**Wanted—Six Hundred Pounds.**—Our readers are already aware that at the annual festival dinner Mr. E. G. Byng offered to give £100 to the funds of the Electrical Trades Benevolent Institution, if nine other firms or gentlemen would do the same within three months from April 16th. The £100 which Mr. Sutton had already given was to be counted as one of the nine; Mr. H. Hirst, through Mr. Sutton, promised a like amount; and Mr. Garcke's promise brings the total up to £400 out of the required £1,000.

It has been thought that some of our generously disposed readers would be willing to follow the splendid example set by these gentlemen and ensure that the conditional offers are fulfilled by making or influencing six other offers. We hope that in later issues it will be possible for us to fill names into the six spaces now standing vacant below:—

1	Mr. E. G. Byng	...	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	...	£100

**Discharging Electricity from Paper, &c.**—A recent patent granted to Messrs. Siemens Bros. & Co. (No. 1,554 of 1912) describes a method of discharging the static electricity evolved in spinning and weaving, or in paper manufacture, by ionising the atmosphere between the charged material and an earthed electrode, by means of ultra-violet rays, produced by an arc between iron electrodes or by a mercury-in-quartz lamp. The use of radio-active substances for producing the ionisation is also discussed (in Patent No. 1,555).

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS.—The report of the Council for the year 1912-13 shows that at May 1st, 1913, the total membership numbered 7,084, a net increase during the year of 547, compared with an average of 137 for the preceding five years. In view of the change in the articles of association which took place during the year, it may be interesting to give in detail the changes in the list of members:—

	Hon.	Mem.	Mem.	Assoc.	Grad.	Stu.	Totals
Totals at May 1st, 1912	7	1,888	8,089	806	—	1,247	6,507
Additions during year:—							
Elected	—	45	409	27	164	256	901
Reinstated	—	—	1	3	5	—	27
Transferred to	—	169	268	4	96	—	537
Total additions for 1912-13	—	215	680	86	260	253	1,474
Deductions during year:—							
Deceased	—	15	5	4	—	5	29
Resigned	—	21	86	63	—	57	167
Lapsed	—	18	49	10	—	117	194
Transferred from	—	—	144	104	—	269	557
Total deductions for 1912-13	—	54	284	171	—	468	927
Totals at May 1st, 1913	7	1,549	8,355	671	260	1,062	7,084

During the session there were 14 general meetings and 61 meetings of Local Sections. Some 200 members took part in the summer meeting at Glasgow.

It is announced, in accordance with the statement which we have already published, that the *Journal* will be issued fortnightly from December to July, and will be of quarto size; in addition to the papers and discussions now published in the *Journal*, it will contain notices of meetings and other communications from the Council to the members.

Particulars are given of the facilities for experimental demonstrations which are now available in the lecture theatre, including gas, water, and various electrical supplies.

Arrangements have been made for the interchange of the privileges of membership with the American Institute of Electrical Engineers.

Provision has been made for the organisation of research to prevent overlapping and to promote research in selected subjects.

The Institution has joined with other British and American engineering societies in raising a sum of £1,650 for a memorial window to Lord Kelvin in Westminster Abbey, which will be completed by the end of June.

The Benevolent Fund at the end of December amounted to £4,612.

The accounts are presented in a new form, showing more clearly than before the margin to the good on the year's working, which last year amounted to £1,238, a decrease of £365 as compared with the previous year. The mortgages had been reduced by £652 from £36,274 to £35,622. The assets amounted to £110,368 against liabilities of £45,151, leaving a balance of £65,217, an improvement on last year of £2,813.

The formation of a lending library has been sanctioned by the Council, and progress is being made with the organisation of the museum.

**I.E.E. (STUDENTS' SECTION).**—The report of the Committee for the Session 1912-13 states that in London the average attendance at the 11 meetings has been about 36, the highest recorded being 51. At Manchester there were eight meetings, with 38 average attendances, and at Glasgow five meetings, with 15 average attendances. At Newcastle nine meetings were held. It was decided not to hold a summer tour last year. Arrangements are, however, being made to hold a tour this year from July 2nd until July 5th in Newcastle and the district.

**I.E.E. (YORKSHIRE LOCAL SECTION).**—At the annual meeting of the Section, held at Leeds on the 14th inst., the following officers were elected:—Chairman, Mr. W. B. Woodhouse; vice-chairmen, Mr. H. H. Wright and Dr. R. Pohl; hon. secretary, Mr. Jno. D. Bailie; for the four vacancies on the Committee, Messrs. W. M. Rogerson, H. A. Nevill, W. Lang, and F. J. Lowe were elected.

**I.E.E. (SCOTTISH LOCAL SECTION).**—This Section has arranged to hold its annual summer outing, on Tuesday, June 17th. The party will leave Central (Low Level) Station, at 11.9 a.m., and lunch will be provided at the Invernaid Hotel, at 2 p.m. On the return journey, the steamer will leave Invernaid at 6.45 p.m., a substantial tea being served on board. Members so desiring will be shown over the works of the Glasgow Corporation water department, at Loch Arklet.

**JUNIOR INSTITUTION OF ENGINEERS.**—On the twenty-ninth anniversary of the foundation of this Institution, on Monday, June 30th, at the Institution of Electrical Engineers, Victoria Embankment, the second Gustave Canet Lecture will be delivered by Dr. Dugald Clerk, F.R.S., who has chosen as his subject "The Working Fluid of Internal Combustion Engines." The late M. Gustave Canet (past president of the Institution of Civil Engineers of France) was president of the Junior Institution of Engineers in 1907-8, his death occurring at the close of his term of office. In accordance with a wish he had expressed, Madame Canet, MM. Paul and Albert Canet, and their families, presented a sum of money to the Institution to form a Gold Medal, in commemoration of his presidency. This Gold Medal is awarded quadrennially to an officer or Member of the Institution invited by the Council to deliver a lecture on the subject of importance to the engineering and scientific world. The first award was made in 1909, the lecture on "The Engineering of Ordnance" being delivered by Lieut. (now Sir) A. Trevor Dawson, R.N., M.Inst.C.E., M.I.Mech.E., president of the Institution 1912-13), who will preside on the occasion of Dr. Dugald Clerk's lecture.

**INSTITUTION OF MINING ENGINEERS.**—The general meeting will be held in London (Burlington House) on Thursday, June 5th. Among the papers to come under consideration is one by Mr. B. Welbourn on "Insulated and Bare Copper and Aluminium Cables for the Transmission of Electrical Energy, with Special Reference to Mining Work." Members are invited to attend the Mining Machinery Exhibition at the Agricultural Hall, Islington, after the general meeting. At night the Institution dinner will be held at the Waldorf Hotel. Friday will be devoted to an excursion to the Chingford Reservoir.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS (WEST OF SCOTLAND BRANCH).**—The annual business meeting of this Branch was held last Friday in the Royal Technical College, Glasgow. Mr. Matthew Brown, general manager of the Banknock Coal Co., presided. It was reported that the Branch was continuing to make gratifying progress both numerically and financially. Office-bearers were elected for the ensuing session, as follows:—President, Mr. Matthew Brown; vice-president, Mr. A. B. Muirhead, Lenzie; secretary, Mr. David Martin, 45, Hope Street, Glasgow; and treasurer, Mr. D. Landale Frew, Glasgow. It was announced that arrangements were being made for a joint excursion with the Scottish Branch of the National Association of Colliery Managers.

**AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—The spring meeting of this Society has been held at Baltimore this week, from May 20th to 23rd. Among the papers coming under attention were the following:—"Cost of Upkeep of Horse-drawn Vehicles against Electric Vehicles," by W. R. Metz; "Present Operation of Gas Engines using Blast Furnace Gas as Fuel," by C. C. Sampson.

**A Novel Shooting Match on the Life Target.**—On Monday last, a team composed of various members of the Electrical Press, was defeated at a shooting competition by a team of precision marksmen from Messrs. Siemens Bros. Yet the Press men were not altogether to blame, for it is the characteristic of the Press representative that he never sheds his journalistic instinct, and it was hardly to be expected that he should give his undivided attention to heads and barnacles and the like when it is explained that this shoot took place in the private range of Messrs. Life Targets, Ltd., at 12, Bow Street, W.C., the company that is handling the interesting kinematograph target that has already been described in these columns. This shoot was doubly interesting in that it constituted the first animated target competition that has been held as yet, and afforded a most interesting contrast between the methods and achievements of the peep-sight school of bull's-eye marksmen and the open-sight snap-shooting school. The shoot in question started with ordinary bull's-eye targets, the indicating or marking device only of the Life Target system being employed, and subsequently each man was confronted with an animated picture of a leaping springbok, at which he had to fire his dozen rounds from a Winchester repeater in under a minute. Modern warfare will undoubtedly call for quick, accurate sharp shooting, and the results of this shoot gave one furiously to think that trained men, who can do so well with a bull's-eye target, miss so

often at running game. For the benefit of our readers, and at the risk of repetition, we would explain that in the life-target system one fires at an animated picture, and at the instant of firing this stops dead, and one is able to see the result of one's effort, be it hit or miss, by virtue of a small point of light, which is caused by the bullet piercing the screen and allowing a strong light that is behind it to penetrate the hole. After about one-third of a second this hole is automatically closed, and the picture resumes motion ready for the next shot. Mr. D. G. M. Hume, A.M.I.E.E., who, on behalf of the company, placed the range at the disposal of the teams, and explained the technical workings of the system, told us that from his point of view the competition constituted a most interesting object lesson in support of the very claims and arguments the company are daily advancing as to the real necessity, as well as attractiveness, of life targets. Everybody went away full of the unusual and novel competition they had been privileged to take part in, not unconscious of the fact that they were the pioneers of inter-team shooting on the new target.

**The I.M.E.A. Meeting.**—The official programme of the convention to be held in London on June 17th, 18th, 19th, 20th and 21st, has now been issued, and follows closely the preliminary announcement given on page 565 of our issue of April 4th. At the Wednesday meeting, open to members and delegates only, the subjects for discussion are the "I.M.E.A. Bill," and "Heating and Cooking." On Thursday the special train to Kingston leaves at 9.30 a.m., and the meeting commences at 10.15, these times being earlier than originally announced.

We note with satisfaction that a demonstration of battery-driven vehicles will be given after this meeting, at which a paper on "Electric Vehicles" is being read. We also notice that the hoped-for visit to the Chingford pumping station, to see the Humphrey pumps installed there, has been arranged for, the time of departure from the I.E.E. being 9.30 a.m. All the London excursions start from the I.E.E., where also an exhibit of cooking, heating and other electrical appliances will be held during the Convention. Tickets for the various functions must be obtained *in advance* from the Secretary, 28, Bedford Square, W.C.

**For Sale.**—The L.C.C. invites tenders for the purchase of two 3,500-KW. steam alternators and two 150-KW. Belliss sets. See our advertisement pages in this issue.

**Fatality.**—A correspondent says that at Oakbank Oil-works, West Calder, Mr. Thomas Penrtherer, foreman plumber, was killed by coming in contact with a live electric wire.

**Copper.**—Mid-monthly returns (May 15th), as set forth in Messrs. H. R. Merton & Co.'s statistical circular, show increased activity in the market for this metal. That the visible supplies still stand at 30,243 tons, being a decrease of only 194 tons on the quantity for the end of April is apparently due to the increase in French stocks of 794 tons, English stocks having decreased by 588 tons, and the quantity afloat by 400 tons. Total European stocks, including Rotterdam, Hamburg, and Bremen, are less by 1,127 tons, and the estimate for other European ports reckons them as holding 400 tons less than for April 30th. European arrivals from North America are strong at 23,059 tons. England and France from Spain and Portugal receive only 308 tons, but from other countries well above the average quantity. Shipments from Chile show small, and Australia under the average. The total deliveries, at 30,052 tons for the half-month, are distinctly high. American stocks for the end of April were 12,822 tons less than for the end of March—a large reduction. The total visible supply, including Holland and Germany, stood at 77,556 tons for April 30th, a reduction of 14,068 tons for the month, a reduction not equalled, or approached, since May, 1912, during which month stocks were lowered 14,199 tons.

**Old Centralians.**—A lawn tennis match between the Old Centralians' Tennis Team and the City and Guilds (Engineering) College Lawn Tennis Club, was played on Saturday at the latter club's ground, North Ealing. The Old Students were beaten by 5-4. The score was as follows:—

Regnard (Capt.) and Saurback lost to R. Burton (Capt.) and H. T. M. Kent, 3-6, 7-5, 4-6; beat J. V. and P. V. Dupré, 2-6, 6-2, 6-4; beat A. P. Dicksee and R. A. Mack, 6-1, 6-1.

Harris and Moore beat Burton and Kent, 6-2, 7-5; lost to J. V. and P. V. Dupré, 1-6, 2-6; beat Dicksee and Mack, 6-1, 6-3.

Ryan and Mannel lost to Burton and Kent, 3-6, 1-6; lost to J. V. and P. V. Dupré, 0-6, 4-6; beat Dicksee and Mack, 6-2, 6-3.

A return match will be played on June 7th.

Old Students of the College who are good tennis players are requested to communicate with the Match Captain (Mr. Richard Burton, c/o Messrs. C. W. Burton Griffiths & Co., 1-3, Ludgate Square, Ludgate Hill, E.C.)

## OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.)

**Central Station Officials.**—The Whitehaven T.C. on May 14th discussed a recommendation that instead of receiving an increased salary, the electrical engineer (MR. B. SANKEY) should be paid a bonus on the trade profits of the undertaking, the exact basis on which to calculate the bonus to be considered by a Sub-

Committee. Mr. W. Hinde said it would be an injustice to Mr. Sankey to pass the recommendation, as there could be no profit for a couple of years until the deficit of £1,338 was wiped out; he hoped that Mr. Sankey would have an increase before two years' time. Other members took the same view, and the matter was referred back to the Water and Lighting Committee for re-consideration.

The Watford U.D.C. has appointed MR. CHAS. E. D. GREENHALGH, of the Malvern U.D.C. electricity staff, as chief assistant electrical engineer.

The General Purposes Committee of Norwich T.C. has recommended that the salary of Mr. F. M. LONG, city electrical engineer, be increased from £600 to £700 a year.

MR. WILLIAM TRAVIS, having accepted another appointment, his resignation of the post of chief assistant electrical engineer has been accepted by the Hastings Corporation. The vacancy has been filled by the appointment of MR. A. J. RYAN (assistant electrical engineer at Gillingham). The salary is £150, rising by annual increments of £10 to £180 per annum.

MR. G. P. SHALLCROSS has been appointed Corporation electrical engineer at Birkenhead.

A Nottingham paper says that MR. F. H. COMFORT, who for the past ten years has been the mains superintendent of the Nottingham Corporation's electric lighting department, is going abroad permanently. Mr. Comfort, before serving under the Corporation, was for 22 years with the National Telephone Co., and for a time was their chief inspector.

MR. R. J. COULSON BRYANT has resigned his position at Portland Dockyard power station to take up the post of shift engineer at the Lowestoft Corporation electricity works.

The Worcester T.C. has promoted MR. H. H. SMITH to the position of works superintendent at the electricity works, at a salary of £150.

MR. FRANK TIMMS, of Newcastle, has been appointed installation engineer to the Tynemouth municipal undertaking.

At the fifth annual general meeting of the Barrow and District Association of Engineers, held on Monday last, MR. H. R. BURNETT, electrical engineer to the Barrow Corporation, was re-elected president.

**Tramway Officials.**—The tramway staff and employés at Croydon have presented an 18-carat gold hunter watch and a jewelled and gold stud to MR. H. B. HARRIS, who recently resigned the post of tramways engineer to the Corporation.

**General.**—The *Times* states that the President of the Local Government Board has appointed MR. H. H. LAW, M.Inst.C.E., as chief engineering inspector to the board, in succession to Mr. George Waller Wilcock, C.B., retired.

ALD. JAS. HENRY ASTON, chairman of the Borough Tramways Committee at Huddersfield, has been appointed a Justice of the Peace for the borough.

It is stated that DR. GISBERT KAPP will be President of Section G (Engineering) at this year's meeting of the B.A., Mr. Aspinall having had to withdraw owing to ill-health.

Congratulations to MR. J. C. DENISON DENISON-PENDER on his election to the House of Commons as the member for Newmarket. The new member is the son of Sir J. Denison-Pender and a grandson of the late Sir John Pender. He is only 31 years of age, but he goes to Westminster with a considerable knowledge of submarine telegraph matters. Not only is the name of Pender a household one in telegraph circles, but Mr. Denison-Pender has had personal and practical experience in submarine telegraph work, both in cable-laying operations and as a director of several well-known companies.

MR. F. R. BATTY has resigned his position as manager to Messrs. R. P. Hulton & Co., London, to take up a position in Manchester.

**Obituary.**—MR. HORATIO A. FOSTER.—We regret to read in the *American Electrical Review* of the death, which occurred suddenly one afternoon in April in a New York subway station, of MR. H. A. Foster, who had been connected with electrical affairs in the States since 1884, having been associated with the Daft Electrical Co., the Thomson-Houston Electric Co., and the United States Census Office (electrical department). Twenty years ago he was editor of an American paper known as *Electrical Industries*, and he also became associated with Prof. George Forbes and the Niagara Falls Power Co. Later his power station and electric traction work brought him into close relation with L. B. Stillwell and B. J. Arnold, and in recent years he had devoted himself more to the valuation of public utilities and the study of traffic conditions. Many readers, doubtless, are familiar with Foster's *Electrical Engineer's Pocket Book*, of which he was the editor.

MR. J. G. FIEGEBEN.—The death occurred on May 11th, after several weeks' illness, of Mr. John George Fiegehen, founder and principal of the Bedford Engineering Co., crane makers, of Houghton Road, Bedford, a business he established about 26 years ago. He was 62 years of age.

PROF. HEINRICH WEBER.—The *Times* Berlin correspondent reports that Prof. Heinrich Weber, Ordinary Professor of Mathematics at Strassburg University since 1894, died on Saturday, aged 71 years.

MR. H. BROWN.—The death occurred on Sunday, after a brief illness, of Mr. Henry Brown, who was for many years on the staff at the Norwich Corporation electricity works. He was 65 years of age.

**Will.**—The late MR. W. M. MUSGRAVE, managing director of John Musgrave & Sons, Ltd., of Bolton, left £2,666 gross and £238 net personally.

## NEW COMPANIES REGISTERED.

**Nitrogen Products and Carbide Co., Ltd.** (128,982).—Registered May 15th, by A. Blackman, 194, Oresham House, Old Broad Street, E.C. Capital £2,000,000 in 11 shares. Objects: To acquire (1) from Nitrate Products, Ltd., the rights for the whole world where patents have been granted (except Rhineland and Westphalia) for the Ostwald Catalytic process for the production of nitric acid and nitrate of ammonia, together with works at Vilvorde (Belgium) having a capacity of about 3,000 tons of nitrate ammonia per annum, and the business of that company as a going concern, with the benefit of subsisting contracts; (2) from Dettliff Power Co., Ltd., the water-power in Iceland known as "Dettliff," and which, when harnessed up, should be capable of generating about 410,000 z.h.p.; (3) options for the purchase of water-power in Norway, known as Aura, Toka and Bleskstad-Bratland, estimated to yield, when harnessed up, about 600,000 z.h.p., and which options the company intend to exercise; and (4) the whole of the share capital of Nitrogen Fertilisers, Ltd. (£220,000), whose works at Adda (Norway) and Alby (Sweden) are at present producing (under licence granted in 1912) about 40,000 tons of cyanamide per annum, to adapt agreements with the said companies, to carry on the business of artificial fertilisers, manufacturers of and dealers in carbides, cyanamides, nitrogen, nitric acid, sulphuric acid, ammonia, sulphate and nitrate of ammonium, cyanamides nitrolim (calcium cyanamide), sulphur, synthetic rubber and chemicals of all kinds, soaps, starches and other products, chemical manures and fertilising substances, electrical, gas and mechanical engineers, tool makers, founders, generators of power by means of water, heat, light, electricity or otherwise, &c. The signatories (with one share each) are:—S. H. Boileau, Sutherland House, Surbiton, manager; T. A. Day, 3, Heather Road, Grove Park, Lee, S.E., clerk; A. H. Barnett, 99, Woodside Gardens, Bruce Grove, N., clerk; G. W. Parsons, Hill View, Oakleigh Road, New Southgate, N., clerk; J. C. Macleure, 99, The Drive, Fulham Park Gardens, S.W., manager; H. C. Harley, Norbury, Sidney, solicitor; M. A. Carson, 31, Princes Avenue, Alexandra Park, N., accountant. Minimum cash subscription, seven shares. The first directors (to number not less than two or more than nine) are A. E. Barton, 28, Charles Street, Berkeley Square, W., chairman (chairman, Alby United Carbide Factories, Ltd.); Albert Vickers, 14, Cadogan Square, W. (chairman, Vickers, Ltd.); Sir Richard D. Awdry, K.C.B., 65, Victoria Road, Kensington, W. (director, Nobel Dynamite Trust Co., Ltd.); Sir Vincent Caillard, 49, Half Moon Street, Piccadilly, W. (director, Vickers, Ltd.); C. H. Maguire, 33, Old Broad Street, E.C. (director, Alby United Carbide Factories, Ltd.); Major C. H. Campbell, Highwood House, Leominster (director, Nitrogen Fertilisers, Ltd.); and Dr. A. Petersen, Adda, Norway (local director, Alby United Carbide Factories, Ltd.); qualification (except first directors), £500; remuneration, £50 each per annum (chairman, £1,250 and 2½ per cent. per annum of the surplus net profits of the company after payment to the shareholders of a dividend of 10 per cent., divisible. Registered office, Winchester House, Old Broad Street, E.C.

**H. Langdon Down, Ltd.** (128,902).—This company was registered on May 9th, with a capital of £2,000 in 11 shares (1,000 "A" 7½ per cent. cumulative preference, 998 "B" 10 per cent. cumulative preference and 2 ordinary), to carry on the business of manufacturers of and dealers in gas and electric fittings and apparatus, and appliances for lighting, extinguishing and controlling at a distance gas, electric or other illuminants, &c. The subscribers (with one share each) are:—H. L. Down, 39, Arundel Place, London, manager; T. B. Shilton, 46, Cameron Road, Ilford, engineer. Private company. The number of directors is not to be less than two or more than five; the first are H. L. Down (chairman), and T. P. Shilton (both permanent). Registered office, 115-117, Cannon Street, E.C.

**Times Electric Co., Ltd.** (128,964).—This company was registered on May 14th, with a capital of £3,000 in 11 shares, to carry on the business of manufacturers and dealers in electrical appliances and machinery, electrical and general engineers and contractors, builders, suppliers of electricity, &c. The subscribers (with one share each) are:—C. H. Paterson, 19, Thornton Road, Barnet, Herts, clerk; L. E. Tucker, 5, Noel Road, North Acton, W., clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first; remuneration, one guinea each per meeting attended (chairman, 10s. 6d. extra). Registered by C. R. Enever, Broad Street House, E.C.

**Scientific Researches Co., Ltd.** (128,910).—This company was registered on May 9th, with a capital of £150 in 11 shares, to promote scientific research and turn the same to account commercially, &c. The subscribers (with one share each) are:—E. Martin Harvey, 33, Lee Park, Blackheath, S.E., merchant; A. Poultier, 19, Finsbury Circus, E.C., company secretary. Private company. The number of directors is not to be more than five; the subscribers are to appoint the first. Registered office, 19, Finsbury Circus, E.C.

**Kentish Town Motor and Electrical Engineering Co., Ltd.** (128,921).—This company was registered on May 10th, with a capital of £750 in 11 shares, to carry on the business indicated by the title. The subscribers (with one share each) are:—F. Rosser, 31, Prince of Wales Road, Kentish Town, N.W.; E. Jackson, 13, Hadley Street, Kentish Town, N.W., clerk. Private company. The first directors are F. Rosser and E. Jackson. Registered office, 114, Kentish Town Road, N.W.

**Cable Construction Syndicate, Ltd.** (128,872).—This company was registered on May 8th, with a capital of £100 in 11 shares, to carry on the business indicated by the title. The subscribers (with one share each) are:—J. Storrs, Fern Bank, Stalybridge, builder and contractor; W. Gornall, Ellesmere Street, Bolton, contractor; J. Dolan, Napier Street, Warrington, builder; T. A. Locan, 23, Strutt Street, Manchester, managing director of a company; C. Locan, 23, Strutt Street, Manchester, managing director of a company. Private company. The first directors are J. Storrs, W. Gornall, J. Dolan, T. A. Locan, G. Locan and F. Woods; secretary, T. A. Locan. Registered office, 23, Strutt Street, Manchester.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Coast Development Corporation, Ltd.**—Mortgage on electric lighting station at Walton-on-the-Naze, with plant and other fixtures used in connection therewith, beneficial interest and goodwill of business carried on thereat, electric lighting poles, cables, wires, &c. and benefit of Walton-on-the-Naze Electric Lighting Order, 1909, dated April 30th, 1913, to secure not more than £2,000, of which £1,550 is now advanced. Holders: Misses E. B., E. F., M. A., E. M. and G. B. Taylor, all of Grove Park, Bromley, Kent.

**Farlington Electric Light and Power Co., Ltd.**—Particulars of £1,500 debts, created December 2nd, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £100. Property charged. The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Albert Green, Ltd.**—Particulars of £2,000 "B" debentures, created May 5th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged. The company's undertaking and property, present and future, including uncalled capital. No trustees.

**South London Electric Supply Corporation, Ltd.**—Issue on April 15th, of £1,500, and on May 6th, 1913, of £1,771 debentures, parts of a series of which particulars have already been filed.

**Transvaal Hydraulic Power Syndicate, Ltd.**—A memorandum of satisfaction in full on April 26th, 1913, of debentures dated October 27th, 1911, securing £9,000, has been filed.

**James Keith & Blackman Co., Ltd.**—Issue on May 5th, 1913, of £270 debentures, part of a series of which particulars have already been filed.

**Rawlins Bros., Ltd.**—Mortgage and Land Registry Charge on certain land and premises in Pembroke Mews, Helgrave Square, W., both dated May 10th, 1913, to secure £10,000. Holders: Alliance Assurance Co., Ltd., 1, Bartholomew Lane, E.C.

**Electrical Trades Supply, Ltd.**—Particulars of £1,250 debentures, created May 9th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled and unpaid capital. No trustees.

**Silent Electric Clock Co., Ltd.**—Particulars of £800 debentures, created May 5th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future. No trustees.

## CITY NOTES.

## Sunderland District Electric Tramways, Ltd.

The annual meeting was held at Winchester House, E.C., on Tuesday.

MR. H. R. HOGG, in moving the adoption of the report (see ELECTRICAL REVIEW, page 822), congratulated the shareholders on the fact that the property was now under their own management, as it was handed over by the Receiver the day after the date of the accounts. The scheme of arrangement with the prior lien and first mortgage debenture-holders was of such a nature that, while settling the claims on an equitable basis, it reduced the fixed charges to a point which should be covered without difficulty by the annual income, and leave a balance in hand for the interests which successively followed after. The outgoings had been under the control of the late Receiver for two years and five months; but as he was unable to spend any of the income on the renewal of cars, most of them were taken over in a very bad state. To remedy this, an order for 10 cars was put in hand at once, and these had been delivered and were now running, and a further six cars had since been ordered. The accounts under review had to allow for full interest on three sets of debentures, and this, with the expenses of the Receivership, increased the old balance to the debit of profit and loss by the sum of £1,175. For some months in the early part of the year the receipts were affected by a strike of colliers, but in the latter half of the year they did fairly well, and at the end the accounts showed a growth of traffic receipts of £649, or over 7 per cent. increase on those of the previous 12 months. During the 26 weeks which had elapsed since the closing of the books, the traffic net receipts had increased by £1,857 over the corresponding period of the previous year. Of course, as he had said, the previous period was affected by the strike, and during the present period there had been the reduction in the charges, but still there had been a continuous increase in the receipts from year to year. The building of houses along the line of route had been steadily increasing, which meant probably that the increase would continue in normal times. He might remind them of their position when the board resumed the control of the property. The cash accumulated by the Receiver amounted to £26,417, but provision had to be made for the payment of the old prior lien bonds, and £10,500 worth of these at 105 and interest brought the total to £11,462. Other debts, amounting to £6,735, had to be paid, making in all £18,197. Thus from that and the sale of 20,000 new prior lien bonds, the board had for the necessary improvement of the rolling stock and line just about £26,000. This would enable them to provide the necessary equipment and make improvements for the better working of the line and the saving of expenses. The standing charges, i.e., the interests which had to be paid every half-year, were reduced to the interest on £110,000, as against the interest which previously had to be paid on £195,500. £40,000 of the first mortgage bonds and £20,000 second mortgage bonds, with the interest accrued during the receivership, had been replaced by bonds which only received interest if earned; but the prior lien bonds were increased by £9,500. He was sorry to say that the company from whom they obtained their power had been taken over by the debenture-holders and sold to another company, and thus they were obliged to make a new arrangement for the supply of current. They were not, perhaps, in such a good position for bargaining as they were at the beginning, but they would do their best to make a good bargain, because, if necessary, they could always erect their own generating station. The present balance-sheet was very complicated, because of the large amounts now standing to the debit of profit and loss, but by reducing the share capital and writing off these debit balances and other assets which were now only nominal ones, the whole thing could be simplified, and the board proposed to bring that before the shareholders at a later date.

MR. R. TAYLOR seconded the motion.

Answering MR. DE PAIVA, the CHAIRMAN said the debentures were reduced to 75 per cent., and 25 per cent. was given to the debenture-holders in income bonds, which would only receive interest if it was earned.

Mr. DE PAIVA said he understood there was some arrangement came to with the income-tax people. The debenture-holders were to have this 25 per cent. allocated to them, but then there was some deduction made by arrangement with Somerset House.

The CHAIRMAN said the matter had not been settled.

Mr. DE PAIVA said he was an income-tax commissioner, and had had to deal several times with appeals by people who had had shares allotted to them representing arrears of dividends, and for which they said there was no market at all. They allowed an appeal like that, and Somerset House was pressing the company for cash they should refuse to pay.

The CHAIRMAN said the board had not paid anything so far, but they were discussing the matter.

Mr. DE PAIVA said the company should say to Somerset House, "These shares are of no value. If you value them at anything, will you buy them?"

The report was then adopted.

### West Coast of America Telegraph Co., Ltd.

SIR J. DENISON-PENDER, K.C.M.G., presided on Tuesday at Electra House, E.C., over the sixteenth ordinary general meeting of the above company.

In moving the adoption of the report (see ELECTRICAL REVIEW, p. 823), the CHAIRMAN said that the gross receipts for 1912 were £53,738, against £53,891, showing a decrease of £153, but when he pointed out that for the eight months of the year ending December, 1912, they were working at a reduced rate of something like 33 per cent. on the old rate—that was to say, a reduction from 3s. 7d. a word to 2s. 9d.—he thought a decrease of only £150 was a very satisfactory item in the accounts. The working expenses for 1912 were practically the same as in 1911, showing a slight decrease of about £44. Salaries showed an increase of £1,090, rent and taxes an increase of £200, travelling expenses an increase of £265, and stationery an increase of £200. This was, of course, a considerable sum, but was counteracted by the cost of maintenance of cables and land lines, which in 1911 cost £14,300, and in 1912 only £12,162. Therefore, the £2,000 gained on this had gone towards the reduction of the general expenses. These had been carefully gone into, but it was impossible to work the company efficiently on less salaries, &c., which must increase with the increase of the traffic. The number of days on which the cable was down in 1912, when they lost traffic, was 23, as compared with 59 in 1911, which was also a satisfactory feature. A shareholder had written to him pointing out that the expenses of the company had nearly doubled in the last 15 years. This was perfectly true, but it was pretty much the same thing with every company, whether it was a cable or manufacturing company. The increase in expenses had been very large, because wages and the cost of materials had gone up, but at the same time they must not overlook the fact that the traffic during this period has also more than doubled. Another shareholder had written with regard to the future, and asked what difference the Panama Canal would make to them. That, of course, they could not say. At any rate, it would be made a new highway through Central America, and he could not see that it could do any harm to the West Coast of America. It certainly ought to develop that part, and, if anything, the company ought to benefit by the opening of the Canal. In conclusion, the Chairman proposed the adoption of the report, with the declaration of a dividend of 2½ per cent.

SIR ALBERT J. LEPPOC CAPPEL seconded the motion, and it was carried.

A hearty vote of thanks was accorded the board and staff.

### Eastern Extension, Australasian and China Telegraph Co., Ltd.

THE half-yearly meeting was held on Tuesday at Electra House, E.C., Sir J. Wolfe Barry presiding.

In proposing the adoption of the report (see ELECTRICAL REVIEW, p. 822), the CHAIRMAN said that the gross receipts for the half-year amounted to £379,000 against £359,000 in the corresponding six months of 1911; an increase of £20,000. Nearly £4,000 of that increase was derived from additional reserve fund investments, and the remainder (£16,000) was due to growth of traffic spread over the whole of the company's system. The working and other expenses amounted to £154,000, showing a decrease of £5,000, partly due to the expenses attending maintenance of cables having been nearly £2,000 less last year than in 1911, and partly to the general expenses of stations having been debited in 1911 with the cost of new relay and other apparatus, for which there was no corresponding item in the accounts for the past half-year. Comparing the figures for the whole year the following satisfactory results were seen:—The gross revenue for 1912 amounted to £747,000, against £689,000 for 1911, showing an increase of £58,000, whilst the gross expenditure for the past year was within a few hundred pounds of the expenditure for 1911. Since December last the depreciation of investments, unfortunately, had further increased by about £17,000, which would be dealt with during the current year. The cable which the Eastern Telegraph Co. had arranged to lay between Aden and Colombo to connect with their new cables would probably be completed towards the end of the current year, and their further sections between Penang and Hong Kong were expected to be laid and opened for traffic in the

early part of 1914. The cost of their new cables would amount to about £750,000, which would be charged against the general reserve fund. The revenue balance carried forward for 1912 amounted to £27,000, against £23,000 carried forward in 1911. The chairman then referred to the proposed new articles of association, and remarked that in addition to the necessary changes to bring them up to date, it was proposed to restrict the directors' borrowing powers, which at present were unlimited, to two-thirds of the nominal amount of the capital. Provision was also made for the appointment and payment of committees of the directors—such payment not to exceed £1,000 per annum without the previous sanction of a general meeting. The new articles also provided for the holding of annual instead of half yearly meetings.

Mr. F. A. BRYAN seconded the motion.

The CHAIRMAN, in reply to a shareholder, who suggested that in view of the flourishing condition of the company the directors might increase the dividend, said he believed their policy of putting their money to reserve was one which on the whole commended itself to the shareholders. By that means they had been able to maintain a steady dividend and to undertake very large extensions of their cables, thus giving the company stability and ability to meet the demands which were constantly being made upon them for lower rates, and a consequent increased volume of traffic passing over their cables. The directors still considered that policy to be the right one, and that it would be a great mistake, especially at the present time, to pay a higher dividend. With regard to wireless telegraphy, there had been nothing in the development of that system during the past year which in any way affected the question. Of course everybody knew that it was the intention of the Government to set up the system in various parts of the globe, but as to whether in view of wireless telegraphy the company was wise in extending its cables, the view of the board was that it would never do for them to be caught napping by finding themselves in the position of not having sufficient cables to do their work. They could not hold their hands and wait for the extension of wireless telegraphy, which might or might not compete with them for the traffic. It would be suicidal to pause in any way and let the traffic which they had fall behind for want of proper cable facilities.

The reported was adopted, and subsequently the new articles of association referred to by the chairman were approved.

### Prospectus.—Nitrogen Products and Carbide Co., Ltd.

—The list was to close on 21st inst. in an issue of 1,231,000 shares of £1 each, offered at par. The company has been formed to acquire the undertakings particularised in our "New Companies" section to-day. The principal objects of the company are to manufacture carbide, cyanamide, nitric acid, nitrate of ammonia, sodium cyanide, and other nitrogenous products. The company intends at once to proceed to harness up about 100,000 H.P., and to install plant, embodying furnaces of a type entirely different from those hitherto used at Odda, and capable of producing about 200,000 tons of cyanamide per annum. Of this quantity it is intended that 100,000 tons shall be utilised for conversion into about 50,400 tons of nitrate of ammonia at works to be erected adjoining the cyanamide factory, and that of the remaining 100,000 tons of cyanamide, part shall be used in the manufacture of sodium cyanide and the balance shipped to various parts of the world, where plants will be installed for converting it into nitric acid.

### Kalgoorlie Electric Power and Lighting Corporation, Ltd.

—The directors report that for the year to December 31st the decrease in the profit is chiefly due to the damage done to the plant and transmission lines by the violent cyclone which occurred in February of last year. The direct cost of rebuilding the damaged works, including new material, amounted to £2,436; the actual loss of revenue and the extra cost of operating during the reconstruction of the condensing plant amounted to about a further £2,500. The amount of power sold was larger than in any previous year. In accordance with the usual custom, £7,500 has been placed to reserve for depreciation and renewals, bringing that account up to £38,000. The balance to be carried forward is £992. The directors much regret that the financial position does not permit them to recommend the payment of a dividend on the ordinary shares. A new unit of plant has been sent to Kalgoorlie and is now being erected, and will be in operation during the latter half of this year. It consists of a 1,080-B.H.P. Parsons turbine and a 750-kw. alternator. The synchronous motors, referred to last year, have also been sent out. When these new items of plant are working, higher efficiency will be attained, resulting in a lower cost per unit of power.

### Traction and Power Securities, Ltd.

—The directors report that the profit and loss account for the year 1912 shows a credit balance of £31,259, plus £9,996 brought forward, making £41,255 to be dealt with. The directors have transferred £30,000 to investment reserve account, leaving a balance of £11,255 to be carried forward. The investment reserve account now stands at £190,000. The *Financial News* says that the company's loan to the Clyde Valley Electrical Power Co. has, since the date of the balance-sheet, been repaid out of the proceeds of an issue of preference shares made by the Clyde Valley Co. In view of the liquidation of this loan, the directors have been approached by an influential body of shareholders with the request that a portion of the paid-up share capital be repaid. After full consideration, the board have resolved to recommend the repayment of £2 per share on the issued shares, the nominal value of such shares being at the same time reduced from £10 to £8 per share.

### Coventry Electric Tramways Co.

THE directors' report for 1912 stated that during the year the company received from the Coventry Corporation payment of the purchase price of the undertaking, in accordance with the arbitration award, so that the asset appearing in the last balance-sheet, under the head of construction and equipment account, does not appear upon the present balance-sheet. The amount received from the Corporation was £202,132, and sundry other receipts amounting to £87, stock reserve as per last balance-sheet £358, making total capital receipts of £202,578; deduct capital outlay as per last balance-sheet £201,186, leaving net surplus upon construction and equipment account of £1,392. Out of the funds received the company has paid off the liabilities appearing in the 1912 balance-sheet, including £34,000 on mortgage bonds, £21,470 new General Traction Co.'s account and sundry other creditors. The income received during the year under review amounts to £6,596. After deducting mortgage interest and other charges, there is left a profit of £5,440, to which is added £250 brought forward, making £5,689 available for distribution as dividend. The directors recommend that this amount be appropriated as follows:—£5,525 to the payment of a dividend at 8s. 6d. per share, and £164 carried forward. In January, 1913, the directors refunded to the shareholders by way of a return of capital £129,350, amounting to £9 19s. per share, in accordance with the resolution passed at the extraordinary general meeting held on November 8th, 1912. This still leaves a balance out of the purchase money which will in due course be distributed amongst the shareholders.

### Potteries Electric Traction Co., Ltd.

THE annual meeting was held on Monday, at the Electrical Federation Offices, Kingsway, W.C., Mr. G. F. M. Cornwallis-West presiding.

THE CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 818), congratulated the shareholders upon the result of the year's working, especially considering the serious effects of the coal strike at the commencement of the year, and the inclement weather of the whole of last summer. Dealing with the capital account, £2,558 had been spent, £1,551 being on account of the improvement and re-construction of the permanent way. He did not want them to go away with the idea that all reconstruction work was paid for out of capital. Where they had to put down a heavier rail, which was a considerable item of expenditure, they had debited that amount—that was the difference between the original cost of the lighter rail and that of the new rail—to capital account. Under all other headings this expenditure had been debited to revenue or to renewals. The traffic showed a decrease which he considered small when they took into consideration the two adverse factors already alluded to. The total amount was only £505. As he informed them last year, the traffic receipts showed up to the commencement of the strike an increase of £790 over those for 1911. At the end of the strike that increase was turned into a decrease of over £2,500, so that, roughly speaking, they lost £3,500. These figures would give them some indication of the probable results of the year's working, but for the labour trouble. On the top of this absolute loss of £3,500, it must be remembered, in considering the revenue account, that an additional burden was thrown upon the staff in the maintenance of the service. Fuel had to be obtained at any price, and in addition to being costly, it was of a very inferior quality; it was even necessary to go to the length of obtaining coal from out-crops in the district, and the energies and resources of the staff during this trying period deserved the highest praise. The parcels receipts continued to show increase, and the advertising receipts remained at about the same figure as the year before. Under the heading of sundry receipts, there was an apparent decrease of some £1,900, but this was entirely accounted for by the different manner in which they were dealing with the sale of scrap material. In past years all cash so received was credited to sundry receipts; this year the value of the scrap sold was credited to the work in hand from which the scrap was taken, as shown in the balance-sheet, where the sum of £2,085 was credited to renewals account. Interest and dividends on their holding in the North Staffordshire Tramways remained the same as last year. On the other side of the revenue account, despite the difficulties under which they were working, their power, running, and parcels expenses, had not increased in total: in fact, they showed a small decrease of about £100, and administration expenses also remained at about the same figure as last year. Repairs and maintenance, after excluding the sum to which he had already referred as realised for the sale of scrap, showed a reduction of £1,464. He wished most emphatically to state that they might not look forward to any reduction in the future in this item of expenditure. In the year 1905 he went very fully into the details of a financial arrangement they were making for the renewal of the permanent way. In that year £2,500 was allocated to be set aside for renewal purposes. Year by year the contributions to that fund had been increased, viz., £3,500 in 1907, £5,409 in 1908, £7,090 in 1909, £7,525 in 1910, £12,000 in 1911, and this year £12,500. That meant they had set aside a sum of £50,000 during the last seven years for renewals. They were able to forecast within certain narrow limits the probable expenditure in the years to come, and in dealing with this point, he thought he should tell the shareholders that they were at present negotiating with the Corporation of Stoke for an extension of their tenure. As they all knew, under the present Act and Light Railway Orders, the tenure of the tramways expired in 1917, and of the light railways in 1932. Negotiations were proceeding, and they would readily

appreciate that they were of a somewhat delicate nature, so that until final terms, or otherwise, were arrived at, it was not advantageous to go more fully into the details. Directly the matter was settled one way or the other, all the shareholders would be apprised of the fact. He mentioned that now, because of its bearing on the amount they proposed to set aside to the renewals fund. If they were able to prolong the tenure, those amounts would be somewhat varied, but he would say this: that in all probability in the next eight or nine years, assuming they came to terms with the Corporation, there would for certainly three or four years be shown a balance carried forward on the debit side of the renewals fund, which would be more than made up a few years afterwards, when they would see a big amount on the credit side. Summarising the result of the year's working they might look upon it in this way: They were able to provide £500 more for renewals; place the same amount to reserve, pay the same dividend on the ordinary shares, and carry forward £136 less than was brought into the account. In other words, despite labour troubles and inclement weather, they were £365 better than in 1911, which was almost a record year for the company. With regard to the present year, the conditions were satisfactory, and there was a very substantial increase in the traffic receipts for this year, as compared with 1912, but they must bear in mind that the period they were dealing with compared with the period last year in which the strike occurred. Still, the receipts were close on £6,000 up, as compared with last year. That was very satisfactory.

MR. S. MEAR seconded the motion, and the report was adopted.

### Swiss Electrical Companies.

*The Akkumulatoren Fabrik Oerlikon, of Oerlikon*, reports that the workshops were satisfactorily employed in 1912, and the turnover increased, particularly in heavy batteries. After placing £5,000 to the depreciation fund, as against £5,400 in 1911, the accounts show net profits of £12,700, as contrasted with £12,400 in the preceding year. The dividend is at the rate of 20 per cent. on a share capital of £48,000, the same as in 1911.

*The Société Franco-Suisse pour l'Industrie Electrique, of Geneva*, reports total receipts from interest, dividends on investments, &c., of £104,000 in 1912, as compared with £95,000 in the previous year. The payment of interest on the loans of £944,000 leaves net profits of £56,000, as against £47,000 in 1911. It is intended to distribute 5 per cent. on the share capital of £1,000,000, this rate contrasting with 4½ per cent. in the preceding year.

*The Schweizerische Gesellschaft für Elektrische Industrie (Swiss Electrical Industry Co.)*, which is an investment trust closely associated with the Siemens & Halske Co., has an ordinary share capital of £800,000 and 4½ per cent. bonds of £1,200,000 and 5 per cent. bonds of £600,000, the last of which were issued in 1912. According to the report for 1912 the gross profits amounted to £136,000, as compared with £102,000 in the preceding year, and, after deducting interest on bonds and defraying general expenses and taxes, the net profits are returned at £69,000, as against £50,000 in 1911. It is proposed to pay a dividend of 7 per cent., being the same rate as in the previous year.

*The Motor A.G. für Angewandte Elektrizität, of Baden (Applied Electricity Co.)*, which is intimately connected with Brown, Boveri & Co., reports an extension of its sphere of activity in the working of, or investment in, electrical undertakings in 1912. The share capital was nominally increased by £400,000 to £1,200,000, the paid-up capital being £916,000, and a further loan of £200,000 at 4½ per cent. was issued, thus raising the loan capital to £1,000,000. As gross profits from the operation of works, installation business and investments, the accounts indicate the sum of £123,000, as compared with £95,000 in 1911. After meeting general expenses, interest on loans and depreciation, the net profits and balance forward total £68,000 as against £53,000 in the previous year. It is intended to pay a dividend of 7 per cent., as contrasted with 6½ per cent. in each of the two preceding years.

The report of the *Elektrizitäts-Gesellschaft Althof, of Basle*, most of whose share capital is held by Brown, Boveri & Co., of Baden, states that the specialisation of production and the division of work among the different works were carried out in 1912, and the way thereby paved towards the ultimate transfer of the Münchenstein shops to Brown-Boveri. The construction of new types of motors was commenced in the spring, and the erection of locomotives was added late in the autumn. During the second half of the year the company was very well employed, and a number of uncompleted orders were brought over into the new year. The realisation of the credit with the former representatives in Italy had been fully effected, and that in the case of the Spanish company had been almost entirely carried out, whilst the liquidation of business in France was proceeding along a normal course. As a result, it had been possible to redeem the whole of the banking credit of £60,000. In addition, the 4½ per cent. loan of £80,000 had been paid off, the Brown-Boveri Co. having made an advance for this purpose. The profits for 1912 amount to £18,900 as compared with £19,500 in 1911, and after allocating £7,000 to depreciation as against £6,800, the balance permits of the payment of a dividend of 4½ per cent. on the share capital of £240,000, being the same rate as in 1911.

**Tramways and General Works Co., Ltd.**—The directors report for the year ended March 31st, a profit, including £151 brought forward, of £1,142. A dividend of 1s. per share is recommended carrying forward £142.

## Mexborough and Rawmarsh Construction Syndicate, Ltd.

THE annual meeting was held at 3, Laurence Pountney Hill, E.C., on Monday, Mr. L. B. Schlesinger presiding.

In moving the adoption of the report (see *ELEC. REV.*, page 819), and the declaration of a dividend at the rate of 2 per cent. per annum, the CHAIRMAN said that the expenses of working amounted to the small total of £13 15s., and the balance of £3,522 was £20 in excess of the dividend received from the Mexborough and Swinton Tramways Co. No charge had been made by the National Electric Construction Co. for the services of secretary, offices, and clerical staff. The directors had again waived their fees. The balance to the credit of profit and loss account was £3,695, compared with £4,517 for 1911, the difference being due to the reduced amount received from the Mexborough and Swinton Tramways Co. by way of dividend. Referring to the accounts of the Mexborough and Swinton Tramways Co., the chairman said that the traffic revenue showed a decrease of £506, which was wholly attributable to the coal strike. When he addressed them on April 15th last year, the traffic receipts at that date showed a decrease of about £400, as compared with the corresponding period of the previous year, and although he expressed the hope that they might make up this deficit by the end of the year, his hopes were not realised. The traffic receipts for the current year up to the 16th inst. showed an increase of £936 over the corresponding period of last year. There was a decrease of £128 in the profit derived from the tramways undertaking, which could be attributed solely to the decrease in revenue, as the working expenses were less than those for 1911. The results of the Rawmarsh electric lighting undertaking were unsatisfactory, as they showed a loss of £211, as compared with a profit of £138 in 1911. On the other hand, the Swinton undertaking showed a profit of £91, against £37 in 1911. Here again, however, the coal strike had hit them badly, as it had all supply undertakings throughout the country. In January of 1912 they were paying for coal 6s. 3d. per ton. In June this had risen to 8s. 6d. per ton, and in December to 9s. 6d. The total cost for fuel amounted to £1,901, as compared with £1,572 in 1911, an increase of £329, which was almost wholly due to the increased cost. During the year 1,069 8-c.p. lamps were connected to the mains, and at the present moment negotiations were in hand for several motors. They had also been requested by a colliery to quote terms for the supply of something like 800,000 or 900,000 units per annum, and this matter was having the attention of their engineers at the moment. If such a consumer could be obtained on reasonable terms, their accounts would show very differently indeed, as it would practically double their output. The plant extensions referred to in the report should be completed about the end of September, and they would effect substantial economies in working. If they got the Bill for which they were applying, it would enable them, at a comparatively small capital expenditure, to connect with the tramways the populous districts of Wath, Denaby and Conisborough. The additional population to be served would be about 30,000. These districts, although within a mile or so of their tramway system, had no connection with it; in fact, they had practically no travelling facilities at all, and it was originally anticipated, he thought with reason, that the tramways would be taken advantage of by the inhabitants of these districts, but this had not been the case, or at least, only to a very small extent, but with such a system in operation it should, in addition to earning a good profit, have a very beneficial effect on the revenue of the tramway undertaking, to which it would act as a feeder. The directors had no hesitation in saying that if the powers were granted, there should be an immediate increase in value of the shareholders' property. While they had had a set-back this year, owing to the coal strike, they had no reason to be discouraged.

The report was adopted.

## Deutsch-Atlantische Telegraphen Gesellschaft.

THE report of the German Atlantic Telegraph Co. states that the Atlantic cable traffic experienced a further development in 1912, and that on the Vigo cable increased in one direction, and slightly declined in the other. During the year one of the company's Atlantic cables, as well as the Vigo cable, was interrupted for short periods. Nevertheless, it was possible to deal with the traffic on the other cable sections without much delay. The repairs were carried out promptly and comparatively quickly by the cable steamer *Grossherzog von Oldenburg*, notwithstanding the very unfavourable weather which prevailed. The Norddeutsche Seekabelwerke, in which the company holds an interest of £150,000, has been engaged on the manufacture of the Monrovia-Togo-Cameroons cable for the German South American Telegraph Co., as well as on various telephone and telegraph cables for abroad, and the Seekabelwerke's dividend of 10 per cent. for 1912 will be brought into the accounts for 1913. The introduction of the Heurtly system, whereby a considerable increase in the speed of transmission on cables is rendered possible, was almost completed. In the case of the Vigo cable the result had been that the traffic, which would have necessitated a doubling of the cable in the near future, could now still be handled with the single cable. The general introduction of radiotelegraphy on ships had yielded a satisfactory volume of traffic to the cables through the coastal stations, and instead of being a competitor, it had grown into a valuable feeder to the cables. Concerning the "L.C." private telegrams at half rates, which were brought into operation on January 1st, 1912, the report records a good development and a permanent increase, and it is also mentioned that the rates for Press messages were

reduced from 50 pfennigs to 35 pfennigs (6d. to 1½d.) on December 1st, 1912. A further extension of the system of the telegraphic transmission of money had taken place by the inclusion of the neighbouring countries of Luxembourg and Switzerland. It is also stated that the obligation to lay cables for the Portuguese Government in the Azores had been discharged by the establishment of wireless connections at a single cost of £10,000. The accounts show gross receipts of £288,000 for 1912, as compared with £267,000 in the previous year. After meeting general expenses and taxes, the cost of cable repairs, and placing £30,000 to the cable redemption fund, as against £29,700 in 1911, the net profits are returned at £139,700, as contrasted with £111,000 in the preceding year. It is proposed to pay a dividend of 7½ per cent. on the share capital of £120,000, being the same rate as in each of the two previous years.

## German Electrical Companies.

THE *Elektrotech. Fabrik Rheylt Max Schorch & Co.* records an increase of 60 per cent. in the turnover in 1912, although selling prices did not keep pace with the higher cost of raw materials. As net profits the accounts indicate the sum of £9,900, as against £9,800 in 1911, and the dividend at 8 per cent. is the same as in the previous year.

The *Elektrochemische Werke, of Berlin-Bitterfeld*, earned gross profits of £82,000 in 1912, as against £89,000 in the preceding year, the net profits being £60,000 as compared with £67,000 in 1911. It is intended to distribute 10 per cent., being at the same rate as in 1911. Most of the departments at Rheinfelden and Bitterfeld are leased to the Griesheim-Elektron Chemical Co., the company restricting its operations to the production of oxalic acid.

The financial statement of the *Sachsenwerk Licht und Kraft A.G., of Niedersieditz*, records gross profits of £39,000 for 1912, as contrasted with £27,800 in 1911. Depreciation absorbs £8,700, as compared with £6,500, and the net profits were £30,300, as against £21,300 in the previous year. It is proposed to pay a dividend of 6 per cent., as in 1911. The orders on hand on January 1st, 1913, were 30 per cent. in excess of the preceding year, and the increase in orders this year indicates favourable prospects.

The accounts of the *Norddeutsche Seekabelwerke, of Nordenham*, whose share capital is held in equal halves by the German Atlantic Telegraph Co. and the Felten & Guillaume Co., show that the sum of £26,000 has been placed to depreciation in 1912, as compared with £33,000 in the preceding year. The amount placed to the reserve fund is £2,300, as against £16,000 in 1911, whilst the benevolent fund receives £1,500, as contrasted with £6,500. As net profits, the accounts indicate £51,000, as compared with £72,000 in 1911, and a dividend of 10 per cent. is proposed on the share capital of £300,000, being the same rate as in the previous year.

The report of the *Kabelwerk Duisburg, of Duisburg*, states that all departments were well employed in 1912. The selling prices for insulated wires and insulating tubes slightly advanced, and satisfactory prices were realised for lead cables, in which business was active, especially for State and communal authorities. The gross profits were £73,000, as against £60,000 in 1911, and the provision made for depreciation is £21,000, as compared with £23,400 in 1911, of the net profits of £23,800, as contrasted with £23,400 in 1911, it is intended to pay 14 per cent. on the share capital of £112,500, being the same as in 1911. The share capital is now to be raised to £150,000 in order to provide for the extension of the works.

The *Deutsche Kabelwerke, of Berlin-Rummelsburg*, state that the volume of business transacted in 1912, was considerably greater than in the previous year. Including the balance brought forward, the gross profits reached £75,000, as compared with £60,000 in 1911. After deducting general expenses, taxes and interest charges, and apportioning £12,000 to depreciation, as against £5,800, the accounts show net profits of £31,000, as contrasted with £24,000 in 1911. The dividend in contemplation is at the rate of 8 per cent., this comparing with 7 per cent. in the preceding year. An abundance of orders had been brought over into the new financial year, and the turnover had so far shown an increase. It is mentioned that the subsidiary companies experienced a further favourable development in 1912. The Union Cable Co. of Dagenham, whose new factory was set in operation last autumn, is well employed at the present time.

The directors of *Voigt & Haefliger, of Frankfurt-on-Main*, report that a considerable increase in the turnover took place in 1912, the business extending to almost all countries. On the other hand, the cost of raw materials was greater, and larger expenses had to be incurred for wages. The disquiet produced by political events, and the dearth of money, did not have any disadvantageous effect upon the undertaking during the year, although it must be assumed that a continuance of these conditions will cause reserve in the allocation of orders. The orders brought over into the new year exceeded in value those of the previous year, but indications in the direction mentioned are already on hand. The gross profits amounted to £141,000, as compared with £100,000 in 1911, and after meeting general expenses and ordinary depreciation the accounts exhibit net profits of £72,000, as against £42,000. It is intended to distribute 10 per cent. for 1912, being the same rate as in each of the five preceding years, and the sum of £25,000 has been placed to extra depreciation, as contrasted with £5,500 in 1911.

The report of the *Aluminium Industrie Gesellschaft, of Neuhausen*, for 1912, states that the exceptionally low price of the metal had opened up many uses for aluminium, which had favourably influenced the development of the industry, and enabled the company to dispose of the whole of the production. In the meantime

a new agreement has been concluded between the aluminium works for the purpose of securing stability in prices and a constant extension of the markets. The company's subsidiary departments—those for the output of carbide and nitric acid—had yielded results in accordance with expectations. After placing the sum of £56,000 to depreciation in 1912, as compared with £45,000 in 1911, the accounts showed net profits of £148,000, as against £92,000, these being increased to £183,000 and £131,000 in the two years respectively by the inclusion of the balance brought forward. A dividend at the rate of 20 per cent. has been declared on the paid-up capital of £520,000 out of a total nominal capital of £1,040,000, this contrasting with 14 per cent. in each of the two preceding years. Out of the balance of net profits the amount of £24,000 has been allocated as a first instalment to a fund intended for the gradual payment of the unpaid ordinary shares of £520,000. The company has realised its investment of £50,000 in the electric steel works of R. Lindenberg, and devoted the proceeds mainly to depreciation in connection with the Marseilles and Goldschmied-Trotha subsidiary companies. At the recent meeting it was stated that the prospects for the current year were favourable, judging from the course of business during the first four months.

### Allmana Svenska Elektriska A. B.

THE annual report for 1912 of the Swedish General Electrical Co. has recently been published. The company has a capital of £333,333, which is equally divided between ordinary shares and preference shares. The dividends to be paid are 10 per cent. on the preference shares and 8 per cent. of the ordinary shares, as compared with 9 per cent. and 7½ per cent. in 1911. The net profits amounted to £35,877 in 1912, £28,555 in 1911, £24,833 in 1910, and to £16,333 in 1909. The gross profits for 1912 amounted to £50,666, as compared with £42,166 for 1911, £31,000 for 1910, and £22,666 for 1909.

The course of business is shown in the following table:—

	1909.	1909.	1910.	1911-12.	1911-12.
Turnover .. .. .	£670,000	£506,000	£733,393	£711,100	£777,400
Value of exports ..	58,338	68,777	117,444	174,777	212,333
Orders in hand, per December 31st, 1912 ..	—	—	186,500	205,000	276,500
Engines and machines delivered .. .. .	9,760	8,245	5,566	6,011	8,001
1,000 kw. .. .. .	140	105	230	220	272
Number of workmen ..	2,167	2,384	2,462	2,527	2,750

The above table shows in all figures a distinct improvement and increase, as compared with the previous years. The only exception is to be found in 1909, which year, however, was quite exceptional on account of the large and prolonged strike. The increase of the export figures is especially remarkable, and the progress is even more striking if a comparison be made with the value for 1906, when it only amounted to £27,000. The exports have in the course of seven years thus increased at a ratio of nearly 1 : 8. The flourishing state of the export branch may, to a great extent be explained by the enormous requirements for electrical machinery of the Norwegian nitrate industry, which was the company's best customer. As regards the prices obtained, these are stated to have been rather low, but this has been more than outweighed by the increased volume of business. In regard to future prospects, it is stated that there is no indication of any slackening of the demand for electrical goods and machinery, at all events as far as 1913 is concerned. With the view of securing more business in future, it is the intention of the directors to enter into a closer connection with a financial institution, so as to enable the company to take an active part in the promotion and financing of enterprises.

### Belgian Electrical Companies.

THE *Société Générale Belge d'Entreprises Electriques*, of Brussels, which is an investment company, earned gross profits of £84,000 in 1912 as contrasted with £76,000 in the previous year. After making provision for general expenses, interest on loans, and making other appropriations, the accounts exhibit net profits of £62,000 as against £53,000 in 1911, the directors recommend a dividend of 10 per cent., this comparing with 9½ per cent. in 1911.

The report of the *Société Anonyme A.E.G.—Union Electrique* states that the general industrial development which was manifested at the beginning of 1912, enabled the company to again considerably extend its business. Whilst the augmentation which took place in 1911 was chiefly in connection with central stations and tramways, the increase in 1912 arose principally from the expansion in industrial transactions and in general sales. This result was due the decentralisation of the organisation which had been undertaken in recent years by the establishment of five offices at Antwerp, Ghent, Liège, Charleroi and Brussels. The extension of the business had necessitated an increase of 10 per cent. in the number of the personnel employed, which amounted to 722 workers, staff and engineers. The length of the working day had been reduced by 10 per cent., and the annual average wages of the workers and assistants advanced from £52 10s. in 1911, to £62 16s. last year. After making provision for depreciation of raw materials and manufacturers' and works' plant, the accounts show net profits of £15,800, or approximately the same as in 1911. It is proposed to pay a dividend of 6½ per cent. for 1912, being the same rate as in the preceding year, on an ordinary share capital of £140,900.

The directors of the *Ateliers de Constructions Electriques de Charleroi* report a considerable increase in the orders booked in 1912, all the departments being abundantly provided with work.

The value of the orders amounted to £771,000 as compared with £576,000 in 1911, and the company's customers were retained notwithstanding the efforts put forward by foreign competitors. Including the balance brought forward the accounts indicate profits amounting to £78,000, of which £39,900 has been devoted to depreciation, thus leaving a balance of £38,100. It is intended to pay a dividend of 14s. 10d. per share on the paid up capital. The share capital was increased to £800,000 in December 1912, and the premium of £80,000 realised on the issue has been applied to writing down the value of the works, so that the Charleroi-Mariemelle construction works, the Charleroi-la-Vallette works, the iron and bronze foundry and the cable factory, wire drawing mills, and tube factory now stand at the value of one franc only in each case. The company gives employment to 2,500 persons. During the past year orders for electric motors for rolling mills have been executed for a number of the leading metallurgical concerns in Belgium, including the Cockerill Providence, Sambreville-Moselle, Metallurgique du Hainaut Athis Grivegnée, Esperance-Longdoz Clabecq, and Thy-le-Chateau Companies. An extensive business was done in electric winding engines and other electric plant for collieries, installations of this kind having been put down at the Marcielle Nord, Bonne Fin, Shepy Bracquergies, Andre-Dumont, &c. Electrically-operated mining pumps have also been supplied to the Grand Horun, Grand Conty, Reunis, and Ongree-Marihay collieries. Considerable activity has also prevailed in the production of steam turbines and alternators, plants of this kind having been completed for the Société de Gaz et de l'Electricité de Hainaut, the Brussels Municipality, La Société de l'Electricité de l'Ouest de Belgique, La Société de l'Electricité du Brabant, La Compagnie Auxiliaire d'Electricité, La Société des Tramways de Tientsin (China), &c. In the electric cable department of the company the value of the orders secured was equal to three times that of those of the previous year, several important contracts for cables for from 15,000 to 18,000 volts having been completed, while the manufacture of 30,000-volt cables has been commenced. Among the orders recently completed or on hand, are cables for the Société des Tramways Bruxellois, the Ghent Tramways, the Ostend-Blankenberghe Electric Railway Co., La Société Auxiliaire de l'Electricité, La Société Bruxelloise de l'Electricité, &c.

### New General Traction Co., Ltd.

THE directors' report and accounts for the eight months ended March 31st, 1913, states that since July 31st, 1912, the date of the last balance-sheet, the liabilities of the company had been reduced out of the proceeds of the sale of the Coventry undertaking by the repayment of loans amounting to £40,700, by the redemption of the balance of £68,000 prior lien debentures, and by the repayment of £41,700 of 5 per cent. mortgage debentures, leaving £158,300 5 per cent. debentures still outstanding. The revenue received and accrued from the various sub-companies amounted to £19,013 for the period under review. The general expenses, including directors' fees and legal charges, amounted to £1,799. The accounts for the period show a profit of £10,288, to which is added £4,690 brought forward, making a total of £14,978 available for distribution. The directors recommend that this sum should be appropriated as follows: £10,480 to the payment of a 4 per cent. dividend, less income-tax, and that £4,498 be carried forward. The dividend received from the Coventry Electric Tramways Co. for the year ended December 31st, 1912, was 8s. 6d. per share. The accounts of the Norwich system show that there was an increase in the traffic for the year, and a decrease in the expenses. A dividend of 3 per cent. was received from that company for the year ended June 30th, 1912, as against 2 per cent. for the previous year. The Douglas Southern Electric Tramways, Ltd., paid 6 per cent. on its preference shares. The income received from the Philadelphia undertaking was in respect of the six months ended December 31st, 1912, and amounted to £6,965. The directors' reports and accounts of the Coventry Electric Tramways Co., the Norwich Electric Tramways Co., and the Douglas Southern Tramways, Ltd., are annexed to the report, and we publish them on other pages to-day.

**Anglo-American Telegraph Co., Ltd.**—An extraordinary general meeting of the shareholders of the above company was held on Monday at Winchester House, E.C., Mr. F. A. Bevan presiding, when the resolution which was passed at the extraordinary general meeting held on April 29th, providing new articles of association, was confirmed as a special resolution.

**Submarine Cables Trust, Ltd.**—At this company's meeting on Wednesday the chairman, Sir J. Denison-Pender, reported that the receipts for the year 1912 were £25,496 and the expenses £1,714. After adding the sum brought forward, the available balance was £23,850.

**Melbourne Electric Supply Co., Ltd.**—The directors have declared a dividend of 4 per cent. actual, free of income-tax, on the £300,000 consolidated ordinary stock, in respect of the half-year to February 28th. The *financier* says that should the earnings of the company continue to show the same satisfactory expansion as they have done hitherto, the directors anticipate that the dividend on the consolidated ordinary stock for the complete financial year ending August 31st will be 10 per cent.

## Calcutta Electric Supply Corporation, Ltd.

MR. PAGET V. LUKE, C.I.E. (chairman), presided on May 15th, at the office, Salisbury House, E.C., over the annual meeting.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 818), said the capital expenditure during the year was £127,509, largely on account of machinery and mains in connection with their new high-tension generating station at Cossipore. The total capital outlay up to December 31st amounted to £1,161,186. It was satisfactory to note that in letting the contracts for the work in connection with the high-tension station, there was a very considerable saving which went towards the cost of several additions to the original scheme, the demand for which arose as the work progressed. The revenue account showed on the debit side a normal increase in running costs due to a larger output. On the credit side there was a satisfactory increase in the sale of current, both for lighting and power purposes. Last year he expressed the hope that the supply of high-tension current from their new station would begin in July or August. As a matter of fact, the new machinery was in position in July, but owing to difficulties which not infrequently arose when starting new plant, it was found necessary as a precautionary measure, to keep some of the old stations running longer than was anticipated. But for this, there would have been a considerable saving in working expenses. The amount to the credit of depreciation and renewals was £79,310, and with the increase of £35,000, which it was proposed to add, it would amount to £114,310, which was a handsome figure, but none too large when they bore in mind the big additions to capital expenditure. It was also proposed to add to the reserve fund the sum of £5,000, and in future to credit to this fund the dividends on investments which amounted during last year to £1,987. Owing to the depreciation of some of the gilt-edged securities, the directors had decided to write £1,500 off their value to the debit of the revenue account. The most important feature of the year was the opening of the high-tension station at Cossipore. The initial difficulties connected therewith had been successfully got over, and they were now in a position to meet any demands for current likely to arise in the immediate future. The increasing demand for current in the Howrah district had culminated in a 20-years' contract for lighting the streets. Two heavy cables were successfully laid across the Hooghly River, and their old generating station at Howrah had been turned into a sub-station served from Cossipore. This laying of cables across a strong tidal river was a work of no small magnitude, and their staff had to be congratulated on its successful achievement. The estimated outlay in connection with the Howrah extension amounted to £18,400. A demand for current had arisen in the neighbourhood of Chetla, a district to the South of Calcutta, where rice-pulling mills were being erected. It had been decided to extend their mains to Chetla and to open a sub-station there. Although these outlays represented a very large expenditure, it was gratifying to see that the profits of the company continued satisfactory, and that there was no difficulty in maintaining the rate of dividend recently paid. The Calcutta improvement scheme had now entered on its second year, and they might soon see some of the proposed schemes put into force, the carrying out of which should tend to promote a demand for electric energy. There was every indication that the question of the economical use of electricity in place of steam had reached an acute stage, and the directors hoped, with the new high-tension plant now at their disposal, that the Corporation would be able to supply current at a price which would induce mill managers and other large consumers to come to them for the power they might require. The difficult matter of the rates to be charged for current was one which had the fullest attention from the directors and the consulting engineers. The supply of current at the cheapest possible rate must, however, be made consistent with a profit satisfactory to the shareholders and the building up of a sufficient reserve for contingencies. In December last one of the directors (Major-General Mahon) went to Calcutta to inspect the undertaking and report to the board. He went very thoroughly into the methods of working and accounts, and his visit and report had been of the greatest assistance, not only to the board, but to the agent in Calcutta, where arrangements had been made which, it was believed, would ensure economical and efficient management of the company's affairs, and prepare the way for carrying out the further extensions which must, in due course, become necessary. As regarded the transfer of the Capital to Delhi, the manager reported that, as expected, it had not affected the prosperity of the company to any extent. It was with much regret that he had to inform them of the retirement of their agent and manager, Mr. F. Rawson, C.M.G., who had so ably controlled their affairs in Calcutta for the past 5½ years. He had piloted the company's business through a difficult time with much tact and ability, and with great success, as the report in their hands testified. He was only leaving because he had no wish to remain another hot season in a tropical climate, and he would ask the shareholders to accord him a cordial vote of thanks for his services. Mr. R. E. Winkfield, M.I.E.E., who had been the chief engineer of the company, and had performed his duties to the satisfaction of the board, and who on several occasions had acted as agent and manager in the absence of Mr. Rawson, had been appointed agent and chief engineer. The board felt satisfied that in making this appointment they were consulting the best interests of the shareholders. The whole of the staff arrangements of the company had been reorganised, in consequence chiefly of the opening of the Cossipore station, and Mr. Winkfield would be assisted on the engineering side by a deputy, and also on the commercial side by the deputy agent. In making these new arrangements, General Mahon's report had been of much assistance to the board. The

chairman next alluded to the question of directors' extra remuneration. They were of opinion that the time had come when a maximum should be fixed to the extra remuneration, and accordingly, instead of proposing an alteration in the articles of association, they had passed a resolution to limit, for the present, the maximum sum to be divided amongst the directors in any one year to £2,500. The agent and the staff had passed through an arduous year of work consequent upon the entire change of the methods of generating and distributing electrical energy, and the satisfactory result of the year's working was in no small measure due to the excellent manner in which they had carried out their duties. The agent bore testimony to this good work of the staff in his annual report, and their services were well deserving of their appreciation. He was sure it would be the wish of the shareholders that the whole staff of the corporation should share in its prosperity. To this end the directors had in view a scheme for according a yearly bonus to the staff based upon the net annual profits.

COL. F. J. G. MURRAY seconded the motion.

MAJOR GENERAL R. H. MAHON spoke at some length on the condition of affairs in India, and the result of his visit as the representative of the board, and said that having carried out a good many similar inspections, he had seldom found more to praise and less to take exception to. Their thanks were due to Sir Alex. Kennedy and Mr. Jenkin for the admirable lay-out of the central generating station, and the dependent sub-stations, which were arranged so as to be capable of extension, to a practically unlimited extent at the minimum of cost. Their engineers in Calcutta were also deserving of thanks for the successful conclusion of their strenuous task of changing from the old system of supply to the new, without a moment's inconvenience to the public. As to the plant itself, they had had a few minor difficulties, but these had been surmounted, and the latest returns reported an economy of production which was the principal justification of the directors in sanctioning the large outlay. He had also inspected the whole office system which was inaugurated by Mr. Reeve, their secretary, when he visited India some years ago, and which had proved sound and durable. Gen. Mahon referred to the question of the rates to be charged for electricity, and said that as the result of prolonged consideration the board had announced special low rates for very large manufacturers. He was informed that there was in Calcutta approximately 60,000 H.P. in use and available for their enterprise, and so far they had only absorbed a comparatively small fraction.

COL. FILGATE suggested that the board might when possible give a small bonus to the ordinary shareholders, which might afterwards crystallise into an increased dividend. He also referred in eulogistic terms to the services of Mr. Rawson, and pointed out that during that gentleman's term of office of five years the net profits had practically doubled whilst the capital had only increased by a third.

The CHAIRMAN expressed the hope that the time would come when the company could pay a bonus.

The report was adopted.

On the motion of COL. FILGATE, a resolution was passed regretting the retirement of Mr. Rawson, and expressing the appreciation of the shareholders of his services to the company.

The CHAIRMAN pointed out that whilst theirs was a commercial undertaking, yet they were engaged in a work which was of real benefit to the people. He was constantly told that the conditions of life in Calcutta had altogether changed since the introduction of electricity.

## Norwich Electric Tramways Co.

THE directors' report for the year ended June 30th, 1912, shows that the total receipts were £36,713, an increase of £1,069, and the total expenditure was £26,730, a decrease of £429. The net profit was £9,983, an increase of £1,498. The above amounts for expenditure include debenture interest, donations and London expenses. Adding £1,013 brought forward from last year (after paying the dividend and providing for the reserve), there is a total of £10,996 to be dealt with. The directors recommend that of this, £2,500 should be put to the reserve fund account, £7,920 to the payment of 3 per cent. dividend for the year ended June 30th, 1912, and £576 carried forward.

	1911.	1912.

Earnings per passenger .. ..	0.99	0.97

## Altrincham Electric Supply, Ltd.

THE directors' report for the year ending December 31st, 1912, says that during the year 76 new installations have been connected to the mains, making an addition representing 10,449 30-watt lamps. After allowing for various disconnections and re-connections, there were, at December, 1912, 1,382 actual consumers and an equivalent of 87,631 30-watt lamps connected to the mains. Twenty-nine installations, comprising 655 30-watt lamps, were in progress. There has been an increase of nearly 88,000 units sold, and notwithstanding considerable additional expenses incurred during the coal strike, and certain repairs to the boilers, the total cost of generation has been only slightly in excess of that for the previous year. Further capital expenditure amounting to £5,777 has been made during the year. Of this amount £3,279 was for plant, and £1,526 for mains. The re-construction on

modern lines of the high-tension and low-tension switchboards at the generating station has been satisfactorily completed, and suitable extensions added to control the new plant. The company was granted a provisional order extending the authorised area of supply, which order received the Royal Assent on August 7th, 1912. The accounts show a profit for the period covered of £5,712, making with the balance of £78 brought forward £5,790, and this has been dealt with as follows:—Written off old stock, £800; general reserve for depreciation, £1,000; general reserve account, £3,500; leaving to be carried forward, £490. In view of the sum expended on capital account during the year, and the considerable sums shown to be due for loans and to the company's bankers, the directors much regret that they are unable to recommend the payment of a dividend. Mr. Henry Wolfenden and Mr. William Murray have retired from the directorate, and Mr. Charles Jermyn Ford has been elected a director and chairman of the company to fill the vacancy created by the retirement of the former.

The meeting was held on May 8th, at the offices in Queen Street, E.C.

### Shanghai Electric Construction Co., Ltd.

The annual meeting of this company was held on Thursday last week at Basilidon House, Moorgate Street, E.C., Sir Alfred Dent, K.C.M.G., presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELEC. REV., page 819), said he referred last year to the considerable amount of vitality that was latent in their undertaking, and that statement he trusted they would consider was borne out by the accounts. The gross traffic receipts, after deducting £23,937 for loss in exchange, of £79,783, against £58,333 in 1911, and after the further deduction for operating expenses in Shanghai, showed a net profit of £27,727, as compared with £14,139 for the previous year. Including the amount brought forward, £3,301, the balance of profit and loss account amounted to £28,029, and that balance they proposed to deal with by transferring to reserve for renewals account £8,500, for reduction of preliminary expenses £1,554, to the payment of a dividend of 5 per cent. for the year £16,000 (less income-tax), leaving to be carried forward £1,974. The reserve for renewals, after charging the account with cost of renewing some of the trolley wire, would then amount to £17,883. The power expenses at £13,137 showed an increase of £1,887 owing to the increased mileage. The five-year agreement having now expired, negotiations for a revision of rates were in progress, and they hoped to get the full benefit of the reductions given to the general body of consumers. The expense ratio for the year was reduced to 66½ per cent., as compared with 71½. The statistics given at the end of the report showed the car-mileage as 2,747,088, or an increase of 505,975. The total number of passengers carried was 40,731,233, as against 27,257,250, or an increase of 13,475,983, and passengers per car-mile 14.83, as against 12.16 in 1911. The loss in exchange brought about by the excessive issue of copper currency by the native authorities amounted this year to £23,937, against £15,477, showing an increase of £8,459. This represented a loss of nearly 7½ per cent. on the capital, and was the most serious of the disadvantages which affected their profit and dividend. It was a feature that did not exist when the company was formed. The matter had been taken up by the China Association in the interest of the tramways and the trading community, and members of the Association would have noticed the correspondence with the Foreign Office on the subject. They seemed still to be a long way off a solution of the many difficult problems connected with currency reform, but there was some satisfaction in knowing that the Ministry of Finance had made a thorough investigation, and that as soon as a definite scheme had been drawn up, the defects of the present situation would gradually be removed. After providing for a substantial expenditure on capital account, the loan from the bankers on December 31st was reduced to £15,000—as compared with £31,000—at the end of 1911. It had been further reduced since the account was made up, and now amounted to £12,000, but to meet their requirements, including the balance of cost of new motors and trailers, it would be again increased, in anticipation of the new issue of capital to which he referred last year—a matter which, in view of the increase in their receipts and the late repayments of the loan, they had left in abeyance until their financial position could be more readily defined than was possible at present. Taking the accounts as a whole, they showed a marked improvement over any that they had hitherto been able to present, and a particularly gratifying feature was that the profits permitted them to recommend a dividend for the year at the rate of 5 per cent. The fact of their having carried 40½ millions of passengers last year, showing an increase of about 50 per cent. on the preceding year, and the continued expansion of traffic and operating profits this year, indicated that the sections and scale of fares had now been adjusted to a point at which they fulfilled local requirements. It also proved the necessity for the additional motor-cars and trailers referred to last year. Reference was made in the report to the

proposed introduction of railless traction. This was a matter to which the general manager, Mr. McColl, directed his attention when he was home on leave during the latter part of last year. He inspected railless systems in England and on the Continent, and went very carefully into the question of operating expenses and the adaptation of existing types of railless vehicles to the special conditions of Shanghai, and reported in favour of the scheme. The development of the company's business in such a way as to secure a larger proportion of the total movement of Shanghai, had received their serious consideration, and of all the schemes which had been presented, railless traction offered by far the best prospects, and was more nearly akin to their tramway business than any of the others. The advantage of the railless car was that it could be operated in narrow thoroughfares which were unsuitable for the fixed rails of a tramway, and being dirigible it could, by means of a pivoted trolley arm, deviate widely from the line of the overhead trolley wires, and thus pass other traffic or an obstruction which would block a car running on a fixed rail. The cost of a car would be rather more than that of a tramcar, and the upkeep somewhat heavier on account of tire repairs, but the daily operating expense of a tramcar and a railless car of equal carrying capacity should be approximately the same. The great advantage of the railless system was that the heavy cost of laying down a permanent track was entirely saved, and that the relatively inexpensive equipment could be easily transferred if desired from one street to another at a small expense. It should, therefore, be the nearest approach to the motor-bus which was so steadily absorbing the traffic in many London streets, with the many obvious advantages of electricity over petrol as the driving power. The directors, having grounds for believing that railless traction might offer good prospects of increasing the company's earnings, and recognising the necessity for the company owing to their present concession, being first in the field should any new form of electric traction be sanctioned, authorised an application to be made to the Council in February for leave to introduce an experimental installation, which was estimated to cost about \$80,000 with a full equipment of cars. That application was granted, on condition that they paid the Council 5 per cent. of the gross earnings and a reasonable contribution towards road maintenance. It was intended originally that the trackless line should run through Horian Road, but Fohkien Road had lately been substituted, concerning which they waited further advice. If the experimental installation proved to be a success, an extension of the system would be brought about as funds permitted, and new districts opened up where tramlines were at present impracticable. Through running with the French Settlement was inaugurated about the middle of June on one route and on a second route in the middle of August. The results of the arrangement entered into with the French company had, in a measure, been satisfactory, and had demonstrated that a demand for thorough facilities existed. They did not consider that the demand would be adequately met until a larger service of cars was available, and through tickets, to which the French company had hitherto objected, had been arranged for. It was anticipated that the improvement in the company's position would continue as the year advanced and the additional motor-cars and trailers came into use, and they were confident that the final result of 1913 would show a good improvement on 1912. They had a record for the race week ended 7th inst., having carried 940,000 passengers, with effective receipts \$18,600—against 810,000 passengers and receipts \$16,000 in the corresponding race week of 1912. The wonder was how this was done with their existing rolling stock, but it showed that the staff in Shanghai, both foreign and native, were working as loyally and assiduously as ever in the interests of the company, and their thanks were due to them and to the local board for their efficient management of their affairs.

MR. J. S. HASKELL seconded the motion, which was adopted.

### Vera Cruz Electric Light, Power and Traction Co., Ltd.

THE sixth ordinary general meeting was held on May 14th, at Salisbury House, E.C., Mr. V. W. Yorke presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 777), expressed regret that the meeting had not been called at an earlier date. Two years ago he said he hoped they would always be able to hold the meeting before the end of March, and last year they were able to do this, but, unfortunately, owing to the disturbed conditions in Mexico during February and March, there had been difficulty in getting the accounts completed, and consequently they were later than usual. He was glad to be able to present that day a thoroughly satisfactory report and accounts, both sections of the company's business having shown a steady and regular increase during the year with corresponding increases in the net revenue. They had not received as much revenue at they had hoped under the contract with the Terminal Co., owing to a considerable falling off in import traffic, but with a revival of trade these receipts ought to show an increase. The contract with the Puebla Tramway, Light and Power Co., which had been arranged since the last general meeting, placed at their disposal a large supply of power, and would enable them to increase their business without incurring further capital expenditure. The Puebla Co. hoped that the supply of power would be available before the end of the year. As soon as they got it, the temporary steam plant in use would be dismantled, and they had made arrangements by which they hoped to dispose of this plant, which had served a useful purpose, at very small loss to the company.

They had transferred from the profits of the year £5,000 to depreciation and general reserve before arriving at the amount recommended as dividend. This amount added to that of last year brought the reserve up to £20,000, which was satisfactory considering that they had only reached the early stages of their history, and, as pointed out last year, the depreciation on an undertaking like this, where the property was fully maintained and kept in first-class condition, was not large. Therefore the provision they were making this year was, in their opinion, ample. As regarded the results of the current year, the earnings they had published showed an increase of \$13,000 for the first three months of the year, which was certainly satisfactory. He was glad to say that political conditions in Mexico showed distinct improvement to those prevailing in the earlier part of the year. They had their share of the troubles during the year, and Vera Cruz was occupied by General Felix Dias in February, and some fighting actually took place in the city. He was glad to say, however, that their business and property suffered only to a trifling extent from these disturbances, and as soon as the political conditions became settled again a real revival of business might be anticipated in which they would participate. He had to express on behalf of the board their appreciation of the zeal and energy shown by the general manager and the staff working under him in Mexico.

DR. S. MACKENZIE seconded the motion.

MR. WATKIN asked how the loan of £7,250 standing in last year's balance-sheet had been paid off; and also when they could expect a quotation of the shares?

The CHAIRMAN said the loan was paid off out of revenue. It was expected they would soon get a Stock Exchange quotation. The report was adopted.

### Douglas Southern Electric Tramways, Ltd.

THE directors' report for the year ending October 31st, 1912, says that the company's season consisted of 124 days, against 118 days last season; and the mileage run was 34,647½, against 34,578½ last season. The total traffic receipts for the season were £5,204, against £5,645, a decrease of £441, due to the cold and wet weather. The passengers carried were 212,528, a decrease of 18,125. The tolls payable to the Douglas Head Marine Drive, Ltd., amounted to £867 and a commission of £260. After deducting these amounts and adding sundry small receipts, there is a total of £4,082 net receipts, against £4,428 last year. The net profit for the year is £1,733, against £2,125. Adding £152 brought forward, there is a disposable balance of £1,885, which enables the directors to recommend a dividend of 6 per cent. upon the preference shares, absorbing £1,558, leaving a balance of £327 to be carried forward. With the exception of £41 unclaimed dividends, there are no debts, debentures, mortgages or any other encumbrances whatever upon the company's property, and the buildings, rolling stock, boilers, engines, electrical equipment and permanent way have been maintained in a high state of efficiency out of revenue. No accident of any kind has happened to either passengers or property.

### Hong Kong Tramway Co., Ltd.

MR. E. C. MORGAN (chairman) presided on May 15th at the offices, 19, St. Swithin's Lane, E.C., over the ordinary general meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 812), the CHAIRMAN said the contents were of more than usual interest. Towards the end of last year the Government of Hong Kong approached them with a proposal that they should refuse to accept the Chinese subsidiary coinage in payment of fares upon the tramways, it being understood that the Government would support them in connection with the circumstances which might ensue from the adoption of so drastic a measure. The primary result of their action was rioting and boycott on the part of the Chinese, which soon caused the comparison of the receipts with those before the boycott took place to assume threatening proportions. After a time, however, the board were able to reassure the debenture and shareholders by the issue of a circular stating that the Hong Kong Government had obtained the consent of the Colonial Office to \$30,000 in compensation up to December 31st, 1912, pending a settlement of the basis upon which the compensation might ultimately be paid. This circular was sent out on January 21st, 1913, when the full force of the boycott was beginning to abate, although it was still, and for some time afterwards detrimental to, their interests. Happily, however, the most recent traffic returns were satisfactory, and the manager advised them that the coinage and boycott question now affected the receipts very little. To fix the amount of loss sustained by the company in consequence of the boycott was a matter of great difficulty, owing to the alterations in surrounding circumstances. As an instance, he might mention that during the period with which they were now comparing, the traffic was abnormal, owing to the fact that the revolution in China had brought a number of refugees to Hong Kong, who, now that peace was restored, had presumably returned to their homes. However, the matter of compensation was still under discussion by the Government, and they were striving to obtain all they could properly claim, as their loss due to their compliance with the Government's request in the matter of the currency. In the abstracts attached to the report they would have noticed under the heading of maintenance and repairs an increase of about £1,000, consisting mainly of improvements in roadway and track, which

should reduce expenditure in the future. He thought it must be conceded that the popularity of the system was shown by the satisfactory figure of the receipts, which, in spite of the fact that the exchange on discount was still a heavy burden, showed a good margin as compared with the expenses. In any case, it appeared that the accounts must be considered satisfactory, and much was due to the tactful management of their manager and agent, and also to the exertions of their staff, during the difficult times they had gone through.

MR. W. J. C. CUTHILL seconded the motion, and the report was adopted without discussion.

On the motion of the CHAIRMAN, a final dividend of 10 per cent. was declared, making 7½ per cent. for the year.

The CHAIRMAN subsequently moved a hearty vote of thanks to the agents and manager and staff for the efficient way in which they had conducted the company's affairs in Hong Kong. He remarked that they had had troublous times, and brick-bats were not altogether absent from the proceedings at times.

MR. R. MILLER seconded the motion, and it was carried.

### Merthyr Electric Traction and Lighting Co., Ltd.

THE report for 1912 states that the capital expenditure now stands at £127,613. During the year a further issue was made of 2,000 ordinary shares of £5 each at par, upon which £3 per share has been paid up. The total revenue from all sources amounted to £21,205, as compared with £20,716 for the preceding year. The expenses amounted to £12,421, compared with £11,837 for 1911. The net revenue is £95 less than in 1911, a satisfactory result having regard to the restriction of trade in the district caused by the coal strike. After deducting all expenses chargeable to revenue (including £2,178 for debenture interest) and charging revenue account with £1,500 provision for renewals, there remains a surplus of £5,106 plus £852 brought forward. The directors propose to place to reserve £1,500, dividend on the preference shares £1,500, dividend at the rate of 6 per cent. per annum on the ordinary shares £2,029, carrying forward £929.

The results from the year's working of the electricity supply undertaking show continued progress. The gross receipts from the electric supply section of the undertaking amounted to £10,136, and the working expenses to £3,854. The receipts for 1912 exceeded those for 1911 by £940, whilst the working expenses increased by £340. The total number of units sold for lighting and power purposes was 688,753, which, compared with the previous year's figure of 568,173, shows an increase of over 12 per cent. The number of consumers at December 31st last, was 858, as compared with 758 at the corresponding date in the previous year, being an increase of over 13 per cent. The extension of the high-tension mains to enable a supply of electricity to be given in the towns of Merthyr Vale, Aberfan and Trebarris, referred to in the last report, has been carried out during the year, and a supply was inaugurated on October 17th last, with satisfactory results.

The gross receipts derived from the working of the light railway undertaking amounted to £10,853, being a decrease of £553, and the working expenses amounted to £6,509, an increase of £55.

Since the close of the year an agreement has been entered into with the Merthyr Corporation under which the company has agreed to pave the whole of certain of the roadways in the lower part of the town with wood setts, and repair the same, and to construct an extension of the line to the Morning Sun in Cefn Coed; in consideration for which the Corporation have agreed to defer their option of purchase of both the light railway and electric supply undertakings from 1924 to 1934, being 10 years beyond the time specified in the Merthyr Tydfil Light Railway Order of 1899, and the Merthyr Tydfil Electric Lighting Order of 1899. It is intended to make an early application to the Board of Trade for amending orders with a view to obtaining the necessary statutory powers to enable the agreement to be carried out.

MR. G. J. SOMERVILLE (chairman) presided on Monday at the offices of the Electrical Federation, Kingsway, W.C., over the sixteenth ordinary general meeting.

In moving the adoption of the above report, the CHAIRMAN said that nearly the whole of the considerable increase of £11,128 in the capital expenditure was upon the electric supply undertaking. This was to provide an electric supply for the districts of Merthyr Vale, Aberfan and Trebarris. The supply was only inaugurated on August 17th, so that the results of this expenditure did not fall into the revenue account for more than two and a half months. They were, however, satisfactory, and for the first quarter of this year they continued to be satisfactory, and the profit had been increased during this period of three months to the extent of £350. The traffic receipts on the light railways showed a considerable falling off during last year on account of the coal strike which affected Merthyr perhaps more than any other part of the country, and left the town very short of money for the remaining part of the year. The deficit in traffic alone amounted to over £500, but now that Merthyr had got into ordinary conditions again, the traffics had again shown a considerable increase, and during the first four months of this year they had more than made up the leeway—there being an increase in traffic receipts of £597 for the first four months of the present year. Altogether, taking into account

the adverse circumstances, the report of last year was quite as good as they could expect, and he could also say that this year promised a much better return than the previous year.

MR. C. G. TEGETMEIER seconded the motion, and the report was adopted without discussion.

### Urban Electric Supply Co., Ltd.

THE directors' report for the year ended December 31st, 1912, states that the gross profits amount to £57,466, as compared with £50,876 a year ago, and after deducting the expenses shown in the profit and loss account, a balance of £54,265 is carried down to net profit and loss account. In the latter account the amounts required for interest and debenture stock redemption absorb £36,182, leaving an available balance, including £414 brought forward, of £18,496. Of this there is to be applied to reserve for depreciation £10,000, to dividend of 3 per cent. for the year on the preference shares £7,500, carrying forward £996. The balance of the 5 per cent. dividend on the preference shares will be satisfied by funded dividend certificates in accordance with the terms of the resolution passed and confirmed at the extraordinary general meetings held on February 2nd and 17th, 1912. Consequent on the reduction of capital sanctioned by the Court on March 12th, 1912, a capital reserve fund of £160,000 appears in the balance-sheet, off which has been written cost of plant dismantled and expenses relating to reduction of capital. The usual comparative statement, showing the profits earned at the various works, is appended. The following table shows the equivalent in 33-watt lamps connected and the gross profits at December 31st of each year:—

### Lisbon Electric Tramways, Ltd.

MR. LUDWIG BREITMEYER (chairman) presided on May 14th at the offices, 1, London Wall Buildings, E.C., over the fifteenth ordinary general meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 779), the CHAIRMAN said that during the year the tramways had suffered from two stoppages of the service owing to strikes. One was of short duration in January, but a much more serious one took place at the end of May, which lasted for over three weeks, when the whole of the service was suspended, the power house was shut down, and not a single car ran in the streets. The result of the first strike was a loss in receipts of about 81 contos, and the 29 days' strike in May resulted in a loss of under 110 contos, making altogether 118 contos. Allowing also for the average increase of traffic during the time of stoppage, as shown over the rest of the year, this would bring the total loss in receipts to about 125 contos, or say, £25,000, which was a heavy sacrifice, but was a small burden for the shareholders to bear, considering the grave issues that were forced upon them, and which had to be resisted with the utmost determination and at any cost. Turning to the actual figures of the traffic movement, the passengers carried were 50,411,963, against 51,852,719 in 1911, a decrease of 1,440,756. The earnings amounted to 1,640,410'685 milreca, as against 1,676,302'658 milreca in 1911, a difference of only 35,892'607 milreca, or about £7,000 in English money. He might pass over the three days' strike in January, brought about through the intrigues of syndicalism, and in which their employes were not involved, being forced against their desire to stop work. The 29 days' strike from May 29th to June 24th was, however, a serious business. The management was faced with an absolutely clear issue—either to submit to its employes on an important question of discipline or to stand firm. The management, with the concurrence and, under the instructions, of the London board, refused to yield to the unreasonable demands of the men, and as the result of this firm attitude, the men returned to work on June 24th, and since then the general manager's relations with the employes had not been disturbed, and, of course, they had no other desire than that they should remain so. It was a critical time for the company, and their thanks were due to Mr. Giles, the general manager, and to Mr. Souza, the assistant manager, and all those of the staff who remained loyal to the company. From the accounts they would see that the balance of profit available was £107,212, from which the usual reserves, amounting to £40,000, had been deducted, and the preference dividend, amounting to £25,533, had been paid, and also the interim dividend of 3 per cent., amounting to £19,020. This left a balance of £22,658 to be dealt with, and the directors now recommended a final dividend of 3 per cent., making a total of 6 per cent. for the year, and absorbing £19,020. The balance of £3,637 it was proposed to carry forward. As the shareholders knew, they did not take any part in politics. They were simply a business undertaking,

but it was impossible to be indifferent to the course of public events in Lisbon, and the present state of unrest could not but continue to be a cause of anxiety. The gratifying feature was that their tramways business maintained the even tenor of its way, with increased development, in spite of the unrest which, unfortunately, still existed. Now that the contract with the Municipality of Lisbon for the reconstruction and electrification of the Nova Companhia dos Ascensores Mechanicos de Lisboa had been completed, the work was being pushed on with all speed, and when completed would be a further favourable factor in the development of the traffic.

MR. J. B. TAYLOR seconded the motion, which was carried without discussion.

It was agreed that the remuneration of the directors for the year ending December 31st, 1912, be fixed at £2,500.

The CHAIRMAN expressed the hope that next year they would have a better balance-sheet, for it looked as if they would have no strikes, although one never knew what might happen.

### British Thomson-Houston Co., Ltd.

THE report of directors for 1912 reads as follows:—

**Works at Rugby.**—The buildings and machinery of the company have been maintained in first-class condition during the year. A number of extensions in progress were mentioned in the last annual report, the most important being a four-floor building to be used for railway work and other manufacturing purposes. This latter building is now completed. On the new tract of land mentioned in last year's report, a one-storey building is in course of erection, to be used for the manufacture of heavy apparatus, also another building for pattern storage which at present will be one storey high, but is so arranged that it can be easily converted into a three or four-storey building.

**Works at Coventry.**—These works are now in full operation.

**Works at Willesden, London.**—It was mentioned in the last annual report that we were erecting a factory at Willesden for the manufacture of Mazda lamps. Since then, however, improved methods of making these lamps have enabled us to very largely increase the output of the Rugby lamp factory, and on account of the rapid expansion of work in other departments, it has been decided to utilise the Willesden factory, which is admirably suited for the purpose, as a switchboard factory.

**Metallic-Filament Lamps.**—The business in Mazda drawn-wire lamps during the year has shown a further increase.

**Curtis Steam Turbines.**—The turbine business of the company continues to show satisfactory results, and the company had a larger number on order and in course of manufacture at December 31st last than ever before.

The company's operations were severely handicapped by the coal strike, which occurred at the beginning of 1912. Although ample coal reserves had been accumulated at the Rugby works, deliveries of raw material, such as iron, steel, &c., required in the manufacturing business of the company, were seriously affected, and the company's output very considerably restricted thereby.

**Debenture Redemption.**—Under the terms of the trust deed securing the issue of the company's debenture stock, the company has this year to pay to the trustees the sum of £4,452, to be applied by them in redeeming debenture stock at 105 per cent. by drawings. Since the closing of the books, debenture stock of the par value of £2,000 has been redeemed, making the total par value of stock retired to date £19,305, and a further £2,240 will be redeemed before the end of the year, making £21,545 in all.

The directors have followed their usual practice in making reserves to cover risks in connection with bad debts, depreciation of shares held by the company, and other contingencies.

The balance-sheet, after paying interest on debenture stock and loans, shows a profit of £31,000, and the directors recommend that this should be appropriated as shown in the profit and loss account—£20,000 to depreciation of plant account; £1,696 to depreciation of office furniture and store-room equipments; £6,270 to depreciation of apparatus, supplies, meters, &c.; £1,825 to special experimental expenses written off—leaving a balance of £1,209. This, together with the previous year's balance, makes a total amount to be carried forward of £8,590.

The meeting is to be held at 83, Cannon Street, E.C., on May 28th.

### Hastings and District Electric Tramways Co., Ltd.

THE directors' report for the year ended December, 1912, shows that there was a decrease in the traffic receipts of £2,433 due to the coal strike and to weather conditions during the holiday season. The expenditure side of the account, as compared with last year, shows a net increase of £1,120. This is chiefly due to the enhanced cost of fuel, and to abnormal expenditure on the permanent way, a part of which, amounting to £1,990, has been debited to depreciation account. The revenue account, after crediting receipts aggregating £17,491, and debiting administration expenses amounting to £1,431, shows a balance of £16,060 plus £2,177 brought forward, and deducting £10,387 for interest charges, there remains available £7,851. Out of this amount an interim dividend of 3 per cent. on the preference shares was distributed in October last, and it is now proposed to pay a final dividend of 3 per cent., making the full 6 per cent. for the year, and to carry forward the balance of £3,051.

"The attention of the Board of Trade having been called by the Hastings Corporation to the unsatisfactory results obtained from

the use of the Dolter surface contact system on the front line, the directors considered it necessary to promote a Bill in Parliament for the substitution of the overhead trolley system, by which all the other sections of the line are worked. They regret, however, to report that the Bill has been thrown out by the House of Lords' Committee. As the company has in the meantime been notified by the Board of Trade of its intention to call for the removal of the Dolter system, the board is carefully considering the alternative system to be adopted to meet the requirements of the public service, and, at the same time, to safeguard the interests of the shareholders."

Mr. E. C. Morgan, the chairman, relinquished that position last March owing to ill-health, and the directors appointed Mr. George Kitchen as his successor. Mr. Morgan continues as a member of the board.

The annual meeting was held on Tuesday at the offices, 1, Queen Victoria Street, E.C. MR. GEORGE KITCHIN, who presided, said that power expenses showed an increase of £369, due entirely to the increased cost of coal. Traffic expenses, on the other hand, showed a decrease of £859, owing to a decrease in the mileage run. Part of this decrease was compulsory; it became necessary to largely reduce the service during the coal strike; and part was voluntary, due to the suppression of unremunerative services. Consequent upon the continuance of the work of putting the track into first-class order, the greater part of the cost of which had come into the 1912 accounts, a sum of £12,980 had been spent upon maintenance and repairs. Of this sum £1,990 was in the nature of capital expenditure, and had been debited to depreciation account. The balance £10,990 had been debited to revenue, and showed an increase of £1,415 over last year, which again showed an increase of £1,143 over 1910. The effect of this heavy expenditure should be apparent in the improved conditions of running, and the reduction of maintenance costs to a more normal figure. General expenses showed an advance of £194, mainly due to an increase from £325 to £400 per mile of the charge made by the Corporation for the wayleave on the front line. The income and traffic showed a decrease of £2,433, due, first, to the coal strike; secondly, to the very unsettled weather conditions. The net result was an available balance of £7,850. From this they had already paid an interim dividend of 3 per cent. on the preference shares, and they now proposed to pay a further 3 per cent., making the full 6 per cent. for the year, and to carry forward £3,051. Proceeding to refer to the paragraph in the report dealing with the Bill which the directors considered it necessary to promote in Parliament for the substitution of the overhead trolley system on the front line for the surface contact system at present in use, the Chairman said he would like to remind them that there was a provision in their 1903 Act which compelled them to work the front line by self-propelled cars, or other system approved by the Corporation, other than the overhead system. After careful examination, the Dolter surface contact was installed in the year 1907, with the approval of the Corporation, as the best system that could be found to meet the case. From the outset it had caused them anxiety, but by sparing neither trouble nor expense, they had been able to work it with sufficient success to provide for the carrying of over 3,000,000 passengers annually on the front line. They were, however, quite aware of the various defects inherent in the system which developed in the working and became accentuated as time went on, and they quite anticipated that sooner or later this would result in a call for its discontinuance. It had been installed in Torquay and Merborough, but in both places had been condemned and removed, while the company which owned the patents had abandoned them as useless. At the same time the directors were strongly of opinion that the only really satisfactory system which could be substituted for the Dolter was the overhead. All the other lines of the company had been successfully worked by this system, but before the substitution could be carried out, it was necessary to obtain the authorisation of Parliament, as not only was the company precluded from installing the overhead system, but by the Act of 1903 the Corporation was estopped from sanctioning its use. In 1911, finding that the Dolter system was deteriorating, they decided to apply to Parliament, but before depositing the Bill they approached the Corporation with a view to obtaining their assent, as they wished to work in co-operation with them, and, if possible, to avoid the heavy expense involved in a contested Bill. On receipt of their refusal they decided not to proceed with the Bill at that time. In April last year, however, the Corporation called upon the Board of Trade for a report upon the working of the Dolter system. The Board of Trade sent down Major Pringle, who inspected the line and furnished such a report, as, in the directors' opinion, confirmed the company in their contention that the defects existing in the system were inherent and of a nature beyond the control of the company. The report was to the effect that though satisfied that the company had done its best to work and maintain the system, the Board of Trade considered that the result had not proved satisfactory, and that it might be necessary at some future date to call for the discontinuance of the system in the interests of public safety. In the interests of the shareholders it became necessary to seek Parliamentary powers to substitute overhead for the surface contact system. They had used every endeavour, though unsuccessfully, to find some other system which would have been possible under their existing Acts, and which should be satisfactory to the public in its working, and to the shareholders in its results. They, therefore, again appealed to the Corporation not to oppose the Bill, and the directors travelled down to Hastings accompanied by Mr. Waller, their engineer, and had an interview with the Parliamentary Committee of the Corporation, in order to endeavour to induce them to modify their attitude, but they finally decided to oppose them. The frontagers also

raised a fund and briefed counsel to fight the Bill before the House of Lords' Committee, and, in the event that Committee decided that the Bill must not proceed. In the meantime, the Board of Trade had advised them that they proposed, at the expiration of six months from March 25th last, to issue an order requiring the company to cease the use of the Dolter system. They found themselves, therefore, in a difficult position, and they were now considering, with their consulting engineers, what was the best system to install—the overhead being forbidden and the Dolter condemned. They had to consider the interests both of the shareholders and the public; indeed, in his view, their interests were really identical. The company could not earn dividends unless it served the public well, and the public could not be well served by a company that could not earn dividends for its shareholders. As he told them last year, their Cooden extension promised to be remunerative soon, owing to the building, &c., going on under the auspices of Earl de la Warr, and lately, he was glad to say there were really some signs that Hastings and its Corporation were waking up, and were going at last to do something to bring their interesting, but sleepy, old town up to date. To that end this company would be glad to assist, and he could only hope that the Corporation would meet their efforts for the good of the town with a little more practical sympathy, and a little less of the spirit of the gentleman who insisted on his pound of flesh. Better relations between them would be for the good of the town, as well as of the people who had put up their money to provide Hastings with a really excellent service of tramways at so serious a financial loss to themselves up to the present. To establish these more friendly relations was the desire of the board, and to that end they would direct their efforts.

MR. E. C. MORGAN seconded the motion.

Replying to a shareholder, the CHAIRMAN said that the board had often wondered why the Corporation had taken up so hostile and so impossible an attitude towards the company, looking to the fact that the putting of the tramways in Hastings, which had been done with their shareholders' money, had been of considerable benefit to the town at large. They were endeavouring to introduce a better feeling between the company and the Corporation. There was no doubt that they both had the interests of the town at heart, and if the town was doing well the tramway company would be among the first to reap the benefits. If, therefore, they could in any way assist the Corporation to improve the town, they would do so, but they looked for a little more kindly feeling and a little more reasonable attitude than they had received in the past from the Corporation. They had for a considerable time been considering the question of petrol motors in connection with their cars, and only the previous day their consulting engineer witnessed some trials in the east end of a new petrol-electric tramcar, which the L.C.C. were proposing to install in the Hackney district, where they could not have the overhead system owing to the opposition of local authorities, and where they found the conduit system too expensive. Their difficulty was to find a system which would enable them to continue the through running between Bexhill and Hastings.

The report was adopted.

**Continental.**—FRANCE.—La Société de l'Electricité de Rheims is the name of a new company which has just been formed at Rheims, with a capital of £80,000.

A new company has lately been formed at Aigueville (Savoy), with a capital of £50,000, and the title La Société des Acieries Electriques d'Aigueville, to carry on a plant for the electrical production of steel.

**RUSSIA.**—La Société des Usines Electrotechniques Siemens et Halske, of St. Petersburg, reports a profit of 636,388 roubles for the last financial year; a dividend of 6 per cent. is again being declared.

## STOCKS AND SHARES.

Tuesday Evening.

APART from the rush to apply for the new Chinese loan, the principal feature in all the markets of the House is the absence of business. Like King Charles's head in Mr. Dick's book, the Balkans trouble crops up with a pertinacity worthy of a better cause. At least, the Stock Exchange says it is the Balkans affair which is acting as a drag upon clients' financial proclivities. Certainly there is little speculation going on; and, notwithstanding all the money which has been made in trade, the investment business of the Stock Exchange proceeds on very joggling lines.

See-sawing in fashion somewhat aimless, the Home Railway market this week has leaned to the dull side. There are apprehensions of difficulties on several of the steam lines, the Great Northern, in particular, being favoured with protests from some of its men that one of their number has been unjustly treated. Once more it becomes apparent that a lull in labour difficulties is not likely to be more than temporary; and so long as the market is subject to these spasms, all the increases in the world will not suffice to encourage substantial buying of the stocks. The soundness of this argument is underlined by the reaction that followed

upon a rally in Home Rails when the Great Northern's differences were composed.

Of the Undergrounds, Metropolitans hardened to 53½, but came back to 52½, and Districts, after going above 40, eased off again to 39½, leaving falls on the week. Underground Electric Railways shares fell 5s. to 4½. The Company's 1s. shares are quiet and steady, speculation in them having died out to a considerable extent. The special settlement took place this week in the new London and Suburban shares, and the Preference made up at 14s. 3d., the Ordinary at 8s. 3d., and the Debentures at 83. These prices compared very favourably with those which were current about 10 days ago, when the Preference fell back to half-a-guinea and the Ordinary to 6s. 6d. The Company is proposing to exchange its own securities for the shares of the South Metropolitan Electric Tramways Company, offering £125 of Preference for £100 of the South Metropolitan Tramways Preference. The latter for a long time past have enjoyed no free market, whereas the London and Suburban have been readily dealt in since they first appeared, and this consideration will probably weigh with some of the South Metropolitan proprietors in inducing them to make the exchange. Thus another step is taken in the direction of fusing into one control the passenger traffic of the Metropolis. British Electric Traction issues rallied to some extent, in spite of the trouble which is being experienced in Birmingham in connection with the threatened tramway strike.

London Electricity shares are disposed to weaken a little. London Electric Ordinary shares went back to 30s.: Charing Cross Ordinary and Preference are easier, and Westminster's fell ½. The improvements in Edmundson's issues are maintained. The Urban report has not affected prices. An important issue of 5 per cent. Debenture stock is pending by the Midland Electric Corporation, and underwriting arrangements have been in progress this week. The money is required partly to pay off the existing 4½ per cent. Debenture stock, which becomes redeemable on June 30th next at 102½. Advances particulars show the stock to be admirably secured. Underwriters, we understand, receive a commission of 1½ per cent.

The Mexican news is again of a very mixed character, and proprietors of securities connected with Mexico are puzzled to know what they ought to do in the present situation. To the outside observer it would appear that affairs there will get straightened out in due time, although this has been a much longer process than anybody expected it would be. There can be no doubt that Mexico will go ahead strongly so soon as the revolutionary spirit is quenched, but in the meantime a good deal of patience is necessary. While the market in the common shares is somewhat dull, prices of the prior charge securities are also being lowered by way of precaution. There are falls this week in Mexican Electric Light 5 per cent. bonds, Pachuca bonds, Monterrey and one or two other similar issues. The market, as a whole, is subject to general influences, too, and there is the forthcoming issue of Brazilian Traction Preferred shares to give an added touch of depression to this department. Brazil Traction's themselves have gone up to 97½. It may be observed, incidentally, that things Brazilian are not in great favour at present, owing partly to the heavy fall in the price of raw rubber, which the alarmists declare may, if persevered in, have a pronounced effect upon the revenues of the Federal Government.

The telegraph market tends, if anything, to the lower side. Anglo-American Telegraph Preferred and Deferred continue to be depressed, and there still seems to be "deceased" stock floating about. The dullness is, no doubt, accentuated by the stagnation prevailing in American circles, the New York Stock Exchange apparently being worse off for business than London is. The question is revived as to whether the three classes of Anglo-American Telegraph stocks could not be unified. The difficulty, however, seems to lie in the off-chance of the relations between the Anglo-American Telegraph Company being dissolved from those of the Western Union, as might conceivably happen if the latter were to be adjudged a monopoly in restraint of trade under the United States laws, and, therefore, it seems necessary that the identity of the three Anglo issues should be separately preserved. Eastern Telegraphs are a little lower, but, on the other hand, Westerns rose 5s. to 13½, which placed them very much on the same level as Eastern Extensions shares and Eastern Telegraph stock. Great Northern's continue to improve, gaining 10s. Indo-Europeans are at £2 12s. 6d. dividend, allowing for which there is no net change in the quotation. Various other securities are quoted at dividend. Marconis have receded still further. Since last we wrote, the price has been down to 4, from which it picked up to 4½, leaving ½ fall on the week. There is nothing much going on in National Telephone Deferred, the price keeping about 21. West Coast of America shares are unaffected by the issue of the report, the first since the expiration of the Portuguese guarantee. The carry-forward is reduced in consequence of this, otherwise there is not much change.

Renters, old and new, lost ½, despite a good report and the maintenance of the dividend on both classes of shares. The banking business is to be separated from the other part, and this seems to be disliked in some quarters.

Copper merchants tell us that orders continue to come in at a rapid pace from their electrical manufacturing customers, but the activity in manufacturing circles which this suggests is not reflected in the share market. British Thomson-Houston Debenture is a point up, and this is practically the only quotable change. Babcock & Wilcox Preference are quoted at the rights to apply for the issue of Second Preference shares, valued for Stock Exchange purposes at ½ premium. Rubber shares relapsed after their brief bout of strength, and business in the market is of meagre proportions.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, May 21st.

**West African Telegraph Co., Ltd.**—The directors' report for the year ended December 31st, 1912, states that the revenue amounted to £46,603, from which is deducted £17,091 for the ordinary expenses, and £6,837 for expenditure relating to maintenance of cables and income-tax abroad, leaving £22,674, plus £987 brought forward, making £23,661. £1,323 has been provided for income-tax, £13,000 has been transferred to general reserve fund, and an interim dividend of 2 per cent. (free of income-tax), absorbing £4,622, was paid on December 1st. The directors recommend a final dividend of 2 per cent. (free of income-tax), on and after May 21st, making, with the interim distribution, 4 per cent. for the year, the balance of £94 being carried forward. The meeting is called for May 21st.

**Cleveland and Durham County Electric Power Co.**—A dividend of 3½ per cent. for the year to December 31st is announced, carrying forward £148.

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING APRIL, 1913.

ALTHOUGH the April export figures fall very far short of the bumper total recorded in the previous month, the difference is to a large extent accounted for by the exceptional telegraphic export included during that month. The April exports amounted in value to £592,621 (as compared with £994,303 in March), while excluding telegraphic items, the total of £474,475 is some £10,000 less than recorded in March.

The month's exports included machinery to the value of over £210,000; cable, some £78,000 in value—showing a considerable decline; and over £70,000 worth of telephonic material—this also being much less than in March.

The imports, at £263,268, compared with £253,412 in March, showing an increase of nearly £10,000 in value, while the re-export totals were £23,349 and £23,723 respectively, for April and March.

Machinery imports were on a somewhat lower scale than in March, but increased values are recorded for cables, fittings and glow lamps.

An excellent all-round customer of this country was Argentina, while India, New South Wales and Canada also made comparatively heavy purchases. In the imports section, both the United States and Germany did an increased business with this country.

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports.	Electrical goods and appliances.	Wires and cables, rubber and other insulations.	Electric lighting fittings and accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters and instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable and apparatus.	Telegraphic cable and apparatus.	Total.

TOTAL EXPORTS: £592,621.

TOTAL RE-EXPORTS: £23,349.

TOTAL IMPORTS: £263,268.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

## PROCEEDINGS OF INSTITUTIONS.

## A New Form of Electrically-driven Two-high Continuous-running Reversing Mill.

By ANDREW LAMBERTON.

*(Abstract of paper read before the IRON AND STEEL INSTITUTE, May, 1913.)*

THE day has not yet arrived when it can be claimed that by the universal adoption of electricity as the motive power for driving rolling mills in iron and steel works, the highest economy in running costs can be attained. Speaking generally, where steelworks are associated with blast-furnaces, and perhaps also coking ovens, and an abundant supply of surplus gas is available for producing electric current at a low cost, electrical driving of such mills is clearly indicated. The greatest difficulty is met with in dealing with reversing mills of the two-high type, where the rolls have to be reversed at each pass, and when these mills are of large size the electrical plant is extremely costly, the reversing mill motors necessary being from 10,000 to 15,000 brake horse-power, due to their having to start from rest under full load at each reversal.

All engineers may be said to be in agreement that where rolling-mills can be driven by a constant-running motor associated with a heavy fly-wheel to take the peak loads of rolling, electrical driving

to rotate in the fixed frames or housings D. In order to make the turning of the gables easy, these are carried on broad revolving anti-friction rollers E, fig. 2, placed immediately under the gables, and carrying the weight of the same. These anti-friction rollers have

FIG. 1.

part of their breadth formed into a spur pinion F which gears with corresponding teeth in the rotating gables. By means of a hydraulically-operated rack G, gearing into the pinion on the bottom roller shaft H, the rotation of the gables is quickly effected, the time taken being only three to five seconds, and the stroke of the hydraulic rams is just sufficient to bring the rolls to

their exact position at each reversal. To provide for the alternate change in the position of the top and bottom roll, the driving spindles J, conveying the power from the mill pinions K to the rolls A, are disposed in the manner shown in fig. 2, and the weight of these spindles is borne by a balanced carrying gear, the weight of the descending spindle balancing that of the ascending spindle at each reversal. The mill pinions are placed side by side, and not superposed as is usual, as this side-by-side arrangement reduces the angle on the spindles during reversals.

The motor, driving gear, and fly-wheel, require no description. By the employment of a high-speed continuous-running motor, the size and cost of such motor is reduced to a minimum; and, as the fly-wheel takes the peaks of the rolling loads, the highest economy in operation results.

A rail-rolling mill plant on this new system, capable of an output of 5,000 tons per week, comprises three distinct mills:—A cogging-mill taking the ingot and reducing it to a bloom; a roughing-mill to reduce this bloom to a roughly formed rail; and a

finishing mill to finish the rail to the required section.

These mills are all of the same continuous-running reversing type. The live roller tables are all fixed tables of the simplest form, and the manipulation of the work is of the simplest character.

The first mill of this new type is now in course of construction, and will be put to work in a large steelworks in England in the early summer.

## Power Supply on the Rand.

By A. E. HADLEY.

*(Discussion on paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Manchester, March 11th, 1913. For abstract of paper see ELECTRICAL REVIEW, March 28th.)*

DR. E. ROSENBERG said that there were some remarkable features which distinguished the Rand power supply from all others. First the incredibly high load factor, with a peak load of 88,000 kW., and sales averaging 1,350,000 units per day. This meant that the load for the 24 hours was equal to 15.3 times the peak load. These figures would be the envy of most central station engineers.

MR. B. WELBOURN said that in certain parts of the world, including South Africa, a good deal of trouble had been experienced in cables due to white ants. He asked if the author had experienced this on the system described in the paper. In carrying a cable network over a country of this character, there was in all

FIG. 2.

is to be preferred, provided, of course, that the cost of current be low enough. For small mills rolling light sections and bars, which can be fed to the mills by hand, the three-high continuous-running mill is practically universally adopted, and in such cases the driving of these mills by a continuous-running electric motor leaves nothing to be desired. For larger mills rolling bars and sections of heavier type which cannot be fed by hand, and where live roller feeding-tables and mechanical manipulators are therefore necessary, the three-high type of mill is not so popular in this country.

It occurred to the author that if two-high section rolling-mills could be designed so as to be capable of being driven by a continuous-running electric motor, and at the same time give the necessary reversals to the bar at each pass, this would go a long way to meet the difficulties, as the ease of setting the rolls in the two-high mill, and the simplicity of the roller tables being fixed instead of moving, would be conserved, and the large and very costly reversing motor rendered unnecessary. The following is a short description of the method by which this is accomplished:—

The root idea of the new system is that, if in a mill with two rolls, arrangements can be made to make the bottom roll the top roll, and *vice versa*, then at each reversal of the position of these rolls there will be a pass in the opposite direction. If then a pair of rolls be mounted in circular gables, which are free to rotate in fixed frames or housings, this will afford a continuous-running two-high mill, which gives reversals at each pass, on the gables being rotated through an angle of 180°—half a revolution.

Referring to fig. 1, the two rolls A are mounted in the usual form of chocks B contained in the circular gables C, which gables are free

probability considerable surface subsidence which might lead to trouble; had expansion joints been found necessary? With regard to the disk insulators used to build up the suspension type insulator, in view of the very frequent dust storms, he asked whether the distribution of pressure over these insulators had been affected by the accumulation of dust especially on the 80,000-volt line. With regard to line protection he had come to the conclusion that any form of arrester that involved a spark was distinctly a thing to avoid.

Mr. G. D. SEATON said the efficiency reports commended themselves to him very much. A good deal of bad machinery was put into use in this country because it was cheap. Anything that brought out the merits of good machinery was to be encouraged, and the author was to be congratulated for his efforts in this direction. He would like to see such methods used by municipalities; if they were, he thought some astounding results would be seen.

Mr. LAMB asked the author for an idea of the size of the cooling pond for the condensation water. The quantity of circulating water seemed to be low for the size of the plant.

Mr. J. LUSTGARTEN asked if during the period of lightning, any insulators had been punctured. The question was an important one, because out of it arose whether an insulator existed to do this work. With regard to earthing the neutral, they had learnt that for all L.T. distribution circuits earthing the neutral was the best policy, but in Mr. Peck's recent paper the conclusions come to were that on H.T. circuits the neutral should not be earthed. The reason for that was that if working with an earthed neutral and flashing over took place on any of the lines, then if this flashing over persisted and the current was large enough, the circuit breakers would trip and interrupt the supply. Recent American practice had been to work with a non-earthed neutral and to use an arc suppressor.

Mr. COATES asked if the switches in the sub-stations were of similar breaking capacity to those in the main stations.

Mr. PARRY said it would be interesting to know how the cost of the 700 miles' scheme from Victoria Falls worked out in comparison with the present steam stations. Was there any reason why the power stations should not have been put down at the collieries and the power distributed from there?

Mr. W. BOLTON SHAW asked what was the drop in pressure at the most distant point on the air supply system? The very small loss of 3 per cent. on the pipe line spoke well for the way in which the line had been installed.

Mr. HADLEY, in reply, said they had not experienced any trouble on the cables through white ants. Owing to the very hard earth formation, subsidence was practically unknown on the reef, and therefore expansion joints were not used. There was no trouble in working overhead and underground cables together, but it had to be remembered that the 20,000-volt cables could only be connected to the 40,000-volt lines through coupling transformers. No trouble had been experienced with the suspension-type insulator due to dust. The Pratt system of induced draught was one of the most interesting features of the installation; it also appealed on the question of saving freight, which was £10 per ton. Anything simplifying labour was also another great advantage. The system was so satisfactory that it had been applied on all the stations. The revision of price was entirely dependent on the cost of production and could take place every eight years. It was based on the average cost of the preceding three years. The size of the cooling pond depended on whether it was possible to discharge at one end and take in from the other. The amount of power used in the works at Rosherville depended on whether the pond was full, so that the natural gravity inlet was at the necessary height. On the whole,  $\frac{1}{4}$  to 5 per cent. was a fair figure, and included the supply to the houses of the staff and the recreation rooms, &c. The water was measured by Lea recorders. As to the puncturing of insulators, it was so seldom that the line itself was struck by lightning that he did not think they had any records of any value on this point. With regard to earthed neutral, with the Merz-Price system, when the station cut off a faulty line, it did not interrupt the supply, as the latter was in duplicate; this was the great merit of the system, and it had been found extremely valuable. In regard to a question whether there were any other protective devices than the Merz-Price system, there were also maximum overload cut-outs provided, but they were screwed up so that they could not work. The general tendency was to make the machines hang on as long as possible, and only take them out of service if it was found really necessary. With regard to switches in sub-stations, there were two sizes of switches smaller than in the power station, i.e., three sizes of switches on the system; since the neutral was earthed, there had been considerably less trouble on the system. The transformers in the consumers' sub-stations were oil transformers, air cooled, but the transformers in the power stations and in the main central stations were water cooled. The compressed-air supply was far larger than anything tried elsewhere. They had never had a failure of the supply, but occasionally the pressure had gone down. The maximum pressure drop between the compressors and consumer was 6 lb.

Mr. Hadley's paper was also discussed at the meeting of the SCOTTISH LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS on April 15th.

The CHAIRMAN was sorry that Mr. Hadley had not given more details about protection from lightning. Tropical storms were terrible, and while the earthed guard wires served as a great protection, at the same time those wires did not protect from static discharges. In a case which was brought under his notice, the only

solution to periodical breakdowns in plant was a high resistance between the line and earth.

Mr. BUNTON expressed interest in the load dispatcher system, and wished Mr. Hadley had described the particular system adopted on the Rand.

Mr. SAM. MAYOR said that the generation and distribution of compressed air on so great a scale was a great piece of engineering. The most striking fact was the very small loss in transmission. The distance between the extreme mines supplied was about 14 miles, and the total run of pipe was 20 miles. The author said that the results of their tests showed that of the air units 95 per cent. had been recorded at consumers' meters and only 3 per cent. lost in transmission. The 3 per cent. loss in transmission must be taken as energy loss and not merely as pressure loss. He had had considerable experience of the use of the Venturi tube, and he had had many hundreds of careful observations made with it, and the results had all been satisfactorily consistent with each other, and he had not the slightest hesitation in saying that the measurements of accuracy claimed in the paper were well warranted. The efficiency of transmission was a testimonial to the type of joint, but he would like to ask how long it was anticipated that india-rubber rings would last? His experience had been that the low efficiency in the application of compressed air to mining was simply appalling. In the course of his investigations he had not found a single colliery where the loss in volume was less than 23 per cent. of the total volume of air compressed. When one compared that with the claims of the paper, the difference was enormous. Where the loss was 23 per cent. the pressure was only 30 lb.; with the higher pressure the loss would be very much greater. In some cases he found it as large as 40 per cent. Some of his tests had been made with up-to-date plant. In one of the largest Lancashire collieries, out of a total of 1,500 H.P., 400 to 500 represented leakage in volume alone. The paper was another illustration of the beneficial influence of the electrical engineer on any undertaking with which he associated himself. There had never been a satisfactory meter for metering compressed air, and, in view of the very considerable scale on which compressed air was used in this country for mining operations, it was not at all creditable to the compressed-air engineers that they had been all this time without a satisfactory meter. The electrical engineer had insisted on knowing what he was doing, and in the absence of a satisfactory meter he set about producing one. Compressed air was used for driving percussion drills. They were still in want of a satisfactory rock drill. The rock drill required a pressure of between 80 and 100 lb. Therein lay their present low efficiency, because the cylinder was filled with high-pressure compressed air at each stroke, and that was exhausted at very high pressure, and was thus thrown away in the exhaust. The power required for each drill was, approximately, 20 H.P., and the energy expended by the cutting of the bit was between 1 and  $1\frac{1}{2}$  H.P., so that the efficiency of the compressed air drill was only about 5 per cent.

Mr. W. L. SPENCE referred to the statement in the paper that the chimneys were all of the cold compressed-air ejector type. These could not of themselves be of a high efficiency, but they were thoroughly adapted to the conditions, because of the high cost of construction in Africa. The figures with regard to air distribution were open to suspicion, but if the figures were correct the scheme justified itself.

Mr. MACLEOD said that the system of induced fans could not be commended for general adoption, as it was open to objection that in certain circumstances the fans might fail the power house staff at a critical time. The confining of the pilot wires for operating the system with the telephone circuit in a lead-covered cable suspended overhead, seemed to him to be a tempting of Providence, because, in the event of a series transformer failing, it was more than likely that the telephone wire would be energised at any pressure up to 80,000 volts, and the operator who happened to be using the telephone at that time would have a very strenuous moment. Here they found there was endless trouble with suspended lead-covered cables through vibration causing cracking of the lead. In the Clyde Valley system they had used bare copper conductors for the protective gear, and also for the telephone system, and they had given uniform satisfaction.

Mr. ROBERTSON (Clyde Valley Co.) pointed out that the cost of current was said to be 525d., but there was no mention of the cost of coal delivered at the generating station. He would like to know the quality of the coal used. A 74 per cent. load factor was mentioned, and he took it that this was for both the electrical and compressed-air plant.

The CHAIRMAN admitted that it was very difficult to get an electric drill. With a solenoid the efficiency was very low, and they did not get the power they could get with an air compressor. There was a big field for anyone who could turn out a satisfactory electric drill to replace the air drills.

In the course of his reply, Mr. STARR (who read the paper in the author's absence) said the system dealt with in the paper was similar to that used at Newcastle and by the Clyde Valley Co. In the latter they had at their Motherwell power house a diagram of connections and the regulations were that no switch was to be closed or opened without communicating with the switchboard at Motherwell. Mr. Mayor had referred to loss in transmission, the figures were 6 lb. out of 131 lb., and that was about  $\frac{1}{4}$  per cent., the figure in the paper was 4 per cent. There was a certain number of units unaccounted for in every system. The jointing material for the pipe lines would not be pure rubber, it would be a compound of some sort. In reply to Mr. Spence, he did not see that the meter was so very complicated as compared with an ordinary electricity meter, and the latter recorded correctly. Induced draught had many disadvantages, and the comparison of natural with induced draught was a matter for controversy. Very often the local conditions

decided in favour of the one or the other. There was no good quality of coal on the Rand. The penalty for shutting down supply was 60 per cent. more than the price the consumer paid the company. That was, the consumer paid 525 per unit, but for a shut down the company paid the consumer a sum equal to the units he should have got at a price of 84 per unit. They had no stringent Board of Trade regulations on the Rand, and he took it that compressed air was used not only for the drills but for ventilation as well.

## STANDARDISATION RULES FOR ELECTRICAL MACHINERY.

(Excluding Railway and Tramway Motors).

The following code of rules was provisionally adopted on April 17th by the Council of the BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION.

Other sections dealing with short-circuit tests, commutation, pressure regulation, parallel operation, efficiency, and tolerances, are at present under the consideration of the Standards Committee of the Association.

### SECTION I.—STANDARD PRESSURES AND FREQUENCIES.

1. The standard frequencies for alternating-current work are:—50 cycles per second, and 25 cycles per second.

2. The standard high-pressure systems for alternating-current work are:—2,000, 3,000, 6,000, 10,000 and 20,000 volts.

3. The standard generator pressures are:—

For direct-current generators.	For alternating-current generators.
115 volts	440 volts
230 "	550 "
460 "	2,200 "
525 "	3,300 "
	6,600 "
	11,000 "

Standard low pressures measured at consumers' terminals:—

Direct-current.	Alternating-current.
110 volts	100 volts
220 "	200 "
440 "	400 "
550 "	500 "

(Motors are to be capable of operating without injury at their rated outputs and overloads on any pressures not exceeding 5 per cent. above or below their standard voltages. See Clause 6, Sec. IV.)

5. Transformers.—The normal rated pressure of the low-tension side of a transformer is to be the same as that of the consumer's supply, according to Clause 5.

It is recommended that the standard transformer ratios should be such as to transform between the standard pressures above-named.

### SECTION II.—HIGH-PRESSURE TESTS AND INSULATION RESISTANCE.

(a) High pressure tests.—(1) commercial high pressure tests are to be made on the completed apparatus while it is in good condition and before it is put into service. In the case of apparatus which has been in service reduced tests only are to be applied.

Unless otherwise specified, the high-pressure tests are to be made at the makers' works.

The test is to be made with a pressure of approximately sine wave form, preferably at the rated frequency of the apparatus, but in general any frequency between 25 and 100 is satisfactory.

Prolonged tests at high pressure are undesirable, since they permanently weaken the insulation.

2. The following tests are to be applied for one minute between the windings and the frame and core when the apparatus is at normal working temperature:—

Rated terminal pressure of circuit.	Test pressure.
Not more than 333 volts.	1,000 volts.
Above 333, but not more than 1,500 volts.	3 times rated pressure with a minimum of 1,500 volts.
Above 1,500, but not more than 2,250 volts.	4,500 volts.
Above 2,250 volts.	twice rated pressure.

Note.—In the case of machines driven by water-wheels and exposed to runaway conditions or otherwise exposed to possible excess pressure, it is recommended that pressure-limiting devices shall be provided, otherwise the test must be based on the highest pressure to which the windings may be subjected.

3. High-pressure tests on field windings are to be based on the excitation pressure. Field windings of synchronous machines intended to be started from the A.C. side are to be tested at a pressure of 5,000 volts unless the field windings are provided with a "break-up" switch, or will always be short-circuited at starting.

4. Transformers are to have the same test between high-pressure winding and core as between high-pressure winding and low-pressure winding. In making such tests the low-pressure winding should be connected to the core.

5. In general, constant current apparatus, and apparatus used for series operation, is to have the test pressure rating corresponding to the maximum pressure which may be impressed upon the apparatus.

(b) Insulation resistance.—(6) Very high insulation resistance (megohm test) should not be specified on electrical machinery, since in order to obtain it, long baking at high temperatures may be required, which may permanently damage the insulating material.

Insulation resistance tests are of value in showing the condition of the insulation, with special reference to moisture and dirt, and it is usually advisable to measure the insulation resistance before making high-pressure tests.

7. In general, an insulation resistance of 1 megohm for windings above 350 volts, or 0.25 megohm for low-pressure windings, is sufficient evidence that the windings are in condition to receive the high-pressure test.

### SECTION III.—TYPES OF MACHINES.

The following classification of rotating machines is recognised: (1) open; (2) protected; (3) enclosed-ventilated; (4) (a) pipe-ventilated, (b) pipe-ventilated, with "forced draught"; (5) drip-proof; (6) totally enclosed; (7) flame-proof.

1. Requires no definition.

2. A "protected" machine is one in which the armature, field coils, and other live parts, are protected mechanically from accidental or careless contact, while free ventilation is not materially obstructed.

3. An "enclosed-ventilated" machine is one in which the ventilating openings in the frame are covered with

(a) Expanded metal or wire gauze of not less than  $\frac{1}{4}$ -in. mesh, so as not to obstruct free ventilation.

(b) Wire gauze, less than  $\frac{1}{4}$ -in., but not less than  $\frac{3}{16}$ -in. mesh, or with perforated metal having not less than  $\frac{1}{16}$ -in. holes.

(c) Machines having ventilating openings covered with screens having smaller openings than those specified in 3 (b) are to be treated as "totally-enclosed" machines as regards temperature rise and overloads.

4. A "pipe-ventilated" machine is one in which the frame is so arranged that the ventilating air may be conveyed to it through a pipe attached to the frame.

If the heated air expelled from the machine is to be conveyed away through a second pipe attached to the machine, this should be so stated.

It is understood that a pipe-ventilated machine propels its own ventilating air unless it is distinctly stated that the air supply is to be maintained by an independent fan external to the machine, in which case it becomes a "forced-draught" machine.

5. A "drip-proof" machine is one having a frame provided with ventilated openings, so protected as to exclude falling moisture or dirt.

6. A "totally-enclosed" machine is one in which the enclosing case does not allow a circulation of air between the inside and outside of the case, and is dust-proof, both as regards case and bearings.

7. A "flame-proof" machine is one in which the enclosing case can withstand, without injury, any explosion of gas that may occur within it, and will not transmit the explosion to any inflammable gas outside it.

An induction motor in which the sliprings and brushes alone are included within a flame-proof case should not be described as a "flame-proof" machine, but as a machine "with flame-proof slipring enclosure."

### SECTION IV.—RATING.

1. Two classes of rating are recognised—continuous rating and short-time rating (for intermittent working).

2. The continuous rating is the output which a machine or a transformer will give for a period sufficiently long to attain practically constant temperature rise, and otherwise comply with these regulations.

Unless otherwise specified, any machine rated to operate between two limits of pressure shall have its ampere rating determined upon the higher pressure.

3. The short-time rating is the output which a machine or transformer will give for one hour, one half-hour, or other specified period, and comply with these regulations.

These ratings are called one-hour rating, one half-hour rating, or other specified rating respectively.

4. Machines with two or more fixed speeds are to have a definite rating for each speed.

5. Variable speed machines. These are of two classes:—

(a) Machines rated to give the same output throughout the entire range of operating speed. In such machines, the heating tests should be made at the lower limit of speed, and commutation tests at the upper limit of speed.

(b) Machines which are not rated to give the same output at all speeds. These machines should have ratings specified for both minimum and maximum speeds.

6. Test rating and pressure variation. Guarantees as to heating, efficiency and other characteristics are to be taken as applying to tests at the pressure marked on the nameplates, but motors must be capable of operating without injury at their rated outputs and overloads on any pressures not exceeding 5 per cent. above or below their standard pressures.

It should be noted, however, that the "pull out" torque or maximum torque available will vary approximately as the square of the terminal pressure.

## SECTION V.—OVERLOADS.

1. (a) Machines with continuous rating having limits of full load temperature rise in accordance with Sec. VI. (a) are to be capable of withstanding 25 per cent. overload beyond the continuous rating for the following periods:—

100-KW. or H.P. and above	... ..	Two hours.
Below 100 KW. or H.P. not below 25 KW.	... ..	One hour.
Below 25 KW. or H.P. not below 2 KW. or H.P.	... ..	One half-hour.
Below 2 KW. or H.P.	... ..	Five minutes.

(b) Machines with continuous rating having limits of full load temperature rise in accordance with Sec. VI. (b) are to be capable of withstanding 15 per cent. overload beyond the continuous rating for the periods shown above.

(c) Machines with continuous rating, of the "totally-enclosed" class, having limits of full load temperature rise in accordance with Sec. VI. (c) have no overload ratings except the momentary overloads required in connection with commutation tests.

The above overloads are to be measured in kilowatts, kilovolt-amperes, or horse-power according to the name-plate, except in the case of series or compound motors for which the overloads should be measured in amperes of input.

2. With machines having two or more fixed speeds the above overload ratings are to apply at each speed.

With variable speed machines having ratings at minimum and maximum speeds, the above overload ratings are to apply at each speed.

With machines having a speed range exceeding 2 to 1 and the same ratings at all speeds, the above overload ratings apply at any speed from the minimum to 75 per cent. of the maximum speed.

3. Motors with short-time rating are to be capable of carrying an overload of 100 per cent. torque for 30 seconds.

4. Transformers are to be capable of withstanding overloads of 25 per cent. for two hours, and 100 per cent. for 30 seconds.

## SECTION VI.—HEATING.

1. Determination of temperature rise.—The temperature rise of electrical machinery, both rotating and static, is to be taken as the difference between the cooling air temperature as defined in Clause 6 and the temperature of the machines after giving their normal rated output for the following periods:

(a) For machines with continuous rating. Until the temperature rise is practically constant; that is, until the rate of increase of temperature rise does not exceed 1° C. per hour.

(This condition will usually be reached in less than six hours, except in the case of oil immersed transformers.)

(b) For machines with short-time rating.—After working continuously for the period defined by the rating.

2. Permissible temperature rise.—For machines with continuous or with short-time rating and designed to operate under ordinary conditions of cooling, i.e., designed for an air temperature of 25° C. (77° F.), the following temperature rises are the highest permissible at the normal full load:—

## (a) MACHINES HAVING UNOBSTRUCTED VENTILATION.

(Section III, Classes 1, 2, 3a, 4a, 4b.)

Rise by thermometer.

All windings...	... ..	40° C. (72° F.)
Cores in which windings are embedded	... ..	40° C. (72° F.)
Commutators and slip rings	... ..	55° C. (93° F.)

In general the temperature rise by increase of resistance should not exceed 55° C. (99° F.) for alternator field coils, or 60° C. (108° F.) for shunt field coils of direct-current machines in this class.

## (b) MACHINES HAVING PARTIALLY OBSTRUCTED VENTILATION.

(Section III, Classes 3b, 4a, 5.)

Rise by thermometer.

All windings...	... ..	47° C. (85° F.)
Cores in which windings are embedded	... ..	47° C. (85° F.)
Commutators and slip rings	... ..	55° C. (99° F.)

In general the temperature rise by increase of resistance should not exceed 65° C. (117° F.) for shunt field coils of direct-current machines in this class.

## (c) MACHINES OF THE "TOTALLY-ENCLOSED" CLASS.

(Section III, Classes 3c, 6 and 7.)

Rise by thermometer.

All windings...	... ..	55° C. (99° F.)
Cores in which windings are embedded	... ..	55° C. (99° F.)
Commutators and slip-rings	... ..	55° C. (99° F.)

In general the temperature rise by increase of resistance should not exceed 70° C. (126° F.) for shunt field coils of direct-current machines in this class.

3. Transformers.—The temperature rise of transformers is to be measured at their rated full-load output, under the conditions specified in Clause 1. It is permissible, however, to reduce the time of test by running for a time on an overload in current and pressure, then reducing the pressure to normal, and maintaining at this until the required standard rate of temperature rise is attained.

The limit of permissible temperature rise at the rated full load is as follows:—Oil-cooled, by resistance or by thermometer, 50° C. oil, 50° C.; air-cooled, by resistance or by thermometer, 50° C.

4. Machines for Tropical Conditions.—For tropical conditions or other cases where the cooling air temperature is in excess of 35° C., the permissible temperature rises shown in the preceding clauses are to be reduced by 20 per cent.

This does not apply to machines insulated with special heat-resisting materials in accordance with Clause 5.

5. Special Heat Resisting Materials.—The limits of temperature rise shown in Clauses 2, 3 and 4 above, apply to windings whose insulation consists wholly, or in important part, of cotton, paper, varnished cloth or similar materials.

Higher temperature rises are permissible in the case of windings where asbestos, mica or preparations of these materials are solely relied upon for insulation.

6. Measurement of Cooling Air Temperature.—The air temperature is to be taken as the mean of the temperatures measured at regular intervals during the last quarter of the test period.

When the machine under test is provided with pipe ventilation or forced draught, the air temperature is to be measured by a thermometer placed in the current of incoming air.

In the case of machines other than those referred to in the preceding paragraph, the air temperature is to be taken as the mean of the readings of two or more thermometers placed not more than 6 ft. from the machine, and on a level with its centre on opposite sides. So far as possible, these thermometers should be placed so as to measure the current of air flowing towards the machine, but they must not be exposed to radiation or stray draughts.

7. Correction for Altitude.—When a machine is intended for service at high altitude, the permissible temperature rise, if tested near sea-level, is to be reduced 2½ per cent. for each 1,000 ft.

## UNIVERSITY OF HONG KONG.

## ADDITIONAL EQUIPMENT.

WE have received a second list of experimental apparatus and machines presented to the newly-established University of Hong Kong. We are glad to notice that upwards of 80 firms have promised assistance, and there is no doubt that there will be, in the greatest distributing centre of China, a permanent exhibit of British engineering appliances. At the same time we regret to notice that electrical firms have not responded to the appeal from this British Colony as well as we should wish. A number of electrical firms have shown practical sympathy, and we sincerely trust that makers of electrical machinery will also send help. The Asiatic Petroleum Co., Ltd., have offered to supply the necessary oil fuel for the engines and boilers, which will be oil-fired. We gave a list of many of the gifts in our issue of January 31st, page 194. The shipping companies have offered to send freight free all the presentations to the University, and intending donors should communicate with Messrs. Matheson & Co., 3, Lombard Street, London, who have kindly taken charge of these arrangements.

We may mention that Prof. C. A. M. Smith will be in London in June, and letters addressed to him at the Royal Colonial Institute, Northumberland Avenue, W.C., will receive immediate attention. Among the electrical apparatus urgently needed we notice the following:—

One 5-KW. D.C. generator, 110 volts, shunt regulation, speed about 750 R.P.M.

One motor converter, speed about 1,450 R.P.M., and consisting of:—(a) One 20-B.H.P. single-phase induction motor, 110 volts, 75 cycles, with starter; (b) one 15-KW. D.C. generator, 110 volts, shunt regulation.

One booster, with potentiometer rheostat on fields, current capacity 50 amperes, voltage range 0.50, with 4-H.P. 110-volt D.C. driving motor.

A 16-panel switchboard for 110 volts.

Telegraphic apparatus.

Telephonic apparatus.

A balancer set consisting of two 7-KW. D.C. generators upon the same bedplate, each generating 110 volts and running at 1,500 R.P.M.

A single-phase four-pole alternator of 10-KW. capacity, frequency 50, and running at 1,500 R.P.M. on the same bedplate as (1). Voltage 110 D.C.

A booster, capacity 100 amperes, and giving any voltage 0.50, with potentiometer regulator and series resistance. Speed about 1,600 R.P.M.

A rotary converter, 7-KW. capacity. D.C. side 220 volts. A.C. side provided with two-phase and three-phase slip rings. Four-pole, speed 1,500 R.P.M. Frequency 50 with field rheostat. To be arranged for separate driving when required.

A 10-KW. three-phaser with separate windings giving 110 volts per phase, capacity speed 1,500 R.P.M., frequency 50, four poles, with field rheostat.

A 12-KW. D.C. motor wound for 110 volts, running at 1,500 R.P.M., mounted on the same bedplate as (5) with starter.

A 220-volt 10-KW. D.C. generator complete with static balancer and field rheostat.

A 15-H.P. D.C. motor 110-volt on the same bedplate as (9), and running at the same speed with starter.

A three-phase induction motor, frequency 50, speed 1,500 R.P.M., 10 H.P., with wound rotor and starting resistance and short circuiting gear.

A 7-kw. 110-volt D.C. generator running at 1,500 R.P.M. and mounted on the same bedplate as (11) with field rheostat and starter for use as motor.

A 3-H.P. two-phase induction motor, 150 volts, frequency 50, squirrel-cage rotor.

Switchboard, 21 panels + 3 spare.

## THE ELECTRICAL INDUSTRY IN FRANCE.

By GEORGES DARY.

(Continued from page 797.)

For some time past Paris, too confined by the surrounding fortifications, has been spreading out in all directions; new houses, streets and avenues having come into existence as far as Versailles to the west; to Champigny on the east; and to Saint Denis and Enghien on the north—a radius of over 12½ miles from the walls of the city. The result of this crowding of inhabitants, and the want of space in the centre of Paris, is that, just as in London, business men, employés and commercials have begun to make for the suburbs in order to secure more space, larger houses, the long-desired gardens, and, above all, to secure a reduction in rent, which, in Paris, has become far beyond the means of ordinary purses. This daily emigration from the city of quite an army of persons cannot be carried out except by a frequent and rapid means of transportation. This is the reason that has rendered necessary within the last five or six years the doubling of the means of transport, which are already insufficient to meet the needs of the steadily increasing number of passengers. Within Paris itself the Metropolitan underground electric railways have proved a solution to a part of the question, but as to the traffic outside Paris, the increase of the number of trains on the suburban lines to the practical maximum has proved insufficient.

The only available means of dealing with the problem was that of the electrification of all the lines running out of Paris in all directions and up to a pre-determined distance. In this way a minimum of congestion in the departure stations in Paris and a maximum of speed and frequency can be obtained. The chief companies have decided on this course, and the programme of the electrification of the Paris suburban railways will be carried out from year to year until the scheme has been completely realised. In 1908 we drew attention to the electric railway between Paris-Invalides and Versailles, and to that from Paris-Quai d'Orsay to Juvisy. The first-named line forms part of the State's Western system, while the second belongs to the Orleans Railway Co. On the present occasion we must mention the very important scheme for the electrification of all the suburban lines running out of the Gare St. Lazare, Paris, and which also form part of the State's Western system.

The St. Lazare station is peculiarly situated: the 27 lines running into it have, owing to the Batignolles tunnel, after reaching Paris, to be reduced to eight tracks, there being absolutely no land available for expansion. On these eight tracks no less than 1,200 trains per day have to be run in both directions without counting the shunting of about 200 locomotives. We believe that the conditions are unique, and find no parallel in any part of the world. As a result of this "bottle-necking," quite a number of complications have to be dealt with—unexpected stops, delays, blockages, . . . and accidents, which are steadily increasing in number. It was, therefore, necessary to alter the whole conditions, and it was consequently resolved:—(1) To demolish the Batignolles tunnel and the numerous houses built above it and to replace it by an open cutting covered by steel bridge work to give communication between the two sides. In this way it will be possible to increase the number of tracks by two: (2) to construct an underground railway with five tracks, and a second arrival station provided with platforms 490 ft. long, reserved for the suburban lines, which are to be electrified.

The electrification scheme which received the official sanction on May 9th, 1912, will consequently comprise the following lines:—

Paris (St. Lazare) to Auteuil and Champ de Mars, 13½ miles, double track.

Paris (St. Lazare) to Versailles (right bank) and to St. Nom la Bretèche, 21½ miles, double track.

Paris (St. Lazare) to Saint Germain-en-Laye, 15 miles, double track.

Paris (St. Lazare) to Mantes and Pontoise, *via* Maisons-Laffitte and Argenteuil, 37½ miles, double track.

With the exception of the Versailles and Argenteuil lines the departure platforms of which will be in the upper station, the others will, on entering Paris, be underground lines as far as St. Lazare.

The work is being carried out in three sections, commencing with the lines that are the most blocked—those to Auteuil and Versailles. It is hoped that the first section will be completed in 1914 or by the commencement of 1915. The total cost of the work is estimated at no less than £5,560,000. In the original project, the supply of the current necessary for the working of these lines was to have been carried out by the State, which owns the system. A generating station was to have been erected on land purchased for the purpose at Bezons Bridge, and the electricity station at Moulineaux was to have been extended so as to have an output of 25,000 kw. Eventually it was decided to procure the necessary electrical energy from private companies in place of establishing a Government plant, and tenders were invited for the contract, conditions coupled therewith being that the contractor should take over the Moulineaux generating station—which supplies the current to the Paris (Invalides)-Versailles line—and the land acquired by the State at Bezons Bridge. Provision was also made for supplying energy by transmission lines from generating stations outside Paris (the Rhone transmission line or that from the Nord). In the latter case, the steam-driven stations established in Paris for the supply of current to the railway system, must be kept with steam up in readiness for use at any time in case of breakdown of the main supply. The power available at the Moulineaux station will be 25,000 kw., and at the Bezons Bridge plant 40,000 kw. The contract is for a term of 30 years, and the contracting company will be required to deposit a sum of £60,000 by way of guarantee.

The trains will be supplied with continuous current at from 600 to 650 volts, and by means of a third rail lateral to the track. The electrical energy, generated at the power stations in the form of three-phase current at a pressure of 15,000 volts, will be transmitted by underground cables to transformer sub-stations erected along the lines.

The trains will comprise new four-axle double-bogie motor carriages, the trials of which have just been carried out on the Invalides-Versailles line. The vehicles, which have a length of 73½ ft., comprise a luggage compartment and two first and second-class compartments. Their large dimensions will enable a single vehicle to form a train during the quiet hours of the day. The underframe is provided with two 250-H.P. motors, by means of which a speed of 50 miles per hour can be attained on the level and 31½ miles per hour on slight gradients. The control is arranged on the multiple-unit system, with controllers at both front and rear of the vehicles. The carriages are lighted and heated electrically, and have seats for 64 persons and standing room for 36 others, or a total of 100 passengers per vehicle. The ordinary buffer connection between the carriages is replaced by an automatic central-coupling attachment. All these characteristics will enable lighter and less lengthy trains than at present to be built up at the busy hours, and will form a true solution of the crowding at the large stations in Paris which are invaded in the mornings and evenings, at midday and at 1 o'clock—that is, four times each day—by suburban passengers and traffic.

Before leaving Paris and its suburbs, we should mention the complete electrification of the tramway system of the Compagnie Générale des Omnibus, an extensive project, part of which has already been carried out, while the remainder will be pushed through as rapidly as possible until the whole scheme is complete. The Compagnie Générale des Omnibus commenced its operations on March 1st, 1855, with 435 horse-drawn buses, which served 25 routes of a total length of 93 miles in Paris, and 28 routes, extending to 122 miles,

in the suburbs. After having constructed several lines of tramway on its own account, it was only in 1903 that the Compagnie des Omnibus took over the municipal tramway system, the concession for which up till then was held by the Paris Municipality. This system to-day comprises 39 routes, having a total length of 183 miles. Up to 1900, it may be said that the methods of tramway traction in Paris included every known system, and formed what may be termed a living museum of all the different types of motors that had been invented, possible and imaginary—compressed-air motors, hot-air motors, steam engines, in fact, motors of all kinds; Serpollet steam generators, Pursey steam boilers . . . electric motors with accumulators, with overhead conductors, with surface contact collectors and underground conduits—and all of these working on the different lines! To-day it is proposed to suppress these different systems and to work the whole tramway system electrically on the overhead principle in the outskirts and on the conduit system in the interior of Paris.

