Smiths, Ltd.**—The directors have declared a dividend of 7s. 6d. per share, less income-tax, on the ordinary shares for the half-year to December 31st, making 10 per cent. for the year, £40,000 being placed to reserve, making £70,000, £500 reserved against fall in market price of investments, and £20,793 carried forward.—*Financial.*

**Continental.**—RUSSIA.—It is reported from St. Petersburg that the Société Russe d'Electricité Schuckert & Co. is about to increase its capital with the object of taking over the Russian business of the Siemens & Halske Co. The title of the company is to be altered to the Société Russe des Usines Siemens-Schuckert.

**Australia.**—The *Australian Mining Standard* states that the capital of the Electric Light and Power Supply Corporation, Ltd., Balmain, N.S.W., is to be increased by £50,000. This move was decided upon at a largely attended meeting of the shareholders held in Sydney. Reports submitted by the directors, general manager, and chief engineer showed the business of the company to be in a flourishing condition.

**United Alkali Co., Ltd.**—After paying the preference dividend, £50,000 is placed to the depreciation portion of the reserve fund and £31,000 is to be carried forward. There is no dividend on the ordinary shares, as compared with 4s. last year.

**County of Durham Electrical Power Distribution Co., Ltd.**—The directors have declared a dividend of 5 per cent. on the preference shares for the year ended December 31st.

**County of London Electric Supply Co., Ltd.**—The directors have declared a final dividend upon the preference shares at the rate of 6 per cent. per annum, less income-tax, and on the ordinary shares at the rate of 8 per cent. per annum, less income-tax, for the half-year to December 31st, making 6 per cent. for the year on the ordinary shares. £27,500 has been placed to reserve for depreciation.

**Northern Light, Power and Coal Co., Ltd.**—It is announced in the financial papers that certain bondholders in this company who are dissatisfied with the manner in which the company's affairs are conducted, have called a meeting for to-day at Salisbury House, E.C., to discuss the present position of the company and to consider proposals for united action.

**South American Electric Light and Power Co.**—According to the *Financial News*, after transferring £4,000 to depreciation account, writing £2,000 off preliminary expenses, and providing for the full dividends on the first and second preference shares, the accounts for 1912 show that the credit balance of £3,067 brought forward was increased to £5,471. This amount it is proposed to carry forward.

**Tyneside Electrical Development Co., Ltd.**—The directors' report states that the profit for the 12 months to January 31st amounted to £3,212, plus £1,989 brought forward. The directors recommend a dividend of 15 per cent. for the year transferring to general reserve account £1,000 (making £6,000) leaving to be carried forward £2,601.

## MARKET QUOTATIONS.

## STOCKS AND SHARES.

Tuesday Evening.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, February 26th.

**Electrical Irrigation Scheme.**—An association has been formed at Tondern (Schleswig-Holstein), to handle a proposition to dam the Bredau estuary. The cost of the scheme is estimated at £68,500, towards which sum the State is to advance £16,200 and the province of Schleswig-Holstein £2,450, the remainder being subscribed by shareholders. It is proposed to build across the estuary a large steel sluice which will retain water required for irrigating purposes, and will enable surplus water to be discharged at ebb tide while preventing inundation of the surrounding low-lying land at flood tide. A pumping station is to be erected to control the water level in the irrigated area, and a central station is to be built to supply electrical energy to the pumps. The landowners in the neighbourhood are wealthy, and the scheme is so much to their advantage that no difficulty is anticipated in raising the £50,000 capital still required.—*Zeit. f. E. u. M.*

MARKETS, as a whole, continue very unsettled, although part of the depression wore off on Monday upon the outlook for foreign politics becoming a little less gloomy. From the news which came in, it was thought that the war in the Balkans might march to a conclusion quicker than had been expected, since Turkey apparently is not eager to continue the struggle. However, the change was more in sentiment than in volume of business, and prices tended to recede after having been better at the opening of the week.

The managing director of one of the big trust companies told us the other day that his board had decided unanimously to cease all business in stocks and shares for at least a fortnight. However tempting might be the underwriting or other proposition put before them, these directors resolved to set their faces against it. The determination is typical, no doubt, of what is happening in many other quarters, individual as well as joint stock. So it is not surprising that prices should dwindle in the absence of support other than that adventurous aid which is afforded by the occasional climbing in of the bears.

New issues are very chary of putting in an appearance just now, and several which were promised for February still repose in the pigeon-holes of their promoters. In view of the chilly reception afforded to others which have been bolder—not to say more rash—the postponements are natural enough. Underwriters themselves are beginning to agree that discretion is by far the better part of valour.

The Home Railway market has been disturbed by the difficulties which have arisen between the Midland Railway Company and its employees over the case of the guard Richardson. The Midland Company, by the way, seems to be somewhat unfortunate in its relations with the staff. The incident had its effect upon prices in the market at large, and Districts fell 1½. Beyond this there is no particular change, except in the prices of the pre-ordinary descriptions, which have receded still further. City and South London 5 per cent. Preference stocks, after their quartet of falls of 2½ last week, have continued to slump. District 6 per cent. Debenture lost 4 points, and the First Preference 2. Metropolitan 3½ per cent. Debenture stock fell 1, and the 3½ per cent. Consolidated Preference stock shed 2. The same movement has been going on amongst all the gilt-edged stocks of the Home Railway department, and the best class Home Railway Debentures can be bought now at levels which pay the round 4 per cent. on the money; while in the cases of Preference issues, 4½ to 4¾ per cent. can be obtained, with nearly 5 per cent. on City and South London Preferences.

Underground Electric Railways shares are 5s. better after their sharp fall, and the 6 per cent. Income bonds regained their drop of 1½, the meeting on Monday being hopeful. London United Tramway Preference have been flat, falling 7s. 6d. to 4½, and declines have occurred in some of the British Electric Traction issues. Great Northern and City Preferred Ordinary is ½ lower.

Dividend declarations are having little effect upon prices in the English electricity supply market. St James', Charing Cross and London Preference all fell ½, while Cities lost the 10s., which they rose last week. The County of London declares its usual dividend of 8 per cent., making 6 per cent. for the year, with £27,500 to reserve for depreciation. There is no change in the price of the shares. South Londons are the turn better. In the manufacturing group there is little of interest to notice. Edison and Swan "A" shares (£3 paid) strengthened a trifle, there being a buyer in the market, and the price is nominally ½ up at 1½ middle.

Affairs in Mexico seem to go from bad to worse, but the fall in the various utility securities has been arrested, and a rather better tone prevails in some of the bonds. Mexican Light and Power First Gold bonds have rallied 3 points, and the Tramways Company bonds are both better, Mexico Tramways Common being a point higher at 107½; while Mexican Electric Light 5 per cent. First Mortgage bonds are 3 points up after their severe fall, so that the pronounced fitness is being quietly wiped out. From the various scrappy items of news that come through with regard to the amount of damage done, it would appear that the soldiers have not done much hurt to private property up to the present, except in the case of some of the railways, upon which, if reports are to be believed, considerable destruction has been wrought in the way of blowing up bridges, and so on.

Other Traction issues are steady, with a fall of 5 in Kalgoolie "B" Debenture, and one of ½ in Anglo-Argentine Tramways 4½ per cent. D. venture. Lisbon Fives are a point higher at 94½ middle. An informal meeting has been called for Friday in this week to discuss the position of the affairs in the Northern Light, Power and Coal Company. Having regard to the parlous state into which the market for the bonds has fallen, and to the fact that they are practically unsaleable at about 15, it is not surprising that steps should be taken to inquire into things generally. The London board was by no means anxious to encourage the meeting, on the ground that a formal meeting of the bondholders will be convened by the directors in the near future.

There is so little going on in the Telegraph market that its affairs can be dismissed in a few lines. The depression of other markets has caused a slight dullness amongst the leading issues, but the only noticeable changes are small falls in Eastern Extensions, West India and Panama, and West Coast of America shares. The Mackay issues are a little duller, and telephone descriptions, as a whole, tend to the lower side. National Telephone Deferred is almost a nominal market, and its quotation was removed from the Stock Exchange Official List on Tuesday, when the company's books closed finally. Marconis are a little easier at 4½ middle.

## AUSTRALIAN TRAMWAY COMPANIES AND THEIR EMPLOYEES. XI.

(Continued from page 292.)

TAKING first the case of Adelaide. In Article IX (Vol. 72, page 191) it was stated that after the evidence as to the cost of living in the various cities of Australia had been taken that conferences between the parties might effect an agreement. When the Court met on December 6th, the Judge was informed that the Adelaide Trust had met the men. The suggestions, or "battlers," were not in their present form acceptable to the men and required consideration, but the Trust also demanded that the agreement should be made under Part 6 of the Act, making it a voluntary agreement. The Judge stated this was not allowable, as it must be under Sec. 24, to make it binding, and he would allow no other course, the case having come before him.

Mr. Goodman then argued that the dispute did not extend beyond one State, and consequently did not come within the scope of the Act, and proceeded to deal with various points in the Union's claims.

The Judge intimated on several of the points the form his award would take. While reserving all rights of the Trust, Mr. Goodman met the Judge wherever possible, accepting his decision that, provided the management were the sole judge of efficiency, promotion should go by efficiency, and in the event of equal efficiency, by seniority. Mr. Goodman objected to the claim that a non-employed should have access to the depôts to collect the men's Union subscriptions, and also to the claim for three minutes' waiting time at termini.

In conclusion, Mr. Goodman asked the Judge to take into consideration the financial position of the undertaking and the cost to the ratepayers which increases in the working expenses would entail, since it was not possible to increase the income by raising the fares. The Judge dissented from the view that these financial considerations should be allowed to influence him. These deficits were caused by payments to a sinking fund which was equivalent to a repayment of capital, and he did not consider that this ought to be done at the expense of the workers. He would take wages first and then consider their financial position.

The Adelaide award when published was in general similar to the Brisbane one already referred to. The schedule of wages are practically identical. Although they are an improvement in most cases on the rates at present paid, and to British readers seem very high, they fall considerably short of the men's request.

Take the principal cases—motormen and conductors. The men asked for 11s. per day; they are awarded, first year of service, 8s. 6d.; second, 9s.; third and subsequent years, 9s. 6d. Overhead wiremen, including linemen. The sum asked was 12s. per day; they were awarded 10s. Firemen in charge of less than four fires asked 12s., and were awarded 10s. Labourers asked 9s. per day and obtained 8s.

The Adelaide award principally differed from the Brisbane one in not demanding preference for members of the Union. Minor differences are a definite minimum of 27 minutes for motormen and conductors' meal relief and a definite minimum two minutes' wait at termini. The men asked for 30 minutes and a minimum wait of three minutes.

The Judge, in making the award, pointed out that the men's Union wanted higher rates than the 8s. 6d., 9s. and 9s. 6d. awarded to motormen and conductors, while the Trust urged him to award the conductors less, as they employed a large number of young men. As it was impossible for him to please both parties, he had kept the two rates equal, as he saw no sufficient ground for differentiation. He had also gone carefully into the question raised by the men that, owing to the high cost of rents and living in Adelaide, they should be awarded higher rates than in the eastern cities. This much was certain, that the cost of living had been increasing more or less steadily throughout the eastern States, and that in Adelaide rent called for at the present time a considerably larger proportion of a poor man's income than in Melbourne. But he could not find any justification for making a difference in a rate ruling for four or five years, in what might be a temporary variation.

With reference to the remaining cases, the Judge stated that he did not consider there was any real dispute in the case of the small horse-car undertaking at Coburg.

Melbourne and Perth had settled their differences by definite agreements, as already stated in these articles.

The remaining cases, namely, North Melbourne, Northcote, Ballarat and Bendigo, Hobart, Prahran-Malvern and Fremantle, gave considerable trouble. There were several conferences between the parties, at some of which the Judge was present, and eventually agreements were made in each case, though too late for binding signatures to be obtained before the close of the year.

In the case of North Melbourne, the motormen and conductors were to receive 8s. 6d. per day first year, 9s. second, and 9s. 6d. subsequent years. It differed from Melbourne in that it did not provide for annual leave, or extra pay on Sundays or extra time on holidays.

At Northcote a flat rate of 9s. 2d. per day was agreed on for gripmen and conductors; the working day to consist of eight hours, with overtime at the rate of time and a quarter for the first hour, and time and a half afterwards. Ordinary rates for Sunday

work and no annual leave. For work on public holidays time and a quarter for first hour, and time and a half later.

The Hobart agreement follows Brisbane and Adelaide in granting 8s. 6d., 9s. and 9s. 6d. per day to motormen, and gives minor conductors 1s. per hour. Ten days annual leave on nine days pay, double rates for Sunday work, and overtime rates for public holidays.

At Ballarat and Bendigo the agreement was to take effect from December 1st, and continue till June 13th, 1916. The working hours were to be 101 per fortnight. The rates of pay to be—Motormen, 1s. 1½d. per hour; conductors, over 21 years of age, 1s. per hour; under 21, 32s. 6d. per week for first six months, 36s. 10d. afterwards. At least 50 per cent. of the conductors were to be over 21 years of age. Casual motormen were to be guaranteed 15s. per week, or two-thirds of the statutory wage. Casual conductors to be guaranteed 12s. per week. Seven days' annual leave for six days' pay, and time and a quarter for Sunday work and public holidays. Time and a quarter for first hour's overtime, and time and a half afterwards.

At Fremantle and Prahran-Malvern there were differences, principally on small points; at Fremantle they were finally surmounted and the agreement was sealed, but at Prahran-Malvern the proposals were not accepted by the men. The Judge finally stated that he should make an award which would be suspended by a direct agreement between the parties if arrived at before January 1st. The general terms were comparable to those agreed on in the other cases.

The final proceedings in this long case consisted of the choice of the representatives of both companies and Union for the various Boards of Reference provided for in the awards and agreements. The Judge then stated that in the event of any of the agreements not being completed and filed by January 14th, awards based on the Melbourne Tramway Co.'s agreement would be made and come into operation. It remains to be seen whether this almost historic dispute which has demanded the close attention of the leaders and managers on both sides, withdrawing them from their proper work for so long a period, will result in peaceful and harmonious working between the two essential factors in tramway success, workers and employers.

**The Constitution of Matter.**—In the course of an address at a Science Exhibition which is being held at Surbiton, Sir J. Crichton-Browne referred to the recent researches of Sir Wm. Ramsay and others, and Sir J. J. Thomson, and pointed out that the view supported by the latter, that every atom consisted of an unchanging core combined with an outer shell which was subject to modifications, strongly reminded the biologist of the ultimate organic cell, which also possessed an inner core (the nucleus) and an outer shell. Similarly Sir J. J. Thomson had said that an atom was a part of an element which had a certain individuality, but was liable to modification by association with other atoms, a view which the lecturer compared with the unchangeable heredity of the living being, whose development, however, was capable of being modified by association with other living beings. He suggested that there might be great fundamental ideas such as these which were common to both the organic and the inorganic world, and which, studied in connection with design, would lift us above a shallow materialism and deepen in us a sense of reverence.

**L.C.C. and Electrical Workers' Hours and Wages.**—A Committee of the L.C.C. reported at Tuesday's meeting having given careful consideration to the representations of the Electrical Trades Union that the rates of wages and hours of labour paid by the Council to armature winders and magnet or coil winders should be increased from 9d. to 10½d. an hour, and from 7d. to 8½d. an hour, respectively. "The representations appeared more particularly to be directed to the rates paid at the central car repair depôt at Charlton, and the minimum asked for appeared to be based on the nature and quality of the work there performed. From inquiry made we are satisfied that the minimum rate at present recognised in London for armature winders is 9½d. an hour, and we recommend that this rate should be inserted in the Council's list. We have asked the Highways Committee to consider the representations of the Union that a rate higher than the minimum should be paid to the men employed at the central car repair depôt. We are not yet prepared to report as to the rate of wages of magnet and coil winders." It was recommended: "That the list of rates of wages and hours of labour be amended by increasing to 9½d. an hour the rate of wages of armature winders."

**Miners' Safety Lamp.**—On January 23rd, says the *Electrical World*, the American Museum of Safety, New York, awarded the Rathenau gold medal to Mr. T. A. Edison for his electric safety lamp. Two of his nickel-iron storage cells are used, in a nickelled steel case, which may be locked. The lamp is carried on the miner's cap, and is mounted in a fitting provided with a parabolic reflector and a thick glass lens, the miner cannot tamper with the lamp without breaking a mechanical seal. The connection between the lamp and the battery (which is attached to a waist-belt) is made by means of a twin-conductor flexible cord, provided with a plug terminal which, when pushed into a socket on the battery case, becomes locked and cannot be removed without unlocking the case. The battery weighs about 2 lb., and has an E.M.F. of 2½ volts, and a capacity of 1 ampere-hours. The tungsten lamp gives 2 C.F.

## WAGES AND HOLIDAYS IN CENTRAL STATIONS.

By JOSEPH S. AINSWORTH, A.M.I.E.E.

In recent years in many central stations a general feeling of dissatisfaction has existed over the very important question of wages paid. The success of recent strikes, and the frank admission of the Government that the cost of living has increased in greater proportion than the increase of wages, have tended to bring the various sections of a central station together, and led them to request for a consideration by the Electricity Committee of the altered conditions in the cost of living and the necessity of a general increase in payment of their employees.

Charge engineers have been grumbling over their ridiculous maximum of 35s. per week; switchboard attendants have been disheartened at their level 20s. per week; drivers and firemen have said that theirs was a non-living wage, and that for years they have had no Sunday off. In a few stations the different sections of the staff have discussed methods suggested by the Electricity Committee to improve conditions. In one or two stations the men have united and have affiliated with some powerful Trade Union. Some have, indeed, already obtained better treatment in both time and pay.

Leaving the other sections for a more convenient season, this article deals with that of charge engineers and switchboard attendants only, who, without having, like the men, recourse to applying pressure by votes, or the seductive persuasions of a threatened strike, which would throw the whole town into darkness, made use of personal and written applications for increases of salary and for the fixing of a sliding scale from a minimum to a maximum, with the view, which was quite legitimate, of knowing exactly what the prospects were in their station.

In a certain provincial central station, after several *individual* applications for an increase of salary had each been promptly acknowledged, but had not, however, proved successful, it was considered high time to take the next step and send in a *collective* application to the Electricity Committee, showing the much larger output of the generating station, its greatly increased capacity of plant, and the consequent larger number of duties. The result was as unexpected as it was curious. One of the applicants received an increase of 5s. per week, while a new arrival, who, by the way, was more experienced than a few of his predecessors, was taken on to fill a vacant position with 5s. per week less!

Another method of procedure had to be adopted. It was argued that if it could be proved that in other central stations of similar capacity and output better conditions prevailed, then a clear case would have been made out for better treatment. The chief was interviewed, and in a few days reported that the Committee would like to be shown that a better state of matters existed elsewhere.

Accordingly, a covering letter was sent to some 58 electricity works; answers to the following questions were asked for, and a definite reason was given:—

(a) *Charge Engineers*: (1) Number employed; (2) Minimum salary; (3) Maximum salary; (4) Average hours per week; (5) Sunday arrangements; (6) Holiday arrangements; and (7) Emergency arrangements.

(b) *Switchboard attendants*: The same seven questions.

About 47 replies arrived in time to be of use. In every case a stamped addressed envelope had been enclosed. In many of the replies a request was made for a copy of the tabulated results. As there is no central station but takes in at least two or three copies of the *ELECTRICAL REVIEW*, it is certain that this contribution will furnish more than interesting reading. It is a pity those stations that asked for a copy of the tables accompanying this short article forgot to enclose a stamped addressed envelope, as had been done when they had been written to. However, we now thank them all for the valuable information placed at our disposal for the betterment of central-station charge engineers and switchboard attendants.

It is to be regretted that several of the questions drew blanks, as can be seen by the many question-marks in the

tables. No answer at all is the only reply to be expected when no maximum salary has been fixed. How about Sundays or emergency arrangements? In most stations week-ends and holidays are arranged amongst the engineers. It would have been interesting to know if it was one Sunday off in three, or in two, or two in three, while a reply of 14 days may mean just 14 shifts.

A couple of stations pay overtime to their engineers on Bank Holidays and on Sundays.

With reference to "emergency arrangements" for charge engineers, information was required to determine *who* took shift when a charge engineer, on very short notice, wanted to have a shift or more off, as occasionally happened through some accident, or when a wedding or funeral had to be attended. Who took shift during, say, the six weeks that the three charge engineers were away on their 14 days' spell each? From both tables it is clear that this brief question was not at all understood, for out of the 47 central stations, only 22 have replied. In 11 out of the 22 stations the charge engineer is relieved by a switchboard attendant, improver, relief engineer, junior charge engineer, or apprentice. In only two cases does a general engineering assistant do relief work. In four stations the chief assistant or station superintendent acts as relief charge engineer. In one station "longer hours" are worked in cases of emergency; but how about during the precious seven days' holidays? One station sagely replies, a "sub" is found!

Eliminating the last two stations owing to their unsatisfactory answers, and omitting the two stations where a general engineering assistant takes charge, we have in 14 out of the 18 stations a junior acting for a senior during an emergency, or while the holidays are on. In only four cases does a chief assistant or station superintendent act in a subordinate capacity—quite possible for a couple of hours, but absolutely unworkable during the fortnight off of each engineer.

A chief assistant's time is more valuable to the well-being of the plant than a charge engineer's, and hence continued relief duty should be undertaken by a junior, *provided* all these are men capable of performing duties more responsible than those of the positions they occupy, a standard which is gradually being arrived at, though occasionally even now an alderman or a councillor, divesting himself of self-respect and manliness, hinders progress by worming in some inexperienced individual.

While the covering letter clearly implied that the procedure in ascertaining the information had had the previous approval of the Electricity Committee and the chief engineer, besides being signed by a responsible engineer, it appeared somewhat in the nature of a waste of time to reply and explain in the case where a chief wrote that the information could only be furnished to another chief. Fortunately for the profession, we had only two such communications.

Where some central stations go in for a low-salaried chief engineer, the strategical method of inaugurating a scale for his charge engineers, with a maximum and a minimum to accord with other stations of similar capacity and output, might, by *pay pressure* from below, produce a goodly scale for the chief himself, gifted with foresight.

But duties are by no means similar in central stations of similar capacity and output. The number of sets in use may be vastly different. One station may generate for lighting and power only, while another may have a combined lighting, power, and tramway traction load controlled from two distinct switchboards.

However much the difference in the amount of responsibility, it is clearly evident that some stations have badly paid staffs. If such stations can make use of these tables, and, encouraged by the success already achieved by one central station, send a covering letter to their chief and the Electricity Committee, a change for the better is bound to take place.

This procedure has been carried out with success by one of the 47 stations. "You have proved your case," said the chief to one of the representatives. A scale has been fixed, and a former level 35s. has become 50s. for charge engineers, while a previous 20s. has been converted into 27s. 6d. for switchboard attendants.

It should, however, be expected that a badly-paid staff on "proving their case," will not obtain a scale to accord with

the best paying station of similar size and output, but will obtain a scale to accord with the averages of the better

payer and the cheap station. Half a loaf is better than none!

## PROCEEDINGS OF INSTITUTIONS.

## Cables for Shafts in Mines.

In opening the London meeting of the ASSOCIATION OF MINING ELECTRICAL ENGINEERS, held at the I.E.E. Building, Victoria Embankment, on February 7th, the chairman (Mr. W. C. MOUNTAIN) said that the Association had now 1,000 members, 11 home branches and one branch in Australia. Ten members were resident in Dover, which was destined to become a most important colliery centre. The London membership had doubled during the past year, and a number of consulting engineers in various parts of the country had joined the Association. The examination system adopted had proved a success; there were already 120 certificated members, and the next examination was to be held in March at the Northampton Institute. Mr. E. Kilburn Scott then read a paper on "Cables for Shafts in Mines."

Broadly speaking, the author recommends that high-tension aluminium cables should be used in mine shafts: that armouring should be dispensed with on shaft cables, a return path for current being provided by metal work already in the shaft or by steel ropes specially suspended to serve this purpose: that siliceous tire rubber be employed in place of steel to provide mechanical protection on cables exposed to moisture and hard wear; and that split telegraph poles be used in place of the sawn casing hitherto used when cables have been enclosed. Shaft cables cannot be handled by men or touched by animals in the ordinary way of working, and there is little danger of their mechanical injury, hence there is correspondingly little need for armouring as a mechanical protection. There is already, or there can cheaply be provided, sufficient continuous metal work in the shaft to act as a return path for current, hence armouring is unnecessary from this standpoint. A haulage rope, originally costing £50, may be worth only £5 when unfit for haulage, yet it will form as perfect an earth return, when suspended in the shaft, as a cable armouring costing several times as much as the original rope. In the shaft of the Frickley Colliery Co. (Doncaster), there is available about 30 sq. in. of continuous steel and iron, which could be used for return current purposes, and which has a conductance equal to that of 3 sq. in. of copper. The sectional area of the steel armouring actually used for return current, which cost about £160, is 2 sq. in., i.e., about one-tenth the section of the wire ropes already in the shaft.

The revised rules require the armouring on mine cables to have a conductance 50 per cent. that of the conductors enclosed: in addition, the armouring must conform to the Engineering Standards Regulations. In H.T. cables there is no difficulty in complying with both sets of rules, but in L.T. cables the 50 per cent. rule calls for heavier armouring than the Engineering Standards Regulation. It is very desirable that there should be no joints in shaft cables, and other things being equal, it is easier to supply cables of great lengths without than with armouring.

Sector cores do not greatly reduce the over-all size of cables designed to operate above 3,000 volts. At 6,000 volts and higher pressures, sector core cables are more costly than, and are nearly as large as, circular core cables. The weight of the conductors is of great importance in shaft cables, and, in this respect, as also by its immunity from attack by bad water, aluminium offers considerable advantages over copper. For equal conductance, the ratio of weights of aluminium and copper cables is approximately as 1:2. Comparing three-core, medium voltage, paper-lead-steel-jute cables, those with aluminium cores are about 17 per cent. heavier than those with copper conductors, but the price of the aluminium cables is 5 per cent. less with round and 8 per cent. less with sector cores. From the point of view of supporting its own weight, aluminium is practically equivalent to steel; the maximum lengths of strand which can be suspended vertically are as follows:—

	Hard drawn.	Annealed.
Copper ... ..	15,500 ft.	5,950 ft.
Aluminium ... ..	25,000 "	13,600 "
Steel ... ..	20,700 "	14,750 "

Aluminium wires of No. 12 S.W.G. have been drawn in continuous lengths up to two miles for years past, and there is a ready market for scrap aluminium, though its relative value, as compared with new metal, is less than in the case of copper.

Aluminium is much more difficult to join than copper, but shaft cables are really main feeders, and are only tapped at the ends. Stranded aluminium cables are best jointed by the use of split sleeves, stepped so as to accommodate and clamp the several layers of each cable at the joint, the layers being cut back so as to permit of this.

The author believes that 11,000-volt shaft cables will soon be in general use, one important point in favour of such practice being the consequent reduction in the starting current to be applied to induction motors. In reviewing the characteristics of various cable insulating materials, the author remarks that the elastic pitch compound used in bitumen cables softens at about 120° F.,

hence this insulation is not suitable for use on cables in upcast shafts. Rubber is at present largely displaced by paper and bitumen for power cables, but, as the supply and quality of plantation rubber improves, and possibly owing to the development of the synthetic production of rubber, the use of this material for heavy cable insulation will become more general. Silicious, or "cab-tire," rubber, has proved very successful as a mechanical sheathing for cables. Rubber insulation must necessarily be used in shaft sinking cables, and it appears reasonable to use a somewhat similar material for the protective coating. Bitumen sheathing is preferable to lead on paper-insulated shaft cables, owing to its lighter weight and the liability of stretching lead sheathing when suspending the cable in the shaft. "Indestructible" insulation consists of layers of paper with a cotton or jute braiding, the whole being impregnated with red lead and linseed oil; cables thus insulated resist chemical action and abnormal climatic conditions.

Coir yarn, made from the fibres of the coconut, is a likely substitute for jute. It is practically incompressible, very tough and less absorbent than jute, besides being cheaper. At present, coir plaiting is done by hand, and is uneven, but this objection could be overcome.

The methods at present employed to place shaft cables in position, are:—(1) Lower the cable from its drum by a winch at the shaft bank; (2) Suspend the drum in or under the cage, and pay out cable as the cage descends; (3) Lower the drum to the bottom of the shaft, fasten the cable end to the cage, and haul up; and (4) Run out the cable on the surface, attach one end to a locomotive, and lower the cable by moving the locomotive towards the shaft. The applicability of each method, and the precautions to be observed in its application, are considered in some detail in the original paper.

Better than the cone type of single suspension for armoured cables, is a suspension in which the armour wires are bent back at right angles on to the flange of the suspension sleeve, and clamped by a top plate and bolts. The elongation of the armouring determines the limiting weight that can be held by single suspension, long before the limiting breaking safety factor is reached. Clipping the cable to two steel ropes provides a suspension which is flexible, and offers less lodgment for dust and slime than cleats, but which introduces trouble in hot shafts by the high coefficient of expansion of the steel ropes as compared with the cable. An armoured cable fixed by cleats practically constitutes a solid bar down the shaft, and if the cleats be suspended from the tubing by chains, the risk of injury by the impact of objects falling down the shaft is much reduced.

The objections usually urged against casing for shaft cables, are: (1) The risk of damaging the cable when fixing capping, or by malleting where the troughing is out of alignment; (2) the difficulty of keeping out water at the lidding joints and between lengths; and (3) the cost of sawn timber, bolts and erection.

The author suggests that split telegraph poles be used for casing, as shown in the accompanying figure. The pole is sawn longitudinally in unequal parts, and the larger one is grooved. When the cable is in place the two parts of the pole are secured by steel "bracelets" A clipped over and driven down towards the butt of each length. The poles would be erected with the butts downwards, and the small end of each would be let into the butt of the length above it (N). By cutting "grains" in the poles, each could be simply and securely attached to the buntons by steel straps, as at C. Unarmoured aluminium cables could then be used with advantage, and excellent mechanical protection would be afforded by the casing.

In dealing with preservatives for timber, the author spoke at length of the Powell process: this will be specifically treated in these columns at an early date. In conclusion, the author considered the special requirements of sinking cables, and pointed out that tire rubber sheathing offers advantages over steel armouring, in respect of flexibility and imperviousness to water. The V.D.E. have issued special regulations for sinking cables, and these rules are reproduced in the original paper.

In opening the discussion, Mr. NELSON (Electrical Inspector of Mines) complimented the author on the exhaustive and practical nature of his paper, and endorsed the chairman's remarks as to the value of the Association and the discussions on its papers. The amount of electrical power used in mines had increased at least 100 per cent. since 1906, yet the latest reports showed the fatal accidents in mines to be fewer than in any year since 1906. This gratifying result was largely attributable to the direct and indirect influence of the Association. Mr. Nelson agreed that it was less necessary to armour shaft cables than cables in-by, but, in his opinion, the ideal system would continuously armour all current-carrying parts, from the generator to the motors, with a sheathing strong enough to resist all destructive agencies which could be foreseen. The difficulty of repairing shaft cables was greater than that of repairing cables in-by, and this probably accounted for the early practice of armouring shaft cables but not the in-by cables. Too much importance was attached by the author to the strength of aluminium as regards supporting its own weight. Taking into account the lower tensile strength and conductivity of aluminium as compared with copper, the lighter metal did not appear to offer great advantages for shaft cables. The difficulty of making joints in aluminium conductors and the larger overall size of the latter for equal conductance were practical objections which became particularly serious in in-by cables. There was no merit attached to the use of very large shaft cables; personally, he would always prefer two small cables to one equivalent larger cable. The larger the cable the stronger the armouring required, and this was secured by the revised rules, which required the conductance of the

armouring to be 50 per cent. that of the conductors enclosed, and which, in large L.T. cables, therefore required heavier armouring than was called for by the Engineering Standards Committee's Regulations. The revised rules were designed to indicate minimum precautions and factors of safety; in some cases it would be desirable to design more liberally than was required by the rules. The case in New South Wales, where armoured cables were destroyed by bad water in less than six months, afforded no argument against the use of armouring. It was presumably possible to protect the conductors from the water, and hence it would have been equally easy to protect the armouring. The German (V.D.E.), regulations quoted by the author called for armouring on shaft sinking cables, and with this rule Mr. Nelson was in complete agreement.

Mr. LUPTON commented on the remarkable extension of the use of electricity in mines since 1881, when its applications were limited to signalling and shot firing. Electrical transmission had proved its advantages over compressed-air transmission in respect of economy and convenience, particularly in deep mines. The speaker was responsible for the sinking of two shafts in Yorkshire over 800 yd. in depth, and in such cases the question of the weight of the shaft cables was undoubtedly of great importance. In dry shafts there were possibilities in the use of bare lines. Most accidents in mines were due to conditions not foreseen; every mishap provided fresh experience and usually led to the evolution of means for preventing its repetition or reducing the seriousness of the consequences. The speaker pointed out that the "earthing" of mine circuits now consisted rather in the provision of a bare metallic return path at earth potential to the generator than in real earthing such as was practised in earlier days.

Other speakers offered the following information and opinions: The armoured & unarmoured controversy was analogous to most others in that the supporters of both sides of the question were, to some extent, correct. Generally, armouring was advisable in mining work, but there were cases in which it possessed practical disadvantages. The limiting temperature ( $120^{\circ}$  F.), suggested by the author for bitumen cables was a very conservative limit, but one which it was advisable to retain in designing colliery equipment since overloading was frequent. There was already a 1'00 sq. in. bitumen-insulated aluminium cable in use in a Durham shaft and bare aluminium lines laid in wood were being used for L.T. distribution in Cornish tin mines. The oxide film on aluminium formed readily in heat and moisture, so that the insulation of a L.T. aluminium line might increase under conditions that would destroy the insulation of a copper feeder. It was not easy to joint aluminium cables; a number of solders had been produced which would unite small wires and strips satisfactorily, but which were useless for jointing large stranded cables. In Messrs. Callender's installation in Brussels—*not* Ostend, as stated by the author—the cast joint described had proved the best type available. Stepped sleeve joints increased the size of connecting boxes, &c., 100 or 200 per cent., and the clamping screws were generally too small to ensure thorough contact between the conductor and the sleeve. The reduction in the current-carrying capacity of the cable by covering it with a thick layer of wood must be considered before deciding to adopt telegraph poles in place of sawn casing.

The advantages of the Powell system of wood preservation were discussed, and it was pointed out that its rapid adoption in tropical countries was due to its offering a perfect solution to the white ant difficulty, in addition to affording thorough protection to timber in other respects and considerably increasing its mechanical strength.

A visitor pleaded for the standardisation of whatever should be decided to be the best shaft-cable construction; the cost of manufacturing cable accessories and switch-boxes, &c., would be thereby reduced. Since enclosed switchgear had become standard for mining use, the manufacturing costs had fallen almost as low as those of the early open switchgear, owing to the greatly increased production of each particular type.

It was decided that the paper should be read and discussed before other branches of the Association.

### Advertising Electricity.

By H. CLIFFORD PALMER.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Manchester, February 11th, 1913.)

THE population of the British Isles is 42 millions, out of which the approximate total number of consumers of electricity is very little more than half a million; whilst the number of users of such articles as electric heaters, cookers, irons, kettles, sweepers, and other potential popular domestic appliances, is but a few thousands. A comparison of these figures will give much food for thought.

In the matter of public education as to the benefits of electricity, we have left undone much that we might have done. The subject of how electricity can and should be advertised is one that interests all alike—manufacturers, station engineers, and contractors. The subject of selling electricity merits the same care, thought, and action as that of plant and apparatus manufacture. Unfortunately, we have been too apt to overlook this important fact in the past.

A few years ago if we got electricity in the home for lighting we felt highly satisfied, and were content to leave it at that; now, lighting is only the beginning, and should in reality merely act as the missionary for electricity. Heaters, toasters, irons, kettles, breakfast-grills, sweepers, and many other current-consuming devices, should follow. But it cannot be expected that the public will adopt such apparatus unless they are educated as to its existence, its use, its advantages, and even its economies.

The natural tendency nowadays is to economise time to avoid inconveniences to study hygiene, and to save unnecessary labour, therefore we should play upon the sensibilities of mankind and womankind in these directions. Within limits electricity has extensively advertised itself. From its inception, its distinctive ness, its obvious advantages, and its many other qualities always ensured for it progress, but progress without "push" must be very tedious. Gas, although fighting a losing battle, is fighting it valiantly, and unless met in the field with equally modern weapons might easily stay our progress longer than any of us would desire. The gas interests have realised the value of co-operative effort, and have organised extensive advertising action accordingly. How much more successful might we be with similar measures?

What we need to popularise the domestic uses of electricity amongst all classes (and upon this depends, to a large extent, our future rate of progress) is a combination of effort in which all interested—i.e., manufacturers, supply authorities and contractors—should join. An educative campaign is necessary.

The public can be educated on extensive lines only by systematic judicious, and practical advertising. That advertising is work for specialists there can be no doubt. Because a man may have had a commercial training, he is not thereby qualified to conceive and carry out comprehensive and profitable advertising. Practical experience, study and ability are required.

The manufacturing section of the industry has done, and is doing, much in this matter of "Advertising Electricity," but the advertising of the manufacturer is directed to those who are already users of electricity; he is merely driving home his individual claims against those of his competitors. Our concern as an industry is not with those who have been converted, but with those whom we desire to convert.

The supply undertakings are already represented in London by what is known as the Electricity Supply Publicity Committee: the manufacturers are represented by the Publicity Section of the British Electrical and Allied Manufacturers' Association; whilst the contractors are represented by the Electrical Contractors' Association. A joint Electrical Publicity Association should be chosen to be composed of selected members from each of the before-mentioned Associations. The duty of this main Association would be to direct the operations (upon expert advice), and control the general policy, of a national educative electrical advertising campaign. Sub-committees could be formed by each Association for the purpose of obtaining the necessary funds.

No measure of success will be achieved unless the response is general. We are now a large industry, and if all contribute, the subscription need be only quite nominal. It cannot be expected that a few enterprising manufacturers and supply authorities would find the necessary funds for such a national scheme which would benefit all sections of the industry alike.

As to the money required to enable a comprehensive scheme to be organised to cover the entire country, I should like to see a sum of not less than £30,000 raised for a 12 months' campaign.

In order to demonstrate what class of advertising scheme could be carried on in a specified area for a given sum and for a given period, I propose to give a few facts depicting an imaginary campaign for London and the area within 50 miles thereof.

For the purpose of an "opening" campaign in the interests of electricity I would advocate the widest and most powerful methods of publicity. I am calculating on a total expenditure of £12,000, which amount would be necessary to enable a 12 months' comprehensive advertising effort in the area mentioned. I should therefore divide the operations as follows:—

- (a) Daily Press advertisements (five-twelfths total expenditure).
- (b) Literature and circularising (this to a considerable extent would be self-supporting) (one-twelfth total expenditure).
- (c) Central information bureau (one-twelfth total expenditure).
- (d) Billposting (two-twelfths total expenditure).
- (e) Expenses of management and staff (one-twelfth total expenditure).
- (f) Illuminated animated signs for night advertising (two-twelfths total expenditure).

Editorial notices in the daily and weekly Press would be covered by the Press advertising.

Of available styles of media for a campaign of this nature, I would recommend the principal daily (morning and evening) papers, as they give more desirable publicity for a stated amount than any other. The Press campaign should be divided into two periods of three months each. The first period, say, the middle of March to the middle of June, should be devoted to cooking, ventilating, and other domestic applications, with power intermixed. The second period, from the middle of September to the middle of December, should be devoted to lighting and heating, also with power intermixed. I would recommend that the insertions should appear not less than one per week in each paper, the size of the advertisement varying from time to time according to the total sum allocated to the paper in question. For the opening of the campaign and for any special occasion (such as the opening of the London Electrical Information Bureau referred to later), full pages should be taken in papers enjoying the greatest and most influential circulation.

Editorial notices come as a sub-heading to Press advertising, since to some extent the one carries the other. By this I do not desire to indicate that the money spent on advertising would positively buy for us the editorial columns of London's leading daily papers without further question; but no matter what may be said to the contrary, it would be bound to obtain for us greater recognition by the Press than we enjoy to-day. After all, it is only reasonable that the papers should expect some *quid pro quo*. Never at any time throughout our scheme (if we succeed in organising it) need we ask the papers for "puff"; but we shall need constantly to

advise them of current items of interest which may affect our industry. Every week we could undoubtedly circulate to the editorial departments of various papers little paragraphs which they would welcome, and which would interest us all indirectly.

If such a scheme as I am now suggesting does mature, I can foresee the day when the London and provincial papers will be willing enough to insert pages of popular Electrical Notes in similar manner to the pages which now exist in most of our premier papers on Motor Notes, Fashion Notes, Empire News, Cycling Notes, &c. It is merely a question of proper recognition and support. Surely the diversity of domestic interests in electricity are sufficient to warrant such action by the Press. We do not want the daily and weekly papers to labour with the technicalities of our industry, as for this purpose we have our own excellently-conducted trade organs; but we do want the general Press to dilate upon the subject of electricity from a domestic and popular point of view; and this they will be ready enough to do if we recognise them as we desire they should recognise us.

I illustrate a few examples of Press advertising, in order to portray a style which might be adopted in connection with a scheme such as I advocate.

Full pages in London's daily papers are somewhat costly, so that their number in such a scheme would require to be limited. Following, therefore, upon first announcements, the size of space would be reduced to possibly a full double-column announcement, such as "Just switch on." Then, perhaps, a half-page, such as "Cleanliness, comfort, safety," following with a variety of other sizes, such as half double-column, quarter double-column, &c.

A considerable number of inquiries would be received by the Publicity Association from its members for the supply of suitable literature descriptive of the various applications of electricity. Provision would, therefore, have to be made for the origination and supply of this. Circularising can be termed "intensive" advertising. If properly carried out, it can, no doubt, be made very

There would be little gained in using this Bureau as a demonstrating showroom, as this work would be too restricted at one address and could be better administered from local showrooms in all districts.

One of the most valuable functions of the Central Bureau would be the arrangement of cooking demonstrations, and lectures in connection therewith. This is a form of publicity which should bring electrical apparatus most closely to the notice of the public.

Opinions are divided as to whether the contractor or the supply undertaking, or both, should run local showrooms, with the result that in many cases instead of the two interests running in harness they run in opposition. In the interests of the general cause this might be properly organised on co-operative lines. Where the contractors have already been sufficiently enterprising and have established good showrooms, station engineers should officially recognise them as sources of electrical information and should recommend the local public to make use of them as if they were actually established by the undertaking itself. In other directions the showrooms already established by the supply undertaking would be the more desirable.

What is required in connection with a national scheme is undoubtedly the establishment of, at any rate, one first-class showroom in every centre, where all the most modern appliances can be viewed and capably demonstrated, where every possible information as to cost, comparative rates, advantages of electricity over coal or gas, manufacturers' list prices, addresses of local contractors, new developments, &c., will be properly registered and always kept available for the benefit of the public.

All such showrooms—whether already established or yet to be arranged for—should be more or less uniform as far as style and lay-out are concerned. Also, they should be properly equipped with all possible information needed by the public, and each should be under the control of a man who is accustomed to deal with the public. Only such a body as that suggested could possibly under-

SUGGESTED EXAMPLES OF PRESS ADVERTISING

effective, but it is, of course, limited in its sphere of operations, and for this reason should be handled independently by the various supply undertakings, manufacturers and contractors.

All subscribers to the Publicity Association desiring to do so should be entitled to purchase the Association literature at special rates, which undoubtedly would enable them to effect considerable savings on their present expenses in this direction, whilst at the same time obtaining the right material.

The supply authorities in all parts of the country should not diminish their individual publicity operations on account of the fact that a broader scheme might be in operation; the one is merely intended to support the other.

To meet the requests for ready-made literature I suggest a series of, say, six booklets. These should be made as attractive as possible, yet should differ widely in appearance from one another. It must be remembered that repetition begets familiarity; and familiarity breeds contempt. The points to be emphasised throughout are the convenience, cleanliness, hygienic qualities, reduction of fire risks, simplicity, and economy of electricity for all purposes.

I would advocate an extension at a later date by issuing separate booklets appealing to distinct industries.

Wherever "intensive" advertising is concerned, avoid generalities so far as possible. Know as much as is possible of the local conditions under which electricity would be used, and convince the reader that his particular requirements have been carefully studied.

I believe there will be general agreement as to the desirability of having a London address for the Publicity Association, no matter what class of scheme is decided upon. Even with the national scheme London would undoubtedly from all points of view be most desirable for the headquarters. From there all the "extensive" advertising of the scheme would be conducted. Moreover, such headquarters would act in an advisory capacity as far as publicity is concerned for the benefit of all members of the Association.

take this work, and then probably only in connection with a scheme for national advertising. Sales should not be effected at these authorised showrooms.

For outlying districts where local showrooms would not be justified, it might be possible to organise a small travelling exhibition, to move from district to district, staying for four to six days in each. Practical demonstrations should be given by a capable lecturer, with lectures on the subject of heating and cooking by electricity.

Bill posting, again, is "extensive" advertising—in fact, the most extensive of all. Press advertising and bill posting work in entirely different directions, and yet posters aid Press work to a very considerable degree. If I were asked to describe the difference between advertising by poster and advertising in the Press, I should class the former as a "shop window" and the latter as a salesman therein. We cannot expect actually to sell by poster, but we can obtain magnificent publicity, which can be followed up in the most desirable and effective manner possible by augmentative copy in the daily papers.

In bill posting, bold methods should be adopted, first in the size of the bill, secondly in the selection of colour scheme, thirdly in the design, and fourthly in the point made. As a general rule, the less said on a poster the more effective the bill is likely to be. No attempt should be made to make more than one point.

In the scheme which I have discussed I would make provision for a permanent display over two periods of three months each, of about 1,100 16-sheet d.c. bills on selected bill-posting stations in the most prominent thoroughfares in London and Greater London. For the spring and summer campaign I suggest two bills, one advertising electric cooking and the other advertising ventilation by electricity. In fair weather it is generally safe to reckon that two bills must be allowed for each position for a three months' display, so that, if the cooking bill went up first, when [a renewal was necessary the

ventilating bill could be put in its place, or *vice versa*. In winter time, an average of 2½ bills per position should be allowed, as renewals are naturally more frequent, on account of rougher weather. In the autumn campaign, I recommend the adoption of similar measures, showing first an advertisement of electric lighting and replacing it with electric heating.

The size of bill which I suggest measures 10 ft. x 6 ft. 8 in. upright. Bill posting requires thoroughly careful handling, otherwise leakages are bound to occur.

By the employment of illuminated animated signs, it would be possible to make one of the most powerful appeals to the public. Again "extensive" advertising, this follows on the same course as bill posting. It never fails to attract, as it stands out in strong contrast with the darkened surroundings, and we, as an industry, have every facility for the production of novelty in this direction. Positions should be chosen with every care, and our appeal made in the most animated form possible. After a suitable "run" in the metropolis, the signs could be re-erected in prominent provincial centres, and so go on perpetually doing good.

Rents for good positions are usually heavy, and this fact, combined with the excellent publicity value obtainable, would prompt me to allocate two-twelfths of my proposed expenditure for this particular purpose.

The proposed Publicity Association should do the "extensive" work only; its establishment need in no way interfere with the individual efforts of supply authorities, manufacturers or contractors, each of whom would continue to advertise "intensively" as hitherto.

Individual efforts, whilst highly desirable, are not sufficient; results of infinite value might be obtained by co-operation. Local efforts might interest a town, but a general campaign would set the nation thinking.

It is a policy which has been openly advocated for some time past by several of the electrical trade journals.

#### DISCUSSION.

MR. W. E. WARRILOW said that this important subject had already been hammered at during a recent discussion in London on the wider uses of electricity. The Press men had also been hammering at the same thing in their columns, and endeavouring to bring about the crystallisation of the various interests concerned. The gas people had already got ahead on this matter, the B.C.G.A. having pursued a line of action for some time similar to that suggested by the author. The B.C.G.A. levied a toll on its members based upon the output of each undertaking, and was supported by the municipalities and gas companies throughout the country. The Electricity Supply Publicity Committee was supported by the London companies by contribution, but he did not know of any Municipal Supply Committee which subscribed direct to that body, though the municipalities purchased pamphlets and booklets from the Committee. The fact that the I.E.E. had formed a Publicity Section, showed that the manufacturers were getting together on a most important question. The author had suggested that the London and Provincial papers would write up electrical notes on the same lines as cycling and fashion notes; he did not think this procedure would appeal to the public. In the case of money spent by the Gas Association, there was nothing to show that they had been able to influence the Press to put in articles and notices as to the delights of gas. Many firms who had been purchasing space for many years, had used this space for communicative articles set up in almost the same type as the text of the paper. The B.C.G.A. did not advertise electricity in any way by depreciating it, and in advertising electricity the advertisements should be free from reference to gas matters. Station engineers did not care for stereotyped material. They preferred to add local colour to the publications, and in view of additional business, to give the order for printing to a local firm. The central information bureau should act almost entirely in an advisory capacity.

MR. A. G. SEAMAN said it was only by making people realise that something greatly to their advantage was offered that they could push the industry along, and the time was now ripe for so doing. The domestic applications of electricity were rapidly coming within the reach of an ever-increasing circle of people, and these facts ought to be brought prominently to the public notice. The expenditure necessary for carrying out such a scheme of publicity would have to be borne by all concerned in the industry, and a combined effort would be essential in order to carry out a comprehensive and thorough campaign.

MR. F. C. RAPHAEL said it was obvious that to advertise electricity more fully would benefit everyone concerned, and it was only a matter of ways and means. Had the author really thought out, not the desirability of such an association, but whether the proposition was within the bounds of practical politics? What would he offer to members who joined the Association? The whole industry would benefit equally, whether they joined the Association or not; and the only benefit that members would obtain would be advice gratis, which was never well received. Publicity literature was also offered at reduced rates, but, as already stated by a previous speaker, a great many engineers preferred to buy this locally. In his opinion, the author would find much difficulty in forming such an Association as was suggested. He had some time ago tried to make much of the point that advertising in the daily Press should be indulged in to a greater extent. If every electrical supply undertaking would contribute an average of £50 a year, a sum of about £25,000 a year would be available. The figure quoted in the paper for daily Press advertising was not enough. Local advertising was permissible, but he did not know whether in municipal undertakings this power was extended to general

advertising. Billposting should not be carried to excess. Press advertising was much more remunerative and warranted a much larger proportionate outlay. Notices written by an advertiser were nearly always recognisable, and they could only be made unrecognisable by much labour on the part of the sub-editor to whom such duties were usually relegated, and further, the advertising man did not look kindly upon such mutilation. There was more friction and trouble in connection with these "puff" notices than in connection with any other branch of paper work, and they were more difficult to handle than any amount of technical work. The same applied to some extent to daily Press work. If it was desired to get electrical notes into the daily Press, they must have first-class lectures by first-class lecturers, embodying new ideas on electrical subjects. He did not believe in the ordinary showroom, and considered it an inefficient way of selling goods. If a supply undertaking had a showroom it should be able to sell the articles displayed.

MR. B. WELBOURN said that in the United States and Canada much greater use was made of electricity by the public than at home. He was not convinced that there was need for the Association suggested, but he did think that the scheme should be placed under the auspices of the parent Institution. Manchester appeared to be a much more central position for an association headquarters than London. The author appeared to lay too much stress on the domestic uses of electricity and not enough on the power side of the industry. There was nothing like the electric iron for bringing home the advantages of electricity for domestic purposes. In the case of a large London supply undertaking, a striking feature of the last year's business was the extraordinary number of extensions to installations for both lighting and power purposes.

MR. F. WALKER did not think the author went far enough in speaking of a total outlay of £30,000. Many firms spent that amount individually on advertising in a single year. A recent exhibition in Scotland cost £200 for a week, and the engineer made the manufacturers pay most of the bill. The advertising of the domestic uses of electricity was primarily for the purpose of selling electricity, and, in consequence, was a supply company's job. The electricity supply undertakings were far behind the gas companies in advertising the sale of their product.

MR. A. J. GREENLY said that everyone agreed that there should be such an association, but would it control the advertising manager and advertising, or would it confine itself to the raising and administration of funds? The present Publicity Committee saw all advertisements and passed on all ideas for advertisements, and the result was not what it might have been. He thought the best way of obtaining new power consumers in all trades was through the medium of the trade organs.

MR. L. F. K. HOLMAR said the point at issue appeared to be the getting of funds for the propaganda. The settlement of the different methods of advertising to be adopted would not be a difficult matter.

MR. F. SELLS approved of the principle of co-operation. If the idea were possible at all, it should be handled by an independent association; in the event of a subject of this kind being tacked on to the Publicity Committee of the I.E.E. and left half done, nothing further could be done. London was not the right centre for a movement of the kind suggested; if the meetings were held in London, the provinces would hear nothing further of the matter. Most of the money for the big electrical exhibitions, which had done a good deal of good to the industry, came from the manufacturers. A scheme of the kind proposed should be supported mainly by the supply undertakings. The attitude of station engineers was shown by their absence from the meeting; they were usually present when curves and technical papers were under discussion, but there were very few present to listen to a discussion on a purely commercial question. Mr. Sells agreed that showrooms did not help selling, they were bound to be a failure.

MR. S. RENTELL agreed with Mr. Sells in regard to showrooms. As already stated, the gas undertakings contributed towards their association, and there was no apparent reason why the electricals should not, through the M.E.A., adopt electrical advertising in a simple way on a similar basis.

The AUTHOR, in reply, said that many of the details in the paper had brought forth useful criticism, but it was not his intention to go further than indicate methods whereby a start might be made. He wished to emphasise the fact that he did not ask for editorial "puffs," as it would be quite possible to supply information to the Press generally in such a way that they would be glad to make use of the information as news purely and simply.

**A Curiosity Abolished.**—Visitors to Bournemouth, especially electrical men, will have noticed with great interest the old method of trimming the arc lamps on the very high poles which are so distinguishing a landmark of the town. Three men pushing a truck, containing a large cage, used to proceed to the foot of the mast; the cage was got into position, and all hand-lowered a circular attachment, which was normally kept suspended at the top. The cage was hoisted with one man in it, who proceeded to trim and clean the lamps at the top of the pole. Now, this has all been done away with, and the modern, safe, and cheaper method of lowering the lamps has been substituted. The work, including erection, was done by the London Electric Firm, using their well-known patent contact-suspender and self-sustaining winch.

## LEGAL.

## EDINBURGH TRAMWAY COMPANY'S APPEAL.

THE First Division of the Court of Session has decided not to disturb the verdict of the jury in the action by an Edinburgh grocer who sued the Edinburgh and District Tramways Co., Ltd., for £1,000 damages in respect of injuries sustained by his son. Pursuer attributed fault to the defenders in respect that the driver of a car failed to keep a proper look-out and give warning of the approach of the car. Defenders denied fault and pleaded contributory negligence. The jury awarded pursuer £200 damages and the company applied for a new trial, but the First Division held that they could not disturb the verdict of the jury.

## ELECTRICAL SUPPLY APPEAL CASE IN THE LORDS.

THE House of Lords has been occupied with the appeal in the case London Electric Supply Corporation, Ltd., v. Westminster Electric Supply Corporation, Ltd. The matter is part heard, and will come on again to-day, when, in all probability, judgment will be reserved.

## SLANDER ACTION AT ABERDEEN.

IN the Second Division of the Court of Session, Lord Hunter heard counsel on the question of the allowance of issues for jury trial in an action by Mr. James Alexander Bell, M.I.E.E., M.I.M.E., electrical engineer of the City of Aberdeen, against Mr. Alfred Edward Milne, solicitor, 31, Adelphi, Aberdeen, hon. secretary of the Aberdeen Branch of the Electrical Contractors' Association, for £1,000 damages for alleged slander in respect of a letter written to the town clerk.

MR. WILTON, counsel for defender, argued that there was no issuable matter, and that the action should be dismissed. Quoting from the concordance, he said: "In carrying out his work, the pursuer was recently applied to by Mr. Alex. Davidson, solicitor, to advise him regarding the installation of a system of electric lighting and heating at his house, Broomhill Park, Aberdeen. Mr. Davidson had received an offer from Messrs. A. B. Robertson & Son, plumbers, Aberdeen, to execute the work of merely wiring in wood-casing, exclusive of lamps, distribution boards, or fittings of any kind. The pursuer, when thus applied to by Mr. Davidson, gave it as his opinion that the charge was excessive and that the installation could be carried out at a very much lower rate per point."

Counsel for defender next read the following letter (in which, he said, the alleged slander was contained), to Dr. Gordon, the town clerk, from 31, Adelphi:—

Aberdeen, November 27th, 1912.

## ELECTRICAL CONTRACTORS' ASSOCIATION.

Dear Sir,—At a meeting of the above Association, held on Tuesday, 26th inst., the members had under discussion a complaint by one of the members against Mr. Bell, city electrical engineer.

The circumstances are as follows:—One of the contractors had been asked to tender for an electrical installation in Aberdeen. The gentleman for whom the work was to be executed met Mr. Bell, and in course of a conversation between them Mr. Bell expressed himself very strongly on the question of the immoderate cost of the installation in Aberdeen, and in reference to the particular contract stated:—"The work is done, and well done, in Edinburgh for 12s. 6d. per point, while your rate is 22s." Following upon this conversation the contractor received a letter from his client, in which he stated:—"I have no choice but to take in competitive offers, or throw up the whole idea if—for the reason indicated by Mr. Bell—none of the offers is at least moderately fair."

From the above you will, no doubt, observe that Mr. Bell has made very grave and slanderous charges against the Aberdeen contractors, reflecting upon their honesty. The Aberdeen contractors emphatically deny that work of the same quality and materials can be done at 12s. 6d. per point, and in evidence thereof refer you to any of the leading architects in Aberdeen, or to the Glasgow contractors, whose charge for the same work is from 25s. to 27s. per point. It will be within your recollection that similar charges were made by the city engineer in reference to the City Hospital contract. In particular, he stated that that contract could be done for half of the amount of the lowest Aberdeen tender, and in support of his contention he invited tenders from the south, which all exceeded those made by the Aberdeen contractors, thus conclusively showing that Mr. Bell's knowledge of electrical contracting work was very elementary.

Apart from this, however, the members consider that it is out-with the jurisdiction of the city engineer to interfere between contractor and client, and that all along Mr. Bell's attitude towards contractors has not been conducive to harmonious working between ratepayers and the official of a public department. In this particular case, Mr. Bell has asked one of his assistants to make a full specification for the electric installation. Mr. Bell and his assistants are paid salaries to look after the ratepayers' interests, but not to take work out of the contractors' hands. His actions, I am sure, must appeal to the members of the Town Council as most intolerable. In Glasgow, where there are many more contractors than in Aberdeen, the relations between the city engineer and the contractors are of a most harmonious nature, and there each endeavours to help the other as much as possible: whereas in Aberdeen there seems to be continuous trouble between the city engineer and the contractors.

Matters have now come to such a pass that steps must be taken to safeguard the interests of the contractors. They consider that they are being most harshly and unfairly treated by the city engineer, and they respectfully beg that the members of the Council will take such steps as they deem best for the protection of the contractors and the safeguarding of their interests.

I shall be glad if you will submit this letter to the Council at their meeting to be held on Monday first, and shall be glad to hear from you.—Yours faithfully,

A. E. MILNE,  
Hon. Sec.

Counsel (proceeding) said Mr. Cooper must admit or deny the truth of the statements he had read.

MR. COOPER, K.C., for pursuer: I say the whole of the statements are false and untrue.

LORD HUNTER: I see no reflection upon anyone's honesty. Supposing you extract a slanderous meaning from an innocent expression, can you describe that as in itself slanderous? It says that in Aberdeen they desire such heavy profits that they want twice as much as what contractors in Edinburgh want. That might be an idiosyncrasy of Aberdeen.

MR. WILTON said it was maintained by the other side that the letter imputed to the pursuer ignorance, incompetency and want of skill in professional duties, but he submitted it was not innuendo borne out at all by the particular passage in the letter. It merely meant that this gentleman had held his position for 15 years, that the electrical trade had developed very much since then, and although he might have been well up in matters at that particular time, he apparently was not abreast of modern conditions. Counsel submitted that the letter, on the whole, was a most reasonable production, and contained no malice and no excessive language.

LORD HUNTER: That would be a privileged letter.

MR. WILTON: Yes: I submit that there must be malice, and there are no facts so far as this particular defender is concerned inferring malice.

A reference by counsel to the Trades Disputes Act, 1906, drew from his Lordship the observation that it would require very strong authority to convince him that, if the letter was slanderous, the Act of 1906 protected the defender.

MR. LIPPE, counsel for pursuer, pleaded that all the issues should be allowed. He quoted a Trade Union precedent where it was held that although the law protected the Trade Union, it did not protect the official who was the mouthpiece of the Union in uttering a slanderous statement. There was nothing in this case in the fact that defender happened to be a solicitor. He was there simply and solely as an official of a Trade Union, by whose hand the injurious statements were written reflecting upon the character of the pursuer. Referring to the third paragraph in defender's letter, Mr. Lippe pointed out that defender did not say, "In my opinion your electrical engineer does not have a great knowledge of his duties," but rather, "It conclusively shows he has a very elementary knowledge of his business." That, counsel thought, had been held in a case much weaker to be a direct charge of incompetency against a person in his professional duties. The Association took the opportunity to write to pursuer's employers to say that "this servant of yours knows little or nothing about the duties he has to perform"—clearly with a view to injuring him. If he had been dismissed for incapacity, what chance would he have had of getting another situation? The slander, if it was slander, was one of the gravest character. Accordingly he held that the language employed in the letter would amply bear the innuendo which the pursuer put upon it—that of "ignorance, incompetence, and want of professional skill." Therefore, he contended that the first issue should be allowed.

Counsel, proceeding, said there could be no possible privilege.

LORD HUNTER: If you interfere with individual members of an Association and the interests of these members, the secretary of the Union may have an interest.

MR. LIPPE: But I don't see how that will give him a privilege.

LORD HUNTER: It may arise from the circumstances.

MR. LIPPE argued that defender himself, not being a member of the Electrical Association, cut himself adrift entirely from the plea of privilege. What privilege could he have except the privilege of his Association? He did not see how defender was different from any private individual in Aberdeen. He got no benefit from the Association.

LORD HUNTER: Do you aver that in writing the letter he exceeded instructions?

MR. LIPPE: My contention is that defender cannot claim privilege and throw upon us the onus of imputing malice.

LORD HUNTER: Any member of the public would be entitled to write.

MR. LIPPE: What right would the man in the street have to interfere in a dispute between the Electrical Association and the electrical engineer? If an ordinary member of the public had written a letter of this sort he would have pleaded in vain that he was privileged. In regard to the second issue, counsel's contention was that it was slander to say of another that he had committed slander. Defender distinctly charged Mr. Bell with having uttered slanderous charges. In their concordance they said:—"The letter further falsely and maliciously states that pursuer was guilty of making very grave and slanderous charges against the Aberdeen contractors reflecting upon their honesty, and that he has made similar very grave and slanderous charges on a previous occasion." If defender had charged them with saying that and it was not true, counsel thought it was perfectly obvious that that was a slander committed against them. Therefore the second issue, subject to his Lordship's suggestion as to the innuendo, should also be allowed.

MR. WILTON said it was not disputed that the letter was written

so that the facts might be put before the Corporation. Plainly no malice was attachable to the association and the members of it, and equally no malice was to be attached to the solicitor or other official who was asked to convey the information. Surely a trader had a right to complain to the Corporation of the actings of one of their officials?

LORD HUNTER: Not in respect of his actings towards a different member.

MR. COOPER, K.C., for the pursuer, said their contention was that the so-called criticism in the letter was not criticism founded upon facts accurately set forth. Defendant did not merely indulge in his letter in criticism, but he went into a criticism which was *per se*, and apart from everything else, libellous. Every day, he supposed, people were saying that particular people were charging too much for what they were doing. That was not a charge of dishonesty. If the defender had said that it was very unfair of Mr. Bell to go and do these sort of things that would have come within the region of fair comment upon facts accurately set forth, but he attributed to Mr. Bell the levelling of slanderous charges against Aberdeen contractors. The idea that a body holding extraordinary protection under the law could constitute itself a sort of censor on the public officials of a town, and although not monetarily interested in the matter at all, could send libellous letters to the Town Council about their officials, was a monstrous one. Regarding the question of privilege, he submitted that the defence had not produced a single authority that came within miles of the position.

LORD HUNTER reserved judgment.

#### DAMAGES AGAINST THE LONDON ELECTRIC RAILWAY CO.

IN the King's Bench Division of the High Court, on Monday, Mr. Justice Coleridge and a Common Jury heard an action in which Mr. Daniel Badcock, of Winchendon Road, Teddington, sued the London Electric Railway Co., Ltd., for damages for personal injuries.

Mr. Badcock's case was that, owing to a defect in the footway leading to the Bakerloo Tube at Waterloo, he fell and seriously injured his right shoulder, and Dr. E. R. Dawson, of Teddington, who gave evidence in support of the claim, said the use of the joint was permanently impaired.

The railway company disputed the claim, with a contention that the accident occurred on a part of the path that did not belong to them, but the jury eventually returned a verdict in favour of Mr. Badcock for £172 damages, and judgment was entered accordingly.

HIS LORDSHIP granted the railway company a conditional stay of execution, with a view to a possible appeal.

#### OSRAM LAMP PATENTS.

IN the Chancery Division, before Mr. Justice Parker, on Friday, February 21st, the alleged infringement of Osram lamp patents was the subject of a motion for an interim injunction.

MR. HUNTER GRAY, counsel for the Osram Lamp Works, Ltd., Brook Green, Hammersmith, plaintiffs in the action, said he was moving for an injunction to restrain the defendant, M. L. Apple, from selling lamps which the plaintiffs contended were an infringement of their lamps. He understood that the defendant, who was appearing in person, had filed one affidavit which he would read, and that defendant would produce evidence at the trial with the object of showing that an essential difference existed between the Osram lamps and the Brewer lamps sold by the defendant. The filaments used in the Osram lamps were made by a chemical process, and the plaintiffs had evidence to show that that process was infringed. Counsel then read the affidavit of Dr. Oberlander who had examined the Brewer lamps. The affidavit was as follows:—"The whole of the lamps examined by me contain filaments made of tungsten, and from my examination I am satisfied that the process adopted in the manufacture consisted in mixing finely divided tungsten with an organic binding medium, subsequently carbonised, and that the greater part of the carbon was afterwards removed therefrom chemically. I know of no method of commercially effecting such chemical removal other than by the use of an atmosphere of steam and hydrogen as described in letters patent 23,899,\* 1904, or the use of hydrogen and nitrogen as described in letters patent 18,622 of 1906."

Counsel then read defendant's affidavit in reply. Defendant said that Dr. Oberlander's expert opinion in the use of the words "finely divided" was too general, and was misleading. He (counsel) submitted that that was no answer, and that a chemical process was involved in the Brewer foreign-made lamps. Defendant got his lamps from abroad, but did not say in his affidavit by whom they were made nor by what process. The case was curious, in that it was impossible by analysis to find out the exact process involved. But he contended that where there was carbon left in the finished filament, then that filament could not have been made without infringing one of the two processes covered by the Osram patents.

THE DEFENDANT, addressing his Lordship, said that, as a matter of fact, he did not supply Osram lamps or lamps like the Osram lamps at all, either by himself or by agents. His lamp was of an entirely different make, and the plaintiffs were a great company, who merely wanted to crush him down. He was fully prepared to offer evidence to prove that his lamps were entirely different.

MR. JUSTICE PARKER: You will have full opportunity to do that at the trial.

Defendant, who was a foreigner, said something in reply which was inaudible.

HIS LORDSHIP: You don't say how your lamps are made, though you say you are prepared with evidence, and I am afraid I shall have to restrain the sale of your lamps pending trial. But you will have an undertaking as to damages from the plaintiffs, and if your contention is right you will recover heavy damages.

Defendant repeated that he did not sell Osram lamps.

MR. GRAY: He (meaning defendant) is one of those gentlemen who gets his lamps from abroad, and it is practically impossible to stop them.

HIS LORDSHIP, in granting an injunction, referred to the defendant's affidavit, and said that though defendant swore that he got his lamps from abroad, he did not condescend to say how they were made nor by whom. That was not satisfactory, although he said he was going to give evidence at the trial, for it was impossible to say from what source that evidence was coming. He would, therefore, grant an injunction pending the trial with a proper undertaking as to damages. Costs of the motion to be costs in the action.

HIS LORDSHIP to the defendant: "You must not sell these things pending the trial, and you quite understand that if you are right you will get damages."

#### ISAACS v. CHESTERTON.

AT Bow Street Police Court, on 20th inst., Sir Albert de Rutzen granted a summons on behalf of Mr. Godfrey Isaacs, managing director of the Marconi Wireless Telegraph Co., Ltd., against Mr. Cecil Chesterton, editor of the *New Witness* (formerly the *Eye Witness*), in respect of a series of libels published between October, 1912, and January, 1913. The hearing began on Wednesday, February 26th.

#### OSRAM LAMP CO., LTD. v. SCHLOSS.

IN the Chancery Division on Friday, February 21st, before Mr. Justice Swinfen Eady, Mr. Gray mentioned a motion in this action which, he said, was to restrain infringement of patent. Defendants, however, required further time to answer evidence; and plaintiffs, with his Lordship's sanction, were disposed to give them another week.

HIS LORDSHIP granted a week's adjournment.

**Austria's Foreign Trade.**—The foreign trade of Austria in electrical goods during the year 1912 was of a satisfactory character, the imports showing an increase of 10,000,000 kronen, and the exports of 2,500,000 kronen. In detail, there was an increase of 30 per cent. in the imports of dynamos, low-pressure apparatus, measuring and calculating instruments, glow lamps, high-pressure apparatus and carbons; of the imports, 90 per cent. came from Germany. The exports of dynamos reached values more than double those of the previous year. A considerable rise marked also the exports of switch and contact appliances, cable and wire. On the other hand, only a moderate increase was shown in the shipments of glow and arc lamps and carbons compared with the previous year. The shrinkage in the export figures is due less to the falling-off in the Eastern, than to the declension in the general European, shipments. The exports for the year totalled 76,028 quintals, of a money value of 41,556,900 kronen, of which dynamos stood for 42,599 quintals, worth 14,480,800 kronen. The exports were 37,982 quintals, valued at 12,532,200 kronen, of which dynamos were 6,150 quintals, of a money worth of 1,344,100 kronen. As stated previously, Germany almost monopolises the Austrian import trade, 10 per cent. of it only being left to other countries, of which Switzerland appropriates the larger portion, the British share being restricted to small shipments (27 quintals) of dynamos, motors and transformers; measuring and calculating instruments (52 quintals); electric lamp fittings (23 quintals); electrical apparatus (200 quintals); cable and insulated wire (30 quintals); and carbons (58 quintals). The chief customers for Austrian exports of electrical goods were the Balkan States, Greece, Russia, Italy, Turkey, Egypt, Spain, the United States, &c., England's small purchases comprising glow lamps (451 quintals), cable and insulated wire (409 quintals), gutta-percha-covered cable and wire (36 quintals), asbestos and paper-covered cables and wire (304 quintals), and carbons (2,052 quintals).—*Elektrotechnik und Maschinenbau*.

**Cinematograph Films of Cable Manufacture.**—We are informed that the A.E.G., of Berlin, have just produced a series of cinematograph films showing the process of manufacturing electric cables from start to finish, and are prepared to lend these films to technical Societies and Institutions for lectures. Every stage of manufacture is shown, from the arrival of the copper ingots to the dispatch of the completed cable, and the A.E.G. have prepared an explanatory lecture to accompany the exhibition of the films. If necessary, they are willing to send an expert to deliver a special lecture. The company only provide the films, and societies using them must make their own arrangements for exhibition, and must provide the apparatus. If possible, the exhibition should take place in a properly equipped cinematograph theatre, but if an ordinary lecture hall is used, care should be taken to keep down the noise of the apparatus as much as possible, so that this does not interfere with the delivery of the lecture. Most of the pictures being of interiors, it is recommended that a 70-ampere projector lamp be used, in order to give the necessary clearness to the pictures on the screen. Application for the loan of these films should be made early to the ELECTRICAL CO., LTD., Charing Cross Road, London, W.C., the British representatives of the A.E.G.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

**New Showrooms.**—The full provision made by the GENERAL ELECTRIC CO., LTD., for the display of various classes of its manufactures has been increased by the opening of a show-room in the basement of 71, Queen Victoria Street, E.C., where there is on view a comprehensive exhibit of arc lamps and accessories, Witton motors and machinery, ventilating and engineering supplies, telephones, electric light supplies, switchgear, &c. The new show-room is open for inspection by the public, and contractors are invited to send their clients to view it. The exhibits are set out on stands down the centre and round the sides of the rooms, the arrangement being such as to give every opportunity for close inspection. A large proportion of the apparatus is wired up, and can be seen in actual working.

**Osram Costumes.**—During the past few months an "Osram Lady" or an "Osram Man" has put in an appearance at entertainments, dances, balls, skating rink carnivals, &c., and we understand that those who have availed themselves of the outfit provided by the publicity department of the GENERAL ELECTRIC CO., LTD., have found it an easy matter to make up fancy costumes sufficiently attractive to win prizes. We have received illustrations showing several simple, attractive combinations of Osram literature and lamps, which have been affected by prize-winners at Watford, Long Ditton and Weybridge carnivals, but the literature lends itself to many other attractive designs.

Contractors' Column	Advertisement pages xxiv, xxvi and xxviii	

DURING the past year, in connection with the electrical industry, a fact has again been noticeable which has from time to time recurred in a striking manner. Concurrently with the reports of abundance of work and general signs of progress everywhere, the statement has been persistently made that the wages to skilled employes have been low. For proof of this statement one has only to turn to the "Correspondence" columns of the ELECTRICAL REVIEW and note the comments which have been made upon the salaries of central-station assistants.

This raises an important problem in the economics of the electrical industry, and indeed of most modern branches of skilled labour, and without in any way professing to discover a remedy, it may be advisable to emphasise truths which have before been enunciated in these columns. To do so we may venture to use a metaphor even at the risk of the accusation of poetical tendencies. Where a complete rainbow is seen, certain portions of the landscape at its beginning and end are apparently transfused with a peculiar glamour caused by the prismatic effect of the light coming from that direction. In the same way, we venture to say that those portions of industrial activity which correspond with the beginning and end of the developmental period of a branch of industry, present features of unusual interest that draw particular attention, and as the tendency to run in masses is a human instinct which is almost irresistible, we observe great quantities of promising material gravitating either in the direction of the initial stages of a new branch of industry or to the opposite pole when the industry becomes stereotyped. In both these directions lie the fewest opportunities; the greatest opportunity lies in the somewhat humdrum region intermediate between these two extremes, when prosaic development is actually and steadily in progress.

We believe this fact to be so important that we think it worth while to insist upon it a little further, and in doing so we will deal first of all with the initial stages of the development of an industry. It is hardly necessary to remind our readers that fortunes have been repeatedly lost in experimenting. As one somewhat cynical authority has stated, "First steps are the most dangerous, because they are usually taken innocently." There is, however, a great temptation, immediately a new form of industry appears to be developing, to get into the new movement as quickly as possible, regardless of the fact that unforeseen and unestimated dangers lie in front which may wreck the most promising career. Even at the present day we believe we are correct in saying that the aeroplane industry, which is so new that it cannot be called fully standardised, and has hardly reached the point of commercial utility, has become swamped with young men tendering their services at nominal wages, and even offering premiums in view of advantages

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEEERAT, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

which they may reap if they succeed in reaching a decent post in the problematic future.

Turn to the other extreme. It is equally fatal to enter a profession when that profession has become a stereotyped affair. During the days of the renaissance of learning, the term "clerk" was one that signified culture and deep reading. It was a title of honour. In the present day, when free education has turned its myriads into poorly paid office positions, the term "clerk" has been shorn of much of its dignity. It is a well-known fact that in most of the older professions, in which there are no new developments and which are reckoned respectable and safe, the entrant pays for his respectability by having to wait for dead men's shoes. There is probably not to be found in the whole country a more respectable, hard-working and intelligent body of skilled men than in the banking profession. On the other hand, the salary received by a bank clerk for a very considerable part of his life is notoriously low. These are used as illustrations of the principle that we are trying to lay down that after the stage of development has passed, it is a mistake to enter a profession with the idea of making money. In engineering we have the case of the central electric power station, which is nowadays to a very large extent a standardised production. Hence, in very many cases (with notable exceptions), wages are low on the part of the operating staffs. Where dissatisfaction as to remuneration occurs, it is worth while ascertaining whether on the one hand the industry referred to is in its pioneering stages, or on the other it is in such a state of standardisation that there is no room to move.

We have laboured these points somewhat, because it is necessary to drive home the truth that the greatest chances of success are in the intermediate stage of steady development, and unless a man can get into some employment where such development is proceeding, he stands a minimum chance of success. It is even better, rather than to go into a pioneering industry too soon, to go into an old industry with a new training. For example, it is quite conceivable that a bright engineering student with a thoroughly good grasp of mechanical principles and up-to-date methods of doing work would make a success financially of such an old-established branch of mechanical engineering as ordinary mill-wrighting work, provided that he brought to bear upon that old profession modern methods. In other words, success, as a rule, in an engineering career depends on doing an old thing in either a better, a quicker, or a cheaper way, and it is here that the prosaic stage of development of industry lies. Here it is also that the money is to be found.

We would like to leave the subject at this point. Readers who examine the argument will find in practice a large number of instances of the truth of the principle laid down, and as nothing is more important to a man than a clear idea of his objective, it has been considered worth while to put forward these remarks, not in a dogmatic spirit, but in order that they can be thoroughly discussed. It is pitiable at the present time to see the enormous waste of good material which is going on among the personnel of engineering activities. Many a good man has been stifled through being in the wrong place, and the reason for his being in the wrong place has been that he has attempted to make his fortune at the ends of the rainbow instead of steering for the middle region.

#### Constantinople Electrical Schemes.

It is advisable that the fact should not be overlooked that the recent grant of a concession for the construction of an underground railway in Constantinople forms part of an international combination for the amalgamation of certain interests in the Turkish capital, which has been proceeding for some time past. The combination, which is specially attributed to the efforts made by the Belgian Société Financière de Transports and the Banque de Bruxelles, bears the title of the Consortium de Constantinople, with headquarters at Brussels, and its technical management is, or was, in the hands of the Société Financière de Transports.

As will, perhaps, be remembered, the Consortium or its associated group already owns the Constantinople tramways, which have been converted to electric traction; the Galata-Pera tunnel railway, which was purchased from an English company; the Stamboul Gasworks; and the Ganz electric lighting concession. The addition of the proposed underground electric railway from Taxim to Bajadiz apparently completes the schemes, which are expected to involve an expenditure of £3,600,000. At least, this is the total share and loan capital which was nominally subscribed a few months ago by the numerous members of the Consortium, which is led by the Deutsche Bank. One portion of the capital has been formed by the assets brought in by the tramways, gasworks and lighting concession, whilst the remainder has been subscribed by four subsidiary groups. Besides the Deutsche Bank, the German list contains the names of 15 other financial institutions, including the Electric Light and Power Investment Co., of Berlin, and the Electrical Enterprises Co. of the same city. The Belgian group contains 11 names, inclusive of those of the two banks previously mentioned; the French group also comprises 11 names, of which the Imperial Ottoman Bank, the Banque de Paris, Comptoir National and the Compagnie Française Thomson-Houston may be cited; whilst Switzerland is represented by the Zurich Bank for Electrical Enterprises and the Swiss Crédit Anstalt. It has, however, to be borne in mind that the Consortium is merely a preparatory syndicate for the Union Ottomane, Société d'Entreprises Electriques à Constantinople, which was formed last September, and which will presumably be required by its interested group to proceed with the construction of the underground railway when circumstances are favourable.

The fact that the railway concession has been entrusted to the Consortium is not particularly new in itself, as it was reported last autumn that the Consortium would be victorious over the rival scheme which was promoted by the French Omnium group, headed by the firm of Perrier & Co. As affairs now stand, the Germans expect to receive a considerable portion of the orders for the execution of the work, whilst the balance may be the share to be allotted to French and Belgian works.

#### Manufacturing in Russia.

ACCORDING to reports circulating in interested circles in Russia, the electrical manufacturing companies of German origin in that country, in which Teutonic capital of considerable amount is invested, experienced very favourable working results in 1912. On the one hand, it appears that quite a number of central stations were carried out in different towns, in consequence of the municipal authorities being able to raise loans for the purpose, and several of these loans were floated in England. The latter cases, therefore, represent further examples of British capital being advanced in order to provide contracts for German works. On the other hand, extensive orders were placed with the electrical firms by manufacturing works in which the use of electric light and power is being extended, and the long-expected orders from the Government authorities also provided good employment.

A further step in connection with the consolidation of the foreign undertakings in Russia is in contemplation. Several years ago the Helios Co. was compelled to suspend its

Russian branch, and a little later the separate cable departments of three works were combined in the form of the United Cable Works Co. Now the Russian Siemens & Halske Co., which has a share capital of £560,000, is to be merged into the Russian Schuckert Co., whose share capital amounts to £300,000. It was only in 1912 that the latter company made an issue of £100,000 for the purpose of defraying the expenditure incurred on extensions of works, and thus advanced the total to £300,000. The dividend paid in 1909-10 and 1910-11 was 4 per cent. for each year, and 5 per cent. was distributed for 1911-12. On the other hand, the Siemens & Halske Co. paid 5 per cent. in 1909, 5 per cent. in 1910, and 6 per cent. in 1911. This company has also made large extensions of works in recent years, and has developed its scope of activity by participating in various undertakings.

The combination of the two companies, which takes the title of the Russian Siemens-Schuckert Works, found its counterpart in the case of the parent undertakings in Germany a few years ago. It is intended to be carried into effect by increasing the share capital of the Schuckert Co. by £1,200,000 to £1,500,000, and the object is to facilitate financially the solution of the lighting, power and traction problems arising in that country. The Russian Allgemeine Electricität Co., which is the only remaining German manufacturing company of importance, now has a share capital of £1,200,000, of which the sum of £400,000 was issued last November. The rate of distribution paid was 6 per cent. in 1909, 7 per cent. in 1910, and 8 per cent. in 1911, whilst from 9 to 10 per cent. is expected for 1912.

### Electric Cooking.

THE paper read before the I.E.E. by Mr. Wilmshurst, which we abstract in this issue, and the interesting discussion

which followed, are welcome indications that the subject of electric cooking is now receiving serious attention at the hands of central-station managers. It will be noticed that there is general agreement on the necessity of letting out the larger apparatus on hire, a proposition which we have frequently supported; there is no doubt at all that that is the method which has enabled gas suppliers to develop their cooking load to such an amazing extent within the last 10 years, and there is no other way to do it. As we have pointed out, this involves the manufacture of electric cookers in quantity, on standard lines, and at the lowest possible cost. Those firms which realise the need and lay themselves out to meet it satisfactorily will be the firms to profit by the developments which will follow. So long as the manufacturers wait for the demand before making the plunge, and the would-be users wait for the reduction in price, we are merely travelling in a "vicious circle," and no progress can be made.

We are glad to note that the design of the heating elements—the crux of the problem—is steadily improving, and that want of reliability no longer avails as a serious argument against the use of electric cookers. The remarkable guarantees that some makers are now prepared to give with their heating elements sufficiently indicate the advance that has been made. The importance of standardisation will make itself felt more and more as electric cooking becomes more popular, and makers ought to give close attention to this subject, though at the present stage of evolution it would be premature and ill-advised to attempt to formulate rigid standards. However, each maker can at least see to it that his own products follow some systematic order, which will enable users to replace parts of their apparatus at any time at the minimum of expense.

We believe that the splendid pioneer work that has been, and is being, done by the gas suppliers not only affords most valuable guidance to electrical men, but is of direct service to the electric cooker, for the public, having learnt to appreciate the convenience and efficiency of the gas cooker, will find it a short and easy step onward to the greater convenience and efficiency of the electrical apparatus, which is free from the offensive fumes and dirt which, beyond question, are the usual accompaniments of a gas cooker.

### HINTS FOR ELECTRICIANS.

By E. A. BELCHER.

It very often happens that the electrician in charge of a number of motors finds, on testing a direct-current motor with a Megger, that the armature has developed a bad earth.

As very few have the advantage of a supply of alternating current to turn to, the following tip may prove of use: the writer has been able to locate and repair faults, thereby saving an enormous amount of valuable time and expense, when otherwise there would have been no alternative but to return the defective armature to the makers, thus stopping machinery for an indefinite period and incurring the wrath of his employers for not being able to effect a repair, as half of them cannot understand what is wrong, when to the eye nothing appears amiss.

Having removed the armature from the frame, proceed as follows:—Connect up wires to armature as in fig. 1, having in circuit a low-reading voltmeter; the writer uses a central-zero cell-testing meter. Put a lamp of small candle-power

FIG. 1.

into holder (this is essential, as using too big a lamp may spoil the low-reading meter, if by any chance the wires are removed from the commutator). The writer uses a 16-c.p. carbon lamp on a 200-volt circuit.

Mark the segment on which the wire is placed, and switch on current, when a certain reading will show on the voltmeter; move the wire round the commutator one segment at a time, and note the readings. Continue doing this until you find a segment or segments which give no deflection on the meter; this will be the end of the coil on which the earth is situated, and having ascertained this, it will be comparatively easy to find the exact spot.

It will be readily understood that connection is made from the spindle through the fault and through the coils to the segment; there will be a drop in volts in proportion to the size of the lamp used, and the nearer the wire is moved

FIG. 2.

towards the coil which is earthed, the less will be the drop in volts, until the faulty coil is reached, and no reading is indicated on the meter.

To find either a broken connection or a short-circuited coil proceed as follows:—

Connect the armature up to any supply, as shown in fig. 2, fixing the wires to the commutator directly opposite one another by means of a piece of string tied tightly round it. Take a cell-testing voltmeter and find the voltage drop between two adjacent segments: if the meter does not show a big enough reading, put in more lamps. The writer uses six 50-c.p. carbon lamps on a 200-volt circuit. Continue testing round, in like manner, segment by segment, until a plate is reached which shows no deflection on the voltmeter, or a very decidedly lower reading; this segment will be the end of the faulty coil if short-circuited. On the other hand,

if there is a disconnection in a coil, the readings in the faulty half of the armature will be *nil* until the faulty coil is reached, when a large reading will be obtained.

The writer has had considerable trouble with various motors to get them to run sparklessly, but has effected a cure in some really bad cases in the following manner:—

After the commutator has been turned and ground, procure a hack saw blade with teeth set to as nearly as possible the width of the mica between the segments; fit over the back of the saw, the whole length, a piece of sheet-iron in order to stiffen it, and with this cut out the mica to about  $\frac{3}{4}$  in. below the level of the commutator surface. As the commutator gets slightly scratched, finish it off by polishing with a very fine piece of emery cloth. The above does not take so long as many may anticipate, and any intelligent labourer can be easily instructed to carry out the work. The writer is in charge of over 40 motors of various horse-power, and has found the above tips very handy in time of need. No novelty is claimed for them.

## THE FUTURE OF BRITISH ELECTRICAL INDUSTRY IN NORTH CHINA.

By HSI CH'UNG CHI.

EVERY engineer who has lived in the North of China for any length of time will be painfully aware of the total lack of energy displayed by British manufacturers in placing their plant and material within reach of the Chinese. With the exception of one firm in Tientsin there is no British manufacturer who has had the enterprise to send a representative here to open an office and get in touch with the big contracts which are now frequently being let. All through the slack time during the revolution the Germans have been organising their methods of business, with the result that it is virtually impossible for British firms to compete with them.

It is of no use to quote the Chinese for engineering material unless prepared to do so delivered with all charges, duty, &c., paid, in good condition at the customer's go down, and there is no British firm in North China which is able to do so. If material is bought f.o.b. London against bills of lading, it is very likely lost during transshipment at Shanghai, and it is necessary in the case of material for towns such as Peking arriving at Tientsin, for someone to journey to the port to clear it through the Customs and put it on the train.

On the other hand, the German engineering firms are perfectly organised both at Peking and Tientsin, having a staff of commercial and technical men who are able to advise the Chinese, quote prices, deliver samples with their tenders *via* Siberia (a benefit which our Postmaster-General considers quite unnecessary), and see their cargo through to its destination, taking back all damaged material.

In the future, nearly all large Government contracts will be decided in Peking, and, under the present conditions, British firms have no earthly chance against the large German ones.

Another fatal error of our manufacturers is their treatment of would-be Chinese engineering students, and a pamphlet has been circulated in North China with the idea of inducing (?) the Chinese to send their sons to England to learn their profession.

Most of the Chinese that I have met who wish their sons to have an engineering education have selected England or America, as English is still the leading foreign language amongst the Chinese, and most of the boys learn it in the secondary schools here, but the idea of spending £220 a year for each boy puts it entirely out of the question. On the other hand, the Germans are encouraging Chinese apprentices in every way they can, and the large Berlin firms will accept apprentices from good families, pay their railway fares to Germany, article them for five years without a premium, and pay them a living wage of, I think, 10,000 marks for the five years.

In return for this when the men come back to hold good appointments, they have a full knowledge of the German language and of German plant and machinery, with a result that they recommend the purchase of German material which they understand in preference to British which they do not.

This is a matter which ought to have the serious consideration of the new British Engineers' Association, but all we have heard of that august committee of gentlemen up to the present is a great deal of after-dinner talk. If this association is to do any real good, the absurd subscription of £10 per firm per annum will have to be very considerably increased, as even if 100 firms subscribe, the revenue will be quite useless to achieve any object here.

Mr. Beilby Alston, of the Foreign Office, came out here about six months ago, but no one seems to know what good he did, as three-quarters of the engineering fraternity had no opportunity of meeting him and expressing their views. It is true that the Tientsin Englishmen gave him a dinner the day before he went away, and hoped to hear something on that occasion about future prospects for British trade, but they were disappointed, as the matter was hardly alluded to.

In conclusion, I would repeat that North China electrical engineering is almost entirely in the hands of the Germans, and it will require a great deal of enterprise to regain for British manufacturers what they have already lost through indifference and lack of enterprise.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Testing the Continuity of Earth Conductors.

Mr. Davis is correct in saying that each set of conditions should be considered separately. Referring to the bridge test, what I mean is this: Suppose I want to take a test in a section where haulages, conveyors, coal-cutters and pumps are operating, one or other, over the whole 24 hours, then arrangements for clearing switches, &c., and, perhaps, short-circuiting a mile inbye, take, say, 15 minutes, test 5 minutes, arrangements for switching on 10 minutes, = half-an-hour, or 15,000 gals. on a 500-gal. pump, walls unstripped, or a train of coal left at the pit bottom at the day's end. His "volt drop" test is only applicable where direct-current is available.

I agree with him that it would be best to use a fairly heavy current for testing, where this can be done, with alternating currents; it would be interesting to get at the "choking" effect of a tape or wire armouring. The former is spirally wound and would have a higher value than the latter, which is placed on with a lay or twist. This, however, presents no difficulty with a small testing transformer having a variable low voltage secondary.

Would Mr. Davis or "Continuity" be inclined to include this in the final result called for under Rule 8 (b) or Rule 12 (e)? I think this would be a proper test to apply with the other.

Individual conductors are mentioned under Rule 8; individual cables under Rule 12. What about the total result, with joints, cross bonds, tee connections, &c., all in series? 1 ohm often means a big difference, or even .05 ohm, on a large conductor.

Again, are we bound down to operating at 1,000 amps. to the square inch? The L.E.E. standard makes a considerable difference on the smaller sizes. This increases the volt drop on the armouring in the event of a fault, when the current is flowing.

It would simplify matters if Mr. Davis and Mr. Field would agree with me that it is practically impossible to have a fracture on the armouring of a three-core double-armoured cable, protected against corrosion. "Continuity" does so in his last letter.

I have seen the cables crushed flat many times, and the copper conductors almost severed, but never yet have I seen the conductivity of the armouring seriously impaired. Would Mr. Davis note that the Home Office do not consider

any other regulations but their own. I know, however, that B. of T. regulation 5 (b) is the rule aimed at.

Perhaps "Continuity" has got into two separate geological "pockets" with his earth-plates. As an experiment, he should try the effect of pouring a few pailfuls of dilute sulphate of copper (a good handful to a pail of water) along the ground between his plates, and test after a few days. I ask him not to use soda or other alkaline matter.

Although I stated in my last letter that the Home Office set a definite value, theoretically, on the armouring and earth conductors, I still maintain that Rule 14 calls for no measurement. If the "electrician," as defined by Rule 11, makes a test to prove efficiency under Rules 8 and 12, he proves continuity under Rule 11.

John P. C. Kivlen.

Uddingston West, March 1st, 1913.

### Earthing the Neutral.

In reply to Mr. Kenelm Edgcombe's letter of February 11th, I would point out that there is not any limiting resistance in the earthed neutral other than the transformer itself. Below is a series of readings taken, which show the conditions under which the transformer works when a fault occurs.

TRANS. 3-2 K.V.A., RATIO 200 TO 2,000, DELTA CONNECTED ON H.T. SIDE AND STAR ON L.T. SIDE, AS SHOWN IN SKETCH.

Current readings.				Pressure readings.				Remarks.
1	2	3	4	1&S	2&S	3&S	1&2 2&3 3&1	
0	0	0	0	20.5	20.5	20.5	36.75 36.75 36.75	Open circuit.
35.0	17.5	17.5	17.5	45	25.0	20.5	25.50 36.50 21.50	Fault on Ph. 1.
17.5	36.0	18.0	18.0	21.0	38.5	25.5	21.25 25.50 35.50	" " Ph. 2.
17.0	17.5	35.75	17.5	26.0	21.5	37.5	36.25 22.50 25.0	" " Ph. 3.

You will notice from the above test that the currents in the two healthy phases are always one-third of the fault current, and the current in the faulty phase two-thirds.

S. E. Fedden, Manager.

Electric Supply Department,  
Sheffield, February 26th, 1913.

### The Electro-Harmonic Society.

As a visitor at the Electro-Harmonic Ladies' Evening at the Holborn Restaurant on Tuesday last, I was very much surprised that smoking was prohibited, although smoking lamps, matches and ash trays were placed on the tables. Surely the ladies would not object to smoking, at any rate, after the interval. I understand that several gentlemen petitioned the Chairman to be allowed to partake of the fragrant weed.

Perhaps this letter may recommend itself to the attention of the Committee of the Electro-Harmonic Society.

Gerald S. Fletcher.

February 27th, 1913.

[We think this letter (which, by the way, seems in very bad taste from a visitor) should have been addressed to the Secretary of the Electro-Harmonic Society. In any case we do not suppose it will have any effect with the Committee, for we have no recollection of a member of the Society ever expressing surprise that smoking is prohibited on Ladies' Nights—which, by the way, are not "Bohemian" concerts—during the 25 years or so of the Society's existence. The Chairman, we may add, had to call the attention of several gentlemen to the fact that it was a "Ladies' Night."—EDS. ELEC. REV.]

### Cost of Running Small Generating Station.

In further answer to your correspondent, Mr. Gray, I give below the average cost per unit over the last 10 weeks of a small 200-KW. power station driven with suction gas plant. The plant consists of a Kynoch tandem gas engine with a suction gas plant by the same maker, coupled to an E.C.C.

generator of modern type. The auxiliaries which take current from the mains before reaching the motor are one direct-coupled air compressor and one direct-coupled circulating pump:—

AVERAGE WORKING COSTS OVER 10 WEEKS.			
Coal	...	...	187d. per unit.
Oil, waste, &c.	...	...	913d. "
Wages	...	...	112d. "
Repairs	...	...	634d. "
Total	...	...	346d. "

These figures do not include stand-by losses, which usually amount to an additional 10 per cent. on the total. The load factor is approximately 60 per cent., which is, of course, very favourable.

During the year some extra item of expenditure may be anticipated, which may possibly double the item of repairs.

If your correspondent is interested, I shall be pleased to show him this plant, and give any information that will be of use to him. I may mention the coal costs 28s. per ton delivered to the bunkers.

H. Robinson.

Perry Barr, February 26th, 1913.

### Morse Signalling on Submarine Cables.

With reference to your notice in the ELECTRICAL REVIEW of the 28th ult., respecting Mr. Edward Raymond-Barker's article on the Morse sounder in "Submarine Telegraphy," and in view that the following facts may be interesting to your readers, I beg to inform you that the method of operating Morse characters over a submarine cable by inverse or alternating currents is not, by any means, new.

In 1907 I was granted a British patent (No. 16,462) for an invention which embodied the principle of telegraphing over submarine cables in type or roman characters, by means of consecutive alternating impulses.

Whilst constructing this typing system, it was apparent to me that the principle could also be applied to the transmitting of Morse characters in the sense implied by the description of Mr. Gott's discovery. An instrument was, accordingly, constructed with this object.

The slip here enclosed shows, beyond doubt, the fact that

I had at that particular date practically established the principle, and obtained Morse characters by consecutive alternating-current impulses (as per Mr. Raymond-Barker's description) for use over submarine cables.

I have submitted these facts for your information, with a view to showing once more that it is possible for two men, entire strangers, to be working on an invention for many years, with precisely the same object in view.

P. O'Neil, Electrician.

London, E.C., March 4th, 1913.

## LEGAL.

LONDON ELECTRIC SUPPLY CORPORATION, LTD., v. WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.

THIS appeal case was last week before the Lord Chancellor and Lord Atkinson, Lord Shaw and Lord Mculton, in the House of Lords. The two companies obtained statutory powers to supply electric energy within certain parts of the City of Westminster. The current supplied by the London company was alternating, and that of the Westminster continuous current. In May, 1910, the two companies entered into an agreement which, in substance, was this: That the Westminster was to work both undertakings, paying the London a yearly sum of about £22,000. The dispute arose in this way: The London said that the position of the Westminster was that of an agent or manager; that the general principle that an agent must do nothing to destroy or diminish his principal's business applied, and that they were bound to supply any customer asking for an alternating current with energy from their (the London's) main, and could not push their continuous current upon him instead, nor could they go to a customer, or a prospective customer, and advise him to take the continuous, instead of the alternating current, which he was then taking, or thinking of taking. Mr. Justice Joyce refused to grant the London, the plaintiffs in the

action, an injunction against the Westminster to restrain the defendants from, as it was alleged, acting *ultra vires* to the agreement. The Court of Appeal upheld the decision of the learned Judge. The London Corporation then carried the matter to their Lordship's Bar.

Mr. Danckwerts, K.C., Mr. Buckmaster, K.C., and Mr. J. Austen Cartmell, appeared for the appellants; and Sir Robert Finlay, K.C., Mr. Younger, K.C., and Mr. W. S. Kennedy, represented the respondents.