The necessary electrical energy will be supplied from three generating stations, situated respectively at Saint Denis, Vitry-sur-Seine and at Billancourt. The three-phase current generated at a pressure of 12,000 volts at these stations, will be distributed by high-tension feeders to eight sub-stations, where it will be transformed to continuous current at 600 volts, and, as such, transmitted to the lines. The sub-stations will be connected one with the other in such a way that, in case of a stoppage at any one of the central stations, they may be fed from the two others. The feeder system will consist of three-core armoured lead-covered cables; the hoop-iron armour is separated from the lead casing of the cables by two sheets of coated paper, a band of cotton and two layers of tarred rope in order to protect the cables from any chemical phenomena which may be experienced in the earth. For the 300, 400 and 600 sq. mm. conductors, aluminium has been substituted for copper.

The underground conduit, which will be adopted for the central part of the system, and which will extend to an additional distance of, about  $37\frac{1}{2}$  miles, has been constructed by the Compagnie Thomson-Houston, and is of the central type already installed on two lines in Paris (three other lines, Etoile-Bastille, Chatelet and Reaumur, are of the lateral conduit type). It is built up of cast-iron chairs weighing 352 lb. each, and set at distances apart of about 4 ft. 3 in.; the extremities of the chairs support the running rails, while the slotted rail is fixed to the centre. The lines worked on the overhead-conductor system extend to a distance of about 144 miles. As regards the rolling stock, the company has decided to suppress the usual double-deck vehicles, on account of their causing delays owing to passengers having to mount

with a motor for driving purposes, while the other axle, which is fitted with smaller diameter wheels, is intended for steering (fig. 2). The point of support of the car body on the frame has been arranged as close as possible to the driving axle in order to increase the load on the latter. These cars are intended for use on the routes on which there is a heavy traffic combined with only moderate gradients. (2) For routes comprising steep hills, and on which cars with trailers are employed, a motor tramcar with two axles and a large wheel base—11 ft. 9 in.—has been adopted; to facilitate running round curves a certain amount of play is left in the axle boxes to permit of convergence in the axles, this arrangement having been adopted with success in connection with the tramways in Vienna. (3) Finally, for the routes on which there is only a relatively light traffic, a smaller type of car with end platforms, and with a wheel base of 10 ft. 8 in., has been adopted.

The electrical equipment will comprise two motors per car, of from 50 to 60 h.p., and of the auxiliary or commutator pole type. The addition of the auxiliary poles has enabled the problem of commutation to be solved. The controllers are of the series-paralled type with magnetic blow-outs and are sectionised, so that in case of accident it is possible to cut out a part of the equipment, and to run at a slower speed with the remaining portion. A small combined motor and compressor produces the compressed air necessary for the working of the automatic brake; it comprises an electric motor of from 3 to 4 h.p., working continuously, but able to develop double that power when used intermittently, a compressor and an electric pressure regulator.

According to a report presented to the Société des Ingenieurs Civils de France by M. Mariage, manager of the Compagnie des Omnibus, the estimates for the acquisition of 1,100 tramcars amount to £960,000. As for other costs in connection with the scheme, they comprise £100,000 for high-tension feeders, £156,000 for sub-stations, and £192,000 for continuous-current feeders.

In addition, the cost of organising and equipping 13 dépôts for the storage of the cars and a central repairing establishment—jointly used for the motor-buses and tramways of the company—is estimated at £140,000.

To summarise or even enumerate the new electricity-distributing installations that have been established in provincial France during the last five or six years is practically impossible, and even if attempted, would consist mainly of a wearily long list of names of towns. Therefore, before passing to the Pyrenees, where at present several interesting installations are being carried out, we will content ourselves by drawing attention to the activity which prevails in all parts of France and the object of which, as we pointed out at the commencement of this article, is to provide the different districts with a supply of electrical energy, either by utilising available water-power or by establishing generating stations directly connected with collieries with the view of securing low costs of production.

To give an example, we may draw particular attention to the plant of the Compagnie Electrique du Nord, which is destined to become the main artery of a large system supplying current for lighting and power purposes to the majority of the industrial centres in the Nord and Pas de Calais Departments, if not later on to the suburbs of Paris, as we have previously indicated. Already the supply mains of the company extend to a distance of over 37 miles, supplying the current required for haulage purposes by the Société de Halage Electrique, which works the canals in the district of Douai.

The generating station, which is situated at Pont-a-Vendin, belongs to the Société des Mines de Lens; it produces 50-period three-phase current, at 45,000 volts pressure. The high-tension mains—three in number—convey the current to five sub-stations, located at Banvin, La Batterie, Douai, Arlenx and Hem-Leuglet. Special care has been devoted to the arrangements for the protection of the overhead lines where they cross roads and railways.

The details of the installation need not now be gone into; we have only referred to it because of the future extensions, which will reach to all parts of the Nord Department, and

FIG. 2.

up to, and descend from, the top. With the view, however, of meeting all requirements, and in order that the cars, notwithstanding their great length, may easily pass round sharp curves, possess perfect underframe rigidity, and sufficient adhesion, the company has been led to adopt three types of car, according to the lines on which they are to be used:—(1) A car with bogies, one axle of which is provided

because of the important character it will assume in the near future. Similarly, we will only mention, in choosing at random from a long list of similar undertakings, the names of the Société de l'Energie Electrique du Centre, La Compagnie Electrique du Jura, La Compagnie Générale Electrique de la Marne, La Compagnie Lorraine d'Electricité, La Société Hydro-Electrique des Basses Pyrenées, La Société de l'Energie Electrique du Sud-Ouest, La Société des Forces Motrices du Refrain (Doubs), and La Société Force et Lumière du Val d'Arly. This short list will be sufficient to prove the truth of our assertions at the beginning of this article, and for us to state that the number of electricity supply companies established in France has more than doubled since 1908.

We may now devote attention to the new installations which have been established, and also to those in course of construction in the Pyrenées, which will complete our endeavours to demonstrate to the readers of the REVIEW, the present prosperous condition of the electrical industry in France and the immense progress which the industry has made within the short space of five years.

To begin with the work which has been commenced by the Midi Railway Co. in connection with the adoption of

heavy traffic, which is more easily dealt with electrically, and it is for these reasons that the Midi Railway Co. has decided to adopt electric traction on practically the whole of its system in the Pyrenées.

(To be continued.)

## ELECTRICAL FITTINGS AND THE LAW.

[FROM A LEGAL CONTRIBUTOR.]

To judge from the legal queries addressed from time to time to the ELECTRICAL REVIEW, it would seem that the supply, hire, and use of electrical fittings, are matters which frequently give rise to questions of legal difficulty. It is probable that few householders in a town have a very clear notion as to how their premises came to be wired for electricity. Again, the consumer's mind is frequently in a nebulous state as to what his rights are in relation to electric fittings as between himself and his landlord.

It will be convenient, in the first place, to consider some sections of the older electric lighting Acts in their bearing on electric fittings. Thus, Sec. 24 of the Electric Lighting Act, 1882, provides that any officer appointed by the undertakers may at all reasonable times enter any premises to which electricity is, or has been, supplied by the undertakers, in order to inspect the electric lines, meters, accumulators, fittings, works, and apparatus, for the supply of electricity belonging to the undertakers, and for the purpose of ascertaining the quantity of electricity consumed or supplied, or where the undertakers are authorised to take away and cut off the supply of electricity from any premises, for the purpose of removing any electric lines, accumulators, fittings, works, or apparatus belonging to the undertakers, repairing all damage caused by such entry, inspection or removal.

The powers conferred by this section must not, however, be arbitrarily exercised. Due notice of an intended visit should be given, for it was decided in *Brompton, &c., Electric Supply Co. v. Shadforth* (ELECTRICAL REVIEW, July 24th, 1903) that where a consumer refused to allow inspectors to come into her house unless she received previous notice of their visit, an injunction ought not to be granted to restrain her.

Electric fittings are also protected from distress from rent. Thus, by Sec. 25 of the Electric Lighting Act, 1882, where any electric lines, meters, accumulators, fittings or works or apparatus, belonging to the undertakers—i.e., the local authority or company supplying electricity—are placed upon any premises for the purpose of supplying electricity, they shall not be subject to distress, or to the landlord's remedy for rent of the premises where the same may be, nor be taken in execution under any process of a court of law. In the ordinary way, they might be seized by the landlord whose rent was in arrear. This affords considerable protection to the undertakers. Very often, when a tenant does flit, the only articles of *vertu* left on the premises are the electrical fittings, which the landlord would be glad to sell in order to satisfy some part of his claim for rent outstanding.

But what are "fittings" within the meaning of the section? Wires and pipes through which wires are laid naturally come under this heading, but there are other things not so easy to classify. It was decided under Sec. 14 of the Gas Works Clauses Act, 1871, which is similar to the above, that a gas stove let for hire is a "fitting for the gas" within the meaning of that section, and is, therefore, not subject to distress for rent (see *Gas Light and Coke Co.*

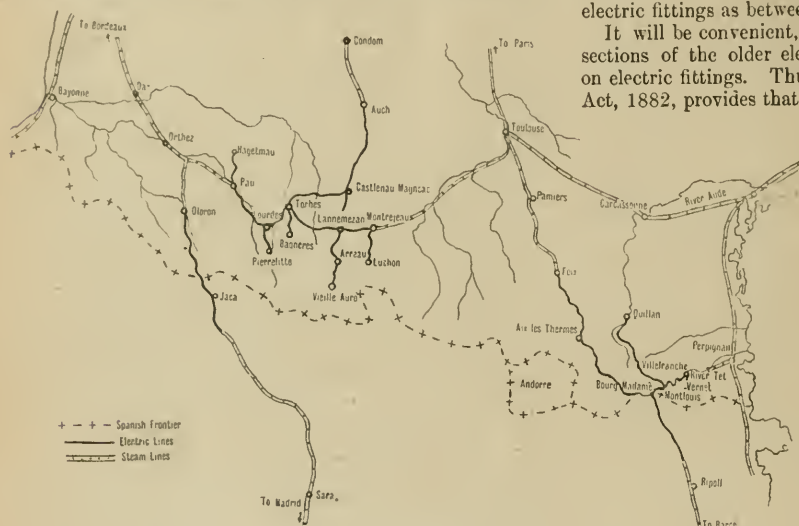

FIG. 3.—MAP OF ELECTRIC RAILWAYS IN THE PYRENEES.

electric traction, it may be stated that this company has decided to electrify practically all the lines comprised in its Pyrenées and trans-Pyrenées system, these being as shown in the accompanying map (fig. 3):—

1. The Villefranche de Conflent-Bourg-Madame (Spanish frontier) line, a distance of 35½ miles, with branches from Villefranche to Vernet, and from Bourg-Madame to La Tour de Carol.

2. The Foix-Ax-les-Thermes line (25½ miles) and its extension from Ax-les-Thermes to Ripoll (Spain) *via* Bourg-Madame, 25½ miles. This line places Toulouse in direct communication with Barcelona.

3. The Montrejeau-Pau section, 70 miles, with branches from Montrejeau to Luchon (22 miles), and from Lannemezan to Arreau (15½ miles), from Tarbes to Bagnères de Bigorre (13¾ miles), from Lourdes to Pierrefitte (12¾ miles), and from Pau to Oloron and Laruns (33¾ miles).

4. The Auch-Lannemezan line (43½ miles), with a branch from Castelnau-Magnoac to Tarbes (25 miles of 39-in. narrow-gauge line).

5. The Arreau-Vielle-Aure (French frontier) line (7 miles).

6. The Pau-Hagetmau line (32¾ miles).

7. The line from Oloron to the Spanish frontier (32½ miles), giving direct connection between the Southern line and Saragosa, Spain, and

8. The line from Quillan to Montlouis and Belesta.

The majority of these lines comprise gradients which are too steep for steam traction; the others have to bear a very

*v. Hardy*, 1886, 17 Q.B.D. 619). It would seem to follow from this that electric stoves, kettles, fans and electric irons, if hired out by the local authority to the consumer, would not be subject to distress by the landlord.

As to whether electric fittings let on hire by the supply authority vest in the trustee in bankruptcy of the consumer, it is difficult to speak with certainty. The law of bankruptcy provides that goods which are in the order and disposition of the bankrupt, with the consent of the true owner, at the date of his bankruptcy, shall vest in the trustee for the benefit of creditors. And this is right; for credit is naturally given to a man upon the strength of the goods which he has upon the premises. But where it is well known that certain classes of goods are customarily lent on hire, the presumption that they belong to the bankrupt does not arise. For instance, the custom of hotel keepers to hire furniture is so well known that such furniture does not vest in the trustee in bankruptcy of the hotel proprietor.

Questions arise from time to time as to the power of local authorities supplying electricity to deal in fittings. It is common to find in the Acts of local authorities a special clause to enable them to sell, let, hire, but not to manufacture, lamps, meters, electric fittings, &c. The terms of these clauses vary somewhat. In the Nottingham Corporation Act, 1889, Sec. 4, the power conferred is to provide and let, &c., but not to manufacture, "lamps, meters, electric lines, fittings, apparatus, and things, for lighting and motor power, and for all other purposes for which electric energy can or may be used, or otherwise necessary or proper for the supply, distribution, consumption or use of electrical energy." The Manchester Corporation (General Powers) Act, 1898, after the usual wide powers, contains these words: "Electrical motors, and apparatus for the use of electricity for motive power and other purposes."

The Halifax Corporation Act, 1898, is even wider in its terms. It authorises the Corporation to "purchase, hire, sell, let on hire, or otherwise deal with dynamos, electric motors, accumulators, meters, burners, arc and other lamps, fittings, wires, plant, engines, conductors, machinery, apparatus and appliances for and in relation to the production, supply, distribution or utilisation of electricity, or required or used for or in connection with their electrical works and undertaking."

The new Electric Lighting Act of 1909 gives a further protection to electric fittings. It is there provided by Sec. 16 that "all electric lines, fittings, apparatus and appliances let by any undertakers on hire or belonging to any undertakers, but being in or upon the premises of which the undertakers are not in possession shall, whether they be or be not fixed or fastened to any part of any premises in or upon which they may be situate, or to the soil under any such premises, at all times continue to be the property of, and removable by, the undertakers, and Secs. 24 and 25 of the Act of 1882 shall extend and apply to all such electric lines, fittings, apparatus and appliances: Provided that such electric lines, fittings, apparatus or appliances have upon them respectively a distinguishing metal plate affixed to a conspicuous part thereof, or a distinguishing brand or other mark conspicuously impressed or made thereon, sufficiently indicating the undertakers as the actual owners thereof. For the purposes of this section, electric fittings, &c., disposed of on the terms of payment by instalments are deemed to be electric fittings, &c., let on hire by the undertakers. This section does not affect the amount of the assessment for rating of any premises upon which any electric lines, fittings, apparatus or appliances are or shall be fixed."

Electric lines, fittings or other apparatus may be so affixed to a house as to become part of the land for "*quicquid plantatur solo, solo cedit*." In that case they would pass by a conveyance of the law, or become the subject of an existing mortgage, although they were merely hired by the owner or lessee of the land under a hiring agreement, or agreed to be purchased under a hire-purchase agreement and not yet paid for. (*Holland v. Hodgson* (1872) L.R. 7 C.P. 328.) The owners of lines, fittings or apparatus has, however, by virtue of the hiring or hire-purchase agreement, if in the latter case they are to remain his property till paid for, an equitable interest in the land under which he may

remove his lines, fittings or apparatus (*re Samuel Allen and Sons, Ltd.* (1907) 1 Ch. 575).

It has, of course, been decided that the Electric Lighting Acts do not authorise undertakers to supply electric fittings and apparatus other than meters.

## CONSULAR NOTES.

**South Africa.**—The Austrian Consul at Cape Town reports that British cables, which are recommended by engineers in South Africa, have recently strengthened their hold on the market. German cables, which are favoured by German importers, have shown a tendency to fall off, and Italian cables have for the first time appeared in the market. The future will show whether this is just a temporary appearance due to one delivery, or whether Italy will continue to prove a factor in the competition. The Cape Province is, however, rather unimportant as a market for cables, when considered relatively with the Transvaal. In order to secure trade in this line, it is almost essential that firms should be represented.

**Japan.**—The American Consul at Yokohama reports that the sale of American electrical machinery and supplies to Japan during 1912 was the largest in the history of this line of business in that country. The total sales of electrical supplies aggregated about £1,000,000, the bulk of the imported products coming from America. The importation of all kinds of machinery into Japan increased by about £300,000 in 1912, the total imports in round numbers being £2,850,000. The principal business during 1912 consisted of the extension of the existing light, power, and railway stations. The Tokio Municipal Railway, for instance, purchased £60,000 worth of apparatus for transforming high-tension current in their various sub-stations throughout the city, to the trolley line voltage.

The machinery ordered about a year ago at Tokio for various large water-power electric companies has been arriving during the past few months and the plants are being completed. The principal ones are as follows:—

**Tokio Electric Light Co.**—An extension of about 40,000 kw. to their first water-power electric plant which amounted, when it was installed, to approximately 20,000 kw. This extension is now about finished.

**The Kinugawa Hydro-electric Co.**—Approximately 40,000 kw. This plant is now about completed and some current is already being transmitted to Tokio from its power stations.

**Katsurugawa Hydro-electric Power Co.**—This equipment complete was supplied from Schenectady, N.Y., the aggregate capacity being about 40,000 kw. All of the machinery has arrived and the work will probably be finished within the next few months, so that a large amount of power from that source will shortly be brought down to Tokio.

**The Inawashiro Hydro-electric Power Co.**—The order for this apparatus, amounting to about 40,000 kw., was placed about one-half with an English firm (Dick, Kerr & Co.), and the other half in America (Westinghouse). This apparatus had not been shipped at the time of writing, and the company will, therefore, not be ready for operation until after the end of this year.

At Yokohama a 3,000-kw. steam-turbine generator was installed to further increase the capacity of the existing lighting plant.

At Osaka there have been many additions to the existing electric railway plants, and some small suburban roads have been put into operation in the last four or five months. Osaka is a very active centre for the electrical business in Japan, and many suburban roads have been successfully put into operation there. On account of the large manufacturing interest developed, electric power will be largely used there in the future, and as there is a large water-power company, the Ujigawa, which is now nearing completion, and which will bring into Osaka 30,000 to 40,000 kw. of current, the prospects are favourable for low cost of light and power in that city in the future.

The Kyushin Electric Railway added during 1912 a 3,000-kw. turbo-generator set, and at Nagasaki two 500-kw. turbo-generator sets were installed as an extension to the existing lighting plant. The coal mines in Kyushin have also been active in purchasing electrical apparatus.

The greater part of the sales reported have been made through the General Electric Co. of America. In addition to the extensive business of selling American electrical machinery, the General Electric Co. is a leading factor in the electric lamp trade in Japan. It has developed a very large lamp manufacturing plant in Tokio, which now supplies the great bulk of the incandescent lamps used in the country. This plant is operated through a Japanese company under American control. It is managed entirely by Japanese, however, and the operatives are largely Japanese girls. It has been very successful both financially and in supplying the demands of the country. In fact, this is a new industry created in Japan within the last three or four years.

The General Electric Co. also owns a considerable interest in the Shibaura Engineering Works at Tokio, which is controlled by the financially powerful Mitsui Co. The Shibaura works manufacture electrical apparatus up to 2,000 kw., and the business for the past six months was so satisfactory that the company has decided to

increase its capital from the present £200,000 to £400,000 to take care of the demands of the market. There is close co-operation between this company and the parent General Electric Co., of Schenectady, N.Y., and "there is apparently no reason why this Japanese electrical manufacturing concern should not become very strong and prosperous." All of its products are manufactured in accordance with the American designs of the General Electric Co.

Large quantities of the smaller electrical supplies are imported into Japan, and in this business American manufacturers and importers participate very satisfactorily. It is evident, however, that the Japanese will be able, particularly through foreign associates, to manufacture the greater part of the smaller electrical supplies, including telephones and telephone equipment. The manufacture of this class of smaller electrical products in Japan is growing steadily and rapidly.

There are in Japan several British manufacturers who have a fairly large electrical business, but the Allgemeine Co. and the Siemens Schuckert Co. are the two important competitors of the American manufacturers of heavy electrical machinery and supplies.

**Persia.**—The British Consul at Ispahan reports that a telephone service, first established in that town in 1910-11, now numbers nearly 100 subscribers, and wires have been carried as far as the villages of Sehdah (about 16 miles) and Najafabad (about 20 miles), west of the town.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AOREKAY, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.90). To all other countries, £1 10s.

THE subject of regulations for overhead wires in this country is one which has always been of very great interest to electrical engineers, and its importance is constantly growing. The new regulations just issued, and reproduced elsewhere in our pages, will therefore claim the close attention of our readers. Any concessions that tend towards facilitating the employment of overhead lines will naturally receive a heartfelt welcome.

The new high-pressure code embodies some noteworthy changes, and alterations have been made also in the memorandum for the guidance of persons applying for leave to use overhead wires. General consent is not given; each case is considered on its merits, and the regulations are drawn up to correspond with the actual circumstances, but it will be found that an attempt has been made to separate the variable from the constant terms of the problem, embodying the latter in a definite code and deriving the former from the applicant.

An important change is the reduction of the wind pressure from 30 to 25 lb. per sq. ft., which, moreover, is the maximum allowance, without regard to snow or ice; in this respect the regulation is more lenient than those in force on the Continent. Our climate in winter is certainly less rigorous than that of Germany or France, and while we may occasionally experience a blizzard, it would be unreasonable to legislate for so exceptional an event, imposing a perpetual burden upon the industry on account of a remote possibility.

An interesting addition to the high-pressure code is the requirement that precautions shall be taken to prevent contact between high-pressure lines and trees. This appears to be due to the difficulty in obtaining wayleaves in this country. It would be better to clear away the trees alongside of a transmission line, as is done in other countries, but the attempt to do so here would, in many cases, result in a blank refusal to grant the wayleave.

Another new regulation in general forbids the erection of high-pressure wires across the premises of a consumer. Permission may be given to do this under special conditions, but such wires might be regarded by the Home Office as service wires, not coming under the Factory Regulations, and in the case of an accident, the supply company would be held responsible. The code, in fact, is intended only to apply to cross-country work.

One of the regulations contains an additional provision regarding the earthing of the ironwork on each pole as alternative to the use of a continuous earth wire.

The failure of the wire cradle to give satisfaction at crossings is recognised in Regulation 24, which leaves

THE UNIVERSAL ELECTRICAL DIRECTORY  
(J. A. Berly's).

1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

the applicant to submit proposals as to the safeguards to be used. Improved methods of insulating and supporting the conductors, by duplication and similar devices, have come into use of late, and it stands to reason that it is much better to render breakage practically impossible than to provide against its consequences.

It will be seen that while the changes are not of fundamental importance, their tendency is, on the whole, towards leniency. The main question, however, is the facility of obtaining consents, and we have been pleased to see that in recent years the number of these has very greatly increased.

#### The Post Office and Telephone Subscribers.

THE man who is compelled to patronise that Government monopoly—the telephone—generally pays what is demanded of him without making a fuss. Life is not long enough to justify the expenditure of time in disputing over small sums—possibly 1s. or 6d.—which may appear to be an overcharge. It would seem, however, that those in charge of the Post Office Telephone system do sometimes make mistakes—like the rest of us; and if a protest is made, it may turn out that the charge cannot be justified. A singular case occurred last week in the Westminster County Court which illustrates this point. A subscriber was sued by the Post Office, the claim being for £7 4s. 9d. alleged to be due for telephone rental and fees, including an item of 4s. 9d. for trunk calls. Owing to his not having paid, he had been deprived of the telephone. From a brief report which appeared in a daily paper, the defendant appeared to admit the £7, but denied that he had had any trunk calls.

It appears that a Post Office witness said that the trunk fees were for postal facilities. In reply to the Judge, who asked for proof, he said that he could produce the books, and that subscribers agreed to take the book records as their accounts. Judge Bray said that might be so, but that did not make the books evidence before a court of law. The nature of the charges must be proved in the ordinary way, and, in the absence of such proof, he disallowed the claim for 4s. 9d. This decision appears to have given rise to an impression that there was some difficulty about the Post Office recovering trunk calls. At any rate, the Post Office appears to have attached importance to it, for, on the following day, the case was again mentioned to the Court, when the Judge pointed out that “he had not decided that the Post Office books were not evidence to prove trunk calls. If the books were produced, he would then have to decide whether they were or were not evidence against the defendant. He now understood that the charges were for Post Office telegrams, and the Post Office were at liberty to prove that fact if they liked.” This puts a very different complexion on the previous decision: but the fact remains that, like every other litigant, the Postmaster-General must be prepared to prove his case if he brings an action at law. It is reasonably clear that, in the absence of agreement, the books or records kept at the exchange are not in themselves evidence against a subscriber for any purpose. Suppose it were alleged against a subscriber who had paid his £6 10s. a year, that there was an additional sum of 19s. 4d. due for extra calls. If his defence was: “I deny that I have had more than 360 calls,” the Postmaster-General would have to prove that each additional call was made. For that purpose he would be bound to summon as witnesses every exchange clerk who recorded any call from that particular number. The exchange clerk, no doubt, would be entitled to refresh his memory by referring to any memorandum made at the time, and his evidence, so fortified, would be difficult to displace; but the fact remains that the burden of proof would have to be discharged. It will be noticed that in the case above mentioned those representing the Post Office relied upon an

agreement by subscribers “to take the book records as their accounts.” Judge Bray stated the law with perfect accuracy when he said that such an agreement was valid *inter partes*, but was not binding on a Court of Law.

We know of no express decision on the point; but it may be that, by agreeing to accept the entries in the Post Office books, a subscriber becomes (as the lawyers say), estopped from disputing their accuracy. In any case of real doubt, however, a subscriber would be well advised to insist on witnesses being called, because he would be entitled to have it proved in Court that the entries were actually made by those in the employment of the Post Office.

#### Electric Lighting for Motor-Cars.

FOR many years those associated with the electrical industry in the United States have set a commendable example in the interest they have taken in everything appertaining to the motor-car. The excellent results that have attended the efforts of the Electrical Vehicle Association in developing the use of electric motor vehicles in the United States have often been referred to in our pages. Now that electricity bids fair to become practically the only medium for the lighting of automobiles, and is also playing an important part in the starting devices which have been introduced to render the usual petrol engine starting handle a thing of the past, it is interesting to find that electrical engineers are working together with the view of seeing that these new departures are developed along proper lines. Thus, the American Society of Automobile Engineers has recently appointed an electrical equipment division, or sub-Committee, which is at present engaged on a discussion as to whether, for car electric lighting installations, the double-wiring system, or the single wiring with earthed return, should be recommended by the Society. Although there is a majority in favour of the latter, it was resolved at the last meeting to postpone the final decision. As a matter of fact, the only direct opposition to the standardisation of the single-wire system came from a single manufacturer of electric lighting and engine-starting systems, who contended that the earthing method had been the cause of many difficulties, and that whereas several “earths” might exist on a two-wire system without putting it out of action, one “earth” might suffice to throw out a single-wire system; furthermore, that fuses would not protect the latter from the losses due to slow leaks. On the other hand, one large firm of motor-car manufacturers stated that they had had no troubles along the lines indicated, and that they intended to adhere to the single-wire system. The representatives of several lamp manufacturing concerns stated that they had no preference for either of the systems, but as it was estimated that at least 7,000,000 lamps would be sold this year for replacement purposes alone, they were anxious to see one or other of the two systems standardised, so that the question of supplying them could be simplified.

Another subject which is being dealt with by the Society is that of accumulators for car electric lighting and starting systems, a proposal to adopt standards for battery ratings and also for the external dimensions of battery containers being under consideration. The representative of an accumulator factory stated that his firm had to keep a stock of no fewer than 128 styles, sizes, and capacities of accumulators, owing mainly to needless divergencies in the location of the same on the car. It was also decided to draw up a standard set of instructions for the charging and care of batteries: these will probably be engraved on a metal plate, to be fixed to the dashboard of the car.

Other points relating to the electrical equipment of petrol cars are being dealt with by the Society, but those we have mentioned will more than suffice to demonstrate the practical interest taken in the matter, this being, as we stated at the outset, an example which might well be followed by the electrical trade in this country.

### Imperial Communications.

THE Dominion House of Commons "Hansard" of May 5th, and Bill No. 188, introducing "An Act to provide for more advantageous telegraphic communication between Canada, the United Kingdom, and other parts of the British Empire," and containing a Schedule giving the terms of an agreement for Radio-Telegraphic communication between Great Britain, Canada, Australia and New Zealand, enables us to understand the exact attitude now taken up by the Dominion Government with regard to cable, telephonic, wireless, and any other means of telegraphic communication. The Act is cited as "The Ocean Telegraph Act," and by this it would seem that it is still the inward belief that the ocean, and not the ether, will have much to do with the future of telegraphy. The Act provides regulations for issuing licences for the landing of cables; for the construction and operation of all telegraphic stations; for their control and management, as well as their inspection; for harmonious working, and for making effective international conventions and treaties.

The debate in the Canadian House brought out a great deal of information which has not appeared in the Press, but we do not think the benefits derived from cable communication by the two countries, Canada and Great Britain, received full recognition. No loss would follow a tribute of this nature, and it does not appear to be large statesmanship to say that a country has been for years in the hands of the cable companies, when the remedy is in the hands of the Governments. If this had been applied many years ago, when the question became active, it is probable that the cost of any necessary undertaking would by now have been paid off, instead of which experimental purposes are to delay further what is agreed to be a vital necessity. The debate when it reached technicality became more involved, especially when a speed of 400 letters per minute (or 100 per cent. more than by cable) was stated to have been guaranteed by wireless. The Pacific Cable project was brought into the discussion, and statements of opinion as to its financial results are very interesting as being the expressions of one at least of the partners in the concern. They agree with statements which have been made by us for many years. Notwithstanding the large capital cost of that undertaking (£2,175,000), it was stated that the venture was profitable, and that if its revenues were not used partly as a sinking fund they would far exceed its expenditure.

The new wireless system is not to be allowed to compete with this cable, but at present this appears to be a harmless provision. It was also said that it might soon be necessary to duplicate the Pacific cable, as it was fully loaded. If this be the case no delay for experimental purposes, however cheap they may appear, should be allowed to interfere with the aim of placing and maintaining the State telegraphic system in a fully remunerative and satisfactory condition, in accordance with the policy which has secured the success of private cable companies.

### The Manchester Steam Users' Association.

THE annual report of the Management Committee Association for 1912 has been issued. This must not be confused with the technical report of the chief engineer, though it is interesting in its own way.

The Association, founded in 1854, now has 10,051 boilers on its books, and during the year succeeded in making total or thorough inspections of fully 92 per cent. in the ordinary way, and over 3½ per cent. specially, in addition to partial examinations, such as internal parts or flues only. Thus, in the year over 98 per cent. of the Association's boilers were probably examined at rest, in addition to over 13,000 visits paid for external or working examination, such visits, of course, including from 1 to 40 or more boilers in one visit. The ten thousand boilers belong to 2,153 owners, or nearly

five boilers to the average owner, and an average of very closely 20 boilers to each 10 works, and a little over two works to each member. The income averages a little over £2 per boiler, and the Association, which gives a pecuniary guarantee with its inspections, possesses a reserve fund of nearly £17,000, including furniture, &c. It is stated as evidence of the care of the Association that no life has yet been lost by the explosion of any boiler inspected and guaranteed. The guarantee is a good feature of the Association's method. If members do not follow the advice tendered them they are not put out in the cold to be a danger to the community, but the guarantee is withheld as a solemn warning, for it would be a very grave matter if, after the guarantee were withheld, a boiler should fail, and the owner would possibly find himself in a serious position.

Compared with America this country is very safe in respect of its boilers. In the United States in October there were 54 explosions and 20 deaths, and we believe that the Hartford Boiler Insurance Co. tries hard to bring practice nearer to English lines, in respect of construction and of pressures. There is certainly too much liberality with stresses in America, and there are, of course, many boilers in distant corners.

In the United Kingdom during the year there were 68 explosions and 31 deaths. Only 17 were boiler explosions proper, the rest being other things, such as pipes, keirs, ovens, &c.

We may, perhaps, assume that the boilers in the United States now outnumber those in this country, but, in any case, the degrees of safety differ very widely.

The Association has had in hand for some time experiments on the fatigue of metals, and some of the results are shortly to be published. It has also surveyed the present condition of knowledge on the strength of flat plates, and on the elasticity of steam bends, both matters of considerable interest to engineers.

### State Co-operation with Private Enterprise.

THE growing practice of co-operation between private enterprise and municipal or communal authorities in lighting and tramway undertakings in Germany is now proposed to be extended by the conversion of the Hamburg electricity works into a concern to be jointly owned by the existing company and the State of Hamburg. At present the company, which has a share capital of £1,100,000, does not possess an exclusive monopoly of the supply business, and it is not intended to confer such a privilege upon it in the future, but permission is to be granted for an extension of the supply throughout the whole of the area of the State, thus bringing within the scope of the works a number of suburbs which are not now furnished with light and power from this undertaking. The Hamburg Senate proposes to subscribe for £500,000 in preference shares, in order to assist in the development of the supply system and to have a large interest in the company. According to the existing agreement between the Senate and the company, the former receives a share of 15½ per cent. of the gross receipts, in addition to one-fourth of the surplus after 6 per cent. has been paid on the ordinary shares, and one-half of the surplus remaining after the dividend amounts to 8 per cent. In future the State is first to receive 5 per cent. on the preference shares, and one-half of the surplus after the dividend on the ordinary shares is 6 per cent., whilst the other half is to be distributed as a super-dividend on the whole of the capital. The amount of the latter devolving upon the preference shares, as well as the fees payable to the three representatives of the State on the board of directors, is to be used for the formation of a fund for the purchase of ordinary shares. The present right of expropriation of the company as from the end of 1913, on giving one year's notice, is to be continued until 1923; if it is not exercised by that time it will lapse under the terms of the new agreement, but this is not the case under the present contract.

## THE INSTITUTION OF ELECTRICAL ENGINEERS IN PARIS.

THE Société Internationale des Electriciens is to be congratulated either upon its singularly good fortune or upon its remarkable control over the weather, for, although Paris had "enjoyed" a spell of disagreeable weather right up to the day on which the British party crossed the Channel, the spell was broken on our arrival. Perhaps Commandant Ferrié and his expert staff, by reversing the ordinary course of events and dispatching thunderbolts into the upper air via the Eiffel Tower from their mysterious caves in the Champ de Mars, had something to do with it. For is not M. Ferrié the world's timekeeper, and does not he distribute the finest possible *temps* to all the world?

SAINT DENIS ELECTRICITY WORKS.

Whatever the cause, the result was charming weather throughout the visit, improving in quality with time, and being at its very best for the excursions to Chantilly and Versailles. The visit officially ended on Saturday, but many members of the party remained for the week-end, and Sunday was a perfect summer's day.

But, of course, our confrères' solicitude was not confined to the elements; they are masters of organisation and foresight, and made admirable arrangements to ensure that the visit should be a success in every

which was more or less known to the electrical world, though doubtless much of it was new to many of the audience—for each of the two nations concerned is of necessity unable to keep closely in touch with the progress of the other, and no man can claim to maintain an intimate acquaintance with all branches of the ever-expanding tree of science known as electrical technology. The excursions, on the other hand, were full of varied and individual interest; the natural beauties of Versailles and Chantilly, and the priceless works of art with which those palaces are so richly stored, contrasted sharply with the magnificence as a masterpiece of engineering of the great works at St. Denis, and the delicate perfection of the porcelain of Sèvres with the no less perfect but wholly dissimilar symmetry and grandeur of the Eiffel Tower; and Paris herself, the mother of all these works of art, provided unlimited food for interest and admiration.

It only needed the efforts of our hospitable friends to co-ordinate all these attractions, and, with the collaboration of the clerk of the weather, to render the visit a success without a flaw. We think we voice the feelings of the whole of the British visitors when we say that all the conditions were fulfilled, and that the "joint meeting" of 1913 will long be remembered by those who took part in it as one of the most pleasant and agreeable experiences of their lives. Where all were courteous, amiable, and genial, it may seem invidious to praise a few; but it is only just to refer with special emphasis to the indefatigable labours of M. Berthelot, President of the Société; M. Grosselin, Past President; M. Bureau, Member of Council; and M. Joly, the Secretary, all of whom exerted every effort to secure the comfort and happiness of their guests and to ensure the orderly conduct of the programme of each day's doings.

Amongst the British engineers who took part in the visit were Mr. W. Duddell, President of the Institution of Electrical Engineers; Messrs. W. Judd and J. F. C. Snell, Vice-presidents; Prof. Carey-Foster, Past-president; Mr. Robt. Hammond, Hon. Treasurer; Messrs.

Cliche du Verascopie Richard.

THE PARTY ARRIVING AT CHANTILLY.

way. The proceedings in this instance partook more of the nature of a congress than of a round of visits to engineering works, as on previous occasions, and it cannot be said that the papers or discussions as a whole brought forward any new developments of notable importance; the former were mainly statements or résumés of work already accomplished, or in progress,

J. S. Hlghfield and Roger T. Smith, Members of Council; Mr. P. F. Rowell, Secretary, and Mr. R. Tree, Chief Clerk; and Messrs. J. Christie, T. Harding Churton, C. B. Clay, W. R. Cooper, K. Edgumbe, F. Espir, G. Hooghwinkel, J. P. Hooper, F. Hope-Jones, A. Jacob, F. H. Nalder, C. C. Paterson, R. W. Paul, Ll. Preece, T. F. Purves, J. W. Record, W. Slingo

(Engineer-in-Chief to the Post Office), G. Stoney, A. A. C. Swinton, H. L. Webb, A. P. Wood, and H. E. Yerbury. The party numbered about 150 in all, including more than 40 ladies. During the visit Mr. J. H. Rider, *en route* from South Africa to England, spent some time in Paris and was cordially greeted by his friends.

The journey to Paris was accomplished without noteworthy incidents; the party assembled at Victoria, and proceeded to Dover by special train. The sea was like a lake, and afforded no excuse for *malaise*. At Calais an excellent lunch was provided, which was partaken of at leisure, and fortified the party for their journey by special train to Paris. At the Gare du Nord the President of the Société with a number of his colleagues welcomed the visitors, who then dispersed to their various hotels.

On Wednesday morning, at 9 o'clock, the visitors with their French colleagues assembled at the Conservatoire des Arts et Métiers; the President of the Société Internationale occupied the chair, and inaugurated the proceedings in due form, addressing a hearty welcome to the visitors and explaining the order of procedure and the programme for the week. A large party of the members, including most of the ladies, then proceeded on a tour of inspection of the exhibits in the Conservatoire, while the remainder settled down to the consideration of a formidable array of papers relating to electric traction on railways. Fortunately, these were not read *in extenso*; all the members having received copies in advance, the Secretary, M. Joly, read a brief *résumé* of each as a preliminary to the discussion.

M. L. Gratzmuller outlined the history of high-tension continuous-current traction, and reviewed the various elements of the problem from the generator to the motor, with particulars of recent installations, pointing out that the pressure had been raised by stages from 500 to 2,400 volts, and not by any abrupt transition. M. Marius Latour's paper dealt with single-phase traction, in the development of which he has played so distinguished a part. He referred especially to the characteristics of the various types of motors available, comparing their respective advantages. M. Jullian described the conditions under which the concession for the railway from Villefranche to Bourg-Madame, in the Western Pyrenees, and other new railways, was accepted by the Compagnie des Chemins de Fer du Midi, providing that the State should bear the cost of a considerable proportion of the hydro-electric works and of the transmission lines, as well as the cost of constructing the railways, a comprehensive scheme was eventually decided upon, embracing the electrification of 622 km. of existing and projected lines. The conversion of the existing lines, about half the total, will be completed in July next. The conditions prevailing are exceptionally favourable to the use of electric traction, which is being effected with single-phase alternating current. The equipment of the line is described in the paper; the voltage adopted for the transmission line is 60,000 volts at 16 cycles, and the generating stations will have an output of nearly 50,000 h.p. Elaborate experiments have been made to determine the best type of motor, resulting in the adoption of the series type.

Mr. A. N. Mazen described the traffic conditions obtaining on the State railways which formerly formed the railway system of the Compagnie de l'Ouest; the traffic has grown to such an extent that it cannot be satisfactorily handled by the present equipment, and the only possible solution to the problem is the adoption of electric traction. It has been decided to adopt continuous current at 650 volts, and to construct 400 to 500 motor-coaches; about 50 km. of line will be electrified. M. H. Parodi contributed a study of the railway electrification problem as it was met with in the United States, broadly considering the subject with the aid of a mass of statistics, the paper constituting a valuable summary of the position.

M. J. B. G. Damoiseau dealt with the subject of petrol-electric motor-vehicles, and described the designs adopted by the leading manufacturers in Europe and the United States. He arrived at the con-

clusion that the petrol-electric vehicle was the best type of independent motor vehicle before the public, and that its use would tend to increase.

Messrs. Mazen, Roger Smith, Hammond, and Bochet took part in the discussion which followed. In the course of his remarks, Mr. Smith expressed the view that in this country electric traction would be economically possible only for two purposes—the working of suburban railways, and of mineral traffic in hilly districts—and stated that the North-Eastern Railway Company was going to lead the way in the latter connection, and a d.c. railway at 3,500 volts would shortly be put in operation in this country. The great obstacle to the extended use of large electric locomotives in Great Britain was the enormous number of traders' wagons—about half a million—which could not stand a draw-bar pull exceeding 12 tons.

In the afternoon a large party, including most of the ladies, proceeded by special steamer to St. Cloud, and visited the celebrated porcelain works of the French

Cliché du Vésicope Richard.

LEAVING THE HÔTEL DU GRAND CONDÉ, CHANTILLY.

Government at Sèvres, where they were entertained at tea before returning, the trip down the river and back being most enjoyable, in addition to the artistic delights of the factory. The more technically bent were taken in motor 'buses to the electrical generating station of the Electricité de Paris at St. Denis, one of the finest installations—if not, perhaps, the finest—in Europe, comprising turbine plant of 120,000 h.p. output. We published a description of the works in our issue of Jan. 11th, 1907, and therefore we need not here dwell upon details. Most of the generating plant was supplied by the Compagnie Electro-Mécanique, and is of the Brown, Boveri-Parsons type, but some of the generators were built by the Ateliers de Constructions Electriques du Nord et de l'Est, of Jeumont. The boilers are of the Babcock and Wilcox marine type.

The most striking characteristic of this splendid example of a modern generating station is the unity of design which has made of it one huge machine. From the barges which bring the coal to the station, to the feeders which convey the energy to the consumers, the fullest use is made of mechanical operation and control, and there are very few men to be seen about the plant. It is interesting to note that Scotch coal is largely used at the station—washed nuts; the bunkers have a capacity of 32,000 tons. While natural draft is mainly employed, two of the ten chimney shafts being 90 m. (295 ft.) in height, the draft of the first four shafts can be increased 50 per cent. with the aid of ejectors on the Prat system, and of additional steam blowers. There are four generating sets of 5,000-6,000 kw. capacity at 10,250 volts, 25 cycles, 3-phase, for the supply of power to the Ch. de Fer Métropolitain; two turbines of the same size driving each two alternators

in tandem, one similar to the former and the other a two-phase machine working at 12,300 volts, 41½ cycles, 6,000-7,200 kw.; four sets of 5,000-6,000 kw., 12,300 volts, 41½ cycles; and one set of 11,000-15,000 kw., 10,250 volts—all of the Parsons type. The two-phase supply is for lighting and power in Paris; the three-phase for the railway and for tramways.

The works include a factory capable of turning out 50,000 bricks a day, made from the ashes. The first turbine was set to work in August, 1905, and the plant has been continuously extended since that date.

From St. Denis the party proceeded to the works of the "Triphasé" at Asnières; this station is of longer growth than the former, and includes some fine examples of the low-speed alternator, driven by horizontal engines, as well as two interesting, because now rarely met with, external armature machines of the Siemens type, the outer bars of the winding forming the commutator.

The newer plant in the station consists of Rateau turbines driving three-phase generators. Here also the coal-handling arrangements were very elaborate and complete, including a long conveyor-bridge over a road,

*G. Eiffel*

THE EIFFEL TOWER IN A STORM.

from the Seine to the works. The huge screens employed, five or six in series, for preventing the ingress of undesirable matter from the Seine with the circulating water, were also found very interesting. At each of these stations the visitors were entertained by the respective companies with light refreshments. They afterwards drove back to Paris, and prepared for the banquet to which they were bidden by the Société Internationale at the Palais d'Orsay.

M. Berthelot presided, and the guests numbered some 360. During the dinner, which was characterised by lavish hospitality, a musical programme was performed by the band of the Chemin de Fer du Nord. M. Berthelot gave the toast of the King, and Mr. Duddell that of the President. Later, M. Berthelot, in the course of a brief speech, proffered a cordial welcome to the British visitors, referring to the achievements of the more distinguished among them. He also expressed the gratitude of the Société to the respective persons and firms who had assisted in providing entertainment and instruction for their guests.

Mr. Duddell, in responding, referred to this as the first reunion of the two societies, and expressed his appreciation of the genial welcome and unstinted hospitality of the Société, and of the persons named by M. Berthelot. He concluded by proposing the toast of

"The Société," which was accorded musical honours by the visitors.

The company then adjourned to a concert room, where an excellent entertainment was provided by artistes from the Opéra and the Comédie Française. The most interesting feature, however, of the evening was a series of cinematograph demonstrations by M. Gaumont, in which the moving picture was accompanied by sounds produced by the gramophone, in accurate synchronism with the picture. An orator delivering a speech, a cock crowing, and an artist performing a humorous item on the banjo were reproduced with lifelike fidelity, though, of course, the defects inherent to the gramophone could not be completely concealed. Another very telling series showed the decomposition of movements, apparently effected by taking a succession of photographs at a rapid rate and projecting the views on the screen very much more slowly. Thus, a man jumping off a table slowly rose into the air, as if gravitation had been neutralised, descended to the ground like a feather, and slowly crouched on his haunches. The movements of the human body in walking, skipping, etc., when thus portrayed become not only surprising but also very amusing.

On Thursday morning, the Congress was resumed at the Conservatoire, but a number of alternatives were provided, parties being formed to visit some of the places of interest in which Paris abounds; one party in particular spent the morning at the Aerodynamical Laboratory of M. Eiffel at Auteuil, under the genial guidance of the founder himself.

The meeting at the Conservatoire, under the chairmanship of M. Berthelot, was devoted to the subject of long-distance transmission of electrical energy. Mr. J. S. Highfield read a paper on the continuous-current Thury system, describing the results which he has obtained with this system in the Western area of the Metropolitan Electric Supply Co. A discussion followed, in which Messrs. Thury, J. F. C. Snell, Edgumbe, Raphael, Roger Smith, Jenkin, and another took part. Mr. Snell doubted whether the saving effected by transmitting electrical energy, for instance, from coalfields to London, would be sufficient to cover the cost of the wayleaves necessary for the transmission line. Mr. Smith pointed out the impossibility of finding sufficient space alongside of the railway tracks near London for a three-phase overhead line, and said that for that reason the Thury system offered exceptional advantages for the operation of railway sub-stations; 1,200 kw. was just the size required to run one railway section carrying two trains simultaneously. He had no fears as to the effect of the return by earth upon railway signals. Mr. Jenkin, also referring to the question of railway electrification, said that the facility for extension resulting from the uniform section of the cable was a strong point in favour of the system, and the difficulty of constructing switchgear capable of dealing with three-phase power supply on a large scale, contrasted with the simplicity of the switchgear on the Thury system, afforded a further advantage when the latter was employed.

M. Maurice Leblanc then read a paper on "Three-phase Currents," which occupied the remainder of the session.

In the afternoon, a party visited the electricity works of the Nord-Sud Railway, and the central repair dépôt of the Compagnie Générale des Omnibus de Paris, where the rolling stock of the tramways and the motor buses are repaired, employing 2,000 hands. The works are laid out on the most modern lines and on a very extensive scale, occupying an area of about 96,000 sq. metres. The machinery is, of course, electrically-driven, with a power plant of 300 kw.

The *pièce de résistance* of the afternoon, however, was a reception by M. Eiffel on the topmost platform of the Eiffel Tower, followed by an inspection of the wireless installation of the military authorities in the Champ de Mars. This was an extremely popular event, appealing to all sorts and conditions, and a very large number took part in the visit to the Tower; M.

Eiffel, in the most kindly way, patiently signed scores of the brochures which he presented to the visitors, containing the reprint of a lecture on the famous Tower delivered by M. Ch.-Ed. Guillaume, at the Fête du Soleil last year, and we reproduce from this an illustration showing the tower struck by lightning—a common event—together with M. Eiffel's signature. We do not propose to describe the Tower, but may remark that its graceful design and majestic proportions were the subject of many admiring comments. The visitors were privileged to ascend beyond the third platform into regions inaccessible to the general public, including M. Eiffel's private rooms, and were entertained with light refreshments. Many of them, undaunted by the vertical ladders inside the central tube, attained to the foot of the flagstaff itself, where there is only room for six people to stand.

(To be continued.)

(Abstracts of Papers discussed in Paris at the Joint Meeting of the INSTITUTION OF ELECTRICAL ENGINEERS and the SOCIÉTÉ INTERNATIONALE DES ÉLECTRICIENS, 21st-24th May, 1913.)

### High-Tension Continuous-Current Traction.

By MONSIEUR GRATZMULLER.

THE object of this paper is to consider the high-tension continuous-current system of traction and its possibilities of development. Its weak point is the lack of a static transformer; this has been the cause of continuous current being set aside. Can this disadvantage be compensated by certain advantages?

When the power station is at a considerable distance from the track (this will always be the case for traction over very long distances) three-phase generators will obviously be employed.

The rotary converter for a frequency of 25 periods and a pressure of 600 volts is to-day giving every satisfaction, and the increase of the continuous-current pressure to 1,200 volts is agreed to universally.

The three-phase rotary converter operates well even at 50 periods, but I think that in this case the continuous-current pressure could not be raised to more than 600 to 750 volts. Continuous-current pressures above 1,200 volts in the case of 25 periods, or 750 volts in the case of 50 periods, should be obtained by putting the converters in series.

When there is no need to generate at a very high pressure, the mechanical power produced by a hydraulic turbine is transformed directly into continuous-current power. Up to 1,500 volts a dynamo with a single commutator will operate satisfactorily. The pressure could be increased up to 3,000 volts by installing a machine with two windings and two commutators, or by putting two machines in series. When the mechanical power is generated by a steam turbine in the neighbourhood of the track it appears to me to be desirable to transform A.C. into D.C. by means of a rotary converter at the most favourable point for feeding the continuous current into the conductor. The mercury converter allows the alternating current to be rectified with a constant fall of pressure. It is being perfected; apparatus of a capacity up to 300 kw. already exist, and for high pressures its efficiency is nearly unity. Hence, electric power in the form of continuous-current power may, in the future, perhaps prove the most economical.

As regards the collecting of current, a pressure of 3,000 volts D.C. promises to be the safe limit for some time to come. A current of 500 amperes at this pressure supplies a power of 1,500 kw. It thus appears that powerful locomotives can only be utilised where a third rail is installed, which alone will provide the necessary surface and contact pressure. Currents up to 150 amperes can be transmitted by means of overhead conductors which are more economical at low speeds with the type of suspension ordinarily employed at pressures of 600 volts, but with double insulation.

An advantage in favour of continuous current is that for the same amount of current there is a smaller loss in the return circuit; on the other hand, there is the question of electrolysis to be considered. Also high-tension continuous current does not cause disturbances in neighbouring telegraph and telephone lines.

Without entering into a detailed examination, it may reasonably be inferred that with (1) the same internal diameter, (2) the same length of iron, and (3) the same weight of copper for the windings, it will be possible to obtain the same torque in normal working whether the motor be wound for continuous current or be a three-phase induction motor.

The commutator segments and the brushes in the case of the high-tension machine will be heavier than collecting rings and their brushes, but the laminations of induction motors have to be held in the frame. Thus I think that the difference in weight for a given peripheral speed will not be of such a nature as to make the continuous-current motor compare unfavourably with the three-phase motor.

The single-phase motor is clearly heavier, but especially for low frequencies the difference is not so great as might be expected. The mean power in an alternating-current machine will differ by only 15 per cent. from the power in a continuous-current machine, and not by  $1/\sqrt{2}$  of this power.

The continuous-current motor and the three-phase motor in normal working are thus approximately equal as regards weight for the same copper or iron losses.

In the series motor the torque increases more rapidly than the current. Another advantage is that the losses diminish rapidly with the load in the series motor. The commutation is very good, because (1) the air gap can be increased so as to reduce the cross flux due to the ampere-turns of the armature reaction, and (2) the self-induction of the coils undergoing commutation decreases automatically with the load owing to the saturation of the teeth in the path of the field flux.

It is useless to attempt to make high-tension continuous-current traction practicable at a pressure exceeding 750 volts unless the commutation is perfect. There is no special technical difficulty, and it seems to me that the pressure of 1,200 volts per motor should be easily reached when multiple units are employed, and 1,500 volts when the motor is placed inside a locomotive. A locomotive of 2,000 h.p. at 3,000 volts could thus be constructed with two motors in series or motors having two commutators. The current required would then be approximately 500 amperes.

Nowadays the capacity of a motor is limited rather by heating than by difficulties of commutation. The use of aluminium seems very suitable for the rotors. The increase of electrical resistance can be largely compensated by the increase in the peripheral speed for the same centrifugal force. The improvement in the cutting of gears has been very great, and we need not be afraid of using reduction gear, which a few years ago could not have been thought of. The working of the Citroën gear for the electric locomotives of Lötschberg is so perfect that the noise of the brushes on the commutator is alone audible. Since the capacity is limited by the heating, it is important to cool the motors by ventilation. The increase of peripheral speeds on the one hand, and of ventilation on the other, will allow the weight of the motors to be reduced by about 50 per cent.

The series-parallel method of regulating the speed is exclusively employed if each motor is so constructed as to be able to withstand the total pressure. When each motor is designed for only half the total pressure (Westinghouse), series-parallel working is used with two groups of motors, each group consisting of two motors in series. With the latter method, it is to be feared that slipping may cause an undue pressure to come on one motor. Protecting relays can easily be designed, but practice has shown their uselessness, as they cannot withstand such abnormal rushes of current as are easily withstood by the motors themselves.

Regenerative working can be obtained on gradients by exciting the field magnets of the motor by means of an auxiliary exciter forming part of a small independent motor-generator.

Where starting and stopping are frequent, the energy dissipated in the resistance, or lost as heat in the brakes, may be considerable. But regulation at all speeds, and also braking, can be obtained under really quite simple conditions by making use of the increase of peripheral velocity and of the ventilation which this can be made to give. An apparently simple solution is the use of boosters on one or more cars. If the voltage of the booster can be supposed to vary from  $-V$  to  $+V$ ,  $V$  being the voltage of the line, the possibility of obtaining all speeds without wasteful losses of energy other than the normal losses of the set, can immediately be seen. Great peripheral speeds and artificial cooling make this solution the one to be adopted.

The Compagnie Générale d'Électricité de Creil has the rights in France and its colonies of the Siemens-Schuckert system, and in 1912 it had constructed, or had in course of construction, apparatus for 14 installations with motors working at from 1,000 to 1,200 volts. Two important installations have been in service since 1906. At Maizières-Sainte-Marie are three 55-ton locomotives, each fitted with four motors grouped in pairs in series across 2,000 volts. Each motor is of 160 h.p., and the weight of the trains is from 200 to 300 tons.

The Westinghouse Electric Manufacturing Company, of Pittsburgh, has installed a number of high-tension continuous-current installations, and in particular several locomotives in America.

Two motors are always connected in series across 1,200 to 1,500 volts, so that each motor is subjected to only half that pressure.

The Compagnie Française Thomson-Houston and the General Electric Company of America have specially developed high-tension continuous-current traction. Four installations in Italy, designed for 1,200 volts and motors of 45 h.p., and 17 in America with motors of from 50 to 300 h.p., may be mentioned. About two-thirds of the installations are more than 50 kilometres long. In the greater number of cases the motors are coupled in pairs in series across 1,200 volts, the pressure per motor thus being 600 volts.

The Brown-Boveri Company has carried out various installations, and in particular it has made controllers for use at high pressures.

Heavy traffic is a favourable factor for high-tension continuous-current traction. The advantages of continuous current are principally the large starting torque, the quality of the commutation (which is shown by the small wear of the commutator and the brushes), and the light coaches. On the other hand, there are the drawbacks of the use of an exposed high-tension rotating part—particularly dangerous in damp localities—the use of a commutator, and the control of the large currents necessary when a large amount of power is required.

All traction, whether on a large or small scale, is tending undoubtedly and rapidly towards electrical working, the weight of the apparatus and the cost of the lines being capable of further marked diminution.

(To be continued.)

## LEGAL.

## OSRAM LAMP WORKS, LTD., v. LOUIS SCHLOSS &amp; CO.

This infringement action came before Mr. Justice Neville in the Chancery Division on Friday, May 23rd, on a motion for judgment in default of defence.

MR. J. HUNTER GRAY, representing the plaintiffs, said that they sued in respect of two patents, one of 1904 and the other, No. 13,622 of 1906. In the particulars of breaches, it was alleged that on January 7th, 1913, the defendants sold 150 lamps which were constructed in accordance with the plaintiffs' patents. There was no defence, and he asked for the usual order—for an injunction to restrain infringement, for delivery up of the infringing articles, for an inquiry as to damages, and for the costs of the action as between solicitor and client. The costs of the inquiry would be reserved.

HIS LORDSHIP: Why solicitor and client costs?

MR. GRAY said that an action had been originally tried, and the plaintiffs had been granted a certificate of validity of their patent by Mr. Justice Warrington. According to the rules, therefore, the plaintiffs were entitled to solicitor and client costs.

The defendants did not appear, and his LORDSHIP made the order as asked.

## OSRAM LAMP WORKS, LTD., v. APPLE.

In the Chancery Division on May 27th inst., before Mr. Justice Warrington, Mr. J. H. Gray moved for judgment in default of defence in this action.

HIS LORDSHIP: The only question I want to be satisfied about is the form of the order for costs. What is the section of the Act?

MR. GRAY: Section 35.

MR. CALVERT: I appear for the defendant, and I have an affidavit showing that there has been an agreement between the parties that a certain sum should be paid for damages and costs.

MR. GRAY: I did not know my friend was going to appear.

MR. CALVERT: We submit to a perpetual injunction and £10 10s. for costs and damages, if any.

HIS LORDSHIP said the defendant did not submit to an injunction at first. He must deal with the matter strictly. He had got the statement of claim and the certificate as to validity, and that was not denied, the plaintiffs were entitled to the relief they asked. His Lordship then gave judgment for a perpetual injunction, inquiry as to damages, the payment of damages after certificate, and payment of costs according to the Act, the costs of the inquiry being reserved.

## GRIFFIN v. THE A.E.G. ELECTRICAL CO. OF SOUTH AFRICA.

In the King's Bench Division, before Mr. Justice Scrutton, this case was mentioned for settlement.

MR. SYLVAIN MAYER, who was with Mr. H. E. Duke, K.C. (for the plaintiff), said his Lordship had reserved this action to be tried on Monday week, but now the Court would not be troubled with it. The parties had entered into an arrangement, and he thought the proper order would be that the action should be stayed on the terms agreed. There would be a Judge's order, if necessary.

MR. CROOM JOHNSTONE (for the defendants): That will include the payment out to the defendants of £57 14s. 1d. paid into Court.

HIS LORDSHIP agreed.

## X.L. ELECTRIC CO., LTD.

In the Chancery Division on May 23rd, Mr. Justice Warrington, on the motion of the plaintiff in the debenture-holder's action of Wiener v. X.L. Electric Co., Ltd., appointed a receiver and manager of the company. Mr. Arthur Sims, for the plaintiff, said there were six debentures issued to the plaintiff by the company. They were not part of a series, but were issued successively, and each stood by itself. The principal moneys amounted to £4,000. No interest had been paid by the company to the plaintiff. According to the conditions contained in the debentures when the interest on any of the debentures was in arrear for a month, the principal money became payable. The company were manufacturers of electric clocks, the motive power being electricity. It was important that various contracts entered into should be carried out.

MR. JENNINGS, for the company, consented to judgment in the action.

HIS LORDSHIP thereupon granted the usual judgment in a debenture-holder's action. As to the receiver and manager, he limited his management to October 20th.

## TRAMWAY COMPANY SUEd FOR £1,000.

AN action has been raised in the Court of Session by a Remton dealer, who sues the Dumbarton Burgh and County Tramways Co., Ltd., for £1,000 damages in respect of personal injuries. Pursuer alleges that one of the wheels of a float he was driving caught against the side of one of the tram rails. The rim was wrenched off and the wheel collapsed, with the result that pursuer was thrown from the top of the float and seriously injured. He alleges that at the point where the accident happened, the setts had become sunken below the level of the rails. Defenders deny that the roadway was defective.

## GIRLING v. FELL.

In the King's Bench Division on May 23rd, Mr. Justice Pickford heard this action, in which Mr. Harry Percy Girling, an electrical engineer, of Maldon, claimed from Mrs. Fell, a lady residing at Maldon Hall, £134 in respect of work done in connection with electric lighting and heating. The lady disputed the claim on the ground that the installation was not satisfactory in its results.

MR. GIRLING gave evidence in support of his claim, stating that, having heard that Mrs. Fell was about to take the Hall, he approached her with a view to inducing her to have the house electrically fitted instead of using gas, which the landlord had agreed to lay in free of charge. She agreed to use electricity if her landlord would undertake the expense for the installation. The landlord consented, and Messrs. Sadd & Sons, Ltd., agreed to bring the mains to the house free of charge. Messrs. Sadd & Sons, he said, were timber merchants having a great deal of wood refuse, which they used for a large gas-producing plant for the supply of electricity to the inhabitants of the locality. He (plaintiff) did their local work, and he had an arrangement by which he was paid a small salary, in return for which he put in work on advantageous terms, involving a certain percentage on materials and labour. The mains were installed to the house by Messrs. Sadd under the arrangement, and he wired the house. He had had many interviews with the defendant as to what she would like in regard to appliances.

HIS LORDSHIP: Where did the mains come to?

PLAINTIFF said they came across private grounds, were fixed to a chimney of the house, and then passed down to a meter where Messrs. Sadd's work ended and his work began. He explained to the lady that the main would not be sufficient to supply all the heating apparatus she required, and that Messrs. Sadd would supply a booster, which would make up for any deficiency. The booster would cost about £17, but an additional main to produce the same result would run into three figures in pounds. The question of the capacity of the main, however, had nothing to do with his contract. Messrs. Sadd had the hooster ready at their works, but would not put it in as the defendant had not paid her bill for the energy supplied during the previous quarter.

MR. HERBERT EUSTACE SADD, director of Sadd & Co., Ltd., said that his company produced electricity as a by-product. The main was put in in this case at a cost of £80, and the company looked for payment by the current supplied.

For the defence, Mr. Herbert Dudley Barlow, electrical engineer, put in a report which he had made as the result of an inspection of the work, the effect of which was that he had no fault to find with the wiring, although the supply was insufficient for both heating and lighting.

The defendant herself did not appear to give evidence.

HIS LORDSHIP, without calling upon counsel for the plaintiff to reply, gave judgment. He said that an electrical installation must always depend upon the facts of the particular case, and might be anything, from the setting up of generators to the mere wiring. In this case the contract was for work necessary after passing the meter for lighting and heating with plugs and switching, and the plaintiff had nothing to do with the mains. The work of providing the mains, fixing the meters, and supplying the current was with Messrs. Sadd & Co., and the plaintiff was right when he told the defendant what was necessary to secure proper heating power with lighting at the same time. Messrs. Sadd were perfectly willing to do everything necessary to give the proper voltage, but they did not do it because the lady would not pay their bill, and the defendant's refusal to pay the plaintiff for the work he had done did not appear to be on account of defective work. Judgment must, therefore, be for the plaintiff for the amount claimed with costs.

Judgment was entered accordingly.

## In re THE ADAMS MANUFACTURING CO., LTD.

APPLICATION was made to Mr. Justice Neville, in the Chancery Division, at the sitting of the Court, on Tuesday, May 27th, with reference to the sale of certain property to which the sanction of the judge was required. Counsel stated that a summons was taken out in a debenture-holders' action returnable on May 23rd, but there was then not sufficient expert evidence to enable the Master to deal with the matter. It came again before him on May 26th, and was adjourned by his Lordship. It was necessary that the matter should be speedily dealt with, or the proposed contract might go off.

HIS LORDSHIP said he would deal with the summons that afternoon in Chambers, after the company winding-up business was disposed of.

**Holidays.**—We have received a copy of a most attractively got-up little book of between 60 and 70 pages, entitled, "To the Continent." It is issued by the Great Eastern Railway Co. and by means of admirable facsimile water colour pictures interests the reader in the company's Harwich route to the Continent. A postcard to the Continental manager at Liverpool Street Station, London, E.C., will bring a copy to any of our readers.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### The "Mego-Meter" Insulation Testing Set.

THIS instrument, which is supplied by the ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., of 111, New Oxford Street, W.C., has been remodelled and improved. It is designed to meet the demand for a strong reliable insulation testing set that is sufficiently accurate for everyday testing work. In principle it is very similar to other well-known testing sets on the market.

It contains a direct-current generator, supplying current at either 240 or 480 volts. This generator is used in connection with a moving-coil indicating system, the dial of which is calibrated direct in megohms, and also has a volt scale.

The construction of the instrument is simple and strong, and, its weight being only 11 lb., it can readily be carried about.

The standard 240-volt set is arranged so that tests can be made at either 120 or 240 volts, and the 480-volt instrument so that tests at 480 and 240 volts can be made.

As a volt scale as well as a megohm scale is provided, the instrument can be used as a testing voltmeter, provided the voltage to be measured is within the range of the instrument; it is suitable

FIG. 1.—THE "MEGO-METER."

for direct-current voltage only. Also, when testing the insulation resistance of an installation that is carrying current, the voltage of the installation itself can be used for testing purposes instead of the generator voltage.

The complete instrument is mounted in a polished walnut case, complete with carrying strap. The generator operating handle is detachable, and is fitted inside the instrument when not in use.

If desired, extra terminals can be fitted, and with the use of separate shunts, current measurements can be made, using the indicating part of the testing set as an amperemeter.

### A New Pulley.

MESSRS. JOHN JARDINE, of Nottingham, have just introduced a new cast-iron pulley, shown in fig. 2, the peculiar design of which is the outcome of considerable study, with a view to overcoming the well-known defects of the ordinary cast pulley. It will

FIG. 2.—THE JARDINE PULLEY.

be noticed that the arms, odd in number, are on the tangent principle, giving better facilities for contraction when cooling after casting; the rim is of light section, but is strengthened by a web

between the arms. The pulley is both light and strong, costs no more than other cast pulleys, and has been successfully used by the makers for some time.

### Siemens Lamp Obscure.

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., of Tyburn Street, Dalston, London, N.E., have sent us particulars of the new lamp obscurer which they have recently placed on the market. The Siemens obscurer is a fluid which etches the glass, leaving an even matt surface. Its application is extremely simple, the acid being simply poured into a container sufficiently large to take the lamp or any other article it is desired to obscure. The surface of the glass should, in the first place, be cleaned to ensure that it is free from dirt and grease; the article is then immersed in the acid for a period of from 4 to 10 seconds. It has then only to drain for about a minute, and afterwards to be thoroughly washed to remove all traces of milky film from the glass. It can then be dried off with a clean cloth and the operation is complete. Heating is not at all necessary, either in the case of the article to be obscured or of the obscurer; neither is it necessary to place the lamps on circuit during the operation.

We have before us a piece of glass which has been obscured by this process, and certainly the surface obtained appears to be of excellent quality. The obscurer is supplied in strong sealed kegs, but owing to the demand experienced, arrangements have been made also to supply it in specially prepared earthenware jars.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"CYCLE" writes:—"One of our friends some short time ago installed the electric light in a house tenanted by him from the landlord. He paid for the complete installation, and did not, as we believe is sometimes done, ask the landlord to bear the expense of the wiring only, himself providing the necessary drops and fittings.

"He now wishes to leave the house, and has been in communication with the landlord as to what he will allow him for the electrical equipment just as it stands. The landlord, however, offers only a very low figure, which the tenant does not at present see his way to accept. He now proposes to remove the lamps and all the special fittings up to the ceiling rose, which, we believe, is usually done, but we should be extremely obliged if you would inform us how he stands regarding the wiring up to the ceiling rose. Can he legally remove the wires from the casing and take down the casings, thus rendering the installation practically useless?"

"\* It would seem that the tenant is very much in the hands of the landlord. A tenant is entitled to movables, but not to fixtures, the maxim *quicquid plantatur solo, solo credit* applying to vest in the landlord everything which has become affixed to the premises. In the matter of electrical fittings, the line seems to be drawn between those parts of an installation which are necessarily of a permanent character and those parts which may be altered to suit the fancy of a particular tenant. Regard must also be had to the extent to which any particular article is annexed to the freehold. For instance, wires embedded in the plaster of a wall could not, by any stretch of imagination, be regarded as a fixture which a tenant was entitled to remove. On the other hand, to go to the other extreme it is clear that a mere incandescent lamp could not possibly be looked up as the property of the landlord. The following views were expressed in the ELECTRICAL REVIEW October 11th, 1912, at p. 593—(a) Wires and wire-casing vest in the landlord; (b) switches and distribution boards, being articles of a permanent character, vest in the landlord; (c) lamp-brackets, often being fanciful in design and capable of being moved without doing damage, are the property of the tenant; (d) a transformer would be tenant's property; (e) ceiling roses are very much on the border line. As they are generally ornamental objects, they should be treated as tenant's fixtures; (f) wall-sockets would be tenant's fixtures inasmuch as they can be easily removed and replaced by a permanent connection to a wall or bracket lamp.

With regard to wires enclosed in casing, it will be seen from the foregoing that these would not be regarded as tenant's fixtures.

**Bradford Strike.**—The electricians' strike at Bradford has not yet terminated, though it has been in progress for the past seven or eight months. The men came out for an advance in wages to 9d. an hour. This the masters refused to grant, and the city was flooded with non-Union men, who were engaged at 8½d. per hour. The Union men offered to go back at this figure, but the masters would not dispose of the services of the non-Union men whom they had taken on when the strike commenced. The Trades and Labour Council, at a meeting last week, passed a resolution protesting against the action of the Electrical Contractors' Association in paying 8½d. per hour to non-Union men and refusing to pay the same rate of wages to Union men.

## BUSINESS NOTES.

**Advertising Electric Power.**—The Union des Exploitations Electriques en Belgique has recently issued a couple of striking posters, with the object of drawing attention to the advantages of electric power. They are entitled "Autrefois" and "Maintenant" ("Then" and "Now"). The first shows the whole staff of a small works tugging round a fly-wheel in an unsuccessful

THEN.

NOW.

attempt to start the gas engine. In the second picture the gas engine is replaced by an electric motor, above which is a notice to the effect that it is only necessary to move the switch to put it in motion.

**"Tricity" Kitchen at Barrow-in-Furness.**—In the accompanying illustration we show the "Tricity" equipment which has been installed at the house of Ald. J. P. Smith, Barrow-in-Furness. In addition to the apparatus here shown there are

"TRICITY" KITCHEN AT BARROW.

two more single cookers which can be used on a table placed in front of the kitchen range, controlled by two panels similar to those shown in the illustration. These are for either heating an urn or for grilling operations. The hot water supply of the house is taken care of by an independent coke stove which has been fixed near the

kitchen range. The installation has only recently been completed, but we understand that the average consumption for cooking for a household of five adults, is eight units per day. During the second week in May a series of lectures and demonstrations was given by the BRITISH ELECTRIC TRANSFORMER CO., and the Corporation has decided to hire "Tricity" cookers to its consumers.

**Consular Notes.**—**Peru.**—The British Consul at Iquitos, in a recent report, states that the first telegraph communication there with Lima was established in 1908, with five wireless and 11 telegraphic relays between Iquitos and Lima. Early in

June last direct communication was established between the new tower erected at Iquitos and that on the Cerro San Cristobal, near Lima. The tower at Iquitos is 100 metres high, and is constructed of trussed steel balanced on an insulated point. The power is 25 kw., and the wave length 1,000 to 4,000 metres. The system used is the Telefunken singing spark. On June 15th last, the new system was inaugurated and public messages were accepted for transmission; since then an excellent service has been maintained. Between Iquitos and Lima the cost per word for messages in Spanish for a minimum of 10 words is 24 cents (6d.), and this is doubled for messages in a foreign language or in code. Iquitos has been from time to time in direct communication with Manao, Para, and other stations outside Peru, but so far commercial messages have not been received for transmission, although private telegrams have been dispatched by special request. It is to be hoped that some arrangement will be made between the Peruvian and Brazilian Governments to permit direct intercommunication between Iquitos and Manao on a commercial basis. The tower formerly in use in Iquitos was recently dismantled, and has since been erected at El Encanto, in the Putumayo region. Experimental messages have already been received from the new station at El Encanto.

**Cape Verde Islands.**—The British Consul reports that the concessions for the electric lighting of Mindello and Praya have not yet been granted. This installation is likely to be one of the first of many prospective improvements.

**Norway.**—Probably more small towns and hamlets in Norway use electricity than in any other country, owing to the abundance of water power. An American Consul states that in the country districts not only are there plants for each collection of five or six houses, but in many cases even small farms have their own

generating plants. In Christiania the electrical plant Kristiania Elektricitetsverk is owned and managed by the city. The plant was built in 1891 by a German firm and cost about £450,000, of which about £275,000 has already been paid off out of profits. The plant was originally fitted completely with German machinery, but the unit recently added was made in Norway. All current consumed in Christiania is sent out from the city plant, but only about one-third of it is generated there. The city purchases 6,500 kw. of alternating current from the Kykkelsrud Co., which generates electricity from the waterfalls at Kykkelsrud, 40 miles from Christiania: 1,950 kw. of alternating current is obtained from the city's plant at the Hammer waterfall, in the Maridalsvand or Maridals Lake district, seven miles from the city; and about 4,000 kw. is generated at the city plant by steam. Of the 4,000 kw., 2,400 is alternating and 1,600 D.C., but it is all transformed to direct. The direct current is used in the centre of the city, and the alternating, which is 50 cycles per second, in the less congested parts and in the suburbs. The voltage used is 230 volts. Both currents are supplied night and day. The total power used in this same year, 1911, was about 10,000 kw., of which 3,859 was D.C. and the balance alternating. Of the latter, 1,346 kw. was furnished to the street-car companies. Notwithstanding the large profit made by the city, energy is furnished to consumers at very low prices. For lighting purposes the rates per kw.-hour, during the last 10 years, have been as follows: 1902 and 1903, 6½d.; 1904, 5½d.; 1905 to 1910, 4d.; 1911, 3½d. For trade purposes the rate has always

been the present one, 2½d. per kw.-hour. On contracts the prices are even lower. Thus the lighting rate is 22s. 4d. per 100 watts per year, and rates for trade uses are about £5 per h.p. up to 15, and £4 per h.p. if more than 15 h.p. are used.

In other cities and in the country districts the rates are also very

low. Alternating current generated from water power is mostly used. The machinery is generally of German manufacture, as also are the lamps, transmission lines, cut-outs, meters, &c. Some of the plants are owned by the communities and others are privately owned.

**Panama.**—According to a report of the Isthmian Canal Commission, survey began early in December for the location of towers to carry the electric transmission line, which will follow the re-located line of the Panama Railroad from Cristobal to Balboa, connecting terminal sub-stations at these points. The line will be fed mainly from the Gatun hydro-electric station, and will be tied into the permanent steam generating station at Miraflores. Energy will be transmitted along this line at a potential of 44,000 volts in delta connection, and reduced at centres of distribution to the requisite potentials for the operation of machinery and for lighting. Each tower is to have a track-span bridge consisting of two side frames connected by a cross-bridge, all of skeleton steel construction. The bridge is to support duplicate three-phase lines, one on either side of the track, a ground wire strung from the top of each side frame, messengers and cables for duplicate telephone trunks and for track signal circuits, and the necessary messengers and wires for a catenary trolley construction should the Panama Railroad be electrified.

The track-span bridges will be located from 200 to 300 ft. apart, according to the curvature of the tracks. Under the specifications being prepared preliminary to advertising for bids on furnishing materials for the line, 725 single-track and 100 double-track bridges will be required, with 2,000,000 ft. of copper wire, No. 00, B. & S. gauge, 6,500 three-unit suspension insulators, and 1,000 ground plates. Inasmuch as the Commission has secured poor deliveries upon recent requirements of structural steel work, in connection with unfavourable prices of both steel and copper in the United States market, foreign manufacturers will be invited to compete for furnishing materials for the transmission line.

**Private Arrangements.**—THE ADAMS MANUFACTURING CO., LTD., automobile and electrical engineers, Balfour House, Finsbury Pavement, E.C., and at Bedford. The following are their creditors here:—

Acme Electrical Co. . . .	£130	Hopper, J., & Co., Ltd. . .	£105

**France.**—LA SOCIÉTÉ DE CONSTRUCTIONS MÉCANIQUES ET ÉLECTRIQUES (Ascenseur Système Houplain & Elluin) is the name of a new company which has lately been formed in Paris (40, Rue Barge), with a capital of £20,520.

**More Lamp Stories.**—All sorts of stories reach us every few days regarding what severe and unexpected ordeals are imposed upon tungsten lamps. No doubt the reader is beginning to find such reports monotonous, and to anticipate the result before he reaches the end of the paragraph. The latest account to reach us relates to a Mazda 60-watt, 230-volt lamp installed at the Palace Theatre, West Hartlepool. This lamp cast itself down from a giddy height of 12 ft. on to a stone pavement below. With it it carried a gallery and heavy bead shade, but when put into the holder again it responded in the usual brilliant fashion, absolutely indifferent to the folly of its fall or the consequences thereof. We also learn that when several cases of Mazda lamps underwent the terrors of shipwreck, and subsequently had to suffer the severe tortures of salvage operations, only 1 per cent. were damaged. Yet again are we told of a stage lighting batten of 100 Mazdas, which fell 5 ft. without one single lamp having grazed its skin or fractured its filament.

**Diploma.**—THE BRITISH THOMSON-HOUSTON CO., LTD., have been awarded a diploma of honour for their exhibit at the International Kinematograph Exhibition, which we described some weeks ago. The main feature of the exhibit was their "Eye-Rest" system of indirect lighting.

**Oils for Electrical Work.**—THE STERN SONNEBORN OIL CO., LTD., of Royal London House, Finsbury Square, London, E.C., announce that recent improvements have enabled them to place on the market transformer oils which vary in colour from almost to absolutely water white. These oils are claimed to give remarkable results as to dielectric strength and specific resistance, and they are being used by leading transformer manufacturers, and light and power installations. Another speciality is their special Sternal white turbine oil.

**Motor-Car Lighting.**—MESSRS. C. A. VANDERVELL AND CO., manufacturers of the well-known C.A.V. car lighting system, were adjudged first on all counts in the competitive trials for lighting sets organised in connection with the Turin Motor Exhibition.

**Patent Applications.**—THE WESTERN ELECTRIC CO., LTD., have applied for leave to amend patent No. 1,950 of 1908, granted to J. E. Kingsbury, for "Improvements in gravity switches as applied to telephones and the like."

THE NATIONAL TELEWRITER CO., LTD., are applying for an extension of term of patent No. 21,918 of 1899, granted to Foster Ritchie, for "Improvements in teleautograph apparatus."

**Scottish Depression.**—According to the *Times*, "two of the works in Glasgow connected with the Malleable Iron Combination closed down on Saturday owing to the dearth of orders, and 500 men were rendered idle. Men were also paid off at several other works." A later paragraph from the *Times* Edinburgh correspondent says that the combine has "been very badly hit, having already closed down four of its 15 works. The depression is the direct result of speculation on the part of local makers, who declined to accept orders during the boom except at higher prices than were then quoted by American and Belgian makers. The result was that orders for fully 100,000 tons of material went abroad."

**Russia.**—THE GESELLSCHAFT FÜR ELEKTRISCHE AKKUMULATOREN "REX" is the name of a new company, which has lately been formed in St. Petersburg, with a capital of 400,000 roubles, to carry on the manufacture of accumulators.

**Liverpool Exhibition.**—This Exhibition is now open, the ceremony having been performed by the Lord Mayor, Sir Chas. Petrie.

**Church Lighting.**—St. Cuthbert's Church, York, has been recently lighted by means of Osram lamps. Every effort has been made to ensure that the general arrangement of the lighting is in entire harmony with the general scheme of architecture.

**Small Loans at 2 Per Cent.**—Under the bequest of the late Samuel Wilson, loans of from £100 to £300 are advanced to *bona-fide* tradesmen and manufacturers carrying on business in the City of London, or within five miles thereof. The loans bear interest at £2 per cent. The grantee must be under 40 years of age, and have been set up in business at least one year, and not more than three years. Further reference is made to the matter in our advertisement pages.

**Catalogues and Lists.**—MESSRS. J. C. FULLER & SONS, LTD., Woodland Works, Wick Lane, Old Ford Road, Bow, London, E.—New catalogue (20 pages) containing full illustrated particulars and prices of their patent Block type accumulators for telegraph, train lighting, house lighting and power, motor-car ignition, hand-lamp, wireless and other service. A number of accumulator sundries, motor-car lamps, ignition coils, fans, &c., are also particularised. The firm are so busy with these accumulators that they have had to open a new factory for their special manufacture.

THE POWER PLANT CO., LTD., West Drayton, Middlesex.—12-page illustrated pamphlet (No. 6), containing descriptions of combined driving, starting and roll turning gear for electrically operated cold rolls, &c., with line diagrams and notes on the method of operation.

MESSRS. BOVING & CO., LTD., 9½, Union Court, Old Broad Street, London, E.C.—New catalogue (40 pages art paper) dealing fully with the "Victoria" turbo pumps and giving many half-tone illustrations of typical plants. Low lift, medium pressure, vertical sinking, high-pressure, turbo-fed, and fire and booster pumps, are covered in the list. Test curves are given in a number of cases. We learn that the total H.P. employed in driving Boving pumps is now well over 20,000 H.P.

THE UNION ELECTRIC CO., LTD., of Park Street, Southwark, S.E., have again issued to their friends one of their little celluloid vest pocket calendar cases containing a supply of sticking plaster.

MESSRS. MANLEY & SANDY, LTD., Caledonia Street, King's Cross, London.—Eight-page pamphlet, illustrating the M. & S. miners' safety lamps, fitted with detector and direct-reading percentage gas indicator within glass, or with detector which can be proportioned to any desired percentage of gas; also showing D.C. generators, A.C. motors, and other lamp cabin equipments.

MESSRS. VERITIS, LTD., 31, King Street, Covent Garden, London, W.C.—Leaflet No. 739, giving illustrated particulars and prices of "Typhoon" D.C. fans and "Delhi" A.C. fans—desk and bracket patterns.

THE POLYSTAT ELECTRIC CO., 222, Marsland Road, Sale, Manchester.—Leaflet "D," describing and stating prices of their wire-length measuring apparatus, for measuring wires, cables, &c. Also illustrated list "C," describing their "Handy" commutator and slip-ring grinder.

MESSRS. SCHOLEY & CO., LTD., 151, Queen Victoria Street, London, E.C.—Four-page supplementary list of electric fans for the current season, including desk and table, oscillating, and portable fans, also four-blade ceiling fans, and the "Mars" special tropical ceiling fan. Particulars of weights, speeds, prices, &c., are tabulated.

**Lamp Economy.**—THE BRITISH THOMSON-HOUSTON CO., LTD., has issued a new piece of publicity matter in the form of a cheque to the value of £40,000, purporting to be drawn in favour of the "World's Electric Light Users," on account of "Mazda—the original drawn-wire tungsten lamp."

The amount mentioned is estimated to represent the daily saving effected by the 20 million Mazdas in use to-day as compared with carbon lamps, reckoning a charge of 4d. per unit, and one hour's service per day.

**Book Notices.**—"Beyond the Atom." By John Cox. "Wireless Telegraphy." By C. L. Fortescue. London: Cambridge University Press, 1913. Price 1s. net each.

"The Uses of Electricity." Three pamphlets. "Electric Lighting." "Electric Cooking and Heating and other Domestic Uses." "Works Driving." London: Kilowatt Publishing Co., Ltd. "Journal of the Western Society of Engineers." Vol. XVIII, Nos. 3 and 4. March and April, 1913. Chicago: The Society. Price 50 c.

"Transactions of the Illuminating Engineering Society." Vol. VIII, No. 4. April, 1913. New York: The Society. Price 75c.

**Bankruptcy Proceedings.**—J. G. M. HILTON, electrical engineer, Birmingham.—First meeting, June 4th; public examination, June 25th, both at Birmingham.

**Trade Announcements.**—THE ELECTRICAL PRESS, LTD., have removed from the Strand, to 13-16, Fisher Street, near Kingsway, London, W.C.

**Dissolutions and Liquidations.**—COLONIAL RAIL AND TRAMWAY SYNDICATE, LTD.—This company is winding up voluntarily with Mr. E. H. Burton, 16, St. Helen's Place, E.C., as liquidator.

ELECTRIC LAMP REGENERATORS, LTD.—This company has resolved upon reconstruction. Mr. F. W. Beard, 480, Salisbury House, E.C., the secretary, is liquidator, and he has authority for the registration of a new company, Electric Lamp Regenerators, Ltd., with a capital of £20,000 in 5s. shares. A meeting of creditors is called for June 5th.

BROWN & PABSONS, LTD., The Parade, Leamington.—A meeting of creditors is called for to-morrow, May 31st, at the offices of the company. Liquidator, Mr. G. H. Butterworth.

BECK FLAME LAMP, LTD.—A meeting is called for June 30th, at 21, Ironmonger Lane, E.C., to hear an account of the winding-up, from Messrs. H. J. Page and G. E. Corfield, the liquidators.

## LIGHTING and POWER NOTES.

**Accrington.**—A report has been issued, showing the financial position of the electricity department. The gross income for the year ended March 31st last was £23,716 and the gross expenditure £14,345, leaving a surplus of £9,371, which represents a profit of 77.3 per cent. on the capital outlay. After meeting various charges for interest and so forth, there was left £2,323, of which £1,150 has been handed over for rate relief. The capital outlay since the electricity works were opened in November, 1900, has been £121,178, £28,834 having been expended in extensions during the past year. The number of units supplied during the year aggregated over 4,800,000, an increase of over 1,500,000.

**Aysgarth.**—At a meeting of the B. of G. on May 20th, it was reported that inquiries had been made with respect to the electric light installations at two small workhouses mentioned by the L.G.B. Inspector, and it had been found that the light had proved a great boon, not only in the way of improved light but also in cleanliness. In one case where oil lamps were formerly used there had been a saving of 25 per cent. The Board has decided to ascertain the cost of an installation.

**Barnes.**—A sub-committee has been appointed to consider what, if any, steps should be taken to increase the output of the Council's electricity undertaking. The electrical engineer reports very poor replies to a letter he had sent to tradesmen explaining the system of hire-purchase of lamps approved of by the Council, and stated that business of this class would go elsewhere unless the Council possessed the powers to undertake the business throughout.

**Beckenham.**—The B. of T. has granted the U.D.C. a prov. order for electric light in the parish of West Wickham, and has inserted a clause revoking the powers of the West Kent Electric Co. for that district.

**Bexhill.**—The Council has instructed the engineer to report on the cost of replacing the whole of the arc lamps of the borough with high-power metal-filament lamps.

**Birkenhead.**—An inquiry has been held by the L.G.B. relative to the Council's application for sanction to borrow £32,600 for purposes connected with the electricity undertaking. Of this amount £18,400 is required for mains and services for three years, and £14,200 for extensions to plant—for two 750-kw. generators.

The Inspector (Mr. H. R. Hooper) expressed a strong opinion in regard to municipal electrical undertakings paying money towards the relief of the rates instead of building up an adequate reserve fund. He felt that no municipal authority could afford to pay a penny to the relief of local rates in the present position of the electrical industry, as it was increasing by leaps and bounds. Therefore, it was all the more necessary to provide a sufficient reserve fund to meet the larger and more up-to-date generating plant which would be required to cope with the ever-increasing requirements. The chairman of the Electricity Committee (Mr. D. J. Clarke), said, after his experience, he quite agreed with the remarks of the Inspector.

**Birmingham.**—It is stated that the city authorities are experimenting with electric lanterns with a view ultimately to equipping the whole of the police force with them.

**Blackpool.**—An annual saving of £550 in the cost of the street lighting was foreshadowed in the electrical engineer's estimates, submitted on May 22nd to the Street Lighting Committee. The electricity department has reduced charges for street electric lighting from 3d. per unit for the first 250,000 units to a flat rate of 2½d. for all consumption.

**Bolton.**—It was reported last week that the total profit of the electricity department, together with the amount brought forward last year, was £31,566. After making allowance for depreciation, interest, &c., there was £1,787 available for distribution, and it was decided by the Electricity Committee to allocate £1,500 of this in relief of the rates. In 1912 the amount voted for this purpose was £3,250, and in 1911 it was £6,500.

**Bootle.**—Mr. H. R. Hooper, L.G.B. Inspector, has held an inquiry into an application by the Corporation to borrow the sum of £3,950 for the purchase of land in Linacre Lane, and £3,750 for purposes of the electricity undertaking. The town clerk explained that the expenditure of the latter sum was necessitated by the development required for the provision of an additional electricity supply to districts which they served, and for a duplicate supply to certain large consumers. Councillor F. W. King (chairman of the Electric Power and Lighting Committee) stated that they wished to proceed with the scheme as soon as possible, because they wanted to make provision for supplying Messrs. Harland & Wolff, the cold stores, and other firms. There was no opposition to the application.

**Bristol.**—It is intended to convert 1,517 street gas lamps for electric lighting, the saving in expense being estimated at 20 per cent.

**Burgess Hill.**—On the proposition of Lady Ruth Pelham, the Burgess Hill group of school managers has decided to recommend the East Sussex Education Committee to take steps to discontinue using gas as an illuminant at London Road schools, as it is considered electric light is more healthy.

**Bury.**—The Electricity Committee has appointed a sub-committee to consider the question of inter-connection being made with the mains of the Lancashire Electric Power Co., so that in case of a breakdown at either works a supply could be obtained from the other works. According to the Manchester papers this is part of a general scheme to interconnect the different generating stations in the neighbourhood of Manchester, with a view to safeguarding the supply.

**Colwyn Bay.**—At a meeting of the Lighting Committee, a statement of the financial results of the past year, which was submitted, showed gross profits of £4,011, and net profits of £1,319. The Committee considered the results very satisfactory. It was decided that the price of current used for public lighting and U.D.C. departments should be reduced from 4d. to 3d. per unit.

**Continental Notes.**—GERMANY.—The new Franken power station, which has a capacity of 6,200 H.P. of the Frankische Ueberland Zentral, of Nuremberg, has just been completed and put in operation. It is supplying current to no less than 160 small towns and villages, the mains having a length of about 320 miles.

SICILY.—Good progress is being made with the adoption of electrical energy for lighting and power purposes on the Island of Sicily. The Société d'Électricité de la Sicile Orientale is now supplying current to 106,808 incandescent and 402 arc lamps, as well as to 758 electric motors belonging to private consumers, and 3,449 incandescent and 827 arc lamps used for public lighting, and the power for the tramways in the town of Catania. Current is supplied altogether to 11 small towns having a total of 504,000 inhabitants.

**Coventry.**—The annual report of the Corporation electricity undertaking has been issued, and shows that the department has had a successful year's working. It states:—The total borrowing powers of the undertaking amount to £275,570, the whole of which have been exercised. The sinking fund amounts to £72,130. During the year the number of consumers increased from 1,962 to 2,517, an increase for the year of 555, as compared with an increase for the previous year of 372, and by far the largest increase recorded since the commencement of the undertaking. The number of units sold increased from 10,173,339 to 13,337,482, an increase of 2,864,143 units, of which the power load accounted for 2,684,266. The revenue from sale of current, motor rents, &c., amounted to £60,521, compared with £60,682 in the previous year, notwithstanding the further reduction in the charge for power which was made last year. The working expenses amounted to £24,765, against £17,370 in the previous year, the increase in the price of coal accounting for a considerable portion

of this increase. The gross profit was £35,756. Capital charges amounted to £19,510, against £17,138 in 1912, the result being a net profit for the year of £16,245. To this has to be added the amount of £18 brought forward, making the available surplus £16,293. The Committee makes the following recommendations as to the disposal of the surplus of £16,293:— (1) That £4,500 be paid over to the general district fund in aid of the rates; (2) That £11,600 be paid to the reserve fund, and transferred from that fund to capital account, such sum to be applied for the replacement of superseded plant and other purposes stated below, in lieu of raising a loan for the same, viz., £1,800 for transformers and sub-station equipment, £2,000 for house services, £4,000 for new machinery and replacement of plant, £3,800 for the plant to be provided in connection with the supply of energy to the tramways department; (3) That the balance of £193 be carried forward to the next account.

**Creswell.**—At a meeting of parishioners last week, an electric light scheme submitted by Mr. J. P. Houghton, managing director of the Belovser Colliery Co. was accepted. Mr. Houghton offers to supply four lights and do the wiring work at a charge of 13s. per house per year to cover interest on capital, upkeep, and cost of repairs and renewals to fittings. The cost of current will be 3½d. per unit.

**Darlington.**—Reporting to the Electricity Committee, the electrical engineer, Mr. Lunn, stated that the units generated for lighting and power in April amounted to 401,483, as against 186,080 in April, 1912, an increase of 116 per cent. From the profits of the past year, £5,000 has been allocated to the relief of the rates. It was decided to submit a tender for the electric lighting of those streets in the borough where cables are laid, in view of the saving over gas lighting.

**Darwen.**—A L.G.B. inquiry was held last week regarding the application of the Corporation to borrow £6,400 for extensions at the electricity works and various sums for other purposes. The town clerk explained that owing to the success of the electricity undertaking it was proposed to obtain new plant. There was no opposition to the application in so far as it related to the money for extensions at the electricity works.

**Egypt.**—According to the *Board of Trade Journal*, the Egyptian Government is considering the development on a large scale of the power at present wasted at the Assuan dam. A large amount of power could be obtained and utilised in the manufacture of chemical manure—calcium cyanamide probably—but a small plant will be provided in the first instance.

**Elland.**—The electricity department receipts have increased from £2,173 to £2,918 last year, whilst the expenditure was £1,968, as against £1,617 in the previous year. The credit balance on the year's working has been increased from £556 to £950, notwithstanding extra expenditure on coal, amounting to £115, as compared with a year ago.

**Epsom.**—The chairman of the U.D.C. electricity undertaking has just issued his annual memorandum. It states that after paying all charges, including capital costs, a profit is shown of £137, which is £54 in excess of the estimate. The total sum borrowed since the undertaking was established was £43,811, of which £15,335 had been repaid. The total income was £6,519, as against £6,681, a decrease of £161; and the total expenditure £3,630, as against £3,622, leaving a gross profit of £2,885, as against £3,059.

**Exeter.**—The results of the year's working of the electricity undertaking, according to the annual report of Mr. Munro, the engineer, are: Receipts, £18,211; working expenses, £9,840; gross surplus, £8,370. The interest, sinking fund and income-tax charges amounted to £6,997, leaving a net surplus for the year of £1,373. The lighting, heating and power output increased by over 60,000 units, but the tramway demand was less by 21,000 units. Although the charges for power and lighting have been twice reduced recently, the loss of revenue from this source is already balanced by the increasing demand. The Committee has decided to carry the surplus of £1,373 to the reserve and renewals account, increasing the credit balance to that fund to £11,785. The Finance Committee has been asked to consider the salaries of the electrical engineer and the members of his department.

**Hanwell.**—The District Council proposes to obtain estimates from the Gas and Electric Light Co. for the lighting and maintenance of the lamps in a portion of Greenford Avenue.

**Hebden Bridge.**—It is proposed to extend the electricity works, at an estimated cost of £3,250. The chief item in the extension proposals is the provision of a Diesel engine for power purposes.

**Herne Bay.**—The U.D.C. has decided to have the electric light installed at the new King's Hall, current to be supplied from the works of Messrs. Hunt at 3d. per unit. This firm will also undertake the installation work.

**Hornsey.**—A special rate of 3d. per unit is to be charged during the summer months for current supplied for garden lighting. At the last meeting of the Council, Councillor Moritz, speaking upon a report of the Electricity Committee with regard to the interference by a workman employed by a local tradesman with a box and fuse belonging to the Council, said that cases of the sort mentioned were becoming too frequent, and the Committee had decided to take drastic steps in the next case.

**Hull.**—The T.C., having received applications for current from residents at Sutton, has applied to the Southcoates R.D.C. for permission to undertake the supply, and for support to an application to the B. of T. for the necessary order. The Town Clerk intimated that his Council intended in the near future to apply for a prov. order for E.L. in the parish of Sutton generally. The R.D.C. has deferred the matter for further consideration.

**Hikley.**—The U.D.C. is proceeding with its electric lighting scheme, and intends to make early application to the L.G.B. for sanction to borrow £18,000 to carry out the work.

**Knottingley (Yorks.).**—The U.D.C. has appointed a Committee to consider the question of applying for a prov. order for E.L.

**Limerick.**—At a meeting of the Electric Lighting Committee, held on the 16th inst., it was decided to again recommend the Council to apply for a full loan for renewals at the power house, including £6,100 for the purchase of a Diesel oil engine.

**Liverpool.**—The existence of the much-debated Electrical Sub-Committee is again threatened. After being dissolved and re-established within a month, a motion to rescind the resolution reappointing it was down for discussion on Friday last.

**London.**—SOUTHWARK.—The L.C.C. is to be asked to sanction a loan of £29,464 to meet the cost of the additional plant required for the extension of the electric light station.

HAMMERSMITH.—The Electricity Committee recommends that sanction to a further loan of £9,500, for mains extensions, services, sub-station transformers, &c., be obtained from the L.C.C.

BATTERSEA.—The L.C.C. has sanctioned the borrowing of £3,275 for the provision of additional plant.

**Luton.**—The borough engineer has submitted to the T.C. a scheme for extending the refuse destructor, at an estimated cost of £7,000.

**Middlesbrough.**—The annual report of the Electricity Committee of the Corporation, shows that during the past year the revenue had increased by £3,533 to £24,448, whilst the total costs £13,365 represented a decrease of '07d. per unit. The gross profit was £11,113, an increase of £837, and the net profit of £3,369 represented an increase of £480. The profit was allocated to the reserve fund and the special redemption fund. The engineer's (Mr. H. M. Taylor's) salary was increased from £425 to £450 per annum, and that of the mains superintendent (Mr. R. Sistrin) from £180 to £200.

**Morecambe.**—Terms have been approved by the T.C. for the supply of electricity to Messrs. Ward's shipbreaking yard, viz., a standing charge of £90 per annum, plus 1d. per unit for every unit supplied, with a guaranteed consumption of 50,000 units per annum, and Messrs. Ward to guarantee to take the supply for a period of five years. The Corporation is protected in the matter of peak load supply and cost of fuel.

**Norwich.**—At the last sitting of the T.C., Mr. Alderman Wild presented a report from the Electricity Committee, as to the sum required for plant during the next five years. He said an estimate prepared by the electricity engineer (Mr. F. M. Long) amounted to £25,000. The increase of business during the last two years had amounted to more than the whole sales when the business was taken over by the T.C. The expenditure proposed was large, but the amount would only be raised as it was required. The report was adopted.

**Oldham.**—At a meeting of the Electricity Committee on May 21st, a summary of the past year's working of the electricity department was given. The expenditure on capital account was £11,668, making the total capital expenditure of the undertaking £318,414. The gross revenue for the year amounted to £46,646, and the gross expenditure to £25,451, leaving a balance to be carried to net revenue of £21,195. Interest and sinking fund charges amounted to £18,618, expenditure on meters to £1,533, leaving a net profit for the year of £1,043. The credit balance brought forward from previous year was £664, which leaves a credit balance to carry forward to next year's account of £1,708. The number of units sold (exclusive of traction) was 3,028,203, as compared with 2,451,116 in the previous year, or an increase of 577,087, or 23'51 per cent. The number of units sold for traction during the year was 3,435,213, as against 3,541,360 in 1912, a decrease of 106,147, or 2'99 per cent. The amount standing to credit of the reserve fund is £5,726. The number of lamps connected was 241,258, as against 206,048, an increase of 35,210, or 17'09 per cent. The generating capacity of the Greenhill station has been increased by the addition of a turbine, and now amounts to 8,600 H.P. The works costs amounted to 0'712d. per unit sold, the total revenue costs to 0'941d., as against 0'669d. and 0'924d. per unit in 1912, respectively. The increase in costs is solely due to the expenditure on coal. The total number of units sold during the year was 6,463,416, as against 5,992,476 in the previous year.

**Peterborough.**—The accounts of the city electricity department for the past year show a surplus on the revenue account of £4,353, but after paying £1,635 for interest on loans, £2,151 for re-payments, and £711 for capital expenditure out of revenue, there is a net deficit of £145, which is met by the reserve fund. Last month (April) the works earned a surplus of £322. The Great Northern Railway Co. has applied for a supply of power for its cranes, which matter is under consideration.

**China.**—To meet the increasing demand for current for lighting and power purposes, two new 2,000-H.P. steam engines and a 1,000-H.P. transformer have been installed at the central generating station at Tientsin.

**Plymouth.**—The electrical engineer has recommended the Council that a turbo-generator of 1,000-kw. capacity be installed, together with the necessary auxiliaries; also switchgear of greater capacity and additional distributor and interconnector cables. Estimated cost £5,500.

**Runcorn.**—The Mersey Power Co. has applied to the B. of T. for consent to the placing of electric lines above ground for purposes of supply under the Runcorn Urban and Runcorn Rural Electric Lighting Order, 1910.

**Southend-on-Sea.**—The T.C. has received the sanction of the L.G.B. to a loan of £3,700 for the provision of an additional 500-kw. steam generator and accessories.

**Stafford.**—The annual statement in connection with the electricity undertaking shows that for the past year the total revenue from all sources amounted to £6,182, and the total expenditure to £3,708, leaving a gross profit of £2,480, compared with £2,809 in the previous year. It has been decided to pay bonuses, as usual, to the employes on the profits of the year's working.

**Tottenham.**—The Council, at its meeting this week, will consider a recommendation from the General Purposes Committee advising the acceptance of the quotation of the Tottenham and Edmonton Gas Co. for lighting the district for a period of 10 years. Competitive prices were obtained from the North Metropolitan Electric Power Supply Co. Reporting on the two offers received, the Council's engineer states that the Electric Light Co. already supplies current to 140 arc lamps in the district, and under an agreement the contract cannot be terminated until January, 1918. The company's tender just received is for the completion of electric lighting in West Green Road and Lordship Lane, and for the installation of electric light in several other streets and portions of streets.

**Walsall.**—The report of Mr. E. M. Lacey on the Corporation electricity undertaking has been issued. He condemns the present generating station site and plant; finds that it has been inefficiently maintained and staffed; that the proposed expenditure of £5,000 on repairs and additions to plant is essential; and that the charges for d.c. supply should be increased, so as to secure an average return of 4.75d. per unit sold for lighting purposes, and of 1.68d. per unit for traction supply. Mr. Lacey goes on to recommend the provision of a modern 3,000-kw. power station, capable of extension to 10,000-12,000 kw., to meet the needs of the area. He finds that responsibility for the present state of affairs rests to some extent with the chief engineer, who, however, has not had the time to give close attention to everything. Mr. A. S. Barnard (borough electrical engineer), in replying to this criticism, points out that he has repeatedly drawn the attention of the Committee to the necessity of appointing a chief assistant engineer, and blames the Committee for ignoring his advice. The General Purposes Committee, after approving the report, said it considered that the borough electrical engineer cannot be freed from responsibility, and after considering whether his services should be retained, it recommended that the matter be decided on the result of the year's working; but that the Council may at any time determine the engagement of the engineer. While agreeing with the consulting engineer as to the unsuitability of the present generating plant, the Committee, in view of the extensions, has deferred consideration of a new station.

**West Ham.**—Application is to be made to the L.G.B. for sanction to a further loan of £21,500, made up as follows:—Transformers, sub-stations, switchgear and accessories, £9,000; general mains extensions, £3,500; services and accessories, £4,000. The electrical engineer has been instructed to report on the use of current for domestic heating and cooking purposes, with a suggested tariff of charges in connection therewith.

**Wigan.**—At a meeting of the Electric Lighting Committee last week, it was decided that tradesmen be granted (on application to the electrical engineer) the loan of festoons and lamps, with free light, for illuminated decorations on the night of their Majesties' visit to the town, subject to their paying the cost of fixing such decorations.

**Willesden.**—The clerk has been instructed to negotiate for the advance, by instalments, of £14,000 sanctioned by the L.G.B. for the purposes of the undertaking. From a special report prepared by the engineer, the Electricity Committee states that the undertaking continues to make steady progress. A communication has been received from the Home Office as to the renewal of the high and low-tension switchboards, which is estimated to cost £2,000, and in accordance with the suggestion of the engineer the work is to be carried out by allocating the sum of £500 per annum for the purpose, until the whole of the work is complete. The latest type of flame arc lamp is to be substituted for the present open arcs, which are now practically worn out, and for which £500 per annum is also to be put aside. During the first year 25 lamps in the High Road, Kilburn, and Shoot Up Hill, are being renewed at an estimated cost of £275. The electrical engineer has submitted to his Committee a report with regard to the supply of current in bulk to the Willesden Infirmary and the extension of cables to meet additional demands in the Park Royal area. In this report the engineer states that in October last he offered to meet the requirements of the Guardians for a fixed sum

of £35 per annum, being 10 per cent. upon the capital cost, and 2d. per unit for all energy used for lighting and power, which was accepted. The cost of this extension to the Infirmary, with provision for meeting any further demand in Park Royal, is as follows: High-tension cables, £708; transformer with switchgear, £100; switch panels, £29; total, £837. In addition to this, at least one 25-H.P. motor will be required to be let on hire for driving the laundry. The greater portion of this expenditure is for the future development of the district.

**York.**—The Corporation having decided to extend its electricity works, a L.G.B. inquiry was held on May 26th into the proposal to borrow £30,000 for that purpose.

It was stated that the works for some time lost money, totalling £8,400. Lately, however, profits had been made aggregating £8,633, of which sum £2,400 had been paid to the relief of the rates. The units sold during the year ended March 31st last were 6,007,800 compared with 3,610,950 units in 1911-12, an increase of nearly 2,400,000. The loan sought was to meet the expenditure necessary to meet the estimated increased demand for next year. Mr. J. W. Hame, the electrical engineer, said the increased sale was largely due to the increase in the power supply. The amounts required were:—Generating plant, £10,100; two water-tube boilers, £4,300; cables, £5,250; batteries, £3,900; building, £890; total, £24,440. This reduction from the amount it was originally intended to borrow was due to the fact that the estimate for the 3,500-kw. generating plant was £14,257. The accepted tender, however, was only £9,967, the highest tender being £15,000. The preliminary estimate was based on a slower-speed turbine, but it was now possible to use machines of a higher speed, which enabled them to be made more cheaply, and they also occupied a smaller space. There was no opposition.

## TRAMWAY and RAILWAY NOTES.

**Australia.**—According to the *Mining and Engineering Review*, Messrs. Griffiths & Co., contractors, of London, are reported to be negotiating with the N.S.W. Government in regard to the financing and construction of the Sydney underground railway system.

**Barnoldswick.**—The Light Railway Commissioners conducted an inquiry on May 23rd into the expediency of establishing a light railway between Gisburn and Barnoldswick. The proposed railway will be  $4\frac{1}{2}$  miles in length. It is designed to commence near the highway, and will join the Lancashire and Yorkshire railway system at Gisburn, thus connecting an important centre of the cotton industry with the Manchester markets. It was stated at the hearing that terms had been arranged with the Lancashire and Yorkshire Co. who were present to support the scheme. The estimated cost was something over £44,000, and it was proposed to raise £45,000 capital.

**Birmingham.**—The City Council has approved of a recommendation of the Tramways Committee to purchase 75 new cars, 40 for the Warwick Road, Hockley Road, and Stafford Road routes, and 35 extra cars. The cars will cost about £83,000.

**Cardiff.**—Mr. Arthur Ellis, the tramways engineer and manager, states that he has included an electrical-petrol car with the trackless trolley and the motor-bus for use in the outlying districts of Cardiff in a recommendation to the Tramways Committee, which has asked the Parliamentary Committee to include these types of vehicles in the Bill which is being prepared in connection with the extension of the city boundaries. The Tramways Committee proposed to take advantage of the Bill to obtain powers to include the running of a service of vehicles to the outlying districts in different directions of the types of one or other of the three referred to. He did not recommend them for city use.

**Conisborough.**—The Parish Council at its last meeting gave consideration to the proposals of the Mexboro' and Swinton Railless Tramway Co.'s Parliamentary Bill and decided to give its support to the latter, the chairman and the clerk being appointed to give evidence in support of the Bill.

**Continental Notes.**—AUSTRIA.—It is reported from Vienna that the Government proposes to carry out the conversion of the Vienna City Railway to electric traction, which has been under consideration for a period of several years, for the account of the State, at an estimated expenditure of £1,250,000. On the other hand, the construction of the proposed new underground railways is to be undertaken by the city of Vienna with the participation of the leading electrical companies and of French capital, if a portion of the money is raised in the French market. The outlay on the lines is computed at from £6,000,000 to £10,000,000, although the work is not to be begun before the completion of the transformation of the existing city railway.

**Dundee.**—The Corporation Tramways Committee, in an effort to beautify the car routes, recommends that flower baskets be attached to a number of the standards.

**East Ham.**—With reference to the last portion of the paragraph inserted under "Ilford" in last week's issue the continuation of that Council's agreement with East Ham Corporation for the lease of the Ilford Hill track, the engineer and manager to East Ham has been directed to negotiate for reduced terms.

**East Kent.**—The East Kent Light Railways Co. are applying to the Light Railway Commissioners for power to construct additional lines of railways in the new colliery district. The lines will run through the parishes of Woodnesborough, Goodnestone, Nonington, Little and Great Mongeham, Sholden, Deal, Wickhambreux, Littlebourne, Fordwich, Ilackington, Canterbury, Coldred, Lydden, Temple Ewell, Alkham, West Hougham, Northbourne, Wingham, and Stonar.

**Exeter.**—In his statement for the year ending March 31st, Mr. H. C. Bartlett (manager of the tramways) says that the total receipts were £16,748, being £512 less than the previous year, which was a record year. The total profit is £2,012, being £224 less than in 1912, the weather during the summer months being very bad for tramway business. The energy consumption has been reduced to a minimum; and although 3,600 more miles have been run this year, the energy has cost £143 less than last year, due to the use of car meters.

**Holcombe Brook.**—The overhead equipment in connection with the electrification of this branch railway has now been fixed, and current, which is supplied by the Lancashire Electric Power Co. was switched on for the first time last Friday.

**Keighley.**—The Tramways Committee has decided to purchase two railless trolley vehicles from Messrs. Trackless Trolley, Ltd., for £1,420, provided the installation of the railless trolley system between Ingrow and Lees is satisfactory. The Committee has also decided to request the B. of T. to grant a further extension of time for the construction of tramways from Dale Street to Stockbridge, and for the commencement and completion of the tramways authorised by the Keighley Corporation Tramways Order, 1909.

A deputation from Brighton visited the town on Wednesday, the 21st inst., in order to inspect the railless trolley system.

**Leith.**—The receipts from the tramways for the year just ended are more than £900 over last year's figures, the total amount from all sources reaching, approximately, £35,500.

**Little Hulton.**—The South Lancs. Tramways Co. is making exceptionally rapid progress in constructing the new tramways through Little Hulton. Connections with the company's existing system will be made at the Ellesmere Memorial, Walkden, and at Buckley Lane, Farnworth.

**Luton.**—The T.C. has decided, subject to the consent of the B. of T. to lease for a further term of 10 years the electric tramways to Balfour, Beatty & Co., Ltd.

**Manchester.**—A general reduction of car fares on all the routes in the city has been adopted by the Tramways Committee. As an experiment, cheaper fares have been in operation on three routes, and Mr. J. M. McElroy (general manager) declares that the result of the experiment is such that the Committee would not be justified in withholding the proposed reduction of the fares on the remaining routes. The experiment referred to covered a period of three months. The passengers carried numbered 13,710,673, against 12,039,136 in the corresponding period a year ago. The receipts amounted to £60,610, against £60,276 in the same period a year ago. Referring to the general all-round reduction, Mr. McElroy states that although there may be some diminution of the net earnings, it will not be of such a substantial nature as seriously to affect the financial position of the department.

The annual report of the tramways undertaking was before the Tramways Committee on Tuesday. There is an increasing revenue, and profits are well maintained in spite of higher labour, power, and other costs. The length of track was 188 miles 651 yd., an increase of 3 miles 687 yd. over the previous year. The traffic revenue increased from £845,460 (in 1911-12) to £876,022. Working expenses increased from £530,068 to £557,737, and the gross profit increased from £326,720 to £329,909. A slight decrease in the revenue per car-mile is due to reductions in fares, and an increase in the traffic expenses is accounted for by increased scale of wages adopted for nearly all grades of labour chargeable to this account. An increase in power expenses is due to the increased price per unit paid to the Electricity Committee consequent upon the higher price of coal. The consumption of electrical energy per car-mile shows a further decrease, notwithstanding the increased number of cars fitted with top covers. The units consumed were 30,514,278 (against 29,890,427 in 1912), and the units consumed per car-mile were 1,625 (against 1,653). Of 629 cars at work, 407 have covered tops, 38 having been fitted during the year. The car-mileage was 18,768,259 (as compared with 18,076,999 in the previous year), the passengers carried, 187,675,183 (against 174,424,237), and the amount paid in relief of rates was £100,000 against £86,000. The profits of the parcels department had risen steadily, and last year were £3,568. The average traffic revenue per mile was 11'202d. The car-miles per day per car averaged 97'2, and the average fare per passenger 1'12d.

**Rotherham.**—The Corporation has under consideration a proposal to substitute a tramways system for the present railless traction system between Rotherham and Maltby.

**Southend-on-Sea.**—The net profits of the Corporation electricity and tramways undertakings for the last financial year amounted to £8,056, of which it is proposed to contribute £4,700 to the rates.

**Swansea.**—At a meeting of the Finance Committee, the hon. treasurer reported that in the original agreement with the Tramways Co. was a clause that in the event of the company paying a dividend of over 6 per cent., there would be an annual payment to the Corporation of £968. Seeing, however, that it was doubtful whether circumstances might arise making such a payment necessary, the chairman said he had substituted a clause by which the company should annually pay the Corporation 2 per cent. on its gross profits. The advantage of this change had already been seen in the payment to the Corporation of the sum of £576 for the last year.

**West Sussex.**—A company is applying to the Light Railway Commissioners for power to construct a light railway between Hunston, West Wittering, West Itchenor and Chichester and Selsey, and to acquire the undertaking of the Hundred of Munhood and Selsey Tramway Co., Ltd.

## TELEGRAPH and TELEPHONE NOTES.

**American Marconi Shares.**—An action has been brought by Mr. O. Locker-Lampson, M.P., and Mr. P. Wright against the directors of Marconi's Wireless Telegraph Co., Ltd., and others, claiming, as shareholders, a sum of upwards of one million sterling in respect of 500,000 American Marconi shares which were put on the market on April 19th last year. The case is not likely to be heard before the Long Vacation.

**Anglo-Dutch Telephone.**—A Bill has been introduced by the Dutch Government for the establishment of telephonic communication between Holland and Great Britain. The length of the proposed cable will be 165 km., and the cost, which is estimated at £62,000, will be equally shared by the British and Dutch Post Offices. It is proposed to run the cable from Westkapelle (island of Walcheren) to Orford Ness (Suffolk), and it will be laid before September, 1913.

**Australia.**—The Commonwealth Government has obtained a stay of proceedings under the order granted by the Full Court, authorising the Marconi Co. to inspect the wireless installations of the Government. The latter is applying to the Privy Council for special leave to appeal against the decision of the Full Court.

**Australia and New Zealand.**—Experiments have been carried out recently between the high-power stations at Pennant Hills, near Sydney, N.S.W., and Awanui, New Zealand, a distance of 1,400 nautical miles, between 11 a.m. and 1 p.m. Communication was successfully maintained without difficulty, during daylight hours. Messages have been received at night at distances up to 4,800 miles.

**Franco-British Telephone.**—The French Chamber has adopted the Bill approving an Agreement for the regulation of telephonic communication between the two countries. The loaded telephone cable has enabled the Electrophone to be used for hearing in London a performance of "Faust" at the Opera in Paris.

**Imperial Wireless System.**—The Select Committee on the Marconi Contract met on Wednesday to consider the draft report of the chairman on the accusations against Ministers. The *Times* states that it is understood that the report, while referring to errors of judgment on the part of Sir Rufus Isaacs and Mr. Lloyd George, exonerates them from any charge of corruption. It is stated that the report finds favour with neither party on the Committee.

**Libel Action.**—The action brought by Mr. Godfrey Isaacs against Mr. Cecil Chesterton (the editor of the *New Witness*) for criminal libel was opened on Tuesday, Sir E. Carson appearing for the plaintiff. The alleged libels imputed corruption to two Ministers as well as to Mr. Godfrey Isaacs. Evidence was given by Mr. H. Samuel regarding the negotiations between the Post Office and the company, and his examination was continued on Wednesday.

**Poulsen Contracts.**—It is reported that as the result of exhaustive comparative tests, the United States Government has placed a contract with the Federal Telegraph Co. for a high-power station at Colon on the Poulsen system, with a range of 3,000 miles by day or night. The Marconi Co. has instituted legal proceedings against the Federal Co. to prevent the execution of the contract, on the ground that it would involve the infringement of 11 Marconi patents.

**The Siemens Quenched-Spark Wireless Telegraph System.**—Messrs. Siemens Bros. & Co., Ltd., have issued a new pamphlet (A. 550) which contains a good deal of interesting data in connection with modern wireless telegraph stations for all classes of mercantile vessels. Messrs. Siemens first took up the manufacture at Woolwich of quenched-spark apparatus in 1910, and since that time they have successfully carried out a large number of installations upon both British and foreign vessels, a particularly large order which has just been completed being for

the equipment of the following vessels owned by Messrs. A. Holt and Co.:—*ss. Keemun, Oanfa, Teucar, Bellerophon, Antiochus, Cyclops, Talithybius, Protestilus, Izion, Titan, Ajax*. Another large contract recently placed with Messrs. Siemens is for the equipment of the following vessels of the Tank Storage and Carriage Co.'s fleet:—*ss. Cuyahoga, Saranac, Cadillac, Seminole, Kennebec, Tuscarora, Dakota, Winnabago, Schuykill, Seneca, Uncas, Treumseh, Shabonee, Winamac, Tascalsua, Tanaha, Tahchee*. In addition to orders for the Mercantile Marine, Messrs. Siemens have supplied several foreign Governments with wireless telegraph installations of long range and special design suitable for naval purposes. Besides marine installations, important contracts for large land stations have been, or are being, carried out. We are informed that the system has given exceptionally good results in tropical countries, and has been adopted by the British North Borneo Co. for commercial stations at Lahad Datu, Jesselton, Sandakan and Silimpon; and by the African Direct Telegraph Co., at Freetown and Lagos. From some interesting statistics which are given, it is shown that of the total number of wireless stations throughout the world more than 50 per cent. are equipped on the "Quenched-spark" system, in which an efficiency of 50-75 per cent. is obtained in transforming the primary electrical energy into useful radiated energy. This high efficiency has led to the classification of the standard types of station according to the energy in the antenna, and not according to the primary energy, which is misleading. For example, a 15-kw. installation of the usual open spark type, with an efficiency of about 30-35 per cent., is said to have only the same radiative power as a quenched-spark 5-kw. installation. Other advantages of this system are also pointed out, such as the harmonic nature and high pitch of the propagated waves, which enable atmospheric disturbances to be largely eliminated; and the absence of noise which, with the ordinary spark-gap, necessitates a specially constructed sound-proof cabin occupying a considerable amount of space, sometimes a serious matter on board ship. The latter half of this pamphlet gives descriptions of standard types of ship stations which have been designed to embody great compactness of apparatus. One station, which has been specially designed to meet the requirements of the recent American Shipping Acts, and has a guaranteed range of 100 miles by day, is totally enclosed in a roll-front case, of which the dimensions are only 4 ft. 8 in. x 2 ft. 2 in. x 2 ft. 4 in. Several pages of the pamphlet are devoted to records compiled from operator's reports, showing that the ranges guaranteed are greatly exceeded in practice, distances of more than twice the guaranteed range being frequently bridged when engaged upon ordinary commercial traffic. The pamphlet contains a large number of illustrations of apparatus and ships which have been equipped.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Atherton.**—June 10th. Two 150-kw. single-phase transformers, for the U.D.C. See "Official Notices" to-day.

**Australia.**—VICTORIA.—June 2nd. 20,000-volt H.T. switchgear and L.T. switchgear and accessories, for the Melbourne Suburban Railways. See "Official Notices" May 2nd.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

June 24th.—H.D. copper wire, telephone parts and telephones, for the P.M.G. See "Official Notices" May 23rd.

July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" May 23rd.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" to-day.

TASMANIA.—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" May 23rd.

QUEENSLAND.—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

WESTERN AUSTRALIA.—July 9th and 30th and August 6th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

June 11th. Metal-filament lamps, for the P.M.G. See "Official Notices" May 23rd.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" to-day.

July 30th.—Cable, switchboard, for the P.M.G. See "Official Notices" to-day.

SOUTH AUSTRALIA.—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

NEW SOUTH WALES.—July 9th. Switchboards, for the P.M.G. See "Official Notices" to-day.

**Bedford.**—June 20th. About 10,870 tons of hard or soft coal, for the Corporation electricity works. Mr. Charles Stimson, town clerk.

**Belgium.**—The municipal authorities of Liège are about to invite tenders for armoured cables for electricity supply service. Particulars from the Service Communal du Gaz et de l'Electricité, 22, Place St. Jean, Liège.

The municipal authorities of Hody (province of Liège) have just invited tenders for the concession for the supply of electric lighting and power purposes in the town.

**Brazil.**—The contract arranged between the Brazilian Government and a private company for the erection of a telephone line between Rio de Janeiro and Sao Paulo having been annulled, fresh tenders are invited by the Brazilian Ministry of Public Works.

**Devonport.**—June 2nd. Cables, wires and meters for 12 months for the Corporation. See "Official Notices" May 23rd.

**Dewsbury.**—June 2nd. Twelve months' supply (about 4,500 tons) of steam coal for the Electricity Works. Specification, &c., from Mr. R. H. Campion, borough electrical engineer.

**Dundee.**—May 30th. Steam and feed piping, steam feed pumps and hot-well tank, &c., for the Corporation Electricity Department. See "Official Notices" May 16th.

**Germany.**—The municipal authorities of Altheissen are at present inviting tenders for the supply of a 500-kw. transformer for the central electric lighting station.

**Halifax.**—June 6th. One natural draught chimney type water cooling tower, for the Electricity Department. See "Official Notices" May 23rd.

**London.**—L.C.C.—June 3rd. High and low-tension cables for Tramways Department. See "Official Notices" May 23rd.

METROPOLITAN ASYLUMS BOARD.—June 4th. Extension of internal telephone system and installation of signal bells at the Western Fever Hospital, Fulham, S.W. See "Official Notices" May 16th.

ST. PANCRAS.—June 9th. Welsh and other steam coal for the Electricity Department, 57, Pratt Street, N.W.

STEPNEY.—The Electricity Committee is about to invite tenders for arc lamp carbons and coal.

**Manchester.**—The Corporation Tramways Committee invites tenders for the supply and delivery of (a) Tramcar trucks, and (b) Tramcar wheel centres. Mr. J. M. McElroy, general manager.

Providing and fixing electric light fittings at the Grange Street Municipal School, Bradford, Manchester. Education Offices, Deansgate, Manchester.

Offers are invited by the Corporation Tramways Committee for scrap metals and materials. Mr. J. McElroy, general manager.

June 7th.—The Electricity Committee invites tenders for the supply of stores required during the 12 months ended June 30th, 1914. Particulars and forms of tender from Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

**Mexborough.**—May 30th. Lancashire boiler, for the U.D.C. Electricity Department. See "Official Notices" April 25th.

**Oldham.**—May 31st. Extra-high-tension switchboard for the Corporation. See "Official Notices" May 23rd.

**Portsmouth.**—June 11th. Wiring for electric light installation at Workhouse Infirmary extensions, &c., Milton. See "Official Notices" May 16th.

**Rawtenstall.**—June 10th. One 1,500-kw. turbo-alternator complete with condenser, for the Corporation. See "Official Notices" May 23rd.

**Salford.**—June 2nd. 1,000 tons of steel tramway rails. General manager, Corporation Tramways, 22, Blackfriars Street.

**Servia.**—Common-battery wall and portable telephones, table telephones, &c., for the Directorate of the Servian Telephones. Particulars from the B. of T. Commercial Intelligence Department, Basinghall Street, E.C.

**Southampton.**—June 19th. Electric lighting of the old pavilions at the Infirmary, Shirley Warren. See "Official Notices" to-day.

**Spain.**—MADRID.—June 16th. Tenders are invited for a concession to establish an electric tramway service between Rens and Tarragona. Provisional deposit 10,427 pesetas. Particulars, Ministerio de Fomento, Madrid.

**Swansea.**—June 6th. Installation of electric light and bells at the new training college, Glamor, for the Education Committee. See "Official Notices" May 23rd.

**West Hartlepool.**—June 14th. Two 300-kw. rotary converters, complete with transformers, switchgear, &c., for the Corporation. See "Official Notices" to-day.

### CLOSED.

**Belgium.**—Only one tender, that of the Société d'Electricité de l'Est du Belgique was submitted to the municipal authorities of Weldenraedt (province of Liège) for the concession for the electric lighting of the town.

Five concerns submitted tenders to the Belgian Telegraph authorities last week for the supply and erection in the basement of the telegraph station at the Royal Palace at Laeken, of two rotary transformers with accessories, the lowest offer being that of the Société Internationale de l'Electricité de Liège.

**Bennis Contracts.**—The following contracts have been placed with Messrs. E. Bennis & Co., Ltd.:—

Barnsley Corporation electricity works.—Six "Bennis" mechanical stokers and self-cleaning compressed-air furnaces for Lancashire boilers. Repeat order.

Narrow-in-Furness Corporation electricity works.—"Bennis" coal conveyor, &c.

Morecambe Corporation electricity undertaking.—Two "Bennis" stokers and self-cleaning compressed-air furnaces. Repeat order.

**Blackpool.**—A Baths sub-Committee has recommended the tender of Mr. Geo. Morrison, for an electric light installation, for acceptance.

**Buenos Ayres.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract for the supply of 12,000 "Wotan" lamps for use on the Buenos Ayres Great Southern Railway.

**Carlisle.**—The T.C. has accepted the following tenders:—

Browett, Lindley & Co.—Engine and dynamo set, £2,708.

Sirling Boiler Co.—Water-tube boiler, superheater, mechanical stokers, &c., £1,610.

Korting Bros.—Multi-jet ejector condenser, £85.

**Cleckheaton.**—The U.D.C. has accepted the tender of Messrs. F. W. Birkett & Son for installing the electric light at the Baths; and those of the Cleckheaton Colliery Co. and Messrs. Wm. Bennett & Sons for coal for the electricity works.

**Dover.**—The Works Committee has under consideration a letter received from Messrs. Dick, Kerr & Co., Ltd., stating that they were not prepared to carry out their tender for the construction of the tramway only in connection with the Council's pier scheme. The Town Clerk reports having been in communication with the next lowest tenderers, viz., Messrs. G. P. Trentham, Ltd., whose price was £3,289, and who were prepared to carry out the work at the price quoted, and Messrs. Paramors, who, as their tender for the road construction had been accepted, were prepared to undertake the contracts for both works for the sum of £15,062, making their price for the tramway the same as that quoted by Messrs. Dick, Kerr & Co.

**East Ham.**—The following tenders have been accepted by the T.C.:—

Ray Electric Co.—Installation of electric light at sewage works, £67.

Dick, Kerr & Co., Ltd.—Supply of permanent way material required in connection with the reconstruction and duplication of the tramway track in High Street North, £776 (quotations were also received from the Titan Trackwork Co. and Hadfield's steel Foundry Co.); 50 tons of 90-lb. girder tram rails, £8 16s. per ton.

**France.**—The French Post and Telegraph authorities in Paris have placed a contract with La Société des Ateliers de Constructions Electrique du Nord for 200 km. rubber and fireproof cotton-covered copper cables, and one with the Société des Trefileries du Havre for 100 km. ditto.

**Grimshy.**—The Lighting Committee of the T.C. on Monday accepted the following tenders:—

British Westinghouse Co., Ltd.—Condensing plant, £550.

Blake & Co.—Cooling tower, £129.

Key Engineering Co.—Conduits, £124.

Bertram Thomas.—Switchboard, £302.

Hipkin, Grimshy.—Foundations, £454.

J. Brown & Co.—Pitch.

**Keighley.**—The Electricity Committee has accepted the following tenders:—

British Thomson-Houston Co., Ltd.—Turbo-alternator plant, £700.

Herbert Morris, Ltd.—Supply and fixing runways, £112.

Hird Bros. & Co.—Reinforced concrete water tower, £888.

J. A. Mullen.—Painting and decorating and repairs to roof at electricity works, £58.

The Tramways Committee has accepted the tender of Trackless Trolley, Ltd., for two trolley vehicles, at £1,420.

**London.**—STEPNEY.—The tender of the B.I. and Helsby Cables, Ltd., to supply 24 street boxes for £129, six for £61 10s., and that of the Universal Electrical Manufacturing Co. for six street boxes for £62 5s., have been accepted by the B.C.

**Mexborough.**—The U.D.C. has accepted the tender of Messrs. Galloways, Ltd., for a Lancashire boiler for the electricity works, at £723.

**Norwich.**—The T.C. has accepted the following tenders for coal for the electricity works:—

W. Cory & Son, Ltd.—4,000 tons Scotch washed peas, 15s. per ton, f.o.b. Bo'ness or other port; 1,000 tons of Newdigate peas, at 16s. 8d. per ton, f.o.r. Norwich; and 1,000 tons of Arley peas, at 16s. 10d. per ton, f.o.r. Norwich.

E. Collier & Sons, Ltd.—2,000 tons of Newstead nutty slack delivered into bunkers at the works, at 17s. 1d. per ton.

**South Africa.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract for 3,500 "Wotan" drawn-tungsten wire lamps for the Union of South Africa.

**Southend-on-Sea.**—The T.C. has accepted the following tenders:—

Korlund Anti-Vibration Co.—Two anti-vibrators under the concrete foundations for the two 600 h.p. steam generators, £141.

Edward Bennis, Ltd.—600 ton capacity coal-conveying plant, £3,000.

Chloride Electrical Co.—Four cells for storage battery, £88.

**Stalybridge.**—The Joint Tramways and Electricity Board has accepted the tender of Messrs. Tinkers, Ltd., for boilers.

**Taunton.**—The T.C. has accepted the tender of Messrs. Warner & Co. for a steam-driven feed pump for the electricity works, at £74.

**Walsall.**—The T.C. has accepted the tender of Callender's Cable & Construction Co., Ltd., for cable, at £601, and that of the British Westinghouse Co., Ltd., for sub-station equipment, at £167.

**West Ham.**—Mr. H. R. Mansfield has received an order from the Corporation for a 12 months' supply of stoneware ducts, at £27 3s. 9d. per 1,000 delivered.

**West Kirby (near Birkenhead).**—The Electric Supply Committee of the U.D.C. has decided to purchase a 400-kw. steam alternator and engine (£2,491) and condensing plant (£1,749), the successful firms being Messrs. Siemens Bros., Messrs. Belliss and Morcom, and Messrs. Ledward & Beckett, respectively.

**Woolwich.**—The B.C. has accepted the tender of the British Electric Transformer Co., Ltd., for a supply of transformers on the following basis prices for the respective sizes:—45 k.v.a., £199; 40 k.v.a., £138; 5 k.v.a., £41 5s.; 90 k.v.a., £316. The tender of the Yorkshire Copper Works, Ltd., has also been accepted for a supply of tubes for re-tubing the second large condenser at the Plumstead works, at 10½d. per lb.

### FORTHCOMING EVENTS.

**Institution of Electrical Engineers.**—Friday, May 30th. At 8 p.m. London Annual General Meeting. Paper on "Practical Application of Telephone Transmission Calculations," by Mr. A. J. Aldridge.

**Physical Society.**—Friday, May 30th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Electro-Thermal Phenomena at the Contact of two Conductors with a Theory of a Class of Radio-Telegraph Detectors," by Dr. W. H. Eccles.

**Royal Institution of Great Britain.**—Saturday, May 31st. At 8 p.m. Lecture on "Radioactivity; the Origin of the Beta and Gamma Rays and the Connection Between Them," by Prof. E. Rutherford.

Thursday, June 5th.—At 8 p.m. Lecture on "Recent Chemical Advances: The Structure of Crystals," by Prof. W. J. Pope.

Saturday, June 7th.—At 8 p.m. Lecture on "Radioactivity; The Radioactive State of the Earth and Atmosphere," by Prof. E. Rutherford.

**Illuminating Engineering Society.**—Tuesday, June 3rd. At 8.30 p.m. At the Royal Society of Arts, Adelphi, W.C. Annual general meeting.

**Institution of Mining Engineers.**—Thursday, June 5th. At 11 a.m. At Euston House, Piccadilly, W. General meeting. Paper on "Insulated Bare Copper and Aluminium Cables for the Transmission of Electrical Energy, with Special Reference to Mining Work," by Mr. B. Welbourn. Followed by visit to the Mining Machinery Exhibition, at the Royal Agricultural Hall, N.

Friday, June 6th.—At 10.5 a.m. Excursion to Chingford Reservoir of the M.W.B.

### THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAP.

The following orders have been issued for the current week:—

Monday, June 2nd.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

Tuesday, June 3rd.—"B" Company. Ditto.

Thursday, June 5th.—"C" Company. Ditto.

Friday, June 6th.—"D" Company. Ditto.

Saturday, June 7th.—Headquarters will be opened for regimental business from 10 a.m. to 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.

For Officer commanding L.E.E.

**Strike Trouble at Manchester.**—A correspondent writes: "The overhead wiremen forming the night shift on the Manchester Corporation Tramways decided to come out on strike, and at midnight on Monday the men on duty ceased work. The men allege that after concessions had been granted, the management stultified them by appointing a number of time-expired men from the Navy who, it is said, were paid less than the usual rate. It was understood that the Tramways Committee should receive a deputation from the Electrical Trades Union on Thursday.

**Inquiries.**—A reader asks for advice as to the best metal to use for handling juices containing acetic acid; another urgently requires armature stampings up to 7 in.

## NOTES.

**A Contributor Thanked.**—For several weeks we have been asking for £600 for the E.T.B.I. To-day we are asked to advise the contributor at Wimbledon who sent the sum of five shillings to Mr. P. A. Lundberg, a member of the Committee, on behalf of the Fund, and omitted to send his name, that his donation has been received.

**Electrical Machinery, &c., Imported into India.**—The India Office has issued a volume of tables dealing with the trade of India during the years 1907-8, 1908-9, 1909-10, 1910-11 and 1911-12, which show that the United Kingdom continues to hold a big lead over other countries in regard to the electrical machinery she exports to that country. In 1911-12 the United Kingdom sent electrical machinery to the value of £193,231, as compared with £182,014, £177,773, £204,682 and £153,674 respectively in the four preceding years. Germany's total in 1911-12 was £30,007, as against £50,496, £7,133, £4,584 and £15,990 in the four preceding years. The United States sent machinery to the value of £26,223, and Italy to the value of £12,842. Under the heading of "Electrical instruments, apparatus and appliances, and parts thereof," the value of the goods sent from the United Kingdom was, in 1911-12, £390,662, as compared with £294,344, £263,593, £282,809 and £295,559 in the preceding four years respectively. In the last recorded year Germany sent such goods of the value of £35,266, and the United States of the value of £5,401.

**Experiments on Tungsten Lamps.**—The Engineering Standards Committee has issued Parts Nos. 1 and 2 of the Report of Experiments on Tungsten Filament Glow Lamps (No. 60). The experiments were undertaken by the National Physical Laboratory to assist the Sub-Committee on Physical Standards of the Engineering Standards Committee in dealing with the question of tungsten filament lamps from the point of view of standardisation. Although the number of lamps tested for useful life was not large, the lamps dealt with were representative, and a very large number were tested for candle-power rating, being lent for that purpose by several large users. The diagrams accompanying the report form a separate volume in order that the text and the diagrams may be more easily be compared and studied. A careful perusal of the report affords a large amount of useful and interesting data as to the uniformity in individual batches of tungsten lamps as made in this country and, although the makers of the lamps are referred to under a letter of the alphabet and not the actual name, the report generally should prove of considerable advantage to all large buyers and of real interest to the industry at large.

**The Metric System.**—The annual report of the Decimal Association states that all measures and weights in the new British Pharmacopoeia will be in the metric system. In view of the adoption of the metric carat of 200 mgm. in the United States, the London jewellers are doing their best to have its use made compulsory throughout the trade. The Government of the Union of South Africa introduced a Bill last year adopting the metric system, but pressure of other business prevented its passage. The Dominions Royal Commission, which was appointed last year to inquire into the trade of the British Empire, has been urged by the Congress of Chambers of Commerce of the Empire to press the adoption of uniform weights and measures, the metric system being recommended. The system will be adopted in Malta on July 1st next year. Siam and China have taken definite steps towards the introduction of the metric system, which has also received the official approval of the Russian Government, embodied in legislation extending its permissive use, and preparing for its obligatory adoption.

When Russia has completed this process, the only great nations continuing to muddle along with a hedge-podge of heterogeneous and chaotic units will be the two which pride themselves on being the leaders of civilisation—the United States and the United Kingdom (not the British Empire, for by that time the Dominions will have made the change).

**When a High-Voltage Wire Breaks.**—What happens when a high-pressure electric wire breaks is shown in the accompanying photograph of a cement sidewalk in a California city. The wire fell upon it and writhed about, emitting sparks and flames until the current was shut off. After the danger was over and the

MARKS OF FUSION ON CEMENT.

wire removed, it was found that the electricity had fused the cement where it had come in contact with it, burning little depressions about half an inch deep and an inch or more wide, which were glazed like china ware. This gives an idea of the exceedingly high temperature, for cement is by no means easy to fuse.

**Distinctive Street Lights.**—San Bernardino, California, is planning to install a distinctive form of lamp post in the shape of an arrowhead, the significance of this design being a natural landmark on one of the near-by mountains, a huge arrowhead, several acres in extent, which forms a bare place on the slope, and which was regarded by the Indians as the sign of the Great Spirit. As the "City of the Arrowhead," San Bernardino has

A SYMBOLIC LAMP-POST.

sought to emphasise its symbol, and to that end street lights of that design have been installed. Two forms have been displayed on the city streets, and the people will decide which is better adapted to the purpose, after which all the city lights will take that form. One of them is mounted upright on an ordinary standard, the outline of the arrowhead, point downward, carrying four large globes with bulbs. The illustration leads us to speculate on the possible results of applying the idea in this country; what, for instance, would be the devices adopted by Burton-on-Trent, or Coventry, or Yarmouth?

**Cable Discounts.**—Under the above title, in our issue of August 30th last year, there appeared a series of formulae designed to facilitate the working out of net prices of cable from the list prices. The recent alteration in the discounts necessitates a new set of formulae; and they are given hereunder. "L," of course, is the list price per mile, expressed in pounds and decimals thereof.

$$\begin{aligned} \text{C.M.A. } \text{£ per mile} &= 10 \text{ L} \times \frac{1}{2} \times \frac{1}{2} - \frac{1}{1000} \text{ of the result.} \\ \text{s. per coil} &= 100 \text{ L} \times \frac{1}{2} \times \frac{1}{2} - \frac{1}{100} \text{ of the result.} \\ \text{d. per yard} &= 10 \text{ L} \times \frac{1}{2} \times \frac{1}{2} - \frac{1}{100} \text{ of the result.} \\ \text{"Non." } \text{£ per mile} &= \frac{1}{2} - \frac{1}{90} + \frac{1}{1000} \text{ of the result.} \\ \text{s. per coil} &= \frac{1}{2} + \frac{1}{9} + \frac{1}{1000} \text{ of the result.} \\ \text{d. per yard} &= \frac{1}{10} \times \frac{1}{2} + \frac{1}{1000} \text{ of the result.} \end{aligned}$$

In each case the terms in roman type give an approximation only, sufficiently close, however, for all practical purposes. If greater accuracy is desired, the inclusion of the final term—that in italics—will give results correct to five figures. As an example, take "non-association" cable of a list price of £100 a mile. The price per yard, according to the last formula above, would be 6'6666 . . pence, as a first approximation; or 6'6733 . . pence, as corrected by the inclusion of the final term. The exact figure, worked out by the usual lengthy process, is 6'6732954 pence. The discrepancy of '0000378 pence per yard is not likely to disturb the equanimity of the most conscientious of contractors.—H. R. T.

**Electric Cooking Demonstrations.**—For several days last week, one of the larger rooms at the Town Hall, Stratford, was given over to the very useful purpose of initiating those members of the public who were sufficiently interested to attend in response to an invitation from the Corporation Electricity Department, into the mysteries and the economies and manifold other advantages of electric cooking. The magician, lecturer, demonstrator and cook, all rolled into one—though we ought to explain that he repeatedly, and with emphasis, asseverates that he is no cook at all, but only an engineer—was the peripatetic, ubiquitous, irrepressible Mr. Grogan. With all that he said in the course of an hour's rapid and effective conversational, but none the less convincing, lecture, punctuated here and there with the pungent odours of grilling bacon, display of the artistic pattern on electric toast, and so on, we need not deal, but it undoubtedly admirably answered the purpose for which it was designed. Did it not set the fair sex looking at each other in astonishment as the "Tricity" advocate got his points home? And did it not set them asking all sorts of searching questions when the lecturer had got home on that question of shrinkage, and had at last shut down? Did it not send the representative of the gas company away speechless—yet bursting with indignation? Two audiences per day gathered; sometimes they were larger than at other times, but

we are sure that this sort of thing can only do good to the electrical cause, bring griet to the mill of the "Tricity" apparatus makers and sellers, and cooking and heating load to the West Ham Corporation electricity supply department. In the main, of course, it was for this last-named purpose that the demonstrations were organised by Messrs. Gillespie & Beales, the sole wholesale selling agents for "Tricity" cookers. Mr. Grogan advocates hiring out apparatus, and tells stories of what happens to a borough electrical engineer away in the "wilds of Cumberland," whom housewives will give no rest because all this year's allowance have been hired out and there are none left for them. The electric supply department at West Ham established its new cooking and heating department last autumn, with Mr. Sellars, formerly of Newcastle, in charge thereof, and between then and now a 250-kw. load of this class has been connected. Those who do not know the salubrious neighbourhood of Stratford and West Ham might not at first place it in the same category as Marylebone or Brompton and Kensington, Tunbridge Wells or Harrogate from the residential cooking load point of view, but we have no doubt that the West Ham department, if it continues to run on its present aggressive lines under the control of Mr. J. W. Beauchamp and Mr. Farndon, the sales manager, and introduces those reduced charges for the cooking directly, will show that anybody anywhere is only too glad to get something for nothing, with something else thrown in.

**Electricity Supply Rifle League.**—On Saturday last (Empire Day) there was a representative gathering from the various clubs composing the above League, on the range of the Hackney Electric Rifle Club, at Millfields Road, Clapton. The object of the meeting was a friendly tussle amongst the 37 competitors for the prizes offered for the best shots at 25, 50 and 100 yards, with a handicap competition at 25 and 50 yards as an inducement for the less experienced shots. Amongst those present to witness the shooting were the president, Sir Alexander Kennedy, F.R.S., Mr. L. L. Robinson (borough electrical engineer, Hackney), and Mr. A. H. Shaw (electrical engineer to the Ilford U.D.C.).

The 25 yards competitions were decided first, and included a scratch competition, handicap competition, and a rapid-firing competition (10 rounds in 90 seconds). A "possible" was recorded by Mr. F. Winchcombe, of the Westminster Electric Club, and secured first prize. For the second place there was a tie at 98 between Mr. Weekes, of Shoreditch, and Mr. Neville, of Westminster, and the re-shoot ended in favour of the former. The handicap competition drew 36 entries, with the following results:—

1st.—Mr. J. K. Wells (Central), 98 plus handicap 1'14	...	99'14
2nd.—Mr. A. J. Randall (Poplar), 93	"	6
3rd.—Mr. W. H. Dice (Ilford), 93	"	5'68
		98'68

In the rapid-firing series Mr. Weekes, of Shoreditch, took first prize with a score of 95, whilst Messrs. Harvey (Central) and Hilling (Hackney) tied for second place with 93, and in the re-shoot the former was successful.

In the 50 yards scratch competition, Messrs. Wells (Central) and Weekes (Shoreditch) each scored 96 and had to re-shoot to decide the winner; the result was a win for the Shoreditch crack.

The handicap competition again drew the largest number of entries, and resulted as follows:—

1st.—Mr. G. Horley (Westminster), 98 plus handicap 1	...	99'00
2nd.—Mr. A. J. Randall (Poplar), 88	"	10'28
3rd.—Mr. A. G. Hilling (Hackney), 95	"	3'12
		98'12

There were 19 entries for the 100 yards scratch competition, which resulted in Mr. W. J. D. Partridge (Westminster), with a score of 95, securing first place, whilst there was a tie for second between Mr. Weekes (Shoreditch) and Mr. Hilling (Hackney), who scored 94 each, but in the re-shoot the former was an easy winner.

The championship of the meeting, carrying a gold medal, was decided upon the aggregate of the three scratch events, and resulted in a win for Mr. Weekes, of Shoreditch, with a total of 288, the next highest being Mr. F. Winchcombe, of Westminster, with a total of 284.

After the ties had been decided, the president presented the prizes to the successful competitors, and the proceedings terminated with the usual votes of thanks to all concerned.

**Fatalities.**—Frank Stafford (36), of Gorton, Manchester, met with a fatal accident at the electricity sub-station on the L. & Y. Railway at Holcombe Brook, near Bury, on Friday. He was working in the station where machinery was being completed in preparation for a trial run of the experimental electrical railway from Bury to Holcombe Brook, and he fell from a plank a distance of 20 ft., alighting on his head.

Edmund Sheard (37), tramcar conductor, of Atherton, died last week. On April 23rd he was the conductor of a South Lancashire Tramway Co.'s car, which got out of control whilst descending a hill. Two passengers, fearing a collision with another car, rushed out and accidentally knocked the conductor off the platform. Sheard was found to be suffering from concussion of the brain, and he died last week from his injuries.

The *Glasgow Evening Times* reports that a miner named Joseph Davis was killed while working in Kenmuirhill Colliery, Carmyle. It is supposed that Davis in some unaccountable way came in contact with the electric cable, but nothing was known of the accident till his comrades discovered him lying dead. Deceased was 28 years of age.

A lady was killed last week in a bath at St. Cloud by pressing the bell-push, which had somehow become connected with a high-voltage circuit. Death was instantaneous.

**Elicit Commissions.**—At the West London Police Court, a few days ago, Henry Hart, a motor agent, was fined £15, with £5 ss. costs, by Mr. Fordham who, fortunately for him, took the view that he had acted as a fool rather than as a knave; and, therefore, did not send him to prison. That the first half of Mr. Fordham's estimate of his conduct was about right seems clear from the fact that he made his corrupt offer in a letter to a buyer of motor lorries in the service of Messrs. Lever Bros., of Port Sunlight, Mr. Arthur Davies, who took the proper course of showing the letter at once to his principals. The case was taken up by the Secret Commissions and Bribery Prevention League; and we are pleased to report their success in dealing with it. We trust that the good example shown by the buyer and his principals will be followed by others in similar circumstances, and that advantage will be taken of the League's organisation whenever occasion arises. It is a public duty to stamp out bribery and blackmail without respect of persons.

**Turbine Steamer Driven by Electricity.**—It is reported from Sweden that the Steamship Co. Svea has recently placed an order with the Lindholmen Shipbuilding Yard, in Sweden, for two turbine steamers, one of which is going to be delivered in the course of the autumn, while the second will be completed in the course of the spring next year. Both steamers are cargo ships, and will be employed for the coasting service. Their loading capacity will be about 1,200 tons each, and they are to be constructed for a speed of 11 knots, and supplied with engines capable of developing 1,000 I.H.P. The ships will be constructed as sister ships, but, as far as the machinery is concerned, one will represent quite a new departure from the ordinary types, as it is going to be fitted with turbines, and will be run by means of electricity. These turbines will be supplied by the Aktiebolaget Ljungströms Aangturbiner (steam turbine).

**The Belling Electric Cooker.**—Messrs. Belling & Co., of Enfield, N., are introducing the electric cooking stove shown herewith, with a view to meeting the undoubted demand for this class of apparatus at the present time. It will be seen that it includes a lagged oven 15 in. sq. and 21 in. high, with heating elements (the firm's standard fire-bar elements) on the two sides, in connection with which three different temperatures can be obtained. Above the oven is a grill with three-heat control and plate warmer, and over these a top plate with three three-heat boiling rings. The total electrical loading is:—Three boiling rings, 1,500 watts

THE BELLING COOKER, SHOWING OVEN HEATERS.

each; grill, 1,750 watts; oven, 2,500 watts. The crown plate over the oven, and the splash plate at the back are white vitreous enamelled, and over the latter are mounted the control switches; the boiling rings have no mica in their construction, and are guaranteed for a year. There is not a single joint or electrical connection inside the oven, and the makers claim that cold water, grease or dirt can be thrown on to the Belling fire-bar elements without causing the slightest injury.

**Institution and Lecture Notes.**—**INSTITUTION OF ELECTRICAL ENGINEERS.**—The fifteenth annual meeting of contributors to the Benevolent Fund will be held at the Institution offices to-night (Friday) at 7.45 p.m., to receive the report of the Committee of management and the accounts for the year ended December, 1912. The income and expenditure account shows, that with £605 brought forward, the income amounts to £893. Out of this grants have been made to the tune of £31, and there is transferred to capital £642, that is the whole of the amount brought forward and £37 beside. The balance carried to the balance-sheet is £217. The capital is £4,612 invested in 3, 3½ and 4 per cent. stocks, and the year's dividends therefrom amounted to £136. The donations of under £5 received during the year totalled £1011s. 6d., £5 and over, £71 5s., and annual subscriptions £65 12s.

**JUNIOR INSTITUTION OF ENGINEERS.**—A paper was recently read before the above Institution by Mr. Archibald Alison, on "Heat Accumulators and their Use in Exhaust Steam Turbine Plants."

**ASSOCIATION OF ELECTRICAL STATION ENGINEERS.**—A general meeting of the London Section was held at Salisbury House, on May 22nd. A set of rules for the Association was put before the meeting for their approval, a number of additions and amendments were made, and the rules were finally agreed to. They are to be submitted to the branches for approval before being finally ratified by the London conference of delegates. A proposal was made that a junior section be formed to include pupils, apprentices, &c., and that the annual subscription for this Section should be 5s., with an entrance fee of 1s.; this was agreed to unanimously. On a report being given on the circumstances leading to the resignations and subsequent withdrawal of some of the Fife Power Co.'s running staff, the meeting unanimously passed a resolution that the Committee be empowered to take any action at its own discretion. In the meantime, the Committee has decided to have printed in leaflet form details of this case and others, and to circulate them widely amongst station engineers, to show the absolute necessity for the organisation of electrical station engineers.

The Manchester branch recently held a meeting at the Crown Hotel, when a paper was read by Mr. J. W. Thomas, on "The Status of Electrical Station Engineers and the Need of an Association," which was followed by a lively discussion. The latter part of the meeting took the form of a social evening, and a few musical items were rendered.

The above paper is to be read at an extraordinary general meeting of the Association in London next month. This meeting will be arranged to be coincident with the conference of delegates from all the principal centres of the United Kingdom, and the delegates will be asked to report on the progress and views expressed by the various branches concerned. The date and fuller details will be announced shortly.

**THE CONCRETE INSTITUTE.**—The report of the Council for the past session shows that on May 8th there were 947 members, and the total membership was 1,006, an increase of 98. It is proposed to form classes of Associate Members and Associates. The income for the year was £1,043, and the expenditure £951, leaving a surplus of £92. The assets were valued at £475. The third annual dinner of the Institute was held at the Connaught Rooms on May 22nd, Mr. E. P. Wells, the president, being in the chair.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS.**—A lecture on "The Manufacture of Electric Cables" was given by Mr. F. F. Unwin, Birmingham, to a meeting of the Association at Cardiff, on Saturday, May 17th.

**The Thames Ironworks.**—It is reported that Messrs. Vickers have purchased the Thames Ironworks at Greenwich as a joint concern. The Canning Town property has been taken over by the Great Eastern Railway Co. Another newspaper report says that the plant and machinery still remaining on Wednesday morning had been sold to Mr. W. Defries, of Defries, Ltd., ironfounders and engineers, Antelope Foundry, Deptford.

**Appointments Vacant.**—Assistant engineers (21-24) in Engineer-in-Chief's Department, G.P.O.; shift engineer for Stockton-on-Tees (32s.); commercial assistant, for the Birmingham Electricity Department (£100); chief assistant electrical engineer, for the Corporation Electricity Department, Gillingham (£150); junior engineer, for the Morley Corporation Electricity Department; visiting teacher of electric wiring, for the L.C.C. School of Engineering and Navigation, Poplar (10s. 6d. per evening); sub-station shift engineer, for the Electricity Department, Bristol (35s.); switchboard attendant, for Portsmouth Corporation (25s.); switchboard attendant, for Salford Corporation (26s.). See our advertisement pages to-day.

**Strike.**—It is reported that 4,000 men employed by Messrs. Stewarts & Lloyds, Ltd., at Halesowen, came out on strike on Wednesday.

**The "Times" Time.**—We have noticed with interest that for some days the clock over the doorway of our honoured contemporary, the *Times*, has been deprived of its hands. This may be a drastic punishment for past errors, but from personal experience extending over many years we can vouch for its justice. This particular clock is—or rather has been—one of the most persistently mendacious "time-keepers" (save the mark) with which we are acquainted, and its face ought to be as crimson as a blush rose. We trust that its present forlorn condition is a sign of coming reform. But the *Times* does not stand alone; the condition of the public clocks of London is a scandal which reflects the greatest discredit upon the capital of our Empire. The constantly varying discrepancy between the said clock and that of Messrs. Spicers & Pond close by has amused us, at the same time that it has

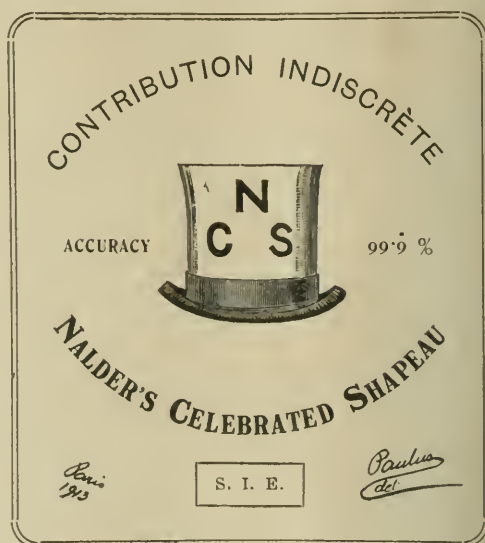

emphasised the need of strong measures. London is dotted all over with clocks showing false time, many of them under the control of professional watch and clock makers.

Some clockmakers, however, have condescended to introduce Greenwich time—which is now so cheap that they all ought to employ it. We are glad to be able to add that we have never known the clock of St. Paul's Cathedral to be wrong, though from our position on Ludgate Hill we have it constantly under observation, and Messrs. Benson's clock close by affords a reliable standard with which to check it.

**The Leicester Strike.**—A Leicester paper records that "the dispute in the electrical trade has ended, and the operatives are to return to work forthwith." According to the new agreement, the experienced wiremen are to get 9d. an hour in August, and the others a minimum of not less than 8½d."

**Stealing.**—At the Lambeth Police Court on Tuesday a labourer, named Randall, was sentenced to six weeks in the second division for stealing electric fittings, the property of the Southwark Borough Council.

**A Noted Tile.**—We have been asked to insert the accompanying device as an interesting souvenir of the I.E.E. visit to Paris. The allusions will be appreciated by those who were present at the meeting and who will recognise a familiar landmark,

the subject of many facetious comments, which were received by the wearer with unflinching good humour. The design was elaborated by a self-appointed committee, and formally submitted to the President and the gentleman most closely concerned for approval.

**Failure of the Telephone Service.**—A fire at a lace factory near Nottingham, says the *Times*, caused damage to the extent of more than £20,000 on Saturday last; the fire broke out at the top of a seven-storey building, and attempts were made to call the fire brigade from Nottingham, which is less than three miles away, but for half an hour it was impossible to get through on the telephone. Eventually a call was put through on a private wire, and the motor fire engines arrived in a few minutes, after which they quickly brought the fire under control, and saved the greater part of the factory. Had it been possible to effect communication directly the fire was discovered, obviously the loss would have been comparatively trivial.

This is another glaring example of the inefficiency of the telephone service under the Post Office régime; the fact that complaints have been frequent since the Government assumed control is notorious, but, as we pointed out a year ago, it was hardly fair to criticise the Post Office severely in the early days of its rule. Now, however, 17 months have elapsed since the Department acquired the telephone system, and it cannot be denied that the service is in a parlous condition. Thousands of would-be subscribers are awaiting connection, but whether they are worse off than those who have been unlucky enough to get telephones installed is open to question. Wrong numbers, premature disconnection, noises in the receiver, and delays are only a few of the faults within our own experience which characterise the service under its present managers. Before the transfer we warned the public that they would regret its consequences, and our prophecy has been abundantly verified.

**Balfour v. Tillett and others.**—For several days this week, Mr. Justice Darling and a special jury have been occupied with an action by Mr. Balfour, of Messrs. Balfour, Beatty & Co., against Ben Tillett and the Glasgow *Daily Record*, for damages in respect of a libel telephoned and published during the Parliamentary election at Govan, Glasgow, when plaintiff was the Unionist candidate. Yesterday it was announced that the action had been settled, the *Daily Record* paying £1,000 damages.

## THE ELECTRICAL INDUSTRY IN FRANCE.

By GEORGES DARY

*(Concluded from page 874.)*

The first of these lines which has been in regular operation for over a year is that from Villefranche de Conflent to Bourg-Madame, *via* Montlouis; it includes gradients of 1 in 20 and even 1 in 15, and curves of 262 ft. radius. The track has a gauge of 3 ft. 3 in. The line forms an extension of the railway from Perpignan to Prades and Villefranche, which is still operated by steam locomotives. The station at Villefranche is located at an altitude of 1,426 ft. above sea level. From that point the line rises to a height of 5,277 ft. at Montlouis, whence it falls, until on the southern side, at Bourg-Madame, the altitude is 3,608 ft.

There was a good deal of very difficult engineering work on the line, which the engineers of the Midi Co. succeeded in overcoming. The Fonpedrouse viaduct and the Gisclar bridge may, amongst others, be mentioned as architectural triumphs, which mark the line as one of the most curious and noteworthy in France. Its construction once more demonstrates the truth of the old saying that the word "impossible" is not French, and that with the aid of science and perseverance even the most daring project can be accomplished.

The necessary electrical energy is produced at a power

River Têt is confined in the reservoir by means of a dam 1,312 ft. long established at La Bouillonne. A canal,  $3\frac{1}{2}$  miles in length, conveys the water to the power station, two reserve reservoirs along the route being also provided. Sluice gates are also provided to enable the water to be turned into one or other of these reserve reservoirs according to the season and the requirements. The head of water is 1,394 ft.

The generating sets are four in number (fig. 4); they comprise 1,500-h.p. Pelton type turbines and direct-coupled double-current dynamos with fixed fields and rotating armatures. The normal output of the generators is 650 kw., a temporary overload capacity of 60 per cent. being possible. Each dynamo can supply its total output, either as continuous current at 850 volts or as six-phase alternating current at 600 volts and 25 periods. The four transformers are each directly connected to their respective generating sets, and

convert the six-phase 600-volt current to three-phase 20,000-volt current.

The overhead high-tension line, which starts at the power station, supplies the current to five sub-stations, situated at Villefranche de Conflent, Thuès, Odeillo, Err and Bourg-Madame. The line, which runs alongside the railway track, is composed between Bourg-Madame and the power station, of six cables of silicone bronze with a section of 10 sq. mm., supported by triple-bell porcelain insulators. The three conductors of each line are separately grouped on cross arms on the poles, in the form of a triangle

FIG. 4.—HYDRO-ELECTRIC PLANT AT LA CASSAGNE STATION.

FIG. 5.—POWER STATION AT LA CASSAGNE.

station situated on the banks of the River Têt, near the village of La Cassagne (fig. 5); it comprises a basement and a ground floor. Located in a part of the basement are the water-control gates and the turbine regulators; in another part are installed the step-up transformers. Above, on the ground floor, is the engine room and the low-tension switchboard. The high-tension control gear is situated on a gallery. The turbines are supplied with water from a reservoir having a capacity of about 47,700,000 cb. ft., built at the foot of Mont Carlitt, at an altitude of 6,724 ft. The water of the

FIG. 6.—SWITCHBOARD, LA CASSAGNE STATION.

having sides measuring  $27\frac{1}{2}$  in. The poles are set at an average distance apart of 114 ft.

Between the power station and Villefranche, the line consists of three aluminium cables of a section of 70 sq. mm., and of three aluminium cables of 30 sq. mm. section. In this case masts of armoured cement have been employed in place of wooden poles. At the power station and near the sub-stations the lines pass into overhead sectioning boxes containing disconnecting switches operated by means of a winch. By this arrangement, it is possible to cut out the three cables of one line on one or more sections.

The five sub-stations above mentioned, and the power station, supply continuous current at 800 volts pressure to the rails. The plant at the sub-stations is identical, and consists of two groups, each comprising a step-down transformer and a rotary converter arranged in a single room. A brickwork extension supports the high-tension apparatus, distribution panels being also attached to the brickwork. The transformers have a normal capacity of 600 kW., or 750 kW. for a period of two hours. For the brief space of five minutes they are also able to withstand an overload of 100 per cent. They receive three-phase current at 20,000 volts, and give out six-phase current at 600 volts.

FIG. 7.—VIADUCT ON THE VILLEFRANCHE BOURG-MADAME LINE.

The rotaries, which are of the fixed field type, produce continuous current at 800 volts and run at a speed of 250 R.P.M. Each machine has mounted on one of its bearings a relay actuated by a centrifugal device keyed on the end of the shaft and intended to break the circuit by means of a cut-out should the machine exceed a speed of 300 R.P.M., or should it, on the other hand, endeavour to run in the reverse direction. Starting is effected by passing through the armature the current from the third rail of the track, the machine then running as a continuous-current motor.

The power rails are of the double flange type and weigh 79.2 lb. per yard, their length being 36 ft. The ohmic resistance is 0.027 ohm per kilometre (0.0432 ohm per mile). The rails are supported every 9 ft. 10 in. on glazed stoneware insulators laid on blocks of creosoted wood, the latter in turn being secured to the sleepers. At level crossings the rail is interrupted and replaced by an armoured cable buried in the ground; at the stations it is protected by fibro-cement casings. The running rails are of the Vignoles pattern, and weigh about 71 lb. per yard; they are connected up in parallel every 328 ft. by a transverse copper connection, in order to ensure communication in case of fracture or replacement of a rail. A similar connection is provided at the points.

The motor vehicles are of two types for passenger and goods service. The first measure 47½ ft. between the buffers, and contain seats for eight first-class and 36 second-class passengers, a luggage compartment and driver's compartments at both front and rear. The goods vehicles have a length of 35½ ft., and have only one driver's compartment. The electrical equipment of the vehicles comprises four series-motors each of 50 H.P., mounted in pairs on each bogie. The control system adopted is of the Sprague multiple-unit type, with certain interesting modifications.

At the present time, the rolling stock comprises 20 motor vehicles and 14 trailer carriages for passenger trains, 65

special cars for the transport of minerals, 29 wagons for cattle and goods, and 52 platform wagons.

In view of the altitude to which the line ascends, and as a consequence of the frequent falls of snow and deposits of hoar frost on the rails, it has been necessary to make special provision to ensure a regular service in all weathers. In ordinary weather, that is, during the fine season, the current is picked up from the conductor rail by each motor vehicle by means of four contact blocks, arranged two on each side, the third rail being sometimes on the left, and sometimes on the right of the track. The contact blocks consist of steel shoes suspended from two small arms, and making contact with the rail by reason of their own weight. In the bad season this system alone would not be efficient; it has, therefore, been replaced by special contact blocks known as "brises-glace" (ice-breakers), consisting of four small steel plates resting on their edge on the conductor-rail, and bolted to the end of a pivoted support, the vertical movement of which is controlled by a piston working within a cylinder under the action of compressed air. The degree of contact of the blocks with the rail is regulated by the driver of the train.

In the second place, having regard to the gradients, which reach as much as from 1 in 20 to 1 in 16, it was necessary to provide the vehicle with powerful and reliable brakes. For this reason each train is provided with no less than four systems of brakes—a Westinghouse, an electro-magnetic brake, a rheostatic brake, and a hand brake. The electro-magnetic brake-shoes with which the motor vehicles are provided are four in number, and consist of electro-magnets suspended from the bogies by spiral springs. The cores of the electro-magnets are expanded at their ends, which are held between the wheels, a slight distance above the running rails, which act as armatures. The coils are actuated by a current from a battery of 12 Tudor cells having a capacity of 125 ampere-hours at a 10-hours' discharge rate; a spare battery is also carried. To operate the brake shoes a current of 80 amperes at 20 volts is required. In the tests which were carried out a motor passenger carriage, weighing 26½ tons, descended a gradient of 1 in 16 at a speed of 8½ miles per hour, and was pulled up in 15 seconds within a distance of 57 yards. For the Westinghouse brake an electric compressor of the Olivier type provides the necessary power; it is driven by an 850-volt series motor, which can be put in operation without the use of a starting resistance. It starts either by switching in by hand, or automatically. The air pump is

FIG. 8.—MOTOR COACH, VILLEFRANCHE BOURG-MADAME RAILWAY.

of the twin-cylinder, parallel spindle type, driven by single gearing off the electric motor.

Each train, when running, is in charge of a driver-electrician, a guard, and an electrical assistant, the latter being located in the rearmost motor vehicle. If the train includes three motor vehicles, two of the latter are placed at the rear. The maximum weight of the trains has been fixed at 120 tons. As for the maximum speeds authorised, they have been fixed in accordance with the gradients, both ascending and descending, as follows:—From zero to 1 in 30, 31½ miles per hour; from 1 in 30 to 1 in 22, 21½

THE MAIN SWITCHBOARD, SEVERALLS ASYLUM, COLCHESTER.

miles per hour; from 1 in 18 to 1 in 16½, 14½ miles per hour.

The consumption of electrical energy is 80-watt hours per ton kilometre. The whole of the electrical installation of the line was carried out by the Société Alsacienne de Constructions Mécaniques, of Belfort, who have thus shown that the employment of double-current machines provides a rational and economical solution of the problem of electric traction.

In a subsequent article, we shall show how the company has introduced modifications in the material for the new electric lines that are projected, or are in course of execution.

## AN ESSEX ASYLUM INSTALLATION.

THERE has recently been opened near Colchester, Severalls Asylum, a large institution to accommodate 2,000 inmates and to serve the northern portion of the county of Essex.

The buildings, which have been erected to the designs and under the supervision of Mr. Frank Whitmore, County Architect, and Mr. W. N. Town, architect, of Colchester, cover a considerable area and comprise a central main group, including in addition to the numerous wards, a

bakery, kitchens, stores, laundries, recreation hall, power station, workshops, &c., connected by covered corridors and several isolated buildings, the total cost of the work carried out amounting to nearly half a million pounds.

The heating and hot water supply of the Asylum is furnished by a calorifier installation fed by steam from five Paxman tubular boilers, designed for a working pressure of 120 lb. per sq. in. Steam is supplied direct to the calorifiers through reducing valves at a pressure of 5 lb. per sq. in.; five calorifiers, together with double-acting Mumford pumps, which circulate the water at a temperature of up to 180° F., through the pipe system, are installed.

The electrical generating plant is

DIAGRAM SHOWING THE GENERAL LAY-OUT OF THE ELECTRICAL DISTRIBUTION, SEVERALLS ASYLUM, COLCHESTER.

Power station shown black, general lighting and power mains in full lines and main road lighting mains in dotted lines.

DAVEY, PAXMAN-B.T.H. (GENERATING PLANT, SEVERALLS ASYLUM.

supplied with steam through a main tapped on to the main steam-pipe system, and the exhaust steam which leaves the engines at a pressure of about 5 lb. per sq. in. is returned to the calorifiers, to augment the direct supply from the boilers, but we gather that once the heating system is working, it can be kept going on the exhaust steam only.

In this case the electricity is a sort of heating bye-product obtained at the expense of about 3 per cent. of the initial heat contained in the steam, and the very small fuel cost which can be credited to its account, will reduce the actual cost of the electricity used in the Asylum to an unusually low figure.

The generating plant is housed in a white glazed brick lined building, 51 ft. long and 36 ft. wide; it consists of compound high-speed enclosed engines

by Davey, Paxman & Co., direct coupled to dynamos by the British Thomson-Houston Co. Two of these are of 100 kw. size, and a third unit consists of a similar engine coupled to two dynamos, each of 50 kw. size to form a steam balancer.

A 60-H.P. FLAME-PROOF MOTOR, MORLEY ELECTRICAL ENGINEERING CO. (see p. 901).

The larger dynamos are compounded and all run at a speed of 450 R.P.M., the larger ones giving 213 amperes at 470 volts, and the smaller ones giving 213 amperes at 235 volts. In addition to the above plant there is a motor balancer by the B.T.H. Co., consisting of two machines each of 15 kw. size.

No battery is at present installed, but room has been provided for one, and the dynamos have been designed so as to work in conjunction with a battery, if one should be put in at some future date.

The main switchboard is placed at the end of the engine room and consists of a number of grey marble panels mounted on an iron frame let in flush with the end wall. Access to the back of the board is obtained by a door leading into a room from which all the circuits are carried. The switchboard is provided with all necessary switches, circuit-breakers, cut-outs, regulating gear and instruments together with meters for measuring the output of each machine, and the lighting and power circuits. Seven positive and seven negative lighting, and four power as well as the machine circuits are provided for.

A 200-H.P. ENDLESS ROPE HAULAGE GEAR (see p. 901).

An overhead travelling crane of Herbert, Morris and Bastert's make is provided in the engine room.

The contract for the plant, switchboard and travelling crane has been carried out by the British Thomson-Houston Co.,

and that for the steam, exhaust and drain pipes and valves, by Messrs. Aiton & Co., of Derby.

The wiring system is very compact; the Asylum buildings are constructed round a large rectangle with several spur wings; a pipe and cable subway about 8 ft. wide and 6 ft. 6 in. high runs round the whole of the rectangular portion with creepways under the wings. The switchboard lighting feeders are carried to a triple-concentric lead-covered ring main running the whole length, about 760 yards, of the subway, and supported in wooden cleats bolted to the walls. The ring main is divided into eight sections by disconnecting fuse boxes, for the purpose of isolating faulty sections, and is tapped at intervals by service cables leading to the various blocks, the larger ones being connected as three-wire, and the smaller ones as two-wire, services on alternative sides of the three-wire 230-460-volt system. A second or subsidiary ring main tapped on to the other one, supplies various detached buildings, viz., the private patients' and idiots' blocks and consumptive hospital, while branch feeders run to the acute male and female patients'

100-H.P. DIRECT-CURRENT OIL-IMMERSED STARTER, BY THE MORLEY ELECTRICAL ENGINEERING CO. (see p. 901).

hospitals, isolation hospital, medical superintendent's house, &c.

A separate service, sectioned by means of disconnecting fuse-boxes, is run for the covered ways connecting the various blocks, and special concentric lead-covered mains from the switchboard, running by way of the subways, supply power to

the laundries, bakery, &c. Each of the covered ways is lighted from two distinct services for purposes of safety, and the same principle is applied to the recreation hall and some of the other blocks.

A handsome recreation hall, 120 ft. x 60 ft., is provided, the auditorium being lighted by 10 fire-light polished brass electroliters and side brackets.

Four of the electroliters in each case are run off one circuit controlled from the stage, while the odd (pilot) lamps and bracket lighting, on

another circuit, are controlled from the hall. The stage lighting is also distinct, and its equipment of vari-coloured batten lighting with liquid dimmers was supplied by the General Electric Co., through the main contractors.

The general wiring of the Asylum is carried out in wood casings run on the surface, the casing with the covers forming a segment of a circle in section so as to avoid all chance of the lodgment of dust. The casings are painted to correspond with the decorations, and the special form used makes them very inconspicuous.

Single and twin lead-covered wires are used for lighting the covered ways, subways, engine and boiler houses, laundries, workshops and similar places.

Two-way switching is employed throughout the corridors and wards for obvious reasons; Edison extra flat switches are employed in ordinary situations, and Edison key switches in places where they might be tampered with, and in all cases locking rings are fitted to prevent the covers from being removed by mischievous persons. In the case of lead-covered wires, Edison water-tight switches have been used, with sweated joints to wiring.

For controlling the various distributing circuits to the wards, and, in fact, throughout the Asylum, Berry-Skinner "fool-proof" switches with detachable handles have been used, a standard arrangement being one of these switches with a glass-fronted distributing board, containing fuses and flat switches, mounted above it.

In the case of two-storey buildings, the upper and lower floors are balanced on either side of the three-wire system.

The fittings are plain throughout, with few exceptions strict economy being studied as far as possible; pendants are largely employed in the main buildings, with a specially-designed bulkhead fitting for the single rooms, and batter-holders in the covered ways and subways.

The power circuits supply the following motors, the contract for which was placed with Messrs. Mawdsley's, Ltd.:—In the pump room, two 28-H.P. motors driving three-throw Pearn fire pumps; bakery, an 8-H.P. motor for kneading and mixing machines, &c.; laundries, a 20-H.P. motor for general wash-house and finishing room machinery, a 7-H.P. motor for blower in general drying closet, which, it may be noted, extracts warm air from the pipe and cable subway, a 12-H.P. motor for foul wash-house machinery, and a 12-H.P. motor for staff wash-house and finishing room machinery.

Other motors will be provided for the deep well, 524 ft. deep, in connection with which two 35-H.P., electrically-driven Brotherhood compressors are being installed to deliver 120 cu. ft. of air per minute at 100-lb. pressure.

These lift the well water into a 12,000-gallon tank in a water tower, which also houses large rain water, hot water, feed and fire tanks—the latter holding 40,000 gallons, being at the top of the building.

It may be mentioned that the whole of the rain water from the many roofs in the Asylum is collected in two subterranean tanks holding 120,000 and 100,000 gallons respectively.

The pump room, in addition to containing the fire pumps mentioned above, will house the compressors; it also contains three Mumford boiler feed pumps and the hot well, into which the condensed steam from the heating system and elsewhere is led for re-use.

The complete lighting of the Asylum comprises about 2,500 points in the main block and 1,200 points in detached buildings, while the motors are expected to reach 200 H.P. in all.

In addition to the electric lighting and power circuits, a complete system of the Sterling Co.'s telephones has been installed, connecting all parts of the Asylum with a central exchange in the porter's room. The telephone exchange is on the central battery system, metallic circuits of twisted pairs of conductors being employed. The switchboard, which is arranged for 100 circuits, is provided with lamp signalling apparatus, hand generator, power ringer worked from the lighting mains, and all necessary apparatus.

A complete system of fire alarms and bells is also provided, in connection with a 35-line indicator fixed in the porter's room.

The insertion of an ordinary door key, as carried by the attendants (an arrangement due to Mr. Beeching, the resident engineer of the Asylum), sets the alarm bells ringing at all the stations throughout the Asylum, as well as starting the steam hooter at the boiler house; the various bells are stopped by means of a hand release operated

by the attendants in the vicinity; some 70 stations are provided in all.

A time recording system with stations in the wards and other parts of the buildings, operating a recorder placed in the medical superintendent's office in the main block, completes the electrical system, except for a number of bells at entrances to wards, &c.

The whole of the wiring in connection with bells, telephones, fire alarms and time recorders is run in wood casing in a similar manner to the lighting system, and the contract for the whole of this work and the electric lighting and power systems has been carried out by Messrs. H. J. Cash and Co., of Westminster.

In conclusion, we are indebted to Mr. W. C. C. Hawtayne, the consulting engineer for the electrical work at the Asylum, for offering facilities for a visit to the latter and to his chief assistant, Mr. A. G. Dixon, for so ably piloting us through this huge institution. To Mr. H. J. Beeching, the resident engineer, who acted as clerk of the works during the carrying out of the various engineering contracts, our thanks are also due for courteously explaining many matters of engineering and general interest.

## SOME "MORLEY" MINING SPECIALITIES.

RECENTLY, through the courtesy of the Morley Electrical Engineering Co., Ltd., of Stanningley, we were enabled to inspect one of their oil-immersed direct-current flame-proof starters and controllers, combined with resistance. Much discussion has taken place on the subject of direct-current oil-immersed switchgear, and it is, therefore, interesting to note that this firm has had considerable success in this direction, having supplied such switches for up to 120 H.P., which have been working day and night in collieries for the last four or five years.

We illustrate on this and the following page a 100-H.P. starter of this type for use with an endless rope haulage gear.

The cables are brought in at one side through a special joint box; armoured glands are provided, and a screw-down cover in place of bolts.

The resistance, built up of sectional iron grids, can be lifted out

SECTIONAL VIEW, 100-H.P. DIRECT-CURRENT OIL-IMMERSED STARTER.

in one piece. The controller consists of two drums, with all metal and mica insulation, chain-gear and driven from a hand wheel.

When dismantling the controllers, these drums which are hinged at the top, can be swung out of the oil for examination, and by a system of plug connections the latter can be speedily remade. An indicating lamp shows when the resistance is in circuit, as it is primarily intended for starting purposes only.

The company makes a speciality of colliery plant, including flame-proof motors, haulages, mining switchgear, coal cutters of the chain type, &c., and supplies a special sand-filled fuse.

We also illustrate a 200-H.P. endless rope haulage gear, arranged for rope driving from a 500-volt interpole motor, running at 500 R.P.M. The drive is through a friction clutch on the first motion shaft—an arrangement found very satisfactory—and double helical gearing.

The surge wheel is 6 ft. in diameter, and the gear, as a whole, is carried on a bed built up of rolled sections. Brake and clutch hand wheels are provided mounted on pillars.

The company builds a special flame-proof mining motor, having a cast-steel magnet frame, with pole pieces cast on, which are fitted with laminated pole shoes. Commutating poles are provided, and end shields, split across above the centre, with wide machined joints.

Large hand holes are provided in the end shield at the commu-

PLAN OF DIRECT-CURRENT OIL-IMMERSED STARTER, SHOWING ARMOURED GLANDS, &c.

tator end, the upper ones being fitted with glass inspection holes.

The removal of the covers allows of free access to the machine, the cables to which are lead into a junction box at the side, provided with a special type of armoured gland, which facilitates earthing and disconnecting. While the company's attention is mainly devoted to mining plant, a good deal of special and repair work passes through the shops.

## NEW COMPANIES REGISTERED.

**Atlas Electrical Co., Ltd.** (128,987).—This company was registered on May 16th, with a capital of £100 in £1 shares, to carry on the business of manufacturers of and dealers in electrical accessories, fittings and devices, arc and other lamps, globes and shades, generators, electric and other wires, insulating and other materials, &c. The subscribers (with one share each) are:—W. H. Clegg, 75, Deodar Road, Putney, S.W., civil engineer; Mrs. A. E. Clegg, 75, Deodar Road, Putney, S.W.; P. D. Clegg, 75, Deodar Road, Putney, S.W., secretary. Private company. The number of directors is not to be less than two or more than three; the first are W. H. Clegg, Mrs. A. E. Clegg and P. D. Clegg (all permanent); qualification, £1; remuneration, £100 per annum, divisible. Registered office, 33, Tottenham Street, Westminster, S.W.

**Electric Ignition Co. (1913), Ltd.** (129,088).—This company was registered on May 21st, with a capital of £7,000 in £1 shares, to take over as from September 29th, 1912, the business of a manufacturer of, and dealer in, all kinds of appliances relating to the electric ignition of internal combustion engines and all accessories connected therewith, carried on at Royal Wellington Works, Sampson Road North, Birmingham, by the Electric Ignition Co., Ltd., and to adopt agreements with R. A. Felton and A. Cox. The subscribers (with one share each) are:—H. Lewis, Athel Lodge, Acocle Green, manufacturer; A. Rose, Kineton Road, Olton, Warwickshire, manufacturer. Private company. The number of directors is not to be less than two or more than five; the first are H. Lewis, A. Cox and A. Rose (all permanent, subject to holding £1,000 shares); qualification, 100 shares; remuneration of H. Lewis and A. Cox, £50 per annum; of A. Rose, £25 per annum; is not to be less than four or more than nine; the first are W. Best, A. E. Best, R. O. Best and M. Best (all permanent, subject to holding 200 shares); qualification, £100 per annum; solicitor, W. A. Gibb, 23, Colmore Row, Birmingham. Registered by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C.

**Best's Safety Lamps, Ltd.** (129,034).—This company was registered on May 19th, with a capital of £5,000 in £1 shares, to carry on the business of manufacturers of, and dealers in, miners' safety lamps, lighting appliances, lamp cleaning machines, electric lighting and other apparatus, and to adopt an agreement with W. Best, A. E. Best, J. C. Best, R. O. Best and M. Best. The subscribers (with 200 shares each) are:—W. Best, Providence House, New Park Street, Morley, safety lamp manufacturer; A. E. Best, 9, Westfield Road, Morley, safety lamp manufacturer; R. O. Best, 3, Marshall Street, Morley, safety lamp manufacturer; M. Best, 41, Vorrall Street, Morley, safety lamp manufacturer. Private company. The number of directors is not to be less than four or more than nine; the first are W. Best, A. E. Best, R. O. Best and M. Best (all permanent, subject to holding 200 shares), and A. H. Weibman, J. R. Spanton, H. Upton, W. Farrar and C. M. Rowbotham who may retain office for seven years, subject to holding one share; remuneration, £50 per annum; solicitor, T. B. Kitson, 72, Abdon Street, Leeds. Registered by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C.

**Scottish Light Railways and Development Syndicate, Ltd.** (129,143).—This company was registered on May 23rd, with a capital of £1,000 in £1 shares, to construct, equip, maintain and work any light railways in Aberdeenshire or elsewhere in the United Kingdom. The subscribers (with one share each) are:—Viscount Selby, 18, Brunswick Square, Hove; Sir James Howe, 28, Cranley Gardens, S.W. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first. Registered by Lumley & Lumley, 57, Conduit Street, W.

**Turbine Engine and Pump Co., Ltd.** (129,044).—Registered May 19th, by W. T. Hick, Broad Street House, E.C. Capital £75,000 in £1 shares. Objects: To acquire, manufacture, sell, let on hire, grant licences in respect of, and deal in, turbine motors, engines and pumps, motor and other cycles, ships, launches, flying machines and vehicles of all kinds, engineers, electricians, &c., and to adopt an agreement with the H.D. and B. Syndicate, Ltd. The signatories (with one share each) are:—F. Sidney, Broad Street House, E.C., law clerk; C. A. Frith, 55, Harrington Road, Crouch End, N., secretary; F. King, 26, Dorset Street, W., clerk; P. J. Barnett, Broad Street House, E.C., solicitor's clerk; E. Knight, 12, Alexandra Road, N., electrical engineer; A. R. Newman, 65, Lewisham Hill, S.E., engineer; M. Schopkovski, 32, Tremaine Road, Anerley, S.E., gentleman. Minimum cash subscription, seven shares. The first directors (to number not less than three or more than five) are not named; qualification £250; remuneration (except managing director), £100 each per annum and £50 extra for the chairman. (NOTE.—The H.D. and B. Syndicate, Ltd., mentioned above, was registered on April 25th last, with capital £100 in 1s. shares, to carry on financial, underwriting, promotion and similar business. The signatories are F. Sidney and F. Barnett, two of the clerks named above. No list of directors and no notice of situation of registered office appear on the file to May 22nd.)

**Carlton Split Ball Bearing Co., Ltd.** (129,106).—This company was registered on May 22nd, with a capital of £2,000 in £1 shares, to acquire a patent for an invention relating to improvements in ball bearings for axles, to adopt an agreement with S. Lumb, A. Schofield, H. Coates and D. C. L. Welch, and to carry on the business of foundry, mechanical and electrical engineers, manufacturers of machinery, ball bearings, axles, shafts and pulleys, &c. The subscribers (with one share each) are:—S. Lumb, 80, Carlton Street, Bolton, spindle maker; A. Schofield, 60, Carlton Street, Bolton, spindle maker; H. Coates, 58, St. George's Road, Withington, Manchester, engineer; D. C. L. Welch, 191, Lloyd Street, Manchester, engineer. Private company. The number of directors is not to be less than two or more than four; the first are S. Lumb, A. Schofield, H. Coates and D. C. L. Welch. Solicitor, J. H. Hall, 20, Acrefield, Bolton. Registered office, 30, Examiner Buildings, Cross Street, Manchester.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**O. C. Hawkes, Ltd.** (49,661).—Return dated April 2nd, 1913. Capital £200,000 in £5 shares (20,000 pref.), 17,000 ord. and 17,000 pref. shares taken up; £5 per share called up on 21,019 shares; £105,095 paid; £64,905 considered as paid up on 12,981 shares. Mortgages and charges: £1,000.

**Newcastle and District Electric Lighting Co., Ltd.** (29,022c).—Return dated March 7th, 1913. Capital £300,000 in £10 shares. All shares taken up; £10 per share called up; £297,400 paid, leaving £2,600 in arrears. Mortgages and charges: £296,040.

**Newcastle-upon-Tyne Electric Supply Co., Ltd.** (27,997).—Return dated April 2nd, 1913. Capital £1,500,000 in £5 shares (150,000 pref.); 137,500 ord. and 137,500 pref. shares taken up; £5 per share called up on 129,529 ord. and 126,741 pref.; £1,281,350 paid; £93,650 considered as paid on 7,971 ord. and 10,759 pref. Mortgages and charges: £838,225 14s.

**Madras Electric Tramways (1904), Ltd.** (80,361).—Return dated March 27th, 1913. Capital £200,000 in £5 shares (25,000 pref. and 15,000 ord.); 18,399 pref. and 11,452 ord. shares taken up; £5 per share called up on 11,839 pref.; £69,195 paid; £89,700 considered as paid on 6,500 pref. and 11,452 ord. Mortgages and charges: £61,180. A further 852 pref. shares were allotted for cash on April 2nd.

**Marsh, Son & Co., Ltd.** (74,746).—Return dated May 10th, 1913. Capital £20,000, in £1 shares; 18,608 shares taken up; £6,608 paid; £12,000 considered as paid. Mortgages and charges: £9,200.

**Mather & Platt, Ltd.** (60,387).—Return dated March 3rd, 1913. Capital £1,000,000, in 40,000 pref. shares of £10 each and 600,000 ord. shares of £1 each. All shares taken up; £10 per share called up on 29,200 pref. and £1 per share on 25,000 ord.; £317,000 paid; £683,000 considered as paid on 10,800 pref. and 675,000 ord. Mortgages and charges: Nil.

**Burgess Hill and District Electric Supply Co., Ltd.** (85,694).—Return dated March 18th, 1913. Capital, £6,000 in £1 shares (3,000 pref., 3,000 ord., and 2,600 pref. shares taken up; £1 per share called up on 3,000 pref. and 2,600 ord.; £5,000 paid; £100 considered as paid on 100 pref. Mortgages and charges: £1,200.

**Midland Electric Wire Co., Ltd.** (104,571).—Return dated March 28th, 1913. Capital, £5,000 in £1 shares; all shares taken up; £5,000 paid. Mortgages and charges: Nil.

**Glantawe Electric Supply Co., Ltd.** (112,615).—Return dated March 18th, 1913. Capital, £10,000 in £10 shares; 940 shares taken up; £9,400 paid. Mortgages and charges: Nil.

**Executors of Thomas Atkinson, Ltd.**—Particulars of £300 debentures, created April 26th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future. No trustees.

**Fors Accumulator Foreign Patents, Ltd.**—Debenture dated May 6th, 1913, to secure £125, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: J. Weir, Dumbarton, Malford Green, Snaresbrook.

**South London Electric Supply Corporation, Ltd.**—Issue on May 20th, 1913, of £900 debentures, part of a series of which particulars have already been filed.

**No Cell, Ltd.**—Debenture dated May 16th, 1913, to secure £1,000, charged on the company's patents, rights, undertaking and property, present and future. Holder: J. F. Greenwood, 12 and 14, Arthur Street, E.C.

**The "Point Fives."**—A meeting was held on Friday last, when it was decided that the June meeting, during the I.M.E.A. Convention, should take place on June 17th at 7 p.m. sharp, at the "Delico" Restaurant, Barrett Street, W.; tickets 3s. 6d., morning dress. At 8.30 the chairman will deliver an address, and a general discussion will follow on the extension of the use of electricity for domestic purposes, including the subjects of tariffs, apparatus, selling methods, &c. Mr. Friederichs, of West Hartlepool, and Mr. Purse, of Carlisle, were elected members of the Point Fives.

## OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

**Central Station Officials.**—At the New Inn Hotel, Pontypridd, on 13th inst., a gold watch was presented to Mr. W. W. COOKE, on his departure to Canada to take up an engagement. Mr. Cooke has been for the last eight years acting as cable jointer under the South Wales Power Co. The proceedings closed with a smoking concert.

Mr. C. CULMER HODGES has been appointed secretary to the Dawlish Electric Light and Power Co., Ltd., in addition to his present post as engineer and manager, in succession to Mr. E. R. Callender, resigned.

Mr. A. E. FIRTH has resigned his position as shift engineer at the Stockton-on-Tees Electricity Works, in order to take up a similar position with the Fife Electric Power Co.

The Colwyn Bay Council has confirmed a recommendation that the salary of the electrical engineer should be increased from £230 to £255 per annum.

The Horsham U.D.C. has granted the electrical engineer, Mr. MORGAN, permission to supervise the carrying out of the electricity undertaking at Basingstoke.

The Hackney B.C. Electricity Committee recommends that in future the minimum salary for the office of assistant distributing engineer be £120, rising by £7 10s. per annum to £150; Mr. A. HILLING is appointed to that office at £120 per annum. The minimum for the office of technical inquiry clerk is to be £90, rising to £120, and Mr. A. GWYN holds that office at £105 per annum. The salaries for cost clerk and general clerk are also to be £90 each, rising to £120, and Mr. F. G. TAYLOR holds the former appointment, and Mr. H. C. ROBERTS the latter. Mr. P. H. SHEARS, canvasser, is to receive £91 per annum, with commission according to scale.

The Ilford U.D.C. has increased the salary of Mr. J. R. MYERS, superintendent of the electricity station, from £200 to £210 per annum, and has awarded him a gratuity of £10 in respect of extra services on the occasion of the recent fire.

On leaving Gillingham (Kent) to take up a position at the Hastings electricity works, Mr. J. RYAN, assistant resident engineer, has been presented by the staff and personal friends with a barometer, silver fruit dish, and a fountain pen.

The Norwich T.C. has adopted the recommendation of the General Purposes Committee (mentioned in the ELECTRICAL REVIEW last week) increasing the salary of Mr. F. M. LONG, city electrical engineer, from £600 to £700 per annum.

The Middlesbrough Electricity Committee has advanced the salary of Mr. H. M. TAYLOR, engineer, by £25 to £450 per annum; and that of Mr. R. SCOTSON, mains superintendent, from £180 to £200.

MR. FREDERICK SWARBICK, chief engineer to the Galway Company, and formerly assistant engineer to the Leigh (Lancs.) Corporation electricity department, has been appointed chief electrical engineer and manager to the Minehead Electric Supply Co., Ltd.

Mr. A. A. DAY, the borough electrical engineer and tramways manager to the Bolton Corporation, has resigned through ill-health. Mr. Day was formerly chief assistant electrical engineer of Manchester. He was appointed borough electrical engineer at Bolton in 1900, and three or four years later was also appointed tramways manager.

**Tramway Officials.**—The Birkenhead Tramways Committee has recommended the appointment of Mr. CYRIL CLARKE as tramways manager in succession to Mr. W. WYLD, M.I.E.E., who was recently appointed chief electrical engineer and manager to the Hampstead Corporation. Mr. Clarke received early training with Mr. G. F. Milnes, tramcar builder, of Birkenhead. He was one of the last six candidates for the tramway managership of the Southport Corporation, but withdrew from the final appointment in order to appear before the Birkenhead Tramways Committee with regard to the present appointment.

Mr. A. S. SLADE, for some time superintendent of the Perth electric tramways, has been appointed traffic superintendent of the Brisbane tramways, in succession to Mr. A. G. STEPHENS, who was recently appointed assistant manager.—*Mining and Engineering Review.*

**General.**—The address of Mr. E. HILL is 26, not 24, Stanton Road, Wimbledon, as given in our issue of May 16th.

The *Mining and Engineering Review* says that Mr. F. S. LEE, who for some years was in charge of the electrical supplies department of Messrs. Noyes Bros. (Sydney) Ltd., recently resigned that position, and has joined the Sydney staff of the British General Electric Co., Ltd.

The *Times* states that SIR WILLIAM CROOKES, O.M., has been elected a Foreign Associate of the National Academy of Sciences, Washington, on the occasion of its semi-centennial celebration.

Congratulations and good wishes to SIR DOUGLAS and LADY FOX, who, on 26th inst., celebrated the 50th anniversary of their marriage.

MR. CHRIS. JONES, A.M.I.E.E., has resigned his appointment at West Cannock Collieries, having accepted the position of chief electrical engineer to Cannock Chase Colliery Co., Ltd. Mr. Jones was, on Saturday, presented with a silver-mounted walking stick and inkstand, from the electrical staff and officials, on the occasion of his leaving.

The resignation of SIR ALFRED HOPKINSON, K.C., of the vice-chancellorship of the Victoria University, Manchester, came

before a meeting of the Court on Wednesday. The *Times* says that the announcement has occasioned much surprise in University circles.

CAPT. H. HALL SANKEY, R.E., has been elected to the Executive Committee of the Deaf and Dumb Association.

The staff of Messrs. Crompton & Co., Ltd., Aero Works, Chelmsford, have presented a basket of cutlery to Mr. PHILIP STOKES, on his marriage; and a Gladstone bag to Mr. A. BUTCHER, who is leaving for Canada.

Congratulations to Mr. G. C. HAMILTON on his election as Member of Parliament for Altrincham by a majority of 1,262, as compared with a majority of only 119 gained by his predecessor.

**Obituary.**—The death is announced of Mr. A. H. HARMAN, a director of the firm of Drummond Bros., Guildford.

PROF. J. T. NICOLSON.—We learn with very deep regret of the death, which occurred on Tuesday, of Dr. J. T. Nicolson, who for the last 14 years had been Professor of Mechanical Engineering at Manchester University. The *Times*, after referring to his interest in internal-combustion engines, adds that at the time he was overcome by illness he was engaged in equipping a laboratory at the Manchester School of Technology, for research work in this department of engineering.

MR. W. M. CALLENDER.—We learn with great regret of the death, which occurred on the 24th inst., at Guernsey, of William Marshall Callender, second son of the late W. O. Callender, of Bournemouth, at the age of 54 years.

**Will.**—The *Times* states that Mr. R. T. PRESTON, engineer, a director of Messrs. J. Stone & Co., Ltd., of Deptford, left estate of the gross value of £91,415, with net personalty £90,511.

## CITY NOTES.

## German Electrical Companies.

The *Treuhand Bank für die Electricische Industrie, of Berlin*, which was originally formed by the Felten and Guillaume-Lahmeyer Works as a financing institution, and was subsequently taken over by the A.E.G., reports that no undertakings were carried out in 1912. The net income from interest, after defraying general expenses and taxes, amounted to £12,700 on a paid-up capital of £312,500, as compared with £11,700 in 1911. A dividend of 3½ per cent. has been declared for 1912, as against 3½ per cent. in the previous year.

The *Kabelwerk Wilhelminenhof, of Berlin*, states that the results for 1912 were not uninfluenced by the rise in the prices of metals and other raw materials used by the company. The degree of activity also was not uniform, but was often rather of a fluctuating character, although satisfactory on the whole. Including the balance forward and after allocating £2,600 to depreciation, as against £1,900 in 1911, and making other appropriations, the accounts exhibit net profits of £11,900 as contrasted with £12,700 in the preceding year. A dividend at the rate of 15 per cent. has been declared, being the same as in 1911. It is mentioned that a good stock of orders was brought over into the new financial year.

The directors of the *Land und Seekabelwerk of Cologne-Nippes* state that the company was well employed during 1912, although selling prices were not always satisfactory. The gross profits are returned at £67,000, as compared with £64,000 in 1911, and the net profits, after placing £14,000 to depreciation, as against £16,000, amounted to £95,000, as contrasted with £90,000. A dividend at the rate of 10 per cent. has been declared, this comparing with 9 per cent. in 1911. It is intimated that the receipt of new orders has also favourably developed in the current year, apart from those which were brought forward from 1912.

The *Gesellschaft für Elektrische Unternehmungen, of Berlin*, which either owns or is financially interested in 77 supply works or tramways in various countries, reports profits of £324,000 from dividends and interest in 1912, as compared with £306,000 in 1911, whilst the sale of securities yielded £65,000, as against £82,000 in the previous year. After meeting general expenses and taxes and providing for the service of the loan debt of £2,057,000, the accounts indicate net profits and balance forward of £279,000, as contrasted with £271,000 in 1911. It has been decided to pay a dividend of 10 per cent. on the share capital of £2,500,000, being the same rate as in the preceding year. The share capital is now being increased to £3,000,000 by the issue of £500,000 of new shares for the purpose of extending the supply works owned by the company.

The *Elektrizitäts Lieferungs-Gesellschaft, of Berlin*, is a supply company having a paid-up share capital of £1,125,000 and a loan debt of £966,000. At the end of 1912, the company owned 23 works, as compared with 28 in the previous year, the reduction being due to the sales of works at a profit; whilst five other works are held under leases. The gross profits realised in 1912 amounted to £274,000, as contrasted with £207,000 in 1911, and the net profits and balance forward were £184,000, as against £124,000. The dividend is at the rate of 12 per cent., this comparing with 11 per cent. in 1911. Formerly the majority of the shares were held by the A.E.G., but they were transferred a few years ago to the A.E.G.'s associated company—the Berlin Electricity Works—in order that the latter might still have scope for activity in the event of the Berlin City Council taking over the Berlin supply works in 1915.

The accounts for 1912 of the *Bergmann Elektrizitäts Werke, of Berlin*, after deducting the cost of manufacturing and writing down stocks by £85,000, show gross profits of £532,000, as com-

pared with £402,000 in the previous year. General expenses, interest charges, and taxes absorb £235,000, as against £203,000, and depreciation of plant £135,000, as contrasted with £98,000, whilst investments have been written off by the sum of £57,000. Including the balance forward the net profits reach £119,000, as compared with £95,000 in 1911, and a dividend of 5 per cent. is proposed on the old capital of £1,450,000, as in the preceding year, and 2½ per cent. on the new capital, of which the Siemens-Schuckert Works furnished £425,000, upon which 50 per cent. has been paid. The large depreciation of investments is understood to chiefly concern the Bergmann Electricity Enterprises Company, and is expected to be continued in the current year. In general the financial strengthening of the Bergmann Works aims at the remedying of the errors of the exceptionally high dividends which were paid in former years.

The report of the *Accumulateuren Fabrik, of Berlin-Hagen*, states that the turnover in the works in Germany and Austria amounted to £1,016,000 in 1912, as compared with £1,023,000 in the previous year, whilst the overseas business remained on the same level as in 1911. The warlike complications in the Balkans scarcely affected the company, as sales in those parts had hitherto been inconsiderable. The accounts show the following figures for the two years:—

	1912	1911
Share capital ...	£600,000	£400,000
Gross profits ...	414,000	366,000
Depreciation ...	35,000	17,000
Net profits ...	225,000	227,000
Dividend ...	100,000	100,000
Dividend, per cent. ...	25	25

It should be explained that the additional capital of £200,000 will become entitled to participate in the profits for the first time in the new financial year. During 1912, certain investments were disposed of, thus reducing securities in portfolio from £441,000 to £257,000, and the proceeds were devoted partly to the repayment of the bonds of £150,000, and for the extension of the German works which was purchased, but the site in Buda Pesh was sold to the Tudor Accumulator Co., of that city. The share held in the Mark Electricity Works was fully paid up; shares were taken over in the Roumanian Company, and an interest was also secured in other companies concerned with the use of secondary batteries. The orders completed by the end of March, 1913, represented an increase of £100,000 over the corresponding period in 1912.

The report of *Felten und Guillaume-Carlswerk, of Mulheim*, states that the general industrial development in 1912 was of advantage to the company, and the war in the Balkans had not had any noteworthy influence upon business. The turnover at the Carlswerk experienced a further increase, and both the quantity and value were in excess of any preceding year, whilst better results were in part obtained from the company's investments. Concerning the Frankfort dynamo works which were transferred to the A.E.G. two or three years ago, it is mentioned that the liquidation of the business made further progress, although some years would be occupied in the final closing of the accounts. The requirements in the matter of semi-finished steel had led to an association with Jules Collare and Co., of Steinfort (Luxemburg); the latter had been converted into the Steinfort Iron and Steel Works Co., and preparations had been made for developing the blast furnace plant into a steel works capable of meeting the needs in ingots and billets, etc. During the year business in iron and steel manufactures stood under the influence of the uncertainty regarding the renewal of the syndicates concerned, and sale prices were consequently not very satisfactory. On the other hand, the wire rope works, the cable factory, copper works, rubber factory, and the factory for insulated conductors, were fully employed at favourable prices. The accounts indicate the undernoted results for the two years:—

	1912	1911
Share capital ...	£2,750,000	£2,750,000
Loan capital ...	1,218,000	1,241,000
Gross profits ...	547,000	509,000
Depreciation ...	83,000	92,000
Net profits and balance forward ...	278,000	212,000
Dividend, per cent. ...	8	6

The dividend of 8 per cent. compares with 6 per cent. in 1911, 4 per cent. in 1910, 6 per cent. in 1909, and 8 per cent. in 1908, thus showing a recovery since the disposal of the Frankfort department. At the end of 1912, the number of workmen and officials employed was 6,846, as compared with 6,682 at the close of the previous year. The company's investments increased from £1,755,000 in 1911 to £2,162,000 in 1912 by the subscription of shares in the Steinfort Steel Works and other undertakings, and by the completion of further instalments on the interests held in Escher, Wyss and Co., the St. Petersburg United Cable Works Co., etc.

### Russian Electrical Companies.

The directors of the *Russian Tudor Accumulator Works Co., of St. Petersburg*, report that a further increase in the turnover and working results took place in 1912, the expansion necessitating an augmentation in the share capital from £120,000 to £240,000. The net profits amounted to £34,748, as compared with £25,556 in 1911, and a dividend of 10 per cent. has been declared on the larger capital, as against 14 per cent. on £120,000 in the preceding year. It is stated that the orders brought over into the new year were substantially greater than at the beginning of 1912.

The report of the *Russian A.E.G., of St. Petersburg*, for 1912, states that an important development took place in the economic life of the country and the further progress of the company in connection therewith was satisfactory. A considerable increase in the turnover was experienced, and the working results were more favourable than in the preceding year. The St. Petersburg United Cable Works, in which the company is interested, again proposed to distribute 8 per cent. for 1912, as in the previous year. As gross profits the accounts of the A.E.G. show the sum of £129,561, as compared with £105,136 in 1911. After placing £28,000 to depreciation, as against £25,000, and making provision for taxes, reserve fund, and other charges, the balance of the profits permits of the payment of a dividend of 9 per cent. on capital of £800,000, as contrasted with 8 per cent. in 1911. The share capital was raised to £1,200,000 in February, 1913, and the premium of £50,000 realised on the issue has been placed to the reserve fund.

The report of the *Russian Siemens & Halske Co., of St. Petersburg*, states that an exceptional growth in orders was recorded in 1912. It was, however, impossible to keep pace with deliveries to a corresponding extent, as a few weeks after starting full working in the new dynamo works, a strike broke out at both works, and was only settled after lasting for three months, whilst at the same time a scarcity of skilled workers was experienced at the new works. Including the balance forward the accounts exhibit profits of £63,638 for 1912, as contrasted with £52,177 in the previous year on a share capital of £560,000. After allocating £20,000 to depreciation, as against £10,000 in 1911, the balance allows of the payment of a dividend of 6 per cent., being the same rate as in the preceding year. The report further mentions that the completion of the new dynamo works afforded the necessary basis for the carrying out of a long considered scheme for amalgamating the heavy electrical engineering department, as had taken place in other countries, with that of the Russian Schuckert Co., of St. Petersburg. The scheme would be accomplished by the latter, assuming the title of the Russian Siemens-Schuckert Co., and increasing its share capital to £1,500,000, of which about £1,100,000 would devolve upon the Siemens and Halske Co. for the assets brought into the combined undertaking. Of the shares to be received from the Siemens-Schuckert Co., the Siemens and Halske Co. would transfer about £825,000 at the nominal value to the parent company in Berlin in settlement of a loan granted by that company, and the two companies would hold eleven-fifteenths of the capital of the Siemens-Schuckert Co. The light electrical engineering departments would be continued by the Siemens and Halske Co. in its own name. The cable business was in the hands of the United Cable Works, in which the company held one-third of the capital of £600,000, upon which a dividend of 8 per cent. had been declared for 1912, as in the preceding year. It is added that the Polish Electrolishmeil Works of Siemens, of which the company owns the majority of the capital, would pay 4 per cent. for the first year's working, after having written off preliminary expenses. The Russian Ozone Utilisation Co. had terminated its first year with a loss, although the prospects were not unfavourable, especially if the larger installation for the sterilisation of the whole of the water supply for St. Petersburg was to be carried into effect.

### West African Telegraph Co., Ltd.

THE meeting of this Company was held on May 21st at Electra House, E.C.

SIR J. DENISON-PENDER, in moving the adoption of the report (see ELEC. REV., p. 864), said that the gross revenue for the year under review amounted to £46,603, as against £54,923 for 1911, or a decrease of £8,320. That decrease would have been larger, owing to the cessation of the payment of the Portuguese Guarantee, if there had not been an increase in other directions. Messages showed an increase of £1,091, and interest and dividends of about £1,600, while they had benefited to the extent of just over £500 by the effect of exchange. With regard to the expenses he was pleased to say they were slightly less than in 1911—£23,900 odd, against £26,000, or a reduction of £2,000. At the same time he must point out that this was entirely due to a reduction of £2,000 in respect of expenses attending the maintenance of cables, the other items of expenditure being practically the same as last year. Therefore they could not rely on that £2,000, for next year if they were unfortunate they might have to pay double that amount in the maintenance of cables. The net result of the year's business showed that they were able, after providing for the usual 4 per cent. dividend, to set aside £18,000 to reserve, which was only £4,000 less than the amount transferred in 1911, and that left the reserve fund at the very satisfactory figure of nearly £300,000. As there had been several decreases in the revenue, he thought it advisable to give the shareholders a short history of the Company to show them what a sound position it was still in. They would remember that the Company was started in 1885 with a share capital of £231,000 and a debenture debt of £300,000; the debentures being subject to annual drawings. At that time they had stations not only at the Portuguese possessions but also at certain French Colonies on the West Coast of Africa. From the Portuguese Government they received a guarantee equivalent to a maximum of £42,000 a year, so that their total income on all through traffic in their Portuguese stations should not fall below that figure. The actual amount received from the Portuguese Government was at the beginning £33,000; but that sum fell to £25,000, and latterly to £21,000 as the traffic developed. The French Government gave

them a subsidy equal to £12,000 a year for the French stations connected by their system of cables. Then came the sale in 1902 of the French cables to the French Government, by which they were able to cancel their outstanding debentures. Of course, the French subsidy ceased when the cables were sold. The prosperity of the Company might be said to date from that sale, and the subsequent relief of the burden of the debenture debt. For years past they had regularly paid a 4 per cent. dividend, and they were able to recommend the same payment this year in spite of the loss of the Portuguese guarantee, which entirely ceased last year, and in face of the fact that there had been considerable reductions in the rates since the cables were opened. At the first blush the present accounts looked unsatisfactory, but when they remembered that the revenue had been earned by traffic and without any subsidies, they would see that it was most satisfactory, and that in spite of the loss of the subsidies the Company was almost certain to continue paying the same dividend and also to put aside satisfactory sums to reserve.

Mr. H. K. GRAY seconded the motion, and the report was adopted.

### Western Telegraph Co., Ltd.

This Company's meeting was held on May 21st at Electra House, E.C.

SIR JOHN WOLFE BARRY, K.C.B., in proposing the adoption of the report (see ELEC REV., p. 822), said that the result of the Company's working during the half-year was satisfactory. There was an increase in message revenue of £2,652 and in interest on investments, etc., £5,064, together £8,316. This result compared with the half-year of 1911, before they largely reduced their tariffs. The period under review had provided no public event in South America of sufficient importance to affect telegraphic traffic to any appreciable extent, and the growth shown was due to the excellent trade conditions existing in the countries they served. The working expenses were higher, for although the increase in message receipts was small, the volume of international traffic dealt with during the half-year was over 20 per cent. greater than during the corresponding six months of 1911, when the higher tariff was in force. The expenses in London were more by £700, principally due to extra staff and increased office accommodation. At the stations the increase was nearly £10,500. The expenses attending the maintenance of cables was more by £10,200, due to increased consumption of coal by the ships and more cable used on repairs than in the corresponding period of 1911. Income tax was higher by nearly £500. The cost of the renewal of the land-lines at Santos amounted to £1,400, but against this the cost of landlines at Pernambuco in 1911 was £4,400, showing a decrease of about £3,000. The net increase in expenses was therefore £18,900, and in net revenue there was a decrease of rather more than £10,000. After providing £16,373 for debenture stock interest and £8,361 for income tax, there remained a balance of £237,679, which, with £33,517 brought forward from 30th June last, made a total of £271,196. First and second interim dividends, amounting to £62,379, had been paid, and after transferring £140,000 to the general reserve fund, £25,000 to the provision on account of investment fluctuations, and £10,000 to the land and buildings depreciation fund, there remained £33,817, which was carried forward. In conclusion the CHAIRMAN announced that in future the interim meeting would be discontinued and an annual meeting only would be held in November each year.

SIR J. DENISON-PENDER seconded the motion, and the report was adopted.

### South Metropolitan Electric Tramways and Lighting Co., Ltd.

Mr. C. G. TEGETMEIER presided, on May 21st, at the offices in Kingsway, W.C., over the meeting of this company.

The CHAIRMAN, in moving the adoption of the report (see ELEC REV., p. 821) said that the result of the year's operations showed a surplus of £15,493, compared with £13,939 in the preceding year. The traffic receipts on the tramways amounted to £44,273, or £491 less than in the preceding year. A comparison between the two years was, however, affected by the fact that in 1911 they had an exceptionally fine summer, and the Pageant of the Empire held that year at the Crystal Palace brought them a good deal of abnormal traffic. Last year the weather, especially during the summer months, was very unfavourable, and the holiday traffic on their lines, which constituted a considerable proportion of their receipts, was very adversely affected. They must regard it as satisfactory that they were able to maintain their receipts so well and to show an increase over 1910 of £1,611. Their working expenses on the tramways showed little variation. With regard to the electricity supply section of the business, very steady progress was being made. The number of consumers increased from 1,355 to 1,535, and there was an increase of £1,841 in the sale of current for private lighting. In the four years since 1908, the receipts from this branch of their business had increased from £6,358 to last year's figures of £11,207, and as a considerable portion of their extensive area of supply was still undeveloped, they might look forward to further and continuous growth. Their capital expenditure during the year amounted to £3,986 upon the electricity supply section, and £354 upon the tramways, the larger portion of the former being for the cost of new mains to serve newly-erected houses. As additional houses were built on the line of mains

this expenditure became increasingly remunerative. The combined working balances from the two sections of the undertaking amounted to £27,372, or £210 less than in the preceding year, but sundry receipts were £1,629 more. An important matter was the proposal the shareholders had received to exchange their preference and ordinary shares for shares in the London and Suburban Traction Company, and it was fitting that he should state the reasons which induced the directors to recommend them strongly to accept it. The speaker went on to refer to the incorporation of the London and Suburban Company, and he added that there could be no doubt that the latter was advantageous to the interests of the shareholders of the Metropolitan Electric Tramways and the London United Tramways, and the directors could not but be equally in the interests of the shareholders of the South Metropolitan Company to join the combination. Their business had for the last few years shown indications of steady although somewhat slow progress. Their electric supply undertaking was developing and was capable of very considerable further development, and if conditions remained unaltered they might look forward to progressive improvement in their tramway undertaking, which at present provided the greater portion of their profits. But conditions were altering, and they had to anticipate that the same motor omnibus competition which had affected the revenue of the other tramway companies in the London and suburban area would also affect them. Since the beginning of the year they had experienced motor omnibus competition on a portion of one of their routes, and the effect upon their revenue showed what was likely to be the result if the competition became more extended. In anticipation of this competition and for the protection of their interests, they decided to acquire and operate motor omnibuses, and they placed an order in the latter part of last year for 10 'buses', which had recently been delivered to them, but it was obvious that to operate a small number of omnibuses in competition with existing omnibus interests would be a difficult business, and would not secure the best results. If the proposed exchange of shares was carried out, the 10 omnibuses would be worked by the London General Omnibus Company under a similar arrangement to that which existed in respect of the omnibuses of the Tramways (M.E.T.) Omnibus Company. The earnings would swell the profits of the London and Suburban Traction Company in which they would be shareholders, and it was easy to realise that the earnings of omnibuses worked under this arrangement would be much larger than if they were worked in competition with the fleet of the London General Omnibus Company. The preference shares in the South Metropolitan Company were £1 each and entitled to a 6 per cent. cumulative preferred dividend, but they ranked equally with the ordinary shares in any deficiency of assets. They were invited to exchange these shares for shares in the London and Suburban Traction Company, bearing a cumulative preferential dividend of 5 per cent., and having priority of capital over the ordinary shares, and they were offered £125 of new shares for every £100 of shares which they held at present. They would therefore receive £1 5s. of new capital in exchange for £1 of present capital, and the return would be £6 5s. per cent. upon the amount of their present capital instead of £6 per cent. as at present. The shares they received would rank for dividend from the last quarter. They would be entitled to the dividend proposed to be paid on their present shares for the past year, but would, of course, not be entitled to any arrears of dividend. With regard to the ordinary shares in the South Metropolitan, upon which no dividend had yet been paid, the holders of these shares were offered £75 of ordinary shares in the London and Suburban Traction Company for every £100 of shares they at present held. While they would suffer a diminution of capital, he believed they also would be in a better position after the exchange than at present. The profits of the London and Suburban Traction Company would be derived from the dividends it received on the shares it held in the Metropolitan Electric Tramways, the London United Tramways, on the whole of the shares in the Tramways (M.E.T.) Omnibus Company, and on the shares it would hold in the South Metropolitan Company if the exchange was effected. It was difficult at present to form any definite estimate of what these profits would amount to, for one reason, because it would be some little time before the whole of the omnibuses of the Tramways (M.E.T.) Omnibus Company were in public service, and bringing in revenue, but they were satisfied that the preference shareholders would receive their dividend, and that there was a good prospect of a fair return in future to the ordinary shareholders who exchanged their shares. Another point to be borne in mind was that by making the exchange they would become shareholders in a company with a very large capital and with a large number of shareholders, and that there would be a better market for the shares than there was for those which they held at present.

Mr. E. GARCKE seconded the motion.

Replying to a question, the CHAIRMAN said the debenture holders were not affected in any way by the proposed exchange.

Mr. CROFT agreed that the combination proposed ought to result in reduced administrative expenses. He asked who would be the directors of the London and Suburban Traction Company.

The CHAIRMAN said if the exchange was carried through, he would be offered a seat on the Board of the Traction Company.

A shareholder thought that the preference shareholders were entitled to the one year's arrears of dividend, which they would lose if they exchanged their shares.

The CHAIRMAN pointed out that there was no compulsion on any shareholder to exchange his shares. If a shareholder did

not exchange, and the arrears of dividend was paid, then he would receive his share. The scheme was not effective unless 75 per cent. of both classes of shareholders exchanged their shares. At present the holders of over 99 per cent. of the ordinary were willing to do so, and of the preference shares nearly 85 per cent. had consented, so that the scheme did become effective subject to the London and Suburban Traction Company agreeing to increase the capital of that company to the necessary extent.

The report was then adopted.

### Kidderminster and District Electric Lighting and Traction Co., Ltd.

MR. S. E. GARCKE presided on May 22nd over the meeting of this Company, held at the offices of the Electrical Federation, Kingsway, W.C. In proposing the adoption of the report, he said the capital expenditure had increased during the year by £2,534, chiefly in connection with the installation of a new battery, and further expenditure would be required during the year, because a certain increase was necessary to the plant, in view of the demands of the coming winter, which they hoped would be greater than in the past winter. With regard to the profit and loss account, the dividend received from the Kidderminster and Stourport Tramways Co. was at the rate of 3½ per cent., as previously. As to the electric supply business, the total revenue from this undertaking showed an increase of £250. There had been a somewhat serious increase in the price of fuel, and the cost of generation had consequently increased by £240. The sum of £220 had been written off motors in the accounts under consideration, and this item, with the increase he had mentioned, accounted for the total increase of £600 in the cost of the supply. The result was that the available balance carried to the net revenue account was £3,693, as compared with £4,076 in the preceding year. The renewals fund now stood at the substantial figure of £6,819, and the reserve fund at £1,750. Altogether the sum of £16,389 15s. 3d. had been provided out of the past profits for reserve and renewals generally.

MR. W. JONES seconded the motion, and the report was adopted without discussion.

MR. B. SHIRREFF HILTON was re-elected a director, and the remuneration of the directors was fixed at £50 for the Chairman and £25 each for the other directors for the year.

### Brisbane Electric Tramways Investment Co., Ltd.

THE 12th annual meeting was held on May 21st, at Winchester House, E.C., Mr. H. R. Beeton presiding.

In moving the adoption of the report (see ELEC. REV., p. 779), the CHAIRMAN said that the strike, which he described at length at the last meeting, had seriously affected the accounts for the year. The service was entirely suspended for 4 days, and largely interrupted during the whole of the first quarter, causing a reduction in the traffic receipts for those three months of £14,837. With the resumption of normal conditions, however, they not only made good that loss in the remaining nine months, but showed a net increase of £870 at the close of the year. The expenses increased by £34,893. Of this amount £15,305 was directly attributable to the strike, £4,765 to the legal and other expenses in connection with the Australian Employees Association's action, and the balance to the general rise in wages, materials, and power house expenses, consequent upon larger sales of current. They estimated that the total loss incurred directly and indirectly by the strike was fully £32,000. In the circumstances, it was a matter for congratulation that the Tramways Company's profits were sufficient after adding £10,000 to its renewals fund (bringing it up to £100,000) to enable the Investment Company, after providing for its debenture interest and preference dividend, and adding £5,500 to its reserve fund, to pay the usual 8 per cent. on its ordinary shares, leaving £3,781 to be carried forward, with an aggregate of renewals and reserve funds and the undivided profits amounting to £121,909. At the last meeting, he mentioned that the various local authorities, through whose districts their lines ran, had had several joint meetings with a view to coming to an arrangement for the purchase of their undertaking, culminating in their promoting a Bill in the Queensland Legislature seeking powers for the appointment of a Joint Board to negotiate with their Company an agreement to enable them to acquire the undertaking at any time at an agreed price and conceding to them a share of profits in the working in the meantime. The representatives of the local authorities, however, while approving generally the making of such an agreement, were unable to agree as to the constitution of the Joint Board, and the Bill was therefore dropped. He also stated at the last meeting that for the purpose of extensions and renewals they would have to issue in the near future further capital, which would probably take the form of an issue of ordinary shares at par. Negotiations were pending as to the terms on which extensions should be made, and the question of the further issue of capital must be deferred until these negotiations were completed. Towards the end of December, 1912, the Commonwealth Arbitration Court gave its award in the matter of the alleged industrial dispute between the Australian Tramways Employees Association and the various tramway undertakings in Australia. That award, so far as their Company was concerned, gave preference to the members of the Employees Association,

an eight-hour day, two weeks vacation, increased wages, and other advantages to the men, the cost of which would amount to a considerable sum. Having been advised that the award was invalid, they immediately applied to the High Court and obtained an order nisi calling upon the Association to show cause why a writ of prohibition should not issue prohibiting any further proceedings against the Company upon the award. The further hearing of the matter had been postponed until June, and might be still further postponed, but until the decision of the High Court was obtained, the award would be in abeyance. As the matter was *sub judice*, he did not propose to say anything further on the point except that they were advised that they might reasonably expect the award to be set aside, as had been the case with other awards made by the same Judge. At the same time, he wished to add that the board had always been willing to accord to their employees a reasonable share in the growing prosperity of the Company, and to consider suggestions for their benefit. Their prospects continued favourable, as was evidenced by the fact that the receipts to the end of April amounted to £99,430, being an increase of £36,190 over the same period last year, and of £23,129 over the same period of the year before. He was glad to be able to report that after giving them the benefit of his presence in London, Mr. Badger had returned to his post in restored health, and to him again, and to the devoted staff which he controlled and inspired, their best thanks were due.

MR. W. F. HAMILTON, K.C., in seconding the resolution, said that he spent ten weeks in Australia last year on the business of the Company. He was very favourably impressed with the great future that lay before Brisbane, and he was convinced that that city would remain the principal port of Queensland. He did not believe there was any likelihood of any labour troubles for many years to come, nor did he think there was any probability of either the Government or the municipalities purchasing the Company's undertaking.

Replying to a shareholder, the CHAIRMAN said that the possibility of motor 'bus competition had been the subject of constant watchfulness on the part of the board, especially in view of the success which had been achieved by those vehicles in London. They, however, felt no fear on the subject, for the two motor 'bus companies which had started in Brisbane had already gone into liquidation, and however much they might succeed elsewhere, he was confident they would never pay in Brisbane.

MR. HAMILTON confirmed the CHAIRMAN's remarks, and said that the conditions in Brisbane were quite unattractive for heavy motor 'buses, the gradients being very steep indeed.

The report was adopted.

The result of the working of the Tramways as shown by the audited accounts of the original Company for the year ending the 31st December, 1912, was:—Total receipts, £254,838. Total expenditure (including strike and arbitration expenses), £162,305, leaving net profit for year, £92,533 plus £2,595 brought forward. There is a balance of profit available of £95,128, which has been appropriated by the Tramways Company in the following manner:—In payment of Dividends on Shares (free of tax), £80,000; in placing to the credit of a Fund for Renewals (bringing it up to £100,000), £10,000, carrying forward £5,128.

### Eastern Telegraph Co., Ltd.

SIR JOHN WOLFE BARRY, K.C.B., presided on Wednesday last week at the meeting of this Company, held at Electra House, Finsbury Pavement, E.C.

THE CHAIRMAN, in proposing the adoption of the report (ELEC. REV., page 822), said that the gross revenue for the half-year amounted in round numbers to £753,800, against, for the corresponding period of 1911, £729,400, or an increase of £24,400. The revenue for the period under review was the highest ever received by the Company in any one half-year, and it was gratifying to be again able to report that the increase was spread over every branch of the traffic, with the exception of South America and Egypt. The former was less owing to the reduction by about one-third in the rates brought into operation by the Western Telegraph Co. in May last year, and represented their share of the loss of revenue occasioned by the reduction; but he trusted that this would be gradually recouped as the traffic expanded with the commercial development which was now taking place in South America. The traffic with Egypt was not quite so good as it was in 1911. The ordinary working expenses for the half-year amounted to £273,200, against £245,300, or an increase of £27,900. As he had so often pointed out, they must expect a constant expansion of working expenses in view of the ever-increasing volume of traffic which had to be handled by the staff, and which necessitated the employment of greater numbers and consequent increases under most of the heads of expenditure. General expenses in London were £1,900 more than they were for the corresponding period of 1911, while working expenses at stations showed an increase of £24,700. There was an increase of £10,800 under the heading of salaries and wages, due to a considerable augmentation in the number of the staff, to annual promotions, and to improved conditions relating to Sunday duty and overtime. Maintenance of instruments showed an increase of some £2,000, which was due to the introduction of new and improved instruments for the better working of the cables, while maintenance of landlines was nearly £4,000 more than for the corresponding half-year, due to the substitution of phosphor-bronze for iron wire over a large portion of their landlines in Egypt. Referring to the item "expenses attending maintenance of cables," the CHAIRMAN said that he had repeatedly pointed out how necessarily

variable the charge to revenue in respect of this account must be, depending as it did upon the number and extent of the cable repairs, and the amount received for the charter of their cable-repairing steamers by foreign Governments and other telegraph companies. On the present occasion the charge to revenue was £45,500 more than for the corresponding period of 1911, and was chiefly due to an expenditure on 85 miles more cable, and to the fact that the amounts received in respect of charters and other credits were over £20,000 less than for the half-year ending December, 1911. In consequence, the net profit for the half-year under review was £47,500 less than in the corresponding half-year of 1911; but he was pleased to be able to state that they had been able to contribute £160,000 to the general reserve fund, and that, notwithstanding the increased expenses, the amount carried to this fund for the complete year of 1912 was £30,000 more than for the year 1911. He referred at the last meeting to contemplated expenditure in connection with important renewals of some of their cables, and to the strengthening of their cable capacity east of Suez by the laying of new and important cables, and £65,100 had been charged against general reserve fund this half-year in respect of that work, which it was estimated would, in all, cost about £1,000,000. Owing to the expiry of the original concession granted to the Black Sea Telegraph Co. by the Russian and Turkish Governments in respect of the cable from Odessa to Constantinople, that company has been voluntarily wound up. The shares were held in equal proportions by the Eastern and the Indo-European Telegraph Companies, and the cable then became the joint property of those companies, to whom other concessions to work the cable had been granted by the two Governments referred to. In consequence of the continued depreciation of the reserve fund investments, the board had considered it advisable to make a further provision on this account by transferring an additional £25,000 from the general reserve fund to the special fund provided for the purpose. This special fund now stood at £325,000, which represented approximately the difference between cost and the middle price according to the official list on December 31 last. To replace the cable ship "Duplex," which had been sold out of the cable-repairing service, the board had purchased the "Cambria" from the Telegraph Construction and Maintenance Co., and capital expenditure had been charged with £35,505 on account of its cost. The CHAIRMAN then referred in detail to the new Articles of Association which had been drawn up, the principal alterations in which were provisions for discontinuing the half-yearly meeting and for remunerating sub-committees of the directors. He also remarked that the board had it in contemplation to add another director to the board, which would mean an additional £500 a year in fees.

SIR J. DENISON PENDER, K.C.M.G., seconded the motion, and the report was adopted without discussion.

### West London and Provincial Electric Supply Co., Ltd.

THE annual meeting was held at 14, Ironmonger Lane, London E.C., on May 21st, Mr. Harry Kahn presiding.

The CHAIRMAN said that there was very little comment to make on the balance-sheet, their real interest lying in the successful working of the Chiswick corporation. The profit and loss account showed an increase in the profits carried to the balance-sheet of £668, which was due to the fact of the Chiswick corporation paying a 6 per cent. dividend this year on its shares, instead of 5 per cent., as last year, and also to a slight increase in the engineers' fees received. This enabled the directors to propose the payment of a dividend of 6 per cent. per annum on the cumulative preference shares, and the payment of interest at the rate of 4½ per cent. per annum on the funding certificates for the year 1911. The Chiswick corporation continued to make steady progress. The number of consumers had increased this year by 181, and the revenue by £1,984, the units sold being 10 per cent. over the units for the previous year, and in spite of the fact that more was being contributed this year to depreciation—viz., £1,149, against £932 last year—and that the repairs account and price of coal had been higher, it was satisfactory to note that the corporation had been enabled to increase the rate of dividend to be paid. The revenue of the corporation during the first quarter of 1913 had again shown an increase, also the second quarter so far as it had gone.

Mr. W. B. Esson seconded the adoption of the report, and it was carried.

**Castner-Kellner Alkali Co., Ltd.**—This company on 23rd inst. resolved to increase its capital from £450,000 to £500,000 by the creation of 50,000 new shares of £1 each, which will be issued at 2 premium. There will be no public issue.

**British Electric Traction Co., Ltd.**—It is stated in the financial papers that the directors have declared the dividend on the 6 per cent. cumulative preference stock and a dividend at the rate of 3 per cent. on the 7 per cent. non-cumulative preference stock for the year ended March 31st.

**Mirrlees, Bickerton & Day, Ltd.**—The net profit for the year ended March 31st last, after providing for depreciation and directors' fees, is £11,116, making (says the *Financial News*), with £337 brought forward, an available total of £11,453. Preference interest absorbs £2,184, and the directors recommend a dividend on the ordinary shares of 7½ per cent. for the year, absorbing £7,104, placing £1,000 to reserve, and carrying forward £1,165.

### Birmingham District Power and Traction Co., Ltd.

THE directors' report for the year ended December 31st, 1912, states, according to the *Financial News*, that the total revenue from all sources was £115,698, compared with £109,361 for the preceding year. The expenses amounted to £55,529, compared with £52,365 for 1911. After providing for all sums chargeable to revenue, including repairs, maintenance, sums payable to local authorities, and placing £6,000 to the renewals fund, there remains £55,108, plus £311 brought forward, making £55,419. From this has to be deducted for interest on loans £7,539, interest on debenture stock £16,084, leaving £31,826. After deducting for debenture sinking fund £4,929, and dividend for the year on the 5½ per cent. cumulative preference shares £11,538, there remains £15,359, which the directors recommend should be applied to payment of a dividend on the preferred ordinary shares at the rate of 3½ per cent. for the year £12,250, to reserve £3,000, leaving to be carried forward £109. The gross receipts from the tramways were £53,639, compared with £50,515 in 1911. The gross receipts from the lighting and power department amounted to £29,475, an increase of £3,005. The dividends received from investments produced £30,180, compared with £29,861 in 1911. Expenditure of £3,945 on capital account was incurred during the year for additional plant, mains, &c., for the lighting undertaking in Smethwick; £4,843 for the purchase of motor-omnibuses for hire to the Birmingham and Midland Motor-Omnibus Co., Ltd., and £721 in respect of parcels equipment, extensions at West Smethwick depot, &c. A sum of £11,798 was received during the year, partly in respect of electric cars, motor-cars, &c., sold, and partly in respect of a payment by the City of Birmingham Tramways Co., Ltd., towards the capital cost of the Tidvale workshops. This sum has been placed to the credit of capital account. The total debenture stock now outstanding, including a further amount of £46,453 issued during the year, is £371,146. In the last report particulars were given of the offer of the Electrical and Industrial Investment Co., Ltd., to exchange the shares held by the company in the City of Birmingham Tramways Co., Ltd., for shares and debenture stock of the Electrical and Industrial Investment Co., Ltd., which offer had been accepted by the directors. The exchange has since been completed, and the company now holds the following securities in the Electrical and Industrial Investment Co., Ltd., viz., £17,275 5½ per cent. second debenture stock, 54,022 6 per cent. cumulative preference shares of £1 each, and 161,566 ordinary shares of £1 each. The company has increased its holding of debentures in the Birmingham and Midland Motor Omnibus Co., Ltd., by £6,800, issued for the purpose of providing motor-omnibuses of a modern type for use in and around Birmingham; 20 petrol-electric motor-omnibuses have been purchased by the Motor-Omnibus Co., and are now in operation, in addition to 29 motor-omnibuses hired from this company. The loan to the South Staffordshire Tramways (Lessee) Co., Ltd., has been paid off, the company having accepted £57,733 4 per cent. debenture stock and a cash payment of £7,150 in discharge thereof.

### Dutch-Netherlands Telegraph Co.

THE report for 1912 of the Deutsch-Niederländische Telegraphen Gesellschaft, of Cologne, states that an increase in the traffic with the Far East took place, especially with the Dutch Indies. The negotiations in regard to the erection of wireless stations in the South Seas—Jap, Nauru (South Sea Islands), Rabaul (New Guinea), and Apria (Samoa)—had been concluded and the company, together with the Wireless Telegraph Co. of Berlin, had participated in the formation of the German South Sea Wireless Telegraph Co. of Berlin for the carrying out of the scheme. Both parties had provided the necessary capital, the German Netherlands Co. having taken over £32,500 in shares and £20,000 in loan capital, and a dividend of 6 per cent. on the shares was guaranteed by the subsidy granted by the German Government. The company would be able to defray out of current funds the instalments to be gradually paid for the new undertaking. The station at Jap was approaching completion, and that at Nauru would presumably be finished in June, whilst the work in Samoa and New Guinea was already in hand. The gross profits from the cable traffic amounted to £104,000, as compared with £103,000 in 1911; interest yielded £4450 as against £3,590, and the sum of £10,800 is brought forward as contrasted with £8,300 in 1911. On the other hand, the general expenses were £22,100 as against £21,600, the cable maintenance fund absorbed £10,200 as in the previous year, the sum of £8,750 has been placed to the cable renewal fund as in 1911, and £15,400 to the cable redemption fund as contrasted with £14,800. The net profits are returned at £42,000 as against £40,700 in 1911, and a dividend of 6½ per cent. is proposed on the share capital of £350,000, being the same rate as in the previous 12 months. The loan capital stands at £282,000, and required £11,200 for its service as compared with £11,800 in 1911.

**Stock Exchange Notices.**—Applications have been made to the Committee to allow the following securities to be quoted in the Official List:—

Consolidated Diesel Engine Manufacturers, Ltd.—Further issue of 4,413 shares of £1 each, fully paid (Nos. 594,547 to 598,959); and 100,000 vendors' shares of £1 each, fully paid (Nos. 427,077 to 527,076).

River Plate Electricity Co., Ltd.—Further issue of £30,000 ordinary stock.

**London and Suburban Traction Co., Ltd.**—The adjourned meeting of preference holders to sanction the increase of capital is to be held at the Holborn Restaurant on June 4th.

**Prospectuses.**—*Brazilian Traction, Light and Power Co., Ltd.*—Applications have been invited this week for an issue of £10,000,000 6 per cent. cumulative preference shares at par, or £20 11s. for each \$100 share. The company owns over 99 per cent. of the share capital of the Rio de Janeiro and Sao Paulo companies, and it is for the purposes of these concerns, and to repay bank loans contracted in connection with same, that the proceeds of this issue are required.

*City of Las Palmas Water and Power Co., Ltd.*—The list was close on Tuesday in an offer of £237,000 5 per cent. first mortgage debenture stock at 93 per cent. The company has a 60-year concession for electric light and power from the Las Palmas municipality. The electric lighting of Las Palmas has been worked successfully by a Belgian company—the Compagnie Internationale d'Electricité—with whom a contract has been made restricting electric supply competition.

**French Thomson-Houston Co.**—The accounts for 1912 of the Compagnie Francaise Thomson-Houston show that investments yielded profits of £79,000, and technical working and subsidiary receipts profits of £217,000, making a total of £296,000. These compare with £81,000, £193,000 and £2,740,000 respectively in the previous year. After meeting general expenses and depreciation, the accounts indicate net profits of £172,000, as contrasted with £153,000 in 1911; and it is proposed to pay a dividend of £1 8s. per share as against £1 5s. in the preceding year. The share capital amounts to £2,400,000 and the loans to £1,120,000, whilst a further issue of 4 per cent. bonds for £600,000 has just been offered for subscription.

**Continental.**—*SWITZERLAND.*—A new company has lately been formed in Geneva, with a capital of £80,000 and the title *La Société de l'Energie Electrique du Valais*.

*FRANCE.*—*La Compagnie Generale de Distribution Electrique à Paris* reports a net profit of £24,339 for the last financial year, as compared with only £17,954 in the preceding 12 months. It is proposed to place a sum of £4,000 to the repairs and accidents account, £17,880 to depreciation and to carry forward. The report of the Société de l'Energie Electrique de Sud-Ouest, of Paris, shows a net profit of £17,272, as against only £7,683 in the preceding year. A dividend of 6 per cent. is being paid on the preference shares, but there is nothing for the ordinary shareholders.

*BELGIUM.*—*La Société des Accumulateurs Tudor*, of Brussels, reports a profit of £10,044 for the last financial year.

**Cleveland and Durham County Electric Power Co.**—After deducting debenture interest, the accounts for 1912 show an available sum, including £528 brought forward, of £18,443. The directors recommend a dividend of 3½ per cent., carrying forward £148.

**Bombay Electric Supply and Tramways Co., Ltd.**—The directors recommend a dividend on the ordinary shares at the rate of 5 per cent. per annum, free of income-tax, for the year ended December, 1912.

**Lima Light, Power and Tramways Co.**—The profit and loss account for 1912 shows that the total profits obtained amounted to £p.175,156, and that the net profit was £p.98,890, which the board has divided as follows:—To reserve and redemption fund, £p.25,994; to shareholders, 4 per cent., £p.53,996; leaving a balance of £p.18,900. Out of this the board proposes to pay an additional dividend of 1½ per cent., in respect of the year 1912, and to carry forward £p.2,027.—*Times*.

## STOCKS AND SHARES.

Tuesday Evening.

It can hardly be said that the sudden advent of summer weather has had much forcing effect upon prices in the Stock Exchange. Certainly a few of the Home Railway stocks were benefited, but even in their case the improvement was very fleeting. That is to say, it was soon succeeded by a fresh relapse into dullness. Business, indeed, throughout the House is slack. A dozen reasons can be supplied to account for this, but all the causes work back to the original root of new issues, the enormous quantity of which simply swamps the markets for existing securities.

So far as the Underground Railways are concerned, the brilliant weather has had no beneficial effect upon their quotations. This is not surprising, having regard to the probability that the public will choose outside methods of transport rather than the tubes during the summer time. Metropolitanans are ¼ down at 51½, and Districts fell to 38½. The Underground Electric Railway issues are flat, there having been some apparently forced selling of the Ordinary shares, which depressed the price to 1, a drop of 5s. while the "A" shares at 11s. 3d. middle weakened in sympathy. The 6 per cent. Income bonds are a point down at 91½.

The feature in the Home Traction market has been a series of vivid rises in British Electric Traction issues. The company has declared a dividend of 3 per cent. on the 7 per cent. Non-Cumulative Preferred stock, and this unexpected announcement served to put up the price of the stock 7½ points. The 6 per cent. Preferred rose 2; the Deferred and the other stocks a point or more apiece. We drew attention last week to the way in which the company's

descriptions were hardening, the especial feature then being a rise of 2½ in the 7 per cent. Non-Cumulative Preferred stock, from which it was inferred that the buying was of the intelligent order. London United Tramways are unchanged. Hastings 4½ per cent. Debenture stock has risen a point.

In the Electricity Supply Department the falls predominate. Citys are marked 10s. lower. St. James' Ordinary and Preference both fell ½, and a similar fall occurred in Kensingtons, Brompton Preference and Westminster. However, 5s. was gained by Chelseas and ½ by Metropolitan Preference; while South London 5 per cent. Debenture stock is again higher, and County Second Debenture stock came into demand at par. That the shares in this market should be dull is not surprising, in view of the season of the year; but it is a little remarkable in that a very large investment order was executed here last week, the purchase money running into many thousands of pounds, and the investments ranging over all classes of securities comprised in this market. Midland Electric 4½ per cent. Debenture stock rose 2, although, naturally, the market is a more or less nominal one, seeing that the stock is to be paid off so soon.

A rough draft of the prospectus of the Wireless Electric Light Syndicate, Ltd., came under our notice the other day. The share capital was stated at £75,000, divided into 70,000 "A" Ordinary shares of £1 each and 100,000 "B" shares of 1s. each, of which it was proposed to issue part of each class. The Syndicate acquires rights in various inventions, one of which is the Moore Light System, with which, no doubt, technical readers of this column are well acquainted.

The telegraph market is depressed as regards the Eastern group. Eastern Ordinary is down 3 points. Eastern Extension shares fell ½, equivalent to 3½ in stock, but the Companies' pre-Ordinary issues are steady. According to the reports of both Companies, just issued, the undertakings occupy a strong position and have little to fear from the wireless competition which, not so very many years ago, was going to extinguish them—according to the fears of the timid—altogether. In some quarters, it is pointed out that investments in good cable companies' shares are preferable, from the security point of view, to those in the shares of the Marconi Company. Various kinds of fantastic estimates are current with respect to what the forthcoming Marconi dividend is going to be. A year ago it was 20 per cent.—4s. per share; and if the present price of the shares is any criterion, the distribution this time ought to be at any rate up to this mark. That it will be, is considered highly improbable, however; and the announcement is awaited with keen interest. The price of the shares at the end of last week dipped to 3½, from which it recovered to 4½; a drop of ½ remains on balance, while the Preference at 3½ are ½ lower. Americans declined at one time to 19s. 6d., Canadians to 12s. 9d., but in both of these cases there have been slight rallies.

The Anglo-American group continues dull and, as regards Direct United States Cable shares, depressed. The last-named fell to 7s. 6d., and the three stocks in the Anglo group are all easier. West India and Panamas at 2½ are ½ down, and Indo-Europeans fell 10s. to 57. The Telephone market is quietly steady, with no movement calling for particular comment. United River Plate Telephones at 6½ are the turn harder, and National Telephone Deferred stock remains in the neighbourhood of 20½.

Brazilian Traction Ordinary shares have fallen 1 on the issue of the prospectus of 6 per cent. Preferred stock at par. Sensibly enough, it was arranged in the market that there should be no dealings in this before allotment; and as the rights on the old stock were valued at nil, it may be said that the new Preferred starts fair and square on its own account. The security is generous; and although possibly enough the underwriters may get left with a certain proportion, there ought to be no difficulty on their part in selling it when the investment markets take a turn for the better.

Mexican issues are still dwindling, fresh declines occurring in Mexican Light and Power Common, Preferred and bonds. Shawinigan Water is also a dull spot, a further fall of a point being registered on the top of that of 2 last week. British Columbia Electric Railway stocks are distinctly weak, the falls in this group ranging from ½ to 3 points. It is thought that the selling—or, at all events, part of it—proceeded from people who have been obliged to sell part of their investment stocks in order to meet their obligation incurred through underwriting and payment of differences. Mexico Trams fell with Mexican Light and Power, and the dullness extended to Rio Tramway bonds. The bright spot in this market is the 5 per cent. issue of the Electric Light and Power Company of Cochabamba, a rise of 2½ taking the price to 97 middle, and surprising the jobbers themselves. Calcutta Electric Supply are better at 6½, while the Trams retain their rise at 6.

The Manufacturing group keeps very strait. Telegraph Constructions went back 10s. in consequence of the dullness in some of the cable companies' shares. Castner-Kellners are ½ off at 3½, notwithstanding the interim dividend for 1913 at the rate of 18 per cent., and Babcocks eased off to 3. On the other hand, British Aluminium Ordinary hardened, and British Insulated Preference are ½ better. British Westinghouse 5 per cent. Debenture stock is a shade higher. Rubber shares were sadly upset by the disappointing report from the Linggi Plantations Company, which somewhat demoralised the whole market. The price of the raw material, however, keeps fairly steady, and the discussion is revived as to whether Brazil will be able to compete with the Middle East if the price of the product falls, say, to half-a-crown per lb. Brazil is making strenuous efforts to encourage rubber cultivation, and it would be interesting if those who use the stuff for the purposes of electrical manufacture would enlighten the public on the point as to why fine hard Para should be specifically stipulated in many of the contracts for which tenders are invited.

## PROCEEDINGS OF INSTITUTIONS.

## Electricity in Textile Mills.

THE most important subject which is now engaging the attention of the TEXTILE INSTITUTE is that of textile mill-driving, and a very keen and interesting discussion is proceeding upon the advantages and disadvantages of various prime movers and means of transmission. The question was opened at the last Autumnal Congress of the Institute which was held at Ilawick, and in September last a full report of the discussion, in so far as it related to electrical power, appeared in our columns. It may be remembered that owing to lack of time, the discussion could not be concluded in the ordinary way, and the authors of the papers upon steam, gas, oil and electricity were unable to reply to the many interesting points raised. The matter was therefore left open for further discussion, and the considered views of several members, together with the replies of the authors of the papers, were recently published by the Institute.

MR. A. N. RYE (Guernsey) who was formerly manager of the Electric Lighting Co. at Ilawick, and carried out the greater part of the electrical driving of textile machinery in that district, declared that the whole question of power production was difficult and complicated, and, provided power could be purchased from an electric supply company at a reasonable price, it seemed advisable to leave the power production to those companies which specialised on the subject. A large power company was obviously in a better position to adopt up-to-date plant than the millowner, and the purchaser reaped the benefit of improvements in a reduced power cost without taking risks himself. Mr. Rye offered very pointed criticism upon the papers dealing with steam and gas power, and stated that, in his particular district, he was getting most satisfactory results with Diesel engines.

MR. T. ROLAND WOLLASTON (Manchester), who contributed a paper on gas, said that some members seemed to have drawn the conclusion that he particularly favoured electrical transmission. He pointed out that he had not had sufficient experience of recent electrical transmission installations to have strong views for or against them, and, with many others, merely accepted the proposition that they must have merits which accounted for their steady progress. Mechanical transmission for textile mills was by no means dead yet. The claims of the electrical drive, as regarded regular turning, quick starting and stopping and power absorption only when running, appeared to be real and important. But the most important claim still seemed to be the elimination of shafting load, which, as they knew, was often excessive. Rapid strides had recently been made in developing the application of ball and roller bearings to line shafting, and several firms were now selling bearings at comparatively low prices, which reduced line-shaft friction to a small fraction of the normal figure; two Manchester gentlemen, Prof. Nicolson and Mr. G. F. Buck, were believed to be engaged on important research work which might materially influence future procedure in mill power transmission.

MR. H. T. HILDAGE (Manchester) observed that the analysis of the claims made by the advocates of the various types of prime movers, and the respective value of these from the point of view of reliability, uniformity of speed and economy, was a task of considerable magnitude and difficulty, and, when it was completed, he thought that textile manufacturers would have a valuable guide to the solution of power problems. The solution of these problems in the past had been undertaken in too haphazard a manner. A textile manufacturer had called in two or three firms of engine builders and electrical engineers, and asked them to advise him as to the best way of fulfilling his requirements. They had looked at the matter rather from their own point of view than from his, and when he had received all their schemes he had the difficult task of comparing them, analysing them, and selecting the most suitable. The manufacturer would always be well advised to have an independent engineer to look at the matter from his own point of view. Mr. Hildage said that in estimating the value of a new machine, or new plant, an American did not ask himself how long it would be before it was completely worn out, but how long it would be before it would have to be superseded by something more economical and better suited to the demands of his work. English manufacturers, he suggested, should have in mind, when putting down new plants, the state of the industry of manufacturing those plants.

MR. W. BROWNING (Manchester), who dealt with the paper of Mr. J. F. Crowley upon electrical power, said the source of supply and the nature of the prime mover was the concern of the electrical engineer only in so far as it gave him a cheap reliable power of constant periodicity or steady voltage, the greatest quality being reliability. On the question of transmission, electrical *versus* mechanical, it fell to the engineer, being the newcomer, to show justification for any change, and, in agreement with Mr. Crowley, he would say that the deciding factor was not necessarily the cost of power. It was difficult to schedule the whole of the reasons why it was worth while to install, in certain cases, electrical transmission, and he expressed the opinion that a great deal of harm had been done to this subject by the indiscriminate application of electrical driving, for he had not yet seen any reason to believe that it was worth while to put a generator and motors on opposite sides of one wall. He was convinced that there was a large field for electric driving, and the increasing number of machines electrically driven, and the decisions in favour of extensions of existing plant led to this conclusion. There was yet a great deal to be investigated concerning the effects of a steadier speed on spinning and preparation machinery, and he regretted that tests he was carrying

out for a paper which he intended to read before the Institution of Electrical Engineers were not sufficiently advanced to give, at this stage, some indication of the results in point of production and quality.

MR. W. O. PEPPER (Bradford), who joined in the discussion as a consultant in electrical and mechanical driving in mills, remarked that those conversant with the application of modern methods in steam and electricity must be in agreement with the general lines of the papers on these subjects. The newer type of prime mover, the turbine, and the newer agent for transmitting power, electricity, had each a sufficiently good case, whether they were combined or worked separately, and would bear the closest examination under certain circumstances. After urging the need for expert advice in each individual case upon prime movers and the method of transmitting power, Mr. Pepper said that much harm has been done, especially to electrical progress in mill driving, by the indiscriminate advice given by people who were unqualified either by knowledge or experience to give such advice. Within his knowledge electrical driving had been retarded in two cases where it was rashly advocated and installed. The result was that clients were dissatisfied with their plant, and spoke disparagingly of it to their friends and fellow manufacturers.

MR. J. F. CROWLEY, in an exhaustive reply on the discussion relating to electricity, said it was very gratifying to find that the readers of the power papers were generally so favourably disposed to the electrical transmission of the power generated by the prime movers they dealt with. Mr. Ramsingh had questioned the figure of 10 per cent. given for the increased production from a loom on individual electrical drive over that obtainable on the ordinary mechanical drive at present prevailing. It was difficult to induce manufacturers to permit the publication of the results they had obtained, but the case had been given of a mill at Vetchau, where an increase in production of from 15 per cent. to 20 per cent., accompanied by an improvement in quality, was obtained on jute looms. Cases had also been given of a German spinning mill in which the increase in production on a worsted spinning frame was as high as 18 per cent., and of a Lancashire spinning mill where 15 per cent. increased production was obtained. Since the paper was read an important Lancashire concern had given permission for the publication of comparative tests that they had taken on continuous running during the past 12 months on over 100 individually-driven cotton looms, and a very much larger number of similar looms on similar warps mechanically driven. The weekly figures showed that the increase in production was in no case less than 10 per cent. Mr. Ramsingh had made comparisons between the relative costs of electrical driving and steam driving, and had estimated that the capital expenditure on a shed with 1,000 looms on the electric drive would be £10,000, and on the mechanical drive only £4,000, leaving a difference of £6,000. The expenditure of this sum on additional looms, Mr. Ramsingh held, would yield an increased production of 15 per cent., as against the 10 per cent. increase claimed for the individual electrical drive. Mr. Crowley pointed out that Mr. Ramsingh's estimate of the cost of the electrical equipment was on the high side, and a reduction of 10 per cent. might be made. Further, no allowance was made for the cost of ropes or strapping, nor for the large saving that could be effected with electrical driving in the roof and walls of a shed. Putting the cost of these latter items at 1 per loom, which was very much on the low side, on this basis the electrical equipment would cost £4,000, and not £6,000, more than the mechanical equipment, which sum would purchase 10 per cent. more looms. This meant, then, that for an equal capital outlay on machinery, the manufacturer could obtain the same production with an electrical drive on a shed of 1,000 looms, as with a mechanical drive on a shed of 1,100 looms. If he adopted mechanical drive, however, he had to provide and pay for the extra land necessary to accommodate the additional looms, extra lights would have to be installed, additional supervision would be necessary for the larger number of weavers, and the employers' share of their insurance contributions would be greater, while the maintenance of the looms and general expenses would naturally increase with the number installed. The advantage of gaining a given production with a reduced number of weavers was, of course, at once obvious, and should particularly appeal in districts where weavers were scarce.

Many other points of a technical nature, and of more particular interest to those engaged in the control of textile factories, have been brought out by the discussion. As yet, only the fringe of the subject has been touched, and the further discussion of the matter, which is to be proceeded with, promises to be of immense value to textile manufacturers, and to the special Committee of the Textile Institute charged with the duty of reporting from time to time upon various methods of mill driving and upon improvements and developments, both in this country and abroad.

The subject was further considered at the closing conference of the Institute, which was held in Manchester on May 2nd.

MR. J. F. CROWLEY pointed out that various arguments, notably those in regard to transmission losses, which might be advanced against group electrical driving on a large scale, did not apply to the individual electric drive, where the machine itself was direct-coupled to the driving motor. The two main points for electrical driving were:—(1) Steadiness of drive, resulting in higher maintained speeds, increased production and improved quality of material; (2) specific advantages on the adoption of individual drive, resulting in still greater production and improved quality. The production was greater because, by the electric drive, they eliminated still further the joining-up links between the source of power and the machine to be driven. There was a speed at which looms could be run on a perfectly steady drive, and beyond which they should not be run. Electrical engineers did not propose to exceed that speed, but they said that

with the mechanical drive, looms were never run at the exact speed at which they could be run, for mechanical reasons, or for textile reasons. He thought it must be admitted that they had made good their case, because in every instance in which the individual electric driving of looms had been installed the speeds had been put up, and kept up, and, as a result partly of that increase in speed, partly of the quicker start which individual drive gave, and partly of the steady speed leading to fewer breakages, the production had gone up, even on plain looms, 10 per cent. The same thing applied to the individual driving of ring frames. In regard to mules, the question had not been considered to a serious extent, but the problem appealed to the electric man because of the varying load during the mule cycle.

MR. F. R. McCONNEL (Manchester) said that a portion of a mill in which he was interested formerly took 50 H.P. to drive, and now it only took 30 H.P. with electric drive.

PROF. G. F. CHARNOCK (Bradford) said he agreed with a previous speaker who alluded to the remarkable steadiness of speed of the steam turbine, and added that this was so substantial as to lead one to the adoption of the electric drive, since it was contended that only by that means could full advantages be taken of it. If it were true, as had been held, that with the individual electric drive, a loom could be driven with a speed variation not exceeding 2 per cent., every loom in the country ought to be driven by the individual electric drive to-morrow. It was only the textile expert who could decide whether or not they got increased production and improved quality—the Textile Institute should make tests—and if they got an increase in production of 10 per cent., and an improvement in quality of 5 per cent., it did not really matter what the speed variation was.

MR. INGHAM (Bolton) said the "mechanical man" had a means of settling whether his plant was efficient or not, and that was by his coal bill. If the efficiency was going down the coal bill was going up.

MR. CROWLEY replied that even if that were so, the chief point was left—the location of the point where loss of efficiency was occurring. Individual electric drive made it possible for that to be done.

MR. O'BRIEN (Manchester) referred to the success which had attended the introduction of the individual electric drive for spinning frames in an Irish mill, and said that the firm which adopted this form of drive was so well satisfied with the results in the shape of increased production and improved material that they had installed a similar drive in a new mill which they had erected.

MR. OSCAR HALL (Bury) said that a firm of German manufacturers with a small plant obtained their electric power from a central station, and the figures of cost month by month showed that for their particular purposes, the electric drive was better than any other. The total bill was less than it would have cost for a man to look after the engine and boiler.

Several speakers undertook to supply the Institute with detailed information and statistics as to the actual results obtained by various prime movers and particular forms of drive, and there is little doubt that the information so obtained will be of great value to the Textile Mill-Driving Committee of the Institute.

### The Formation of Deposits in Oil-Cooled Transformers.

By DR. MICHIE.

(Abstract of Paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Newcastle, April 21st, 1913.)

THE object of the present paper is to deal with some of the chemical changes which occur in transformer oils during use, and more particularly with the formation of the solid matter which deposits on the windings and other parts of transformers, a subject to which my attention was drawn several years ago by the Newcastle Electric Supply Co. These deposits vary in appearance from pale yellow soft sludges to dark brown or black hard masses, and their presence materially affects the circulation of the oil and leads to overheating of the windings.

It is well known that electrical stresses may cause a separation from oils already having solid matters in suspension, but it is rather difficult to imagine how the electrical stresses can effect a transformation of the liquid oil into the solid sludge. Pairs of sheet-metal electrodes  $4 \text{ in.} \times 1\frac{1}{2} \text{ in.}$  were set at a distance of  $2\frac{1}{2} \text{ in.}$  apart and placed in a series of glass tanks containing different qualities of transformer oils. A pressure of 20,000 volts was maintained between each pair of electrodes for three weeks, but not a trace of deposit separated out from any of the oils tested. It will be shown later that electrical discharges may have an influence on the formation of these deposits through the generation of ozone.

In only one instance has a deposit been obtained in which it could be definitely ascertained that it was entirely derived from the windings. In this case, the freshly varnished windings had been immersed in the oil before proper drying and hardening had set in. The deposit in this case was quite different from what is usually obtained, and there was no difficulty in detecting the linseed oil used in the preparation of the varnish. Not only is it impossible to detect any quantity of varnish or other insulating compounds in the majority of deposits, but the quantity of deposit is frequently far too great to be accounted for in this way, and deposits also occur in transformers in which the use of varnish is avoided. In most cases the deposits must be mainly derived from the transformer oil itself.

It has been suggested that these deposits are the result of a polymerisation of the hydrocarbon molecules of the oil brought about by the influence of the heat of the transformer. Several

samples of American and Russian transformer oils were heated in glass flasks for 200 hours at  $150^{\circ} \text{C.}$  out of contact with air, but, although the oils darkened in colour, no deposit separated out. Analyses of transformer deposits show that these contain a considerable proportion of oxygen, and as the original oils are free from oxygen the only conclusion that can be drawn is that the formation of these deposits is brought about by the oxidising influence of the air on the transformer oils. In all likelihood there is a simultaneous polymerisation of the oxidised molecules. A sample of sludge taken from a transformer gave the following analysis:—

Carbon.	Hydrogen.	Oxygen.
76.0	7.1	16.9 per cent.

In order to confirm the oxidation theory various samples of transformer oils were subjected to the action of a current air at an elevated temperature. The rate at which the air was drawn through was 0.07 cb. ft. per hour. The flask containing the oil to be tested was placed in an oil bath and kept at a temperature of  $150^{\circ} \text{C.}$  As a rule the passage of the current of air was continued for 45 hours. Different transformer oils when subjected in this way to the action of a current of air gave strikingly different results. Generally the oils darkened in colour and increased in acidity, but whereas in some cases the oils remained clear and bright, in the majority of cases they became turbid from the formation of solid matter. In order to determine the amount of solid matter which separated out, the oils were diluted with petroleum spirit and filtered. The solid residue after freeing from oil by washing with petroleum spirit was then weighed. In some cases no deposit was obtained, while in others it weighed as much as 2.5 per cent. of the weight of oil taken. These differences in the behaviour of different samples are not surprising in view of the different chemical characters of the oils, depending on the source of the crude oil, the method of distillation, and the degree of refinement.

Deposits obtained by treating mineral oils with air closely resemble what is obtained in transformers. A deposit obtained in this way gave the following figures on analysis:—

Carbon.	Hydrogen.	Oxygen.
74.27	6.62	19.11 per cent.

In both cases the deposits are almost insoluble in petroleum spirit, but readily soluble in benzol. The melting or softening point varies from about  $70^{\circ} \text{C.}$  to about  $220^{\circ} \text{C.}$  for different deposits.

Although a temperature of  $150^{\circ} \text{C.}$  has been chosen for these tests, on account of the greater rapidity of the oxidising action, the formation of sludge no doubt takes place at comparatively low temperatures if the period of exposure is prolonged, and there are still other conditions in a transformer which accelerate the formation of sludge. The presence of ozone in the air of the transformer greatly increases the rate of sludge formation, and by using ozonised air a heavy deposit was obtained from an oil in a comparatively short time at  $90^{\circ} \text{C.}$

The rate of sludge formation is accelerated by the presence of certain metals, notably copper.

The greater the surface of metal exposed to the oil, the greater is the influence on the rate of oxidation. Thus an oil which, when treated with air in the absence of metals, gave no sludge after 45 hours, gave 0.5 per cent. of sludge when the test was repeated on another portion of the same oil containing copper foil of  $4\frac{1}{2} \text{ sq. in.}$  surface, and 1.8 per cent. of sludge when  $25 \text{ sq. in.}$  of copper was used. The copper, which, as a rule, is only very slightly attacked, does not enter into the composition of the deposits, and here, as in many other oxidation processes, plays the part of a catalytic agent. In the case of lead, the metal generally shows signs of corrosion, and enters into the composition of the deposits, which are of a characteristic pale yellow colour. In one deposit 36 per cent. of lead was found.

The quantity of sludge which separated out in the oxidation process is largely dependent on the degree of refinement of the oil. As a general rule, the more an oil is refined the more stable it becomes towards oxidising agents.

Although several transformer oils are on the market, which, when subjected to the oxidation test, give no deposit after 45 hours, no oil has been met with which did not give rise to deposit after prolonged treatment. In one instance an oil withstood the test for 150 hours without a deposit appearing. All oils oxidise in time, but it is only reasonable to expect that those which come out well on the oxidation test will also behave well in the transformer.

Apart from the question of the quality of the oil, the design of the transformer has to be considered, and in this connection, if the formation of deposits is to be avoided or minimised, the following conditions should be avoided:—(1) Overheating; (2) undue access of air to the oil; (3) conditions likely to give rise to the formation of ozone; (4) contact of the oil with clean surfaces of copper, iron and lead.

### DISCUSSION.

MR. P. V. HUNTER (N.E.S. Co.) said that the sludging of oils in transformers was costing thousands of pounds per annum. He assumed that Dr. Michie did not consider this paper to be the last word on the subject, as there were sure to be further developments as time went on. Of the four chief requirements, oil only met one, viz., that of high insulation. It did not meet the others because it was inflammable, had considerable viscosity, and was anything but stable. At best, oil was a makeshift, but at present there was no alternative. With regard to the assertion that from the appearance of certain deposits taken from windings a temperature very

considerably over 100° C. must have been attained, he thought that Dr. Michie was mixing up cause and effect, as the appearance remarked upon was entirely due to the ventilating ducts being sludged up, and thus giving the oil no access to them. The total amount of heat generated in a transformer did not increase as sludging increased, at least not to any great extent, and it was thus impossible to tell from the mean temperature or appearance of a transformer whether or not sludging was taking place, and as a matter of fact no evidence of sludging was visible until the transformer was lifted out of its case. For a number of years the Newcastle district was the only one in which sludging seemed to be prevalent. There were two possible explanations for this, one being that in the Newcastle district they used transformers which depended for their cooling upon ducts, and local overheating naturally occurred as soon as these sludged up, whereas, on the other hand, where older designs were in use, in which there were no ventilating ducts, even if the oil did sludge, nothing happened. The other explanation was that, in the Newcastle district, in common with the rest of their machinery, transformers were rated much more heavily than usual. He had come across an interesting case in connection with a furnace transformer which had sludged very rapidly, although the working conditions were not by any means severe, and he could only put this down to the large amount of exposed copper inside the transformer case.

MR. L. R. MORSEHEAD (Caxton House, Westminster) said that some years ago he had been intimately connected with the manufacture of transformers, and the question of sludging had given him a good deal of trouble at that time. The phenomenon was considered to be an electrical one, and also to be due to the wearing out of the materials used in insulating.

MR. J. WILSON (Brown, Boveri & Co.) drew attention to the system of clearing oil by immersing coke breeze in it.

MR. J. SCHUL (A. Reyrolle & Co.) said he had found that different oils varied enormously in their ability to take up moisture. He asked if the purifying treatment to which oils were subjected, left any trace of acid or alkali, as he had come across oils which were accused of attacking the contact surfaces of oil switches. Any analysis which had been made, however, had always proved that the amount of acid or alkali present was extremely small. Another trouble in oil switches was due to minute quantities of the sulphur used in fixing the various parts dropping off and dissolving in the oil. While he agreed that there was no electrical action on clean oil, he thought that there must be some action on oil which had already sludged, as the particles of sludge could be seen moving about rapidly in the oil when subjected to high pressure.

MR. G. STONEY said that the paper explained to him why black deposits were frequently found in the bearings of turbines. Deposits were not generally found if the temperature was kept below 100° or 120° F., but if it was allowed to run up to 160° F., with many oils large deposits took place. He had the impression that the American oils, which were really saturated paraffins, left no deposits, while, on the other hand, Russian oils always gave considerable deposits. In the case of turbine bearings, of course, water was present, and this would in some degree, account for the rapidity with which the action took place. He had in some cases seen deposits as hard as coke. He had noticed that the oils did not attack the copper-tin alloys in the bearings, but that they had a considerable action on zinc alloys, e.g., the nut rings which were usually of zinc alloy frequently showed signs of corrosion. The paper seemed to show that it was possible to get oils which would not give a deposit.

MR. W. C. MOUNTAIN said that so far as he could see, sludging was largely a matter of price, as the highly refined clear oils did not sludge to any great extent, but, of course, they were much more expensive. Another point was that if transformers were rated within more reasonable limits sludging troubles would not occur.

DR. A. C. MICHIE, in reply, said that leaving the conductors bare led to excessive sludging. It was an undoubted fact that the flash point was reduced after filtering, due to the breaking up of the oil under high temperatures. As a rule, filtered oil was liable to form further quantities of sludge. With regard to the question of using coke breeze, the action was already well known, and, as a matter of fact, crude oil was filtered through animal charcoal, in order to take out the colour and other impurities liable to cause sludge. With regard to moisture in oil, under normal circumstances this was so small that it could only be detected by electrical means, and, even in saturated oil, was of the order of '003 per cent. only. Hot oil would, of course, take up a larger quantity, but on cooling, this separated out in the form of globules. All oils were treated with acid and alkali during purification, and minute traces might be left, but he did not think that these could have much effect on the sludging.

## EBONITE TESTS.

We are informed that some time ago the National Physical Laboratory made some exhaustive tests on various grades of ebonite at the request of the Admiralty for the purpose of preparing a specification for ebonite.

The result has been embodied in the Admiralty Specification No. 756, and the following tests have been laid down by our Naval Authorities.

*Specific Gravity.*—The specific gravity of the material must not exceed 1.21.

*Yield Test.*—For sheets of  $\frac{1}{4}$ -in. thickness and upwards and for cylindrical rods exceeding 1 in. the test piece shall be 9 in. long and rectangular in section. For rods of 1 in. diameter or less, the test-piece shall be 9 in. long, and circular in section. The test-piece shall be secured within a clamp at one end, so as to be supported as a cantilever. At a point 6 in. from the nearest edge of the clamp shall be supported a weight of the amount specified in the table below; the section of the test-piece being specified in the table. The cantilever shall be placed in an oven maintained at a uniform temperature of 70° C., and the weight shall be attached not less than 15 minutes after placing the test-piece in the oven. At the end of two hours' exposure with the weight attached, the material shall not yield more than is indicated by the point of support of the weight dropping through a distance of 15 mm. during the time. The distance yielded shall be measured before and after the test with the weight removed:—

Description of ebonite.	Section of test-piece.	Weight applied.
Sheet $\frac{1}{4}$ in. thickness and upwards, cylindrical rod exceeding 1 in. diameter...	Rectangular 1 in. $\times$ $\frac{1}{4}$ in.	1 lb.
Sheet ebonite $\frac{1}{4}$ in. thick ...	Rectangular 1 in. $\times$ $\frac{1}{4}$ in.	12 oz.
Cylindrical rod 1 in. dia. ...	Circular 1 in. diameter	14 lb.
" $\frac{3}{4}$ in. dia. ...	" $\frac{3}{4}$ in. diameter	8 $\frac{1}{2}$ lb.
" $\frac{1}{2}$ in. dia. ...	" $\frac{1}{2}$ in. diameter	5 $\frac{1}{2}$ lb.
" $\frac{3}{8}$ in. dia. ...	" $\frac{3}{8}$ in. diameter	3 lb.
" $\frac{1}{4}$ in. dia. ...	" $\frac{1}{4}$ in. diameter	1 $\frac{1}{2}$ lb.
" $\frac{3}{16}$ in. dia. ...	" $\frac{3}{16}$ in. diameter	8 oz.
" $\frac{1}{8}$ in. dia. ...	" $\frac{1}{8}$ in. diameter	2 oz.

*Dielectric Strength.*—In ascertaining the dielectric strength of the material the pressure shall be applied between two metal spheres, each 2 in. in diameter, embedded into opposite sides of the test-piece, so that the thickness of the ebonite between them is about 0.5 mm. An alternating pressure of approximately sine-wave form shall then be applied between the spheres, the pressure being gradually increased (over a period of about 1 min.) until breakdown occurs. Under these conditions, the pressure at which the material breaks down shall not be less than at the rate of 125,000 volts per mm. (This pressure is the effective or root mean square pressure.)

The test piece and spheres may be placed under oil during the test with a view to reducing the size of the test-piece required.

Unless otherwise directed, the test-pieces for this test are to be disks 4 in. in diameter. The spherical recesses in the test-pieces shall be machined out with a keen cutting tool, which is to be re-ground before the last cut is taken. Care shall be taken that the spheres make a good fit in the recesses. This machining will be carried out at the National Physical Laboratory and the spheres will be provided by that body.

No material shall be rejected on the ground of insufficient dielectric strength unless and until two pieces have been tried and both have failed.

As these tests are said to be more severe than any that have hitherto been applied on ebonite, Messrs. Traun & Sons, London Agency, sent some material manufactured by them to the National Physical Laboratory, and we have before us a facsimile of the report received, which shows their material to have achieved most excellent results.

The specific gravity of their material was found to be 1.198. In the yield test both their samples showed after two hours' exposure a yield of only 8 mm., and after four hours only 10 mm.

Both samples showed a dielectric strength of over 125,000 volts per mm., and one sample only broke down after being subjected to this test for four minutes.

These results should be of interest to users of high-class ebonite, which is made from pure fine para, and is especially recommended for the very finest work.

**Social Club.**—The Leyton District Council electric power station employees' Social and Athletic Club was formally inaugurated last Friday week by Mrs. Harman Lewis. Mr. F. Harman Lewis, who presided, and is president of the club, threw himself enthusiastically into the scheme when it was proposed some time ago. The Council allowed the club the use of one-half of the storeroom, where the old gas generating plant used to be, and in their spare time the men prepared the building for its new purposes, the Council providing the necessary timber for partitioning and flooring. In the centre of the room there is a billiard table. Some 74 out of the 80 employees are already members of the club.

## Electrical Equipments for South African Mines.

—Mr. R. W. Schumacher, speaking at a recent meeting of the South African Institute of Electrical Engineers on the transition from steam to electricity in the Transvaal mines, said he hoped that electrical machinery makers would not insist upon supplying standards which might be suitable elsewhere but not for the South African mines. Local requirements should be considered, makers should meet them as best they could, and the material supplied should be the best that could be obtained anywhere.—*The African World*.

## STANDARDISATION RULES FOR ELECTRICAL MACHINERY: A COMPARISON.

THE Rules just issued by the British Electrical and Allied Manufacturers' Association, hereafter called the B.E.A.M.A. Rules, are here compared with the Report issued in 1907 by the Engineering Standards Committee (Publication 36), called the E.S.C. Rules; the revised rules issued by the Verband Deutscher Elektrotechniker (as published in the *Elektrotechnische Zeitschrift*), hereafter called the German Rules; and the rules of the American Institute of Electrical Engineers.

The B.E.A.M.A. Rules deal only with standard pressures and frequencies, high pressure and insulation tests, types of machines, rating, overloads and temperatures.

### FREQUENCIES.

B.E.A.M.A.	E.S.C.	American.
50 periods per sec.	50	60
25 " " "	25	25

### GENERATOR PRESSURES.

B.E.A.M.A.		E.S.C.	American.	
D.C.	A.C.		D.C.	A.C.
115	—	115 volts	125	—
230	—	230 "	250	—
460	440	460 "	—	—
525	550	525 "	550	—
—	2,200	2,200 "	—	2,200
—	3,300	3,300 "	—	—
—	6,600	6,600 "	—	—
—	11,000	11,000 "	—	—

The standard high-pressure systems for alternating current are:—

B.E.A.M.A.	E.S.C.	American.
2,000	2,000	—
3,000	3,000	—
6,000	6,000	6,600
10,000	10,000	11,000
20,000	—	22,000 and up

### LOW PRESSURES AT CONSUMERS' TERMINALS.

B.E.A.M.A.		E.S.C.	American.
D.C.	A.C.		
110	100	110	110
220	200	220	220
440	400	440	—
500	500	500	—

The variations introduced by the B.E.A.M.A. rules in the pressures are probably dictated by other branches of the industry. The pressures are still, however, within the variations provided for in the E.S.C. Report.

### HIGH-PRESSURE TESTS.

Rated pressure.	B.E.A.M.A.	American.	German.
Volts.	Volts.	Volts.	Volts.
Below 333	1,000	1,000-1,500	1,000
333 to 1,500	three times rated pressure	1,500-3,500	2½ times rated pressure (min. 1,000 volts)
1,500 to 2,250	4,500	5,000	ditto.
2,250 to 5,000	twice rated pressure	twice rated pressure	2½ times rated pressure
5,000 to 7,500	"	"	rated pressure plus 7,600 volts
Above 7,500	"	"	twice rated pressure.

All tests for one minute.

For pressures between 1,500 volts and 2,250 volts, the selection of one test pressure instead of the German rule is curious, and a good reason for it is hard to see.

### TYPES OF MACHINES.

B.E.A.M.A.		E.S.C.
Open	...	Open.
Protected	...	Protected.
Enclosed ventilated	...	Ventilated.
Pipe ventilated (with or without forced draught)...	...	—
Drip proof	...	—
Totally enclosed	...	Totally enclosed.
Flame proof	...	—

### RATING.

The various rules are as follows:—

**B.E.A.M.A.**—Continuous rating is the output which a machine will give for a period sufficiently long to attain practically constant temperature and otherwise comply with these Regulations.

**E.S.C.**—The rated load for continuous working shall be the output at which they can work continuously for six hours and conform to the prescribed tests.

**German.**—Rated output for continuous working is that which can be given for any length of time and conform to the prescribed tests, with the qualification that the period of test shall not exceed 10 hours.

**American.**—These are the same as the B.E.A.M.A.

**B.E.A.M.A.**—The short-time rating is defined as the output which a machine will give for one hour, one half-hour, or other specified period, and comply with these Regulations.

**German.**—These are very similar to the B.E.A.M.A.

**American.**—Three classes are defined, as follows:—

1. Intermittent rating (periods of load and rest alternating).

2. Minute rating (load for one minute only).

3. Variable-service rating (not yet defined).

The B.E.A.M.A. Rules define the ratings for machines which have to deal with variations of speed as follows:—

(a) Machines with two or more fixed speeds are to have a definite rating for each speed.

(b) Variable-speed machines. These are of two classes:—

(i) Machines rated to give the same output throughout the entire range of operating speed. In such machines, the heating tests should be made at the lower limit of speed, and commutation tests at the upper limit of speed.

(ii) Machines which are not rated to give the same output at all speeds. These machines should have ratings specified for both minimum and maximum speeds.

These details are not dealt with in the other rules, but are necessary.

The new Rules do not deal with the rating question in a satisfactory manner. The continuous running for six hours as originally adopted by the E.S.C. and the maximum continuous run of 10 hours adopted by the German Rules are both better than the B.E.A.M.A. rule. Machines do not, as a rule, run continuously, so that it would be more satisfactory to rate them for daily service and to reduce the rating for continuous running. The American rules for short-time rating are more satisfactory than the B.E.A.M.A. rules. A short-time rating based on a run of short duration from cold is not a satisfactory one, in so far as it does not provide a comparison in the case of different designs.

### OVERLOADS.

**B.E.A.M.A. Rules.**—These specify the following periods of running with 25 per cent. overload for machines with continuous rating. Ten per cent. less is allowed for ventilated machines, and no overload at all is allowed for totally enclosed machines:—

100-KW. or H.P. and above	...	...	two hours
Below 100-KW. or H.P., not below 25-KW. or H.P.	...	...	one hour
Below 25-KW. or H.P., not below 2-KW. or H.P.	...	...	one half-hour
Below 2-KW. or H.P.	...	...	five minutes.

In the case of series or compound motors, the overloads are to be measured in amperes of input. The enclosed type machine must be able to carry momentary overloads, required in connection with commutator tests.

**American Rules.**—These specify for motors and generators 25 per cent. overload for two hours, and for motors 50 per cent. overload for one minute.

**German Rules.**—These specify 25 per cent. overload for half an hour and 40 per cent. for three minutes, but this overload is only permitted when the temperature limits allowed by the rules are not exceeded. They also specify that a machine must run at 15 per cent. excess speed for five minutes.

Although at first it may seem that the B.E.A.M.A. Rules are more onerous than the German, and about the same as the American, they are actually, in the majority of cases, less exacting. The majority of machines now in use come under the reduced overloads, and a very great number

are not allowed any overload at all. Overloads are unsatisfactory, and it would be better to avoid them entirely than to reduce them to a lower value than is adopted by the great commercial rivals of the British manufacturers.

Momentary overloads required in connection with commutator tests are said to be permitted, but what these are is not stated.

#### HEATING.

The rules specify the following temperature rises. - The B.E.A.M.A. Rules state that they are for an air temperature of 25° C., but no exceptions or alterations are provided until an air temperature exceeding 35° C. is reached, which is the maximum air temperature permitted by the German Rules. The American Rules only provide for the stated temperature rises when the air temperature does not exceed 25° C.

—	B.E.A.M.A.			E.S.C.	Ameri- can.	Ger- man.
	*	†	‡			
All windings ...	40° C.	47° C.	55° C.	50° C.	50° C.	60° C.
Cores in which windings are embedded ...	40° C.	47° C.	55° C.	—	—	60° C.
Stationary field coils of alternators measured by resistance ...	55° C.	—	—	60° C.	—	—
Shunt field coils of D.C. machines measured by resistance ...	60° C.	65° C.	70° C.	—	—	70° C.
Commutators ...	55° C.	55° C.	55° C.	—	55° C.	55° C.
Slip rings ...	55° C.	55° C.	55° C.	—	—	60° C.
Bearings ...	—	—	—	—	40° C.	50° C.

\* Open type. † Ventilated type. ‡ Totally enclosed type.  
§ 60° C. if by resistance.

The E.S.C. rules provide for a reduction in these temperature rises of one degree for every degree the air temperature exceeds 25° C. In all cases variation is permitted in the case of machines insulated with heat-resisting materials.

An analysis of these figures would be much simpler if temperature "rise" were replaced in all cases by maximum temperature, and many peculiarities in the rules would be avoided. The B.E.A.M.A. rules provide principally for the use of thermometers in carrying out heating tests, but in all cases the most accurate method available should be specified.

The correction for altitude in the B.E.A.M.A. rules amounts to a reduction in temperature rise of 2½ per cent. for every 1,000 ft. up.

The temperatures prescribed for short-time rating are the same as those prescribed for continuous running. As the former have periods of rest of uncertain length, some alteration either to the rating or the heating is necessary. The alteration should be applied to the rating.

Here, as in the case of overloads, the B.E.A.M.A. rules appear more conservative than they are. For example, the maximum temperatures permitted by these rules, compared with the E.S.C. and German, are as follows:—

	B.E.A.M.A.	E.S.C.	American.	German.
Windings ...	90° C.	85° C.	75° C.	95° C.
Shunt field coils ...	105° C.	85° C.	75° C.	105° C.

These figures show how deceptive "temperature rise" figures can become unless great care is taken to understand them fully.

#### GENERAL.

If these new rules (B.E.A.M.A.) were set out more completely, and some of the undefined expressions avoided, fewer exceptions to the rules would be necessary. However, they form an interesting addition to the literature on the subject, and when modified by the purchaser, should form a satisfactory basis for carrying on business in this class of apparatus.

It is, however, very desirable that the best of the various rules should be made into one complete set, with a view to their universal acceptance.

**Cable-Stealing on the Rand.**—According to the *Cape Argus*, a gang of thieves has recently been at work stealing a large quantity of electric cables, the losers including the Victoria Falls Power Co., the Croesus mine, and the Johannesburg municipality. Several arrests have been made, and some coloured men charged.

#### NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

NEXT month the Wheatstone high-speed automatic apparatus, designed to transmit 400 words per minute, will be installed by the Great North-Western Telegraph Co. between Montreal and Toronto.

The Western Power Co. are installing two more units of 13,000 h.p. capacity each.

The city of Calgary, Alberta, is evidently in need of more power, as the consulting engineer has just recommended that a contract be made with the Calgary Power Co. at once for the supply of 5,000 or more horse-power; at the same time he has reported on the question of the utilisation of natural gas, which is obtainable at a distance of some 175 miles from the city. Partly on account of possible failure of such a long pipe line and partly for other reasons, the engineer recommends the adoption of gas-fired boilers and steam engines in preference to gas engines, as the boilers could be readily fired with coal in the event of failure of the gas supply.

The Commission of Conservation has just published some very interesting figures, apparently taken partly from a paper read before the American I.E.E. by Mr. J. V. Hunter in 1911, though the figures relative to freight rates on coal from the mines to the point of consumption have been calculated from Canadian freight tariffs. The figures give a "comparison of fixed charges involved in power transmission and freight charges of fuel transportation"—in other words, they show the saving which may be effected by carrying electricity from the mines to the distributing centre instead of carrying the coal from the mines to such centre. The distance assumed is 100 miles, and it is shown that an annual saving of from about £12,400 for a 5,000-kw. plant, to about £69,300 for a 20,000-kw. plant, may be effected by transmitting electricity instead of transporting coal.

The figures are used as an argument in favour of having an investigation made into the question of utilising the lignite fields in Western Canada by putting down large central stations situated on the fields, as owing to the lignite being of comparatively low calorific value, it would not pay to transport it any great distance.

The same Commission, discussing the causes of failures in water-power projects, chief among which are under-estimation of the cost of development and over-estimation of the water power available, relates that a well-known engineer, now at the head of one of the largest power organisations in the United States, was given the following rule by one of his bankers:—

"We will not consider a water power project unless, after doubling the cost, cutting the available power in two, and reducing the market price by 40 per cent., it will still show interest on the bonds necessary to issue."

The Hydro-Electric Power Commission of Ontario, has this month (May) issued its rules and regulations dealing with ordinary inside installation work in houses, factories, &c.

These rules are based on the National Electrical Code, and, in fact, contain practically the same rules, though the general arrangement is different, and various modifications and additions have been made, chiefly with a view to the safeguarding of life.

There is one important clause in the preface which is worthy of note; this states that, "Until further notice, all such materials, fittings or devices as are formally approved by the Underwriters' Laboratories of Chicago are hereby approved by the Commission. Should it, however, be demonstrated to the satisfaction of the Commission that any fitting, material or device complies in every respect with the specifications of the Underwriters' Laboratories, the Commission may permit the use of the same."

The italics are the writer's. These words evidently indicate that the Commission is prepared to put its own seal of approval on materials, &c., without waiting for that of the Underwriters' Laboratories, provided that it be first satisfied that the specifications of the latter body have been complied with.

Thus will probably be removed, in Ontario at least, one of

the difficulties of the British manufacturer in getting his products introduced over here, as he will not need to apply to Chicago for approval, but can go direct to the Hydro-Electric Power Commission. The approval of the Commission will also be a strong recommendation for him in trying to introduce his goods into other provinces of the Dominion.

It must not be supposed that the Commission will readily grant permission for the use of materials, &c., differing from these requirements of the Underwriters, though the opening words of the foregoing quotation ("until further notice") seem to indicate that in the future there might come a time when the Commission would act on its own initiative apart from the Underwriters, though, doubtless, there will always be more or less co-operation between these two bodies.

There seems to be a steadily increasing market over here for electric household appliances of all kinds—toasters, radiators, smoothing irons, &c.—and as, so far as the writer is aware, there are no Underwriters' specifications, but only a few general requirements, to bar the way to the introduction of such appliances, it would seem that the British manufacturer should have a chance if his prices can compete.

Now that the Commission's Rules and Regulations are out, it will, however, be necessary for manufacturers to obtain the approval of that body for any materials, &c., before they can be used in installations in the Province of Ontario, for, referring again to the preface, we find the following:—

"In general, all installation material, conductors, apparatus, &c., must be of a suitable character, approved by the Commission. . . ."

The italics are again those of the writer of these notes—approval is not, of course, required for each individual piece of apparatus, but for the type or design.

**Synchronising Turret Clocks.**—In a letter to the *Times* of April 30th, Mr. H. R. Kempe described a simple and inexpensive method of applying electrical synchronisation to existing turret clocks. The latter are constructed with elaborate and costly devices to ensure accuracy of time-keeping, but the result is notoriously ineffective. However, Mr. Kempe shows that any "old clock" of a clock, so long as it will go at all, can be made to keep as accurate time as the finest clock made, at small expense and without the trouble of climbing the tower. All that is necessary is to regulate the clock to gain a little—as little as one or two seconds an hour, it may be—but to gain without fail. An electromagnet and armature fixed near the scape wheel locks the latter when the electromagnet is excited. This electromagnet is in circuit with a switch formed by the "warning" lever of the striking movement. This lever commences to rise at about 10 minutes before the hour, and in rising breaks the line circuit in which the electromagnet is placed, and on falling (as it does) exactly at the hour again closes the circuit. Wires from the electromagnet and switch pass down from the clock chamber to the base of the tower, where a fairly good quality clock (about £3 in value) is placed; this clock is fitted with a contact (in circuit with the line wires and two small dry cells), which is closed about a minute before the hour and broken exactly at the hour. When the church clock strikes, therefore, it closes the circuit, and being slightly (a second or so) in advance of the regulating clock it is stopped by the armature of the electromagnet being pulled forward. The regulating clock then breaks contact exactly at the hour and releases the scape, so that the church clock starts off exactly regulated to time, or rather exactly in correspondence with the regulating clock. The whole contrivance need cost but a few shillings, and any small error in the regulating clock is corrected by a touch of the finger; Greenwich time being received at the local telegraph office at 9 o'clock every day, enables one's watch (by means of which the regulating clock is kept right) to be set to correct time if necessary. There is nothing very special in the whole arrangement (which, however, answers its purpose admirably) it being a simplification of a somewhat similar device devised and fitted by him some years ago to the turret clock of the old General Post Office building, recently pulled down, and also to the turret clock of the Leeds Post Office building.

The great point to which Mr. Kempe draws attention is this—that as a turret clock when fitted with the arrangement is bound to keep time with the regulating clock, no matter how cheaply the former is constructed, it is only necessary that the latter should be a good timekeeper; and as the latter is far less costly than a large turret clock of good construction, the total cost of the combination—i.e., a cheap turret clock and a good regulating clock—is considerably less than that of a good turret clock, whilst the facility of regulation is very great indeed.

In later issues the subject has been further discussed by a number of correspondents, and Mr. Kempe's letter has evidently aroused a good deal of interest in the matter. Mr. Kempe, in replying to various criticisms, points out that the "forcible" mode of synchronisation which he advocates is used in the case of the Baudet, Hughes, and Delancy telegraph systems, and is in fact the only possible way of obtaining uniformity of running in such cases.

## GOODS AT OWNER'S RISK.

[FROM A LEGAL CONTRIBUTOR.]

It is not often that the trader is able to point the finger of scorn at a railway company on the ground that it has been worsted in a dispute in the Courts. Without in any way presuming upon the position which it occupies as having a virtual monopoly in certain forms of traffic, the railway company generally manages to assume a position of vantage when litigation takes place. The case of Western Electric Co. v. Great Eastern Railway Co., however, which was decided last week by two Judges of the King's Bench Division, serves to show that the railway companies, as carriers, are not able to limit their liability unless they comply strictly with statute; and, furthermore, that the fact that the trader has not asserted his rights for a number of years does not by any means involve their complete abandonment. The facts of the case were briefly these:—

The Great Eastern Railway conveyed certain goods of the plaintiffs from Antwerp to North Woolwich *via* Harwich. They were injured by rain on the train journey from Harwich. In respect of the sea transit, there was a bill of lading containing a clause exempting the company from liability for damage arising, *inter alia*, from the negligence of the crew. The bill of lading was in the company's ordinary form, which would also be applicable where goods were not sent at owner's risk. As to the carriage by land, the plaintiffs had, under the contract, been given the option of paying a higher rate in consideration of the railway accepting the position of common carriers. The County Court Judge held that the agreement was not just and reasonable, inasmuch as the plaintiffs had no optional rate on the sea voyage. He therefore held that the agreement limiting liability was void. The Judges of the King's Bench Division came to the same conclusion. Mr. Justice Channell said: "I think it extremely unjust, but of course Acts of Parliament which are passed with the best possible objects, do sometimes work injustice in particular cases."

The law on the subject is thus stated in "Halsbury's Laws of England," Vol. 4, p. 25: "Every railway and canal company, except in certain special cases, is liable for loss of, or injury to, goods in the receiving, forwarding or delivering of them, caused by the neglect or default of the company or its servants, notwithstanding any notice, condition or declaration given or made by the company limiting its liability. The company may, however, by contract limit its liability for such neglect or default provided that the conditions of the contract are such as are adjudged to be just and reasonable by the Court before whom the question may be tried, and also provided that the contract is in writing signed by the contractor or his agent. A contract purporting to limit the liability of a railway company for the neglect or default mentioned is null and void, unless it fulfils two requisites: (1) It must be in writing, signed by the consignee or his agent; and (2) its conditions must be just and reasonable (Peck v. North Staffordshire Railway Co. (1863), 10 H.L. Case 473).

It was held in 1906 that a condition that goods shall be carried at the owner's risk, the company remaining liable "for any wilful act or wilful default of the company or their servants, if proved, for fraud and theft of their servants, or for collision of trains conveying the goods within the company's limits," is reasonable where an alternative rate is offered.

Traders, generally, will not echo the sentiment of the learned judge that the decision at which he felt constrained to arrive was harsh and unjust. In these days of competition, manufacturers and others are fairly compelled to send goods at their own risk, the only alternative being payment of rates which they cannot possibly afford if a profit is to be shown.

**Bitterne.**—The South Stoneham R.D.C. has decided to grant the request of the Southampton T.C., for permission to supply current in the parish of Bitterne, where the Southampton garden suburb is being established.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

## Water Divination.

In the letter of "W. B. S." we have just the usual letter of the believer in dowsing. There are flung at us two Sirs, a Marquis, and an Emperor. But the possession of titles is no mark of special ability. What we want is facts. What and where were Sir Edward Fry's tests?

If coins under carpets can make themselves felt, what about the thousand other radioactivities which may come between the twig and water or dryness below?

On what scientific advice did Sir Henry Harman make his Horsham failures? Horsham is in the Weald, a faulted area of clays and sand rocks. I once obtained easily 10,000 gallons per hour from boring at this place. Frankly, I do not believe that Sir Henry called in scientific advice.

As to the late Marquis of Salisbury, if his Hatfield estate was the place, this is in Hertfordshire, a chalk county *par excellence*. The Amwell springs rise out of it, whence flows the New River. I have bored many wells in the county, and have yet to make a failure. In short, I am a mere stratigraphical hydrogeologist, and have been so this 20 years or more; I have bored in every main geological formation in this country, from the Crag to the Cambrian, and I have been concerned in five failures. One of these was in the fine sands of the Bracklesham, or similar sands in Hampshire. There was plenty of water, but by an error of judgment, I bored too small a hole to permit of the use of a suitable sand screen. A second was a dry chalk borehole, out of which we made a success after all by boring to the lower green sand.

A third was a boring in the Kenper Marls, not carried on by my advice, which was refused. A fourth was a borehole specially made against my earnest dissuasion. I had foretold that it would be dry. The fifth was a boring into the Weald clay, which the owner's purse did not allow to be carried through.

Thus, of these five water failures only the second was an advice failure. The fourth was a success, for it proved the correctness of the advice. The third and fifth I was merely connected with, my advice being not asked, and in one case rather brusquely refused. Is not this record of the failures out of hundreds of wells far better than the "blessed" rod of Herr Von Usler, who makes 21 per cent. failures with an appliance which, if of any real value, would be correct every time?

A dowser was given several chances on an estate in Ireland. Every declaration he made proved a failure. An artesian engineer selected a spot and made a success. Yet the owner retained his belief in dowsing even after that. And such as "W. B. S." will, perhaps, retain their faith after the comic opera of Guildford.

The folly is spread by the Daily Press, which will publish anything of this rubbishy order. Were I to send accounts of my successes to the daily Press, the advertisement canvasser would come round next day. But the dowsing charlatan gets all these Press puffs for successes in areas where an experienced man would not hesitate to bore at any spot.

The whole of the men named by "W. B. S." without any disrespect, cannot be named on the same day as water experts with one little white-haired young man of 80 known to us all.

## Hydrogeologist.

Will you allow me to add a few words to this controversy? When, about 40 years ago, I was working with a firm of hydraulic engineers in France, I had frequent opportunities of studying the "dowser" and his ways, as my firm made a speciality of supplying water and boring artesian wells. There are two types of "dowsers," one trusting entirely to luck and the illimitable gullibility of human nature, the other possessing a fair knowledge of the configuration and a smattering of the geological strata of the country he is operating in. Both, however, for reasons

best known to themselves, are most anxious to keep up the belief in the magic power of their craft, and strange to say, one success in scores of failures is generally sufficient to establish the reputation of a water diviner in a district, whereas a few pardonable mistakes may often spoil the business of an engineer who knows his profession; so much for the power of superstition and the credulity of human nature.

With regard to the divining rod, I have known many rational people who firmly believed that such a rod twisted of its own accord when approaching water, and I have myself experienced that uncanny feeling at first. But I am sure that the motion of the rod is simply caused by the muscles of the hand under nervous excitement. The "dowser" takes you to a place where he is almost certain to find water under the surface, and tells you to grip the rod very firmly with your hand and to concentrate your whole mind on the subject. In the case of a novice or a highly-strung person, this is sufficient to cause a slight twitching of the muscles, and with a little imagination he will firmly believe that the rod twisted of its own accord, especially if water is found. In case of failure, the "dowser," with a smile, assures you that you are mistaken in thinking that the rod twisted, as the divining rod can never be wrong, and suggests that you try again.

The testimony of people in high places is a very poor guarantee, as it is a well-known fact that such persons, though acting in perfect good faith, make the best mediums.

G. A. Nussbaum.

London, E.C., May 26th, 1913.

## The Mutual Protection of Engineers.

The letter of "Only an Engineer" in your current issue is not untimely. Engineers in general will have read it gladly, and will thank you for its publication. Something surely *must* be done? And, of course, nothing need long remain undone if the members of our profession would only realise the necessity and value of effective organisation. It certainly would seem apparent that our wages and working conditions may soon differ little from those of the bench. And from the employers' standpoint, why should they? But the existing institutions can do very little, I'm afraid, since they are so obviously allied with the manufacturers themselves. Nothing short of a strong, independent, live association is required. And the sooner we form it the better, is the opinion of

A Birmingham Engineer.

May 25th, 1913.

## Long-Range Instruments.

Kindly allow me to make an observation on a letter of Mr. J. W. Record, in the ELECTRICAL REVIEW, of May 9th.

The appearance of my letter in your issue of April 18th arose out of various statements made by Mr. Record. Two of them were published in *Electricity* for January 10th, and are as follows:—

1. "The Record . . . moving coil instrument . . . is outwardly distinguished from all . . . instruments hitherto available by the extraordinary length of its scale."

2. ". . . a number of years ago, Mr. B. Davies introduced a long-scale instrument . . . in this case it was impossible to arrange a longer scale arc than about 180° . . ."

3. "An advertisement of the following form:—We claim to be the *only* makers . . . of long-scale instruments for direct current. All other long-scale instruments are for alternating current and will *not* work on direct current."

Mr. Record does not mean to be inaccurate, but anyone reading my previous letter will see that all of the quoted statements are incorrect.

Moreover, the third statement is erroneous in a twofold sense. Thus, Messrs. Johnson & Phillips have produced an excellent long-scale instrument of negligible inductance and of the true root-mean-square type. Besides, we have still with us our good old friend of the same type, viz. the Cardew meter. These instruments *will* "work on direct current."

The burden of my previous letter was the "long range." This Mr. Record entirely evaded in his letter. He will therefore recognise, I am sure, the obvious necessity of quoting in detail his own statements, so as to bring them face to face with facts—facts easily accessible to all.

But for the quoted statements and the fact that some months prior to the appearance of Mr. Record's instruments Messrs. Gambrell Bros. & Co. had undertaken the manufacture of the 1893 instruments, my letter would not have been written.

As to Mr. Record's quite legitimate and substantial thrust that the writer had "twenty years' start," it may be said with a high degree of probability that had Mr. Record tried his hand at that date his experience would have been the same as mine.

B. Davies.

Enfield, May 20th, 1913.

### Electric Lighting Fittings.

After reading "H. A. W.'s" attack on indirect lighting, one feels that his knowledge is even more ancient than the obsolete type of fittings to which he refers. We are all quite prepared to admit that the old type of inverted fittings were most inefficient, especially as most of them were installed when the use of carbon lamps was in vogue.

At the present time, however, with indirect lighting fittings supplied by firms making a speciality of this form of lighting, and containing efficient forms of reflectors suitable for every condition, the results are entirely different, and, in fact, although the actual current consumption for measured foot-candles may be rather higher compared with direct lighting, it must not be forgotten that there is very little difference in efficiency when taking what may be called "visual activity" into consideration, as owing to there being no bright sources of light in the line of vision, the eye is enabled to work at its fullest aperture without strain of any kind, and one is therefore able to see as well with a lower candle-power than would be required for direct lighting.

Then, again, your correspondent would appear to assume that with indirect lighting, it is not possible to direct light where it is wanted, and thus again displays his ignorance, as with the correct type of reflectors, and the proper chain lengths, it is possible to throw most of the light on the actual working plane, and further, he infers that indirect fittings are necessarily ugly; but if he will refer to some of the lists now sent out, he will see that this is the reverse of the case, many of them being of the most ornamental appearance.

The writer is quite ready to admit that he was not prepared to encourage indirect lighting fittings as recently as two years ago, but since then, with the improvement in fittings now on the market, his opinions have been entirely altered.

In the course of his business, the writer has to put forward various forms of direct light in addition to indirect lighting, and whilst both have their own field, at the same time, indirect lighting has many advantages, amongst them being greatly increased visual comfort, owing to there being practically no shadows, and it is impossible to get in one's own light, with the further advantage, in these days of highly finished papers, that, with indirect lighting, the glaze appears to be entirely eliminated, allowing one to read or write on such paper in absolute comfort; but with direct lighting, this is certainly not the case, as it is necessary to be continually shifting the paper or book.

R. E.

**Electric Steering-gear.**—A method of controlling electric motors used for operating ordnance, steering-gear, swing bridges, &c., is described in Patent No. 1,901 of 1912, issued to A. Martin and others. A rotatable resistance box is geared to the driven apparatus, so that when the contact arm is moved, and the apparatus is set in motion, the box follows the arm until the latter stands at the "off" position, when the motor comes to rest. The rheostat is arranged to act on the fields of both the dynamo and the motor, so as to reverse the direction of the latter without affecting the direction of the former.

## BOARD OF TRADE REGULATIONS FOR OVERHEAD LINES.

THE following regulations have been issued for pressures exceeding medium-pressure continuous current and low-pressure alternating current:—

**Supply.**—1. The supply will be transmitted at a minimum pressure of — volts.

**Conductors.**—2. The conductors will be of hard-drawn copper wire or aluminium.

3. Hard-drawn copper wire conductors will have a breaking load of not less than 24 tons per sq. in., and on breaking the elongation will not be less than 2 per cent. in a length of 10 in. Aluminium conductors will have a breaking load of not less than 12 tons per sq. in., and on breaking, the elongation will not be less than 3 per cent. in a length of 10 in.

4. The minimum sag of the conductor will be regulated to give a stress due to its weight and to wind (but excluding its elasticity) of not more than one-fifth of the breaking load, at a temperature of 22° F. Wind pressure will be taken at 25 lb. per sq. ft., and the effective area of the conductor will be taken as 0.6 of the diameter multiplied into the length.

5. The minimum height of any part of any conductor from the ground will not be less than 20 ft., except with the consent of the Board of Trade.

6. Conductors will not cross any building other than a substation or be accessible to any person from any building or tree without the use of a ladder or other special appliance. When the conductors are so placed that a tree, if uprooted, could come in contact with a conductor, an earth cradle enclosing them, or some other precaution approved by the Board of Trade, will be provided to prevent all danger of any shock.