MR. DANCKWERTS, K.C., in opening the appeal, submitted that upon the true construction of the agreement of May 4th, 1910, the Westminster company having assumed the management and working of the London company's undertaking within the Westminster area, came under an obligation to the latter to preserve and maintain that undertaking, and that there was a warranty to be implied from the relation of the parties that the Westminster company would do nothing to destroy, diminish, or injure that undertaking. They could not, therefore, refuse to supply a customer, whether new or old, with electric energy from the London company's supply, nor could they solicit customers who desired an alternating current to take instead a continuous current.

LORD ATKINSON: Your case shortly is that the Westminster company are your agents to work your undertaking, and that they have failed to perform the statutory obligation under which you are liable to supply the public generally with an alternating current.

MR. DANCKWERTS: Yes, I say that occupying as they do a position as our agents they are bound by the established principle of law that an agent may do nothing which is against the interest of his principal. The learned counsel then went on to say that the course of management adopted by the Westminster must be prejudicial to the interest of the London company.

MR. BUCKMASTER, K.C., followed on the same side. He said that the construction which the London company put upon the agreement was in accordance with the powers given by the Electric Lighting Act of 1908, and Sec. 20 of the Electric Lighting Act of 1909; whereas the construction put upon it by the Westminster company made it an agreement which was *ultra* the statutory powers of the parties to enter into. The respondents said, "whether it is *ultra vires* or not, you cannot set up that it is, even on our construction of it, because you have chosen to sue us upon the contract." That was the view which, erroneously as he respectfully submitted, was taken by the Courts below. But the answer to that was this:—"It is not *ultra vires* when properly construed, as we construe it, and so construed the Westminster company have committed breaches, which entitled the London company to an injunction and the declaration as asked."

SIR ROBERT FINLAY, K.C., for the respondents, submitted that the decision of the Courts below was right. The only obligation which the agreement put upon the Westminster company was that of paying the various sums mentioned in the agreement as they became due, and this the respondents had faithfully done.

LORD MOUTON pointed out that at some date the City of Westminster Corporation could acquire the undertaking at a valuation of both companies. The quantum of business which the London company was then doing would be important in estimating the sum to be given for that undertaking.

SIR ROBERT replied that the agreement provided for all that, but the important question was what was the relation created by the agreement? He submitted that the respondents were not managers of the appellants' business in the sense that there was any fiduciary relation between the two. On the true construction of the agreement, the appellants had wholly failed to establish that the Westminster company had committed, or threatened, or intended to commit any breach of any obligation imposed upon them.

LORD ATKINSON: In short, do you say that Mr. Justice Joyce was right when, in his judgment, he said the effect of the agreement was to enable the Westminster company to say "We are in a position to supply you with either alternating current or continuous current, but we have, under the Act of Parliament and the rules and regulations of the Board of Trade, a right to say which of the two we will supply"?

SIR ROBERT replied that that was the construction which he asked their Lordships also to hold was the true one. Later in his argument, the learned counsel said that the object of the Westminster company in entering into the agreement was to promote competition, which would be killed if an injunction such as that sought by the London company, was sanctioned.

LORD ATKINSON asked whether starving or strangling the London company to death would promote competition. In such an event there would be one company only, and it could not be said that there was competition then. As it was, customers had a choice, but if there was only one company which offered a supply, that choice would cease to exist.

The LORD CHANCELLOR remarked that it was only natural that a company would say that the article they supplied was the best.

LORD MOUTON thought that if Sir Robert's contention was upheld, the Westminster company could diminish the business of the London company by coaxing their customers away.

LORD SHAW observed that if they were free to do that it would enable the Westminster to reduce the receipts of the London to an enormous extent. It was a question of most vital financial importance, and one which was also of vital importance in keeping up the standard of electrical energy.

MR. YOUNGER, K.C., followed on the same side. He referred to the correspondence between the companies and the Board of Trade. He pointed out that it would be against the interest of the consumer that there should be a double set of mains worked by agreement *inter parties* by the same company within the same area. It would be also to the advantage of the ratepayer, when the

time came for the City of Westminster to acquire the undertakings, to have them merged in one complete system.

LORD MOUTON: That, I suppose, is how you attempt to justify this policy which must end in practically wiping out the London company.

MR. YOUNGER did not agree. It was admitted that £100,000 was the very utmost value of the London company's undertaking. It was their capital. Whenever the City acquired the undertakings they were to have all their capital paid them back. If the City gave less than £100,000 for the London company's undertaking the Westminster were to make up the balance. Meanwhile, not a penny piece would the London company be called upon to find, no matter what expense the Westminster had to meet, and no matter how much the demand for alternating current might increase and new distributing stations be required to meet the demand.

LORD MOUTON pointed out that the Westminster had no statutory power to supply alternating current. If lamps of lower voltage came into general use, alternating current might become almost universal. The agreement, *inter parties*, by which the Westminster were able to supply the alternating current, was, therefore, one which might be very valuable to them.

MR. YOUNGER replied that while that was so, the London had got a very good bargain. At the time that the contract was made, they had only 750 consumers on the books.

The LORD CHANCELLOR: If that statement is true, it suggests that the Westminster expected that the alternating current would come into favour, and that it would be to their advantage to enter into some arrangement by which they could supply it.

In conclusion, MR. YOUNGER said an injunction in the form asked for was one that the Court of Chancery could never sanction. The injunction was not to restrain the Westminster from doing a particular specific thing, but to do nothing which might be calculated to destroy, diminish, or impair the undertaking. Such an injunction would lead to endless litigation, and at any time the Westminster might be called upon to answer a motion for contempt.

MR. BUCKMASTER, K.C., in reply, said that an injunction could be granted in view of the circumstances which led to this case. Two customers, at any rate, both living close to a distributing main belonging to the London company, had been refused an alternating supply by the Westminster, acting on behalf of the London company. The Westminster said they were under no obligation to supply alternating current to anyone who was not a consumer, and that if they did supply, the customer would have to take the supply from the point where it suited them best to connect his house to. An electric supply company had to keep a map showing their mains, and, naturally, a consumer would want to be connected to one near his house, because only 60 ft. of connecting wire was supplied free. If the obligation upon the London to supply was discharged by supplying, not from the nearest point, but from any point on their system, a would-be consumer might have an indefinite length of wire to pay for, although he was entitled to see the map for a fee of 1s., and on that map there was a main close to his house, and presumably he had a statutory right to be supplied from that main.

The learned counsel referred to the powers which a company was given by the Acts of 1908 and 1909 of entering into an agreement for another company to take and supply energy from the producing company. The Act of 1908 was a local Act. The Act of 1909 was a public statute.

In conclusion, he pressed their Lordships to allow the appeal.

The LORD CHANCELLOR said the matter was one of importance, and they would take time for consideration.

#### ABERDEEN CITY ELECTRICAL ENGINEER'S SLANDER ACTION.

(Continued from page 370.)

LORD HUNTER, in his judgment, has allowed issues for the trial of the action by jury.

In the course of his judgment, his LORDSHIP states that it was averred that the letter was slanderous in respect, first, that it contained a false charge of professional incompetence against the pursuer; and second, that it falsely alleged that the pursuer, as city engineer, recklessly and without justification imputed dishonesty to the Aberdeen contractors. If the statements of, and concerning, the pursuer amounted to either of such charges, they would be slanderous, as to impute slander was itself a slander. For the defender, Lord Hunter continued, it was maintained that the letter narrated certain facts, and then contained an expression of opinion with reference thereto. It had, no doubt, been decided in the case of a newspaper commenting upon the acting of a public man that, as put by Lord McLaren in the case of *Archer v. Ritchie and Co.*, 1891: "The expression of an opinion as to a state of facts truly set forth was not actionable, even when that opinion was couched in vituperative or contumelious language." His Lordship, however, did not think that that doctrine protected a communication written to the employer of a public official alleging that action taken by him had arisen, not from error of judgment, but from incompetence or recklessness. Besides, the pursuer did not admit the accuracy of the facts alleged by the defender in the letter complained of. His Lordship did not, of course, determine that the statements in the letter were slanderous. They appeared to him to be capable of bearing a slanderous meaning, and it was for the jury, therefore, to say whether they were used in an innocent or slanderous sense. The defender maintained that, in any event, he was privileged, as he was writing on behalf of the Association. No action lay against that body for slander in virtue of the provision of the Trades Disputes Act, but it had been decided that an official of a Trade Union might be sued. His Lordship did

not think that an official so sued enjoyed any greater privilege than the Association would have done. In the present case, the contractors, whose work was criticised by the pursuer, would have been privileged; but, so far as the averments in the present case with reference to the Association were concerned, he did not think he could hold, at all events, at this stage, that they were privileged. If at the inquiry it appeared that the Association were entitled to privilege, the jury might be directed that the pursuer was not entitled to succeed unless malice on the part of the defender were proved. His Lordship should also notice the averment made by the pursuer to the effect that the defender, in making the statements which he did, exceeded the instructions he received from the Association. If that were established, he would, or might, lose the benefit of the plea of privilege to which, otherwise, he might have been entitled.

Counsel for the pursuer, Mr. Cooper, K.C., and Mr. Lippe. Agents, Scott & Glover, W.S. Counsel for the defender, Mr. Murray, K.C., and Mr. Wilton. Agents, Davidson & Syme, W.S.

#### TRAMCAR OBSTRUCTION.

At the Bradford West Riding Court, on Thursday, a teamster, named George Rhodes, of Keighley, was summoned for obstructing a tramcar belonging to the Bradford Corporation. Mr. J. G. Gunter prosecuted, and in the evidence it was stated that the defendant had obstructed the car for a distance of some 700 yd., totally disregarding the persistent ringing of the bell on the car by the driver, and the driver had had to leave the car and lead the horse from the tramlines before the car could pass. The defendant was fined 20s. and costs.

#### GLASGOW CAR MISHAPS.

In the Court of Session a settlement was intimated to Lord Dewar in the action by a Govan riveter, against the Glasgow Corporation for £1,000 damages for injuries sustained through being knocked down by a Corporation tramway car. Pursuer agreed to accept £75 and expenses.

After hearing evidence in an action by a woman whose husband had been fatally injured by a Glasgow Corporation car, a jury in the Court of Sessions awarded the widow £250, £50 to her pupil son, and £5 to each of her four other children. The Corporation denied fault, contending that the accident was entirely brought about, or materially contributed to, by deceased's own carelessness or recklessness in suddenly and unexpectedly stepping back on to the tramway track after clearing it.

#### OSRAM LAMP WORKS, LTD., v. SCHLOSS & CO.

On Friday, February 28th, Mr. Justice Swinfen Eady had again before him in the Chancery Division the motion in this case. This was a motion by the plaintiffs, who asked for an injunction to restrain an infringement of their lamps. It was stated on behalf of the defendants that the plaintiffs desired to answer their evidence, which had just been received by plaintiffs, and subject to his Lordship's sanction, it had been arranged that the motion should stand over for a week. This his Lordship agreed to.

#### COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD. v. J. SALOMON AND CO.

In the King's Bench Division, on Tuesday, March 4th, before Mr. Justice Bankes and a common jury, an action was brought by plaintiffs against defendants, leather dealers, Rotherasy Street, Weston Street, Bermondsey, to recover £1,880 for electricity supplied to the factory of the defendants at Mina Road, Old Kent Road, S.E., over a period ranging from June, 1908, to November, 1911, the claim being based upon a contention that through the misreading of the dial of the registering meter, the defendants had only been charged about one-tenth of the proper amount, viz., for 33,428 Board of Trade units instead of 334,272 at 1½d. per unit.

The defendants pleaded various defences. They said they had paid for the electricity consumed, alternatively they said it was plaintiffs' duty to supply and maintain a suitable meter, and that any loss that had occurred through mistaken reading must be borne by the plaintiffs; they also pleaded breach of statutory obligations by the plaintiffs, and entered a counterclaim against the plaintiffs, saying that they had carried on their factory upon a certain understanding as to the cost of electric power—as represented by the accounts presented by the plaintiffs and duly paid by the defendants—that they had based their estimates of cost of production on the prices charged by the plaintiffs for light, and that they would never have carried on their works if the charge had been on the scale now sued for by the plaintiffs.

For the plaintiffs, Mr. T. R. Atkin, K.C., Mr. Colefax, K.C., and Mr. Slumper appeared, and defendants were represented by Mr. Duke, K.C., and Mr. Spokes.

MR. ATKIN, K.C., said that the defendant company, it appeared, employed a certain amount of machinery in connection with their business for extracting water from hides, &c., and they took over some works at Mina Road that had been supplied with electric

power, and the defendants had used the power since 1908. The defendants made a contract with the plaintiff company whereby they were to have the power at 1½d. per Board of Trade unit, the current to be registered in the ordinary way by the electric meter. The meter now concerned was in regular use, and no complaint had been made of its working. In this case the last unit in the total shown on the dial had been erroneously read as a decimal, and the result was that for 3½ years the defendants had been charged just about one-tenth of the proper charge for the current actually consumed. The mistake was undoubtedly a very unfortunate one, and it brought about the result that this leather factory had had its power for one-tenth of the correct charge as shown by the meter, the accounts submitted to the defendants being based entirely on the misreading referred to. The plaintiffs now came to Court and submitted that defendants should be called upon to pay for the power supplied to them. The mistake was discovered in 1911, and the defendants were informed, but they declined to pay and the proceedings were begun. The defendants had put in a number of different defences. They said there was a clause in the contract which barred going back more than one quarter, but this clause actually applied in the case of an incorrect meter. Here the plaintiffs contended the meter was accurate—it had only been misread. The defendants had also pleaded that the current they had had was the current they had actually been charged for, and they had acted on that basis in estimating their cost of production and the cost of carrying on their works, and they said that for three and a half years the works had been carried on at a loss, and if they had known they were using the amount for current now contended by the plaintiffs, they would have closed their works down, and therefore the plaintiffs ought to pay the defendants money in respect to the loss incurred in carrying on their works. Apparently (said Mr. Atkin, K.C.) the attitude of the defendants was like this: "If your grocer makes a mistake in his bill, and he charges you only half as much as he ought to, you can say to him, 'I will not pay your bill, because if I had known what the real bill was I should not have eaten so much jam and drank so much tea. Therefore, I will not pay for the goods that have been supplied to me.'" It was also pleaded by the defendants that the plaintiffs, in breach of their statutory powers, had supplied the current from Camberwell instead of from Southwark; but the plaintiffs would say that it was supplied to the defendants through Southwark, and that this defence could not be supported.

Counsel went on to detail the history of the electrical installation at the defendants' factory. The original company under the contract was a company carrying on business in the same premises, called the Mina Chemical and Dye Works, Ltd., and the contract was dated 1906. There was a 7½-H.P. engine, and later a 25-H.P. motor. The price was 1½d. per Board of Trade unit. It was found that defendants had had 334,272 units, and they had been charged for 33,428, so that 300,844 units had not been paid for at all. Roughly speaking, the charge for power was £600 a year, but the defendants had only been charged, in fact, £60 a year. In the autumn of 1911 a meter reader went to take his quarterly reading, and read the meter correctly. He had noticed what the figure for the previous quarter had been, and he could not understand how it could be that the consumption had jumped up ten times. He put the reading down, treating the last figure as a decimal, but he reported at headquarters the doubt he felt about the matter, and on November 7th two inspectors visited the factory and discovered the error that had been made. Certain correspondence ensued, the plaintiffs presented their account, and ultimately defendants wrote to say that they could not accept liability for irregularities in the meter; they had had the current since July, 1908, and the meter had been regularly inspected by the plaintiffs' representatives.

MR. ATKIN added that as a fact it had been found that the meter showed a slight tendency to under-register intermittently, so that this was an advantage to the defendants. Counsel also said that the defendant company had entered into a new contract to have the power at 1½d. per unit. Although the defendant company had in their pleadings said they would have closed their works, they had not, in fact, closed them, and counsel said he would submit that a *bona fide* mistake had been made, and the plaintiffs were entitled to recover. He would submit that the defendants could not support their defence of an estoppel. Counsel subsequently called evidence in support of his case.

MR. CHARLES SPARKS, M.Inst.C.E., M.I.E.E., said he was engineer-in-chief to the plaintiff company, and was responsible for the generating stations, the system of distribution, the supply and the meters. Witness spoke to the history of the electric installation at the works, and said that the meter now in question was of the type known as the "K.G.," and it was supplied by an electrical company. This type was approved by the Board of Trade in 1910, and it was supplied in 1906 to the defendants, it having not been approved at this date. He regarded this meter as the same in principle as the one approved in 1910. It was a sealed meter, and he could not see inside it to see if it was exactly the same in the details of construction as the K.G. approved type, but he believed it to be the same in principle. They had used the K.G. type for seven to eight years, and they used hundreds of them.

What's your opinion as to the suitability of the meter for registering current used at the defendants' works?—In every way it is a most suitable meter. Witness further testified that the figure that had been read as a decimal was, in fact, a unit, and should have been charged as such, and that the current was supplied through the Southwark district. Witness handed in a table, which he said was to show that the power that had been actually charged for could not be sufficient for the requirements of the defendants' machinery.

MR. DUKE, K.C., in cross-examination, suggested to the witness that the Board of Trade had never approved of a meter that carried on its face the marks that had caused the alleged misreading by the plaintiff company's servants.—Witness said they had many of the K.G. type that bore the decimal mark, but it was possibly true that never had one been approved that had a dial just like this one.

The K.G. type has only been approved for a capacity not exceeding 10 amperes? I do not know that. Witness added that the K.G. type was made in Germany and was made for the English market.

MR. DUKE, at this point, applied to his Lordship for consent to amend the defence so as to raise the point that the plaintiffs had, in contravention of their powers, supplied power from other than the Southwark area.

MR. ATKIN, K.C., opposed the allowing of the amendment, and pointed out in the course of his argument that the defendants were still having the electricity under a new contract.

MR. JUSTICE BANKES said the amendment sought to raise the question as to whether the plaintiffs were acting within their powers, and he was inclined to think that he ought to explain it and assist that investigation, subject to all questions of costs being reserved.

Subsequently, evidence was called to prove that there was always a supply by the plaintiffs from Southwark, that the red-line indicated on the meter dial was used as a test, and that the K.G. type was very extensively sold on the Continent and in a smaller measure in the United Kingdom.

After the closing of the plaintiffs' case, MR. DUKE, K.C., addressed the jury for the defence. He said that the attitude the defendants took here was that they had been led to carry on their leather business for years on the footing that the cost of electricity was a certain cost, and had been paid, and that the matter must rest there, and if plaintiffs had made a mistake they must lose on their side by their error. The defendants were for a very long time in doubt as to whether it would be of advantage to them to have electric power at their works: the introduction was made on the representation of the plaintiffs that it would be cheaper than either steam power or suction gas. The defendants had gone on with their business, on the footing that the cost of the power was that which they were being charged by the plaintiffs, and the defendants now contended that plaintiffs were estopped on the ground of their own conduct. It came as a complete surprise to defendants to be told that they ought to have paid 10 times more than they had done. The defendants had, at considerable expense, laid out their works in such a way as to use electricity in the future. If this meter was one that misled every accustomed person who came to see it and misled the plaintiff company's own servants, then it was difficult to see how it could be regarded as a suitable meter. He would call evidence to show that the red line on this dial, to the ordinary understanding indicated that the figure was a decimal and not a unit.

For the defence, MR. DAVID SALOMON gave evidence to the effect that there was nothing whatever to indicate that the meter was only registering one-tenth. Witness gave evidence at length as to his interviews with Mr. Scott before the electricity was introduced, and said he was assured that it would be cheaper than other means. He would not have used the electricity had the cost been such as now contended, and if he had known that the meter was only indicating one-tenth of the cost, Witness showed in further evidence how he had based his prices and estimates of cost of production in relation to the cost of electricity.

Cross-examined, he was still continuing his business; he had "sunk" £35,000 in it. He made a good profit last year, as the prices for leather were higher through the shortage.

MR. ERNEST EDWARD SHARPE, M.I.E.E., and associated with meter manufacturing for many years, deposed that he would read the last figure on the dial of this meter as a decimal, because of the red line in front. He said this mainly because of the red colour. Red was always associated with a decimal point. The German meters invariably had red to indicate the decimal point.

Other evidence of a similar character was called to show that the dial was unsuitable, that the figure on the extreme right would be read as a decimal, and that the meter was not of a type approved by the Board of Trade.

After other evidence, counsel addressed the jury, and Mr. Justice Bankes summed up. His Lordship left the following questions to the jury, and they were ultimately answered by the jury as indicated:—

Did the plaintiffs, in rendering their quarterly accounts, represent to the defendants that the quantity of electricity supplied was materially less than was actually the case?—Yes.

If so, did the plaintiffs intend in making such representation that the defendants should act upon it in determining (a) to continue to take a supply; (b) whether or not to continue to carry on their business; (c) the selling price of their goods; and (d) whether to extend their plant?—No.

Did the defendants act upon such representation to their detriment in respect to any of the above, or either of them?—They did act on it, but there is no evidence as to detriment.

Was the meter supplied a suitable one?—Yes.

Were the plaintiffs' servants negligent in reading the meter?—Yes.

Did the plaintiffs keep the meter in proper order for correctly measuring the supply?—Yes.

Ought the defendants by the exercise of reasonable care to have discovered that they were consuming more electricity than they were paying for?—Yes.

The case was ordered to be set down at a future date for legal arguments to be heard on the jury's answers.

#### WOOLLEN v. LONDON UNITED TRAMWAYS, LTD.

In the Divisional Court of King's Bench, on March 4th, Mr. Justice Channell and Mr. Justice Bray heard an appeal from a judgment of Judge Woodfall given in the Westminster County Court in this action. The plaintiff, at about 4 o'clock in the morning, was driving from Ealing to London in his motor-car a party of ladies who had been to a dance, and he came into collision with a rail scrubber which was at work on the tramline. The evidence at the trial was very conflicting as to upon whom the blame rested, and the County Court Judge found for the plaintiff.

MR. HAYDEN, who appeared for the respondent (the plaintiff in the action), contended that the Court had no jurisdiction to hear the appeal, as the defendants raised no point of law at the trial. Their Lordships, however, decided that the case would have to be heard before they decided whether a point of law could have been raised.

MR. RAYNER GODDARD, for the appellant, stated the facts of the case, and said that although the plaintiff had been found to have been guilty of contributory negligence, the Judge had decided in his favour, on the ground that the driver of the "scrubber" had also been negligent in not sounding his gong. If he had sounded his gong, said the County Court Judge, the plaintiff would not have been entitled to recover. There was no evidence that the defendants' servant was responsible for the accident, and upon the facts found by the County Court Judge, he (counsel) asked for judgment for the defendant company, or a new trial.

MR. JUSTICE CHANELL said that, without saying whether the result of the trial was right or wrong, he was of opinion that the case had been decided upon a question of fact, and not of law. The fact of the trial having been unsatisfactory was no ground for a new trial, and the appeal would, therefore, be dismissed.

MR. JUSTICE BRAY concurred, and the appeal was dismissed with costs.

## BUSINESS NOTES.

**Lamp Tests.**—The Westminster Electrical Testing Laboratory has just completed a series of life tests on 13 of the best-known makes of metal-filament lamps. These tests indicate the relative values of the different makes now on the market, and show, when compared with the previous tests, the progress that has taken place during the last 12 months. Five 200-volt 32-watt lamps were ordered of each maker, and were run for 2,000 hours on an automatically regulated 200-volt circuit. The candle-power and consumption of each lamp were measured at the start and afterwards every 250 hours. The report contains all individual results, as well as various tables of averages. The tests show very clearly the need for including in a specification a specified life as well as specified limits of efficiency, which should be, in many cases, quite outside the makers' regular standard.

**For Sale.**—The Dewsbury Corporation has for disposal a quantity of steam-driven generating plant. See our advertisement pages in this issue.

**Air Filters.**—MR. H. R. WITTING, 41, Berners Street, London, W., the sole British representative of Messrs. K. & Th. Möller, G.m.b.H. of Westphalia, informs us that he has recently booked orders for patent single pocket air filters from the following:—James Simpson & Co., Ltd.; Wellman, Seaver and Head, Ltd.; C. A. Parsons & Co., Ltd.; W. Beardmore & Co., Ltd.; the Brush Electrical Engineering Co., Ltd.; the Glangarnock Iron and Steel Co., Ltd.; Dick, Kerr & Co., Ltd.; the British Westinghouse Electric Co.; the Newcastle-on-Tyne Corporation Tramways, and others.

**"Lux" Electric Candles.**—THE LUX CANDLE CO., Ltd., of 36, Whitfield Street, Tottenham Court Road, London, W., announce improvements in these candles in a leaflet just issued. A different make of metal-filament lamp of improved efficiency and strong filament is now employed, which is made for up to 125 volts, without increasing the size of the bulb at the candle point or spoiling the candle-like appearance.

**Book Notices.**—*"The C.D., 1913."* Melbourne: Critchley Parker. This is the Australian Mining Standard Classified Directory of makers of mining, electrical, and industrial machinery and other manufactures for the mine. *"The Newspaper,"* by G. B. Dibblee. Home University Library, No. 69. London: Williams & Norgate. 1913. Price 1s. net.

**Catalogues and Lists.**—MESSRS. GILBERT GILKES AND CO., LTD., Kendal.—New catalogue of 16 pages, containing a full description, with line drawings and half-tone illustrations, of their "Centuri" centrifugal pumps, which embody entire revision of designs and patterns. Tabular information is detailed respecting single-cell and multi-cell pumps, and other useful matter, is given, including notes on installation and working. A loose sheet tabulates prices of the pumps.

ADNIL ELECTRIC CO., LTD., Artillery Lane, London, E.C.—Effective newspaper folder, issued with the object of showing how their indirect lighting fittings eliminate possibility of "glare."

MR. H. C. SLINGSBY, 142-146, Old Street, London, E.C.—Eight-page list (No. 142), effectively illustrating their extension ladders.

**THE WESTINGHOUSE COOPER HEWITT Co., LTD.,** 80, York Road, King's Cross, London, N.—List No. 40 relating to the special adaptability of Cooper-Hewitt lamps to the production of cinematograph films. The leaflet sets forth the prices and general advantages, one of which, apart from the high actinic value of the light, is the economy in current consumption.

**MESSRS. OZONAIR, LTD.,** 96, Victoria Street, London, S.W.—New pamphlet No. 3 (32 pages), containing a description of the Ozonair system of pure air ventilation. Introductory notes deal with the principles of ideal ventilation. The apparatus is finely illustrated, and there are also many pictures of buildings, &c., where the system is in use.

**THE EMANDA ENGINEERING Co., LTD.,** Emanda Works, Sumner Avenue, Peckham, S.E.—Sheet of illustrations showing their switch and fuseboards, distribution boards, &c.

**MESSRS. SIEMENS BROS. & Co., LTD.,** Woolwich.—Abridged illustrated price list of round pattern switchboard instruments, electromagnetic and moving coil.

**MESSRS. J. H. HOLMES & Co.,** 17, Soho Square, London, W.—New pamphlet of 18 pages (newspaper printing section) containing a description, with illustrations, of their improved Holmes-Clatworthy system, with hand or push button control for electrically operating rotary web presses. A number of improvements have been introduced.

**MESSRS. FREDK. BRABY & Co., LTD.,** Ida Works, Deptford, London, S.E.—In a small pocket pamphlet of eight pages the firm give information respecting economical storage of petrol, and the underground storage tanks, pumps and overhead measuring tanks and other apparatus supplied by them for that purpose.

**MESSRS. MELDRUMS, LTD.,** Timperley, near Manchester.—Several new publications describing respectively the Meldrum improved forced-draught furnace; patent refuse destructors; and the "Koker" and "Sprinkler" mechanical stokers.

**MESSRS. RICHARDSONS, WESTGARTH & Co., LTD.,** Hartlepool.—Admirably got-up pamphlet of 36 pages, containing a full account (with numerous clear sectional diagrams and beautifully-executed photographic reproductions of completed plants) of the combined impulse and reaction turbine built by the firm. This is of the same type as that built by Messrs. Brown, Boveri & Co., of Baden, and Messrs. Richardson, Westgarth have supplied, and have in hand, a large number of machines of this type of various sizes. In addition to general and constructional particulars, there are test curves given. Turbines for special purposes (back-pressure and bye-pass) are also included.

**THE POWER PLANT Co., LTD.,** West Drayton, Middlesex.—Four-page leaflet, giving a specification of their self-contained mill gears for low and medium ratings.

**THE STEARN ELECTRIC LAMP Co., LTD.,** 47, Victoria Street, London, S.W.—Illustrated and priced leaflets respecting the new Stearn "Globolite" lamp, heating and the "Leuconium" lamps.

**Strike Settlement.**—We are informed that the strike at the works of **MESSRS. EVERSHED & VIGNOLES, LTD.,** caused by the dismissal of a workman for reading instead of going on with his work, has been settled by the withdrawal by the men of the demand for his reinstatement. The company on its part has undertaken to take back the strikers into its employ. It is stated that with one or two exceptions, good feeling has prevailed during the struggle, which involved the whole of the workshop hands, numbering about 220. The support of the staff and a number of other employes has helped materially in bringing about the successful issue of the dispute. The firm ask us to state that the aid received from a large number of manufacturers has strengthened their hands in the conduct of the matter, and to these manufacturers they express their thanks for such assistance. Messrs. Evershed & Vignoles ask customers to continue to extend to them consideration in the matter of deliveries, as these will necessarily for the present be somewhat delayed, though no effort will be spared to speedily remedy this.

**Trade Announcements.**—With reference to a notice that appeared in our last issue, **MESSRS. WARD & GOLDSTONE** state that in place of Mr. Stafford Sinclair they have engaged Mr. G. G. Turvey to act as their Glasgow representative. They are giving up their present address at 50, Wellington Street, Glasgow, having taken more commodious premises in West Campbell Street, which will enable a larger stock of their manufactures to be kept, and will also afford greater facilities for showrooms, &c.

Mr. Leo. Eppenheim has taken into partnership Mr. Percy Levy, and the business will be carried on under the style of **LEO. EPPENHEIM, LEVY & Co.,** at 31-5, Duke Street, St. Mary Axe, E.C.

**MESSRS. JONES & ATTWOOD, LTD.,** heating and hydraulic engineers, of Stourbridge, have added an electrical department for the supply and erection of plant and fittings for all kinds of electrical work, with Mr. W. Bannister as manager.

Premises at 60, Hamilton Square, Birkenhead, have been taken by the **ECONOMIC ELECTRIC Co.,** electrical and mechanical engineers.

Mr. H. W. POWER, engineering publicity expert, of 31, Queen Victoria Street, E.C., informs us that his telephone number is now City 8590, instead of 8509, as given in the Universal Electrical Directory.

Mr. F. H. WAY has been appointed Midlands' representative for the Electrical Apparatus Co. Ltd., with headquarters in Birmingham, and Mr. W. ROBERTS (late of the British Westinghouse Co.), has been appointed the firm's South Wales representative, with headquarters in Cardiff.

During the past year, large extensions and improvements have been made in the works of the **HOFFMANN MANUFACTURING Co., LTD.,** at Chelmsford, which are devoted entirely to the manufacture of ball and roller bearings and steel balls. Extensions to the

grinding department, cage department, testing department, and stores have been made, increasing the available floor space by 28,200 sq. ft. Even with the above extensions, the demand has again overtaken the capacity of the plant, and, at the present time additional extensions are being made. A further Diesel engine of 1,000 H.P. is on order, making the total available horse power over 2,000.

**MESSRS. W. WHITE & Co.,** have taken larger premises at 25, Budge Row, Cannon Street, London, E.C., the premises recently occupied by Messrs. Krupka & Jacoly.

**Bankruptcy Proceedings.**—**CHARLES SPENCER NORTH-COTE,** electrical engineer, 67, Stanthorpe Road, Streatham, London.—The public examination of the above named debtor was held at the Court House, Wandsworth, last week, before Mr. Registrar Willoughby. The statement of affairs showed liabilities amounting to £1,713 and assets estimated to produce £61. Questioned by the Official Receiver, debtor stated that in 1906 he left a company with which he had been connected, selling his shares for £4,000, and starting on his own account at Queen Anne's Gate, Westminster, under the style of "Wholesale Electric Traders." In 1908 he was concerned with an electrical exhibition, over which he lost £2,000. He gave up his office three years ago, and since then had been living on his capital, having no paying business. His capital became exhausted at the beginning of last year, and he gave instructions to Messrs. Debenham, Storr & Sons, auctioneers, to sell the greater part of his furniture. Debtor was dissatisfied with the amount handed to him, and as a result of statements made in letters sent by his solicitors to Messrs. Debenham, they commenced an action for libel. Judgment was given against him, and subsequently the damages were assessed at £400. Debtor calculated that he had lost £1,000 over the sale of a house at Forest Hill. The examination was adjourned.

**W. H. MICKLETHWAIT,** electrician, Harrogate.—First meeting, March 13th; public examination, April 4th; both at York.

**Liquidation.**—**ROSSENDALE BELTING Co., LTD.,**—A petition (presented by Messrs. A. E. Bennett & Co., Liverpool) for winding-up this company, is to be heard on March 17th at Liverpool.

## LIGHTING and POWER NOTES.

**Accrington.**—Negotiations respecting the supply of electrical energy to the paper works of Messrs. Peebles & Sons have been in progress, and application is to be made to the L.G.B. for power to borrow the amount required to carry out the requisite extension.

A report in regard to the new gas engine plant has been issued by the electrical engineer. A three months' trial on one engine and electrical generator started on February 4th, running 164 hours per week, as near to full load as circumstances permitted. The gas making plant started a three months' trial on March 1st.

**Barking.**—It has been decided to withdraw the Council's opposition to the Romford and District Electric Lighting Order, conditionally upon the words "by agreement, but not otherwise" being inserted after the word "may" in line 10 of Clause 20 (Bulk Supply) of the Order. At the last meeting of the Council a report from the clerk was considered, showing the position of affairs with regard to (1) the suggested transfer of the electric lighting undertaking; (2) the taking of a bulk supply of energy from the West Ham Corporation; (3) the taking of a supply of electricity for traction purposes from the East Ham Corporation; and (4) the proposed leasing of the light railways from East Ham boundary to Loxford Bridge, to the East Ham Corporation. It was decided (a) to take no further regard to item (1) at the moment; (b) that the consideration of item (2) remain in abeyance; (c) that the clerk negotiate further with the East Ham Corporation with regard to item (3); (d) that with regard to item (4), the East Ham Corporation be informed that the terms suggested are such as cannot be accepted; (e) that the engineer prepare a report upon the question of extensions to the electricity plant, to which item (2) be also referred.

**Barrow-in-Furness.**—The T.C. has approved of the Electricity Committee extending the mains on Walney Island in order to supply current to 102 houses which are to be erected by Messrs. Rainey Bros. The electrical engineer reported that at the next meeting of his committee, he hoped to put forward some definite proposition in regard to fixing electric cooking apparatus in each of the houses. It was agreed to support a demonstration of the uses of electricity by the British Electric Transformer Co., Ltd.

**Beckenham.**—The U.D.C. has applied to the L.G.B. for sanction to borrow £2,500 for services and £1,000 for meters in connection with its electricity undertaking.

**Birmingham.**—The proposed new power station scheme at Nechells, to provide an additional 100,000 kw. of generating plant, is still held up. The committee's indecision is explained by the nearness of the end of the financial year, the trading result of which should be available shortly.

**Bispham (near Blackpool).**—An inquiry has been held by Mr. T. C. Ekin, L.G.B. Inspector, relative to the Council's application for sanction to borrow £8,178, for extensions to the electricity undertaking. Although the station has only been in

operation a little over 12 months, the demand for electric lighting has far exceeded the anticipations of the Council, which has found it necessary to increase the plant to something like two and a half times its present capacity. There was no opposition to the application.

**Bolton.**—The Electricity Committee has approved of the plans of the proposed generating station, completed with the amendments decided upon by the engineers.

The chairman and vice-chairman have been deputed to open and tabulate the tenders for the supply of switchgear.

**Continental Notes.**—**LUXEMBURG.**—It is reported from Luxembourg that, after protracted negotiations, an agreement has been reached between the Government of the Grand Duchy and an English power association, whereby the latter undertakes shortly to begin the erection of the proposed Sauer Valley dam in the upper Oesling, in connection with the hydro-electric scheme for the supply of the whole of the Duchy. The expenditure on the work is estimated at £640,000, and the approval of the agreement by the Chamber appears to be assured. Associated with the scheme is a rumour of the projected establishment of a large new steel works near Erpeldingen, above Ettelbruck, which would obtain its supply of power from the hydro-electric works in question.

**FRANCE.**—A company has just been formed at Aulne (Parthe), with a capital of £10,000 and the title *La Société Sarthoise d'Electricité et de Force*, to establish a small electricity generating station in the town.

**SWEDEN.**—The Stora-Kopparbergs Aktiebolag, the second largest mining company in Sweden, and the owner of a large area of timberland, is going to erect a large electrical power station at Forshuford, to utilise the falls of the Wal River. The same company may be said to be the financial pioneer of the development of electrical smelting of iron-ore in Sweden and elsewhere, and has, in addition to the electrical furnace at the Domnarhuford Iron Works, another electrical furnace of different construction in operation, the latter having a capacity of 12,000 H.P.

**NORWAY.**—The largest power station in Europe, says the *Génie Civil*, is being constructed on the Norefall, near Nore, in the Næmedal, to supply electricity to Christiania and Eastern Norway. The buildings, 160 m. in length, are at the foot of a mountain, upon which will be a penstock fed from a reservoir 6 km. away, and the available head will be 420 m. There will be 11 turbines of 20,000 H.P. each and two of 10,000 H.P., making a total of 216,000 H.P.

**Dartford.**—The U.D.C. has applied to the B. of T. for consent to supply current in the rural area to the premises of Vickers, Ltd., the S.E. and C. Railway Co., at Slades Green, Messrs. Richard & Brignall, Messrs. Murgatroyd Bros., Messrs. G. P. and J. Baker, and Messrs. D. and C. Rutter, Ltd., all in the parish of Crayford. It is proposed to give the supply by means of overhead cables, carried as far as possible alongside the railway.

The Electric Lighting Committee has had under consideration the question of the scale of charges for current. It states that the falling off in the demand for power purposes is adversely influencing the finances of the undertaking, and recommends a fixed charge of 25s. per kW. (approximately £1 per H.P.) of demand per quarter, and in addition charges based on consumption varying from 1d. to 3d. per kW.-hour. The Committee states that Messrs. Vickers, Ltd., who have already arranged to take current at their Crayford Works, will be requiring before long 200 kW. The capital expenditure is put at £4,300, of which £1,800 would be spent on two 250-kw. rotaries, with transformers to raise pressure to 6,600 volts, and £600 on two 200-kw. transformers at Vickers' premises, and the necessary switchgear. The total demand would run to some 450 kW., and the capital expenditure be raised to £11,000, with annual receipts on the new scale of £1,705, as against an expenditure on coal, wages, interest and repairs of £3,375.

**Dorset.**—The County of Dorset Electric Supply Co. has been successfully floated, and is putting in hand the scheme for supplying electricity to the various towns in Dorsetshire, particulars regarding which have already appeared in these columns. The works in Swanage, Dorchester, and Blandford are being started this spring, and it is hoped that the supply will be available in the course of a few months. It is intended to start the works in the other towns in Dorset—Sherborne, Wimbourne, &c., directly circumstances permit.

**Dundee.**—The Dock Street sub-station is now completed and capable of relieving Dudhope Crescent Road Station of 1,500 kW.

Specifications have been issued for the steelwork and chimney for the extensions at Carolina Port. Tenders are due on the 10th inst.

**Edinburgh.**—The T.C. has agreed to raise the maximum salary of the station engineer at McDonald Road station from £270 to £330 per annum, by such increments as may be recommended by the resident engineer with the approval of the Committee. The convener of the Committee justified the increase on the ground that the salary of £270 was fixed 10 years ago.

**Faringdon.**—Works for electric lighting for this town have been constructed at the old brewery in Southampton Street. Consent of the public authorities to the erection of the poles having been given, most of the poles are now in place, but a numerously signed protest against these erections has been sent to the District Council, complaining of their unsightliness. The Council, however, has refused to move in the matter.

**Fleetwood.**—A L.G.B. inquiry was held on February 25th into the application of the D.C. to borrow £7,176 for the purpose of the electricity undertaking.

**Galashiels.**—The Tenants' Association has unanimously petitioned the T.C. to make the supply of electricity a Corporation concern. The question engaging public attention at present is whether the scheme should be undertaken by the Council or by a private company. Before coming to a decision the Council sent a deputation to Glasgow to consult an expert, and the members reported to a private meeting the result of their visit. On Thursday, last week, Mr. Parsons, the expert consulted, visited Galashiels for the purpose of getting information to enable him to prepare his report.

**Halifax.**—It is proposed to extend the H.T. supply to the works of Messrs. Asquith, Ltd., at a cost of £352 (subject to a guarantee that the income will not be less than £200 per annum for five years), to West Croft Mills, and to New Brunswick Mills, at an estimated cost of £398, and to Horley Green Mill, at an estimated cost of £767.

**Haslingden.**—The L.G.B. has sanctioned the loan of £3,750 for a period of 25 years for electricity cables, and the sum of £1,600 for a period of 15 years, for electric services.

**Hastings.**—A L.G.B. inquiry has been held concerning the application of the Corporation to borrow £8,133 for electric lighting. In one item of £4,000, the engineer (Mr. Ferguson) said he might include the cost of a high-tension main to the borough boundary. The Inspector said the amount was not ear-marked, and it would be left to the Council to act as it pleased. At the close of the inquiry, there being no opposition, the Inspector said the improved position of the undertaking was quite encouraging. There was rather a long list of what they might call "moral obligations" when they got to the right side. He noticed that the number of consumers had gone considerably. "Don't spend your money on buildings; spend it on wheels," added the Inspector.

**Hebden Bridge.**—The D.C. has decided to apply to the L.G.B. for sanction to borrow £3,250 for the purpose of extensions at the electricity works.

It is anticipated that, for the first time since the electricity works were started, there will be a profit on the working of the undertaking.

**Heston and Isleworth.**—The electrical engineer, Mr. P. Rycroft, reported to the last meeting of the U.D.C. that the engine for the new plant would not be ready until the middle of March owing to the difficulty that had been experienced by the makers in obtaining castings and fittings.

**Keighley.**—The Electricity Committee has made a recommendation that an agreement be entered into with the Bingley U.D.C. for the supply to the latter of electrical energy, in bulk, on the three-phase extra-high-tension system at 6,600 volts, 50 periods per second, on the following terms:—The U.D.C. to pay a fixed annual charge according to the following scale.—If the consumption does not exceed 300,000 units per annum, £400; if the consumption exceeds 300,000, but is not more than 400,000 units per annum, £500; if the consumption exceeds 400,000 units per annum, £600. And in addition to such fixed charge, 1d. per kW.-hour registered by a meter to be fixed at the Bingley end of the H.T. cable; accounts to be subject to 5 per cent. discount, and to be paid quarterly. The agreement to be for a definite term of 10 years, with options to the Bingley Council to extend the term for two further periods of five years each. Application will be made to the B. of T. for an order to give effect to the proposed agreement.

**Plymouth.**—The T.C. is making application to the L.G.B. to borrow the sum of £5,500 for the purpose of extending the plant at the electricity works. The Electricity Committee reports that it is estimated that the sum required for interest and sinking fund will amount to £488 per annum, and that the saving in working expenses that will result from the operation of the proposed plant will equal the above capital charges at the time it is put into operation. The increase in total plant capacity will enable additional and profitable revenue to be earned. Cables are to be laid to Laira, subject to the intending consumers entering into an agreement.

**Portsmouth.**—At a meeting of the Council the Lighting Committee recommended (the matter arising out of the agreement between the Council and the new Electric Lighting Co.) that, as the streets and highways were to be illuminated by electricity, the number of lamps should be increased by 61, making a total of 174, with the 113 existing lamps. The cost of the 113 gas lamps was £285, and the increase of more than 50 per cent. in the number of electric lamps, would mean an additional expenditure of only £39. The report was unanimously adopted.

**Radstock (Somerset).**—At the last meeting of the U.D.C., a special committee appointed by the Council presented an extensive report upon the question of the public lighting of the town. The gas projects having practically failed, the Committee stated it turned its attention to the question of electric lighting, and secured the services of a well-qualified engineer from London, who visited Radstock and forwarded the surveyor a lengthy report.

With regard to public lighting, the scheme provides for 150 lamps of 50 and 100 c.p., lighted for 1,500 hours per annum. It was proposed that a charge of 6d. per unit be made for private lighting. The capital expenditure was estimated as follows:—Buildings and foundations, £200; plant, including moving the engines, new dynamos, battery, switchboard, &c., £1,130; motors for sewage pumps, £135; street lighting, £285; overhead mains on wooden poles, £1,700; services and meters, £150; cost of prov. order, £200; legal and other expenses, £200; total, £4,000. The revenue was estimated as follows:—Public lighting, 150 lamps, £210; private lighting, 1,600 25-c.p. lamps with current at 6d. per unit, £480; power, £25; sewage pumping, £25; meter rents and sundry receipts, £25; total estimated gross revenue, £765. The corresponding expenditure will total £575. With reference to the total amount which would probably be required to extend the undertaking, if Radstock only were served, it was considered a further £1,500 might be required for additional plant and mains in two years after the undertaking has been started; if Peasedown were included another £2,000 would probably be required. After some discussion, the matter was deferred until the May meeting of the Council.

**Reading.**—The Electric Supply Co., Ltd., has applied to the T.C. for consent to the alteration of the frequency of the supply of current in certain parts of the borough where the supply is given by alternating current, to 50 periods per second.

**Shipley.**—The U.D.C. last week decided to carry out extensions to the electricity works, at a cost estimated at £14,000. The electrical engineer (Mr. Redman) reported that at present the load was just equal to the full safe capacity of the plant, and that it would be overloaded next winter. If the Council were to undertake the supply of power to manufacturers, it would be absolutely necessary to install new plant. This would entail the purchase of an additional turbo-alternator, boiler, motor-generator, condenser, and a new building and switchboard, with which outlay the Council would be provided with a modern 1,000-kw. set.

**Slough.**—By installing electricity at the workhouse, the Guardians for that town have effected an enormous saving. For the year just ended, the actual cost for current was £47, against £200 for gas in the previous year. Taken altogether, it is estimated that a saving of £300 a year has followed the introduction of electricity for lighting, pumping, and laundry purposes.

**Southampton.**—Additional plant is required to meet next winter's load, and, upon sanction being received from the L.G.B. to the proposal, tenders are to be invited. The estimated cost is put at £8,200.

**Stalybridge.**—At a meeting of the Joint Tramways and Electricity Board on February 27th, it was reported that the Extensions Sub-Committee had recommended a boiler house extension plan for acceptance, and had expressed the view that it would be unwise to further extend on the present site. Mr. Noel (chairman of the Generating Station Committee) said the extensions were now going on. They had written to the L.G.B. pointing out that they were so handicapped that they were obliged to go on with the work. The demand for electricity continued to increase.

**Tottenham.**—The North Metropolitan Electric Power Co. having been invited by the Council to submit terms for lighting the parish, has replied that it is not prepared to carry out the whole of the street lighting, but only in those streets where its mains are laid. The Tottenham and Edmonton Gas Co. sent a letter to the same meeting of the Council, stating that it would have no possible objection to competition with the Electric Power Co. so long as it was for the whole of the district, and not for the best selected parts; also, conditionally that actual candle-power is taken into consideration as the basis for comparison. The company proceeded to quote prices. Both letters were referred to a Committee.

**Tutbury (Staffs.).**—The R.D.C. has given its consent to the erection of an overhead H.T. main from the borough boundary to the pumping station at Stretton, in order to supply electricity to the Clay Mills pumping station and the works of the English Grains Co., Ltd.

**Walthamstow.**—An additional feeder is to be laid to the corner of Church Hill and Hoe Street, at an estimated cost of £828; and a second cooling tower is to be installed at the electricity works. The cost of this latter work is put at £1,800. Current is to be supplied to the factory recently opened in Billet Lane by the Fuller Electrical Engineering Co., at an approximate cost of £1,128. In view of certain observations by the district auditor, the consumption of current at the various Council schools is, in future, to be grouped together for the purpose of fixing the charge to be made.

**Warrington.**—The electrical engineer has been directed to report upon the capacity of the plant and the supply of power in anticipation of the demand during next winter; also to purchase 25 domestic electric irons, and sell or hire them out. Tenders are invited for an annual supply of motors.

**Whitstable.**—A memorial with the signatures of 266 residents at Tankerton has been presented to the U.D.C. urging that body to favourably consider the electricity scheme submitted by a private company, as "in our opinion this should prove a most attractive addition to our town, and besides bringing about healthy competition with the existing lighting supply, will no doubt bring more residents to this district, as there will be the inducement of a cheaper light for domestic use."

**Workshop.**—The T.C. has arranged to give a temporary supply of current to the works of Messrs. Oates, Ltd., and arrangements are to be made for a permanent supply for a fixed number of years.

**Wrexham.**—Having established a rate of 4d. per unit for shopkeepers, thus enabling them to adopt heating at a competitive price, Mr. Pickvance, the borough electrical engineer, recently suggested a modification of the present assessment tariff to the extent of giving householders an alternative to the present charge. The new rate is 15 per cent. on the net assessment of the house, and 4d. per unit for all current used. Taking an ordinary assessment and ordinary consumption for lighting, 15 per cent. and 4d. per unit for the current is, he states, very little different in its net result to the existing charge, which is 12½ per cent. and a certain number of free units, with 1d. per unit for current used in excess. The advantage, however, of 15 per cent. and 4d. per unit is that cooking and heating may be adopted without any fear whatever as to large bills, and as the department is securing a fixed sum per annum which pays all standing charges comfortably, the scale will be a very beneficial one to the undertaking. The engineer's recommendation was unanimously adopted by the Council.