7. Conductors will not be carried by the undertakers across the premises of a consumer, except with the consent of the Board of Trade and subject to such conditions as the Board may prescribe.

**Poles.**—8. The conductors will be carried on poles, either (a) wooden poles, or (b) poles or structures of iron or steel, hereinafter called steel poles.

9. Each pole will be clearly and permanently marked with a number.

10. Danger notices will be fixed on at least one pole in five and on each pole at the crossing of a road.

11. Provision will be made to prevent climbing by barbed wire being coiled round the pole, in one or more coils of an aggregate length not less than 2 ft., the lowest coil being at least 8 ft. from the ground.

12. Where gnyrs or stays are used they will be securely anchored and earthed.

13. A continuous earth wire will be carried from pole to pole, and will be well connected to substantial earth-plates at intervals of not more than five spans; or the iron work on each pole will be connected to a substantial earth-plate.

**Wooden Poles.**—14. The poles will be sound winter felled red fir, free from large knots or other defects, with the natural butt, and will be well injected with creosote, or they will be of a description approved by the Board of Trade.

15. Single poles, or A poles, will be used for the ordinary run of the line. Stouter poles, H poles, or built up or strutted poles, provided if necessary with stays, will be used for terminals, for intermediate anchor poles, for important differences of span, and for corner poles where there is considerable change of direction. Ordinary poles provided with stays will be used where the direction makes a small change.

16. Poles of ordinary lengths, unless in rock foundation, will be set in the ground to a depth of 6 ft. The earth will be well punned into the holes. Where necessary, they will be set in concrete.

17. The factor of safety for the poles will be calculated at 10, for a wind pressure of 25 lb. per square foot; the effective area of a round pole being taken at 0.6 of the mean diameter of the exposed part into the length of that part.

**Steel Poles.**—18. Poles of tubular type will be painted with oil paint not less than once every five years, and poles of the lattice type not less than once in every three years.

19. Each pole will be set in concrete.

20. The concrete below the pole will be dropped on to a substantial cast-iron earth plate bonded to the pole by a wire or rod.

21. The factor of safety for the poles will be not less than 8, taking the maximum wind pressure at 25 lb. per square foot. In the case of lattice poles, the pressure on the lee side will be taken as one-half of the pressure on the windward side.

**Arms.**—22. The conductors will be carried on insulators mounted singly or in pairs on steel channel arms, or singly upon iron brackets fastened to the poles; or if wooden arms are used, an earthing strip or stout wire will be fastened on the upper side of each arm.

**Road Crossings.**—23. Where the line crosses over a public road, canal, or railway, the angle between the line and the direction of the road, canal, or railway at the place of crossing will not be less than 60°, and the height of the line not less than 25 ft.

24. Where the line crosses over a public road, canal, or railway or runs parallel to it at a distance less than one and a half times the height of the highest wire from the ground, it will be erected in a manner approved by the Board of Trade.

Where for the protection of his electric lines or works the Postmaster-General makes requirements, which, in addition to pro-

testing those lines or works, afford ample provision for securing the safety of the public, further protection need not be provided.

25. Provision will be made by earthing brackets, or wires, or other device, to ensure that in the event of a failure of a conductor or of a pole, the line will be put to earth.

*General.*—26. Galvanised iron wire used for stays, cradles, or other mechanical purposes; galvanised iron binding wire; arm bolts, nuts and washers; stay swivels; truss and brace rods and truss tie, tie, and brace bolts; stay rod tighteners; and test pieces, will conform with the British standard specification for such material (British standard specification of telegraph material) so far as that specification is applicable.

27. The work will be carried out so far as circumstances permit in accordance with the Post Office technical instructions for the construction of aerial lines.

28. Where the line crosses, or is in proximity to, any other wire or metal, precautions will be taken by the undertakers against the possibility of a conductor coming into contact with the other wire or metal or of the other wire or metal coming into contact with the line by breakage or otherwise.

29. Every line including its supports and all the structural parts and electrical appliances and devices belonging to or connected with the line, will be duly and efficiently supervised and maintained as regards both electrical and mechanical conditions.

30. Every line, including its supports, will be removed on ceasing to be used for the supply of energy, unless the Board of Trade are satisfied that it is to be again brought into use for such supply within a reasonable time.

*Memorandum issued for the guidance of applicants for the consent of the Board of Trade to the placing of electric lines above ground.*

Every application for the consent of the Board of Trade to the placing of electric lines above ground should be accompanied by the following particulars:—

1. Where the undertakers are a company, or a local authority supplying outside their own area, evidence of consent of the local authority for the district.

2. A statement showing commercial or other considerations why underground cables should not be used.

3. A brief description of the proposed system, including the working voltage; the kind of wire whether copper or aluminium; whether solid or stranded; the total sectional area; tensile strength and elongation; average and maximum length of span; minimum height of wires from the ground; name or description of automatic protective device, if any.

4. A statement whether the supply is to form (1) an extension of an existing system of underground cables, or (2) of an existing traction system, or (3) an independent system.

5. An ordnance map on a scale of 6 in. to the mile, showing the proposed route of the overhead lines and any existing overhead lines. The sheets of these maps must not be fastened together.

6. In the case of high and extra high pressure, plans of construction of poles, &c., on a scale of about 1 in. to the foot, or a reference to previously deposited plans where these are identical with the proposed work.

*NOTES.*—Codes of Regulations have been made (1) for overhead lines for low-pressure and medium-pressure continuous-current supply, and for low-pressure alternating-current supply; and (2) for pressure exceeding low or medium-pressure continuous-current and low-pressure alternating current. Regulations will be made for each case separately, following these codes unless special alterations are sanctioned.

Attention is called to the necessity for obtaining the approval by the Postmaster-General of plans and works under Sec. 14 of the Schedule to the Electric Lighting (Clauses) Act, 1899.

Board of Trade, May, 1913.

**Lignite as Station Fuel.**—It has just transpired that the Berlin Electricity Works Co., whose works are the oldest and the largest hitherto equipped by the A.E.G., recently secured an option until the beginning of October on the lignite mines of Golpa-Jessenitz, near Bitterfeld, and on various adjoining lignite properties, all of which represent a transaction of from £150,000 to £300,000 if carried into effect. The idea, which has already been given effect to in the same locality in connection with the Muldenstein station, which furnishes power for the operation of the Dessau-Bitterfeld electric railway, is to erect a large steam power station with boilers using lignite as fuel, and to transmit the energy at high pressure to Berlin, which is 74 miles distant in a direct air line. It has, however, to be remembered that the Berlin Municipal Council possesses the right of expropriating the Berlin electricity works in 1915, and although negotiations on the question are proceeding, it is uncertain whether the right will be exercised or the company allowed to continue its business. At any rate the Municipal Council has to decide by October 1st, 1913, whether the company's concession shall be prolonged in a modified form or whether the city shall purchase the undertaking in 1915, the former date coinciding with that on which the option on the lignite mines will expire. Nevertheless, it is said to be probable that even in the event of a change of ownership taking place, the great lignite scheme will be proceeded with for other purposes, especially as a plentiful supply of water is available from the river Mulde. It would, for instance, be possible to transmit the energy for the supply of the outlying districts of Berlin and the manufacturing works situated in those localities, whilst at the same time the Municipal Council is thought of as a possible customer should that body acquire the company's works in Berlin.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

\* **BRITISH GUIANA.**—A new Customs Tariff which is to remain in force until March 31st, 1914, saving new legislation, provides for the importation free of duty of telephones and material necessary for the construction of telephones.

**DENMARK.**—The Danish Customs Authorities have issued a decision to the effect that protectors for electric wires, telephone wires, &c., made of plate iron, about 2½ mm. thick of various lengths, one end being fitted with a pressed projecting collar with a perforation, and the other with a riveted pin to fit into the hole, are to be dutiable at the rate of 10 öre per kg. (Note 100 öre = 1s. 1½d.)

**GERMANY.**—The German Customs Authorities have decided that cable silk, i.e., raw silk for the insulation of electric wires in which two or more threads (each thread being once twisted) are united by slight torsion, is not dutiable as silk "once twisted" but as "twice twisted" as follows:—

Not made up for retail sale:

Undyed or dyed white	...	...	120 marks per 100 kg.
Dyed in colours other than white	...	140	"
Made up for retail sale	...	140	"

**FRANCE.**—The Board of Trade have received information to the effect that in future a commercial traveller who desires to obtain temporary free importation of his samples into France by depositing the amount of duty payable, which will be refunded if the samples are re-exported within 12 months, will be required by the French Customs Authorities to have in his possession a "carte de légitimation" or certificate of identity. These certificates are obtainable from Chambers of Commerce in the United Kingdom.

## PATENTS EXPIRING IN 1913.

The following are abstracts of Electrical Patents applied for in 1899, which expire during the current year. About 950 electrical Complete Specifications were filed during that year; only 53 of these, however, have been maintained for their full term of 14 years.

214. "Railway signals." M. G. L. DE FEERREIRA and H. J. PRICE. January 4th.—Relates to apparatus for electrically interlocking the block instruments and mechanical signals, and a locking mechanism for the commutator handle of the block instrument. The rimping plunger works through the spindle of the commutator handle, which carries a plate fixed to the handle or collar. The plate is formed with a slot and notches corresponding with the different positions of the handle, the notches being adapted to receive the locking-pin on the lever armature of the electromagnet.

516. "Electric telegraphs." A. MURHEAD. January 9th.—Relates to arrangements for working ultramarine and other systems of telegraphy, either singly or by duplex methods, and for translating from one cable to another. Various arrangements are described of the coil lead and bridge circuits, when duplexing; the use is also described of double or differentially wound synchronizer coils, and the use of a second such coil in connection with the final relay or translating circuits.

517. "Printing-telegraphs." C. D. ABEL. (Siemens & Halske, Aktien-gesellschaft.) January 9th.—Relates to apparatus available both as transmitter and receiver in printing-telegraphy. The apparatus is shown diagrammatically, and is too complicated for abridgment.

635. "Lighting gas by electricity." C. FRANZEN. January 11th.—The rotary disk or other gas valve and the incandescent or sparking igniting device are simultaneously operated from a common electromagnet, and the leads of the igniting device are arranged within the incandescent or other burner. The wires and the igniting device are carried by a glass tube, which may be easily detached and renewed.

1,434. "Telegraphic Apparatus." S. G. BROWN. January 21st.—Relays for telegraph systems, such as those used in submarine working, are arranged with the swinging coil carrying or connected to a fixed arm, or fixed and movable arms, which bear on the divided periphery of a rotating drum, the two sides of which are arranged in the divided battery circuit. The drum may have two pairs of conducting disks, or may be arranged horizontally when it is undivided; two horizontal drums may also be used. Several arrangements of submarine signalling are described, the essential feature of which consists in the employment of an inductive resistance having a closed magnetic field. The resistance may, or may not, be adjustable, and may have an exciting circuit to bring the magnetic core to near its saturation point.

1,862. "Electric telegraphy." F. FRANK. January 26th.—Relates to systems of wireless telegraphy in which waves of low frequency are employed, such as are generated by a Leyden jar.

4,124. "Electric stoves." H. J. DOWLING. February 24th.—Several elongated incandescent lamps are situated in front of angularly-placed reflectors of bright copper or other metal, which, with the back of a casing, form triangular channels in which air is heated and ascends below a forwardly-inclined top.

4,576. "Dynamoes, regulating." N. BROWN. (Torrill Automatic Potential Regulator Co.) February 27th.—Relates to a telestatic potential regulator for dynamoes, in which a regulating-resistance is suddenly cut in or out of the field-magnet circuit by means of one or more solenoids. In a shunt taken from points on the supply mains are arranged the operating solenoids, an electromagnet, and a resistance, while in a supplementary shunt taken from other points are arranged contacts operated by the solenoid cores, an electromagnet and a second contact arrangement, operated by a magnet. The shunt field circuit of the dynamo contains a resistance, and its terminals are connected to contacts which are opened and closed by the armature of the magnet. When the potential falls, a pair of levers, connected with the solenoid cores on the one hand and with a spring on the other, cause the closure of the contacts. The magnet thereupon becomes energised, and its armature closes the other contacts, thereby short-circuiting the resistance and producing a rise in potential.

4,801. "Electric switches." J. H. HOLMES and F. BROADBENT. March 4th.—Relates to resistance switches for motors or for circuits where it is undesirable to switch on the whole current suddenly. The switch is so arranged that the resistances are cut out slowly and automatically after the main circuit is completed, and means are provided for preventing the switch from being left in improper positions.

5,657. "Wireless telegraphy." G. MARCONI and WIRELESS TELEGRAPH AND SIGNAL Co. March 15th.—Relates to improvements in wireless telegraph apparatus. The transmitting-key is provided with a long arm, so that the contacts separate by a considerable distance when transmitting, but fall together when receiving. The contact is connected to that radiator sphere attached to the aerial wire.

5,932. "Telegraphic systems." A. POLLAR, J. VIRAG, J. EROER and F. SILBERSTEIN. March 15th.—Relates to a system of rapid signalling for submarine and other work in which the message is transmitted from a perforated tape having two rows of short and wide holes. The message is received by a telephonic receiver or an oscillation meter in which a small light mirror is caused to reflect a beam of light on to a photographic paper.

6,229. "Electric telegraphs." F. H. W. HIGGINS. March 22nd.—Colour-printing telegraph receivers are arranged to work with Wheatstone transmitters sending alternating currents. The line currents are employed to operate a polarised double electromagnet, the armature of which controls an escapement on the type-wheel shaft, and a non-polarised magnet the armature of which is released only on the stoppage of the current to effect the printing.

6,349. "Posts." SIEMENS BROS. & Co. and G. W. PERRY. March 23rd.—Telegraph and like posts are steadied in soft ground by means of a steady-plate, through an aperture in which the post is driven, forcing it into the ground. The plate has inclined ribs, and the post may have a shoulder or collar.

6,685. "Primary batteries." R. G. A. HEINRICH. March 25th.—Relates to H-shaped cells in each of which is a liquid electrode, and a common electrolyte. The invention consists in constructing the diaphragms which separate the electrodes from the electrolyte of two perforated disks, either made in one with, or fixed on, a vent tube. The space between the disks is packed with a porous material, such as asbestos.

6,883. "Gzone." M. OTTO. March 30th.—Relates to apparatus for producing ozone and other gases by means of the silent electric discharge. In this case, between fixed electrodes there are "movable separating disks having alternately conducting and insulating sectors, or more generally having alternate sectors, such that whilst one sector allows discharge to pass between the electrodes before which it moves, the following sector interrupts this discharge, and thus automatically prevents the dangerous short-circuits that might otherwise occur."

6,932. "Induction coils." G. MARCONI and WIRELESS TELEGRAPH AND SIGNAL Co. April 1st.—Induction coils for use in wireless telegraphy. The primary coils are arranged in parallel or in series-parallel, and the secondary, which may be formed of one or several sections, arranged in series and having a diminishing number of turns as the distance increases from the centre.

7,277. "Electricity, measuring." H. ARON and ARON ELECTRICITY METER, LTD. April 6th.—Quantity meters are provided with clocks for automatically changing the registration during any desired times in each day, either by connecting or disconnecting resistances or shifting change wheels to alter the rate of the meter, or otherwise by shifting connecting wheels so that registration is effected on two or more different sets of dials during the different times.

7,370. "Railways, &c., electric." LEIGH. (F. J. Sprague) April 7th.—Relates to the "multiple-unit" system of controlling an electrically driven train from any desired point on the train. The master or driver's controllers at each end of the car are connected by local wires to each other and to the motor-controllers and to the train wires which are carried through the whole length of the train by proper couplings. The motor-controller consists of a rheostat cylinder driven by a pilot motor, independent series-multiple switch, and reversing switch operated by solenoids, throttles and a switch which limits the operations of the pilot motor and the solenoids. The general arrangement is such that the main motors are put into series or multiple by manipulating any one of the driver's switches.

(To be continued.)

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

11,158. "Mariners' compasses." KELVIN & J. WHITE, LTD., and F. A. KING. May 13th.

11,169. "Section insulators for overhead electric trolley wires for tramways." C. WILLIS and A. J. BOESFIELD. May 13th.

11,177. "Telephone exchange system." E. R. CORWIN. May 13th. (Complete.)

11,191. "Electric indicator table for hotels and the like." H. MYLO. May 13th. (Complete.)

11,193. "Individual telephone mouth-pieces." C. S. WARREN. May 13th. (Complete.)

11,208. "Devices for protecting telegraph and like wires against inductive action from neighbouring circuits." O. MALL and P. KESCHWITZ. May 13th. (Complete.)

11,214. "Dynamo-electric machines." V. A. FLYNN. (Convention date, May 13th, 1912, United States.) May 13th. (Complete.)

11,215. "Fire alarms." J. STEVENS. May 13th. (Complete.)

11,219. "Method and apparatus for the electrostatic separation and cleaning of grits, grain or the like." (Convention date, April 29th, 1913, Germany.) May 13th. (Complete.)

11,240. "High-frequency dynamo-electric machines." BRITISH THOMSON-HOUSTON Co., LTD. (General Electric Co., United States.) May 13th.

11,243. "Electric telegraph stations." MANOEL CABRAL DOS SANTOS. (Convention date, May 14th, 1912, France.) May 14th. (Complete.)

11,245. "Securing electric lamps in their sockets." R. J. BOTT. May 14th.

11,250. "Receiver holder for subscribers' telephones." G. D. H. ROSS. May 14th.

11,267. "Regulation of electric circuits and means therefor." SIEMENS BROS. DYNAMO WORKS, LTD. (Siemens-Schuckertwerke, Germany.) May 14th. (Complete.)

11,274. "Apparatus for regulating electric currents passed through the human body or through electric lamps." E. E. GARFIELD. May 14th.

11,275. "Sparkling plug for igniting charges in gas, oil and petrol engines by low-tension magneto." A. B. R. PENDER. (W. G. Pender, Rhodesia.) May 14th.

11,277. "Bearings for electrical measuring instruments and the like." H. ARON-ELECTRICITÄTSZÄHLEFABRIK G.m.b.H. (Convention date, December 14th, 1912, Germany.) May 14th. (Complete.)

11,298. "Electric wire fuses." E. WEISSHERO. May 14th. (Complete.)

11,300. "Manufacture of alkali metal alloys by the electrolysis of caustic alkalies in a fused state and the manufacture of alkali metals and derived products therefrom." E. A. ASCROFT. May 14th.

11,301. "Suspension of overhead line wires for electric traction." Snc. VERDVELLI, PRIESTLEY ET Cie. (Convention date, November 20th, 1912, Switzerland.) May 14th. (Complete.)

11,313. "Alternating-current commutator electric motors." SIEMENS-SCHUCKERTWERKE G.m.b.H. Convention date, May 14th, 1912, Germany.) May 14th. (Complete.)

11,317. "Instrument for testing the magnetic susceptibility or permeability of magnetic substances." W. H. F. MURDOCH. May 15th.

11,355. "Electric switching devices." H. S. HATFIELD. May 15th.

11,368. "Burglar alarm apparatus for safes and the like." H. S. WOOLTACH. May 15th.

11,371. "Wireless telegraph transmitters." G. MARCONI. May 15th.

11,430. "Rotary magnetic separators." F. C. R. MARKS. (Maschinenbau Anstalt Humboldt, German.) May 16th. (Complete.)

11,440. "Containers for galvanic cells." E. S. FRANKLIN. May 16th.

11,441. "Apparatus for measuring high voltages." E. WILSON. May 16th.

11,453. "Means for detecting continuous electrical oscillations." MARCONI'S WIRELESS TELEGRAPH Co., LTD., and C. S. FRANKLIN. May 16th.

11,470. "Electric pocket lamp." MARCUS WEISS and W. JERGER. May 16th.

11,500. "Shears for cutting wire fences or obstacles or telegraph and telephone lines and the like." N. GULENITCH. (Addition to 13,613/11.) May 17th.

11,569. "Mariners' compasses." KELVIN & J. WHITE, LTD., M. B. FIELD and D. RENFREW. May 17th.

11,566. "Synchronous dynamo-electric machines." E. ROSENBERG. (Addition to 9,644/12.) May 17th.

11,583. "Regulation of lifts, elevators, and the like." D. TESSIERI. May 17th. (Complete.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 5d. (in stamps).

### 1911.

ELECTRIC SIGNALLING SYSTEMS. R. HACKING. 27,974. December 13th. (June 13th, 1912.)

### 1912.

DYNAMO-ELECTRIC ALTERNATING-CURRENT MACHINERY. Akt.-Ges. Brown, Boveri & Cie. 7,253. March 25th. (January 23th, 1912. Addition to No. 4,460 of 1912.)

AUTOMATIC TOLL RECORDER FOR TELEPHONE SYSTEMS. E. G. GODFREY, 7,264. March 25th. (April 3rd, 1911.)

METHOD OF REGULATING THE ATTENUATION IN ELECTRIC TELEGRAPH AND TELEPHONE LINES LOADS ACCORDING TO THE PUPIN SYSTEM, FOR VIBRATIONS OF VARIOUS PERIODICITIES. F. A. BECKER. 7,303. April 1st. (March 31st, 1911. Addition to No. 65 of 1911.)

TELEGRAPHY. E. S. HEURTLEY. 9,783. April 24th.

MANUFACTURE OF ELECTRIC INCANDESCENT FILAMENTS OR BODIES. F. HANSEN and W. F. MOHR. 9,941. April 26th.

ELECTRICALLY-HEATED APPARATUS. E. C. R. MARKS. (Landers, Fray & Clark.) 10,029. April 27th.

ELECTRIC IMPULSE TRANSMITTERS. Automatic Telephone Manufacturing Co. (Automatic Electric Co.) 10,120. April 29th.

MAGNETO CURRENT GENERATORS. E. PODLESK. 10,299. April 30th.

BRANCH EXCHANGER TELEPHONE SYSTEMS. Telefonfabrik Akt.-Ges. vorm. J. BERLINER. 10,364. May 1st. (May 11th, 1911.)

TELEPHONE SYSTEMS. T. G. MARTIN. 10,376. May 1st. (May 2nd, 1911.)

ELECTRODES FOR PRIMARY OR SECONDARY BATTERIES. A. HEIL. 10,641. May 3rd. (May 9th, 1911.)

ELECTRIC MOTORS. Submersible and J.-L. MOTORS, LTD., and T. L. R. COOPER. 10,654. May 4th.

DYNAMO-ELECTRIC MACHINES. Submersible and J.-L. MOTORS, LTD., and H. B. POYNDEY. 10,655. May 4th.

SHADE SUPPORTS AND LAMPLOCKS FOR ELECTRIC INCANDESCENT LAMPS. J. N. MOLLETT and E. E. EDWARDS. 10,738. May 6th.

## THE ACCESSION OF ELECTRICAL ENGINEERS TO PARLIAMENT.

SOME months ago a leading article appeared in this journal wherein the view was expressed that there was room for more electrical engineers in Parliament. Since that date there have been two by-elections, in which gentlemen connected with the electrical world have played a prominent and a successful part. Mr. J. C. Denison-Pender, the member for the Newmarket Division of Cambridgeshire, is well known to those who are interested in submarine cables. Mr. G. C. Hamilton, M.P. for the Altrincham Division, served an apprenticeship with Messrs. Scott & Mountain, to become, in later years, a director of Messrs. Drake and Gorham.

Here, then, be two members of Parliament whose intimate acquaintance with matters electrical renders them eminently qualified for a seat in the legislature—apart altogether from political attainments. In the same connection mention may properly be made of Mr. George Balfour, a member of the firm of Balfour, Beatty & Co., who are engaged in tramway and electrical undertakings. But for certain happenings which were recently brought to light in the case of "Balfour v. Tillett and others," we might have been able to add his name to the list of electrical M.P.'s. He stood for Govan in the election of December, 1911. The night before the poll, at a time when there was no possibility of his taking steps to refute it, a rumour was spread abroad that Mr. Balfour, as managing director of the Lanely Tramways, had refused to recognise the men's Union. He lost the election, and brought an action for libel against Mr. Ben Tillett and the *Daily Record*—a Glasgow paper. Before it was heard out, the defendants paid £1,000 and costs in settlement, and apologised. Seeing that nine-tenths of the electors were working men, it is but fair to assume that the libel had some considerable effect on the election, although it was not contended at the trial that it actually cost Mr. Balfour the seat.

It is satisfactory to note that, since our article appeared, two members of a great profession have been summoned to the great Council of the State. Were we to attribute this result to any effort of our own, we might incur the censure of him who, when speaking of the conceit of a young man, said: "He is as shy as a newspaper when speaking of its own merits!" No; the satisfactory feature of this new departure is that it is a sign of the times. Parliaments, like the races of mankind, progress and develop by slow degrees. That progress, although slow, is sure. One hundred years ago the Lower Chamber consisted almost entirely of landowners and lawyers. Either it had not occurred to the man of business to enter Parliament, or it had occurred to those who were in possession to do everything that was possible to keep him out. As for your Labour Member, he had not even been born or thought of

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

But look at the House of Commons of to-day! It contains representatives of nearly every class, creed, and business in the United Kingdom. The process of evolution has been slow, but it is by no means complete. The labour movement which commenced and developed in the nineteenth century had reached an age equal to the allotted span of human life before it began to make its voice articulate in the Halls of Westminster. Great industries, like great movements, must exist and thrive for many years before their position is thus recognised by the people who have the power of the vote. Moreover, to pass from the industry itself to the men who make and mould it, they, too, have to develop before they acquire the knowledge and the leisure which will enable them to take their places in the Parliamentary fighting line. The head of a great business cannot afford to neglect the routine work of his office unless he has educated a large staff, to whom the performance of much of the detail work can be safely delegated.

The exigencies of contemporary politics make it necessary that those who now seek to represent us in Parliament shall belong to one or other of the great political parties. But knowing, as we do, the type of man who is singled out for leadership in one of the greatest of modern industries, we have no fears on this score. Whether he be Tory or Radical, the special knowledge of the electrical engineer will be at the disposal of the legislature when questions arise which he is well qualified to answer. We are persuaded that he will now and always be an ardent exponent of the doctrine of Rutherford B. Hayes, who wrote: "He serves his party best who serves the country best."

**Payments on Account.** It constantly happens that in the carrying out of large works it becomes necessary to provide for "payment on account" as the work proceeds. An arrangement is accordingly made whereby when a certain part of the work is done, the builder or contractor becomes entitled to a certain percentage of the contract price.

While the chief duty of the engineer in relation to a contract for a large works is to supervise the work of the contractor, it is by no means an unimportant part of his duty to decide, subject to the terms of the contract, how the contractor shall be paid, and whether he is keeping up to time, having regard to all the unforeseen difficulties which arise in the execution of works of any magnitude. It is proposed to consider the legal effect of the certificate by means of which the engineer usually expresses his decision on all these different questions. As a rule, the engineer authorises the contractor to be paid, and otherwise expresses his approval by means of a certificate. To save trouble and to avoid disputes, the contract between the employer and the contractor should provide for a written certificate. Otherwise a mere verbal statement may be sufficient. Thus, to draw a legitimate analogy from a case which concerned the building trade, in *Elmes v. Burgh Market Co.*, 1891, a contract provided that: "The contractor shall receive payment for his contract at the rate of £80 per cent. for the works completed on the surveyor's certificate of completion and the balance at the end of the term of maintenance, less deductions that may be made in accordance with the terms of the contract and on the surveyor certifying that the whole works are in a complete and satisfactory state." It was held that a certificate within the meaning of this clause might be given orally by the surveyor. Where a written

certificate is expressly required the contractor is helpless unless it be forthcoming. He cannot sue the employer for the price of any portion of the work which he has done unless he can show that the certificate has been withheld by the engineer acting in collusion with the employer, subject to adjustment or re-adjustment at the end of the contract. The mere fact, therefore, that the engineer, by granting a progress certificate during the course of the work, appears to express approval of that which is already done, will not enable the contractor to sue for payment. The "progress certificate" is sometimes termed a "certificate on account." In some forms of Model Conditions sanctioned by the Institution of Electrical Engineers it is specially provided that no such certificate is to prejudice the rights of the purchasers against the contractor or relieve the contractor of his obligations for the due performance of the contract. It is usual to make provision for progress certificates by saying that the contractor shall be entitled, upon the certificates of the engineer, to payments by the employer in accordance with provisions to the following effect:—(1) As the works progress, 80 per cent. upon the contract value of the work from time to time delivered or executed on the site to the satisfaction of the engineer; (2) the remaining 20 per cent. (usually termed the retention money) in respect of each district section or part of the works as follows:—(a) 10 per cent. at the expiration of one month after the employer takes over the works, and (b) 10 per cent. at the expiration of nine months after the first 10 per cent. becomes due under (a). Payments made under the former provision are made on "progress certificates." To avoid any chance of misunderstanding as to the effect of these documents, it is often wise to insert a clause providing that the certificates given during the work shall not in any way prejudice the employer in the final settlement of accounts, in case it should appear that the contractor has been paid too much.

#### Postal Electricians in Australia.

It is becoming so usual a thing in Australia for the wages of different classes of workers to be regulated by the State, that it is no surprise to find, from a recent issue of an Australian paper, that postal electricians have applied for, and obtained, a State award. Under the Arbitration (Public Service) Act of 1911, it is not necessary for any inter-State dispute to arise before a claim may be made, and it was, therefore, only necessary for the Postal Electricians' Union to formulate its wishes to ensure consideration under the Act. The case was heard by the President of the Federal Arbitration Court, Mr. Justice Higgins. The award does not extend to either telegraph or telephone operators, but only to linemen, battery men, mechanics, overseers, inspectors, and those engaged in the mechanical department of the telegraph and telephone branches of the Post and Telegraph Department. Some of the claims that were made were rejected on the ground that they involved the transfer of responsibility for administration from the present responsible heads. The Judge declined to dictate a system of management or administration to the Department. He also declined to allow first-class railway fares for journeys over 100 miles, or to insist upon a seven-hour shift in cases where continuous work was necessary.

He pointed out how rapidly the work of the Department had increased in recent years. In New South Wales there were on December 31st, 1900, 45 telephone exchanges, 8,755 lines connected, and 12,197 instruments. Eleven years later, there were 353 exchanges, 34,551 lines connected, and 41,954 instruments in use.

Mr. Justice Higgins protested against reckless liberality as conducive to unrest and dissatisfaction in other branches of the service and kindred industries. He then referred to the rates paid in London and the provinces, and remarked that "s. here would buy as much of a worker's necessaries as 10s. would in Australia. This is a useful comparison to bear in mind."

The award gives the following minimum rates of pay to employees of the department, who are members of the Postal Electricians' Union:—

Telegraph or telephone mechanics, £168 per year; senior mechanics, £198; foreman mechanics, including foreman mechanics in electric light and power, £208; exchange foreman mechanic, £228; telephone inspectors, £228; mechanicians, Hobart or Perth, £261; Adelaide, £300; Brisbane, £312; Sydney, £321; Melbourne, £321; cadets, mechanics, or junior mechanics, 14 to 15 years of age, £39; 15 to 16, £52; 16 to 17, £65; 17 to 18, £78; 18 to 19, £91; 19 to 20, £104; 20 to 21, £126; 21 to 22, £140; 22 and upwards, £156; batterymen, £133; foreman batterymen, £186.

It was also awarded that provided it was previously decided that work had been satisfactorily performed, mechanics, senior mechanics, batterymen and foreman batterymen should receive three annual increments of £6 each, and other classes should be entitled to scheduled increases at scheduled times as the Commissioner might determine.

Except in the case of shifts, a week's work was to consist of 44 hours. Overtime to be paid at the rate of time and a half for the first five hours, and double time thereafter. Sunday duty time and a half, holiday duty double time. When shifts are worked, eight hours, including one hour for meals, to be the limit, no shift to be commenced later than 11 p.m.

Holidays to a total of 18 days each year, exclusive of Sundays and public holidays, to be allowed.

Whenever one officer temporarily takes the place of another who receives lower pay than himself, he must not suffer any reduction in pay, and if he relieves one of higher status he shall, after one month's service in the higher grade, be paid the higher rate.

A cadet mechanic is to become a junior mechanic after two years' service, or on attaining the age of 18. Every cadet or junior mechanic who attends classes, or joins classes conducted by correspondence, shall be entitled on the recommendation of his superior officer to a payment of half the fees as they fall due, and of the remainder on his passing the prescribed examination for a mechanic.

Other clauses in the award permit of the wearing of a badge of membership in the Union during working hours—a right evidently much prized in Australia—and permission for the Union to display notices on business premises.

These provisions seem decidedly more moderate in tone and temper than those given in other cases where electrical workers are concerned. They only become operative 30 days after being laid before the Federal Parliament. A motion in Parliament is necessary to vary the terms of the award.

The rates of pay seem high for the class of work to be performed, but, as stated by the Judge, the purchasing power of money is less in Australia than here. As the service is a public one, it really means that the revenue of the department must be so arranged that these rates of wages are feasible. In the end, the public pays. Up to a certain point, the gain in efficiency due to just conditions of labour warrants, even in an economic sense, the increase in working expenses; but there is a point—and that point is for the Judge in such disputes as this to find—beyond which increased working expenses bring no increase of efficiency and only result in making increased charges to the public necessary.

The provision as to help to young workers in the matter of technical class fees is, in our opinion, very good, helpful to the worker and economical to the employer. It is, to a certain extent, done in this country, but there is still room for its more general adoption. The National Telephone Co. gave a good lead to our own Post Office in this respect.

WHERE WE to come down to breakfast on one of His Majesty's Birthdays, or on the morning of one of those other auspicious occasions when Honours are announced, and discover that those in authority had actually awakened to the real merit of electrical and other engineering men and scientists, we should fancy that we were still under the influence of the visions of the night. As it is we have no need to "pinch" ourselves to find out if we are awake, for after scanning the latest list very closely, we are moved by the same old impulse to "punch" somebody editorially, which means that this Government, and those associated with it in meting out national awards, have been by vaccination, or in some other way, made immune to all engineering and electrical infections. Maybe the Government is sick with Marconi malaise or telephonitis, and does not desire to encourage those associated with these matters in any way. We regard as little short of scandalous the omission of a number of names of electrical men who have rendered signal service to the nation, and whose honours are

long overdue. Of course, we are grateful for such recognition as we find of men who have thoroughly deserved it in departments allied to electrical and other such effort. To these our hearty congratulations—but we profoundly wish that there were more of them, and that they were electrical leaders. These are the names that we select from the list announced on Tuesday last:—

*Privy Councillor:* Sir Alfred Mond, Bart., M.P., managing director of Brunner, Mond & Co. Ltd.

*Baronet:* Archibald Denny, Esq. (a past president of the Junior Institution of Engineers).

*Knight:* Prof. John Harvard Biles, LL.D., *amateur* at *Tatag* inquiry.

*Knight:* Robert Bruce, Esq., C.B., Controller of the London Postal District since 1905.

*Knight:* Prof. E. A. Schäfer, F.R.S., president of the British Association, Dundee meeting.

*Knight:* George Henry Smith, Esq., head of the firm of Frederick Smith & Co., Ltd., wire manufacturers, Halifax and Salford.

*C.B.:* Mervyn O'Gorman, Esq., Superintendent of the Royal Aircraft Factory.

*Imperial Service Order:* C. P. O'Reilly, Esq., Indian Telegraph Department, Deputy Superintendent and Honorary Assistant Superintendent, Allahabad.

### Municipal Parsimony.

A REPORT in the *Irish Times* of June 3rd of a meeting of the Dublin Corporation reveals a mental attitude on the part of some of the members which does no credit to their intelligence, though it may throw some light on the subject of the inadequate salaries of engineers in municipal employ. The revision of the scale of salaries paid to the shift engineers and switchboard attendants of the Electricity Department was under consideration, when a Mr. Partridge proposed that the matter be adjourned until the case of the working men, who taught the shift engineers and switchboard attendants their business, was considered. He said he did not think very highly of electrical engineers, as, in his opinion, it was a profession adopted by men who wanted to draw wages without doing any work.

This egregiously delinquent was greeted with laughter; tears would have been more appropriate. The Lord Mayor, who evidently is better acquainted with the facts, said he thought engineers and switchboard attendants should get at least £156 and £104 respectively—it was only a clerk's wages. The question was adjourned for further consideration, and it is to be hoped that in the meantime steps will be taken to enlighten the members of the Council as to the duties and qualifications of their technical staff.

A report on the revision of the salaries of the higher officials of the department was also considered. A Mr. Cosgrave said the rates had subsidised the concern to the extent of £45,000, and the ratepayers ought at least to get back their money before the salaries of these officers were increased. Could anything be more paltry? How can the Corporation hope to see the business making a profit unless it employs, and pays, the best men to control it? The aggregate salaries of the three officers concerned amounted to £1,500, and the capital invested in the undertaking is £750,000: the salaries, therefore, represent 0.2 per cent. on the capital value—and the three recipients are to be penalised until a profit equal to 30 years' salaries has been made by the department. The consideration of this report was adjourned for six months. Clearly it is high time that steps were taken to protect the interests of station engineers. The Association of Electrical Station Engineers may well direct its attention to the first case mentioned above, but cannot deal with the second; however, a new association is in embryo, as will be gathered from our "Correspondence" columns to-day, and if it is formed we hope it will prove effective in raising the status of engineers in the eyes of the public.

The extraordinary views of the municipal man were further illustrated in the course of the same discussion, when a Mr. Beattie stated that in 19 years the ratepayers had got only £9,000 back out of the £750,000 they had invested in the electric undertaking. "They had invested"—cannot these gentlemen realise that the ratepayers have not invested one penny in the undertaking beyond the £45,000 derived from the rates? Meum and tuum seem to have lost their meaning in Dublin.

## THE INSTITUTION OF ELECTRICAL ENGINEERS IN PARIS.

(Continued from page 883.)

DURING the visit the six aerial antennae attached to the top of the Tower were heard at work, emitting a crackling sound. On descending, the visitors heartily applauded a brief speech addressed to M. Eiffel by M. Berthelot, expressing their appreciation of his kindness in affording them the opportunity to visit his masterpiece under such agreeable conditions. Many of the party then proceeded to the underground wireless installation controlled by M. le Commandant Ferrié, which

Cliché du *Vériscope* Richard.  
THE PARTY LEAVING VERSAILLES.

is situated a few hundred yards from the Tower, and was not easily found by some of the visitors—for even when the pit through which the connection to the aerial is taken has been located, the entrance to the extensive subterranean department remains to be discovered, and at least one gentleman, to our knowledge, only attained this end when he saw the other visitors coming out of the ground. To attempt to describe the equipment of the station in detail in the space here available would be a hopeless task; but we may say that the apparatus works on the "spark" system, with generating plant of about 50 kw., and in order to increase the range and strength of the signals a 100-kw. set is now being installed.

It will be remembered that the Eiffel Tower station maintained communication throughout the campaign

beneath the underground chambers and flooded the station. The present equipment comprises three sets of transmitting apparatus, namely, the original 10 kw. plant, which is still used for moderate distances; a 40-kw. set, with Moscicki condensers of 0.7 mfd. capacity and a spark-gap which originally consisted of zinc cylinders 25 cm. in diameter x 50 cm. long, revolving 4 times per second; and a 10 kw. set with a musical spark, fed with alternating current at 600 cycles per second by a Bethenod alternator, with a spark-gap consisting of a brass tube 50 mm. in diameter and 1 mm. thick, having its axis at right angles to a flat copper disk. A blast of air is driven through the tube to blow out the sparks and keep the parts cool. With this type of spark-gap pure and regular tones are obtained, and it needs no adjustment except regulation of the gap. Signals sent by this equipment, using less than 10 kw. at the terminals of the alternator, have been received by the Marconi station at Glace Bay during the night. The success of the tube-and-disk gap led to its adoption for the 40-kw. set, using a brass tube 20 cm. in diameter and 1 cm. thick, with a copper plate 65 cm. in diameter and 2 cm. thick. The spark in this case is 15 mm. in length, and the current in the antenna has reached 60 amperes.

The antenna consists of 6 steel cables, suspended from the top of the Tower and attached at the lower ends to pillars concealed in shrubbery; the middle portions of the cables are effectively insulated from the ends, and are connected together at their lower limits and joined to a single cable dropping vertically into the station. Abundant provision of receiving apparatus is made, and the equipment also comprises all that is

Cliché du *Vériscope* Richard.  
AT THE AERODROME, BUC; M. BLERIOT IN CENTRE.

necessary for the conduct of investigations into all branches of wireless telegraphy.

Laboratory accommodation is provided for testing wireless apparatus of all kinds, and a large number of military, marine, and other sets manufactured by the three French wireless companies, were shown in operation. The spark-gap belonging to the "musical" installation for distributing time signals, meteorological and other information of value to navigators and other professional men, was set at work in the presence of the visitors, the sparks sounding like pistol shots. The enthusiasm manifested by M. Ferrié in demonstrating the capabilities of this important station—the official international centre for the distribution of time—was excelled only by the courtesy and good-nature with which he answered questions and explained apparatus, while his staff zealously followed his example.

On Friday morning Mr. Duddell presided at the meeting of the Congress, which was devoted entirely to the subject of electric traction on railways, continuing the discussion which was commenced on Wednesday. Amongst those who took part in the discussion were

Photo by B. Thomas.  
TEA AT THE TRIANON.

in Morocco, in 1908, with the cruiser Kléber, which was stationed at Casablanca; thanks to the great height of the antenna, a power of 10 kilowatts sufficed for this purpose. The success thus achieved led to the development of the station on a permanent basis; progress was delayed by the flood in 1910, which burst an old drain

Messrs. Thury, Gratzmuller, Latour, Slingo, Mazen, Grousse and Parodi. Mr. Slingo pointed out that in England the telegraphs were more liable to interference owing to the high speed at which our circuits were worked. The adoption of the central battery system for the telegraphs in London had overcome the trouble, thanks to the higher resistance and higher voltage employed, which swamped the stray currents. Alternating current harmonics gave trouble, even on perfectly erected looped overhead telephone lines.

In the afternoon a special train, provided by the courtesy of the Chemin de Fer du Nord, conveyed a large party—some 230 in number—to Chantilly, whence they drove in brakes through leafy avenues to the famous Château. They were conducted through

BLERIOT AEROPLANE ABOUT TO START.

the Musée Condé by the curator, M. Berger, and were charmed with the exquisite works of art which it contained, as well as by the splendour and beauty of the shell in which these priceless pearls are stored. Some found time for a delightful stroll through the richly-wooded grounds, and afterwards driving through Chantilly, the Newmarket of France, the party rendezvoused at the Hôtel du Grand Condé for tea before returning to the city.

Saturday morning at the Congress certainly provided the most interesting and varied programme of the week; Mr. Duddell again presided, and first M. G. Claude delivered a lecture on lighting with vapour tube lamps, a subject of which he is a master, and which he handled with inimitable grace and humour. After referring to the discovery of neon and the other rare gases of the atmosphere by Sir William Ramsay, M. Claude explained that he had succeeded in devising means of producing neon on a commercial scale; the gas was particularly suitable for use in electric lighting, owing to its low resistance to the electric discharge—neon only requiring 13 volts where air required 1,000 volts, to cause the discharge to pass.

Unfortunately, the spectrum of neon is practically devoid of blue rays, the colour of the light being a rich reddish orange, and the gas is extremely sensitive to impurities, which are given off by the electrodes. The latter are also apt to volatilise. However, by using large electrodes, and absorbing the impurities with charcoal cooled by liquid air, M. Claude has succeeded in increasing the life of the neon tube beyond that of incandescent lamps. The voltage required by the neon tube is one-third that of the Moore vapour tube lamp, and the candle-power per metre is 200 c.p. as compared with 60, the efficiency being 0.6 watt per candle against 1.7. The light is physiologically excellent, and increases visual acuity by 25 per cent.

By using mercury vapour lamps alongside of neon tubes the excess of red and deficiency of blue rays can be corrected; M. Claude has applied this correction by placing some mercury in an ordinary neon tube, which then gives the mercury vapour spectrum. When the correcting tube is used together with the ordinary neon tube, the result is an excellent white illumination giving colours in their true tints, with an overall efficiency of 0.8 to 0.9 watt per candle. These facts were admirably demonstrated by a series of experiments, which were completely successful and were extremely effective in driving home the different points made by the lecturer.

On the other hand, for some purposes, such as advertising signs, the orange-red light of the neon tube alone is most effective; with the aid of his colleague, M. de Beaufort, M. Claude has made neon tubes of small diameter in the form of letters, etc., with striking effect, and some of the theatres in Paris employ the neon tube over their entrances, rendering them conspicuous at a great distance.

Next Mr. Slingo read a paper on methods recently introduced into the British telephone exchanges for automatically facilitating manual operating, by distributing traffic evenly over a number of operators' positions, improving the transmission conditions where several call-wires terminate on one "B" position, and by automatically selecting and isolating a call-wire when one is required by an "A" operator. The experimental equipment described in the paper was installed for the Post Office by Messrs. Siemens Brothers and Co., Ltd.

M. Charbonnel briefly summarised the communication for the benefit of his colleagues, and Mr. G. H. Nash also took part in the discussion.

Commandant Ferrié followed with a paper on the application of wireless telegraphy to the distribution of time signals, explaining the methods adopted at the Eiffel Tower station for dispatching the signals, and illustrating his remarks in the most effective manner possible—namely, by receiving the signals sent out from the Tower before and at 10.45 a.m., and rendering them audible to the whole audience.

M. Ferrié also explained how the time can be given with an accuracy of 1-100 of a second by the "method of coincidences"—in essence a very old device of English origin, and familiar to the workers in physical laboratories, but new to the bulk of the audience. This was also demonstrated by a very pretty experiment, and it was explained that by this means differences in longitude could be determined with great accuracy, and observatories could obtain from one another "the right time," so as to tide over periods when bad weather rendered astronomical observations impracticable. At the International Conference held in Paris in October last year, the time signals were reorganised, and the Eiffel Tower was designated as the centre of the International time-service. The new system will come into operation on July 1st. It is interesting to note that in communicating time signals between Paris and Washington, a distance of 6,000 km., the time occupied in the transmission of the electric waves has to be taken into account, being of the order of 0.02

Photo by B. Thomas.

AEROPLANE LEAVING THE GROUND.

second, which is not a negligible quantity; it is hoped that this period will shortly be known so accurately that it will be possible to compare the times in Paris and Washington to an accuracy of 1-1,000 of a second.

M. Ferrié's interesting lecture was followed by a brief discussion, in which Messrs. Turpain and Abraham took part.

In the afternoon the members of the two Societies, with many ladies, forming a party of about 300, were conveyed in motor-omnibuses to Versailles, where they visited the Palace and, as at Chantilly, were charmed with its magnificence and the beauty of its contents. They partook of tea and light refreshments at the Trianon Palace Hotel, and here Mr. Duddell took the opportunity of expressing the gratitude of the British visitors to their hosts, and in particular the thanks of

the visiting ladies to the French Committee of ladies, headed by Madame Grosselin, who had provided so abundantly for their entertainment. M. Berthelot responded, and toasted the lady guests with a cup of tea, in the absence of a more appropriate fluid. We may remark that the thoughtfulness of our French confrères in providing tea on many occasions, often in addition to the products for which their country is justly famed, was much appreciated by many of the visitors.

From Versailles the party proceeded to the Aerodromes at Buc, where they were received by Colonel Renard, and first inspected the establishment of M. Blériot, who also welcomed the guests. A large number of Blériot aeroplanes were marshalled on the flying-ground, and ascended one after another with an ease and certainty that left nothing to be desired. The Government flying-ground was also visited, and various machines—Farman, Esnault-Pelterie, etc.—went up in succession. Often there were seven or eight aeroplanes in the air simultaneously, and the daring evolutions which they performed thrilled the spectators.

It is interesting to note that M. Berthelot himself was one of the first to acquire the title of "aviator"; but unfortunately he was too modest to favour the visitors with an exhibition of his skill.

Finally, the motor-buses conveyed the party to the Gare de Versailles, where they were received by M. Claveille, director-general of the State Railways, and Messrs. Mazen and Foucault briefly explained to them the construction of the new electric coaches, in which they returned to Paris. This concluded a meeting which was full of varied interest and will long dwell in the memories of the British visitors as a most enjoyable and successful occasion.

We are indebted to M. Perrin, director of the firm of Messrs. Richard Frères, for several of the photographs which we have reproduced in the course of this article, and to the kindness of our confrères of *La Lumière Electrique*, as well as of many other friends, for innumerable courtesies rendered to us during the visit.

(Abstracts of Papers discussed in Paris at the Joint Meeting of the INSTITUTION OF ELECTRICAL ENGINEERS and the SOCIÉTÉ INTERNATIONALE DES ÉLECTRICIENS, 21st-24th May, 1913.)

### Single-Phase Traction.

By MONSIEUR MARIUS LATOUR.

IN the first place the author makes a few general observations in regard to the mechanical construction of single-phase locomotives and to the erection of overhead conductors.

The tests carried out by the Compagnie du Midi have been very interesting, because every type of motor has been tried.

The motors experimented with, excluding the well-known Westinghouse series type, have been: (1) the simple repulsion motor (Brown, Boveri) and the compensated repulsion motor (A.E.G.); (2) the series motor with a transverse local field for compensating the electro-motive force of short-circuit under the brushes (Jeumont) and the series motor with an elliptical field (French Thomson-Houston Company).

The simple repulsion motor is shown in Fig. 1. As the present author has shown, there is found in the repulsion motor, due to the current produced in the short-circuited coil by its rotation, a transverse field which interacts with the main field so as to give a synchronously rotating field, thus ensuring satisfactory commutation at that speed. This simple observation, which previous authors have overlooked, has settled the future of the repulsion motors.

At speeds above synchronism, however, the transverse field increases in strength, the commutation becomes unsatisfactory,

the iron losses increase, and at speeds above  $\sqrt{2}$  times synchronous speed the commutation of the repulsion motor becomes worse than that of the series motor.

I have given the name compensated repulsion motor to the motor shown in Fig. 2. This motor has the essential characteristics of an ordinary repulsion motor. It has, moreover, the advantage of working at approximately unity power factor, due to the property of commutator motors with short-circuited brushes having no inductance at synchronous speed and nega-

tive inductance above that speed, even when supplied with simple alternating current.

A series motor with an artificial transverse field which neutralises the electromotive force of short-circuit as happens naturally in repulsion motors at synchronism, is shown in Fig. 3. The winding  $h$  can be connected in shunt to the terminals of the motor. If it is assumed that the compensation in the motor is provided so as to ensure perfect commutation with continuous current, it is clear that the winding  $h$  should carry a current 90 degrees out of phase with the main current. But the winding  $h$  can be allowed to assist compensation, and in this case such winding, in addition to the current which is 90 degrees out of phase, will carry a current in phase with the main current. If, on the other hand, over-compensation takes place with the winding  $C$ , the winding  $h$  will carry a current opposed to the main current.

I have given the name elliptical field motor to the motor arranged as shown in Fig. 4. A short-circuit is established between the point  $g$  of the exciting winding, which can be extended for this purpose, and the point  $h$  of the transformer supplying the motor. Apart from the ordinary compensation, which would give good commutation in the case of continuous current, a local strengthening of the field can be provided, as is shown in Fig. 4; it follows that the point  $g$  should not be so far removed from the rotor.

By rubbing surface we mean the contact area of the brushes on the commutator. The reduction in the contact surface is the important feature in alternating-current machines provided with a commutator. It is easily shown that the losses on the commutator are a minimum when the losses due to the current are equal to the losses due to the short-circuit currents.

Theory shows the decided advantage of a high peripheral speed for the commutator. To obtain the high peripheral speed a high-speed motor should be used. But high speed requires the introduction of gearing. This is the feature of the Jeumont and Westinghouse locomotives, as well as of the Oerlikon locomotive at Lötschberg. Gearing appears to give entire satisfaction from the mechanical point of view.

High speed is not in principle incompatible with any type of repulsion or series motor. But it so happens that in the case of the repulsion motor, where the number of poles is determined by the number of conductors, a frequency of 15 leads to a motor with a small number of poles.

It would seem to be difficult to obtain a pressure between the segments low enough for large powers, but the arrangement of having two short-circuits has been suggested (see Fig. 5), in which the brushes would be placed in a position where the pressure between the segments is still lower; and I have also suggested the use of independent overlapping windings, and especially the arrangement of two overlapping windings with two commutators.

A doubt may arise whether it is possible to arrange for a sufficient number of sets of brushes to carry the current. My arrangement of multiple brushes (see Fig. 6) would, however, at the same time do away with this difficulty.

The bad commutation of repulsion motors is often wrongly attributed to over-synchronism. Faulty compensation is alone responsible in such cases.

The inferiority of the repulsion type of motor at a frequency of 15 appears to lie in its weight, and indirectly in its lower efficiency. In consequence of the smaller number of poles, the repulsion motor requires a greater amount of iron; a larger external diameter is necessary, or, on the other hand, for a given external diameter a smaller bore has to be used, thus leading to a less advantageous utilisation of the material.

Whatever may be the frequency the efficiency of the repulsion motor remains in principle identical with that of a single-phase alternator of the same frequency, whilst the efficiency of a series motor tends at lower frequencies towards that of a continuous-current machine. The difference in efficiency between the two types of motor is thus appreciable at a frequency of 15.

The transverse field which is 90 degrees out of phase, and is required to neutralise the short-circuit electromotive force varies directly as the current and inversely as the speed. Supposing the excitation is provided by constant current, the resultant field of commutation is a function of the speed.

All the types of motors to which we have referred above, even the series motor of which the auxiliary pole is in shunt with the

terminals, possess, so long as their circuits are not modified, a transverse field 90 degrees out of phase, which increases linearly. Accordingly, the electromotive force of short circuit can only be neutralised satisfactorily for a certain speed. It is therefore quite natural to think of adjusting the transverse field according to the speed. These adjustments can be carried out by a centrifugal governor, or by an electrico-dynamical speed device. Complications, however, arise in this respect.

It should be noticed that the presence of true commutating poles in repulsion motors detracts from the simplicity of their construction and connections as compared with the series motor. If simple arrangements could be fitted so as to ensure a transverse field suitable for all speeds and for effecting satisfactory commutation, such arrangements would then be preferable. With the winding *h* of Fig. 3 connected across the terminals of a resistance *r* through which the principal current of the motor flows (see Fig. 7), it is seen at once that the transverse field will be proportional only to the current, and will be independent of the speed. In other words, with variable speed, the commutation of a polyphase series motor is substituted for that of a repulsion motor.

Whilst the use of a resistance may be practicable at 15 periods, it may be expected to be inadmissible at 25 periods.

In order to reduce the losses in the resistance it is convenient, a low frequency and narrow auxiliary poles having been chosen, to work with reduced air-gaps, high speeds, and a large number of poles. At a frequency of 15 periods these losses can be reduced to the negligible value of  $\frac{1}{4}$  or  $\frac{1}{2}$  of 1 per cent.

### The Electrification of the State Railway: The Paris Suburban Lines.

By MONSIEUR A. N. MAZEN.

THE State railway system, formerly the Ouest lines, serves a very considerable portion of suburban Paris. The lines of this system, which end at three termini, comprise at present a total length in this section of about 500 km. of single track. This total will be increased to 800 km. in a few years' time. A huge traffic naturally corresponds with such a large development of track. From the point of view of the number of outward and inward travellers, the St. Lazare station is by far the most important, not only of the Paris but of European stations. Only Liverpool Street Station in London is at all to be compared with it.

In addition the State railway organisation has to suffice for its main-line service; the system, with its 9,000 km. of track, brings daily from the ten principal extremities more than 80 train loads of passengers into the capital by the main lines. If to these the number of suburban trains are added, a total of more than 820 train-loads entering Paris daily is obtained, which, with the outward trains, amounts to a total of more than 1,640 trains (in and out) in the 24 hours, and as the day is made up of 1,440 minutes, this corresponds to more than a train per minute entering or leaving Paris.

The number of passengers who annually make use of the three State railway termini of Paris amounts to about 70 millions. Of this total the St. Lazare station alone accounts for about 60 millions; and the annual increase is of the order of 2 millions. The permanent way and everything connected with it must be utilised to its maximum capacity. At present the service is only made possible by using coaches with roof seats, which increase the capacity of the trains, but could not be retained in a modern scheme.

The most difficult sections to work are those in which trains having very different speeds (expresses, fast trains, local, and goods trains) are run on the same track. The traffic congestion does not allow of a very good service for the different suburban sections, and the speeds obtained are, in almost every case, insufficient. For the local trains a speed of 25 km. per hour (a speed scarcely greater than that of the Métropolitain, 20 km. per hour) can alone be assured; by the fast locals and fast trains from 35 to 45 km. per hour.

The amount of rolling stock employed in the suburban service is very considerable, in spite of the comparatively small number of trains per hour. It comprises about 1,500 coaches and 200 locomotives which represent, together with the necessary workshops and sheds, a total capital expenditure of more than 50 million francs. The utilisation of the seating capacity does not exceed 18 to 20 per cent., and the weight moved is obviously very great (1,500 million ton-kilometres per year). The final outcome from the financial point of view is a large deficit, which will go on increasing unless stringent measures are taken for improving the service as a whole, while providing for a great increase in traffic.

At a terminus the necessity of making two, three, or four movements for every train coming in or going out blocks the exit roads and undoubtedly increases the chances of accident. To increase the capacity of the terminus and its platforms, it is absolutely necessary to decrease the number of these movements by preventing the transfer of the locomotive from the back to the front of the train, by equipping the train in such a manner that it can be driven either from the front or from the rear.

With electric traction all requirements are satisfied. The system of multiple-unit control allows of all the electric motors driving the axles of the train to be worked from either end. Further, by distributing the electric motors among the different carriages of the train a large adhesive weight is available allowing rapid acceleration, which permits of the trains getting away quickly from the platforms, increasing their capacity.

The considerable experience obtained in the use of steam traction shows that it is useless to try to exceed a maximum of 10,000 to 12,000 passengers per hour with carriages without top seats, on a two-track line with frequent stops. With electric traction, with carriages 3 m. wide, and 22 m. long, and assuming eight carriages per train, the enormous figure of 40,000 passengers per hour is reached, or, considering seats only (no standing), that of 20,000 passengers per hour.

The conclusion is therefore arrived at that electric traction, with its rapid acceleration, allows of the time taken on the journey being so diminished as to double the capacity of the line. It moreover eliminates train movements and reduces the number of platforms at the termini necessary for a given service.

To obtain the preceding figures it must clearly be understood that each section of the line under consideration would be used only by suburban trains running at the same speed. This implies that trains of different speeds shall travel on separate tracks.

No section of a steam line can deal with more than 100 trains in each direction per day, whilst it is agreed that on electrified lines this figure may reach 350.

The electrified line from the Invalides to Versailles has shown traffic increases of 12 to 13 per cent. per year, while the other steam lines showed increases of barely 2 or 3 per cent.

A single type of electric carriage has been adopted, consisting of guard's van and first and second class compartments. This coach can carry 100, including straphangers. During much of the time the service will be carried out by single-coach trains, the number of seats being amply sufficient at such hours. During the time of heavier traffic and on the more busy sections the trains will be composed of several similar coaches.

The Nord-Sud has successfully employed continuous current on the three-wire system, using as conductors an overhead wire and a third rail, each at 600 volts, the track rails serving as a neutral wire. A system has thus been evolved which by suppressing the return current and its drop in pressure is completely innocuous, so far as electrolysis is concerned. The three-phase system hardly lends itself to rapid acceleration, and is useless for multiple-unit working. The other systems only employ two conductors, one of which is, in almost every case, the track rail. The single-phase system permits the use of high voltages on the working conductor; it is therefore possible to use a light overhead wire. The continuous-current system, if normal pressures of 500 to 700 volts are used, is only available with a heavy steel conductor about ground level.

With the single-phase system there is a considerable simplification in distribution from the use of static transformers in place of sub-stations with rotary converters; there is also a saving in the number of attendants, better efficiency, and freedom from electrolysis troubles. With the continuous-current system, the equipment of the coaches is much lighter and less cumbersome, the acceleration more rapid, with a better efficiency of the motors, and lastly, less waste of energy per useful ton carried.

In numerous recent railway investigations for particularly heavy traffic, the continuous-current system has shown a real superiority to the single-phase on the economic side. The stationary installations are cheaper for single-phase than for continuous-current (sub-stations and tracks). On the other hand, the equipment of the rolling stock is both heavier and more costly. The heavier the traffic the greater the advantage of the continuous-current system. It is the same with the working expenses, the more the installation is utilised, the lower is the expense per ton carried by the continuous-current system as compared with the single-phase system, chiefly owing to the weight of the equipments.

As regards the single-phase system, it is necessary to include the difficulties caused to telegraph and telephone transmission, which are not yet overcome. For all these reasons, and particularly since on most of the sections the density of the traffic is already very high and is bound to increase, the State railways, being anxious to make no mistake, have adopted the continuous-current system at 650 volts. This system is sanctioned by long usage, it is thoroughly reliable, and in the present instance it is certainly the cheapest. Everything that exists in Paris in the way of heavy electric traction is worked with continuous current at 650 volts.

To avoid trouble from frost after a thaw, a conductor rail with under collection was proposed. This rail weighs 76 kg. per metre. It is carried by supports of impregnated wood. The motor-coaches collect the current by a special shoe, called "universal," arranged so as to collect either from the upper or under surface of the rail.

The sub-stations, placed wherever possible at junctions, contain rotary converters of 1,500, 1,000, and 750 kw. output, according to their importance. Their distance apart varies from 3 to 8 km., according to the density of the traffic. The sub-stations are supplied by three-phase underground cables at 15,000 volts, 25 cycles. Electric energy will be furnished by two power stations, the construction and working of which has just been entrusted, after public tender, to an industrial syndicate. There is a sliding scale of charges under which, when the stations are finished, electric energy will be sold to the State at an inclusive charge of about 5 centimes per kilowatt-hour.

The two power stations, comprising steam turbine units of 5,000 kw., will be placed at Mouligneux and at Bezons on the banks of the Seine. When the installations are complete, they will have a capacity of about 60,000 kw., and will furnish the State with about a hundred million kw.-hours per annum.

(To be continued.)

## CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## The Mutual Protection of Engineers.

I observe with pleasure that our engineers are, at last, appealing for mutual protection. Is it not an uncomplimentary reflection on modern times that they, the greatest race of men the world has ever known, should have to do so?

If you could kindly allow a digression, I would take the liberty of reminding you that Alexander the Great made the following list of the Seven Wonders of the World:—The Pyramids of Egypt; the Hanging Gardens of Babylon; the Tomb of Mausolos; the Colossus of Rhodes; the Statue of Zeus by Phidias; the Lighthouse on the Island of Pharos; and the Temple of Diana. But Alexander the Great was not even an engineer. What has happened to his treasures?

Of the first, there is no authentic record as to whom they were erected by. With the second, after a decade, the worms and the weeds had their way. The creation of the third was too exquisite—too precious to last. In the age of Caesar the fourth was but a memory; and though it was of marble, inlaid with gold, ivory and ebony, the Romans tumbled the fifth from its pedestal, and carried it away *en bloc*. Nor has the sixth met with better fortune; whilst even in the time of Paul, the material of the seventh was used for houses and barns by anyone who cared to appropriate it.

These Seven Wonders of the World were things of pride and pomp, constructed to glorify and to amuse the few. Discord and misery and death for the many were the results of the proud plans of their making.

But to-day, if one asked the engineer to make a list of the Seven Wonders of the World, he would probably mention:—The turbo-generator; the ocean liner; the motor-car; the rotary printing machine; the telephone; the tram-car; and the modern express.

These things minister to all the people. They influence the lives of every sane and efficient person. They serve us daily. Unlike the Seven Wonders of Alexander, none are for the exclusive few. All represent inventions, not merely individual things. They can never die, because they are founded on the ideas of a race of engineers, and are self-duplicating.

The principles for which they stand sprang from the brains of the engineers, and now these principles are the priceless heritage of the living world. Other men may die and turn to dust, but the record of our engineering dreams, once made tangible, remains.

An Association for the Mutual Protection of Engineers is long overdue.

M.Sc.

May 31st, 1913.

[Our correspondent appears to be comparing incommensurables—monumental works with inventions; the former were individual constructions, each of which was unique, while the latter were the fruit of evolution extending over long periods. The Forth Bridge, the Taj Mahal, the Eiffel Tower are examples of the former class, while the wheel, the screw and the mariner's compass are comparable with the latter in importance to mankind, and are of immense antiquity. The modern engineer builds upon the foundations laid by his barbarian forerunners, whose work will endure to the crack of doom.—Eds. E.R.]

the admirable results of kindred associations (*e.g.*, the various Trade Unions, the British Medical Association, and the Law Society), an association has not yet been formed to preserve the rights and to vindicate the claims of the class of engineers to which I have referred above.

I am afraid that we cannot expect the I.C.E., the I.E.E., or the I.M.E. to champion our cause. These Institutions were formed for the purpose of furthering and promoting the technical aspects of engineering and not of protecting the individual interests of the members. As such, their members are drawn from all classes of engineers; at the Institution meetings, employer and employé fraternise with a genuine unselfish desire to further the interests of the Institution of which they are members. Any action on the part of one of the Institutions to help us now, therefore, would inevitably mean the displeasure and ultimate resignation of the employer members—a course of events which would speedily cause their ruin.

It is obvious, therefore, that we must endeavour to form a new association, something equivalent to, and comparable with, the B.M.A. The function of this association should be solely to regulate conditions of employment, and to deal with allied questions. It should not trespass on the territories of the existing institutions by becoming a technical institution. Neither should it become as academical as these. It should regard itself purely and solely as a means of protecting the interests of staff employé. There must surely be thousands of engineers who would like to see such an association initiated. Now is an opportune time for declaring their views.

Let the opportunity not be missed.

Frank Gill.

[To prevent confusion, we may say that our correspondent is not the well-known telephone engineer of the same name.—Eds. E.R.]

Your correspondents and readers in general may be interested to learn that we hope to submit for publication in your issue of June 13th or 20th definite proposals for the formation of a suitable British Engineering Staff Association. This suggested institution will have as its objective, of course, the maintenance and furtherance of the economic and social interests of engineers—mechanical, civil, electrical, &c. Meanwhile, perhaps those gentlemen who approve of such an Association will kindly give the matter as much publicity as possible.

L. H. Fletcher,

Hon. Acting Secretary, Proposed Association.

London, E.C., June 2nd, 1913.

## Heavy Capacity Lampholders and Adapters.

Some little time ago through your valuable columns I stated that the above were very much wanted, so that 5—10-ampere radiators and other medium current consuming apparatus could be fed from any lamp socket, &c. At least one manufacturer has met the long-felt want as regards the lampholder, but no one has yet supplied an adapter to carry the same current without heating up, so that the one without the other leaves the problem only half solved.

C. J. Stonier,

Sales Superintendent.

Dundee Electricity Supply,  
May 29th, 1913.

## Cable Discounts.

The formulae given on page 894 of the current ELECTRICAL REVIEW appear to be unnecessarily elaborate. List price less  $27\frac{1}{2}$  per cent., 15 per cent. and 10 per cent. is equal to list price  $\times .554625$ . Surely  $L \times .555$  is much more simple than the rather formidable formula given by your correspondent for "C.M.A. £ per mile," and the former gives a result only .07 per cent. too high, surely near enough for the "most conscientious of contractors"? For estimating .55 is quite near enough, as the error is less than 1 per cent.

It is sincerely to be hoped that the correspondence started in your columns on the above subject will develop into the definite formation of some central organised body to protect the interests of members of manufacturers' engineering staffs. When one considers the atmosphere of oppression under which many of us labour, and one's helplessness to combat the many petty inflictions that are continually imposed on us, one cannot help reproaching oneself that we have collectively been so dilatory. It is truly disappointing that in view of

As it happens, 555 and 55 are very simple multipliers to use, and the result may usually be obtained with very little figuring, and very often by inspection only. As  $555 = \frac{111}{2}$ , it is evident that 555 multiplied by an even number is equal to half that number repeated three times and followed by 0, thus:— $555 \times 4 = 2,220$ ;  $555 \times 6 = 3,330$ .

555 multiplied by an odd number is equal to half that number, with the sum of the two figures thus obtained repeated twice and inserted between the two figures, thus:—

$$555 \times 5 = 2,775; 555 \times 9 = 4,995.$$

(This is, of course, the same thing as:— $\frac{5550}{2} = 2,775$ ;  $\frac{9990}{2} = 4,995$ .)

If 55 is used, the figure in the case of an even multiplier is repeated twice only, and in the case of an odd multiplier, the middle figure is used once only, thus:— $55 \times 4 = 220$ ,  $55 \times 5 = 275$ . Though this method may appear at first sight to be rather complicated, it is really very simple. As an example, take a list price of £85 10s. (i.e., £85.5). In this case, if 555 is used, one would simply write down from inspection,

$$\begin{array}{r} 44.400 \\ 2.775 \\ \hline 27.75 \end{array}$$

and obtain the result 47.4525, or £47 9s.

If the list price is, for example, £50, the result, £27.75 or £27 15s., is obtained at once by inspection. For "C.M.A.s. per coil" the formula is  $L \times .69328125$ ;  $L \times .7$  gives a result under 1 per cent. too high.

For "C.M.A.d. per yard" the formula is  $L \times .0756307$ ;  $L \times .075$  gives a result under 1 per cent. too low. In this case it is most convenient to take three-quarters of the list price and shift the decimal point one to the left. In most cases, the result may be obtained by inspection. Similarly, for "N.A.d. per yard," it is convenient to take two-thirds of the list price and shift the decimal point one to the left.

A note may be kept of the percentage error of each formula, and if one wishes, for a special purpose, to obtain a very close figure, the necessary percentage may be added to or subtracted from the result obtained from the approximate formula.

John W. Black.

Glasgow, June 2nd, 1913.

## LEGAL.

### BALFOUR v. TILLET and the GLASGOW "DAILY RECORD."

ON May 29th was concluded, by compromise, in the King's Bench Division, before Mr. Justice Darling and a special jury, an action for damages for alleged libel brought by Mr. George Balfour, managing director of the firm of Balfour, Beatty & Co., the well-known electrical engineers and contractors, against Mr. Ben Tillett, the secretary of the Dockers' Union, and the proprietors of the Glasgow *Daily Record*. The action was a sequel to a strike of tramway men employed by the Llanely Electric Lighting and Traction Co., in which the plaintiff's firm have the controlling interest, and Mr. Balfour alleged that he was libelled by a statement which appeared in the *Daily Record*, and which was instigated by Mr. Tillett. That gentleman denied the publication, which, however, was admitted by the *Daily Record*, and both defendants pleaded justification, alleging that the statement made was true.

MR. DUKE, K.C. (for the plaintiff) explained that his client regarded the libel as a malicious falsehood, published to injure him when he was candidate for Parliamentary honours in the Conservative cause for the Govan Division of Scotland. It appeared that the plaintiff's firm formed the Llanely Tramway Co. They had engaged in many large electrical undertakings of that character, and employed on an average about 1,500 men. They were always willing to recognise a Trade Union. When the Llanely Co. was formed a branch of a Trade Union was commenced among the workmen. On the morning of Mr. Balfour's poll at Govan, in December, 1911, the following appeared in the *Daily Record*:—

"Mr. George Balfour, the Unionist candidate for Govan, is the managing director of the company that governs the tramways of Llanely. The Dockers' Union asked the company to recognise the Union, so that an endeavour might be made to avert a stoppage, but the company refused to do so. On behalf of the Union Mr. Ben Tillett then wired to Mr. Balfour, asking him to recognise the Union in order to prevent an outbreak, and Mr. Balfour has now instructed his head office to refuse that recognition." A Llanely telegram says that the strike is causing great inconvenience in the town.

That statement was read by practically nine-tenths of Mr. Balfour's constituents, who were staunch supporters of Trade Unions in general, and the result was that Mr. Balfour felt the power of the Press and the Dockers' Union, and lost his election. A few days afterwards Mr. Tillett, in a conversation he had with Mr. Balfour, without any change having taken place in the relations between the company and the men, said he was willing to get the men back to work. So he (counsel) suggested to the jury that the tramway men of Llanely had been used as political pawns, while Mr. Ben Tillett had engineered the strike for political purposes and for those purposes only.

MR. BALFOUR, in the witness box, said he served five years in a Dundee engineering works. His firm had always recognised Trade Unions, and based their system of wages on Trade Union scales. In his electoral campaign he advocated the usefulness of Trade Unions. When the threat to strike was received by the company from the Llanely men, he told Mr. Tillett that he would debate the matter directly after his election business had concluded. Although he agreed to that, Mr. Tillett brought the men out, and thus prepared a foundation for the libellous statement which appeared in the Glasgow *Daily Record*. He (witness) had never refused to recognise the Trade Union. He considered that he lost his election through the libel.

Evidence was given by MR. A. McCLEURE, the plaintiff's election agent, to the effect that on the day of the poll, after the libellous statement appeared, the men who had hitherto supported plaintiff cordially, showed signs of hostility. He was also of the opinion that the publication of the statement made an adverse difference to Mr. Balfour's chances of success.

Addressing the jury for Mr. Tillett, MR. HEALY said as far as his client was concerned, he made the statement complained of honestly and *bona fide*, believing that it was true. The strike, far from being got up for political purposes, had been going on for months before Mr. Balfour's election contest, and he thought the documents would show that Mr. Tillett did his best to suppress the strike in Wales. It was begun against his wishes and the commands of his Union. Mr. Tillett at no time stated that Mr. Balfour had refused to support Trade Union principles. What he said was that Mr. Balfour had refused to recognise the Dockers' Union, and that was true.

After a two-day hearing,

MR. SHEARMAN said that the *Daily Record* would pay the plaintiff £1,000 as damages and a sum to cover his costs, and express their regret that the paragraph had appeared. They were satisfied that there was no want of sincerity on the part of Mr. Balfour, with regard to his attitude towards Trade Unions, and therefore the appearance of the paragraph did him considerable harm.

MR. HEALY (for Mr. Tillett) said the plaintiffs now saw that his client was not an electoral disturber as had been suggested, and that the strike at Llanely had been threatened long before Mr. Balfour's election took place. Mr. Tillett now agreed that it would be unfair to suggest that Mr. Balfour had refused to recognise the Trade Union, and expressed his regret that the statement had appeared.

MR. DUKE (for the plaintiff) accepted the apology and the damages offered, and after his Lordship had expressed appreciation of the arrangement, judgment was entered for the plaintiff on the terms of the settlement.

### X.L. ELECTRIC CO. v. ARON.

IN the Chancery Division on Friday, May 30th, Mr. Justice Neville had before him a motion by the plaintiffs in this action, by which they sought to restrain the defendant, until the trial or further order, from dealing with certain electric patents in contravention of his agreement.

MR. MORITZ, in support of the motion, said that the order asked for was to restrain the defendant from selling, offering for sale, parting with, dealing with, or otherwise disposing of, certain patents which he had sold to the plaintiff company, and from opposing certain patent applications that were pending. He understood that the defendants desired an adjournment in order to answer the evidence, but much damage might be done to the plaintiffs during the week, and he could not consent to the matter standing over until the following Friday without some undertaking.

COUNSEL for the defendants said that the injunction asked for was extremely wide, and he could not give an undertaking on the terms of it, but he was quite willing to undertake for a week not to part with, charge, mortgage, or dispose of, the two patents in question.

MR. MORITZ said he could not accept that. The second part of the injunction he asked for was the most important. The defendant had entered into a contract with the plaintiff company, by which he covenanted that he had presented applications for letters patent for improvements in the inventions, the letters patent for which had been assigned to the plaintiffs. The company had purchased the defendant's inventions, and he was afterwards taken into the company's employ as electrical engineer. It had been found necessary to dismiss him, and there was consequently a considerable amount of bad blood between them. There were applications pending for patents for his inventions, which under the agreement would belong to the company, and he was threatening to withdraw them or oppose them if made by the company. There was evidence that he had written to the company's solicitor that he was quite open to consider any suggestion coming from them, but unless something definite was arrived at immediately he should withdraw his application for patent No. 19,237 of 1912. That patent, said counsel, was a most important asset of the com-

pany. The agreement between the parties was that in consideration of shares in the company the defendant should assign to them the benefit of the two patents and secure the assignment of them to the company. That he had failed to do, though the share consideration had been assigned by the company. Further, he agreed to submit to the company and its expert advisers any future inventions he might make in connection with the two patents, or any improvements in them, and any inventions in connection with electrically-worked clocks, and such inventions were to be patented at the expense of the company, and the patents assigned to them. The defendant, at the expense of the company, was, when required, to apply for foreign protection, and the attitude the defendant had adopted was calculated to prejudice the company in America, Germany, and elsewhere. The company was a private company, formed on April 28th, for the purpose of carrying out the defendant's inventions, and on May 10th, besides being managing director, he was appointed advisory engineer and superintendent at a salary of £8 a week. From that post he had been discharged for alleged misconduct, and he had now made a distinct threat to withdraw these applications for protection, which were of vital importance to the company.

His LORDSHIP said he would grant the injunction asked as an *ex parte* injunction over next Friday.

COUNSEL, for the defendant, said that the time for withdrawal before the Comptroller of the applications in question expired on Tuesday next, and he thought he ought to have authority from the company to apply to extend the time for withdrawal.

His LORDSHIP said that seemed reasonable.

MR. MORITZ said he had no objection. The company would give authority by letter to apply to the Comptroller in the name of the company and its managing director to extend the time for withdrawal of the applications before him for a fortnight.

On that understanding, his LORDSHIP granted the injunction as asked over Friday next, the motion standing adjourned until that day.

#### LONDON ELECTRIC SUPPLY CORPORATION v. WESTMINSTER ELECTRIC SUPPLY CORPORATION.

In the Chancery Division on Friday, May 30th, before Mr. Justice Eve, an application was made in this case that the order of the House of Lords should be made an order of Mr. Justice Eve's Court. The application was granted.

#### LADY'S TELEPHONE SHARE EXPERIENCE.

In the City of London Court on Monday, before Judge Lumley Smith, K.C., Mr. Walter J. Crumplin, Ockwells Cottage, Kimber Lane, Maidenhead, formerly a member of the London Stock Exchange (he having recently retired), sued Mrs. Kichgessner, 36, Upper Marylebone Street, for £50 5s. 5d. balance due on a purchase of National Telephone deferred shares. By way of defence, the Gaming Act was raised. Mr. Doughty appeared for the plaintiff, and Mr. Harold Travers for the defendant.

MR. DOUGHTY explained that the transaction sued on began in April of last year, when the defendant's daughter wrote on behalf of herself and her mother instructing the plaintiff to buy two Telephone deferred shares. They then stood at 168, and were subject to a certain amount of speculation, in view of the arbitration then proceeding between the Government and the company. The ladies imagined, of course, that the shares were going up as a result of the award. There was now a balance against the client.

PLAINTIFF said he carried the shares over at the defendant's request on several occasions, and cheques were sometimes paid by him and sometimes to him. On December 30th, she paid £13 14s. 10d. when the stock stood at 140. It then fell to 107, on account of the award coming out, and there was a further balance of £33, which defendant owed. The shares again fell, and the present balance was due. In November, he strongly urged the defendant to sell when the shares stood at 168, showing her a profit.

In cross-examination, plaintiff indignantly denied that the transaction was a gamble. Defendant told him she did not intend to take up the shares if he would carry them over, and that she was sure they would rise.

MR. TRAVERS submitted that the transaction was a gamble, and that the plaintiff could not recover.

PLAINTIFF added that he had actually paid for the shares, as he had to close the account and he had paid the difference. He was an agent for the defendant.

Mrs. KICHGESSNER, the defendant, said she never intended to take up the shares. It was only a speculation. She thought they would probably rise when the award was given.

JUDGE LUMLEY SMITH: If this were a good defence nobody would ever lose any money on the Stock Exchange. I do not think it was a gaming or wagering transaction. Judgment for the plaintiff, with costs.

#### THE NATIONAL TELEPHONE CO., LTD., v. POSTMASTER-GENERAL.

In the House of Lords on Tuesday, their Lordships said that the appeal of the National Co. failed. They would give their reasons in writing later. As the case was one which ought to be disposed of at once they formally dismissed the appeal with costs, affirming the judgment of the Court below.

## PARLIAMENTARY.

### London County Council (Tramways, Trolley Vehicles and Improvements) Bill.

ON the motion for the second reading of the above Bill in the House of Commons, an important motion was carried at the instance of Mr. H. Lawson. He moved "That it be an instruction to the Committee on the Bill to insert a provision in the Bill making the erection of trolley-vehicle equipments on, over, under, along or across any street or road in the County of London subject to the provisions of Sec. 23 of the London County Council Tramways (Electrical Power) Act, 1900." He said the question was whether the House, without any cause shown, should practically repeal the provision which was passed for ensuring that overhead wires should not be erected in London without the consent of the local authority of the borough concerned.

MR. MORRISON seconded the motion.

In the discussion which followed, MR. GOLDSMITH pointed out that at the present time the borough councils had an absolute veto with regard to tramways in London, and could stop the overhead system of tramways in their particular districts. In the case of railless trolleys, however, the promoters had not to obtain the authority or the sanction of the road authorities before they came to Parliament. He contended that if the resolution were adopted, it meant that the railless trolley system would never be adopted in any part of the county of London, because each district wanted the most expensive system—the conduit system.

SIR W. BULL, who supported the resolution at the request of the Hammersmith Borough Council, expressed the opinion that in 20 years there would not be a tramway in London.

The instruction was carried by 119 votes to 40.

**Electric Lighting Provisional Order (No. 1) Bill.**—This Bill has been before the Standing Orders Committee and referred for Second Reading. It is for the purpose of confirming Electric Lighting Orders granted by the Board of Trade to the following: To the Urban District Council of Baildon, in the West Riding of Yorkshire; to the Urban District Council of Beckenham, in respect of the parish of West Wickham; to Wm. Albert Schultz, carrying on business as the Chipping Norton Electric Supply Co.; to the U.D.C. of Hazel Grove and Bramhall; to the U.D.C. of Itchen, in the County of Southampton; to the U.D.C. of Skelton and Brotton, in the North Riding of Yorkshire, with clauses enabling them to take a supply of power from the Cleveland and Durham County Power Co.; to the U.D.C. of Southborough, in the County of Kent; to the Burslem Corporation in regard to the inclusion of the whole of Wolstanton ward in the area; to the Truro Corporation; and to the Weaverham Electric Supply Co., Ltd., in respect of certain parishes in the Northwich Rural District.

**Electric Lighting Order (No. 5) Bill.**—On Monday, the Examiners found Standing Orders complied with in regard to No. 5 Bill, which confirms Provisional Orders granted by the Board of Trade to the following:—To the U.D.C. of Caerphilly (powers not to be exercised unless transferred to a limited company); to the Colne Valley Electric Supply Co., in respect of the parish of Pinner; to the Birmingham District Power and Traction, Ltd., in respect of the County Borough of Smethwick (a clause is inserted for the protection of the Shropshire, Worcestershire and Staffordshire Electric Power Co.); to the Urban District Council of Watford, in respect of the parish of Abbots Langley; to the Wellesborough Electric Supply Co.

**Tramway Provisional Order Bill.**—The Examiners have passed the Bill promoted by the Board of Trade for confirming Provisional Orders granted to the Baildon U.D.C., for the construction of about a mile of tramway, and to the Newcastle-on-Tyne Corporation for the construction of a number of small junction lines.

**L.C.C. Greenwich Generating Station.**—Mr. W. Thorne asked the President of the Board of Trade whether his attention had been called to the recent breakdown at the London County Council Power Station at Greenwich; if he was aware that the breakdown was caused by over-loading the machinery in consequence of there not being enough machinery to generate the amount of power required for general use; and if he would cause an inquiry to be held in connection with the recent breakdown?—MR. BUXTON said he was informed by the London County Council that the breakdown in question occurred in consequence of a cotter falling out of the high-pressure piston rod of one of the engines, and that there was no foundation for the suggestion that the mishap was caused by overloading the machinery. He hardly thought that an inquiry, such as suggested, would serve any useful purpose.

**Kent Electric Power Co.**—The late Bill of the Kent Electric Power Co. to provide for the reduction and rearrangement of the capital of the company, was before the Examiners last week, and was found not to have complied with Standing Orders. The Bill will accordingly go before the Standing Orders Committee.

**York Corporation Bill.**—The York Corporation Bill has received the approval of the Unopposed Bill Committee of the House of Commons, and has been referred for Third Reading. The principal object of the Bill was to authorise the Corporation to purchase the gas undertaking, but as this was defeated by a citizens' meeting, it had to be abandoned. A number of minor matters were left in the Bill, including authority to acquire land for the purposes of the electricity undertaking.

**Nottingham Corporation Bill and West Bridgford U.D.C. Bill.**—Owing to an agreement having been come to between the promoters of the above Bills, opposition has been withdrawn, and they have been referred to the Committee on Unopposed Bills. The Notts. Corporation promoted a Bill for powers to construct tramways and provide trolley vehicles and motor-omnibuses, but by an arrangement with the West Bridgford Urban District Council, who are seeking to run motor-buses, the powers for trolley vehicles are dropped.

**Various Bills.**—In the House of Commons on May 27th the Chesterfield Corporation Railless Traction Bill and the Westgate and Birchington Gas and Electricity Bill were read a third time.

In the House of Lords on the same day the Herne Bay Gas and Electricity Bill was read a second time, and the Crowborough District Gas and Electricity Bill passed its third reading.

In the House of Commons on May 30th the Rhondda Tramways (Railless Traction) Bill, and on Monday the Metropolitan Electric Tramways (Railless Traction) Bill were read a third time. The London Electric Railway Bill, Metropolitan District Railway Bill, and Wimbledon and Sutton Railway Bill were read a second time on Monday.

In the House of Lords on June 2nd the following were read a first time:—Metropolitan Electric Tramways Railless Traction Bill, and Rhondda Tramways and Railless Traction Bill.

## BUSINESS NOTES.

**Consular Notes.—Egypt.**—In his recent report on the condition of Egypt in 1912, Lord Kitchener states that the Telegraph Department earned £E136,888, an increase of £E9,922 over 1911. Working expenses amounted to £E113,500, an increase of £E3,574. There has been an increase in all classes of messages sent and in the revenue derived from trunk telephones. Two new trunk telephone lines, viz., Ismailia to Suez and Cairo to Zagazig, have been opened, a telegraph line from Suez to Safaja, in the Red Sea littoral, *via* Jemsa, two telephone circuits at Safaja, and part of the line along the western coast of Sollum. The telegraph capital account stands at £E189,921, the interest on the capital being £E12 3s. 9d. A new scheme of deferred foreign telegrams at cheap rates has been introduced. Fifteen new offices have been opened during the year.

In a further report, dealing with the Sudan, Lord Kitchener states that the number of telegrams sent in the Sudan during 1912 increased by 6 per cent., and this increase is reflected in the revenue. There have been no extensions of the telegraph system during the year, which now consists of 4,777 miles of line and 9,896 miles of wire. The telephone service continues to expand, especially in the towns.

**China.**—The American Consul at Hankow reports that there are three electric light plants there, one for the Chinese city, and two, one of them very small, in the foreign concessions. There is a telephone service operated by the German post-office in the foreign concessions, and a Chinese telephone service in the native city. The Chinese telephone service connects with the neighbouring cities of Wuchang and Hanyang. In Wuchang there is a small electric plant, mostly for official use, but it is understood that a municipal system is contemplated. In Changsha, the capital of Hunan Province, there is a fair electric light plant, and there is also a telephone system, though the latter is little used by private persons. In Kinkiang there is no electric light plant, in Nanchang there is a small plant, and in both cities there are telephones, although there is no system in general use by any considerable number of subscribers. It would be extremely difficult, if not impossible, for a foreign company to get any public service concession, and the number of Chinese merchants with whom a joint Chinese-foreign enterprise could be conducted is still very small.

**Hawaii Islands.**—Dealing with the prospects of British trade in these islands, the British Consul, in a recent report, states that the lack of direct transportation facilities is an obstacle. Further, local business interests and connections are all centred in the United States. It is, therefore, not possible to urge the ordinary method of having travellers visit the islands, as it is more than doubtful whether any resultant business would directly compensate for the time and expense of a special trip; nevertheless, should such representatives have occasion to pass through the territory it might in certain lines be worth while to delay a little to study the local market. Possibly the most likely way to advance the small British trade would be to encourage the attention of those already handling British goods in the United States. Articles which find a market there might also be able to get a footing in Hawaii, and having no further duty to pay, both stock and organisation in the United States would be available to compete for any business which might be open. Local firms being able to deal so much more easily with the United States than with other countries could be more readily approached from there than by direct trade; this will be particularly the case should the opening of the Panama Canal lead to larger imports from the British Empire to the Pacific coast of the States.

**Philippine Islands.**—Manila and Mangarin are now connected by wireless telegraph, says an American report. A powerful plant was installed at the sugar town under joint action of the Mindoro Co. and the Bureau of Posts. The former found it difficult to conduct its extensive industry without immediate communication. When the Mangarin station gets into swing it will be able to converse with Hong Kong as well as with the stations to be erected in the Southern islands. In the latter connection it is expected to be a helpful link in Philippine communication.

**Canada.** The Canadian Minister of Railways has decided to establish wireless telegraphy between Le Pas and the Hudson Bay terminal when the harbour work is started. This will allow the department at Ottawa to keep in close touch with the progress of the work. Extensive preparations have been made to send north an expedition with dredges and equipment to start work on the harbour at the earliest possible date. The Government will probably do most of the work itself.

**Aluminium Wire Prices.**—It is stated that recent offers of Continental aluminium wire in the most marketable sizes of from 20 mm. to 15 mm. show a considerable advance over former quotations. When the price of ingots was £1 per cwt. the charges of wire ranged from £5 5s. to £6, whereas at present with ingots dearer wire has risen to from £6 10s. to £7 per cwt.

**A Swiss Absorption.**—It was expected when the Swiss firm of BROWN, ROVERI & Co entered into a community of interests with the Alioth Electricity Co., which took place two or three years ago, that the eventual result would be an amalgamation of the two undertakings. It is now announced that Brown, Roveri and Co. have acquired by purchase all the workshops of the Alioth Co. and will continue them as the company's Münchenstein branch.

**"Korfund."**—THE KORFUND Co. have recently received the following orders for insulating machines with their "Korfund" cork foundation plates to prevent the transmission of vibration and noise:—

Belfast.—One 4,000-h.p. Diesel engine.  
Hong Kong.—Two 550-h.p. Diesel engines.  
Rushden.—Two 240-h.p. Diesel engines.  
Southend-on-Sea.—Two 600-h.p. Belliss-Grompton sets.  
Wisebach.—One 70-h.p. Crossley gas engine.

**Patent Applications.**—The Comptroller-General has made an order restoring patent No. 22,125 of 1907, granted to the Westinghouse Brake Co. for "Improvements in automatic fluid pressure brake apparatus for railway and like vehicles." Messrs. Mathiesen Aktien-Gesellschaft, of Leutzsch, Leipzig, are applying for leave to amend Patent No. 22,342 of 1904, for "Improvements in Arc Lamp Electrodes." An announcement appears among our advertisements to-day.

**Ebonite Tests at the N.P.L.**—Referring to our note on the new Admiralty Specification for Ebonite, the ST. HELENS CABLE AND RUBBER CO., LTD., of Warrington, inform us that the National Physical Laboratory has made tests upon their ebonite made to the Admiralty specification, and has signified that it has passed the test required. The Admiralty test is the exceedingly severe one of 125,000 volts per millimetre. Apart from this very high-class ebonite, the company make other classes more suitable (in price) for general work.

**Book Notices.**—*Electrical Tables and Memoranda.* By S. P. Thompson, F.R.S. London: E. & F. N. Spon. Price 1s. net.—This is the second edition of the little waistcoat-pocket book, which constitutes the smallest of Dr. Thompson's many works. It is literally a *multum in parvo*, dealing with an extraordinary variety of subjects in its 131 pages; the treatment is, as would be expected, most lucid, and the matter is condensed to a degree only comparable with the tabloid system. We have read many pages of the tiny volume with interest, and find it fully up to date and packed with useful information, including a variety of tables. As a "pocket memory," it should be found very useful.

"Reports for the Year 1912 on the Geological Survey, the Geological Museum in Jernym Street, the Science Museum at South Kensington, and the Work of the Solar Physics Committee." 1913. London: Wyman & Sons, Ltd. Price 1s.

"The Year-Book of Wireless Telegraphy and Telephony." 1913. London: St. Catherine's Press. Price 2s. 6d. net.

"Car Troubles: Their Symptoms and their Cure." By H. W. Slauson. London: Harper & Bros. Price 1s. net.

"Instructions for the Use of Calculating Rule for Illumination and Photometric Measurements." By T. Hirobe and R. Mitsuda. Tokio, Japan: The Electrotechnical Laboratory.

"Chronique Illustrée du Concours International de Télégraphie Pratique, Turin, 1911." Rome: Ministero delle Poste e dei Telegrafi.

"Atti della Associazione Elettrotecnica Italiana." Vol. XVII, No. 10, May 31st, 1913. Milan: The Association. Price L. 150.

"Bulletin Mensuel de la Société Belge d'Electriciens." Vol. XXX, April, 1913. Brussels: E. Bruylant. Price 1 fr. 75 c.

**British Manufacturers in Australia.**—In the recently-published report of the Australian Association of British Manufacturers and their Representatives (430, Little Collins Street, Melbourne) reference was made to a directory that was being prepared by the Association. We have now received a copy of this publication, known as the "All-Red Directory." It contains only the names, &c., of members of the Association, as all members are entitled to have their names included in all three sections, together with full particulars of the goods which they manufacture, without any further charge beyond the annual subscription of £2 2s. The advantages derived from such publication and from circulation of the Directory are merely incidental to the general benefits of membership of the Association.

**Electric Lighting for Motor-Cars.**—THE CHLORIDE ELECTRICAL STORAGE CO., LTD., of Pendlebury, Manchester, remind us that many motor-car lighting equipments are coming into this country fitted with "Exide" accumulators, and that they manufacture this type of battery, as used on the "Delco" and other electric self-starting and lighting equipments. They also carry stocks of spare parts for these batteries.

**B.T.H. Rotary Converters.**—A most instructive pamphlet has recently been issued by the BRITISH THOMSON-HOUSTON Co., on the subject of rotary converters, which, while it naturally illustrates the methods adopted by this firm in particular, also covers in a brief, practical style the main features of rotary converter practice at the present time. It commences with a *résumé* of the characteristics of rotary converters, under which are discussed voltage and current ratios, armature heating, commutation efficiency, overload capacity, use of rotaries as three-wire balancers, and the power factor of rotaries running A.C. to D.C. Then follow several pages describing the principal methods that have been adopted for obtaining variable D.C. voltage with constant A.C. voltage and *vice versa*, the starting of rotary converters, and a further section is devoted to construction, the whole of the pages being profusely illustrated with specimen machines, curves, diagrams of connections, &c.

Under "Variation of Voltage," are discussed reactance control (*i.e.*, variation of D.C. voltage by the introduction of reactance in the supply transformer or externally) simple vector diagrams being given; booster control—an A.C. booster being inserted between the slip-rings and converter armature, the power factor in this case being independent of load and voltage; regulator control (an induction regulator inserted between transformer and rotary slip-rings); split-pole control, particularly a method using a two-part pole, which has been developed by the B.T.H. Co., and is claimed to be the simplest that has been devised where voltage variation is required independent of power factor; lastly, brush-shift control, which is not recommended.

As regards starting, diagrams illustrate (1) A.C. starting by means of transformer taps, and for machines above 500 kW.; (2) induction motor starting, using squirrel-cage or slip-ring motors; the squirrel-cage motor is recommended, except where reduction of starting current is important. The induction motor is constructed with one pair less poles than the rotary, so that it is possible to speed the rotaries up considerably above normal speed. The connections for direct-current starting are also illustrated, and this is the best method to adopt when a direct-current supply is always available for the purpose.

The section devoted to "Construction" illustrates and describes the main details of the B.T.H. rotary, which, we note, has been built in practically all sizes up to 1,500 kW., and will (if required) be built up to 3,000-KW. capacity for any voltage up to 1,500 for 25-cycle work and up to 750 volts for 50-cycle work.

**Diplomas.**—THE ELECTRICAL ENGINEERING AND EQUIPMENT Co., LTD., have been awarded a Diploma of Honour for their exhibit at the International Kinematograph Exhibition and Conference held in London recently.

THE WESTMINSTER ENGINEERING Co. have also been awarded a Diploma of Honour for their projection and photographic arc lamps exhibited at the same Exhibition. These are made at their works at Willesden Junction.

**For Sale.**—The Bermondsey Borough Council has for disposal three small generating sets. See our advertisement pages in this issue.

**Catalogues and Lists.**—MESSRS. VERITYS, LTD., 31, King Street, Covent Garden, W.C.—Priced and illustrated leaflet (No. 742) particularising their "Aston" ceiling and roof fans for D.C.

MESSRS. A. REYROLLE & Co., LTD., Highbury-on-Tyne.—We have received a collection of new lists just issued, in an expanding binding cover. The following manufactures are covered—brief descriptive matter on a fancy paper, being followed with illustrations printed on coloured art papers.—Split conductor protection; sheet-steel switchgear (three-phase generator panel up to 3,000 volts); cable glands and fittings for armoured cables; no-voltage release; wall-operated switchgear; plugs and sockets; cast-iron distribution boxes.

THE UNION ELECTRIC Co., LTD., Park Street, Southwark, London, S.E.—Advance copy of 20-page booklet giving a full illustrated account of the "Fortiter" direct-current watt-hour meter.

THE MIRRELES WATSON Co., LTD., Scotland Street, Glasgow.—Pamphlet C32 gives an illustrated description of the latest surface condensing installation (Mirreles-Leblanc rotary type), supplied by them to Pinkston Power Station, Glasgow. Readings are tabulated giving results of the plant running under the usual working conditions.

THE DIAMOND COAL CUTTER Co., Stennard Works, Wakefield, Yorks.—Twenty-page booklet, being a special exhibition number of their "Machine Mining Monthly," issued on the occasion of the Mining Machinery Exhibition, now open at the Royal Agricultural Hall. It contains half-tone views of many of the shops at the Stennard Works, and a list of users of the "Diamond" coal-cutting machines and conveyors in Great Britain.

MESSRS. ISARIA, LTD., 208, Tower Bridge Road, London, S.E.—Sixteen-page pamphlet containing full tabulated particulars and prices of their "Isaria" table, oscillating, self-rotating, ceiling and port-hole electric fans, also shutters for port-hole fans, starters and rheostats. Copies of the list may be obtained on application.

THE MIDLAND ELECTRIC MANUFACTURING Co., LTD., Stafford Works, Rea Street South, Birmingham.—48-page comprehensive price list of "M.E.M." switchgear. Thirty pages are devoted to ironclad lines, the remainder dealing with various types of fuses, fuseboards, distribution boards, knife switches and other manufactures. The illustrations are numerous and admirably clear, a good art paper being used throughout. Prices are very plainly shown

at the foot of each page. The firm who are now specialising in the manufacture of ironclad switches and switchgear, have recently made extensions and additions to the plant in their works, and larger stocks are now being carried thus ensuring prompt delivery. By mutual agreement, Messrs. G. C. Fisher & Co. ceased to represent the company's interests for Glasgow and Scotland last month, and Messrs. Andrews & Co., 198A, St. Vincent Street, Glasgow, are now their representatives, and are carrying stocks of their standard manufactures.

MESSRS. LANDIS & GYR, LTD., 28, Denman Street, London, S.E.—Leaflet relating to their switchboard wattmeters for single-phase A.C. circuits and three-phase circuits with balanced loads. Dimension sketches and diagrams of connections appear.

MESSRS. DAVID BROWN & SONS (HUDD., LTD.), Huddersfield.—16-page booklet containing information and excellent illustrations describing the "DBS" spur gear and its application as a speed reducer; also a list of double helical gears.

**Mining Machinery Exhibition**—This exhibition at the Agricultural Hall, Islington, closes at the end of this week. We shall refer to the matter in our next issue.

**Canada.**—Mr. James A. Farrell, president of the United States Steel Corporation, in testifying as to the corporation's export trade in the United States Government suit, referred to the Canadian business in part as follows:—"Through Montreal we sell about 60,000 tons of wire product a year, sheet-iron, mine rails, and sometimes standard rails, when they cannot be supplied by their own corporations. We are now supplying the Canadian Northern Railway with 25,000 tons of rails shipped by boat from Chicago and thence by rail to Calgary, where they cost \$17.13 delivered. At Vancouver we supply much material, but the freight weight from Pittsburgh there is \$18 a ton. Material from Liverpool or Antwerp may be shipped for \$6 to \$8 a ton. After we established our office there we found it necessary to run a steamship service there. Our ships leave about every two months, making stops all along the line. On the return we go into a general merchandising business."—*Canadian Engineer.*

**Dissolutions and Liquidations.**—ADAMS MANUFACTURING Co., LTD.—The following creditors were, on May 9th, appointed a committee of inspection in this matter:—Mr. Price, of Dunlop Rubber Co., Ltd.; the secretary of the Varley Magnet Co.; Mr. Brain, of Thomas Green & Co.; Mr. Watson, of the Rochdale Electric Co.; Mr. George Smith, of James Smith (Norwood), Ltd.

H. A. HARVEY & Co., LTD.—A petition was to come before the Court on Wednesday for the winding up of this company.

SOUTHPORT AND LYTHAM TEAMROAD Co.—A meeting is called for July 3rd, at 14, Castle Street, Liverpool, to hear an account of the winding up from the liquidator, Mr. J. T. Wood.

HILO MANUFACTURING Co., LTD.—A meeting is called for July 4th, at 58, Coleman Street, E.C., to hear an account of the winding up.

CANADIAN BRITISH ENGINEERING Co., LTD. (registered in 1910).—A meeting is called for July 7th, at 18, Austin Friars, E.C., to hear an account of the winding up from the liquidator, Mr. P. J. Hellis.

R. & H. DOBSON, electrical engineers, 39, Dean Road, Salford.—Messrs. Robert & Hugh Dobson have dissolved partnership. The latter attends to debts, &c.

ENGINEERING INSTRUMENTS, LTD.—This company is winding up voluntarily, with Mr. J. W. Watson, Tubwell Row, Darlington, as liquidator. An agreement has been made between Mr. J. E. Hodgkin, on behalf of the company, and the Skerne Works, Ltd., for the sale by transfer of the undertaking and the assets to the Skerne Works, Ltd. A meeting of creditors is called for June 11th, at Savings Bank Chambers, Tubwell Row, Darlington.

BULLOUGH'S ADJUSTABLE RAIL JOINT SUPPORT Co., LTD.—This company is winding up with Mr. Raymond Wells, 2-6, St. John Street, Smithfield, E.C., as liquidator.

**Fire.**—A fire on Monday afternoon at the extensive grocery premises of Mr. William Wakefield, Hetton-le-Hole, County Durham, caused damage to the value of over £5,000. An electrical plant with dynamos was completely wrecked.

**Metal for Handling Acetic Acid.**—Referring to an inquiry in our last issue, the BRITISH ALUMINIUM Co., LTD., write to point out that vessels made of pure sheet aluminium with autogenously welded seams are practically immune from corrosive action due to juices containing acetic acid. The information may be of interest to other readers besides the correspondent who made the inquiry.

**Trade Announcements.**—MESSRS. PETO & RADFORD, LTD., who have been at 100, Hatton Garden, E.C., for more than 25 years, are removing their London headquarters to 12, Heddon Street, Regent Street, W., where they will have facilities and space required by their increasing business, including covered accommodation for fitting up 25 cars at a time.

MR. T. W. MURRAY, of the Felix Street branch of Messrs. Drake and Gorham, Ltd., of Westminster, is no longer connected with the firm.

MESSRS. W. A. SHAW & Co., electrical engineers, of Warren Street, Stockport, have taken new premises at 107, Princes Street, Stockport.

MESSRS. EDWARD LE BAS & Co., of Dock House, Billiter Street, E.C., notify that their telephone numbers have been altered; in future they will have five lines, all No. 5463 Avenue.

## LIGHTING and POWER NOTES.

**Abercarn.**—It was reported at the May meeting of the U.D.C. that the B. of T. had refused to grant the Council a prov. order for electric light.

**Accrington.**—Fourteen arc lamps in the Market Hall are to be replaced by twenty 200-c.p. Osram lamps. It is computed that the change will effect a saving of nearly £49 per annum. The recently-introduced alternative charge with regard to electric lighting has been adopted by 47 persons.

**Atherton.**—The D.C. has approved of an amended estimate of the new electrical sub-station prepared by Mr. T. L. Miller, the consulting engineer, and application has been made to the L.G.B. for sanction to a loan of £6,300 instead of £5,500.

**Banbridge.**—The B. of T. has decided not to grant the prov. order recently sought by this Irish town.

**Barrow-in-Furness.**—At the T.C. meeting on June 2nd, Alderman Smith stated that the accounts of the Electricity Committee for the year ending March 31st last had now been completed. The total capital expenditure upon the undertaking had been £120,802, and of the amount they had repaid, £39,250, leaving the existing debt at £81,552. The revenue during the year, as compared with the preceding 12 months, had increased by £1,694, and it was the largest amount they had ever had. Unfortunately, the costs had increased to a greater extent, namely, £2,562, and the net profits had been reduced to £971. The increased revenue was made up of £609 for lighting, £526 for power, and £559 for traction. On the expenditure side, they had had to provide for increased rates and increased cost of coal. The output was increased by 310,940 units, which was equal to 22 per cent. Before next winter it was hoped to complete the extensions to the works, whereby they would be able to reduce the cost of production. The report was approved.

**Bexley Heath.**—Messrs. Gillespie & Beales recently organised a successful demonstration of electric cooking with the "Tricity" cooker. The lectures and demonstrations were given by Mr. Grogan on the British Electric Transformer Co., Ltd., who has interested large audiences twice a day during the past week.

**Birmingham.**—Sanction has been received from the L.G.B. to the borrowing of £50,000 for the erection of additional plant at the Summer Lane Station.

**Bispham.**—Formal sanction has been received for the borrowing of £8,155, of which £3,835 is for excess expenditure on buildings, plant and street lighting; £2,780 for additional plant wanted; and £1,540 for prospective expenditure. The Board deferred the granting of the Council's application for a loan for the extension of electric lighting to the Greenlands end of the district, because the consent of the B. of T. had not yet been obtained by the Council.

**Blackburn.**—The annual report of Mr. Wheelwright, the borough electrical engineer, on the electricity department, shows a net profit of £3,521 on the last year's working. The total units generated for lighting, power, traction and heating amounted to 6,108,685, an increase of nearly a million on the previous year. The series of interesting curves published with the statement show the progressive character of the undertaking, which has approximately 1,500 looms, with individual motors, connected to its mains in addition to other power users, who altogether aggregate 5,000 B.H.P. The report states that a noticeable increase has occurred in lighting supply, which has been introduced into the electrically-driven weaving sheds. A second turbine set has been installed, and the whole of the first three-phase H.T. contract has been completed. The original turbine installation last year was greatly delayed by the strikes, and consequently the advantage from its use was not felt. One of the curves included shows typical loading of the three-phase mill supply on March 17th last, and affords an instructive comparison with typical week-day and Sunday load curves, which are also given.

**Brighton.**—On the suggestion of Mr. J. Christie, engineer and manager of the electricity works, the Lighting Committee of the T.C. recommends the purchase of electric cooking apparatus, to be let out on hire, at the cost of £250, and the purchase of six Jackson cookers at £12 1s. each. Mr. Christie also suggests that a loan of £3,000 or £5,000 should be applied for, for the purchase of cooking apparatus, and that this should be included in a large loan for mains and feeders, motors and street lighting on the Front.

**Burnley.**—The electricity department has decided to construct a sub-station in the Burnley Lane district, and the estimated cost is £1,300. Plans have already been passed.

**Canada.**—The City of Alberta is proposing to spend £65,000 in extensions to the electric light department.

**China.**—The General Electric Co. is supplying through its Chinese branch, three H.T. three-phase alternators, coupled to Bolinders oil engines, and a 14-panel switchboard for the Fatshan Electric Light and Power Co., which will supply Fatsan, near Canton.

**Cleckheaton.**—In the annual trading accounts for the year ended March 31st, the electricity and destructor department of the Council shows a loss of £635, as compared with a year ago.

**Continental Notes.**—RUSSIA.—According to a report from St. Petersburg, the electric power station at the well-known Briansk Iron and Steel Works was destroyed by fire a few days ago.

FRANCE.—La Société de l'Energie Electrique du Littoral Méditerranéen reports a net profit of £50,863 for the last financial year, as compared with only £47,154 in the preceding 12 months.

**Croydon.**—The report on the sixteenth year of the working of the Corporation electricity works was presented at the B.C. meeting on Monday, with the accounts. The borough electrical engineer (Mr. Alex. C. Cramb) reported an increase of 242,516 units sold, of which 56,558 were for heating and cooking. It was hopeless, he remarked, to expect any material increase of business from cooking until the Corporation took in hand a satisfactory scheme for developing this business by hiring out cookers at reasonable rates. The increase of £4,082 in capital expenditure was entirely upon distribution. On the revenue account the total expenditure was £40,063, an increase of £5,074; and the total receipts were £66,740, an increase of £4,147. The cost of generation went up owing to the increased coal bill; coal contract prices had risen from 11s. 11d. per ton in 1909-10, to 18s. 3d. for certain contracts of the present year. There had been an advance in prices from 10 per cent. to 20 per cent. on practically all material purchased. At the end of the year the reserve fund stood at £39,031, plus £1,045 interest on investments, but £8,026 had since been withdrawn for new plant. There were outstanding liabilities for work chargeable against this fund amounting to £7,693. Owing to the coal strike in the spring of 1912, the new 1,000-kw. steam turbine plant, which should have been running last November, was not yet complete. A credit balance of £2,792 was carried to the appropriation account, from which £3,000 was taken towards relief of the rates. The auditors pointed out that £6,466 had been debited to revenue account, which might have been regarded as capital. The chairman of the Lighting and Electricity Committee strongly protested against the Finance Committee having taken a further £3,000 of the profits to relieve the rates, against the Committee's will. The money was needed for use in the business. Alderman Lillio remarked that that would mean that the rates would never get any benefit at all. Alderman Fox suggested that the Committee's plan now of charging certain large expenditures to revenue was to prevent the Finance Committee getting anything from the rates next year. Alderman Betteridge calculated that if coal had remained at the price it was three years ago, they would have been £8,000 or £9,000 more to the good. An amendment that the expenditure on certain new works relating to distribution and a new induced-draught plant—involving over £1,700—should not be charged to revenue, was defeated by a large majority.

**Dundee.**—The accounts of the Corporation electricity department for year ending April 30th, 1913, have just closed with a net profit of £7,028. The increase in the sale of units is between 1½ and 2 millions, representing an increased revenue of £4,000. The bulk of the increase is again for power purposes, although there is a gratifying increase of a quarter of a million units for lighting. On the expenditure side, there is, of course, a big increase in the coal account, which latter is fully £3,000 more than last year, while the assessments and taxes are also £1,000 higher due to a certain extent to the large profit in the previous year. The whole of the profit has been allocated to the reserve fund, bringing this up to fully £21,000, which is very creditable when it is considered that this has practically been built up in three years.

**Eccles.**—The revenue account of the electricity undertaking for the year ended March 31st, shows a profit of £111, based on the payment for energy by the Salford Tramways Committee from April, 1912, being calculated at the rate of 1d. per unit, both subject to adjustment on a settlement of the rate to be paid. The amount has been transferred to the credit of the reserve fund.

Officials of the Corporation have discussed with officials of the Salford Corporation the terms of settlement in reference to the price to be paid by the latter to the Eccles Corporation for energy supplied to the cars running in the borough, which is referred to on page 936.

**Epsom.**—The U.D.C. has applied to the L.G.B., for sanction to borrow £450 to defray the cost of services in connection with the electricity undertaking.

A L.G.B. inquiry was held on the 23rd ult., into the Council's application to borrow £500 for laying an electricity main in connection with the water undertaking. The inspector was informed that the pumping could be done by electricity, at the rate of 3½d. per thousand gallons. He afterwards visited both electricity and waterworks.

**Ford.**—The Sunderland R.D.C. has received an offer from the Durham Electric Supply Co. to illuminate the parish of Ford at 30s. per annum for each 50-c.p. lamp, plus 8s. for maintenance. The Council has asked the company to make the same offer in regard to the areas of Castletown and North Hylton.

**Guatemala.**—The town of Ocos is threatened with outer darkness. According to the *Popular Electricity Magazine*, a steamer of the Kosmos Line, about four years ago, was carried into shoal water by a tidal wave, and remained fast, though undamaged, near the shore. A native is said to have utilised the ship's lighting

plant during this period for supplying electricity in the town. Now, however, a salvage company has succeeded in refloating the vessel, and, incidentally, deprived the town of its electricity supply.

**Grimsby.**—The T.C. has received from the L.G.B. sanction to loans of £8,760 for additional plant for the electricity works, £120 for extension of cooling towers and oil separators, and £6,000 for mains (prospective).

**Halifax.**—The Tramways and Electricity Committee proposes to lay a H.T. cable along the main road to Well Royd, and then to erect an overhead line across open country to the premises of Messrs. C. Lindley & Co., Ltd., Beauvoir Works, Luddenden, at an estimated cost of £1,364, subject to the consent of the B. of T. being obtained. The Town Clerk is instructed to make the necessary application to the B. of T.

The Corporation has received the sanction of the L.G.B. to the borrowing of £23,180 for the provision of electricity plant and mains.

**Hebden Bridge.**—An inquiry was held by Mr. T. C. Ekin, on behalf of the L.G.B., into the request of the Council for sanction to borrow £3,250 for extensions to the electricity works. A ratepayer who was present at the inquiry said that there was a feeling amongst ratepayers that as regards efficiency and output the works had not come up to expectations, and recently the supply of electricity had been very erratic.

**Heston-Isleworth.**—The anomaly of charging some 100 C.P. lamps at £5 per annum and others £3 being considered undesirable, the U.D.C. has adopted the electrical engineer's advice to charge all such lamps in future at £1 per lamp; and also to reduce the price of 50 C.P. lamps from £3 to £2 15s. each. This will mean a reduction in the Council's charges for public lighting of £91 10s. per annum, and a corresponding decline in revenue, but the concession, it is felt, will be ultimately to the advantage of the department.

Mr. Rycroft's annual report to the Electricity Committee states that the total income for the past year was £8,878, and the working expenses £4,308, leaving a gross profit of £4,569, and a net profit of £409, after payment of £4,160 in respect of interest and repayment of principal. The net capital expenditure at the end of the year was £66,970, and the percentage of gross profit to capital expenditure, 6·8 per cent. In the previous year, the total income was £8,321, the gross profit £4,273, and the net profit £150. The output for the 12 months in units generated was 1,094,789, compared with 1,040,774 for the previous year. In regard to units sold, there was a net increase of 44,201, which may be considered satisfactory, as it is chiefly made up of new small consumers and a general expansion in business. The engineer comments on the number of improvements effected during the year, both in respect to machinery and the organisation of lighting arrangements, and notes with satisfaction that the first month of the current year shows an increase over the corresponding month of the year under review of nearly 20,000 units.

**Japan.**—According to the last Japanese mail, negotiations are in hand with the view of effecting an amalgamation of the four companies at present supplying electrical energy for lighting and power purposes in Tokio.

**Keighley.**—The Corporation has applied to the B. of T. for an order for powers to supply the urban district of Bingley with electricity in bulk. It is the intention of the Board to make the order.

**Leek.**—At a recent meeting of the U.D.C. it was intimated that Messrs. Nicholson & Hall, Ltd., a large firm of silk manufacturers, would not renew their contract for supply from the Corporation electricity department beyond the present year. The firm intends to extend the use of electricity throughout its mills, and to install its own generating plant of 800 H.P., and it is expected that the cost of power will be not more than 55d. per unit, a price at which the Council is unable to compete. Special meetings of the Council and Committees are being arranged to consider the matter.

**Leicester.**—The T.C. on May 27th adopted recommendations from the Tramways and Electricity Committee to install additional generating plant, at a cost of £52,350, in order to cope with the demand for power. A 5,000-H.P. three-phase turbo-generator is to be installed at the Lero generating station, with reversible rotary converters, switchgear, &c., and steam-raising plant; at the Aylestone station a 500-H.P. rotary converter is to be provided, and high and low-tension cables are to be laid in the various areas.

**Liverpool.**—The Mersey Docks and Harbour Board has decided to lay an electric supply main from the north-east corner of Salthouse Dock to the Albert Dock warehouses at an estimated cost of £800.

**Llandudno.**—Madoc Street and Lloyd Street are about to be lighted by electricity.

Representations having been made by leading hotel proprietors for more favourable terms for electricity for lighting purposes, the Electricity Committee recommended to the Council that a supply be provided at 3½d. per unit (as now), but that the minimum should be reduced from 15,000 to 10,000 units, with a discount of 2½ per cent. for prompt payment—these terms to apply to all consumers of 10,000 units per annum. The Council, however, has adopted an amendment to the effect that the Electric Light Committee should consider whether it would be possible to make a reduction to the general consumer.

**London.**—FULHAM.—The gross surplus on the working of the undertaking during the year ending March 31st last amounts to £6,020, as compared with £2,512 in the previous year. The net available surplus is £4,666, and gives a total available revenue balance of £7,899 to be carried to the next year's account. The revenue account shows a gross income of £40,988, as compared with £34,219 for the previous year, while the gross expenditure amounted to £36,322, as against £32,678. The total number of units sold for private purposes during the year was 3,091,166 at an average net rate of 2·32d. per unit, as compared with 2,505,747 units the previous year, at an average rate of 2·422d. per unit. The percentage of increase in the units sold during the year 1912-13 over the year 1911-12 is thus equal to 23·4d., while the actual increase in income derived from private sales was £1,989. The outstanding capital at March 31st amounted to £235,104, and the total capital repaid amounted to £49,363, equal to 17·35 per cent. of the total loans taken up. The showroom trading account shows a total income of £265, against an expenditure on stores of £224 and on rates, taxes, &c., of £155.

An expenditure of £295 has been authorised for the complete equipment of a new sub-station to improve the supply to consumers on the Queen's Club Gardens Estate, West Kensington. An expenditure of £980 has also been authorised for the erection of another new sub-station, &c., at Brandenburg Road to improve the supply in the Crabtree district.

BERMONDSEY.—The additions at the electricity station have been assessed at £1,590 gross and £530 rateable.

**Manchester.**—The detailed statistics and accounts of the electricity undertaking for the year ended March 31st, which were before the Electricity Committee last week, show that sales of current produced £167,194, as against £127,701 in the previous year. Hire of motors yielded £10,293, as against £8,616. Working expenses, other than capital charges, absorbed £253,561, as against £215,895—the difference being due to additional consumption of coal, expenses of new business, and inflated coal prices. The balance left was £223,926, as against £220,422. Average costs of production worked out at 1·033d. per unit sold, against 1·045d. in 1912. The cost of coal over the year was 12s. 4d. per ton, against 10s. 10d. in the previous year. The average price realised in pence per unit sold were 1·085 for lighting and power, and 1·046 for traction, as against 1·131 and 1·017 respectively in the previous year. The total units sold were 104 millions, against 93 millions in the previous year. On mains, the net addition was 15 miles 1,147 yards. Important developments in the lighting of the streets by electricity have taken place. The balance of £223,926 was appropriated as follows: Interest, £67,745; statutory sinking fund and voluntary supplementation thereof, £127,850; rate aid, £24,500; loss on India 3 per cent. stock, £3,831.

Mr. T. C. Ekin conducted a L.G.B. inquiry last week into an application to borrow £75,000 for electricity purposes. Mr. P. M. Heath, deputy town clerk, said the sum was made up of £45,000 for mains, £15,000 for services, and £15,000 for consumers' sub-stations. Mr. S. L. Pearce, chief electrical engineer, said they were asking for rather less than the amount allowed by the Board during the past three years. For the year ended March 31st the total units sold for all purposes was 104,340,000 units, an increase of nearly 11,000,000 units on the previous year. Mr. P. Percival, who opposed the application on behalf of the Ratepayers' Association, said he understood that the money for sub-stations was required chiefly for large power consumers, in which case these consumers had an unfair advantage over the large body of ratepayers. The inquiry was closed.

**Neath.**—The B. of T. has granted the R.D.C. an order empowering it to supply electricity in all the parishes of the Vale of Neath and the Dulais Valley.

**Nottingham.**—The Lighting Committee, reporting on the working of the department during the year ended March 31st last, states that experiments are still being carried out with clock-work automatic lighting and extinguishing apparatus, which continues to act very efficiently. The apparatus is now attached to 486 lamps. As the most efficient method of lighting, four powerful electric lamps have been erected across the middle of the open space at the top of Derby Road. This had proved most satisfactory, both as regards the lighting and the reduction of the danger arising from the cross traffic.

**Portsmouth.**—A special Electric Light Sub-Committee is considering the electric power rates charged in various towns with a view to generally reducing the rates in Portsmouth and securing a better motor load.

**St. Helens.**—A L.G.B. inquiry was held on May 28th into the application of the T.C. for a loan of £3,700 for electricity purposes—£1,049 in respect of excess expenditure on a loan of £10,800 sanctioned in 1911, £511 for switchgear, and £2,040 for a 2,000-kw. alternator. There was no opposition.

**Salford.**—The Council's E.H.T. switchgear is to be divided into two parts; this proposal will involve the provision of three extra isolation switches and five blank operating panels; the work is to be carried out by the British Westinghouse Co.

**Stafford.**—In pursuance of the arrangement as to profit-sharing by the employes at the E.L. works, the T.C. has for the past year paid a bonus of 9·90 per cent. on the wages paid, as against 11·7, 10·4 and 7·9 per cent. in the three previous years.

**Stoke-on-Trent.**—The T.C. has decided to lay a high-tension main from the Burslem works to the Tunstall boundary, in order to supply *en route* current to Mr. Alfred Meakin's Highgate Tile Works and the Goldendale Iron Works. The cost will be £3,500.

**Stretford.**—The U.D.C. is presently contemplating considerable extensions to plant, &c., 1,000 kw. is mentioned, at the generating station at Longford Bridge. The capacity of the plant at present is 1,800 kw.

**Swansea.**—After considering the price of current supplied to theatres and picture halls, the Electric Light and Tramways Committee of the T.C. has decided to reduce the charge from 3½d. to 3d. per unit. The revenue derived from these places of amusement is about £2,000 a year.

**Tempo.**—An electric lighting company has been formed in this Ulster village, the power required being obtained from a suction gas engine and water-wheel at a local saw mill.

**Ventnor.**—The U.D.C. has decided to enter into a three years' agreement with the Electric Light and Power Co. for public lighting, with 21 800-c.p. lamps.

**Wallasey.**—The Electricity Committee contemplates extensions on a large scale and the T.C. is to be asked to confirm a recommendation that borrowing powers to the extent of £65,000 be applied for. The scheme is to secure a site near the gasworks and build a new three-phase power station. It is proposed to use the present building in Seabank Road as a transforming and converting sub-station.

**Waterford.**—Mr. Mark Ruddle, city electrical engineer, Dublin, has visited the town at the request of the Corporation to report as to the advisability of starting a municipal electricity supply undertaking.

**West Ham.**—The Education Committee has decided to experiment by heating a school with electricity.

**Wood Green.**—At the May meeting of the U.D.C., an important statement was made by Mr. W. P. Harding, the clerk, upon the present position of the electric light question. As already reported in the ELECTRICAL REVIEW, the Tottenham and Edmonston Gas Co. has promoted a Bill to supply the district of Wood Green with electric light, and the North Metropolitan Electrical Power Supply Co. is also anxious to supply the district. The clerk reported that, as the result of a two days' inquiry held by the B. of T. into the application of the North Metropolitan Power Distribution Co. for a prov. order, the Board decided, after hearing all parties, not to proceed further with the application. On May 1st a Committee of the House of Commons sat to hear the application of the North Metropolitan Electric Power Supply Co. to allow it a *locus* to oppose the Bill of the Gas Co., but the Committee decided that the Supply Co. was not entitled to be heard in opposition to the Bill, and disallowed the *locus* accordingly. The petition of the Tottenham Urban District Council against this portion of the Bill had been withdrawn. Several hundreds of notices had been served upon the owners, lessees and occupiers of all dwelling houses within 300 yards of the proposed site of the Gas Co.'s generating station, and only one objection had been offered. It would now be open for the Electric Power Co. to apply to the Committee of the House of Lords for a *locus*, but, in view of the facts, the clerk concluded there was very little chance of any Committee of the House of Lords allowing a *locus* at this stage.

**Worcester.**—The accounts of the electricity undertaking, which were presented to the City Council on Monday, showed that the income for the year ending March 31st, 1913, amounted to £19,418, compared with £17,294 for 1911-12, an increase of £2,124. There was a net profit of £640, but this, and a sum of £1,526 from the general district fund, had been spent in carrying out improvements, chiefly in adopting the change from single-phase to poly-phase system. This change over had been expedited because of the unprecedented increase in the demand for power. During the year, 62 new customers had been connected, and the total increase of demand was equal to 9,742 30-watt lamps. There had been an addition of 61,721 units for lighting, and for power purposes an increase of 303,840 units. The costs of production had fallen, despite substantial increases in certain charges, from 1'0d. to 9'11d. per unit sold. The chairman of the Committee said there had been a phenomenal demand for power and lighting. The capital expenditure on the undertaking had been £168,588, and £81,000 had been written off.

**Worthing.**—Acting on the recommendation of the Electricity Committee, the T.C. approved of extensions to the plant and buildings at the generating station at an estimated cost of £6,750. Of this sum £4,850 is for extensions of the plant; and in recommending the purchase of a Diesel engine of approximately 400 B.H.P., direct-coupled to a generator of 260-kw. capacity, the resident electrical engineer, Mr. G. Porter, says that the experience of the past 16 months with Diesel engines has been extremely satisfactory. During the year ending March 31st last, the use of the oil plant enabled the fuel bill to be reduced by £750 with an increase of 10'8 per cent. in the number of units sold, as compared with the figures for the previous year. The proposed extension of the engine room buildings will afford space for a future 350-kw. set when required.

## TRAMWAY and RAILWAY NOTES.

**Aberdeen.**—The Tramways Committee has approved of the report and recommendations of a Sub-Committee regarding the tramways extension in the city. The scheme involves the running of motor-omnibuses and the equipment and running of railless trolley cars. The estimated cost is £7,830 and £6,230 respectively.

**Accrington.**—For some time past the accommodation at the car-sheds has been inadequate, and Mr. Pilling, general manager, has now prepared a preliminary report. The Electricity Committee has gone into the matter, and the borough engineer has been instructed to prepare plans for an extension.

**Bingley.**—A conference has been held between representatives of the U.D.C. and of the Bradford Corporation with reference to the commencement of the Bingley tramway. At a meeting of the U.D.C. Mr. Dawson, who formed one of the sub-Committee, stated that after discussion the conclusion arrived at was that there was no reason why the Corporation should not go on with the work of laying the line forthwith. The powers granted required that the work of construction was to be substantially commenced within 12 months, and as the powers were granted on August 6th last year, he thought the requirements would be met, and that every preparation was being made.

**Blackpool.**—On May 30th the brake on a Promenade car at the Gynn failed to act, and the car ran across the road, crossed the Fleetwood tramlines, and was only prevented from descending the steep Warbrick Hill by colliding with a trolley standard. Fortunately there was no Fleetwood car passing, or there might have been a serious smash.

**Bradford.**—The city tramways traffic report for the 54 days of the year show that the receipts were £46,018, and the car-mileage 920,800, against £41,193, and 892,262 miles for the 55 days of last year. The receipts for the present year show an increase of £1,825 on last year.

**Brighouse.**—The T.C. has complained to the Halifax Corporation about the totally inadequate service of cars from Brighouse to Bailiff Bridge, especially since the inauguration of the Bradford Corporation tramway service to that place.

**Croydon.**—The figures presented at the B.C. meeting on Monday showed increased mileage run and a considerable decrease of passengers, due to motor-bus competition. To meet it the whole of the Council's 75 cars were in service on a recent Saturday, Sunday and Monday. The chairman of the Tramways Committee (Councillor Denning) declared that it would be suicidal, with the present competition, to reduce the mileage.

**Darwen.**—Instead of giving the work to an agent as formerly, Darwen Tramways Committee have decided to take over all matters concerning advertisements on Corporation tramcars.

**Davyhulme.**—An agitation has been set on foot for securing the running of cars through Trafford Park to Davyhulme, a village near the Ship Canal, which is being rapidly developed.

**Edinburgh.**—Following suggestions as to the possibility of adapting self-propelled cars to the existing service, Mr. W. A. Stevens, of the Tilling-Stevens Co., makers of the electric 'bus and car, visited Edinburgh last week, and accompanied by the burgh engineer, inspected certain routes. The power stations were also inspected. Later, Mr. Stevens had an interview with Mr. Shepherd, manager, and Mr. Harris, engineer, of the Edinburgh Tramway Co. At a meeting of the Tramway Committee held later in the week, Mr. Stevens stated that there would be no difficulty in applying the self-propelled car to any of the lines in Edinburgh. On the other hand, he was afraid that the Edinburgh cable car could not be adapted to the petrol-electric chassis. That, he explained, would be commercially impracticable. The Committee also discussed the report of the deputation which visited various English towns in connection with the tramway developments.

**Greenock.**—The Corporation has appointed a deputation to collect information regarding the railless trolley system. The intention is to introduce the system, if it is found suitable, in the upper parts of the town where such facilities are urgently required.

**Huddersfield.**—The difficulties between the Huddersfield Corporation and the W.R. County Council and the District Councils of Elland and Greetland in regard to the proposed tramway extension from Birchencillife to West Vale have been overcome. The extension is to be completed within three years, and Long Wall is to be widened to 27 ft. for its whole length. This latter work will cost £1,500, and has been apportioned as follows:—Huddersfield Corporation, £525; W.R. County Council, £525; Elland Council, £325; and Greetland Council, £125.

**Hurst.**—The U.D.C. has decided, subject to the consent of the B. of T., to grant a lease for five years of the tramways to the Ashton-under-Lyne T.C. It is not intended to reserve any rent by the lease, but the T.C. will covenant to expend £300 on renewing the tramways during the five years, and to pay any part of that sum not actually expended to the U.D.C. at the end of the term.

**Glasgow.**—The representative of the REVIEW in Glasgow has been favoured with the following official report of the year's working of the T.C.'s Tramways Department:—

Average track mileage open during year (single) ...	194½	Increase.
Car-mileage ...	23,335,008	899,932
Traffic receipts ...	£1,007,652	£20,372
Traffic receipts per car-mile ...	10'36d.	dec. '19d.
Traffic receipts per passenger ...	77d.	dec. '08d.
Passengers carried ...	311,480,086	35,869,701
Passengers per car-mile ...	13'34	1'06

The following statement gives the number of passengers carried at each fare:—

	May 31st, 1913.	May 31st, 1912.
½d. ...	191,944,261	121,212,468
1st two-stage ...	—	9,062,479
2nd do. ...	—	9,068,682
1d. ...	87,676,208	104,334,320
1½d. ...	20,354,233	20,337,702
2d. ...	6,191,033	6,258,659
2½d. ...	2,761,992	2,736,945
3d. ...	1,317,543	1,340,308
3½d. ...	1,076,768	1,109,998
4d. ...	158,048	158,824
	311,480,086	275,610,385

**Leeds.**—The Corporation Parliamentary Committee has decided to promote a Bill in the next Session providing for extensions of the tramway and railless traction systems.

The Corporation Tramways Committee has decided to establish ½d. fares on the Headingley, Roundhay and Chapeltown routes at the earliest possible moment.

**Liverpool.**—The Council at its meeting this week will consider a motion as to the practicability of using the tramways for the conveyance of goods to neighbouring towns.

**London.**—The first of the tramway trailer cars was put into service by the L.C.C. on March 17th, the B. of T. consent being for three months. The Board has now asked for a report on the working of these cars at the expiration of that period, and the Highways Committee being of opinion that experience should be gained in their use over conduit routes of greater length has asked the Board to sanction their being run on the Merton circular route, *via* Tooting, Clapham, and the Victoria Embankment.

In connection with the opening of the Rushey Green and Forest Hill tramway, on May 29th, the L.C.C. allowed the public free rides on that day in order to give publicity to the new route.

A Progressive member of the L.C.C. is urging the desirability of issuing monthly and quarterly season-tickets on the tramways in view of the popularity of return tickets on South London routes.

An article recently appeared in the *Financier* criticising the experimental conversion of three old horse cars for petrol-electric working. The article refers to the success of the Tilling-Stevens petrol-electric motor-buses, but considers that the experimental tramway car is a patchwork arrangement, which cannot do justice to the petrol-electric plant and system of working. It points out that the petrol consumption is wasteful, viz., 8 miles per gallon, or the same as for a motor-omnibus requiring 300 per cent. more tractive energy per ton. The article concludes that the new car distinctly suggests that it has been a case of "too many cooks," and that this is borne out by the fact that the L.C.C. engineering department appear to have superintended the whole job.

**Newcastle-on-Tyne.**—At a meeting of the Tramways Committee, on the May 29th, the chairman made his annual statement. He said the year just closed had been one of records in income, expenditure, gross profit, and net surplus. During the year they had taken for traffic £226,281, and for parcels £1,810, a total of £228,091, and an increase over the previous year of £11,500. There had been received for public street lighting £4,619, and for lighting for public buildings £1,067, for advertising on the cars they had received £3,678, and with other items the total income reached £238,204, an increase of £11,570 over the previous year. The traffic expenditure had been £64,493, against £60,663 in the previous year; general expenses totalled £18,674, against £17,730. This increase was largely accounted for by the increase of rates and taxes, and the extra charges for accident and fire insurances. For general repairs and maintenance the expenditure had been £25,943 against £27,122. They had had to pay out of the reserve fund £1,229 for car renewals. On the permanent way they had expended £7,692 against £5,800, the outlay being simply for the repair of streets, and on the electric equipment they had spent £2,088, compared with £3,612. Power expenses had been £11,998 against £9,239, an increase almost wholly due to the late coal strike. The coal bill had been £8,191, as compared with £5,416. During the strike, the Committee secured itself by buying and stocking a very large quantity of coal, and it had to buy it at a considerably enhanced price, which more than doubled the coal bill for the time. The Committee could, however, congratulate itself on the fact that it had always sufficient coal in stock, and was able to keep a full service of cars running without having to shut down a single minute during the whole progress of the strike. After the settlement it had to purchase again at a high price, and for the present year the coal bill was estimated at just about twice the amount it was before the strike, viz., £10,000. During the year, £3,510 had been spent on maintenance and repairs

at the power station and the sub-stations. The cost of repairs to steam and electrical plant was also higher owing to increased attention to the machinery necessitated by wear, and here it might be stated that the Committee had placed an order with Messrs. Parsons & Co. for a new turbine. This provision was necessary to meet the peak load. The total working expenditure for the year had been £129,019 against £122,012, and there was a gross profit of £109,181. Out of this there had been paid for interest on loans £30,431 and £39,556 for sinking fund, leaving a surplus for the year of £38,564. Of this sum, £12,000 had been paid to the relief of the rates, and after meeting certain other items there remained £21,189 to go to the reserve and renewal fund, which would make it £119,407. He mentioned that no less a sum than £60,000 was included in this year's estimates for renewals.

**Nottingham.**—The City Council at its meeting on Monday adopted the annual report of the Tramways Committee. The report showed that the receipts for the year, exclusive of interest on investments, amounted to £167,160, an increase of £4,562. The average per mile was 11'50d., or an increase of 28d. over the previous year. The working expenses amounted to £108,273 (increase £2,111), leaving a balance of £58,886. This has been disposed of as follows:—To interest on stock and loans, £14,349; to repayment of capital, £19,761; in aid of district rate, £19,000; to reserve and renewals fund, £4,775; and to part cost of removal of centre poles in Mansfield Road, £1,000. The increase of expenditure includes £1,340 in wages of traffic staff and £1,128 in maintenance charges. Against this increase is a saving of £1,448 in the reduced consumption of electrical energy. The maintenance charges of £18,683 include £8,517 expended upon cars, £1,305 upon the overhead electrical equipment and £8,361 upon permanent way. A number of new and improved motors have been charged against the reserves and renewal fund, which now stands at £63,744. The cars ran 3,185,789 miles, an increase of 9,527 over the previous year, the result of increased services on two of the busiest routes. The number of passengers carried (38,481,032) was an increase of 2,457,561. There was an increase of 3,008,954 in the number of children's tickets issued. This concession, however, affected the issue of penny tickets, in which there was a decrease of 947,096, as against an increase of 395,713 in those of a higher figure. Ordinary penny tickets formed 74'69 per cent. of the total issued, and the least used were the workmen's 2d. and the ordinary 3½d. fares.

The discussion of the report produced a string of suggestions for the improvement of the undertaking.

In reply, Ald. Radford said the Corporation was applying for powers for railless trolleys in the Bill now before Parliament. It might go on reducing fares until it cut the revenue away altogether. The Committee had considered the question of transfer tickets, but could not see that the thing was practicable with efficient working of the system. "Pay-As-You-Enter" cars would be considered, but the question arose how to prevent the blocking of traffic at busy times. The Committee were unanimous that universal penny fares were not practicable.

The report was adopted.

On the Sherwood section of the Nottingham tramways, work is in progress in the removal of the central trolley wire standards; with the completion of this work the last remaining centre poles in the city will have disappeared, side poles for the central standards having been substituted along the other routes.

The Corporation has decided to drop all the clauses relating to the running of motor-buses outside the city in the Bill which it is promoting in the present Session of Parliament. As a consequence of this action the West Bridgford Council's Bill, the object of which is to provide a motor-bus service for its district, will now be proceeded with. The original proposal in the Corporation's Bill was to run a motor-bus service from the city through the Bridgford district, also through the urban districts of Carlton and Arnold.

**Plymouth.**—The solicitor to the London and South-Western Railway Co. has informed the Corporation that Clause 33 of the Bill promoted by the company with respect to road vehicles has been withdrawn. By Clause 33 it was provided that the company may work in connection with, or extension of, their whole railway system, "road vehicles" driven by horse, electrical or any mechanical power, for the conveyance of passengers, luggage, parcels and goods, "whether to and from any of their stations or otherwise." Spirited opposition is responsible for the result stated above.

**Salford.**—The Council has accepted the offer of the Eccles Corporation to supply current to the Salford tramways in Eccles for a term of five years at 1'12½d. per unit for a minimum consumption of 675,000 units per annum, and for all above that quantity at 75d. per unit. A coal clause is to be inserted in the agreement.

**South Shields.**—The annual report on the working of the Corporation tramways just issued, shows that the net profit of £6,318 creates a record, being an increase of £654 on the previous year. The total revenue was £34,151, an increase of £1,219. The receipts averaged 10'06d. per car-mile, as against 9'71d. in the previous year. The working expenses show a slight increase—£19,221, as against £18,426, or 5'66d. per car-mile, against 5'44d. in the preceding 12 months. This increase is principally due to advances of employees' wages, and payment under the Insurance Act, the maintenance costs being practically the same as last year. Out of the gross profit of £14,930, £8,612 was paid for interest and sinking fund. The practice of the tramways department in carrying on its own insurance has amply justified itself, the total amount paid in accident claims being £497, which included the costs of a case carried into court. The profit on carrying 68,000 parcels was £284.

**Sunderland.**—The manager of the Corporation tramways (Mr. A. R. Dayson) has reported to the Tramways Committee upon the request of the Sunderland District Tramways Co. for running powers over the Corporation's lines from Grangetown to the centre of the town. The Committee agreed that such powers are desirable, and has consented to grant them, providing it has power to do so, upon conditions to be mutually agreed upon.

**Walthamstow.**—Notice of objection is to be drawn against the assessment of the tramways undertaking; a special Committee is to consider the reorganisation of the staff and employees in the tramway department.

**West Hartlepool.**—At a special meeting of the T.C. on May 29th, Alderman Suggitt moved a resolution authorising application to the Light Railway Commissioners for an order under the 1896 Act, amending the West Hartlepool Light Railway Order, 1897, with the object of assuring for the Corporation further powers with reference to the borrowing of money, &c. It was explained that with respect to the purchase of the tramways by the Corporation it had the necessary powers for all sections with the exception of the Seaton Carew section which was constructed under the Light Railways Act. It was, therefore, necessary to obtain those powers by an amendment of the order. The resolution was adopted.

## TELEGRAPH and TELEPHONE NOTES.

**Greece.**—A Bill has been introduced into Parliament sanctioning an outlay of 1½ million francs for the purpose of extending the telegraph and telephone networks.

**Imperial Wireless System.**—The Select Committee on the Marconi Contract sat on Monday and yesterday to consider the chairman's draft report on the rumours regarding the dealings of Ministers in shares. The *Times* states that alternative reports were put forward by the Unionist and Liberal members respectively, treating the question on party lines.

**Libel Action.**—The action for libel brought against Mr. C. Chesterton by Mr. Godfrey Isaacs was still in progress yesterday. Last week Mr. Samuel and a number of official witnesses were examined as to the course of the negotiations between the Post Office and the Marconi Co. Sir Rufus Isaacs was then called, and in the course of cross-examination, stated that the facts regarding his purchase of shares of the American Marconi Co., and his dealings with Mr. Lloyd George, were privately communicated by him to Mr. Falconer and Mr. Booth, members of the Select Committee of the House of Commons, before the journalists were examined by the Committee. [It will be remembered that the Committee, by a majority vote, refused to allow the witness to answer a question as to whether any of the Committee had received private information of this nature.] Mr. Godfrey Isaacs was next examined and described the negotiations with the Post Office. He stated that at present the company had 1,600 telegraph stations on board merchant ships. There were also installations on board some ships and on board men-of-war which were not managed by the company. The company had supplied 163 military field stations and 200 or 300 land stations. The company employed about 200 skilled engineers, and the total number of employees was about 3,000. All the £250,000 7 per cent. preference shares were now issued. In addition to the £500,000 ordinary shares, £250,000 ordinary shares were created in October, 1911, and the subscribed capital of the company was now £1,000,000. The company was incorporated in 1897, and down to the beginning of 1910 no dividend was paid. The preference shares were created in 1908, and the first dividend on them was paid in 1910. On September 1st, 1911, an interim dividend of 5 per cent. was paid on the ordinary shares, and the dividend for the year on the ordinary shares was 20 per cent. From 1910 down to 1912 the business of the company increased very largely. In July, 1911, the contracts in hand amounted to about £250,000, and in July, 1912, they amounted to about a million sterling. The latter sum included the Post Office contract, which amounted to £360,000—six stations at £60,000 a station. After the declaration of a dividend in August, 1910, the value of the Marconi ordinary shares began steadily to rise.

Mr. Isaacs was cross-examined with regard to companies with which he had been previously connected, and stated that he had never received any complaint from any shareholder or from his co-directors in respect of any of those companies. The Judge repeatedly intervened to check the cross-examining counsel.

On Monday Mr. Isaacs's examination was concluded, and on Tuesday Mr. Marconi was the principal witness; he expressed the greatest confidence in the ability and integrity of Mr. Isaacs, and similar evidence was given by former colleagues of the latter. The case for the defence was then opened.

**Loaded Telephone Lines.**—According to the *Journal Télégraphique*, the longest line in Europe provided with Pupin loading coils is that between Stockholm and Lules, 1,299½ km. in length. The Pupinised line between Berlin and Aix-la-Chapelle is almost 700 km. long.

**Norway.**—A submarine bell has been placed at Lille Faerder, at the entrance to Christiania Fjord. The bell is worked by electricity.

**Nose Telephone.**—A new telephone transmitter has been devised by Dr. Jules Glover, with a nose-piece intended to catch the nasal sounds which occur so frequently in the French language, for example, and which are lost when the ordinary mouthpiece is used alone.

**Telephone Cable from Dublin to Holyhead.**—The telephone trunk line connecting the General Post Office, Dublin, with the new cable which crosses from Holyhead to Howth has now been completed. The wires are carried on high standards, which have been set at some distance from those of the Tramway Co. The standards, instead of being placed on the road, have been erected on concrete foundations in the sea along the edge of the harbour, and are carried thence on the western side of the railway line to the city.

**Wireless Service between Germany and America.**—Experiments have been made since the end of January last between the Telefunken station at Nauen, near Berlin, and the station at Sayville, Long Island, which is owned by the Atlantic Communication Co., of New York. These experiments have given satisfactory results, and have, for the first time since the inception of wireless telegraphy, allowed radio-telegraphic messages to be sent across the ocean on the route, New York-Berlin. The distance bridged in this connection works out at about 6,500 km., whereas the distance between Ireland and Canada, where a Marconi service has for some years been in operation, is only about 3,200 km. The experiments above referred to are being continued with a view to collecting all necessary data for establishing a regular radio-telegraphic service. We are not informed whether the communication is effective during daylight hours.

**Wireless Telephony.**—A record in telephony is claimed to have been accomplished by the Telefunken Co., of Berlin, in connection with the experimental station at Nauen by the use of the company's high-frequency machine for the production of sparkless oscillations, in conjunction with a new method of switch arrangement. Having previously notified various receiving stations of the intention, extracts from newspaper articles were recently read aloud at the Nauen station, and are said to have been transmitted distances of from 370 to 430 miles, as, for instance, to the Vienna Technological Museum, where they were perfectly understood by Prof. Kann.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Accrington.**—The electrical engineer has been instructed to prepare specifications and obtain tenders for the work of replacing 14 carbon arc lamps in the Market Hall by 20 200-c.p. Osram lamps.

**Atherton.**—June 10th. Two 150-KW. single-phase transformers, for the U.D.C. See "Official Notices" May 30th.

June 11th.—Contract No. 1: Sub-station buildings; No. 2: extra-high-tension, high-tension and low-tension switchboards and transformers; No. 3: mains. W. Garnett, Clerk to U.D.C., Town Hall.

**Australia.**—VICTORIA.—June 11th. Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

June 24th.—H.D. copper wire, telephone parts and telephones, for the P.M.G. See "Official Notices" May 23rd.

July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" May 23rd.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" May 30th.

TASMANIA.—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" May 23rd.

QUEENSLAND.—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

WESTERN AUSTRALIA.—July 9th and 30th and August 6th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

June 11th. Metal-filament lamps, for the P.M.G. See "Official Notices" May 23rd.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" to-day.

July 30th.—Cable, switchboard, for the P.M.G. See "Official Notices" to-day.

**SOUTH AUSTRALIA.**—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

**NEW SOUTH WALES.**—July 9th. Switchboards, for the P.M.G. See "Official Notices" May 30th.

**Austria.**—June 13th. The Austrian State Railway authorities in Vienna are inviting tenders for an electric power installation at the Railway boiler works at Simmering.

**Belgium.**—June 14th. The Belgian Telegraph authorities, at La Sille Madelaine, Brussels, are inviting tenders for 5,234 metres of telegraph cables, with accessories.

**Brazil.**—June 23rd. Tenders will be received for the establishment of rubber-refining works (1) in Manaus, capital of the State of Amazonia; (2) and in the States of Piahy, Ceara, Rio Grande do Norte, Pernambuco, Bahia and São Paulo; and (3) for the manufacture of rubber goods in the towns of Manaus, Belen do Para, Recife and Bahia. Particulars from the Bureau de Renseignements die Brésil, 59, Rue Richelieu, Paris.

**Chile.**—September 10th. According to an advertisement in the *Times*, tenders are invited for the establishment of a "thermo-electric central station and distribution of electric energy at the port of Valparaiso." Particulars, &c., can be obtained at the offices of the Chilean Legation, 48, Grosvenor Square, W. Tenders to Offices of Ports Commission, Santiago.

**France.**—NEVERS.—August 31st. The city of Nevers has opened a competition with a view to the supply and installation of a water-lifting system at the new waterworks. Steam, suction gas or electric motor systems may be submitted, the power required being equal to raising normally 120 litres of water to a height of 72.30 metres actual. Particulars and plans from M. Huet, Ingenieur en Chefs des Ponts et Chaussées, 2, Rue de la Poissonnerie, Nevers.

**Germany.**—July 3rd. The Prussian State Railway authorities (Maschinen-Amt, 2) at Bremen, are inviting tenders for two electrically-operated coal-loading cranes.

**Halifax.**—June 6th. One natural draught chimney type water cooling tower, for the Electricity Department. See "Official Notices" May 23rd.

**Hungary.**—June 15th. The municipal authorities of Torokbecse are inviting tenders for the concession for the public and private electric lighting of the town. Deposit 5,000 kronen. Particulars from the Gemeinde Notarsamt, Torokbecse, Hungary.

**MARÓJUSVÁR.**—June 15th. Tenders are invited for the supply and erection of an electric lighting installation at the Royal Salt Mines at Torda. Particulars of the K. Ung. Oberbergamt, Marójusvár, Hungary.

**Leyton.**—June 24th. Electric lighting and hot-water heating for the new Church Road Schools, for the U.D.C. See "Official Notices" to-day.

**London.**—ST. PANCRAS.—June 9th. Welsh and other steam coal for the Electricity Department, 57, Pratt Street, N.W. L.C.C.—June 24th. One 50-ton overhead travelling crane for Greenwich generating station. See "Official Notices" to-day.

June 25th.—Electrical installation at Randall Place Elementary School, Greenwich, S.E. See "Official Notices" to-day.

**HAMMERSMITH.**—June 18th. Air-cooled static transformers, for the Borough Council. See "Official Notices" to-day.

**SOUTHWARK.**—June 11th. Supply of cable for 12 months, for the Borough Council. See "Official Notices" to-day.

**Manchester.**—June 7th. The Electricity Committee invites tenders for the supply of stores required during the 12 months ended June 30th, 1914. Particulars and forms of tender from Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

**Newcastle-under-Lyme.**—June 21st. Supply and laying of cables, for the Corporation. See "Official Notices" to-day.

**Newport (Mon.).**—July 1st. Refuse destructor for the T.C. Borough Engineer, Town Hall.

**Portsmouth.**—June 11th. Wiring for electric light installation at Workhouse Infirmary extensions, &c., Milton. See "Official Notices" May 16th.

**Rawtenstall.**—June 10th. One 1,500-kw. turbo-alternator complete with condenser, for the Corporation. See "Official Notices" May 23rd.

**South Africa.**—WELLINGTON (CAPE PROVINCE).—Tenders are called for an electric lighting installation for the municipality comprising two 70-H.P. suction gas engines and producers (or, as an alternative, superheated steam engines), two 48-kw. three-wire dynamos, one 10-kw. motor-balancer, and one three-wire battery booster set, battery and distilling plant, switchboard, poles, copper, insulators, feeder pillars, travelling crane, meters, instruments, &c. also for erection, overhead equipment, &c. Specifications on deposit of certified cheque for 10 guineas, payable to the order of the Town Clerk, Wellington, from Mr. Chas. G. Trevett, consulting engineer, 70, Fletcher's Chambers, Cape Town.

**Southampton.**—June 10th. Electric lighting of the old pavilions at the Infirmary, Shirley Warren. See "Official Notices" May 30th.

**Spain.**—June 16th. The municipal authorities of Montalban (province of Cordoba) are inviting tenders for the concession for the electric lighting of the town during a period of 13 years.

**Stalybridge.**—June 7th. Engine fuel and stores for the Joint Tramways and Electricity Board for 12 months, commencing July 1st next. Specification, &c., obtainable from Mr. R. Blackmore, Engineer-in-Chief, Generating Station, Stalybridge.

**Swansea.**—June 6th. Installation of electric light and bells at the new training college, Glamor, for the Education Committee. See "Official Notices" May 23rd.

**Swindon.**—June 23rd. Cooling tower, water softening plant and flanged cast-iron piping, for the Electricity Department. See "Official Notices" to-day.

**West Hartlepool.**—June 14th. Two 300-kw. rotary converters, complete with transformers, switchgear, &c., for the Corporation. See "Official Notices" May 30th.

## CLOSED.

**Belgium.**—Two tenders were submitted to the Société du Canal et des Installations Maritimes de Bruxelles for the supply of five electrically-operated 3-ton cranes for the loading of steamers on the Brussels Ship Canal, the lowest being that of the Société des Ateliers de Constructions Electriques, of Charleroi.

**Bennis Contracts.**—The following contracts have been received by Messrs. E. Bennis & Co., Ltd.:—

Rawtenstall Corporation electricity station.—Two stokers and self-cleaning compressed-air furnaces (repeat order).  
Rochdale Corporation electricity works.—Four chain-grate stokers.  
British Insulated & Helsby Cables, Ltd., Prescott.—One chain-grate stoker (repeat order).

**Bolton.**—The Tramways Committee has accepted the tender of Mr. T. W. Ward, Sheffield, for 150 tons of old rails, and that of Messrs. Todd Bros., St. Helens, for 50 tons.

The Electricity Committee has accepted the following tenders:—

B.I. & Helsby Cables, Ltd.—Cables.  
Doulton & Co.—Conduits.  
T. Wragg & Sons.—Conduits.

**Brighton.**—The Lighting Committee of the T.C. has accepted the tender of Messrs. Gardner, Locket & Hinton, Ltd., for not less than 40,000 tons, or more than 48,000 tons of Grangerigg washed nuts for the Southwick electricity works for two years, at 16s. 5d. per ton.

**Coventry.**—The T.C. has accepted the tender of Messrs. Edgar Allen & Co., Ltd., for a track lay-out at the car-shed of manganese steel, at £315; and that of Messrs. Shaw & Nicholas, for the erection of a car-shed, at £3,838.

**Derby.**—The E.L. Committee of the T.C. has accepted the tender of Messrs. Newton Bros. for a motor-alternator, at £1,835, and that of Messrs. Graves & Co. for chains for the coal elevator and conveyor, at £54.

The Tramways Committee has accepted the tender of the Brush Electrical Engineering Co., Ltd., for five roof covers for tramcars, at £548.

**Eccles.**—The T.C. has accepted the tender of Thos. Beeley & Son, Ltd., for a Lancashire boiler at the electricity station.

**Harrogate.**—The T.C. has accepted the tender of Messrs. Ferranti, Ltd., for switchboard extensions for the new generating plant, at £195.

**Hull.**—The City Education Committee has accepted the tender of Messrs. J. Walsh, Ltd., for installing electric light at Saner Street Schools, at £271.

**Leeds.**—The Tramways Committee of the T.C. has accepted the tender of Messrs. Wm. Airey & Son, for the erection of a tramway shed, depot and workshop offices at Sovereign Street, at £22,199.

**Liverpool.**—The T.C. has accepted the following tenders:—

National Steam Car Co., Ltd.—Motor chassis for the Tramways Department.  
Pope's Electric Lamp Co., Ltd.—Annual supply of 40-watt and 60-watt metallic-flame lamps.  
J. Huoter & Son, Ltd.—About 8,000 yd. of worsted serge for use in the Tramways and Electricity Departments.

**London.**—LEYTON.—The U.D.C. has received the following tenders for the supply of cable for the new feeder to Leigh Road:—

R. R. Todd .. .. .	(accepted) £1,719
Standard Cable Co., Ltd. .. .. .	1,797
Western Electric Co., Ltd. .. .. .	1,820
B.I. and Helsby Cables, Ltd. .. .. .	1,827
Kiemens Bros. & Co., Ltd. .. .. .	1,827
W. T. Henley's T.W. Co., Ltd. .. .. .	1,860
Glover & Co., Ltd. .. .. .	1,860
Johnson & Phillips, Ltd. .. .. .	1,860
Electrical Engineering and Equipment Co. .. .. .	1,934
Callender's Cable Co., Ltd. .. .. .	1,982
General Electric Co., Ltd. .. .. .	2,049
Pirelli, Ltd. .. .. .	2,088
Union Cable Co., Ltd. .. .. .	2,168
General Cable Manufacturing Co. .. .. .	2,190
Connolly Bros. .. .. .	2,850

Tenders for annual supplies of meters have been accepted from Vanner & Co., Electrical Apparatus Co., B.T.H. Co., B.I. and Helaby Cables, Ltd.

The quotation of the British Westinghouse Electric and Manufacturing Co., Ltd., has been accepted, at £16 10s., for a spare armature for two 25-H.P. fan motors, and, at £21, for a spare armature for two 8-H.P. machines.

**MARYLEBONE.**—The following tenders have been accepted by the B.C. for supplies to the electricity department:—

Flexible cords.—Pirelli, Ltd.; Armorduct Manufacturing Co.  
Carbon brushes.—Le Carbone, Ltd.  
Box compound.—The Dussek Co.  
Rubber insertion.—North British Rubber Co.  
Para strip and black tape.—Siemens Bros.  
White Silesian tape.—J. North Hardy & Co.  
Fireproof tape.—Siemens Bros.  
Rubber nuts and manhole rings.—Messrs. Ingram.

The tender of Herbert Morris, Ltd., has also been accepted, at £100, for four 10-ton travelling cranes at the Aybrook Street sub-station.

The Local Government Records and Museums Committee received the following tenders for electric lighting installation at Geffrye's Almshouses, Shoreditch, which buildings are now being adapted for museum purposes:—

W. C. Tackley & Co., Ltd.	.. .. .	(recommended)	£113
R. H. & J. Pearson, Ltd.	.. .. .	.. .. .	119
Cunningham, Ltd.	.. .. .	.. .. .	184
G. Weston & Sons, Ltd.	.. .. .	.. .. .	149
P. Lawrence & Sons, Ltd.	.. .. .	.. .. .	161
C. H. Cathcart & Co.	.. .. .	.. .. .	225

**L.C.C.**—The Highways Committee received tenders, as below, for (1) slot rails and conductor ties; (2) track rails and fastenings; (3) special track rails, renewable guards and fastenings, for the tramways:—

Frodingham Iron and Steel Co.	.. .. .	(recommended)	£12,812
John Batt & Co., Ltd.	.. .. .	.. .. .	15,711
Walter Scott, Ltd.	.. .. .	.. .. .	16,566

Chief Engineer's estimate, £15,875.

	Carbon steel.	High silicon steel (Sandberg process).
A. W. Nye (Société Anonyme d'Ougrée-Marihay, Belgium) (fish bolts not quoted for)	.. .. .	.. .. .
Bolckow, Vaughan & Co., Ltd.	.. .. .	.. .. .
J. Batt & Co. (London), Ltd.	.. .. .	.. .. .
Walter Scott, Ltd.	.. .. .	.. .. .
A. Brown & Co. (Soc. Anon. des Acieries d'Anclœur, Belgium)	.. .. .	.. .. .
Barrow Hematite Steel Co., Ltd.	.. .. .	.. .. .
Cammell, Laird & Co., Ltd.	.. .. .	.. .. .
Bolckow, Vaughan & Co., Ltd.	.. .. .	.. .. .
Barrow Hematite Steel Co. (no bolts quoted)	.. .. .	.. .. .
J. Batt & Co., Ltd.	.. .. .	.. .. .
Walter Scott, Ltd.	.. .. .	.. .. .

For an overhead travelling crane for the permanent way dépôt, Leven Road, Poplar, the tenders received were:—

J. Spencer & Co., Ltd.	.. .. .	(recommended)	£72
Huginbottom & Mennoek	.. .. .	.. .. .	84
Thos. Smith & Sons	.. .. .	.. .. .	90
East Ferry Road Engineering Works Co., Ltd.	.. .. .	.. .. .	107

The Committee has extended for a year contracts with the Morgan Crucible Co., Ltd., the Sloan Electrical Co., Ltd., and Messrs. W. Geipel & Co., for carbon traction motor and other brushes for electrical machinery.

**BERMONDSEY.**—The B.C. received tenders for time switches from the Adnil Electric Co., the Bat Meter Co., G. Braulik, Chamberlain and Hookham, Ferranti, W. Geipel & Co., Landis & Gyr, Reason Manufacturing Co., Siemens Bros. Dynamo Works, and Veritys, Ltd. The offer of the Reason Co. was accepted.

**Maidstone.**—The Electricity Committee of the T.C. has accepted the tender of Messrs. Wm. Cory & Son, Ltd., for a year's supply of coal as follows:—Northumberland rough, 16s. 6d. per ton; Yorkshire house screenings, 18s. 6d. per ton.

**Newport (Mon.).**—At a recent meeting of the Electricity Committee, tenders for a turbo-alternator and for a 600-kw. D.C. generator were considered, and after careful consideration of a report of the tenders (prepared by the borough electrical engineer, Mr. A. Nichols Moore), the Committee recommended for acceptance the tender of the A.E.G. Electric Co., Ltd., for a 3,000-kw. turbo-alternator, and that of the Lancashire Dynamo Co. for a 600-kw. D.C. generator. We understand that in the case of the turbo-alternator the accepted tender was the most favourable and advantageous, the price being approximately £1,000 lower than that of any English tenderer, and earlier delivery was guaranteed. The steam consumption guaranteed was also lower.

According to the discussion which took place at the special Council meeting on Tuesday, as reported in the *Times*, Mr. John Moxon, the chairman of the Electricity Committee, said that they had no option but to ask the Council to go outside the country for the bigger plant. There were 36 tenderers for the turbo-generator, and 28 for the direct-current generator. No English firm came anywhere near the price quoted by the German firm. It was unfortunate to have to go out of the country, but they as a Corporation could not afford to be philanthropists. The matter of the Germans being able to supply at a lower cost than that of British manufacturers was explained by the existence in Germany of a "common good fund," provided jointly by the manufacturers and the State, to recoup any loss a manufacturer may sustain in such a contract. Another point was that the English firms had

modified the contract conditions "set down" by the Corporation, and no English firm could carry out the whole of the work. If the contract was let to English manufacturers, it would mean that the Council would have to deal with three firms, and they had had some experience in the matter of dividing responsibility in such cases.

In the speech of Mr. Robjert, as reported in the *Monmouthshire Evening Post*, this gentleman said that as a member of the Committee he did not consent to the main contract going out of the United Kingdom. The loss of wages to our workpeople, compared with the small capital cost saving, was a weighty argument against acceptance of the tender. While the British manufacturers had combined together and inserted in their tenders certain conditions, which were not conditions acceptable to the Committee, on the other hand, the German firm had practically accepted the whole of the conditions the borough electrical engineer put forward. A good many things had happened since that time. The English manufacturers had been given to understand the position, and the result had been that they agreed to the whole of their conditions, and at the present moment they compared, to all intents and purposes, with the German manufacturer. They had modified very considerably their tenders, and whilst the A.E.G. Co. had imposed fresh conditions, the English manufacturers had come down.

**Nuneaton.**—The T.C. has accepted the tender of Messrs. W. Lucy & Co., Ltd., for 25 street lamp brackets, at 14s. 6d. each.

**Salford.**—The following tenders have been accepted by the T.C.:—

J. Gerrard & Sons, Ltd.—Erection of new extra-high-tension switch-house and foundations at the Frederick Road electricity station, £957.  
Bertram Thomas—Copper strip for main lighting and power switch-board, £302.  
British Thomson-Houston Co., Ltd.—Switchgear required for the bulk supply meter house of the Lancs. Electric Power Co., £1,352.  
Bell Bros.—Annual supply of natural black oil, 1s. 1d. per gallon.

**South America.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have received a contract for the supply of "Wotan" pure-drawn tungsten wire lamps for a large town in South America. The lamps, which have just been dispatched from their Shackell Lane stores, are mainly intended for street lighting. The total number of lamps for the consignment is 36,100, and the total C.P. 2,117,000. The highest C.P. lamp employed will be 400, and the lowest 16. These lamps are for a circuit voltage of 200. "Wotan" lamps were decided upon after exhaustive tests.

**Southampton.**—The following tenders were received by the T.C. for the installation of electric light at the Regent's Park School:—

L. Groves & Co.	.. .. .	(accepted)	£121
F. W. Cook & Co.	.. .. .	.. .. .	175
J. Davis & Co.	.. .. .	.. .. .	185
A. Kingman & Co.	.. .. .	.. .. .	189
W. Dibben & Sons	.. .. .	.. .. .	265

## FORTHCOMING EVENTS.

**Royal Institution of Great Britain.**—Saturday, June 7th.—At 3 p.m. Lecture on "Radioactivity; The Radioactive State of the Earth and Atmosphere," by Prof. E. Rutherford.

**Salford Technical and Engineering Association.**—Wednesday evening, June 11th. Visit—Pollock & McNab, Ltd., Britannia Machine Tool Works, Bredbury.

**British Engineers' Association.**—Thursday, June 12th. At 2.15 p.m. At Institution Rooms, 200, Buchanan Street, Glasgow. Meeting, Mr. T. C. Stewart presiding. Addresses by Captain T. C. FitzHugh and others on "Chios."

**Tramway and Light Railway Association.**—Thursday and Friday, June 12th and 13th. At Blackpool. Annual Conference. The papers to be read are as follows:—"Possibilities for Increasing Profits on Interurban Lines," by E. H. Edwards; "Tramways—a Résumé," by F. Bland; "Railless Traction and Motor-Buses," by H. Eogland; "Standard Rules for Motormen and Conductors," by A. V. Mason.

**Physical Society.**—Friday, June 13th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments on Tinfoil Contact with Dielectrics," by G. E. Baird. Paper on "A Method of Measuring the Pressure of Light by Means of Metal Foil," by G. D. West.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAP.

The following orders have been issued for the current week:—

Monday, June 9th.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

Tuesday, June 10th.—"B" Company. Ditto.

Thursday, June 12th.—"C" Company. Ditto.

Friday, June 13th.—"D" Company. Ditto.

Saturday, June 14th.—Headquarters will be opened for the transaction of regimental business from 10 a.m. to 12 noon.

(Signed) J. H. S. PHILLIPS, Major, L.E.E.  
For Officer commanding L.E.E.

## NOTES.

**Wanted—Five Hundred Pounds.**—Our readers will have noticed that an invitation has been given in several issues of the *ELECTRICAL REVIEW* for six gentlemen or firms to subscribe £100 apiece so as to enable the Electrical Trades Benevolent Institution to take advantage of Mr. E. G. Byng's offer of £100, provided nine other offers were forthcoming within three months from April 16th. Last week we omitted the notice with a feeling of disappointment that generously-minded men were of so very retiring a disposition, but we are only too glad to publish the table again this week, for the fifth hundred pounds has come along from the kindly heart of a veteran of the industry. Sir William H. Preece, K.C.B., F.R.S., in his advancing years, has shown his desire to assist the Institution of which he has for a number of years been president, and his name accordingly appears below. Five spaces still remain open, and once again we renew our appeal to the large-hearted to phone or write to the secretary, or to us, under the first impulse that possesses them after reading this note. Maybe there are some whose nature it is to shrink from publication of their gifts of charity. To such we would put it that the effect of their example might be rightly to influence others, but we would also add that there is always the alternative of anonymity. So long as the money is brought to the coffers of the fund, so as to be available for ameliorating the lot of the needy sons and daughters of the electrical industry, what matters it whether the hundred pounds be by name or anonymously? The position now stands as follows:—

1	Mr. E. G. Byng	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	£100
5	Sir W. H. Preece, K.C.B., F.R.S.	...	...	...	...	£100
6	*	...	...	...	...	
7	*	...	...	...	...	
8	*	...	...	...	...	
9	*	...	...	...	...	
10	*	...	...	...	...	

**Electrical Contractors' Dinner.**—The annual dinner of the Electrical Contractors' Association, Inc., will be held on Tuesday, June 17th, at Frascati's Restaurant.

**The B.E.A.M.A.**—The following firms have been elected "Members" of the British Electrical and Allied Manufacturers' Association:—

The Wilson-Wolf Engineering Co., Ltd.  
Tilghman's Patent Sand Blast Co., Ltd.

The following firm has been elected an Associate:—

Maschinenfabrik Augsburg-Nürnberg A.G.

**Institution and Lecture Notes.**—JUNIOR INSTITUTION OF ENGINEERS.—On June 30th, at 8 p.m., at the Institution of Electrical Engineers, Victoria Embankment, the Gustave Canet Lecture on "The Working Fluid of Internal Combustion Engines" will be delivered by Dr. Dugald Clerk, F.R.S. Tickets may be had on application to the Secretary, 39, Victoria Street, S.W. Also at 8 p.m., at the Great Western Hotel, Birmingham, Dr. Dugald Clerk's lecture will be delivered before the Midland Section by Mr. A. A. Remington. Tickets may be had on application to 60, Arderton Park Road, Moseley, Birmingham. From July 4th to 7th the Institution week-end visit to Ghent Exhibition will take place.

**INSTITUTION OF ELECTRICAL ENGINEERS.**—At the meeting on May 30th, the Report of the Council was adopted, and it was announced that the following gentlemen had been elected to the Council, the list of Members being, otherwise, as given in our issue of April 4th:—Ordinary Member of Council (one vacancy) Mr. R. A. Chattock; Associate Members (three vacancies), Mr. F. E. Berry, Capt. Henrici and Mr. A. W. Martin; Associates (two vacancies), Mr. E. R. Clarke and Mr. A. M. J. Ogilvie.

**MUNICIPAL TRAMWAYS ASSOCIATION (INC.).**—A meeting of the Managers' Section opened yesterday (Thursday morning) at the Town Hall, Sunderland. After the usual Corporation welcome, there were discussions on the following subjects:—"Description of Sunderland Corporation Tramways System," by Mr. A. R. Dayson; "Interim Report of Rail Corrugation Committee," introduced by Mr. R. H. Wilkinson. After luncheon at the Town Hall, the party went by steamer to South Shields. To-day, again at Sunderland, the following subjects will be introduced for discussion:—"Petrol and Trackless Trolley Vehicles," by Mr. C. J. Spencer; "Standardisation of Specifications for Tramcar Equipments," by Mr. J. W. Hawe.

**"Increased Powers" Bill.**—We read in the *Times* that on Wednesday afternoon Sir Howell Davies (Bristol) presented a Bill to give increased powers to local authorities with regard to electric lighting and other purposes connected therewith.

**Damages Against the L.C.C.**—The L.C.C. was, on May 29th, sued in the King's Bench Division for damages before Mr. Justice Bankes and a common jury, for the loss of a husband. The action was brought by the widow, Mrs. Lilian Phyllis Cobbett, on her own behalf and on behalf of her two young children. The deceased man was driving a horse and cart at Lower Tooting, and he turned off the tramline, the wheel of his cart caught in the

rails, with the result that he was thrown out, run over and killed. The accident, it was said, arose from the fact that the rails were much worn, and that the guard rail was, in consequence, 1 in. above the other side of the rail. The jury awarded the plaintiff damages to the amount of £500.

**Appointments Vacant.**—Assistant to the County Electrician, Middlesex Education Committee (42s.); Showroom attendant for the Torquay borough electricity department. See our advertisement pages to-day.

**Bombardment at Earl's Court.**—We think we can say with little hesitation that the Imperial Services Exhibition at Earl's Court, which was opened by the Duke of Connaught on Saturday last, will be very popular during the coming months. We do not now refer so much to the exhibits themselves, as these we have not yet closely examined, but we are very much mistaken if the performance or display of naval and aerial warfare in the Empress Hall is not going to "take" with the public in these days of boy scouts and of increased feelings of personal responsibility in the matter of national defence and self-preservation. The spectator witnesses an attack on a fortified coast town by a number of warships, some of 19 ft. and others 30 ft. length, which are models of modern vessels in our fleet to-day. The models were built by Messrs. Bassett-Lowke, Ltd., at Northampton, and they are operated by a couple of men by means of a 1½-h.p. electric motor of special design and a battery of 28 Premier cells. The public will be able to have their heart's content of thrill and noise, as the forts are attacked and respond, as the city is fired, and after a more or less stout resistance shows the white flag—all in a matter of a comparatively few minutes—quickly almost as a cinematograph film tells its story. The interest of the display is added to by the control by the Raymond Phillips wireless system of a 22-ft. airship which manoeuvres over the scene prior to the conflict. There were whispers of bomb-dropping from the said airship and of submarine mines in the lake, but these were not in evidence on the occasion of a preliminary Press view at which we were privileged to be present. However, there was quite sufficient to convince us of the popular appeal which such a demonstration is likely to make. The show is well worth seeing.

**Copper.**—Messrs. Merton's monthly circular for May shows considerable activity in the market for this metal, the total deliveries (Europe) reaching the extraordinarily high figure of 61,020 tons. The drop in visible supplies, however, only shows as 833 tons, the decrease in English stocks of 1,240 tons being largely compensated for by increase in French stocks and quantities afloat. The decrease in total European stocks is heavier, the drop (when including Rotterdam, Hamburg and Bremen stocks, and quantities estimated for other ports) being 4,141 tons.

Supplies to Europe from North America are considerably above the average. Spain and Portugal send a small quantity to England and France. Chile shipments are rather low, and Australasian not up to average. The drop in American visible supplies during April was 12,822 tons, a large quantity, and the decrease in the world's visible supply (including Holland and Germany) was 14,068 tons.

**Celluloid Regulations Bills.**—With reference to our recent comments by way of criticism of the two Bills in which unreasonable provisions were set forth for the control of premises containing small quantities of celluloid, it is satisfactory to note that the City of London Celluloid Regulations Bill was thrown out on the second reading on Wednesday last week. The House divided on Mr. Baird's motion for the rejection of the Bill, and the voting was as follows:—For the rejection, 127; against, 47; majority for the rejection, 80. The London County Council then withdrew the celluloid part of its Bill. We believe our readers will agree with us that this is a very satisfactory climax to a piece of unnecessary and grandmotherly legislation. Mr. T. R. Brooke, of the British Xylonite Co., Ltd., and others who took early and energetic measures in connection with this matter are to be congratulated.

**More Strikes.**—We seem to be again in the midst of wars and rumours of wars in the industrial world. In the Midlands a wide-spread strike is in progress, involving the Metropolitan Amalgamated Railway Carriage and Finance Co., the Midland Carriage Works, and some hundreds of men employed by the General Electric Co., Ltd., at Witton. The trouble at Stewarts & Lloyds, Ltd., is still in progress, though a conference between the men and the directors is proceeding. At Bedford there has been a strike of girls employed by Cryselco, Ltd., but all is now normal.

**The Bolton Vacancy.**—In regard to the vacancy created by the resignation of Mr. A. A. Day, borough electrical engineer and tramways manager at Bolton, the Corporation Tramways Committee has appointed a sub-committee to confer with the Electricity Committee as to the best way of filling the office.

**Colliery Fatality.**—Mr. G. C. Lewis, coroner, has held an inquiry at Old Hill respecting the death of Albert Priest, who was killed at the Fly Colliery, Old Hill, the previous Tuesday. The evidence adduced showed that the deceased had been putting a piece of wood behind the electric cable, which it would be necessary for him to move; and George Hickman, a loader, found him hanging by three electric wires, which he had hold of with both hands. The electrician at the mine said the cables were supported by string and protected by rubber; he was of opinion that the cable had been stripped by the weight on the timber. The jury returned a verdict that death was due to electric shock, and expressed the opinion that some better method of protecting the cables should be adopted in the future.

(Continued on page 946.)

## TWO NEW MEMBERS OF PARLIAMENT.

WE count ourselves happily placed in being able to look at Parliamentary elections from a detached point of view. With party politics in the generally accepted sense we, as a journal, have nothing to do, though we have occasionally

journal, for he served with Messrs. Ernest Scott & Mountain, Ltd., the Newcastle-on-Tyne firm who for so long a period held a front-rank place among engineering concerns engaged in electrical and mining installation work. In these days, when we are all saying so much about the necessity of foreign travel for electrical engineering men, and, indeed, when prominent after-dinner speakers are expatiating upon the importance of more trips abroad by Ministers, it is interesting to note that Mr. Hamilton saw "active service" for the firm with which he was apprenticed, in India, Egypt, Bulgaria, Greece and Russia. He is now joint managing director with Mr. B. M. Drake, of the well-known electrical firm of Drake & Gorham, Ltd., of London, Manchester, &c. He is chairman of the Knutsford Conservative Club, and a member of the Knutsford Urban District Council.

Mr. John Cuthbert Denison Denison-Pender, the new member for Newmarket, is the eldest son of Sir J. Denison-Pender, K.C.M.G., and Lady Denison-Pender. Born in 1882, he is 31 years of age. After his education at Eton, he passed through the numerous branches of the Eastern Telegraph Co., including important cable-laying operations, and he is to-day a director of the Eastern Telegraph Co., Ltd., the Eastern and South African Telegraph Co., Ltd., and the West African Telegraph Co., Ltd.

Mr. Denison-Pender is a grandson of the late Sir John Pender, who was one of the pioneers of submarine telegraphy, and who represented the Wick Burghs as a Liberal in 1883, and retained his seat as a Liberal Unionist in 1886 after the Home Rule split. He is also a nephew of Sir James Pender, Bart., the well-known yachtsman, who captured Mid-Northamptonshire from the Liberals in 1895, defeating the Hon. Robert Spencer. The new member contested South St. Pancras as a Municipal Reformer in the L.C.C. elections of 1910 and 1913, winning the seat on each occasion by majorities of over 1,000.

[Lafayette.

MR. C. G. C. HAMILTON, M.P.

felt it our duty to state our views upon legislative questions. This has not been done with any desire to contribute to party controversies, but with the hope that we might afford assistance in the consideration of questions affecting electrical and engineering industries and the labour and other problems with which all concerned in those industries have been faced. When, therefore, we express satisfaction at the result of certain recent by-elections, it need not be inferred that we are glorying in the success of one party over the other. As we indicate in our leading article to-day, we welcome the return of Mr. J. C. Denison-Pender and Mr. G. C. Hamilton to the Parliamentary councils of the nation, not so much as the Members for Newmarket and Altrincham respectively, as because of their specialised experience in fields of scientific application and industry that the ELECTRICAL REVIEW represents. Both of these gentlemen are by training and experience well qualified to overwatch the interests of the engineering profession and industry, which have down to the present had far too few spokesmen at St. Stephens. Both are young men, comparatively speaking, and an interesting coincidence is that both were married in 1906, and each of them has one son and one daughter.

Mr. Collingwood George Clements Hamilton, M.P. for Altrincham, is the youngest son of the late Ven. George Hans Hamilton, Archdeacon of Northumberland and Canon of Durham, by his marriage with Lady Louisa Frances Clements, sister of the fourth Earl of Leitrim. He was born at Eglingham, Northumberland, in 1878, and is accordingly 35 years of age. Educated at Aysgarth School, Yorkshire, and at Charterhouse, he entered upon the career which gives him a claim upon our attention in this

Photo by]

[J. Jarman.

MR. J. C. DENISON-PENDER, M.P.

To both of these gentlemen we wish a long and successful career in the new and larger sphere of life upon which they have now entered.

## THE SPERRY GYRO COMPASS.

As our knowledge of electrical science advances, each fundamental step forward constitutes the basis for many useful inventions which can be built upon it. The possibilities of utilising the reaction of rotating bodies have been known to mankind for years, but it is only within comparatively recent time that we have had any means for maintaining a high speed of rotation while at the same time eliminating brushes and moving wires, which might disturb the equilibrium of the wheel. This fundamental step was made by the development of the induction motor, and as a result of this step we now have the gyro compass, or, we may say, the electrical compass, inasmuch as its operation depends entirely upon the application of electricity.

The development of the gyro compass has come at a very opportune time. The use of steel in our modern ships has made the ship a magnetic shell, so that very little magnetism reaches the magnetic compass, and it is consequently weak and vacillating in its tendency to hold the north, and its use involves the constant application of numerous corrections, many of which are very imperfectly known.

On the other hand, the gyro compass depends for its directive force upon an earthly phenomenon which is absolutely changeless and undeviating. This phenomenon is the rotation of the earth. The manner in which this phenomenon might be used to keep the gyro compass in the north and south meridian has been

known for years, but the problem has been so difficult that few have attempted it, and hardly any have been rewarded with anything like success.

A brief description of the theory of the gyro compass will give the reader an understanding of the problem involved in its development, and will enable him to understand how this problem has been solved in the Sperry gyro compass.

FIG. 3.—MODEL GYROSCOPE.

The inertia of a rotating wheel is relative to space, and by reason of its rotation it offers great resistance to any angular movement impressed upon it. Impressing any angular force on a rotating wheel tending to deflect its plane of rotation results in an angular movement at right angles to the impressed force, termed precession.

For instance, we have in fig. 3 a gyroscope suspended so that it is free to rotate about its vertical axis  $BB$ , and free to move about the horizontal axes  $EE$  and  $GG$ . If we impress a force about the axis  $GG$  by pushing down on the

near side of the horizontal ring, that force will be resisted, and movement of the gyro will take place about the axis  $EE$ , the top of the ring  $C$  moving to the left.

If we had impressed the force about the axis  $EE$  by pushing to the left on the top of ring  $C$ , movement about the axis  $GG$  would have taken place. In other words, the gyroscope tries to place itself so that it is rotating in the plane of the force impressed upon it.

If we had maintained the impressed force on the near end of the axis  $EE$ , the rotating wheel would eventually have turned to rotate in the plane of the force we had impressed upon it, which in this case would be the vertical plane.

Inasmuch as the inertia of the gyro is relative to space, if the wheel is rotating in a vertical plane with the axis east and west, and if the wheel is suspended with freedom about all axes, the earth in turning will tend to rotate "out from under" it, and the axis of the gyro will apparently incline relatively to the horizontal at the particular spot where it is situated. If we use gravity or some other means to suppress the freedom of the gyro, so that it inclines against an impressed force, precession towards the meridian will be instituted. This precession will continue until the axis of the gyro precesses across the meridian and the earth turns "out from under" it in the opposite sense, thus causing it to precess back. If freedom is further suppressed about the vertical axis, the gyro will not only precess towards the meridian when its axis is inclined, but will also precess towards the horizontal, so that the oscillations will be damped,

FIG. 1.—SPERRY GYRO COMPASS, WITH AND WITHOUT COVER.

FIG. 2.—PART VERTICAL SECTION OF THE SPERRY GYRO COMPASS.

and the compass will, within a comparatively short time, settle down into the only position of equilibrium it can find, which will be with its axis on the north and south meridian, and with its plane of rotation coincident with that of the earth. This, briefly, is the principle of the gyro compass.

The directive force of the gyro compass depends upon the angular velocity of the earth and upon the speed and weight

its east and west plane. The wheel is here considered as rotating on the axis *A*, which is perpendicular to the plane of the paper. The axis *A* is carried on bearings in the airtight casing *B*; this casing is further suspended on horizontal pivots in the vertical ring *D*.

The gyro wheel, its casing and the vertical ring *D* are termed the sensitive element in contradistinction to the non-sensitive frame. The ring *D* is suspended by a stranded steel wire *E*, the top of which is carried in the stem *U*. This stem forms a part of the frame surrounding the sensitive element and carrying the compass card. Part of this frame is termed the "phantom" ring (marked *G* in fig. 2).

Fastened to the ring *D* and projecting through, but not touching the ring *G*, is a small post, on which is carried a silver trolley wheel *V*. This trolley wheel rests on contacts *W*, which are carried on the frame surrounding the sensitive element. The silver trolley wheel co-operating with these contacts controls the motor *M*. The shaft of this motor carries a pinion which drives the frame surrounding the sensitive element.

It can be seen that the stranded wire suspension permits the use of a very heavy wheel. As the wheel tends to turn about the vertical axis in its tendency to place and keep itself in the north and south meridian, the silver trolley wheel co-operating with the contacts *W*, operates the motor *M* to cause the stem, frame, and phantom ring to follow the gyroscopic or sensitive element. It can be seen from this that friction about the vertical axis is almost entirely eliminated, inasmuch as the top of the suspension wire is constantly made to move to follow the bottom of it, so that it is virtually a torsionless wire. The gyroscopic or sensitive element need only manifest a tendency to move, all the work of movement being assumed by the motor *M*.

The phantom ring *G* is always held in positive relation to the ring *D*, but is nevertheless quite independent from it, and consequently can be used as a base from which to suppress the freedom of the gyro wheel. The freedom is suppressed by the pendulum *R*, swung in horizontal pivots in the ring *G*, and attached to the gyro casing at the point *S*. When the axis of the gyro is perfectly horizontal the pendulum *R* has no effect, but if the axis of the gyro is off the meridian, the earth will cause it to incline against the weight

FIG. 4.—CORRECTION DEVICE.

of the wheel. Because the angular velocity of the earth is so very small (one revolution in 24 hours) the directive force of the gyro compass must be very minute, and the problem of the development of the gyro compass becomes extremely difficult. We find, however, that the directive force varies directly as the speed, but as the square of the weight, so from this we see that to get an efficient gyro compass we must use a heavy wheel, inasmuch as a large increase in speed will not give very much of an increase in directive force, and will have mechanical disadvantages which are always inseparable from high speeds of rotation. No matter if a very heavy wheel is used, the directive force will still be very small, so we must find some means of suspending this wheel which will almost entirely eliminate friction about the vertical axis.

A further problem is involved due to the fact that the freedom of the wheel must be suppressed about the horizontal and vertical axes by just the right amount for the purpose in hand. After these things have been accomplished, we find that the gyro compass has a certain natural error depending upon three variables, viz., the speed and course of the ship in which it is mounted and the latitude. If we depend upon tables to correct these errors, we have not made much of an advance from the magnetic compass, inasmuch as the application of corrections from tables is always a confusing process and a serious disadvantage.

The instrument must also be made substantial and durable, as it is quite likely to receive considerable knocking about on board ship.

To summarise, the problems involved in the development of the gyro compass are:—

1. To provide a method of suspension which will permit of the use of a heavy wheel, while at the same time providing perfect freedom for the wheel to move about the vertical axis.
2. To provide a means for suppressing the freedom of the wheel about the horizontal and vertical axes by just the right amount to cause it to settle down on the meridian.
3. The force used for suppressing forces about the horizontal and vertical axes must necessarily be some form of pendulum or device acted upon by gravity, and must be such that the acceleration pressures arising from roll, pitch and change of speed of the ship do not cause deviations of the compass.
4. To correct the natural error of the compass automatically, so that no tables are necessary.
5. To make the instrument substantial and durable.

The manner in which all of these problems are solved will be readily understood by reference to fig. 2, which is an elementary partial vertical section of the compass through

FIG. 5.

REPEATER COMPASS.

FIG. 6.

of the restraining pendulum, which will impress a force about the horizontal axis and also about the vertical axis, inasmuch as the point *S* is eccentric to the vertical axis of the gyro. The effect about the horizontal axis institutes precession towards the meridian, while the effect about the vertical axis precesses the axis of the gyro back to the horizontal position, and so damps the oscillation of the gyro to

cause it to settle down in its only position of equilibrium, which is with the axis north and south and horizontally.

To correct automatically the natural errors of the compass, an arrangement of cams is used. These cams are laid out on curves of the logarithmic functions of the variables. The dials of the cams for speed and latitude can be seen in fig. 2. These are set to approximate speed and latitude by hand; the cam for course is under the compass card, and is set by the compass itself. These cams serve to adjust constantly and automatically a system of levers, which are so arranged as to add or subtract their arms and adjust the reference point or lubbers' line of the compass to correct its natural error. Front and back views of this correction device are shown in fig. 4.

It can be seen from fig. 2 that the instrument has few parts, and is consequently very substantial and durable, and not at all likely to get out of order.

Attached to the gyro casing are the levels  $x_1$  and  $x_2$ . If

position in the ship, and is used to operate repeater or auxiliary compasses utilised for steering and navigating the

FIG. 7.—GYRO WHEEL AND STATOR.

MAIN AND SYNCHRONISING SWITCHBOARDS.

FIG. 9.

the axis of the gyro should for any reason be displaced from the meridian, it must necessarily incline, and this inclination will be shown by the levels. Consequently a glance at the levels will always reassure one as to whether the compass is exactly on the meridian or not. In fact, if one should deliberately try to force it off the meridian, the

ship. These repeater or auxiliary compasses are operated by a rotary step-by-step system, which in principle is similar to that used in electric clocks and other devices for reproducing movement at a distance.

Figs. 5 and 6 are illustrations of one type of repeater compass. The small switch shown is used for varying the

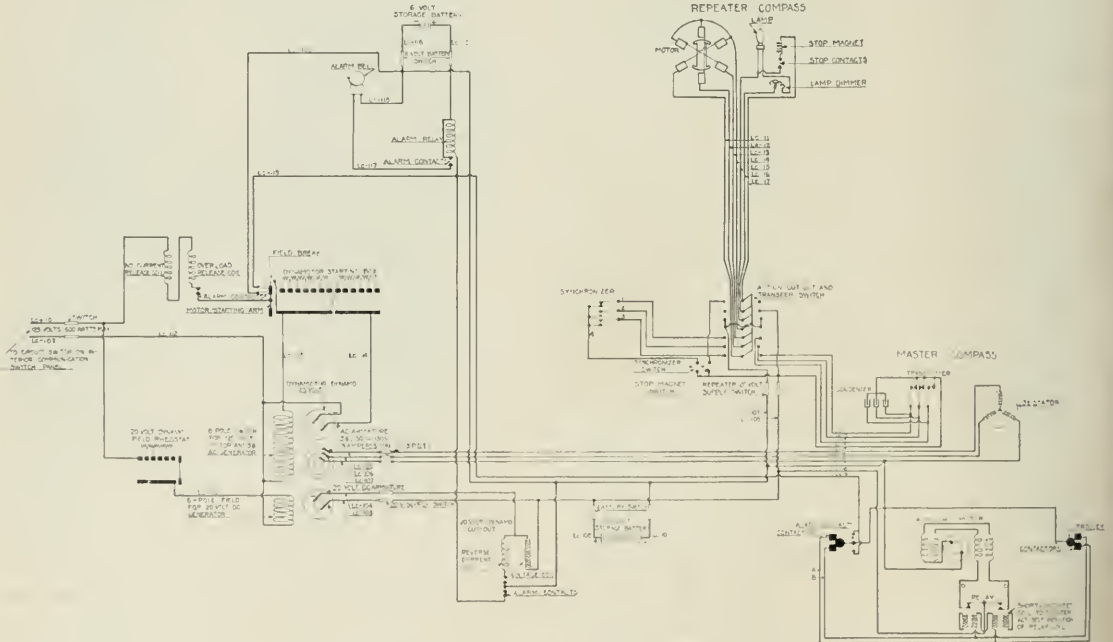

FIG. 10.—DIAGRAM OF CONNECTIONS.

levels would show that it was going off before any deviation took place.

Fig. 1, p. 942, shows the appearance of the master compass with covers removed, and with covers in place.

The master compass is placed in a well protected

amount of illumination on the card, which is obtained by a small lamp placed behind it.

Another type of repeater compass is used for taking bearings. The repeater compass for this purpose is swung in gimbal rings, and is used in conjunction with an alidade,

or azimuth circle, with which the true bearing of any object can be obtained directly.

The development of the gyroscopic compass has involved numerous electrical problems of the greatest interest.

The gyro wheel is spun by an induction motor at a normal speed of about 8,600 R.P.M., although the directive force is quite sufficient when the speed is anywhere about 3,000 R.P.M. The wheel is shown in fig. 7, and, as can be seen from this view, the inside of the wheel is hollowed out, and the internal periphery is inlaid with the short-circuited bars of the induction motor. Attached to the side of the wheel casing, and projecting inside the wheel, is the stator, which is shown to the left in fig. 7.

To reduce the amount of power used, the wheel is spun in a vacuum, and for this reason the major problem in the design of the induction motor was to arrange the windings and laminations, so that the heat arising from the current would be efficiently conducted to the outer fins of the casing and radiated from them. A surprising degree of success has been attained in this, which makes it possible to keep the wheel quite cool, although there is no air wash to facilitate the removal of heat.

The design of the contacts for controlling the azimuth motor was a very interesting problem, as they are constantly making and breaking contact, and must be so designed that this constant make and break will not "pit" them.

After a great many trials of all sorts of contact material it was decided to use tungsten. The efficiency of a contact which is constantly making and breaking depends upon the melting point of the material used. The melting point of tungsten is far above that of any conductor except carbon, and carbon is prohibitive for contacts on account of its high resistance when used for that purpose. As a solid block of tungsten cannot be obtained, it was necessary to use a sheet of tungsten "wetted" to a steel back by means of copper. The tungsten could not be wetted directly to the steel back, as the oxide between tungsten and steel is a non-conductor. The oxides between tungsten and copper and between copper and steel are conductors. Wherever used on the compass the contacts are made quickly detachable, so that they may be conveniently withdrawn and examined.

The silver trolley co-operating with the tungsten contacts controls the azimuth motor  $M_1$  by means of a relay, so that the current broken by the contacts is very small. Still further to reduce the spark at these contacts the relay coils are wound with a secondary winding of exactly the same size as that used for operating the relay. This secondary winding is short-circuited. The current generated in the secondary relay coil upon making and breaking exactly counteracts the induction of the active coil, and so absolutely eliminates any spark discharge at the contacts.

The azimuth motor is wound with two separate sets of field windings, wound in opposite directions. This makes it possible to reverse the motor with one contact. It also makes it possible to reverse the motor almost instantaneously, inasmuch as the current does not have to die down and build up in the same set of fields.

The commutator of the azimuth motor is novel, in that the insulation between the commutator segments is not extended to the surface of the segments. This gives absolute reliability in the azimuth motor, as there is no possibility of the insulation holding the brush off the commutator.

The transmitter for operating the repeater or auxiliary compasses has three pairs of tungsten contacts, operated by steel cams driven by the master compass.

Three-phase alternating current, at a voltage of about 100 and a frequency of about 150 cycles, is required for spinning the gyro wheel. The relay, azimuth motor and repeater compasses are operated by means of 20-volt direct current. The ships on which the compass is used usually have a supply of direct current at a voltage of 125 or 220, and this current is converted into alternating current and 20-volt direct current by means of a so-called dynamotor-dynamo. This dynamotor-dynamo has two sets of fields both energised from the current of the ship. Rotating within one of these fields is an armature, on which are wound the direct-current motor windings, and in the same slots the three-phase alternating-current windings. Rotating within the other set of fields is an armature wound to produce 20-24 volt direct current.

A 10-cell accumulator is floated on the 20-volt line. An automatic cut-out between the 20-volt generator and the battery automatically cuts out the generator if its voltage falls below that of the battery and automatically cuts it in again immediately the voltage rises above that of the battery. This cut-out has two coils wound on the same core, one in series with the current and one in shunt, the design being similar to that of devices used on automobiles.

Fig. 10 is an elementary diagram of the electrical system. The synchroniser connections there shown are for the purpose of adjusting the repeater compasses to synchronise them with the master compass when first starting. When synchronising, the repeater compasses are connected to the synchroniser, which is a hand-operated transmitter, and a circuit to a stop magnet within the repeater is connected. The synchroniser is then turned, so that its card passes through  $360^\circ$ . No matter where the repeaters have been previously, the synchroniser must turn them to the zero point. When they are near the zero point, contacts on the repeater card complete the circuit to the stop magnet, which draws a latch down on the armature shaft of the repeater motor. When the repeater comes to exact zero this latch falls into a slot on the armature shaft, and thus stops and locks the repeaters at zero.

The operator in the central station thus knows that after he has turned the synchroniser through  $360^\circ$  the repeaters must all be at zero. He then turns the synchroniser to zero, and releases the stop magnet. The repeaters must now be at the same reading as the synchroniser, and free to turn with it. As the synchroniser or repeater switchboard is immediately adjacent to the master compass, the operator has only to glance at the card of the master compass to see what the reading of the repeaters should be; he then turns them to the reading of the master compass, and switches them off the synchroniser and on to the compass.

An alarm system is provided which immediately gives notice of failure of the supply of current to the dynamotor-dynamo, or of failure of the 20-volt direct current. Contacts on the master compass also serve to operate this alarm, in case the frame of the master compass fails to follow.

After much study and experiment a very convenient switchboard has been evolved for the supply of current to the gyro compass system. The most convenient feature of this switchboard is the small direct-current voltmeter and voltmeter switch, which are used for finding the voltage of the supply, the voltage of the battery, the voltage at the 20-volt dynamo terminals, and positive or negative leakage in any part of the circuit. The connections to this voltmeter which make it possible to find the leakage at any time are especially valuable, as it will usually be found that the only source of trouble on board ship with electrical apparatus is leakage in the wiring of the ship between the various parts of the apparatus. Leakages are usually due to nothing but neglect, and if convenient means are provided for ascertaining whether or not there is leakage at any time, it is a very simple matter to hunt down and eliminate the trouble.

Fig. 8 is a view of the main switchboard, and fig. 9 shows the switchboard used for cutting out and synchronising the repeater compasses.

Space does not permit of our dwelling on the many advantages which accrue to men-of-war, submarines and merchant ships by the use of an absolutely accurate compass without "lag." Most of these advantages, however, are quite obvious. It may be interesting to add that repeated tests of the Sperry gyro compass under the most severe conditions of roll, pitch and change of speed, have failed to show a deviation of more than  $\frac{1}{2}$  of a degree at any time.

A branch office of the Sperry Gyroscope Co. has been opened at 57, Victoria Street, London, S.W., and in this office will be installed a gyro compass mounted on a testing machine capable of subjecting the compass to heavy roll and pitch and rapid changes of course.

The Sperry gyro compass is now in successful operation on board some 16 battleships of the United States Navy, in addition to eight submarines. Wherever it is used the compass is depended upon for all purposes connected with navigation, to the exclusion of the magnetic compass, which is used as an occasional check; and up to the present time its adoption has proceeded without encountering that manifestation of the laws of inertia known as "conservatism."

## NOTES.

(Concluded from page 940.)

**"The Point Fives."**—We are informed that Dr. Ferranti will open the discussion at the meeting on June 17th, which will take place at the Delico Restaurant at 7 o'clock (tickets, 3s. 6d.).

At the recent debate on the standardisation of cookers, the following "five points" were unanimously agreed upon:—

"Whilst 'The Point Fives' in no way wish to hamper the development of cooking apparatus by attempting, at this early stage, to standardise details, they desire to place before manufacturers a number of general preliminary principles which, as a result of their use of various types of cooking apparatus, they consider to be of importance:—

"(a) That domestic and other cooking ranges (consisting of oven, grill and hot plates) should have each sub-circuit separately fused, and each protected by a switch. (The oven should have two or more circuits.)

"(b) That switches and fuses be placed in such a position that they cannot become unduly heated, that they cannot be damaged by liquids being spilled over them, and that they are easily accessible.

"(c) That provision should be made for efficiently and thoroughly earthing all apparatus.

"(d) That cooking ranges be fitted with at least one indicating device (separately fused), which will clearly show whether any circuit is turned on.

"(e) That manufacturers and designers should endeavour to develop a hot plate which will work satisfactorily at a red heat."

In the time available it was found impossible to deal fully with this matter, and it was left for future meetings to add to the above-mentioned points. The standardisation of electric tariffs was also deferred to a future meeting.

**Electric Vehicle Progress in England.**—Supporters of the movement to introduce the electric battery vehicle into this country on a practical scale will welcome the news that an unofficial reliability run is to be made next week from Dumfries to London, by an Arrol Johnson-Edison coupé, a product of the Arrol Johnson Co., which, as previously mentioned, has taken up the manufacture of electrical vehicles, and judging by external appearance, has succeeded in producing a handsome equipage.

The body, of aluminium, is mounted on an underslung chassis with Lanchester type springing. The electric motor is in the centre with an "under" worm drive, which is somewhat of a novelty for this type of car, and an Edison battery is placed half under the bonnet and half under the rear seat.

The vehicle is a three-seater with wheel steering, the wheel being inside, as in the majority of American electric cars.

The Dumfries-London run is, of course, partly intended for demonstration purposes, and the various halts are more numerous than would otherwise be the case. These include (Monday) Carlisle, Penrith, Kendal, Lancaster, Preston and Manchester, where the night will be spent. From Manchester (Tuesday) the run will be *via* Burslem, Stafford, Walsall, Birmingham, Rugby, Northampton, Bedford, Luton and Barnet, at each of which a short stop will be made, the arrival in London being timed for about 11 p.m.

The organisation of the trip is due to Mr. W. H. L. Watson, of the Edison Battery Co., who has invoked the aid of the numerous central station engineers in the towns visited. We understand from Mr. Watson that in connection with the paper on electric vehicles to be read at the Kingston meeting of the I.M.E.A. on June 19th next, 16 different electric cars, of both the pleasure and commercial types, by various makers, will be on view for demonstration purposes, thus affording an excellent opportunity for close acquaintance with the modern battery car, the successful introduction of which depends so largely on the charging facilities which the municipal authorities must now be prepared to give.

It is a sign of the times that H.M. Post Office has now obtained a trial electric mail truck, built by the Silvertown Co., for postal deliveries; we understand that a wholesale adoption of these trucks, in place of horse vans, in one centre, is being considered, the Postal authorities possessing exceptional facilities for battery charging from their own plants. In London, Messrs. Liberty's have obtained the first of 30 Edison battery cars for town delivery work; Messrs. Harrods have received four 1-ton Edison battery vans, and are proposing to introduce 60 for London deliveries, while we gather from Mr. Watson that his firm has inquiries for as many more. It is interesting to notice that the Glasgow Corporation is proposing to obtain 25 battery-driven scavenging vehicles, and the Marylebone Council is considering the adoption of 18 similar vehicles.

The Ilford authorities have an Edison battery bus under consideration, and a tower wagon for tramway repair work, equipped with an Edison battery, has been adopted by one system.

From the foregoing it will be gathered that station engineers must now seriously consider the matter of providing adequate charging facilities. The standardisation of the charging voltage is also a matter of the first importance.

**The I.E.E. Conversazione.**—Invitations have been issued by Mr. W. Duddell, F.R.S., President, and Mrs. John Smithers, and the Council of the Institution of Electrical Engineers to the conversazione to be held at the Natural History Museum, Cromwell Road, S.W., on Thursday evening, June 26th, from 9 to 11.30 p.m.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—The town electrical engineer and tramways manager of East London, South Africa, Mr. J. MORDY LAMBE, expects to arrive in this country in June. In view of the considerable extensions in the electricity supply and tramways undertakings of East London now in contemplation, Mr. Lambe is particularly interested in central station plant and machinery and motor-buses, and will attend the Imperial Motor Transport Conference to be held in England in July. His address will be:—Care of Wm. Dunn & Co., Broad Street Avenue, London, E.C.

Owing to the operation of the Glasgow Boundaries Act, 1912, MR. T. C. PARSONS and MR. W. SILLERY have retired from the management of the Govan and Partick electricity undertakings respectively.

At the Watford Council Offices recently, the staff presented to MR. F. W. PURSE, the electrical engineer, who has been appointed to a similar post at Carlisle, a silver coffee-pot and four silver vases. The presentation was made by Mr. W. F. Goodrich, chairman of the Council.

Accrington Electricity Committee has engaged MR. HARVEY WHITTLE as a special canvasser for the department.

Having concluded 12 years' service at Weybridge with the Urban Electric Supply Co. as assistant engineer, MR. SELBY HOWARD, has been presented with a silver cigarette case and a cheque by the employers. Captain H. W. Watts, resident engineer, made the presentation on Thursday last week, at the Lincoln Hotel.

MR. ARNOLD GILL has been appointed second assistant electrical engineer at the electricity works of the Hebdon Bridge District Council.

We understand that our notice of last week with reference to Basingstoke electric lighting was not quite correct. Mr. John B. Morgan, electrical engineer to Horsham U.D.C., only asked the permission of his Council to render assistance to Mr. F. R. Phipps, the Basingstoke surveyor, in connection with the preliminary preparations for the electric lighting scheme which has been placed in his hands. The work of supervising and laying down the plant will be undertaken by the Basingstoke officials.

The salary of MR. J. SHEPARD, mains engineer of the Southampton undertaking, has been advanced from £104 to £130 per annum.

MR. A. G. LOW has resigned his position with the Carlisle Corporation to take up the post of shift engineer at the Stockton-on-Tees Corporation Electricity Works.

**Tramway Officials.**—The Tramways Committee of the Derby T.C. has increased the salary of MR. P. W. BANCROFT, chief clerk, from £130 to £156 per annum.

The Blackpool Tramways Committee has increased the salary of MR. F. S. FIELD, tramway engineer, from £3 10s. to £4 per week.

At the West Ham Tramways Committee meeting on Tuesday last, the resignation of MR. H. E. BLAIN from the position of manager was received and considered. Mr. Blain is about to take up an appointment elsewhere in this country. The Committee decided to recommend the Council to accept the resignation with regret, and many good things were said regarding the splendid service rendered to the borough by Mr. Blain. It is proposed that the Council present him with an illuminated testimonial under seal, and that a successor be advertised for at a salary of £550 per annum, advancing by £50 per annum up to £700.

**General.**—MR. LAWFORD GRANT has resigned his position as president and managing director of the Canadian British Insulated Co., Ltd., Montreal, to take over the management of the Eugene F. Phillips Electrical Works, Ltd., Montreal, one of the largest wire and cable factories in the Dominion of Canada. Mr. Grant, who is the honorary secretary-treasurer for Canada of the Institution of Electrical Engineers, has built up a large business for the Canadian British Insulated Co. He went from England to Canada about six years ago as manager of the company in the Dominion, and later assumed the position of president and managing director of the Canadian Co., which, we understand, now numbers amongst its customers all the most important power supply companies and cities in Canada.

MR. FRANCIS W. T. BRAIN, Gloucestershire's new knight, has been closely identified all his life with the mining industry of the Forest of Dean. We are informed that he was a pioneer in the application of electricity to mining. Our correspondent writes:—"It was at the Trafalgar Collieries, with which he is still associated as managing director, that electricity was first applied underground. This was in January, 1883. He contributed papers explanatory of the work done, to the South Wales Institute of Mining Engineers, and also to the Bath Meeting of the British Association in 1886. Mr. Brain is recognised as an expert in electric blasting. Electric fuses, now so generally used in collieries, were first perfected and supplied by him more than 25 years ago, and the Cinderford or Brain's fuse, manufactured under his patents, is still well known and largely used. He was President of the Mining Association of Great Britain in 1911-12."

On the occasion of the visit of Mr. JOHN BURNS to Beckenham last Saturday to open Kelsey Park to the public, he was welcomed by Mr. George Sutton, J.P., in his capacity as chairman of the District Council. A commemorative oak tree was planted by Mrs. Sutton.

MR. W. J. LING has resigned his position in the electrical department of Messrs. A. Emanuel & Sons, Manchester, and has joined Mr. A. Borghys (trading as Royer & Borghys, 59 and 61, New Oxford Street, London, W.C.) as a partner. The name of the firm will be unaltered.

ALD. H. W. PEAL, J.P., chairman of the Borough of Ealing Electricity Committee, is lying ill at Switzerland with rheumatic fever. Though reported to be making satisfactory progress, it will be a considerable time before he is able to return home.

The *Australian Mining Standard* states that Mr. W. M. ARNOT has resigned his position as general manager of Messrs. Siemens Bros., and intends visiting London on private business at an early date.

**Obituary.**—Our readers will regret to hear that CAPT. W. R. LUGAR, who had been in bad health for six months, passed away at his residence, 5, South Street, Halifax, N.S., at 4.30 a.m. on May 21st, in his fifty-ninth year. The Nova Scotia papers pay tribute to his memory and to the esteem in which he was held by all, and his English friends will be in accord with the expressions of the *Halifax Recorder*, which says: "Captain Lugar was highly esteemed for his many sterling qualities. Conscientious in all his dealings, he has passed away to the deep regret of those with whom he was brought in contact." We extend to Mrs. Lugar and the sons and daughters our deep sympathy in their bereavement.

We regret to read of the death, which occurred on May 30th, at Catford, of Mr. FREDERICK HENRY ALMROTH STEVENS, who was for 48 years with the Telegraph Construction and Maintenance Co., in his sixty-third year. The funeral took place on Tuesday last at Hither Green Cemetery.

**Will.**—MR. E. M. UNDERDOWN, K.C., chairman of the Direct U.S. Cables Co., Ltd., who died in April, left £108,556 gross and net personalty £14,057.

## CITY NOTES.

### Crompton & Co., Ltd.

AN extraordinary general meeting of this company was held on Wednesday at Salisbury House, E.C., to consider a scheme for reconstruction, and to pass resolutions adopting same and winding up voluntarily (with Mr. E. Reeves as liquidator) for the purpose of registering a new company, to be named Crompton & Co., Ltd. A second extraordinary general meeting is to follow on June 19th for confirmatory purposes. The letter issued to the shareholders contains the following statement explaining the reasons of the board for bringing forward the scheme at the present time:—

"For some time past the directors have had under their careful consideration the question of the reorganisation of the company's capital, and the provision of further working capital which is urgently required to enable the business to be carried on at a profit to the shareholders. The demand for electrical machinery and appliances is increasing and prices are rising; consequently the present appears to be a favourable opportunity for placing the company in a position to take advantage of the improved trade conditions. During the ten years ending March 31st, 1909, the profits earned by the company, after providing and paying all outgoings, including depreciation, interest on debentures and loans, &c., amounted to £143,324, or an average of £14,332 per annum. In the years ending March 31st, 1910 and 1911, and in the first half of the following year, there was a scarcity of orders, and losses were incurred, due partly to inability to keep the works profitably employed and partly to losses on a contract abroad. Since 1911 the position has much improved. The volume of orders has increased, considerable reductions have been made in the standing establishment charges, and, with adequate working capital, it is fully anticipated that satisfactory profits will be earned. With a view to the adjustment of the capital account, and to the introducing into the business of the necessary working capital, the directors, after consultation with the principal shareholders, have decided to recommend the scheme of reconstruction, which is fully described in the memorandum enclosed herewith, and which can be carried through with but little, if any, interference of the company's business. The directors are of opinion that with this fresh capital the prospects of the new company will be distinctly favourable. The amount required to pay 7 per cent. dividend on the proposed preference shares is £9,520, and arrangements have been made to underwrite the issue."

The scheme of reconstruction submitted by the directors includes voluntary liquidation with a view to the transfer of its undertaking to a new company in consideration of (a) The discharge by the company of the debentures of the present company and the performance and fulfilment of the pending engagements of the present company, and the costs and expenses of and incidental to the liquidation of the present company. (b) The allotment and issue to members of the present company of fully-paid ordinary shares provided for below. (c) The rights of the shareholders of the present company to apply for and have allotted to them,

and/or their nominees, partly-paid shares in the new company on the terms stated below.

The new company will be incorporated with a capital of £221,000, divided into 221,000 shares of £1 each, of which 136,000 shall be 7 per cent. non-cumulative participating preference shares of £1 each, and 85,000 ordinary shares of £1 each for the purpose, *inter alia*, of carrying on the business of the present company. The preference shares will be preferential both as to dividends and capital, and will also be entitled, after payment of a non-cumulative dividend on the ordinary shares of the company for the time being at the rate of 7 per cent. per annum, to participate in the profits available for further dividends, *pari passu*, with such ordinary shares, and after repayment of the capital in a winding-up to participate in the surplus assets, *pari passu* with such ordinary shares in both cases in proportion to the amounts paid or credited as paid on the preference and ordinary shares respectively. The 85,000 ordinary shares will be allotted, credited as fully-paid up, to the registered holders of the ordinary shares in the present company, and/or their nominees, in the proportion of one ordinary share for every one existing share held by them; the preference shares credited with 12s. 6d. per share paid-up, to be offered to the registered holders of shares in the present company, and/or their nominees, in the proportion of eight of such preference shares for each five shares held by such shareholder in the present company. Failing acceptance of any of the preference shares by the shareholders of the company, and/or their nominees, within the period specified below, such shares shall be issued to the nominees of the liquidator of the present company, credited with 12s. 6d. per share paid thereon.

The new company shall be at liberty to issue first debentures for £100,000, carrying interest at the rate of 5 per cent. per annum, for the purpose of being exchanged for the debentures of the present company, such new debentures to constitute a first specific charge on the freehold and leasehold property, patents and patent rights of the present company, and a first floating charge on the remainder of the property, present and future, of the new company, including its uncalled capital, and to be secured by a trust deed in a form to be approved by the trustees of the trust deed securing the debentures of the present company.

The period during which the holder of shares in the present company shall be entitled to claim as of right by himself and, or his nominees, an allotment of preference and ordinary shares in the new company, is to be stated in the notice, or notices, inviting applications for such shares, but shall not be less than seven days from the posting of such notices.

The unpaid liability of 7s. 6d. per share on the preference shares of the new company shall be payable as to 1s. per share on application, 1s. 6d. on allotment, and the balance by calls not exceeding 2s. 6d. per share at intervals of not less than three months.

The new company shall be at liberty to procure the underwriting of the whole of the preference shares at a commission of 5 per cent. and an over-riding commission of 1 per cent. on the sum of £51,000 which will be provided by the issue of those shares, and also to pay the expenses of and incidental to the formation of the new company, and of the transfer to it of the property and assets of the old company.

We understand that at the meeting on Wednesday the resolutions were carried without opposition.

### British Thomson-Houston Co., Ltd.

THE eighteenth ordinary general meeting was held on Wednesday, May 28th, at the offices, 83, Cannon Street, E.C., Mr. J. F. Nauheim presiding.

THE CHAIRMAN, in moving the adoption of the report (see ELEC. REV.) said the past year had been a very satisfactory one from the point of view of orders received. Both in the home and export trade they had had record figures, but, on the other hand, their deliveries had not been satisfactory owing to the great difficulties which they experienced in obtaining raw material owing to the coal strike. Those difficulties continued up to the end of the year and seriously affected their output, and it was largely owing to this that the profit for 1912 was only as large as that shown for 1911. They had, however, also to take into consideration that they had had to pay higher wages, the cost of the new Insurance Act and the increased amount for interest on the advances to pay for the various extensions mentioned in the report. Generally speaking, they had made good progress, and the volume of business secured in 1912, which would come into account in 1913, entitled them to look forward to a very favourable result for the present year, all the more so that the orders secured since the beginning of this year showed an important increase over those secured in the same period of 1912. The workshops were fully occupied, and the additional facilities which they had provided justified entirely the large outlay of capital already expended and to be incurred.

MR. G. FRANKLIN seconded the motion, and the report was adopted.

### Birmingham District Power and Traction Co., Ltd.

THE meeting of this Company was held on May 28th, at Electrical Federation Offices, Kingsway, W.C., Mr. C. S. B. HILTON presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELEC. REV., page 907), said that at the meeting last year he stated that the business had shown expansion in both branches, and he was happy to be able now to inform them that those hopes had not been disappointed, and that the expansion had been continuous throughout the past year and showed no sign of

abatement. The total result of the year's operations showed a surplus of £55,449 13s. 6d. This compared with £52,841 16s. 0d. in the preceding year. Those results were really better than they appeared. In 1911 they had an exceptionally fine summer, which had a beneficial effect on the general traffic of the tramways, while last year's receipts were prejudicially affected by the exceptionally bad weather, in spite of which, however, the traffic receipts showed an increase of £2,400, and the receipts from parcels an increase of £700, while the expenses of the tramways department showed an increase of only £400, and the receipts of the tramways of the subsidiary companies showed improvements in all cases. Turning to the electricity supply, the Company's steady progress was well maintained. The receipts showed an increase of £3,000, while the expenses had increased by about £2,300. The increase of profit was, though small, satisfactory, as it represented current sold to new consumers, who had more than replaced one very large consumer who was supplied at a very low rate. Repairs and maintenance showed a slight increase, and there was a small increase in administration and general expenses. The renewals account had again been credited with £5,000; £3,000 had been added to the reserve fund, against £3,570 in 1911, while the sinking fund, under the operation of the trust deed, received £460 more. The dividends and interest received on investments from the associated companies amounted to £30,180, compared with £29,861 in the previous year, and this in spite of the fact that the Electrical and Industrial Investment Company paid no dividend on its ordinary shares, in which that company had so large a holding. The renewals account now stood at the substantial sum of £12,000, and the reserve account at about £12,500, while the debenture sinking fund stood at £27,919, making altogether over £52,000 passed to various reserve accounts from profits. In addition to these sums the subsidiary companies had separate reserve and renewals funds, the total amount of which was £68,744. Turning to the capital account, until the Smethwick Electric Lighting undertaking had been transferred to the Shropshire Power Company, expenditure on mains and additional plant must be provided by this company, and such expenditure as had already taken place would, it was hoped, be adjusted during the present year, when the undertaking of Smethwick was transferred to the Shropshire Company under the Board of Trade Transfer Order now awaiting confirmation by Parliament. It would then be possible to reduce the loan from the Shropshire Company, standing at £122,091 in the balance sheet, by at least £166,347, the amount expended up to December 31st last on the Smethwick undertaking, and the balance of the loan would be still further reduced if negotiations now in progress for the acquisition of a transfer to the Shropshire Power Company of the electricity supply undertaking in Dudley were duly completed. An amount of £4,843 had been expended at December 31st on the purchase of motor omnibuses out of a total liability of £21,698, of which at present about £6,000 was undischarged. It was considered preferable that the Company itself should purchase omnibuses and lease them to the motor omnibus company rather than that the Company should further increase its holding in debentures of the motor omnibus company. This method had the advantage of enabling the omnibuses to be operated by the company in districts away from Birmingham, should it ever be necessary, as that company was not restricted in its operations to Birmingham only. It was hoped that by the end of the present month 49 omnibuses would be in operation. To summarise, the combined working balances from the two sections of the undertaking amounted to £35,128, an improvement of £3,400. Sundry receipts were about £650 less, interest and dividends from investments £319 more, with the result that after making all the provisions he had referred to, they were able to recommend a dividend of  $3\frac{1}{2}$  per cent., against 3 per cent. for 1911, and to carry forward a rather larger sum. While all these results were satisfactory and encouraging, it was important to remember that the operating costs showed a tendency to increase. The increased cost of coal, due to last year's strike, they must accept as permanent, while the prices of all stores and materials had risen, and, in addition the company had been faced with the necessity of improving the rate of pay of the employees all round. Early in April considerable agitation arose amongst the men employed by the Company and the other companies operating the Black Country tramways, for increased pay and improved conditions, and the main argument put forward was the increased cost of living. The men asked to be put on the same scale of pay, etc., as the men employed by the Birmingham Corporation, but it would be realised that what was possible to a municipal system running in a city like Birmingham was not possible for a company serving a poorer and more widely scattered population. The cost of meeting the men's demands on all the Black Country tramway companies would have meant some £7,500 a year, which was about two-thirds of their gross increase in traffic receipts for the past year before providing for expenses. On May 16th they gave the men an all-round improvement in their pay and other conditions. The men recognised that the board had done all that could reasonably be expected of them, and he was hopeful that things would now resume their normal aspect. The CHAIRMAN proceeded to deal with the exchange of the Company's holding in the old City of Birmingham Co., Ltd., for stocks and shares in the Electrical and Industrial Investment Company, which was sanctioned last year, and said there was every reason to expect that for the present year a substantial dividend would be paid by the Investment Company on its ordinary capital, and a larger return might be anticipated on the investment than was received on the old investment previous to 1911. As to their investment in the Birmingham and Midland Motor

Omnibus Company, although that company had not quite recovered from the losses made in previous years, it had made substantial progress, and the outlook was encouraging.

Mr. S. R. BLUNDSTONE seconded the motion, which was carried unanimously.

### Kalgoorlie Electric Power and Lighting Corporation, Ltd.

THE seventh ordinary general meeting was held on May 28th, at Winchester House, E.C., Mr. R. W. WALLACE, K.C., presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELEC. REV., page 855), said that last year he told them they were unable to pay any dividend on the ordinary shares, because of the cyclone which had taken place, and which destroyed their cooling towers and a large number of their transmission lines. He estimated that the cost of repairing the damage would be about £3,000, but fortunately it only cost them £2,300. The inconvenience of an accident of this kind, over which, of course, the management had no control, did not only extend to the replacing of the damaged plant, but it also affected the working during the year. The brunt of that loss had fallen upon the present accounts, and they estimated that it amounted to between £2,500 and £3,000. He was glad to say that all their difficulties had been overcome; they had no trouble with their consumers, and except for the delay of a few hours they kept their tramways running. Another matter which had depreciated the profits last year was the change in the working of the water supply company from Perth, which consisted in adding chemicals, probably lime, to their water, in order to get rid of the acidity in the water in the mains running from Perth to Kalgoorlie. When those alterations were made the Company took the very best expert advice that could be obtained, for the effect of using that water with the chemicals in it was that coating took place in certain of the tubes in their boilers which necessitated the use of more fuel, thus adding to the expense of working. He was glad to say that the difficulty had been effectively overcome now. With regard to the business, the power sales were very much larger than usual, but the cost of manufacturing had gone up. Last year he told them they were putting down a new unit of plant. That had now arrived, but they had not yet had the benefits of its working. It was satisfactory to be able to say that the new plant had been entirely paid for out of the internal resources of the Company, and they expected that there would be increased profits in the future as a result of further economy in working. In conclusion, the CHAIRMAN said he wished they had been able to declare a dividend on the ordinary shares, but they were not justified in doing so at the present moment, and it was only by the working of the new plant that they could anticipate that their profits would increase to enable them to pay a dividend in the future.

Mr. EDWARD POPE seconded the motion.

The CHAIRMAN, replying to Mr. Crose, said that as the Company was not paying, it was only natural that the shareholders might think that the directors were too highly paid, but he could assure them that the work of the board was no sinecure, and that they were by no means excessively paid. Speaking on the spur of the moment, he should say that the effect of the new plant ought to mean an increased profit of between £6,000 and £7,000, and if that was so, it would enable them to pay a dividend on the ordinary shares.

The report was adopted.

### Urban Electric Supply Co., Ltd.

THE annual meeting was held on Wednesday, last week, at Salisbury House, E.C., Mr. P. D. TUCKETT presiding.

In moving the adoption of the report (see ELEC. REV., page 862), the CHAIRMAN said that the first and most important item in the accounts was that of profits earned at the various works, and this, he was glad to say, showed a 13 per cent. increase of £6,586, in spite of the coal strike last Spring, which, apart from the indirect loss it entailed, had directly resulted in an extra coal bill of £4,427, compared to what it would have been at the old prices. This represented an increase of 24 per cent. in the price of coal, and he need not tell them that it had proved a heavy burden. It was all the more fortunate, therefore, that trade had been good and that they were blessed with a summer which, in spite of its compensations, he imagined few of them wished to see repeated. But for these favourable influences he was afraid the results for the past year might have proved disappointing, whereas he thought they would agree that the actual results realised were not unsatisfactory. The balance of £54,265 carried down to net profit and loss account compared with £47,649 a year ago. Interest charges were up some £3,560 in consequence of the comparatively heavy capital expenditure of the last two years, and the provision for the redemption of debenture stock was increased by £411, leaving a net disposable balance of £18,083. This they proposed to apply by appropriating £10,000 to reserve for depreciation, and £7,500 to the payment of a 3 per cent. dividend on the preference shares, carrying forward £906. Capital expenditure had increased by £54,079, as against £68,006 the previous year, the issued debenture stock, less amount redeemed, being increased from £320,818 to £367,534. The principal change, however, arose out of last year's reduction of capital. The ordinary share capital now stood at £240,000, instead of at £400,000 as

formerly, the difference of £160,000 being represented by the new capital reserve fund, against which had been written off the expenses incurred in connection with the reduction of capital and the cost of plant dismantled, hitherto appearing as a suspense account item on the assets side. The existence of a fund formed in this way, and representing their estimate of the depreciation or permanent loss of capital value existing at the date of the capital reduction, was, of course, unusual, but they felt that in the case of a company whose undertakings were subject to purchase, it was desirable to deal with the matter in this way, writing off losses from time to time as they were actually ascertained, rather than to reduce their assets by the full amount at one stroke. The existence of this fund in no way relieved them of the obligation to provide for current and future depreciation. It was essentially a fund to provide for a potential loss which already existed, but of which only a small part had yet been realised. This year, as he told them last year would be the case, they would, in the ordinary course, have also written off against this fund the two items of preliminary expenses and discounts and stamp duty on debenture stock issued, but the recent telephone arbitration had suggested that it might be unwise entirely to eliminate such items, and consequently, as he was unable to give the matter the careful consideration it deserved, owing to his having been called away to the United States in April, they decided to let these items stand this year with a view to their being dealt with next year, as might then seem best. To the debenture redemption reserve they had this year added £5,257 from profit and loss, plus £618, the discount on the debenture stock redeemed, and they now recommended the appropriation of a further £10,000 to the depreciation reserve, making the joint total £42,995, a figure which he thought they would agree represented a substantial beginning, considering the short time those reserves had been forming; and, in addition, some £1,800 had been set aside during the year for battery maintenance, wiring stocks had been written down by £434, and some other small reserves made in the branch accounts. Without in any way unnecessarily overdoing it, they had every intention of safeguarding the future by the provision of adequate reserves, and, as their prosperity increased, he hoped it might be possible for them to increase still further the amount of the annual provision now made, for, in spite of the fact that it was not always recognised, he maintained most emphatically that the strengthening of the Company's financial position by the provision of adequate reserves was in the real permanent interests of the ordinary shareholders no less than in that of the debenture holders and preference shareholders. Proceeding to refer to the table of lamp connections, the CHAIRMAN said they would be glad to see that they had increased their connections by the equivalent of 87,758 33-watt lamps, an increase of nearly 15 per cent., compared with increases of 9 per cent., 10 per cent., and 12 per cent. in the three previous years. This steady progress constituted a most satisfactory feature, showing as it did the healthy growth and active potentialities of the business. It was true that a large part of the increase, as in the previous year, was attributable to Cornwall, and 72 per cent. of it represented power, but it was all good business, and was not to be despised because it might represent a somewhat smaller proportionate profit than an equal amount of lighting connections. As compared with the previous year, the lighting connections showed an increase of 7 per cent., and power an increase of 26 per cent. The output for the past year increased by 5,494,331 units, from 11,196,157 to 16,690,488, a 49 per cent. increase, for which, as in the case of the lamp connections, Cornwall was principally responsible, the power and heating units representing an increase of 66 per cent., as against a 7 per cent. increase in the lighting units. For the first quarter of the current year, they had connected the equivalent of 14,585 33-watt lamps against 21,804 for the corresponding period last year, when they had an exceptionally large connection in Cornwall. Consequently, of this year's total the lighting connections represented 47 per cent., as against only 16 per cent. a year ago. During the same period the output had increased 47 per cent., the lighting units showing a 5 per cent. increase and the power units a 64 per cent. increase, and these increases were accompanied by a satisfactory growth of profit, so that in spite of the continued high price of coal, he thought they might consider that the outlook was favourable. Referring to the results realised by the individual undertakings, they would see that Newton Abbot continued to show a steady growth of profit, as did also Grantham and Newbury, those three towns being the ones least affected by the increase in the cost of coal, Newbury being a water-power station. Caterham had also done well, and it might be a source of satisfaction to them to notice that the return on the capital invested there was now over 5 per cent., whereas it was little more than 1 per cent. when he joined the board five years ago. The poor results shown by Hawick were principally due to the rise in the price of coal, which, in the case of an undertaking like Hawick with a large power load, was a far more serious matter than in the case of a purely lighting station. Both Weybridge and Twickenham had been adversely affected by dearer coal, and apparently the influence of the metal lamp was still felt in a greater degree there than elsewhere, since in neither case had there been any substantial diminution in the growth of lamp connections, and yet the revenue had not shown a corresponding expansion. Dartmouth had suffered from dearer coal, and also from the adoption of metal lamps by the Naval College, which constituted a large proportion of the load. For the bulk of their increased profit they were indebted to Cornwall, as was only natural in view of the large amount of capital spent there during the last two years; and this profit should again show a large increase for the

current year, for he was glad to say the business was developing in the most satisfactory manner, and gave every promise of fully justifying their policy in embarking on it. The only drawback was that it was developing so rapidly and satisfactorily that, to cope with it, they were reluctantly obliged to incur fresh capital expenditure before they had reaped the full benefit from their original expenditure, but it was a purely passing phase, and however inconvenient it might prove to those who were responsible for the raising of the money in these unpropitious times, it was not a matter which need occasion them any anxiety, for they could not well have a better or more direct indication of the prosperity awaiting them. The other towns, Stamford, Godalming, Glossop, and Berwick had all suffered from the effects of dearer coal, and this principally accounted for the poor results shown by them. With reference to the position generally, he did not know that he could usefully add anything to what he had said on previous occasions. From the particulars he had already given them they would have gathered that the business was making steady progress, and everything pointed to its continuing to do so. Without entering into further details, he would content himself by saying that the increased earnings for the current year should more than suffice to pay the increased cash dividend on the preference shares.

MR. FRANCIS E. GRIPPER seconded the motion, and the report was adopted without discussion.

Replying to a vote of thanks, the CHAIRMAN said he hoped the shareholders would stick to their holdings and not throw them away at the present low prices, for he was certain that by holding on they would find the position for all classes improve.

### Delhi Electric Tramways and Lighting Co., Ltd.

MR. A. W. TAIT presided on May 29th over the seventh ordinary general meeting of this Company, held at Basildon House, E.C.

In moving the adoption of the report, the CHAIRMAN said that the results for the year 1912 were unsatisfactory, but there had been several contributory causes. The chief causes were the low receipts and high traffic expenses of the tramway system, the abnormal amount of repairs executed owing to the poor condition of the cars and their equipments and the amount of overhauling which had been necessary to the plant in the Power Station. The year's operations had also been affected by the considerable rise in the cost of coal, which might be emphasised by the fact that fuel expenses for the twelve months under review were nearly as high as the figure for the fourteen months ended December, 1911. The increase in the cost of coal was approximately 20 per cent., and he did not see any prospect of this being reduced in the near future. It was, therefore, all the more necessary for the Company to consider the generation of the whole of the power required by Diesel oil engines, which were much more economical in operation. Owing, however, to the fact that the existing oil engine had to undergo extensive overhaul during the year, the generating costs were adversely affected, and the service of the tramway system was, therefore, on various occasions, interrupted. These interruptions naturally prevented the tramway system from being worked in an economical manner, and this part of the Company's business had shown a loss for the year. They had, however, during the year, done a great deal to improve the condition of the plant and equipment on the tramway system. The Company had also had to contend with the increase in labour rates of all classes, and this rise might be regarded as permanent. Another difficulty had been the low receipts per car mile. A tramway expert who had considerable knowledge of Eastern conditions, and who, at one time, was face to face with the same difficulty and had successfully overcome it, had made an exhaustive report, suggesting drastic changes in fares and traffic conditions, and, after consideration, the Board decided to adopt his recommendations. These had only been in full operation for the last two or three weeks. For sixteen weeks from 1st February, the traffic receipts showed an increase of approximately Rs. 15,000, which was equal to about 55 per cent. For the period since 31st December to date, 1,839,000 passengers were carried, as against 708,000 for the corresponding period of last year. This would seem to prove that the tramway system was now catching on with the native population, and they might, therefore, look for a continuation of the increase in receipts. In order to deal efficiently with the traffic under the new conditions, a European traffic superintendent had been appointed. The exceptional expenditure for maintenance would no doubt go on for some time yet, until the system was put into thorough working order. The generating costs for the year were high—due to the increased cost of coal, also to the amount of expense incurred in overhauling and maintenance. It had also been necessary entirely to renew the battery equipment, and they had purchased a condenser, which was now placed in position. It was the hope of the directors that the position of the Company would warrant, in the near future, the installation of further Diesel plant, not only to meet the increased demands which were coming on the system, but also to supersede the existing steam sets, leaving them only as a stand-by in case of breakdown. From recent information received from the Manager, it would seem to be necessary, owing to the growth of the load on the station, to instal further plant at a comparatively early date. The Board had this matter under consideration, and were obtaining competitive tenders for the plant required. With regard to the electric supply undertaking, the gross receipts for the year amounted to £9,136, as compared with £10,360 for the corresponding twelve months of the previous year, which included the special Durbar receipts.

For the four months to 30th April, 1913, as compared with the corresponding four months of the previous year, there was an increase in receipts of over £1,800, equal to over 65 per cent. In addition to the growth of the ordinary lighting demand, the demand for power for small motors continued to grow satisfactorily, and, in order to encourage this still further, the Directors had recently agreed to a reduction in the scheduled rates, which they hoped would attract a considerable number of the small mill-owners in the city. They had also successfully completed negotiations with the Municipality for a new contract for street lighting for a period of five years, which was a considerable extension on the previous contract; and they had also been successful in recently connecting to their mains one or two large institutions which would take a fair supply for lighting and fan work. The number of units which had been generated during the year was 999,347, of which approximately one-half had been sold for lighting and power purposes, the balance being used by the tramway. The average price per unit sold for all purposes was 4.30d.; and the consumers connected during the year amounted to 202, as compared with 157 last year. The total number of consumers at 31st December, 1912, was 887, and, from a cablegram which they had just received from the General Manager, this had now risen to over 1,000. The number of fans which they had connected to their system was 1,059 at 31st December, 1912, as compared with 865 at 31st December, 1911; of which 194 were connected during the financial year as against 162 in the previous financial year. These statistics showed the encouraging progress which had been made by the lighting section. They were also in negotiation with the Government for a supply to their temporary works to the north of the existing city. This supply would, in the first instance, probably be for a period of from 4 to 5 years, although it was impossible to say for what time it would be extended at the expiration of that period. The load was, however, a satisfactory one, and it would enable the Company to reduce considerably the generating costs per unit on the whole system. With regard to the development of the power and lighting station in the new City, it was impossible to give any definite information at the present time. As they knew, the Government experts had made a very close study of the situation, and it was only comparatively recently that they had definitely fixed upon the site for the new City. They were in touch with the officials of the Government—both here and in India—and had received intimation from them that when the Government plans were fully developed, the Company would be asked to tender for the supply. They must, therefore, wait until the scheme was developed, and, when it was received, it would be submitted by them to consulting engineers, in order that they might be advised as to the best and most economical method of carrying out the work and the form of tender which should be sent in. Should the Company be successful in obtaining the concession for the new City and the contract with the Government, this would involve a considerable extension of its capital account. The Company would have to provide for the increasing load on the power station, and a certain amount of capital expenditure would, therefore, be necessary very soon. The Board had the matter under consideration as to the best and most economical manner in which the necessary capital could be raised. He hoped and believed that, to a certain extent, the amount required would be minimised by the profits which should now accrue from the system. It must be the policy of the Board for some little time to come, as profits were made, to retain them in the Company for the purpose of providing for the necessary capital expenditure, which would all tend ultimately to improve results. The affairs of the Company had taken a decided turn for the better, and there was every prospect that its position should slowly but gradually improve. The local board in Delhi was no longer necessary and had been dissolved. It would be better that all matters of administration should be dealt with direct between the London Board and the General Manager in Delhi. In conclusion the CHAIRMAN dealt briefly with the accounts, and also referred to the retirement of COL. SIR BUCHANAN SCOTT from the chairmanship of the Company owing to ill-health, although he retained his seat on the Board.

COL. SIR BUCHANAN SCOTT seconded the motion.

A shareholder pointed out that last year they were told they would be able to obtain some Diesel engines from the Government, but they still appeared to be working by steam. He also understood that another company was going to bring current from some falls near Delhi where it could be generated much cheaper than they could do it, and it was suggested that they should work with the promoters of the scheme.

In reply to this and other speakers, the CHAIRMAN said they were advised locally not to divide up the accounts of the two undertakings. With regard to the new expenditure they had got out certain alternative tenders for plant which would be required to meet their own normal increase, and also the supply to the Northern City. These tenders were on the other side, and until they received them back it was impossible to say what the expenditure would be. He believed that the resources they had, viz., the balance of debentures not yet placed and the profits they were able to make, would enable them to finance that capital expenditure. This was, of course, quite apart from the capital expenditure involved in dealing with the new City of Delhi. They would be very glad to put aside depreciation if they had it. He agreed that the shareholders had had a long time to wait, but they were slowly pulling round. They were like others learning by experience.

The report was adopted, and the retiring directors were re-elected.

### Metalite, Ltd.

THE further adjourned ordinary general meeting of the shareholders of the above Company was held on Friday at the offices, Christopher Street, Finsbury, E.C., MR. STEWART (Chairman) presiding.

The CHAIRMAN said he understood that at the last meeting Mr. Bentley presided, and informed them that a Receiver had been appointed by the Bank, and that arrangements had been made by which no sale should take place up to the end of August, to enable the directors to form a scheme of reconstruction. The board had now decided on the general outline of such a scheme, and it had been placed in legal hands, and would be issued to the shareholders he hoped by the end of next week. The new capitalisation of the Company would be nominally £80,000, with £20,000 7 per cent. cumulative preference shares to be issued for cash; a distribution of £20,000 ordinary shares amongst the existing debenture holders and a further £20,000 of 5s. ordinary shares credited with 8s. 6d. paid amongst the existing ordinary shareholders. The present Board would retire, and a new Board would be elected by the shareholders of the new company, for which a special meeting would be called. However, the full scheme would be before the shareholders, and a meeting would be called to consider it, as it was impossible to discuss it that day. He thought they would agree that under the existing unfortunate circumstances it was the best thing that could be devised. He formally moved that the meeting stand adjourned until August 29th, in order that the scheme might be carried into effect.

MR. STONE seconded the motion.

MR. GREGORY asked if August 29th was not too long an adjournment. If they were to assent to any scheme it was important that matters should go quickly.

MR. VINCENT said August 29th was purely an arbitrary date. The shareholders would be notified to attend an extraordinary meeting, and if a scheme was carried through the adjourned meeting would never be held.

MR. GREGORY said he was satisfied with that explanation. He would like to know if it was intended to invite the shareholders to confer with the Board before a scheme was finally drafted.

MR. VINCENT said it was intended to call the ten largest shareholders to a conference.

MR. ANDERSON said that in a public room in Birmingham he heard it stated that the Company had no lamps. Such a statement was calculated to prejudice the Company, and he suggested that in issuing the scheme the Board should give some information about the lamp and its present position.

MR. GREGORY said there was no justification for such a statement.

MR. HARRISON said they could take it from him that the Company had manufactured lamps. He had manufactured many thousands of them.

The motion was then carried.

### Electrical Apparatus Co., Ltd.

THE directors' report for the year ended 31st December, 1912, states that the profits (after providing £502 for depreciation and £302 for various items written off) amounted to £5,408 plus £132 brought forward. After deducting directors' fees £1,902, works manager's bonus £32, and preference dividend for the year £285, there is available £3,322. It is proposed to deal with this as follows: Dividend of 8 per cent. per annum on the ordinary shares, £1,256; reserve account, £1,000; development risk account, £250; appropriation to workmen's bonus account, £100; writing down patents account to the nominal amount of 1s., £348; writing off the balance of Milford Works account, appearing in balance sheet under New Buildings, £89; writing off the balance of development account, £110; leaving to be carried forward, £169. The rapid expansion of the Company's business has necessitated an extension of the works and offices; new buildings have been erected this year at a cost of upwards of £3,000, giving an additional floor area of over 10,000 square feet. To provide for the larger volume of trade the issued capital was increased from £13,550 to £22,250, and the Board was augmented by the election of Mr. H. R. C. Partridge, who has taken over the works management, and Mr. H. Taylor, who retains the secretaryship. The sum standing to the credit of reserve account on 31st December, 1911, with the further sum set aside out of the profits to that date amounted to £3,000. This has been distributed amongst the ordinary shareholders by the issue of 3,000 fully-paid ordinary shares, being equivalent to a dividend of 3 1/4 per cent. on the ordinary share capital shown in the last balance sheet. The turnover of the Company shows an increase of nearly 60 per cent., and the net profits 66 per cent. over the previous year's trading. This satisfactory result has been contributed to by the higher prices at which the Company's products have been sold during the year under review. A number of new products were developed, from which, however, the Company did not reap any benefit during the year covered by this report, but it is anticipated that considerable improvement will result therefrom in the business for the current year.

**Gwynnes, Ltd.**—The directors report that the accounts for the year to January 31st, after deducting debenture interest, show a credit balance of profit and loss account of £237.

**Edison & Swan United Electric Light Co., Ltd.**

THE directors have issued notices to the 4 per cent. first debenture stockholders, and the five per cent. second debenture holders, calling extraordinary general meetings of such stockholders for Wednesday, June 18th, at 12.30 and 2.30 o'clock respectively. The circulars read:—

"The reason for asking your assent to these proposals (see below) is to provide additional working capital for the general purposes of the business. The progress of the Company is being retarded owing to insufficiency of working capital caused mainly by the heavy outlays which it has been necessary to make during the past years in erecting further plant, the expenditure upon this heading since 1905 having amounted to upwards of £60,000. The proposals now laid before you, which include the amalgamation of both classes of debenture stock, have been submitted to several of the largest debenture stockholders, and the scheme has met with their approval. You will notice that the Resolutions empower the directors to call up a sum not exceeding £1 per share of the liability now existing upon 99,261 'A' shares of the Company. In return for this the directors propose to hand over to the trustees for the stockholders as further security £25,000 5 per cent. debentures and 33,346 shares of £1 each fully paid, held by the Company in the Altrincham Electric Supply Ltd., and further to raise the rate of interest upon the first debenture stock by  $\frac{1}{2}$  per cent., the rate of interest on the second debenture stock being correspondingly reduced. (The circular to the second debenture holders adds at this point: 'but, on the other hand, the second debenture stockholders will have a benefit of ranking *pari passu* with the first debenture stockholders.') In addition, one-third of the profits in each year will be set aside for redemption of debenture stock. The Altrincham Co. is the sole supplier under statutory powers of electric light and power for the town of Altrincham and surrounding district, about eight miles from Manchester; its operations are very successful, as will be seen from the profits made during the last three years, which are as follows:—1910, £4,586; 1911, £4,744; 1912, £5,750. For the current year it is anticipated that they will amount to not less than £7,250."

The following is part of the resolution that will be submitted authorising and agreeing to the arrangement between the Company and holders of the said stocks:—

1. The £313,872 Four per cent. First Debenture Stock of the Company constituted and secured by Trust Deeds dated the 12th January 1897 and the 22nd November 1898 respectively, and now outstanding, and the £135,602 Five per cent. Second Debenture Stock of the Company constituted and secured by trust deeds dated the 19th June 1900 and the 25th November 1900 respectively, and now outstanding, to be consolidated into one stock bearing interest as from the 1st day of July 1913 at  $\frac{4}{2}$  per cent. per annum, and so that the securities respectively constituted by the said Trust Deeds shall henceforth be held by the Trustees for the holders of the said Consolidated Stock for the benefit of all such holders *pari passu* in proportion to the amount of the Consolidated Stock held by them respectively.

2. By way of further security for the payment of the principal moneys, interest and other moneys to become payable in respect of the said Consolidated Stock the Company to charge by way of specific security in favour of the Trustees for the holders of such stock, £25,000 of Debentures and 33,346 Shares of £1 each fully paid of and in the Altrincham Electric Supply Limited, but so that such Trustees may in their discretion permit such a number of the said Shares as shall be necessary to qualify the representatives of the Company upon the Board of the Altrincham Electric Supply Limited to remain registered in the names of such representatives for the time being.

3. The Company to covenant with the Trustees for the holders of the said Consolidated Stock that in every year, commencing from the 1st day of July 1913, the Company will apply one-third of the profits of the Company available for the payment of dividends upon the shares of the Company in the redemption of the said Consolidated Stock either by purchase in the market or otherwise at or under par or by drawings at par.

4. Notwithstanding the provisions of the said Trust Deeds and the charges thereby respectively constituted the Company to be at liberty from time to time to call up the capital for the time being uncalled upon the shares of the Company for the time being issued to an extent not exceeding in the aggregate £1 per share, and to apply the moneys so called up for the general purposes of the Company's business.

In the course of a circular addressed to the "A" shareholders, the directors say that they regret the necessity for making a call, but feel that if the business of the company is to be successfully carried on, it is absolutely essential that further working capital be provided, and in their opinion this should have the effect of considerably augmenting the future profits. The call will become payable by instalments not exceeding 5s. each, at intervals of not less three months.

**New General Traction Co., Ltd.**

THE seventeenth annual general meeting was held on Monday, at the offices, 4, Crosby Square, Bishopsgate, E.C., Baron Emile B. d'Erlanger presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 855), said it would be noticed that the accounts covered a period of eight months only, the previous balance-sheet covering a period of 16 months. In future the accounts would always be made up to March 31st. The balance-sheet was now a very simple affair, due to the fact that they had in the course of the year paid off all the prior lien debentures and the floating debt owed by the company, and they had redeemed £41,700 of the 5 per cent. mortgage debentures, leaving £154,300 still outstanding. Those debentures were now covered over and over again both as regarded capital value and earnings. Since they had now entirely sold the Coventry tramways they had only the following three sources from which they could hope for profit—the American undertaking from which they got a fixed and guaranteed income; the profits from the Douglas Tramway Co., which was a small concern, whose net earnings fluctuated with the weather conditions prevailing during the holiday season; and the large interest they still retained in the Norwich Tramways. It was from the latter source that they could hope to improve the situation either by increasing their profits or by diminishing their expenditure. As to increasing the traffic, they were in the hands of the public—all they could do was to give as good a service as possible. They were, however, in hopes of decreasing the expenditure by improving the generating station. By a capital expenditure of between £3,000 and £4,000 they hoped to be able to make a reduction of some £1,500 or £2,000 in the annual expenditure.

MR. R. J. WEST seconded the motion, and the report was adopted.

**Provincial Cinematograph Theatres, Ltd.**—Notice of interim dividend of 5 per cent. has been declared, payable on the ordinary shares to shareholders whose names appear on the registers from May 26th.

**STOCKS AND SHARES.**

Tuesday Evening.

To deal at all adequately with the markets this week a thorough-going bear would be required. The ordinary man, seeing the prices dwindle of securities in which he has placed his faith and his money, makes a poor stick to deal with the dismal catalogues of losses shown by all the markets of the Stock Exchange during the past few days. Everybody clamours for a reason that shall explain the fall, but the real cause is too humdrum to satisfy most people. It is too simple a thing for the average man to hear that the stream of new issues is responsible for the greater part of the slump. He demands an explanation of more exciting character, and, to satisfy his appetite, all sorts of rumours are being circulated with reference to this, that, and the other house being in financial straits. Naturally, a prolonged and a heavy fall must have disquieting effects upon the position of houses speculatively inclined, but quite a lot of the reports are manufactured simply in order to meet the demand for them.

Money is in eager demand all over the world. London, Canada, South Africa, Australia, China, Mexico, and the South American Republics are amongst clamant competitors for fresh capital. The ordinary man might well suppose that underwriters could put the brake on new issues if they wished to do so; and it is a matter of astonishment to many people that they do not consider it good policy to set some bounds to the issues which they are prepared to underwrite, knowing full well that the success of them with the public is a dubious matter.

Coming to our own particular departments, most of them show losses more or less substantial in amount. There has been, and is still, a good deal of pressure to sell on the part of people who must have money to meet calls from other directions. This week and last, investment stocks have been coming out in noticeable quantities; and in the House it is becoming more and more difficult to sell what is commonly described as rubbish.

The Home Railway industry is threatened with another strike, an extension of the trouble which originated in the shipping yards. Much bellicose talk characterised the week-end meetings of the men, but, even without this, stocks would probably have gone back. Metropolitanans are  $2\frac{1}{2}$  down, Districts lost 3, Central London Deferred 2 and the Ordinary stock 1. The slump spread to Underground Electric Railways issues, where the £10 shares in particular were acutely depressed, drooping 10s. to 3s. The income bonds fell to 8s., while the other issues also declined. British Electric Traction has quieted down, though the 6 per cent. Preferred and the Deferred are  $\frac{1}{2}$  up at  $11\frac{1}{2}$  and  $6\frac{1}{2}$  respectively. South Metropolitan Tramways fell back to  $\frac{1}{2}$ , partly on a fall in London Suburban Traction shares, these being depressed by statements that a new issue is in contemplation.

Something akin to slump has befallen the Latin-Canadian group. All kinds of inferences are drawn from the violence of the drop, but none are in any way reliable. Brazilian Traction has lost  $\frac{1}{2}$  points, Mexico Trams 3, British Columbia Railway issues  $\frac{1}{2}$  to 2 points, Montreal Light and Power  $\frac{1}{2}$ , and so on. The various companies' bonds and Debenture stocks have given way to a lesser degree, the principal decline is 2 points in Mexico Tramway Sixes

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in and to grant a quotation to:—

Mississippi River Power Co.—Scrip, fully paid, for a further issue of \$3,000,000 first mortgage 5 per cent. 40-year gold bonds.

And to allow the following securities to be quoted in the Official List:—

Consolidated Gas, Electric Light and Power Co. of Baltimore.—Further issue of \$404,000 general mortgage  $\frac{4}{2}$  per cent. 30-year gold bonds of \$1,000 each (Nos. 9,362 to 9,765).

Madras Electric Tramways (1904), Ltd.—20,000 6 per cent. cumulative preference shares of £5 each, fully paid (Nos. 1 to 15,000 and 80,001 to 85,000) (renewed special application).

National Telegrapher Co., Ltd.—100,999 preferred ordinary shares of £1 each, fully paid (special application).

Underground Electric Railways Co. of London, Ltd.—Further issue of 21,000 shares of £10 each, fully paid (Nos. 7,201 to 8,200 and 26,793 to 46,792).

**Consolidated Gas, Electric Light and Power Co. of Baltimore.**—The directors have declared a dividend of  $\frac{1}{4}$  per cent. on the common stock for the quarter ending June 30th, being 6 per cent. per annum.

**Mackay Companies.**—The directors have declared the regular quarterly dividend of  $\frac{1}{4}$  per cent. on the common shares.

In one or two cases the sales appear to have come from stale "bulls" closing their accounts; in others, they are evidently due to pressing need for money, a need the satisfaction of which has led to more or less steep falls in many purely investment securities. Calcutta Trams, and Anglo-Argentine First Preference, are amongst the few shares which have risen superior to the general tendency of depression. In both cases small advances have occurred.

English Electricity Supply descriptions are, in the words of a dealer in that market, stupid to dull, the last-named being the Stock Exchange way of describing slight depression. This is most noticeable in Charing Cross and City shares, the Ordinary and the City undertaking Preference showing losses of 5s. Counties are also down. Other prices are not notably altered to any extent worth noticing. Metropolitan  $\frac{1}{2}$  per cent. Debenture stock is again harder. Regret is felt at the way in which the cohesion of the Publicity Committee seems to be in peril, especially considering the vast amount of time, work and thought spent upon it in recent years, and those who follow the matter have been overheard to hope that the threatened schism may be averted even at this eleventh hour.

The scheme for reconstituting the finances of the Edison & Swan Company is an elaborate and rather an involved affair. One of its first consequences was to raise the protest that the proposals formed an attempt to tamper with the security of the proprietors of the First Debenture stock. Following this there came other objections, to meet some, if not all of which, another circular is to be issued by the board. On the first one, some of the shareholders took what was not unnatural alarm, and tried to give away their partly-paid shares for nothing, in order to escape the liability. It may be doubted, however, whether many shares changed hands on this basis. The Second Debenture stock has lost several points.

It is refreshing in these drab markets to be able to write of cheerfulness and better prices in the British Westinghouse trio. The shares are  $\frac{1}{2}$  higher; the 4 per cent. Debenture stock has put on 2 points, and the prior lien 1. British Aluminium Ordinary have hardened. Sympathy with the Telegraph market brought down Telegraph Constructions 10s. Castner-Kellners are  $\frac{1}{2}$  lower, the shares being quoted  $\frac{1}{2}$  rights. Rubber shares rallied a little after being uncomfortably flat, but the results of this week's auctions are rather disappointing.

Telegraph descriptions reflect the weakness of other investment markets. Eastern Ordinary is marked down 3, and Eastern Extensions are 10s. lower, for both of which the dividend deductions account. Western Telegraphs lost their recent improvement. Anglo-Americans continue to fall away; West India and Panama First Preference are back to 9 $\frac{1}{2}$ . Cuba Preference, however, rose 5s., and Direct United States have improved. United River Plate Telephones fell back  $\frac{1}{2}$ .

Marconia, which were 3 $\frac{1}{2}$  when we last wrote, have been down to 3 since then, from which a rally on bear-covering lifted the price to 3 $\frac{1}{2}$ . Americans dropped to 12s. 6d., Canadians to half-sovereign before support came to brace them up to 14s. and 11s. respectively. In National Telephone Deferred stock there has been little going on, the price remaining about 20 $\frac{1}{2}$ .

■ Edward Tilt & Co.	■ W. F. Dennis & Co.

**Prospectus.**—Sir W. G. Armstrong, Whitworth & Co., Ltd.—This company has been making an issue at par of £1,000,000 5 per cent. non-cumulative second preference shares of £1 each.

**William Beardmore & Co., Ltd.**—The list closes to-day in an issue of 1,000,000 6 per cent. cum. pref. shares of £1 each. at par, for paying off £866,400 outstanding second mortgage debentures, and for general purposes.

**Doulton & Co., Ltd.**—The directors' report for 1912 states that after providing £14,000 for debenture interest, and £711 for depreciation of investments, writing £500 off goodwill and deducting the debit balance of £9,782 brought forward, there is a credit balance of revenue account of £13,812, which it is proposed to carry forward.

**Mirrlees, Bickerton & Day, Ltd.**—At the annual general meeting, held in the Chartered Accountants' Hall, Manchester, on Tuesday last, the directors recommended the payment of a dividend of 7 $\frac{1}{2}$  per cent. on the ordinary shares and 5 $\frac{1}{2}$  per cent. on the preference shares, which was approved.

## METAL MARKET.

## Fluctuations in May.

**The German Accumulator Industry.**—A remarkable conflict of opinion has just arisen regarding the situation of business in the German trade in secondary batteries. As in connection with the Board of Trade in Great Britain, so in the Fatherland there exists a Government official organ which professes to reflect the position of the labour market and of trades at certain intervals. On the present occasion the organ, apparently referring, in the first place, to last year, states that complaints were made of inadequate activity in the manufacture of stationary accumulators, whilst the works engaged on the production of portable batteries were only moderately employed. The decline in the receipt of new orders for stationary batteries, which started in the autumn, continued at the opening of 1913, although this was not entirely surprising, as business in the early months is always quieter. In March and April it is customary for orders to experience a large increase, but in the current year the newspaper declares that the decrease has become accentuated, whilst the call for delivery on old contracts has also abated. The execution of the latter still permits of the maintenance of full working, although a limitation, it is added, will be inevitable in the near future. Although there are various manufacturers of storage batteries in that country, the largest individual firm is the Berlin-Hagen Co., which also exercises, to some extent, a monopoly in the trade, owing to its wide connection with the largest groups of manufacturers, and with the central stations established or promoted by them and their associated interests. This particular company, which brought over into 1913 orders exceeding by £100,000 in value those on the books at the beginning of 1912, recently reported that business continued very active, and that a further development was taking place in the portable battery trade. If then the smaller makers are suffering, according to the official labour organ, it is apparent that the largest undertaking at any rate has no grounds for complaining of the situation of the trade.

## REVIEWS.

*Metallurgy of Iron and Steel.* By MESSRS. SEXTON and PRIMROSE. Manchester: The Scientific Publishing Co. Price 12s. 6d. net.

The subject of the metallurgy of iron and steel is at the present time almost beyond the scope of any one individual. All volumes containing up-to-date information are acceptable, and the present one is especially so, as it is written with undoubted authority. It forms the second edition of a previous work with the same title. Great progress has been made during the last few years in the science of metallurgy, and this book has, therefore, many features of an entirely new work. The authors' aim has been to present a text-book of moderate dimensions for the student, but at the same time to cover the whole field of the metallurgy of iron and steel. A work of this nature cannot possibly gain the approval of every reader, but the authors have made a very careful selection of the more important facts relating to this industry.

The volume begins with a somewhat extensive list of errors, which, for the sake of appearances, might have occupied a less conspicuous position; and, after a quotation from Bacon, the student is introduced to the importance of iron. The first few pages are devoted to introductory remarks on the classification of iron ores. The book is then divided into sections, the first of which deals with the production of pig-iron. This part of the book gives a very clear and interesting account of our present knowledge of the subject. No important facts are omitted, and such vital questions as cost and durability of furnaces receive brief but necessary attention.

Part III treats of malleable iron, and deals with the subject in a very comprehensive manner, especially from the point of view of the English manufacturer. Part IV is devoted to the production of steel, and a considerable amount of space is given up to the important and interesting study of the micro-structure of iron and steel. The authors touch upon the subject of electric steel, but this is disposed of in four pages. We are of opinion that considerably more attention might have been devoted to this section of the book, especially in view of the growing importance of this branch of the industry. Two electric furnaces are illustrated, but neither of these has come into extensive use, whereas other types are now well known. We notice that the appendix contains a diagram of an electric smelting furnace, which has recently been undergoing trials in Sweden.

The book throughout is exceedingly interesting. It is copiously illustrated, both with diagrams and photographs, which, besides giving a fair knowledge of the principles involved, offer some idea of the actual plant in action. The volume teems with useful tables and information, and may be recommended to anyone interested in the subject. Our best thanks are due to the authors for presenting such a useful and valuable compilation compressed into so small a volume.

*Electroplating.* By W. R. BARCLAY and C. H. HAINSWORTH. London: Edward Arnold. 1912. Price 7s. 6d. net.

This volume, comprising 400 pages, deals with the subject of electroplating in a very comprehensive manner. It is written from the engineering side, and is eminently practical. We must take note, however, that the book is not intended to take the place of practical experience, but rather to supplement the already acquired knowledge of the electroplater. The writers have taken as their basis a course of lectures delivered to students in the technical classes of the University of Sheffield, supplemented by the syllabus in electrometallurgy of the City and Guilds of London Institute.

The volume commences with a chapter on fundamental chemical principles. These are disposed of in a few pages, and will be of very little use to anyone who has no previous knowledge of chemistry.

Following this is a chapter devoted to electrochemical principles, which is very simply and concisely written. The next chapter introduces the electroplater to fundamental

electrical principles. These are very hurriedly disposed of, and will prove somewhat confusing to readers who are not electricians. Then we have the usual theoretical considerations relating to primary and secondary cells and the dynamo. These chapters should prove of considerable interest to the electroplater.

The authors then introduce the real business in hand, namely, the practical side of electroplating. This part of the book is by far the most interesting, and contains a very complete *résumé* of the present known processes of plating. It is well illustrated, and for the most part expressed in language that will commend itself to the class it is written for. Numerous recipes are given which will undoubtedly prove of great value. The theoretical considerations are, as a rule, clearly expressed. There is, however, a tendency to give information whose connection with the theory and practice of electroplating is not at once apparent. We find several passages in the book which are likely to lead to misconception. On p. 249, for example, the idea of catalysis is somewhat confusing, and will probably be misunderstood. The authors further state that recent researches suggest that colloids added to the electrolytic bath move to the cathode. We might point out that this is an actual fact, and not a suggestion, as can easily be demonstrated by the use of the microscope. The subject of electrotypes is touched upon *en passant*, and we consider that this might, with profit, have been considerably elaborated. There is extreme difficulty in gaining accurate information on this latter subject, and more precise knowledge would have been gratefully received.

Throughout the book, simple methods for the analysis of various materials are described. These are perfectly clear, and will not lead to ambiguity. We sincerely hope that this volume will be well received. It deserves the careful consideration, not only of those directly employed in the electroplating industry, but also of those interested in the wider field of electrotechnics.

*Applied Electrochemistry.* By A. J. ALLMAND, D.Sc.  
London: Edward Arnold. 1912. Price 18s. net.

It is a lamentable fact that this country, the birthplace of electrochemistry, falls a long way behind the German Empire in the production of standard literature. Neither country has any great natural facilities for the development of water power, or for the production of cheap electricity, except from coal. In spite of this, however, Germany has taken the lead in the world of electrochemistry, whereas England has fallen considerably behind. There are numerous volumes written in the German language dealing with electrochemical processes, but hardly any in English. Nevertheless, electrochemistry is quietly gaining a firm foothold amongst a certain class of English manufacturers, who are ready to assimilate new facts relating to their technical processes. The present volume is evidently intended to fill their requirements. The author, in his preface, states that he has designed his book for both technical men and students; a laudable ambition, but difficult to fulfil. There is no doubt that the volume will be of immense value to the student. It presents, in book form, facts relating to electrochemical processes which have hitherto been confined to periodical literature.

Dr. Allmand commences his book by a general theoretical introduction, and deals with commercial electrochemistry based on theoretical considerations. A few pages are devoted to the question of power, and the information is of necessity somewhat fragmentary. The reader is then introduced to simple problems of equilibrium, whose general utility is hidden behind involved electrochemical nomenclature. This chapter is quite comprehensible to an advanced student of electrochemistry, but entirely useless to the average technical man. In fact, the chief fault we have to find with the book is the too frequent use of complicated formulae. The first part of the work deals entirely with the theoretical side of electrochemistry. It is undoubtedly well written, and offers many novel conceptions which have hitherto not been presented in book form.

The second part of the book deals with the commercial side of electrochemistry. There are the usual considerations of primary and secondary cells, treated from the

theoretical side. The author then turns his attention to the refining of metals. All the well-known processes are described and diagrammatically illustrated. Electroplating and typing are touched upon and disposed of in a few pages. Other electrochemical industries are dealt with in turn, and described with accuracy. The very interesting work on the fixation of atmospheric nitrogen is ably dealt with at some length; also many other industries which have not been so fortunate as the former in firing public imagination.

It is a pity that working costs are not discussed. To the technical man this is of primary importance. The diagrams are numerous and clear, but give little conception of the actual plant. Greater elaboration would have been useful to the technical man. It is suggested that the book would have been more useful if written in two entirely separate volumes; the first volume treating of the subject from a theoretical standpoint, and the second volume designed exclusively for the technical man. However, it is pleasant to notice that no important electrochemical development has been omitted. The book undoubtedly fills a great need, and is extremely well written and interesting. The thanks of all students of electrochemistry are due to Dr. Allmand for his very interesting addition to our standard electrochemical literature.

*Measurement of Induction Shocks.* By ERNEST G. MARTIN.  
1912. London: Chapman & Hall, Ltd.

This little volume gives a concise account of an improved apparatus for producing standardised electrical stimuli as an aid to physiological research.

The methods adopted by the author are the outcome of observations carried out over a considerable period, during which he became impressed with the necessity of having exact measurements, with a view to obtaining results that could be compared with those of other workers.

The earlier chapters are devoted to an explanation of the conditions affecting the character of Faradic stimuli, an historical review of the progressive steps taken to improve the technique of the work, and a statement of the various requirements necessary for the construction of an ideal apparatus.

The suggestions put forward by the author to overcome the difficulties encountered are extremely ingenious, and apparently the apparatus made in accordance with his ideas gives uniform and satisfactory results.

Full instructions are laid down in connection with the calibration of the instruments, and the mathematical issues involved are clearly dealt with, forming a decidedly unusual feature of electromedical literature.

It is to be feared that the circulation of the book will be limited, as it can only be of direct interest to physiologists, but to such the book will be of undoubted value and, in all probability, it will be instrumental in co-ordinating future work in an important branch of science—important, because physiological knowledge is the basis of medical and surgical procedure.

*Handbook of Wireless Telegraphy.* By J. ERSKINE-MURRAY, D.Sc. London: Crosby Lockwood & Son.  
Fourth Edition. Price 10s. 6d. net.

Considerable revision and additions to this work are features of the fourth edition, and Dr. Erskine-Murray is certainly to be congratulated on his endeavours to keep the book abreast of progress, and to effect improvements therein. Much new matter has been added, mainly in connection with more recent developments. The description of the Poulsen system is amplified, and the more recent methods and types of apparatus used by the Telefunken Co. are fully considered. The Goldschmidt high-frequency alternator and the Galletti system of transmission also receive attention.

In reference to these latter the descriptions given are very meagre, and it is doubtful whether more than a vague idea of the methods will be conveyed to the student. Taking the case of the Goldschmidt alternator, it is suggested that an explanation of the reactions occurring in low-frequency alternators when the power factor has a very small value would

pave the way for the student to understand the principle involved in the Goldschmidt machine. It could, with advantage, be pointed out how an alternator takes upon itself the functions of a transformer, in addition to those of a generator under certain conditions of working; and how the frequency due to rotation is added to the armature frequency when this transformer effect comes into play.

The high-speed methods and appliances designed for use in connection with the European Poulsen system are adequately illustrated and described. At the end of the book extracts are given from the Marconi Co.'s outline specifications for high-power stations proposed for the Imperial wireless chain.

*La Télégraphie sans Fil pour Tous.* By F. DUROQUIER. Paris: E. Orlhac. Price 3 fr.

The author sets out to provide an elementary treatment of the construction and installation of wireless apparatus and the applications of wireless telegraphy. We must congratulate him on his happy knack of spanning wide gulfs, in the theory and developments of apparatus and methods, in such a manner that the discontinuity is hardly noticed, but, at the same time, we believe that few non-technical readers would be able to follow the book. In our opinion, it is admirably suited to the needs of the general electrical engineer who, having read indiscriminately a certain amount of matter dealing with wireless telegraphy, wishes to acquire a good elementary grounding in the subject, either with a view to proceeding to a more advanced study, to enable him to take up amateur wireless work or simply to enable him to read, with greater intelligence and profit, the current "wireless" Press.

In his opening paragraphs, the author sketches the present importance of wireless telegraphy and the general nature of Hertzian waves. The methods of generating and radiating the latter are then considered. When it is stated that Transmission is dealt with in  $4\frac{1}{2}$  pages, under the following paragraph headings: Ruhmkorff Coil, Condensers, Interrupters, Transmitting Circuits, Antennae, Direct and Indirect, Shunt and Inductive Excitation of the Aerial, it will be seen how summarily these matters are dismissed. No explanation is given of most of the technical terms employed, hence the layman is not likely to derive much benefit from the book. On the other hand, a reader grounded in general electrical engineering would gain a good elementary understanding of the subject dealt with. If suitably amplified by lectures, the book should prove useful for students' use.

In Section III, dealing with the reception of Hertzian waves, the Branly and other coherers and relay circuits for use with these are described and illustrated. Various forms of detectors and their advantages in conjunction with telephone receivers are next considered. Surely it is too sweeping a statement to say that crystal detectors are more sensitive than the best electrolytic types? Quite the best printed explanation and distinction which we have seen of and between the telephone sounds produced by damped and aperiodic radiations is given as *cr. crrr* and *tû. tûûûû* (French pronunciation). The author's detector, using a semi-conducting artificial crystal, appears to be highly sensitive, and, by the uniformity of its structure, little subject to derangement; tests have shown it to be eminently suitable for use in field and other sets exposed to rough usage. An explanation of the nature and importance of syntony leads to an explanation and comparison of various arrangements of the receiving circuit. Considering the knowledge assumed in other sections, it seems to be unnecessary to explain the distinction between series and parallel connection on p. 22.

The second part of the work (comprising 20 pages) deals with the construction and installation of wireless apparatus for amateur work. The author is careful to explain that no apparatus, methods, tests or results are described with which he has not had experience and success which can be realised by any reader following the instructions set forth. A station suitable for transmitting messages up to 150 km. is described, but this is rather beyond the needs of the average amateur, and the equipment suggested would certainly be too expensive for the latter. The construction and use of a number of pieces of apparatus—including a convenient ball-interrupter—are explained and clearly illustrated.

Some useful suggestions are made as to methods of arranging and suspending the aerial network (often a matter of perplexity to the amateur), and a simple arrangement is described whereby telephone subscribers may use their exchange line as a receiving aerial without in any way affecting the working of the ordinary telephone service. Tuning circuits are described in some detail, and the section concludes with an enumeration of points requiring attention in the maintenance of a wireless equipment.

The third part of the book reviews the present applications of wireless telegraphy, including public service, time signals, weather reports, naval and code messages, Press reports, &c., and sets forth, *inter alia*, the Morse code, a number of station call-ciphers, and the procedure followed in transmitting various signals and reports.

The Appendix includes 14 wiring diagrams, showing the principal arrangements of transmitting and receiving circuits, and commenting briefly on the characteristics and advantages of each. The volume suffers from the defects, common to most French books, of having no index and of being paper bound, but it is certainly to be recommended as a reliable work and a good investment.

## BUSINESS METHODS IN NEW ZEALAND.

By WIGWAM.

In some previous notes on electrical matters in New Zealand, we foreshadowed these comments on usual business methods, and in view of difficulties that commonly arise in importing plant and material, we are led to believe that there are a number of English manufacturers who might read them with profit.

It must be borne in mind that the State controls interests in the Dominion that are commonly in the hands of private individuals at home. It not only administers the Public Works, and Posts and Telegraphs, but also the railways, two of the principal coal mines, and its own printing departments. Incidentally, it may be worth mentioning, as showing the extent of such public ownership, that the State runs a Tourist Department, including the administration of the town of Rotorua, which is the centre of the thermal district, a State insurance department, and a number of experimental farms. Recently it has secured control of all the latent water power in the waterfalls and rivers, and has actively commenced to develop it.

To the operations of the Government departments may be added the activities of the municipal bodies, Harbour and River Boards, &c., and together they may be taken to be the purchasers of the great bulk of electrical and mechanical plant, as distinct from agricultural and allied machinery. It will be understood, of course, that such materials as lighting accessories, small motors, and so on, are purchased and installed by private traders and contractors. But, in general, the remarks following may be considered applicable.

Practically all important contracts are publicly advertised, and tenders are invited to a prepared specification. So far, the usual practice in England is followed. Where it differs is in that there are almost invariably the following conditions: First, a deposit has to be paid in when a tender is submitted; secondly, sureties have to be found to guarantee due fulfilment of the conditions if the work is secured.\* To these may be added the usual payment for copy, or copies, of specification and drawings, and penalty for delay in completion. The deposit is generally from  $2\frac{1}{2}$  to 5 per cent. of the contract price, and has to be made in the form of a marked cheque of an approved bank (the tenderer's own cheque being insufficient); it is held until the contract has been signed by the successful tenderer. Should any hitch occur in settling the final details with the successful firm, the deposit of the next in order of merit, or even of all the remaining firms, may be held, pending settlement, and no payment or allowance is made for bank interest. Thus, on a tender of, say, £30,000 value, a deposit of £750 might be held for weeks, and even months, without acknowledgment of interest due, and when a number of tenders close on

\* "Wigwam" is apparently not aware that sureties are often required in this country.—EDS. ELEC. REV.

or about the same date, it will be seen that the total amounts outstanding in that way may be considerable.

The second condition is sometimes even more difficult to deal with. Two sureties are generally to be named, who will together bind themselves in a sum usually of about 10 per cent. of the contract price, for the fulfilment of the contractor's obligations. These sureties are to be approved by the purchasers, and usually the clause is so drafted that it is practically essential to find local men.

Thus the local representative of an English firm is in the position of having to find two bondsmen to back him up on behalf of a firm who may be totally unknown to them. Not only has he, therefore, to add their payment for such bond to his price, but unless his principals guarantee him, he may have to pledge his own property as security. If to these risks is added that of a penalty for delay in delivery or completion, it will be seen that to successfully compete, there must be entire confidence and trust between the local and the home house. It might be argued that the home firm might tender direct, but there are numerous reasons to be urged against this, of which, perhaps, two will suffice.

A firm outside the Dominion, and doing local trade, does not thereby escape the attentions of the income-tax department. The Commissioner of Taxes, in the absence of evidence in the shape of the firm's books, may assess their profit himself, and tax them on his own assessment. The possible result only needs a little contemplation to prove the folly of risking this course.

The second reason is that very frequently the time allowed for completing estimates and making up tenders, does not admit of obtaining detailed prices from home, even if the home firm knew that tenders were being invited.

It will be seen, then, that the position of a local representative endeavouring to open up business, particularly for a home firm whose name is unknown, is not altogether an enviable one, and that he needs not only the friendly assistance but the active co-operation of the home manufacturers. The extent to which this is forthcoming will be largely the measure of their mutual success, or otherwise.

Competition is keen, a fact which many manufacturers do not seem to realise. There is a certain class of British manufacturer who invariably quotes for cash against shipping documents at English port, involving his selling agent in a further expenditure for bank exchange, as well as interest on the value of the goods while they are at sea, *i.e.*, for about two months. He further throws upon the selling agent the risks of making good defects in the material itself, breakages in transit and delays in shipment, or disputes, all of which would appear to be difficulties in which he might reasonably be expected to bear a fair share.

It thus often happens that the local man is unable to agree to some clause in a specification, which involves too much risk to himself in matters over which he has no control, and by striking out such clauses, he places himself at a disadvantage with competitors whose principals support them.

The bank exchange, for instance, where payment is obtained by drawing on a London bank on production of bills of lading, costs about  $1\frac{3}{4}$  per cent., a sum quite sufficient on, say, a contract for cables, to put prices out of competition. If payment is made by cheque through the mail on receipt of invoices, the rate can be reduced to about  $\frac{1}{4}$  per cent.

It may be argued that the manufacturers equally cannot afford to stand out of the payments for the time the stuff is in transit, but in how many cases of similar contracts made at home would he receive payment in less time?

To turn to other phases of the subject, wherein the makers can materially help their representatives, as has already been said, tenders are often called at short notice, and unless local people have up-to-date prices, it is important that they should be able to obtain them cheaply and accurately by cable—*i.e.*, a complete code system is necessary. Recently there has been introduced a system of deferred cables at half the usual rate per word. They are, however, only transmitted after all the ordinary cables have been put through, no code words or figures are allowed, the message must read intelligently and convey no other meaning than its text implies.

The cost of cabling special points of a specification is heavy, and sometimes the time allowed for completing figures is just sufficient to allow of detailed particulars being sent home by mail and the prices cabled on receipt.

The Customs tariff is often a stumbling block. Suppliers often fail to make the necessary declaration as to the origin of the material on the back of their invoice. British material is admitted at preferential rates, in most things the foreigner being liable to pay 150 per cent. of the home maker.

The duty is assessed on the trade value of the material, plus packing. It occasionally happens that suppliers quote *c.i.f.* prices, and make out their invoices in the same way. The importer may thus be charged duty on freight and insurance costs included in the total. These should all be shown separately, to save dispute. Quotations should also show both *f.o.r.* and *c.i.f.* costs, and give both shipping weight and dimensions, since local railage, wharfage and cartages vary in different districts, and unless the local man has this information, he must either guess the tonnage, or allow extra for contingencies.

The term "Trade value" is the price at which the material is commonly sold to the trade, *i.e.*, list price less discount. If a deduction is shown as commission, this is taken to mean that the deduction is a special one for the benefit of that particular purchaser, and is liable to duty. In assessing the duty, a primage of 10 per cent. is added to the invoice amount; *i.e.*, the duty on £100 worth of goods would be charged on £110.

It is essential to detail all the items that appear on an invoice, and to avoid showing a lump sum for a composite article made up of a number of parts subject to different rates of duty. This particularly applies to electrically driven machines. For instance, machine tools are admitted free, as also are certain classes of mining plant, while cranes and machines generally, other than agricultural plant, are classed as "manufactured articles of metal" liable to duty of 20 per cent. The motors are liable to 10 per cent. only. Insulators are dutiable, whilst the bolts are free. It may be taken that the Customs officials exact the maximum amount to which they can lay claim, and it facilitates matters considerably if manufacturers make out their invoices showing the separate values of each of the items that go to make up the total, and where the different classifications are known, separate invoices should be made out.

It should also be borne in mind that mistakes made either in this connection, or, indeed, in any business transaction, require practically three months to clear up, this being the length of time that usually elapses before a reply is received in course of mail.

The tendency of most public bodies, including Government Departments, is to purchase through local houses rather than through London shippers, as used to be the case, and to hold the local firm responsible.

There is a greater sense of security in having the principal accessible in case of difficulty or dispute, rather than in relying on suppliers who are some 14,000 miles away, and who can only be reached by correspondence.

There can be little question that manufacturers who are represented by thoroughly accredited local houses of good standing and with a working knowledge of the goods to be handled, are those who secure the bulk of the business, and that the most successful combination can only be attained by complete working harmony at home and in the Dominion.

---

**An International Fire Library.**—The British Fire Prevention Committee having established a technical library that will be known as the International Fire Library, with a nucleus of over 2,000 books dealing specifically with matters of fire prevention, fire service and fire loss, is desirous of calling the attention of authors, public authorities, publishers and collectors to the fact that a new catalogue is in preparation, and that any books, pamphlets or reports which they are able to spare for this collection should be addressed, as soon as possible, to the Honorary Chief Librarian, The International Fire Library, 8, Waterloo Place, Pall Mall, S.W. The chairman of the Library Committee is Mr. Oswald Wylson, F.R.I.B.A., and the hon. secretary, Mr. D. W. Wood, insurance surveyor. The library, which is the first of its kind anywhere in Europe, promises to be a very complete specialist technical library, and will be made easily available to all primarily concerned in the subject of fire protection.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Scott's Patent Air Compressors.

MESSRS. ISAAC STOREY & SONS, LTD., of Empress Foundry, Cornbrook, Manchester, have introduced the Scott patent air compressor in which an interesting type of valve is employed. As shown in the part sectional view, fig. 1, the valve consists of two plates and a number of small hardened steel balls. The bottom plate is drilled with a series of holes of two diameters, the top portion slightly larger and the lower portion smaller in diameter than the balls, thus forming a pocket for the ball and a seat for it to rest on. The upper plate is drilled to the same template as the

FIG. 1.—BALL VALVE FOR SCOTT PATENT AIR COMPRESSOR.

lower one, and is fixed so that the holes in it are staggered with those in the lower plate, the bars between the holes forming a stop for the lift of the balls. The plates are screwed together, and the valve is thus to all intents and purposes a one-piece device, with positive and rapid opening, large area with small lift ( $\frac{1}{8}$  in.), no springs, and small clearance space. The wear is inappreciable, and the valves cannot be broken.

The application of the valve is shown in fig. 2, a section of a simple single-crank compressor. The end of the trunk piston is closed with one of the valve plates above described, which

FIG. 2.—SECTIONAL VIEW OF SCOTT COMPRESSOR.

approaches almost to touching the fixed valve plate, so that the clearance is exceedingly small. The inlet air passage is cast in the top of the frame, and communicates with the interior of the cylinder through inlet ports round the circumference. The upper end of the cylinder is cooled by a surrounding water jacket containing a large body of water. It will be noticed that the momentum of the balls in the piston valve-plate tends to open and close the valves automatically at the right moment.

The compressors are made of single or double stage type, with one to three cranks, and are designed for driving directly or through gearing by electric motors, as well as by various other means. The air pressure is up to 100 lb., and the maximum capacity 3,000 cu. ft. of free air per minute.

An automatic pneumatic-electric control system has been developed for use with these compressors.

### The Anger Automatic Brake Adjuster.

An ingenious device which is being marketed at the present time, after a number of years of testing under various conditions in all parts of the world, is the Anger improved automatic brake adjuster.

This device is the invention of Mr. John Edward Anger, the general manager of the United Electric Car Co., and is being placed on the market by the ANGER MANUFACTURING AND SUPPLY CO., LTD., of Preston. The company has factories at Manchester, Paris, Brussels, and is at present arranging for them in Canada and the United States.

The principle of this apparatus is very simple, and it can be applied to any type of truck with any type of platform brake gear.

The question of automatic slack adjustment in brake shoes has of late become quite pertinent, not only in its relation to economies in car maintenance, but in the saving that results from reducing energy consumption and preventing accidents.

Great care and attention should be given to the adjusting of brakes, but this work is often more or less overlooked or neglected, and in most tramways the men appointed to do this kind of work are at the same time called upon for many other duties, with the result that brake adjustment is always more or less attended to in a hurry, and, in many cases, not done with the accuracy that is necessary to give the motorman perfect control of his car.

It is an established fact, and well known to tramway engineers, that the proper place to adjust or take up the slack or wear of the brake shoes is at the point nearest where this is caused, and the Anger adjuster is the only device of its kind that operates on the brake rods, which is the nearest point in the brake equipment to where the slack takes place.

The action of the adjuster is as follows:—

In the application of the brake, the brake lever is drawn outwards, which causes the connecting rod to move the casing in the direction indicated by the arrows, fig. 5. Should the brake lever on the truck be allowed to travel farther than a certain point (owing to the wear of the shoes), the casing which carries the little pawl will travel on the ratchet nut, the pawl engaging with it, and upon the brakes being released and the brake lever returning to its normal off position, the ratchet will be moved forward one tooth and thereby tighten up on the thread on the rod to the amount of the wear

FIG. 3.—PLAN VIEW OF ANGER BRAKE ADJUSTER.

that has caused this extra travel of the brake lever. Thus whenever the slack increases so as to allow the brake lever to move the casing a greater angular distance than one tooth, upon its return the slack is automatically taken up, and the winding upon the brake rod is always in one direction; the ratchets being connected by a top connecting rod, both sides are simultaneously wound up in one direction, and the brake shoes are always kept the proper distance from the wheels until they are worn out.

It is only necessary to press down the thumb-lever, when the adjuster becomes a simple nut, and unwind it with the wrench, in order to replace the shoes.

The threaded part of this adjuster is made of best phosphor bronze to prevent jamming on the thread, and ensure perfect working and freedom on the rods; it eliminates the old trouble of having to replace rod ends by cutting them off when the hand nuts

were corroded and jammed on the rod. This device is at the present time in use successfully in over 60 systems in this country, and 75 other systems in all parts of the world, and everywhere we gather that it is giving entire satisfaction.

The company's orders for Corporation systems at the present time include 100 sets for Sheffield, 100 for Birmingham, and 60 for Cardiff, and it has executed its third order for Manchester and its second order for Salford. The device is included in the new specifications for trucks for the Corporations of Sheffield

FIG. 4.—ANGER ADJUSTER APPLIED TO STANDARD GAUGE TRUCK.

York, Walthamstow, Santos, East London, Capetown, Ayr, Salford, and many other places.

All of the cars have been recently equipped for the Preston and Blackpool Corporation tramways, and these two systems have placed orders for their bogie trucks as well.

#### The "Rex" Totally-Enclosed Fuse.

THE GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, E.C., have just introduced an enclosed cartridge fuse, in which a number of improvements have been embodied. It is claimed for the "Rex" fuse that it is reliable in operation under the most severe conditions; fuses of one capacity cannot be inserted in bases designed for fuses of another capacity; all metal parts are entirely shielded, rendering it impossible to touch any current-carrying parts when inserting or removing the fuse; and an

FIG. 6.—"REX" ENCLOSED FUSE.

allowance is made for blown fuses upon their return. The fuse can readily be fitted on existing fuseboards with the ordinary 2½-in. break, and it meets the requirements of the Home Office and Supply Authorities. An indicator shows clearly when the fuse has blown.

#### Slow-Motion Starting Gear.

MESSRS. H. T. BOOTHROYD, LTD., of Bootle, have brought out a slow-motion gear for operating electric starters and the like (fig. 7). It consists of a special worm and wheel device arranged to be double automatic in any position of the starter arm, and also arranged so that the arm cannot be moved until the main switch is closed, or left in any position other than the "full on" position.

The arm is fixed to the hub of the worm wheel, whilst the rim of the wheel is loose on the hub, and the worm can drive the rim round the hub so long as there is no connection between the two. The connection is provided by a coil—the no-volt coil—which is energised in the usual way, and which operates an armature carrying a toggle and pawl, the latter engaging with teeth cast on the inside rim of the loose worm wheel. The worm handle carries two contacts connected to the terminals of the no-volt coil, and these contacts are closed (thereby short-circuiting the coil) until they are opened by pressure of the hand on the turning handle, thus removing the short circuit, and so allowing the coil to be energised, and the hub of the worm wheel to be picked up by the rim clutch.

On removing the hand from the handle, the two contacts referred to close again, and the no-volt coil is shorted and the hub is released from the rim and returned by a spring to the "off" position. The starter is retained in the "full on" position by destroying the short circuit across the no-volt coil when the hand is released. This is done by introducing into one of the leads from

FIG. 5.—ANGER RATCHET ADJUSTMENT.

the handle to the no-volt coil terminal, a pair of contacts arranged so as to be open-circuited by the arm in the "full-on" position only. Thus when the arm is in the "full-on" position, it is immaterial whether the hand is removed from the handle or not, because there is a break introduced into the short-circuiting circuit as described above. The no-volt coil is also short-circuited in the usual way by the operation of the overload release.

The object of the device is to make the gear automatic and quite independent of the operator for returning to the "off" position, either due to overload or failure of the supply. The operator is not able to leave the starter in any intermediate position, but only in the "full-on" position. The gear is also certain in its action; it does not rely entirely upon a strong magnetic pull for keeping the

FIG. 7.—BOOTHROYD SLOW MOTION GEAR, APPLIED TO WOOLLCROFT LIQUID STARTER.

catch in position, as this is accomplished by a toggle arrangement, which requires very little magnetic energy to retain the pawl in action, and thus it is able to use a very small no-volt coil, which is usually not in service with the field circuit. Also, with this type of gear the operator is able to rotate the switch to the "full-on" position, or bring it from the "full-on" position gradually to the "off" position, which is very useful for slowing-down motors for putting on belts, &c., when it is not required to stop the machine entirely. The worm and worm-gear are always in mesh, and one hand only is required for operating the starting gear.

#### Low-Water Alarm and Feed Regulator.

MESSRS. O. ELLEFSEN & Co., of 26A, Silver Street, Bradford, have brought out a new patent low-water alarm and feed regulator of very ingenious design.

A copper tube is attached to the boiler shell, projecting into the interior, and carries at the further end a lever at right-angles to its axis. The lever carries at one end a bucket, and at the other a counter-weight. The inner end of the tube is closed, and is supported by a sling from the boiler shell. Within the tube is a steel rod, fastened to the inner end and projecting through the boiler shell at the base of the tube; the free end of the rod carries

business. Unless adequate provision is made, a time must arrive when, owing to some of the plant, mains and apparatus having become wholly obsolete, an amount will have to be debited to profit and loss account, which should in strictness have been borne by previous years.

There is the certainty of deterioration, and always the risk of obsolescence, even though kept in good repair. The estimate of the period of useful life therefore can only, after all, be an estimate. Very seldom does plant, &c., wear out or become obsolete exactly in the way anticipated.

The method of dealing with depreciation in which a fixed percentage is taken annually out of receipts to write off the original outlay within a fixed period, paying at the same time interest on the outstanding amount, appears to be the soundest method; repairs and renewals as necessary being made a separate charge to revenue accounts. An average depreciation or writing-off of the capital account within 15 years should be allowed for.

An analysis is made of the published returns for the year ending March, 1912, and appearing in the *Electrical Times*. This is divided as follows:—Table A, covering 21 local authorities of more than 15 years' working. Table B, covering 33 local authorities of 15 years or less working; each with 2,000 kw. or more of plant, and with total capital costs per kw. of plant, £60 or less.

The amortisation of the capital account on a 15-year basis to bear 3½ per cent. interest on outstanding principal is taken as an annual charge per £100 of capital expended of £9 14s. This figure covers depreciation and minimum interest, to this amount must, therefore, be added working expenses, set against revenue account before contingencies and true profit can be arrived at.

On this basis the results, as summarised below, are most unsatisfactory. However, since a few undertakings show a substantial profit, the soundness of the basis taken is, I think, confirmed:—

From Table A. From Table B.

Years working ... ..	16 to 28 years	7 to 15 years
Total capital cost per kw....	£48 7½	£42
Per cent. revenue to capital ...	14½ %	16 %
Working costs per cent. of revenue	45 %	53½ %
Load factor (based on maximum demand).	11½ % to 25½ %	13½ % to 29½ %
Standing charge per unit sold ...	£83d.	£63d.
Works cost per unit sold ... ..	£17d.	£65d.
Total net production costs per unit sold.	£14d.	£138d.
Average price obtained ... ..	£137d.	£123d.
Present loss per unit ... ..	£65d.	£98d.
Loss as % of revenue ... ..	47½ %	80½ %

A consideration of these results indicates that an increase in price is necessary to bring about financial stability.

The tariffs as set forward below would appear to meet the respective cases, and to form the basis of a scale of charges which would meet the capital and working costs involved. The questions of contingencies and profit are eliminated.

**Table A.**—Total capital cost per kw. = £48 7½. This written off in 15 years at 3½ per cent. interest = £4 27 as a standing charge per annum per kw. of plant in commission—i.e., £6 05 as a standing charge per kw. of plant installed. The average works costs = £17d. per unit sold, and assume this on 20 per cent. load factor of station plant.

We then have:—Standing charge £6 05 per kw. of maximum demand + works costs per unit sold, based on load factor of use of supply, or:—

	Per unit.
For 20 % load factor supply use a charge =	£83 + £17 = £143d.
" 10 % " " " =	£646 + £12 = £2158d.
" 40 % " " " =	£4165 + £47 = £835d.

**Table B.**—Total capital cost per kw. = £48 7½. This written off in 15 years at 3½ per cent. interest = £3 65 as standing charge per annum per kw. of plant in commission—i.e., £4 85 as a standing charge per kw. of plant installed.

The average works costs = £65d. per unit sold.

We then have:—Standing charge £4 85 per kw. of maximum demand + works costs per unit sold, based on load factor of use of supply, or:—

	Per unit.
For 20 % load factor supply use a charge =	£663 + £65 = £1328d.
" 10 % " " " =	£326 + £45 = £2171d.
" 40 % " " " =	£3315 + £42 = £8135d.

Present prices charged for supply of load factors up to 10 per cent. are, generally speaking, remunerative, and the losses are made on the supply at higher load factors—in other words, on the industrial power supply. Unless the charge be based on these lines all round equity is not obtained, and the tariff on these lines appears to be the only basis on which capital expenditure is justified.

It is suggested that accounts should be subject to revision—say, annually—with regard to the following points effecting the tariff:—

**Diversity.**—This factor varies from time to time, being greater, the greater the variety of industries served.

**Power Factor of Load.**—The effect of low power factor to choke the revenue-bearing property of the capital outlay. In order that the importance of this fact may be brought to the notice of the consumer, it is necessary that he should contribute his proportion of the extra charges involved.

A minimum payment equivalent to half the estimated total revenue should be enforced in order that the tariff shall be equitable. Not only is it necessary to cover the standing charges of the plant, but the establishment charges have to be met whether units be taken or not.

The efficiency of consumers' working capital and the result of putting money saved on power plant down in productive machinery does not appear to have had the proper consideration and use as a very real argument, that it might have had.

Whereas £100, if put into the power plant yields 5 per cent. interest, if put into the business instead, for productive plant, it yields 5 per cent. and 7 per cent.

The inherent advantages of the electric drive are becoming more and more realised, and it is up to the supply undertakings to insist on them when negotiating business.

#### DISCUSSION AT LEEDS.

MR. T. ROLES said that no doubt the author had based his figures on a general principle of all-round equity to all types of consumers, but he (Mr. Roles) held that it was impossible to get that. The only basis upon which they could hope to run a supply undertaking was in a general way to aim at charging every class of consumer at a price somewhere in the near neighbourhood of the cost at which he could, in the alternative, supply himself. If they wanted to get a large power user, they would probably have to charge him in the neighbourhood of 3d. or 4d.; and in his judgment it was absolutely necessary to get the large power user. If the amount of returns from a mill was sufficient to pay the capital charges on a main and transformer station, they could make their profit on the lighting consumers.

MR. H. H. WRIGHT was inclined to agree with Mr. Simpson that where profits had been made at all they had been made on the small consumers, and he contended that the losses which were recorded by Mr. Simpson were due to the low prices charged to the larger consumers. The actual cost of driving a weaving mill with steam, including everything that ought by any possibility to be taken into account, was 18s. 10d. per loom per year of 2,730 hours, or 4½d. per week. Upon a carefully prepared estimate of the cost of electric driving he arrived at a cost of 50s. per loom per year, or 1s. per week.

DR. R. POHL said he thought there must be fundamental mistakes at the bottom of both the author's and Mr. Wright's conclusions. Mr. Wright had assumed the maintenance of the maximum load right through, whereas he thought the average load would be considerably less. In the second place, if they had a shed of about 100 looms those would not all be running at the same time. There would be a diversity factor that might be anything between 60 and 75 per cent., and that had not been taken into account. Mr. Simpson's mistake seemed to lie in the standing charge per unit sold, which Mr. Simpson calculated at a depreciation rate which wiped out all the capital in 15 years, and which at the same time included 3½ per cent. on the capital standing in the books at any given time. Surely they did not propose to depreciate the entire site value in 15 years; the greater probability was that the site value would appreciate. Fifteen years might be all right for the life of generating plant, but the depreciation was surely altogether excessive on buildings and mains, the latter of which accounted for quite 50 per cent. of the capital as a rule. Altogether, he considered that the figures for standing charges were quite excessive, and that was sufficient to explain the extraordinary result according to which practically every central station in the kingdom was losing money continually. If they were to accept Mr. Simpson's suggestions as to charge for maximum demand, they would not get a single power consumer, and would, in effect, be definitely declaring themselves bankrupt. He agreed with Mr. Simpson that, to a large extent, they made the lighting consumer pay for the large power consumer, and that was the way in which the supply authorities managed to make a profit, as he contended they did. Instead of increase of prices, he would suggest a very considerable reduction of the lighting rates, so that the cooking and heating load would increase rapidly, as well as the lighting load. He fully believed that, if they took their courage in both hands in that matter, the demand would increase at such a rate that there would be no risk of having to increase power charges.

MR. E. S. RAYNER said he was anxious for information as to how to tackle the power load question, because Doncaster was now a centre of very rapid development, and he did not see how it was to be done satisfactorily. How could they compete with a firm putting down their own plant in the case of a place which wanted 1,000,000 or 2,000,000 units per annum?

MR. SCHOFIELD agreed with Mr. Simpson's figures. He thought that Mr. Wright had made a mistake somewhere in his cost of electric drive in a weaving shed, because a loom of the kind referred to had been found by actual tests to consume about 10 units per week, and at a 4d. per unit, that was only 5d. instead of 1s.

MR. J. C. B. INGLEBY said he was particularly struck with the low revenue of the supply authorities, compared with the amount of capital embarked. Any business should, surely, at least turn over its capital once a year. The only way to do this was to increase the load-factor, and reduce the capital costs, and not touch the prices at all, or, if anything, reduce them.

MR. H. BROWN agreed that any increase of prices would be very difficult, and thought that the only thing to do was to increase the load factor, and keep prices as they were.

MR. SIMPSON, in reply, defended his theory of charging the various classes of consumers on principles of equity, and argued the matter out, at some length, with Mr. Roles.

## DISCUSSION AT SHEFFIELD.

MR. H. E. YERBURY objected that the author's period of 15 years for repayment of capital was too short, and did not bear a correct relation to actual experience. In their last Parliamentary Bill in Sheffield, for instance, they obtained a 20 years' period for power stations and cables. The really equitable method of charging appeared to him to be for each consumer to pay a sufficient sum to cover standing charges on the plant required for his purposes, plus a charge based on works cost and a reasonable percentage of profit. Then as the output for any station increased the customers would get the benefit of the increase by way of the lowering of the proportion of the works costs charged. The great difficulty about the proposition for an increase of prices was that in proportion as these were put up inducements would be offered to manufacturers to install their own generating plant. Low-priced energy was one of the means of attracting new undertakings to a city for the benefit of the ratepayers.

MR. H. A. NEVILLE said that if Mr. Simpson's 15 years' proposition meant that he would equate all loans and pay them out in 15 years, he could not agree to it at all. The principle of equated loans seemed to him to be absolutely wrong. The only equitable basis for repayment of loans was to take each section of the works and plant at its own determined life or at a reasonable estimate of its life, and reckon a varied period of repayment for each section. He differed from Mr. Simpson in regard to his suggestion that the lighting consumer was being charged a high price in order to make up for the low price charged for power. When they took into consideration the load factors, it was easily seen that the long-hour consumer at a low price was a much more profitable consumer than the short-hour consumer at a high price.

MR. W. N. Y. KING also defended the position of the larger consumers who, he thought, ought to be credited with a good deal of the economy on the running costs, as well as on the capital costs, and he agreed with Mr. Yerbury that in municipal supply there should be no question of profit, but merely a desire to produce energy as cheaply as possible in order to assist and stimulate productive industries.

MR. J. C. B. INGLEBY urged the importance of cutting down capital expenditure, and said he thought that the most expedient way to do that would be by having rather less expensive buildings and a more economical management of the laying of mains. If they could reduce the capital expenditure by a reasonable amount most of the undertakings dealt with in Mr. Simpson's tables would be made to show a working profit. They could not, in his opinion, increase the charges for electricity.

MR. E. J. MARSH pointed out that in Sheffield they had to compete with gas supplied at 11d. per 1,000, which, of course, meant a very low power figure. He thought, too, that a mistake was made in having too many systems of charging for electricity. A simple system was what the consumer required. If he had the choice of 30 different systems he would never be satisfied that he had selected the right system for himself.

MR. SCHOFIELD said he entirely agreed with the wisdom of the 15 years' period for repayment, and thought that they should consider, not so much what they could get in the way of prices, as what was profitable.

MR. W. E. BURNARD said that in regard to capital expenditure, he was always struck by the very large amount of plant that had to be kept up for the sake of a load which only came on for a very few hours in the year. This plant was really out of all proportion to the amount of income from it. In Sheffield the spare plant to meet the needs of a peak load, which was used not more than five hours a year, represented 8,000 kw.

The CHAIRMAN (Mr. W. B. Woodhouse) said he was afraid there was only one ideal system of charging, and that was on the simple principle of the highwayman who demanded: "How much money have you got?"

MR. SIMPSON, reverting to the Leeds discussion, held that the final effect of Mr. Wright's contrast of steam and electric driving costs was that by the use of electricity in such a case £4,800 would be saved on capital account, and with that money the manufacturers would be able to put in 160 more looms, and that meant an increase of profit of about £760 per annum, in addition to which there must be considered the additional advantages of the speeding-up of the drive and the extra output, which would result from the steadier running. As to his 15 years' period, he adopted it as a conservative figure, which was hardly likely to be on the wrong side, though time alone would show that. As to his grading of the tariff, unless it was done on some such lines, they could not justify capital expenditure. There was this to be remembered in regard to the loan period, that whatever the loan periods were it was the actual life of the plant which determined the soundness or unsoundness of the depreciation basis.

## Recent Developments in the Street Lighting of Manchester.

By S. L. PEARCE, M.I.E.E., AND H. A. RATCLIFFE, M.I.E.E.

(For abstract of Paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, see our issue of March 21st, 1913.)

## DISCUSSION AT GLASGOW.

MR. R. D. MITCHELL (Glasgow) said the authors referred to lowering gears rather than to their detriment. He, personally, emphatically endorsed the conclusion come to at the recent London conference, that lowering gear made a great saving. In Glasgow they had not only gone in for flame lamps with lowering gear,

but for magnetically operated switches with control from a central point. Where flame arc lamps were substituted for ordinary arc lamps, it was almost necessary to adopt these appliances owing to the greatly increased cost of carbons with flame lamps. Economies had to be got in other directions, so that the total cost might not be seriously affected. Lighting authorities in general were quite willing to accept the greatly increased illumination but they were not willing to pay more—at any rate, not very much more—for the change. It was by automatic switching, long-hour lamps and lowering gear that these economies might be effected. In Glasgow they had 837 arc lamps now, nearly all flame arc lamps, and they were busy fitting the last 100 lowering gears. When the electric control was first put into use, the trimming staff numbered 23 men. This change enabled them to reduce the number to 11. With the long-hour magazine lamps and lowering gear, a further reduction to four regular men and one spare man would be brought about. Each man attended to 62 lamps per day and no Sunday work was necessary. In the summer, out of the four men, two could be taken off the lamps to do overhauling in the shop. The switching was done by the inspectors, who, after switching on, set out on bicycles to do their rounds, each taking one-half of the city. All the lamps were switched on in five minutes. He considered that in connection with any new scheme of street arc lighting electric control should be taken into account. The control cable was laid at small expense along with the arc leads. His experience was that the candle-power of high-pressure gas lamps did fall off 50 per cent., and that quickly. He had found in high-pressure gas lamps in Glasgow streets, a falling-off of about 33½ per cent. in one week's time, the first reading being 3,200 c.p. at 26°, second reading 2,200 c.p. at 50°, and less than 2,000 c.p. at 26°. He saw it remarked by the authors that the use of clear globes was objectionable, due to the glare causing eye strain. He did not think there was glare to that extent. Even when the globes were quite clear the light appeared to emanate from the whole surface of the inner globe, more intense, of course, but the arc itself should not be taken as the source. Clear globes with lower surfaces only obscured were inevitable, in his opinion, in view of the competition to be faced. The gas people never thought of using anything else, glare or no glare. With reference to the experiments made with dioptric globes, it was stated in the paper that the tremendous intensive heat was due to the open lower end of the globes. No doubt that was so, but did the authors not find also by using dioptric globes with open lower ends that the fumes from the carbons condensed on the cold surface of the outer globe, and in a very short time obscured it? Some experimental lamps in Glasgow had shown this effect after having been in place for two weeks.

MR. ALEX. WILSON (general manager, Glasgow Corporation gas department) said the authors stated that the electric lighting possessed all the practical advantages. As to lower cost, he agreed that in Manchester they might be quite right; the arc lighting there had been taken in hand in a scientific way. The reason for the difference between the state of affairs in Manchester and in London was the excessive gas leakage which was shown to have existed in Manchester. With regard to the simplicity of switching operations and the possibility of dispensing with lamplighters, they in Glasgow had a large proportion of lamps where the switching was done automatically, and automatic switching could be carried out in any way desired. As to the c.p. of the lamps in Manchester, the efficiency of these was far too low. They had had a great deal of trouble in Glasgow in getting the lamps adjusted, but having done that, they got an efficiency of, say, 60 candles per cb. ft. He noticed that the outlay was very heavy: the actual cost was about £30 a lamp, and for gas £48. In Glasgow they would want four or five lamps for that.