The borough electrical engineer submitted, at the meeting of the T.C. on February 25th, a letter from the secretary of the Wrexham Co-Partnership Tenants, Ltd., inquiring whether the Corporation would be prepared to supply electricity to the houses and other property proposed to be erected on land between Gresford and Wrexham, where they intended to place a "garden city" close to the new Gresford Colliery. The Council instructed the engineer to present a detailed report.

## TRAMWAY and RAILWAY NOTES.

**Accrington.**—The Electricity Committee recommends that a sum of £1,568, equal to a rate of 2d. in the £, be appropriated from the tramways to rate funds for the year 1913-14.

**Bacup.**—The capital cost of the Bacup Light Railway (tramway between Bacup and Rochdale) has been agreed with the Rochdale Corporation as follows:—Cost of the order and agreement, £462; permanent way, £12,123; overhead equipment, £2,611; cars, £4,950; car-shed, £1,118; land, £76; total, £21,342. It was resolved that the Rochdale Corporation be approached with a view to ascertaining whether it would be prepared to work an extension of the Bacup Light Railway along Burnley Road.

**Bradford.**—A scheme is in progress of negotiation for the establishment of a through tramway service between Bradford and Dewsbury, by way of Batley and Birstall. The only through service between Bradford and any other town running tramways is at present that to Leeds, and as in that case, the gauge of the Bradford lines differs from that of the lines of the Heavy Woollen District Tramways Co.'s lines, with which the junction will have to be made in the service to Dewsbury. It is proposed to use special cars fitted with the patent extensible axle invented by Mr. C. J. Spencer, manager of the Bradford City Tramways, and which is in use on the Leeds-Bradford system. The establishment of a through service with Dewsbury would reduce the journey between the two places from 50 minutes to 35.

The long-deferred linking-up of the Bradford and Brighouse tramways by way of Wyke and Bailiffe Bridge is expected to come to fruition within the next few weeks, when a stretch of 7½ miles of hilly road will be traversed. This will be the third point at which the Bradford tramways will meet those of Halifax, the others being at Shelf and Queensbury. The new line will, it is expected, bring down the exorbitant railway charges of the locality.

**Burnley.**—The Tramways Committee has decided to gradually remove all the centre pillars, which carry the trolley wires. It has been recognised that, in view of the constantly growing fast vehicular traffic, these poles are a source of danger.

**Continental Notes.**—GERMANY.—By a majority of a single vote, a Special Committee of the Prussian Diet has decided to allocate £1,250,000 towards the electrification of Berlin's city railway and circular system. The proposal to proceed at the same time with the electrification of the suburban lines was defeated by a large majority.

**Croydon.**—At the B.C. meeting on Monday, 20 new fare stages were adopted, of which 13 were 1½d. distances. The chairman of the Committee (Councillor Denning) explained that this was not a cutting of fares, the new stages being uniform with the existing ones. A resolution for the adoption of 4d. fares was lost by a substantial majority.

**Dublin.**—At the half-yearly meeting of the Dublin and Blessington Steam Tramway Co., the chairman stated his conviction that the electrification of the line would immediately turn it into a paying concern.

**Glasgow.**—This week the Tramways Committee formally took over the new 5,000-kw. turbo-alternator which has been installed in the Pinkston power station by Messrs. Richardson, Westgarth. The Corporation installed a turbine of 3,000 kw. at Pinkston, and it, together with the original engines, has hitherto carried the whole load. The two turbines will now do the work, the original engines being only used in cases of emergency. The

change has been brought about partly owing to the increased demands for tramway power, but it will also add to the efficiency of the station, and will effect a saving in the consumption of coal estimated to amount to between £2,500 and £3,000 per annum. The new turbine and generator have cost £10,200, bringing up the cost of the two turbines and the electrical apparatus to £20,400, compared with £102,000, which was the cost of the original plant.

The officials of the T.C. Tramways Department are looking forward with hopeful expectation to topping the million pounds sterling in revenue for this financial year, which ends on May 31st. Confidence is lent the outlook as the result of the last quarter's trading, which ended on February 28th; the number of passengers carried from June 1st to March 1st shows an increase of no less than 28,142,688 over the corresponding total of last year, the figures being: 1911-12, 200,859,408; and 1912-13, 229,302,096. This large augmentation is largely due to the doubling of the 3d. stages early in the course of the present financial year—a course which was expected to bring down considerably the aggregate earnings. That this anticipation was not justified is apparent from the revenue to date, although it was not until about Christmas week that a deficiency was overcome and finances began to mount. The earnings on cars to February 28th for the nine months totalled £743,744 17s. 8d., against £738,558 8s. in the corresponding period a year ago, an increase of over £5,000. As the weekly drawings now average over £19,000, the million of income is, as stated, looked upon as sure, there being still 13 weeks to go.

As reported recently in the REVIEW, Glasgow T.C. is exercised over the question of providing better facilities of access between the north and the south banks of the Clyde, and the Tramways Department of the Corporation, recognising that the cars contribute to the congestion in the main traffic arteries, have verbally offered to share in the cost of erection of a new and suitable bridge. The matter was remitted to the various Committees whose interests were involved, and this week the Tramways Committee appointed members to represent it in negotiations.

**Huddersfield.**—Great keenness is shown by the townships of Elland and Greetland for the carrying out by the Corporation of the proposed electric tramway along Long Wall. The Huddersfield authorities, however, appear to be having some difficulty with the County Council, which has submitted long clauses to Huddersfield, including one for the widening of the way known as Long Wall, an undertaking which would cost £3,000, quite apart from certain points of land ownership which might arise. The Greetland Council has written urging the county authorities to be as lenient as possible, and it appears likely that Greetland and Elland will combine in support of Huddersfield.

**India.**—In connection with the electrification schemes which the Indian railway authorities are understood to have placed before Mr. C. H. Merz, the following projects have been under consideration:—

1. The electrification of the Bombay suburban lines of the Great Indian Peninsula and Bombay, Baroda and Central India Railways. The network here involved is anything from 50 to 100 miles of track.

2. The electrification of the Calcutta suburban lines of the Eastern Bengal State Railway; the conversion of from 20 to 40 miles of track is contemplated in the first instance.

3. The conversion of the Ghazt (main line) section of the Great Indian Peninsula Railway, involving some 30 miles of track. This scheme would be of special engineering interest, as the nature of the Ghazt inclines has always provided locomotive and traffic working problems of great difficulty.

4. The electrification of the Karachi Port Trust Railways.

5. Mr. Merz was also consulted by the authorities of the Ceylon Government Railways, but no details are so far available in this matter. It may, however, be pointed out in this connection that by means of a big engineering scheme, involving extensive bridge-work, the railways of Ceylon are now being linked up with those of India, so that a decision to electrify the lines in the south of the mainland would not be without a bearing on the future of the Sinhalese Railways.

**Lancaster.**—In proposing at the T.C. the adoption of the minutes of the Tramways Committee, Mr. J. Wilkinson referred to the gratifying increase in the traffic returns, and stated that, if they had more top-decked cars, the Committee believed the increase would be still greater.

**Leeds.**—The City Council at its meeting on Wednesday was asked to approve a resolution of the Tramways and Electricity Committee to adopt a plan for buildings for a tramway depot and offices, and a club for the men, upon land in Sovereign Street, at an estimated cost of £22,000.

**Leyton.**—The purchase of an electric watering van is under the consideration of the Council. The cost of the vehicle, with a 1,800-gallon capacity, is put at £770.

**Liverpool.**—Sanction has been received from the B. of T. to the borrowing of £8,000 for the provision of additional tramway cars.

**Llandudno.**—The receipts of the Great Orme tramways for the half-year amounted to £1,747—the highest on record; the net profit was £983, and the number of passengers carried was 61,829.

**Newcastle-on-Tyne.**—A collision of a rather serious character—over 30 passengers being more or less injured—occurred on the North-Eastern Co.'s electrical lines at Manors Station on Saturday morning. The accident was due to a following steam train, and of no account electrically, except as regards the reported short-circuiting of the live rail, which apparently did not lead to fire. A second accident occurred later about a mile away, when an electric train jumped the points without apparent damage to itself, and blocked three tracks for some time.

**Quinton.**—The Light Railway Commissioners on February 26th held an inquiry into the application of the Birmingham T.C. for powers to construct a light railway at Quinton, which will unite the systems between the city boundary and Halesowen. There was no opposition.

**Salford.**—Ten combination tramcars are to be dismantled, and tenders invited for the supply of car bodies and trucks, to be fitted with the electrical equipment taken from the combination cars. Application is to be made to the L.G.B. for sanction to borrow £700 to cover the cost of the installation of filtration plant at the electricity station.

**South Africa.**—Although a somewhat belated move has now been made to carry out the ratepayers' mandate in regard to the railless traction scheme for Bloemfontein, some considerable time must necessarily elapse still before the city possesses a fully equipped system. It is, of course, impossible to specify a given time in which the system will be completed, but it is hoped that the work will be practically completed at the expiration of a period of six months from the time when operations are commenced in earnest. To facilitate the work, much depends, of course, on the condition of the city's thoroughfares through which the tramways will pass. At present the majority of the streets are in a deplorable condition, and it is urged that matters could be facilitated very considerably by this question being taken in hand at once, and a substantial vote being given now towards a thorough and much-needed overhauling of the city's streets.

**South Shields.**—Mr. W. T. Robson, the manager of the Corporation tramways, has submitted a report to the Committee recommending that a 1d. fare be adopted generally on the system. It is pointed out that in the receipts for 1912 1d. fares represented 84·68 per cent. of the whole total, and 1½d. fares 4·08 per cent., the balance being made up of children's, workmen's and return tickets. As the percentage of 1½d. fares was so low, and taking into consideration the probable increase of passengers if the reduction were made, he does not think the receipts would suffer. The Tramways Committee, after consideration of the report, decided to recommend the Council to adopt a universal system of 1d. fares, with the following scale of fares:—1d. single ticket, 3d. single ticket for children, 1d. return ticket for workmen if issued before 8·45 a.m., 2d. double return ticket for workmen if issued before 8·45 a.m., the first return half and the second outward half being available between 11 a.m. and 2 p.m. In each case the single journey to be limited to the present 1½d. distances.

**Tasmania.**—The Hobart ratepayers recently cast 3,439 votes in favour and 905 against purchasing the business of the Hobart Electric Tramway Co., for £210,000. The company is a British one, and owns 9 miles of tramways.

**Todmorden.**—At the T.C. meeting on February 27th there was a lively discussion on the motor-bus undertaking and the proposal of the Motor-Buses Committee to issue workmen's fares at 25 per cent. below ordinary prices. Alderman Dawson said that during the six years the 'buses had been on the roads there had been a total loss of £8,000, in spite of help from the profits on the gas undertaking. Yet it was now proposed to increase the plant and reduce the fares. Councillor Holgate contended that the 'buses should be run more for public convenience than profit. Councillor Wordsworth said the proposal for workmen's cheap fares had been on the carpet for two years, and it was time the Corporation did something. The minutes embodying the proposal and the Committee's recommendation to purchase two more 'bus bodies were adopted.

**U.S.A.**—A definite plan has at last been formulated with a view to consolidating all the surface and elevated traction companies in Chicago. The bodies financially interested have laid a proposition before the city authorities which will probably be subjected to a referendum vote in April next. The total surface and elevated traction mileage in Chicago is about 1,070, all of which is electrically operated. The elevated railway companies are already consolidated, and have a total property value of £15,000,000; the total capital account of the surface companies is about £28,000,000. It is proposed to issue free transfers between any of the lines in return for a 5-cent fare between any two points within the city limits. Subways are ultimately to be provided for rapid transit to all parts of the city, and the elevated railways are to be given access to a subway system, the union elevated loop being then removed.

The financial sections of the scheme provide that 6 per cent. interest shall be paid on the capital account of the properties after paying operating expenses. When the subway for the elevated trains is complete, 7 per cent. interest is to be paid on the gross total capital account. After this 7 per cent. has been deducted, the remaining profit is to be divided between the city and the consolidated company in the proportion 7:3. The greater part of the interest allowances will go to the 5 per cent. bonds outstanding and yet to be issued. The remainder and the company's share of the surplus profits will go towards the payment of dividends and retire

the stocks of the company. The city's share will be used to wipe out the companies' bonds now issued, and yet to be issued for extensions and improvements, so that after 10 or 50 years the whole system of consolidated surface and elevated railways and subways will come into the city's possession free of encumbrance. The city authorities are to have the right of assuming ownership at any time by paying off the capital account plus 10 per cent. It is suggested that a Joint Board of Control be appointed to regulate the operation and extension of the system.—*Electrical Review and Western Electrician*.

## TELEGRAPH and TELEPHONE NOTES.

**Canada.**—An American Consul, in Prince Edward Island, reports that important improvements are being made in the telegraph service there. A new multiple cable is to be laid across Northumberland Strait to supplement the present cable connecting Prince Edward Island with the mainland, and will cost approximately £9,000. In addition to two telegraph wires, the new cable will provide permanent telephonic communication across the strait. There are 28 telegraph offices upon the island.

**China.**—The Chinese Department of Communications is reported to have decided to establish a wireless telegraph station at Woosung. The apparatus will be capable of communicating in the daytime within a radius of 1,200 miles.

**Imperial Wireless System.**—Mr. George Balfour, prospective Unionist candidate for Govan, in the course of an address, referred to the Marconi inquiry. He said he was not entitled to say a word about the grave rumours that were in circulation regarding certain of H.M. Ministers, but he was entitled to say something regarding the manner in which His Majesty's Ministers were dealing with these accusations. The Government had appointed a Select Committee of the House of Commons. That Select Committee was necessarily a partisan Committee. That meant that the majority of its members were supporters of these very Cabinet Ministers who were involved in the accusations, while the minority was composed of their opponents. It was not good that there should be partisanship at all. The way to deal with the matter was not to appoint a Select Committee, but a Select Commission, and because of the judicial minds of the men composing it they would, as upright men, give their verdict free from bias. He asserted emphatically that the Government had failed absolutely in its duty in this respect.

**International Radiotelegraphic Convention.**—The United States Senate has passed a resolution approving of the Convention signed in London in July last year.

**London-Berlin Telephony.**—Successful experiments have been carried out in communication by telephone between London and Berlin, via St. Margaret's Bay and La Panne in Belgium. The length of submarine cable in circuit was 60 miles, and the total length of line nearly 700 miles. It is hoped that a regular service will be provided before long.

**New Wireless Stations.**—Amongst other new stations ordered from the Marconi Co. is one of 30 KW. for the Italian Government, to be erected in Eritrea. The Portuguese Government has ordered five land stations, for Lisbon, St. Miguel, Funchal, St. Vincent, and Oporto; the Brazilian Government, four land stations of 25 and 15 KW., for naval purposes; the British Government, a station for Valentia, in Ireland; and numerous orders have been placed for smaller sets, as well as for the customary 1½-KW. set and emergency set, for use on board ship.

**Peru.**—A proposal is before Congress to devote £17,750 to the construction of two wireless telegraph stations on the north and south coasts of the country respectively.—*The Marconigraph*.

**Telephony in Mines.**—A Bochum engineer, named Joseph Reineke, has devised a wireless telephone system for use in mines, on original lines. The system has been at work for the past four months with success in the "Carolinenglück" colliery at Bochum-Hamm, and the "Minster-Stein" mine is now being fitted with a similar equipment.—*Zeit. für Schwachstromtechnik*.

**Wireless Time Service.**—According to *The Marconigraph*, the German Imperial Post Office is about to attempt to carry out a scheme for controlling public clocks throughout the whole country by means of wireless signals sent out from the big station in Fulda, once every minute.

**The "Wireless World."**—This is to be the new title of the journal hitherto known as the *Marconigraph*, the organ of the multifarious interests which have grown up on the foundation laid by Mr. Marconi. The new magazine will be larger than its predecessor, and it will deal with everything of interest in the world of wireless telegraphy. The first issue, in April, 1911, consisted of 16 pages; 12 months later it comprised 62 pages, and the *Wireless World* will contain 96 pages. It will appear once a month, and will be "never at any time abstrusely technical," but will aim always to interest the general public. We wish it all success.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberaman.**—March 10th. Electrical goods, for the directors of the Powell Duffryn Steam Coal Co., Ltd. Stores Manager, Aberaman, near Aberdare.

**Australia.**—April 14th. H.M. Trade Commissioner for Australia reports that tenders are invited for plant required to generate three-phase current for the high-power radio-telegraph station at Darwin, Northern Territory, and for lighting and power purposes in the neighbourhood. For further particulars see this column and "Official Notices" last week.

**Belfast.**—March 12th. The Harbour Commissioners are inviting tenders for four 5-ton electric gantry cranes for the Queen's Quay and Abercromby Basin Quay. Specifications, &c., from the Harbour engineer, Mr. W. Redfern Kelly, Belfast.

**Birmingham.**—March 11th. Additional rolling stock (electric tramway cars) for the Tramways Department. Mr. A. Baker, general manager, Tramway Offices, Council House, Congreve Street. (Deposit £2.)

**Bridgend.**—March 21st. One 400-K.V.A. steam alternator and accessories, for the U.D.C. See "Official Notices" Feb. 28th.

**Brighton.**—March 10th. Storage battery (800 amp.-hours) for the T.C. See "Official Notices" February 28th.

**Burnley.**—March 10th. Electrical work for the B. of G. for six months. Mr. J. S. Horn, clerk, Union Offices.

**Chile.**—September 10th. The Harbour Works authorities at Valparaiso are inviting tenders for the establishment of a central generating station for the supply of electricity for lighting and power purposes at the port.

**Colchester.**—March 10th. Sundry stores for the Corporation Electricity Department. Mr. W. Friby, electrical engineer, Osborne Street.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" Feb. 21st.

**Dover.**—March 12th. Electrical sundries and cables, for a year, for the Harbour Board. Mr. Martyn Mowll, registrar, Castle Street.

**Dundalk.**—March 24th. Stores for a year, for the U.D.C. Electricity Department. See "Official Notices" to-day.

**Dundee.**—The Corporation invites tenders for the construction of a brick chimney, and for the supply, delivery and erection, complete, of structural steel work for extensions to Carolina Port generating station. Mr. H. Richardson, general manager and engineer.

**Eastbourne.**—March 10th. Combined coal elevator and conveyor for the Corporation Electricity Department. See "Official Notices" February 28th.

**Germany.**—MÜNSTER.—March 15th. Tenders are invited for the supply, erection and setting at work of five electric travelling cranes of 8,000 kg. lifting capacity for the new locomotive workshops at Osnabrück. Particulars, enclosing postage (1'50 marks), from the Königliche Eisenbahndirektion, Münster, Westphalia.

POSEN.—March 17th. Supply of 22,100 metres of paper-insulated cable. Particulars, enclosing postage, from the Königliche Eisenbahndirektion, Posen.

**Heckmondwike.**—Maintenance and repair of electric fire alarms, for the U.D.C. The Surveyor.

**Heston and Isleworth.**—March 8th. Stores and materials for a year, for the U.D.C. electricity department. See "Official Notices" February 21st.

**India.**—March 14th. Motors, transformers and motor-generator, for the B.B. and C.I. Railway. See "Official Notices" February 21st.

**Liverpool.**—March 10th. Electrical fittings for a year, for the Select Vestry. Mr. C. W. Coster, clerk, Brownlow Hill.

**London.**—L.C.C.—March 19th. Electrical installation at the Victory Place elementary school, Walworth, S.E. See "Official Notices" to-day.

It is proposed that during the recess, the Highways Committee shall have authority to open any tenders that may be received for the construction of the authorised conduit tramways from Calford to Southend via Bromley Road, and the reconstruction of the existing horse tramways from Chapel Street to Nile Street, Woolwich.

**MILE END.**—March 20th. Re-wiring wards, &c., at the Infirmary, for the Guardians. See "Official Notices" to-day.

According to an announcement in a daily paper, estimate, plan and drawings are invited for the following for the Anglo-German Exhibition, Crystal Palace, 1913:—A light electric railway, connecting from the Low Level entrance to the Crystal Palace Terrace. Two escalators from the Terrace to the main building of the Crystal Palace. Offices of the Anglo-German Exhibition, Empire House, Piccadilly, W.

**Macclesfield.**—March 11th. Electrical goods for the Cheshire County Asylum, Parkside. Mr. Wm. Tingay, clerk of the Asylum.

**Manchester.**—March 12th. High-pressure steam and feed pipes for the Electricity Committee. Mr. F. E. Hughes, secretary, Electricity Department, Town Hall. Deposit £1 ls. returnable.

**Norway.**—March 15th. Town Council of Narvik. 10 tons of electrolytic copper wire. Tenders for delivery c.i.f. Narvik received at "Narvik formandskab," Narvik, North Norway. Further particulars from Hr. Per Larsen, engineer, Hamar, Norway. No special form of tender is required.

**Portsmouth.**—March 18th. Stores and materials for a year for the Corporation Tramways Department. See "Official Notices" to-day.

**Pontypridd.**—March 17th. Tramway-men's uniforms for the U.D.C. See "Official Notices" February 28th.

**Southampton.**—March 10th. Cable for the Corporation Electricity Department. See "Official Notices" to-day.

**South Shields.**—March 10th. Stores for a year for the Corporation Electricity Supply Department. Mr. H. S. Ellis, electrical engineer, Mill Dam.

**Spain.**—The municipal authorities of Banolas (province of Gerona) have just invited tenders for the concession for the electric lighting of the town during a period of three years.

**Swindon.**—March 8th. General stores and materials for a year, for the Corporation electricity and tramways departments. See "Official Notices" February 14th.

March 10th.—One 500-kw. mixed-pressure turbine and condensing plant, boiler feed pump and pipework, and one switchboard panel and cables, for the Corporation. See "Official Notices" February 14th.

March 20th.—The Standing Joint Committee of the Wilts County Council invite tenders for work in connection with the installation of electric light at the Old County Police Station, Swindon. Plans and specification and form of tender from County Surveyor's Office, Swindon.

**Swinton and Pendlebury.**—March 10th. One 25-kw. transformer and switchboard, main along Chatsworth Road, and annual supply of materials, for the U.D.C. Electricity Department. See "Official Notices" February 21st.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Wallasey.**—March 15th. Fuel oil (400 tons) for a year, for the Corporation electricity department. Mr. J. A. Crowther, electrical engineer, Seaview Road, Liscard.

**War Office.**—Cables, electrical stores, iron telegraph poles, &c. See "Official Notices" February 28th.

**York.**—March 10th. One 3,000-kw. turbo-alternator, with condensing plant, pipework and switchboard, water-tube boilers with chain-grate stokers, &c., storage battery and H.T. cables, for the Corporation. See "Official Notices" February 21st.

## CLOSED.

**Accrington.**—The Tramways Department has accepted the tender of Messrs. Briggs, Jones & Gibson, for the supply of uniform clothing, and that of Messrs. Leffet & Co. for caps.

**Australia.**—The following contracts have been placed:—

**VICTORIA.**—P.M.G.

Three combined Gardner oil engines and generators (a) one for Thursday Island and (b) two for Port Moresby (Papua) wireless telegraph stations, (a) £283, £242 each.—Noyes Bros.

**SYDNEY.**—P.M.G.

Glazed earthenware conduit, 4,000 ft.—Brunswick Brick, Tile and Pottery Works, Ltd. Ditto (about 22,000 ft.)—Mills & Co.

One X absorber, £150.—Maritime Wireless Co. (Saw System), Ltd.

**VICTORIAN RAILWAYS.**

Telephone cable.—Automatic Telephones (Australia), Ltd.

—*Australian Mining Standard.*

**SYDNEY.**—The City Council Finance Committee recommended the acceptance of the tender of the Australian Metal Co., Ltd., for the supply of motors for refrigerating plant at the Fruit Markets,

at £2,742. The tenders of the Vacuum Oil Co., the British Imperial Oil Co. and the Pacific Oil Co. for oils were recommended. The Electric Light Committee recommended the following:—Time limit relays, Noyes Bros., £306; arc lamp contact, &c., gear, Laurence & Hanson Co., £214.—*Tenders.*

**Belgium.**—La Société des Ateliers de Construction Electriques de Charleroi submitted the lowest tender last week for the establishment of an electric lighting installation in the Royal Palace at Laeken, near Brussels.

**Birkenhead.**—Messrs. Chamberlain & Hookham's tender for D.C. meters has been accepted by the Council.

**Birmingham.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract for the supply of tantalum traction lamps for the lighting equipment of the whole of the cars on the Corporation tramways system for the ensuing 12 months. During this period, it is anticipated that a quantity of some 20,000 lamps will be required.

**Bolton.**—The Electricity Committee has accepted the following tenders in connection with the new Back-o'-the-Bank generating station:—

John Musgrave & Sons, Ltd.—Two turbo-alternators of 4,000 kw. each.  
Babcock & Wilcox, Ltd.—Four water-tube boilers including superheaters and stokers.  
Green & Son.—Four sets of economisers.

**China.**—It is reported that a German company at Shanghai has contracted with a Chinese syndicate for the supply of electricity for lighting purposes at Wuchang.

**Dartford.**—The tender of the Premier Accumulator Co., Ltd., has been accepted by the U.D.C. at £723, for the supply of a battery, and for the maintenance of same for 10 years, at £65 per annum.

**Derby.**—The T.C. has accepted the tender of Messrs. C. A. Parsons & Co., Ltd., for a turbo-alternator, at £7,292.

**Dewsbury.**—The Corporation has accepted the tender of Messrs. Ferranti, Ltd., for a switch panel for the turbine generator at the electricity works, at £266, and that of the Union Cable Co., for fire-proof cable, at £114.

**Eccles.**—The Corporation Public Lighting and Electricity Committee has accepted the tender of Mr. J. F. Heys for trench-cutting and cable-laying for 12 months.

The T.C. has accepted the quotation of the London Electric Firm for the supply of 13 sets of hoists and lowering-gear for the four-light clusters to be fixed on the tramway centre poles in Church Street and Liverpool Road, at £2 19s. 5d. per set.

**Glasgow.**—The T.C.'s Committee on Tramways has recommended the acceptance of the following:—

Steel step treads.—H. & F. Bonten, Ltd.  
Armature coils.—British Westinghouse Electric, &c., Co., Ltd.  
Scrap.—(a) copper and lead.—P. & W. MacLellan, Ltd.  
(b) brass, and (c) copper and mica turnings and zinc.—Pegler Bros. and Co.  
(d) brass dust.—R. M. Easdale & Co.  
(e) rubber.—City Waste Rubber Co.  
(f) cable.—Ballardie, Holden & Co.

**Kidderminster.**—The B.G. has accepted the tender of the Birmingham Telephone Co. for the installation and maintenance of telephones in the Workhouse.

**Kingston-on-Thames.**—The T.C. has accepted the tender of the Craigpark Electric Cable Co. for 110 yd. of 2 sq. in. high-tension concentric lead-sheathed and armoured cable, at £52, this being the lowest of seven tenders; and that of the British Thomson-Houston Co., Ltd., for a Tirrill regulator complete, at £150. The Council has also accepted the tender of the Anglo-American Oil Co., Ltd., for up to 20 tons of fuel oil for the electricity works, at £4 3s. 6d. per ton.

**Leyton.**—The U.D.C. has accepted the following tenders for annual supplies:—

Oliver Arc Lamp Co., Ltd.—Carbons for lamps of own make, £214s. 6d. per 1,000 pairs.  
Johnson & Phillips.—Second grade carbons, £3 8s. 6d. per 1,000 pairs.  
Wakenfield & Co.—Oil.  
R. Todd.—Service line cable.

**Liverpool.**—The T.C. has accepted the tender of the Worthington Pump Co., Ltd., for the supply and erection of four cooling towers at the Lister Drive power station. The following tenders have also been accepted for annual supplies:—

Insulated cables and wires.—Liverpool Electric Cable Co., Ltd.; Anchor Cable Co., Ltd.  
Metal-filament lamps.—The Gabriel Lamp Co.  
Carbon-filament lamps.—Electrical Co., Ltd.  
Carbons for arc lamps.—Wm. Geipel & Co.  
Cables and accessories for mains (three years' contract).—Callender's Cable and Construction Co., Ltd.

**London.**—L.C.C.—The Asylums Committee has accepted the following tenders for stores:—

Electrical sundries.—General Electric Co., Ltd.; Siemens Bros. Dynamo Works, Ltd.; Varvite, Ltd.; McLellan & Co.; Cox-Walkers, Ltd.; Edison & Swan United E.L. Co., Ltd.; Falk, Stadelmann & Co.  
Electric lamps.—Siemens Bros. Dynamo Works, Ltd.; B.T.H. Co.; and G.E. Co., Ltd.

The Stores and Contracts Committee have placed contracts for electric carbons with Messrs. W. Geipel & Co. and Messrs. H. G. Mayer & Co.

After three months' satisfactory trial, which has shown that a saving in labour amounting to £100 a year will be effected thereby, an adding machine is to be purchased from the Burroughs Adding Machine Co., Ltd., for £153, for use in the tramways department. The tenders received for three 1,500-KW. rotary converters for the Shoreditch tramway sub-station were:—

Dick, Kerr & Co., Ltd.	.. .. .	(accepted) £8,422
British Westinghouse Co., Ltd.	.. .. .	8,713
General Electric Co., Ltd.	.. .. .	9,145
Estimate of Chief Officer	.. .. .	7,900

The Committee says that the tenders are "subject to general conditions laid down by the B.E. and A.M.A.," but it sees "no objection thereto, provided the conditions in question are not materially at variance with the general conditions in the Council's form of contract."

For the wiring of the Camberwell and Cressy Road car-sheds the tenders were as follows:—

Williams & Bach	.. .. .	(recommended) £2,140
Electrical Installations, Ltd.	.. .. .	2,146
G. E. Taylor & Co.	.. .. .	2,815
G. Weston & Sons, Ltd.	.. .. .	2,672
Lund Bros. & Co.	.. .. .	2,623
L. G. Tate & Co.	.. .. .	2,683
Tilley Bros.	.. .. .	2,697
W. C. Tackley & Co., Ltd.	.. .. .	3,075
Estimate of Chief Officer	.. .. .	2,080

An agreement is to be entered into with Messrs. Thermit, Ltd., for the supply of welded rail joints, at 19s. 6d. each, during the year.

Tenders received for four towers for fitting to existing motor wagons were:—

Watlington & Co., Ltd.	.. .. .	(recommended) £202
Peter Boswell & Sons	.. .. .	379
Bayley's, Ltd.	.. .. .	604

Four hydraulic pit jacks for Camberwell car-shed were tendered for thus:—

National Rail and Tramway Appliances Co., Ltd.	.. .. .	(recommended) £35 10 each
Buck & Hickman, Ltd.	.. .. .	89 0

For smiths' hearths and exhaust and blower fans for the Leven Road, Poplar, and Battersea Wharf permanent way depôts the tenders were:—

Alldays & Onions Pneumatic Engineering Co., Ltd.	.. .. .	(recommended) £109
Standard Engineering Co., Ltd.	.. .. .	167
G. O. Hatch, Ltd.	.. .. .	177
Davidson & Co., Ltd. (fans only)	.. .. .	50
" " " (alternatively)	.. .. .	48

The following tendered for 125,000 drawn-wire metallic-filament lamps:—

Siemens Bros. Dynamo Works, Ltd.	.. .. .	(recommended) £7,800
" " " (alternative)	.. .. .	10,237
General Electric Co., Ltd.	.. .. .	10,237
British Thomson-Houston Co., Ltd.	.. .. .	10,237

Tenders for 380 yd. of H.T. cable were received as follows:—

Siemens Bros. & Co., Ltd.	.. .. .	(recommended) £248
W. T. Henley's Telegraph Works Co., Ltd.	.. .. .	252
Western Electric Co., Ltd.	.. .. .	252
B.I. and Helsby Cables, Ltd.	.. .. .	253
W. T. Glover & Co., Ltd.	.. .. .	254

For special section rolled-steel bar for magnetic brake shoes the contract is to be given to the Lillishall Co., Ltd., at £8 2s. 6d. per ton (total £4,745). The tenders were:—

	Prices a ton, both sections.
	£ s. d.
Lillishall Co., Ltd.	.. .. . (accepted) 8 2 6
Earl of Dudley's Round Oak Works, Ltd.	.. .. . 8 2 6
A. C. Schove, Purley (works Société Anonyme d'Ougrée-Mariage, Belgium)	.. .. . 8 2 9
Frodigham Iron and Steel Co., Ltd.	.. .. . 8 5 6
P. & W. McLellan, Ltd.	.. .. . 8 7 3
Andrew Brown & Co. (agents for Société Anonyme des Acieries d'Angoulême)	.. .. . 9 5 0
Henry Bessemer & Co., Ltd.	.. .. . 9 10 0
Cammell, Laird & Co., Ltd.	.. .. . 9 10 0
Patent Shaft and Axletree Co., Ltd.	.. .. . 9 12 6
Bayliss, Jones & Bayliss, Ltd.	.. .. . 10 7 6

ISLINGTON.—The B.C. has accepted the following tenders for annual supplies to the Electricity Department:—

Are lamp carbons.—Sloan Electrical Co.; Geipel & Co.	
Are lamp globes.—City Glass Co. Ltd.	
Electricity supply meters.—British Westinghouse Electric and Manufacturing Co., Ltd.	
Cables.—British Insulated and Helsby Cables, Ltd.	
Electrical sundries, lamps, brushes, and lamp parts, &c.—Maxim Lamp Co., Ltd.; Pope's Electric Lamp Co.; Gene at Electric Co., Ltd.; Heap and Johnson; Messrs. Round.	
Cable terminal, service and network boxes, tape, and iron castings.—B.I. and Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Lucey & Co., Ltd.; Sykes & Sugden, Ltd.; J. Gibbs & Co.; British Insulated and Helsby Cables, Ltd.; Dusek Bitumen Co.; India Rubber, Gutta-Percha and Telegraph Works Co., Ltd.	

SHOREDITCH.—The B.C. has received the following tenders for the supply of economisers for the boiler plant at the Whiston Street Power Station, which is invariably worked at an overload capacity:—

Economisers, Ltd.	.. .. .	(accepted) £1,600
E. Green & Son	.. .. .	1,875
E. Lowcock, Ltd.	.. .. .	2,697
Clay Cross Co.	.. .. .	2,850
E. Goodbrand & Co.	.. .. .	2,370
J. Thompson	.. .. .	2,500

STAFFORDSHIRE.—The County Education Committee has accepted the tender of the Electric Construction Co., Ltd., at £365, for the installation of electric plant and machinery, &c., for the Burntwood, Chase Town, New County Mining Institute.

ROCHDALE.—The Corporation Gas and Electricity Committee on Friday decided to recommend the acceptance of the following tenders in connection with the extensions at the electricity works

Building.	.. .. .	R. & T. Howarth.
Turbo-alternator.	.. .. .	W. H. Allen & Co.
Steam turbine.	.. .. .	J. Howden & Co.
Motor alternator.	.. .. .	The General Electric Co., Ltd.

The contract for boiler and hoppers was left over for further consideration.

WARRINGTON.—The T.C. has accepted the tender of Messrs. T. Speak for wiring the new baths.

WIGAN.—The T.C. has accepted the tender of Messrs. Dorman & Smith for a new switchboard for the Market Hall.

## FORTHCOMING EVENTS.

ROYAL INSTITUTION.—Friday, March 7th. At 9 p.m. Discourse on "Photography of the Paths of Particles Ejected from Atoms," by Mr. C. T. R. Wilson.

Saturday, March 8th. At 3 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture V.)

Saturday, March 15th. At 3 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture VI.)

CHARGING CROSS, WEST END AND CITY ELECTRICITY SUPPLY CO., LTD. Friday, March 7th. At 8 p.m. Staff Smoking Concert. The Pillar Hall, Victoria Station (S.E. & C. Railway).

ASSOCIATION OF ELECTRICAL STATION ENGINEERS.—Friday, March 7th. At 8 p.m. At Exeter Café, Deansgate, Manchester. Meeting to form Manchester branch.

Wednesday, March 12th.—At 7.45 p.m. At the Y.M.C.A., Bothwell Street, Glasgow. Meeting to form Glasgow branch.

JUNIOR INSTITUTION OF ENGINEERS.—Friday, March 7th. At 39, Victoria Street, S.W. Paper on "The Training of a Colonial Engineer," by Mr. A. C. Herapath.

Wednesday, March 12th. At 8 p.m. At the I.E.E. Paper on "Water-Heat-team: the Effects of Heat upon Water, and a Consideration of Water Movements in Steam Boilers," by Mr. A. Ross.

Friday, March 14th. At 39, Victoria Street. Continuation of discussion on paper on "Water-Heat-Team."

INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS (Metropolitan Section).—Monday, March 10th. Meeting at 6 p.m. At the I.E.E.

FARNLEY SOCIETY.—Wednesday, March 12th. At 4.30 p.m. At the Chemical Society rooms, Piccadilly, W. General discussion on "Colloids and their Viscosity."

ASSOCIATION OF ENGINEERS-IN-CHARGE.—Wednesday, March 12th. At 7.30 p.m. At St. Bride's Institute, E.C. Paper on "The Province of the Engineer-in-Charge," by Mr. A. E. Penn.

INSTITUTION OF ELECTRICAL ENGINEERS (LONDON).—Thursday, March 13th. At 8 p.m. Paper on "Power Supply on the Road," by Mr. A. E. Hadley.

(Newcastle Section).—Monday, March 10th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Condensing Plant," by Mr. W. A. Dexter.

(Manchester Section).—Tuesday, March 11th. At 7.30 p.m. At the University, Manchester. Paper on "Power Supply on the Road," by Mr. A. E. Hadley.

(Scottish Section).—The meeting set down for Tuesday, March 11th, has been postponed to March 18th, and the annual general meeting from April 8th to April 15th.

(Yorkshire Section).—Wednesday, March 12th. Meeting at 7 p.m. At the University, Leeds.

(Birmingham Section).—Wednesday, March 12th. At 7.30 p.m. Meeting at the University, Birmingham.

(Dublin Section).—Thursday, March 13th. Meeting at 8 p.m. At the Royal College of Science, Dublin. Paper on "Recent Developments in the Application of Electricity to the Textile Trades," by Mr. S. F. Crowley.

PHYSICAL SOCIETY.—Friday, March 14th. At 5 p.m. At the University College, Gower Street, W.C. Paper on "Some Oscillograms of Condenser Discharges and a Simple Theory of Coupled Circuits," and "An Exhibition of Braun Cathode-Ray Tubes and an Electrostatic Machine for Working them, used as a High-Frequency Oscillograph," by Prof. J. A. Fleming; and other papers. Demonstration of Spark Photographs, by Mr. W. B. Haince, before the meeting.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer.—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, March 10th.—"A" Company. Recruit training, 7 to 10 p.m. company training, 7 to 10 p.m.

Tuesday, March 11th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, March 13th.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Friday, March 14th.—"D" Company. Company training, 7 to 10 p.m.

Saturday, March 15th.—Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.  
For Officer commanding L.E.E.

## NOTES.

**The Easter Holidays.**—Owing to Friday, March 21st, being Good Friday, the *ELECTRICAL REVIEW* for that date will be published two days earlier, appearing on the morning of Wednesday, March 19th. Our advertisement department asks that new advertisement copy and alterations to existing advertisements for that issue should be received not later than Saturday morning, March 15th. An announcement on the matter will be found in our advertisement pages to-day.

**Cost of Operating Electric Wagons.**—The Commonwealth Edison Co. has published interesting schedules showing the cost of operating two 700-lb.; four 15,000-lb.; four 2,000-lb.; and 20 3,000-lb. electric wagons during the three years, January, 1909, to December, 1911. Nineteen of the vehicles have Edison, and the remainder lead batteries. From these returns (published in the *Electrical Review* and *Western Electrician*), we extract the following average data:—

Item.	Average cost.		Item.	Average cost.	
	Per car.	Per car.		Per car.	Per car.
	per mth.	per mth.		per mth.	per mth.
	s. d.	d.		s. d.	d.
Fixed charges ..	126	6	20		
Fixed charges on land, buildings and garage ..	24	0	0-4		
Operating expenses ..	582	0	9-15		
Total general expenses ..	67	10	1-05		
Grand total ..	800	8	12-6		
Miles travelled per car per mth. ..	775				
Miles per day per wagon in service ..	30-5				
Days per month in service (per wagon) ..	22-6				
Average kw.-hr. per car-mile. ..	0-495				

Item.	Average cost.		Item.	Average cost.	
	Per car.	Per car.		Per car.	Per car.
	per mth.	per mth.		per mth.	per mth.
	s. d.	d.		s. d.	d.
Including:—					
Oil and other supplies ..	21	2	0-35		
Energy at 24. per unit ..	63	0	1-00		
General repairs ..	55	6	0-88		
Tires ..	36	8	0-55		
Batteries ..	40	11	0-65		
Total ..	217	2	3-40		

Interest at 6 per cent.; taxes, 1-5 per cent.; insurance, 2 per cent.; depreciation, 10 per cent. Including driver's salary, washing, oiling and minor repairs and operating garage expenses. Including supervision, wheel tax, licence and insurance.

It is said that the 1912 operating costs were lower than the above, but no precise figures for last year have yet been published. It should be noted that the figures apply to American conditions, and probably lower figures would be obtained in this country.

### A Powerful Sterilising Mercury-Vapour Lamp.

In the types of mercury-vapour lamps hitherto in use, the electrodes have been at opposite ends of a straight tube, the enlargements, condensing chamber or radiating vanes of which have prevented close approach of the luminous part of the lamp to objects that are to be illuminated. With a view to removing this limitation and securing a much higher percentage of ultra-violet light than is provided by ordinary 110–220-volt mercury lamps, Messrs. Henri, Helbrunner & Recklinghausen have constructed a lamp in which the luminous vapour is contained by a quartz U-tube. The internal diameter of the tube is 0-55 in., each limb is 6-3 in. in length, and the two limbs and the electrodes are very close together. The lamp operates on 500 volts, the P.D. between the electrodes being 375–390 volts and the current flowing 3 amperes. The net power consumption of the lamp is thus 1,150 watts, and the candle-power, in a plane through the centre of the arc perpendicular to the axis of the lamp, exceeds 8,000 c.p.

The absolute value of the ultra-violet radiations has not yet been determined, but their chemical and bacteriological effects have been compared with those radiations from 110 and 220-volt lamps. It is reported that the new 500-volt lamp produces the same effect on amidon in six hours and on glycerine in four hours, as is produced by a 110-volt lamp in 260 hours and 240 hours respectively. The sterilising effect of the new lamp on a bacteria culture (*coli*) is 60 times as rapid as that of a 110-volt lamp placed at the same distance from the culture. Considerable photo-combustion and photo-polymerisation of carbides of hydrogen have been effected by the new lamp, whereas such action is very limited if 110-volt lamps be used.

The new lamp provides ultra-violet radiations from 50 to 60 times as intense as those from a 110-volt lamp (though its wattage is only 4-6 times as great). When applying the lamp to the economical sterilisation of large quantities of water, the luminous portion of the tube is enclosed by a cylinder of transparent quartz fixed at the centre of a circular tank, through which flows the water treated. Baffle plates are provided to guide the water round and against the central cylinder.—*Technique Moderne*.

**"New Light Marvel."**—Under this title the *Standard* recently put before its readers an account of a "discovery" made by a French engineer, M. Dussaud. The description ran as follows:—

The invention is based on the principle of matter having need of rest, or molecular equilibrium. For example, two springs working alternately work out more slowly than if each is worked continuously. "Cold light" is the application of this principle to incandescent electric lamps. Light is concentrated in a single point by all the filaments working successively, and projected through a lens multiplying a thousandfold. By this process M. Dussaud has succeeded in concentrating 2,000 c.p. in a single point and passing 32 volts into an 8-volt lamp, which otherwise would burst.

The advantages claimed are, first, the elimination of danger, since a lamp, though producing so dazzling a light that it is impossible to look at it with the naked eye, can be held in the hand without

the slightest heat being felt. Second, such a lamp requires a hundred times less current than the ordinary lamp, and in the absence of a sector it can be produced by a tiny battery. The motive power can be given by an ordinary water tap, a squirrel in a cage or the operator's foot. Third, it contains ultra-violet rays, thus requiring a hundred times less electricity than usual.

These facts were all demonstrated on the screen. A beautiful coloured landscape, 3 yards square, to project which with ordinary lamps would require 40 volts, or 2,000 watts, only needed 20 watts with the "cold light," costing one centime instead of a franc, or a hundredth of the cost. All the views shown were produced with very small and inexpensive apparatus, and henceforth similar illustrations can be given in schools by professors without danger, the only appliance being a cheap little apparatus that can be slipped into the pocket.

We need not follow the enthusiastic correspondent of the *Standard* further. Those of our readers who remember our exposure of the analogous "Poleforica" fallacy will not be surprised to know that we regarded this report with the coldest scepticism, and we did not publish anything about it. In the meantime, we have communicated with a distinguished French scientist, who informs us that there is no foundation for M. Dussaud's extravagant claims—backed though they were said to be by no less eminent a physicist than Prof. Branly—except the statements of the inventor himself, who has produced no evidence in support of them.

**Electrical Trades Union.**—Under the auspices of the Plymouth Branch of the Electrical Trades Union, a smoking concert was held at the Clarence Hotel, Morice Town, Devonport, on Friday evening. There was a good attendance, and the general organiser (Mr. J. Hinniburgh) attended and addressed the members on the importance of organisation. He pointed out that it was impossible to get the old men employed in the Dockyard to see the benefits of Trade Unionism. The reason was that they were all right themselves and did not care twopenny for any of the other workers. He therefore made an appeal to the young men, those hands who had come around from Scotland, the North of England and London, to join the organisation, and then band themselves together with the hope of making the electrical trade better in the future than it had been in the past. Organisation or combination was absolutely essential for the self-preservation of the individual. The speaker observed that the members of the House of Commons fixed £400 a year as the minimum rate of wages on which they could exist. Supposing those 700 gentlemen suddenly dropped dead, no one would be put about much except their near relatives. For any real necessity they would not be missed at all. But take the working classes. Supposing 700 bakers in the Three Towns were suddenly to drop dead. They could easily understand what a serious position would be caused thereby. The 700 bakers were far more necessary than the 700 gentlemen who legislated for their country at Westminster. The speaker reminded his hearers of the campaign to be initiated shortly for an 8-hour day. That matter might not interest those engaged in the Dockyard, but those working outside the Dockyard would recognise that an 8-hour day was a big proposition.

Subsequently Mr. T. Parr, who has held the office of secretary of the Plymouth branch for the past five years, was the recipient of a fountain pen in recognition of services rendered.

**Gas Fires and Evil Odours.**—In a leaderette on "The Education of the Gas Consumer," our contemporary, the *Gas World*—for which, by the way, we have sincere respect—courageously publishes some plain truths about the gas fire; as our contemporary occasionally does us the honour to quote from our columns, we return the compliment:—

"The truth of the gas fire situation, as it is capable of being realised to-day, is precisely as Mr. Wilson put it:—No gas fire ought to announce its existence through the sense of smell. Unfortunately, very many gas fires do so betray their defective construction or fitting. It is high time that this deplorable misbehaviour of gas fires were corrected."

"Mr. Wilson speaks of tracing our complaints; but the right rule is not to wait for complaints. All experience shows that absence of complaints is no proof of want of cause for them."

"Many gas consumers are quite resigned to the evil odour of a badly-adjusted boiling ring, or a smothering gas fire. So they will go on, until a case of sickness requires the doctor's visit; and the first thing he does is to condemn the stove or the fire. The degree of toleration of a bad gas smell varies considerably in different people, and an inspector with a keen nose for it is worth money to a gas undertaking."

We agree with every word of these extracts, except, perhaps, the last line or two. If there is real value in a keen perception of a bad gas smell, we ought to be worth a mint of money if we were inspectors.

**Electrical Progress in Russia.**—With a view to ascertaining the position of municipal supply in Russia, the town of Ivano-Vosnesensk (says the *Financier*) has instituted inquiries as to the working of central stations in nine towns: Pensa, Wilna, Viatka, Nerechta, Tula, Kischinev, Stavropol, Minsk, and Astrakan. Presumably information was gathered from towns more or less resembling Vosnesensk in conditions or population, or from the sources where it was most readily available, as this list does not, of course, include the largest towns in Russia, which are lighted by electricity. (If this is Vosnesensk on R. Bug, the population at the last census was 107,000; that of Pensa, 79,000; Wilna, 184,580; Tula, 130,800; Kischinev, 118,807; Stavropol, 54,800; Minsk, 97,990;

and Astrakhan, 149,600.) In eight of the nine towns mentioned, the stations were working successfully, and contributing to public revenue. The net profits were as follows: Wilna, 85,000 roubles (say £8,000); Minsk, £6,800; Astrakhan, £4,100; Tula and Pensa, £3,800; Viatka, £2,900; Kischinev, £2,600; and Stavropol £1,400. In manufacturing, Germany has all the most important electrical concerns, as the Russian General Electric, the Russian Siemens & Halske, and the Russian Schuckert Co. There are two other large houses—the Russian Tudor Accumulator Co. and the Volta. These concerns have a combined capital of 16,800,000 roubles (£1,600,000), which is about 85 per cent. of the capital of the 10 existing electrical concerns in Russia. The Schuckert now proposes an extension of capital of 12,000,000 roubles and the General Electric is extending its capital 4,000,000 roubles. In 1912, the branches of the Siemens & Halske firm in Poland were transformed into an independent establishment.

**Electricity from Cinders.**—The cinders deposited in locomotive smoke boxes are a fuel of considerable value, since its calorific power is equal to 4,500 to 6,000 calories per kg. Till lately its utilisation has defied every attempt of the many experimenters with it. Recently, however, the firm of J. Pintsch, of Berlin, has succeeded in overcoming the difficulties attending its gasification, by means of a specially devised producer. Several of these have been acquired by the Prussian State Railways, for the production of electric current, which is used to light railway stations and workshops. In practice it is found that 1.5 to 1.6 kg. of cinders is needed to produce a kilowatt-hour. First cost charges are from 1,097 fr. to 1,305 fr. per kw. Working costs range from 0.0325 to 0.055 fr. per kw.-hour, exclusive of charges for sinking fund and interest.—*Revue Electrique.*

**Fatalities.**—A correspondent states that at the Helsby Cable Works, Charles Antrobus was working in the cable testing department, on Friday morning, when he came in contact with a live wire. He was killed instantly.

A Sheffield paper says that while following his employment as a coal-cutting machine driver at Houghton Main Colliery, on Saturday, Joseph Bains (26), of Middlecliffe Cottages, Houghton Parva, was killed by an electric shock.

The *Cape Times*, just to hand, reports that on February 3rd, at Johannesburg, Winter Hart (34), who held the position of assistant distributing engineer in the electrical department of the municipality, was killed while on duty. Hart was inspecting work under his supervision. The Parktown high-tension side of a transformer kiosk was open, and, in the execution of his duty, Mr. Hart, in some inexplicable manner, came into contact with the high-tension terminals at a pressure of 3,300 volts alternating at 50 cycles periodicity, and he was killed instantaneously. He was very badly burnt about the chest. The usual methods of artificial respiration were kept up for over half an hour, with no beneficial result. He leaves a young widow and a baby six weeks old. Verdict, "Death from misadventure."

**Annual Socials and Dinners.**—LONDON.—On Saturday, February 22nd, the members of the Kensington and Knightsbridge Electric Lighting Co.'s Cricket Club held their eighth annual concert at the Constitutional Club, Hammersmith. The chair was taken by Mr. H. W. Miller, supported by Messrs. C. L. Lichtenberg, R. W. Roberts, G. C. Weston and A. France. The whole of the arrangements were carried out under the management of Mr. A. C. Adams, the M.C. for the evening, assisted by Messrs. G. Gilbert, Gammage, Ashpool and R. Mitchell and other members of the Club. The concert was preceded by a whist drive. The winners of the whist drive prizes were as follows: Ladies—Mrs. Enderwick, Bishop, Godfrey and Stebbings; Gentlemen—Messrs. Biddlecombe, Stenning, Featherstone and Shea. There was a half-an-hour's interval between the drive and concert for refreshments, which were supplied by the steward, Mr. Goodchild. Mr. Frank Mitchell and Mr. Spriggs entertained with humorous songs; Mr. G. Gilbert, with mandoline solos; Miss Gillies, Miss Hammond and Mr. E. Driver sang, and Mr. Carter gave siffleur performances. Mr. F. C. Mitchell presided at the piano. The Cricket Club prizes were presented by the president, Mr. H. W. Miller. The winners were as follows: Mr. A. France and L. S. Fosbrooke shared the "A" XI batting prize; Mr. A. Waters, "A" XI bowling; Mr. O. A. Bartlett, "A" XI fielding; Mr. A. Cox, "B" XI batting; Mr. A. Jolly, "B" XI fielding prize. No member qualified for the "B" XI bowling prize. A vote of thanks was proposed by Mr. Gammage to the president of the Club for presiding; this was received with hearty applause, and the chairman responded. A vote of thanks was then proposed to Mr. A. C. Adams for so excellently carrying out the arrangements; Mr. Adams replied, and in turn thanked the artistes and the stewards.

LONDON.—The annual dinner of the staff and other employés of the Westminster Engineering Co., Ltd., of Willesden Junction, was held on Saturday, March 1st, at the Bush Hotel, Shepherd's Bush. A capital musical programme, provided mainly by the employés of the company, followed. The chair was occupied by Mr. J. O. Girdlestone. Mr. W. Meacher proposed the health of the staff.

EDINBURGH.—The annual staff ball of Bruce Peebles & Co., Ltd., was held last Friday evening at the North British Station Hotel, Edinburgh, and, as usual, a large gathering was present. Sandwiched between the two halves of the dancing programme was the supper, to which about 150 individuals sat down, these including guests and members of the staff and works. The usual toasts were proposed, the chairman (Mr. Lee Murray) proposing "The King." Mr. R. Graham proposed "The Firm of Bruce Peebles & Co., Ltd.," Mr. Alex. Mackenzie (director) replying,

Mr. J. H. Bunting proposed "Our Guests," and on behalf of the guests Mr. Alex. Robertson-Durham replied, but the toast of the evening was that of "The Chairman" (Mr. Lee Murray), proposed by Mr. S. E. Barstow, who, in the course of his remarks, took the opportunity of making a presentation to Mr. Murray, who has just retired from the position of general manager, having been appointed to a seat on the board of directors. The presentation took the form of an album handsomely bound in full morocco and containing, in addition to an illuminated address, the signatures of between six and seven hundred members of the staff and works. Mr. Murray suitably replied, and emphasised the importance of giving to the new joint general managers, Mr. S. E. Barstow and Mr. J. H. Bunting, the same support which had been loyally given to him during his whole tenure of office. There was an optimistic tone about all the speeches, and it was pointed out that not only were orders being received from new customers at home and abroad, but repeat orders from all old customers were being continually received. Dancing was continued until the small hours of the morning.

The annual smoking concert of the Great Eastern Railway Electrical Engineers' Department will be held at the Great Hall, Cannon Street Hotel, on Saturday, April 19th, at 7.30 o'clock p.m. Mr. H. W. Firth, M.Inst.C.E., will preside.

The staff smoking concert of the Charing Cross, West End and City Electricity Supply Co., Ltd., will be held to-night at 8 o'clock, at the Pillar Hall, Victoria Station.

**Change of Name.**—With its April issue our United States monthly contemporary, *Southern Electrician*, will change its name to *Electrical Engineering*, representing the consolidation of the *Southern Electrician* and the *Electrical Age*.

**Institution and Lecture Notes.**—ROYAL INSTITUTION.—The following are included in the lecture arrangements after Easter:—Prof. W. J. Pope, three lectures on Recent Chemical Advances: (1) Molecular Architecture; (2) Chemistry in Space; (3) The Structure of Crystals. Mr. H. A. Humphrey, two lectures on Humphrey Internal Combustion Pump. Prof. E. Rutherford, three lectures on Radioactivity: (1) The Alpha Rays and their connection with the Transformations; (2) The Origin of the Beta and Gamma Rays and the connection between them; (3) The Radio-Active State of the Earth and Atmosphere. The Friday evening meetings will be resumed on April 4th, when Mr. James J. Dobbie will deliver a discourse on the Spectroscope in Organic Chemistry.

JUNIOR INSTITUTION OF ENGINEERS.—On Wednesday, March 12th, at 8 p.m., at the Institution of Electrical Engineers, a paper will be read on "Water-Heat-Steam: The Effects of Heat upon Water and a consideration of Water Movements in Steam Boilers," by Mr. Arthur Ross, F.I.C., F.C.S. The paper will treat of the behaviour of water (1) when heated at atmospheric pressure;—Convection; conduction; steam; spheroidal water. (2) In a boiler working at high pressure:—When lighting up boiler; when steaming lightly; when steaming hard; the effects of hindering free discharge of steam; priming. These points will help in the explanation of:—Grooving; pitting and corrosion; the effect of zinc plates.

ELECTRO-TECHNICAL ASSOCIATION, BRADFORD.—On Monday evening, February 24th, at the Royal Hotel, Bradford, an interesting lecture was given by Dr. Robert Pohl, chief engineer to the Phoenix Dynamo Manufacturing Co., Ltd., entitled: "What are the Output Limits of Electrical Machines?" The lecture was well attended by members of the Association, and after a discussion on various points a hearty vote of thanks was accorded to the lecturer.

THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION.—This Association will hold its annual gathering in Blackpool, on June 12th and 13th next. It is expected that from 150 to 200 delegates will attend. The Blackpool and Fleetwood Tramroad Co. will entertain the members, who will also have a trip on the St. Anne's and Lytham line. The Finance Committee decided, on February 27th, to entertain the members at dinner, and the expense will be provided for in the salary of the Mayor voted to him in connection with the King's visit.

INSTITUTION OF CIVIL ENGINEERS.—A paper was read at the meeting on Tuesday last, entitled "Notes on City Passenger-Transportation in the United States," by Mr. G. D. Snyder.

SOCIETY OF ENGINEERS (INC.).—In the inaugural address of the president, Mr. Arthur Valon, A.M.Inst.C.E., delivered on Monday last, the author said that the development of engineering during the past 20 years had wrought a great change in the personnel of the profession. When engineering was almost entirely a matter of practical experience, professional qualification was independent of general education; but now that rational methods of calculation and design had superseded those of empiricism, a complete knowledge of these principles was necessary to every engineer, so that the system of apprenticeship no longer completely met educational requirements. The requirements for modern engineering training were contrasted with those of 20 years ago, and it was shown that a great increase had taken place in the number of engineers occupying more or less subordinate positions, for which technical competence was a greater recommendation than personal initiative.

THE CONCRETE INSTITUTE.—A paper by Mr. John A. Davenport, entitled "Economy in Reinforced Concrete Design," was read at the meeting on February 27th. The next meeting of the Institute will take place on March 13th, when a paper will be read by Mr. H. C. Johnson on the subject of "The Strength of Cement." The total membership of the Institute is now 968. When the membership reaches 1,000 an entrance fee, which at present is not required, will be imposed.

INSTITUTION OF ELECTRICAL ENGINEERS (NEWCASTLE LOCAL SECTION).—Arrangements are being made for a visit to works in the Middlesbrough district on Wednesday, April 9th, to be followed, at 7 p.m., by a meeting, at which Mr. A. E. Hadley will read a paper on "Power Supply on the Rand."

Mr. S. L. Pearce, electrical engineer to the Manchester Corporation, will deliver a lecture at the Municipal Evening School of Commerce, Manchester, on Monday next on the work of the electricity department.

On Wednesday last a paper was read by Mr. E. L. Pope before the L.C.C. Tramways Engineering Society on "The Equipment of Electric Tramway Conduit."

**Copper.**—It is gratifying to note an increase in the production of any European country, and the figures relating to Russian output during 1912 given in the *Financier* of February 24th show remarkable progress. The production for the first 10 months of 1912 is given as 1,698,000 poods (say 27,300 tons) over the corresponding period of 1911; this shows an increase of 34.4 per cent. The district with the highest production is the Ural range, with 14,700 tons; the Caucasus contributes 7,800 tons, Siberia 3,800, and 1,080 tons come from the chemical works and refineries. The increase in the Urals is 42.5 per cent. (for the period taken, compared with the same period in 1911). The leading company is the Kyshtim Corporation (Urals). Sisserts factories also show a large increase. In the Caucasus the Caucasian Copper Co. and the Synnikia factory have largely increased their output. In Siberia, the Spassky Co., with an output of 3,500 tons, shows an increase of 33 per cent. over that of 1911. The Yenissei Co. shows a drop on its small production—436 tons to 226 tons.

The hardening in the price of copper is ascribed to better prospects of peace in the Balkans, and should be confirmed by the removal of the strike depression at home. The decrease in visible supplies during February (England, France, and afloat thereto from Chile and Australia) was 2,052 tons, the greater part of which is from English ports; French stocks were only 191 tons less, and the quantities afloat amounted to 375 tons less than on January 31st. Rotterdam has increased stocks by 2,700 tons, and Hamburg by 924 tons, the total European visible supply being thus 1,572 tons better than on January 31st.

In detailed supplies (quoting, as usual, from Messrs. H. R. Merton and Co.'s circular) arrivals from North America were up to average, Spain and Portugal very low, Chile shipments below average, and Australian just on. Total deliveries at 38,599 tons are (allowing for the short month) up to the average of the past 12 months, which, however, is 1,500 tons below that of the 12 months preceding them (i.e., the greater part of 1911, and two months of 1912). American stocks (American Producers' Association figures) were 7,986 tons better on January 30th than at the end of December, the world's supply standing (January 30th) at 93,198 tons, or 5,825 tons above the preceding month.

**The British Fire Prevention Committee's Testing Station.**—Owing to the greater demands made upon the Committee for testing facilities, it has been decided to enlarge the testing station and to add to the Committee's plant. The main building is also being rearranged in such a form that the principal rooms will be available for the Committee's interesting technical and historical collections. It is anticipated that the alterations will be completed early in April, when the testing operations of the new session will be commenced. Apart from the usual applications for fire tests emanating from Great Britain and the Colonies, there is a marked increase in the requests for tests from Germany and from the United States, where the Committee's reports also enjoy the recognition of the public authorities.

**The Expert and the Witness.**—Mr. John Emanuel Mackey, M.L.A. (Vic.), who was chairman of the Select Committee which was appointed to inquire into Mr. Merz's electrification scheme for the Melbourne metropolitan railways, is feeling somewhat sore concerning an incident of the inquiry which is vastly amusing to everybody else. Mr. Mackey, who was a very strenuous worker in his University days, and carried off many honours and scholarships, determined to get right to the bottom of this electrification business before he entered upon his responsible duties as chairman of the Committee, and with that end in view, it is said that he spent much midnight oil in mastering the contents of an elaborate article on electrification, which forms part of an important scientific encyclopaedia.

Crammed with new and half-digested scientific knowledge, Mr. Mackey adopted a very stern attitude towards Mr. Merz when the latter appeared before him as a witness. Mr. Mackey cross-examined Mr. Merz on every detail, turning him inside out, and determined to catch him tripping if it were possible. Finally, it is said, Mr. Mackey quoted the authority which he had been consulting, and asked Mr. Merz if he agreed with the conclusions of the writer of the article. "Yes," said Mr. Merz demurely, "I quite agree with him. In fact, I wrote the article on which you have been examining me, myself." A broad smile illumined the faces of all Mr. Mackey's fellow committeemen, but since that time the chairman himself has looked upon electrification with a jaundiced eye.—*British Australasian*.

**The Dynamocables.**—The Dynamocables anniversary dinner will take place on Wednesday, April 2nd, at the Trocadero Restaurant, at 7.30 p.m. Mr. J. E. Kingsbury will be in the chair.

**Ten Years in the Norwegian Nitrate Industry.**—February 13th, 1903, was a noteworthy date in the history of the nitrate industry, because it was on that day that Prof. Birkeland

and Engineer S. Eyde met together and came to a final decision with regard to the problem of extracting nitrogen from the air. There is no industry which can show a similar development in the course of such a short period as 10 years. The start was made with a couple of men, and the total amount of power employed was no more than 5 h.p. On February 13th, 1913, there were employed about 400 engineers and officials and more than 2,000 workmen, while the amount of electrical power used had risen to 200,000 h.p. As a result of this activity, there has grown up a new town of the name of Notodden, which has a population of between 4,000 and 5,000 and which recently obtained all the rights of a town. Another community which has grown up in the same neighbourhood, viz., Rjukan, also will shortly obtain official recognition as a town.

**Manufacturing in Russia.**—The question of the utilisation of the power of the small Imatra Falls in Finland, to which reference has been made on former occasions, now appears likely to form a matter of dispute. A concession for the right of use of the falls was secured some time ago by the St. Petersburg (1886) Electric Lighting Co., which proposes to erect large hydro-electric works for the transmission of energy to St. Petersburg for its own services, and for those of the other two supply companies in the capital. But the Government of Finland now wishes to retain possession of the Imatra Falls, and also to utilise the Rauhala Falls in connection with the suggested conversion of the Finnish railways to electric traction. German financial interests who are concerned with the three supply companies in St. Petersburg contend that if the Government of Finland intends to prevent the use of the Imatra Falls, it will be necessary for it to pay full compensation to the lighting company of 1886 on account of expropriation. The point in dispute is so delicate that future developments cannot fail to be of interest, especially as German firms expect large orders to result from the Finnish hydro-electric undertaking for the additional requirements of St. Petersburg.

**An Electric Dinner.**—An informal all-electric dinner at "Tricity House," 48, Oxford Street, W., on March 14th, is the latest venture on the part of the Students' Section of the Institution of Electrical Engineers. The dinner is open to all Students and their friends, and tickets (price 2s. 6d. each) are to be obtained from the hon. secretary of the Students' Section, Mr. E. T. Driver, 24, Bradgate Road, Catford, S.E.

**Inquiries.**—Makers of "Rosalin" soldering paste, and makers of chains, 14 and 16 gauge, are asked for.

**Appointments Vacant.**—Electrician for the Cornwall County Asylum (24s.); sub-station foreman, for the Shanghai Municipal Council; Meter tester, for the Birmingham Corporation (30s.). See our advertisement pages in this issue.

**The Electrical Iron Industry in Norway in 1912.**—There are now three electrical ironworks in operation in Norway. The new industry has met with difficulties, and, as compared with the electrical iron industry of Sweden, it has made slower progress. The first works set in operation were the Hardanger Electrical Iron Works. The process employed at these works is that of the Swedish Co. "Electrometall," which was demonstrated at the Trollhättan Works. The total production of electrical pig-iron in 1912 amounted to 2,200 tons, and the number of men employed to 55. At the Ulefors Iron Works there is also a small electrical plant in operation. The production of electrical pig-iron in 1912 was 300 tons, which was used in the foundry belonging to the ironworks. The Tinfos Electrical Iron Works have now at last been able to make a start, after the completion of the plant, which was delayed for a whole year on account of late deliveries of machinery and materials, while they also were kept waiting a long time for the necessary permission from the Government to erect the cable for the transmission of energy. At the end of the year there were two out of three furnaces in operation. The production of each has averaged about 10 tons of pig-iron per 24 hours, which, roughly, would give an annual production of 3,000 tons per furnace, or 9,000 tons for the whole plant. The process employed at these works is the invention of a Norwegian engineer, B. Lorentzen, and the products obtained have proved to be of excellent quality. The total production of electrical pig-iron in 1912 was thus rather more than 3,000 tons.

The Stavanger Electro-Steel Works at Jörpeland, in the neighbourhood of Stavanger, have also experienced some delay, but have now been completed and started. The necessary power is derived from the Ryfylke Waterfalls, and 1,500 h.p. are, in the first instance, going to be employed. The annual production will, according to the estimate, be about 6,000 tons of steel, which will be produced from scrap iron, chiefly from old ships, which is first melted in a Martin furnace, and afterwards refined in an electric furnace. The electric furnace has already been tested. A forge is also going to be built in connection with the steel works.

**Electric Smelting of Iron Ore.**—According to the *Revue Electrique* there are only six existing electric furnaces for the production of iron by the direct treatment of the ore, viz.:—Four in Sweden: Trollhattan (2,500 h.p.), Domnarfvet (3,500 h.p.), Hagfors (two of 3,000 h.p. each); one in Norway (Hardanger, 3,500 h.p.) and one in California (Heroult City, 3,000 h.p.). Five other furnaces are nearly completed—one of 3,500 h.p. at Hardanger (Norway), three of 3,000 h.p. at Arendal (Norway), and one of 2,500 h.p. in Switzerland. The total power engaged in iron smelting with the electric furnace is at present about 32,500 h.p.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Our note of last week with reference to Mr. "J. Phillip" contained inaccuracies. Mr. A. D. PHILLIPS, assistant manager of the Fife Electric Power Co., who has just secured the appointment of engineer and manager to the Derbyshire and Nottinghamshire Electric Power Co., has occupied his position at Dunfermline for the past seven and a half years. He went there from the Glasgow Corporation Electricity Department, not from Dundee as stated by us.

The staff of the Cardiff Corporation Electric Light and Tramways Department has presented a solid silver salver to the engineer and manager, Mr. ARTHUR ELLIS, as a token of esteem and respect.

MESSRS. A. SADLER, of Messrs. Chapman & Hall, engineers, and H. STEAD, of Linkfield Road, Isleworth, have been appointed to positions on the works and office staffs respectively of the Heston-Isleworth Council's electricity undertaking.

Among a number of increases of salary granted to Corporation officials by the Wrexham Town Council, was that of the electrical engineer, from £250 to £275 per annum.

At a special meeting of the Electricity and Tramways Committee of the Heywood Corporation on Monday, a letter was received from Mr. JAMES STOTT, resigning his position as electrical engineer and manager, on account of ill-health. The resignation was accepted. Mr. Stott has held the appointment for a number of years.

**Tramway Officials.**—The Bury Corporation Salaries Committee recommends the T.C. to advance the salary of the tramways manager, Mr. WM. CLOUGH, from £400 to £450, with a further advance to £500 at the end of another year.

MR. L. C. F. BELLAMY, of Liverpool, has been appointed tramways engineer to the Ilkeston Corporation. Mr. Bellamy has for three years been assistant manager to the tramways at St. Helens.

MR. CHARLES MITTELHAUSEN, who has recently resigned his position as engineer and manager to the Bexley Council Tramways and Electricity Undertaking, was entertained to dinner on February 28th, at Whitehall Court, by the tramways managers of the greater metropolitan area. The chair was occupied by Mr. H. E. Blain, West Ham, other present including Messrs. A. Coveney (Erith), S. Dudman (Dartford), W. E. Hammond (Metropolitan Electric), L. E. Harvey (Ilford), A. V. Mason (South Metropolitan), F. Schofield (Leyton), H. P. Stokes (Bexley), and W. C. Ullman (West Ham). Messrs. Goodyer, Holmes, Murray, and Pott were unavoidably prevented from attendance. All present expressed, in very warm terms, their appreciation of Mr. Mittelhausen's official and personal qualities, and their good wishes for his health and success in his new sphere.

**General.**—A correspondent writes: "It will interest your athletic readers to know that Mr. PERCY MITCHELL, who acts as business manager for Mr. Cleave (Messrs. Drake & Gorbam's Bristol agent), was selected to play centre forward for Gloucestershire in the Association football match, Dorset v. Gloucestershire on the Bristol City ground on February 26th. In one of the reports of the match Mr. Mitchell is referred to as follows: 'The score was equalised after clever work initiated by Mitchell, of St. Andrew's. He ran with the ball for 20 yards, and when he was tackled by Brown, Sherry got possession and passed to Powell, who succeeded in finding the net.' Unfortunately for Gloucestershire, their opponents scored another goal in the second half, and, undoubtedly, Dorset was the better team. Bristol City have been angling for Mr. Mitchell for some time past, but he prefers to face the future with the light of the Conference lamps still shining brightly on his path."

DR. A. R. FORSYTH, F.R.S., has been appointed chief professor of mathematics at the Imperial College of Science and Technology. Dr. Forsyth is of world-wide reputation, and will carry into effect the new policy framed by the governing body of the college in connection with the revision of the whole of the mathematical teaching.

We learn that MR. WILL C. MEYER, the Heckmondwike manager for Messrs. H. Hainsworth, Ltd., has been appointed chief electrical engineer at the Holbrook Colliery, Halfway, Sheffield. There were over 150 applicants.

MR. A. J. FIPPARD, of the Hankow Waterworks and Electric Light Co., Ltd., expects to arrive in England about April 21st, on a short visit.

**Obituary.**—SIR WM. ARROL and SIR WM. WHITE.—Within the past few days the country has lost two prominent and justly-honoured engineers, Sir Wm. Arrol and Sir Wm. White, K.C.B. Sir Wm. Arrol, the builder of the Forth Bridge, was no less an engineer for being a contractor. Without his experience and resource in overcoming the difficulties of what was then a novel method of bridge building, applied to one of the most formidable undertakings ever attempted, the work would not have been carried through so rapidly, or constructed so soundly. The sinking of the great caissons on to unequal foundations, through an unprecedented depth of water, was the first stage; and the last was the lifting from the water-level, and erection of the connecting girders—in themselves great bridges—without scaffolding, with the

sole support of the vast cantilevers that had grown out boldly over the Forth, unsupported in any way, and carrying, as they grew, all the heavy tackle required in their own construction. The vision splendid originated in the brains of Sir John Fowler and Sir Benjamin Baker. For its materialisation, Sir Wm. Arrol was indispensable. His works live after him, and will endure so long as good material and honest workmanship can survive the attacks of nature. He was a good employer and a generous public-minded citizen. To Sir Wm. White, the eminent naval architect, must be attributed the beginning of the extraordinary progress in the size and power of battleships during the past 25 years. From the age of 14 till the year 1902, with an interval of 2 years at Messrs. Armstrong's, Sir Wm. White was in the service of the Navy. Gradually working his way to the top, he was for the last 16 years of that period chief constructor. He witnessed and encouraged an immense extension of the use of electricity on war vessels, for internal lighting, for searchlights, for fire control, and for communication from ship to ship and from ship to shore by "wireless." For power purposes, such as gun-laying, ammunition hoisting, closing bulkheads, working capstans and cranes and other auxiliary machinery, a warship now calls for the highest electrotechnical skill. It is not many months since Sir Wm. White was discussing at Dundee the problem of electrical transmission for ship propulsion. He was a strenuous supporter of the leading Engineering Institutions, and engineers were looking forward keenly to his Presidency of the British Association at Birmingham this year, and to the prominence which might be expected to be given to engineering science on that occasion. After he retired from the service of the Admiralty, Sir Wm. White took a leading part in the design of the *Mauretania*. He was a great supporter of technical education, and, having carved his own way to eminence and success, was ever ready to lend a helping hand to others. His sudden seizure in his office, and subsequent death in the Westminster Hospital, have given a painful shock to his many friends and to the engineering profession generally.

MR. W. MUSGRAVE, J.P.—The death occurred on February 27th, after a brief illness, of Mr. Walter Martin Musgrave, J.P., managing director of Messrs. John Musgrave & Sons, Ltd., of Bolton, and grandson of the late Mr. John Musgrave, founder of the concern in 1839. The deceased, who was 68 years of age, had spent the whole of his life in the business, and in 1891 he succeeded his father, the late Mr. Joseph Musgrave, as head of the firm. The late Mr. Musgrave had served on the Bolton Town Council, and was a borough and county magistrate.

MR. J. G. WILSON-DICKSON.—The death is announced from Biggar, Scotland, of Mr. John Gordon Wilson-Dickson, member of the firm of Merz & McLellan, of Newcastle-on-Tyne.

## NEW COMPANIES REGISTERED.

**Woodbridge and District Electric Light Co., Ltd.** (127,395).—This company was registered on February 25th, with a capital of £4,000 in £1 shares, to carry on the business indicated by the title, and to adopt an agreement with the Rural Districts Electric Undertakings, Ltd. The subscribers (with one share each) are:—H. T. Harrison, 11, Victoria Street, S.W., engineer; J. H. P. Berthon, 91, York Street, Westminster, engineer; S. G. Leach, 91, York Street, Westminster, engineer; G. Cornish, 51, Cleevely Road, Ealing, W., clerk; J. P. Powell, 91, York Street, Westminster, secretary; W. G. C. Masham, 54, New Broad Street, E.C., incorporated accountant; L. E. Jones, Allendale, Woodstock Avenue, Hendon, N.W., merchant. Minimum cash subscription, 500 shares. The number of directors is not to be less than two or more than seven: the first are H. T. Harrison, S. G. Leach, O. H. Valpy and W. Riggs; qualification, £100. Registered by Jones, Son and Andrews, Chapel House, New Broad Street, E.C.

**Mea Magneto, Ltd.** (127,390).—This company was registered on February 25th, with a capital of £5,000 in 4,950 preference shares of £1 each, and 1,000 founders' shares of 1s. each, to carry on the business of manufacturers of, and dealers in, magneto, magneto parts, and accessories, motors, motor-cars, cycles, &c. The subscribers (with one share each) are:—B. Metz, 3, Great Winchester Street, E.C., merchant; H. W. Cook, Iverdal, Billerica, confidential clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. No qualification required. Registered by Goldberg, Barrett & Newall, 23, West Street, Finsbury Circus, E.C.

**Research Laboratory, Ltd.** (127,422).—This company was registered on February 26th, with a capital of £1,000 in £1 shares, to carry on the business of chemists, druggists, dyers, electricians, engineers, suppliers of electricity for light, heat or power, &c. The subscribers (with one share each) are:—G. T. W. Oliver, Foscote, Datchet, telegraph engineer; A. Williams, 75, Rodenhorst Road, Clapham Park, S.W., engineer. Private company. The first directors are not named. J. Abernethy is the first secretary. Registered office, 20, Bucklersbury, E.C.

**Rubelite, Ltd.** (127,478).—This company was registered on February 28th, with a capital of £500 in 1s. shares, to adopt an agreement with W. Rubel and L. W. Holmes, and to carry on the business therein referred to (as described in memorandum of association). The subscribers (with one share each) are:—W. Rubel, Berlin Charlottenburg Reichstr. 103, button-chemiker and metallurg; L. W. Holmes, 48, Great Russell Street, W.C., electrical engineer. Private company. The first directors are W. Rubel, J. Waldhausen, A. G. Temple, L. W. Holmes and H. M. Harris. Registered by Hicks, Arnold & Mozley, 35, King Street, Covent Garden, W.C.

**Rebels, Ltd.** (127,391).—This company was registered on February 25th, with a capital of £1,000 in £1 shares, to purchase an option relating to type-printing telegraph systems, and to adopt an agreement with E. J. Reid and Reid Brothers, engineers, Ltd. The subscribers (with one share each) are:—E. J. Reid, 12, Wharf Road, N., engineer; M. Roberts, 197, Victoria Street, S.W., civil engineer. Private company. The number of directors is not to be less than two or more than six; the first are E. J. Reid, M. Roberts, W. B. Good and W. E. Reid; qualification £50; remuneration as fixed by the company; secretary, W. E. Reid. Registered office, 12, Wharf Road, City Road, N.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Midland Ignition Co., Ltd.**—Debenture dated February 14th, 1913, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holders Capital and Counties Bank, Ltd., 23, Corporation Street, Birmingham.

**South London Electric Supply Corporation, Ltd.**—Issue on February 14th, of £500, and on February 18th, 1913, of £1,000 debentures, parts of a series of which particulars have already been filed.

**Works Control, Ltd.**—Particulars of £500 debentures, created February 6th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £200. Property charged: The company's property, present and future, including uncalled capital. No trustees.

**Indian Electric Supply and Traction Co., Ltd.**—A memorandum of satisfaction in full on February 5th, 1913, of mortgage dated November 18th, 1910, securing £50,000, has been filed.

**Rawlings Bros., Ltd.**—Trust deed dated February 20th, 1913 (supplemental to trust deed of December 27th, 1910, securing £10,000 debenture stock, of which £5,000 is now outstanding), charged on various properties in Kensington, Chiswick, and Westminster. Trustees: J. W. Reacher, 4, Queen Victoria Street, E.C.; and W. R. Rawlings, Lakeside, Wimbledon Park, S.W.

**Alumic m Stamping Co., Ltd.**—Particulars of £1,500 debentures, created February 17th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

CITY NOTES.

County of London Electric Supply Co., Ltd.

THE directors' report for the year ended December 31st, 1912, states that the capital expended on account of the company's London districts amounted to £71,902, and the net total expenditure in respect of those districts now amounted to £1,885,648. The balance from revenue account No. II, after deducting generation and distribution costs, rents, rates, taxes, wages, directors' fees, general establishment and other charges, and proportion of salaries, was £134,082 plus £3,132 brought forward, making £137,214 available, less interest on the first and second debenture stock and interest on temporary loans to December 31st, 1912 (less income-tax), £44,039, and amount carried to reserve for depreciation, repairs, renewals, &c., £27,500, leaving for distribution for the year £65,675. Interim dividends on 55,000 6 per cent. preference shares, on 40,000 ordinary shares, and on 19,000 new ordinary shares from the due dates of calls, for the half-year ended June 30th, 1912, at the rate of 4 per cent. per annum, less income-tax, had been paid and now required confirmation. These interim dividends absorbed £23,663, and left for further distribution £42,012. The directors now recommend a further dividend on the 6 per cent. fully-paid preference shares for the last half-year, and a further dividend on ordinary shares and new ordinary shares for the half-year ended December at the rate of 8 per cent. per annum, less income-tax. These payments will absorb £36,796, and leave £5,215 to be carried forward.

The applications received during the past year amounted to the equivalent of 4,023 kw., making the total at December 31st last 45,362 kw. The total units sold were 22,512,478, as against 20,450,787 for the previous year, being an increase of 2,061,691 units. The number of consumers has increased from 18,459 to 20,246. The funds required to meet the capital expenditure incidental to the rapidly-growing business of the company have been provided by an issue in March last of 19,000 ordinary shares at par. In spite of the dislocation of business resulting from the trouble with the transport workers and the coal strike, the company maintained a full supply to all consumers. The increased costs involved have been partially met by increased economies in generation. The directors of the Bournemouth and Poole Electricity Supply Co., Ltd., have declared a final dividend on the ordinary shares of that company at the rate of 7 per cent. per annum, making 6 per cent. for the year. The business of the Coatbridge and Airdrie Electric Supply Co., Ltd., continues to show substantial improvement. The units sold during the year amounted to 4,445,035, being an increase of over 25 per cent.

Units generated	29,636,258
Units sold—Public lamps	57,524
Private consumers by meter	22,454,954
Total	22,512,478
Used on works	2,435,577
Total accounted for	24,948,055
Not accounted for	4,688,213
Public lamps	363
Total maximum supply demanded, kw.	12,800

The meeting is called for March 10th at the offices.

**London United Tramways, Ltd.**—The directors report a net revenue of £109,793 for 1912. After paying interest on debenture stock and loans, £41,228 remains—a decrease of £15,203, as compared with 1911. £16,000 is to be placed to general reserve, £25,000 to reserve for renewals and contingencies, and £1224 carried forward. The meeting is called for March 12th.

Fife Tramway, Light and Power Co., Ltd.

MR. WM. LOW, of Blebo, presided at the fourth annual general meeting, held in Edinburgh on Friday last. For the benefit of new shareholders, the chairman explained that the earnings of this company were wholly derived from dividends and fees received from the Dunfermline and District Tramways Co., the Fife Electric Power Co., and this year, to a small extent, from the earnings derived from the electric lighting companies taking power from the Fife Electric Power Co. The company owns the whole of the issued capital of the companies referred to. A sum of approximately £60,000 had been expended during the year in new capital works, against which shares were issued to this company by the two statutory companies. The earnings derived from the Tramways Co. during the year, paid over to this company as dividends and management fees, amounted to £12,200, compared with £12,600 for the year 1911. This slight fall off could be accounted for by the want of circulation of money during the coal strike last spring. The lines operated during the year were the same as during 1911, with the exception that the Lochore extension was opened on December 6th. The benefit of this extension would be felt during the current year. The Fife Electric Power Co. had made substantial progress during the year. The consumers connected in 1910 were 176; in 1911, 263; and in 1912, 381. The receipts in 1910 were £6,700; in 1911, £8,700; and in 1912, £12,200. The receipts for January were £1,880, compared with £1,260 in January, 1912. During the year transmission lines were opened northward to Frenchie, and from Wemyss towards Leven. Cables were also laid from the power station to the west and south of the Burgh of Dunfermline and from Dunfermline to Inverkeithing. During the current year, the directors proposed to largely increase the plant at the generating station to deal with the rapidly increasing demand, and to extend the transmission lines and cables to further duplicate the supply to certain areas. He moved the adoption of the report, and the declaration of a dividend on the preference shares for the half-year to December 31st, 1912, at the rate of 6 per cent. per annum, and a dividend on the ordinary shares for the year at the rate of 3 per cent. per annum.

MR. GEORGE BALFOUR, in seconding the resolution, made special reference to the recommendation by the directors that a dividend of 3 per cent. should be declared on the ordinary shares. With regard to this, he pointed out that the capital expenditure during the year referred to by the chairman would be productive of a substantial increase in the revenue in the current year, and that the directors had this rapid increase in view in making the recommendation.

The report was adopted.

Capital Expansion in Germany.

THE capital requirements of the German Transmarine Electricity Co. (Deutsch-Übereseeische Elektrizitäts Ges.), notwithstanding the various large issues in recent years, have not yet been brought to a conclusion, a fresh emission of £1,250,000 in the form of 5 per cent. bonds being now in contemplation. As is known, the company possesses an extensive supply undertaking in Buenos Ayres, and is also interested in other enterprises at Santiago, Valparaiso and Monte Video. The share capital already amounts to £6,000,000, and the loans to £4,250,000, whilst the further issue of £1,250,000 will raise the total to £11,500,000. The new emission is prompted by the increase in the sale of current and the extension of the circles of consumers, particularly in Buenos Ayres, where cables are being laid in the most distant parts of the city in view of prospective competition on the part of the Lacroze Co. and the Italo-Argentine Co.

The Schuckert Electricity Co., of Nuremberg, proposes to raise fresh capital by the issue of a new 4½ per cent. loan of £750,000, and application has already been made for the admission of the loan to the Berlin Stock Exchange. Since the dividends paid on the ordinary share capital again began to assume an upward direction in 1909, the increase in the company's capital has been rapid. The ordinary shares now amount to £3,500,000, and the loan capital to £1,800,000, whilst the further emission in contemplation will raise the latter to about £2,500,000. Out of the total capital already issued the company's interests in the Siemens-Schuckert works, of which it is joint proprietor with the Siemens & Halske Co., reached the sum of £3,497,000 at the end of the financial year 1911-12. The Schuckert Co. now explains that the continued great activity of the Siemens-Schuckert works has been attended with fresh capital requirements, and the two proprietary companies intend to advance a further loan of £1,000,000 for this purpose. This transaction will raise the amount of the non-terminable loans to £3,500,000, so that with the ordinary capital of £4,500,000, and the bond capital of £4,000,000, the grand total of the capital of the Siemens-Schuckert Works will be brought up to £12,000,000. It is proposed to provide the Schuckert Co.'s share of £500,000 in the new loan to the S.S. Works out of the issue of 4½ per cent. bonds for £750,000 as already mentioned, whilst the balance will be devoted, among other matters, to the expansion of the company's Russian undertaking in conjunction with the heavy electrical engineering works of the Russian Siemens & Halske Co. It is not yet known what method will be adopted by the Berlin Siemens and Halske Co. for the provision of its half share of £500,000 in the new fixed loan of £1,000,000 to the S.S. Works.

**Bruce Peebles & Co., Ltd.**

IN the course of his speech at the fourth annual general meeting of this company, held at Edinburgh last Friday, 28th ult., Mr. F. E. ANDREWS, the chairman, expressed the deep regret of the directors that the report and accounts were not of a more satisfactory nature. A year ago, they all looked forward to a successful year and anticipated with some confidence that the considerable progress that had already been achieved would not only be maintained, but would be appreciably improved upon during 1912. This had not been the case. The outstanding feature of the year had been the extraordinary number of strikes which had taken place, the evil effects of which, unfortunately for all concerned, were reflected in their trading results. The extremely difficult labour conditions which had prevailed during the whole period had sadly hampered manufacturers, and whilst gravely affecting employers, had been seriously detrimental to the best interests of the workmen themselves. In the early part of the year, whilst they were still feeling the effects of the railway strike, the strike of the coal miners took place, causing serious disorganisation of the works, for, although they had naturally provided as far as possible against the contingency by laying in a large and adequate stock of fuel, this did not help them much, as they were quite unable to obtain supplies of raw materials from other works, and even now it was impossible to get them in anything like a reasonable time. The strike also cost the company a considerable amount owing to the increase in the price of fuel, not only during the strike, but afterwards, because fuel prices were now on a much higher level than previously. Following the coal strike there was the dockers' strike in Glasgow, London, and Leith, and then in August there was a serious strike of apprentices in Scotland. They demanded an increase of wages in order to make up for the amounts which the companies were obliged to deduct in compliance with the National Insurance Act. This Act was another burden on industry, and it was difficult to see what recompense, either direct or indirect, manufacturers could possibly derive therefrom, unless it proved true, as he thought it would, that the passing of the National Insurance Act was the tolling of the knell of Trade Unions. Shortly after the apprentices' strike they had two strikes of the carters at Leith, which again impeded them by still further delaying delivery of raw materials, and finally towards the end of the year a strike of electrical winders took place, and this had only recently been settled. All these strikes had the effect not only of increasing the expenses of the year, but they seriously interfered with the output of the works, which might have been much greater but for these troubles. Thus 1912 had been a distinctly worrying and trying period, during the whole of which they had been anxiously contending with seriously adverse labour conditions—conditions largely brought about by present-day politicians, whose chief aim seemed to be to pass pernicious and ill-considered legislation, which only hampered the masters and irritated the men, and was therefore bound, sooner or later, to cause disagreement. Then, when disputes arose, the Government stepped in and patched up a so-called peace, which was unsatisfactory to all concerned. In his opinion, the ultimate effect of Government interference in industrial disputes was disastrous. All these strikes naturally caused a steady rise in the item of labour on all contracts they had in hand; but, apart from this, there had been a considerable increase in the cost of all raw materials, so that when one considered the very low prices it had been possible to obtain for electrical machinery, it was not difficult to account, to a large extent, for the poor results of the year's working. But although these results were disappointing to all, especially to those on his side of the table, representing as they did such a large proportion of the total capital of the company, they would be glad to hear that in some directions they had continued to make a steady and substantial progress. The total value of orders obtained had been greater than at any time during the existence of the present company, and they were now approaching the maximum capacity of their existing workshops. The volume of work given out in the home markets had undoubtedly been greater than for a long time past, and they had been successful in obtaining a fair share, but it was unfortunately the fact that prices had not until quite recently improved to any appreciable extent, and they showed an inadequate margin over the bare cost of materials and wages. Orders also were still often placed under conditions which entailed giving unreasonably long credit for a considerable portion of the contract sum and on terms which were unfair to the manufacturer. In this connection, however, some improvement had been brought about by the British Electrical Manufacturers' Association—their efforts, under the able chairmanship of Mr. Bruce Anderson, were already bearing fruit, and he could only express the hope that their admirable work in the interests of the industry would be vigorously continued. They themselves had, in a slight degree, as the works got full, been able to discriminate to some extent in the contracts they had accepted, but on account of unreasonable terms and conditions they had had to allow some business to go past them, and had had also to decline more than one substantial order, because they felt it was impossible to obtain the raw materials in time to enable them to deliver by the date required, and they were not disposed to jeopardise their reputation for good deliveries and run the risk of incurring penalties for being late. However, they had not very much ground of complaint regarding the amount of work which had been entrusted to them, and he was not without hope that the present tendency of prices to harden slightly would continue and the general position be thereby somewhat improved. With regard to foreign business, they had continued their active campaign abroad, and in pursuance of this policy sent one of their engineers on a five months' tour in South America, during which time he visited their

agencies in Brazil, Argentine and Chile. The results of his journey were quite satisfactory, and he had no doubt, as time went on, they would be recompensed by increased business from those countries in the same way as they had reaped improving results from other parts of the world which had been similarly visited by their engineers on previous occasions. Electrical engineering was a science that progressed at a great rate, and machinery that was judged splendid three or four years ago, was only considered very passable to-day. Hence it was essential for manufacturers who intended to keep in the front rank to be continually overhauling and improving their designs. The machinery that they turned out continued to give every satisfaction, and it was an eminently gratifying feature that the number of customers on the books was constantly and steadily increasing. In the accounts buildings machinery and plant stood at the same figure as before. Of course it would be very desirable to write off a certain amount for depreciation, but this was obviously not feasible until the profits were sufficient. All additions to loose plant and tools were debited against the results of each year, and everything was kept in a very high state of efficiency, a considerable sum being spent each year in so doing—this year no less than £4,138. This amount was, of course, appropriated from the revenue before arriving at the figures in the profit and loss account. Fuel cost £1,601 more than in the previous year, and the Workmen's Compensation Act tended to become an ever-increasing burden, for whereas when the Bill was under discussion it was stated that the cost to the employer would not be more than 1s. 6d. on each £100 of wages paid, the average was now something like 25s. per £100, and very possibly it might go still higher. Stock, stores and work in progress stood at £52,282 this year, as against £36,481 before, which was an indication of the increased volume of work in hand at the end of the year. The orders in hand at the present time were sufficient to keep the works going at their full capacity for some time. Debts due to the company stood at £48,856, whilst the debts owing by them amounted to £30,517, showing a balance in the company's favour of over £18,000, whilst the actual cash in hand was over £10,000, so that their position in this respect was quite satisfactory. The profit of £3,865 from the manufacturing and trading account was, unfortunately, smaller this year than last, so that after paying the interest, amounting to £3,452, on the mortgage debentures, and allowing for the interest of £3,987 accrued on the unsecured debentures, there was an adverse balance on the year's working. This shortage, however, was more apparent than real, and did not affect their cash position to any appreciable extent. The net result of the year was that, after paying all expenses and spending £4,138 on the efficient maintenance of their plant, they had a surplus nearly sufficient to cover their mortgage debenture interest. Since the formation of the company, each year up to the present had shown substantial progress. What was now wanted was a period of immunity from these incessant labour troubles, so that employers and employed could proceed steadily with their legitimate work. Though disappointed, he, personally, was neither discouraged nor disheartened; the outlook was distinctly brighter, and he had reason to think that when they met next year they would be able to look back on 1913 with much more pleasurable feelings than they did on 1912.

The report was adopted.

**Aberdeen Suburban Tramways Co.**—At the half-yearly meeting Mr. A. Wilkie, managing director, in moving the adoption of the report, said that the directors had been considering the extension of the tramway system both on Deeside and Donside, and had had under consideration various systems, both trackless trolley-cars and motor-buses. The leading factor which the directors had to keep in view was the cost of power. They would have to get their electrical supply at a more reasonable price. Motor-buses had greatly improved lately, but if they could get their electricity at a slightly reduced cost they might favour the trackless trolley system. They were just now waiting for a reply from the Corporation with regard to the price they were going to charge for the electricity. No doubt that would have a great deal to do with the decision which the directors might submit to the shareholders at a future meeting. The reports were adopted.

**Metropolitan Electric Supply Co., Ltd.**—The directors announce a dividend for the last half-year of 1912 at the rate of  $\frac{1}{2}$  per cent. per annum, making  $\frac{1}{2}$  per cent. for the year, as against 4 per cent. in 1911, placing £20,000 to reserve, as against £17,000.

**Brompton and Kensington Electricity Supply Co., Ltd.**—The *Times* states that, after appropriating to depreciation and sundry reserve accounts £14,200, the directors recommend the payment of a final dividend on the ordinary shares for the half-year ended December 31st at the rate of 11 per cent. per annum, making 10 per cent. for the year, carrying forward £7,001.

**Willans & Robinson, Ltd.**—A petition for confirming the reduction of the capital from £483,336 to £141,665 is to be heard in London on April 4th. An announcement on the matter appears in our advertisement pages to-day.

**California Railway and Power Co.**—The directors have declared an initial dividend of  $\frac{1}{2}$  per cent., or at the rate of 7 per cent. per annum, on the prior preference stock.

**Ottawa Electric Railway Co.**—A dividend of 12 per cent., with a bonus of 3 per cent. for the past year, is announced in a financial daily.

**Metalite. Ltd.**

The adjourned second annual general meeting was held on Friday, at 20.22, Christopher Street, Finsbury, E.C., Mr. W. Stewart, the chairman, presiding.

The CHAIRMAN, in proposing a resolution for the further adjournment of the meeting until April 29th, when the audit of the accounts would be completed, said that the bank, on the 6th inst., appointed a Receiver of the company's property to secure an advance which they had made. In the meantime, the directors were not letting the grass grow under their feet, and arrangements were practically complete for placing at the company's disposal a minimum of £12,500 within a period of two months. Under the contemplated arrangement, the board would be strengthened by the appointment of additional directors, which, he thought, could only be for the benefit of the company and the shareholders. He would give them full details at the next meeting, and, in the meantime, he was glad to be able to tell them that the series of debenture-holders, in order to assist the company, had agreed to postpone their security, so that there did not appear to be any likelihood of the matter falling through. The £25,000 series of debentures were held almost exclusively by the directors and their friends. He was satisfied that under the proposed arrangement, the company would have an excellent opportunity afforded it of doing a profitable business. The whole details would be placed before the shareholders at the adjourned meeting.

A shareholder said he would like to ask whether the directors and the secretary had retired.

The CHAIRMAN: Neither the directors nor the secretary have retired.

The shareholder said he would like to know whether the new lamp was being manufactured, and whether it belonged to the company. Further, he wished to know whether there was any litigation pending against the company or the directors. He remembered that at the meeting at Derby there were threats of litigation, and he would like to know whether they were still pending, or if they had been settled, in what manner. He further inquired whether the works at Derby were still open, and whether the new lamp was to be had anywhere.

Another shareholder asked whether the adjourned meeting would be held in Derby or London.

The CHAIRMAN, in reply, said that the next meeting would be held in London. The directors were still in office. Mr. Metcalfe was unwell and unable to be present, but Mr. Bentley was present. Mr. Alderton had retired. The new lamp did belong to the company. So far as he knew no litigation of any sort was at present in existence against the company or the directors.

The SHAREHOLDER: That does not answer my question about the litigation that was threatened at Derby.

The CHAIRMAN: You refer to the petition; a petition was presented, and it was dismissed.

The SHAREHOLDER: I am not referring to the winding-up of the company. There were threats at Derby about action being taken against the company or the directors.

The CHAIRMAN: We know nothing of them. A Receiver was put in on the 6th of this month. There are a few lamps in stock, but there are none being manufactured at the present moment.

In reply to another shareholder, the CHAIRMAN said they were paying £400 a year for the rent of the premises in which they were meeting, and it was the intention of the board to sublet some portion of it.

The resolution was then carried, and the meeting stood adjourned until April 29th.