MR. J. A. ROBERTSON (Greenock) said he believed that in the Westminster lighting district the maximum candle-power to be obtained was specified as to be taken at 20° and 45° from the horizontal. It seemed to him, looking at the curves, that it would be a comparatively easy thing to get at the result by using a proper globe, so that the specification which called for a particular candle-power at a given angle was upon the basis of what they wanted. So far as lowering gear was concerned, he could understand difficulties arising with types of gas lamps, but it was exactly here that electricity had the advantage. His belief was that they should always try to get an illuminant approaching nearest to daylight. They were rushing to extremes in high candle-power for street lighting, and when that was taken in conjunction with the illumination caused by shop-keepers and at picture palace frontages, there was sure to be a reaction, if for nothing else than for the safety of the public.

MR. S. LONGLANDS (inspector of lighting to Glasgow T.C.) expressed himself as not altogether favourable to lighting tests on the streets, for many matters had to be taken into consideration where they had a mixture of grey, white and red stone buildings. He thought in every case the laboratory test was best. At present his department was equipping a laboratory for this purpose, so that it might stand in perfect fairness right between the gas and electricity departments.

MR. PEARCE, in the course of his reply, said he quite appreciated the value of the economies which could be obtained by using raising and lowering gear, but those who knew the conditions in two typical Manchester streets would appreciate their position. He was, however, open to conviction on the general question of fixing lamps, and, if they had future extensions in Manchester, they would consider the question of traversing and lowering gear. A point which weighed with them in this connection was the extreme difficulty of getting the necessary permission from property owners for attaching the gear to the walls of buildings. In connection with the depreciation of gas mantles, he thought street trading

had a great deal to do with that, to say nothing of heavy vehicular traffic. In both those respects Manchester was a very bad city, and in one of the districts referred to in the paper the change from gas to electricity was made because of that. Gas leakage was inevitable, and he admitted that in Manchester it was excessive. As to the efficiency of Manchester lamps, it seemed to him that if they wanted to get up to the neighbourhood of 50 candles per cb. ft., it must be got by gradually increasing the pressure and renewing mantles more frequently at the expense of maintenance. The general point of the paper was that, assuming electricity cost twice as much as it was stated to cost in the paper, or assuming that the gas lamps were twice as efficient as given, the result was in favour of electricity. As to uniform lighting, that was frequently obtained at a cost out of all proportion to the advantage resulting from it.

MR. RATCLIFFE also briefly replied.

## PATENTS EXPIRING IN 1913.

(Continued from page 920.)

7,427. "Rotary converters." J. IMRAY. (Proc. Adonyme pour la Transmission de la Force par l'Electricité.) April 8th.—Relates to a converter or transformer for converting simple or alternating currents. Two armatures, preferably Gramme rings, are mounted on one shaft. The one ring rotates within an inductor of an asynchronous motor supplied with alternating current. The other ring rotates between field magnets in the polar extensions of which are fitted rings connected by copper bars.

7,525. "Submarine telegraphy." A. MUIRHEAD. April 10th.—Relates to arrangements in connection with submarine telegraphy for transmitting, receiving and translating either in single or duplex working. The specification describes a number of modifications for obtaining a shifting zero, employing and regulating currents, and the use of "outflow" and "overflow" circuits in connection with the artificial line for regulating and sharpening the signals in translating from one circuit to another.

7,892. "Electric batteries." E. W. JUNGNER. April 14th.—Relates to both primary and secondary batteries, and consists in the use of an electrolyte which remains unchanged during the charging and discharging of the battery, except that its solvent water is separated from it. Potassium and sodium hydrates are examples of such electrolytes. The plates or electrodes consist of insoluble oxides of metals or finely-divided metals.

8,223. "Electricity measuring." G. C. FRASER and G. K. B. ELPHINSTONE. April 19th.—A portable apparatus for measuring the currents necessary to fire primers, and given by firing batteries, and for testing the condition of primers; it consists of a dead-beat ammeter, connected in series with a key and a variable resistance between two terminals in a case; two other terminals, connected together, are also provided.

8,961. "Telegraph and telephone recording apparatus." V. POULSEN. April 25th.—Relates to means for recording and reproducing messages, such as telegraphic or telephonic messages, by means of an electromagnet acting upon or being acted upon by a magnetisable wire or strip. A cylinder is covered with a close spiral of steel wire, which is to take the place of the phonographic plastic cylinder, and an electromagnet is mounted on a sliding carriage to take the place of the stylus. The carriage is mounted on a rotating tubular frame, and is provided with a centrifugal lever, which brings the edge of the magnet against the wire while the frame is rotating. The removal or obliteration of the messages from the strips is obtained by traversing the wire, &c., with a magnet carrying a steady continuous current. (A petition for extending this patent has been filed, but the result is still pending.)

9,882. "Lighting railway, &c., vehicles." E. J. PRESTON and A. B. GILL. May 10th.—Relates to improvements in train, &c., lighting. A switching arrangement for controlling the number of lights is used. The current is supplied from a battery or other source, and the lamps are divided into two sets connected to a switch consisting of two drums engaging with contacts. The spindle carrying the drums is rotated by electromagnetic means controlled by a switch. The contact faces on the drums are so arranged that one or both sets of lamps may be alight or both may be extinguished.

13,093. "Crabers." J. G. W. ALDRIDGE. June 29th.—In electric cranes, the switch handle is connected by links to the clutch for the hoisting-drum, so that, as the motor is started, the drum is automatically and simultaneously geared with the motor-shaft. The descent of the load is regulated by a hand or other brake.

13,561. "Electric motors." M. J. BARREAU. June 30th.—Relates to a construction of electric motors, designed to secure maximum efficiency, notwithstanding variations in speed, especially applicable to electric traction, but also applicable to navigation and transmission of motive power. The windings of the induction coils are divided into sections, and by means of a rotary controlling switch these sections are variously connected into sets or groups, while the battery cells are similarly grouped, in order to give the variations of speed desired.

(To be continued.)

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

11,551. "Ratchet and pawl free-wheel driving pulleys fitted to dynamo used for electrically lighting motor-cars." O. BIRD. May 19th.

11,553. "Method of and means for protecting and supporting pipes, tubes, conduits and the like when exposed to furnace flames or subject to other high temperature." R. C. LYNES. May 19th.

11,560. "System of enumerating telephone calls and apparatus therefor." S. D. WILLIAMS. May 19th.

11,561. "Mariners' compasses of the projector type." KELVIN and J. WHITE, LTD., and M. B. FIELD. May 19th.

11,579. "Selector arrangement for several stations lying on a common line." K. BECKMANN and ART. GES. MIT & GENERT. May 19th. (Complete.)

11,580. "Graded service automatic or semi-automatic telephone system." H. BARON. (G. Helman, Germany.) (Addition to 11,261/12.) May 19th. (Complete.)

11,609. "Telephony." S. G. BROWN. May 19th.

11,623. "Electrically operated or controlled valve." E. C. IRVING and J. P. O'DONNELL. May 19th.

11,629. "Trolleys for electric traction systems." E. M. MUNRO and R.E.T. CONSTRUCTION CO., LTD. May 19th.

11,680. "Circuit arrangements for telephone systems." SIEMENS & HALSKE ART. GES. (Convention date, May 25th, 1912, Germany.) May 23rd.

11,694. "Process for the electrolysis and treatment of sulphate liquors." E. J. HUNT and W. T. GUDEN. May 19th.

11,697. "Protective device for electric distributing systems." BRITISH THOMPSON-HOUSTON CO., LTD. (General Electric Co., United States.) May 19th.

11,698. "Electrical control clocks for trunk line switchboards." AKTIESELSKAPET L. M. ERICSSON & CO. (Convention date, May 21st, 1912, Sweden.) May 19th. (Complete.)

11,673. "Incandescent electric lamps." C. W. READ. May 20th.

11,674. "Electrical method of burning lime." G. C. GOODMAN. May 20th.

11,677. "Electric heating and cooking apparatus." E. W. LANCASTER. May 20th.

11,678. "Electric heating and cooking apparatus." E. W. LANCASTER. May 20th.

11,704. "Arc lamps." H. E. MORTL (Korting & Mathieson Akt.-Ges., Germany.) May 20th. (Complete.)

11,715. "Electrically-operated mechanism for advertising and other purposes." J. R. BELL, jun. May 20th.

11,737. "Spark plugs." L. J. DIRAND. (Convention date, October 29th, 1912, United States.) May 20th. (Complete.)

11,750. "Apparatus for the production of alkali metals by the molten electrolysis of alkali compounds." G. W. JOHNSON. (Deutsche Gold und Silber Scheide Anstalt vorm. Rosler, Germany.) (Addition to 1,983, 1913.) May 20th. (Complete.)

11,751. "Electrical relays." J. H. BAKER and A. E. MCKENZIE. May 20th.

11,791. "Cramp belts adaptable as electro contact cramps and the like." J. S. ROMANES. May 21st.

11,825. "Electricity meters." COMPAGNIE INTERNATIONALE D'ELECTRICITE SOC. ANON. (Convention date, May 31st, 1911, Germany.) May 21st. (Complete.)

11,833. "Wireless telegraphy." H. L. SHOOT, A. E. SHOOT and H. O. SHOOT. May 21st.

11,850. "Electric cut-outs with multiple safety fuses." R. DRUPESBALES. (Convention date, March 31st, 1913, Belgium.) May 21st. (Complete.)

11,852. "Electrostatic apparatus for separating and cleaning grits, grains, seeds or the like." J. KAUS. (Convention date, April 30th, 1913, Germany.) May 21st. (Complete.)

11,858. "Electric safety-lamps for use in mines and other places." T. HARRISON and A. STONE-FRAXER. May 21st.

11,860. "Electrical equipment of motor vehicles." H. LEITNER. May 21st.

11,872. "Electrolysis of aqueous solutions." SOC. OF CHEMICAL INDUSTRY IN BASLE. (Convention date, December 9th, 1912, Germany.) May 21st. (Complete.)

11,886. "Communtators." C. ZENE. (Convention date, May 21st, 1912, United States.) May 21st. (Complete.)

11,888. "Automatic or semi-automatic graded service telephone system." H. BARON. (G. Helman, Germany.) May 21st. (Complete.)

11,896. "Electric water heaters or the like." R. WEAVING and FERRENTI, LTD. May 21st.

11,905. "Means of equalising or balancing electric currents, applicable to rotary converters or other dynamo-electric machines." A. H. RAILING and C. C. GARRARD. May 22nd.

11,930. "Construction of electrical hot-plates, boiler rings, and the like." C. R. BELLING. May 22nd.

11,945. "Contact make-and-break devices adapted for use in wireless telegraphy and for other purposes." L. B. TURNER. May 22nd.

11,960. "Electrical connectors of the plug and socket type." A. P. LUNNBERG, G. C. LUNNBERG, P. A. LUNNBERG and G. PROO. May 22nd.

11,970. "Illuminated signs." J. G. A. TETART and M. J. STAEBCHE. May 22nd.

11,972. "Automatic ships' telegraph alarms." J. A. SULLIVAN. May 22nd. (Complete.)

11,975. "Production of electrical resistance materials." RESISTO-ELECTRICAL MANUFACTURING CO., LTD., and C. RZCZKA. May 22nd. (Complete.)

11,990. "Electric ignition generators." B. LAWRENCE. (Addition to 14,324 and 21,682, 1912.) May 22nd. (Complete.)

11,993. "Urns, or the like, for heating water by electricity." J. MANN. May 22nd.

11,997. "Chemical, electrochemical and electric treatment of plants, fields, seeds, crops or the like." R. MIES. May 22nd. (Complete.)

11,998. "Telephone systems." AUTOMATIC TELEPHONE MANUFACTURING CO., LTD. (Automatic Electric Co., United States.) May 22nd. (Complete.)

12,001. "Igniters." E. C. JONES and J. PEARSON. May 22nd.

12,035. "Telephone systems." AUTOMATIC TELEPHONE MANUFACTURING CO., LTD. (Automatic Electric Co., United States.) (Addition to 13,970/12.) May 23rd. (Complete.)

12,054. "Incandescent electric lamps." C. A. HARRISON. May 23rd.

12,060. "Telephone systems." SIEMENS & HALSKE-AKT.-GES. (Convention date, May 25th, 1912, Germany.) May 23rd. (Complete.)

12,061. "Trolleys for electric traction systems." E. M. MUNRO and R.E.T. CONSTRUCTION CO., LTD. May 19th.

12,065. "Electric welding." E. H. JONES. May 23rd.

12,074. "Oscillation spark gaps." W. T. DITCHAM and GRINDALL-MATTHEWS WIRELESS TELEPHONE SYNDICATE, LTD. May 23rd.

12,075. "Microphones for use in wireless telephony." W. T. DITCHAM and GRINDALL-MATTHEWS WIRELESS TELEPHONE SYNDICATE, LTD. May 23rd.

12,076. "Apparatus for use in wireless telephony." W. T. DITCHAM and GRINDALL-MATTHEWS WIRELESS TELEPHONE SYNDICATE, LTD. May 23rd.

12,082. "Arc lamps." H. AYRTON. May 23rd.

12,100. "Multiple way indicators." T. G. HODGKINSON. May 23rd. (Complete.)

12,115. "Fittings for metallic conduit systems for housing electrical conductors, specially applicable to ceiling rose fittings and the like." SIMPLEX CONDUITS, LTD., and L. M. WATTS. May 24th.

12,129. "Apparatus for heating liquids electrically." BRITISH ELECTRIC HEATER CO., LTD., and C. KRATT. May 24th.

12,157. "Switching arrangements for use in wireless telephony and wireless telegraphy." W. T. DITCHAM and GRINDALL-MATTHEWS WIRELESS TELEPHONE SYNDICATE, LTD. May 24th.

12,163. "Telephone systems." AUTOMATIC TELEPHONE MANUFACTURING CO., LTD. (Automatic Electric Co., United States.) May 21th. (Complete.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained from Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1912.

ARC LAMP ELECTRODES. British Thomson-Houston Co., Ltd. (General Electric Co.) 28,684. August 14th.

CONTROLLING OR REGULATING DEVICES FOR ELECTRIC LAMPS. E. JOHNSON. 22,127. September 24th.

WALL-PLUGS FOR ELECTRICAL FITTINGS. F. SCHEIDIG. 23,568. October 15th. (October 16th, 1911.)

ON Tuesday next week the Annual Convention of the Municipal Electrical Association will be commenced at the Institution of Electrical Engineers, London. It is seven years since last the Convention was held in the Metropolis, and we can assure the members that they may count upon a cordial welcome and excellent entertainment. Although the Association is not numerically strong, it undoubtedly represents the great bulk of the municipal supply undertakings in this country, and therefore its proceedings are vested with an importance which renders the Convention one of the principal events in the calendar of the electrical year.

Of the papers to be discussed one cannot say much at present; though fewer in number than usual, they touch on matters of great interest at the present time, and ought to lead to considerable discussion. Dr. Ferranti's paper on "Prime Movers" will, we believe, somewhat disappoint those engineers who have been craving for information as to the highly-superheated steam turbine; Mr. Christie's paper describes a useful development in the shape of a water filtering plant for the cooling air, in connection with turbo-generators; and the paper by Messrs. Watson and Mitchell deals with the electric battery vehicle—a subject which is of the greatest importance to central station engineers at the present time. In view of the progress which the authors' firm is making with the Edison battery vehicle in this country, and the demonstration of various types of electrical vehicle which follows the reading of this paper, it is to be hoped that the visitors will be stimulated into displaying rather more practical interest in the subject in the future, than has been the case in the past. A most urgent matter is the standardisation of charging voltages and appliances, and we trust that the opportunity will be seized to arrive at a decision on this point.

But it is not only with the reading of papers that the Convention is concerned; visits have been arranged to the historic Deptford generating station, the West Ham Corporation's electricity works, the Chelsea Underground Railway power station (which we illustrate in this issue), and to the Chingford Reservoir, to view the celebrated Humphrey pumps. Many of the visitors to Kingston-on-Thames will, no doubt, find much to interest them in the horizontal Diesel generating plant recently installed in the Corporation's electricity works, a brief illustrated description of which appears in this issue.

On this occasion the proceedings will be conducted partly *in camera*, the discussion on the Electric Lighting Bill promoted by the Association, and on Electric Heating and Cooking, being restricted to Members and Associates. We have received a copy of the Bill from the hon. secretary, Mr. H. Faraday Proctor, it having been introduced on Wednesday last week; most of its provisions are of a non-

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

contentious nature, and are likely, if approved by Parliament, to prove beneficial to the industry, but there is one clause which is sure to arouse the bitter opposition of the electrical contractors—the familiar clause which confers full powers upon the local authorities to provide, sell, let for hire, and fix, repair, maintain and remove electric lines, fittings, apparatus and appliances for all purposes. The only restrictions imposed upon them by the clause are that the local authorities shall not manufacture, shall confine their activities to their own areas and their own consumers, shall adjust the charges so as to cover all expenditure (including capital charges), and shall separately show the charges made for such work on demand notes, and the expenditure and receipts in their published accounts. Similar powers are conferred upon companies by another clause.

It will be seen that if these powers are granted, the local authorities will be enabled to enter into direct competition with the contractors, and the latter will oppose the clause on the ground that such competition, supported by the rates to which they contribute, is unfair. On the other hand, the municipalities will claim that, having been authorised by the State to embark upon the supply of electricity, they are entitled to the possession of full power to conduct the business on the most efficient lines, and not improbably the matter will end in a dead-lock, as usual. It is most unfortunate that this miserable controversy cannot be settled by agreement between the respective parties. We have often urged the desirability of compromise, and the fact that this can be achieved is strongly suggested by the harmonious co-operation which obtains in several towns where the municipality has succeeded in securing the powers in question. It is by no means too late to bury the hatchet even now, and we sincerely trust that the subject will be discussed by the M.E.A. with "Conciliation" as the text. Compromise demands concession from both sides. The contractors do not wish to clog the wheels of progress, and the municipalities do not wish to ruin the contractors. Surely they can agree as to their respective spheres, and arrive at a reasonable division of labour?

Another clause empowers the undertakers to provide showrooms, hold exhibitions, and carry on publicity schemes, all very laudable objects. It is alleged that the municipalities are at present unable to contribute to the funds of the Publicity Committee, for example, and that the latter is thereby crippled for lack of money. Whether this is the fundamental cause of the notorious failure of the Committee to exert any appreciable influence upon the progress of the industry is open to question; we fear the trouble lies deeper, and that the only remedy for the disease with which it is afflicted is that of dissolution.

Clause 4 authorises the sale of by-products, and Clause 5 the imposition of a minimum annual charge for a stand-by supply of energy. In other clauses power is taken to pay subscriptions to associations, such as the M.E.A., and the expenses of members attending conferences, provisions which are certainly highly desirable in the public interest. One clause deals with the allocation of surplus revenue to the purposes of the undertaking, instead of carrying it to the credit of the local rates; the intention is good, and the policy is one which we have long advocated—but surely an Act of Parliament is not necessary to allow it to be carried out. Other clauses facilitate the borrowing of money for working capital to a limited extent without the trouble and expense of an inquiry, and enact minor provisions in connection with the conduct of the business. The joint exercise of the powers to supply fittings, &c., and to carry on publicity campaigns with other bodies or persons is provided for, and this may contain the germ of a working agreement with the contractors.

## THE LEAD MARKET.

ONE of the most pronounced and striking features in the metal markets during the gloom in evidence last week was the firmness of lead, the price of which hardly flickered, even when tin and copper were pressed for sale at continually weakening figures. The reason was, of course, that the intrinsic position of the metal is one of wholly exceptional strength, the causes operating in connection with which place the article in a category by itself. The consumption of lead naturally increased in common with that of all other metals during the recent period of exceptional industrial activity, but for reasons quite apart from those operating elsewhere (except in a limited degree as regards copper), there has been a reduction in the output, and it is this factor which has placed lead on the very strong foundations seen to-day. The whole position practically arises out of the long-drawn-out revolutionary disturbances in Mexico. This country is reckoned as the fourth largest producer of the metal, occupying this position for a number of years up to 1911, the returns for which year are the latest at present available; the output for 1909 was 113,000 tons, for 1910 115,000 tons, and for the following year 118,000 tons.

What the production will prove to have been last year is merely a matter of surmise, but there is not the slightest doubt that this year it has been very seriously reduced, owing to the revolution, the railways being cut, the transport of fuel, ores, and general supplies to the smelters being stopped, and the forwarding of lead from the smelters to the coast for shipment to Europe being suspended, and these conditions still continue in practically full force. The troubles will also be reflected in a falling-off in the United States lead production, for very large quantities of lead ore and argentiferous lead are sent from Mexico to be treated at United States plants, the total in 1911 being about 75,000 tons in soft lead contents.

For a very long time now, the Mexican smelters in the Torreon district have been practically at a standstill, and even though a small quantity of metal was got through from Torreon to Tampico last week for shipment to Europe, the general situation gives cause for the utmost anxiety to those who have been relying upon the Mexican product for their supplies of raw material. The output of the largest smelter at Torreon is taken by a leading firm of British lead manufacturers, and their buying of metal to replace the Mexican supply, has at times had an important influence on prices in the London market. The restriction of supplies has, indeed, been felt very severely, and the position does not seem to be getting any easier, for every ton of lead is swept up as soon as it comes in; the prospect is exceedingly uncomfortable for those consumers who have not had the foresight, or the proper knowledge, with which to gauge the probabilities of market happenings. It is to be feared that there is too often, on the part of even large users of commodities, an indifference to the course of commercial currents directly affecting their interests, an indifference which at times involves them in difficulties which could have been avoided easily enough, but which if neglected prove costly, and on occasion impossible of repair. Ultimately, of course, the situation in lead will be relaxed, but that can hardly occur until the normal working conditions are restored in Mexico, and the date of that may be far off even yet, though one naturally hopes for the best. Meanwhile, consumers who have not provided for their needs stand in an unenviable

position, because lead for immediate and near delivery commands an almost prohibitive price.

Consumers are very distrustful of lead at £20 a ton and upwards, and truly that is a high price. The average price of soft foreign lead was £17 15s. 10d. in 1912, £13 19s. 2½d. in 1911, £12 19s. in 1910, and £13 1s. 8d. in 1909, but in 1907, the boom year, it was £19 1s. 9d., while in 1902 it was no more than £11 5s. 3d. The highest figure reached was £23 15s. a ton in September of last year, and the lowest £9 in 1894. This year's monthly averages work out as follows with comparisons for the two previous years.

	1913.	1912.	1911.
January ...	£17 1 11	£15 11 2	£13 0 8 a ton.
February...	16 8 5	15 13 9	13 1 11 "
March ...	15 19 8	15 19 8	13 2 11 "
April ...	17 8 10	16 6 6	12 18 5 "
May ...	18 14 3	16 10 2	12 19 2 "

No doubt the spirit of caution is a virtue, even with the Mexican trouble looming large, but the point must be kept in mind in considering the position that one of these days things in Mexico will settle down, and when the news comes that the country's political troubles are over, one of the first events will be a readjustment of lead prices in consonance with the altered position. For the time being, however, the consuming trades have been pretty hard hit, and in more than one direction a restriction of operations is now in force, users not having bought ahead or against contracts, in a measure sufficient to protect themselves, and being either unable or unwilling to purchase at current figures. The supplies coming in from abroad are very moderate, and neither Spain nor Australia is increasing output to an extent sufficient to fill the gaps left by the shortage from Mexico. Further, Australia has had labour troubles to face which have tended to accentuate the stringency of the position. Then, again, consumption has increased very largely in the Far East, and important quantities of lead which formerly came to London are now shipped direct from Australia to Japan and China, while a good deal of Russia's requirements is now dispatched direct from Spain to St. Petersburg, all of which tends to restrict the tonnage of material coming to this country. In the long run, it makes no difference to British consumers, but it does tend at times to narrow the market for buyers. If ever there were an excess of supplies shipped, it would no doubt be London which would provide the temporary home for metal waiting for a market, when prices would naturally be expected to suffer. The anticipation that a period of lessened stringency is not very far off is entertained, is shown clearly enough by the fact that while the price of June shipment lead is over £20 a ton, that of August is only £19 7s. 6d. The discount reflects the market's estimate of the chances of a restoration of reasonable working conditions in the areas of unrest. Viewing the metal markets as a whole the tendency at present appears to be towards a lower level, not only because trade is thought to be waning, but also because finance has developed some unsound spots, and because trouble of this kind always reacts immediately upon public confidence, and through this, on national spending capacity in every direction, both public and private. It is too much to hope when once fairly normal conditions are restored in Mexico, that lead will prove a law to itself. In any event, consumers regard lead at £20 a ton with a suspicion born of experience, and buying is restricted.

#### Guaranteed Wiring.

WE referred some time ago to a proposal of the Electrical Contractors' Association to guarantee the work of its members. The proposal has not yet been translated into a definite scheme, but a report has been made by a Sub-Committee of the Association formulating certain definite suggestions which it is proposed should be incorporated in the scheme.

Briefly, these are (1) that every member of the Association shall undertake to carry out all his indoor contracts within the British Isles in strict conformity with the rules

of the Institution of Electrical Engineers, except where some other standard is specified by the purchaser; (2) that the Association shall indemnify the employer of any member against bad workmanship or materials supplied by such member, subject to certain limitations; (3) that any member failing to remedy defective work after being called upon by the Association to do so shall at once cease to be a member of the Association.

A question which naturally suggests itself is, who is to be the judge? Many members might conceivably object to the judgment of a brother-member or a committee of members who might be competitors of his. This objection is met by the proposal of the Sub-Committee to appoint a competent engineer to inspect and report on work which is called in question. In the event of an adverse report, the costs of the inspection are to be borne by the defaulting contractor, whilst the employer is to pay if the report is favourable to the contractor.

It is considered in some quarters that the proposals aim at the elimination of slip-socket conduit, which, whatever its faults, has done a good deal to cheapen the cost of wiring and pave the way for screwed conduit, which is now regarded as an essential factor in really good work. Slip socket has, in fact, had its day, and few, if any, of the leading insurance companies look with favour upon it, although they possibly accept the risk in ordinary residential property.

There can be no doubt that one of the chief objects of the Electrical Contractors' Association, in formulating the proposals referred to, is to raise the general standard of wiring and to eliminate, if possible, the jerry wiring contractor, and these objects have our entire sympathy.

#### Expert Witnesses in America.

It would seem that war is now being waged against the expert witness in the United States. According to a leaderette in the *Canadian Engineer* (May 22nd), a strong opposition to the present method of securing expert evidence in cases at law, and a growing feeling that expert witnesses should be designated by the Courts, led the American Institute of Consulting Engineers to hold a discussion on this subject a short time ago. The American proposal, apparently, is that in certain classes of cases which require expert testimony, such as the valuation of public utilities, conflicting claims of water-power companies, and the like, "time will be saved and cases will be better presented if studied from *ex parte* points of view before the action at law is begun. The appointment of engineer associates by the Court would probably be helpful in clearing up *conflicting and confusing testimony*." (The italics are ours.) With all respect to the president of the American Institute of Consulting Engineers who put forward this view when summing up the discussion, he seems to us to beg the whole question. What is the "conflicting and confusing testimony" which the engineer associate of the Court is to pass in review? Surely it must be the evidence of other experts. We make bold to say that every proposal to abolish the expert witness in technical cases which has ever been brought forward in this country has always had a fundamental flaw: no efficient substitute has been suggested. We recall the *dictum* of a distinguished Cambridge scientific professor who was asked whether he favoured compulsory Greek. "No," he replied, "I am against it." "But will you vote against it?" was the next question. "Yes," he replied, "I will, as soon as you satisfy me that you are going to put something as good in its place." Who is to replace the technical witness in a complicated electrical patent case? The plaintiff and the defendant must both put their arguments before the Court; and the arguments of counsel can only be founded upon the opinions of experts—opinions which those experts are prepared to uphold in the witness box, subject to the searching criticism of cross-examination. True, the inquiry may be long and tedious, but the results are generally satisfactory. Nor are our judges wholly incapable of dealing with a purely scientific issue when instructed by the skilled testimony of the expert. He who commends the present system is no mere *laudator temporis acti*. It is the growth of hundreds of years.

# THE INSTITUTION OF ELECTRICAL ENGINEERS IN PARIS.

(Abstracts of Papers discussed in Paris at the Joint Meeting of the INSTITUTION OF ELECTRICAL ENGINEERS and the SOCIÉTÉ INTERNATIONALE DES ÉLECTRICIENS, 21st-24th May, 1913.)

(Continued from page 927.)

## The Electrification Schemes of the Chemin de Fer du Midi.

By MONSIEUR JULLIAN.

THE problem of the electric haulage of trains presented itself for the first time to the Compagnie du Midi in 1902 at the time when the concession for the development of the line from Villefranche-Vernet-Les-Bains to Bourg-Madame in the Department of the Western Pyrenees was offered by the State. The conditions for the building of the line differ very considerably from those inscribed in the scale of rates of the Compagnie du Midi. Advantages were conceded because the line to be constructed was of narrow gauge, with sharp curves, and because the gradients were 80 mm. per metre.

The question of the electrification again presented itself to the Compagnie du Midi in 1907, when the State proposed granting it the concession for lines which it wished to construct in the region of the Central Pyrenees, including gradients up to 40 mm. and curves of radius less than 300 metres. At the moment of signing the convention relating to these lines, the State entered upon new negotiations for the line from Pau to Ilagelmau.

The Compagnie du Midi made a new proposal with a view to reconciling the interests of both sides, and two agreements were signed in 1907 and 1908.

When all the lines comprised in these two agreements are working, the Compagnie du Midi will have a system of 622 km. of electrified lines, of which 112 will be double track, that is to say:

Lines actually working	... ..	327 km.
Line under the agreement of July 4, 1908	227 "	"
Lines crossing the Pyrenees	... ..	68 "

The equipment of the lines actually working is in course of completion, and will be finished in the month of July next, throughout about half of this length.

Another electrification has been undertaken for other reasons; this is the line from Perpignan to Villefranche in the Eastern Pyrenees. In 1911 the company equipped this line electrically for a length of 24 km. in order to make some tests in view of the electrification of the Central Pyrenees line.

Owing to the fact that the outlay for these tests has already been incurred, and that the volume of mineral traffic on this line is constantly increasing, there is no doubt that electrification will be advantageous.

The Company has also had in view the extension of the electrification of other parts of its system by prolonging the lines which have just been referred to. The preliminary investigation into these electrification schemes has been made with favourable results. The electrification is justified by the extremely advantageous economic conditions under which it will be carried out. It is also justified by the particular features of the system. The lines to be constructed have steep gradients, which are one of the main factors leading to electrification. The lines now at work which are to be electrified run at the foot of the approaches of the Pyrenees, and often penetrate into the steep valleys. They have gradients of which the greater number lie between 15 and 32 mm. Except over the section in the neighbourhood of Pau the practicable speeds do not exceed 70 km. per hour, and the mean speed is rather nearer 60 km. per hour. These conditions are excellent for traction by electric motors. Finally, during a part of the year these lines have a heavy service of passenger trains, for the hauling of which electric traction will have some advantages.

The current used for the working lines is single-phase current at 16 periods and 12,000 volts. The frequency was fixed at 16 periods in order to secure the best working conditions for commutator motors of the series type. The engineers considered—and experience has justified them—that repulsion motors, although possessing a series characteristic, would not be suitable for working on so variable a load as required in this particular case of electric traction. The pressure on the working line was fixed at 12,000 volts for economic reasons.

It is intended to distribute energy by means of single-phase current at a pressure of 60,000 volts. The alternators at the station will generate current at 6,000 volts; the transformers will raise this pressure to 60,000 volts, and in the sub-stations the pressure will be stepped down to 12,000 volts for the supply of the overhead conductor. The distribution by means of simple alternating current is justified from the standpoint of economy.

In the experimental line from Villefranche to Vernet-Les-Bains, six types of overhead equipment have been established: four of these belong to the simple catenary type, one to the double catenary, and one to the rigid type. The spans are 100 metres, 60 metres, or 50 metres, and the longer sections are provided with compensating arrangements.

It is clear from these tests that the simplest overhead equipment is the best, for almost all accidents are due to the faulty working or breaking of apparatus introduced to obtain a better compensation or a greater flexibility for the line, and the efficacy of such apparatus is in general very doubtful. To be precise, on the lines comprising fairly numerous curves of a radius lying between 350 and 800 metres, and worked over by trains at speeds

between 75 and 80 km. per hour, but not exceeding 90 km. per hour, the choice should fall upon the simple uncompensated catenary type for spans of between 50 and 60 metres, with pull-offs on the curves to bring back the overhead conductor towards the centre of the track when necessary. The catenary cable should in this case invariably be anchored to the insulator at each bracket.

Poles made of reinforced concrete are too expensive, and owing to their weight too difficult to erect for existing lines. The "Midi" type of pole, composed of old rails fastened together, is very suitable for single-track lines, even if it has to support high-tension cables, provided that these cables are spaced at equal distances with reference to the axis of the pole. They cost very much less than other poles, are easy to erect, and do not sensibly obstruct the view.

For a double track with high-tension cables, the "Midi" pole made up of rails is not sufficiently strong, and lattice-poles must be used.

The overhead conductor is of red copper, 100 square millimetres in cross-section, of circular section, grooved for taking the suspension clamps.

The high-tension transmission comprises two lines, usually in parallel, each consisting of two aluminium cables, which have 131 square millimetres cross-section on the branches from Arreau to Pierrefitte, and 81 square millimetres cross-section on the other lines.

The insulators are of porcelain on the line from Lourdes to Pierrefitte, and of glass everywhere else. The high-tension insulators have been tested to 150,000 volts, and those for the overhead conductor at 4,500 volts.

Opposite each pole, to ensure that the rail shall not have a high potential with respect to the earth, the track rail and the pole are connected together and to earth. The rail joints are copper bonded.

On the first section, which is a single track, of which the length is 21 km., with a high-tension transmission line, the total cost amounted to 410,000 fr., including the equipment of the station sidings, except those at Lourdes, and all accessories. The equipment works out then at 19,500 fr. per kilometre.

On the sections from Tarbes to Lourdes, double track with high voltage transmission of which the length is 21 km., the cost of equipment reaches 450,000 fr. under the same conditions as those above. The equipment works out in this case at 21,500 fr. per kilometre.

The cost of equipment of large railway stations is not yet known; this will vary with each station in accordance with local conditions.

For the Central Pyrenees there will be two generating stations, at Soulem and Ejet. For the lines crossing the Pyrenees there will also be two generating stations, at Porte and Soussouéou. For the line between Perpignan and Villefranche the generating station will be at Fontpédrouse.

At the station at Soulem the work is in the most advanced state. The power continuously available amounts to a total of 10,300 h.p. This power, thanks to large reservoirs constructed at the head of the pipe lines, may reach 18,000 h.p. for periods sufficient to ensure the train service.

The four transmission lines leaving the station are protected by a large choking coil, an electrolytic lightning arrester, and a water-jet discharger. A Tirrill regulator is provided to keep the voltage constant in spite of the very considerable variations in load on the high-tension line.

It appears that the cost per horse-power installed will work out at about 500 fr.

The station at Ejet has not yet been started. It will have an output of about 18,000 h.p.

The sub-stations will be five in number, and are placed at Montréjeau, Lannemezan, Tarbes, Lourdes, and Pau. Their normal output is 2,500 k.v.a.; they will have an overload capacity of 3,750 k.v.a. for one hour, and of 5,000 k.v.a. for one or two minutes.

Work on the generating stations at Porte and Soussouéou has not yet begun. At Porte power to the extent of 3,500 h.p. will be continuously available.

The work at the generating station at Fontpédrouse is as advanced as that at the station at Soulem; the station will be put to work towards the middle of June. The continuous power available at the shaft of the turbines is 2,600 h.p., and this power may be increased to 3,600 h.p. for an hour and a half by making use of the storage water available at the head works and in the reservoir.

The rolling stock consists of locomotives and motor-cars. The locomotives are especially intended for the hauling of long goods trains coming from or going to non-electrified sections. The motor-cars are provided exclusively for branch lines and for trains working on the electrified section only. Chiefly for the purpose of gaining the necessary information to decide on the type of locomotives and motor-car, the Compagnie du Midi in 1912 arranged for the tests already mentioned on the line from Perpignan to Villefranche.

In these tests locomotives were employed capable of starting a 400-ton train on an up-grade of 11 mm. per metre, and in addition of hauling a train of 100 tons at a speed of 60 km. per hour, and a train of 280 tons at a speed of 45 km. per hour over the hilly section from Ille to Villefranche, which has long and numerous gradients of 17 mm. per metre and some even of 21 mm. On a down-gradient these locomotives were able to deal, by electric braking alone, with the same loads at speeds

capable of being regulated by the driver between the up grade speeds and one-half of those speeds. The electric braking can be obtained by returning the energy given out by the motors, either to the transmission (regenerative braking), or else to resistances.

The motor-cars can haul over the above gradients a train of 100 tons, motor-car included, at a speed of 65 km. per hour, and on the down grade electric braking occurs under the conditions indicated above, but without always returning current to the line.

Three of the locomotives tested satisfied the conditions imposed. These locomotives were constructed by the Ateliers de Constructions Electriques du Nord et de l'Est, by the Compagnie française Thomson-Houston, and by the Compagnie française Westinghouse. The motor-car constructed by this latter firm also satisfied the conditions. These tests are not yet concluded.

In the locomotive made by the "Ateliers du Nord et de l'Est" the torque of the motor is transmitted to the wheel by a pinion keyed to the motor shaft and a spur wheel driving the axle through a spring coupling.

This arrangement, demanding the use of at least one motor per axle, allows the power to be divided up among several motors, which simplifies their construction and also the design of the locomotive. But it has the drawback of lowering the centre of gravity of the locomotive, which results in punishing the track. The test locomotive weighs 86 tons, and current is taken from the line by two pantographs. Control is effected by means of an induction regulator, which allows of contactors being dispensed with. The working of this regulator gave satisfaction during the tests.

The motors are of the Latour series-repulsion type. They are designed to start as repulsion motors and to change to series motors automatically as soon as the speed reaches 25 km. per hour, which corresponds with synchronism. Each motor is able to develop 400 h.p. for 6 hours, and 500 h.p. for 1 hour.

During the repulsion working the stators of the three motors are connected in parallel, so that each rotor cannot take up a speed appreciably different from that of the other two. This provides an electric coupling which has given good results during the tests. Forced air ventilation of the motors is used.

For the regenerative braking the motors working as generators employ for their excitation current lagging 90 deg. behind the supply current. This current is furnished by a winding on the stator of the ventilating fan motors. After some initial trouble the regenerative working has given complete satisfaction.

On test this locomotive has hauled a train of 100 tons on an up-grade of 17 mm. at a speed of 60 km. per hour, taking from the station 860 kw.; a train of 280 tons on the same incline at a speed of 41 km. per hour, taking from the station 1,150 kw. The electric braking requirements on descending grades have been fulfilled, and the power returned to the line has often reached 350 kw. With regenerative braking the power factor is very nearly unity. The current given out by the motor may, in fact, actually be in phase with the pressure, or even leading in phase.

The Compagnie du Midi has ordered eight locomotives of this type, with the power increased to 1,500 h.p. continuously, or 1,800 h.p. for 1 hour, with a max. speed of 90 km. per hour. The repulsion working at starting is to be suppressed, and the electric coupling of the axles to be retained at all speeds. The locomotive to weigh 90 tons.

The locomotive made by the Compagnie française Thomson-Houston is equipped with two motors only, and the use of connecting rods has been unavoidable. The locomotive weighs 89 tons. The electric control is effected by varying the voltage supplied to the motors, requiring the use of contactors connected to tapings on the secondary of the main transformers.

The motors are of the series-repulsion type, and the connections are automatically made for repulsion working for speeds below 25 km. per hour. The working of this arrangement has given trouble. The makers are engaged on a new design.

The Westinghouse locomotive is equipped with two motors, requiring the use of idle shafts and connecting rods. The trial locomotive weighs 82 tons. The electrical control is effected by varying the voltage supplied to the motors by means of contactors. The motors are of the compensated series type and work in series all the time; they have forced ventilation, and can develop 600 h.p. for 6 hours, and 700 h.p. for 1 hour. The motors are not designed for repulsion working.

When a high-tension power transmission line and a telephone or telegraph line happen to run close together for a considerable distance, the former sets up induced electromotive forces in the latter, resulting in disturbances in the receivers. Disagreeable, if not dangerous, results may follow to workmen and to the public. These phenomena are produced with special intensity if the two lines are alongside railway track, and if alternating current is returned by the running rails. In such a case, the current instead of returning wholly by the rails returns in greater or less proportion through the earth, thus affecting the telegraph apparatus, which works with an earth circuit.

Up to the present the precautions taken to avoid these disturbances are neither completely efficacious nor practically realisable, owing to their cost. This applies to the replacement of the lines affected, and the use of telegraph circuits without earth connections.

It was considered better to find a solution of the problem by the use of apparatus capable of neutralising the effects of the disturbing currents. Among those which have been considered, that of M. Girousse has proved successful in the protection of Morse apparatus, as has been demonstrated in official tests. The company is about to apply these protectors in the first

place to the railway station apparatus on the line from Perpignan to Villefranche, and will bring them into general use, if required, on the whole of the electrified section. The Post and Telegraph Administration has decided to install this apparatus in such offices as are affected by the traction current.

In order to ensure satisfactory working of the telephone, the Administration is about to replace ordinary insulators by others of greater insulation resistance, to transpire the two lines every 300 or 400 metres, and to insert transformers between the lines and the receiving apparatus. This last arrangement, the object of which is to save users from dangerous or perhaps only disagreeable shocks, has the drawback of weakening the sound of the voice; it is the same fault which hitherto has prevented the use of protectors for telephonic apparatus. Nevertheless, experiments with these protectors have not been given up.

The Compagnie du Midi will probably have to pay the cost of all this work. That will not prevent it from trying all suitable means for rendering the traction current as harmless as possible to telegraph and telephone lines. For this purpose the company contemplates the addition to the alternators and to the motors of arrangements for damping the high harmonics, to which the disturbing phenomena should be attributed to a large extent.

From the foregoing account it is clear that the electrification of a large railway system is to be undertaken by the Compagnie du Midi, under conditions as advantageous as possible.

### Petrol-Electric Motor-Vehicles.

By MONSIEUR J. B. G. DAMOISEAU.

Of the various heat engines capable of application to automobiles running on rails, the internal-combustion engine using liquid fuel—petrol or benzol—is the only practical type. Continuous current is likewise universally employed.

The design adopted for motor-vehicles using internal-combustion engines is necessitated by the limitations of these engines. Thus, as internal-combustion engines are unable to start under load, means must be provided for starting them light. Moreover, such engines give a practically constant torque, and to be economical should run at a speed below that corresponding with maximum power so as to prevent the engine being pulled up; but as they must operate somewhere near that critical speed, it follows that it is essential to introduce gearing between the engine and the axles so that the speed of the car can be varied whilst that of the engine remains uniform.

As the internal-combustion engine can work either at constant or variable power (by regulating the admission of the fuel), and the power required for traction is also variable, two distinct methods may be considered:—

(a) An arrangement comprising a means of storing energy and for dealing with the fluctuations in the demand for energy whilst the engine generates constant output. This method has the advantage of allowing the energy to be stored which is produced when the car runs down gradients, and whilst braking.

(b) An arrangement in which energy is not stored, and in which the engine supplies the power necessary for driving the vehicle.

There are at the present time automobiles with internal-combustion engines and mechanical, electrical, and mixed drive; but those with the mixed drive are the only ones in which accumulators are utilised. The present paper deals with motor-cars with internal-combustion engines and with electrical or mixed drive.

In 1904-5 the Société Anonyme de Locomotion Electrique, owners in France of the Heilmann patents, built a petrol-electric vehicle to demonstrate its practical value. At about the same period trials with motor-vehicles were being carried out in England by the North-Eastern Railway Co.; the petrol engine was constructed by the Walsley Tool and Motor-Car Co., and the electrical equipment was supplied by the British Westinghouse Electric and Manufacturing Co. These two cars were only test cars to prove the practical value of this form of traction.

The first exploitation of petrol-electric motor-vehicles dates back to the years 1905-6, and was undertaken by the Hungarian Arad Osnad Railway. This railway system has normal gauge and a length of 400 km. It was worked at first, as far as the passenger traffic was concerned, with 36 petrol-electric cars of two types. Those destined for slow trains had each a petrol engine of 30 h.p., and those for fast trains a 70-h.p. engine. The petrol engines and the generators of all these cars were supplied by the Société de Dion-Bouton.

As traffic increased in consequence of the introduction of this kind of traction, the railway company was induced, so that trailers could be added, to increase the equipment from 30 h.p. to 40 h.p. It was found essential to increase the power still more. A Hungarian firm, a branch of the Société Westinghouse du Havre, was asked to undertake this transformation, which is still being carried out. The cars at present in use are of 40 and 70 h.p. (Dion-Bouton) and 60 and 90 h.p. (Westinghouse). This is at present the most important application of this kind of traction in Europe.

The Dion-Bouton cars have each a petrol engine with four vertical cylinders driving through a flexible coupling a continuous-current compound-wound generator running at 500 volts. This group supplies electrical energy to two electric motors which drive the two axles of the car. A controller is fitted in the driver's cabin, with one handle for operating the car in either direction, and

connected for series-parallel working, the speed of the car being controlled in that way. This controller is fitted with four notches for forward running, and only one for reverse. The air required for the brake is supplied by an air compressor worked electrically and provided with an automatic pressure regulator. When the current is interrupted by means of the controller the engine runs at the reduced speed of 300 R.P.M. When the controller is brought into operation, the current supplied by the generator has the effect of opening gradually the regulating valve, consequently of increasing the speed and the power of the engine. When the speed of the engine is sufficiently high, the car starts, and its speed can be regulated by the controller.

The two four-pole motors are of the series type. The field coils of each motor are connected two in series, and each pair can be connected in series or parallel. In order to pass from one notch to another, whether for increasing or decreasing the speed of the car, the driver first operates the control valve so as to reduce the speed of the petrol engine, then places the controller in the position required for the desired speed, and finally brings back the control valve to its first position corresponding with normal speed. This method of working is to prevent the current being broken at the controller. The petrol engines have four cylinders, and run at 1,000 R.P.M.

The cars are heated by the water which circulates in the cylinder jackets, and are lighted by means of acetylene. The 40-H.P. cars provide seating accommodation for 42 passengers, and weigh 13 tons; the 70-H.P. cars seat 39 passengers, and weigh 16½ tons. Each of these motor-cars is capable of hauling two trailers with seating accommodation for 96 passengers, and of a total weight of 12½ tons.

The motor vehicles on the Westinghouse system are of two types. The first has a 60-H.P. petrol engine with four cylinders, and the other has a 90-H.P. engine with six cylinders. The engine is connected through a flexible coupling to a continuous-current generator with shunt excitation. The pressure of the generator can be varied between 800 and 550 volts by altering its excitation and the speed of the engine. The generator supplies current to the two electric motors driving the axles of the car. The electrical plant is always placed crosswise in the driver's cabin.

Each driver's cabin contains a special controller with two handles for connecting the motors in series or parallel, adjusting the excitation of the generator, varying the speed of the petrol engine and of the car in either direction: the air brake is generally fed by an electrically-operated compressor having an automatic pressure regulator.

The driver starts the car and regulates the speed by means of the controller, which connects the motors in series or parallel, and also varies the excitation of the generator. To vary the amount of air admitted to the carburettor, and thus the speed of the engine, the driver turns the port portion of the controller handle, which, by means of a connecting wire, acts on the governor of the engine. This control is, therefore, independent of the field circuit of the generator and the connections of the motors. If the stud in the handle is released the engine slows down, and the car stops. This contrivance operates, therefore, in the case of any failure on the part of the driver. The Westinghouse cars are able to haul one or two trailers.

The Prussian State Railway management in 1907 adopted some petrol-electric cars made by the Allgemeine Elektrizitäts-Gesellschaft and the Bergmann Elektrizitäts-Unternehmungen Aktien-Gesellschaft.

Each of the cars equipped by Messrs. Bergmann comprises an electric generating set, spring-supported, which rests directly on the two axles of one of the two bogies of the car, the other bogie carrying two electric motors, to which current is supplied by the generator. This arrangement facilitates the rapid replacing of the set, and avoids the transmission of the vibrations due to the engine to the body of the car. The body of the car is entirely distinct from the generating plant, the engine being covered with a removable hood. The benzol engine has six cylinders, and develops about 100 H.P. at 700 R.P.M. A centrifugal governor controls the admission of the gas, and is connected to the controller handle, so that the speed of the engine is reduced automatically to one-third when the engine runs without a load.

The engine is started by means of compressed air obtained from the reservoir for the air brake, the air compressor being driven by a benzol engine. The engine weighs 2,500 kilograms. The liquid fuel is stored in a reservoir, being covered with an inert gas under pressure, either nitrogen or carbonic acid gas being used; the latter are stored in a gas cylinder. The continuous-current generator, the pressure of which is varied by altering its excitation, is direct coupled to the engine, and is fitted with commutating poles and a compensating winding. It can develop continuously 66 kW. at 300 volts and 700 R.P.M. As the speed of the car is only controlled by varying the excitation of the generator, it is necessary to use accumulators to maintain a steady pressure for the electric lighting of the car, the electric alarm bell, the field windings of the motors, and for exciting the main automatic switch. By means of a special arrangement, this generator with its variable pressure can supply current to the auxiliary circuit for charging the battery.

Each of the two electric motors, which are of the series type and are fitted with commutating poles, can develop 85 H.P. for one hour. The controller is fitted with a push button, so that should the driver remove his hand from the controlling handle when the latter is on one of the forward notches, the whole of the current is cut off and the compressed-air brake is immediately brought into action.

This car, with accommodation for 100 passengers, weighs 47 tons, and reaches on a level a speed of 70 km. per hour.

The motor-vehicles supplied by the A.E.G. Co. for the Prussian State Railways are arranged to a considerable extent on the same plan as those of the Bergmann Co. The electric lighting of the car is supplied from the exciter and the battery, which are connected in parallel when the speed of the electric generator is 700 R.P.M. When the speed is below this, the exciter is automatically cut out of circuit and the lighting is obtained from the battery. The car provides accommodation for 95 passengers, weighs 55 tons, and has a speed on the level of 65 km. per hour.

The same company has built, for branch lines, another type of petrol-electric car of 55 H.P., which was recently placed in service on the East German railway system at Königsberg, East Prussia.

In the motor-vehicles of the General Electric Co., U.S.A., the two electric motors are lodged on the front bogie beneath the driver's cabin. The main set consists of a gasolene engine driving at one side an electric generator and at the other an air compressor. The auxiliary set comprises a petrol engine driving an electric generator and an air compressor.

The main engine has eight cylinders, and runs at 550 R.P.M. The generator has eight poles as well as commutating poles, and supplies 100-kw. continuous-current at 600 volts. The voltage of the generator varies from 260 to 800 volts, according to the power required for traction.

The two electric motors, which are fitted with commutating poles, are designed for a pressure of 600 volts and can each develop 100 H.P. for one hour.

The controller connects the motors in series and parallel and varies the excitation of the main generator.

The cars are constructed entirely of metal, having seating accommodation for 60 to 100 passengers, and weigh from 40 to 50 tons. They are capable of developing a draw-bar pull of about 5,500 kilograms, and a speed on the level of about 90 km. per hour.

The Great Western Railway Co. of England is at present experimenting with a motor-vehicle having only two axles, and the electric equipment has been supplied by the British Thomson-Houston Co.

The petrol engine of 40 H.P. drives a dynamo which supplies current to two electric motors, each of which transmits power to one axle. This car weighs 14 tons, and has seating accommodation for 44 passengers.

The petrol-electric motor-vehicles at present undergoing trials on the Swedish State Railways are the first to be equipped with Diesel engines for use on railways, to reduce the cost of fuel. Each motor-vehicle has a Diesel engine of 75 H.P. at 700 revs. per minute, coupled to a 50-kw. continuous-current generator feeding the two electric motors, each of 30 H.P. The Diesel engine used has six vertical cylinders, water-cooled, and a supplementary cylinder for supplying the compressed air necessary for starting the engine and for injecting the petrol for starting. The fuel consumption is said to be 225 grammes of oil per horse-power-hour at the full load of 75 H.P.

The generator gives a variable pressure from zero to a maximum of 440 volts according to the speed of the engine. It has commutating poles and is connected to the engine by means of a flexible coupling.

A battery of 23 cells and of 200 ampere-hours capacity is automatically connected with the generator when running without load, i.e., when the car is at rest or running down an incline. This provides the lighting of the car, besides supplying the auxiliary apparatus used in working the car.

The speed of the engine is regulated by a small electric motor operated from the controller. No starting resistances are employed. When the normal speed of the engine is reached, the regulation of speed is effected automatically, the design of the generator and of the electric motors being such that the power taken from the petrol engine is remarkably constant and cannot exceed the maximum power that the engine can give.

The arrangement to ensure the greatest measure of safety in working is as follows, one attendant only being required: On the roof of the car and on each side wooden bars have been fixed for keeping a spring mechanism in position. If the car passes beyond a signal which is at danger, one of the bars strikes an arm fixed to the signal, opens a switch in the motor circuit, and puts the air brake in action, thus stopping the train.

These motor-vehicles seat 39 passengers, weigh 26 tons and are built for a maximum speed of 60 km. per hour. The electric equipment was supplied by the Allmänna Svenska Elektriska Aktiebolaget.

The automobiles on the Pieper system are of the mixed-transmission type, with energy storage and regeneration. In this system the internal-combustion engine drives the axles directly by means of a cardan shaft and bevel gear. A shunt-dynamo fixed on the engine shaft is connected to a battery of accumulators.

When the power of the engine is insufficient, the battery automatically supplies energy to the dynamo, which then operates as a motor. When the power given by the engine is in excess of that required for traction, or when the kinetic energy of the car can be recuperated, i.e., when the car is slowing down or running down a gradient, the dynamo works automatically as a generator and charges the battery.

The admission of the gas to the engine is controlled by an automatic regulator consisting of a differential solenoid.

The driver starts the engine by sending the current from the battery into the dynamo, which is excited to the maximum. The engine having been started, the driver admits current from the battery gradually into the electromagnet clutch. This starts the car smoothly, and its speed is afterwards increased by gradually diminishing the excitation of the dynamo. Its control is afterwards effected automatically.

When the car reaches a gradient, should the resisting torque on

the wheels become greater than the turning moment of the engine, the speed of the latter diminishes, the voltage of the dynamo falls and becomes less than that of the battery. The battery then discharging into the dynamo produces a torque which assists that of the engine until it balances the resisting torque of the car. The assisting couple produced by the motor is, moreover, a maximum, since the admission of the gas, which is governed by the discharge current, is likewise at a maximum.

Similarly, when the car arrives on a gradient, if the resisting couple is less than the turning moment of the engine, the speed of the latter tends to increase, and the voltage of the dynamo rises so that the dynamo begins to charge the battery. This charging current passing through the regulator results in the rate of admission of the gas being reduced to the minimum and the torque of the engine becomes zero. For each section of the route, equilibrium is obtained between the three torques, viz., the torque of the car, the torque of the engine, and the opposing or motoring torque of the dynamo.

In order to slow down or accelerate at will the speed of the car, it is sufficient to upset this equilibrium. To slow down, the resisting torque must be increased; this is done by the driver increasing the excitation of the dynamo, which then begins to charge the battery. This charging current diminishes the rate of admission of the gas and consequently the driving torque. The kinetic energy stored in the car is thus restored to the battery. For accelerating purposes the driving torque must be increased, i.e., the excitation must be diminished. When the car is at rest, the engine clutch is disengaged. The engine may then be either stopped or changed to low speed in order to charge the battery.

This description shows that the internal-combustion engine owing to its constant connection with the axles of the car, and owing to the fact of its being automatically governed, works with variable cut-off. This type of motor-vehicle, which requires accumulators, has also the advantage of storing energy when the car is slowing down or running down gradients. In the motor-vehicles in operation on the Pieper system in France, by the Compagnie des Chemins de Fer de Grande Banlieue, from Saint-Germain to Poissy, the generating set with its two clutches is suspended on springs by two longitudinal girders from the frame of the car, between the two bogies, below the luggage compartment. This set drives the extreme axle of each bogie through a cardan shaft and bevel gear. The engine has four cylinders, and uses benzol as fuel. The car has seating accommodation for 33 passengers and standing room for 16. It weighs 217 tons, and can haul two 10-ton trailers.

A motor-vehicle on the Thomas petrol-electric system, with mixed transmission, is in service on the Central South African Railway.\* This car has a petrol engine, epicyclic gear and two dynamos. The whole works on M. Gasnier's electromechanical method of varying the speed. The electric generating set is placed in the centre of the car, and drives through a cardan shaft and gear the extreme axle of each of the two bogies.

The dynamos are series wound, and are permanently connected in series. The car is started and its speed controlled by varying the excitation of the two dynamos. The engine develops 120 H.P. at 670 R.P.M.

The car has seating accommodation for 42 passengers, and weighs 215 tons; when running without a trailer a speed of 80 km. per hour was reached on the level, and with a 16-ton trailer a speed of 70 km. per hour.

The advantages of independent motor-vehicles, no matter of what type, depend essentially on the possibility of forming trains of less weight, and consequently of employing a greater number of trains than is the case with steam locomotives. This increase in the number and frequency of the trains should result, in general, in an increase in traffic, and consequently in the revenue, which would cover—supposing that the working expenses are not too high—the initial capital outlay of certain secondary or local lines which, if operated with steam locomotives, could not give such good results.

This use of independent motor-vehicles could even be extended to certain main lines of important railway systems, and would allow an increase in the actual overall speed of long-distance trains, by doing away with stops at the less important stations, such stations being served with independent motor-trains. This method of working, viz., separating the general traffic from the local traffic, would make it possible to do justice to the requirements of these two kinds of traffic, which requirements are at present so conflicting; and in that way it would bring about an increase in the speed and frequency of communication, both of which are so much insisted upon by the travelling public.

The introduction of petrol-electric cars has numerous advantages.

By using internal-combustion engines the car is always ready to start, and only a short time is required to take in fuel, &c., for long journeys. The start is as rapid as in the case of all vehicles adapted for electric traction, consequently the net speed is increased. One man only is required to drive the car, which is easy and safe to work. The driver can concentrate all his attention on the speed of the car, and on the track and the signals. The absence of smoke, and the fact that he stands at the front of the car, facilitate his observation of signals, &c.

The petrol-electric cars are very flexible as regards their operation, owing to the system of control employed. If the stops are of long duration the engine can be shut down and any waste of fuel thus avoided. The maintenance of petrol-electric cars can be attended to without interrupting the service. Repairs are rarely

necessary, and the removal from service for this purpose is, consequently, of short duration.

The use of two drivers' cabins dispenses with the necessity of turning the car at the terminus. The reduced weight of the petrol-electric cars and their smooth running reduce the wear of the rails to a minimum.

The cars can be coupled together by very simple contrivances to form trains, which can be operated from one of the driver's cabins, as is done in the case of multiple-unit electric traction.

Finally, the petrol-electric car, having no permanent mechanical connection between the engine and the axles, may be placed between any two carriages of a train hauled by a steam locomotive, and may be used as an ordinary carriage. At any point *en route* the petrol-electric car may then be removed and continue its journey in any desired direction by its own means of propulsion. In this way several distinct trains may be combined as one train, each section branching off as required.

The principal disadvantage of the petrol-electric car consists in the danger of fire, consequent on the use of a highly inflammable liquid fuel. However, this danger can be completely overcome.

The component parts are very simple, and the most complicated part, the internal-combustion engine, has been so extensively adopted that this point need not be discussed.

From a comparison of various systems it follows that the simplicity of the electric transmission and its flexibility justify its almost exclusive adoption.

The liquid fuels used for motor-vehicles are: gasoline or petrol (density, 0.680–0.720) and benzol (density, 0.885). In countries where there are no supplies of petrol, the present practice is to use benzol, which is a natural product distilled from coal-tar. These two fuels have practically the same calorific value, produce almost the same power from the engine, and can be used alternatively without any modification of the plant. When using benzol it is necessary to start with petrol because benzol requires a certain amount of pre-heating.

In France the price of benzol is about 0.25 franc per litre, whilst petrol, owing to the duty, costs 0.35 franc.

The cost of fuel could be very much reduced by using heavy oils derived from the distillation of petroleum or tar, the prices of which are at present relatively low. The price of the generating set is higher, both as regards the engine and the generator, on account of the lower speed.

The price of a petrol-electric car varies from 40,000 to 150,000 francs. A 90-H.P. car weighing 20 tons and having seating accommodation for 40 passengers costs about 50,000 francs. The 120-H.P. car of the type used on the Prussian State Railways, which weighs 50 tons and provides accommodation for 100 passengers, costs about 90,000 francs when fitted up for third and fourth-class traffic.

The motor-vehicle of the General Electric Co., weighing from 40 to 50 tons, with accommodation for from 60 to 100 passengers, costs from 100,000 to 150,000 francs according to the furnishing of the interior.

The consumption of fuel depends on many factors, and varies according to the traffic of the line on which it is operated. The consumption of fuel per ton-kilometre varies in practice between 15 and 30 grammes according to the profile of the line and the condition of the track.

Assuming that the fuel used is benzol, as is the case in France, the cost of running cars on the petrol-electric system is as follows, the figures being given per ton-kilometre:—

Fuel (benzol) ... ..	0.0042 fr. to 0.0084 fr.
Lubrication ... ..	0.0005 " " 0.0010 "
Repairs and maintenance ... ..	0.0015 " " 0.0040 "
Total running expenses ...	0.0062 fr. to 0.0134 fr.

The driver's wages may be taken as 0.0040 fr. per ton-kilometre.

Although the time that such cars have been in use is too short to allow the "wear and tear" and depreciation to be determined from experience, it appears that if we take 10 per cent. per annum of the value of the total equipment, including the car itself, this estimate is, if anything, rather too high. As an annual mileage of 50,000 km. may be expected per car, this means that "amortisation" represents about 0.005 fr. per ton-kilometre.

If interest on the capital invested is taken as 5 per cent., this represents 0.0025 fr. per ton-kilometre. Thus the total cost of running, if wages, "amortisation," and interest are taken into account, is 0.0177 to 0.0249 fr. per ton-kilometre.

Lines which can be worked by petrol-electric cars must have a relatively small traffic, because the working of a line by petrol-electric cars can only be economical with light trains; and relatively constant traffic, because the power of these cars does not allow heavy trains to be run. It is necessary for the goods trains to be hauled by steam locomotives.

The four types of independent motor-vehicles are at present steam, accumulator, petrol with mechanical transmission, and petrol-electric. Accumulator cars have, however, been abandoned, and as the petrol engine with mechanical transmission has not been found sufficiently flexible, there remain, therefore, at present only the steam motor-car and the petrol-electric vehicle. The characteristics enumerated for petrol-electric cars emphasise the shortcomings of the steam motor-car, and the conclusion may, therefore, be drawn that if the use of independent motor-vehicles continues to develop—and there is no reason why it should not—then petrol-electric motor-vehicles will preponderate.

(To be continued.)

\* This system was fully described in the ELECTRICAL REVIEW, May 5th and June 23rd, 1911, and September 27th, 1912.

## NOTES FROM INDIA.

[FROM OUR OWN CORRESPONDENT.]

**Dacca.**—The new company, called the Dacca Electric Supply Co., has begun to do productive work, and promises of success are assured. The managing agents in Calcutta, Messrs. Octavins Steele & Co., know how to make a sound bargain for their shareholders. They got the Provincial Government to guarantee a minimum consumption per annum, which will at least pay interest and standing charges, thus ensuring that all sales of current beyond this figure go towards net profit. The old Dacca Electric Lighting Trust, which has done good service for 10 years back, has been absorbed by the new company; as it had established a fairly large connection, this should automatically go over to the new company and become a valuable asset. In spite, therefore, of the degradation of Dacca from being the capital of a province to its present position as a provincial town, there is every prospect that the efforts of the promoters of this enterprising scheme will be rewarded by handsome dividends later on. Big developments are anticipated, and the time will perhaps come when Dacca may be justly called the Oxford of India.

**Madras.**—The Madras Electric Supply Co. has, for the second time since its opening, given notice that in certain districts its mains are fully loaded, and that the present machinery in its power house is not, until further extensions are carried out, able to cope with any more load. This points to wonderful and unexpected development, which should be pleasant news for the shareholders. Power users in and about Madras have been quick to realise the benefits of cheap power. The Madras Tramways Co., having scrapped or sold their old steam generating plant, now buy current in bulk from the supply company, with the result that even their shareholders have been experiencing profitable returns in the shape of a good dividend.

Electric street lighting has made great strides in Madras. A very few years ago it was usual to carry about with one after dark a Hink's or similar lantern as the street lighting was so bad; now some of the principal thoroughfares are well lit, and bear favourable comparison with those of any other city in India.

**Lahore.**—The Electric Supply Co. is daily adding new consumers to its mains and promises to show good financial results in the near future. Local power users, such as mill and factory owners, are beginning to see that there are many advantages to be gained by using electric power, and spurred on by the frequent visits of contractors' representatives, they are slowly but surely coming round to the inevitable opinion that the substitution of electric drive for expensive steam is good economy. With steam coal costing 24 Rs. a ton in Lahore this is not to be wondered at—by the way, good steam coal costs 5 Rs. per ton at the pit's mouth in Bengal, the balance is railway freight.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

## The Prevention of Accidents in Electric Lifts.

As active workers for many years in the field of invention for the above object, we are interested in the recent discussion on safety locks, and the more so as our work and published views have been referred to more than once.

Mr. W. J. F. Cooper leads off in his first letter with an attack on the character of all locks of a date prior to "a few weeks back," basing it on the admittedly hypothetical danger that the interlocking of the latch may never take place.

He supports his argument by pointing out that the motive power of most interlocks is gravity, or the recoil of a spring, which powers are alleged to be especially likely to succumb to rust and dirt.

He then claims to have seen a lock which avoids this risk and "overcomes all defects," &c. But he does not describe the mechanism of the lock, or give more than a hint of the methods adopted, so we are left to surmise.

By the context, however, we are bound to suppose that gravity and springs are barred; the motion of the cage is specifically barred; and turning to Mr. Cooper's second letter we find the only positive clue in the words—"No gate can be opened till the current has been cut off from the controller." Conversely we may therefore assume that the locking operation is effected by switching current on to the controller, and presumably through the intermediary of one or more solenoids or magnets.

In any case the duty of locking and unlocking is shifted to the controller, and, if so, why find fault with gravity and springs? Does Mr. Cooper know of any lift controller worked by switches which does not depend on gravity or springs for its motion in one direction?

But leaving the controller and coming to the solenoid which actually does the locking, is it seriously contended that the magical letters S O L E N O I D provide unlimited power to overcome dirt and rust.

Those who know most about them know that their power is limited as definitely as that of a spring or of a falling weight, by the conditions prescribed by the designer.

The secret of success in all three cases is the provision of an ample margin of power to overcome all reasonably contingent obstacles.

Mr. Carroll reminds us that springs break. Just so, and solenoids go to earth or short circuit and burn out—or get overheated and jib—or fail to get current at all through their switches.

As to the liability of a spring to break (its only tangible defect, in our recent work, not only in locks but in other directions) we have devised modifications enabling a spring fractured into several fragments to act as effectively as when intact.

So far as Mr. Cooper's description carries us, it is therefore difficult to see how the lock he writes of advances matters in the direction of security against the only danger he describes, that of the interlock failing to act. Solenoids will fail as often as springs from dirt and neglect, and will also suffer from troubles peculiar to themselves.

But Mr. Cooper's find does apparently prevent unfair interference with the lift when passing a floor by persons who have not called it. That, however, is not a question of safety, but purely one of removing a nuisance.

We hold no brief for the force of gravity or for springs—there is no need; the former has been working quite satisfactorily for much longer than "a few weeks," and the latter have been doing good service at least since the days of Archimedes.

Our object so far is merely to clear away some confusion of thought and false reasoning, as will appear below.

Mr. Cooper says he has "had every-day experience of lifts for many years;" later he quotes a specification of ours, dated 1905 (*eight years ago*), and says it "fairly represents modern practice." Is that quite fair? Or is it a compliment?

The facts are that in 15 years we have improved our lock 17 times, we have issued 18 distinct patterns, and the 1905 pattern referred to is known as our No. 9. In 1905, however, it stood for a long step in advance of all predecessors, and therefore appears in the Patent Office files.

Mr. Cooper states that the lock which he discovered "a few weeks back" produces the following results:—

"The gates must be electrically and mechanically locked (not merely latched) before any movement of the cage can take place, and the locking action depends in no way upon the motion of the cage. Also the gate cannot be opened while the cage is passing the floor, but only when the control current has been cut off by the operator or the control gear."

He also refers to it as "unique," "the only one," and as the "one type of lock" which solves the problems, and he, therefore, may be interested in the following additional information:—

One of our nine patterns introduced since 1905 accords precisely with the above quoted specification, and it was designed very much farther back than "a few weeks."

We have been acquainted for about two years past with two different systems in use in Continental cities, achieving the same results with more or less success. We have reason to believe that such apparatus is obtainable in this country from three separate sources.

There is, however, another point arising out of Mr. Cooper's letter. Unlocking the latch at the proper time is often more important than detecting the correct moment for locking it.

It is to be regretted that we are not told exactly how it is done. We know that it follows the cutting off of current to or from the controller, and may assume that only the latch on the floor for which the cage is destined will be released.

But suppose that for any one of a dozen possible reasons, current is cut off when the cage is between floors above or below its destination—will that predestined latch be released all the same?

It may be replied, "No, the cage must be opposite the floor." But what is meant by "opposite."

This question is not frivolous. Much play has been made by two writers on the fact that most interlocks act only after the cage leaves the floor. Whatever value there is in this point, exists equally when considering the question of unlocking.

Nothing could be more simple than to confine the unlocked zone to a space, say,  $\frac{1}{2}$  in. above and  $\frac{1}{2}$  in. below the floor. But even that done, with high-speed switch-controlled lifts, with a new boy in the cage missing the floor every time by 6 in., the apparatus would soon be scrapped.

But there is another condition to be considered. Lifts will overrun occasionally beyond normal limits, and the various safeties and limit switches need time and space in which to act, and the cage may be from 2 ft. to 3 ft. beyond the top or bottom floor when finally stopped. Obviously, the passengers would be alarmed, and if they could not, then instantly escape through an *unlocked gate*, the financial results to the owners might be emphasised.

Experience has, therefore, practically determined that an unlocked zone measuring about 2 ft. 6 in. above and 2 ft. 6 in. below the floors should be provided.

When that phase of the problem is faced, the designer is apt to find himself once more in close company with the despised inclined plane, spring and force of gravity, or some of them.

As a matter of fact, we never heard of any accident arising from the provision of an unlocked zone extending 2 ft. 6 in. in either direction, and the Duc de Louge's death was in no way connected with that feature.

Most of Mr. Carroll's points have been touched on above, but his ideal lock is worth summarising.

It is to be automatic, not to work by gravity, springs, or the motion of the cage, and it is to act before current is switched on, so that solenoids are ruled out. As an "ideal" we lift our hats to it, but fear it will remain in that stage for some time yet—though little is really impossible in "electrics" if purchasers will pay for it.

Mr. Carroll's last six lines read rather like a misconceived paraphrase of something we have often written. Our letter is already too long to correct this in detail, so we merely say that Mr. Carroll's words do not represent our views. It may be that we were not in his mind at all.

Smith, Major & Stevens, Ltd.

Northampton, June 2nd, 1913.

I have been extremely interested in the recent correspondence relative to the above, and have been expecting to find the matter taken up by some of our lift makers.

From an architect's point of view, the statements made by Mr. W. J. F. Cooper, supported by Mr. Carroll, are somewhat startling, and if correct, it behoves architects to hesitate before accepting the advice of lift experts when specifying. Surely the subject matter of your correspondents is not too trivial to be allowed to pass unchallenged by any of them?

One can only conclude that the letter has passed unnoticed, or that the alleged inefficiency of safety locking and lift control is a fact.

Generally speaking, it is not within an architect's power

to appreciate the technical details and working of these points, and he has to place reliance on lift makers.

It would be of interest to hear other opinions on this vital matter.

G. W. Newman.

Brighton, Sussex.

June 9th, 1913.

#### Electric Lighting Fittings.

Your correspondent, "R. E.," prefaces his letter with matter not likely to interest your readers, *to*, personalities aside, let us proceed.

No matter how efficient the form of reflector, there is no getting away from the fact that with indirect fittings the light is first projected from the lamp to the reflector, thence to the ceiling and back to the working plane, covering part of the distance for the third time, so that we get—

1. Loss from lamp to fitting.
2. Loss on first reflection.
3. Loss from reflector to ceiling.
4. Loss on second reflection.
5. Loss from ceiling to working plane.

I would again repeat that, in these days of competition, we cannot afford to entirely ignore efficiency. Surely the most efficient method of lighting is direct lighting, and if we can conceal our source of light and, at the same time, produce direct lighting, this must be the most common-sense method; to my mind it fulfils all the physiological points raised in "R. E.'s" letter. Is it not possible to fit the efficient reflector he speaks of, so as to reflect the light directly where it is required, and without the intervention of the ceiling, which, by the way, is not primarily designed for reflecting purposes? It should be an easy matter to interpose a small translucent or even opaque screen to protect the eye from the glare of naked lamps. This should render "R. E.'s visual activity" equal in both cases. I do not assume that it is impossible to direct the light with indirect fittings, but experience teaches that you cannot presuppose that every man who installs this system is a lighting expert, neither is the working plane for ever a fixed position. I take it that any alteration of this would mean a different set of reflectors and chain lengths, or would it be necessary to alter the height and contour of the ceiling, in order that the relative positions of the reflecting surfaces might remain the same? It certainly seems to open up prospects of good business for the consulting engineer.

I would ask "R. E." where I imply that indirect fittings are necessarily ugly. I think that even "R. E." himself will agree that some indirect fittings beggar description. Others admittedly look very nice in print, but in use the illumination of the fitting itself is such as to render its artistic design unnoticeable. In fact, its appearance with lamps burning resembles a big black patch, intensified by the white background.

Then there is the vital question of dust collection, which "R. E." does not touch upon. I have seen fittings which, after a month's use, cease to have any reflecting value whatever. No, "R. E.," I think you really admit to yourself in quiet moments, that indirect lighting leaves the Supply Co., and the lamp and fittings manufacturers, with a temporary increase of profit, which will rapidly disappear when the user awakens to the fact that he has been bluffed. Meanwhile, our competitors concentrate on efficiency and romp ahead.

H. A. W.

#### Long-Range Instruments.

Mr. Davies's last letter on this subject compels me to point out that Mr. Record did not write the article in *Electricity* which has been the *casus belli*. I might reasonably dilate upon the fact that it was hardly courteous of Mr. Davies not to have contributed his letters to *Electricity* as well as to the *ELECTRICAL REVIEW* and the *Electrical Times*. Without, however, going further into this matter, and without entering further into the discussion itself than to point out that the Record instrument possesses merits realised in no other commercial instrument, may I emphasise the fact that neither Mr. Record nor his representatives framed the article in question, which, moreover, they did not see till after its publication. The article was written after hearing

the inventor's views and thoroughly inspecting the instrument. As to the wording of Mr. Record's advertisements, I disclaim all responsibility. I do not propose to contribute further to this discussion should it be prolonged. My present motive for writing is to free Mr. Record and *Electricity* from an unjust imputation.

**The Writer of the Article.**

London, W., June 3rd, 1913.

I must apologise for again encroaching upon your valuable space to continue, as "Electricity" so aptly puts it, an "unnecessary correspondence," but when one's veracity is challenged, defence is advisable.

Mr. Davies now knows, to his discomfort, the result of his rashness in jumping to conclusions, and it only remains for me to repudiate the alleged inaccuracy of my firm's advertisement: "We are the only makers of long-scale instruments for direct current; all other long-scale instruments are for alternating current, and will not work on direct current." This announcement was not only correct, but justified.

Mr. Davies states it is erroneous in a twofold sense—first, because Messrs. Johnson & Phillips have produced a hot-wire instrument, and second, because "we have still our old friend the Cardew." To bring in the Cardew to give the lie to such an advertisement is ludicrous, and to bring in J. & P. for that end is unfair, because Mr. Davies must know that Messrs. Johnson & Phillips only brought their instrument to public notice for the first time three months after the introduction of my instrument, and after the appearance of my firm's advertisement, and Messrs. Gambrell have not yet done so. This disposes of Mr. Davies's unwarranted attack.

In conclusion, if M. Carpentier, followed by Mr. Davies, produced long-range instruments of the moving-coil type 20 years ago, succeeded by several years in which long-range instruments of the moving-coil type have been commercially unobtainable, it cannot be denied that the Record Electrical Co., Ltd., started with their unique instrument a new era in January, 1913, so far distinguished by the greatest anxiety on the part of those interested to make it appear that such instruments have always been available, coupled with frantic haste to develop rival articles to support the suggestion.

I wish to thank "Electricity" and the real "Writer of the Article" therein for their letter of June 5th, and for the high tribute they have paid to my instrument.

**J. Westmoreland Record.**

Broadheath, June 9th, 1913.

**The Mutual Protection of Engineers.**

Our suggestions towards the formation of the proposed Association will be submitted for publication in your next issue. A little delay is almost inevitable, the preliminary work being such that it can only be done slowly. The general opinion, so far, is keenly in favour of the Association. It is respectfully requested that reports be sent in as soon as possible, whilst progress would be facilitated if engineers in general would kindly canvass their friends with a view to our securing, at an early date, the number of those gentlemen who would be likely to give the Association their support.

**L. H. Fletcher,**

*Hon. Acting Secretary, Proposed Association.*

31, Queen Victoria St., London, E.C.,

June 9th, 1913.

I am not actively concerned with the formation of the suggested Association, but I have drawn my own conclusions as to the reason in pressing for combination. Nor am I sure that an Association could eliminate a case like my own; but I will give the facts just as they are.

Until about a year ago my career was all I could desire. My services were sought, and my salary was a good one. Then an important hitch arose a few months ago. I applied at once for another position with a competitive firm who had always been friendly towards me, and though I requested almost 50 per cent. increase in salary, the first interview was satisfactory.

It was at a subsequent interview that things were some-

what different. I was offered very little more than my old firm were paying me, and was told what that amount was to a shilling. My blank refusal to consider such a proposal might be expected; but at length I was led to suppose that the position would be offered me practically at my own terms when the preliminaries were completed.

About a week later, to my surprise, I was notified that the company in question had not been able to decide in my favour, and it now appears that each application I make to other firms gets only so far. I do not wish to publish my personal conclusions, but it is apparent that as engineers we are not to have a free hand in estimating our own commercial value. An Association might, therefore, well consider such cases, as they should concern every engineer who is an employé.

From every standpoint, however, I wish the proposed Association success, despite my doubts that my brother engineers will rally round it in time. We somehow appear to comprise so much of that unique stuff of which the middle-class man is made; and instead of asserting ourselves we plod on patiently, complaining only in secret. Those above and those below us are more than ever at pains to save their own skins, but we middle-class folk do nothing, unless it is to earn the contempt of the two sections of society between which we are situated.

We are subject to ever-increasing taxation for the benefit of the workman, the particular investments of our own class have depreciated, and the cost of living has risen, but we don't stir a finger for our own good. I add this, of course, because members of the engineering profession form so great a part of the middle-class, whose doom it is to be harassed, taxed, weighed down by increasing burdens, and left vaguely to mutter and grumble, wondering why someone—anyone but ourselves—doesn't do something.

It is not too much to suggest that the engineering profession represents the standard of ability in the country, and that brains were never of such account as now. As a body, we are therefore getting our deserts. It would appear that if we are to benefit ourselves to any extent the shackles of apathy and snobbery must at least be removed. We must adopt the team spirit—the spirit of cricket as opposed to that of golf. Indeed, it is not unlikely that we will soon have to go to Trade Unionism for our lesson, and, rejecting its glaring errors, adopt the obvious good points. Like the mechanic we would then learn to speak of "us," and not of "me."

If the Association will help to awaken our class to a sense of its duty to itself, I sympathise with those who are striving for its initiation.

**Salesman.**

You do well to call attention in your last issue to the absence of honours conferred upon those directly associated with engineering. Your article on "Municipal Parsimony" was likewise necessary, since such instances of municipal ignorance should be pointed out. Another such example was referred to in a recent issue of the *Manchester Guardian*, and should be of interest to those who are now endeavouring to improve the status of the engineer. The latter case concerned an advertisement inserted in the technical Press on behalf of the Sharnbrook Reformatory. This public institution is in need of a tall, smart, young engineer and electrician, apparently to look after its heating, lighting and power services. In addition, he has to assist with any other institution duties; which might mean anything from sweeping floors to teaching a class in grammar. He has also to be fond of boys (bad boys, presumably, since it is a reformatory), and able to play cricket and football well. In return for these varied services he will receive board and lodging, in addition to the princely salary of £40, rising to £48. Forty pounds a year seems to be about 16s. a week, but the advertisement also specified that the successful applicant should not have been guilty of the indiscretion of marriage.

Among other things, such advertisements serve to demonstrate the astounding conception which even public officials have of the status of an engineer. They also show how much skill is believed to be necessary to take charge of engineering plant and to perform all repairs, renewals, and modifications called for from time to time.

If an association were formed as suggested it might turn its attention to this question without delay. Perhaps it

might even be able in some way to render assistance to an engineer whose pecuniary circumstances tempt him to apply for such positions.

June 7th, 1913.

F. V. Robertson.

Having read and re-read the illuminating letter of "M.Sc." in your current issue, and being sufficiently an engineer to refuse to acknowledge myself beaten, I will be content with the non-committal comment of—"Exactly!"

To return to our subject, however, I am glad to note that the interest of the men concerned, appears to have been awakened by the letters which have recently appeared in your hospitable columns, and I believe that the announcement promised by Mr. Fletcher, is being eagerly looked forward to.

I make no doubt that a very few years ago the idea of any combination of the members of the engineering and commercial staffs of our various industrial concerns on Trade Union lines would have been very repugnant, but there seems to be little question now as to its necessity and advisability. With a combination of masters on the one side, and of operatives on the other, we, the individuals (at the present stage), must be wary or the usual fate of the unconsidered trifles caught between the upper and the nether millstones, will be ours.

Combination of some kind is certainly necessary, and I believe any steps to this end will meet the hearty response of those whom it is intended to assist, provided only that it is carried out on satisfactory lines, and is used as a weapon of defence, rather than of offence.

Mac.

I send you my Play on this particular subject, together with a cutting from the *Daily Telegraph*, which recently reviewed it at length, and, as you will see, glowingly. Any electrical engineer who is interested in the idea of bettering the status of the *engineers' draughtsman* is invited to communicate with the Society of Engineers, 17, Victoria Street, and to apply for a copy of the book as a loan to read, as the library of that Institution has some 50 volumes in circulation and is doing its level best to create an interest in the subject. It is hoped that the Play will be produced later in one of the more important London theatres.

Lloyd St. Clare.

Twickenham, June 7th, 1913.

[The title of the play is "A Woman of Imagination."—Eds. E.R.]

#### The "Times' Time and Synchronising Turret Clocks.

With reference to the article in your issue of May 30th describing Mr. Kempe's method of keeping turret clocks to time, we would refer him to our well-known system which is working satisfactorily at the *Times* office and many other important buildings.

At the *Times* offices there are about 60 dials which receive an impulse every half-minute from a transmitter. The two turret clocks also work on the same circuit, being electrically escaped. The whole of the system has now worked many months without attention, and keeps time to within one or two seconds.

The recent reported failure of the bottom turret clock was due to a mechanical accident outside the clock, in which some of the wheels of this clock were smashed, but this accident is in no wise attributable to us.

The system is checked hourly by a signal bell actuated from Greenwich, and in view of your remarks under the heading of "The *Times*' Time," you may be interested in this statement, especially as this can be verified by reference to the engineering officials on the staff of the *Times*.

Gent & Co., Ltd. A. E. EATS, *London Manager*.

London, S.W., June 9th, 1913.

[As we understand the matter, Mr. Kempe's suggestions apply only to the synchronisation of ordinary existing clocks, whereas Messrs. Gent & Co.'s system relates to electrically-driven clocks—a totally different matter. We were not aware that their system was in use in the *Times* office, nor did we question the accuracy of the indoor clocks; our comments applied only to the public clock over the front door, the behaviour of which, until its recent repair, was very erratic.—Eds. E.R.]

## PARLIAMENTARY.

### Wood Green Electric Lighting Transfer.

MR. HERBERT CRAIG'S Select Committee of the House of Commons has passed the preamble of the Tottenham and Edmonton Gas Bill, which provides, *inter alia*, for the transfer to the company of the Wood Green Urban District Council's Electric Lighting Order.

MR. HONORABLES LLOYD, K.C., who appeared for the promoters, said that the electric lighting order was granted to the Wood Green Urban District Council in 1902, and it was at their suggestion that it should now be transferred by agreement to the gas company. In the early days of electric lighting the gas company contemplated seeking powers to supply electrical energy, and in 1897 they communicated with the various local authorities in their area to this effect. In the following year they obtained an Act which authorised them to apply for licences or provisional orders to supply electricity, and they intimated to the local authorities their intention to apply for provisional orders. On the local authorities intimating that it was their intention to make similar applications, the company abandoned their scheme. In 1902 the Wood Green Council obtained their electric lighting order, but although various schemes had been put forward, nothing had actually been done in the matter. In 1911 the Council approached the promoters and inquired whether they were still wishful to undertake an electric lighting scheme for the district, and after negotiations between the parties, the present Bill was agreed upon. The Bill contained the usual provisions for purchase under the terms of the Electric Lighting Act, and, in addition, there was a clause, by which the local authority could purchase the undertaking in 1928 by giving 12 months' notice, on payment of the capital expenditure plus 20 per cent.; in 1929 by payment of the capital expenditure plus 19 per cent., and so on for each succeeding year until 1948, when the Council would be able to purchase by simply paying the capital expenditure. The maximum charge for lighting under the proposed Order would be 5d. per unit; for power 2d. per unit; and for public lighting 2½d. per unit. Having cited instances to show that it was not a new idea to entrust a gas company with an electric lighting order, Counsel proceeded to deal with the opposition of the Printers' Almshouse Corporation, who alleged that the site for the proposed generating station would constitute a nuisance. Mr. Lloyd contended that the station would neither be a nuisance nor create a noise, seeing that gas engines were to be used for the generating plant.

After hearing evidence for and against the Bill, it was ordered to be reported for third reading.

**West Bromwich Corporation Bill.**—The Omnibus Bill of the West Bromwich Corporation which includes powers to provide and work trolley vehicles and motor omnibuses, make street improvements, &c., has been approved by the Select Committee of the House of Commons, presided over by Mr. E. Gardner. Mr. C. C. Hutchinson, K.C., who, with Mr. Jeeves appeared for the promoters, said the total tramway capital of the Corporation was £117,000. It was proposed to run trolley vehicles on six routes and the estimate for the proposed new trolley vehicles and equipment was £18,197 and for motor-buses £8,000. The new lines were intended to give a thorough means of communication to the workers in the industrial areas who had now to walk long distances between their homes and their work. Mr. H. Lloyd, K.C., appeared for the South Staffordshire Tramways Co., who are the lessees of the promoters, and who contended that if the powers were granted their traffic would be taken away. After a consultation with counsel, the Committee passed the Bill subject to the route from Greet's Green to Greet Bridge not being constructed or worked except with the consent of the lessee company during the unexpired term of the company's lease. The same condition was laid down in the case of the All Saints to Wednesbury and All Saints to Walsall routes.

**Various Bills.**—In the House of Lords on June 5th the Northern Counties Electricity Supply Bill, Chesterfield Corporation Railless Traction Bill, and Westgate and Birchington Gas and Electricity Bill passed second reading.

In the House of Lords on June 9th, the Dundee Corporation (Improvements and Tramways) Bill was read a third time and passed.

In the House of Lords, on June 10th, the Kent Electric Power Bill and the Rhondda Tramways (Railless Traction) Bill were read a second time. The Herne Bay Gas and Electricity Bill was read a third time and passed.

**Colinton Tramways.**—Mr. Jenne, Examiner, has found that Standing Orders have not been complied with in the case of the Colinton Tramways Bill, owing to the promoters not having obtained the consent of the Edinburgh Corporation, who are the road authority, to the proposed extension. The Bill will go before the Standing Orders Committee, who will decide whether it will be allowed to proceed.

**Leatherhead and District Electric Lighting.**—The opposition threatened to the Leatherhead and District (Extension) Order in the Electric Lighting Provisional Orders (No. 2) Bill has been withdrawn, and consequently the order to commit it to a Select Committee has been discharged.

**Electrical Exhibition in Spain.**—At a meeting lately held in Barcelona, at which representatives of about 300 firms were present, it was decided to organise an International Exhibition of Electrical Industries in that city. A syndicate was formed at the meeting to take the necessary steps to carry out the idea.

## LEGAL.

### THE NATIONAL TELEPHONE AWARD.

IN the House of Lords on Monday, June 3rd, an appeal was heard before the Lord Chancellor and Lords Loreburn, Atkinson, Shaw, Moulton and Parker in the case of the National Telephone Co. (in liquidation) and Another v. His Majesty's Postmaster-General. The appeal was from an order of the Court of Appeal, dated April 16th this year, whereby it was declared that the Court had jurisdiction to hear an appeal by the Postmaster-General from the Court of Railway and Canal Commission sitting under the authority of an agreement between the company and the respondent, dated February 2nd and August 8th, 1905, and the Telegraph (Arbitration) Act, 1909.

The counsel for the appellants were Sir C. Alfred Cripps, K.C., Mr. Danckwerts, K.C., and Mr. H. H. Gaine. Counsel for the respondent: The Attorney-General, the Solicitor-General, Mr. Buckmaster, K.C., Mr. Schwabe, and Mr. Branson.

The ATTORNEY-GENERAL said he desired to be heard on the preliminary objection that their Lordships' House had no jurisdiction to entertain the appeal. He submitted that there was an appeal from the decision of the Railway and Canal Commission to the Court of Appeal on the construction of the Act of 1909, but that their decision was final.

LORD LOREBURN: Can we properly hear your objection until we have heard Sir Alfred Cripps, whose argument, I understood, was to be that the Court of Appeal had no jurisdiction to make the order from which he now appealed?

The ATTORNEY-GENERAL: I am quite content that appellants' counsel should be heard. I only desired to make this point to your Lordships before you heard the appeal opened.

SIR ALFRED CRIPPS, K.C., then proceeded to open at some length the case of the appellants. He argued that if the Railway and Canal Commission had the power to entertain the arbitration it was apart from the provisions of the Arbitration Acts of 1873 and 1888. The right of appeal was a substantive right and not one of procedure. It was a right of legislation and jurisdiction. He went on to quote the sections of the Acts of 1873 and 1888 and also the Act of 1909 in order to support his contention. Next he read the judgments of their Lordships in the Court of Appeal, maintaining that there could be no proceedings under the Act of 1909 except by the consent of both parties, which the majority of the Lords Justices in the Court below had overlooked.

MR. DANCKWERTS, K.C., followed on the same side, elaborating the point that a right of appeal could not be derived by implication. That right could only be given by direct legislation, and there was no such authority here. Even if jurisdiction had been given to the Railway and Canal Commission, it did not necessarily follow that jurisdiction had likewise been given to the Court of Appeal.

The LORD CHANCELLOR said: Their Lordships were unanimously of opinion that the preliminary objection raised by the Attorney-General to this appeal being heard could not succeed, and that they were entitled to decide the appeal which had been opened and argued for the appellants. No case had been made out which rendered it necessary to hear the respondent in reply. They thought the appeal failed, and they would give their reasons in writing hereafter for coming to that conclusion. But as the case was one which ought to be disposed of at once, they proposed in order to save time at once formally to dismiss the appeal, with costs, and affirm the judgment of the Court below.

The LORD CHANCELLOR then put the motion from the Woolsack, which was agreed to.

Solicitor for the appellants, William E. Hart; for the respondent, the Solicitor to the Post Office.

### X. L. ELECTRIC CO. v. ABON.

BEFORE Mr. Justice Neville in the Chancery Division on Friday, June 6th, was renewed the motion by the plaintiffs in this action, by which they sought an interim injunction to restrain the defendant until the trial or further order from dealing with, or disposing of, certain patents relating to electric clocks, and from interfering with or withdrawing applications that were pending for protection for improvements in such patents, or for foreign protection.

MR. MORITZ, counsel for the plaintiffs, reminded his Lordship that in the previous week the defendant had given an undertaking and the matter had stood over for further evidence. They had just received an affidavit from defendant which dealt with several fresh matters, but with regard to the material part of the injunction the plaintiffs were asking for, he was quite prepared to go on with the motion. The position was that there were pending applications with regard to patents which came within the scope of the contract of the defendant with the company, and those applications he was threatening to interfere with. Clause 8 of the contract provided that if at any time the defendant should effect any improvements in the inventions relating to the patents he had assigned to the company, the patents for such inventions should be assigned to them they paying the necessary expenses incurred in obtaining protection. The defendant had made an invention which came within that clause before he quarrelled with the company and at the company's expense, and jointly with them he had applied for a patent. The Comptroller of Patents, in the exercise of the discretion vested in him, had declined to allow the application to proceed as an application for protection for an addition to a previous

patent, and had decreed that the application must be for a substantive patent. The only difference was a question of expense, and the company was quite prepared to proceed with the application in accordance with the Comptroller's ruling. The defendant had, however, threatened to withdraw the application for a patent altogether. The attitude he took up was that if he could not proceed with the application as a patent for an addition he would withdraw the application altogether, and he did not in his evidence deny that he had threatened to withdraw it. There was also a threat on the part of the defendant to interfere with the foreign protection the defendants were seeking to obtain, but without going into the matter, if the defendant would undertake that he would not until the trial withdraw any of the applications that were pending with regard to the English and foreign patents, the company would be content, otherwise he must proceed with the motion.

MR. SIMMONS, for the defendant, said he was not prepared to offer any undertaking.

MR. JUSTICE NEVILLE asked what was the defendant's point.

MR. SIMMONS said that, with regard to the English patent, a time limit had been fixed, and subject to that time limit being extended his client was prepared to undertake not to withdraw the application; but with regard to the foreign patents, he could not give any undertaking, as he was merely a joint applicant. His Lordship ought to know that the defendant held two-thirds of the shares in the company.

HIS LORDSHIP asked who, under the agreement, had the conduct of these patent proceedings.

MR. MORITZ said that the action was undoubtedly in the hands of the company. Counsel then proceeded to read the affidavits filed in support of the motion, which set forth that the company was registered on November 28th, 1912, and was formed with a capital of £20,000 to take over the defendant's patents for an electrically-controlled clock, and up to the present time the defendant had refused to make any assignment of the patent.

MR. SIMMONS submitted that his client had not said that he would not carry out the agreement. The whole question was as to the manner in which the application for protection should be prosecuted. As to the assignment in an agreement for sale, it was always a condition that the vendor should have the goods to assign.

MR. JUSTICE NEVILLE said he was not deciding that point. What he had to decide was what was to be done with regard to the application for a patent. Where he thought the defendant was wrong was in thinking that he was entitled to have the sole right of saying how the proceedings with regard to the patent were to be taken. That was for the shareholders. They were the people who had control of the matter.

MR. SIMMONS: Your Lordship has heard how the shares stand.

HIS LORDSHIP said he could not look at that. What he had to consider was what the rights of the company were.

MR. MORITZ submitted that it was to the interest of everybody that these patents should not fall to the ground.

MR. SIMMONS said that there was an application for a patent in the joint names of the defendant and Mr. Harrison. Mr. Harrison should be made a defendant. Mr. Moritz said that that was the first he had heard of such a patent having been taken out, and it would be in fraud of the company's rights.

MR. SIMMONS said that the company would be in a better position if they would abandon their present patent and take an interest in this new patent referred to in the affidavits. If that was clearly shown on the evidence, he submitted the Court would not interfere by interlocutory injunction. If the matter was allowed to stand until the trial, the defendant was willing to give any undertaking his Lordship might think right. With regard to the foreign patents, it was entirely a matter of policy, and there was no ground for an injunction, as the defendant had shown his good faith in making the application. With regard to the English patent, if it was allowed to go forward as a new patent, and not as an addition to the old patent, it would jeopardise a new patent which was now pending, and which, in the defendant's opinion, was much more valuable.

HIS LORDSHIP asked whether the company were prepared to undertake to pay the expenses of the pending applications.

MR. MORITZ said they were.

MR. JUSTICE NEVILLE: Then I need not trouble you further.

In giving judgment, he said that on that undertaking he must grant an injunction restraining the respondent from withdrawing, or permitting to be withdrawn, any of the existing applications, and from opposing or preventing or permitting to be opposed or prevented any application in connection with the patent rights subject to the agreement made between the parties. The injunction would extend until the trial or further order, and the costs of the motion would be costs in the action.

---

**A Low-Compression Diesel Engine.**—A patent has been recently taken out by Mr. Heinrich Zoelly, of turbine fame, to enable much lower pressures than usual to be used in the Diesel engine. According to *The Motor-Ship and Motor-Boat*, the idea is to heat the mixture of fuel and air before it is injected into the cylinder and comes into contact with the compressed air, so that the temperature of the latter, or rather its pressure, need not be so high as the 500 lb. per sq. in. pressure usually adopted. The interesting detail of the proposed system is the provision of a small electrical heating grid immediately under the fuel inlet valve, to heat the fuel mixture as it passes through. If the idea should materialise, it would enable a lighter type of engine to be constructed.

## MINING MACHINERY EXHIBITION.

THE Exhibition of Mining Machinery, which was held at the Royal Agricultural Hall from May 29th to June 7th, contained an unexpectedly large number of features of interest to electrical engineers. The collection of coal-cutters, both electrical and pneumatic, was exceptionally large and varied, and indicates the rapid progress that is being made in the adoption of up-to-date methods of coal-getting in our collieries.

No attempt was made by exhibitors of pneumatic coal-cutters to challenge the great economy effected by the use of electric transmission—practically all of them, in fact, showed electrically-driven machines. MESSRS. MAYOR & COULSON, Glasgow, had a very large exhibit, including their well-known Pick-quick bar coal-cutters, driven by three-phase and direct current and by compressed air; their Samson disk coal-cutters, and a variety of other mining apparatus. A special feature of novelty was the use of air-cooling tubes in the Samson disk small size three-phase machine, in order to get the maximum power with minimum height. The motor is completely enclosed, dust and flame-proof, and the stator is provided with groups of straight brass tubes extending through the shell internally from end to end. A fan on the motor shaft (outside the shell) propels air through the tubes, and another fan (inside the shell) circulates the internal air over the surface of the tubes, thus cooling it without allowing the external air to enter the interior of the motor shell. The gears in these machines are mounted on sleeves running on fixed shafts, so as to give a very long-bearing surface, which cannot be obtained when the shafts rotate in bearings fixed to the frame.

THE DIAMOND COAL-CUTTER CO., Wakefield, had a representative exhibit of their manufactures. Their 30-H.P. disk type longwall coal-cutter is fitted with an A.C. ball-bearing motor of the totally enclosed type; the gearing is all machine-cut, and mounted on substantial bearings, all end thrust being taken by ball bearings. A reversible valveless oil pump supplies oil to all bearings. The controller is of the drum type, worked by hand wheel from either end of the machine. A pivoted cable connector box of entirely new design is fitted, which, by releasing one thumb-screw, enables the adaptor to be swung round, thus ensuring a straight lead on the trailing cable. This prevents the cable having to be bent over when the machine is cutting back, and entirely obviates any risk of the cable being nipped between the machine and the props. The power factor of the motor is 0.82 at full load, and the efficiency is very high.

A bar type longwall machine was also exhibited, driven by a four-cylinder compressed-air engine, and a longwall chain machine, fitted with a 25-H.P. patented type D.C. compound-wound motor, having four main wound poles and two commutating poles, and ball-bearings. This is the firm's standard swinging jib pattern arranged to cut at floor level, and, like the other machines, is interchangeable for alternating current or compressed air.

A new gate-end winch for trailing cable, which should effect a great saving in the life of the cable, Blackett's patent coal-face conveyors driven by electricity and compressed air, and an improved friction clutch for use with A.C. motors, together with various patterns and sizes of this company's well-known safety type gate-end switch boxes and other accessories, were also shown.

MESSRS. ANDERSON, BOYES & CO., LTD., Motherwell, showed two disk longwall coal-cutters and one of the chain type, all electrically driven. One of the former was their latest pattern of three-phase machine, 8 ft. overall: the gear is very compact, and is provided with an exceptionally effective oil-thrower to render creeping impossible. Oil is pumped to the bearings. The shaft of the controller handle passes from end to end of the machine inside the frame; at the back end it can only be used to stop the machine, not to start it, so as to ensure safety to the men. The controller is of steel and mica construction, and the trailing cable plug is locked in place when the circuit is closed. Interlocking gate-end switch and fuse boxes were also shown.

MESSRS. A. HIRST & SON, LTD., Dewsbury, showed their "Crescent" machines, one of which was fitted with an electric motor. The insulation of the electrical parts of this machine is of mica, and flame-tight joints are employed throughout. Both D.C. and A.C. machines are made of the disk type. The drum controller in the former is provided with blow-out coils. Interlocking gate-end boxes and a coal drill were shown.

THE SULLIVAN MACHINERY CO., of London, though newcomers into this country, have many machines at work in the British Dominions, and have sold nearly 6,000 in all. The special feature of their three-phase coal-cutter was the small space occupied and the compactness of the motor, though the latter was rated at 30 H.P. for one hour continuously. The motor runs at 900 R.P.M. and is fitted with ball bearings; it is tested with a pressure of 5,000 volts A.C. The switchgear also occupies very little space, being simply a star-delta starting switch with no regulating appliances. The body of the machine is only 2 ft. 6 in. wide. The motor is started on light load, and is thrown into gear with a friction clutch, which is set to a predetermined maximum torque; a two-speed feed-gear is provided, giving a slow continuous feed for cutting and a fast speed (7:1) for "fitting," which renders the machine easy to handle quickly. A chain is used instead of a rope for the feed, and in the event of jamming in the cut the friction clutch protects the machine from damage. When a D.C. motor is used it is compound wound, preventing runaway. A reversing switch is provided, and all the controlling handles are close together at the front end of the machine. The feed can also be reversed without stopping the motor, and the machine can be run backwards without any delay. The friction clutch and change-

gear levers are interlocked so that the pull on the feed chain cannot be increased beyond the normal value. The change-gear has also a neutral position, and the cutter chain can be instantly stopped with a jaw clutch. Altogether the machine presents a number of interesting features not met with in British types. The exhibit also included a compressed-air machine and rock drills.

Turning next to miners' lamps, the "CEAG" ELECTRIC SAFETY LAMP CO., LTD., London, had a large exhibit of their lamp—the winner of the first prize in the recent competition set on foot by the Home Office. Equipments were shown for charging simultaneously 80, 40, 24, 12 or 6 "Ceag" lamps, with 110 or 220 volts, the smallest of these sets being constructed in the shape of a "rescue shelf" in accordance with the new Rules. Racks for 200 lamps each, with number plates, magnetos for opening magnetically locked lamps, motor-driven cleaning machines, lamp wagons, acid filling apparatus, &c., were exhibited, as well as new and improved designs for lamp cabins, facilitating the distribution and collection of the lamps. Several special types of "Ceag" lamps for officials, lamps fitted with bull's eyes, sinking lamps of 16 C.P., &c., were also shown. We understand that many thousands of the "Ceag" lamp have been supplied to British collieries, with satisfactory results, the maintenance costs (inclusive of labour, material, repairs and energy) being not more than 24d. per lamp per week—no more than for oil safety lamps. The works can turn out 3,000 lamps per week.

MESSRS. ACKROYD & BEST, LTD., Morley, showed amongst other lamps the Hallwood electric safety lamp, which is of the cylindrical type, with the lamp on the top. A single cylindrical accumulator cell is used, and the construction of the lamp is such that it is flame-proof, while it is easily opened for charging. A pneumatic or magnetic lock is provided, if desired. Special inspection lamps with lenses and reflectors are also made.

MESSRS. JOHN DAVIS & SON (DERBY), LTD., Derby, amongst a great variety of instruments and mining apparatus, showed the Gray-Suessman type of electric lamp and lamp stands.

MESSRS. MANLEY & SANDY, LTD., London, were showing a new electric gas detector and indicator which they have devised. This is combined with a miner's electric lamp, and is housed within a small gauze cover on the top of the battery case; it is capable of detecting as little as 1 per cent. of gas, and can be adjusted in advance to a given percentage. The indication is produced by the catalytic action of a platinum salt, but does not depend upon current flowing through the platinum. An inspector's lamp is provided with a deflecting pointer, which shows the percentage of gas present (down to  $\frac{1}{4}$  per cent.) on a divided scale. The lamp gives 1.2 C.P., and the battery will serve for one or two shifts, according to size. Effective precautions are taken to provide against explosion. Charging switchgear and a special small-power gas engine for driving a charging dynamo were also shown.

MESSRS. JAMES KEITH & BLACKMAN CO., LTD., London, had a large exhibit of their fans and blowers, many of them directly driven by electric motors. One of these, a ship ventilating fan, was fitted with a special watertight motor to run on deck. In the small fans, the blades of the runners are spot-welded. A mining fan with a capacity of 240,000 cu. ft. per minute, at 6-in. water-gauge, was one of the exhibits, and at the other end of the scale was a little portable blower for cleaning motors, &c., which could be carried by hand. Forge blowers, portable and fixed, and a gas compressor for the Keith high-pressure lamps, were other items of the exhibit.

MESSRS. HOBDELL, WAY & CO., LTD., London, had a very varied exhibit of engineers' supplies, including "Kulite" cork heat insulation in slabs and sections of all sizes, "Dorite" belting suitable for the individual driving of looms, and for use in a moist atmosphere, conveyor belting, "Hobbsleyte" asbestos sheets suitable for the cubicles of high-pressure switchgear and for roofing, and cork floor slabs for switch rooms. A special novelty was a tube scaler, consisting of four scrapers mounted on springs, which is driven by a flexible shaft, and in actual practice with water-tube boilers has been found to give exceptionally efficient results. The action is pure scraping without hammering, and the inside of the tube is left bright and clean.

MESSRS. BLEICHERT'S AERIAL TRANSPORTERS, LTD., London, showed a model of their ropeway in operation, as well as an electrical automatic telfer for conveying coal, &c. The whole of the control is effected from one spot, the tub being lowered or raised, and traversed, with only three wires. Very many such telfers have been erected, and the large ropeways have been built to carry up to 450 tons per hour.

MESSRS. JOHN DUGDILL & CO., Failsforth, showed a variety of their well-known patent movable fittings, and MESSRS. HANN AND INGLE, Manchester, their "Adaptable" earthing and continuity clips, which should be found very useful in mines.

MESSRS. HANS RENOLD, LTD., Manchester, had an exhibit of their silent, roller and block chains.

THE INGERSOLL-RAND CO., London, showed a large compressor driven by a Lancashire Dynamo and Motor Co.'s motor, and various rock drills, &c. A feature of the exhibit was the Temple-Ingersoll "Radialaxe" coal-cutting machine, which consists of a motor-driven pulsator connected to an air drill by two short lengths of hose. The air in the hose forms the medium by which power is transmitted to the drill, with perfect elasticity and high economy, as the air is never exhausted, but simply pulsates. The machine thus combines the advantages of electrical transmission to the working face and pneumatic operation of the tool. The whole equipment is mounted on a wheeled truck. The cutter is really a drill mounted on a special column, and, in fact, the parts are interchangeable with the company's rock drill.

MESSRS. W. & T. AVERY, LTD., Birmingham, exhibited a complete weighing and totalling machine, which automatically weighs

a constant length of the conveyor at suitable intervals, and records the total weight of material which has passed over the machine. The motive power is derived from the working of the conveyor itself. The machine was shown in operation with a Babcock and Wilcox gravity bucket conveyor.

MESSRS. REAVELL & CO., LTD., Ipswich, exhibited their axial type compressor, motor driven, with an oiler at one end of the main bearing, whence the oil is forced by a spiral groove on the shaft to the working parts. The quadruplex compressor is fitted with automatic positive lubrication, the oil being forced through a filter to a tank, whence it gravitates to the working parts. A reversible valveless self-contained pneumatic mining hoist, sub-station cleaning set, &c., were also shown.

MESSRS. G. M. CALLENDER & CO., LTD., London, showed bitumen sheeting, and "Bitusol" paint for the protection of iron and steel work.

THE ELECTRICAL APPARATUS CO., LTD., London, had an exhibit of their starters and switchgears: a novel feature in an automatic triple-pole oil switch was a patent oil level interlock, which prevents the switch from being closed if the level of the oil is so low as to expose the contacts. A new A.C. meter of the induction type was also on view.

THE UNION CABLE CO., LTD., Dagenham Dock, appeared to be the sole representatives of the cable makers, with an exhibit of all kinds of cable, including bitumen-insulated mining cables and boxes.

THE COVENTRY CHAIN CO., LTD., Coventry, showed samples of their noiseless and roller chains and gears, and MESSRS. DAVIDSON AND CO., LTD., Belfast, had a large exhibit of Sirocco fans.

An ingenious sprinkling shovel for hand-stoking was shown by MR. A. C. FEIL, of Dronfield.

## BUSINESS NOTES.

**Heavy Capacity Lampholders and Adaptors.**—We have received from MESSRS. G. ST. JOHN DAY (PATENTS), LTD., a letter referring to the letter in our issue of June 6th, by Mr. C. J. Stonier, Dundee, in which they inform us that their Mumps and one-part adaptors, &c., will, and do, carry the same current as their Mumps holders; they guarantee these holders and adaptors, when used together, to carry 10 amperes. The only difficulty they experienced with large current-carrying capacity holders, adaptors, &c., was the size of the conductors entering or connected to such appliances, which necessarily required large holes. This difficulty has been overcome, and we have before us a Mumps lampholder and one part adaptor, coupled and wired with 7/22 wire and 130/40 flex. The makers inform us that they have tested the holders and adaptor with 20 amperes passing continually for 18 hours without heating up. The holder sent us is provided with side channels in the barrel to observe the method of contact making, as well as for heat testing, and it occurs to us that these channels might be made a permanent feature of the holders to allow of the circulation of air.

**Electric Lamp Films.**—At the Blue Hall Cinematograph Theatre, 207, King Street, Hammersmith, during this week, at 8 p.m. daily, there is being shown a special film illustrating the operations at the Osram and Robertson lamp works, with views of the employés at work and at play.

**Dissolutions and Liquidations.**—JOHNSON-BILLINGTON ELECTRICITY METERS, LTD.—A petition for winding up this company, presented by Mr. W. H. Johnson, 62, Langham Road, Teddington, a creditor, is to be heard on June 17th.

**TRACTION SUPPLIES, LTD.**—Creditors should send particulars of their debts, &c., to the liquidator, Mr. T. Metcalf, 50, Frederick Street, Sunderland, by June 27th.

**ADAMSON, RAMSBOTTOM & CO., LTD.**—Creditors should send particulars of their debts, &c., to Mr. B. Cookson, 6, Castle Street, Liverpool, the liquidator, by July 31st.

**HALPIN'S PATENT THERMAL STORAGE, LTD.**—A meeting is called for July 16th, at 5, Coleman Street, E.C., to hear an account of the winding up from the liquidator, Mr. S. V. Tiddy.

**Bankruptcy Proceedings.**—J. G. M. HILTON, electrical engineer, 103, Exchange Buildings, Birmingham.—The first meeting of creditors herein was fixed for Wednesday of last week, at Ruskin Chambers, Corporation Street, Birmingham, but the meeting was adjourned in order to enable the debtor to formulate a scheme by which the creditors would receive a composition of 7s. 6d. in the £.

**W. LONGDON and V. G. COBB** (Longdon & Cobb, electrical engineers), Nottingham.—Also W. LONGDON (separate estate).—June 28th is the last day for receiving proofs for dividend. Mr. E. W. Humphreys, Official Receiver, 1, Castle Place, Nottingham.

**C. S. NORTHCOTE**, electrical engineer, Streatham.—A first and final dividend of 1½d. in the £ is payable June 23rd, at 132, York Road, Westminster Bridge Road, S.E.

**Book Notices.**—*Reid's Handy Colliery Guide for Northumberland, Durham and Yorkshire*. Newcastle-on-Tyne: Andrew Reid & Co., Ltd. 2s. 6d.—This book opens with a large folded map of the district named in the title, showing the position of the collieries and the railways. It is largely a directory of colliery-owners, collieries, agents, managers and engineers, while

it also contains lists of associations and institutions connected with the coal trade, and names and addresses of H.M. inspectors and assistant inspectors of mines. The latter half of the book and more is occupied with copies of Acts of Parliament and Coal Mines Orders, also the special rules for the installation and use of electricity, Workmen's Compensation Act, miscellaneous information and mining statistics.

*The Practical Electrician's Pocket Book* for 1913. Edited by H. T. Crewe. London: S. Rentell & Co. Price 1s. net.—The little red volume, which comes before us fatter than ever, though some of the old sections have been omitted, is unusually late this time; it only reached us last week. The new matter deals with electrical coal-cutting machines, vacuum cleaners, generators and motors, control of lighting circuits, measurements, &c. The field covered by the book is so wide and varied that it resembles an encyclopaedia, and it is a mine of information in brief on electrotechnology.

*The Faraday House Journal*, Vol. V, No. 3, for June, which has just been issued, contains much information regarding the doings of old Faradians, as well as articles on the Dyott monoplane, Transformer Regulation on Inductive Loads, the Inductive Coupling of Oscillatory Circuits, and Electric Winding Plant for Collieries, with other matter, making it a very readable issue.

"Electric Wiring." By W. C. Clinton. Third Edition. 1913. London: John Murray. Price 2s.

"The Modern Bioscope Operator." 1913. London: Ganes, Ltd. Price 3s. 6d.

"Science Abstracts." Vol. XVI, Part 5, May 30th, 1913. Sections A and B. London: E. & F. N. Spon, Ltd. Price 1s. 6d. net each.

"Electricity in Mining." By Siemens Bros. Dynamo Works, Ltd. London: Charles Griffin & Co., Ltd. Price 10s. 6d. net.

"Journal of the Institution of Municipal Engineers." Vol. IV, No. 16, May, 1913. London: The Institution. Price 1s.

"Journal of the South African Institution of Engineers." Vol. XI, No. 10, May, 1913. Johannesburg: The Institution. Price 2s.

"Journal of the United States Artillery." Vol. XXXIX, No. 3, May-June, 1913. Fort Monroe, Va.: Coast Artillery School Press.

"Proceedings of the American Society of Civil Engineers." Vol. XXXIX, No. 5, May, 1913. New York: The Society.

**New Electric Stove and Toaster.**—A new and cheap form of combined electric stove and toaster has just been placed on the market by MESSRS. F. A. WILKINSON AND PARTNERS, LTD., of Hatfield, Herts. The framework is

ELECTRIC STOVE AND TOASTER.

constructed of bright wire, attached to which is a polished aluminium tray containing a simple form of heating element. The consumption is 600 watts, and the apparatus is of high efficiency. A slice of bread can be toasted both sides in 1½ minutes, while 3 pints of water can be boiled in 22 minutes. Ordinary household utensils are employed, it being unnecessary to use those with flat bottoms.

**Catalogues and Lists.**—MESSRS. GRIFFITHS BROS. AND CO., Macks Road, Bermondsey. London.—36-page booklet containing much information relating to their various insulating varnishes and compounds (Ohmaline, Armacell, Pakyderm, Insulderm, &c.) and the purposes to which they are applied.

MESSRS. VERITYS, LTD., King Street, Covent Garden, W.C.—Folder No. 746 illustrates and gives prices of "Aston" fireproof and insulated lampholders, house service boards, tumbler switches, automatic two-part lampholders, ceiling roses and other devices.

THE BRITISH ALUMINIUM CO., LTD., 109, Queen Victoria Street, London, E.C.—8-page pamphlet (No. 133) containing fully illustrated information relating to the erection and jointing of aluminium bus-bars and connections; tabulated areas, weights and other particulars of aluminium rod, bar and strip, are tabulated. Leaflet No. 222A shows the use of aluminium feeders for railway electrification. A special binder file accompanies the lists.

THE SCHNIEWINDT ELECTRIC CO., 40 and 41, Staniforth Street, Birmingham.—Ten-page list, describing their electric stoves, in which Schniewindt resistance grids are used. Illustrations appear of some 17 designs, and prices, weights and dimensions are tabulated. Prices and particulars of the resistance grids are fully set forth.

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., 38 and 39, Upper Thames Street, London, E.C.—Leaflet relating to the "chain-pull" switch lampholder, and a supplementary price list of tumbler and other switches.

MESSRS. ROSS & CO., 62, Robertson Street, Glasgow.—Twenty-four-page illustrated wholesale and export price list of rubber

wires and cables, flexibles for lighting and motor-car service, bell, telephone, shot-firing and fuso wires, enamelled copper wires, cable sockets, sundries for dynamo repairs, &c.

MESSRS. MAGIC APPLIANCES, LTD., 6, Farringdon Avenue, London, E.C.—Folder, giving brief particulars, illustration and price of the "Magic" electric blower for factory and workshop service.

MR. FRED. J. DOWNS, 6, 7 and 8, Crutched Friars, London, E.C.—Illustrated lists describing a spring hammer and drills for drilling holes in concrete, brick and stone. An extension for overhead drilling is shown, and typical ways of using the hammer are pictured. Other lists give particulars of gear shield—a graphite gear lubricant—such as is in use on a large number of tramways and railways.

THE ELECTRICAL CO., LTD., 122-124, Charing Cross Road, London, W.C.—Twenty-four page catalogue, illustrated, and giving prices, speeds, dimensions, weights, &c., of electric fans—ceiling, desk, portable, swivel and trunnion, and other types.

MESSRS. KRUPKA & JACOBY, LTD., 26-36, Chapter Street, Westminster, London, S.W.—Illustrated and priced leaflet ("F") giving particulars of electric fans—universal joint, swivel and trunnion movement, ceiling, portable, propeller and desk types; also a list of prices of small power motors.

MESSRS. E. BENNIS & CO., LTD., 28, Victoria Street, London, S.W.—28-page catalogue in a brilliant "fery cover," containing introductory comments on "cheap steam and a smokeless chimney," followed by a description of the construction and operation of the Bennis stoker. Tests results are tabulated both for a power-house and a cotton mill. Nine pages of interesting drawings follow showing the application and general arrangement of these stokers and furnaces to different types of boilers. One of the pictures shows the stoker arranged for gas firing as an alternative to coal firing; and another shows a Cheshire power station where 12 boilers are fired by the firm's machines, the coal used being a small slack.

THE STERLING TELEPHONE & ELECTRIC CO., LTD., 200, Upper Thames Street, London, E.C.—Folder (No. 210), showing their receivers for wireless telegraphy, and stating prices.

**Wheatstone Slip.**—We have received from MESSRS. H. ERHARDT & CO., LTD., of 9-10, Bond Court, Walbrook, E.C., a sample roll of their Wheatstone slip, which is said to be free from oil, grease and fluff, and to keep in condition for any length of time in any climate. The sample is strong and crisp, with a clean sharp edge, and should prove admirably adapted for use with telegraph and time recording instruments.

**Installation Contracts.**—MR. JOHN RICHARDS, electrical contractor of Burton-on-Trent, has a number of complete plant installations in hand, particularly for country houses and industrial works. The country house installations include Wychnor Park, Lichfield; Cotton Hall, Sudbury; The Gables, Rangemore; and Croft House at Grendon, where he has recently completed the electric lighting of Grendon Hall. Other work now in hand includes the complete equipment of the Nestlé & Anglo Swiss Condensed Milk Co.'s new factory at Ashbourne, Derbyshire, with some 28 motors, 350 lights, intercommunication telephones, electric clocks, &c.; Messrs. Warwick & Richardsons' Brewery, Newark-on-Trent, with some 30 motors and 250 lights; Messrs. James Hole and Co.'s Brewery, Newark-on-Trent, with some 300 lights, besides numerous installations on town supplies.

**The British Engineers' Association and Merchant Firms.**—The Secretary of the British Engineers' Association (Caxton House, S.W.) writes to correct a misapprehension that the Association intends working against the interests of merchant firms. He thinks its existence is probably due to the Association having had to decline to elect a number of merchant firms of highest repute "simply because the membership is confined strictly to manufacturers." The Association being purely an organisation of manufacturers, a merchant or agent is not considered eligible. Its members are at liberty to deal with merchants as much as and however they choose. It is sometimes asked whether the Association is working with the merchants, but the secretary says that as an Association it cannot do so; its members, however, do as they please. The Association's aim is to influence trade for the benefit of its members, the latter taking orders through any channel they may find convenient.

**British Electrical Developments in China.**—While increased attention is being devoted to the Chinese market in the hope of preventing golden opportunities slipping past our manufacturers, both now and in the future, it is satisfactory to learn that the GENERAL ELECTRIC CO., LTD., whose efforts in China are not unfamiliar to our readers, are very satisfied with their experience there. The General Electric Co., of China, Ltd., report that recently they have secured several contracts for the supply of electrical machinery for the Chinese cities of Soochow and Changchow, in Kiangsu Province. All electrical plant and materials in these places will be of British make and manufactured at the works of the G.E. Co., Ltd., in England. For Soochow a Witton single-phase alternator, capacity 375 kw., with high-tension switchboard, is being supplied as an extension of the present generating plant. In the case of Changchow, which is a similar city, a Chinese company has been formed, and the contract secured for a Witton alternator of about 200 kw., complete with high-tension switchboard, Allen's engines, &c. Another contract recently secured has been for three Witton high-tension alternators, with 14-panel switchboard, for the lighting of Fatchan, in Kwangtung Province. The General Electric Co., of China, Ltd., was only established in 1911; its headquarters are at Shanghai, and sub-branches are located at Hong Kong, Tientsin and other places.

**Trade Announcements.**—We understand that some confusion and inconvenience has arisen owing to correspondents failing to address letters correctly for firms of somewhat similar title at Walsall. Readers are asked to take note that the address of the Walsall Electrical Co., Ltd., is 57, Bridge Street, Walsall, and that of the Walsall Hardware Co., who manufacture conduits and fittings, in the directories is Walsall only. Mistakes have also occurred in the correspondence of these two concerns and that of the Mechanical and Engineering Co. Each of these firms has lately received letters intended for one of the others.

THE HALLAMSHIRE ELECTRIC CO., LTD., has removed to 16, Carver Street, Sheffield.

THE BENJAMIN ELECTRIC, LTD., announce that their accounts and order departments are now managed at the company's works at 1A, Rosebery Avenue, E.C. (telephone No. "City 2107"), and all communications relating thereto should be sent to that address. The sales office and showrooms are still at 117, Victoria Street, S.W. (telephone No. "Victoria 1297").

MESSRS. FALK, STADELMANN & CO., LTD., have arranged for permanent showrooms at 107/111, Shudehill, Manchester, for the display of electrical fittings and accessories of every description, and a complete stock will be carried.

We understand that MESSRS. BAXTER & CAUNTER, of 219, Tottenham Court Road, W.C., are rearranging their switchboard department, putting it under new management, particulars of which will be duly announced. Mr. L. B. Best is no longer associated with the firm.

**Low-Water Alarm and Feed Regulator.**—We regret that the address of MESSRS. ELLEFSEN & CO., makers of this device, was wrongly given in our last issue. It is 26A, Silver Street, Bedford (not Bradford).

## LIGHTING and POWER NOTES.

**Ashford (Kent).**—At a meeting of the U.D.C. on June 5th, an application was received from the East Kent Electric Supply Co. for permission to use overhead wires for the supply of current under the order held by the company. The matter was referred to a Committee for the collection of further information.

**Banff.**—The Lunacy Board has under consideration the lighting of Ladybridge Asylum with electricity, at an estimated cost of £1,100. It is calculated that by adopting electricity a saving of about £100 per annum would be effected, as the gas installation costs a good deal annually for repairs.

**Barnstable.**—The income from the electricity undertaking for the year ending March 31st, 1913, amounted to £5,400. The expenditure totalled £3,062. There is, therefore, a profit balance to carry forward of £2,337. The capital account shows an unexpected balance of £99, the expenditure being £33,385.

**Bedford.**—The L.G.B. has informed the T.C. that the inquiry into the application for a loan of £11,590 for additional plant at the electricity works will be reopened on June 18th by Mr. T. C. Ekin. There have been two previous inquiries concerning the loan, particulars of which have appeared in the ELECTRICAL REVIEW.

**Belfast.**—The two years' discussion on the proposed new power station does not appear to bring the matter any further towards a settlement. Mr. Bloxam's report upon the estimated comparative capital and working costs of the various sites has been issued, showing considerably in favour of the harbour sites in the matter of working expenses. The capital expenditure on an 18,000 kw. station, including over £100,000 for machinery, is estimated at between £183,000 and £202,000 according to the site selected.

For the year ended March 31st last, the Electricity Department shows a working profit of £34,947 carried to net revenue account, to which has been added £1,380 for bank interest, making a total of £36,327. After providing for fixed charges, amounting to £22,478, income-tax, &c., there remained to the credit of the new revenue account a disposable balance of £13,175. The appropriation of this sum will be considered at a later meeting of the T.C.

**Bradford.**—The city electrical engineer has been instructed to furnish members of the Electricity Committee with a copy of the report presented by him upon suggested extensions of the generating plant, together with an estimate of the capital cost involved. The Committee is to hold a special meeting at an early date, and to proceed to Newcastle, Manchester and other towns to inspect the electrical undertakings.

The electrical engineer has also been instructed by the Committee to proceed with the work of extending existing E.H.T. feeders at an estimated cost of £5,458.

**Burnley.**—A statement prepared by the borough treasurer and submitted to the T.C. shows that the actual profits from the electricity undertaking on the past year's working amount to £7,926. This is £3,133 more than the amount estimated.

**Bristol.**—In his annual report to the City Council, Mr. Proctor, the city electrical engineer, says the Electrical Committee has agreed to reduce the charge for public street lighting by £2,000 per annum and to give a supply of current free of all charge to numerous incandescent electric lamps on the line of route of the mains. Cooking by electricity has been introduced, and is rapidly becoming popular. The number of cooking stoves in use would have been appreciably larger, but for the difficulty experienced in obtaining sufficient deliveries from the manufacturers, who throughout the country are overcrowded with orders. The increase in the connections to the mains, reduced to the equivalent of 30-watt lamps, is 65,068. This is the greatest increase in any year since the commencement of the undertaking, except only the year 1908-9. The total connections to date amount to 639,523; 15,000 H.P. of motors on consumers' premises are now supplied, over 2,000 H.P. having been added during the year. The total sale of energy has increased 25 per cent. The total revenue from the current sold has risen from £73,335 to £82,130, an increase of £8,795, as compared with an increase of £5,072 for the former year. The gross profit on the year's working is £56,129. The Committee has opened a general reserve fund this year, to the credit of which it has placed the sum of £6,000.

**Burton-on-Trent.**—Application has been made to the L.G.B. for sanction to the borrowing of £5,000 for 25 years for mains and feeders, £1,500 for 15 years for services, and £2,000 for 15 years for transformers and sub-stations.

**Bury.**—Mr. S. J. Watson, the borough electrical engineer, in his just-published annual report, states that the total units sold for all purposes were 5,076,634 (of which 1,370,266 were for tramway purposes), as against 4,220,191 (1,340,355 for tramways) in the preceding year. The total generating costs were 55d. per unit sold, compared with 62d. per unit last year, and the average price obtained for the total output was 105d. per unit, compared with 110d. per unit for the previous year. After payment of all working expenses there was a gross profit of £10,577, equal to 64.9 per cent. on the average capital employed, compared with £8,472, equal to 56.5 per cent. on the capital for the previous year. The sum of £11,219 was required to pay interest on loans and sinking fund, leaving a debit balance of £642, which had been taken from the reserve fund. During the year £7,066 had been expended on new mains, services and transformers. Although a loss of £642 has to be recorded, adds Mr. Watson, the general position of the undertaking shows a marked improvement over the previous year, and the next accounts will probably show that the undertaking is once more established on a profit-earning basis. Commenting on the report at the T.C. meeting on June 5th, Councillor Jamieson said the capital charges and the working expenses had now reached a normal level, and all additional income would consequently yield a much larger percentage of profit.

**Canterbury.**—During the year ended March, 1913, the sum expended on capital account on the electricity undertaking amounted to about £766, making a total expenditure of £70,188 up to date. The income from sales amounted to £10,088, as against £9,557 in the previous year. An increase of 7 per cent. in private consumers is reported. The expenditure was £5,706, against £5,263; the gross profit of £4,954 shows a return of 7 per cent. The net profit, after providing for interest, income-tax, capital repayment, and sinking fund of £3,981, was £972; £174 had been expended for the purchase of the free wiring installations, and apart from that the profit would have amounted to over £1,000 during the year.

**Charnmouth.**—An electric lighting scheme for the village has been propounded by Mr. C. H. Steele, who proposes to use local water-power and to invoke the aid of the Dorset Electric Lighting Co.

**Cheltenham.**—The T.C. has applied to the L.G.B. for a loan of £2,000 for prospective mains extensions.

**China.**—According to the *Indian Textile Journal*, the Kwangtung Electric Co. is extending its lighting cable to Fati, on the other side of the Canton river. The town named is the terminus of the Canton-Samshui Railway and boasts of quite a number of European godowns and residences. To meet the new supply, two additional Diesel engines and dynamos of 300 kW. each are to be installed, capable of giving 30,000 lights. These additions will bring the company's plant up to 12 engines.

**Clacton-on-Sea.**—The U.D.C. has received from the L.G.B. sanction to a loan of £6,000 for electricity purposes, £5,390 being for a Diesel engine, and £610 for extensions to the generating station.

**Colne.**—The Corporation has received the sanction of the L.G.B. to the borrowing of £2,000 for the purpose of extending the electricity mains.

**Crewe.**—The T.C. has received the sanction of the L.G.B. to a loan of £430 for converting to electric lighting certain street lamps in the North Ward of the borough.

After paying all costs, there is a surplus of £1,329 on the electricity undertaking for the year ended March 31st. Of this amount, £600 is to be applied in aid of the general district rate for 1913-14.

**Bartford.**—The electrical engineer has been authorised to issue an illustrated pamphlet calling attention to the cheap rates at which energy is supplied to power consumers and to the advantages which the locality affords for the erection of factories.

**Budley.**—In connection with the sale of the Corporation's electricity undertaking, a deadlock arose owing to the limitation on both sides of the statutory powers; but, as a result of a special meeting of the Council in reference to this matter, all difficulties have now been overcome. Under the new agreement, as under the original one, all losses which the Corporation has sustained in connection with electrical supply will be refunded. A rearrangement of the working plant, to be carried out at a cost of £20,000, is to include the erection of transforming plant to give high-pressure current on, it is believed, more favourable conditions to consumers. It is understood that the sale can now be completed without any public inquiry.

**Dundee.**—Treasurer Soutar, dealing with the Corporation electricity accounts at a meeting of the Town Council, said the year had closed with a net profit of £7,028. Although this was fully £3,000 less than in the previous year, it was accounted for by the increase in coal cost and assessments. The total units sold were over 10,000,000, showing an increase of 1½ millions, and the total revenue was £52,390, an increase of £3,000, in spite of the fact of considerable reductions made in the price. Practically the whole of the increased units sold had been for power purposes, although there was also a gratifying increase in the units sold for lighting. The whole of the net profit had been placed to reserve fund, which now amounted to £21,781. Councillor Don congratulated Mr. Richardson, the Corporation engineer, and said the result was an ample answer to the complaints about continuous expenditure on capital account, and to the criticism which was offered when they decided to go to Carolina Port; he thought it was only after they had increased the power demand that they could hope to grant any advantage to the consumers for lighting. The accounts and estimates were approved, the charges remaining unchanged.

**Eastbourne.**—The annual report of Mr. J. K. Brydges, the borough electrical engineer, on the work of his department, shows that the income of the year was £27,860, the gross profit £14,476, and the net profit £2,495, which compares with £1,089 in 1911-12. The total energy sold was 1,620,648 units, as compared with 1,432,323 units in 1911-12.

**Eccles.**—In regard to the figure of £112, given as the net profit of the electricity department for the past year, Alderman Pearson explained to the Council last week that the sum was estimated at the time the price to be paid by Salford was in dispute. The Council had now practically agreed as to a price, and the profit would be £380. That, however, was a decrease on the amount under the old arrangement. Referring to the revenue account, he pointed out that, after paying for all working expenses, there was a gross profit of £4,193, which was slightly over 7 per cent. on the capital invested.

**Esom.**—The U.D.C. has decided to apply for sanction to a loan of £480 to carry electrical cables to the Woodcote Park Estate. If supplied with current, the Royal Automobile Club, which has premises on the estate, has guaranteed £60 revenue per annum for three years.

**Elland.**—The Council last week confirmed the recommendation of the Electricity Committee that in future electricity for public lighting be charged at the rate of 1½d. per unit. It was reported that the number of consumers was now 349. The total output for last month was 35,440 units, a decrease of 1,331 on the previous month, and an increase of 16,419 on the corresponding period of last year.

**Felixstowe.**—The U.D.C. has decided not to reopen negotiations with Dr. C. H. Lieberbrand on the subject of the transfer of the electricity undertaking, or to have any further correspondence with him on the matter.

**Gillingham (Kent).**—The T.C. has decided to supply electrical energy to the Admiralty for the Naval Hospital, for heating and cooking, at 1d. per unit on a guaranteed minimum consumption of 50,000 units per annum, or 1½d. per unit without such guarantee.

**Gloucester.**—Subject to a satisfactory agreement, the T.C. has decided to supply current for lighting and power to Messrs. Spillers & Bakers' flour mill. A cable will be run through a pipe under the canal.

**Halifax.**—At a meeting of the T.C. last week, the Electricity Committee recommended that the charges for electricity for lighting purposes be 4d. per unit for accounts up to 1,200 units a quarter and 2d. per unit for energy supplied in excess of that amount. The vice-chairman of the Gas Committee moved that the minute be referred back, and was supported by several speakers, including the Mayor, who said that competition between the Electricity and Gas Committees, if carried to extremes, would kill both departments. The chairman of the Electricity Committee, in answer to the Mayor, said the two Committees had already met, but had not been able to come to any agreement. The warfare between the Committees was ridiculous. The motion to refer back was carried.

**Hastings.**—At last Friday's meeting of the Corporation, the annual accounts of the electric light undertaking (up to March 31st) were submitted by the borough accountant, and showed that considerable progress had been made. From the time when the undertaking was purchased by the Corporation from a local company—in 1893—the financial position has been handicapped by the heavy capital involved.

The income for the year was £22,327, showing an increase of £1,719 on the previous year; the expenditure was £10,669 and

the gross profit £11,658. After meeting capital charges, the net profit amounted to £557, and compares with £90 in the previous year. Both these amounts were transferred to reserve.

**Hull.**—On June 5th a L.G.B. inquiry was held by Mr. Hooper respecting the application of the T.C. for a loan of £1,800 for electric light fittings for the new Guildhall. Mr. Hooper pointed out that the proposed outlay was very high, being £1 5s. per light, and it was intimated that, if necessary, the Council could try and reduce the cost.

**India.**—The chief engineer of the Karachi Port Trust has been instructed to estimate the cost of the general lighting by electricity of the Port Trust properties at Keamari from the board's own installation.—*Indian Engineering.*

**King's Lynn.**—The abridged returns of the Electricity department for the last year's working show a total income of £7,314, and after meeting working expenses and financial charges, net profit of £876 remains, as compared with £503 in the previous year.

**Kirkcaldy.**—The Electric Lighting Department returns show a loss of £37 on the last year's working. It was estimated, however, that the deficit would have been greater, but the raising of the rate for current supplied to the tramways from 1d. to 1½d. per unit has considerably improved matters.

The Council proposes experimenting with a new type of arc lamp for street lighting, with a view to economising in that department.

**Korea.**—The total amount of capital invested in electrical concerns in Korea is about £1,225,000. Of this sum £980,000 is invested in concerns already working, and the balance in electrical works which are in course of construction. During the year 1912 new companies commenced operations. One supplies the town of Gensan with light and power, and is the only hydro-electric company in the country. The other supplies light and power to the town of Taikyn. Eight more companies which have already received official sanction are expected to commence work during 1913.—*Board of Trade Journal.*

**Leigh (Lanes.).**—It was reported last week-end that the profit on the municipal electricity department last year was £1,080, an increase of over £500 upon the previous year.

**London.**—STEPNEY.—The income of the electricity undertaking for the year ended March 31st last amounted to £78,431, being an increase over the previous year of £9,154, whilst the total expenditure amounted to £39,208, an increase of £3,123. This leaves a gross surplus of £39,226, as compared with £38,196, and represents a gross profit of 8½ per cent. on the capital employed, which, in view of the very low tariff in force, the Electricity Supply Committee deem satisfactory. There has been an increase in the number of units sold during the 12 months from 11,972,955 to 12,580,982. With reference to the net revenue account, the total income, including the balance from revenue account, amounted to £39,834, against which are charged £27,278 for loan charges paid, £500 for stand-by charges, £8 additional provision for accrued charges, and £441 for certain temporary work, leaving a balance carried to appropriation account of £11,507, as compared with £2,757 the previous year. As regards this latter account, the total amount available, including £11,507 from the net revenue account and £251 brought forward from the previous year, amounts to £13,760, and it is proposed to charge against this account the following:—£1,125, representing expenditure in the nature of capital net revenue by loan; £2,711 written out of the capital account in respect of assets (i.e., machinery, meters and house services), now non-existent; and £8,443 transferred to reserve, carrying forward £1,482 to next year's account. The available balance on the reserve account was £21,193 (including £8,443 transferred from the appropriation account), against which has been charged £193 cost during the year of removing plant from Whitechapel to Limehouse, leaving £21,000 carried forward to next year's account. Of this latter sum, £1,000 is reserved in respect of bad and doubtful debts. The known bad debts have been actually written off. The capital commitments during the year amounted to £26,834, and new loans amounting to £23,250, were taken up to meet this. The aggregate capital expenditure amounted to £461,114.

**ST. PANCRAS.**—The terms upon which the Council is to enter into an agreement with the London Housing Society for a supply of current to its residences in Judd Street are to be altered so as to provide that no supply shall be given except on the understanding that no gas is to be used in the buildings for lighting purposes. The Council's opposition to the London Electric Railways Bill has been settled by an agreement being entered into by which the promoters promise to pay to the Council £300. The Electricity Committee anticipates that, when the plant for the further extension of the principal generating station is installed, it may be able to make a further favourable revision of charges.

**TESTINGTON.**—Application is to be made to the L.C.C. for sanction to borrow £10,000 required in respect of high and low-tension distributing mains, meters, services and transformers for the ensuing year.

**HACEY.**—In connection with the coal contracts to March 1st, for the first time alternative tenders were asked for "named" and "guaranteed" coal. The Electricity Committee, after analysing the tenders, feels obliged to recommend "named" coal, as in no case are the "guaranteed" coal prices sufficiently low, when the advantages for superiority to standard is taken into account. Offers by Messrs. Cory and Sons, at 16s. 7d. and 17s. 6d. per ton for "named" coal were accepted; the "guaranteed" prices comparable were 16s. 11d. and 17s. 1d.

**Manchester.**—The E.L. Committee has adopted the "Norwich" system of charging as an alternative rate (at the option of the consumer) to the existing tariffs for domestic supplies. The new rate is based on a fixed charge of 12½ per cent. on the net rateable value of the dwelling house, plus 1d. per unit metered for all supplies. The adoption of the new tariff is further contingent on the consumer agreeing to install for domestic power purposes a certain minimum number of kilowatts, according to the rateable value of the premises, in addition to the existing lighting requirements.

**Middleton.**—There is a loss on the year's working of the electricity department of £1,800, after allowing for £500 for depreciation. This is due chiefly to the high price of coal and to the breakdown which occurred. Although there is an increase in the number of consumers, the amount consumed has not increased, and the department has received £476 less for electricity supplied for traction purposes. The deficiency on revenue account is £1,124.

**Morocco.**—La Sociedad Hispano-Marroquí de Gas y Electricidad is the name of a company which has lately been formed, with a capital of £200,000, to acquire and carry on the central electric lighting station in the town of Melilla. The plant, which has a capacity of 800 H.P., is to be increased by the establishment of a new 600-H.P. station to enable current to be supplied to Nadar and other small towns in the district. A gas-works is also to be established at Melilla by the company.

**Nuneaton.**—The T.C. has reduced the price of current on the flat rate to 4d. per unit with ordinary meters, and to 4½d. per unit with slot meters.

**Rochdale.**—The Corporation Electricity Committee has under consideration the terms on which a bulk supply shall be granted to the Heywood Corporation.

**Rhosllanerchrugog.**—As the outcome of inquiries made by the local Traders' Association, the Welsh E.L. Syndicate has intimated that it is prepared to supply electricity to the town at 6d. per unit. Another scheme, whereby current could be obtained from Wrexham by means of overhead lines, has been submitted by the borough electrical engineer. The matter is being considered by a Lighting Committee appointed by the Association.

**Roscrea.**—The Council has granted to the Roscrea Co-operative Bacon Factory a lease for 21 years to put up poles and do other necessary work so as to supply the town with electric light and power, the factory to pay to the Council a nominal rent.

**St. Helens.**—At a meeting of the T.C., Sir Joseph Beecham, reviewing the work of the electricity department, said the income during the year amounted to £27,365, an increase of £1,339 over the previous year. On the expenditure side, the working expenses were reduced by £599 to a total of £13,344, so that the gross profit amounted to £14,821, which was a return of 7½ per cent. on the capital. After deducting capital charges, there remained a surplus of £1,629, compared with £518. The total number of units sold was 4,890,438, an increase of 73,506 units. The power units amounted to 2,998,830, an increase of 5½ per cent. over the previous year. In connection with the tramways supply, there was a decrease in the amount of energy taken of 57,609 units, or 4.2 per cent.

**Salford.**—At the T.C. meeting last week, the question of the public lighting of the borough was referred to the Lighting and Cleansing Committee for a report as to whether the lighting is efficient.

**Sheffield.**—The T.C. has engaged Mr. Haydn Harrison, of Westminster, at an inclusive fee of 100 guineas, to go into the question of the relative cost and efficiency of gas and electricity for street lighting.

**Siberia.**—According to a St. Petersburg paper, the Minister of Commerce has decided to equip the Port of Vladivostok with a number of electric cranes and other cargo-handling appliances, for which is allocated 1,000,000 roubles. A complete dredging plant is also to be acquired, at a cost of 300,000 roubles, for use at Ust-Kamchatka, on the east coast of the island of Saghalin.

**South Africa.**—Relative to the supply of electric current by the Durban Corporation at reduced prices, with a view to encouraging its use for domestic heating and cooking, H.M. Trade Commissioner for South Africa reports that the efforts of the Corporation are meeting with considerable success, and that electric heating and cooking are now fairly well established in popular favour in Durban.

**Spennymoor (Co. Durham).**—By 10 votes to 6 the U.D.C. has decided to utilise electricity for public lighting, and the tender of the E.L. Co. at £2 10s. per lamp per annum on a three years' contract, has been accepted.

**Tilbury.**—The County of London Electric Supply Co., which is applying for a prov. order for electric lighting, has informed the U.D.C. that it cannot include in the order the conditions desired by the Council as to the payment of Trade Union rate of wages, as it considers it outside the scope of the order. The question of opposing the company's application will be considered at a future meeting of the Council.

**Wakefield.**—The City Council last week decided to make application to the L.G.B. for powers to borrow £12,806 for the purpose of extensions to the electricity undertaking. During the last two years, it was stated, the expansion of business had been greater than during any similar period in the life of the undertaking. The output rose from 1½ million units in 1911, to 2½ millions in 1912, and 3½ millions in the year just completed, and it was expected that the output would be at least 4 million units in the current year. The extensions consist of new generating plant, additional condensing plant, an additional boiler and the provision of a high-tension distributing station at the bottom of Kirkgate.

**Wallasey.**—The T.C. has adopted the recommendation of the Electrical Committee, referred to in our last issue, which proposes to construct a new three-phase power station at a cost of £65,000, near the Great Float, which offers facilities for obtaining both coal and water. The present generating station will ultimately be used as a transforming station and the Diesel engine set will be retained there for the time being.

**Walsall.**—The B. of T. has revoked the Midland Electric Power Distribution and Lighting (Extension) Order, 1901, for the Parish of Great Barr, in the Rural District of Walsall.

The sanction of the L.G.B. has been received to the borrowing of £3,000 in respect of prospective expenditure on mains.

**Warrington.**—At the T.C. meeting last week, Alderman Smethwick said the financial result of the working of the electricity department during the past year was very satisfactory, a profit of close upon £3,000 having been made. There had been a large increase in the consumption of energy for power and lighting, despite strikes and advanced coal prices.

**Watford.**—At the last meeting of the U.D.C. the Chairman of the Electricity Committee said that during the past year, though the charge for energy had been reduced ½d. per unit, which represented a loss of £1,000, the profit for the year worked out at £1,110, and after giving £850 in aid of the rates, they had carried forward £261 to the reserve fund, bringing that fund up to £1,533.

**Wigan.**—The T.C. has decided to apply to the L.G.B. for sanction to borrow £6,700 for the purpose of meeting the expenditure estimated to be necessary for the installation of a new turbine and accessories at the electricity works. The Council was informed by the Mayor that, at the present time, the engines were running at their fullest load, and in view of the large consumers that were coming on, the Corporation had to make provision for an increased output.

## TRAMWAY and RAILWAY NOTES.

**Aberdeen.**—The revenue on the Corporation tramway system for the past year amounted to £80,150, an advance over the previous year of £2,970, and an increase in three years of £9,029.

At a meeting of the T.C., a scheme for an important development of the system was adopted, and it was agreed to borrow £50,000 to carry it out. Application will be made to Parliament for power to extend the track to the city boundary at Craiginches; to use railless trolley cars between Castle Street and York Place, and between Schoolhill and Forresterhill Road; and to use motor-omnibuses within and outside the city. It was also agreed that power be sought to apply one-third of the surplus receipts to the Common Good fund or towards the reduction of rates.

At a later meeting of the Tramways Committee, it was agreed to extend the route in the west end a distance of 1,263 yd. at a cost of £12,560. The Committee also recommended that the tramway manager's salary be increased by £50 to £450.

**Belfast.**—The amount at the credit of the tramway net revenue account for the last year was £28,801, and it has been agreed to apportion this as follows:—£13,000 to the depreciation fund, and £15,801 to the general purposes fund for the relief of rates. The city accountant also presented the accounts of the electricity undertaking.

**Birkenhead.**—It has been decided to add to the renewals fund of the tramway department the whole of the profits from the undertaking for the year ended March 31st, 1913.

**Black Country.**—With the object of averting a strike the directors of the various electric traction companies operating in this district—including the South Staffordshire Tramways (Lessee) Co., Ltd.; Dudley, Stourbridge and District Electric Traction Co., Ltd.; Wolverhampton District Electric Tramways, Ltd.; and Birmingham and District Power and Traction Co., Ltd.—have had posted in the depôts of the companies official notices authorising alterations and additions to be made to the terms offered to the men as set out in the notices of May 15th and 21st. The new terms came into operation on Saturday last.

**Burnley.**—The annual report of the Tramways Committee states that the year ended March 31st last has been the most successful on record in every respect. The number of passengers carried was 15,949,359, an increase of 1,481,128 on the previous year. The total revenue was £79,890, an increase of £7,181; working expenses amounted to £49,430, an increase of £3,973. The sum of £5,791 has been placed to the reserve fund, and £8,750 has been allocated to the borough fund out of the profits.

**Croydon.**—The Tramways Committee has under consideration the question of extending the tramways from Norwood to Addiscombe.

**Dewsbury.**—The Electricity and Tramways Committee has decided to sanction the proposals of the Dewsbury, Ossett and Soothill Nether Tramways Co. for the extension of double lines of rails, and application is being made to the L.G.B. for sanction to borrow £1,000 for this purpose.

**Dover.**—Our contemporary, the *Kentish Express*, draws the attention of the T.C. to what, if correctly described, must be a most extraordinary state of affairs in connection with the local tramway track. Thus we gather that on the Folkestone Road "there were no less than four pieces of the line missing, the lengths varying from a yard to a foot." A further reference, this time to Snargate Street, states that "three pieces of rail about a yard long were missing." Is it possible that our contemporary viewed the scene in the pale morning light—when repairs are sometimes carried out?

**Glasgow.**—This week the final adjustment of the balance-sheet in connection with the Glasgow Corporation's tramway department, for the year ending May 31st, was submitted to, and approved by, the Committee. The figures showed that the surplus over the year's working accounts to be handed over to the Common Good—a general fund which holds a lien upon the undertaking—was £33,003, as compared with £52,067 for the preceding year, and £68,678 for the year 1910-11. A number of factors contributed to the decreased surplus. These included the following increases in expenditure:—Wages of motormen and conductors, £6,190; wages of cleaners, £3,145; local rates, £7,615; maintenance of track, £17,207; fuel for Pinkston, £2,826; interest on capital, £6,681; sinking fund, £3,214; and renewal and depreciation, £2,053—a total of £48,931. On the revenue side the ordinary receipts showed an increase of £20,468, and the interest on investments an increase of £8,859—a total increase of £29,327. Deducting this from the excess of expenditure, the balance is a sum of a little over £19,000, which represents a shortage in the surplus as compared with the surplus of the preceding year. As already reported in the REVIEW, the traffic receipts exceeded £1,000,000 sterling; they amounted, in fact, to £1,007,652, a circumstance largely attributable to the working of the extended ½d. stage. The total working expenses were £619,346; the balance carried to net revenue account was £392,196; this, with interest on investments, made a total of £450,827, from which are deducted rent of lines, capital charges, renewals and depreciation (£215,766) leaving the net surplus mentioned above.

**Hove.**—In connection with the trolley 'bus' question, the General Purposes Committee of the T.C., after considering a detailed report on the inspection of the systems of railless electric traction established in Bradford and Leeds, has decided that as the proposals for the trolley 'bus' system through Brighton and Hove were made in reliance upon licences being granted for the use of double-deck cars; and as the non-granting of such licences might seriously affect the success of the scheme, it is of opinion that before the Hove Corporation expends the large sum required for the installation of the trolley 'bus' system, it should be ascertained whether such licences will be granted, and that, if not, an opportunity should be afforded for reconsideration of the joint system to be adopted on the through routes. Also that it would be more satisfactory to the Hove Council if the original proposal of the Brighton Corporation to test the system in the first place upon a portion of the route only were carried out.