**North Metropolitan Electrical Power Distribution Co., Ltd.**

THE report submitted to the meeting held at Kingsway, W.C., on March 4th, stated that the revenue amounted to £17,816, an increase of £2,010 compared with the previous year. The balances from the local revenue accounts amount to £6,859. After adding sundry receipts and £214 brought forward, and deducting administration expenses, legal charges and debenture interest, there remains £5,291. The directors propose that £1,000 be put to renewals, £1,000 to reserve, and that 6 per cent. be paid on the ordinary shares, requiring £3,000, leaving £291 to be carried forward. The expenditure upon capital account during the year amounted to £2,973, of which £2,373 was in respect of extensions of mains and installations upon consumers' premises.

**Barnet Electric Supply.**—The revenue amounted to £5,639, compared with £5,637 during 1911. Installations connected to mains approximately equivalent to 22,100 30-watt lamps.

**Enfield Electric Supply.**—The revenue for the year amounted to £3,821, compared with £3,056 during 1911. Installations connected to mains approximately equivalent to 18,950 30-watt lamps.

**Hertford Electric Supply.**—The revenue amounted to £3,820, compared with £3,787 during 1911. Installations connected to mains approximately equivalent to 19,950 30-watt lamps.

**St. Albans Electric Supply.**—The revenue amounted to £4,334, compared with £3,118 during 1911. Installations connected to mains approximately equivalent to 29,450 30-watt lamps.

The additional connections made during the year to the mains in the four districts represented the equivalent of 12,150 30-watt lamps, making a total connection at the end of the year of approximately 90,450 30 watt lamps. The number of units sold during the year was 1,337,157 which, compared with the previous year's figure of 1,159,323, was an increase of approximately 15 per cent.

Application is being made for an electric lighting provisional order for the Urban District of Wood Green, and for an extension of the Barnet order, to include the parish of Arkley. The Wembley Electric Lighting Order, 1906, which was granted to the Wembley Urban District Council and transferred to the company, has been re-transferred back to the Council under Sec. 67 (b) of the Electric Lighting (Clauses) Act, 1899, for a nominal consideration.

	Barnet.	Enfield.	Hertford.	St. Albans.	Total.

**Bournemouth and Poole Electricity Supply Co., Ltd.**

THE directors' report for the year ended December, 1912, says that capital expended during the year amounted to £9,371, making the total £469,577. The balance from revenue account, after deducting generation and distribution costs, rent, rates, taxes, wages, directors' fees, general establishment and other charges, and proportion of salaries is £37,606 plus £1,209 brought forward, making £38,816. From this there are deducted interest on debenture stock and interest on temporary loans, less income-tax, £9,145; leasehold and special redemption funds and interest, £1,762; amount written off suspense accounts, £637; amount carried to reserve for depreciation, &c., £5,000; leaving available for distribution, £22,272. Interim dividends on the 7,500  $\frac{1}{2}$  per cent. preference shares, on the 15,000 6 per cent. second preference shares, and on the 15,000 ordinary shares at the rate of  $\frac{1}{2}$  per cent. per annum for the half-year ended June 30th, 1912, less income-tax, amounting to £9,358, have been paid, leaving for further distribution £12,914. Final dividends on the  $\frac{1}{2}$  per cent. preference and on the 6 per cent. second preference shares for the half-year ended December, less income-tax, have also been paid.

The directors recommend a final dividend on the 15,000 ordinary shares, at the rate of 7 per cent. per annum, for the half-year ended December, 1912, less income-tax. The above final dividends absorb £10,770, leaving £2,144 to be carried forward.

The total applications received at December 31st last amounted to the equivalent of 8,245 KW., being an increase of 613 KW. for the year. The total units sold for all purposes was 3,338,425. The directors of the Richmond (Surrey) Electric Light and Power Co., Ltd., have declared a dividend of 6 per cent. on the ordinary shares for 1912. Mr. H. B. Renwick, previously secretary, has been elected to the board, and appointed managing director. Mr. W. D. Brightman, previously local secretary, has been appointed secretary to the company; and Mr. F. C. McQuown has been appointed London secretary.

Units generated	4,022,129
Units sold—Public lamps	22,795
Private consumers by meter	3,815,630
Total	3,338,425
Used on works	363,014
Total accounted for	3,701,439
Not accounted for	320,690
Public lamps	130
Maximum supply demanded, KW.	2,347

The annual meeting will be held in London on March 13th.

**Stock Exchange Notices.**—Applications have been made to the Committee to allow the following securities to be quoted in the Official List:—

Consolidated Cities Light, Power and Traction Co.—\$1,000,000 first lien 5 per cent. gold bonds, in lieu of the scrip.  
La Plata Electric Tramways Co., Ltd.—£100,000 5 per cent. first mortgage debenture stock (special application).  
Western Canada Power Co., Ltd.—\$205,400 5 per cent. 40-year first mortgage bonds of £100 each (Nos. B1 to 2,654) (renewed application).

**Davis & Timmins. Ltd.**—The directors report that the net profit for the year ended December, 1912, including £10,452 brought forward, after allowing for depreciation and commission to manager, was £29,270. After paying interim dividend on the 6 per cent. preference shares and interim dividend at the rate of 6 per cent. on the ordinary, there was placed to general reserve account £2,000, leaving £24,060. The remaining dividend on the preference shares requires £1,800, and a balance dividend at the rate of 10 per cent. per annum on the ordinary shares for the last half-year is proposed, making 8 per cent. per annum for the year (requiring £2,350), also a bonus of 10 per cent. out of profits (£4,700), leaving to be carried forward £15,210. The annual meeting is called for March 14th.

**British Insulated and Helsby Cables, Ltd.**—The directors recommend a final dividend of 6s. per share, making, with the interim dividend already paid, 10 per cent. for the year. £90,000 is to be placed to reserve and depreciation, leaving about £74,000 to carry forward.

**Continental.**—SWITZERLAND.—La Société Suisse pour l'Industrie Electrique, of La-le, is declaring a dividend of 7 per cent. for the last financial year, the same as for the preceding 12 months.

## South Metropolitan Electric Light and Power Co., Ltd.

MR. H. ST. JOHN WINKWORTH presided on February 26th at Winchester House, E.C., over the annual general meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, p. 311), the CHAIRMAN said that it was the most favourable report for some years past. The number of consumers increased during the year by 566, which compared with 392 for the previous year, and constituted a record. In addition, 552 extension orders were received from existing consumers, an increase of 30 per cent., making a total of 1,202 new and extension orders for the year. The 35-watt lamp equivalents also showed a record increase of 28,681. The total units sold were 5,481,316, as compared with 4,855,580—an increase of 12·8 per cent. The sales of electricity produced £52,489, as compared with £47,636—an increase of £4,853, or 10·2 per cent. The revenue for 1911 included about £2,000 for electricity supplied to the Festival of Empire at the Crystal Palace, and as there was no such item in 1912, the growth of the general business was in reality larger by that sum. Coal cost £1,560 more, about £1,000 of which was extra cost caused by the colliers' and lightermen's strike in the spring and summer, as the directors felt it necessary to increase the stock of coal and to take all steps possible to ensure a continuous and unrestricted supply of electricity for all classes of consumers. The stock was reduced during the strikes, but had since been built up again, and they now had stored on vacant land about three months' supply of coal. The development expenses were a little less, notwithstanding a large increase in the outdoor staff, owing to the continuous increase in the business done at the showrooms, the number of transactions having increased from 2,750 for 1911 to 4,080 for last year, and the sales exceeded £10,000. The company's offices and showrooms in High Street, Lewisham, had proved most useful as a supplement to the work of the outdoor representatives. The total expenditure he had dealt with amounted to £22,670, or £2,129 greater than last year and represented 40 per cent. of the gross receipts, as against 39·8 per cent. The cost per unit sold amounted to '99d. as compared with 1'01d. They had a net revenue of £33,933, an increase of £2,861, which represented a return of 5·8 per cent. on the average capital expenditure as compared with 5·49 per cent. for 1911 and 4·91 per cent. for 1910. In the course of his references to the capital account, the chairman said that about £5,000 was in respect of the new 1,500-kw. turbine, which was expected to be brought into service shortly, and in addition to enabling the company to cope with a large increase of business, considerable economies in working should be effected. The business of the West Kent Electric Co. was developing, and the accounts for the past year showed a small profit after providing for all expenses. During the year agreements had been entered into with the Woolwich Corporation and the Urban District Council of Bexley for bulk supply, and arrangements were being made for affording a supply in other districts. Looking to the future, their prospects were distinctly favourable. The large increase in the connections last year would benefit the revenue for the present year. The new orders received this year were greater, and the connections made compared favourably with the corresponding period of 1912, while as regarded power, the factories, more particularly in the industrial area, were busy with contracts, and extension orders were being negotiated. The output of units sold showed a satisfactory increase, so that their gross receipts for the current year were likely to show a marked increase. On the other hand, they had to face a higher price for coal, but they expected to be able to effect economies by a greater use of the most economical plant, so that he hoped when they met again next year they would be able to present accounts which would show further and substantial progress.

MR. H. BOWDEN (managing director and engineer), in seconding the motion, said that last year he referred to the important developments taking place in the Lewisham area. The demand had still further increased and was being largely dealt with by the extra high-tension system, which continued to work efficiently and satisfactorily. The area was now practically covered by the high-tension network (except Brockley, where further extensions were anticipated). Having regard to the extensive area covered by their network of cables, they had for the year under review, been remarkably free from faults or interruptions of any kind, and this might perhaps be attributed to the systematic testing and frequent inspection which was pursued of all cables and apparatus, thus permitting the removal of incipient faults before they became troublesome. As a result, the cost of repairs was extremely small. The maximum load had increased from 3,600 to 4,000, or 11 per cent. The output on feeders at the power-house had increased from 6·3 millions to 7·06 millions units, or 12 per cent. The units sold advanced from 4·85 millions to 5·48 millions, or 12½ per cent. From these figures it could be seen that the efficiency of distribution had increased from 77 per cent. to 77·6 per cent. At the power house they had laid down one 1,500-kw. turbine and two boilers, which were practically finished and ready for steaming. He had hoped to be in a position to tell them the new set had been started, but, owing to the delay in the delivery of material, this had not been possible. The plant should, however, be available within a fortnight. The total cost per unit had been reduced from 1'01d. to '99d., but a still further saving would have been shown had it not been for the coal, which had increased from '35d. to '37d. This increase was largely accounted for by difficulties experienced during the strike (although he was glad to say they were able to give an uninterrupted supply without exhausting their coal stock), and by the inferior quality of the coal delivered about this time, and partly owing to the late delivery of new plant, which they

had hoped would have been in time to assist the winter load, and thus largely dispense with the almost constant running of the reciprocating plant in the West House. He thought they might look to see considerable economies effected in this direction, except for any increase they might be obliged to pay on entering into a new coal contract. It was satisfactory to note that their total cost per unit had been reduced, and he thought he was correct in saying that they still held the second lowest total cost for all the London companies.

MR. POWELL said it seemed to him the position of the ordinary shareholders was hopeless, and it did not seem that the expenditure incurred had been justified by the results. The West Kent shares were put in the balance-sheet at par, and he did not know how far the directors were justified in doing that. Instead of carrying forward £5,000, they ought to wipe out the preliminary expenses.

MR. HUGHES also expressed disappointment, and said he had been requested by Liverpool shareholders to ask what fees the managing director got, and what time he devoted to the company.

MR. HIBBERT thought the board might have paid 2½ per cent. this year, as that would have helped them to place debentures and preference shares.

The CHAIRMAN said that the board, who were large shareholders, regretted the non-payment of a dividend, but they felt it was in the true interests of the undertaking to conserve their resources at the present time, and build up a strong financial position. As he had previously explained, by the terms of the debenture trust deed they were prohibited from paying a dividend until they put away to reserve and depreciation a sum equivalent to 2½ per cent. of the capital expenditure during the year, and therefore the profits were not sufficient for the payment of a dividend. He certainly thought the shareholders were within sight of a dividend. The managing director received the same fees as a director as the other directors did, and he received £600 a year as managing director and engineer-in-chief, and he spent a great deal of time in the service of the company.

The report was then adopted, and a vote of thanks was accorded to the staff.

## Bath Electric Tramways, Ltd.

THE annual meeting was held on Thursday last week at Winchester House, E.C., the Hon. Sir James Sirewright, K.C.M.G., presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELEC. REV., p. 357), said that although they had undoubtedly earned, they did not find themselves in a position to pay a dividend on the preferred ordinary shares. The cause of that was the same as he dwelt on at considerable length last year. Naturally there was a feeling of irritation on the part of the preferred ordinary shareholders, and on nobody's part was that irritation more felt than on his own, because he was far and away the largest preferred ordinary shareholder. He had held 10,000 of those shares since the inception of the company, which he subscribed for at par, and he had not parted with a single one. It would, therefore be understood that they had done everything in their power to meet the situation, and be in a position to pay the dividend which they had earned. One or two shareholders had written complaining of the report, including the secretary of the River Plate Electricity Co., which company held 2,700 preferred ordinary shares. In the course of his letter he said that the report was most unsatisfactory, and he said that the phrase which the directors used as to the pending completion of arrangements which were being made for meeting the loan standing in the balance-sheet at £21,150, had been used over and over again. That was not quite the fact, but he could say that to-day they were at all events nearer the completion of the necessary finance to enable them to attain the end in view. Having referred to the history of the negotiations and their present position, he said that if they succeeded, they would have a sufficient sum of money to repay the loan to the bank, and it would also give them money for improvements which would bring in a fair return. The secretary of the River Plate Co. went on to criticise the action of the directors in putting aside £8,000 to the contingencies and renewals account, which he regarded as altogether unnecessary and unjustifiable. In view of the fact, to which the auditors drew attention, that no special provision had been made for depreciation, the directors were rather in the position of being between the devil and the deep sea in that respect. All he could say was that they believed the policy which they were carrying out was a conservative one. They had maintained the system in all its branches—tramways, motors and foundry—in a manner second to no similar undertaking in the kingdom. They had paid off £5,000 of their debentures; they were carrying forward £3,200, and they had put to the renewal and contingencies account £10,000, making in all about £18,000, which was available. Not only had they done that, but they had just ordered, and partly paid for, four new torpedo motor-omnibuses. The traffic receipts showed an increase of £2,163 over those of the previous year—in fact it was the best year that the company had ever had. He was sorry to say, however, that the net profits were considerably less, owing to a variety of causes. They had to pay a very largely increased price for coal, but although the price had gone up since the strike, their coal bill for 1913 would be considerably less than it was last year. That was due to the introduction, also paid for out of revenue, of mechanical stokers which would enable them to burn a much inferior class of coal. The motor-omnibus traffic was very satisfactory and was full of promise. They had gone very carefully into the cost of running the system, and he thought they could hold their heads up against any tramways either company-owned or belonging to municipalities.

Their working expenses per mile last year were 5'005d., which was considerably more than in 1911, owing to the causes he had referred to. In the case of 17 companies whose records were accessible their average cost of working in 1911 was 5'980d. per mile, and in the case of 79 local bodies possessing tramways the average cost per mile was 6'56d. He thought, therefore, they might fairly claim that in their staff they had an efficient, vigilant and economical body of men. As to the future, it was very dangerous to prophesy, but the first eight weeks of the present year had shown an increase in gross receipts of £300, and an increased net profit of a little over £100. Given a fairly average summer and a fair autumn, they would see a very considerable increase both in the gross takings and in the net profits. Should that be so, and should they succeed in carrying out the financial arrangements to pay off the bank loan, then he thought he could positively promise that the long-deferred goal of paying a dividend on the preferred ordinary shares would be reached.

MR. HUGH CLUTTERBUCK seconded the motion, which was adopted after a short discussion.

### Kensington and Knightsbridge Electric Lighting Co., Ltd.

COL. R. E. CROMPTON, C.B., presided on February 27th, at the offices, 148, Brompton Road, S.W., over the meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 313), the CHAIRMAN first referred to the absence of Mr. Erskine, their secretary, who had been with them during the whole of the life of the company and was away for the first time, but he was glad to say that after a prolonged illness he was now in a fair way of recovery. It was proposed to pay the same dividend as last year, and the carry forward was increased from £1,680 to £1,780. The total amount now standing to the credit of the renewal and reserve fund, £115,361, was very substantial and satisfactory. There were two chief causes for the diminution of the profits earned during the year, the first being a falling off in revenue due to the reduced sales of current from £76,918 to £75,847, a decrease of £1,071, or about 1·4 per cent. The other cause was the increased price of coal, which was likely to be intensified in the future. They had not had to pay an increased price for coal itself, which was a direct result of the coal strike, but in addition they had had to deal with an indirect result of the strike, as they had to draw very largely on their reserved stock which had accumulated at Wood Lane, and which had, to some extent, deteriorated by exposure, so that an extra quantity of this reserve coal had to be used to generate a given quantity of electricity. During last year the price of coal per ton increased by about 10 per cent. The combined effect of this increase in price, and the increased quantity used from the reserved stock, had increased the total working cost per unit supplied from the Wood Lane works to Kensington customers by about 11½ per cent., and it seemed from the still higher price they had to pay for coal for the coming year, averaging the existing contracts, and the new contracts they had yet to make, they must be prepared for a future increase in the cost per unit delivered, of about 15 per cent., and this would affect the total supplied to their customers by about 5 per cent. Under these altered conditions of cost of production, the directors had under anxious consideration the best method of meeting it. The falling off in the units sold was not large, and the fall which actually showed was due partly to the Early Closing Act, which affected the units sold to shops and other trade customers, and the board found it would be necessary to adjust the price to those customers to meet the altered conditions. As the shareholders were aware, the price per unit realised by them for the sale of electricity was especially low for the district, and they compared favourably in point of cheapness with any other company or district. They could not expect any considerable increase in the output otherwise than by the rebuilding going on in certain neighbourhoods where small houses were being pulled down and replaced by larger ones, and there was no doubt whatever that the increased cost of manufacture must be met by some adjustment of their price. In view of the liberal discounts they had been giving in the past, they thought this could be done without any of their customers feeling it. Apart from the increased cost of coal, the general cost of distribution and administration including that of maintaining their plant and mains and meters in as perfect a condition as possible, had not increased, in spite of the fact that they had had to make good during the current year the result of the short-circuit of mains, which occurred shortly before he addressed them at the last meeting, and when he put before them the possibility that they would have to pay heavily for that trouble. He thought the shareholders were to be congratulated that they had practically paid for that short-circuit without any notable increase in their maintenance cost.

MR. R. WALLACE, K.C., seconded the motion.

MR. KILLINGWORTH HEDGES said that it was with a little feeling of disappointment that he heard the chairman foreshadow that the output of electricity would not be increasing, but that it might from certain circumstances tend to decrease, and it behoved this company, as well as other companies, to do all they could to popularise electricity. The speaker referred to efforts which were being made to establish electric cooking, and personally spoke highly of such cookery, but said he found electric lighting companies gave away plenty of literature about cookers and heaters, but did not give the public facilities for seeing how these things were done. He thought they ought to follow more on the lines of the gas companies when they introduced gas cookers.

The CHAIRMAN said they had co-operated with other companies and with the local authorities, and had done a good deal to popularise electric cooking and heating. No one was a greater believer in the future of these two methods of utilising electric energy in residential districts than himself, but it was a slow process to overcome the conservatism of the English kitchen. He thought it highly probable that in six or seven years' time they would have made considerable progress in electric cooking, but he hardly thought it wise, at a shareholders' meeting, to put before them that there was likely to be any substantial increase in the output of electricity during the next year from this cause, although they were doing all they reasonably could to further what Mr. Hedges asked. Owing to the care observed by the staff the cost of the short-circuit they experienced was not one-twentieth of what they anticipated it would be at first.

The report was then adopted, and a hearty vote of thanks was accorded the board, Mr. Miller, the engineer, and the staff for their services, on the motion of MR. HEDGES, seconded by MR. SCHWANN.

### Telegraph Construction and Maintenance Co., Ltd.

THE meeting of this company was held on Thursday last week at the offices, 38, Old Broad Street, E.C., under the presidency of Lord Selborne.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 311), said that the net profits for the year had amounted to £109,000, as compared with £87,000 in the previous 12 months. Adding £106,000 brought forward, they had a total of £216,000, as against £195,000 last year. From that had to be deducted the interim dividend already paid of £22,000, which left £193,000 available for distribution, as against £172,000 a year ago. The directors proposed that the reserve fund should be increased by the addition of £20,000, as against £10,000 last year. They proposed a dividend at the rate of 10 per cent. and a bonus of 12s. per share, which would leave practically the same amount to be carried forward as was brought into the account—£106,000. The freehold and leasehold premises, machinery, plant, stocks of stores and materials, stood at nearly £619,000, a considerable increase over last year, the reason being that they had larger stocks of materials on hand, and a larger amount of manufactured cable in connection with contracts in progress. On the other side, the debts owing by the company, and reserves for insurance and contingencies (£1,407,416) had increased. The conservative policy which the board had always adopted in dealing with the company's finances had hitherto met with the approval of the shareholders, and he could give them an illustration to show how necessary that policy was for the success of the company. The amount of material used in the business in the course of a year was very large indeed—partly raw material and partly manufactured material, which they further manufactured, such as gutta-percha, jute, copper, iron, and, of course, a very large amount of coal. As they dealt in such large quantities, it was of the greatest importance that they should buy their materials at the most favourable moments, and one of the secrets of their success was that they were able to do that by reason of the financial strength of the company. At the moment, they had important contracts in connection with work in the Far East. Last year was a period of comparatively small jobs, largely on behalf of foreign Governments, and those Governments, he was glad to say, had always testified their great satisfaction as to the way in which work had been done for them. As he had said they had undertaken an important and anxious work in the Far East. It was in the interests of the company that they should be able to take such contracts, although the responsibility connected with them involved great anxiety, but they could not undertake such work unless they had large stores of materials. Then, again, last year had been a period of great unrest with the railway strike, the coal strike, and the dock strike. Each one of these strikes might have affected their business very seriously, although the relations between the management and the workmen had always been of the most harmonious and sympathetic kind. Their work was not impeded for a moment in spite of those troubles, because they had large stocks of material on hand, and he might say that when the coal strike ended they had enough coal in stock to carry on the works for two months longer.

SIR JAMES PENDER, Bart., seconded the motion.

Replying to a shareholder, the CHAIRMAN said his opinion was that wireless telegraphy would always have a market of its own, and he did not think it would seriously interfere with work which could only be done by the cable.

The report was adopted.

### Chelsea Electricity Supply Co., Ltd.

THE directors' report for the year ended December 31st, 1912, states that the profit for the year amounted to £37,460, which, with £3,241 brought forward, and £1,937 for interest, makes a total of £42,638. After deducting interest on debenture stock, £7,875, interim dividend on the preference shares at the rate of 6 per cent. per annum, £900; interim dividend on the ordinary shares at the rate of 4 per cent. per annum, £1,914; there remains a balance of £28,919, which the directors recommend shall be appropriated as follows: to credit of reserve for renewals, depreciation and contingencies, £13,626; to credit of debenture stock premium redemption fund, £704; to amount written off cost of extinction of founders' shares, £1,089; to amount written off cost of purchase of Cadogan Electric Light Co., £1,000; to amount written off cost of invest-

ments, £1,352; to final dividend on the preference shares at the rate of 6 per cent. per annum, making 6 per cent. for the year, £900; to final dividend on the ordinary shares at the rate of 6 per cent. per annum, making 5 per cent. for the year, £7,415, leaving to be carried forward £2,833. The number of 8 c.p. lamp equivalents connected on December 31st, 1912, was 293,973, an addition of 11,597 during the year, and the total number of units sold was 1,184,072, being 167,594 more than for the previous year. The directors record the death of their late colleague and chairman, Sir Irving Courtenay. The vacancy on the board has been filled by Mr. Stanley Becton. Mr. W. R. Davies has been appointed chairman.

The meeting is called for March 12th.

### British Electric Transformer Co., Ltd.

THE annual meeting was held on February 28th at Salisbury House, E.C., when, in the absence of Mr. J. F. Albright (the chairman), through illness, Mr. A. F. Berry presided.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 359), first dealt with the variation of the figures in the balance-sheet, due to the increase in the capital owing to the acquisition of the whole of the Berry Construction Co. in accordance with the agreement of April 1st, 1912. Sundry creditors were more by about £1,767, due to increased business and its extending nature. They did not propose to add anything to depreciation reserve, as their advisers did not consider it necessary. On the other side of the balance-sheet, the item for patents and goodwill had been increased by £26,632, due principally to the absorption of the Berry Construction Co., as owners of the "Tricity" cookers and heaters. They had the general reserve account of £21,745, which could be set against this asset or for any contingency. The goodwill alone of a business such as theirs, which was the result of something over 15 years' continuous specialisation, and one which earned them profits of about £20,000 a year, if valued in one or other of the many different ways of arriving at a fair valuation, would give them a sum of about £60,000, but in addition to this, there was the value of the patents. It was, of course, on these patents that the business and the goodwill had been built up. Some of their foreign patents had been sold, and for others licences had been granted, and they were now earning a revenue. The cost of all lapsed patents or those sold had been written off, and the patents left, numbering well over 100, and being regularly added to, were the only ones included in the balance-sheet. Having dealt with the items of freehold land and buildings, &c., and of office furniture, the chairman said the increase of £10,600 in the stock was incidental to a business such as theirs, where with increased orders they had to carry increased stocks of raw material. The manager's valuation of the stock had been verified as far as possible by the auditors, who were of opinion that the valuation was on the conservative side. Work in progress accounted for a large part of the item of stock and materials, and was taken from their cost books, which were very carefully kept, and were also verified by the auditors. Investments were increased owing to the investment of some of their spare cash. All the business of the year had been done on a strictly cash basis, and there were no shares taken in part payment, or anything of that sort. With regard to the profit and loss account, general charges were increased by about £3,786 in consequence of the largely-increased amount of work they had done in both the transformer manufacture and the "Tricity" cooker manufacture. The gross profit was about £4,874 more than last year and discounts, &c., were £892 in excess. Turning to the year generally, 1912 had been quite eventful for the company in several ways. About this time last year, they had to face the consequences of the coal strike, difficulties in getting raw materials, and in delivering their finished goods. But in spite of all the difficulties they had in common with most other manufacturers of electrical apparatus throughout the country, shared in what was clearly a trade boom, in the electrical world at any rate, and the volume of work turned out was considerably in excess of that of 1911. Their shipping work increased appreciably, and in nearly every case where they had obtained an order from abroad they had got repeat orders, which was perhaps the best testimony they could ever hope for. They commenced the year 1913 with some 25 per cent. more work than they started 1912, which, as they were told last years was a record and far in excess of anything they had previously done. It was not safe to prophesy, but they did not see any reason why there should be any falling off in the orders, judging by the number of inquiries they received. This year they started with practically the same loyal staff, and there seemed no reason why the operations of the company should not proceed just as smoothly as in the past. With regard to the manufacture of transformers, in the past they had been used more particularly by authorities supplying electric light and power and dealing only with alternating current. But owing to the increase in the demand for electrical energy, and the greater distance over which it had to be distributed, the direct-current stations and the railway companies had found it necessary in a number of instances to put down alternating-current plant for the generation and transmission of electric energy, and by means of transformers and rotary converters to convert the direct current just where the energy was required. The principal purchasers of transformers to-day were Corporations, Government departments, railway, tramway, colliery, mining, electric light and power companies—all of which they would agree were a first-rate class of customers to get on their books. The "Tricity" business was progressive, and the users of their cooker expressed themselves well satisfied with its behaviour.

They had equipped their works at Hayes with a complete apparatus. That they were not alone in looking for a greatly extended use of electricity for cooking was shown by the fact that some 25 manufacturers were contemplating starting the making of electrical cooking apparatus. They believed their system was the best, and this was borne out by the fact that some 28 supply authorities were now hiring their cookers. Their experience in manufacturing both transformers and cookers led them to think they would continue to hold the position they held that day. In conclusion, the chairman again referred to the work of the staff, and expressed the belief that the company owed much of its success to the fact that so large a portion of its shares were held by the directors and their friends and by the staff.

Mr. T. Rowe seconded the motion.

In the subsequent discussion questions were asked as to circulars coming addressed from Copthall House offering large blocks of shares of the company for sale, and as to the attacks made on the company by a financial print. It was also asked what connection there was between the company and "Modern Kitchens, Ltd."

The CHAIRMAN said the board had no control over any circulars outside brokers might issue. The company running the Tricity House restaurant, which was equipped exclusively with their cookers, were, he was glad to say, doing an extraordinarily good business. As a company they had a small interest in it, but they had a great interest in it from the point of view that it was teaching the public to appreciate their cookers, and already it had done a good deal of good to them. With regard to the competition of other makers, if they produced good cookers it would all help to make such apparatus popular.

The report was then adopted.

### Lancashire United Tramways, Ltd.

THE HON. ARTHUR STANLEY, M.P. (chairman), presided on February 27th, at Winchester House, E.C., over the annual meeting.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 357), the CHAIRMAN said that there was a profit of £19,465, which showed an increase of £281. The profits were the highest figure they had yet reached, and were obtained in spite of the coal strike, which, of course, was a heavy loss to them. The receipts per car-mile were 821d., which was also the highest figure they had yet reached. The units sold to outside consumers were 1,025,000, as against 660,000 last year, showing a very satisfactory increase of 364,000 units. They might hope that that would be very considerably increased this year, because under the arrangement with the Lancashire Power Co., who had certain rights in the district, they had arranged to supply the urban district of Tyldesley. The load they were at present carrying, and this new load, had necessitated a new battery and a turbine. The new battery was already erected, and they had made arrangements for erecting the turbine at once. When they had got the new turbine they would be in a position to cope with any load that they might expect to get for some time to come, and there was not likely to be much more capital outlay under these heads. They proposed to construct a short bit of new line. They had been able to make very satisfactory arrangements with the local authorities for the necessary powers, and also for the maintenance of the road, and he hoped, therefore, they would be able to run that section at a profitable rate. It was a continuation of one of their lines, and would join up to their main system a rather important district which had been very anxious to see the tramways there. It also would enable them to make effective use of about half a mile of line which was laid, but which hitherto they had not been able to work. As regarded finance, they had left with the companies they controlled after paying dividends £6,900, and the depreciation and renewal funds they had built up in these companies, now amounted to £16,400. It was quite certain, now that their lines had been running some years, that they would have a good deal to spend within a little time on renewals, and they would all agree that it was wise that they should build up the fund in anticipation of the work they would have to do. In a company like that, which had to be very carefully worked, and where the increase each year was not very large, it was important that it should be progressive. It was only by taking a series of years that they could really see the increases which were made. He had taken 1909, not because it was a particularly good year, but because it was a convenient year, and there was no better year before it. In 1909 they carried 13,450,000 passengers, whilst in 1912 they carried 14,500,000, or an increase of over 1,000,000. The traffic receipts in 1909 were £68,900, and in 1912 £72,400. The sale of electricity was rather a remarkable figure, for while in 1909 it was only £690, in 1912 it was £2,500. The total revenue in 1909 was £71,500, and in 1912 £77,600. Perhaps the most gratifying feature was that the increase had been secured at a cost of under £1,900 increase in the expenditure on the lines, and therefore he thought they might say with absolute confidence that the position in 1912 was materially better than in 1909. He thought that great credit was reflected on the secretary and other officials who managed the lines. He could assure them that it was a very complicated business to work if they controlled various lines which worked under different conditions. It wanted very careful watching, and the proof that vigilance was being exercised was shown in the increasing returns, and the fact that expenditure did not increase to a corresponding extent.

SIR J. BEECHAM seconded the motion.

MR. NEWGASS, whilst sympathising with the directors, remarked that friends of his at Liverpool had told him that if there were certain outlays the returns could be materially improved. They

had motors running over their lines and damaging the road, and could the company not carry goods traffic itself?

MR. TAYLOR complained that the accounts did not enable them to form an intelligent opinion of what was actually being done on the tramways, and it would help them if more statistics were given of what was actually being done. He thought the working expenses were high, and compared unfavourably with other companies.

The CHAIRMAN, replying to the criticisms, pointed out that if they could not raise money at a good rate it was certain they could not use it in the district in a remunerative way. If Mr. Newgrass had known the difficulty they had over the prior lien bonds he would realise that the chance of raising capital at a remunerative rate was very remote. They did once have a great idea of the possibilities of goods traffic, but, after going most exhaustively into the whole matter, they could not see how they could fit such a service in practically with the passenger service. With regard to the prospectus they issued for the prior lien bonds, they had the advice of Mr. Salter and Mr. Sellon, and that the results had not come up to anticipations was due to many circumstances it was impossible for him to go into at the moment. He would not venture to make any prophecy as to when they were likely to get a dividend.

The report was then adopted.

### W. T. Henley's Telegraph Works Co., Ltd.

The annual meeting was held on Friday last at the offices, 13 and 14, Blomfield Street, E.C., Mr. Sydney Gedge, M.A., presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 358), said that when a company could show such a good balance-sheet as they were able to show this year, succeeding, as it did, similar balance-sheets for a good many years past, it would be strange, indeed, if they had to find any fault with the directors. During the year they had made a profit of £92,068. They had spent £32,483 upon additions to their buildings. Out of the balance of £12,164 they proposed to put £13,790 to depreciation for buildings and machinery. It was quite right to do that, but it did not mean that the money had gone out of their pockets, it was still in the business. They had also written a further £4,219 off their trustee securities. He could not say how long that depreciation was going to continue. Personally, he thought that until there was a change in the Government of the country that depreciation was likely to continue, and he might say that since December 31st their securities had depreciated a further £3,000. He hoped that something would happen in the course of the next year or two to cause consols and other gilt-edged securities to go up again. They had put £15,000 to the reserve account, bringing it up to £200,000, and they carried forward £8,155. He thought they would agree that that was a very strong position for an industrial company to be placed in. During the year they had considerably increased their office accommodation, and also their warehouse accommodation in the basement. They had also made considerable additions to the works. The directors had, in accordance with their usual custom, held board meetings at Gravesend and Woolwich, and been over the works, and he thought they were all very pleased with them. Everything was in very excellent order. The whole of the business had worked very smoothly during the year; there had been no strikes; the health of the workpeople had been good, and there had been no accident of any moment whatever.

MR. GEORGE SUTTON, the managing director, in seconding the motion, said the report was as good as shareholders could possibly expect. It represented a year of intense work and of full employment at both factories. It represented the largest turnover that the business had ever done, and that with prices not above the normal. The satisfactory feature of this increased turnover was that it was not due to any one or two abnormal contracts, but, almost without exception, the business had increased in every part of the world. He wanted them to understand that the improved profit was not due to a larger profit upon their goods, but to a larger turnout of material. There were two factors which had contributed to the excellent results of the past year, namely, labour and raw material. In the case of labour, they had had a year of peace; they had had no trouble at either of their factories. There was no bitterness left in the minds of either employers or employed as a result of the strike of 1911. The improvement of the conditions of their workpeople as well as of the staff was always in the minds of the managers; they did not want to be pressed by Trade Unions or other people to do justice to their workpeople. Perhaps there was one echo of the strike during the past year, and that was, that efforts had been made to induce certain of their municipal customers to refrain from renewing their contracts with them. Of course, those efforts were not made by their workpeople. He knew the source from which they emanated, but he had the satisfaction of telling them that in no single instance had they succeeded, and three of their largest customers who were approached had renewed their contracts with the company. As to raw material, as the shareholders were aware, the principal materials in which the company dealt were copper, lead and india-rubber. They had had no boom in any of those materials during the past year. Booms were no doubt very exciting and enjoyable to a large section of the public, but they were very embarrassing to manufacturers who had to use the boomed articles. The fairly level prices which they had had throughout the year, had kept a continuous stream of orders coming in to the works, whereas when prices were unreasonably high, as they were two or three years ago in the case of india-rubber,

buyers were apt to wait and wait until the pendulum swung to lower prices before they sent in orders, and so the equilibrium of trade was upset. As to the future, he could speak with a pretty sure prophetic voice; they were going to be all right this year, because their order sheet at the present time was the largest they had ever had. With regard to the future beyond 1913, the directors were looking with a considerable amount of hope to the electrification of railways, which business ought to bring a great deal of profit to the company. They had no reason to suppose that they would not get a fair share of orders for cables which would be needed in that direction. They had one order on their books for £100,000 for the construction and laying of cables for the electrification of a portion of the Central Argentine Railway—the largest order of the kind which had ever been placed. He might say that at the new works, which they were putting up at Gravesend, it was intended to manufacture pneumatic motor tires.

After some complimentary observations by shareholders, the report was adopted.

### London Electric Supply Corporation, Ltd.

MR. R. H. BENSON presided, on February 27th, at Winchester House, E.C., over the annual meeting.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 358), first referred in sympathetic terms to the late Lord Crawford, one of the original directors and the late chairman. To fill the vacancy they had elected Lord Duncannon who, probably, before long, would again be in Parliament, when he would be in a position to render them valuable service. Further, his close connection with the chairman of the Brighton Railway, with which they already had large dealings and expected larger to come, should tend to the best mutual understanding, and they welcomed any occasion for cementing still more closely the already pleasant relations which had always existed between the Brighton Railway Co. and themselves. Those who had studied the accounts could not fail to have noticed that in three respects the year under review constituted a record:—First, in the actual number of units sold, 28,409,755, an increase of 8,000,000 over the best preceding year; secondly, in the gross receipts for sale of current, the figures being £138,000, as against £125,000, the next highest total, in 1905; and lastly, in the cost of generation per unit sold, namely, '66d., as against '82d., a decrease of 20 per cent. They might fairly claim this as a most satisfactory showing, and one which was full of promise for the future. It was true that the net revenue had not risen sufficiently to enable them to increase their dividends, but it did show an increase of over £7,000, and but for the necessity now imposed on them of creating a sinking fund for the repayment of their debentures in 1931, which required £12,000 a year, they would have had a larger surplus to divide. They proposed payment on the ordinary shares of the same dividend as last year, viz., 2½ per cent, carrying forward £4,706; £1,000 had been placed to contingencies' account, and owing to the provision of the sinking fund, to which he had referred, it had not been thought necessary to increase the reserve, which remained at £77,500. He should like to anticipate a question which some shareholders might be inclined—and very legitimately inclined—to put to them: "You tell us year after year," it might be said, "of the progress which the company is making, of the increase in the number of the units sold, and of the decrease in the cost; and yet our dividend remains the same. What is the advantage of all this to us? You are continually issuing fresh capital, but this capital does not appear to do more than earn its own interest, and the ordinary shareholder is not benefited." This was a natural, and, as he said, a legitimate objection, and he would endeavour to meet it. He had a comparative table showing gross and net revenue, debenture interest, dividends, and surplus placed to reserve, for the last 12 years, beginning 1901, which provided the answer to the question they were considering. It showed that in the year 1906, the year which followed those two exceptional years in which they were supplying current to the L.C.C. for their tramways pending the completion of their own supply station, there was a fall in the gross revenue from £130,591 (this included all other sources of revenue as well as current) to £112,039, and in the net from £78,721 to £56,522. In the following year, 1907, there was a further drop to £105,539 in the gross and £46,320 in the net. That was the low-water mark, viz., the year 1906. During those years they were supplying very little current for power purposes. But directly they began—towards the end of 1910—to supply current to the Brighton Railway for traction purposes, and to manufacturers and industries, as well as for light, their revenue, both gross and net, began to expand. The secret of cheap power was to supply it for all purposes and for the greatest number of hours out of the 24, so as to keep the machinery steadily running. The year just past was the first year in which their two new turbine plants were running—and even then not for the whole period; and the result, as they saw, was an expansion in gross receipts of £15,000, and in net of £7,000, or nearly 12 per cent, while the units sold had increased from 20,000,000 to 28,000,000. What was the conclusion to be drawn from all this? Was it not that the work they had been carrying on during these past years had been work of preparation—arduous but necessary for the harvest which, he thought, was in sight? During the past nine years they had increased their preference share capital by £200,000 and the debentures by more than £100,000; but even in these comparatively lean years of preparation they had earned interest on this money, and a small dividend besides and had

strengthened their position so much that they were producing current considerably cheaper per B.T.U. than any other company in the London area. The board long since came to the conclusion, and it had been often stated from that place, that it was in the generation of current for industrial and traction purposes, combined with lighting, that the prosperity of the company lay. In the lighting field they were out-distanced by more fortunate competitors who had benefited by their pioneering experience, and whom they could not hope to displace. It was for this reason that they turned their attention to obtaining large power contracts, and that they concluded with the Westminster and St. James' companies agreements which were intended to eliminate waste competition for lighting, and give the most efficient service in the areas which they served along with those companies. They were entitled to claim that the event had amply justified their action. Any attempt to develop their lighting field further could only have resulted in a cut-throat competition, which, while it might have damaged their rivals, would probably have brought them very little increase of revenue, and he had no hesitation in saying that without the load for traction and industrial power, and relying only on their lighting units, it would have been impossible to get any fair return for the service rendered to the public. Their contract with the Brighton Railway Co. had now been in full operation for not much more than two years. In February, 1910, he said that in the (then) coming year they expected to sell them over 5,000,000 units, and hoped for much more. Well, last year that 5,000,000 was increased to nearly 15,000,000; and that was nothing to the demand which they expect shortly to be called upon to meet. The board of the Brighton Railway, had now decided to complete the electrification of their entire suburban system; and they had good reason to expect that they would come for their supply of current to the company with whose co-operation during the existing contract they had more than once publicly expressed their satisfaction. Their demand might amount to anything, from a minimum of 80,000,000 units up to as much as 150,000,000. Now, as a general principle, and leaving out of account exceptional factors such as a sudden rise in the price of coal, as the number of units generated increased, and the load factor rose, so did the costs of generation tend to fall. Therefore, without his labouring the point further, they would see that in a contract for the supply of power on such a scale as this, when combined with a supply to other customers for industrial purposes, there should be room for profits sufficient to place their ordinary shareholders at last on the footing which they certainly had a right to expect, and for which they had so long and patiently waited. And this brought him to another point—the question of capital. It was obvious that they could not meet so big a demand upon them without a large extension of plant; and that would involve the finding of fresh money. For this purpose they were submitting that day a resolution for increasing the capital of the company by £250,000, to be "divided into shares of such denomination, either preference or ordinary, as the board may determine." That would also increase their borrowing powers, which were now exhausted. They did not anticipate that any of this fresh capital would be needed during the current year, but they wished to be prepared for any emergency. As the length of their tenure diminished, the difficulty of finding fresh capital, of course, increased, for they had to provide for its repayment if they were taken over by the purchasing authority in 1931; and as they had seen in the case of the recent issue of debentures, this had necessitated the provision of a very heavy sinking fund. But their financial advisers were confident that for the purposes of undertaking so important a contract as that on which they hoped shortly to be called upon to enter, there would be no difficulty in finding the necessary capital. In conclusion, he would like once more to bear testimony to the spirit of zeal in which everyone in the company's employment, from highest to lowest, worked for the furtherance of its interests. In a few months their managing director, Mr. Bain, and the chief engineer, Mr. Partridge, would have completed 25 years in the service of the company. They entered upon their duties together soon after the company came into being, and they had worked together, with unflagging keenness for its interests from that day to this. They had so far identified themselves with the company that it was not too much to say that its success was their life's work; and it was a work of which they had a right to be proud, for they had seen the company through many dark days, and it was only by untiring watchfulness, patience and persistence that they, working with the late Lord Wantage as chairman, piloted it to the position that it now occupied. He should like, therefore, in conclusion, to invite them to pass a special vote of thanks to Mr. Bain and Mr. Partridge on the occasion of the completion of their twenty-fifth year of service with the company, which they would hope might also coincide with the signature of a new and profitable contract with the Brighton Railway.

MR. STEWART BAIN (managing director), in seconding the motion, first thanked the chairman for his references to the approaching semi-jubilee of himself and Mr. Partridge, and said he would like to take the opportunity of testifying to the great assistance he had always received from Mr. Partridge. He also endorsed what had been said by the chairman regarding the late Earl Crawford. The capital expenditure for the year was £46,631, as compared with £73,000 last year. This was less than was anticipated, and nearly the whole of it was in connection with the Brighton Co.'s contract. They laid about 6½ miles of new mains during the year, bringing the total number of mains laid up to 196½ miles. They did not anticipate a very large expenditure this year, but when the new contract with the Brighton Railway Co. in connection with their extension came along, very considerable extensions to their plant and machinery and mains would have to be met. Some idea of what it might be might be obtained if he

read an extract from a recent article in the *Times*, viz.: "The supply of electricity taken from the London Electric Supply Corporation has proved so satisfactory, that it is intended to purchase all the current required for operating the suburban system from the same source. In consequence that company will have to install additional plant amounting to some 40,000 or 50,000 kW and their power station at Deptford will become one of the largest, if not the largest, in the country." With regard to the revenue account, the total expenditure was about £8,000 more than in the previous year, but as the generating expenses alone were about £9,000 more, the expenditure under the other heads of the account was about £1,000 less. The average price paid for coal during the year was 10d. per ton more, but owing to the precautions they took in building up a large stock of coal they had no difficulty in meeting every demand upon them. The gross revenue showed an increase of £15,000 over last year. The average price received for every unit was about 1½d., as compared with 1½d. for the previous year—a reduction of about 20 per cent., and it spoke well for the efficiency and zeal of the staff that the total cost had fallen from 8½ to 6½ per unit. This latter figure was one which their engineering staff had every reason to be proud of. They were paying special attention to the supply of power for industrial purposes, and manufacturers were gradually realising the economy, efficiency and facility of electric driving, as compared with steam driving. Generally, the year had been one of progress, and the future was not only hopeful but bright.

MR. MAKINS suggested that with regard to the debenture redemption fund, it would be well if the company purchased its own stock. He also urged the board to take care in negotiating the Brighton Railway contract, as it might be that a few years hence the railway company might think it better to generate their own electricity.

MR. HANKEY said he was glad they had heard the chairman give them some hope for the future. They seemed so far to have been a philanthropic company to provide electricity first for the London County Council and then to the Brighton Railway Co.

The CHAIRMAN, in reply, said that they were acquiring their own debenture stock, and last year for £12,000 they purchased £13,353 worth of stock. The present contract with the Brighton Co. had 15 years to run, and it went without saying that they must have a sufficiently long contract to make it pay.

The report was then adopted.

The necessary resolutions for increasing the capital as explained in the chairman's speech were carried.

On the motion of MR. INCE, seconded by MR. HANKEY, a special vote of thanks was passed to Mr. Bain and Mr. Partridge; and the latter gentleman, in acknowledging it, said the progress being made by the company was due to the wonderful engineering staff they now had. He had visited many stations on the Continent, and nearly all the stations in this country, and had never seen a more competent staff than they had at Deptford.

### Waste Heat and Gas Electrical Generating Stations, Ltd.

THE annual meeting was held on February 28th at the offices in Newcastle-on-Tyne. Dr. J. B. Simpson, chairman of directors, presided.

The CHAIRMAN said the issued capital was the same as last year, but it had been fully paid up during the whole year, and consequently the amount required for the same dividend was considerably more than it was in the previous year, when only a small part of the new capital was dividend earning. The reserve and depreciation account had been increased by the transfer of £9,600 out of the year's profits, and amounted to £33,350. Their capital expenditure had been increased by £13,600, which represented further payments made in connection with Grangetown, Port Clarence and Ayresome generating stations. These stations had been completed during the year, and had produced a considerable increase in the revenue of the company. Their investments had been increased by £17,000 by the payment of the balance on the new shares taken up in the Bankfoot Power Co., Ltd. The profits of the Waste Heat Co. showed an increase of £10,939 on the previous year, which was owing principally to the starting up of new generating stations. All the company's stations were running very satisfactorily, and had it not been for the miners' strike in the early part of last year, the profits would have shown a still further increase. As it was, however, the coke ovens and ironworks, from which they obtained the waste heat and gas, were shut down during the period of the strike, and in consequence the generating stations had to be closed down also. The revenue from the production of electricity was reduced to nothing during the period of the strike, but at the same time, of course, they had no payments to make for waste heat or gas. Advantage was taken during that period to thoroughly overhaul all the plant in their stations, which was consequently in a thoroughly efficient state of repair. The directors had not yet concluded any further agreements for the erection of new generating stations, but proposals were still under consideration, and they hoped that during the current year agreements would be finally concluded whereby one or more additional generating stations would be erected by them. The character of their business was, he thought, so far as this country was concerned at least, unique. They purchased waste heat from the people who had it, converted it in their stations into electric power, and sold the electricity in bulk to power companies, by whom it was distributed throughout the district. Their contracts with the power companies were very simple. As that company could supply

them with power from the waste heat stations more cheaply than the companies could produce it in their coal-burning stations, the power companies were glad to take from them as much power as the stations could generate. In addition the former companies bore the cost of operating the stations, and kept them in repair and paid that company a rental for the use of them. The expense of obtaining a sale for and distributing their product, which was such a large and growing item in the expenses of most companies who manufactured and sold, was borne by the power companies, which placed them in a specially favourable position. On the other hand, the supply of cheap power was of the greatest possible benefit to the power companies, and ultimately to the consumers. But the Waste Heat Co.'s operations were more than this—they were of great advantage to the ironmasters and coalowners in that district. Not only did they earn a substantial revenue from energy which was formerly wasted, but that company also supplied them with electric power for their own use at a price and with a reliability which they could not obtain by themselves. The fact that all their stations were linked together and with those of the power companies enabled a continuous supply to be given throughout the year.

The report was unanimously adopted.

### Para Electric Tramways and Lighting Co., Ltd.

SIR WILLIAM EVANS GORDON (chairman) presided on February 28th, at the Cannon Street Hotel, E.C., over the annual meeting.

The CHAIRMAN, in moving the adoption of the report (see ELEC. REV., page 358), said it was the most satisfactory they had ever had. The hope he expressed at the last meeting regarding a reduction of operating expenses had been fulfilled. The results of the improvements in the plant, and the cessation of interference with their operations, which was caused by the construction of the Port Works, had come up to their expectations, and they were able to show the substantial decrease in total operating expenses of £17,317. He would remind them, however, that this decrease was not fully apparent by a comparison of the figures in the respective reports. This was due to the fact that a different rate of exchange was used in their accounts in the two years. For the past year the rate had been altered from 15d. to 16d. per milreis. This rate of 16d. had now been fixed as the legal rate by the Brazilian Government. For the purpose of a true comparison, therefore, the 1911 figures must be converted at the rate of exchange of 16d., and this had been done, as closely as was now possible without reanalysing every item in last year's accounts. The number of passengers carried increased by 766,546, and the operating expenses fell from £132,200 to £124,304—a decrease of 6 per cent. The result in net gains over last year's figures was £8,147. As regarded the lighting branch of the business, the gross receipts decreased from £95,510 to £94,610, but the operating expenses fell from £52,468 to £44,047, or a decrease of 18 per cent. The net result on the lighting was, therefore, a gain over last year of £8,521. To sum up, the percentage of operation to gross receipts over the whole year was 54 per cent., against 59 per cent. for the previous year. It was satisfactory to know that the number of their lighting customers during the year increased by 14 per cent., and, as regarded the slight decrease in gross receipts, he might say that this was accounted for by the extended use of metallic-filament lamps, and also by some reduction in the public or street lighting. Turning to the capital expenditure, they spent on capital account £24,637. The principal items for which this expenditure was made were a new 600-kw. traction set, a new boiler already in service, and material for two further boilers not yet completely erected. They had also to provide for extensions in their lighting system, and a considerable increase in the number of consumers' meters. This expenditure was required for meeting the growth and progress of the undertaking. The sum of £4,654 had been written off capital expenditure and charged to the reserve for renewals account. This sum represented the value of an old unit of 240-kw. capacity replaced by the 600-kw. set, and an old boiler replaced by the new one. In this way they followed the usual practice of writing off new expenditure, which did not increase their actual earning capacity. They had to face the fact that the rubber position, upon which the prosperity of Para largely depended, was at present not very satisfactory, and that a period of depression was being experienced, and might continue. It was, indeed, most encouraging that during this depression their business had continued to do so well, and no signs of bad times were noticeable in their results. But they considered it wise to be amply provided against any trouble that might occur, and felt that their financial arrangements this year placed them in a very secure position. In the spring of 1912 their manager in Para, Mr. P. C. Barley, was taken seriously ill, and was compelled to return to England, and, they regretted to say, had been unable to resume his work in Para. Mr. C. H. Julius, of Messrs. J. G. White & Co., Ltd., their engineering managers, at once proceeded to Para, where he remained for several months. The directors fully appreciated his efforts and ability in the operation of the property and in reducing operating expenses. The retirement of Mr. Barley had led to several changes in the operating staff. Mr. Walter Binns, formerly of the Reading tramways, had been appointed general manager. He took up his duties in December last, and they looked forward to continued and increasing prosperity with him in charge. They had also been fortunate in obtaining Mr. J. P. Kemp, who was in charge of the Birmingham electric supply station, as the chief station engineer, and with these two additions to their existing well-tryed and loyal staff, they felt that their property was in the safest possible hands.

As to the future, he did not believe he could give a better indication than to tell them that for the first two months of the current financial year the gross receipts of the undertaking had increased by £3,575, and the surplus, after providing for all charges, including preference dividend, was increased by £2,451 over the corresponding period of 1912. The weekly gross tramway takings to date showed the continued maintenance of satisfactory increases. Every effort was being made by the board and by the engineers to still further reduce expenses and improve operating results. The new governor and new Mayor had just taken their seats, and strong efforts were being put forward by them and the Federal Government to foster the great resources of the Amazon country.

MU. E. C. CHESTON seconded the motion, and the report was adopted without discussion.

MR. W. J. FISHER proposed a vote of thanks to the board, and this was carried.

### City of London Electric Lighting Co., Ltd.

THE directors report that capital expenditure on additions, extensions and replacements during the year 1912 cost £46,509, and there has been written off in respect of buildings, plant and other works dismantled £191,150, leaving a net expenditure under capital account at £2,000,324, a net deduction of £145,642. £176,841 of the amount written off represents the cost of engines and generators erected in succession to the original pioneer plant. The bulk of this plant was retained as a measure of precaution until last year when the completion of the erection of turbine generators of the most modern type permitted its removal. It is the intention of the directors to continue their policy of replacing any further plant which from time to time may become obsolete or uneconomical in operation, as they consider that this policy is in the best interests of the shareholders both as regards the earning of profits in future years, and the maintenance of the plant in the highest state of efficiency in view of ultimate purchase by the L.C.C. upon the terms of the Electric Lighting Act, 1888.

The directors have credited the first debenture stock premium redemption account with £1,476 from revenue for interest, raising the amount at the credit of the redemption account to £62,961. They have also transferred £50,000 from net revenue account to reserve account. The balances at credit of the reserve funds total £240,164, including dividend equalisation account balance, £7,352. Amount to be carried forward to 1913, £24,333.

The total revenue for the year, including interest on investments and discounts (£2,710), was £300,619, from which must be deducted the following items:—Expenses of generation and distribution, £70,131; repairs and maintenance of buildings, machinery, plant, mains and other works, £10,960; rent, rates, taxes, management expenses and special charges, £55,847; leaving £163,681, plus £25,943 brought forward, making a total available revenue of £189,625. Of this sum the following amounts have been distributed or provided for:—Interest on loan from bankers, consumers' deposits, &c., £2,787; interest on first and second debenture stock for year ended December, 1912, £31,546; interest transferred to debenture stock premium redemption account, £1,476; leasehold redemption account, interest and appropriation, £269; contributions to employees' provident funds and under National Insurance Act, £1,804; stores, written down, £1,628; transfer to reserve account, £50,000; leaving available for dividends on preference and ordinary shares and for "carry forward" to 1913, £100,115. The directors now recommend the following dividends for the year ended December 31st, 1912, subject to deduction of income-tax:—Preference shares, 12s. per share (6 per cent. per annum); ordinary shares, 16s. per share (8 per cent. per annum), as against 8 per cent. for the previous year. These absorb £75,782, leaving £24,333 to be carried forward. The directors also propose to distribute a bonus of 2s. per ordinary share, less income-tax, out of the amount standing at the credit of the dividend equalisation account. This fund was set aside out of profits in past years in order to ensure the maintenance of a 7 per cent. dividend upon the ordinary shares, it being then impossible to foresee to what extent the company's revenue might be reduced by the introduction of the metallic-filament lamp. The directors, however, are glad to say that the loss so caused has been almost counterbalanced by the progressive consumption of electricity for other purposes than lighting, and, as the metallic-filament lamp has now been adopted by practically all lighting consumers, they consider it is no longer necessary to retain the full amount of this fund, but they propose to leave the balance of £7,352 for the present. The following comparative tables show the position of the company:—

	REVENUE.	Dec., 1910.	Dec., 1911.	Dec., 1912.	+ over 1911.
Gross revenue .. ..	£282,129	£291,584	£300,619	£9,035	
Net revenue .. ..	£166,766	£161,866	£163,681	£1,815	
Div. on ordinary shares ..	7 %	8 %	8 %	—	

Private supply for all purposes: average prices per unit obtained.

	1909.	1910.	1911.	1912.
	2.49d.	2.45d.	2.69d.	2.87.

The following show total number of customers and connections, after allowing for disconnections (private supply) on account of removals, substitutions of metallic-filament lamps, &c.:—

	1910.	1911.	1912.	+ over 1911.
Number of customers .. ..	18,876	14,246	14,729	483
kw. connected (including power and heating) ..	87,127	89,122	41,151	2,029

On February 19th, 1913, there were 42,311 kw. applied for, out of which 41,290 were connected, and the customers numbered 14,789. The following are the total units generated, sold, utilised on works, &c. (including public street lighting):—

	1911.	1912.
Generated .. .. .	30,527,716	32,220,808
Sold .. .. .	26,040,769	27,488,860
Metered and used by company	1,183,635	1,429,794
Expended in distribution, &c.	2,710,391	3,801,694
Maximum supply demanded, &c.	17,762	18,610

The total units sold during 1912 show an increase of 865,101 over 1911.

Power and heating supplies continue to show a steady increase, the total units sold for these purposes in 1912 being as follows:—Power, 9,280,870 units; heating, 1,670,275 units, = 10,951,145 units, or equal to 41·6 per cent. of the total units sold for private supply. It is hoped that during the present year active progress will be made with the reorganisation of the public street lighting in accordance with the tender already accepted by the Corporation. Wayleaves for attachments to buildings are being obtained by the Corporation, but these necessarily take some time to negotiate.

At the ordinary general meeting of the company, held on March 4th, 1903, a resolution was passed constituting the company a contributing company of the British Electrical Superannuation Fund, and authorising the directors to make annual contributions to that fund on behalf of members of the company's staff. Owing to an adverse actuarial report necessitating the reorganisation of that fund, the directors and those of the company's staff who were members of the fund decided to withdraw therefrom. After very careful inquiries and consideration the directors decided that it would be more advantageous to the company and its staff to form a Staff Provident Fund, taking as a nucleus the amount of £8,954, which was received by the company as the share of the assets belonging to these members of its staff who were members of the British Electrical Superannuation Fund.

The directors have also decided that contingent provision should be made by the company for making appropriate grants where circumstances call for such assistance, with due consideration to long service and good conduct on the part of the employees concerned. The shareholders will be asked to approve and confirm by resolution the action of the directors in making annual contributions for this purpose and to aid the staff in providing systematically for the eventualities of the future.

The directors' report contains the following references to the question of purchase of the undertaking:—

"Your directors desire to call attention to the fact that the company is approaching the date, August 18th, 1914, at which (or within six months of which) the Corporation may give notice of its desire to purchase the company's undertaking in respect of the City of London and, in view of the interest which has already been aroused upon this subject, the following extracts from the company's provisional orders relating thereto, are quoted for the information of the shareholders. It will be noticed that, so far as public lighting is concerned, the terms of purchase are to be those contained in Sec. 2 of the Electric Lighting Act, 1888, but as regards the remainder of the undertaking, by agreement, or as, in default of agreement, may be determined by arbitration."

#### EXTRACTS FROM PROVISIONAL ORDERS.

**EASTERN DISTRICT (LAINO WHARTON & DOWNS).** Royal Assent, August 18th, 1890.

Sec. 61.—The local authority may within six months after the expiration of 24 years from the commencement of this order, by notice in writing require the undertakers to sell, and thereupon the undertakers shall sell to them so much of the undertaking as relates to public purposes, and also, if the local authority so require, so much of the undertaking as relates to private purposes.

So far as relates to public purposes, the said purchase shall be on the terms specified in Sec. 2 of the Electric Lighting Act, 1888.

So far as relates to private purposes, the said purchase shall be upon such terms as may be agreed upon between the undertakers and the local authority, or as, in default of agreement, may be determined by arbitration.

**CENTRAL DISTRICT (BRUSH).** Royal Assent, August 18th, 1890.

Sec. 18n.—The local authority may within six months after the expiration of 24 years from the commencement of this order, by notice in writing require the undertakers to sell, and thereupon the undertakers shall sell to them so much of the undertaking as relates to public purposes, and also, if the local authority so require, so much of the undertaking as relates to private purposes.

So far as relates to public purposes the said purchase shall be on the terms specified in Sec. 2 of the Electric Lighting Act, 1888.

So far as relates to private purposes the said purchase shall be upon such terms as may be agreed upon between the undertakers and the local authority, or as, in default of agreement, may be determined by arbitration.

**WESTERN DISTRICT (BRUSH).** Royal Assent, August 5th, 1891.

Sec. 2.—The City of London Electric Lighting (Brush) Order, 1890, hereinafter called the principal order, and this order shall be read and construed together as one order, and may be cited as the City of London Electric Lighting (Brush) Order, 1890 and 1891.

Sec. 10.—The period of 42 years mentioned in Sec. 2 of the Electric Lighting Act, 1888, shall for the purposes of the principal order and this order be reckoned from the commencement of the principal order.

[\* Commencement = Date of Royal Assent.]

The annual meeting is called for March 12th, at Salisbury House, E.C.

### Charing Cross, West End and City Electricity Supply Co.

MR. W. F. FLADGATE (chairman) presided on Tuesday at the office, St. Martin's Lane, W.C., over the annual general meeting of the above company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 357), the CHAIRMAN said he was glad they were not this year in the unhappy position they were last year, viz. in the middle of the coal strike, although labour troubles did not seem to have ended, and they might have something to meet in the course of the current year. At the last annual meeting the coal strike was absolutely at its height, and the board were filled with very great anxiety as to what might be the effect upon the company's affairs. He was happy to say that the strike was dealt with, and they emerged from it without any very great loss. Of course, expenses were increased consequent upon it, but the effect of the care and economy with which their engineer ran their stations had been that he was able to put before them a statement of accounts which he considered exceedingly satis-

factory. No alterations in the share or debenture stock had been made during the year. They only spent £30,000 on capital account, and part of this was in the purchase of freeholds, and part in the erection of an oil fuel tank at the Bow station in order to provide against emergencies in case of further coal strike or future difficulties in maintaining their fuel. There was no need to trouble them with the details of the revenue account because the corresponding figures of last year were set out in the accounts, and further the figures showed little variation. The only real difference was that in the West End stations they had generated rather more electricity, and the results as a whole were satisfactory. From the West End undertaking in 1911 for an expenditure of £69,000, they brought in on account of sales £135,862. For the year 1912, with an expenditure of £66,000, they brought in sales to the extent of £111,989, or between £6,000 and £7,000 more, and this showed the result of the economies. To get the gross figures they had to bring in the meter rentals and other small receipts, which brought their total receipts for 1912 up to £146,675, as against £140,900 for 1911. These figures gave them the sum of £79,889 to deal with, or with the £15,949 brought forward, a sum of £97,833. Out of this they had paid the debenture interest, amounting to £17,829, and provided £15,000 for depreciation, which was somewhat in excess of what they had been accustomed to. They had also placed £9,054 to the general income reserve account. They had opened this account because they did not think it right to carry forward a very large figure, and because it would be well to set up an intermediate account on which they could draw for different purposes, and they proposed to add to that from year to year. This left £56,000 for division, out of which they had paid the preference dividend, amounting to £18,000, and recommended a dividend of 5 per cent. on the ordinary shares, which would absorb £20,000, and leave £18,000 to be carried forward. Some might think with such a satisfactory state of affairs they might have been tempted to declare a higher dividend, but after careful consideration, the board felt it would be better to increase the reserve funds. It would be remembered that last year they had to make a very large inroad into those funds, and had to write off practically the whole of the value of the Lambeth station, and the effect was to decrease their depreciation funds until they did not stand at a very high figure. Consequently they thought it wiser to have respect to the depreciation fund first and consider the dividend afterwards. The business had increased, but not by a very large extent. In the West End undertaking the increase had only been 5·7 per cent., or 686,000 lamps in 1912, against 649,000 lamps in 1911. They could not expect in these West End districts to increase with the same rapid strides as at first, but in the current year they did hope for a somewhat larger increase consequent upon the fact that the property in and around Kingsway, which had been lying unoccupied for so many years, was now apparently beginning to be dealt with. The demand for energy for heating and power was increasing in the West End, and no less than 34 per cent. of their whole load was used for these purposes, which necessarily brought down the average price for the units sold. Last year they sold 6·1 per cent. more current than in the previous year. He was glad to say that in the present year the loss on transmission was smaller than for some time past. In 1910 it was 28 per cent., in 1911 26 per cent., and in 1912 23·9 per cent., which was a benefit of 2 per cent. With regard to the City undertaking, they had not made a high rate of progress, but it was satisfactory. They had spent £21,000 on capital account, principally in the purchase of turbines for the Bow station. For 1911 the total expenditure was £84,356 and in 1912 £84,958, an increase of only £600; but the expenditure in 1912 produced £147,198, as against £144,299 in 1911. Therefore, with a slight increase of £600 in the expenditure they had earned some £3,000 more. Bringing in meter rentals, &c., the total was £148,513, against £145,671, and bringing in the carry forward from the previous year, they had £99,712 to deal with. They had paid the debenture and loan interest, amounting to £30,891, which left £68,820. The preference dividend took £18,000, and they had opened a general reserve fund on the City undertaking, to which they had put £32,820 17s. 10d., leaving to carry forward to revenue account £18,000, which was the amount of the preference dividend for the coming year. This result was exceedingly satisfactory in view of the fact that they were working against the coal strike for a considerable part of the year. The coal cost per unit in 1911 was '270d., and in 1912 it increased to '273d., being an increase of 1 per cent. on the whole cost to them of the coal they bought. But the price of coal during that period had increased by 13 per cent. Fortunately, owing to the economies practised by their engineer, the coal burnt per kilowatt, which in 1911 amounted to 4·7 lb., in 1912 only amounted to 4·2 lb., or a decrease of 11 per cent. As usual, the auditors pointed out that there was no depreciation fund for the City, but, as he had before pointed out, the form of their provisional order was such that they did not consider it right or advisable to absolutely set up such a fund, but they had set up a reserve fund to which he had referred, and they proposed to add to that fund in the future. The demand in the City had increased by 4·2 per cent., but the load in the City was now over 50 per cent. for heating and power, and under 50 per cent. for lighting which brought down the price. The losses on distribution were not so satisfactory in the City as last year, but the engineer pointed out that the reason was that last year, when their losses were only 26·2, there was an abnormal figure as regarded losses through their meters. That figure last year the engineer admitted he did not understand. It was 2 per cent. less than he expected it to be. This year the losses on distribution were 28·7 per cent. instead of 26·2 per cent. He looked on the whole position of the company as being exceedingly satisfactory. The whole of their plant was now modern, and was, he believed, to-day worth every shilling they had

expended on it. So far as they could see, there would not be any large capital expenditure in the future, and they hoped to be able to meet such expenditure out of the reserves they were creating each year. Happily, they had not now to spend large sums as in years past in fighting rivals. The London County Council had appointed a Committee, which sat last year, with a view to considering what course they would take with regard to the electric lighting undertakings, and he had reason to believe that the Committee would be reconstituted. Whether the Committee would take any steps which would imperil their position he did not know, but, speaking for himself, he looked forward without the slightest fear to the future so far as that company was concerned. They were actually supplying 20,000 H.P. for machinery, which showed that whatever might be said as to the want of cheap electricity, it was not a charge which could be sustained against them. In conclusion, the chairman invited the shareholders to assist the company by pushing the merits of electrical appliances, and said he could not sit down without expressing the appreciation of the board to their officers and staff for the zealous help they had given in the past year.

Mr. J. M. GATTI seconded the motion, and the report was adopted without discussion.

The retiring directors were re-elected, and a hearty vote of thanks was accorded to the board and staff.

## STOCKS AND SHARES.

Tuesday Evening.

The expectation that Turkey would make peace through the mediation of the Great Powers was a useful factor in strengthening markets throughout the Stock Exchange. The chief reason for the relief felt at this prospect lies less in the anticipation of hostilities ceasing than in that of money becoming easier immediately the war has spent itself. The money which has been hoarded up during the Balkans affair will, it is supposed, be released, and on the hope of this there was a general recovery throughout the House.

The Home Railway market, however, provided the damper for the spirits of the bulls. This week's meetings of railway-men were not encouraging to the confidence of those who had looked forward to a strike being averted, and up to the time of writing on Tuesday evening, the possibility of a struggle is certainly present. This has had a depressing effect upon prices, which just before had started to recover, on the theory that the March figures would look bumper ones in comparison with those of the corresponding period last year, during which the coal strike was in full blast. It looks now as though strike figures might compare with strike figures, although, so far, it must be admitted that hopes of a possible solution of the difficulties are far from dead.

Metropolitans have been up to 53½, but dropped to 51½, leaving off with a net fall of 4 on the week. Districts, in which there has been a sharp rise, reacted to 38½, at which they still show an improvement, while the Underground Electric Railways group is firm. The speech of Sir Edgar Speyer at the meeting of the Underground Company last week infused fresh courage into the minds of holders, who had been rather disappointed with the character of the company's report, for Sir Edgar hinted at the prospect of a dividend being nearer than might have been supposed from the report itself. The 6 per cent. Income bonds at 94, ex £3 coupon, show a rise of 2—in their case the coupon is paid without deduction of income-tax. The £10 shares rose ½, but lost it again, and the "A" are somewhat weaker than might appear from the official quotation.

Central London Ordinary and Deferred have come into some prominence on the consideration that the stocks are cheap at the present yields. The dividend is guaranteed at 4 per cent. in the case of the Central London trio, and, accordingly, is so worked out in our list overleaf. City and South London Preferences have again fallen sharply, the 1903 issue being down to 94½, at which the yield is £5 2s. per cent. on the money, this being about the highest return obtainable from sound stock in the railway preference division. London United Trams have not recovered from their last week's fall, and the British Electric Traction sextet remains dull.

The list of English Electricity Supply shares is once more a colourless one. Dividends have been deducted from Westminster Ordinary, St. James's Ordinary and Preference, and South Metropolitan Preference, the markings being reflected in the prices. City Lights fell ½ on the issue of the report, good though it is. The County of London report makes a very favourable showing, while that from the Chelsea Company is very like its predecessor of a year ago, the net result being almost the same in each case. The reports which have been published so far make a satisfactory appearance on the whole, but they are not sufficiently exciting to prove of themselves strong enough magnets to arrest the attention of the ordinary investor, who retains a lively recollection of the fact that within some vague number of years the companies will be taken over. He is not aware that it is to 1931 that most of the concessions run, but the mere fact of their having a term at all is his ground for letting the market alone.

The recovery in Mexican issues has made further progress this week. The main change is a rise of 4 points in Mexico Trams Common, but Mexican Light and Power Common gained 3, and the First Gold bonds advanced 2. Monterrey provided the exception, with a fall of a point to 83½. The news from the country is read as showing that there is a strong man in power, who, if he can

avoid assassination and similar little excursions inseparable from the life of a president in Mexico, may be able to restore order with a firm hand.

Other stocks and shares in this department are steady. Montreals shed 3 points, but Shawinigan rose this amount, the bonds putting on ½. Brazilian Traction Ordinary, at 101, are 3 points higher, and one or two of the British Columbia emissions have small rises to their credit. La Platas are a little easier, and Victoria Falls Preference, at 4½, have gone back another ½ per share. The Anglo-Argentine group is steady, and City of Buenos Ayres Trams recovered part of their dividend deduction.

The Telegraph market shows a series of small rises, which has included the pre-ordinary stocks as well as the junior securities. The improvements are noticeable in the Anglo-American group and in the Eastern section. West India and Panamas are a little better on relaxation of the monetary tension, the price regaining 2s. 6d. of its fall. Globe Shares, both Ordinary and Preference, are ½ up; but Mackay Common fell back to 84½. It may be noticed that Reuter's new shares have been added to our list of Telegraph and Telephone prices. The market now is largely in these new shares, which stand a trifle under their seniors, the discrepancy being accounted for by the fact that up to June 30th they carry a little less dividend than the others.

Business in National Telephone Deferred stock has come to something like a stop, now that the Company's books are finally closed. Nobody can tell how long it will be before the final settlement of the transfer will take place. Some fix it as six months, but the estimates are little better than guesswork. Marconi's fell back to 4½, and the subsidiary companies' shares are mostly a trifle lower, the market, for some reason or other, being a bad one at present. It is said that a new issue may be made by the Cuban Telephone Company.

In the Manufacturing division, General Electric Preference are nominally a little better, while Edison & Swan partly-paid shares have moved up to 5s. middle, following their last week's rise of ½, with another of equal amount. British Westinghouse Preference are somewhat easier. The Rubber share market is weak, with the price of the raw material gradually dwindling. Its decline to 3s. 10½d. per lb. has given rise to uneasy sentiments in the minds of some of the rubber share holders, although there is no pressure to sell good shares.

\* Compared with the corresponding period of 1912.

† Three weeks only.

‡ Includes horse, steam and other receipts.

**The Bradford Strike.**—A Bradford correspondent writes:—"The strike of Bradford electricians still continues, although this is the end of the twentieth week of the strike, and there is no immediate prospect of a settlement. Most of the contractors in the city have got staffs of non-union men working, and a lot of the strikers have been driven to take up other jobs, so that there is little likelihood of any further negotiations between the masters and men. There is an impression that the men were very ill advised by their leaders at the commencement of the trouble, and the Trade Union organiser left the district some time ago."

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING JANUARY, 1913.

THE returns of electrical business during January, which we publish herewith, show a considerable advance over the figures for the last month of 1912.

The exports reached a total value of £576,526, as compared with £510,700 in December last, and included very large amounts due to machinery and cables, the former reaching over £212,000 in value, and the latter nearly £114,000.

The imports totalled £252,167, as compared with £231,554 in the preceding month, while the re-exports amounted to £28,494, as compared with £24,867 in December.

The exports from this country showed a general improvement over those of the preceding month, and although they included £81,713 worth of telegraphic material—an amount rather above the average—the remaining business, totalling £494,813, was only once exceeded in value during 1912. Brazil, India, New South Wales and Argentina were our best customers during the month, the former owing its unusually prominent position to a telegraphic purchase valued at £15,000. Machinery and cable imports were both at a considerably higher level than in December—the imports total of £252,167 comparing with an average of about £217,000 per month during 1912.

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

## A PLEA FOR THE DOMESTIC LOAD.

By "WHISTLEFIELD."

ELECTRICITY undertakings have lately wakened up to the need of pushing for business and trusting less to Providence to send along new consumers. The convenience and utility of the electric motor, even in inexperienced hands, have led to a great increase in the output of electricity for power purposes of undertakings situated in industrial areas, and the result of this day load has been an improvement in the load factor, with a consequent reduction in the cost of generation, to the mutual advantage of the undertaking and the consumer. Recently, however, engineers have begun to realise that a day load does not necessarily mean a motor load only, because electrically heated and operated appliances are being put on the market which can be relied on to do useful work without continually breaking down, and which can also be purchased at a reasonable cost.

The operation of these appliances will be found to increase the much-desired day load, since most housework is done in the forenoon, and, in any case, only a small proportion of houses are wired for plugs so that connection can be obtained only by removing a lamp and using an adaptor. Even in the case of radiators, kettles, toasters, &c., which are used during the hours of heavy lighting load, the fact that their use is intermittent and for short periods only, prevents the peak load from being appreciably affected, for the chances of a large number of, say, kettles or hot plates being "on" at identically the same time are very remote.

Engineers who are striving for a better load factor do not, however, appear to realise the importance of encouraging the use of the smaller domestic appliances, quite overlooking the fact that although they may be used for a short period only each day they nevertheless take a fairly high current compared with lamps, and so can be relied on to appreciably increase the units used from any service without increasing the capital expenditure in distribution.

To put a new service in a small shop, whose average load will probably not exceed six 55-watt metal-filament lamps, will cost approximately £5, including meter and other charges. Such an installation, as the examination of ledgers clearly proves, uses between 250 units and 500 units per annum, depending on the nature of the business, while the average for small dwelling houses comes to about 250 units per annum. A large proportion of the units used on such installations are taken at times of heavy lighting load, so that each installation connected means not only an increase in the capital expenditure on mains but also on plant.

The use of small domestic appliances, however, like irons, kettles, &c., requires no extra expenditure to install them, as far as the supply authority is concerned, and increases the units used from existing services by as much as 10 per cent. to 30 per cent. Even undertakings which have a good power load could profitably develop a domestic load, for power loads usually overlap the lighting load in winter, and plant must be provided for this overlapping, so that the domestic load helps to utilise the surplus plant not required during the day for power purposes.

Some undertakings, realising the advantage of a domestic load, have commenced to hire out electric cookers, but, so far, it is uphill work; people are not quite convinced yet that cookers are reliable, and they are not prepared to put in a special circuit for the cooker, or to run the risk of being left without food through a blown fuse or a defect in the apparatus, though they may be quite convinced of the advantages of electric cooking. This method also involves heavy capital expenditure to the undertaking for comparatively small returns.

The following method tried by some other undertakings seems to promise more success, since the capital expenditure involved is small and the returns are fairly large. A number of 6-lb. flat irons fitted with 3 yards of flexible, and terminating in an adaptor, are loaned to consumers on the distinct understanding that no liability of any kind is incurred by their use. Since there is no preliminary expense for alteration to wiring, or liability for damage to apparatus, the consumer will have every inducement to give the iron a trial, and if there are

any babies or grown-up daughters in the house, that iron will be in use on an average at least half an hour per day. The convenience of merely turning on the switch to heat the iron makes people put it on for doing the smallest article, and as it takes about five minutes to heat up, and may be in actual use only five or ten minutes more, the number of times the iron is heated up accounts for quite an appreciable number of units.

At the end of five or six weeks, when the iron is taken away to be loaned elsewhere, the contrast between the old method and the new will be so great that the household will find that it cannot get on without an electric iron. If the supply authority has powers to supply apparatus on hire, or hire-purchase, a good business can now be done, not only in irons, but also in other current-consuming devices due to the favourable impression made by the iron. If the undertaking cannot hire apparatus, arrangements should be made with a good local firm to stock a quantity of irons identical with those sent out on loan. A good iron, complete with flexible and adapter, can be bought wholesale for about 7s. 6d., so that for the same expenditure as on a new service 15 irons can be put out on loan. Assuming that each iron is switched on only for three hours a week, a very moderate estimate, each iron will account for 63 units in the year, and the whole 15 will increase the annual output by nearly 1,000 units, units which are used during the day, and, therefore, at times of light load, and most of which will have been paid for at lighting rates while the irons were on loan.

A good electrical cooking outfit will cost complete about £15; this sum spent on smaller apparatus, such as irons, would be able to purchase 4½, which, on the above basis, would cause a consumption of about 3,000 units per annum, a return far greater than that which a single cooker would cause, besides which the irons will have done six weeks of canassing work in 360 households, and probably caused another 200 irons, involving an annual consumption of 12,000 units, to be connected to the mains.

When lending out irons, small shops should not be neglected, for in many of these the proprietress or her daughters will bring down their work and do it in the back shop during slack times.

After the possibilities of an ironing load have been exhausted, the same procedure can be adopted with electric kettles. Even if a kettle is used only twice a day for ten minutes each time, at breakfast and tea, for keeping a supply of hot water available, it will consume two units a week or 100 units per annum, so that a household with a 2-pint kettle and iron will use at least 150 units more per annum than before; this is not a great quantity, but it very often represents a 50 per cent. increase in the units supplied through the service without any appreciable increase in the maximum demand at times of peak load from that service.

These are only two of the many small, and, therefore, comparatively cheap domestic appliances which can be judiciously pushed amongst electricity consumers, and the figures quoted give some indication of the percentage by which the output from any undertaking could be increased. Great care, however, must be exercised in choosing the apparatus which is circulated, as bad design, resulting in continuous breakdown, will do a great deal of harm, which will take a long time to neutralise. To make the use of electrically operated domestic appliances popular, the prices charged for the energy used must be made reasonable; there are several methods of doing this. One is to make a special charge for all units used for domestic purposes other than for lighting or power; this is almost out of the question if it means a separate meter, and, therefore, a separate circuit throughout the house; the additional expense in fitting up the installation would probably kill the movement at once.

The only method of charge which seems to meet the case is the "telephone" or "annual charge" system, by which a fixed sum is paid each quarter, and all units used on the premises are charged at a low rate, ranging from 1d. to ½d. per unit.

The methods adopted by different undertakings for arriving at this fixed charge vary a great deal; some make the charge a percentage of the rateable value, others

base the charge on the maximum demand, while others, again, base their charge on the floor space. Since the ideal arrangement would be to charge for all units used for lighting at the lighting rate, and all units used for domestic purposes at the special low rate, without, however, the drawbacks and expense of two separate circuits, the annual charge must be fixed at such a figure that, if electricity were used for lighting only, the bill would come to the same amount on either the flat rate or the annual charge rate; then every extra unit used, presumably for domestic purposes, would actually be obtained at the low rate.

For example, if, in a certain case, the lighting bill per annum averaged £3 with energy at 3d. per unit, it follows that the units used per annum must have averaged 240. If the annual charge in this case were fixed at £2, and all units used were charged at 1d. per unit, then the annual consumption of 240 units on this system would work out at £3, the same as on the flat rate; but if, in addition to using the 240 units for lighting, 150 units had been used for heating purposes also, the bill would work out as follows:—

Annual charge ... ..	£2 0 0
390 units at 1d. per unit ... ..	1 12 6
Total ... ..	£3 12 6

which is exactly the figure which would have been arrived at if the units had been registered on separate circuits, that is, 240 units at 3d. = £3, and 150 units at 1d. = 12s. 6d., total £3 12s. 6d. Of course it is not advisable to base the annual charge for any installation on the units actually used on that installation, because there may have been abnormal conditions prevailing; also, it would lead to such anomalies as two identical houses being charged annual sums of different values. The correct and only safe way is to collect the data relating to houses of the same size and strike an average; all the figures obtained can be compared, and, where necessary, graded so as to obtain an equitable scale.

Such a scale can be easily explained to consumers, and as it is perfectly straightforward without any electrical terms by which he may be trapped later, there is no difficulty in inducing a consumer to go on to this system of charging when domestic appliances are installed.

Undertakings with a good motor load can afford to neglect this kind of day load, but undertakings situated in residential districts will find, if they go into the matter carefully, that in the development of the domestic load they have the means whereby they can appreciably increase their load factor, and thus considerably reduce the cost of production.

## THE USE OF ELECTRICITY AND ELECTRICAL ACCIDENTS IN MINES.

(Concluded from page 333.)

IN the Manchester and Ireland district there was only one non-fatal accident, which occurred on the surface at Hulton Colliery to a turbine generator attendant. In attempting to replace blown-out fuses, not having switched off pressure, he was slightly burned on the face and eyes. He had passed the switch on his way to the fuses. The arrangement of the switch did not meet with the approval of Mr. Nelson, the fuses being on the "live" side of the switch; the position should be reversed.

In the Liverpool and North Wales district the inspector says: "I am pleased to be able to report that another year has passed without any fatal accident due to electricity. There were, however, four non-fatal accidents, one to an electrician while trying to locate a fault in a fan motor with the pressure on, with the result that the armature shorted and his eyes were thereby slightly injured. In another case a shaft sinker, preparatory to testing, made contact with bare wires at the end of a shot-firing cable. The third accident was due to the bursting of a trailing cable connected to a coal-cutting machine. In the remaining case a motor attendant at St. Helen's Colliery received a shock

while lowering a set of tubs down an incline, at the time when the motor of the haulage engine was at rest."

One can scarcely credit that anyone termed an "electrician" would attempt to locate a fault in a motor with "current" on, and in regard to the shaft sinker we must assume that the shots were being fired from a power or lighting cable, a foolish practice, as it would scarcely be possible for him to receive an injury from a shot-firing battery, which ought to be used in every case for shot-firing purposes. But whatever is meant by a cable "bursting"—we presume it fused owing to its not being of sufficient capacity to carry the current. Was this the result of economy or of sheer ignorance?

"At the St. Helen's Colliery, current in the pit is got from a power house on the surface. The system of distribution is three-phase, 2,200 volts pressure, with insulated neutral. Current is taken down the shaft by a double-armoured three-core cable to a distributing station near the pit bottom. From that point it is taken by single-armoured cable along the main roads to sub-stations, and after being transformed down to 440 is conducted by unarmoured cables to the various motors in the pit. Current at 440 volts was also taken through a small double-pole switch to eight lights arranged four in series. This lighting switch fused and caused a short between two phases, the overload coils in the power station tripped, and so cut off the entire current; but, strangely, the overload cut-outs in the sub-station did not act." There must have been a heavy leak to earth through the cover when the lighting-switch fused, and the shock accident to the attendant was apparently caused through the earth return to the surface being unable to take the discharge sufficiently rapidly. Mr. Nelson, H.M. Electrical Inspector of Mines, subsequently inspected the plant, and his opinion was that one of the earth connections might have been disconnected at the time of the accident, but made good before the responsible electrician made his investigations.

The italics are ours, but the last statement is amazing, if true. Whoever would break and connect up again the earth connections if not the responsible electrician?

There were two non-fatal underground accidents in the South-Wales district, and three non-fatal accidents on the surface, but of the latter no particulars whatever are given. As regards the two former, in one a "haulier," while harnessing a horse on a double parting, received an electric shock by his head coming into contact with an unarmoured cable carrying 500 volts D.C., the insulation of which was defective. The place was wet, and the water had seriously deteriorated the insulation of the cable. On receiving the shock the haulier fell, and his head struck a tram, causing concussion of the brain. He was unconscious for 45 minutes.

In the other case, a motorman at a hauling engine received an electric shock causing burns to his hand and arm by treading on a wire, the insulation of which was abraded through having been trodden on, while his hand was on a resistance grid. The wire was one of a number between the controller and the resistance grid, which were not properly protected. Pressure 500 volts, three-phase.

One fatal and one non-fatal accident were reported to the inspector by the Midland and Southern district. In the fatal accident, deceased was in charge of a haulage motor. He also had under his control a switch from which cables extended through a ropeway to a 7½-H.P. pump motor, 200 yd. distant. These cables had been in use over 12 years. Originally, they were armoured throughout, but owing to leakages from time to time the armour had been removed in numerous places in varying lengths, from 2 ft. to 10 or 12 yd. apart. The armouring was not earthed, except at two junction boxes which, together with the armouring where they entered the boxes, were earthed in connection with a line of waterpipes. The voltage was 425 D.C. Three days prior to the accident the electrician had tested all sections of the armouring for leakage of current, but said he had found none. The deceased was found lying dead in the ropeway in contact with a strand of wire rope, which was hanging over the electric cables, by a man who attempted to remove him; but he himself received a shock, and therefore went to the motor house and opened the switch, thus shutting off the current. The haulage

rope had been respiced on the previous day, and it appeared that someone had carelessly thrown the strand of wire upon the cables in the ropeway to get rid of it. Deceased had authority to travel along the ropeway after shutting off the electric current from the pump motor, but this he neglected to do. Subsequent examination revealed a leakage of current from the cables at the point where deceased met his death. The faulty cables have now been replaced by new ones.

The Inspector goes on to say—and we quite agree with him—that "the accident was very clearly due to inefficient earthing of cable in which the armouring had been cut in a number of places without being bridged over or otherwise rendered electrically continuous." The manager was of opinion that "it is not reasonably practicable to keep the armouring of cables earthed in a haulage road subject to heavy squeeze necessitating heavy repairs over a long period." The answer to this appears to be that if a road is of such a nature that electrical cables cannot be maintained in such a condition as to ensure as far as possible the safety of the workmen, the cables ought not to be there.

Mr. Nelson, H.M. Electrical Inspector of Mines, subsequently visited the colliery, and was of opinion that the supervision and maintenance of the plant had been very inefficient. In his report upon it he stated: "... I think it is impossible to come to any other conclusion than that the person in charge of the electrical plant at the mine has either been grossly ignorant of the risk he was allowing the workmen working on the cable level to run, or gravely negligent as regards his responsibility. If the risk in question was also unknown to the management, then it ought not to have been, but, in any event, the conditions which admittedly existed before the accident constitute, in my view, a serious reflection upon those responsible."

The non-fatal accident occurred to a pump-motor attendant at Whitefield Colliery, North Staffordshire, on September 19th. It appeared that the pump had lost its water, and the attendant switched off the current and then switched it on again without placing the controller in the "off" position. The resistance being cut out, there was a flash from the contact, which slightly burned the back of his hand.

---

## SUPPLY TO PREMISES SITUATE OUTSIDE THE "AREA OF SUPPLY."

---

WHEN the 1909 Act became law, many supply authorities considered that they would benefit themselves and the public by giving a supply to the many premises situate just outside their boundaries. Clause 6 of the 1909 Act reads as follows:—

1. Where it is proved to the satisfaction of the Board of Trade that the occupier of any premises is desirous of obtaining a supply of electricity from any undertakers within whose area of supply those premises are not situate, the Board of Trade may, if the local authority within whose district the premises are situate, and the undertakers (if any) authorised to supply electricity to such premises, consent, by order permit the first-mentioned undertakers to give a supply to those premises on such terms and subject to such conditions as the Board think fit; provided that, if in the opinion of the Board of Trade any consent required by this sub-section is unreasonably withheld, the Board of Trade may proceed as if such consent had been given.

2. An order given by the Board of Trade under this section may, for the purpose of enabling a supply to be given thereunder, confer any such powers and impose any such duties on the undertakers as would have been conferred or imposed by the Electric Lighting Acts and as might have been conferred or imposed by provisional order if the premises and the route along which lines are to be laid for the purpose of giving the supply were within the area of the supply of the undertakers, anything in the special Act or order relating to the undertaking to the contrary notwithstanding.

3. If the undertakers on whom powers are conferred by an order under this section are not a local authority, the works and lines erected and laid under the powers so conferred shall, so long as the order remains in force, be deemed, for the purposes of the provisions as to purchase applicable to the undertaking, to form part of the undertaking within the district of the local authority which comprises the area of supply of the undertakers, or, if that area is comprised within the districts of more than one local authority,

within such of those districts as the Board of Trade may determine.

4. Nothing in this section shall enable the Board of Trade, without the consent of the undertakers within whose area of supply the premises are situate, to give such permission as aforesaid to any undertakers where the last-mentioned undertakers are by any Act of Parliament specifically prohibited from supplying electricity within the area of the first-mentioned undertakers.

For the information of those who have not yet taken advantage of the clause, I will quote the procedure of the Board of Trade in answer to an application lately made.

Having obtained the consent of the local authority, and also the authorised undertakers (a power company), sanction was applied for from the Board of Trade. The Board wrote enclosing a memorandum of procedure, Part "E" of same, reading as follows:—

"E.—Application by undertakers for order of Board of Trade under Sec. 6 of the Electric Lighting Act, 1909, permitting them to give a supply of electricity to premises situate outside their area of supply:—

1. The application must be made in respect of specific premises, and not in respect of an addition to the area of supply of the applicants.

2. The application must be accompanied by:—

(a) A map or plan on a scale of not less than 6 in. to the mile, having marked thereon, in some distinctive colour, the route of the electric lines proposed to be placed for the purpose of giving the supply, the names of any streets in or along which the said electric lines are to be placed, and the situation of the premises proposed to be supplied.

(b) A list of the streets and any railways or tramways proposed to be broken up for the purpose of giving the supply, showing separately those streets (if any) which are not repairable by the local authority, and an affidavit or stamped statutory declaration to the effect that the streets repairable by the local authority are so repairable.

(c) Proof of the consent of the local authority in whose district the premises are situate, and of the undertakers (if any) authorised to supply electricity to the premises forming the subject of the application, or evidence that those consents are unreasonably withheld.

(d) Evidence that the occupier of the premises to which the application relates is desirous of obtaining a supply of electricity from the applicants.

(e) A statement of the terms and conditions on which the supply is proposed to be given; and

(f) An affidavit or stamped statutory declaration to the effect that the applicants are not by any Act of Parliament specifically prohibited from supplying electricity within the area in which the premises are situate.

3. The consent of the local authority, if given, should be given in pursuance of a resolution passed at a meeting of a local authority held after previous notice of the same and of the purpose thereof has been given in the manner in which notices of meetings of the local authority are usually given, and the fact that such a resolution was duly passed should be proved by a certificate signed by the clerk of the local authority reciting a copy of the notice and of the resolution, and declaring that the notice was duly given and the resolution duly passed.

4. The consent of any undertakers being a company authorised to supply electricity to the premises, if given, should be proved by a certificate signed by the manager or secretary to the company.

5. In cases where for the purpose of giving the supply the applicants require to break up any street not repairable by the local authority (including any street repairable by a County Council), or any railway or tramway they must (unless the authority, company, or person by whom that street, railway, or tramway is repairable consent to the breaking up thereof) apply to the Board of Trade under Sec. 13 of the Electric Lighting Act, 1882, for the written consent of the board authorising and empowering the applicants to break up that street, railway or tramway in the manner provided in this memorandum (see page 1).

6. Any costs or charges which may be incurred by the Board of Trade in connection with the application must be paid by the applicants.

The Board also stated that, in the event of their deciding to make an order, it would be necessary to refer the draft order to counsel, requiring a fee of three guineas. Now this, added to the cost of the affidavit mentioned in Clause 2, Sub-Sec. (f), of the Memorandum of Procedure, and the cost of cable, would in many instances preclude the supply from being profitable.

Again, as indicated in Clause 1, one may assume that the procedure must be gone through and the costs borne for each application to the Board.

One can imagine the comments of another Government Dept., namely, the Local Government Board, when a local authority applied for a loan and supplied the L.G.B. with the cost per service in detail, as they now require. Is it all necessary?

Clause 6 of the 1909 Act sets out clearly the procedure, and ties up the undertakers sufficiently. Why, then, should the Board of Trade put undertakers to any expense if the evidence asked for is supplied?

## PROCEEDINGS OF INSTITUTIONS.

### The "Electric Arc."

At a meeting of the INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH LOCAL SECTION), in Edinburgh, on February 11th, Mr. W. B. Hird, of Glasgow, contributed a paper on the *Electric Arc*, an electrically-propelled ship equipped by Messrs. Mavor & Coulson, Ltd., Glasgow. Mr. Hird, who confined himself mainly to the features of electrical interest, said that since the question of electrical transmission had been considered from the point of view of covering the whole field, including power for fairly large ships, it became evident that continuous current was not suitable. The only objection to polyphase plant was that it did not lend itself readily to any change of speed. The best-known way to change the speed was to provide the motor with windings which would enable it to be run either as a six or eight-pole machine. Another plan was to have two motors and run them in cascade. These methods had both a certain amount of complication. Mr. Mavor employed the "spinner motor," in which the outside part of the induction motor was mounted so as to be capable of rotating. This was controlled by a second induction motor built on the outside, and provided with a different number of poles, so that while the first motor would run at 500 R.P.M. they could drive the inside one at 250 R.P.M. in the same or in the opposite direction, giving three different speeds. In ship installations the current could be supplied at two different periodicities, and motors could be provided with two windings, one for 20, and the other for 33½ periods per second, each still giving the same speed. It was considered highly desirable that the rotor should be, if possible, of the squirrel-cage type, and have no windings. The simplicity of this rotor commended itself in that it had no connections outside, no contacts and no windings to give trouble or go wrong. Another point was that the arrangement should always be such as to involve no running in parallel of two or more generators, because synchronising was considered to be too delicate an operation on board ship, where the propellers might suddenly have to be varied in speed in cases of emergency. Taking all these points into consideration, it was finally decided that an experiment on a small scale should be carried out with a system in which three-phase current should be generated at two different periodicities of supply, the motor being provided with two windings on different numbers of poles suitable for receiving the two periodicities, and the result was the *Electric Arc* boat built at Dumbarton by Messrs. MacLellan & Whitson. The boat was 50 ft. long with a 12-ft. beam, and the displacement was about 19 tons. The propeller had a diameter of 3 ft. 6 in. In a small installation of this sort only one engine was provided, although two would be required for a larger installation. Both periodicities were got from one alternator. In the case of a larger installation the different periodicities would be supplied by separate machines. The vessel was put on the Clyde early in 1911, and had given quite good results on the lines expected. It had enabled them to show that the combination of generating motor and switchgear was workable, and would allow a boat to be easily and effectively handled. It was evident, however, that even with the largest type of boats a combined efficiency of 95 or 96 per cent. could scarcely be hoped for, and, therefore, it was necessary to show that by increasing their turbine speed and reducing the propeller speed they gained in propeller efficiency more than the 8 or 9 per cent. which they must lose in electrical gear in order to work profitably.

### DISCUSSION.

PROF. BAILEY (Edinburgh) said the driving of ships seemed to lend itself very well to special speed contrivances, because one did not want to vary the speed of a ship as one varied the speed of a motor-car. But how would they go dead slow? Another question which he did not understand was with relation to reversing. In reversing, the motor was not so satisfactory as the steam engine, as that could run at a low speed with quite as large a torque. They would require a very much improved squirrel-cage motor, but in other respects, when they were going full speed ahead or at half speed, it seemed an ideal system.

MR. STEVENSON suggested that in an experiment of this kind, the spinner motor would have been well adapted to meet the conditions, though he thought the double frequency would have given better results, so far as the mechanical side was concerned. He quite appreciated the squirrel-cage motor for the smaller sizes, but when they came to bigger machines there seemed room for doubt.

MR. ROBERTSON (Greenock) referred to the difficulty of synchronising alternating machines on board ship. Some years ago, he was able to obtain some details of a scheme got up by a large firm of electrical engineers for the electrical propulsion of a cruiser, which had been submitted to the Government. The weight of the vessel was 22,000 tons, and the alternators were to be run at 3,000 volts, with change-over switches operated from the bridge, the captain's room, or the engine room. The scheme seemed very complete and

well thought out, but there was no provision for changing the speed of the motor. It was full speed in each case, which meant that an auxiliary set had to be provided for half speed for cruising. The additional weight would be about 60 per cent. of the whole of the electrical installation, and that put the matter out of court. His opinion was that if the problem was to be solved, its solution lay in the principle Mr. Hird had suggested—double frequencies to drive the motors, or the use of some type of spinner motor.

Mr. SAM MAYOR (Glasgow) said that the very high state of perfection to which the reciprocating steam engine had been brought made it difficult for any new method to gain a footing. Engineers should, however, bear in mind that generators for driving ships effected an enormous saving of weight on even that class of plant. He saw a scheme the other day for driving a yacht of 500 tons, and in comparing the electrical drive with the ordinary steam drive, there was a saving of 10 tons in weight—the steam plant weighing 100 tons and the electrical plant 90 tons. The centre of gravity was very much lower than in the case of a yacht with the usual top-hammer, and further, the increased area for the men in the mid portion of the ship was something like 9 or 10 ft. of her available accommodation.