**Kirkcaldy.**—The returns of the year's working of the tramways show a profit of £1,370, as compared with £1,351 for the previous year.

**Leeds.**—Various developments are contemplated by the tramway authorities. The Tramways and Electricity Committee recently recommended an application for powers for tramway and railless traction extensions, but the Parliamentary Committee decided that it was inexpedient to attempt to promote a Bill in Parliament in the next session, and recommended the Tramways Committee to consider only extensions for which powers could be obtained by prov. order. This will limit extensions for the time being to within the city boundary, and will not include those beyond that limit which were thrown out of the Bill now before Parliament by a ratepayers' meeting last January. It is understood that 25 new cars are to be constructed in Leeds, and about a similar number are to be purchased elsewhere. Halfpenny fares are to be instituted on the Headingley, Chapeltown and Roundhay routes—the only routes which have not yet tried this system; the experimental trial of fare collecting on the platform is to be extended throughout the system, a six months' trial on all routes being given before finally adopting this arrangement.

**Liverpool.**—The Tramways and Electricity Committee has been instructed by the City Council to consider the practicability of utilising the tramway system for the conveyance of goods to neighbouring towns. Mr. P. D. Holt, who brought the proposal forward, said he thought that at least the experiment could be made at very little cost. Sir Charles Petrie did not oppose the motion, but pointed out that some few years ago the Corporation sought the co-operation of neighbouring towns in dealing with goods in this way. The unfortunate part of the business was that Bootle would under no circumstances allow them to draw goods traffic through the streets, and without the outlet at the north end they could not go on with the scheme, and the matter had to be dropped from the Parliamentary Bill.

**Sheffield.**—According to the statement of accounts the total expenditure of the tramway undertaking for the year ended March 31st last (including motor-buses) amounted to £207,689, or an average cost per car-mile run of 6'17d., compared with 6'11d. in the previous year. Against this total there was an income from both cars and buses of £362,127, leaving a gross profit for the 12 months of £151,303. After providing for various charges, interests, &c., there remains a balance of £77,296, which represents an increase of £8,561 over the previous year. This balance is to be appropriated as follows:—Street improvements, proportion of service of debt, £7,631; renewals fund (including interest on investment and bank interest), £30,186; special purposes fund, £2,000; accumulated surplus fund, £7,211; transfer to general district rate, £30,231. The amount to be added to the tramway renewals fund, &c., is to be increased from £30,000 to £35,000 per annum.

**South Shields.**—At a meeting of the T.C., on the 4th inst., Ald. Wylie moved the adoption of the annual report on the tramways for the past 12 months, and congratulated the Council on the success that had attended the system. The Committee's suggestion was that £500 should be paid to the insurance fund and the balance should go to the depreciation fund, and he said that it was essential that there should be a substantial reserve fund. Ald. Redhead moved an amendment to the effect that £1,600 of the profits should go to the relief of the rates. He pointed out that with the addition of the £4,217 that would be left, the reserve fund would amount to about £20,000, which he suggested was adequate. The amendment was, after long discussion, carried.

**Torquay.**—The T.C. has instructed the borough surveyor to make inquiries of certain towns where lifts are installed, and to communicate with the makers, and report thereon. This has reference to the proposed cliff railway at Babbacombe.

**Warrington.**—The net profit on the working of the tramways, for the year ended March last, is £3,320, of which £1,500 has been handed over towards the relief of the rates.

**Wolverhampton.**—The annual report of the Tramways Committee for the year ended March 31st, on the working of the Corporation Tramways, shows there has been a gross profit for the year on electric traction account of £24,232. To this sum should be added the balance of £306 on motor-car-a-banc account, representing a total of £24,538, which has been disposed of in the following manner:—Interest on capital, £6,964; income-tax, £100; repayment of loans, £5,146. To the renewals account, £3,809; additions and improvements, £1,105. On account of extensions at car dépôt, 1913-14, £3,636; borough rate, 1913-14, £3,777. The sum of £50,220 now stands to the credit of the reserve and renewals fund. The traffic receipts for the year, the Committee states, have been highly satisfactory, and constitute a record in the history of the undertaking. The earnings have averaged over £1,000 per week. The total working costs per car-mile are 6'27d., or an increase of '05d. per car-mile over last year's figure. Taking into consideration the extra cost of material, as well as the concessions made to the employés during the year, this figure is considered quite satisfactory. With reference to the Fallings Park Motor Car-a-banc Account, the Committee considers the result satisfactory. The working costs, including depreciation, amount to 8'107d. per mile, which is a very favourable figure for operating motor bus services.

Martha will communicate with ships south of the Republic. The report of the Minister of Marine states that the naval wireless telegraph stations have worked with unfailing regularity. New Marconi stations have been purchased, and the good results obtained justify the adoption of the Marconi system in the Brazilian Navy.

**Cables and Trawlers.**—An international conference has been sitting in London since Thursday last week, to consider what steps can be taken to protect submarine cables from damage due to trawling.

**China.**—The Republican Government has appointed Mr. Nakayama Ryuji, an engineer attached to the Japanese Department of Communications, as Adviser of Telegraphs and Telephones in the Chinese Department of Communications.

**Formosa.**—It is reported that the Formosan Government is considering the question of laying a submarine cable between the Island of Formosa and Hong-Kong.

**Imperial Wireless System.**—On Thursday last week, the Select Committee on the Marconi Contract examined Mr. F. S. Salaman, trustee of the estate of Mr. C. E. Fenner, a stockbroker, who appears to have absconded. His evidence showed that the Master of Elibank, who purchased 1,000 American Marconi shares from Sir Rufus Isaacs, also purchased 3,000 American shares through Mr. Fenner—2,500 on April 18th at 31, and 500 on May 14th, 1912, at 2½. On Monday Mr. Percy Illingworth, Chief Government Whip, stated that he was informed on May 31st that Lord Murray (the Master of Elibank) had purchased these shares on behalf of the Liberal Party, while as Chief Whip he had sole control of the funds, but the shares had not been handed over to him. His name was associated with that of Lord Murray as co-trustee, but he had no knowledge of the purchase until the end of May. The chairman stated that Lord Murray in April, in answer to a telegram, replied that he could not return before July to give evidence before the Committee, owing to his business engagements. On Tuesday, Captain Murray, brother of Lord Murray, informed the Committee that the shares were left in his possession by Lord Murray, who said he had purchased them on behalf of the party, but proposed to keep them until the Marconi business was cleared up, so that nobody should be involved but himself. The Committee afterwards proceeded to consider the interim report.

On Wednesday a telegram from Lord Murray was read, stating that he had had no dealings in Marconi shares other than those mentioned above. He would make a sworn statement, or would return at once if the Committee desired it.

It is understood that the Committee on Wednesday rejected the chairman's draft report, and adopted a report declaring that Ministerial dealings in American shares did not concern the Committee.

**Libel Action.**—The result of the action brought by Mr. Godfrey Isaacs against Mr. C. Chesterton for criminal libel was that the defendant was found guilty and was fined £100 and costs. In passing sentence Mr. Justice Phillimore commented very severely on the cruelty of the charges, which, he said, were largely due to ignorance and prejudice on the part of the defendant.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—VICTORIA.—June 24th. H.D. copper wire, telephone parts and telephones, for the P.M.G. See "Official Notices" May 23rd.

July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" May 23rd.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" June 6th.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" May 30th.

July 22nd.—Telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

July 29th.—Detectors, for the P.M.G.'s Department. See "Official Notices" to-day.

August 4th. (a) Twin surface condensers, hotwells, piping and sundries; (b) air and water extraction pumps and motors; (c) circulating water and sump pumps, with motors, for the Melbourne Suburban Railways power house. See "Official Notices" to-day.

QUEENSLAND.—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

WESTERN AUSTRALIA.—July 30th and August 6th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" to-day.

July 30th.—Cable, switchboard, for the P.M.G. See "Official Notices" to-day.

## TELEGRAPH and TELEPHONE NOTES.

**A Bedstead Antenna.**—Mr. A. A. Campbell-Swinton, who recently discovered that various metal fittings in his house gave out telephonic vibrations, has continued his domestic investigations, and writes to *Nature* of June 5th to say that he finds that an iron bedstead with wire mattress on the top (fourth) floor of the house answers quite well as an antenna for the receipt of wireless signals. It is only necessary to connect the receiving apparatus, which includes a Brown relay, between the bedstead and the water-pipe to receive the Admiralty signals loudly, and others from various unidentified stations faintly but quite audibly. He finds, also, that with the bedstead antenna it is possible to get the time signals from the Eiffel Tower. The signals are not very loud, but are sufficiently audible to be recognised and read easily.

For a portable station we suggest that it may yet be possible to use an umbrella, connected to the nails in one's boots, thus approaching a step nearer to the vest-pocket apparatus foreshadowed, we believe, by Prof. Ayrton.

**Australia.**—Recent tests in Melbourne show that out of 338 calls from subscribers' premises, 80 per cent. were answered within 10 seconds; only 17 took over half a minute. Apparently, therefore, a marked improvement in the service has been effected.

Tenders involving an expenditure of £90,172 have been accepted by the Minister of Home Affairs for material to be used in the construction of a telegraph line along the route of the Kalgoorlie to Port Augusta Railway. The greater portion of the amount is for the purchase of tubular iron poles and copper wire.

**Brazil.**—Government wireless stations are to be erected at Rio de Janeiro, Bauru and Porto Murinho, by Marconi's Wireless Telegraph Co.

These stations will enable communication to be established with the base of the Matto Grosso Squadron. Another station at Santa

**SOUTH AUSTRALIA.**—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

**NEW SOUTH WALES.**—July 9th. Switchboards, for the P.M.G. See "Official Notices" May 30th.

**Belgium.**—June 18th. The municipal authorities of Liège are inviting tenders for a large quantity of armoured cables required in connection with the electric lighting undertaking in the city. Particulars can be obtained from the Bureau des Adjudications (Annexe de l'Hotel de Ville), Liège.

The Belgian Telegraph authorities in Brussels have just issued a notice to the effect that early in August next they will be inviting tenders for the supply and laying of underground cables between Brussels and Antwerp, and between Ans and Verviers. Those interested in the matter are invited to at once commence their inquiries as to the requirements, particulars of which may be obtained from the 2me. Direction Technique des Telegraphes, Hotel Centrale des Postes et des Telegraphes (1er Etage, Local No. 32), Place de la Monnaie, Brussels.

**Carlisle.**—June 23rd. (a) Extensions to coal storage and conveying plant; (b) extensions to steam and water piping, for the City Electricity Department. F. W. Purse, City Electrical Engineer, Victoria Viaduct.

**Eccles.**—June 16th. Electricity Supply Committee. Coal and coke for 12 months. Borough Electrical Engineer, Cawdor Street, Patricroft.

**Elland.**—July 2nd. Street lighting lanterns, for the U.D.C. See "Official Notices" to-day.

**France.**—The municipal authorities of Foix, in the Pyrenees, are about to invite tenders for the concession for the supply of electrical energy for lighting and power purposes in the town.

**PARIS.**—June 16th. The Administration des Chemins de Fer de l'Etat are prepared to receive tenders for two batteries of electric accumulators for the Garenne-Bezons lighting and power sub-station. Particulars from the Bureaux du Service Electrique, 1re Division, 43, Rue de Rome, Paris.

June 20th. Tenders are invited by the State Railway Administration for electric machinery equipment of the Meudon-Val Fleury traction sub-station. Particulars from the Bureaux du Service Electrique, 2me Division, 43, Rue de Rome, Paris.

**VERSAILLES.**—Shortly. The Conseil Général de Seine-et-Oise have decided to call for tenders for a concession for the establishment and working of a line of electric tramways from the station at Enghien to Ermont-Eaubonne, passing through Soisy, Audilly, Margency, Montlignon and Euabonne. Particulars from and tenders to M. Monet, ingenieur en chef des Ponts et Chaussées, 2 bis, Rue Colbert, Versailles.

**Germany.**—**BREMEN.**—The plans drawn up for increasing the accommodation at the port of Bremen contemplate the outlay of £260,000, part of which is allotted for electric grain loading and unloading appliances, electric cranes, and the erection of a power house. Particulars from the Deputation für Häfen und Eisenbahnen, Bremen.

**Leyton.**—June 24th. Electric lighting and hot-water heating for the new Church Road Schools, for the U.D.C. See "Official Notices" to-day.

**Limerick.**—July 3rd. Switchboard and gallery, battery, motor-driven booster, balancer, &c., for the County Borough Council. See "Official Notices" to-day.

**London.**—L.C.C.—June 24th. One 50-ton overhead travelling crane for Greenwich generating station. See "Official Notices" June 6th.

June 25th.—Electrical installation at Randall Place Elementary School, Greenwich, S.E. See "Official Notices" June 6th.

July 2nd.—Electrical installation at the Caldecot Road Elementary School, Denmark Hill, Camberwell (192 lighting points). See "Official Notices" to-day.

The Fire Brigade Committee is inviting tenders from selected firms for a motor-generator and switchboard for electric charging apparatus for use at the new Hammersmith fire station.

**HAMMERSMITH.**—June 18th. Air-cooled static transformers, for the Borough Council. See "Official Notices" June 6th.

**STEPNEY.**—The Electricity Committee invites tenders for two E.H.T. converting plants suitable for 6,000-volt three-phase A.C. to L.T., D.C., for Limehouse and Whitechapel stations. See "Official Notices" to-day.

June 30th. Arc lamp carbons, for a year, for the Borough Council. See "Official Notices" to-day.

**Newcastle-under-Lyme.**—June 21st. Supply and laying of cables, for the Corporation. See "Official Notices" June 6th.

**Newport (Mon.).**—July 1st. Refuse destructor for the T.C. Borough Engineer Town Hall.

**Rochdale.**—Cable. Mr. C. C. Atchison, Electricity Works, Dane Street.

**Rotherham.**—Annual supply of coal to the Electricity Department; also stores for the Tramway Department.

**Salford.**—June 23rd. 4,000 steel tie-bars, for the Tramways Committee. General Manager, 32, Blackfriars Street.

**Servia.**—**BELGRADE.**—Tenders are required for the supply of telephone apparatus and instruments—226 wall telephones à batterie commune, 200 portable and 200 table telephones.

**South Africa.**—**CAPE TOWN.**—July 4th. High-tension switchgear, feeder pillars and three-phase transformers, for the Corporation. Particulars from the City Electrical Engineer on payment of deposit of £1 ls. per section (three sections).

**Southampton.**—June 19th. Electric lighting of the old pavilions at the Infirmary, Shirley Warren. See "Official Notices" May 30th.

**Spain.**—The municipal authorities of Aldeamayor (province of Valladolid) have just invited tenders for the concession for the electric lighting of the town during a period of four years.

**MADRID.**—July 7th. The Minister of the Marine has been authorised to acquire, by way of public tender, from foreign manufacturers, two wireless stations of great range for installation on board the cruisers *Extramadura* and *Rio de la Plata*; also of two others for erection in the naval school.

**Sweden.**—June 16th. Tenders are invited by the Swedish State Railways Administration for the supply of (1) 206,700 arc lamp carbons, and (2) 44,100 electric incandescent lamps. Tenders, marked "Anbud a haglampor" in the case of (1) and "Anbud a glödlampor" in the case of (2), to "Kungliga Järnvägsstyrelsens Förordsbjura," Stockholm, whence copies of the specifications and forms of tender may be obtained. Copies of the specifications and forms of tender (in Swedish) may be seen by manufacturers in the United Kingdom at the Commercial Intelligence Branch of the B. of T.

**Swindon.**—June 23rd. Cooling tower, water softening plant and flanged cast-iron piping, for the Electricity Department. See "Official Notices" June 6th.

**Torquay.**—The Electrical Engineer has been instructed to prepare a specification for illuminating the Pavilion and Gardens, and to invite local tenders for carrying out the work.

**West Hartlepool.**—June 14th. Two 300-kw. rotary converters, complete with transformers, switchgear, &c., for the Corporation. See "Official Notices" May 30th.

## CLOSED.

**Aysgarth.**—The B. of G. has accepted the tender of Messrs. Burton, of Askrigg, for installing the electric light at the Workhouse.

**Belgium.**—Eight concerns—two Belgian and six German—submitted tenders last week to the municipal authorities of Schaerbeek for the establishment of a low-tension network in connection with the municipal electricity supply undertaking. The lowest offer was that of the Société des Ateliers de Constructions Electriques, of Charleroi.

**Bolton.**—The Electricity Committee has accepted the tender of the Electrical Apparatus Co., Ltd., for the supply of 3 and 5-amp. direct-current meters.

**Bradford.**—Messrs. Roberts & Co., Ltd., whose tender had been recommended for acceptance for steelwork for workshop extensions at Thornbury tramway depot, withdrew their tender, owing to an alleged clerical error therein, and the Tramways Committee has decided to accept in lieu thereof, the tender of Messrs. Henry Barrett & Sons for the execution of the work, at £1,230.

The tender of Messrs. Beecroft & Wightman, Ltd., has been accepted, at £265, for a supply of hardwood paving blocks to the Tramways Department; also that of Messrs. John Brown and Co., Ltd., at £350, for 200 steel tramcar tires; that of Messrs. Collier Bros., at £408, for 4 miles of 0000 grooved copper trolley wire.

The following tenders for electric lighting at schools have been accepted by the Education Authority:—

Belle Vue Boys' Secondary School.—R. Crust, £222.  
Deaf and Cripple School.—R. Crust, £205.

The Corporation Libraries and Arts Committee has accepted the tender of Messrs. A. Ridgway & Co. for the installation of electric light at Manchester Road Branch Library, for £57, and at Gilling-ton Branch Library, for £65.

**Burton-upon-Trent.**—The Gas and Electricity Committee has accepted the tender of Messrs. Sallsbury & Wood for applying 1,000 tons of fine slack to the electricity works.

(Continued on page 989)

# NEW DIESEL PLANT AT KINGSTON-ON-THAMES.

ALTHOUGH the official programme of the Municipal Electrical Convention makes no mention of the new Diesel generating plant which is just being completed at the Kingston-on-Thames Electricity Works, yet we do not doubt that amongst the numerous visitors to the riverside borough on Thursday next, many will take the opportunity of inspecting this plant, which is practically the first of its kind to be installed in this country, being of the horizontal type.

Two Diesel-engine units have been installed, one being of the four-cycle and the other of the two-cycle type; each is coupled to a 270-kw. Siemens alternator of the fly-wheel type, the contract for the complete plant having been entrusted to the Maschinenfabrik Augsburg-Nürnberg A.G., whose reputation for Diesel engines is of the highest.

house. Mr. J. E. Edgcome, the borough electrical engineer, therefore decided to have one four-cycle set with the lowest

possible fuel consumption to take the whole load of the station for an average of 16 hours a day, and to shut down the boilers entirely during such hours.

Further, in order to obviate the risk of stoppage, it was decided to be less costly to install another Diesel set rather than to keep the necessary boilers banked during the day. This second set, in addition to its stand-by duties, will assist the steam plant on peak loads, and the less costly, though slightly less efficient, two-cycle engine was selected as the best for the purpose.

The views on this page are of the four-cylinder four-cycle engine, rated at 400 B.H.P., with a speed of 192 R.P.M. The alternator, to generate 2,100 volts, 77 cycles, single-phase current, is placed between the pairs of cylinders;

HORIZONTAL 4-CYCLE, 4-CYLINDER DIESEL ENGINE, KINGSTON-ON-THAMES;  
COMPRESSOR END.

HORIZONTAL 4-CYCLE, 4-CYLINDER DIESEL ENGINE, SHOWING CYLINDER HEADS, VALVE GEAR, &c., KINGSTON-ON-THAMES  
ELECTRICITY WORKS.

When the engines were ordered it was the intention to decrease both fuel costs and wages and repairs in the boiler

a 110-volt exciter is mounted on one extremity of the crankshaft and a direct-driven air compressor on the other.

The engine is all enclosed, and one governor controls the oil pumps for all the cylinders; the fuel injection valves are situated behind the cylinder heads, the air inlet valves on the top, and the exhaust valves underneath.

The air for combustion purposes is drawn through pipes from the crank chambers, entering the covers through small inspection doors. This arrangement not only provides for cooling the crank chambers themselves, but it also sucks into the cylinders oily fumes which would otherwise escape into the engine-room, and, moreover, is very silent in operation.

The valves and oil pumps are worked by small eccentrics on a lay shaft worm geared to the crankshaft.

The two-cycle two-cylinder engine, also rated normally at 400 B.H.P., has a speed of 165 R.P.M.; both alternator and exciter are mounted on one side, while at the other end of the crankshaft are a direct-driven compressor and scavenging pump facing each other on opposite sides of the shaft. In this engine the pistons are

cooler, the cylinder jackets of the air compressors, the working cylinder jackets and cylinder heads in both engines, back to the river. For the piston cooling of the two-cycle set, however, small electrically-driven plunger pumps are

installed to force the water through the pistons. Duplicate pumps are installed in each case, but only one is normally in use. Both the compressors are provided with inter-coolers between H. and L.P. stages; two starting and two injection bottles are provided which are cross-connected to both engines.

A central lubricating and oil-filtering plant is provided, and both gravity and forced lubrication are adopted in the engines.

Two 60-ton fuel storage tanks have been installed in the boiler house,

and these will be filled from tank barges in the Thames, 200 yards distant, by electrically-driven pumps, and will contain sufficient fuel to provide for average day and night load running of the 4-cycle engine for 20 weeks. From these tanks a small electrically-driven pump (with a stand-by

HORIZONTAL 2-CYCLE, 2-CYLINDER DIESEL ENGINE SET. KINGSTON-ON-THAMES ELECTRICITY WORKS.

GENERAL VIEW SHOWING THE NEW DIESEL PLANT AT KINGSTON-ON-THAMES.

water cooled. The cooling water system is of interest; river water is pumped, by means of small motor-driven centrifugal pumps, into an overhead 5,000-gallon tank, and from this flows by gravity through the compressed air inter-

hand pump) lifts the fuel oil into a service tank, which is subdivided to serve for both tar oil and crude oil residues, which latter is the so-called ignition oil when working with tar oil. From the service tank the fuel gravitates through filters to

the main fuel pumps, and smaller "ignition" oil pumps, which are provided to each cylinder, the former being governor controlled. The guaranteed fuel consumption of the 4-cycle engine on normal load is 41 lb. per B.H.P.-hour, and of the 2-cycle engine about 10 per cent. more.

In view of the high price of ordinary oil fuel, Mr. Edgcome proposes to use water-gas tar as a fuel, its cost being considerably less, and the engines being adapted for using either water-gas tar or coal tar oil in place of the normal oil fuel.

The two-cycle engine has a considerable overload capacity, equivalent to 25 per cent. for two hours.

As the horizontal Diesel engine will, no doubt, be viewed with critical eyes in this country, it may be worth while to point out its good features. These are mainly concerned with accessibility. It is possible to withdraw the piston from the crank end and without interfering with the cylinder head, which, necessary in the case of the vertical engine, means disturbing all the pipe connections. The whole of the valves are within easy reach, and more likely to receive regular supervision, and dismantling is a somewhat easier operation.

The cylinder heads are fitted underneath with blow-off valves which are opened every time the engine stops, allow-

## THE CHELSEA RAILWAY POWER STATION.

THE Chelsea power station of the London Underground Railways system, at Lot's Road, which will be visited by the Municipal Electrical Association during the forthcoming Con-

5,500-6,000-KW. PARSONS-WESTINGHOUSE TURBINE SET AT THE CHELSEA POWER STATION OF THE LONDON UNDERGROUND RAILWAYS.

vention, has long been a feature of electrical London, its size, constructional features, and the services which it is called on to render being matters of considerable interest to the engineering fraternity. The plant, which was very fully described and illustrated in our columns when first opened,\* supplies three-phase current at 11,000 volts, 33 $\frac{1}{3}$  cycles, for

transmission to rotary sub-stations on the routes of the Metropolitan District, with its connecting lines to Barking and *via* the recently-electrified East London Railway to New Cross, the Piccadilly, Bakerloo, and Charing Cross-Hampstead tubes, and the Kingston-Wimbledon sections of the London United Tramways. The accompanying views give a good idea of the modern Parsons-Westinghouse turbo-alternator plant installed in this station, the eight sets each having a normal rating of 5,500-6,000 kw.

These turbines exhaust into vertical condensers situated in a deep central pit running the length of the engine room between the lines of

turbines; the circulating water is drawn in through strainers and 66-in. pipes from the river Thames.

Each turbine consists of separate high and low-pressure sections, coupled through a steam chest below floor level. Solid forged steel H.P. rotors and built-up L.P. rotors are

GENERAL VIEW OF THE ENGINE ROOM, CHELSEA RAILWAY POWER STATION.

ing the deposit and grit to be blown into the exhaust piping, and incidentally enabling the pistons to be kept at work a much longer period than when this cannot be done. The makers claim a good many other advantages in addition to the above.

In conclusion, we are indebted to Mr. Edgcome for facilitating the preparation of this short description.

\* See ELECTRICAL REVIEW, June 9th and 16th, 1905.

fitted, while each section has its own thrust-block adjustment allowing of finer clearances being used in the H.P. sections.

Steam at 185 lb. pressure, superheated 150°, is admitted through a Ferranti-Hopkinson valve at the high-pressure

the end of the building, has led some people not unmindful of the American features of the plant, to liken the station to a gigantic teddy bear upside down.

The H.T. switchgear, as shown in our view, is arranged on three galleries running along one side of the spacious engine house, while the auxiliary switchgear is installed on galleries at one end of the building. This was all supplied by the B.T.H. Co.

A feature of the station is the oil-cooling plant for a total capacity of 20,000 gallons: the station output amounts to about 150 million units per annum.

### NEW TURBINE PLANT AT POPLAR.

ON Friday last we were privileged spectators at the official inauguration of the extensions recently carried out at the Poplar Borough Council's generating station at Bow. Prior to the actual starting up of the machinery, the assembled guests were welcomed outside by Councillor H. R. Barge, chairman of the Electricity Committee; Mr. Horace Bowden, the borough electrical engineer, briefly described the features

of interest of the new plant, while the Mayor (Councillor Aldrick), Ald. Bussey, and several others also spoke.

Though the showery weather somewhat damped the municipal eloquence which one naturally associates with an occasion of this sort, the new turbine sets subsequently got

THE CHELSEA (LOT'S ROAD) RAILWAY POWER STATION.

end, into a steam chest which carries an emergency stop valve—automatically controlled by an auxiliary governor—the main governor-controlled stop valve and an automatic by-pass valve, spring controlled, which admits live steam to a second group of blades on the H.P. rotor, and thus enables the turbine to quickly follow sudden changes of load, such as may occur in a plant of this kind.

The turbines were, of course, built to suit existing foundations and to drive existing alternators (speed 1,000 R.P.M., efficiency 95 per cent.) and the steam consumption is 14 lb. per kw.-hour, with a 28-in. vacuum. The normal rating, as already mentioned, of the machines is 5,500-6,000 kw., but we gather that they periodically work up to 9,000 kw. or more.

According to report, it is intended to install a 15,000-kw. turbine unit at no distant date.

This turbine plant is supplied with steam by 64 Babcock boilers, arranged on two floors and equipped with economisers, chain-grate stokers, superheaters, &c. A very complete coaling plant is installed for filling the bunkers, of 15,000-tons capacity, from a barge basin on the river side, the coal being mostly water borne.

The chimneys, four in number, 19 ft. diameter internally and 275 ft. high, are familiar landmarks for miles round—indeed, their symmetrical arrangement on the boiler house, two and two, together with the projecting conveyor trunk at

3,000-KW. WILLANS G.E.C. TURBINE SETS INSTALLED AT THE POPLAR ELECTRICITY WORKS EXTENSION.

to work in a most businesslike manner, and the visitors were then free to explore the works.

The Borough Council's electricity undertaking was originally started in 1899, Mr. A. S. Blackman being responsible for the scheme, which was for direct-current supply; its limitations led in 1904-5 to the introduction of three-

phase alternating-current supply of 6,000 volts pressure, in connection with sub-stations which were established in the Isle of Dogs and near Victoria Park, and which contain motor-converting plant for the supply of direct-current at 460 volts. The last extensions which have now been brought into use add some 6,000 kw. of three-phase plant to the Council's resources, and in view of the fact that the output last year rose to 12,000,000 units, from 9,500,000 units in the previous year, it will be seen that this plant is a very necessary addition. Briefly, large additions have been made to the boiler and engine houses, the area occupied being some 8,000 sq. ft. The new boiler house is designed to accommodate four large boilers, of which two have been installed, together with a 400-ton coal bunker, ash hoppers, conveying plant, feed pumps, &c.

The boilers are of the Babcock marine type, each normally rated at 36,000 lb. per hour evaporative capacity, with a maximum of 41,500 lb.; each has a heating surface of 6,295 sq. ft., and an integral superheater of 1,108 sq. ft. One is fitted with two underfeed stokers giving 154 sq. ft. grate area, an air heater in the uptake to the steel chimney and a fan for driving the air through the furnaces; the other boiler has two modern Babcock chain grates, giving 224 sq. ft. grate area, and a Babcock feed-water heater below the chimney, which is equipped with the Prat induced draught. Both chimneys stand 91 ft. high above firing level. The boilers are designed for 200 lb. working pressure, but actually supply steam at 185 lb., and the two typical equipments provided, have, we understand, given some interesting comparative data, which as regards steaming power was apparently much in favour of the boiler equipped with the Prat draught system and chain grate stoker.

The coal conveyor has a capacity of 40 tons an hour, and together with an ash hoist, was supplied by the New Conveyor Co. Messrs. Weir supplied a "Rotofeed" turbine-driven single-stage feed pump, for delivering 10,000 gallons per hour, in which the steam consumption at full load is 60 lb. per w.h.p. per hour; a Bony Simplex continuous automatic water softener has been provided, which stands over a 14,000-gallon storage tank. The reagents used with this softener are distributed to the water in powder form.

The engine room plant, which we illustrate, consists primarily of two 3,000-kw. Willans-G.E.C. turbo-alternators, but a 1,000-kw. Peebles motor-converter, and a 1,000-kw. Westinghouse rotary together with switchgear by the Westinghouse Co., have also been installed.

The turbines are of the disk and drum type, with an overload capacity of 50 per cent. for half an hour and 25 per cent. for three hours; the guaranteed steam consumption is as follows:—

Load ...	5/4	4/4	3/4	2/4	1/4
Lb. steam ...	13'8	13'7	14'4	15'7	19'7 net

Steam pressure 180 lb., superheat 150°, and vacuum 28½ in.; with the higher steam pressure possible, correspondingly lower consumption figures would be obtained. The alternators are excellently finished machines, turned out at the Witton Works of the General Electric Co., and have the following guaranteed efficiencies:—

Load ...	5/4	4/4	3/4	2/4	1/4
Efficiency ...	94 %	93 %	92 %	89½ %	83 %

Each machine weighs, complete, 38 tons, and has an exciter mounted on an extension of the main shaft.

The Willans condensing plant is of normal type, arranged under the turbines, with triple crank single acting air pumps, direct-driven at 125 R.P.M. by 30-B.H.P. B.T.H. motors; the air pump discharges are measured by Lea recorders.

The circulating water for this plant is obtained from an adjacent canal, where a pumping plant has been installed 210 ft. distant from the engine room. The plant consists of three Rees Roturbo vertical spindle circulating pumps, each to deliver 4,800 gallons of water per min., when running at 625 R.P.M., and coupled to Peebles 100-B.H.P. motors. At full load the pump efficiency, w.h.p./b.h.p., is 0 per cent.

The pumps draw from a settling chamber where the water passes through C.I. screens; it is interesting to record that during the reconnection of the circulating water piping, which took 36 hours, the load of the station was taken up by the adjoining Stepney undertaking, in order to avoid

running non-condensing, thus proving the emergency value of the electrical linking up of the two concerns, which was originally engineered in 1908.

To return to the engine-room plant, both the Peebles motor-converter and Westinghouse rotary converter are rated at 1,000 kw., and installed for converting 6,000-6,500-volt alternating current to 470-540-volt direct current.

The former has guaranteed efficiencies of 92½ per cent., 91½ per cent. and 90 per cent. at full, three-quarter and half load respectively, these figures comparing with 91½ per cent., 93½ per cent. and 91½ per cent. overall efficiencies (including transformer) guaranteed for similar loadings in the case of rotary plant.

The Westinghouse rotary is a 12-pole compound-wound machine running at 500 R.P.M. (as against 375 R.P.M. in the case of the motor-converter), and is supplied with six-phase 350-volt current from an oil-insulated self-cooled transformer situated in the basement below the switchboard.

The business end of the new switchgear is placed in a disused battery room behind the switch gallery. The switches have a normal breaking capacity of 9,000 kw., and an emergency capacity of 18,000 kw.; the Stepney link, of 1,500-kw. capacity, is protected by Merz-Price relays and transformers, and the new engine room is spanned by a Royce 30-ton electric travelling crane. The extensions have been carried out by Mr. Horace Bowden, the borough electrical engineer, to whom we offer our congratulations.

## CONTRACTS CLOSED.

(Concluded from page 984.)

**Canterbury.**—The T.C. has accepted the tender of Mr. R. E. Connold, Canterbury, for electrical work for the ensuing half-year.

**Cheltenham.**—The T.C. has accepted the following tenders:—

Ferranti, Ltd., and British Westinghouse Co., Ltd.—Electricity meters.  
Geipel & Co.—Arc lamp carbons.  
Webster & Co.—Flame carbons.  
E. Le Bas & Co.—Cast-iron pipes for new condensing plant, £65.

**Cleckheaton (Yorks).**—The tender of Messrs. F. W. Birkett & Sons, Ltd., has been accepted for the electric light installation at Whitcliffe Road Wesleyan Church.

**Croydon.**—The T.C. has accepted the tender of Messrs. Newbold & Co., of Sutton, for electric lighting installation at the fire station, at £216 10s., and at the Library, at £129 10s.

**Devonport.**—The Electric Power Committee of the T.C. has accepted the tender of Messrs. A. J. Smith & Co., of Bristol, for 6,000 tons of coal, at £1 0s. 2d. per ton.

**Doncaster.**—The Corporation Electricity Committee has considered tenders for generating plant for the electricity works, and recommended that the tender of Messrs. Siemens for the alternator be accepted, and that the order for the turbine and condenser be placed with Messrs. Willans & Robinson, Ltd., or Messrs. J. Howden & Co. These recommendations have been adopted by the Council, who agreed to leave the decision in the latter matter to the chairman and vice-chairman on the receipt of further particulars from the engineer.

The T.C. has accepted the tender of the Lancashire Dynamo Co., Ltd., for a dynamo, at £168.

**Dover.**—The T.C. has accepted the tender of the Featherstone Colliery Co. for coal for the electricity works, at 17s. per ton.

**Dundee.**—The offer of Messrs. Babcock & Wilcox, Ltd., at £2,510, for steam, feed and drain piping, &c., have been accepted by the Electricity Committee.

**France.**—The French Post and Telegraph authorities in Paris last week placed contracts as follows:—

La Société des Ateliers de Constructions du Nord et de l'Est, of Jeumont (Nord).—100 km. of single-conductor lead-covered telephone conductor; 80 km. ditto, with two conductors; 25 km. ditto, with seven pairs of conductors; 125 km., with two conductors.  
La Société des Tréfileries du Havre.—50 km. ditto, with single conductor; 40 km. ditto, with two conductors; 25 km. ditto, with seven pairs of conductors; and 125 km. ditto, with two conductors.

**Glasgow.**—The following contracts have been accepted by the T.C. Tramways Committee:—

Steel rails and fishplates.—Bolework, Vaughan & Co., Ltd.  
Lighting fittings.—Drake & Gorbam, Ltd.

In connection with additional plant for Pinkston power station, offers have been opened for a 5,000-kw. turbo-alternator, and the estimate of the British Thomson-Houston Co. has been accepted.

**Haslingden.**—Mr. A. M. Cramp, of Haslingden, has secured the contract for the electric lighting and electric organ-blowing plant at the Trinity Baptist Chapel and Schools, Blackburn Road; also the order for an electric light and power and vacuum cleaning plant at Carr Hall, the residence of Mr. J. Lambert, and at "Knowl Gap," the residence of Councillor A. Bailey.

**Liverpool.**—A further order for 4,000 Robertson lamps has been secured from the Corporation by the General Electric Co., Ltd. We understand that these lamps have been specially ordered for the purpose of illuminating a certain part of the city in honour of the forthcoming visit of the King.

**London.**—L.C.C.—The Fire Brigade Committee received the following tenders for an electric lighting installation for the new fire station at Hammersmith:—

A. Hawkins & Sons .. .. .	(recommended) £205
Pinching & Walton .. .. .	218
W. C. Tackley & Co., Ltd. .. .	228
Electrical Contracts and Maintenance Co., Ltd. .. .	282

Engineer's estimate, £200

The "Cedes" Electric Traction, Ltd., which recently received a contract for the supply of a petrol-electric motor chassis for converting a turntable ladder for motor traction, has been in communication with the Committee, as the result of which the Committee has rescinded its resolutions on the matter. It expresses the opinion now that an electrically-driven chassis would probably be more suitable than a petrol-electric one for the purpose.

In connection with the alterations required to the parapet lanterns on Westminster Bridge in connection with the conversion of the existing arc lighting to metallic-filament lighting, the following tenders were received:—

S. Pontifex & Co. .. .. .	(accepted) £72
John Biggs .. .. .	160
W. Sugg & Co., Ltd. .. .. .	216

**HACKNEY.**—The Electricity Committee recommends that the tender of Messrs. W. Cory & Sons, Ltd., for Cowdenbeath, Edinburgh and Hillhouse coals for nine months to March next, be accepted.

**POPLAR.**—The Electricity Committee recently reported that, in order to cope with the estimated demand, it was necessary that the order should now be placed for the remaining two boilers to equip the station. The firm price of £9,975 for the supply and erection of two boilers exactly similar to No. 10 boiler, already installed, had been obtained from Messrs. Babcock & Wilcox. Boiler shops were extremely busy, and any delay by advertising for and considering tenders would render it impossible to complete the installation next winter, whereas Messrs. Babcock & Wilcox promised completion in January next. In addition to the boilers, it would be necessary to obtain prices for the steam, feed and blow-down piping, and also for one additional ash hoist. The Committee recommended the acceptance of the offer of Messrs. Babcock & Wilcox, and this the Council agreed to.

The B.C. has received the following tenders for the supply of a 1,000-kw. converter at the Millwall sub-station:—

Siemens Bros. Dynamo Works Co., Ltd. .. .. .	£2,185
General Electric Co., Ltd. .. .. .	2,196
Bruce Peebles & Co., Ltd. .. .. .	(recommended) 2,285
Vickers, Ltd. .. .. .	2,473
British Westinghouse Co. .. .. .	2,507
British Thomson-Houston Co. .. .. .	2,516
Dick, Kerr & Co., Ltd. .. .. .	2,618

The Electricity Committee states that, in view of the small difference in price (£100) between the tender of Messrs. Bruce Peebles and Co., whose converters are already in successful operation in the Council's stations, and the lowest tender, it would be advantageous to the Council that such tender for a motor converter, identical with that supplied last year, should be accepted, and it has been decided accordingly.

**Manchester.**—The following tenders have been recommended for acceptance by the Corporation Electricity Committee:—

E. Green & Son, Ltd.—Replacement of No. 3 economiser.	
S. P. Bidder & Co.—Repairs to chimney and exhaust pipe.	
General Electric Co., Ltd.—Two 50-h.p. three-phase motors.	
Aiton & Co.—1 p. steam and water pipes.	
Siemens Bros. Dynamo Works Co., Ltd.—Switchgear, bus-bars, &c.	
Holden & Brook, Ltd.—One electrically-driven boiler feed pump.	
Sturtevant Engineering Co., Ltd.—Air filtration plant.	
De Barge & Co., Ltd.—Steelwork for foundations of 15,000-kw. turbo-generator.	
Bruce Peebles & Co., Ltd.—Two 750-kw. motor converters.	
British Electric Transformer Co., Ltd.—Requirements of 76-k.v.a. transformers.	
W. T. Henley's Telegraph Works Co., Ltd.—L.T. cable and paper-insulated cable.	
Electrical Engineering and Equipment Co., Ltd.—L.T. cable.	
Charles Macintosh & Co., Ltd.—Rubber-insulated cable.	

The Corporation Tramways Committee has recommended the following tenders for acceptance:—

Drake & Gorbam, Ltd.—Traction type incandescent lamps.
Easter Bros.—Canopy trolley standards.
Bolckow, Vaughan & Co., Ltd.—Steel fishplates.
Bayliss, Jones & Bayliss, Ltd.—Steel tie bars.

**Rochdale.**—The Corporation is recommended to accept the tenders of the Vulcan Pump and Engine Co. and Messrs. Marshall, Osborn & Co. for the supply of boiler feed pumps for the electricity works.

**Salford.**—The tender of Mr. Bertram Thomas for copper strip required for the main lighting and power switchboard at the electricity station, at £302, has been recommended for acceptance by the Electricity Committee.

**Stoke-on-Trent.**—The T.C. has accepted the tender of Callender's Cable & Construction Co., Ltd., for feeder cables, at £500,

**Sheffield.**—The tenders of the Tinsley Park Colliery Co., Ltd., and Messrs. M. L. Burnby & Son have been accepted for an annual supply of washed coal to the Kelham Island power station, at 13s. 6d. per ton, and 13s. 2½d. and 13s. 5d. per ton respectively. For the erection of a building to house the new rotary converting plant at the Kelham Island power station, the tender of Messrs. W. & A. Forsdike, Ltd., has been accepted, at £3,210.

**Sunderland.**—The T.C. on Wednesday accepted the following tenders:—

Sturtevant Engineering Co.—Air filter for new alternator.
A.E.G. Co., Berlin.—Short-circuiting device for new alternator, also spare parts for alternator.
Dick, Kerr & Co., Ltd.—Spare parts for alternator.
Phoenix Dynamo Co.—Re-insulating one 750-kw. alternator.
J. Thompson & Co.—1,500 yd. wood troughing.
B.L. and Helsby Cables, Ltd.—4,000 yd. L.T. cable; 500 yd. E.H.T. cable.
Credwell & Hardy.—1,250 yd. w.i. piping and bends.

**Tonbridge.**—The U.D.C. has accepted the tender of:—

Mirrlees, Bickerton & Day, for additional plant for the electricity works, £1,884.
Western Electric Co.—Cables.

**Walsall.**—The Corporation has accepted the tender of the British Westinghouse Co., Ltd., for a 100-kw. rotary converter at the Sandwell Street sub-station, including station transformer and other accessories, for £636, and for the erection of a high-tension feeder at the generating station, at £70 10s.

The tender of the Electrical Power Storage Co., Ltd., has been accepted by the T.C., at £26, for renewing the storage batteries at three stations. The price quoted is subject to an allowance of £12 10s. per ton for all old plates removed.

**Wimbledon.**—The tender of Messrs. E. Foster & Co. has been accepted by the T.C. for an annual supply of about 4,000 tons of Kingsbury Rider small nuts coal to the electricity works, at 17s. 10d. per ton.

**Wolverhampton.**—The Corporation has accepted the following tenders:—

Amies & Sharratt.—Additions to the electricity stores, £738.
Davies Bros. & Co., Ltd.—Materials required in the construction of safety guides for the bucket conveyor, £65.
Vanham & Sons.—One 5-ton and one 8-ton overhead travelling cranes, £105.
Electric Construction Co., Ltd.—Direct-current switchgear for the converter plant, £172.

## FORTHCOMING EVENTS.

**Tramways and Light Railways Association.**—Friday, June 13th. At Black-pool. Annual Conference concludes.

**Physical Society.**—Friday, June 13th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments on Tinfoil Contact with Dielectrics," by Mr. G. E. Baird. Paper on "A Method of Measuring the Pressure of Light by Means of Metal Foil," by Mr. G. D. West.

**North of England Institute of Mining and Mechanical Engineers.**—Saturday, June 14th. At 2 p.m. At the Wood Memorial Hall, Newcastle-upon-Tyne. General meeting.

**Municipal Electrical Association.**—Eighteenth Annual Convention. Tuesday, June 17th.—At 10 a.m. At the I.E.E. London. Opening by Mr. W. Duddell, F.R.S. Address of Mr. C. E. C. Shawfield. Paper on "Prime Movers for Electric Power," by Dr. S. Z. de Ferranti. At 2.30 p.m.—Leave for visits to Deptford power station and West Ham electricity works.

Wednesday, June 18th.—At 10 a.m. Discussion *in camera* (members and delegates only). Subjects:—(1) The I.M.E.A. Bill; (2) Heating and Cooking. At 12.30 p.m.—Leave for visit to Lot's Road power station, Chelsea. At 7 p.m.—Annual dinner at the Hotel Cecil (members, visitors and ladies).

Thursday, June 19th.—At 10.15 a.m. Meeting in the Empire Theatre, Kingston-upon-Thames. Address of welcome by the Mayor. Papers on "Air Filtration," by Mr. J. Christie, and "Electric Vehicles," by Messrs. W. H. L. Watson and R. J. Mitchell. Demonstration following. At 1.30 p.m.—Luncheon at Nuthalls, Ltd. At 3 p.m.—River trip. At 7.30 p.m.—Dinner at Nuthalls, Ltd.

Friday, June 20th.—At 10 a.m. At the I.E.E. Annual general meeting. Saturday, June 21st.—At 9.30 a.m. Leave for visit to Chingford reservoir.

**Electrical Contractors' Association.**—Tuesday, June 17th. Annual dinner.

**Institution of Electrical Engineers (Scottish Section).**—Tuesday, June 17th. Annual summer outing to Inveraspall.

**Royal Society of Arts.**—Tuesday, June 17th. At 9 p.m. At the Natural History Museum, South Kensington, S.W. Conversation and reception by Lord Sanderson.

**Chemical Society.**—Thursday, June 19th. At 8.30 p.m. Ordinary meeting.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, June 16th.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 5th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m. Leaf Cup competition will take place on miniature range, commencing at 7 p.m.

Tuesday, June 17th.—"B" Company. Ditto. Advance party for Bers Island parade at Headquarters at 12 noon.

Thursday, June 19th.—"C" Company. As for 16th inst.

Friday, June 20th.—"D" Company. As for 16th inst.

Saturday, June 21st.—Main body for Bers Island parade at Headquarters at 12 noon. Headquarters will be opened for the transaction of regimental business from 10 a.m. to 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., Adjutant.  
For Officer commanding L.E.E.

## NOTES.

**Wanted—Three Hundred Pounds.**—We are pleased to be able to make two additions to the list of donors of £100 who desire to enable the Electrical Trades Benevolent Institution to take advantage of Mr. E. G. Byng's offer. Mr. Justus Eck, who has just returned to these shores from a lengthy tour in the Colonies, made it one of his first duties to communicate to the secretary his wish to co-operate to the full in this matter. Mr. Eck has done for this fund right from its very beginning more than many people can ever know, and he again shows the sincerity and zeal with which he regards his offspring by putting his name in the accompanying list. Mr. Dane Sinclair has also generously forwarded to us personally a cheque for £100, which we have handed on to the secretary. The deep concern with which Mr. Sinclair has noted our continued appeals for the fund, and his great desire to prevent the movement being unsuccessful, will appear from the following letter which accompanied his donation:—

"Dear Mr. Gatehouse.—Considering the best interests of the electrical fraternity in this country, I have been sorry to see that it has been necessary for the REVIEW to ask so often for the total of £1,000 to be subscribed to the Electrical Trades Benevolent Fund, and had hoped to see what one might term the more wealthy members coming forward and doing the necessary; but the time-limit is now approaching, and I should be sorry to see this good cause falling through for lack of funds, and have therefore pleasure in enclosing my cheque for £100. I shall be glad if you will add my name to the list of those who have already subscribed, and I trust that this week will see the full amount raised.

"I think the thanks of everyone are due to you for the trouble your paper has taken in this matter.—Yours faithfully,

"DANE SINCLAIR.

"June 10th, 1913."

Three spaces still remain open, and once again we renew our appeal to the large-hearted to phone or write to the secretary, or to us, under the first impulse that possesses them after reading this note. The position now stands as follows:—

1	Mr. E. G. Byng	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	£100
5	Sir W. H. Preece, K.C.B., F.R.S.	...	...	...	...	£100
6	Mr. Justus Eck	...	...	...	...	£100
7	Mr. Dane Sinclair	...	...	...	...	£100
8	* ...	...	...	...	...	...
9	* ...	...	...	...	...	...
10	* ...	...	...	...	...	...

It has been suggested that, as all the donations down to date are from individuals, the company contributions are long overdue. But then it takes longer to get a proposal passed by a board of directors than for a private gentleman to settle the matter with his own heart and conscience. After all, "company" proposals generally have an individual origin. We hope that both boards and private individuals will speedily find the remaining three hundreds.

**Foreign Trade in May.**—The returns published this week show that during the month of May imports advanced by 11·2 per cent. (nearly 6½ million sterling), exports by 12·9 per cent. (over 5 million sterling), while re-exports fell by 13·4 per cent. (nearly 1½ million sterling). The electrical and machinery figures for the month, and for the five months, are as follows:—

Imports.	Month of	Inc.	Five	Inc.
Electrical goods and apparatus, excluding machinery and insulated wire ...	May 1913.	or dec.	months 1913.	or dec.
...	£	£	£	£
118,723	+18,576	624,868	-6,091	
Machinery ...	650,362	-18,623	3,162,493	+278,970
Exports.				
Electrical goods and apparatus, excluding machinery and insulated wire ...	465,072	+163,595	2,381,357	+636,603
Machinery ...	3,255,976	+496,550	15,190,633	+2,060,971

**Tramway Appeal in the Lords.**—At the time of going to press, the appeal in the case of the Tottenham Urban District Council v. the Metropolitan Electric Tramways, Ltd., is being heard in the House of Lords.

**Lead Prices.**—The agreement as to lead quotations recently arranged by Hamburg manufacturers has now been extended to the whole of Germany under the following conditions:—The basis price for leaden articles is raised 1·50 marks per 100 kilog., the sale prices being as follows:—For the Rhineland and Westphalia, freight basis of Cologne, 45·10 marks; for South Germany, 45 marks, freight basis of Mannheim, Mayence and Strassburg; for Middle Germany, 44·50 marks, freight basis of Hanover and Hamburg; for Brandenburg, 44·60 marks, freight basis of Brandenburg; for Berlin, 40·50 to 43·50 marks, freight basis of Berlin—all per 100 kilog., payable within 14 days, with 1½ per cent. discount.

**Meeting of London Electrical and other Workers.**

—We are informed that a meeting of electrical workers was held at Caxton Hall on June 2nd, under the chairmanship of Mr. George Dew, L.C.C., the Secretary of the London Building Industries Federation, who hoped that that splendid gathering was an augury for a brighter future for the electricians of the Metropolis. Mr. Jack Potter, the district secretary, moved a resolution pledging the meeting to support the efforts of the London District Committee to secure an advance of wages and better working conditions for those engaged in the industry. He stated that some of the employers were making a very definite attempt to reduce the wages of the wiremen—a miserable 9d. per hour. They were approaching the London County Council and the Government departments to get the schedule rates reduced, and unless the men put up a strenuous fight, they would go down. He appealed to the audience to go into the highways and imbue their fellows with the spirit of solidarity, so that they could stand shoulder to shoulder with the workers of other industries, to create a social order where poverty and low wages would be impossible. Mr. H. Roll, of the Electrical Trades Union, seconded the resolution. Other speakers were Mr. Ben Tillet, Mr. James Macdonald, the late secretary of the London Trades Council, and Mr. Jack Kinniburgh, the organiser of the E.T.U., who said it was a disgrace to the electricians that they were not yet on the move. The E.T.U. had raised wages in all industrial centres; London alone had not moved, but he hoped that that meeting would inspire them with the determination not to rest until they had secured more of the good things of this life. Mr. Harry Adams, of the Bricklayers' Society, promised the support of their members in whatever efforts were made, and Mr. Hugo Beazley, the organiser of the Plasterers' Union, thanked the electricians for the splendid support they had rendered the plasterers in their dispute with the master builders. A speech, urging the necessity of combination among all workers, from Mr. Fred Knee, the secretary of the London Trades Council, concluded the meeting, which, we are informed, carried the resolution unanimously.

**London Railway Contracts.**—The *Financial Times*

stated last Saturday that the contract for electrifying a portion of the London and South-Western Railway at a cost of just under £300,000 had been given to the British Westinghouse Electric and Manufacturing Co. "The order, it is stated, is the largest single one of its kind ever handed out, and the British Westinghouse Co. is to be congratulated on having secured it on terms, it is to be presumed, which will keep its plant profitably employed for a considerable period. The contract of a similar nature of the London and North-Western, involving a sum of £160,000, has gone to the Oerlikon Co., of Zurich. Great disappointment is felt in engineering circles that a British firm has failed to obtain this order, and private conferences are being held to discuss the causes of the unsuccessful tendering of home manufacturers. The two contracts alluded to do not include power stations, the details of which have not yet been settled, but relate solely to railway equipment."

Our contemporary added in its Monday issue:—"The contract for the construction of the necessary power houses has still to be awarded, and in engineering circles it is generally believed that this work also will be given to the British Westinghouse. The sum involved will be large, precisely how much cannot be stated, but probably over £200,000, and the contract will naturally be greatly sought after. Doubtless, however, the successful tenderers will come to terms with the rest of the trade, it being customary among the big engineering interests to sub-let portions of works of the magnitude of these railway electrification schemes."

The *Railway Times* says that the Oerlikon contract is for the electrical equipment of over 40 trains. We understand that the contracts for the boilers and rotary converters for the L. & S. W. Railway have also been given out.

**Association of Electrical Station Engineers.**—A

meeting was held at Birmingham on June 10th, at which Mr. McKee was in the chair, and a branch was definitely formed for the Midlands. Mr. E. A. Gordon was elected hon. secretary, and representatives from Worcester, Birmingham, Walsall, Wednesbury and West Bromwich were elected on the Committee. The hon. secretary was elected delegate for the Conference, and the meeting passed a few resolutions, which the delegate was instructed to put before the Conference. A similar meeting was held recently at Liverpool, when Mr. A. C. Black was elected delegate for the Conference. The date of the general meeting of the whole Association has been fixed for June 24th, to be held at Chandos Hall, Maiden Lane, W.C.

**Contracts and Fair Wages.**—In the House of

Commons questions, Mr. O'Grady asked the First Lord of the Admiralty whether he was aware that the firms of Spagnoletti, Ltd., Shepherd's Bush; Johnson & Phillips, Charlton, Kent; Keith and Blackman, Holloway Road; and Messrs. Crompton, Chelmsford, contractors to the department, paid instrument makers in their employ wages ranging from 7d. to 9d. per hour, the standard rate being 9d., and also employed a very large amount of boy labour on similar work at rates ranging from 2d. to 4d. an hour, thus enabling these firms to compete unfairly with firms employing adult labour; and whether he would make inquiry into the matter with a view to enforcing the provisions of the Fair Wages Clause. Dr. Macnamara replied that he was not aware of the circumstances referred to, but would have inquiries made. He might add that the Trade Union had recently instanced one of the firms named in the question as being a firm who paid 9d. per hour.

**Electricity Supply Rifle League.**—The following matches were decided during May:—Hackney (Smith 95), 550; Westminster (Wincombe, Herley 98), 567. Hackney (Hilling 96), 559; Shoreditch (East 99), 570. Shoreditch (Weeks 100), 578; Ilford (R. Tufnell 97), 556. St. James's (Green, Young 93), 521; Ilford (R. Tufnell, McKelvey 95), 553. Central (Law 97), 564; Westminster (Partridge 99), 576. Central (Rhodes 98), 575; Poplar (Mogg 93), 490. St. James's (Strange 98), 567; Stepney (Heavyside 96), 539. Stepney (Barber 98), 556; Brompton (Mugford 96), 559. Poplar, 507; St. James's (Hocking 96), 547.

The following are the positions to date:—

	Shot.	Won.	Lost.	Points.	For.	Against.
Shoreditch ...	6	6	0	12	3,441	3,278
Westminster ...	6	5	1	10	3,414	3,302
Ilford ...	6	5	1	10	3,383	3,210
Central ...	6	3	3	6	3,369	3,284
St. James's ...	6	3	3	6	3,196	3,265
Brompton ...	5	2	3	4	2,778	2,767
Stepney ...	6	1	5	2	3,256	3,190
Hackney ...	6	1	5	2	3,221	3,259
Poplar ...	5	0	5	0	2,264	2,767

**The Dumfries-London Electric Vehicle Trial.**—We understand that the 380-mile trial run of the Arrol Johnson-Edison battery vehicle, to which reference was made last week, terminated successfully on Wednesday. No electrical, mechanical or tire troubles were experienced; but due to adverse weather, and the limited maximum speed of the vehicle, which is fitted with a nominal 3½-H.P. series motor, the run took rather longer than intended. It is, however, stated to be the first time that such a long run has been carried out by an electrical car in Europe.

**Annual Outings.**—For their annual outing on June 4th, the staff of the Guildford Electricity Supply Co., Ltd., went for a trip to Portsmouth. They were accompanied by Mr. H. L. Alderton, engineer and manager, and Mr. R. Harold Piper, secretary and accountant, together with several guests. Luncheon was served at Scullard's Victoria Hotel, Southsea, and later, trips were made to the Isle of Wight and other places in the vicinity of Portsmouth. In the evening the party were present at the Portsmouth Hippodrome.

**Institution and Lecture Notes.**—ASSOCIATION OF MINING ELECTRICAL ENGINEERS—EAST OF SCOTLAND BRANCH.—At the annual meeting of the branch held at Dunfermline, Mr. C. A. Carlow, of the Fife Coal Co., who has been the president of the branch since its inception three years ago, resigned, and Mr. H. G. Fraser, Leven, chief electrician to the Fife Coal Co., was nominated for the vacancy. Mr. R. W. Peters, electrician to the Lochgelly Iron and Coal Co. was appointed to the joint post of secretary and treasurer, and Mr. N. A. Wilkie, Cardenden, was elected as auditor. After the business meeting, the members were socially entertained by Mr. C. A. Carlow, the retiring president.

A meeting of the Association was held at Hedgesford, on Saturday. Mr. A. Hall was unanimously re-elected president for the ensuing year; Messrs. C. F. Jackson, M. J. Moffeth, Chris Jones and J. R. English were elected vice-presidents. Mr. H. Arnoth was re-elected as secretary and treasurer. A discussion took place on Mr. Bolton Shaw's paper on "Notes on Colliery Generating."

**VICTORIAN INSTITUTE OF ELECTRICAL ENGINEERS.**—At the meeting of this Institute, held at Melbourne on May 1st, there was a discussion on the notes on his "Trip Abroad," read at a previous meeting by the hon. secretary, Mr. Westwood, and three 10-minute papers followed:—"Wire Drawing: A New Australian Industry," by J. K. McDougall; "Use of Aluminium Conductors," by G. B. Lincolne; "Fire Resisting Materials," by Noel Murray.

**PHYSICAL SOCIETY OF LONDON.**—At the meeting on May 16th a paper on "Some Experiments to Detect  $\beta$ -rays from Radium A," by Dr. W. Makower and Dr. S. Russ, was read by Dr. Russ. A paper on "Vibration Galvanometer Design," was read by Dr. Haworth. The author states that it is an advantage to be able to increase the useful power input per unit voltage. To do this the resistance of the instrument must be decreased. This can be done by leading the current in and out at the bottom bridge and short-circuiting the wires at the top bridge, and it results in a great increase of sensibility. At high frequencies the flux density required is large. In order to obtain this result economically it is convenient to make the depth of the poles small compared with the maximum length of the wires. The result is a very satisfactory instrument with a much flatter voltmeter-sensibility-frequency curve than obtained usually. Mr. W. Duddell remarked that if it was required to make a really efficient galvanometer for high frequencies it was best to redesign the whole instrument. When a very low resistance was wanted silver wires could be used. A strong field necessitated using an electromagnet, against which he had a prejudice, for vibration galvanometers. Mr. A. Campbell pointed out that in some cases it was current sensitivity that was required. This depended upon the bridge the galvanometer was used with.

At the meeting on May 30th, a paper on "Electro-thermal Phenomena at the Contact of Two Conductors with a Theory of a Class of Radio-Telegraph Detectors," was read by Dr. W. H. Eccles. The paper is a purely theoretical one, and deduces mathematically the laws connecting the current and the applied E.M.F. in a circuit containing a light contact of two conductors. The bulk of the wireless telegraphy of the world is carried on by such contacts as these, and the present paper, therefore, constitutes a theory of the action of these detectors. It is shown that, in general, when

a contact is used as a radiotelegraph detector, there may be some coherer action mixed up with the thermoelectric "rectifying" action; and that, whether there is or is not any coherer action, the principal features of the characteristic curve connecting current and E.M.F. are determined by the Thomson rather than by the Peltier effect. Dr. J. A. Fleming communicated a statement to the effect that a large number of measurements of characteristic curves of his valves and other detectors had shown that there were sudden changes of curvature in them. The results did not, however, fall in with any very simple theory of such rectifying detectors.

**INSTITUTION OF ELECTRICAL ENGINEERS (STUDENTS' SECTION).**—The officers of the Students' Section for the session 1913-14 are as follows:—Chairman, Mr. S. M. Hills; vice-chairman, Mr. R. E. Dickinson; hon. secretary, Mr. E. T. Driver; hon. assistant secretary, Mr. R. A. McMahon.

**NEWCASTLE LOCAL SECTION.**—The report of the Committee for the session 1912-13 states that the total membership of the Section is 319, a decrease of two on last year's figure. The full members, associate members, associates and graduates have increased by 47, and the student members decreased by 49. The average attendance was 52. The Tees-side members have held several meetings in Middlesbrough, under the direction of a Local Sub-Committee. This activity has been much to the advantage of that district and also of the Institution, as its membership has thereby materially increased. There are now about 56 members in the Tees-side District. The Student Section has done good work, and two of the students have been awarded premiums for papers. The Committee has some prospect of concluding arrangements by which the members will be at liberty to attend the ordinary meetings of other Societies in exchange for similar privileges. The officers and Committee for the ensuing session are as follows:—Chairman, Mr. C. Vernier; vice-chairmen, Messrs. P. V. Hunter and J. H. Holmes; past chairmen, Messrs. C. Faraday Proctor, C. S. Vesey Brown and W. C. Mountain. Committee, Messrs. W. McLellan, R. P. Sloan, C. Turnbull, G. Stoney, A. H. Marshall, J. R. Andrews, Wm. Thornton, H. Stroud, J. R. M. Elliott, A. P. Pyne, G. L. Drury, J. A. Anderson, C. H. Davidson, and E. Fawcett. Hon. treasurer, Mr. W. A. Clatworthy; hon. secretary, Mr. H. W. Clothier; assistant hon. secretary, Mr. W. G. Guns; hon. auditors, Messrs. H. L. Riseley and F. O. Hunt.

The Committee of the **NEWCASTLE STUDENTS' SECTION** reports that the membership at the end of the session 1911-12 was 151. During the past year there have been 29 additions, but owing to the large number of removals and transfers the total has decreased to 102. It has been thought that the Committee of the Students' Section in London is officially in a somewhat false position. Recent correspondence suggests that the "London Students' Section" is to be so named, and that a satisfactory definition of the functions of the "London Students' Committee" has now been made. The Students' annual tour this year is to take the form of a visit to Newcastle from July 3rd to 5th. The officers for the new session are Messrs J. Hacking (chairman), E. Wyatt (vice-chairman), H. V. Henniker (hon. sec.).

**IRON AND STEEL INSTITUTE.**—The preliminary programme of the Brussels meeting, from September 1st to 4th, has been issued. A number of papers are to be read and discussed; Ghent Exhibition is to be visited; and there are to be excursions to Liège and Charleroi, where important works will be visited.

**ILLUMINATING ENGINEERING SOCIETY.**—The report of the Council for the session to May, 1913, refers to the effective co-operation of the Society with other bodies, and to its growing prestige on the Continent. Dr. R. T. Glazebrook has been nominated a Vice-President. The membership of the Society now exceeds 400. With the co-operation of the Society, a similar association has been formed in Germany, supported by the Reichsanstalt, and has made good progress. The finances of the Society are in a satisfactory condition.

**Strikes.**—The *Times* on Monday stated that the works of the General Electric Co. at Witton had been closed down for a week, the office staff taking a holiday. The firm were willing to concede the minimum wage, but would not consent to wipe off the debts which the employees had accumulated in connection with their work. The total amount of the debt was said to be at least £1,000, and the individual sums ranged from £3 to £50.

**Appointments Vacant.**—Assistant lecturer in electrical engineering, Manchester School of Technology (£200); sales engineer, for the York electricity department (£120); foreman electrician and electrical foreman, for locomotive workshop power house (Rs. 250 per mensem), for the South Indian Railway; mechanic and blacksmith, for the Watford U.D.C. (32s.). Twenty electrical fitters are wanted for I.L.M. Dockyard at Devonport (38s.); assistant superintendent for Sheffield installation and motor department (£150). See our advertisement pages to-day.

**Batti-Wallah River Trip.**—The motor-boat *St. George*, which took the Batti-Wallah party on their down-river trip, came to grief by colliding with some floating wreckage off the Owens Buoy. One of her planks was knocked in and she sank in 7½ minutes. The engine kept going until half-submerged, assisted by the crew paddling with floor boards, &c., and the party reached shore in 4 ft. of water. We understand that interesting photographs will be exhibited to those forming the Up-River party on 28th inst.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—On leaving the generating station, Gloucester, for a position in Canada, Mr. T. H. MORRIS was presented by the chief engineer, on behalf of the staff and workmen of the department, with a suit case.

Our Cape Correspondent writes: "The town clerk of Port Elizabeth has received a cable stating that Mr. H. J. HOLDEN, the municipal electrical engineer, who is at present on leave in England, met with a serious accident, as a result of which he has been unconscious for a week. The cable stated that an operation had been successfully performed on the skull, but that a further operation might be necessary."

The Leck U.D.C. has increased the salary of Mr. CARR, electrical engineer, by £25 a year.

The electric supply and tramway staff at Ipswich have presented an oxidised silver table standard lamp with silk shade, to Mr. GEO. L. GARTON, who has charge of the installation department, on his marriage. From the workmen, &c., of the installation department, Mr. Garton received a tea service.

Mr. S. T. ALLEN, late city electrical engineer at Carlisle, on leaving to become electrical engineer at Wolverhampton, has been presented by the staff with a gold watch and oxidised silver inkstand.

The Elland U.D.C. has increased the salary of Mr. WM. C. KNOWLES, chief electrical engineer, from £150 to £165 per annum.

Mr. T. R. STANCOMBE has resigned his position of installation superintendent to the York Corporation Electricity Department, and has been appointed engineering representative for power purposes to the Bristol Corporation Electricity Department.

**Tramway Officials.**—The members of the Metropolitan Association of Electric Tramways Managers, are entertaining Mr. H. E. BLAIN to dinner on Friday, the 4th prox., at the Municipal and County Club, Whitehall, on his resignation as tramways manager at West Ham, and also as Chairman of the Association.

**General.**—Mr. JUSTUS ECK, whose departure we announced last October, has now returned to London, after many months spent in visiting Australia, Tasmania, New Zealand, Canada, and the United States, in the interests of the Union Electric Co., of Southwark. During his visit to Melbourne he read a paper on "Indirect Lighting by Arc Lamps," before the Victorian Institution of Electrical Engineers, and received an invitation from the Engineering Society of Queensland, to read a paper before that body. Unfortunately, lack of time compelled him to decline. Mr. Eck expresses himself satisfied in every way with his tour, and particularly with the cordial reception universally extended to him by members of all branches of the electrical industry.

Canada states that the HON. ADAM BECK, chairman of the Ontario Hydro-Electric Power Commission, arrived in London last week.

Mr. W. P. BURTON, who has been invited by Sir T. Lipton to command the new America Cup Challenger, is the vice-chairman of the Ipswich Electric Supply and Tramways Committee. He is also the Master of the East Suffolk Foxhounds and Master of the Stagbounds.

Mr. W. HAYES has resigned his position in the Supply Department of British Westinghouse Co., Ltd., Manchester, and has joined the staff of Messrs. Falk, Stadelmann & Co., Ltd., as outside representative for their new branch establishment, now open at 107-111, Shudehill, Manchester.

The marriage took place at St. Matthew's Church, East Croydon, on June 3rd, of Mr. JOHN WM. HOLDRON, only son of the late Mr. John Holdron, of Holdron & Son, electrical engineers, of Market Street, Ashby-de-la-Zouch, and Miss Marguerita Pullen, youngest daughter of the late Mr. John Pullen, of East Croydon.

A marriage took place at St. Gabriel's Church, Cricklewood, London, on June 4th, of Mr. ROBT. BARRON, electrical engineer, of Fleetwood, and Miss Winifred Baxter. Mr. and Mrs. Barron were the recipients of a large number of presents, including silver plate from the bridegroom's Fleetwood employes, and a clock from the members of the Fleetwood Canine Society, of which the bridegroom is hon. secretary.

Mr. J. E. SPAGNOLETTI has severed his connection with the firm of Spagnoletti, Ltd.

DR. CARL HERING is at present in London from the States on a business trip.

Mr. W. LEWIS has been presented with an illuminated address on his retirement from the secretaryship of the sick benefit society founded by the employes of Messrs. Spagnoletti, Ltd., Shepherd's Bush. Mr. John Griffiths made the presentation at a large gathering of the staff.

Mr. M. N. JACKS, director of Messrs. Humphreys, Ltd., and Mr. J. NORMAN AMBLER, have joined the board of Scholey and Co., Ltd.

**Obituary.**—Mr. J. W. COURTENAY.—We deeply regret to learn of the death, which occurred very suddenly at his residence at Stevenage, on Sunday, June 1st, of Mr. James Watts Courtenay. The deceased gentleman was better known to that section of our readers who are interested in tramway matters by reason of his being managing director of our esteemed contemporary, the

*Tramway and Railway World.* For many years he carried on business as a tramway advertising contractor with branches in various cities, but in 1892 he associated himself with others in the establishment of the paper mentioned above, subsequently acquiring a controlling interest and becoming its managing director. The Tramway and Light Railway Exhibitions held some years ago at the Agricultural Hall, Islington, were mainly due to his enterprise and organising genius, and in other connections both the Municipal Tramways Association and the Tramways and Light Railways Association have paid a tribute to the useful services rendered by Mr. Courtenay to the tramway industry. For some years he had suffered from a heart affection, but he bore up under this burden with remarkable bravery. For years he had faced imminent death without the least complaint. Lately, however, he had appeared to be in better health, and his death at the age of only 56 years, came as a shock to all. Those who were long associated with him in the offices of our contemporary will greatly miss a personal friend, for he was a man of exceptional charm to his intimates. To these we extend the sympathy of *confreres*. We understand that Mr. Courtenay's death will not entail any change in the policy or staff of the paper, and that his advertising business had recently been converted into a limited liability company, under the style of J. W. Courtenay, Ltd., and it will be continued as before.

A number of our readers will, we are sure, desire to associate themselves with us in expressing sympathy with Mr. W. S. Foale, engineer and manager of the Portsmouth Corporation electricity works, in his bereavement. His wife passed away on Monday last, after an illness of some weeks.

## NEW COMPANIES REGISTERED.

**Electrical Engineering and Motor Co. (Carlisle), Ltd.** (129,213).—This company was registered on May 28th, with a capital of £3,000 in £1 shares, to carry on the business of automobile engineers and store and garage keepers, suppliers of electricity and other motive power for motors, motor-engines, motor-buses, flying machines, carriages, &c., and to adopt an agreement with C. Armstrong Lamb and W. R. Armstrong Lamb. The subscribers (with one share each) are:—C. Armstrong Lamb, Lowther Street, Carlisle, electrical engineer; W. R. A. Lamb, Lowther Street, Carlisle, electrical engineer; A. Castiglione, Lowther Street, Carlisle, motor engineer. Private company. The number of directors is not to be less than three or more than five; Armstrong Lamb is first managing director. Solicitors, E. and Kighley J. Hough, Carlisle. Registered by Morrison & Powell, 5, Raymond Buildings, Gray's Inn, W.C.

**Beatson & Co., Ltd.** (129,208).—This company was registered on May 28th, with a capital of £8,000 in £1 shares, to take over the business of an electrical engineer, carried on by H. Beatson at 14, Waingate, the field, and 76, Frederick Street, Rotherham. The subscribers (with one share each) are:—H. Beatson, 50, Overton Green, Sheffield, electrical engineer; H. A. Holliday, 8, Park View Road, Sheffield, secretary. Private company. The number of directors is not to be less than two or more than five; the first are H. Beatson (permanent) and others to be appointed by the subscribers; qualification, £50; remuneration as fixed by the company. Solicitor, E. Ayrton, 17, Bank Street, Sheffield. Registered by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C.

**Wireless Electric Light Co., Ltd.** (129,284).—Registered May 30th, by H. G. Campion & Co., 25, Old Broad Street, E.C. Capital, £75,000 in 70,000 ordinary "A" shares of £1 each, and 100,000 ordinary "B" shares of 1s. each. Objects: To carry on the business of electric lighting and general engineers and contractors, suppliers of electricity, manufacturers of and dealers in electric, magnetic, galvanic and other apparatus, &c., and to adopt an agreement between O. Markiewicz, M. J. Stoeck, and R. H. Markiewicz, of the one part, and J. L. Gilmore of the other part. The signatories (with one share each) are:—E. Wilding, 22, Midway Chambers, 7, Union Court, E.C., chartered accountant; J. L. Gilmore, 6, Broad Street Place, E.C., merchant; R. Lee, Belsouth, Woodmansterne Road, Purley, engineer; L. Perry, 16, Sunderland Terrace, Westbourne Gardens, W., engineer; E. R. Baines, Green Street Green, Orpington, accountant; W. B. Beaumont, 4, The Waldeins, Croydon, secretary; T. H. Browton, 23, Old Broad Street, E.C., electrician. Minimum cash subscription, 100 ordinary "A" shares. The first directors (to number not less than two or more than seven) are E. Wilding, J. L. Gilmore, and M. Stoeck. No qualification required till nine months after statutory meeting; afterwards £100 (managing director excepted); remuneration (except managing director), £200 each per annum (chairman, £250), and 25 per cent. of the net profits, after 10 per cent. dividend is paid, divided between them. Registered office, 6, Broad Street Place, E.C.

**Morris & Lister (London), Ltd.** (129,269).—This company was registered on May 30th, with a capital of £3,000 in £1 shares, to carry on the business of agents for, and dealers in, electrical and engineering machinery and plant, electricians, engineers, suppliers of electricity, &c., and to adopt an agreement with Morris & Lister, Ltd. The subscribers (with one share each) are:—F. J. Bakewell, Northcliffe, St. Margaret's Bay, Dover, engineer; P. A. Lambach, 36, West End Lane, West Hampstead, N.W. Private company. The number of directors is not to be less than two or more than three; the first are F. J. Bakewell and D. J. Morris. Registered office, 3 and 4, Palace Chambers, Bridge Street, Westminster.

**W. E. L., Ltd.** (129,282).—This company was registered on May 30th, with a capital of £2,000 in 1s. shares, to carry on the business of electric lighting and general electrical engineers and contractors, suppliers of electricity, carriers of passengers and goods, &c. The subscribers (with one share each) are:—J. L. Gilmore, 6, Broad Street Place, E.C., merchant; E. Wilding, 22, Midway Chambers, 7, Union Court, E.C., chartered accountant. Private company. The number of directors is not to be more than five; the first are not named; remuneration, £10 each per annum (chairman £15). Registered office, 6, Broad Street Place, E.C.

**Magnetaire, Ltd.** (129,366).—This company was registered on June 4th, with a capital of £100 in 1s. shares, to take over the business of therapeutists and manufacturers of and dealers in electrical and magnetic appliances carried on by W. Light and A. W. Light, as "Crinson, Garris and Co." at 11 and 13, Finsbury Square, E.C. The subscribers (with one share each) are:—W. Light, "Lutterworth," Burrendon Road, Brighton, publisher; A. W. Light, 8, Priory Road, West Hampstead, N.W., medical electrician. Private company. The number of directors is not to be less than two or more than five; the first are W. Light and A. W. Light. Registered office, 11 and 13, Finsbury Square, E.C.

## CITY NOTES.

**Bombay Electric Supply and Tramways Co., Ltd.**

THE directors report that the total revenue for the year to December 31st from all sources, including the amount represented by sale of current to the tramways, amounted to £256,699, an increase of £17,391, or 7.27 per cent. over the previous year. The total expenditure (says the *Financier*) amounted to £128,017, an increase of £2,292, or 1.82 per cent., compared with 1911. The net profit from the year's working, which aggregated £123,682, shows an increase of £15,101, or 13.28 per cent. After deducting interest on the debenture debt, amounting to £36,452, placing £22,000 to depreciation account, and £6,548 to sinking fund for capital redemption, there remains £63,682, plus £7,385 brought forward, making an available total of £71,067. The directors recommend that this sum should be applied to dividend on the 6 per cent. cumulative preference shares, and a dividend on the ordinary shares at the rate of 5 per cent. per annum, £30,000, leaving to be carried forward £5,072. The tramway traffic receipts, which amounted to £161,013, compare with £157,807 for the previous year. The working expenses in Bombay amounted to £78,842, against £74,449. The balance of receipts over expenses in respect of the year's working is £84,820, compared with £86,074 for the previous year. The tramway receipts for the previous year received an abnormal increase from the additional traffic which resulted from the Royal visit to Bombay in December, 1911. The receipts for the last three months of 1912 suffered from the refusal of the Corporation to continue the increase in some of the long-distance fares to which it had accorded temporary sanction during the preceding 2½ years. On the other hand, the expenses in 1912 were swelled by the thorough overhaul of the company's rolling-stock then undertaken. The gross receipts from electric supply for the year, including the amount represented by the sale of current to the tramways, amount to £91,413, compared with £76,530 for the preceding year. The working expenses were £45,683, against £48,261 for the previous year. The receipts, exclusive of the revenue represented by the current supplied for the tramways, amount to £61,462, compared with £47,895 for 1911. The balance of £45,730, as the result of the year's operations, compares with a balance of £28,266 for 1911.

**Aluminium Corporation, Ltd.**

THE directors' report for the 12 months ending December 31st, 1912, states that the operations of the company were subject to many adverse factors, but a net profit is shown for the first time in the history of the company. The coal and transport strikes caused very serious inconvenience and loss, and the abnormal depression in the price of the metal which prevailed until towards the end of 1912, naturally militated against a more successful working. The completion of the new carbon works at Dolgarrog has been considerably retarded by the difficulty of obtaining the necessary building material. The machinery and plant having been maintained in a high state of efficiency out of revenue, it is not deemed necessary in the present accounts to make any provision for depreciation. An arrangement has been completed with the British Aluminium Co., Ltd., whereby that company has acquired a substantial interest in the Bauxite Refining Co., Ltd., and it is believed that the extensions at present being made to these works will prove to be of considerable advantage to the Corporation. Mr. A. F. Bott was appointed a member of the board in January last.

**Stock Exchange Notices.**—The Committee have ordered the undermentioned securities to be quoted in the Official List:—

Consolidated Diesel Engine Manufacturers, Ltd.—Further issue of 4,413 shares of £1 each, fully paid (Nos. 594,567 to 598,959); and 100,000 vendors' shares of £1 each, fully paid (Nos. 427,077 to 627,076).

Consolidated Gas, Electric Light and Power Co., of Baltimore.—Further issue of \$404,000 general mortgage 4½ per cent. 30-year gold bonds of \$1,000 each (Nos. 9,362 to 9,765).

London and Suburban Traction Co., Ltd.—1,411,469 ordinary shares of £1 each, fully paid (Nos. 1 to 1,411,409); 1,018,175 per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 1,018,175); and £144,441 4½ per cent. first mortgage debenture stock.

River Plate Electricity Co., Ltd.—Further issue of £30,000 ordinary stock. Underground Electric Railways Co. of London, Ltd.—21,000 additional shares of £10 each, fully paid (Nos. 7,201 to 8,200 and 26,793 to 46,792).

Victoria Falls and Transvaal Power Co., Ltd.—£1,000,000 5½ per cent. second mortgage debentures, Series "A" (Nos. 1 to 9,610 of £100, and 9,611 to 11,440 of £20 each), in lieu of the scrip.

Applications were made to the Committee (1) to appoint a special settling day in and to grant a quotation to:—

Brazilian Traction, Light and Power Co., Ltd.—100,000 6 per cent. cumulative preference shares of \$100 each, fully paid.

And allow the following to be quoted in the Official List:—

Montreal Tramways Co.—Further issue of \$2,890,000 first and refunding mortgage 5 per cent. 30-year gold bonds, Nos. D1,047 to 1,246 (\$500) and M9,923 to 12,712 (\$1,000).

**India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.**—A half-yearly meeting will be held at 106, Cannon Street, E.C., on 21st inst., at 11.30 o'clock a.m. Dividends are proposed as follows:—Preference shares, 5s. per share, less income-tax, being half-yearly dividend due on July 1st, at the rate of 5 per cent. per annum. Ordinary shares, 5s. per share, free of income-tax, being an interim dividend of 2½ per cent.

**Provincial Tramways Co.**—An interim dividend of 8d. per share on the ordinary shares is announced for the half-year ended March 31st.

**The American Westinghouse Electric and Manufacturing Co.**—The report for the year ended March 31st, 1913, as abstracted in the *Financial News*, states that the sales billed for the year were in excess of any previous year in the history of the company. The ratio of manufacturing profit to sales billed increased over last year, but unusually keen competition in all the company's activities prevailed and still continues. The value of unfilled orders as of March 31st, 1912, was \$8,137,961 and as of March 31st, 1913, \$12,061,473. The surplus as of March 31st, 1912, was \$6,648,964. This balance was increased, by the net income for the year and various items detailed in the statement of profit and loss, to a gross surplus of \$9,932,203. Against this surplus have been charged dividends declared during the year on the preference stock at the rate of 7 per cent. per annum (\$279,909), three dividends of 1 per cent. each, aggregating \$1,053,666, on the common stock, and miscellaneous charges totalling \$283,187. These charges reduced the surplus to \$8,315,442, against which depreciations of investments, aggregating \$966,919 were written off, leaving the surplus as of March 31st, 1913, shown in the same balance-sheet, of \$7,348,522. So far as the foreign companies are concerned, while further depreciation is possible in some of them, it will probably be more than offset by the appreciation of others: so that, after the final adjustment resulting from liquidation of the Russian company, it is believed that, under existing conditions, their aggregate book value will be a fair actual value. The four-year notes issued under the plan for the discharge of the receivers of the company matured January 1st, 1913, and were paid.

**Electric and General Investment Co., Ltd.**—The directors recommend the following dividends for the year-ended May 31st:—Ordinary shares, the full dividend of 2s. per share, being 10 per cent. per annum, of which 1s. per share was paid on account in January, leaving 1s. per share to be now distributed; deferred shares, a dividend of 6d. per share.

**J. G. White & Co., Ltd.**—The directors have declared a dividend of 6 per cent. less income-tax, on the cumulative preferred shares for the half-year to February 28th, making 12 per cent. for the year, and a dividend of 6 per cent. less income-tax, on the ordinary shares for the half-year to February 28th, making 12 per cent. for the year, and an extra dividend of 10s. per share, less income-tax, on the ordinary shares for the year to February 28th, making a total of 62 per cent. on the ordinary share capital.—*Financier*.

**Prospectus.**—**Midland Electric Corporation for Power Distribution, Ltd.**—The list was to close yesterday in an issue of £400,000 5 per cent. first mortgage debenture stock, which is guaranteed absolutely as to principal and interest by the British Insulated and Helsby Cables, Ltd. The matter was referred to in the report of the meeting of the latter company recently. The present issue is made to replace the whole of the company's outstanding debentures, amounting to £250,000, and to provide the additional capital required for its extended and rapidly-extending business. After providing for the replacement of such debentures, and for the payment to the British Insulated and Helsby Cables, Ltd., of £92,000 or thereabouts (being the estimated cost up to June 30th, 1913, of the new turbo and other extensions), the present issue will provide £58,000 in cash for the general purposes of the company, including further extensions, and for the expenses of this issue.

**Pulford Bros., Ltd.**—The fifteenth annual meeting was held at the office, 108, Whitechapel, Liverpool, on June 5th. We are informed that Mr. Egerton G. Pulford, who presided, reported that the business during the past year again showed a satisfactory increase. Resolutions declaring a dividend of 30 per cent., free of income-tax for the year ended March 31st last, and carrying the balance to reserve account, were passed. The chairman also reported that a contract had been signed to purchase 106 and 108, Whitechapel, with a view to rebuilding the premises to suit the growth of the company's business. At an extraordinary general meeting held immediately afterwards it was resolved to increase the capital by issuing 3,000 6 per cent. cumulative preference shares of £1 each.

**Bahia Tramway, Light and Power Co.**—Sir Wm. Plender presided at a meeting of the holders of the 5 per cent. 50-year first mortgage gold debentures held at Winchester House, E.C., on 5th inst., when the contract for the sale of the company's properties to the municipality of Bahia was ratified. Bondholders receive approximately £8 for each \$500 debenture.

**Official Announcements re Companies.**—The following companies have been struck off the Register, and are accordingly dissolved:—

Bartons Light Cure Institute.  
Carnarvonshire Electric Traction Syndicate.  
Empire Electric Light and Power Co.  
Improved Electric Supplies.

Unless cause is shown to the contrary, the following companies will be struck off the Register at the expiration of three months:—

Haste Pump Co.  
Midgley's Electro-Therapeutic Co., Ltd.  
Motor Traction Co. (1905), Ltd.

**Victoria Falls and Transvaal Power Co., Ltd.**—The directors have declared a dividend on the preference shares at the rate of 6 per cent. per annum for the year ended December 31st, 1911.

**Western Telegraph Co., Ltd.**—Third quarterly interim dividend of 3s. per share, free of income-tax, for the year ending June 30th, 1913, being at the rate of 6 per cent. per annum.

### British Electric Traction Co., Ltd.

THE directors' report, which is to be submitted at the annual meeting at the Holborn Restaurant, on Monday, June 16th, states that during the year ended March 31st, 1913, good progress has been made by the Associated Companies in regard to tramway traffic, the sale of electricity for light and power purposes, motor-omnibus services, and in other respects. The total traffic receipts on the lines which were in operation both last year and the preceding year show an increase for last year of £61,467, and the number of passengers carried an increase of 13,607,818. The aggregate traffic receipts were £1,749,246, as compared with £1,770,748 for 1911, a decrease of £21,502. The aggregate of passengers carried also shows a small decrease, but these decreases are due to the company's interest in several undertakings having been disposed of. The electricity supply receipts amount to £353,002, an increase of £35,564 as compared with 1911. The directors consider that the increases in the gross receipts from both the traffic and electricity supply branches of the business are satisfactory, but they regret that the net profits of the Associated Companies have not increased proportionately to the larger volume of business. The coal strike, the strike of transport workers and other labour troubles, have abnormally increased the cost of fuel, materials and stores of all kinds.

"The directors have for some time past felt that the advent of the modern and improved motor-omnibus would still further discourage the extension of tramways and light railways in Great Britain, and in some cases would have an important bearing on the profits of existing undertakings. There is a large scope for the employment of motor-ombuses, especially in London, where the tramways do not, as is the case in provincial towns, serve the central and most populous areas, while in the provinces the cost of permanent way for tramways to serve outlying and sparsely populated places is not justified under existing legislative conditions. The Associated Companies have accordingly taken steps to provide a number of motor-ombuses for working in connection with their tramways, and the British Automobile Traction Co., which is practically owned by this company, is establishing and developing motor-omnibus systems in districts not served by tramways and light railways. It is the policy of that company to assist local undertakings and to work in co-operation with local authorities and railway companies." The directors go on to refer to arrangements made with the L. G. Omnibus Co. in regard to motor-omnibus and other traction business in London and the provinces, and to the formation of the London and Suburban Traction Co.

"The last-named company will control 123 miles of line, and several important electricity supply undertakings, and will operate, either directly or through its Associated Companies, about 380 motor-ombuses. The British Automobile Traction Co. is also operating a fleet of motor-ombuses in London and the suburbs.

The British Canadian Power Co., in which as stated in the last report the company had taken an important participation, has during the year been amalgamated with the Northern Ontario Light and Power Co., by means of an exchange of bonds and common stock of the British Canadian Power Co. for bonds, preference stock and common stock of the Northern Ontario Light and Power Co. The latter company has an issued share and debenture capital of over 1,500,000 dols., and is the only company supplying electric power, compressed air and electric light in Cobalt and the surrounding districts. The yield on the company's holding shows a good return on the cost at which it stands in the books of the company. Arrangements have been completed for the formation of a syndicate, in which the company has retained a substantial participation, for providing additional capital for the Maritime Coal Railway and Power Co. in the Province of Nova Scotia. The reports of the company's representatives and other experts who have examined the property are favourable. The company has in conjunction with Brazilian interests formed the Rio Grandense Light and Power Syndicate, Ltd., with a subscribed capital of £100,000. The syndicate has contracted to purchase the concession for electric tramways, lighting and power in the town of Pelotas in the Province of Rio Grande do Sul, Brazil, and the works are now under construction. The syndicate has also obtained options upon other electrical undertakings in the same district.

Negotiations are proceeding with regard to the establishment of other undertakings in England and abroad. The cost of these negotiations has been included in the expenses of the year and debited to revenue account.

The Electrical and Industrial Investment Co. is now established with a subscribed share and debenture capital of £480,000.

Increased dividends have been paid by the following companies, viz.: Airdrie and Coatbridge Tramways, Auckland Electric Tramways, Birkdale District Electric Supply, Birmingham District Power and Traction, Bombay Electric Supply and Tramways, Devonport and District Tramways, Gateshead and District Tramways, Greenock and Port Glasgow Tramways, North Metropolitan Electric Power Supply, Tramways and Light Railways Estates, and Yorkshire (Woolfen District) Tramways, and several other associated Companies show improved results. There are, however, few companies which show diminished profits. The investments and undertakings of the company have in several instances been materially improved as the result of negotiations and agreements with local authorities and in other ways which are not reflected in the present accounts. The work done by the Federation for the Associated Companies is proving of great advantage in such matters of common interest as mutual insurances, rating and assessments, collective purchases of stores, the securing of advertisements on cars and the development of parcels carrying business. During the year the company's interest in the Leamington and Warwick Electrical Co. has been sold for cash, and the Hartlepool

Electric Tramways Co. has been liquidated on sale of the tramways to the Corporation. The difference between the amounts at which the investments stood in the books of the company and the proceeds of these sales has been debited to reserve.

The gross profit for the year amounts to £210,880, as compared with £195,040 for 1911-12. After deducting management expenses and other charges, including the expenditure during the year on surveys and negotiations in regard to new business, there remains a balance of £189,712 plus £10,751 brought forward. After deducting debenture stock interest, £91,807, there remains a balance of £108,657. The revenue account has been debited with £7,732, being the amount reserved against or written off various assets. This includes £1,000 in respect of goodwill, which item now disappears from the accounts, and £1,500 in respect of previous expenditure on surveys and negotiations, reducing that item in the balance-sheet to the nominal amount of £1,000. The directors have in addition placed £40,000 to reserve for depreciation, and they recommend the payment of the dividend for the year upon the 6 per cent. cumulative preference stock and a dividend of 3 per cent. upon the 7 per cent. non-cumulative preference stock, together amounting to £48,431, carrying forward £12,193. During the year the directors purchased in the market and cancelled £5,100 5 per cent. perpetual debenture stock and £18,265 1½ per cent. second debenture stock of the company. The outstanding debenture stocks have been reduced by these amounts and the difference of £4,368 between the nominal value and the purchase price has been added to reserve. Investments and undertakings, after deducting the reserve for depreciation, stand at £4,696,053. The yield for the past year was 4.11 per cent. as compared with 3.77 per cent. for the preceding year on £4,695,103. Investments which stood in the books at March 31st, 1912, at a cost of £472,994 were realised during the year, while investments were acquired during the year which stand in the books at £404,185.

The reserve against depreciation of investments has been increased by £4,368 in respect of debenture stocks purchased and cancelled; by £9,115 profit on sale of sundry investments, and also by £40,000 transferred out of the profits of the past year. The reserve has been debited with £124,759, being the deficiency in book value on realisation of the Leamington and Hartlepool undertakings above referred to, sale of Consols and other investments, and sundry investments written off. The balance at credit of this account is now £552,457, which amount is shown in the balance-sheet as a deduction from the amount at which the investments and undertakings stand in the books. There are additional reserves against specific assets of £64,299, and a balance carried forward amounting to £12,493. The reserves of the Associated Companies, including the balances carried forward, amounted at December, 1912, to £1,28,444.

### Imperial Tramways Co., Ltd.

THE directors report as follows for the year ended December 31st last.

Middlesbrough, Stockton and Thornaby Electric Tramways.—The gross receipts were £56,719, as compared with £56,686 for the preceding year, an increase of £33. Passengers carried were 11,214,750, against 11,221,628, a decrease of 6,878. Net profit £17,413, as compared with £13,305. The work of reconstructing the permanent way has been continued, with the result that during the last two years two-thirds of the track has been re-laid. The reconstruction of the remaining portions is being proceeded with, and it is expected that the work will be completed by the end of the summer.

The working of the Corris Railway Co.'s undertaking shows an increase in net profit of £84.

The scheme for the consolidation of the interests of the London United Tramways with those of other companies is referred to.

The opportunity having offered of disposing of a portion of the company's investment in the London United Tramways, Ltd., the directors decided to reduce the holding in that company by selling 20,000 shares out of the 44,446 5 per cent. £10 preference shares. They hope to obtain an improved return upon the re-investment of the sum thus realised, whilst it is anticipated that the amount remaining in the London and Suburban Traction Co., Ltd., will contribute its quota to the future revenue.

The scheme of arrangement has received the sanction of the High Court, and accordingly the arrears of dividend on the preference shares to December 31st, 1911, have been cancelled and the ordinary shareholders have relinquished their exclusive rights to the ordinary shares dividend fund, which will in future form part of the dividends equalisation fund applicable to maintenance of the dividends on both preference and ordinary share capital. It has been deemed advisable to write down the investment in the London United Co., and £85,000 has been transferred from the reserve fund for renewals and contingencies for that purpose. The reserve funds will therefore now stand as follows:—For renewals and contingencies, £23,872; for Middlesbrough S. & T. renewals fund, £11,500; for dividends equalisation fund, £29,750.

In view of the various changes, information will doubtless be desired as to the future prospects of the company, and the directors therefore state that in their opinion the shareholders may now look for the regular payment of the preference dividend and the maintenance of at least 4 per cent. on the ordinary share capital, and in arriving at this conclusion they have only taken into account the receipt of dividends on the preference portion of the holding in the London and Suburban Traction Co., though there is no reason to doubt the statement made by the new company that there will also be a fair return upon its ordinary share capital.

The revenue account for the year shows an available amount of £24,256, and after payment of interest on debenture stock for the whole year there is a balance, including £7,678 brought forward, of £19,221, which the directors recommend should be appropriated as follows:—Dividend at 6 per cent. for the year on the preference capital, £11,300; dividend at 4 per cent. for the year on the ordinary capital, £7,533, carrying forward £388.

### United Electric Tramways of Monte Video, Ltd.

The directors' report for the year to March 31st, 1913, contains the following particulars of results of the operation of the tramway system for the year to October 31st, 1912 (the fiscal year of the Uruguayan Co.):—

	1911-12.	Increase over 1910-11.
Gross receipts .. .. .	\$1,627,636	\$224,436
Operating expenses .. .. .	994,852	140,160
Net receipts .. .. .	\$692,784	\$84,276
At exchange of \$47 to £ .. .. .	£147,401	£17,931
Passengers carried .. .. .	40,736,902	6,074,064
Car-miles run .. .. .	7,079,195	721,118
Percentage of operating expenses to gross receipts .. .. .	57.44	81

The increase in the ratio of working expenses to gross receipts is partly accounted for by the increase in rates of wages granted by the company having been in operation during the whole year, as compared with a period of about five months of the previous year. Fuel costs were also increased as a result of the coal strike in this country. The results for the year, however, again show satisfactory expansion. The extension of the Colon line was completed during the year under review, and has been in operation since June 20th, 1912. This increases the total mileage of the system from 86½ to 88½ miles of single track. The additional rolling stock has been in use since December, 1912. Sites have been secured for the erection of two sub-stations, and the necessary plant has been ordered. To increase the accommodation for rolling stock, a new car-shed is in course of erection. The existing central car-shed is also being extended, so as to provide additional space for repair and paint shops. Considerable expenditure will be necessary during the next year or two in connection with an extensive scheme for repaving of streets which has been commenced by the Municipality of Monte Video. These works will cause a temporary interference with some of the company's services. The amount received from La Sociedad Commercial de Monte Video in respect of dividend and interest was £138,084. The profit and loss account for the year, after providing for administration expenses, and charging £44,440 for debenture interest, shows a credit balance of £87,721. Adding £13,467 brought forward there is a total to be dealt with of £101,188. The following amounts have been set aside:—For redemption of debenture stock, £2,810; for redemption of the preference and ordinary share capital, £2,500; for renewals and contingencies, £30,000. Interim dividends were paid in December at the rate of 6 per cent. on the preference and 6 per cent. on the ordinary shares, absorbing £24,041. The directors now recommend dividends for the half-year to March 31st, 1913, on the preference shares, at the rate of 6 per cent. per annum (£12,712), and on the ordinary shares, at the rate of 8 per cent. per annum, making 7 per cent. for the year (£15,104), leaving to be carried forward £14,020.

The meeting will be held in London on June 16th.

## STOCKS AND SHARES.

Tuesday Evening.

Stock Exchange markets are passing through an extremely uncomfortable—not to say grave—period, and although the sentiment alters a little from day to day, for the last week it has leaned strongly to the side of flatness. Put in a nutshell, the causes of the trouble are nothing more sensational than our old friends the Balkans War and new issues, although arising out of these there are a variety of minor reasons which have contributed to the slump in speculative departments. On all hands one hears the question asked whether or not the Stock Exchange is drifting towards panic; and, viewed with what impartiality can be expected from members of the House, the position is generally declared to be one which is susceptible of being weathered without panic supervening. For all that, brokers and jobbers alike will sleep more comfortably in their beds after the turn of the present week.

The markets with which these notes are concerned have suffered in company with the rest of the Stock Exchange. The slump in Home Rails swept Metropolitan to 4½, a fall of 3½ on the week. Surplus Lands stocks losing 1 at 62. Districts fell 2½, Great Northern and City Preferred ½ to 2, Central London Preferred 4, the Ordinary and Deferred 2 points apiece. It is not as though the falls were confined to this week's list of prices; they follow upon heavy declines previously, and it is this cumulative flatness which weighs so heavily upon the markets. Various causes are assigned to account for the various falls. In Metropolitan, for instance, the weakness is said to be due to the opposition that is to be offered to the company's absorption of the Great Northern

and City line, though a little reflection would, no doubt, remark as anomalous the drop in the shares of both companies concerned.

The truth of the matter is that in any stock where a "bull" account exists, stale holders have been doing their best to get out while they were able. The news that the London and South-Western electrification is about to be taken in hand made no difference to the prices of the stocks of that company; while the issues of the British Westinghouse Company, which has secured the contract, are unchanged. Possibly the sharp improvements of the past fortnight in Westinghouse may be due to advance buying on the expectation that the company would be given this important work.

It is not only ordinary stocks which have given way amongst Home Rails, but a number of the more gilt-edged varieties are down also, as may be seen by a reference to our lists. British Electric Traction are reasonably steady on the issue of the report, but three of the stocks are ½ to 1 lower.

The market for English Electricity Supply shares is weak, for no reason other than that money has to be provided by the sale of actual investments in order to pay for other obligations. The dullness this week has affected more particularly the preference shares of the various companies, losses being sustained by those issues in the Westminster, Metropolitan, Edmundsons' and City of London Companies. "City Lights" ordinary have dropped to 16½, the other ordinary shares in the catalogue maintaining their quotations with a good deal of firmness. One or two of the Debenture stocks, however, show small falls; and, like a good many investment securities round the Stock Exchange at the present time, it is difficult to deal readily in some of those stocks where the market is not distinguished for its freedom in the ordinary way. The prospectus of the Debenture issue by the Midland Electric Corporation is out this week; advance particulars were given here last month.

The report of the Bombay Electric Tramways Company caused some little disappointment. It had been thought from the dividend announcement, which raised the rate from 3 per cent. to 5 per cent., that a better showing would be made. Perhaps the optimists expected a little too much, for certainly the company is doing very well; and it is remarkable in these days, when securities are offered to pay such big rates of interest, that Bombay Tramway should stand at 13½, at which the return is but 3½ per cent. on the money. The 6 per cent. Preference pay 5½ per cent.; but as the part of the recent buying of the Ordinary came from India, evidently the local investors have a high opinion of the undertaking.

The Anglo-Argentine Tramways group is a little dull, the last-issued Debentures showing slight falls, while City of Buenos Ayres Trams are ½ lower. No change occurred in United Electric Tramways of Monte Video upon the appearance of a report showing fine progress. Para Electric Trams are easier, both as regards the Ordinary and Preference.

News from Mexico is not bad, but the market in Mexican Power and similar concerns remains subservient to the depression prevailing through the rest of the House. In consequence of this, Mexican Light and Power Common show a loss of 5, and the 5 per cent. Mortgage bonds are down 2½, the yield at their present quotation being over 5½ per cent. on the money. In view of the security which these offer, the return looks tempting, for the lately-issued report was quite a good one. In view of the fact, however, that the Mexican Government itself is about to issue a 6 per cent. loan at 96½, upon which the return, taking redemption into account, will work out to 6½ per cent., it is not surprising that bonds in the utility companies should suffer by comparison. At the same time, some investors take it as axiomatic that a well-secured bond from an industrial corporation may in some circumstances form a better security even than that offered by the loans of the country itself in which the company's works is situated.

Montereys are a point down, and Mexico Trams lost 2. A decline of 10 is marked in Montreal Light and Power shares, Shawinigan Water fell 4, Canadian General Electrics 3, these high-priced shares offering a target for the sellers. Brazil Traction Ordinary have undergone sharp changes during the past few days, and at 88, the price is 4 points down on balance, while Rio Tramways Second Bonds are 3½ lower at 90. The Victoria Falls Power report failed to realise some of the "bulls" anticipations, and the price is dull at 17s. 6d. sellers.

The Telegraph market is troubled by realisations of actual stock on behalf of people who want money. The Eastern group is depressed, and Western Telegraphs are ½ down. New York 4½ per cent. bonds shed 1. The quotation for West India and Panama shares is broadened by the dropping of the lower price. United River Plate Telephones have gone back to 6½; and the Anglo-American Telegraph division continues to shrink. Marconis were, of course, unaffected by the decision in the Chesterton case. The price has again dwindled, Canadians going back to 10s., Americans to 13s. 9d. Men in the market were not the only ones to be amused by the tone of Lord Murray's replies to Sir Albert Spicer's invitation to come back before July in order to give evidence before the Marconi Commission.

The Manufacturing section presents few alterations. Castner-Kellners are a little easier, and it has already been remarked that the British Westinghouse issues retain their previous rises. Opposition is offered to the Edison & Swan scheme. The price of the "A" shares is nominally nothing to ½, but some of the shareholders have been trying to rid themselves of the liability by offering to give money, if they can find a buyer who will take it, with their shares. The Rubber department is as weak as the rest of the Stock Exchange; and it is noteworthy that the issue of Preference shares by the Armstrong, Whitworth Company the other day resulted in the underwriters being left with 55 per cent. of their obligations,

## THE PROGRESS OF THREE-PHASE TRACTION ON RAILWAYS.

By "DELTA."

THE first practical application of three-phase A.C. for electric traction was the equipping of the Lugano tramways in 1895-6 by Messrs. Brown, Boveri & Co., with three-phase induction motor equipments.

Since that time, the three-phase system has made slow but steady headway, especially in its application to heavy traction and railways. Several small lines were electrified in and around Switzerland, but the adoption of three-phase working by the Italian State Railways for nearly 150 miles of track on their various lines, immediately followed by the successful application of the system in the Simplon Tunnel in Europe and the Cascade Tunnel in America, seems to indicate that it deserves, and will hold, a high place in railway electrification of the future. Wherever the system has been tried it has proved highly satisfactory in operation.

It is the author's intention to set forth the main points to which the induction motor and the three-phase system in general owe their success in the electrification of railways, and, further, to briefly deal with the applications of the system up to the present date.

The relative advantages claimed by the three-phase system of railway electrification may be enumerated:—

1. No commutators are required whatsoever, and all commutation difficulties are obviated. The majority of induction motors used for traction are of the slip-ring type, but the more recent locomotives of Messrs. Brown, Boveri & Co. employ squirrel-cage motors, thus dispensing with everything of the nature of a moving contact.

2. The induction motor is capable of exerting two or three times its full-load torque for starting. The G.E.C. motors for the Cascade Tunnel of the Great Northern Railway Co., of America, are designed to exert three times full-load torque at any speed from standstill to within a few per cent. of synchronism.

3. The efficiency, power factor and speed are constant for a considerable range of output.

4. High voltages are employable on the motors themselves; thus there is no necessity to load up the locomotives with transforming plant. Up to the present, 3,000 volts has only been exceeded in Europe in one case—the Gergal Sante Fe line in southern Spain, which operates on 5,500 volts, but the Cascade Tunnel line in America is supplied from 6,000-6,600-volt trolley wire. The standard voltage adopted by the Italian State Railways is 3,000 volts at 15 cycles.

5. Electrical braking and regenerative control is possible since the motors may be made to run as generators, with their rotors excited from low-voltage D.C., and supply current back to the line. The speed of the motors is then limited to approximately that of synchronism, and this may be made considerable use of, especially on mountain lines and very heavy grades. The tendency to limit the speed should not be affected by the removal of one bow or trolley from contact with the overhead wire.

6. When squirrel-cage motors are used there are no rheostatic losses at starting, and the starting efficiency may be brought up to 97 per cent.

7. By a suitable arrangement whereby resistances may be inserted in the rotor circuits, lost time may be made up on down grades.

8. The comparative cheapness of three-phase generating plant and sub-station plant in comparison with low-tension direct-current plant is yet another advantage of the system under some circumstances.

The advantages of the induction motor system are thus seen to be many, and although the control systems now in use for three-phase work appear to be elaborate, the following table shows them to be comparable in weight with the D.C., and superior to the single-phase equipment.

The disadvantages of the system are:—

1. The necessity of employing two overhead wires which, to some extent, limits the voltage allowable owing to the difficulty of insulating one from the other, especially in tunnels where there is much moisture present. The two

overhead wires are also liable to short-circuit at cross-overs.

2. The increased rail drop consequent on the use of any A.C. system presented another difficulty, which has been, however, largely overcome by the use of a low frequency. The frequency employed on the earlier three-phase railways ranged round 40 cycles. In recent practice 15 and 16 cycles are more generally adopted, as in the case of the Simplon tunnel line.

3. Where heavy trains are employed and two locomotives are used for hauling, it is essential that their wheel diameters should be identical, otherwise they will not share the load.

Both the Italian Westinghouse Co. and Messrs. Ganz and Co. have an ingenious method of overcoming this difficulty by the use of a water resistance in the rotor circuit, in which the water level can be automatically controlled by compressed air.

Yet another feature, repeatedly put forward as a disadvantage, is that induction motors require a very small air-gap to maintain a decent power factor. In the old type 150-m.p.

motors of Messrs. Brown, Boveri and Messrs. Oerlikon the gap was  $\frac{1}{16}$  in. on a 24-in. diameter rotor. In the G.E.C. motors for the Cascade tunnel  $\frac{1}{8}$  in. air-gap has been allowed, and yet the power factor has been kept up to 80 and 86 per cent. It is obvious that  $\frac{1}{8}$  in. air-gap will allow for a great deal of bearing wear and of the rough usage a railway motor is bound to encounter in the shape of sudden and heavy starting strains. The actual motors, taken all round, are well suited to traction work. This may also be said of the control systems. The series parallel arrangement in direct current work only allows of two economical speeds in which to run the motors:—(1) Full series; (2) full parallel.

This is not the case with induction motors. By suitably arranging the poles so that they may be changed in number, three and four synchronous speeds may be obtained. This is also true where the cascade or concatenated arrangement of motors is used. Hence the induction motor may be provided with two, or more than two, economical working speeds in excess of those which the ordinary D.C. series motor possesses. There is a considerable amount of choice in the control system for induction motors. The simplest is that employed on the earlier locomotives in Europe and more recently on the locomotives in the Cascade Tunnel. This consists of the ordinary secondary rheostatic control, where resistances are placed in the rotor circuit at starting and cut out as the speed increases. Such an arrangement possesses but one economical working speed and allows heavy rheostatic losses.

The next system was that employed in the Simplon Tunnel locos, and also by Messrs. Oerlikon, of changing the number of stator poles as the speed increased. Thus a motor would be started up in the usual manner with control through rotor resistances and run up to full speed as a 16-pole motor. The pole-changer would then change it to an eight-pole motor and re-insert the resistances, which would again be slowly cut out till the motor ran at full speed as an eight-pole motor. Messrs. Oerlikon have in some cases constructed motors capable of four arrangements of poles, thus giving four speeds. For lines where there are frequent stops the arrangement allowed of heavy rheostatic losses as before mentioned, hence Messrs. Ganz & Co. developed the cascade arrangement of motors to suit traction work. They arranged to insert a separate low voltage motor in series

with the H.T. motor rotor in starting. This gave an additional economical speed to the loco. Originally, the low voltage motor was built into the same frame as its high voltage companion. The arrangement was used in the earlier Valtellina locomotives with great success, as it gave the locomotive two economical speeds. (1) Full cascade connection; and (2) full short-circuited rotor connection of the H.T. motor. This success led Messrs. Ganz & Co. to still further develop their system. The more recent locomotives of the Valtellina line are equipped with two motors each, one an eight-pole motor and the other a 12-pole motor, each capable of working the train alone, and thus giving two synchronous speeds to the locomotive. A lower synchronous speed is attained by placing the 12-pole motor in cascade connection with the eight-pole machine. Using the H.T. 12-pole motor for cascade connection necessitates its being arranged to work at a reduced voltage. This is done without the aid of any auxiliary transformer by changing the stator windings from their H.T. arrangement of three coils in each phase in series, with the phases star connected, to the lower tension arrangement of three coils in each phase in parallel, with the phases mesh connected.

This cascade arrangement gives a speed equivalent to that of a 20-pole motor. In each arrangement the rotor resistances are cut out in the usual manner, giving a fine regulation of speed. This is done with water resistances instead of rheostine wire, as in the original locomotives. These locomotives then have speeds corresponding to 20, 12 and eight-pole motors, at which they can operate with perfect economy. These actually correspond to 16, 26 and 40 M.P.H.

The induction motor for traction is very similar in construction to the ordinary motor used for other commercial purposes. Where the motors have to be placed within the wheel truck, it is necessary to employ recessed bearings. The frame for carrying the laminated core is made as light as possible.

Messrs. Ganz & Co. found they had not room to spare for the slip-rings inside the frame, since it was more necessary to bring the cranks as near the motor as possible, hence the slip-ring leads were carried through the crank to a set of rings outside the frame of the locomotive.

Having dwelt on the most prominent points in connection with the three-phase system, the author will briefly deal with three of the most important undertakings now in operation.

The Valtellina line runs along the shores of Lake Como between Lecco and Callico, with branches to Sondrio and Chiavenna. The electrical equipment is by Messrs. Ganz & Co., and on the motor-cars consists of four motors per car—two high-tension 3,000-volt, 200-H.P. motors and two low-tension 300-volt motors for cascade connection in starting. The frequency is 15.

Three locomotives were also supplied, in the first instance, of the four-axle type, and having a speed of 18½ M.P.H., equipped with two 750-H.P. motors.

Soon, however, some 1,500-H.P. locomotives were added, which had two speeds of 20 and 40 M.P.H. In these locomotives the motors were mounted high up in the cabs, thus securing a higher centre of gravity and also allowing the use of fewer and larger motors. This latter is a great advantage, since, in all traction work, the weight per H.P. of a large motor is always much less than that for an equivalent output in smaller motors.

The power is transmitted to the driving wheels through a form of scotch yoke. Three pairs of 59-in. drivers are coupled together. The yoke which transmitted the power from quartered cranks on the motor shafts, drives down on to the middle pair of drivers through a special sliding bearing which will allow for the vertical movement of the axles independently of the locomotive main structure. Connecting rods to the two other pairs of drivers are taken from the yoke at points near this bearing. This arrangement has proved light in construction and very successful in operation. The control systems have already been dealt with.

2. Following the Valtellina line, the Simplon Tunnel was electrified with three-phase A.C. by Messrs. Brown, Boveri at their own risk, and proved so successful that the international authorities controlling this important line have taken over the system to work the tunnel permanently.

The original locomotives are practically identical in construction with those of the Valtellina line, both being built to the designs agreed upon by the engineers of the governments and firms concerned.

The mechanical construction is by the Swiss Locomotive Co. of Winterthur. These motors had two synchronous speeds of 22 and 44 M.P.H., and employed the usual pole-changing apparatus. Rheostine wire resistances in the rotor circuit allowed speed regulation. The rated output was 1,100 H.P.

Later, Messrs. Brown, Boveri put some further locomotives in service, which have four pairs of drivers and no pony wheels. These are rated at 1,700 H.P. and employ two motors. The motors have no slip rings, and no rotor resistances are used. The stators are capable of having their windings arranged so that speeds corresponding to 16, 12, 8 and 6-pole motors are obtained. This is done by a compressed air operated pole-changer, which, together with an auto-transformer for reducing the heavy current at starting, constitutes the whole of the control apparatus.

3. Outside Europe, little three-phase work has been done, but the Cascade Tunnel of the Great Northern Railroad of America, equipped by the G.E.C., is the exception. These locomotives develop 1,900 H.P., and are operated from 6,000-

4,600-volt overhead lines. However, in their construction simplicity seems to have been the great aim, and economy in service was set aside to gain this.

The motors operate at 500 volts, and the loco. therefore carries transformers to step the line voltage down to this value. The frequency is 25 periods and the speed about 15 M.P.H.

From this summary of the progress of three-phase traction it appears the system is becoming more popular, and the author ventures to predict that the electrification of the future will find the high-tension direct-current and the three-phase systems occupying higher places as rivals to the single-phase system. One advantage of the H.T. D.C. is the great ease with which the voltages may be varied from H.T. in country districts to L.T. in the towns, and yet permit the use of the same equipments. This is not so easily accomplished with the three-phase, and is perhaps one of the greatest limitations of the system. On the other hand, the direct-current system does not allow of so many economical working speeds as the induction motor fitted with pole-changing gear does. This may be a disadvantage in the D.C. system.

Some authorities pay more attention to economy in the construction and operation of the plant up to the trolley wire rather than the actual rolling stock. In this respect the three-phase system possesses many advantages. For any given output the cost of generation and of generating stations is approximately equal, but the three-phase railway sub-station is simply a transformer house, whereas with D.C. it is necessary to employ rotating converting plant often in conjunction with transformers. However efficient these sets may be, they must constitute an additional source of expense. Whether this expense is justified by the simplicity of rolling-stock equipment secured with D.C., is a debatable point beyond the scope of this article.

## ELECTRICAL HEATING.

[COMMUNICATED.]

THE writer's attention has been drawn by the ELECTRICAL REVIEW to the increasing prominence given every year to questions concerning the application of electricity to domestic uses, such as heating and cooking. Almost every electric supply company or Corporation realises the advantages it will reap if only it can popularise the consumption of electricity in this direction, and the larger supply companies and Corporations now give annual exhibitions, with the view of educating the general public to the possibilities and advantages of electricity in the home. There is no doubt that, due to these exhibitions and also to the lower rates per unit now being charged for energy used for this purpose, electricity is being adopted on a larger scale every year by ordinary domestic consumers in this connection. Is this progress as rapid as it might be? Most people will agree that it is not. It is true that supply authorities have to overcome a prejudiced public, which cannot be done in a day, but the lack of progress is also due to the unscientific manner in which the subject has been tackled both by the manufacturers and by those engineers who advocate its use. It is the object of this article to give to those who are interested in this question the conclusions arrived at by the writer as a result of his investigations in this field.

A few years ago the writer had occasion to carry out some research work to investigate the respective merits and demerits of various makes and types of electrical heating apparatus then on the market. The great argument then in favour of electrical heating apparatus was that all the energy expended in the different apparatus was turned into heat, and therefore the heater had an efficiency of 100 per cent. At first sight this argument seemed quite plausible to those who had not given much thought to the question, but it must have occurred to many that it was at least curious that every electrical apparatus, quite irrespective of design, could possibly be equally good and efficient, and that it only remained for the manufacturers to turn out reliable and attractively-designed heaters.

Before going any further it would, perhaps, be just as well if the term "efficiency," as applied to electric heaters

(or any heater, for that matter), were defined. Efficiency used in this sense should be represented by the following equation:—

$$\text{Efficiency} = \frac{\text{Useful heat developed.}}{\text{Heat absorbed in the heater.}}$$

The denominator of this equation is easily determined, as the heat units absorbed per hour is simply the number of B. of T. units consumed multiplied by 3,112. The numerator, on the other hand, is not so easily defined, and can only be arrived at as the result of experiment.

It would appear that manufacturers start away with the idea that the efficiency of any electrical heater is 100 per cent., and that it only rests with them to introduce cheap and attractive designs. This is, of course, a mistake. It is possible to conceive of a convector (non-luminous radiator) placed on the floor of a room in such a position relatively to a ventilator that the convector would take the place of an exhaust fan, and tend to cool the room rather than heat it. For instance, a popular way of testing a convector is to sprinkle some charred paper over the top of the convector and observe whether the paper is blown up to the top of the room or not: if the paper is carried up, the convector is supposed to be very good, as it produces a strong circulation of hot air. Now, imagine there is a ventilator in the ceiling immediately above the convector which can produce this supposed desirable circulation of air: it would be found if the paper test were applied that the paper would be blown to the top of the room and out at the ventilator, and so also would the hot air which was intended to heat the room. A heater of such a type and placed in such a position relatively to the ventilator would be worse than useless.

The foregoing remarks prove pretty clearly that the question of heating cannot be considered apart from the ventilation scheme, that is to say, if it is to be carried out successfully and efficiently. This applies to all heating systems, but especially in the case of electric heating, because if electric heating is to compete successfully with coal and gas fires as to running costs, it must necessarily be run efficiently. We may safely say therefore that electric heaters should be chosen with due regard to the ventilating scheme. As a rule, in most dwelling rooms and offices there is no definite scheme of ventilation, and in such rooms where artificial heating is resorted to a cold draught of air along the floor results.

The next question to be considered is what we mean by an ideal system of heating. It will be generally admitted that the ideal would be a room evenly heated throughout, and thus free from cold draughts, due regard, of course, being given to the ventilation. The temperature in the room should not be any higher than is necessary, in order to keep the body comfortable. Most people will agree that if one's feet are warm, it is a simple matter to keep the rest of one's body warm. A heating system should be such, therefore, that the hottest part of the room is near the floor and not the ceiling. With such a system the rest of the air in a room could be kept at a minimum temperature, which, from a health point of view, is very desirable, as one would not run the same risk of catching a chill by going into the cooler outside atmosphere that one would if the room temperature were excessively high. A heater that can be made to perform the above functions is much to be preferred to one that, however it may heat the air of the room near the ceiling, induces a cold draught near the floor, as this means "hot heads and cold feet." The writer arrived at the above conclusions after carrying out a number of experiments with various kinds and types of electric convectors and radiators. The tests, which were carried out in a small room, consisted of placing a number of thermometers (about 14) in the room in different positions and at different heights, and observing the temperature rise of each after stated intervals, and so determining the manner in which each different device heated the room. None of the heaters which were experimented with heated the room efficiently: some of them heated the ceiling first, and others concentrated the heat too much in one part of the room. After due consideration the writer came to the conclusion that his ideas could only be successfully carried out by means of luminous radiators, as the difficulty with convectors was that it was not possible to direct the heat where it was wanted, whereas radiant heat could by means of suitable reflectors be directed to any part of the

room without difficulty. Some people are inclined to imagine that a certain amount of power is wasted in a luminous radiator because it gives off light: this loss of power is so small, however, that it can be neglected, and is more than counterbalanced by the cheerier appearance obtained.

In order to carry the above ideas into practice a luminous radiator was designed which consisted of an ordinary horizontal radiator lamp having a consumption of 250 watts, placed horizontally and at the focus of a parabolic reflector. The lamp and the reflector were fixed relatively to one another and the reflector which held the lamp was supported on a frame which stood some 12 in. off the floor. The reflector was held in such a manner that it could be tilted so that the heat rays given off could be directed at practically any desired angle with the floor. As the rays given off by such a reflector would be in parallel lines, by tilting the reflector any desired heat density could be arranged. The radiator was purposely designed in small units so that by placing these at suitable points round the room concentration of all the heat at any one point was avoided. In the subsequent tests with this form of radiator, the heaters were placed in such a position, and the reflectors tilted at such an angle, that the floor appeared to be equally well covered by luminous heat. The results obtained were almost exactly what might have been anticipated, *i.e.*, the atmosphere throughout the room was very nearly uniform whilst the hottest part of the room was the floor which was in direct contact with the radiant heat rays. The tests were particularly satisfactory, as they showed that it was possible to utilise all the power absorbed by the radiator as useful heat. Very little heat was given off from the radiator by convection, the reflectors remaining practically cold after the heater had been on for some hours; it was, therefore, safe to assume that all the heat given off was in the form of radiant heat, and as this was all reflected on to the floor the heat was all turned to a useful purpose.

One of the great advantages of radiant heat, apart from its pleasing effect, is that it is not necessary to switch on the radiator for any length of time before using a room, as its full heat becomes apparent directly one comes in line with the heat rays.

One of the chief arguments put forward by opponents to electrical heating (although they admit the system is feasible) is that it is much too costly for the ordinary man in the street. Any such statement can safely be refuted provided that electricity can be obtained at 1d. per unit, as against gas at 2s. 6d. per 1,000 cb. ft., as if electricity is properly applied it is just as cheap as gas.

To take a concrete case where a man has a small office in which he spends most of his time sitting at a roll-top desk; one radiator such as described above placed in the knee hole, screwed to the back and at the top, the reflector being tilted to reflect the heat on to the floor, should prove ample to keep that man warm. The cost per hour with electricity at 1d. per unit is only 1d., and it is doubtful whether either a coal or gas fire could show such good results at the price.

A room having a floor area of 200 sq. ft. should not require more than a unit of electricity per hour to heat it under ordinary winter conditions in England, provided, of course, the heat is used to the best advantage.

The scheme the writer would like to see adopted, and, no doubt, it will some day come along, is that every house should have a proper system of ventilation. A very good form of ventilation to adopt with a heating system such as outlined above, is to draw fresh air in and along one side of the room near the top, and expel the vitiated air by means of an exhaust fan placed in the opposite wall and at the same height. Suitable convectors could be placed in the air inlet, which could be switched on in very cold weather to augment the heat given off by the radiators.

---

**Electricity in Agriculture.**—The *Fruit Grower* states that very careful trials in electro-culture are being carried out this year at Dumfries and Balmakewan, as well as by the U.S.A. Department of Agriculture, to which a set of Lodge high-tension discharge apparatus has been supplied. The Egyptian Government Department of Agriculture has also a set on order.

## AGREEMENTS FOR "HIRE" AND "HIRE-PURCHASE."

By "EXCELSIOR."

It is generally recognised that, where the law permits, electrical undertakings should have a department for hiring out motors and other consuming devices whose purchase prices are high. It is incumbent on these undertakings also to see that their interests in this connection are safeguarded from unscrupulous consumers, by having definite regulations laid down for the operation of these appliances, and to have concise terms formulated, so that no dubiety can possibly exist in the consumer's mind as to the conditions under which the "hire" or "hire-purchase" is granted. It is necessary, therefore, that an agreement should be drawn up in each case so that the obligations of both parties may be clearly set forth before the hiring is commenced.

An agreement has been defined as "An act in the law whereby two or more persons declare their consent as to any act or thing to be done or forborne by some or one of those persons for the use of the others or other of them." Some Corporations and Borough Councils are content with the hirer's simple note of hand, while others draw up elaborate instruments and have them embossed with 10s. seals to ensure their legality in case of disputes arising between the hirers and the supply authority.

The validity of an agreement does not, however, depend on the seal which it bears. If it is a simple unsealed document, there must be some worthy consideration for the promises made by either party to the agreement before it can be held as valid; while an agreement under seal is binding even without any consideration. It is not necessary, therefore, to affix a seal to an agreement for the "hire" or "hire-purchase" of a motor or cooker, as both parties have certain obligations to fulfil. A hire agreement, written, printed, or partly written and partly printed, will be held as quite satisfactory in a court of law, provided a sixpenny stamp has been cancelled on the agreement form. The wording should be almost always of a formal nature, expressing the intention of the parties in correct legal language, and avoiding punctuation as much as possible.

The commencement of the agreement should be "An Agreement made," and then the date should follow. After an accurate description of the parties, including the names, residences and occupations, each party may be subsequently indicated by reference to the character in which they enter into the agreement, as "the owners" or "the hirer." The order in which the parties are placed at the beginning should be maintained throughout the document. With regard to the remainder of the agreement, brevity and simplicity will be attained by following the order in which the subject-matter would seem naturally to fall: for example, after the introduction and particular promises of both parties have been set forth, the agreement should wind up with general provisions relating to valuations, arbitration, &c.

In drafting agreements for "Hire" or "Hire-Purchase," extreme conciseness is required, and as far as possible, avoidance should be given to the words "reasonable" and "proper," as these, in many cases, leave the matter open to question as to what is reasonable or proper? In certain instances, however, these terms may be used where the intention leaves no room for doubt. The signatures of both parties should be appended to all agreements, as difficulties often arise in proving assent by the non-signing party. It is not essential that the signature of a party should be attested by a witness, but a testing clause may be added as follows: "In witness whereof the said (parties) have hereunto set their hands the day and year first above written."

An adhesive stamp of the value of sixpence should be cancelled by the person by whom the agreement is last signed. A full inventory of the apparatus supplied on "Hire" or "Hire-Purchase" should be included in the form, and reference to the details should be made in the agreement. If, through any special circumstance, marginal additions or corrections require to be written on the printed form, the initials of both parties must be placed in proximity to the additions or corrections to show their respective concurrence in the alterations. It is better that two copies

of the agreement be made and signed by both parties, each party retaining a copy in his possession. This arrangement is, of course, quite arbitrary, but the consumer considers himself in a safer position when he can refer to the signed agreement should he be in doubt about his obligations at any time.

The following form of agreement has been drafted for the guidance of supply authorities who let out motors and other appliances on "Hire" or "Hire-Purchase" terms. With little correction it may be adapted to suit the requirements of many undertakings whose conditions of hire vary from the conditions given in the specimen form.

HIRE OF \_\_\_\_\_.

An agreement made the \_\_\_\_\_ day of \_\_\_\_\_ between \_\_\_\_\_ (hereinafter called the owners) of the one part, and \_\_\_\_\_ (hereinafter called the hirer) of the other part. Whereby it is agreed as follows:—

1. The owners will let to the hirer a \_\_\_\_\_ (hereinafter called the \_\_\_\_\_) detailed in the schedule hereunder written, to consume electricity from the owners' mains, and on or before the \_\_\_\_\_ day of \_\_\_\_\_ to be placed in the premises occupied by the hirer, situate at \_\_\_\_\_, for the term of one year from the \_\_\_\_\_ day of \_\_\_\_\_ next, at the yearly rental of \_\_\_\_\_, payable quarterly in advance on the \_\_\_\_\_ day of \_\_\_\_\_, the \_\_\_\_\_ day of \_\_\_\_\_, the \_\_\_\_\_ day of \_\_\_\_\_, and the \_\_\_\_\_ day of \_\_\_\_\_, the first payment to be made on the \_\_\_\_\_ day of \_\_\_\_\_ next.

2. The owners will supply and fit up the \_\_\_\_\_ on a foundation to be prepared and paid for by the hirer. The cables, tubing, switches and cut-outs between the owners' service fuses and the \_\_\_\_\_ shall also be provided and paid for by the hirer, and the work will be subject to the conditions and regulations issued by the \_\_\_\_\_ for the wiring of consumers' premises.

3. The owners will, during the period of hire, inspect and examine the \_\_\_\_\_ from time to time, and will replace, on request, such part of the said \_\_\_\_\_ as shall be worn out or destroyed or damaged by damp, or by the use and wear thereof be rendered unfit or unsuitable for the use of the hirer.

4. The owners will indicate by a plate affixed to the \_\_\_\_\_ that the same is the property of the owners, and the hirer shall not remove the plate without the written consent of the owners.

5. The hirer will pay the said rent without any deduction, keep the said \_\_\_\_\_ clean and in good order and condition (in which he admits the same now to be), and preserve the same from injury, except such as may be occasioned by damp or by the use and wear thereof, and deliver up the said \_\_\_\_\_ to the owners, or to such other person as they shall by writing appoint at the end of the hirer's tenancy, clean and in good order and condition.

6. The hirer shall pay the cost of all lubricating oil and carbon brushes, which must be purchased from the owners.

7. The hirer shall permit all servants of the owners to have access to, and inspect, the \_\_\_\_\_ at all reasonable times, every such servant producing to the hirer on demand a card authorising him to inspect the said \_\_\_\_\_.

8. The hirer will not remove all, or any part of, the said \_\_\_\_\_ to any other place or places without the consent, in writing, of the owners, nor without such consent underlet or otherwise part with the possession thereof to any other person or persons whomsoever, unless by law required so to do.

9. In case the said \_\_\_\_\_, or any part thereof, shall be damaged by fire or water, or negligently or wilfully destroyed or rendered useless by the hirer, the hirer will within \_\_\_\_\_ days next after such destruction or damage respectively, either replace the \_\_\_\_\_ or part thereof with a similar article of equal value, or pay unto the owner the full value of such article or articles as shall be so destroyed or damaged.

10. The owners may determine the agreement and take possession of the said \_\_\_\_\_ and for that purpose enter upon any premises on which the same shall be if default is made for \_\_\_\_\_ days in payment of any instalment of \_\_\_\_\_ after the same is due or if the hirer commits any breach of any stipulation hereby made binding upon him.

11. The hirer may determine the hiring at any time by requiring in writing the owners to remove the said \_\_\_\_\_ at his risk and cost and paying up all payments which, at the date of such removal, have accrued due hereunder.

12. The determination of the hiring by either party shall not affect the right of the owners to recover from the hirer all rentals which shall have accrued due at the date of such determination and damages for the breach of this agreement.

In witness whereof the said \_\_\_\_\_ and \_\_\_\_\_ have hereunto set their hands this \_\_\_\_\_ day of \_\_\_\_\_ in the year \_\_\_\_\_.

D.P. FUSE .....		Amps. ....	
Other appliances .....			

The "Hire-Purchase" Agreement will be almost identical to the "Hire" form, with the following exceptions:—In Clause No. 1 the words "one year" will be altered to suit the period of hire-purchase, and a conclusion to this clause appended as follows:—

"Upon payment by the hirer of \_\_\_\_\_ quarterly payments of \_\_\_\_\_ each to the owners the said \_\_\_\_\_ shall become the absolute property of the hirer, but until such payment has been made the \_\_\_\_\_ shall remain the sole property of the owners."

In Clauses 4 to 9 inclusive, the phrase "during the period of hire-purchase" should be inserted at a suitable place in the composition. The word "rentals" in Clause 12 should be replaced by the expression "hire-purchase instalments."

Under the Electric Lighting (Amendment) Act, the proprietor's power of distraint does not apply to electrical apparatus on "hire" or "hire-purchase" in a consumer's premises, so that it is not absolutely necessary to obtain the proprietor's signature to the agreement.

The proprietor's consent to the placing of the motor or cooker in the premises should, however, be obtained in writing, and it will add to the effectiveness of the document if a note regarding his power of distraint is also inserted in the proprietor's memorandum. A suitable form is given below:—

PROPRIETOR'S MEMORANDUM.

\_\_\_\_\_ the undersigned, hereby agree to the installation of a \_\_\_\_\_ in the premises at \_\_\_\_\_ occupied by \_\_\_\_\_ and \_\_\_\_\_ also agree that should the tenancy of the within mentioned hirer become determined at any time the within mentioned owners shall be at liberty to enter the said premises and remove the said \_\_\_\_\_ and \_\_\_\_\_ further agree that \_\_\_\_\_ powers of distraint shall not apply to the said \_\_\_\_\_.

**Worm-Gear Testing.**—A paper read recently by Mr. F. W. Lanchester referred to a new method of testing introduced in a machine built, to the author's design, by the Daimler Co. With its efficiency tests can be made with great accuracy, the average error being probably less than one-tenth of 1 per cent. The National Physical Laboratory certifies the accuracy as within one-fifth of 1 per cent. In the course of his remarks, the author said that many facts of importance had been elucidated by the new method, among them that the loss of efficiency at reduced speeds is far less than previously supposed—in motor-car work it rarely falls below 94 per cent. The importance of lubrication was shown; mineral oils were found inferior to others, the viscosity of the oil is no guide to its suitability, and too much lubricant lowers efficiency. The heavier loads are carried with the best results at high speeds of revolution.

**Booming the Electric Motor Vehicle.**—Further evidence of the activity of the Electrical Vehicle Association of America in booming the use of electric motor vehicles was seen in the two-day Congress just held in Boston, when about 1,000 central station men were present. Among the papers read was one on "The Growing Popularity of Electrics," by Mr. H. H. Rice; another on "How a Central Station can develop its Electric Vehicle Load," by Mr. W. C. Anderson, and one on "What Service should the Central Station furnish Owners of Electric Cars," by Mr. L. R. Wallis.

**Canadian Tariff on Electric Stoves.**—The Canadian Customs authorities have lately given a decision to the effect that the duty to be imposed on electric stoves is at the rate of 27½ per cent. *ad valorem*, under the general tariff, 25 per cent. under the intermediate, British goods being, however, dutiable at only 15 per cent.

## TRADE STATISTICS OF EGYPT, 1912.

THE following statement, showing the imports of electrical and similar goods into Egypt during the year 1912, is taken from the recently-issued trade statistics. The figures for 1911 are added for purposes of comparison, and notes of any increases or decreases are given:—

## THE ELECTRICITY SHOWROOM.

By "ATTENDANT."

OF all places of interest and amusement none can compare with an electricity showroom.

Designed entirely for the purpose of advertising the supply company, the showing of new electrical appliances and fittings, and for advocating the general use of electricity, it becomes by force of circumstance converted into a haven and refuge from the weather, an inquiry bureau for any and every subject under the sun, a receiving office for complaints, and has even been used as a medium for practical joking.

The writer, in this short article, is endeavouring to interest his readers by recalling a few of the most amusing incidents which it has fallen to his lot to hear of or to witness.

It has been stated above that the showroom is looked upon by some as a haven in the storm, and it is indeed a fact that not only travellers and contractors, but the public generally often use it for that purpose. Some of these people even go so far as to say that they have just dropped in till the rain has ceased, while others, not so straight-forward, proceed to occupy the attendant in some conversation until the weather outside is more inviting. It is needless to add that these people can always be distinguished from genuine inquirers, for their conversation usually lags, and more often than not bears on any subject other than electricity. Possibly they are under the impression that the duties of an attendant are merely to attend, and they little think that while they are so wasting his valuable time he has other more important matters to deal with.

Sometimes, by way of a change, persons having no intention of purchasing fittings, or even installing electricity at all, will bounce into the showroom with a question such as this: "Is this the only showroom that you have, or is there another upstairs?" Or they will ask, "Do electric heaters give out heat?" and forthwith proceed to warm their chilled bodies. You can nearly always rely on these people being weather-bound, and, the storm having passed over, or they themselves having been sufficiently warmed, they proceed on their journeys feeling, no doubt, a sense of satisfaction at having patronised the Electricity Department, by visiting their showroom and learning a little of the great value of electricity.

It is, however, as an inquiry bureau that the showroom is at its best. Here are a few of the inquiries, some by personal investigation, others over the 'phone:—

A lady called in a certain showroom one afternoon to inquire if they had any houses to let. Still another lady wanted to know if they sold wedges for windows.

By way of variation, a gentleman rang up to know whether there was any electrical means of maintaining a gas flame at a definite height, and how many heat units there were in a unit of electricity. These may be fairly sensible questions, but they are rather a tax on the average showroom attendant.

Another gentleman called in to know "why two lamps burning in series consumed less electricity than one in parallel." He had in this case been instructed by a local contractor, who merely knew that it was so, but could not give the reason. When the absurdity of the proposition was pointed out to him and the true facts were given, he would not believe it, because he said the company did not like series wiring owing to its economy, and, moreover, it was not to the advantage of the contractor to deceive him.

A "Ratepayer" called in one day, and asked, "Is the electricity undertaking run for the benefit of the ratepayers?" On being told that it was so, he wanted to know why there were no mains in the particular street in which he lived. He was then told that the Council did not lay mains for the mere fun of the thing, and could not undertake to do so unless they received some sort of guarantee that it would not be wasted expenditure. He was not satisfied however. He seemed certain that the Council had some ulterior motive in refusing to lay mains except on these terms, and went away in a wrath promising the attendant that he would hear more of the matter. As it was just before the Council election it seems probable that the gentleman wanted his information for some party purpose, but whether that be so or not, no more was heard of a "Ratepayer."

"Do you want to buy a second-hand gas-engine cheap?" Such was the question that fell on the startled ears of an attendant on one occasion. He replied that the showroom was the property of the Electricity Supply Co., and that they did not deal in gas-engines, much preferring electric motors. But the inquirer was unabashed. "I thought perhaps you could use it to drive some of your electrical motors with," he replied, much to the amusement of the man in charge.

The persons who come to pay the gas account or who want a wick to fit the top of some particular make of oil lamp are innumerable; but there is another type of inquirer who pesters the life out of the average showroom attendant.

The showroom is usually situated in some conspicuous place, and it is, perhaps, for this reason that it becomes the happy hunting ground for so many professional canvassers or cadgers, whichever you like to call them. In any case, they number occasionally anything up to six per day, inquiring "would you like to subscribe to this or that?" As the attendant has to keep up a good personal appearance, it may be that he looks wealthy and prosperous; and if that reason suits the case we have, at least from the attendant's point of view, a sound argument in favour of the simple life.

One naturally expects complaints in a showroom, but some of those received can only be described as exceeding the limit. Take the following as an instance:—A reverend gentleman complained one day that the company in laying the electric light next door had broken the flag at the gateway, thereby causing the gate support to tilt over, so that he (the reverend gentleman) could not open or shut his gate. The attendant thought it unlikely that their workmen had been guilty, since, as he pointed out, they did not in any way touch the stone, but simply ran through under it, at a distance of some 3 ft. below it. But the reverend gentleman persisted; he had, in fact, been pointing it out to everybody, telling them "that is what the electricity people do for you," for quite a long time. On asking what his reverence meant by a long time, the attendant was very surprised to hear that it occurred 10 years ago. The chief engineer, who happened to be standing in the showroom, overheard the remark and took up the case, pointing out that it was hardly in keeping with the gentleman's profession to "slang" the Supply Co. for 10 years, and then ask them to repair what might have been an accident on their part.

Almost as curious was the complaint of the lady who wanted the Supply Co. to alter their voltage to suit a kettle she had picked up cheaply. "Why did not all the companies work at the same voltage?" she asked, and indeed why?

There is plenty of scope for practical joking in a showroom, but the following is an example of the worst kind.

A "lady" one day called at one of our suburban showrooms and giving an address in Park Lane ordered a large quantity of elaborate fittings and appliances, none of which were in stock. The attendant, however, was a bit suspicious, and did not get the goods, and it was as well, for although the "lady" promised to look in again on the following Tuesday, she was neither seen nor heard of afterwards.

The following, although it was taken as a joke, was probably not intended as one. A lady called in with a box containing a small bell and battery which she wanted repaired. She was informed that work of that nature was not undertaken by the department, but out of kindness the attendant offered to look at the job, and finding that it required a new battery told the lady to go to a contractor who would supply her with one. Judge of his astonishment when, a little later in the day, he received the following note:—"Mrs. ——— regrets that he ——— Borough Council is not capable of mending her small bell."

The writer has endeavoured to select the best out of an almost limitless supply of incidents, but without doubt there are many more favoured persons who could give experiences which would provide even more interesting reading than the examples selected here. However that may be, no one will venture to dispute that the Electricity Showroom is one of the funniest places ever invented.

## PROCEEDINGS OF INSTITUTIONS.

### Röntgen Society.

A GENERAL meeting of the RÖNTGEN SOCIETY was held on June 3rd, when PROF. C. G. BARKLA delivered a lecture on X-ray reflection. This line of work was started, he said, by Friedrich, Knipping, and Laue some months ago in Germany, and these physicists proved that when a beam of X-rays was transmitted through a crystalline structure impressions were obtained on a photographic plate, not only of the direct beam, but of a large number of faint secondary pencils, resulting in a complete interference pattern, as though it might have been produced by a beam of light passing between a series of regularly spaced obstacles. After recounting the work of Bragg, father and son, and others along this line of investigation, Prof. Barkla said that in his own experiments he had used X-rays emerging from a pinhole aperture and projected them through a sheet of rock-salt, 2 mm. in thickness, placed some 40 or 50 cm. from the anticathode. By the effects obtained on a photographic plate after the X-rays had passed through the crystal, he was able to demonstrate that the laws of regular reflection were observed by the Röntgen rays. The reflections obtained were due to the vibrations set up by the impinging waves upon the constituent electrons within the molecules of the crystal surfaces, and from this point of view a crystal surface was different from a surface of mercury or of any polished metal. The X-rays were not reflected regularly from a surface of mercury, because such a surface, although appearing to be a plane, had in reality irregularities of molecular structure which were large as compared with the wave-length of the Röntgen radiation. Every molecule in a surface, on being submitted to the X-ray beam, sent out a train of rays: but unless certain relations held as to the distance between molecule and molecule, there would be destructive interference, with consequent effacement of the effect. In a crystal, however, the molecules were arranged perfectly in definite planes, giving a surface of sufficient regularity to produce regular reflection. Prof. Barkla showed a large number of photographic results with selenite, tourmalin and other crystals, and pointed out the arrangement of the numerous secondary pencils around the central opaque patch, which was due to the direct beam. The intensity of these secondary reflection effects was in no case, he said, near 1 per cent. of that of the primary, but the phenomena were sufficient to prove that the X-rays were regularly reflected exactly like light from the planes in the crystal. Dr. R. W. A. Salmond also read a short paper on a cognate subject, expressing the view that in crystallography was to be found the most promising field for X-ray investigation, and the chairman (Mr. Duddell), in summing up the discussion, said that, it having been proved that X-rays could be reflected, they would probably be found capable of being refracted, approximating to light in their properties, so that there would be no further need to call them "X"-rays.

### Municipal Tramway Managers.

#### ANNUAL CONFERENCE AT SUNDERLAND.

THE annual Conference in connection with the Managers' Section of the Municipal Tramways Association, was held in the Town Hall, Sunderland, on Thursday and Friday last week. Between 50 and 60 delegates attended the opening session, which was presided over by Mr. A. R. Fearnley. A detailed description of the methods under which the Sunderland system is worked was given by the general manager (Mr. A. R. Dayson), who, at the close of his address, was closely questioned in regard to transfer tickets, which are extensively used in all sections of the system. During the debate, it transpired that not more than 8 per cent. of the municipal tramway systems in the kingdom utilise the transfer ticket, and the general opinion of the Conference was against any further extension of its use on the ground that it tended greatly towards the encouragement of fraud both on the part of conductors and passengers.

A paper on the "Interim Report of the Rail Corrugation Committee," read by Mr. R. H. WILKINSON, was discussed at considerable length. The general trend of opinion was that the vibration theory would prove the most likely in regard to the cause, and the Special Sub-Committee dealing with the question was requested by resolution to pay particular attention to this phase of the problem.

Under the presidency of the Mayor (Alderman Richardson), the delegates were entertained to luncheon, and in replying to the toast of the "Municipal Tramways Association," MR. FEARNLEY said that that body fully realised the responsible position they now filled. They represented a capital of 55 millions sterling invested in municipal tramways, which were returning an aggregate revenue of 12 millions per annum. A few years ago the numbers of passengers carried by railways and tramways were about equal, but last year the latter carried double the number of passengers accounted for by the former.

A sea-trip along the coast of Durham and Northumberland followed, after which the delegates were landed at South Shields, and there the delegates partook of tea in the Town Hall as guests of the Mayor (Councillor J. W. Henderson). In the course of a brief speech his WORSHIP illustrated the advantage of a municipal tramway service over one controlled by private enterprise, so far as the community were concerned, by quoting the experience of South Shields. In the early days of their system they received invaluable advice and assistance from the neighbouring borough of Sunderland, which could not have been given or expected had the tramways there

been in the hands of a private company. A cruise up the Tyne, past the Elswick Works of Armstrong, Whitworth & Co., concluded the day's entertainment.

Practically the whole of Friday morning was devoted to the discussion of a paper by the secretary, Mr. C. J. Spencer (Bradford), on "Petrol and Trackless Trolley Vehicles." At the outset Mr. Spencer said he tackled the question with an absolutely open and unprejudiced mind. It was common ground that some cheap form of transit was needed in many districts where tramways proper were prohibitive owing to the heavy capital expenditure. That fact was amply proved by the great number of applications before the current session of Parliament for railless trolley and motor-omnibus powers in various parts of the country, even having full regard to the uncertainty of the law on the question of who was to bear the full burden of road maintenance. He did not doubt for a moment that if that question could be satisfactorily settled without any very serious burden being thrown upon either motor-omnibus or railless trolley operators, there would be an enormous development of these means of transit throughout the country. Speaking from the public point of view regarding both railless trolley vehicles and motor-omnibuses, he would wipe out of consideration the experiences with the very early types and consider what they might reasonably expect with vehicles constructed in the light of modern experience and capable of efficiently providing public service. The modern motor-bus certainly did not run so smoothly as a rail-borne-car and could not be expected to do so. With the motor-bus the noise of moving machinery was reduced to a minimum, and with proper maintenance and care should not exceed the tramcar in that respect. But whatever might be the case at present, it should be possible to construct railless trolley vehicles to run more quietly and with less vibration than motor-omnibuses. The absence of spur-gearing, or chains, in the case of future railless trolley-cars was bound to result in less vibration and noise, and consequently smoother running, than could possibly be the case with the internal-combustion types. On the other hand, the motor-omnibus had no trolley pole, and consequently no hissing noise from that source, and it might be admitted by even the railless trolley bigoted expert that the petrol omnibus did not need to stick to a silly groove, but could wander over fields, hedges and pavements at its own sweet will. With regard to convenience and facility of operation, it had been argued that there was a considerable advantage in a railless trolley extension system in connection with an existing tramway system of considerable size, on account of the fact that after all a railless trolley-car was little more than a tramcar running on road wheels, the overhead equipment being the same. On the other hand, if a small number of motor-buses were purchased the position was altered; their design was altogether different from a tramcar, their inspection and maintenance were of a far higher order and quite another type of fitter and staff was required to handle them, and, where their number was small, it was difficult to get the fullest economy and efficiency from a special staff. In regard to traffic expenses, he submitted that an average figure in a semi-industrial area would be 2'67d. for the motor-bus and 2'5d. per car-mile for the railless-trolley vehicle, the extra 1'7d. in regard to the motor-bus being for lubrication. Under the head of general expenses they might fairly assume that, with two exceptions, all were common to both. As the law stood at present the rates on railless trolley-cars were in excess of those paid for omnibuses. So far as his knowledge went, the railless trolley-car would be rated on its revenue-earning capacity and the petrol omnibus on the rateable value of the garage. What the ratio of these two figures really was he could not say. On the other hand, he thought it might be fairly argued that the liability to accident with a railless trolley-car was less than with a motor-omnibus, and certainly the amount paid for fire insurance would be higher in the case of the motor-omnibus. After discussing general repairs and maintenance, which he estimated at 1'79d. for the railless trolley-car and 2'21d. for the motor-omnibus, and power at 2d. per car-mile for petrol and 1d. for electric energy, he summed up the total cost per car-mile of running the respective vehicles as 6'09d. for the railless trolley-car and 7'71d. for the motor-omnibus. Turning to capital costs, he argued that the petrol vehicle was, and would continue to be, the most expensive, and if they took its useful life at 100,000 miles and the capital cost at £850, with a life of five years, they would have to pay a sum of 2'27d. per car-mile for interest and depreciation charges. In the case of the railless trolley £750 should be a fair cost of the vehicle, and with a life of 10 years, or 200,000 miles, the cost per car-mile in interest and depreciation charges would be 1'09d. Thus they had a total cost, including capital charges of 9'98d. for the motor-omnibus and 7'18d. for the railless trolley car.—Mr. J. W. Hame next submitted a paper on "The Standardisation of Specifications for Tramcar Equipments," after discussing which the Conference terminated with a brief meeting of the Executive Council.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"ANXIOUS" writes:—"I am desirous of erecting private overhead telephone wires in a town, but am informed that it is necessary to obtain permission from the Postmaster-General. Will you kindly say if such is the case, and if so, is it necessary to pay an annual wayleave?"

"\* It is well-settled law that the telephone is part of the monopoly of the Postmaster-General, and that it can only be used under licence from him. Even the late National Telephone Co. were his licensees. The only exception to the rule is that a man may sometimes have a private telephone between one part of his business premises and another, or between his house and his business premises; but in that case he must obtain wayleaves from private persons over whose property he carries his wires.

"UNIT" writes:—"I received an order for a small plant complete with wiring for a certain number of lights. During the progress of the work additional lights were added, by the client's instructions, to quite twice the original number. This necessitated a larger engine, dynamo and battery, which was put in also to the client's verbal instructions, and now that the account has been sent in he refuses to pay. I might say that the account is quite twice the amount of my original estimate. I am quite agreeable to have an independent valuation made, but this the client will not entertain."