In the course of his reply, Mr. HIRD stated that the voltage was 310 volts, variable to a small extent either way. Great stress had always been laid upon not having two alternators in parallel in cases of ship propulsion. The scheme they were considering did not prevent a combination of three alternators and three different motors, unless the motors were all of the multiple wound type. If they had a ship with three propellers, a whole range of combinations could be obtained. As to the suitability of the squirrel cage, he thought Prof. Bailey overestimated the power required to reverse the propeller. The experiments showed that in this case it did not take the full torque corresponding to full load to reverse the propeller. They had made experiments which had shown that the ordinary propeller, when asked to act as a turbine, had a bad efficiency, and that accounted for the fact that the propeller would reverse more rapidly than would appear at first sight. The question of size was a different one. It was a squirrel-cage rotor that they had on this boat, and it was well known that if the vessel was small the squirrel cage would do what they wanted. It was only on bigger sizes that it failed. He thought that in the case of ship propulsion there were some considerations which would lead them to hope that they might come to higher sizes of squirrel-cages, chiefly because of the fact that they had there an installation which was at their disposal simply for the purpose of driving a squirrel-cage motor and nothing else. To change speeds in a big ship by simply throwing over a switch, would of course, be impossible. The switch itself would not stand it.

## The Commercial Aspect of Electric Cooking and Heating.

By T. P. WILMSHURST, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Birmingham, February 26th, 1913.)

THE object of the present paper is to consider how far the use of electricity in the home is likely, in the near future, to supersede existing methods of cooking and heating.

The question of lighting may be considered settled. The author's experience for some years past has been that all new houses within reach of the mains, of a rental value as low as 7s. per week, are now wired as a matter of course for electric light, even though the initial cost may be £4 10s. per house, as against 30s. to 40s. for gas, as the owners now realise that houses fitted with electric light have a better letting value. The service cable should not be less than 7/18 s.w.o.

Probably more than half the revenue of a modern gas undertaking is derived from the cooking load, and the greatest cooking load in the smaller houses occurs on Sundays.

In London, in four years the number of gas cookers on the mains of the Gas Light and Coke Co. has increased from 312,865 to 475,853, and on those of the South Metropolitan Co. from 245,165 to 281,880. Manchester shows an increase from 36,214 to 53,730, Birmingham from 34,069 to 40,945, Derby from 11,819 to 17,500, Southampton from 16,834 to 21,473, and Coventry from 11,102 to 17,332. These magnificent results have been obtained by supplying an article which fairly well met the needs of the consumer at a low rental (usually 10 per cent. per annum), or free of all rental; by the innate advantages of availability and cleanliness; and by good business organisation, including intelligent canvassing and frequent popular demonstrations and lectures.

In a gas oven the joint of meat during the whole cooking operation reposes in an atmosphere consisting of the objectionable products of combustion of coal gas; and many consumers have, on taking up electric cooking, at once been struck with the vastly improved flavour of the meat. If it can be proved to the consumer's satisfaction that electric cooking is not more expensive than gas or coal-fire cooking, the battle will be won, as the innate advantages of the former are so considerable that progress is bound to be very rapid.

The author's first experience, about three years ago, was with a "lagged" or "black" oven made by one of the best firms in the country: the design, however, was crude, and the makers evidently had not studied the housewife's problem at first hand.

At Olympia in September, 1911, several types were exhibited which showed a marked advance in design; but it is, in the author's view, largely due to the business foresight of one man, Mr. A. F. Berry, that substantial progress is now being made. Mr. Berry has for some time past organised a series of lectures and demonstrations in various towns, given by Mr. F. S. Grogan, in co-operation with

the local supply authorities; these practical demonstrations have done more to stimulate public interest than any amount of literature could have effected.

Prior to Mr. Grogan's visit only two cookers were connected to the Derby mains, and they were evidently regarded as luxuries, as the revenue from them was small and fitful. The Derby Corporation offered to lend a complete outfit to *bona fide* lighting consumers for a week's free trial, including temporary wiring, with the result that over 30 satisfied consumers were coupled up within two months; others have come on since, and several new houses are being completed in which cookers are arranged for.

The advantages of electric cooking are at once apparent to those who adopt it, the chief being:—

1. Absolute cleanliness.

2. Absolute certainty of results, owing to the voltage limit restrictions laid down by the Board of Trade. This is in marked contrast with the results obtained with gas cookers, owing to the wide fluctuations of gas pressure in practice, or with the results with coal ovens. With the "Tricity" system absolute evenness of temperature is attained by a simple arrangement of deflectors fixed under the top heater and over the bottom heater. With an electric cooker it is only necessary to weigh the joint and allow 15 to 20 minutes per pound, according to taste, and at the predetermined time the joint is taken out with the certainty that the meat will be cooked perfectly and without the door of the oven having once been opened.

3. A saving owing to the diminished loss of weight as compared with other methods.

This is the best money-saving argument, and although many convincing figures have been given both before the Institution and in the Press, a few further figures may not be out of place.

In the introduction to "Mrs. Beeton's Cookery Book" it is stated that with coal or gas-fired ovens the loss of weight in cooking beef or mutton is 25 per cent. to 33½ per cent., and with pork the loss is nearly 50 per cent. owing to the greater proportion of fat. With an electric cooker this is very much reduced. The following figures, some of which are taken from experience at Derby, relate to results with the "bright" oven, of which the "Tricity" is the best known type.

### FROM THE COAL RANGE.

	Raw.	Cooked.	Percentage loss.
	lb. oz.	lb. oz.	
Sirloin of beef ...	7 4	4 4	41'3
Ribs of beef...	5 7	3 12	31'0
Boned sirloin of beef ...	4 0	2 13	29'7
Half-leg of mutton ...	4 0	2 13	29'7
Leg of pork ...	10 14	6 9	39'6

Marmalade making:—18 lb. orange pulp and sugar gave 13½ lb. of marmalade, or a loss of 25 per cent.

### FROM THE GAS OVEN.

	Raw.	Cooked.	Percentage loss.
	lb. oz.	lb. oz.	
Ribs of beef...	9 14	7 14	19'0
Sirloin of beef ...	3 2	2 6	24'0
Leg of mutton ...	8 4	6 0	27'3

### FROM THE "TRICITY" COOKER.

	Raw.	Cooked.	Percentage loss.
	lb. oz.	lb. oz.	
Ribs of beef...	10 14	9 13	9'8
Sirloin of beef ...	6 0	5 6	10'4
Ribs of beef...	5 3	4 13	7'2
Shoulder of mutton ...	4 14	4 5	11'5
Leg of mutton ...	9 1	7 10	15'8
Leg of pork ...	10 8	9 0	14'3
Sirloin of beef ...	5 2	4 8	12'2
Ham ...	10 0	9 7	5'6

Marmalade making:—17 lb. of orange pulp and sugar gave 14 lb. of marmalade, or a loss of 17 per cent.

A pork butcher in Derby cooks an average of 30 legs of pork per week, as well as pork pies, hocks, &c. For nearly six months this cooking has been done entirely on a "Tricity" double oven measuring 19 in. x 28 in. x 16 in. internally. This consumer assures me that the saving in meat is so great as far to outweigh the cost of current at 1d. per unit. And whereas the loss on his coal range was formerly 40 per cent., this is now reduced to an average of 20 to 25 per cent. The following table gives a few typical figures obtained from this consumer.

	Raw.	Cooked.	Percentage loss.	Cost of current in pence.
	lb. oz.	lb. oz.		
Legs of pork ...	12 12	9 12	23	13
	12 8	9 10		
	13 12	10 10	22½	8
Pork and hocks ...	11 0	8 4	25	10½
Legs of pork ...	12 12	8 8	21½	11
	10 8	8 3		

Taking the first and last results, which represent the output of the double oven, the saving in weight over the coal range amounts to 18 per cent., or 4½ lb. The cooked meat is sold at 1s. 2d. per lb.; therefore the net money saving on each two joints, after deducting the cost of current, is 3s. 10½d. and 4s. 0½d. This consumer also assures me that there is no comparison as regards the regularity of the results and the improved taste of the meat.

If the domestic consumer would take the trouble to keep a balance-sheet, setting the diminished but her's bills against the

cost of current, it could be proved every time to his own satisfaction that he was money in pocket at the end of the year.

A further obvious economy is the diminished consumption of coal in the kitchen. The annual consumption of coal in a house of, say, £50 rental is about 15 tons, of which at least 10 tons are used in the kitchen. In providing for warming the kitchen and providing hot water for baths, &c., probably not more than 4 tons are required, thus showing a saving of 6 tons, representing (at prices in the Midlands) £1 10s. per annum.

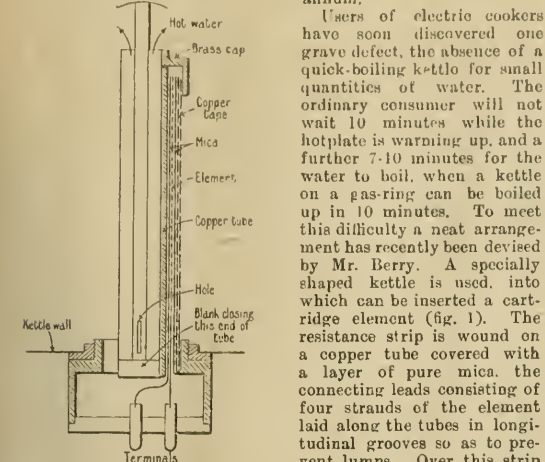

FIG. 1.—SECTION OF 1,200-WATT  
"BERRY"  
CARTRIDGE ELEMENT.

one end; and at the other end is a brass terminal box, which carries the contact pins. When all the parts are assembled the whole apparatus is soldered up solid and watertight. A smaller tube is fixed down the centre of the main one into the plug closing the end carrying the terminal box, and has holes at the bottom end; the other end carries a small "umbrella." This arrangement allows the water to circulate inside, the "umbrella" preventing the overflowing stream from interfering with the cold water entering. The loading is 1,200 watts, and this can be assisted by standing the kettle on the hot-plate. With an initial temperature of 40° F. three pints of water can be boiled in six minutes with 2,000 watts, at an efficiency of over 98 per cent.

The author would suggest from his own experience the following points for the promotion of economy in the kitchen and for the satisfaction of the consumer:—

When cookers are first installed, fix for a few weeks an additional meter alongside of the cooker, and provide a card to show both the daily consumption and also the money saving on each joint of meat cooked. Provide a small red lamp or other indication that current is being used. For small houses use a 1s. or 6d. slot-meter, fixed near the cooker, and provided with an indicator which will show when the value has been expended. Follow up the first installation of the cooker by a visit from a lady expert to give advice and instruction.

The author's experience is that the consumers very soon find out how to get the best results from the cooker, so simple is it in operation.

The usual practice with gas undertakings is to let apparatus out on hire at 10 per cent. of the net cost of the outfit. This course has been adopted in Derby with electric cookers. The rentals charged are:—

For outfit, including "duplex" cooker,	
extension heater and oven ...	4s. 0d. per quarter.
Including grill and grease pan ...	4s. 3d. " "
Additional extension heater ...	1s. 4d. " "

The small utensils used with the hot plates are sold outright at prices approximately 10 per cent. above the net cost.

The consumption of energy, at any rate with the "bright" oven, usually amounts to 1 to 1½ units per person per day; the lower figure may be obtained by strict economy, and at 1d. per unit the author believes this will compete with gas at 2s. 6d. per thousand cubic feet.

With electricity at 1d. or ½d. per unit, as is now charged in some towns, there is no question of the economy of electric cooking.

To some engineers, the warming of rooms offers an even more attractive problem than electric cooking, on the ground of the much lower selling and hiring prices of radiators; on the other hand, it must not be forgotten that they are very little required in summer, whereas the cooker is an all-the-year-round load, and is even more used in winter than in summer.

It is difficult to lay down definite rules for the amount of electrical energy required for warming rooms, as it depends on so many factors, such as the window area and the user's idea of fresh air. For proper ventilation it is necessary to change the air of a room three times an hour.

A good rule, based on hot water practice is —

$$\text{Kilowatt capacity} = \frac{(30A + 8B + \frac{1}{2}C) 20F \times l}{60 \times 60 \times 1,000}$$

Where A = number of square feet of window surface, B = number of square feet of wall surface, C = number of cubic feet of air in room; n = number of times air is changed per hour l = number of degrees F. the air has to be raised in temperature.

Thus in a room 30 ft. x 16 ft. x 10 ft., with three windows 3 ft. 6 in. x 6 ft., would require 2½ kw. to raise the temperature 20°; and a room 16 ft. x 11 ft. x 10 ft. high with one window 5 ft. x 3 ft. 9 in. would require 1½ kw. to raise the temperature 20°.

The electric radiator contains all the elements of success. It is clean, portable, cheerful and instantaneous. The present difficulties are the innate conservatism of the householder, the necessity for two sets of wiring where ordinary flat rates of charging are in force, and the running cost where the radiators are used for long hours at the ruling price of 1d. per unit.

It is unnecessary to point out the absurdly low efficiencies of coal and gas fires owing to the necessity of providing for the disposal of the products of combustion. In the aggregate, the smoke nuisance from domestic chimneys is far more serious than from factory chimneys, and if more attention were paid by the municipal authorities, as it should be, to the prevention of smoke from private houses, an enormous impetus would be given to electric heating.

Water heating is, financially, by far the most difficult problem to deal with. Comparing coal, gas and electricity on a calorific basis, the case for electricity appears to be hopeless, and its only salvation lies in the exceedingly high efficiency of the electric heater. Taking coal at 17s. per ton, and 13,000 B.T.H.U. per lb., gas at 2s. 6d. per 1,000 cb. ft. and 600 B.T.H.U. per cb. ft., and electricity at 1d. per unit and 3,455 B.T.H.U. per unit, a comparative statement is somewhat as follows:—

	B.T.H.U. obtainable for 1d., assuming 100% efficiency.	Efficiency in practice (say)	Useful B.T.H.U. obtained for 1d.
Coal ...	142,750	10 %	14,275
Gas ...	20,000	50 %	10,000
Electricity ...	3,455	90 %	3,109

The author has seen tests made by an independent and reliable authority in which an efficiency of over 97 per cent. has been gained with a Belling electric geyser.

The three most notable attempts to solve this problem are the Therol heater, the Belenus boiler and the Belling geyser.

In the first mentioned, the heating coil is embedded in a block of cast-iron, providing a large degree of thermal storage. The capacity of the coil varies from 50 watts to 900 watts in the large sizes, and the hot water at 110° F. varies from 5 gallons to 135 gallons per day. The apparatus is the essence of simplicity, and provides a demand of 100 per cent. load factor, obviously forming a most desirable load, even at an exceedingly low price for electrical energy.

An interesting installation of Therol heating in a private house in London may be mentioned. The household consists of seven persons, including two children. A 300-watt heater is installed with an auxiliary 1,000-watt unit, also a small 200-watt heater for the kitchen and scullery; there are three baths required per day, and of course, hot water continually for other purposes. This installation has replaced a gas circulation heater. After one year the consumer found a saving of 7½ per cent. in actual payments, as well as a saving in deterioration of decorations. The price paid for current, based on £4 per kilowatt installed plus ½d. per unit, came to about 0·65d. per unit.

The Belenus boiler consists of a column of cast-iron provided with deep corrugations along the bore in order that the surface in contact with the water may be as great as possible, and with a number of deep slots on the outer surface in which the elements are embedded. These elements are plain strips of inert material, wound with heavy gauge wire run at a low current density, and are insulated by pure mica from the column. There is at least ½ in. of cast-iron between the elements and the water. The boiler, when arranged as a circulation heater, is always full of water, and the elements can never attain a high temperature or burn out.

The boiler is installed in exactly the same manner as the old-fashioned saddle-back kitchen boilers, iron pipes being run from the top and bottom to the top and bottom respectively of the household hot-water tank. In old houses the electric boiler can be fitted in the riser to the tank, and employed to reinforce the kitchen boiler and to take its place in the summer. The boiler is provided with a steel case and air lagging around the column. A high efficiency is attained when sheet lagging is fitted over this and the pipes are lagged in the usual manner. The Belenus boiler can be installed in the kitchen, scullery, or any convenient out-of-the-way position; it can be fixed in series with the kitchen boiler and simply switched on when the fire is not in use.

The Belling geyser is somewhat similar in operation to the Belenus boiler, but it has in addition a control gear by which the electric switch and water supply handles are interlocked so that it is impossible to switch on the current before the water, or to turn off the water without first switching off the current. Independent tests show an efficiency as high as 98 per cent. The heavy loading of 10 kw. is, however, an objection.

Undoubtedly the cheapest solution of the problem, at the present time, would be to discard the kitchen fire altogether; to fix a coke stove of the "Ideal," or other type, for hot water purposes, and to

cook by electricity. A small "Ideal" boiler will supply 50 gallons of hot water per hour at, say, 120° F. for 30,000 B.T.U. per hour, or, say, 1d., a result not yet approached by any other method.

Supply engineers are now realising that the application of the Hopkinson system of charging in one form or another is a necessity for domestic supply, if heating and cooking by electricity are to make rapid headway.

The two best known modifications are the "Norwich" system and the "Telephone" system. In the former the initial charge is a percentage of the rateable value, plus a low charge for current. At Norwich the rate is 12½ per cent. of the rateable value, plus 1d. per unit for all current consumed. At Bradford the rate is 15 per cent., plus ½d. per unit, and at Sunderland 10-15 per cent., according to the size of house, plus ½d. per unit.

In the "Telephone" system the initial charge is based on the connected lighting load. In Marylebone the charge is based on 70 per cent. of the connected lighting load at £14 per kW., plus 1d. per unit.

A house on the Derby mains is rented at £18, and the rateable value is £40. The consumer, during 1912, paid for—

250 lighting units at 4½d., or	...	...	£4 13 9
2,100 heating units at 1d., or	...	...	8 15 0

Total ... .. £13 8 9

Average price, 1'37d. per unit.

Under the Norwich system at 15 per cent., plus ½d. per unit, he would pay :—

Initial charge...	...	...	£6 0 0
2,350 units at 4½d.	...	...	4 16 8

Total ... .. £10 16 8

and all additional units would be obtained for ½d. per unit, thus giving every encouragement to use more heating units.

From the preponderance of heating over lighting units in the above case it will be seen what enormous developments are possible, especially in towns which depend on lighting rather than power for their revenue. The preponderance may also be emphasised by a comparison of figs. 2 and 3, which are the lighting and the heating recorder charts for the house above mentioned.

FIG. 2.

FIG. 3.

At Southampton, Mr. H. F. Street informs me that prior to 1910 only 20 radiators were in use. Since the institution of a flat rate of ½d. per unit, however, about 1,000 radiators have been connected, and more than half of these are of the 2-kw. type. At Luton, Mr. W. H. Cooke has sold about half a million units for heating during the last year at a low price. It is obvious, therefore, that once a satisfactory price can be adopted the load will follow, as a matter of course.

#### DISCUSSION.

MR. FRED. S. GROGAN (British Electric Transformer Co., Ltd.) said he congratulated Mr. Wilmshurst upon his paper dealing with practical results obtained from the "Tricity" cooker, especially as he had accepted the manufactured article instead of, as was often done in the very smallest supply stations, attempting to design his own cookers, and, with experimental work costing a few pounds, expecting to do what had cost the manufacturer thousands of pounds. He agreed with the author in having heavier service cables, and would go even further and specify 7/16 S.W.G. as a minimum. From the latest returns he found there were almost 3½ million gas cookers in use in the United Kingdom, so that a large field was waiting for the enterprising supply engineer. Undoubtedly excellent results had been obtained where good organisation existed and popular demonstrations were given. Having been the first to introduce these cooking lectures, he said that such a lecture must not consist of a dry cooking lesson, but must teach the audience how to apply their own cooking know-

ledge to the newer methods, and deal with the question of cost of operation in both the new and old methods, at the same time bringing out the advantages of electric cooking. The gas companies started by denying that a saving in shrinkage could be effected, but they were now producing figures showing that they could cook with the same saving in weight as with an electric oven. He had formed the opinion that the saving with the electric method was entirely due to their ability to alter quickly the temperature in the oven. The meat was first seared for a short period at a high temperature, and then cooking was continued at a much lower temperature. Such a saving could be effected in the older methods of cooking, but only with an infinite amount of care on the part of the cook, and continual attention to the oven during the cooking operation. That was why electric cooking would always win, because this saving could be effected without any attention on the part of the cook. The "Tricity" system would obtain such results with the minimum of trouble, because there was not a large mass of iron to be heated up in preparing the oven for cooking. It naturally followed that any oven employing large masses of iron must gradually accumulate a large quantity of heat, and the temperature in the oven could not, therefore, be rapidly lowered on account of the reserve heat in the casting, unless a great amount of care and watching was given in the cooking operation. As a proof of the ease of manipulation, he was visiting many towns during the year, and invariably cooked a joint of meat for the public to see for themselves the great saving. He did not take a number of joints and select a special one to show, but cooked only one joint, and always got the same result—a shrinkage of 10 per cent. With a cooking outfit supplied to a school at Eastbourne by his company, the results averaged over last term gave a consumption of just under ½ a unit per head per day. There were in all 100 people to cater for, and besides the ordinary daily meals for boys and staff, the adults were served with a full course dinner in the evening. Coming to the water heating, about 95,000 useful B.T.U. of heat were obtained for 1d. from the "Ideal" coke boiler. He asked them not to rush at doing everything electrically just because they were electrical men. The hot-water-supply-in-bulk problem was one which they should leave alone; both electricity and gas were beaten hopelessly on cost when compared with the coke stove. He preferred to have the independent hot water boiler connected in parallel not in series with the kitchen boiler. Where he had installed electric cooking, he had also put in many independent coke boilers, and they worked perfectly when coupled in parallel. The disadvantage of the series arrangement was that when the kitchen fire was not working the whole of the circulating hot water passed through the old boiler at the back of the kitchen range, and rapidly lost heat by its proximity to heavy masses of iron. He strongly advocated the charging of an annual fixed sum plus a low price per unit, for this would encourage those already connected with the supply mains to use more electricity for domestic purposes, and the supply engineer would rather increase his load on existing services, than extend by new connections. He noticed the excellent progress reported in Southampton, and would like to emphasise the fact that about 70 per cent. of the radiators were hired out by the Corporation; if the number placed in one large installation, where the radiators were bought, was omitted, the percentage of hired radiators was considerably increased, thus driving home again the condition pointed out by the author as being necessary for success, viz., hiring apparatus at a low rental.

MR. W. FENNELL said he was convinced that two things were necessary before it was advisable to push electric cooking. A suitable tariff, and an electric oven at £4. He had at Wednesbury the Norwich system for private consumers—10 per cent. of the annual rateable value plus 1d. per unit in winter and ½d. per unit in summer. Having provided the proper tariff, he was now waiting for the manufacturer to come along with the oven; when he saw the oven, he would push electric cooking. It was useless to offer an oven for hire at £1 per quarter (and that was necessary with the £12 to £15 outfit), while the gas authorities offered the equivalent at 3s. 6d. Water boiling by electricity was uneconomical, and to combine this with the oven was sure to cause the whole apparatus to be rejected, in an industrial district. He had had two years' home experience of electric cooking, with both the types of oven described: both cooked splendidly, and they did not know what good cooking was until they had the electric oven. They would not change back to coal or gas. The hot-plate portions were not used (he could not face the bill), so they conducted all the boiling operations on the top of the old gas range. He was, therefore, speaking from experience when he said, "Push the oven, and leave the boiling for the gas people." Hot water jugs, afternoon tea kettles, toasters, &c., for use on the table were very successful, because large quantities of heat were not required. They added a little to the revenue, and greatly to the reputation of the electricity supply. Regarding the percentage losses in weight (gravely carried to decimal points), he thought it unwise to make too much of the point, because it was easy for the other side to retort that this much-vaunted saving in "meat" was only a saving in water, which was not worth anything unless they were going to sell again by weight. It would be better, therefore, to keep on safe ground by maintaining that cooking in an electric oven was very simple, and reasonable in cost, and that the result was a cooked article, whether meat or pastry, which was far superior to that produced in coal or gas ovens.

MR. N. B. ROSHER gave some particulars of a proposed electrical cooking installation for the office staff of some works, numbering 20 persons. Relying upon the published figures as to saving in cost with electric cooking due to less shrinkage of meat, it was

estimated that this system would pay handsomely, but an experiment carried out to ascertain the relative cost of cooking by gas and electricity resulted in favour of the former. It was only fair to state that the same cook cooked both joints, but that whereas she was experienced with the gas cooker, she had never before used an electric oven.

MR. W. C. S. PHILLIPS suggested that the difference in results obtained by means of the "Tricity" cooker and the gas oven might be due to the difference in mechanical construction of the two ovens. The electric cooker was practically a closed box.

MR. MORRISON said that the results obtained with "black" or lagged ovens were of the same order as those obtained with "bright" ovens.

### Institution of Electrical Engineers (Manchester Section).

The annual dinner of the Manchester Section of the I.E.E. was held in the Midland Hotel, Manchester, on Friday last. In the absence of the chairman (Mr. A. A. Day), Prof. E. W. Marchant presided. There were present 184 members and friends, including the Lord Mayor of Manchester, the President of the Institution of Electrical Engineers (Mr. W. Duddell), Profs. Rutherford and Petavel (Manchester University), Dr. Rosenberg, Mr. S. Z. de Ferranti, Messrs. S. L. Pearce, C. D. Taite, J. E. Kingsbury, W. Cramp, W. C. Mountain, J. Frith, hon. sec., and A. L. Green (assist. sec.).

After the loyal toasts had been duly honoured, Mr. S. Z. de Ferranti proposed "The Corporations of Manchester and Salford." He said a great change had come over the electrical industry. At one time manufacturers viewed each other with a very great amount of suspicion, but recently this was changed, and there was now a tendency to a certain amount of co-operation between manufacturers which would help both the latter and the public generally. A good deal of preference had been shown to municipal authorities in the Electric Lighting Acts. Some people considered it desirable for public bodies to go in for trading; on the other hand, there was the opinion that only private business firms should trade. He believed that the best method of carrying on the supply of electricity was by a combination of the local authorities and private companies. In the United States, powers were granted to public companies to provide lighting and power supplies over large areas on the basis that when the money subscribed by the shareholders had earned a fair rate of interest, the surplus should be divided between the municipality and the shareholders. In this country we were, generally speaking, suffering from too high prices. An enormous development would take place if only people would take more risk by supplying at a lower rate. Risk, however, was not the sort of thing a public body should undertake to any great extent. He had given a good deal of thought to the subject, and had come to the conclusion that the best way of giving a cheap and efficient supply was by the co-operation of the private company and the municipal authority—a co-operation which would have the stability of the municipality and the business keenness of the private company.

The LORD MAYOR, in replying, said electricity supply was in itself of the nature of a monopoly. They could not have half-a-dozen companies competing in the streets of Manchester. Whether they adopted the American or the German system, it was only a half-way solution. Manchester, it would be admitted, supplied electricity at as cheap a rate as most of the towns in the country, and at a cheaper rate than other towns which had not special advantages in this way. He was not one of those who believed that the trading departments of a Corporation should make handsome profits in aid of rates. After those departments had paid interest and sinking-fund charges, and, say, 1 per cent. or 1½ per cent. for the risk—if there was any risk—the remainder should go to the reduction of prices, and if there was any good in electricity, the low price would stimulate the demand. He was of the opinion that Mr. Ferranti was on the wrong line, and that, in the long run, those things that were in the interests of the people must be worked by municipalities or the State for the benefit of the people.

PROF. RUTHERFORD proposed "The I.E.E.," to which the PRESIDENT and PROF. MARCHANT replied. In the course of his remarks Mr. Duddell said that the Council of the Institution had decided to do some research work in connection with the properties of materials used in electrical engineering. In London there was to be found one of the finest libraries of electrical literature in the world. The Council were also forming a lending library, so that provincial members could consult a book without the expense and inconvenience of visiting London for that purpose. He wished that there should be no misunderstanding on the question of the proposed examinations. They were to be of such a character that any man who knew his work well could pass them without any cramming.

PROF. MARCHANT, in replying to the toast, spoke of the large amount of electrical engineering work done, and power supplied and used in and around Manchester and Liverpool. The Manchester Section possessed great opportunities for discussing all matters relating to electrical engineering, and it would be the aim of the Committee to foster in every possible way the interest of the members in the work of the Section, by providing papers of the widest range, which would give those engaged in the profession in the district the opportunity of supplying practical information on the branches of work on which they might be engaged. He hoped that in the future as in the past, the papers and discussions in Manchester might become known for the breadth of their scope, and for the practical value of their matter.

MR. W. CRAMP gave "The Visitors," to which Mr. E. W. LANGDON responded.

### A 60,000-VOLT UNDERGROUND CABLE INSTALLATION.

In a paper read before the Elektrotechnischer Verein, Dr. Leon Lichtenstein\* gives some interesting particulars of what is probably the first 60,000-volt a.c. underground cable to be laid. The installation is one for supplying single-phase power to the Dessau-Bitterfeld railway, from the central station at Muldenstein. The transmission distance is at present only 4·3 km. (2·7 miles), but this extra-high pressure was selected partly to meet the requirements of future extensions, and partly for the sake of obtaining experimental data. The cable described was made by the Siemens-Schuckert Co., and forms one of three sets of feeders connecting the same points, another of them being a similar cable supplied by the Felten & Guillaume Co., and the third an ordinary overhead system. The cables came into full operation at 60,000 volts and 16½ cycles per sec. in April, 1911, and have been successfully operated (at comparatively light load) ever since, the two makes of cable being generally used alternately for a week at a time each.

The central station contains a turbo-generator of 4,100 K.V.A., at 3,300 volts, 1,000 r.p.m., and some smaller machines, and eventually four more similar turbo sets are to be added. The energy from each turbo set is transformed to 60,000 volts, in two 2,000-K.V.A. transformers, and at the far end the voltage is reduced in similar transformers to 10,000 volts, which is supplied direct to the overhead line of the railway. The middle point of the 60,000-volt system is earthed at the station through a high resistance, so that the voltage of each cable to earth is limited to 30,000 volts. Every provision against high voltage rises has been made, but no particulars of the arrangement are given.

It was decided to employ two single-core cables in preference to a two-core cable, as the experimental data available for the latter type were less complete. In order to avoid undue losses in the cable sheathing no iron armouring is used.

The cable core is of stranded aluminium, and has a section of 100 sq. mm. (157 sq. in.). This is covered with a radial thickness of 13 mm. of impregnated paper, as shown in fig. 1, p. 414. Outside the lead covering there is a layer of jute, and this is coated with asphalt and chalk.

The permissible load of the cable is about 240 amperes for a maximum temperature rise of 25° C., so that the full-load output of the cable is 14,400 K.V.A. At 240 amperes the ohmic drop is about 150 volts per km. run, and the inductance drop about 35 volts per km. run, so that the net voltage difference between the two ends of the transmission works out at about 650 volts, or 1·1 per cent., with a power factor of '9.

If a copper conductor had been used of equivalent carrying capacity, its section would have had to be about 57 sq. mm. with a radius  $r = 4·75$  mm. With the same radial thickness of insulation ( $\delta = 13$  mm.), this would mean a maximum number of volts per mm. near the surface of the wire of—

$$\frac{\text{volts to earth}}{r \log_e (r + \delta/r)} = \frac{30,000}{4·75 \log_e 17·75/4·75} = 4,790,$$

whilst with the actual aluminium cable the maximum volts per mm. work out at—

$$\frac{30,000}{6·5 \log_e 19·5/6·5} = 4,200,$$

or some 14 per cent. less. To give the copper cable the same maximum stress, the paper would have had to be increased to 16·7 mm. radial thickness, making the overall diameter inside the lead 42·9 mm. in place of 39 mm. The use of aluminium in this case was, therefore, considered to be fully justified.

The cable was manufactured in lengths of 750 m., so that, in all, 10 joints were required on the system besides the four special end-connection pieces.

The junctions were insulated with impregnated paper by hand, whilst the cable ends were similarly treated and

\* E.T.Z., January 2nd, 1913.

then encased in special porcelain covers, to exclude the air. No special difficulties were experienced in this direction, as the single-core cable lent itself much more readily to treatment than would a multi-core cable.

The laying of the cable along the railway line commenced in the middle of October, 1910, and was completed in the middle of December. The two cables are laid side by side in split earthenware troughs filled with sand, in a single trench 8 m. deep, as shown in fig. 2. Where the cable had to be laid over the railway bridges, it was placed in wooden troughs. The sections of both troughs are shown in figs. 3 and 4. The laying was carried out under somewhat difficult weather conditions, the mean temperature being only about 5° C., whilst the joints were made with an air temperature of -2° C. to -5° C., and so had to be surrounded by artificially-heated tents during the process.

Measurements made in the factory before laying, and at a temperature of 15° C., showed an insulation resistance of 3,000 megohms per km., a conductor resistance of 275 ohm per km., and a capacity to lead of 169 microfarad per km. The latter figure enables the mean value of the specific

!- Although this cable is normally intended to work at 30,000 volts to earth, it is possible, under certain circumstances, to have one cable working at 60,000 volts to earth if a short-circuit to earth occurs on the other. This increased voltage would, of course, not damage the cable instantly, but in order to prevent its continuing for any length of time, an automatic indicating device is provided at the station to draw attention to any earthing of either pole.

Special earthing rods are also provided both at the central station and at the sub-station, which connect the cable to earth through a resistance when it is disconnected from the bus-bars. In this way, any danger from residual charge on the cable is avoided. The cable has been in regular use, although only at the small current of 10 amperes, for alternate weeks and about 20 hours a day, since April, 1911, and only one serious accident has occurred. On this occasion (in July, 1912) a h.t. transformer in the main station and the cable itself were both found to have broken down. Very careful tests, and examination of the cable since, show that nothing in the shape of ageing can have been the cause of

FIG. 1.

FIG. 2.

FIGS. 3 AND 4.

inductive capacity or dielectric constant  $\kappa$  of the insulation material to be estimated:—

$$\text{Capacity in microfarads per km.} = \frac{\kappa}{2 \log_e (r + \delta)/r} \times \frac{1}{9},$$

from which

$$\kappa = 3.35.$$

After laying, the values were again measured, and showed the following results:—8,620 megohms per km., 265 ohm per km., and 1705 microfarad per km. The differences are accounted for by the fact that the temperature was lower (being about 4° C. in place of 15° C.), and serve to indicate that no damage can have been done to the cable during laying, in spite of the fact that it was unarmoured. When these three constants were again measured at the end of 1911, they still showed the same values. The cable was further tested with 50,000 volts to earth (corresponding to a line-to-line voltage of 100,000).

Such a test was only possible in this case, because it was permissible to earth one pole of the transformers temporarily, and because the length of line and the frequency were both moderate. Even so the charging current taken would be about  $2\pi \times 16\frac{2}{3} \times 50,000 \times 17 \times 4.3 \times 10^{-6} = 3.83$  amperes, corresponding to an apparent power of 190 K.V.A.

The writer points out the difficulty that would be met with in testing a longer line, and at a more usual frequency, such as 50 cycles. Even supposing that compensating choking coils are inserted to reduce the K.V.A. taken from the supply, the size of these choking coils would introduce fresh difficulties. He suggests that possibly some such device as the high-tension rectifying commutator described before the Turin Electrotechnical Congress in 1911, by Herr Delon, might be employed to test such cables after laying, with h.t. direct current, but before this can safely be done further experiments as to the relative effects of A.C. and D.C. high voltages must be carried out.

the trouble, as neither the break-down voltage nor the electrical constants had altered appreciably, whilst the appearance of the paper, &c., was quite unchanged. Since repairing the fault the cable has again been in use for some months without any trouble, so that the accident must be put down to some outside undiscovered cause.

A point of some importance in connection with h.t. cables is the question of dielectric hysteresis loss. Under normal working conditions this should amount to a very small value, and in this case it was, in fact, too small to measure directly with the available apparatus. The loss to be expected can, however, be approximately estimated by reference to Höchstädt's tests made in 1910\* on cables of similar manufacture. The writer has done this, and finds that the loss for the whole line (4.3 km. run) at 30,000 volts to earth, and 16 $\frac{2}{3}$  cycles, should only amount to about 2 kw. This is only about 1.45 per cent. of the full-load  $C^2 R$  loss in the line, and should produce about 1.45 per cent. of the temperature rise at full load. The full load temperature rise is estimated to be 25° C., so that a rise of only about 36° C. might be expected, due to the dielectric hysteresis loss alone. A 20-hour no-load temperature test was made on the cable in October, 1911, and the temperature rise was estimated from careful measurement of the copper resistance. This rise proved to be of the same order as that estimated, thus showing that no serious dielectric loss or eddy-current loss in the lead covering could be taking place.

**Truro Electric Lighting.**—The electricity question has this week been the subject of an inquiry at the B. of T. offices in London, when the claims of the T.C. and the Gas Company for a prov. order were considered.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Siemens Radiator Flexible.

The illustration, fig. 1, shows a specially designed wire, which MESSRS. SIEMENS BROS. & CO., LTD., Woolwich, are supplying for use with all kinds of heating apparatus, such as radiators and irons; it is also suitable for portable hand lamps in garages and other places. It contains two rubber-insulated flexible conductors of fine tinned copper wires, and can be provided, when necessary, with an earthing wire to meet the Home Office Regulations for workshops. The wire is supplied with either a polished cotton braid finish or a flexible metallic covering, the latter being recommended where the wire is likely to be subjected to severe mechanical use. In either case, a special feature of the wire is the provision of a wrapping of metallic foil immediately beneath the cotton braid which protects the rubber insulation from grease, oil and other injurious substances. It is desirable that the surface of any metallic protective covering employed for this class of wire should be perfectly smooth, so that it can be handled without any possibility of the slightest injury being caused to the user, such, for instance, as would result from the sharp points of broken wires of a metallic braiding. It will be seen from the illustration that this condition is fulfilled by covering the wire with a spiral wrapping of segmental aluminium or brass, the rounded outer surface of

FIG. 1.—SIEMENS RADIATOR FLEXIBLE.

which gives the finished wire a very neat appearance. The finished product possesses the required degree of flexibility without being springy.

### The "Klipton" Lamp.

MESSRS. ROSE BROS., of 38-39, Beech Street, Barbican, E.C., have recently added to their "Klipton" specialities an improved large size lamp for use with current from the mains—the original "Klipton" being a pocket lamp for use with dry batteries.

The new fitting, shown in fig. 2, is, of course, of more substantial build than the earlier one, and is finished in lacquered brass with a strong clip and hand-made ball-and-socket movement, a reflector, 3 yd. of flexible, and an adapter or plug, as desired, for coupling to the main supply. Like its predecessor, it is a most convenient accessory, which can be clipped on to any ledge and adjusted to give light where wanted, or if clipped on to a ruler or book, will take the place of a standard lamp on a table. It appears to be a particularly useful adjunct for shop window lighting.

### Tailoring Irons.

The introduction of the electric iron into tailoring shops will confer great benefits upon the employés, but the heavy duty required of the iron calls for a device much more highly developed than the ordinary laundry electric iron. To meet this need, the GENERAL ELECTRIC CO., LTD., has produced the "Magnet" tailoring

FIG. 3.—MAGNET TAILORING IRON.

iron, which is illustrated herewith; this is made in weights varying from 12 to 25 lb., the former size being adapted for dressmakers' use and the latter for heavy tailoring work. Special attention has been given to the flexible connection, the weak spot of the electric iron; the cord is very strong, and is heavily insulated with rubber covered with a thick layer of asbestos and heavy cotton braiding over all. Connection with the heating element is made in a substantial box, to which a strong spring is attached, supporting and protecting the flexible for a length of about 9 inches. The heating element consists of a narrow metal ribbon of special alloy, and is readily replaceable. Ample heat is provided, and the design provides for reliability and efficient working.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS

AUSTRALIA.—The Commonwealth Customs authorities have issued the following decisions as to the duties to be levied on certain imported goods:—

Etching machine: motor, blower and switchboard	20 % ad val.
Ruberoid or ruberine cement	... (classification to be decided on analysis)
Surgical and dental instruments: "Multostat," including the motor, which is an integral part	... free
Electric motor-wagons:	
Body	... £36 each
Chassis	... free
Vulcanising equipment	... 25 % ad val.

FIG. 2.—NEW "KLIPTON" LAMP.

NOTE.—The duties given above are in all cases those levied under the Preferential Tariff applicable to goods of British origin.

BRAZIL.—The Brazilian Budget Law provides that clearance of goods for consumption in Brazil will not be permitted without presentation by the consignee of the original Consular invoice, unless the consignee enters into an engagement to produce the document within a period of 90 days. This period may not be extended, and if the invoice is not forthcoming on its completion, the consignee will be liable to a fine of 50 per cent. of the total amount of duties and other charges leviable in respect of the goods.

The Brazilian Budget Law provides that goods which have undergone transshipment in foreign ports shall not be cleared through Customs Houses of the Republic unless they are accompanied by a transit certificate issued by the Consular agent at the port of transshipment.

BOLIVIA.—A Commission has been appointed to revise the existing tariff of import duties. The Commission is to communicate with all Chambers of Commerce in Bolivia inviting suggestions for the modification of the tariff, and is to submit a new draft tariff in August next. If the new tariff is approved, it will come into force on January 1st next.

MEXICO.—The Board of Trade are informed that the Bill for the revision of the Mexican tariff, referred to in these columns some few weeks ago, has been postponed until the ordinary session of Congress, which opens on April 1st next.

A decree has been issued increasing the rates of duty under the Mexican tariff by 10 per cent. from February 16th. This 10 per cent. includes the 5 per cent. increase imposed on goods imported from September 1st, so that the net effect is to increase the rates by a further 5 per cent. only.

**Eccles Electricity Supply.**—The Public Lighting and Electricity Supply Committee of the Corporation has considered a report of the Manchester Steam Users' Association upon No. 1 boiler. The engineer recommended the provision and fixing of a new boiler, at an estimated cost of £360, allowing for the sale of the present boiler, estimated to last 10 years, at a cost for repair of £165, and the Committee adopted the recommendation and decided to invite tenders.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

- 8,976. "Mechanical shutters for operating box in picture halls that can be closed quickly with electricity from one or more places in the hall or box in case of fire." F. BRADSHAW. February 17th.
- 8,987. "Electric lighting switches for automobiles." M. S. CONNER. February 17th.
- 8,988. "Non-conductor connection." T. E. ORANGE. February 17th.
- 4,008. "Electric apparatus for heating or boiling liquids." M. RAILINO and C. H. ARCHER. February 17th.
- 4,034. "Process for the manufacture of filaments for electric glow lamps." A. JEST. (Convention date, March 11th, 1912, Germany.) February 17th. (Complete.)
- 4,071. "Telephony." D. S. HULFISH. February 17th. (Complete.)
- 4,090. "Process for manufacturing electric transformers of small power." VEDOVELLI, PRIESTLEY & Co. (Convention date, February 21st, 1912, France.)
- 4,091. "Method of and means for winding coils." (Convention date, January 10th, 1912. Divided application on 91 of January 1, 1913.)
- 4,093. "Electric motor-controlling devices." BRITISH THOMSON-HOUSTON Co., LTD., and H. E. BRITTON. February 17th. (Complete.)
- 4,106. "Ignition lead cases for motor vehicles and wagons." CLAYTON and Co. (Huddersfield), LTD., and A. BRIGGS. February 15th.
- 4,117. "Means for attaching shades to electric and other lamp fittings." W. S. ROSS. February 18th.
- 4,131. "Rheostat." T. RHODES. February 18th. (Complete.)
- 4,164. "Order telegraphs." A. H. POLLEN and H. ISHERWOOD. February 18th.
- 4,197. "Electro-magnetically operated diaphragms for producing sound." E. A. GRAHAM. February 18th. (Complete.)
- 4,225. "Device for holding a coil or coils of insulated or other wire which is being used in the installing of electric lighting, bell and telephone, and like systems." H. W. BROTHERTON. February 19th.
- 4,230. "Electric switches." L. RASCH. February 19th.
- 4,239. "Device for assisting in setting or timing the ignition and valves of internal-combustion engines." W. H. LEEKE and A. J. R. WILSMITH. February 19th.
- 4,256. "Electrical signalling apparatus for lifts and the like." G. A. LONDON. February 19th.
- 4,297. "Electric mercury switches." T. GUIMER. February 19th. (Complete.)
- 4,344. "Telephone silent-speaking apparatus." F. HODSON. February 20th.
- 4,345. "Insulated rail-joint for track circuit railway signalling." R. C. S. Woods. February 20th.
- 4,349. "Holders for testing motor sparking plugs." W. T. LORD. February 20th.
- 4,355. "Electric ozone generators." C. W. DENNY. February 20th.
- 4,381. "Spark-plugs." F. R. BLAKE. February 20th. (Complete.)
- 4,383. "Electric contacts." E. M. WILKEY. February 20th.
- 4,386. "Intercommunication telephone systems." STERLING TELEPHONE AND ELECTRIC Co., LTD., and F. G. BELL. February 20th.
- 4,397. "Lighting fixtures." BRITISH THOMSON-HOUSTON Co., LTD. (General Electric Co., United States) February 20th.
- 4,398. "Protective devices for electric distribution systems." BRITISH THOMSON-HOUSTON Co., LTD. (General Electric Co., United States) February 20th.
- 4,401. "Dynamo-electric machines." C. SCHLICK. February 20th. (Complete.)
- 4,405. "Electric typewriter." R. IMME. (Convention date, February 27th, 1912, Austria.) February 20th. (Complete.)
- 4,406. "Electric train lighting." G. W. MACARTNEY. February 21st.
- 4,425. "Signalling apparatus on transcars and the like." R. HEATON. February 21st.
- 4,462. "Incandescent electric lamps." A. A. BARRON. February 21st.
- 4,472. "Electrically prepayment meters." BRITISH INSULATED AND HEATSEY CABLES, LTD., and L. B. WILSON. February 21st.
- 4,479. "Electrically-heated cooking and like utensils." J. MANN. February 21st. (Complete.)
- 4,490. "Telephone systems." AUTOMATIC TELEPHONE MANUFACTURING Co., LTD. (Automatic Electric Co., United States) February 21st. (Complete.)
- 4,502. "Telephone attachment." N. MANN. February 21st.
- 4,507. "Starting switches and the like for alternating-current induction motors." SIEMENS BROS. DYNAMO WORKS, LTD., and C. RODERS. February 21st.
- 4,508. "Ignition systems." C. F. KETTERING. (Convention date, March 4th, 1912, United States) February 21st. (Complete.)
- 4,514. "Aerial conductors for use in wireless telegraphy." MARCONI'S WIRELESS TELEGRAPH Co., LTD., and C. S. FRANKLIN. February 21st.
- 4,528. "Telephonic apparatus." H. W. SULLIVAN and C. E. HAY. February 22nd.
- 4,543. "Electrically-driven secondary clocks." H. HAYCOCK and T. SANDYSON. February 22nd.
- 4,548. "Sparking plugs for internal combustion engines." W. DOUGLAS (trading as Douglas Bros.) February 22nd.
- 4,573. "Electrical instruments." P. W. SCHOLEFIELD and FERRANTI, LTD. February 22nd.
- 4,584. "Selective electric signalling." H. H. HARRISON and C. M. JACOBS. February 22nd.
- 4,591. "Automatic electrical switches." ELECTRIC SIGN Co., LTD., and W. K. L. DICKSON. February 22nd. (Complete.)
- 4,595. "Magnetic separator." F. KNUFF Akt.-Ges. GROSSWRE. (Convention date, March 15th, 1912, Germany.) February 22nd. (Complete.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

1912.

- ELECTROSTATIC MACHINES FOR THE PRODUCTION OF ALTERNATING CURRENT. W. PETERSEN. 2,442. January 30th.
- ELECTRIC INCANDESCENT LAMPS. British Thomson Houston Co. (General Electric Co.) 2,468. January 30th.
- ELECTRIC ALARM DEVICE FOR MEASURING INSTRUMENTS. S. WORLICZKA and M. BLUZAR. 2,517. January 31st.

- MEANS FOR, AND METHODS OF, CHARGING AND DISCHARGING ELECTRIC ACCUMULATORS OR SECONDARY BATTERIES. A. M. TAYLOR. 2,680. February 1st. (Cognate application, No. 12,834 of 1912.)
- AUTOMATIC AND SEMI-AUTOMATIC TELEPHONE CIRCUITS. Siemens Bros. & Co. (Siemens & Halske Akt.-Ges.) 2,671. February 1st.
- AUTOMATIC AND SEMI-AUTOMATIC TELEPHONE CIRCUITS. Siemens Bros. & Co. (Siemens & Halske Akt.-Ges.) 2,672. February 1st. (Addition to No. 2,320 of 1912.)
- SELF-EXCITED DIRECT-CURRENT DYNAMO-ELECTRIC MACHINERY. Akt.-Ges. Brown, Boveri & Cie. 2,731. February 2nd. (February 24th, 1911.)
- AUTOMATIC AND SEMI-AUTOMATIC TELEPHONE CIRCUITS. Siemens Bros. & Co. (Siemens & Halske Akt.-Ges.) 2,743. February 2nd. (Addition to No. 2,320 of 1912.)
- STARTING GEAR FOR INTERNAL-COMBUSTION ENGINES AND OTHER PRIME MOVERS. H. LEIDNER. 2,746. February 2nd.