"\* It is not easy to give a satisfactory answer to this query without access to the documents. Assuming, however, that a certain number of lights of a certain candle-power were specified, it is manifest that "Unit" was only obliged to provide an engine, dynamo and battery of sufficient capacity for the purpose. If, as is apparently the case from the statement of the facts, the employer not only ordered the extra lights, but the engine, &c., of greater power, it is clear that a new contract has come into existence, which "Unit" can enforce, by suing on what the lawyers call a *quantum meruit*. It should be observed that the mere assent of an employer to alterations is not generally sufficient. So in the case of *Lovelock v. King*, 1831, 1 Mov. and Rob. 60, a carpenter had agreed to alter certain premises for a fixed sum. Considerable deviations were made from the original plan, which it was alleged the employer had seen and not objected to. The carpenter sued for the "measure and value" price of all the work done. It was laid down that the employer was not liable for any larger sum than that paid by the contract, by reason of his assenting to deviations, unless he was expressly or impliedly informed that such deviations would increase the cost.

"TROP" writes:—"The supply of energy over a considerable area is controlled by a public supply company; this company supply to a works in a village about 6 miles distant a load of about 200 kW., where it is transformed and converted to 220-volt D.C. and 440 A.C. The village authority are taking up the question of lighting the streets, and are met at the outset by a rival company promoted by certain officials of the works mentioned. The Council maintain that the works supplied by the supply company, who would thus become secondary supply authority, would be benefiting themselves on account of lower price obtainable for larger quantity of power passed through. Do you consider it would be within the legal right of the Council to insist on the supply authority giving a supply independently of the works mentioned, and is there a statute price of current which the suppliers (whoever they may be) are bound to accept?"

"\* This is a problem which, in one form or another, has frequently been discussed in this REVIEW. It is evident that those who control the works in the village intend to take current at one price from the supply authority and farm it out in the village at a profit. It is very much in doubt whether this is legitimate, but it appears to be a question as between the supply authority and the works, not as between the village Council and the supply authority. If the latter body is not sufficiently vigilant to prevent a supply being transformed and used in this way, that appears to be a matter for the shareholders or ratepayers to take up.

As to the second question put by "Trop," this is clearly answered by Sec. 19 of the Electric Lighting Act, 1882, which provides that "where a supply of electricity is provided in any part of an area for private purposes, then except in so far as is otherwise provided for by the terms of the licence, order, or special Act authorising such supply, every company or person within that part of the area shall on application be entitled to a supply on the same terms on which any other company or person in such part of the area is entitled under similar circumstances to a corresponding supply."

**Oxygen and Hydrogen.**—Referring to the article in our issue of May 16th on "The Commercial Production of Oxygen and Hydrogen" with the I.O.C. electrolytic plant, the British manufacturers, MESSRS. ARTHUR LYON & CO., ask us to state that their address is 608, Caxton House, Westminster, S.W.

**Anglo-German Exhibition.**—The Lord Mayor of London opened this Exhibition at the Crystal Palace on Wednesday.

**The Holidays.**—THE GREAT EASTERN RAILWAY CO. have issued a handbook, "On the East Coast," giving prominence to some of the less known parts of East Anglia and to the country between the Cromer and Hunstanton coast and the Norfolk Broads. The book, which is attractively illustrated in colour, can be obtained free from the superintendent of the line, Liverpool Street Station, London, E.C.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**TRINIDAD AND TOBAGO.**—In accordance with the terms of the Canadian-West Indies Treaty, it is proposed to revise the Tariff of Trinidad and Tobago for the purpose of establishing a system of preferential duties on British (and Canadian) goods as against foreign goods. The new Tariff will come into force at a date to be fixed later, and the following are some of the new rates which will affect readers of the ELECTRICAL REVIEW:—

	Preferential tariff.	General tariff.
Glass and glassware, lamps, &c.	8 % ad val.	10 % ad val.
Electric machinery not provided for below, and electric dental appliances ... ..	8 % "	10 % "
Iron wire... ..	8 % "	10 % "

The following are to be admitted free of duty:—

Articles imported by or for the use of the Colonial Government; electric lighting and power plant on estates or mines; plant for railways and tramways on estates or mines, including rails and rolling stock; mining plant of all sorts, including machinery and pipes for the sinking of oil and artesian wells.

**CANADA.**—The Canadian Customs authorities have issued revised regulations as to the Customs treatment of samples imported into the Dominion which it is intended subsequently to re-export. These revised regulations read as follows:—

1. Samples of dutiable goods, solely for use in taking orders for merchandise, imported temporarily into Canada direct by non-residents from any British country, may be admitted upon deposit of a sum equal to the duty, to assure the re-exportation of such samples within one year.

2. A temporary entry of such samples, in duplicate, with certified invoices annexed in the usual form, shall be presented to the collector of Customs at the port of entry.

The importer shall make and subscribe to a declaration on the face of the temporary entry that the goods described therein are *bond fide* samples for use only in taking orders for merchandise and to be re-exported within 12 months.

3. When the samples are marked by a Customs officer for identification and the temporary entry duly completed, the collector may issue his permission for the release of the samples, upon receiving from the importer a sum of money equal to the duty, so as to assure the re-exportation of all the samples.

4. The permission for the release of the sample goods shall be in duplicate, with a notation thereon that the money deposited with the temporary entry of samples shall be returned to the importer, provided the whole of the said samples be exported within 12 months from the time of entry, with proof of such exportation furnished to the satisfaction of the Collector.

One copy of the temporary entry, with invoice and permission annexed, shall be delivered to the importer, so that the same may be presented to the Customs Officer when samples are re-exported.

**NOTE.**—The foregoing privilege does not extend to articles which, owing to their quality or value, or which, owing to their nature, could not be identified upon re-exportation.

**UNITED STATES.**—With reference to the recent decision of the United States Customs authorities regarding the admission free of duty of materials for the construction or repair of vessels built in the United States, and of all such materials as are necessary for the building or repair of their machinery, it has now been decided that electric light bulbs and fixtures for vessels, and ship telegraph and signalling apparatus and telegraph and telephone apparatus on naval vessels for controlling gun fire, constitute articles of outfit and equipment which are admitted free of duty.

14,704. "Electric lamps." H. BREMER. July 17th.—Electrodes are made of carbon mixed with large proportions of salts of calcium, magnesium, strontium or other metals, to increase the production of light, and such that the electrodes contain at least 5 per cent. of fluorine, iodine or bromine to form fusible slags with the bases, which fall off in small drops near the arc. Calcium fluoride and cryolite are most suitable.

15,118. "Electric conductors." H. EMMERS. July 27th.—Conductors are coated with spirals of paper, and are finally saturated with a mixture of sealing and waterproofing compositions. Coverings of braided jute, &c., or final armourings may also be employed. The paper strips employed are saturated with (1) a sealing or waterproofing composition consisting of a mixture of resinous matter, such as copalophony, and oxidized oil, such as blown vegetable or fish oil, and (2) an oily matter, such as a heavy mineral oil, with or without mineral wax.

16,005. "Incandescent lamps." A. SWAN. August 6th.—Bulbs are attached to stems carrying the leading-in wires and filaments, and their necks are expanded either in moulds so that they will fit caps, or directly in indented caps, by the machine described in the specification.

16,960. "Rheostats and switches." C. DE KANDU. August 21st.—A liquid resistance is controlled pneumatically, together with a short-circuiting switch. Electrodes are fired in a vessel, in which is a bell, the vessel and bell normally communicating through a valve, so that the resistant liquid stands level in them, below the electrodes. Compressed air may be admitted from a reservoir, to close the piston valve in opposition to a spring.

16,961. "Electric tramcars, &c." C. DE KANDU. August 21st.—Relates to electric motors or motor casings for tramway vehicles and the like in which the motors are disposed on the wheel axles. While retaining the largest possible diameter for the rotating parts in order to preserve a high circumferential velocity, the motor casing is brought within the limited space allowed between the lower part of the car and the rails by official regulations by forming or cutting it horizontally.

17,580. "Electric switches." M. GUERTT. August 28th.—Switches giving a quick make and break. The contact lever carrying the contacts is pivoted at one end, and is formed with shoulders  $c^1, c^2$ . The tumbler-lever is formed with two shoulders  $c^1, c^2$ , the former engaging with the contact-lever, and the latter with a spring, which also embraces the shoulder  $c^1$ . On moving the handle the spring is put in tension until the shoulder  $c^1$  clears the shoulder  $c^2$ , when the spring snaps the switch off. The shoulder  $c^1$  then passes sufficiently below the shoulder  $c^2$  to hold up the contact-arm.

17,736. "Telegraphic apparatus." S. G. BROWN. September 2nd.—Relates to transmitting or receiving telegraph apparatus in which the periods of + and - currents received in submarine telegraphy are broken up into their initial impulses for retransmission either directly with or without cur currents, or by means of a perforated strip, the strip being the form in which the message is received.

18,457. "Tramcars." J. TIDSWELL. September 18th.—Obstruction removers for electric and other tramcars. Should the hinged "feeler" meet an obstruction a pivoted catch is released, and allows a bell crank to lower the spring tender close to the track. The "feeler" is reset by depressing a pedal.

20,655. "Electrical conduits, drain pipes, &c." ALBION CLAY Co. and R. LAWTON. October 14th.—Relates to apparatus for moulding the spigot and socket ends of drain pipes and multiple conduits. The spigot end of the conduit is inserted in a mould mounted on a base-plate, and a core is lowered down on guide rods into the centre of a socket. Bituminous composition or cement is then introduced between the mould and core and the ends of the pipe to form a spigot and socket accurately in line with one another.

21,354. "Electric winding-mechanism." H. ARON and ARON ELECTRICITY METERS, LTD. October 25th.—Relates to improvements in mechanism for winding up, or giving tension to, driving-springs. The arm carried by the swinging armature and insulated from it, is provided with two pins. The driving-spring is connected to one pin and conveys the current from the energising coil. The other pin makes and breaks the circuit. An adjustable cylinder fixed by a screw, serves to adjust the tension of the spring, and thereby control the play of the return stroke of the armature.

21,855. "Electricity measuring." H. ARON and ARON ELECTRICITY METER, LTD. October 25th.—Work supplied on a four-wire three-phase alternating system is measured by a pendulum or motor meter in either of two ways. The mains may be connected in any way, and unequally loaded. In one arrangement, the three principal mains contain stationary coils A, B, C, influencing two pendulums, which carry coils connected between the two mains A, B, and the fourth or "neutral" mains; the effects of the coils A, B, on the pendulums are summed, but the middle coil C is placed and connected so that it reduces the effects of both coils A, B.

21,657. "Electric lamps." H. BREMER. October 30th.—Rods are made of angular sections of mixtures of powdered carbon with large proportions of powdered metals or metallic salts, to produce incandescent vapours, and with the addition of 1 per cent. or more of boron, liquid fluorine, or other material to render metallic accumulations sufficiently fusible to drop off the edges of the rods. The light may be coloured by a further addition of 25 per cent. of fluorine, bromine, or iodine, or magnesia. Opposite edges of the rods may be notched at intervals to cause the breaking off of projecting corners, if the arc burns inward.

(To be continued.)

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

## PATENTS EXPIRING IN 1913.

(Continued from page 964.)

13,646. "Electric motors." T. D. HOLICK. July 1st.—Relates to means for stopping, starting, reversing, and varying the speed of electric motors used for driving cranes, hoisting-gear, and other machinery, or for electric traction. The armature and field magnets are arranged so as to rotate in opposite directions, the field magnets being supported by a sleeve on the armature spindle. The gearing is such that if the field magnets are stopped by applying a brake to the drum, the armature will drive the pulley at half its own speed. Similarly, the armature may be stopped by a brake acting on a drum, in which case motion in the opposite direction is derived from the field magnets.

14,304. "Motor road vehicles." W. P. THOMPSON. (Canteno, E.) July 11th.—Relates to the application of electric motors to automobile vehicles, especially motors, in which the power is regulated by varying the excitation of the field magnets. The invention comprises a series-parallel controlling system, a switch acting in conjunction with both the electric controller and the mechanical means for operating the fore-carriage, and a resilient worm driving gear for facilitating the starting of heavy vehicles without shock.

14,703. "Electric lamps." H. BREMER. July 17th.—Electrodes are made of carbon uniformly mixed with luminiferous matter, such as alkaline earths or calcium carbonate, fluoride, or silicate, to increase the production of light, and are coated with material adapted to form a fused slag therewith, this dropping off near the arc. The coating also protects the carbons from the air. Suitable coatings are produced by electroplating with metal or by dipping red-hot carbons in fused boric acid, borax or a neutral or acid borate or alkaline silicate.

12,208. "Electrolytic cells." E. C. R. MARES. (Hooker Electrochemical Co., United States.) May 26th. (Complete.)

12,215. "Means for automatically operating electrical switches for stopping and restarting motors for compressing air and other fluids into cylinders and other receivers." T. C. WALTER and DISPLAYER CO., LTD. May 26th. (Complete.)

12,235. "Electrically-driven automatic lathes." H. KIENZLE. May 26th. (Complete.)

12,238. "Extensible electric light fixtures." F. GARRECHT. May 26th. (Complete.)

12,246. "Electric sadiron." W. H. DALTON. May 26th. (Complete.)

12,253. "Metal filament incandescent electric lamps." EHRLICH & GRAETZ. (Convention date, April 4th, 1913, Germany.) May 26th. (Complete.)

12,311. "Magnetic separators." H. H. THOMPSON and A. E. DAVIES. May 27th.

12,335. "Telephone receiver or transmitter." E. RYAN and H. W. BROWN. May 27th.

12,368. "Magnetic separators." H. J. H. NATHORST. (Convention date, June 4th, 1912, Sweden.) May 27th. (Complete.)

12,377. "Manufacture of stable boron nitride." BRITISH THOMPSON-HOUSTON CO., LTD. (General Electric Co., United States.) May 27th.

12,404. "Means for securing shades, reflectors or other attachments to electric lampholders and the like." G. ST. J. DAY. May 28th.

12,417. "Wire-drawing apparatus." G. WATSON, and W. and D. HOUGHTON and Co., LTD. May 28th. (Complete.)

- 12,421. "Manufacture of tungsten metal bodies." C. GLADITZ. May 28th.
- 12,423. "Machine telephone switching systems." WESTERN ELECTRIC CO., LTD. (F. T. Woodward, United States.) (Divided application on 15,952, 1912, July 8th.) May 28th.
- 12,424. "Machine telephone switching systems." WESTERN ELECTRIC CO., LTD. (F. T. Woodward, United States.) (Divided application on 15,952, 1912, July 8th.) May 28th.
- 12,425. "Machine telephone switching systems." WESTERN ELECTRIC CO., LTD. (F. T. Woodward, United States.) (Divided application on 15,952, 1912, July 8th.) May 28th.
- 12,426. "Machine telephone switching systems." WESTERN ELECTRIC CO., LTD. (F. T. Woodward, United States.) (Divided application on 15,952, 1912, July 8th.) May 28th.
- 12,428. "Automatic electric contact apparatus." V. VON VANGEL. May 28th.
- 12,437. "Means for electrically indicating or counting revolutions of shafts, axles and the like." SIEMENS BROS. & CO., LTD., and F. HIRD. May 28th. (Complete.)
- 12,444. "Electric furnaces." COMPAGNIE POUR LE TRAITEMENT DES METAUX ET DES MINERAUX PAR L'ELECTRICITE. (Convention date, January 19th, 1913, France.) May 28th. (Complete.)
- 12,461. "Electric radiator." A. H. BRAUNERIECH. May 28th.
- 12,463. "Reflectors for electric lamps." C. C. REGNART. May 28th.
- 12,471. "Vapour electric devices." F. CONRAD. (Convention date, June 21st, 1912, United States.) May 28th. (Complete.)
- 12,477. "Governing mechanism for engines." BRITISH THOMSON-HOUSTON CO., LTD. (General Electric Co., United States.) May 28th.
- 12,499. "Means and method of changing the frequency of alternating currents." A. M. TAYLOR. (Addition to 8,533 of 1911.) May 29th.
- 12,527. "Means for indicating or recording or indicating and recording when a storage battery has been charged or discharged to a desired limit." R. RANKIN and ELECTRICAL POWER STORAGE CO., LTD. May 29th.
- 12,544. "Shade or globe for electric light bulbs." N. S. CORNEY. May 29th.
- 12,565. "Inductance coils for telephone or other circuits." SIEMENS and HALSKE ART-GES. (Convention date, May 29th, 1912, Germany.) May 29th. (Complete.)
- 12,566. "Circuit arrangements for telephone systems." SIEMENS BROS. and CO., LTD. (Siemens & Halske Akt.-Ges., Germany.) May 29th. (Complete.)
- 12,575. "Electric arc lamps." SIEMENS BROS. DYNAMO WORKS, LTD. (Siemens-Schuckertwerke G.m.b.H., Germany.) May 29th. (Complete.)
- 12,578. "Electrical regulating systems." W. J. MELLERSH-JACKSON. (United States Light and Heating Co., United States.) May 29th. (Complete.)
- 12,587. "Method and means whereby equalisation of light from an artificial illuminant is obtained." S. MADDOCK. May 30th.
- 12,628. "Automatic electrical advertising writing reproducer." L. J. COLARNOCK. May 30th.
- 12,635. "Arrangements for eliminating irregularities in electric signalling." A. ORLING and ORLING'S TELEGRAPH INSTRUMENTS SYNDICATE, LTD. May 30th.
- 12,638. "Apparatus for transmitting synchronous movements by rotating magnetic field." R. FEDERICO and L. SEGALIN. (Convention date, May 31st, 1912, Italy.) May 30th. (Complete.)
- 12,639. "Apparatus for use in charging electric accumulators." H. LEITNER. May 30th.
- 12,651. "Circuit arrangements for telephone systems." SIEMENS & HALSKE ART.-GES. (Convention date, July 8th, 1912, Germany.) May 30th. (Complete.)
- 12,653. "Automatic light-extinguisher." L. RADET. (Convention date, July 17th, 1912, France.) May 30th. (Complete.)
- 12,670. "Means for adjusting the accumulators of electric safety lamps on charging benches." P. WOLF. May 30th. (Complete.)
- 12,672. "Means for and methods of changing the frequency of alternating currents." A. M. TAYLOR. (Addition to 8,533/11.) May 31st.
- 12,695. "Electrical switches." A. P. LUNDBERG, G. C. LUNDBERG, P. A. LUNDBERG and G. PEGG. May 31st.
- 12,710. "Circuit breakers and the like for the protection of alternating-current induction electric motors." G. ELLISON. (Addition to 13,285/67.) May 31st. (Complete.)
- 12,723. "Testing insulation and other purposes." EVERHED & VIGNOLES, LTD., and S. EVERHED. May 31st.
- REMOTE CONTROL FOR ELECTRICALLY-OPERATED APPARATUS. W. P. THOMPSON. (Ateliers de Constructions Electriques de Charleroi.) 11,537. May 15th.
- DEVICES FOR SETTING THE SELECTIVE CONTROLLING APPARATUS ON A MOVING AUTOMATIC GOODS CONVEYOR OR TRUCKER FROM A FIXED STATION. L. ROTTENBURG and NEW TRANSPORT CO. 11,681. May 16th.
- ECONOMISERS OR SHIELDS FOR MULTIPLE ARC LAMPS. Ges. fur Maschinen- und Metall-Industrie. 11,812. May 18th. (May 19th, 1911.)
- ARRANGEMENT OF RECEIVING STATIONS FOR WIRELESS TELEGRAPHY. Capt. Z. DAN and G. ROTHBLANDER. 12,444. May 25th.
- TESTING OF ENGINES. Electric and Ordnance Accessories Co. and J. Elchells. 13,352. June 15th.
- METHOD OF, AND APPARATUS FOR, THE PRODUCTION OF ALTERNATING CURRENTS OF HIGH FREQUENCY. H. SEFTON-JONES. (Ges. for Drahtlose Telegraphie.) 14,380. June 19th.
- MEANS FOR OBTAINING TWO SEPARATE AND OPPOSITE DRIVERS FROM A SINGLE ELECTRIC MOTOR. H. T. HOLMES and J. KEMP-WELCH. 14,550. June 21st.
- HOLDERS FOR ELECTRIC INCANDESCENT LAMPS. R. WACHMULLER. 14,760. June 24th.
- LEADING-IN CONDUCTORS FOR SEALING INTO ELECTRICAL APPARATUS. British Thomson-Houston Co., Ltd. (General Electric Co.) 15,832. July 1st.
- PHOTOMETERS. Siemens Bros. Dynamo Works, Ltd., and S. H. CALLOW. 15,660. July 4th.
- FIRE ALARMS. A. KIRK and C. J. BAKER. 15,676. July 4th.
- SELECTOR SWITCHING DEVICE FOR AUTOMATIC TELEPHONE SYSTEMS AND THE LIKE. Telephone Apparat Fabrik E. ZWISLUSCH & Co. Ges. 16,151. July 10th. (January 18th, 1912.)
- APPARATUS FOR PROJECTING ON TO A SCREEN IMAGES OF OBJECTS WHICH MAY BE OPaque TO LIGHT. W. H. S. MARIOTT. 16,542. July 15th. (Cognate application No. 123 of 1913.)
- LOU-SPEAKING ATTACHMENT FOR TELEPHONES. H. W. FRANCE. 17,357. July 26th.
- COMBINATION OF SUBSTANCES FOR USE AS CATTLE FOOD, OR FOR INSULATING PURPOSES, AND FOR THE PREPARATION OF COATED FABRICS AND ARTIFICIAL BOARDS. A. S. ROWE. 17,554. July 29th.
- MARINERS' COMPASSES. L. W. P. CHETWYND. 17,768. July 31st.
- ELECTROLYTES FOR USE IN ELECTROMETALLURGY. N. H. M. DEKKER. 17,836. August 1st.
- ELECTRICALLY-HEATED KETTLES, SACEPANS AND THE LIKE. G. H. COLLINS and H. F. COLLINS. 18,911. August 19th.
- INCANDESCENT ELECTRIC LAMPS. C. Joly. 20,361. September 6th.
- CALCULATING APPARATUS PARTICULARLY ADAPTED FOR RECKONING OCT CHARGES FOR THE USE OF ELECTRICITY, GAS, WATER AND SO FORTH. H. BRUCKMANN. 21,443. September 20th.
- DYNAMOS. J. POLKEY and GEORGE POLKEY, LTD. 22,500. October 3rd.
- LEAD ALLOYS FOR TAPES. Western Electric Co. (Western Electric Co.) 25,690. November 1st.
- BOARDS FOR, AND TAPES FOR, TELEGRAPH OR TELEPHONE CONDUCTORS. R. SCHAEFER. 25,449. November 6th.
- SUPPORTS FOR COLLECTOR POLES FOR USE WITH AERIAL CONDUCTORS. C. L. DELACHAUX. 25,577. November 7th. (December 4th, 1911.)
- ELECTRIC ELECTRODE FURNACES. Jussingford Manufacturing Co., A/S. 26,165. November 14th. (April 13th, 1911. Divided application on No. 8,193 of 1912. April 4th.)
- TILTING ARRANGEMENT FOR METALLURGICAL FURNACES. Jussingford Manufacturing Co., A/S. 26,166. November 14th. (April 4th, 1911. Divided application on No. 8,193 of 1912. April 4th.)
- APPARATUS FOR USE IN FORMING JOINT ENDS ON ELECTRICAL CONDUITS, DRAIN-PIPES AND THE LIKE. R. LAWTON. 27,510. November 29th.
- ELECTRIC INCANDESCENT LAMPS. M. SIDON. 27,613. December 1st.
- APPARATUS FOR COOLING INCANDESCENT WIRE AND LIKE ROLLED GOODS. G. MOLLER and J. KOBIG. 27,950. December 4th. (December 4th, 1911.)
- NON-HEAT ELECTRIC ARC LAMPS. W. RODGERS and G. ROWE. 28,027. December 12th.
- MANUFACTURE OF NEGATIVE ELECTRODES FOR SECONDARY ALKALINE CELLS. H. P. R. L. PORSCHKE and J. A. E. ACHENBACH. 29,845. December 27th.
- METHOD OF REFORMING, VULCANISING AND SIMILARLY TREATING INDIA-RUBBER. T. GARE. 8,554. April 11th.
- APPARATUS FOR THE PRODUCTION OF OZONE. W. DUBILIER. 11,090. May 9th.
- MANUFACTURE OF ELECTRIC RESISTANCE BODIES. G. COOPER. 11,889. May 13th.
- MEANS FOR STARTING INTERNAL-COMBUSTION ENGINES (MORE ESPECIALLY THOSE OF MOTOR-CARS OR THE LIKE) AND FOR GENERATING ELECTRICITY FOR LIGHTING OR OTHER PURPOSES. W. H. SCOTT. 11,888. May 13th.
- SYSTEM OF FIRE CONTROL FOR SELF-PROPELLED TORPEDOES. H. W. SHONNARD. 11,459. May 14th.
- METHOD OF, AND MEANS FOR, CLOSING ELECTRIC CIRCUITS. G. C. PILLINGER and L. SUNDERLAND. 11,466. May 14th.
- ELECTRIC SWITCHES. P. V. HUNTER and W. L. SHAND. 11,586. May 15th.
- VAPOUR ELECTRIC APPARATUS. E. E. DARMOIS and M. A. E. LEBLANC. 11,570. May 18th.
- TELEPHONE SYSTEMS. E. A. MELLINGER. 11,964. May 20th.
- MERCURY VAPOUR LAMPS. P. G. TRIQUET. 12,270. May 23rd. (August 30th, 1911.)
- CAR AND TRACK SIGNALLING APPARATUS. J. TREACHER. 12,533. May 26th.
- RAILWAY SIGNALLING APPARATUS. J. STITT. 12,649. May 29th.
- BI-POLAR FORM-WOUND ROTOR WINDINGS FOR DYNAMO-ELECTRIC MACHINES. H. SCHNEIDER. 12,766. May 30th.
- AUTOMATIC ELECTRIC THERMAL CONTROL. S. L. R. PRICE. 15,178. June 28th.
- ELECTRIC HEATER. H. W. PURLE. 15,429. July 2nd.
- PRODUCTION OF MAGNETIC OR ELECTRIC FIELD APPLICABLE FOR CHANGING THE FREQUENCY OF ALTERNATING CURRENTS AND FOR OTHER PURPOSES. M. PLOHL. 15,774. July 5th. (July 11th, 1911.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1912.

- SYSTEM FOR THE ELECTRICAL REGULATION OF CLOCKS AND THE LIKE. L. J. ARON. 23,690. October 15th. (October 16th, 1911.)
- RECEPTION OF ELECTRIC WAVES IN WIRELESS TELEGRAPHY. R. GOLDSCHMIDT. 23,784. October 17th. (October 18th, 1911.)
- ELECTRIC HEATING UNITS. E. C. R. MARKS. (Landers, Fray & Clark.) 24,776. October 29th. (Divided application on No. 10,029 of 1912, April 27th.)
- IGNITION DEVICES FOR INTERNAL-COMBUSTION ENGINES. E. PODLESKE. 25,646. April 30th. (Divided application on No. 10,209 of 1912, April 30th.)
- POCKET IONISERS. L. JAHREISS. 26,861. November 16th.
- THEFT ALARM BOXES AND THE LIKE. R. M. BRYDONE. 27,002. November 23rd.
- ELECTRIC LAMPS FOR AUTOMOBILES. J. GALLAY. 27,783. December 3rd.
- SIGNAL LAMPS FOR AUTOMOBILES AND THE LIKE. W. J. MELLERSH-JACKSON. (Wright.) 29,074. December 17th.
- PRIMARY GALVANIC CELLS. J. A. E. ACHENBACH. 29,847. December 27th.
- METHOD OF, AND MEANS FOR, HEATING WATER AND OTHER MEDIA OR FLUIDS. G. G. BELL. 2,873. February 3rd.
- ELECTRIC LAMPING SYSTEMS. K. E. STUART. 2,957. February 5th.
- ELECTRIC LAMP HOLDERS. H. HALE. 7,552. March 29th. (September 30th, 1912.)
- REGULATION OF THE FREQUENCY PRODUCED BY POLYPHASE INDUCTION GENERATORS. Siemens-Schuckertwerke Ges. 6,070. April 3rd. (April 3rd, 1911.)
- METHOD OF, AND APPARATUS FOR, MOLDING SILICON AND SILICON ALLOYS, AND THE APPLICATION OF THE PRODUCTS AS ELECTRIC RESISTANCES AND HEATERS. G. GUALTIEROTTI. 10,657. May 4th.
- MEANS FOR ESTABLISHING ELECTRICAL COMMUNICATION BETWEEN SHIPS AND OTHER VESSELS AND THE SHORE. A. G. POSSOLO. 10,701. May 6th.
- ELECTRIC INCANDESCENT LAMPS AND LAMP HOLDERS. J. STONE & Co., Ltd., and A. C. T. MYERS. 10,959. May 8th.
- ELECTRIC SWITCHES. A. H. F. PERL. 11,551. May 9th.
- ELECTRIC ARC WELDING. A. P. STROHMMEYER. 11,079. May 9th. (Addition to No. 1,274 of 1912.)
- GRADED SERVICE AUTOMATIC TELEPHONE SYSTEM. H. BRON. (Heimann) 11,261. May 11th.
- ELECTRIC MEASURING APPARATUS OF THE MOVING COIL TYPE. W. H. APTHORPE and Cambridge Scientific Instrument Co., Ltd. 11,279. May 11th.

### 1913.

- ELECTRIC FURNACES FOR FIXING NITROGEN FROM THE AIR. G. HARKER and E. K. SCOTT. 866. January 11th.
- APPARATUS FOR CONTROLLING MOTION FROM A DISTANCE, APPLICABLE MORE PARTICULARLY TO THE CONTROL OF SEARCHLIGHTS OR PROJECTORS, STEERING GEAR AND THE LIKE. Siemens-Schuckertwerke G.m.b.H. 1,017. January 14th. (July 24th, 1912. Addition to 966 of 1912.)
- INSULATING SECTIONAL IRON MASTS. Siemens Bros. & Co., Ltd., and G. W. PERRY. 1,899. January 23rd.
- RAILWAY OR LIKE SIGNALLING OR INDICATING SYSTEMS AND APPARATUS THEREFOR. K. L. STUART. 3,528. February 5th. (Divided application on 2,957 of 1912. February 5th.)
- FIELD MAGNETS FOR DYNAMO-ELECTRIC MACHINERY. Siemens-Schuckertwerke G.m.b.H. 8,627. February 12th. (February 17th, 1912.)
- ELECTRIC ROTATING LIQUID RESISTANCES. II. C. E. BOUTARD. 8,856. February 14th.
- TRANSMITTERS FOR USE IN WIRELESS TELEGRAPHY. J. BABULKA. 6,479. March 15th. (March 15th, 1912.)
- ELECTRIC MOTOR METERS. II. ARON ELEKTRICITÄTSMETERFABRIK Ges. 792. January 10th. (August 28th, 1912.)
- DISTRIBUTOR FOR ELECTRIC IGNITION IN INTERNAL-COMBUSTION ENGINES. Firm of Robert Borch. 5,632. March 5th. (April 12th, 1912. Addition to No. 9,810 of 1911.)

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSPAPER IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AEGEEAT, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

## CURRENT TOPICS AT THE I.M.E.A.

THE proceedings of the Municipal Convention this week have been favoured with ideal weather—weather most appropriate to the discussion on "Heating and Cooking," which is in progress as we write these lines—and the conditions generally are conducive to the most satisfactory and successful results. The cool rooms of the Institution of Electrical Engineers afford a welcome and refreshing shelter from the solar rays, and dispel the languor which might otherwise hamper the eloquence of speakers.

The unabated energy and zeal of Dr. Ferranti must surely inspire enthusiasm in the hearts of his hearers. With a prophetic vision reaching far beyond their view, and a breadth of ideas which embraces the whole field of the electrical industries, he continues to preach the doctrine of "Progress"—downwards as regards the price of energy, but upwards as regards the prosperity of the industry and of the whole nation—which he so ably expounded from the Presidential chair. We are glad to see that Mr. Shawfield, ex-Presidential author of the Presidential address, strongly supports a similar policy. He firmly believes that there is room for drastic reductions in price, and that the outcome of such a policy would be prosperity to the municipal undertakings and to the community in general—a view which we have consistently favoured for some years.

The trouble is that, unlike Dr. Ferranti, the managers of electricity works are far too prone to confine their consideration to the needs and prospects of the immediate future. We do not forget that they unfortunately have to bear in mind the limitations imposed by their committees (though this excuse is wanting in the case of the company undertakings, which, strange to say, are even more timorous than their municipal *confères*)—but enthusiasm is contagious, and a man who is really earnest and enthusiastic can carry with him his associates. We could instance striking examples of success resulting from a policy which, at first sight, might be stigmatised as not merely bold but reckless.

In this connection it is significant to note that whereas at the formation of the "Point Fives" at Harrogate last year but seven were mustered, at the meeting on Tuesday evening held under the auspices of this young Association, no fewer than 120 persons were present, and the proceedings were marked by the greatest interest and enthusiasm. Although the Association numbers only 15 actual members, it has accomplished splendid work in less than 12 months—and on what basis?—the adoption of the charge of one halfpenny per unit for heating and cooking. We have heard that all the manufacturers of apparatus for these purposes are "full up" with work, and there can be no doubt that the movement has acquired an impetus which will carry it far beyond our wildest dreams of a year ago. Such men as Dr. Ferranti and Mr. Chattock thought it worth their while to attend the meeting; we have already mentioned that the former continued his campaign in favour of the lower price, and he also expressed the view that the policy of the "Point Fives" should be energetically pursued in order to *extend the market* for the apparatus employed, and thus bring about the much-to-be-desired reduction in manufacturing costs. To improve the load factor he advocated the adoption of thermal storage, but we fear that, in view of past attempts, this is not a proposition likely to evoke enthusiastic support. But this is, of course, only one of many ways to fill up the load curve. Why not charge storage batteries—the batteries of electric vehicles? In view of our incessant advocacy of the adoption of these, we are almost afraid, though by no means ashamed, to return to the subject: but, fortunately, the exhaustive paper on "Electric Automobiles," read by Messrs.

Watson and Mitchell, under the aegis of Mr. A. Hugh Seabrook (who is also a confirmed advocate of electric vehicles), relieves us of the responsibility. We cannot help feeling that this question is one of the utmost importance to the supply industry, and is bound to compel close attention to its merits in the very near future; and we are glad to learn that active steps are in progress to bring the matter to a head.

Considerations of space preclude further comment on the doings of the M.E.A., but the indications are that this year's meeting will reach the high-water mark of enjoyment, profit and success.

#### The Endowment of Research.

A FORTNIGHT ago Mr. Balfour opened the new buildings of the medical school at Guy's Hospital, and gave an address, in the course of which he touched upon the

subject indicated in the title of this article.

There can be no possible divergency of opinion as to the necessity for research in every scientific profession or industry. The question that arises, however, when the subject is considered, is: Who is to do the work? The ordinary professional or business man in active practice cannot spare the time from his customary avocations. The professor or teacher has more opportunity, but in this country administrative and detail work takes up the greater part of their time. So we see at once that we must have men for this work who are not bound to mix it with other work—not unimportant, but distracting, and fatal to that activity of mind and brain, that clearness of perception and mental vision, which are, perhaps, more vital to achievement in discovery than to success in any other direction. The investigator must, in Mr. Balfour's phrase, possess that kind of originality which will enable him to point out in what direction the next advance should be made, and where progress might be expected, "and who could, by a happy inspiration of genius, perhaps suggest a solution of some long-standing difficulty which might throw light on a multitude of apparently separate phenomena and suggest one line of successful investigation."

Such a man must live, and must be sure that, in turning his talent to the work in which he is able to excel, he is not prejudicing his worldly prospects or sacrificing the interests of those who look to him for support.

The employment of researchers in industrial undertakings, and notably in electrical concerns, has made much more progress in Germany than here. Moreover, the encouragement given to research in educational institutions by manufacturers has been greater. This part of the question was thoroughly ventilated in an important article by one of the professors of Manchester University, in the *Manchester Guardian* of November 20th, 1912. His opinion is that Germany has here got so far ahead that this country can never hope to make up the leeway.

The endowment of electrical research is not unknown here, but is in much the same position as any other privilege in which electricity is concerned. The wealthy world cares for none of these things. It is notorious that, on every occasion on which an honours list is published, electricity and engineering hardly figure in it at all. The services, politics, the law—these are the favoured professions. The moneyed classes turn their sons into them, and maintain them until they can look after themselves—that is to say, they endow them. The average electrical man, with very few exceptions, starts right in on the bread-and-butter tack as soon as he has had a couple of years at college. How, then, can he afford time or money for investigation?

In any scheme for the endowment of research care must be taken that the right men are aided. Every earnest student thinks he would like to be a researcher, but it would never do merely to provide a man with means whereby he should be enabled to loaf away his time in a laboratory.

Why is it that our great concerns find it so difficult to pay their way? Many will jump up at once with suggestions,

but the fact is that the difficulty is cumulative. Lack of money gives rise to lack of educational facilities, and especially to lack of facilities for research. Lack of educational facilities reacts upon the financial question. The work of research and the establishment of laboratories for experiment are the last things thought about—if, indeed, they are considered at all. Plenty of skill, plenty of thought, plenty of energy, are devoted to office organisation, order-getting, and so on, but it is not yet properly realised that the investigator and experimenter is as great an asset to a business concern as the most successful salesman or accountant.

Mr. Balfour appealed to the liberality of the general public on behalf of a true organisation of medical research; and, if the general public is wise, it will respond, because medical research repays the community a thousandfold in the lessening of suffering. It would pay equally well to develop the application of electricity by the organisation of electrical research, for none can deny that the increased and increasing use of electricity has tended in the past, is tending now, and will tend in the future, to the greater happiness of the nations.

#### The Position of Rubber.

THE price of crude rubber is now getting very low, standing as it does in the neighbourhood of 3s. per lb. for the best plantation grades. This figure is considered far more representative of actual market conditions than the rather fictitious and artificially high quotation of hard Para, which shows a premium over the former of about 9d. per lb.

Plantation rubber has now a very free and wide market, and with the method of selling in vogue at the auctions, at which increasingly larger quantities have been handled of late years in consequence of the rapid expansion of the output in the Middle East, trade buyers have been enabled to secure supplies at constant concessions. Yet the expansion of the world's consumption has been fully as great as that of the output, thanks to the steadily increasing uses for the product at the persistently falling prices. Indeed, consumption and production have since 1911, the year of the big boom, been running together pretty closely, hence the statistical position of rubber appears to be healthy. The huge quantities which have become available this season have been remarkably well absorbed by manufacturers in spite of the unusually adverse conditions which have confronted the market.

Notwithstanding the severe political and financial difficulties and the set-back in the American manufacturing trades through labour troubles and the damage wrought by floods, the absorbing power of the market has been really wonderful, and there is certainly no reason to despair of the future of the plantation industry, whose extension will probably be at a much slower rate in a few years' time. This season's Brazilian harvest, now nearing an end, will show a surplus of roughly 3,000 tons over that of the previous season, while the 1913 output of Malaya alone is expected to show an increase of nearly 10,000 tons, making a total surplus of 13,000 tons apart from the notable increase from the Ceylon and other Eastern plantations.

Yet the available stocks of crude rubber are apparently a good deal less than two years ago, the visible supply of Para grades being actually 50 per cent. smaller. About the same increase as for 1913 is looked for in the output of the Malay peninsula for each of the next three years, but in view of the low prices ruling, the prospective increase—assuming that normal progress is not interfered with by unforeseen causes—may be easily taken care of by the rapidly increasing outlet for the product. The steady growth of the electrical trades and other manufacturing branches largely using rubber is calculated to ensure a constant expansion of consumption. During the great boom of 1911 the price of fine plantation rubber rose to 12s. 10d. per lb.; it has since been brought down to about 3s. per lb., and it may possibly dip temporarily to 2s. 6d. per lb., pending a further increase in consumption, but stocks do not accumulate at the present low level.

## THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION'S ANNUAL CONGRESS.

### BLACKPOOL.

#### WHERE HEALTH AND HAPPINESS JOIN HANDS.

Such is the legend which first meets the eye on opening the official guide to the Queen of West Coast Watering Places. However, one in the throes of an acute bronchial attack does not quite appreciate the joining of hands at its true worth. But all's well that ends well, and although we missed the lovely country and picturesque scenery in the neighbourhood of last year's gathering, for nothing will grow in or near the town, there is no doubt about Blackpool being an ideal meeting-place for the members of the Tramways and Light Railways Association, and the record in point of numbers attending the Convention was attained. The sources of Blackpool's witchery are its resources. It is well served by railways, no praise of Blackpool as a health resort can be over-stated, it possesses a record of municipal achievements unequalled by any corporate body, and it combines all the good points of other watering places without any of their faults, and, as Mr. G. R. Sims has it, it strikes the top-note of human happiness.

After the Reception on Thursday morning by the Mayor and members of the Corporation, and Boards of the Blackpool and Fleetwood, and Blackpool and St. Anne's Companies respectively, most of the delegates settled down to the discussion of the papers presented by Mr. E. H. Edwardes and Mr. Fred Bland.

After luncheon, the party left the Imperial Hotel in special cars provided by the general manager of the Blackpool, St. Anne's and Lytham Tramways Co., for Lytham, a delightful journey of 7 miles along the sea coast. The day was perfect, and we all appreciated the trip to the full, for at every turn we were met by objects of interest and, after a time, with pleasing scenery. During a long run through golf links and sandhills we passed the Thursty Holiday Home for Children, where poor boys and girls from Manchester were enjoying themselves to their hearts' content, and looking the picture of health and happiness. How they must have blessed the founder, Sir John Thursty, of Burnley.

Lytham, the terminus of the tramway, is a sweet old town, well wooded, abounding in delightful walks, and having a long stretch of greensward on the front, where we were glad to stretch our legs after a long spell on the cars. Returning, we broke the journey at St. Anne's, another charming and peaceful resort, where the company had very thoughtfully provided an elegant tea for the delegates and their ladies in the imposing and splendidly appointed Imperial Hydro. In 1875 the site of St. Anne's was a waste of sandhills, overgrown with starr grass and wild flowers. Now there is a residential population of 11,000 to 12,000, and a visiting population of 30,000 in the summer months. This and Lytham appear to be ideal places for a quiet holiday, amidst beautiful surroundings and health-giving air.

In the evening we were entertained to dinner at the invitation of the Mayor of Blackpool, Councillor Milton G. Wilde, J.P. The banquet was most choice, excellently served, and reflected much credit upon the management of the Imperial Hydropathic Hotel. The speeches, too, were of unusual merit for post-prandial efforts, especially those of the Hon. Arthur Stanley, M.P., Chairman of the Association, Mr. Harry England, Mr. Alderman Brodie, the genial and breezy chairman of the Blackpool Corporation Tramways and Electricity Committee, Councillor Collins, the ex-Mayor, in the absence of Mr. Alderman Heap, and Sir Edward White, chairman of the L.C.C. Highways Committee.

In speaking of the L.C.C. tramways, Sir Edward deplored the unfavourable returns—we had not then seen the result of the year's working—but he hoped that the falling-off in revenue, owing to motor-bus competition, was only temporary. The wish is, no doubt, father to the thought, but if we are not mistaken, the excessive outlay on the conduit will prove to be an insupportable burden on the finances of the undertaking, and the policy advocated by the ELECTRICAL REVIEW years ago will be amply vindicated. As Alderman Brodie said, the conduit system was a costly affair, though

London had seen fit to adopt it, but the only system that would pay at the present time was the overhead.

The Mayor, in submitting the toast of the Association, referred to the pioneer efforts of Mr. Holroyd Smith, which brought back to us many old and half-forgotten reminiscences of the early days of electrically-propelled tramcars.

The contributors to the musical programme were Madame Susie Higson, Miss Eccleston, Mr. Crumbleholme and Mr. Ben Adams (humorist), with Mr. W. P. Young at the piano, an instrument which, we imagine, he cursed for all he was worth! In the notice to members concerning the arrangements of the Congress it was hoped they would bring their wives. Many did so, and we are fain to believe that much heart-burning resulted amongst the ladies, who had to seek their own amusements during the time the male things were engaged in the gentle art of gastronomy. Perhaps the size of the dining-room was the cause, but as they joined the delegates at dinner last year at the Mumbles, it seemed too bad that they should be deprived of the same privilege on the present occasion.

The next morning, Friday, was devoted to the papers of Mr. Harry England and Mr. A. V. Mason, and then special cars conveyed the members and their ladies to the Norbreck Hydro, for lunch as guests of the Blackpool and Fleetwood Tramroad Co.; thence to Fleetwood to board the steamer *Lady Moyra*, for Barrow and Furness Abbey, returning to the Imperial Hotel for the members' supper and dance.

Not all of us, however, were allowed to remain to listen to the eloquence of those who discussed the papers, for the ladies were bound for the south shore "Pleasure Beach," and Alderman Brodie commanded the great majority of the male persuasion to accompany them to "The Sands of Pleasure," where all the fun of the fair was at their disposal upon presentation of their badges. The representation of the naval battle between the *Monitor* and the *Merrimac*, showing the first engagement between ironclads, was a marvellous spectacle, but this was only the central attraction in the midst of water chutes, scenic railways, river caves, switchbacks, and innumerable other side shows, which made one think of the White City, Earl's Court, and the Crystal Palace rolled into one.

To us, and to several of our intimates who are not votaries of Terpsichore, the ball room of the Imperial offered no attraction, so we quietly wandered down to the Tower, and later sauntered through the ferneries, floral halls, and palm houses of the wonderful Winter Gardens, finally finding our way to the Empress Ballroom, where we discovered an elderly Councillor in full evening warpaint of "clean biled rags and claw-hammer," who had evidently wandered from the fold, footing it merrily with the ladies of his choice. He hails from the outskirts of London, but wild horses would not drag his name out of us. We watched him for some time, and concluded that he was making the best use of the privileges his badge conferred upon him, as the Gardens afford an unlimited range of entertainments to "Improper Peter."

A courtesy which was most acceptable was that extended by the directors of the Athenæum Club, offering us the use of the club premises during our stay in the town for the most successful conference yet held.

Invitations from the management of the Tower, the Palace, the Opera House, the tramway systems and the South Shore Golf Club were also generously proffered to the delegates and ladies.

To Mr. Brodie, whose acquaintance we first made some 18 years ago, we owe our thanks for many kindnesses, and each succeeding year only gives us a higher appreciation of the sterling qualities of Blackpool's popular Alderman. To the Mayor, whom we visited in the Town Hall Council Chamber, and to the Blackpool Corporation, to Mr. England, to Mr. Furness, who was here, there and everywhere, to those who offered us their hospitality at St. Anne's and Norbreck, and last, but not least, to Mr. de Turkheim, the tactful, energetic and ever courteous secretary we wish to make our salaams.

No wonder that the Hon. Arthur Stanley should conclude his speech by hoping that the Association would be invited to Blackpool on many other occasions of the kind, and be given the same good cheery welcome, to which we will add, may we be there to see!

## REPORT OF THE PROCEEDINGS.

The fifth annual Congress of the Tramways and Light Railways Association took place at Blackpool on Thursday and Friday of last week, and was highly successful, both from the standpoint of interest in the papers and discussions, and from the standpoint of enjoyment of the social functions and outings arranged for the delegates. The business proceedings took place in the handsomely-appointed ball-room of the Imperial Hydro Hotel.

The Chairman of the Council (the Hon. Arthur Stanley, M.P.) was unable to be present at the opening, and Mr. Harry England (the Vice-Chairman) occupied the chair. He was supported by members of the Council, Mr. A. de Turckheim (Secretary), and other officials, and nearly 200 members were present.

A very cordial official welcome to the town was extended by the Mayor (Councillor M. G. Wilde), who incidentally paid tribute to the excellent management of the local tramway undertakings; and Mr. R. B. Barningham (Director of the Blackpool and Fleetwood Tramroad Co., Ltd.), and Mr. C. E. Riding (Secretary of the Blackpool, St. Anne's and Lytham Tramways Co., Ltd.) also offered words of welcome.

The CHAIRMAN made a suitable response on behalf of the members. Proceeding to open the business proceedings, the chairman referred in sympathetic terms to the death of Mr. Courtenay, through whose assistance the Association, some years ago, was able to tide over a period of difficulty, and become firmly established as a sound and vigorous body. He suggested that a resolution of condolence should be sent to the bereaved family, and the members agreed, rising in their places.

In calling upon Mr. E. H. Edwardes to read his paper the CHAIRMAN mentioned that the Liverpool Corporation, at a forthcoming meeting, was to consider a motion with reference to the possibility of using the tramways for the conveyance of goods to neighbouring towns.

MR. E. H. EDWARDES, A.M.I.E.E., general manager of the Lancashire United Tramways Co., then read a paper on "The Possibilities of Increasing Profits on Inter-Urban Tramways," pointing out that many such lines had been constructed which presented little prospect of dividends, so that economies were essential. The cost of electrical energy could hardly be reduced, nor could the wages of employes be altered, but the author considered an elaborate uniform unnecessary.

The chief maintenance charge was the maintenance of cars: these were often gorgeously painted and decorated, with unnecessary brass hand railing and other superfluities. An absolutely plain car, built mainly of iron and painted plainly was all that was requisite in the country, as a tramcar was an object of utility and could never become a thing of beauty.

The wear of track and paving was largely due to the ever-increasing motor traffic, which favoured the tramway track. The electrical equipment of the lines was cheap and satisfactory, but could be made a source of unnecessary extravagance. Ornamental bases and collars, massive finials, elaborate scroll work were costly to maintain and were not needed. In the author's experience, a 10 or 20 minutes' service was better than  $7\frac{1}{2}$  or 15 minutes, simply because the former was an easier multiple of time.

The carriage of goods offered an important opening for increased receipts, besides tending to diminish the use of the track by motor lorries. On one road alone between Bolton and Manchester, 150 motor lorries passed daily, and 50 per cent. of them had trailers. The carriage of goods by motor-lorry cost about 4d. per ton per mile, and the cost was likely to increase, owing to the rising price of petrol. An efficient system of electric wagons with two or three trailers carrying about 8 tons each would enable them to improve on this figure and make a considerable profit. Most of the haulage would have to be done at night, and the electrical plant would then be working throughout the 24 hours, improving the load factor. The tramway systems of South Lancashire, shown in the figure, offered extraordinary possibilities for the carriage of goods.

PLAN OF INTERCONNECTED ELECTRIC TRAMWAY SYSTEMS OF SOUTH LANCASHIRE.

At present, owing to the enormous congestion of traffic, the railway companies could not cope with the demand, and delays of a week or 10 days took place before the mills could obtain goods from the docks. Therefore the shippers and manufacturers would welcome any such proposition. It would not pay to lay a siding into every mill, but central goods yards could be established in the manufacturing areas and the goods shipped to lorries for delivery. Such a scheme would offer a fair return on the capital outlay, and would diminish the motor traffic over the tramway tracks. It could only be carried out by co-operation between the various adjoining tramways.

From the statistics of 12 typical undertakings, the author showed that the average cost of energy was 31.6 per cent.; wages (including uniforms), 40.1 per cent.; maintenance and cleaning of cars, 18.2 per cent.; maintenance of track, 6.9 per cent.; maintenance of electrical equipment, 2.9 per cent. of the total. Two of the above were private companies, and the statistics showed that their cost of energy was 33 per cent. less, wages 10 per cent. more, and maintenance of track 75 per cent. more than the above averages.

MR. PARIS (Heavy Woollen District Tramways), in opening the discussion, remarked that running costs were practically standardised to a certain extent, but when they came to be divided under five headings, as was done in the paper, there were found to be many discrepancies, although the totals might almost approximate. In the case of electrical energy generated by a company or a corporation, the charge was 1d. to 1½d. lower than his company had to pay to some four local authorities in whose districts their cars ran. If his company were able to produce their own electricity, they would effect a saving of from £4,000 to £6,000 per year, or from 2 to 3 per cent. on the capital expended on the undertaking. That, of course, was a very big thing. In regard to the heading of wages, they were now in a very unhappy position. All their employes were wanting more money. They had had to face the question, and increase the wages. He did not see finality in it; he was afraid the wages bill was going to be still higher, and they had to consider how they could recoup themselves. As to maintenance of cars, he thought Mr. Edwardes's remarks were quite right. The question of track was a very serious item. Tracks got older and more dilapidated, and road traffic increased. The Act of 1872 made the undertakers repair the track, but in the days when that Act became operative, the cars were drawn by horses, and the track was naturally destroyed by them. Nowadays, the tramway companies and undertakings did not destroy the track. They only used the lines. Yet they went on, year after year, promoting Bills with all the old-fashioned "liabilities" hanging on to them. Why should they have to pay for the track that they did not wear out? Fortunately, a prominent electrical engineer, Mr. Hamilton, who, no doubt, knew their needs and requirements, had just been returned to the House of Commons, and he hoped that his knowledge of all the disabilities with which the electrical and tramway industries of this country were saddled would lead him to make a firm stand on their behalf. He had ruminated over the problem of the carriage of goods on the tramway systems for the last ten years, but could not see his way out of it. In the district that he represented they had no fewer than four different gauges—4 ft. 8½ in. in Leeds, Wakefield, Ossett and the Yorkshire Woollen district; 4 ft. 7½ in. in Huddersfield; 4 ft. in Bradford; and 3 ft. 6 in. in Halifax. How were they going to run through cars? Through goods traffic in the way suggested would be impossible in the West Riding. On the other hand, it seemed to be the ideal thing in Lancashire, and ought to be done.

ALDERMAN SMITH (Liverpool) remarked that the figure of 4½d. per ton per mile was given as the cost of carriage of goods by motor lorry. If they could put three tons of goods upon an electrically-hauled truck, and convey them at the rate of about 1s. per mile during the night time, it appeared to him that it would be quite as good as was the carrying of passengers on some of their best lines during the day time. They would be making a decent income. There were difficulties in regard to the extraction of goods from the docks, and certain other difficulties had been touched upon in the paper, but he thought these might be overcome.

MR. W. CLOUGH (Bury) said that with regard to the maintenance of car bodies, even in the Black Country it might be more economical to have the interiors of cars finished with what the author of the paper described as "finest figured wood." Then they only required to be periodically cleaned and varnished, which was much less costly than repainting in the style he recommended. To some extent this applied to the outside panels. The fact that the bodies were well finished in the painting and varnishing rendered the nightly cleaning much cheaper. He had taken out the figures for both classes of work, and he found that the reduction in cost which Mr. Edwardes suggested was small in comparison with the extra cost of maintenance and cleaning which would be entailed. He could not agree that a 10 or 20 minutes' service was better than a  $7\frac{1}{2}$  or 15 minutes' service, simply because the former was an easy multiple of time. The author ought to look for some other cause for the increase in receipts. A 20 minutes' service might be altogether insufficient, and 10 minutes' service might be too frequent. He would not allow the difficulties to prevent his arranging the exact time-table which the traffic required—run with the least possible number of cars and with the least possible running time. The author suggested that the carriage of goods on tramways could help them in two ways—by increasing the receipts, and by driving off the road motor vehicles which did so much damage to the tracks. They should look at the difficulties they had to overcome before they could secure those advantages. There was no prospect of getting suitable trucks and overhead equipment installed in the dockyards and railway sidings, or in the mill yards and warehouses. Seeing that the tramways would approach this matter as competitors with railway companies, the latter could not reasonably be expected to give the tramways any facilities. If, however, the railways and tramways were prepared to work a combined scheme, it would be possible to devise a means of conveying a railway wagon direct from the sidings to the mills and warehouses. In fact, at the present moment he had under consideration the conveyance of coal wagons from a private siding to a proposed coal yard, a distance of five miles. It was proposed to construct a tramway track as a short extension of the railway track, but at a lower level, and to run the

railway wagons on to the shallow tramway trucks, and so convey the railway wagons along the tramway. Co-operation between railways and tramways was out of the question; therefore, as the author said, it would be necessary to have central goods yards in the various towns. Suppose the tramway authorities formed a joint board with goods warehouses throughout the manufacturing district of Lancashire. The tramway companies would be in the same position as the railway companies were in to-day. On the one hand they would have a set of warehouses or depots connected by tramways. On the other hand they would have a set of warehouses connected by railways, with the admitted additional advantages, in the case of the railways, that there existed facilities for the exchange of goods, and they were able to get into the warehouses alongside the docks. The only way in which the tramways could possibly secure any advantage would be in the cost of haulage. Could the tramways carry goods at a cheaper rate than the railways now charged? The railway company was asked to convey 25 tons of cotton goods from Bury to Liverpool, a distance of 35 miles, and quoted a rate of 10s. per ton, station to station. The total cost was £12 10s. To convey those 25 tons by tramway they would require three vehicles, for they must remember the bulk, as well as the weight of the materials. One vehicle fitted with electrical equipment would cost, say, £750, and the other two, without electrical equipment, would cost £500 each, a total of £1,750. Giving a 10 years' life, and the money borrowed at 3½ per cent., the annual charge of £236 5s. for interest and depreciation, provided the vehicles were in use six days per week, equalled 15s. 9d. per day. The wages and expenses of two men taking the vehicles to Liverpool would be 7s. 6d.; the cost of electrical energy, 1 unit per vehicle per mile at 1d. per unit would be 8s. 9d.; the maintenance and repair of vehicles at ½d. per mile run would be 6s. 7d.; the mileage to be paid to other authorities, say, 6d. per car-mile, which was sufficient to cover wear and tear and renewals of track and overhead equipment, was £2 12s. 6d.; making a total cost of £4 11s. 1d., provided there was a return load. If the vehicles had to return empty there required to be added:—Wages, 7s. 6d.; energy, 8s. 9d.; maintenance and repairs, 6s. 7d.; and mileage £2 12s. 6d., which amounted to £3 15s. 4d., or to a total of £8 6s. 5d. Compared with the present charges of the railway company this left a balance of £4 3s. 7d., with which to pay for the cost of warehousing at each end of the line. Now take the case of the goods carried by motor. At the author's figure of 4½d. per ton per mile, this equalled £16 8s. 1d., but for this amount the goods were conveyed direct from the mill at one end to the shipping warehouse at the other. Therefore, to compare the costs there must be added on to the tramway costs the expense of carting and handling at each end of the line. One mile of carting at each end would be a fair average, and that would amount to £2 10s. The tramway cost would therefore be increased to £10 16s. 5d., and, compared with the motor, this left a balance of £5 11s. 8d. in favour of the tramway, plus any advantage from a return load. There would scarcely be time, he thought, to travel the 70 miles of the return journey between the hours of 11 p.m. and 4.30 a.m., but this difficulty could be overcome by an exchange of crews, which would be possible if worked under a joint control. He believed, with the author, that now that railway rates had been so much increased, and with the increasing cost of petrol, the tramways were to-day in a position to compete with railways or motor haulage, and he would be prepared to meet any others to consider whether a joint board could be formed to take up this question of additional means of revenue. One of the first questions they would have to ask would be whether the tramway authorities had power to enter into this traffic. In the case of his own system, they had power provided that not more than 4d. per ton per mile was charged.

MR. J. W. DUGDALE (Oldham) said it was quite feasible to arrange for a board to deal with this traffic. He represented the important spinning town of Oldham, where there were 89 cotton mills, with 6,250,000 spindles. In Oldham and district there were 197 cotton firms, with 14,750,000 spindles. The amount of raw material used in Oldham was 5,000 tons per week. There were 1,700 tons of raw material brought by road from Manchester to Oldham, and the total quantity of yarn dispatched by road from Oldham to various places amounted to 2,500 tons per week, the quantity to Manchester being 1,000 tons per week. There was a great field there for them.

MR. C. D. STANLEY (St. Helens) said the statement had been made that "Bright, nicely-painted cars attracted traffic." In an industrial town in Lancashire the one thing that attracted traffic was a good and convenient service. To spend 15s. on elaborate decoration of each tramway pole per annum was not only wasteful but artistically wrong. A tramway pole was for use, and should be strong, plain and straight; elaborate work was out of place. In regard to tramway services, on one of their routes they had recently discontinued a 15 minutes' service, and had put on a 20 minutes' service instead, with the result that the service was actually more popular, and there was an increase in receipts. Very largely the reason was that the loops were in very bad places, and the 15 minutes' service did not run well, whilst a 20 minutes' service happened to fit. As to the carriage of goods, he thought a scheme could be devised by which a railway and a tramway could co-operate, just as railway companies and other haulage firms co-operated at present. The carriage of goods on the tramways between Liverpool and the manufacturing districts of Lancashire was bound to come.

MR. EDWARDES, in the course of his reply upon the discussion, said the difficulties in the way of the carriage of goods were increased enormously when all the gauges in a district were different. Fortunately, in Lancashire they were not different. As

to the car decoration, if the inside of a car was lined with deal and stained and varnished, it was equally as good as three-ply maple and figured oak. It was quite as easy to clean, and, in regard to the outside, it was the varnish that implied the cleaning, not the brightly coloured paints and transfers. Clean cars did attract traffic; beautiful cars did not—at any rate in Lancashire. He thought the difficulty of running trucks on railway lines could be overcome. At Liverpool he believed the lines at the docks were owned by the Dock and Harbour Board, and, therefore, they would not have to ask the railway companies for their lines. Another point was that the railways did not run sidings into the Lancashire mills.

(To be continued.)

## NOTES FROM INDIA.

[FROM OUR OWN CORRESPONDENT.]

**Lahore.**—It was obvious from the beginning that an electric supply company would be a success in this very important capital of the Punjab. The capital has been subscribed by a coterie of local Indian magnates—men of shrewdness and enterprise, who foresaw a good return for invested money. New consumers continue to be added to the mains daily, both for lighting and power purposes, and most of the Government buildings have been or are being electrically wired. Hence local wiring contractors have been reaping a good harvest, and it is to be hoped that they will continue to do so for some years to come as the mains are extended. A good few motors have been connected on to the system; and these are being watched with considerable interest by some of the more conservative steam users in local mills and factories.

**Lahore. North-Western Railway.**—Mr. Cardew, who for some years held the important post of Electrical Inspector to the Madras Government, has been recently appointed Chief Electrical Engineer to the North-Western Railway, whose headquarters are at Lahore. His predecessor, Mr. G. H. Wright, who held the position for many years, has retired—young in years, robust in health and, rumour has it, robust in wealth to boot.

**Amritsar,** close to Lahore, and remarkable for its wonderful Golden Temple of the Sikhs, sent out inquiries not long ago, through its enterprising municipal engineer, for schemes for electric lighting and power. Much money and labour were spent by several firms of contractors both in Bombay and Calcutta in planning out suitable schemes and estimates; but so far, nothing seems to have resulted. The pity of it is that, when lighting and power schemes of this nature are contemplated, the authorities concerned do not either appoint a reputable consulting engineer for a fixed fee to draw up plans and specifications, or appeal to Government to help by lending one of their many capable electrical engineers to do so. This, of course, would be a business-like way of doing things, but—we are in India.

**Nagpur.**—Messrs. Crompton & Co., of Bombay, who are the main contractors for the electrical equipment of the Nagpur Electrical Supply Co., are proceeding with the work in not too rapid a manner. It was hoped at one time that possibly current might be available for at least some fans for this hot weather, but according to the look of things this will not be so. Contracts have not as yet been given for the wiring of the many Government buildings, current for which will at first go to form the major portion of the power house load. Several Bombay and Calcutta firms have put in tenders, varying from £1 to £1 10s. per point, including drop pendants, and prices for fans vary from £5 10s. to £6, with regulators thrown in. As there is no official electrical engineer yet in the Central Provinces, the responsibility of deciding on the above varying figures may be the cause of the delay.

**Port Trust, Calcutta.**—Messrs. Pyne, Hughman & Co. recently obtained a contract for supplying 13 electric 2-ton lifts, at a cost of just under one lac of rupees, for the new extensions at the Port Trust. This very enterprising young firm is forging ahead rapidly. On most of the large new buildings in Calcutta their name-boards testify that they have almost a monopoly of passenger lift work.

"Henley's metal-covered wire" system has caught on rapidly, and is being generally specified for important buildings. It is cheap, fairly easily fixed, and when carefully put up looks neat and does not interfere with decorative schemes of interiors. If it is found to be *lasting* in our Indian climate it should eventually oust from the market most of the other "systems" which have held the field for years back; but its lasting qualities have still to be proven. In India one has to hasten slowly with innovations, be they ever so certain in their behaviour at home.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### The Prevention of Accidents in Electric Lifts.

Whilst agreeing with several points put forward by Messrs. Smith, Major & Stevens, Ltd., in their letter dated June 2nd, I think they have misunderstood my idea of an ideal lock. To make matters more clear, I should have added that though gravity or springs may take a part in the operation of the lock, should these fail the gate or door shall not open unless the car is at that floor. This, I contend, is not the case with the most up-to-date locks fitted by different makers at the present day—not even with the locks manufactured by Messrs. Smith, Major & Stevens, Ltd. As a matter of fact, within the last two months, I have on two occasions experienced failures of their lock patent No. 2,766, fitted to the doors of a totally enclosed well of a push-button lift installed in a private house in the West End of London. On the first occasion the butler telephoned up in much alarm, he having found that the door on the ground floor could be opened whilst the lift was away from that floor. On the second occasion, I discovered the defect whilst inspecting the lift. In both cases broken springs were the cause of failure, and marred what was otherwise a very efficient lock. This lift was installed two years ago, and is therefore practically up to date. I do not quarrel with the use of long inclined planes in order to give a good margin for the unlocking of gates. What I do raise objection to is the fact that owing to the interlocking device being independent of the switch and latch, there is the possibility of the gate or door not being securely locked without interfering with the running of the lift. At the time of writing, I have been brought into touch with the inventor of a lock which, strange to say, as far as I can at present see, practically covers all the requirements of my ideal lock, but not as yet having seen one in actual use, I cannot state definitely whether, to my mind, the absolutely safe lock has at last been invented.

W. H. Carroll.

London, E., June 16th, 1913.

The attempt made by Messrs. Smith, Major & Stevens, Ltd., in your last issue to clear away "confusion of thought and false reasoning" in the very clear remarks of Mr. Cooper, appears to be singularly unfortunate.

Referring to the sentence: "No gate can be opened until the current has been cut off from the controller," your correspondent's assumption that the locking and unlocking is shifted to the *controller* is surely without good ground, as there is no necessary connection.

As regards types of locks in use at present, it will, I think, be admitted that any lock which is operated by an inclined plane or tappet of any kind fixed to the cage, and which is locked after the cage leaves the landing, by any means whatever, must possess that element of danger which Mr. Cooper claims is overcome in the new lock in condition (1): "Cage cannot move until the gates are both mechanically and electrically locked." That Messrs. Smith, Major and Stevens have not successfully provided against the above-mentioned point is clear from their argument as to the necessity for an unlocked zone extending about 2 ft. 6 in. above and below each landing.

As to the passengers becoming alarmed owing to the lift stopping between floors, and their not being able to escape from the cage, surely this is better than risking their lives by providing inefficient locking systems.

The assumption that even this last point is not provided against in the new lock is characteristic of Messrs. Smith, Major & Stevens's adventurous methods of discussion.

Helicon.

London, June 16th, 1913.

We have been reading with considerable interest—not unmixed with some amusement—the correspondence in your columns in reference to the above, but we had not proposed to intervene for fear it should look as if we were endeavouring to obtain an advertisement for our manufactures.

In view, however, of the letter by Mr. G. W. Newman, written from the architect's point of view, we should like to ask you to allow us to make a statement which is the result of our very large experience, as we have fitted some hundreds of automatic lifts, which we regularly inspect and maintain and are, therefore, thoroughly familiar with all the points in connection with the same. From this experience we should have no hesitation whatever in assuring architects that the automatic lift, as now supplied by us, reaches all the requirements of practical safety, and that the locking gear which is fitted to our lifts, on the design and manufacture of which we have spent a large amount of time, meets all likely contingencies.

In reference to the point raised by Mr. Cooper, while, in the ordinary way, it is frequently possible for a landing gate to be opened at the moment the cage is passing, this would have the effect of stopping the travel of the lift, which would therefore necessarily cover the opening produced by the removal of the gate, and, consequently, there would be no real danger of accident from this cause, although there might be some inconvenience to the person travelling in the lift. It is, however, quite easy to overcome this, and we have done so in some cases, by fitting an additional electrical attachment, which prevents the gates being opened until the lift has been stopped, or by another arrangement by which the gate lock will be released at the floor at which the lift is intended to stop. This is, of course, an advantage so far as the convenience of the lift is concerned, and can be fitted in any case where it is desired.

It is necessary, however, to bear in mind that all these additional precautions involve additional complications, and therefore add to the possibility of getting out of adjustment and stoppage of the lift.

For R. Waygood & Co., Ltd.

H. HARMSWORTH,

Director and Sales Manager.

London, S.E., June 17th, 1913.

### Bedstead Antenna.

In connection with the note under the above heading on page 983 of your current issue, I enclose herewith an extract from the "London letter" of the *Yorkshire Observer* for the 16th inst., in which the writer states that the even burning of arc lamps in London has been affected by the time signals from Paris.

Do you know if there is any truth in this statement? It seems scarcely credible!

W. H. B.

### Long Scale Instruments.

It was somewhat with surprise that I read Mr. J. W. Record's last communication to you. I should be the last to wish to charge him with the intention to mislead, but I can show you a price list of the Davies instrument, which was published at the time when Mr. Record was in his electrical short clothes. It is consequently quite possible that he is not aware of the whole history of the subject, though, making the claims he has done, he ought to have acquainted himself with this history, and not ask the public to believe *ex parte* statements which are not warranted by facts. His *ex parte* statements do not confer upon him any right to

claim originality for long-scale moving-coil instruments in the way he has done, by ignoring the previous work of Mr. Davies and others.

You can, by referring to your advertisement columns of the same period, see advertisements by Messrs. Muirhead offering the Davies long-scale instruments, not once but many times, and they had a sale.

I enclose my card, and have the honour to subscribe myself as

**An Electrical Instrument Maker  
who has some Knowledge of the History  
of the Trade.**

#### The Electrical Industry in China.

In reference to my recent articles on the future of the electrical industry in North China, I enclose a letter received by my Chinese engineer relative to his son's progress whilst serving his apprenticeship in one of the big German electrical firms. You will see that the letter is written in perfect English, and first flatters the boy's father with a position he doesn't hold, and then tells him of the curriculum, which begins with six months' instruction into "German business life," "German custom" and "how to make himself understood in the German language."

The letter itself is exceedingly interesting as to the size of the undertaking, and the cloven hoof is only exhibited in the last sentence, where, through services rendered, orders are respectfully solicited. Have we in England any manufacturing firm as enterprising as this?

**Alfred R. Sillar, M.I.E.E., M.I.Mech.E.,  
Engineer-in-Chief.**

Peking, May 27th, 1913.

In compliance with your request, I am glad to inform you that your son is going on with his study quite satisfactorily. When he first came over to Berlin, he was for about six months in our office (foreign department), which is one of the largest offices here in Germany. The reason for this was to give him at first an insight into German business life and German customs, as without this knowledge it would have been quite impossible for him to continue his studies. After he had gathered a fair general knowledge, and knew how to make himself understood in the German language, he attended a technical college for about a year, and for the last about six months he has been in our machine factory as an apprentice, so as to obtain a practical knowledge of all the work required for his future career.

In order to give you an idea of our machine factory, I would mention that this one department only employs about 15,000 workmen.

I take it that you have received likewise reports from your son, and I hope that you will be quite satisfied when he returns to China.

*As far as business is concerned, I regret to say that I have heard nothing from your company for some considerable time, but I hope you will do your best in the interests of — and Messrs. — as soon as business in our line should turn up.*

With kindest regards,  
I remain,  
Yours faithfully,

#### The Mutual Protection of Engineers.

It is gratifying to see the letter of Mr. Frank Gill in your issue of the 6th inst., proposing that engineers should have a body to do for them what the British Medical Association does for the medical profession. There is a very general feeling abroad to this effect which augurs well for the success of such a movement if engineers are prepared to forego a little of their individualism and become more cohesive. They must also be prepared for long and hard work to attain the desired end. Lastly, these things cannot be done free of cost, and a subscription of probably a guinea per annum or more will be necessary. The British Medical Association has about 27,000 members, and yet their subscription of 25s. is found scarcely large enough. A very great deal can be done by such a voluntary body, as, for example, was made very evident in connection with the Insurance Act. Many think that the success of the work of the British Medical Association is due to the Statutory Registration of medical men. This does no doubt assist them, but the principal Medical Acts (which deal with registration) are those of 1858 and 1886, whereas the B.M.A. was started in 1832. I am pleased to say the

Society of Engineers (Incorporated) is at work at the subject, and feel sure they would be glad of any assistance that engineers can give them in the matter of information, experience, and suggestions.

More societies are not required. No profession can have more societies connected with it than engineering. What is wanted is the hearty support by engineers of those bodies which are trying to raise the status of the profession in the manner that the B.M.A. has raised that of medicine.

A. S. E. Ackermann.

London, S.W., June 12th, 1913.

#### Proposed British General Engineering Staff Association.

Your correspondents and readers will be glad to learn that it is definitely proposed to form a new and separate association for the Mutual Protection of Engineers. So far, indeed, the movement has met with every encouragement. Those representative gentlemen who have most keenly considered its inception are now hoping for general support.

You will recollect that a recent correspondent referred to the "trust" which, it would appear, has been formed already by our large employers. It was suggested that this powerful body has as one of its main objectives:—"The prevention of an engineer—who may have displeased those in authority—from obtaining employment in any constituent firm; the regulation of interchange of staff, should an engineer endeavour to improve his position; the extension of the hours of staff employment; the reduction in holidays, with abolition of payment for that period; and the general lowering of the status of engineers."

Such charges are, of course, most serious, and may or may not be disproved. The certainty is that manufacturers, being primarily concerned with profit-making, could mutually deem it to their monetary advantage to impose such conditions upon us. And it must also be admitted that, without organisation, our position is a perfectly helpless one.

This latter fact is demonstrated once more by the result of a recent dispute between the directorate and staff of one of our principal companies. Into the offices of this company has been introduced a system to which a large proportion of the staff openly objected. The outcome at best may be simply a formal "Staff Protest," directed to the board, and summarised as below:—

"Whilst reluctantly accepting the uncompromising ruling of the directorate, we regretfully enter this our deliberate protest against the enforcement of a system which impairs the cordial relationship hitherto existing between the management and the staff."

The position is surely one of failure—dismal and undignified. Yet little other than this was expected. Most of us feel that it is almost futile to insist upon the maintenance of our professional status at present. We lack the support of an association which would represent the engineering staff throughout the country as a whole.

It is proposed that membership of such an institution should be opened to all engineers—mechanical, civil, electrical, &c. The Official Committee of the Association will undoubtedly confirm that decision later. The widespread conclusion of the moment is that the new Association itself is an absolute necessity, especially as the existing institutions—the I.C.E., I.M.E., and the I.E.E.—are concerned solely with the purpose of promoting and furthering the technical aspects of engineering.

The aims of the suggested federation are practically obvious. One need merely say, therefore, that its members would co-operate for the maintenance and furtherance of their economic and social interests. And this object could, perhaps, be attained as follows:—

(a) By the study of social-economic questions, and by the development of the spirit of unity.

(b) Through the medium of statistical information and extensive inquiries into existing conditions of employment (including remuneration), with a view to their regulation.

(c) By the systematic airing of grievances in the Press.

(d) By means of monetary assistance to members.

(e) By the aid of vacancy lists.

(f) By means of free advice in law cases of professional interest, with partial or total assistance in defence.

(g) By free advice in connection with patents.

(h) By influencing the framing of laws, in so far as they concern members of the Association; and

(i) By means of local branches of the Association.

Such, of course, are mainly the aims of the German Bund der Technisch-Industriellen Beamten. In fact, those who are interested will find the current report of that Society most instructive. It readily convinces one that co-operation alone is of mutual advantage. As an instance of its utility, during 1912—the year on which the report is based—the German Institution concerned itself with almost every kind of legal action. Such actions were fought mainly with the object of eliminating inferior working conditions, systematic overtime without extra remuneration, and adverse clauses in contracts, and of procuring employment references and salaries wrongfully withheld, &c. And no less than 70 per cent. of these “defensive actions” and 85 per cent. of the “actions for improvements” appear to have been successful.

It is hoped that the proposed British Association will soon be established on equally progressive lines, and that its work will ensure its rapid growth. As many as 250 members of the staff of one firm alone have already signified their approval of the society, and reports from various quarters are similarly gratifying. The engineers attached to the largest companies are specially in favour of the movement.

Meanwhile, each gentleman who is interested, or each intending member, is kindly requested to send his name, with that of his employer, to the undersigned, supplemented by any suggestions he may care to offer. Every communication will, of course, be treated as perfectly confidential and private. It is also important that the Association be given as much publicity as possible.

L. H. Fletcher,

*Hon. Acting Secretary, Proposed Association.*

June 16th, 1913.

#### Agreements for “Hire” and “Hire-Purchase.”

Although not a practical electrical man, but only a practicing solicitor, I am a constant reader of the *ELECTRICAL REVIEW* in its less technical, and especially in its legal parts. I was much interested in “Excelsior’s” article with the above title in your issue of June 13th. It is a thoroughly useful article, and contains nothing to mislead the practical man (except possibly on the question of stamp duty), but will, on the contrary, prove exceedingly helpful to “Owners” and “Hirers” alike. Such documents, although always described as agreements, were not always reckoned agreements for stamp duty purposes. With the probable exception undernoted, they are now liable, if under hand only, to the agreement stamp duty of 6d., and if under seal, to the deed duty of 10s., like any ordinary agreement; but that is only in virtue of the provisions of Sec. 7 of the Finance Act, 1907, a comparatively recent Act. Previously to the coming into force of that Act, such documents were dealt with as follows:—If merely for “hire,” they were not considered by the revenue authorities to be liable to agreement duty, not even to lease duty, as one might suppose would be the case, but to bond or covenant duty, which in cases where the payments were to continue for a definite period, so that the total amount to be ultimately payable could be ascertained, was the same as mortgage duty (2s. 6d. per £100), and in cases where the period was indefinite, was 2s. 6d. per £5 of the sum periodically payable. I am rather inclined to think (differing apparently on this point from “Excelsior”) that mere “Hire Agreements” are still liable to the bond or covenant stamp, for the proviso in the Finance Act of 1907 refers only to agreements “whereby the goods in consideration of periodical payments will or may become the property of the person to whom they are supplied.” If for “hire-purchase,” it depended on the terms of the document whether it was liable to duty or not. If it contained a proviso that the article supplied was to remain the property of the owners until full payment had been made, it was reckoned a bond or covenant, and held liable to a duty of 2s. 6d. per £100

on the total amount of the purchase price. I have before me, as I write, a “hire-purchase agreement,” dated in 1902, relating to printing machinery, on which the duty is adjudicated by the Inland Revenue at 2s. 6d. per £100 of the total amount payable in hire before the machinery could become the property of the hirer. If, however, the document implied an out-and-out sale, the price being payable by instalments, with or without a clause of forfeiture in the event of default in payment of the instalments, it was reckoned an agreement for the sale of goods and so exempt from any duty, by virtue of a proviso in the Stamp Acts to that effect, which is now repealed so far as hire-purchase agreements are concerned by the section of the Finance Act of 1907 above cited.

It may be useful to many of your readers to know that in Scotland a document “under hand” means a document without a consent to registration, and that a document “under seal” means a document with a consent to registration. “Registration” means registration in the Books of Council and Session. Registration in those books involves the giving-up of the deed to be preserved in the archives of Scotland and gives the “extract” or office copy issued in lieu of the original the effect of a decree of the Supreme Court of Scotland. In Scotland, therefore, it may be well worth while to spend the extra 9s. 6d., and put a consent to registration into the document, because in the event of its being necessary to enforce the “agreement,” that can then be done without the delay and expense of bringing an action in Court.

W. P. M. Black.

Glasgow, June 16th, 1913.

#### Heavy Current Lampholders.

With reference to your remark on page 978 of the current issue, June 13th, 1913, under “Heavy Capacity Lampholders and Adaptors,” namely, “it occurs to us that these channels might be made a permanent feature of the holders to allow of the circulation of air,” we wish to point out that we build our lampholders so that they will not heat up with the current they are guaranteed to carry, and we do not require or rely upon any auxiliary means to keep the contacts cool. As it is just possible some of your readers may, through your remarks, think our lampholders are deficient in construction or liable to heat up, we shall be obliged if you will make the above point clear.

With regard to permanent holes in the cases of lampholders, these holes would have to be much smaller than those in the sample you sent, otherwise there is a danger of shock and shorts to persons handling same.

We can, of course, supply holders with ventilating holes if required; but we do not think they are necessary.

## LEGAL.

LUND & EXCELSIOR CHEMICAL CO.

IN the City of London Court, on 13th inst., before Judge Rentoul, K.C., Mr. Richard Lund, carrying on business as Lund Bros. & Co., motor and electrical engineers, 78, Queen Victoria Street, E.C., sued the Excelsior Chemical Co., 20, Old Church Road, E., for £6 9s., balance of account amounting to £27 10s. for work done in wiring and fixing a 20-H.P. motor for the defendants for use in their factory in driving machinery.

MR. H. GORNBLEET, who represented the defendants, said that the balance was not due. The work was included in the £17 estimate for wiring and installing the whole apparatus connected with supplying a motor, cleaning and reversing it.

MR. KUHN, plaintiffs’ counsel, said that the defendants made an arrangement with Messrs. Pooley & Austin to do the work, and Messrs. Pooley & Austin employed plaintiffs to carry it out.

Mr. WOOD, plaintiffs' manager, said that after the work was done he went over with the Borough Council's engineer. The engineer suggested that there should be extra fuses placed on the motors, one on the motor already running at the defendants' works, and one for a new 20-h.p. motor which they were putting in, and which the plaintiffs wired for them. The engineer said he could not pass the work unless the fuses were fixed. He told the defendants it was outside their contract to supply the fuses, and the defendants gave them an order accordingly and the work was done.

Mr. GOHNBLEET said that the defendants were not electrical engineers, and it was no use for the plaintiffs to fix a motor unless it was workable according to the regulations of the Borough Council.

Mr. WOOD added that one motor was passed by the Council. It was the other which they supplied fuses to that had to be passed by the borough engineer. They could not supply the fuses for the original price.

Mr. HAMMOND, in the plaintiffs' service, said he found that the defendants' motor was running in the wrong direction, and he was told to remedy that.

JUDGE RENTOUL said that what Messrs. Pooley & Austin ordered plaintiffs to do the defendants were responsible for, as they were their agents. Judgment for the plaintiffs, with costs.

#### MONTREAL TRAMWAYS AND POWER CO.

IN the Chancery Division, on 13th inst., Mr. Justice Warrington heard a motion in the matter of the Montreal Tramways and Power Co., Ltd., to extend the time for registering two debentures.

The defendant company, Mr. GORE BROWNE, K.C., explained, was registered in England in December, 1910. In 1912 the company made two issues of stock notes, which were secured by a deposit of a number of Stock Exchange securities. The company was advised in Canada by two King's Counsel that it was not necessary to register the notes, as they were not debentures within the meaning of the Act. The transaction went through, but afterwards the English solicitor, on hearing that the notes had not been registered, informed the company that, according to English law, it was necessary that they should be registered, because they were, in fact, debentures.

His Lordship granted an extension of time for 30 days from that day.

#### JOHNSON-BILLINGTON ELECTRICITY METERS, LTD.

A PETITION, presented by Mr. H. Johnson, for the winding-up of this company, was before Mr. Justice Neville, sitting for the disposal of company business, on June 17th.

COUNSEL for the petitioner, however, stated that evidence had been filed against the petition which he desired to answer, and the hearing was accordingly adjourned for a week.

### PARLIAMENTARY.

#### Mexborough and Swinton Railless Traction Bill.

AFTER a hearing extending over a fortnight, the Select Committee of the House of Commons, presided over by Sir Ivor Herbert, has come to a decision on the Bill promoted by the Mexborough and Swinton Tramways Co. for the construction of railless traction along several routes.

Mr. E. H. LLOYD, K.C., who appeared for the promoters, explained that they had already constructed tramways in Swinton and Mexborough running to Rotherham, and they now asked for powers to construct railless traction from Swinton to West Melton, from Mexborough to Ardwick; and from Conisborough to Mexborough. These routes were  $3\frac{1}{2}$ , 1 and  $1\frac{1}{2}$  miles respectively. Borrowing powers to the extent of £35,000 were sought. The Mexborough Urban District Council, who opposed the Bill, alleged that the financial position of the promoters was unsound, but as a matter of fact they were earning enough to pay 3 per cent. on the total cost of construction, and were beginning to reap the benefit of their past efforts.

Mr. D. L. WINTER, a director of the company, gave evidence in support of the Bill, and was cross-examined by Mr. FITZGERALD, K.C. (for the Urban District Council), at considerable length, with regard to the financial position of the company. He said the original capital was £150,000, but he did not know that £825 was paid in cash and the rest of the shares were issued as fully paid. Mr. Binns was the original promoter, and he sold the undertaking to the New Traction Co. He was not aware that on April 19th, 1905, the New Traction Co. sold the undertaking to Mr. Godfrey Isaacs, or that on May 4th Mr. Isaacs sold it to another company. The National Construction Co. was connected with the present company as undertakers. It was proposed to raise the £35,000 by debentures.

Mr. W. B. COWNIE, another director, gave evidence, and said the company were prepared to be put under an obligation to construct within two years.

In cross-examination by Mr. WEDDERBURN (also appearing for the Urban District Council), Witness said that the syndicate

bought the undertaking from Mr. Godfrey Isaacs for £11,000 in cash and £11,000 in shares. He did not think Mr. Isaacs made anything out of the transaction.

A number of local witnesses were called in support of the scheme, who said that the tramway company had fulfilled a public service. One witness, Mr. H. G. BAKER, of Swinton, as a large ratepayer, said he was simply appalled at the idea of the municipality undertaking any such scheme.

Mr. F. E. STANLEY, chief engineer of the National Construction Co., gave evidence as to the populations in the districts proposed to be served, and said the total cost of actual construction, exclusive of the cost of the Act, would be about £22,637. He estimated that 133,500 car-miles would be run per year, which, putting the earnings at 10d. per car-mile, would produce £5,562 10s. The estimated cost of working was 6½d. per mile, leaving a balance of £1,946, out of which any contribution towards road maintenance would have to come. They were willing to pay £210 for road maintenance.

Mr. E. CROSS, electrical engineer of Rotherham, gave it as his opinion that the earning power of the cars would be 10d. per mile. The Rotherham trolley system had proved a good feeder to the tram.

Mr. E. MARTIN, borough engineer, Rotherham, gave evidence as to the developments of the South Yorkshire coalfields. He did not think the promoters should be called upon to make any contribution towards road improvement, as the damage would be recouped by increased rateable value. If the powers were not given to the company, it would mean the introduction of motor-buses, and then the local authorities would get no contribution.

Mr. J. E. WALLER, consulting engineer, also gave evidence in favour of the Bill.

Mr. KEEN addressed the Committee for the Swinton Urban District Council, and contended that whilst further travelling facilities were undoubtedly needed in the district, the proper way of meeting the want was for the local authorities to join together and provide a comprehensive scheme. He objected to the proposals of the promoters as being a bad one.

Mr. S. C. WARD, chairman of the Highways Committee of the Swinton District Council, was called in support of counsel's contention. In cross-examination, he admitted that, in his opinion, trolley vehicles would pay in the district.

The Hon. J. D. FITZGERALD, K.C., on behalf of the Mexborough U.D.C., urged that the scheme should be rejected as being unsatisfactory, and also that the financial history and position of the company was unsatisfactory.

Several witnesses were called for the Mexborough U.D.C., who generally opposed the promoters' scheme as being defective, and supported the contention that the matter should be left to the local authorities.

The Committee found the preamble of the Bill proved with the exception of the proposed route from Swinton to West Melton, which they did not consider was well planned. Further, they decided that the promoters should pay one-third of the cost of adapting the roads to the traffic, such sum not to exceed £350 per mile, and thereafter to pay ½d. per car-mile for the maintenance of the roads.

#### Leicester Corporation Bill.

THE Select Committee of the House of Lords, presided over by Lord Clinton, has passed the preamble of the Bill of the Leicester Corporation, which seeks to extend the existing tramway system, to extend the area of supply for electrical purposes, and to run motor-buses.

Mr. H. LLOYD, K.C., who represented the promoters, explained that most of the opposition to the Bill had been withdrawn. The main purpose of the Bill was to extend the tramways within the borough, and to this there was no opposition. The tramway undertaking of the borough had been carried on for many years and had been very successful. By clause 15, power was asked to run motor-buses partly inside and partly outside the city and the routes proposed were: (1) from the tramway terminus in Melton Road to Thurmaston; (2) from the tramway terminus in Groby Road to Anstey; and (3) for the London Road tramway terminus to Oadby. For years there had been a demand for increased travelling facilities in these districts, and some ten years ago the County Council asked the Corporation if they would take a lease of tramways in the districts if the County Council constructed them. The Corporation felt that tramways were impossible, and that motor-buses would best meet the needs, and hence the question of the contribution which the Corporation should pay to the cost of upkeep of roads would come in. In previous Bills Select Committees had fixed the contribution at three-eighths (of a ½d. per car-mile, and the Corporation considered that this would be reasonable. The Corporation were asking also for authority to extend their area for electric lighting purposes. At present they supplied in the borough, and by their 1909 Act they had power to come to the Board of Trade and the Local Government Board if they wished to supply outside districts. They now asked to be allowed to supply within the parish of Birstall, the parishes of Humberstone and Evington, and the parishes of Oadby and New Parks. The only petitioners against the Bill were the County Council, in respect of the contribution towards roads, and the Leicestershire Power Co., who had powers to supply the areas scheduled in the Bills. He submitted that the Power Co. would not be interfered with under the Bill.

Mr. A. MACONACHIE, on behalf of the Power Co., offered to withdraw the opposition if this was made quite clear.

After consultation, the Committee decided to insert a clause offered by Mr. Lloyd, to the effect that nothing in the Bill should

be deemed to give the Corporation the right of an exclusive supply in the districts in question; and on the point of the contribution to the cost of the roads used by motor-buses, they inserted a clause to the effect that for three years from the running of the buses the Corporation should pay to the County Council three-eighths of a penny per car-mile; and at the end of three years the matter should be submitted to an arbitrator, who should decide what extra cost had been involved by the running of the buses, and the Corporation should then contribute one-third of such extra cost.

### Huddersfield Corporation Bill.

LORD CLINTON'S Select Committee of the House of Lords has had under consideration the Bill promoted by the Huddersfield Corporation, which, amongst other things, proposes an extension of the tramway undertaking to Slaithwaite and Marsden along the Manchester Road, and to extend the Birchencliffe route to Elland and Greetland. There were also a number of proposals for divisions of authorised lines. Mr. Balfour Browne, K.C., Mr. Harper and Mr. Jeeves, appeared for the Corporation; and Mr. Freeman, K.C., and Mr. Tyldesley Jones, for the Yorkshire Electric Power Co., who opposed the proposed extension to Greetland.

Mr. BROWNE, K.C., contended that what the opposition of the Power Co. amounted to was that if the Corporation made the line it must buy its electric current from the company. Elland had its own electric lighting order, and Greetland had a lighting order which it was bound to transfer to a company, which appeared to be an offshoot of the Yorkshire Power Co. In Greetland, however, there were already tramways worked by the Halifax Corporation and supplied by Halifax. The Huddersfield Corporation merely proposed to do the same thing as the Halifax Corporation was doing.

Mr. K. CAMPBELL, borough engineer, of Huddersfield, stated that the cost of Huddersfield's electric current delivered on the trolley wires did not exceed 162d. per unit. He was informed that the Power Co. was supplying electricity in bulk at 14d. a unit to Sowerby Bridge from an electric main crossing the projected tramway route. The Corporation used direct current, whilst the Power Co.'s current was alternating, and would need transformation. He considered that the extra cost of the company's power would eat up all the profits of the tramway.

Evidence was called from the localities affected in favour of the extension.

Mr. TYLDESLEY JONES stated that the real objection to the company was to the wording of Clause 15, under which it seemed to them the Corporation might seek to supply tramways in other districts adjacent to those named.

Mr. BALFOUR BROWNE said that was not the intention of the Corporation, and he was prepared to amend the clause so as to make it clear.

Subsequently the Power Co. withdrew their opposition, and the Committee passed the preamble of the Bill.

### Morley Corporation Bill.

THE DUKE OF BEDFORD'S Select Committee of the House of Lords has passed the preamble of the Bill of the Morley Corporation, which deals with railless traction and the gas and water undertakings. The only part of the Bill which was opposed was that relating to trackless trams.

Mr. BALFOUR BROWNE, K.C., represented the promoters, and said the West Riding County Council opposed, and contended that as the trolley-cars would run over main roads, the Morley Corporation ought to contribute to the cost of extra wear and tear. Some of the original proposals in the Bill had been dropped, and it was now proposed to run the cars through Drighlington, Gildersome, Morley and East and West Ardsley, the local authorities of which districts were in favour of the scheme. It had been agreed that the Leeds Corporation should work the system, and should pay to Morley Corporation a rent sufficient to meet the interest on capital expended and the sinking fund.

Subsequently Mr. HUTCHINSON, K.C., who represented the County Council, announced that an agreement had been arrived at, by which Morley should contribute to the cost of main roads at the rate of 8d. per car-mile.

The Committee thereupon inserted a clause to this effect, and ordered the Bill to be reported.

**Folkestone, Hythe and Sandgate Railless Traction.**—It is understood that the Bill of the Folkestone, Hythe and Sandgate Tramways Co., to provide a system of railless traction between these towns, has been withdrawn.

**Various Bills.**—In the House of Commons on 16th inst., the Metropolitan Railway Bill was read a second time.

In the House of Lords on June 12th, the City and South London Railway Bill and the Central London Railway Bill passed their third reading.

In the House of Lords on June 16th, the Metropolitan Electric Tramways (Railless Traction) Bill was read a second time, while the following Bills passed third reading: Richmond (Surrey) Electricity Supply Bill, the Cleveland and Durham County Electric Power Bill, and the Northern Counties Electricity Supply Bill.

**Post Office (London) Railway Bill.**—In the House of Commons last week, there was some criticism offered regarding certain points in this Bill, the second reading of which was moved by the Postmaster-General. The second reading was carried by a majority of 170, and the financial resolution in connection with the Bill (£1,100,000) was also passed. Mr.

H. Samuel, in the course of his reply to criticisms and questions, said that the power for working the railway would be obtained from the Post Office station at Blackfriars, which could be extended at a comparatively small cost.

**Porthcawl and District Gas Bill.**—This Bill has passed the Unopposed Bill Committee of the House of Commons, but the electricity clauses have been dropped. It was originally proposed to erect a generating station and supply electricity.

### THE I.M.E.A. CONVENTION, 1913.

THIS year's Convention of the Incorporated Municipal Electrical Association, the eighteenth in the series, was opened on Tuesday morning last at the Institution of Electrical Engineers, London. Excellent weather conditions prevailed, but despite external attractions, the large lecture theatre of the Institution was well filled with members, delegates and visitors—many of the latter being ladies—when Mr. W. Duddell, the President of the Institution, rose to welcome the visitors. It was very right, he considered, that such an important body, so closely allied to the I.E.E., should meet in their building, and the Council welcomed them and would do anything it could to assist them in their work.

Subsequently Mr. J. E. Edgcome (Acting President, I.M.E.A.) explained the circumstances under which Mr. C. E. C. Shawfield, who was originally elected President of the Association for the year 1912-13, had had to resign office, and how he (the speaker), as a Past-President, had been selected to fill the office for the remainder of the year. Mr. Shawfield was not able to be present, but he had prepared an address, which the speaker subsequently read.

In his preliminary remarks, Mr. Edgcome urged the necessity of forming an information bureau, a matter which he had brought forward seven years previously during his period of office as president: unfortunately he afterwards found, in his capacity as treasurer, that there were no funds available for such a purpose. He suggested that this matter should be considered afresh, and that its cost could be defrayed by subscription.

He further referred to instances of age limits being imposed by some municipal authorities when appointing new engineers, which was a mistaken policy. Experience and age were interdependent, and a Council should always exercise its discretion in regard to age when selecting a candidate.

Mr. Edgcome then read the Presidential Address, which we abstract elsewhere, and the usual vote of thanks was awarded to Mr. Shawfield. Dr. Ferranti then gave an interesting *résumé* of the principal points covered in his paper, the greater portion of which, together with the interesting discussion, we give below.

The paper, as Dr. Ferranti mentioned in his opening statement, deals with the general question of prime movers, the conclusion arrived at being all in favour of the steam turbine for the near future, with coal as a fuel in any case. Needless to add that while he found a considerable majority in support of his conclusions, there were those present who disagreed with him and emphasised the attractions of the Diesel and producer gas engines.

To some extent we believe this criticism to be due to lack of comprehension of Dr. Ferranti's ideal big power station of the future, heartily agreeing, as we do, with one speaker, that one of the greatest faults of the past has been the inability to look ahead in the electrical industry.

Indeed, when one remembers the number of turbine sets of 10,000 to 20,000 kw. output in actual use on the Continent and in America and turns to what is being done in this country, it seems certain that very few of our central station engineers, with big industrial loads to develop, are looking ahead to the extent which circumstances appear to justify. Nothing can shake Dr. Ferranti's sanguine views as to the great future before the electrical industry, and we would that there were more practical evidence of our leading engineers sharing in this optimism.

The question of the sufficiency of oil fuel raised by one speaker is of considerable interest; we have never gathered that there was likely to be a permanent shortage, but rather that the possibilities of rigging the market were such as to render the price uncertain.

At the conclusion of the meeting, the members adjourned for luncheon, many of them, however, paying a visit to the interesting exhibit of cooking, heating and other electrical appliances which has been gathered together by several well-known firms in the Common Room of the Institution.

The afternoon was spent in visiting the Deptford and West Ham generating stations, while the event of the evening was undoubtedly the meeting of the "Point Fives" at the "Delico" electric restaurant, where, after an informal dinner, the enthusiasts and their friends, numbering about 120, spent a busy evening discussing the pros and cons of electric cooking and heating.

Prominent among the numerous speakers was Dr. Ferranti, who, amongst other matters, referred to the urgent necessity of cultivating a 24-hour load, hinting at the possibility of devising electrical heat storage apparatus towards this end, with a view to filling up the gap in the load curve which occurs in the small hours of the morning.

We would emphasise the fact, however, that the early morning load is already to hand in the shape of vehicle charging, while the heat storage problem still awaits practical solution. In view of the fact that one half-ton electric may take 25 units a night, and larger sizes up to 75 units a night for a 5-ton vehicle, it is clear that the battery vehicle will materially assist in the problem.

As to the proceedings of the rest of the week, including the annual dinner on Wednesday evening, and yesterday spent at Kingston-on-Thames in discussing the electric vehicle and admiring the scenic beauties of the river, we must refer our readers to our next week's issue.

#### Abstract of Address.

By MR. C. E. C. SHAWFIELD, Ex-President, late Chief Electrical Engineer to the Corporation of Wolverhampton.

IT IS, I believe, the first time in the history of your Association that the opening address at the annual Convention has been given by other than the President for the time being, and I deeply appreciate the compliment which your Council have paid me. It was with very real regret that I found myself compelled to lay down the reins of office, owing to my vacating municipal service.

One of the most curious anomalies of the present position of the public supply of electricity in this country is that whilst a municipality is empowered to generate and distribute electricity throughout its area, and to make contracts with consumers as to the terms and conditions of supply, it is practically debarred from installing in a consumer's premises the apparatus which is necessary to enable that consumer to utilise the electricity which the municipality has for sale.

In London, and in a few of the larger provincial towns, this necessity can be, and is, to a large extent provided by private enterprise, but many of you who are associated with stations in smaller communities know only too well that the average wiring contractor has not the capital or the staff, and too frequently also has not the ability, to adequately supply the requirements of consumers. It is true that some municipalities have been fortunate enough to obtain, by means of private Acts, full powers to carry out wiring and installation work of all descriptions and to sell and fix electricity consuming devices. The Corporation of Wolverhampton has possessed these powers since 1899, and after 14 years' experience of the practical operation of these powers, I can unhesitatingly affirm that both the electricity department and the local wiring contractors are in a flourishing condition. If a municipality has only the restricted powers given under the Electric Lighting Clause Amendment Act—by which wiring work can only be carried out through a contractor—the result is of very little use to either party.

I sincerely trust that this Association and the municipalities which it represents will continue to press for the general concession of those powers to all municipalities, which are at present confined to a section only.

I am entirely opposed to what I regard as the vicious practice of rate relief from the profits of electricity undertakings, and I sincerely trust that the members of this Association will do whatever lies in their power to discountenance these donations. Whilst municipally owned electricity undertakings should be self-supporting, their surplus earnings should be allocated, first, to the accumulation of an adequate reserve fund; secondly, to the provision of working capital, and any balance remaining should be devoted to the extension and improvement of the undertaking.

Much has been done in recent years in the direction of lowering the average rate of charge per unit to all classes of consumers, but much still remains to be done in this direction; if municipally-owned electricity undertakings as a body were to go boldly for a drastic reduction in prices, they would not only be more faithfully performing their duties to the community as a whole, but they would also reap a rich reward in the shape of increased output and better financial results. As a general principle I believe that practically every central station can afford to sell electricity at a profit, at a lower price than that at which none but a specially circumstanced private generating plant can produce it, and it should

be the aim of every undertaking to supply from its mains every unit of electricity consumed within its area.

The time is now rapidly approaching when a large part of the present capital liabilities of electricity undertakings will be liquidated by the operation of the sinking fund, and, when this day arrives, it seems probable that such a general reduction in the selling price of electricity will be possible, that its practically universal adoption for lighting and motive power purposes will become inevitable.

The chief engineer of every electricity undertaking should be given full control, not only of the technical, but also of the financial side of his department—subject, of course, to the strictest audit by the accountants' department and the public auditors. He should have complete control of the general staff of the department, and all matters of discipline and of the remuneration of employees should be left to his discretion. He should also be provided with a competent and well-paid technical staff. In too many cases the rates of pay of the technical assistants in some of our large undertakings are entirely inadequate to their duties and responsibilities. The best asset that any electricity undertaking can possess is a loyal and zealous staff, who have at heart the commercial and technical well-being of the concern, and, in order to secure this, it is necessary that every member of the staff of every grade shall be made to feel that he is a trusted and responsible official, and that he is adequately remunerated for his services.

#### Prime Movers for Electric Power.

By DR. S. Z. DE FERRANTI, Past President I.E.E.

(Abstract.)

NOTWITHSTANDING the amount that has been written regarding the different systems of driving electric generators, the subject still seems to be one of considerable interest.

The position to-day is that the steam turbine is in possession of the field, and that gas and oil engines are looked upon as likely alternatives. Many people believe that it is only prejudice or the fear of doing something new that prevents engineers from using these two latter methods for generating their power. I do not, however, agree with this view, and believe that engineers are using the only means that are at present economically available for the work they have to do.

As we are a coal-producing country, it is evident that coal is our natural fuel. The very fact of oil being so sought after as fuel for certain purposes puts it out of the question for general power production.

A good steam turbine and boiler plant will to-day give back 15 per cent. of the energy of the fuel as electricity. As high an efficiency as 18½ per cent. has actually been obtained in practice. It is probable, however, that this is by no means the limit of economy, and that developments in this class of machinery will result in an efficiency of 25 per cent. being obtained in the near future.

The next coal-burning machine that we have to consider is the gas engine. With it we have to consider not only the efficiency of the machine itself, but also that of the gas producing plant. When the system is considered from this point of view, its efficiency is probably between 20 per cent. and 22 per cent. With this process there should, of course, be worked by-product recovery. Although it appears evident that in the future all coal must be gasified, and its by-products recovered, it does not seem that present knowledge enables this to be done at sufficient profit for it to be generally adopted.

In the oil engine we have a machine which represents the highest efficiency yet realised. Moreover, test figures and those obtained in practice agree very closely. The efficiency, as already defined, may be taken as between 28 per cent. and 30 per cent.

The question of stand-by losses may next be considered. In the oil engine there is practically no loss under this heading. In the gas engine there is the producer loss, and in the turbine the boiler loss. These will vary very much with the nature of the load, and where the plant is well designed and run, and the load factor is good, they may be reduced to a small quantity. Both the oil engine and the gas engine are, however, badly handicapped in relation to the steam turbine by their incapacity for dealing with overloads which the station must always be in a position to meet.

With regard to the question of the labour involved in running and maintaining the plant, as matters stand to-day the turbine installation is undoubtedly the best, but it is hard to make a direct comparison, as the number of generating units with either gas or oil would be so great. It is, however, certain that the plant which is the simplest will always have the advantage, and where one is purely rotary and the other reciprocating there can be no question at all.

In the matter of capital cost the turbine system is again much the best, the simplicity, large units and small space occupied contributing to this result. The size of the units on the turbine system compared with those on the other systems is perhaps the greatest determining factor in the case. The turbine is to-day adequate in fulfilling the demand, whereas the other two systems are not. Moreover, combined with its boilers and auxiliary plant, it is a simple means of generating power.

Reliability of operation is, of course, vital, and here again the turbine system scores on account of its simplicity and because in working its parts are not subjected to either high or uncertain stresses. In practice the turbine system has proved its capacity to meet the demand that is made on power-producing plant. All this goes to show that the course now followed by engineers in the

selection of their plant is the right one, and that they really have no option in the matter.

Looking at the question in the light of possible developments in the future, I cannot help thinking that as long as engines are used the rotary principle will be followed. For the moment the steam turbine system will be perfected so as to improve its efficiency and fuel consumption; later on, when the turbine can be made of the internal-combustion type, better economies still will be obtained.

#### DISCUSSION.

ALDERMAN SINCLAIR (Swansea), who opened the discussion on the above paper, agreed with the speaker's concluding remarks, but said that these applied to large stations only; for small stations the reciprocating engine would always find a place. As an instance of what the reciprocating engine could do, he cited his own experience with two 300-kw. uniflow type engines in use some two years, with steam superheated 225°. These operated on 9 lb. steam per I.H.P.-hour and consumed 3½ lb. of coal per unit, the total operating cost being 34d. per unit. The plant was worked in conjunction with a battery

MR. A. E. SEATON in the course of a humorous speech dwelt on the necessity of engineers ensuring that their guarantees on new plant were obtained. He pointed out that no engineer could claim that he knew all about "diddling," consequently it was necessary that tests of new plant should be carried out by an independent party, as, for instance, one of the well-known insurance companies. Under no circumstances whatever would he (the speaker) allow the contracting firms to have anything to do with the testing.

MR. H. S. RUSSELL (Mirlees, Bickerton & Day) took up the cudgels on behalf of the Diesel oil engine, attacking the author's assumption that it was necessary to have a big power station, transmission line and sub-stations. It would be more economical to install Diesel engines in sub-stations (requiring no more attendance than previously) and to dispense with the power station and transmission, as there was not much use in trying to save 10 per cent. in generating costs if 15 per cent. was going to be lost in transmission. The question whether coal was the most suitable fuel for power station purposes depended entirely on economic conditions; it might pay better to export it. In any case, in view of the important by-products of coal distillation, particularly the tar oil obtainable which was suitable for Diesel engines, it seemed that the latter was the best prime mover even with coal as a fuel. He pointed out that there was a considerable difference between coal stored and coal burnt due to fuel depreciation, and the coal stored figure should be used for comparisons. Steam plants on the average always exceeded their rated consumption (German statistics showed that they took over 100 per cent. more than their rated consumption), while Diesel plant worked within a narrow margin of guarantees. The high price of oil fuel now was entirely due to lack of transport facilities; huge stocks of oil were being held up, and there was no appearance of shortage of production. Moreover, the use of the Diesel engine in the Navy would lead to a substantial reduction of the oil consumed for naval requirements as compared with its use for boiler firing.

MR. R. A. CHATTOCK (Birmingham) did not consider the criticism of Dr. Ferranti's remarks as justified in view of the ascertained facts. In connection with the large Birmingham extension, he (the speaker) had carefully considered the relative costs of steam and gas plant for their new station, and taking capital and all the items usually entering into works costs, he found that for a gas-engine station, running on a 27 per cent. load-factor, the cost would be 12 per cent. higher than if a steam turbine plant were used. Further, if town's gas were used at only 6d. per 1,000 cu. ft. in large gas engines, the working cost would be 41 per cent. higher than with steam turbines. The load factor was low for a gas-engine plant, but taking an all-round 25 per cent. load factor of supply, he did not see how it would be possible to get more than from 27 to 30 per cent. on the gas plant. The turbine units were of 5,000 kw., and the gas-engine sets of 4,000 kw., which was the largest size commercially made. If smaller gas engines were considered the labour charges increased unduly. With regard to the previous speaker's suggestion for Diesel engine sub-stations, with a 100,000-kw. scheme as at Birmingham, it appeared that some 200 Diesel engines would be required, and the labour costs would be appalling. Lack of overload capacity in internal-combustion engine plants was a serious drawback, as if the plant would not stand up to the load it might mean a total shut-down.

MR. R. W. WEEKES referred at some length to the economy to be derived in industrial plants where the steam required for electrical generating purposes was subsequently used for heating and boiling, as was the case in the sugar and soap-making industries.

MR. H. GRAY (Accrington) remarked that all were well acquainted with the steam turbine and what it could do, but only the Accrington Council had so far installed large producer gas engines with by-product recovery plant, and their experience only covered eight months as yet. This plant was intended to run fully loaded, but due to the poor Sunday load the load factor had only reached 82 per cent. The running conditions suggested by Mr. Chattock were unsuitable; such a plant must run night and day. Their output from the gas engines had been 86,000 units per week; the fuel consumed was 156 lb., costing 125d. per unit, taken over a period of three months. From by-products there was a credit of 70d. per unit, or more than half the total fuel cost, and this was obtained with local coal. It was a question whether it would pay to increase the by-products return by using better

coal. Keeping a 1,250-h.p. producer ready for working for one week required ½ ton of coal, which compared well with any steam plant. For overload purposes steam plant should be installed.

MR. E. E. HOADLEY (Maidstone) said that consideration of a smaller extension scheme at Maidstone, where the question of steam or oil plant arose, had led him to decide on a 750-kw. steam set, as, taking carefully ascertained costs for an output of 2½ million units by this set, he found that steam plant was the cheaper, although he had himself favoured oil-engine plant in the first instance.

MR. C. H. WORDINGHAM suggested that the author dealt entirely with the future, which was some way off. Present requirements pointed to the small station as a necessity, and he adhered to his opinion, expressed recently, that the practical solution of the problem was to use small gas engines running in conjunction with the existing gas works. He knew they were in general disagreement with him, and that they favoured Dr. Ferranti's views.

MR. H. RICHARDSON (Dundee) said that, in connection with H.T. supply in Dundee, he had considered the question of steam and oil generating plant, having had the idea of assisting the sub-station plant by means of Diesel engines. He found that a 5,000-kw. turbine, with boilers, bunkers, &c., would cost £30,000, while four Diesel units, to give the same output, would cost £58,000, neglecting the greater space taken. With the Diesel plant the fuel cost would be 15d. per unit generated, while they were then generating at their own steam station for 11d. per unit coal cost. The oil engine was suitable for small lighting areas, but could not compete in power areas. The Sunday interval which Mr. Gray deplored was often highly valued by those using gas engines. He agreed with the author on the necessity of looking ahead; it had been a great fault in the past that this had not been done. The capital cost of hydro-electric works rendered it hopeless for water power to compete with steam generally.

MR. W. A. CHAMEN (S. Wales E.P.D. Co.) said he had been much disappointed on looking into the question of oil and gas plant in his area. He pointed out that sub-station attendance was not nearly so serious an item as was made out by the Diesel engine people, as many sub-stations were of the static type. Transmission losses were also less than had been suggested.

MR. J. E. ENGCOMBE (Kingston-on-Thames) said his interest in the paper was aroused by the remarks on fuel. At Kingston he was hoping to run his Diesel plant on water gas tar, but found it was nearly all exported to Germany.

DR. FERRANTI, in replying, said that what could take place in the future was likely to help greatly in the decisions of the present. He thought it possible that he might be charged with dealing too much with the present, in view of his remarks on the turbine.

The plant one would have to use was really settled by what one could use. In America he found huge gas engine-plants in use, under ideal conditions, at the Gary plant of the U.S. Steel Corporation and elsewhere, yet the Commonwealth Edison Co., at Chicago, were installing 25,000-kw. steam turbines, and were considering one of 30,000 kw. capacity, despite their full knowledge of the use of gas engines. The question of prime movers was closely allied with extension of distribution; if large communities could supply smaller adjoining ones, it would be very beneficial to the country at large.

(To be continued.)

## BUSINESS NOTES.

**Earl's Court Exhibits.**—The visitor to this Exhibition will observe among the other objects of military interest a display of telegraphic equipment for field service loaned by the Secretary of State for War. The Harper Electric Piano Company relieves the quietness of the hall wherein this exhibit is to be found, and elsewhere we observed Mr. Heathman's show of portable and other ladders, and an exhibit of the Acme patent ladders. From the electrical point of view the finest show, in our opinion, is that of the International Electric Co., Ltd., of Kilburn, who have an excellent collection of military and naval telephones, selective railway signalling sets and other manufactures well worthy of a visit.

**"Paragon" Internal-Combustion Locomotive.**—A manufacturing licence for the construction of this interesting locomotive has been purchased by MESSRS. HAWTHORNE, LESLIE & CO., locomotive engineers, of Newcastle-on-Tyne. The power transmission in these locomotives is on the "Paragon" variable-frequency polyphase alternating-current system (Durnall's patents). The electrical plant will be manufactured by licensed manufacturers of the "Paragon" plant. Mr. Durnall informs us that a large amount of business is opening up in various parts of the world, judging from the number of inquiries both himself and his partner, Mr. Herbert H. B. Deane, of Sydney, Australia, have received for these locomotives, which are being designed for use with both residue oil and coal gas as fuel. Designs are now being got out for locomotives up to 800 h.p. for a large Colonial railway, on which this system will be used. The principle on which these engines work was explained in our issue of January 10th, 1913.

**Osram Motor Vans.**—THE GENERAL ELECTRIC CO., LTD., have just put on the road two new motor delivery vans (40-h.p. Daimler), devoted exclusively to the distribution of Osram drawn-wire lamps.

**Lamp-making Films.**—MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., of Dalston, made arrangements for the exhibition of their "Wotan" and Tantalum lamp-making films at the Kingsland Empire Cinematograph Theatre, Dalston, on Monday afternoon last.

**Book Notices.**—*Electric Wiring.* By W. C. Clinton, B.Sc. London: John Murray. Price 2s.—This book has been revised and the type has been entirely reset, with new illustrations, and a new chapter on dynamos and motors; it has been reprinted five times, and is now in its third edition. The voice of good report has, therefore, spoken in its favour, and we need only say that it is a neat and handy little volume, clearly printed, clearly worded, and covering the ground very well. The subjects dealt with are elementary principles, calculations, insulation and wiring, switches and lamps, installations, bells, batteries, testing, and dynamos and motors.

"*Journal of the American Society of Mechanical Engineers.*" Vol. XXXV, No. 6. June, 1913. New York: The Society. Price 35 cents.

"*Journal of the American Institute of Architects.*" Vol. I, No. 6. June, 1913. Washington: The Institute.

"*Boletín de Ingenieros.*" Vol. III, No. 9. May, 1913. Mexico: Secretaría de Guerra.

"*Bulletin Scientifique de l'Association des Elèves des Ecoles Spéciales.*" April, 1913. Liège: Lahaye & Co. Price 75 cents.

"*Memoirs of the College of Science and Engineering, Kyoto Imperial University.*" Vol. IV, Nos. 1 and 2. November and December, 1912. Vol. V, Nos. 1 to 5. September, 1912, to April, 1913. Kyoto, Japan: The University.

**Catalogues and Lists.**—THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—The company have issued their 1913 fan catalogue. Early in 1912 they erected at Wotton a separate factory which is devoted to the construction of fans, and this catalogue covers the whole field of the application of electricity to ventilating work. Beginning with a small desk fan taking 20 watts, the catalogue concludes with centrifugal fans and exhaust fans with diameters of 60 in.; ceiling fans, oscillating fans and punkahs in great variety are included. Amongst the various designs of "Freezor" desk fans, the "Lite-weight" fan may be mentioned. It consumes 25 watts and weighs 10 lb.—a point which will appeal to shippers, especially where Customs duties are charged on a weight basis. For use aboard ship, a back plate pattern of fan has been introduced, which can be fixed to a ceiling and withdrawn from the plate and disconnected at will. The air can be thrown in any direction by an adjustment of the fan, which is effected by merely turning a screw. Illustrations and particulars are given of the desk and bracket fans made to British Admiralty specification; the Swan fan; Pitter blades for fitting in place of the ordinary blade; exhaust fans of both C.C. and A.C. types having either induction or repulsion motors; a large range of centrifugal fans, for which a big order was recently placed by the Admiralty. The speed regulators listed include a neat device not much larger than an ordinary tumbler switch by which the speed of a fan can be varied as desired. All Freezor desk fans have a special regulator fitted in their base, so that no additional speed regulator is necessary. Moreover, since the speed regulator also includes an "off" position, the installation of a switch is obviated. In the sweltering weather that we have just passed through, the very name of the GENERAL ELECTRIC CO.'s fan is refreshing, and we are informed that the company have inaugurated a special express delivery service to enable their trade customers to cope with the demand without carrying large stocks.

THE CAMBRIDGE SCIENTIFIC INSTRUMENT CO., LTD., Cambridge.—New catalogue (No. 107) of about 40 pages, dealing fully with electro-cardiographic apparatus, including full descriptions and cost of outfits suitable for taking electro-cardiograms and phono-cardiograms. Several special pieces of apparatus, such as the cardiograph switchboard and time markers, &c., have been designed, and complete outfits are arranged in every way to meet the requirements of either the ordinary medical practitioner or the research physiologist. The pamphlet is well and fully illustrated.

ALLGEMEINE ELEKTRICITÄTS-GESELLSCHAFT, Berlin.—Pamphlets relating to "Electricity in Farmers' Houses," and "Tube-wire," an insulated wire with a metal sheath which is used in installation wiring.

THE SCHNIEWINDT ELECTRIC CO., 40 and 41, Staniforth Street, Birmingham.—New illustrated price list No. H.P. 100, giving particulars of "asbestos cement" electrically-heated hot-plates, cast-iron cooking plates, and large enamelled iron cooking plates with nickel-plated feet.

MESSRS. J. BURNS, LTD., 187 and 189, Central Street, London, E.C.—Price list, No. 513, giving tabulated sizes and prices of vulcanised fibre, and ebonite sheets, tubes, rods, &c.

MESSRS. SCHOLEY & CO., LTD., 151, Queen Victoria Street, London, E.C.—The *Scholey Magazine*, of which No. 1 is before us, is a booklet specially intended for shippers and exporters, containing a description of a number of the firm's manufactures—Graham electric lifts, electric soldering and branding irons, indestructible cables, tool-steel gears and pinions, and switchgear. There are some notes entitled "Why Australia Buys So Cheaply."

THE DOWNSING RADIANT HEAT CO., LTD., 105, Great Portland Street, London, W.—Eighteen-page list containing a number of illustrations, with brief particulars and prices, of their Solarium or

electric light cabinet baths. The folding and reclining patterns shown have, we understand, been installed in many country houses, including those of the Duke of Westminster, Duke of Portland, and Lord St. Oswald. Portable electric baths, supplied for giving local light and heat treatment to particular limbs or parts of the body, are among the lines included in the list.

MESSRS. OSKAR WEBER, 25, Pariserstrasse, Berlin, W. 15, announce the issue of their new catalogue, No. 200, of numerous types and fittings for wire lamps of all sizes, and installation materials, in five languages.

MESSRS. MAGIC APPLIANCES, LTD., 6, Farringdon Avenue, London, E.C.—Illustrated folder (for consumers' education) entitled "A Scandal in High Society," dealing with the "Magic" suction cleaner, and a leaflet "Aids to Health and Comfort," showing and pricing the "Oscillus" vibrator and the "Hotwynd" hair dryer, &c.

MESSRS. SIEMENS BROS. & CO., LTD., Woolwich.—Catalogue No. 513 (28 pages) fully illustrating and describing, also stating prices of, their electric apparatus for mines, including luminous and combined visual and recording mine shaft signalling apparatus, bell indicators, hooters, bells, loud-speaking 'phones, dial signalling apparatus, &c.

MESSRS. R. H. PATTERSON & CO., LTD., Forth Street Works, Newcastle-on-Tyne.—June catalogue of new and second-hand machinery for sale or hire.

THE NATIONAL ELECTRIC TIME CO., LTD., 15, Great Sutton Street, Clerkenwell, London, E.C.—Several publications relating to their electric impulse clocks, headway indicators, and train time recorders. One is entitled "Electric Time Service for Railways," and another gives descriptive notes, with illustrations and prices, of the Dallett controlled system of electric impulse clocks. These clocks are now being installed at the northern stations of the Bakerloo section of the London Electric Railway, and the company have devised a system to meet the special requirements, including the transmission of time impulses imparted over the long distances entailed.

**Strike Settled.**—The *Daily Express* says that the first settlement of importance in connection with the Black Country strikes took place on Monday, when the General Electric Co., of Wotton, decided to concede the 23s. minimum wage.

**Montreal Exhibition.**—*Canada* says that an electrical exhibition is to be held in the city of Montreal, at the Arena, from October 18th to 25th. The Montreal Light, Heat & Power Co. are taking a special interest in the exhibition, and are arranging to have a very elaborate display.

**Hendon Cottage Hospital.**—MESSRS. FRANCIS READE AND CO., of Finchley, carried out the electrical work at the Hendon Cottage Hospital, which was opened last Saturday by Princess Henry of Battenburg.

**Electrical Industry.**—The annual report just issued by the Wolverhampton Chamber of Commerce contains the following reference to the electrical engineering trade:—"This industry has been very busily engaged during the past 12 months. The use of electricity for a large variety of purposes continues to increase and expand. Wireless telegraphy has caused a large demand for special types of electric generators, and large power plants have been put down nearly all over the country, while at the same time there has been a steady flow of good shipping business. The local factories are full of work, and there is no doubt that a heavy demand will be made upon them for a long time ahead. Prices are better, and the industry on the whole is in a much more satisfactory condition."

**Malleable Iron.**—MESSRS. JAMES SIMMONDS & CO., LTD., of Whitmore Reans, Wolverhampton, inform us that by an entirely new process Blackheart malleable iron is being produced giving, as certified by Prof. Dixon, of Birmingham University, a tensile breaking strain of 20·8 tons per sq. in., and with a bending strain, on a bar 1 sq. in. in section, between points 12 in. apart, weight in centre 2·7 tons, a deflection of  $\frac{1}{4}$  in. The material withstands repeated shocks better than mild steel, and can be worked under the hammer hot or cold, in very much the same way as mild steel. It can also be machined with ease. They are the sole selling agents for this material.

**English Steel Works in Canada.**—The *Times* correspondent at Montreal, reports that MESSRS. ARMSTRONG, WHITWORTH are about to erect steel works on the south shore of the St. Lawrence River, opposite Montreal. The site cost £80,000, and the first series of buildings will cost £200,000. The works will be in operation on May 1st next year. They will employ 500 men to start with, and in two years' time 2,000 men. The undertaking is not designed for warship building. It is proposed to establish later subsidiary plant throughout the Dominion.

**Dissolutions and Liquidations.**—GEM DYNAMO BRUSH CO., LTD.—A meeting will be held at 233, Park Lane, Aston, Birmingham, on July 14th, to hear an account of the winding up from the liquidator, Mr. J. W. Massey.

THORP & ARKELL, motor and electrical engineers, Marlborough Street, Faringdon.—Messrs. J. Thorp & T. Arkell have dissolved partnership. Mr. Thorp attends to debts and will continue the business as James Thorp & Co.

**H. BARDER & Co., Johannesburg.**—Messrs. H. Barder & Alexander Solomon have dissolved partnership. Mr. Solomon will continue the business (under the old style until August) at the same address, 169, Simmonds Street, Box 2,587. Mr. Barder has commenced business with Mr. T. H. W. Williams, M.E., as H. Barder and Co., Ltd., doing business in electrical and mechanical appliances. Catalogues and terms are invited by the new company at Box 2,587 as above.

**Meter Approved.**—The Board of Trade has approved of the polyphase meter type D.a. submitted by the ELECTRICAL CO., LTD., in April last.

**Fire.**—It is reported that a serious fire occurred on Sunday morning at the works of MESSRS. YATES & THOM at Blackburn, doing damage to the tune of £150,000.

**Bankruptcy Proceedings.**—FRANK HUCKS, electrical engineer, lately carrying on business at 2, Adelaide Road, Hampstead, under the style of Frank Hucks & Co. The first meeting of creditors was held on Tuesday at the London Bankruptcy Court, under a receiving order made in this case. It transpired that the debtor commenced business in May, 1909, having a seat in his father's office in James Street, Camden town. He removed a year later to 18, Charing Cross Road, and from thence, in February, 1911, to Hampstead, where he carried on the business until last February, when he relinquished it and became managing secretary to a company. The business was never a success, and the debtor kept it afloat from the beginning with the aid of borrowed money: he eventually gave a bill of sale over the furniture, and sold his reversion under his father's will: but owing to pressure by creditors, he closed down. Since then, a creditor continued to exercise pressure, with the result that the debtor filed his petition on June 14th. He attributes his failure and inactivity to loss on contracts through under-estimating, and to further losses caused by a 12 weeks' illness in the spring of 1911. The liabilities are estimated at £775, and the assets consist of "book debts, £110." In the absence of any proposal, the estate was left to be wound up by the Official Receiver in bankruptcy.

FRED. SHAW, electrical contractor, Hesse Road, Kingston-upon-Hull.—A supplemental dividend of 3d. and 4 per cent. interest is payable June 20th, at York City Bank Chambers, Lowgate, Hull.

ROBT. E. JOY (Bristol Electrical Co.), electrical engineer, 143, Cheltenham Road, Bristol.—Discharge suspended for two years, to take effect from May 23rd, 1915.

TOM ARTHUR FLATHER, electrical engineer, of 406, Mendwood Road, Leeds.—At the Leeds Bankruptcy Court, last Tuesday, before his Honour Judge Graham, K.C., application for discharge from bankruptcy was made. The liabilities in the case were £357, and the assets totalled to only £23. The discharge was suspended subject to the debtor consenting to judgment for £100.

J. G. S. CUNNINGTON & H. P. ALISON (Laing Wharton & Cunningham), electrical engineers and contractors, 7, Great Newport Street, London.—Third and final dividend of 1½d. in the £, payable at 24, King Street, Cheapside, E.C.

CECIL WRAY, electrical and mechanical engineer, Bradford.—A first dividend of 10d. in the £ is payable at 12, Duke Street, Bradford, by the Official Receiver.

J. A. BAKER (Electrical and General Engineering Co.), 17, Gracechurch Street, E.C. Trustee released, May 28th.

**Trade Announcements.**—MESSRS. NALDER BROS. AND THOMPSON, LTD., announce that they will shortly be moving their factory and head office from Queen Street, E.C., to very much larger premises now building at 97A Dalston Lane, N.E. They will retain an office and showroom at Queen Street which will be in communication with the head office by means of a private telephone extension line. The existing part machine shops at Kingsland Green will be continued as heretofore. The new premises will afford the firm largely increased facilities both for output and for prompt delivery.

THE SOUTH LONDON CONDUIT FITTINGS CO., of Kennington, are removing to larger and more convenient premises at 16-16, Marlborough Road, Old Kent Road, S.E., where they are putting down more extensive machine shops and a malleable and common iron foundry.

MR. G. E. HOPKINS, formerly with Mr. O. C. Knight, has commenced business as an electrician and electrical goods dealer at 48, Wolverhampton Street, Dudley.

THE ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., 169-111, New Oxford Street, London, W.C., are taking up the sale of the "Pelapone" oil and gas engines.

MESSRS. EDMISTON, BROWN & Co., mechanical and electrical engineers, have removed to 219, St. Vincent Street, Glasgow. Telephone numbers:—Central 1189 and 1190 (two lines).

In our paragraph regarding MESSRS. BAXTER & CAUNTER last week we mentioned their "switchboard" department in error. We should have said "export" department. For Mr. Best read Mr. Betts. Some words sound very similar on the telephone.

THE BASTIAN ELECTRIC HEATING SYNDICATE, LTD., are, tomorrow (Saturday), removing their sales office from Palmerston House, E.C., to 185, Wardour Street, W. (near Oxford Street end).

MESSRS. BRITISH INSULATED AND HEATSEAL CABLES, LTD., last week removed their Manchester branch to Orme Buildings, Parsonage, Manchester, where more commodious premises have been secured. The telephone and telegraphic numbers remain unchanged.

## LIGHTING and POWER NOTES.

**Argentina.**—The Mayor of Santa Fé has stated that as soon as the additions to the electric light station have been completed it will be the fourth in importance in the Republic. The inhabitants of that city are of the opinion that it would be advantageous to the authorities if they were to reduce the present rate charged for energy which is considered to be excessive.—*Review of River Plate.*

The Gesellschaft Columbus für Elektrische Unternehmungen, which, as stated in a recent issue, has been formed at Glarus, Switzerland, will devote itself to the development of electrical undertakings in the Argentine Republic; to this end it has acquired three-fourths of the shares of the Compagnie Italo-Argentine d'Electricité.

**Barnstaple.**—The increased stability of the municipal electric light undertaking is shown in the result of the past year's working. The gross profits amount to £2,337, compared with a five years' average of £1,400, and show an increase of £871 over last year. There have been increased receipts for private lighting amounting to £198, and for power and heating amounting to £102. Public lighting has cost £49 less. By the installation of new accumulators, a reduction of no less than £345 was effected in the cost of production, although the output was largely increased. Capital charges amounting to £2,124, left a net profit of £213 on the year's working. But the new accumulators were paid for out of revenue, and this left a debit balance of about £20. Extensions of the service and other indications point to a further increased output next year.

**Barrow-in-Furness.**—The L.G.B. has sanctioned an expenditure of £764 by the B. of G. for lighting the workhouse by electricity. Of this sum £650 is to be obtained on loan, and repaid in 10 years.

**Bedford.**—For the convenience of consumers, the T.C. has decided to allow connections for one or two lamps to the power supply for the purpose of lighting isolated motors or machines. For this a fixed charge is to be made of 2s. per quarter for each 30-watt point *et pro rata* in addition to 1d. per unit for energy used. The minimum charge per point is to be 2s. per quarter. A cable is to be placed under the railway in order to supply current to the new works of Messrs. Peek, Frean & Co.

**Bedworth.**—The P.C. has decided to have experiments in public lighting made by the Leicestershire and Warwickshire Electric Supply Co. and the Gas Co. The former offers to supply 100 50-c.p. lamps at £3 10s. per lamp per annum.

**Bexhill.**—The financial report of the borough electric light undertaking for the year ended March 31st shows a gross profit of £6,173, as compared with £5,247 in the previous year. A sum of £611 is brought forward from last year's account, and after providing for the repayment of, and interest on, loans, there remains a balance of £1,875, which has been allocated as follows:—Meters, £320; public lighting, £100; income-tax on profits, £125; depreciation account, £51; balance carried forward to next account, £1,275. There has been no borrowing during the year. The total capital sanctioned and borrowed amounts to £74,148, of which £23,359 has been repaid, leaving an outstanding debt of £50,782 at March 31st.

**Bingley.**—The U.D.C. has applied to the L.G.B. for a further loan of £1,500 for electricity purposes. The Council has sealed an agreement with the Keighley T.C. for a supply of current in bulk.

**Bradford.**—The Electricity Department of the Corporation reports that the past year's trading shows a net profit of £8,477, an increase of £425 upon that of the previous year. The income has increased by £9,802, of which £8,969 is in respect of the sale of electricity; expenditure on coal has increased by £4,955 to £17,969; the total cost of generation was £35,120; the cost of distribution was £4,921; and repairs, £7,736, an increase of £486. The gross profit on the year's working was £66,743, as compared with £64,808 a year ago; £21,614 has been paid for interest on loans and income-tax, and £36,652 has been set aside to the sinking fund for paying off the debt. The total capital expenditure on the undertaking has been £877,000, in respect of which the present debt is now only £502,382. The total number of units sold during the year was 24½ millions, an increase of 2½ millions as compared with a year ago; the tramways absorbed 10½ million units of the total sold.

**Colchester.**—A L.G.B. inquiry was held on June 10th by Mr. T. C. Ekin, relative to the Corporation's application for a loan of £7,660 for electricity purposes, viz., services, mains, feeder pillars, feed pump, condenser, 375-kw. set, a booster and switch panel. There was no opposition.

**Gargrave.**—At the last meeting of the Parish Council, the matter of electric lighting was considered and a suggested contract with Messrs. Crompton & Co., Ltd., of Chelmsford and Manchester, was read. In this the company proposed to make arrangements with the Rural District Council in regard to road breaking; the sum of £2,000 would be required for the electric undertaking, and the company would be glad if the money could be raised locally for the formation of a company to be called the Gargrave Electric Supply Co., Ltd. After some discussion on the subject the following resolution was unanimously adopted:—

"That this Council approves of the scheme, and would be willing to accept the offered terms of the promoters for street lighting purposes."

**Gravesend.**—In order to further encourage the greater use of electricity the T.C. has adopted an alternative tariff to the present flat rate, viz.:—A fixed charge of 9s. per annum per 25-c.p. 32-watt lamp, with supply for lighting, heating, or cooking at  $\frac{1}{4}$ d. per unit, or a contract rate of 12s. per 25-c.p. 32-watt lamp per annum.

**Great Lumley (Co. Durham).**—It was reported at the last meeting of the P.C., that the local Colliery Co. had signified its willingness to take over the Council's electric lighting plant, to light up the district on certain conditions, and also to supply current to private consumers.

**Hebburn-on-Tyne.**—At the meeting of the Urban Council on the 9th inst., the General Purposes Committee reported that the clerk had written to the B. of T. requesting it to hold an inquiry into the circumstances of the explosion on March 30th, and the board had replied that it was making certain investigations with regard to the laying of mains in the district, and that on the completion of the investigation, the board would communicate further with the Council. The Committee recommended that the clerk be instructed to write again to the Board urging upon it the necessity of holding an inquiry. It was further reported that a letter had been received from the Northern Counties' Electricity Supply Co. stating that the cables to be laid to the C pit would be lead-covered with steel armour and laid direct in the ground without any troughing, in accordance with the company's usual and most recent practice. The report was adopted.

**Hull.**—The Sculcoates District Council has sanctioned the application of the Corporation for the supply of electricity to the village of Sutton. The price is to be  $\frac{1}{4}$ d. per unit, being a  $\frac{1}{4}$ d. higher than the price charged in Hull.

**Invergordon (near Cromarty).**—The T.C. has appointed a Committee to inquire into the advisability of introducing electric light into the burgh.

**Kettlewell (Yorkshire).**—In the upper reaches of the river Wharfe, high among the Craven Hills of West Yorkshire, last Saturday was a day of festivity, when the new electric lighting installation of the village of Kettlewell was inaugurated. The affair is under the control of a little local company, the Kettlewell Electric Supply Co., Ltd., which has £625 capital in 25 shares, fully paid up, and of which the village postmaster is secretary and the village schoolmaster one of the directors, with the support of other local gentlemen. The plant consists of a "Turgo" turbine of 10 H.P., and a dynamo of 6 kW. at 230 volts, 515 R.P.M. The plant is in a stone power house, erected on a concrete foundation on the bank of a stream, the waters of which drive the turbine. The village is connected by four miles of aerial cable. The installation is probably the smallest and cheapest public one in the country. It was provided at a cost of £560. The lighting in this village is a change direct from oil and candle to electricity. The local council is considering the question of lighting by electricity streets which have never been lit by anything before.

**Knottingley.**—The U.D.C. on June 12th passed a resolution for application to be made to the B. of T. for a provision for electric lighting. It was also decided that Messrs. Crompton and Co. be informed that the Council cannot at present enter into any arrangement with them, and that the Electricity Committee should prepare a scheme for the consideration of the Council.

**Leek.**—The U.D.C. on June 10th decided that it had no power to grant the facilities for laying cables across part of the town, applied for by Messrs. Brough, Nicholson & Hall, Ltd., silk manufacturers, in order to convey current for use at their works, in lieu of steam as at present used. Particulars of the firm's scheme appeared in a recent issue of the ELECTRICAL REVIEW.

**London.**—**FULHAM.**—Application is to be made for sanction to borrow £5,000 to cover the estimated expenditure for mains extensions during the ensuing two years. The accounts of the electricity undertaking for the year ended March 31st last, show an excess income over expenditure of £4,665, which is arrived at after debiting the revenue account with £631 in respect of new meters, and £722 for house connections. If these items had been charged to capital account in the usual way, the total surplus would have been £6,020. The total available surplus, including the amount brought forward from the previous year, now amounts to £7,898, and of this amount, £5,000 is to be transferred to reserve account.

**HAMMERSMITH.**—The Council, in May, 1912, decided to set aside a sum of £100 for the purchase of electric fans for hiring purposes at the following rates for 12-in. fans:—Minimum terms, 7s. 6d. each; first month of hire, 7s. 6d. each; second month, 5s. each; third, and each subsequent month, or part of a month, 3s. each.

**SOUTHWARK.**—At a meeting of the Board of Guardians on Friday, the medical superintendent of the infirmary (Dr. Bruce) submitted in his annual report that the electric light should be substituted for gas throughout the building. The new nurses' home had been fitted with electric light, and its extensions, Dr. Bruce stated, would result in advantageous terms all round. "The advantages of electric light," Dr. Bruce wrote, "in an institution for the sick are enormous. It reduces dirt and greatly facilitates the nursing of the sick during the night. Its installation would be an improvement of the first magnitude." Acting on this advice

the Guardians have decided to ask the London Electric Supply Co. to furnish them with a quotation for installing the electric light, and to give the price per unit.

**BATTERSEA.**—The B.C. has decided not to take any further action to restrain the London Electric Supply Co., Ltd., from laying mains through the Borough. The Court of Appeal ordered that the action of the Council should be dismissed, with costs, and it was then agreed that the hearing of the appeal should be treated as the trial of the action. The Council proposed that the B. of T. be urged to approve an alternative route for the mains. The company desires to lay its mains through Nine Elms Lane, Battersea Park Road, and York Road.

**WOOLWICH.**—An inquiry has been received from the chief engineer of the L.C.C. as to the probability of the B.C. being able to give a supply of electricity for lighting and power purposes at the North Woolwich pumping station, which would necessitate the laying of mains through a portion of the East Ham area. Subject to a definite application being made by the County Council, an agreement is to be entered into with the East Ham authority to allow of the necessary mains being laid.

**HOLBORN.**—At the last meeting of the B.C., the Works Committee reported having considered the question of the desirability of extinguishing a proportion of the public lamps at or about midnight. Having regard, however, to the difficulty and expense which would be incurred in rearranging the conditions of the present lighting contracts by which the contractors are paid a gross sum per annum, the Committee thinks that any saving in the cost of light would be outweighed, and it has therefore decided not to take any further action on the suggestion.

**MARYLEBONE.**—Special protest has been made against the clause of the Post Office London Railway Bill, which, if carried, will empower the Postmaster-General to supply with electricity any Post Office premises in the borough from the generating station of the proposed undertaking.

**Londonderry.**—At a L.G.B. inquiry held on the 14th inst. into the proposal of the Corporation to borrow £13,000 for electric lighting extension, the town clerk stated that the electric lighting undertaking was proving most successful. This year the Corporation would have a profit of £1,247. Mr. Macrory, electrical engineer, said the necessity for the contemplated expenditure arose through the re-opening of the shipyard, which was taking all its power from the Corporation. The Inspector asked whether the losses to the ratepayers in the early years of the undertaking had yet been made up. Mr. Algoe, city accountant, said there was still a deficit of £2,426 to be made up. The town clerk said the wiping of this out would only be a matter of time. There was no opposition.

**Luton.**—The total working expenses of the electricity undertaking during the year ended March 31st last amounted to £13,485, as against £9,384 the previous year, an increase of £4,100. The income amounted to £23,039, as compared with £17,767, an increase of £5,272. The revenue account shows a gross profit of £9,553, an increase of £1,171 over last year, and this profit equals 10.68 per cent. of the capital expenditure, as against 10.43 per cent. for 1911-12. The net profit amounts to £3,135, being £590 less than last year, and equal to 3.5 per cent. of the capital expenditure, comparing with 4.64 per cent. in 1911-12. Amounts have been charged against profits totalling £1,957, leaving a balance of £1,177 to be appropriated. The reserve and renewals fund amounted to £6,925 at March 31st, being equal to 7.74 per cent. of the capital expenditure at that date. The expenditure on capital account during the year was £8,929, making the total capital expenditure at the end of the year £89,260. The amount repaid or in sinking fund is £23,316, leaving a net debt of £63,297.

**Morley.**—Under the auspices of the Corporation Electricity Committee, and by arrangement with Messrs. Gillespie and Beales, a series of demonstrations and lectures on electrical cooking with the "Tricity" cookers has been given in the King's Hall, Town Hall, by Mr. F. S. Grogan.

**Newport (Mon.).**—On Friday a fire occurred at the Corporation electricity works, at Newport (Mon.), and practically destroyed one of the old turbo-generators, doing damage to the extent of about £500.

**New Zealand.**—A private company has agreed with the Devonport B.C. to erect an electric lighting and power station for that town, and to spend about £20,000 upon the system. The new Plymouth municipality is raising £55,000 for an electric tramway service.

**Shrewsbury.**—In presenting to the T.C. the report of the Lighting Committee, Ald. T. P. Deakin stated that the total income of the electricity undertaking for the year was £8,388, an increase of nearly £500 on last year. The capital raised for the undertaking was £59,289, and they had already paid off nearly £30,000 on it. With their reserve fund they had made on the undertaking about £32,000. The report was adopted.

**Southend-on-Sea.**—On June 11th a L.G.B. inquiry was held by Mr. T. C. Ekin, relative to the application of the T.C. for a loan of £11,000 for boilers and other plant at the electricity works. There was no opposition.

**Swindon.**—The T.C. has instructed the electrical engineer to prepare plans and specifications for the provision of an additional cooling tower at the electricity works. A loan of £9,200 for extensions to the plant has been applied for.

**Taunton.**—The T.C. on June 10th decided to apply to the L.G.B. for a loan of £2,600 for extensions to the electricity works, for which a site has been obtained.

**Tynemouth.**—In order to improve the lighting of the borough, the Electricity Committee has rescinded its resolution to extinguish 400 lamps during the four summer months. The extra cost will amount to about £120 a year.

**Truro.**—The T.C. has been informed that there is now no opposition to the Bill in which a prov. order for electric light is applied for.

**Whitworth (near Rochdale).**—The B. of T. has deferred the question of the revocation of the Whitworth Electric Lighting Order, 1905, until the end of the year.

The U.D.C. decided at its last meeting to apply for sanction to borrow £10,005, the estimated cost of the work in connection with the electricity scheme.

**West Bromwich.**—At the last meeting of the T.C. a report was presented which showed that on the electricity undertaking there was a balance of £337.

**West Ham.**—At the last meeting of the T.C. the electrical engineer (Mr. J. W. Beauchamp) submitted a detailed report upon the use of electricity for domestic cooking and heating, with recommendations for a domestic tariff suitable to the needs of the borough, and based upon the ascertained costs of supply. There has been, the report states, considerable development during the past year in the production of electric heating and cooking apparatus for domestic use, but before a cooking and heating load of considerable magnitude could be developed at all, it would be necessary to offer a suitable tariff. In framing a domestic tariff it becomes necessary to keep in mind several points of importance, which, in the case of West Ham, are:—(1) The present flat-rate charge for lighting (3d. per unit) is already quite low in comparison with gas at 2s. 6d. per 1,000 cu. ft. (2) A suitable tariff would put within the reach of the private house consumer a supply of electricity at a cost which would compete with gas or coal for heating and cooking; and (3) It is desirable that the tariff should be so designed that the consumers are encouraged or discouraged in proportion to the hours of use during which they employ their apparatus; that is to say, in proportion to their desirability or otherwise from the point of view of the supply department. The following is the tariff which the engineer proposes to make, and which will be applicable only to private houses, and the family residence portions of business premises where electric light is in general use. In the latter it is proposed that all electricity supplied for the business portion of the premises shall be treated separately and kept electrically distinct from any residence portion in which this tariff is adopted:—(1) An annual charge payable in advance, on account of lamps or apparatus used directly or indirectly for the production of light, at the rate of £10 per annum per 1,000 watts installed (a) with a minimum annual payment of £2 for any lamps or lighting apparatus installed up to 200 watts capacity; (b) beyond the limit of 200 watts, the annual charge of £10 per annum per 1,000 watts will be subject to division into one-hundredths (being 2s. per 10 watts per annum). (c) Where the aggregate capacity of lamps or lighting apparatus is less than or equal to 200 watts it will be taken as 200 watts, and where more than 200 watts it will be taken at the next higher value in tens of watts. (d) In assessing the fixed charge an allowance up to 25 per cent. may be made off the aggregate capacity of lamps and lighting apparatus connected in order to allow the installation of lamps for occasional use free of fixed charge. (2) An annual charge payable quarterly in advance on account of all other apparatus used for heating, cooking, power, and other uses of electricity permitted by the Supply Department, and in accordance with the following schedule.—10s. per annum for the first 1,000 watts capacity of permanently connected or portable apparatus, with a minimum annual payment of 10s. for apparatus up to 1,000 watts capacity; 10s. per annum for the second 1,000 watts capacity of permanently connected or portable apparatus; 6s. 8d. per annum per 1,000 watts beyond 2,000, and within such limits as may be allowed by the supply department for apparatus under this tariff. (3) In addition to the above charges, electricity consumed for all approved purposes will be registered by one meter (supplied free), and charged at ½d. per unit. Concluding, the engineer states that he considers the tariff proposed will be sufficiently attractive to bring about a very great increase in the present heat business, and that a subsidiary advantage of the system from the point of view of the consumer, is that the bulk (about 5ths) of the electric lighting bill is known accurately in advance, whilst the actual rate per unit which is to be paid for the heating and cooking is very much in the consumers' hands, if he is properly advised with regard to the type of apparatus and method of use.

**Birmingham.**—It is stated that the Tramways Committee contemplates introducing an ambitious scheme for linking up the various tramway routes in the centre of the city.

**Chesterfield.**—The Tramways Sub-Committee is to report upon the type and number of motor-buses to be obtained for route trials consequent on the passing of the Corporation Railless Traction Bill.

**Dumbarton.**—Subject to the interests of the county being safeguarded, the Eastern District Committee of Dumbarton County Council has expressed approval of the scheme to extend the tramways from Clydebank to Duntocher.

**Dunfermline.**—The T.C. has offered to relieve the Tramways Co. of the annual payment of £100 per mile for upkeep, provided that the company extends the line to Milesmark.

**Edinburgh.**—At a meeting of the T.C. last week the town clerk stated that they had got a definite offer from the Colinton Tramway Co. to sell their undertaking to the Corporation at a given sum. That offer was under the consideration of the Tramway Committee. The Council agreed to meet on July 1st to deal with the question.

**Farnborough (Hants.).**—The U.D.C. has decided to offer no opposition to the application of the Aldershot and Farnborough Light Railway Co. for a further extension of time until June 4th, 1914, for the completion of the proposed electric tramways.

**Little Hulton.**—It was announced on Monday that cars will probably be running by the end of September or the beginning of October on the South Lancashire Tramways Co.'s new lines through Little Hulton, near Bolton, connecting up at Walkden and Farnworth.

**Ilford.**—The U.D.C. has under consideration the question of purchasing a motor-tower wagon.

**London.**—L.C.C.—The figures for the past year's working of the Council's tramway system are eloquent of the effect of the strenuous competition of the motor-bus. Although the cars travelled 3½ million more miles in 1912-13 than in the previous year, they carried 20,787,000 fewer passengers, with the result that the gross earnings fell by £195,159. After deducting debt and other charges, the surplus remaining is only £497, compared with £222,702 in 1911-12. Appended are the figures for the two years:—

	1911-12.	1912-13.
Car-miles run ... ..	50,457,812	53,943,104
Passengers carried ... ..	533,440,235	512,652,653
Gross earnings ... ..	£934,212	£739,053
Net surplus ... ..	£222,702	£497

The surplus of £497 is all that is available for the renewals fund, for which a resolution of the Council provides that two-thirds of a penny for each car-mile run on the electric system must be set aside each year. On this basis the provision for 1912-13 should amount to £150,309. Nothing is, of course, available for the general reserve fund, to which any surplus remaining after providing for renewals is carried. On March 31st the renewals fund amounted to £633,010, and the reserve fund to £273,786. How the position as regards these funds compares with the previous year may be thus stated:—

	1911-12.	1912-13.
Available for renewals ... ..	£138,151	£497
Available for reserve ... ..	£84,551	Nil

The year's income amounted to £2,251,729; working expenses were £1,512,676, leaving a surplus of £739,053. Of this amount, debt and other charges absorbed £738,556, and a balance of only £497 remained.

The following table shows the position of affairs during the past few years:—

	Miles open.	Receipts per track-mile.	Receipts per car-mile.	Gross receipts.
1906-7 ... ..	40'66	£19,929	11'95d.	£810,320
1907-8 ... ..	61'91	20,223	11'74d.	1,252,001
1908-9 ... ..	77'94	19,762	11'56d.	1,539,434
1909-10 ... ..	99'61	18,546	11'21d.	1,817,327
1910-11 ... ..	116'98	17,925	11d.	2,096,914
1911-12 ... ..	127'55	17,498	10'98d.	2,231,902
1912-13 ... ..	132'49	16,179	9'73d.	2,143,569

The Highways Committee, discussing the question of successfully meeting this competition, considers that the linking up of the London termini and a rearrangement of services and fares would meet the position. Reference is also made to the burden of road widening at the expense of the tramways, which facilitates bus competition; also to the all-night services and workmen's fares, the burden of which falls only on the tramways.

**Oldbury.**—The Light Railway Commissioners have granted an order for the extension of the electric tramways from Birmingham to Warley, in the area of the Oldbury U.D.C.

**Scarborough.**—The South Cliff Tramways improvements are now nearly completed. The old steam power plant has been superseded by an electric pump, and a new type of car is to be used which will enable the officials to deal more effectively with heavy traffic.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—Work has commenced on the electrification of the Santa Fe tramways, and it is hoped to have the first section ready for service by the middle of next year. The work is being carried out by Messrs. J. G. White & Co.—*Review of the River Plate.*

**Tynemouth.**—The Tynemouth and District Electric Traction Co. recently proposed extending the tramway system to Preston, but has now been informed by the Parliamentary Committee of the local Corporation that it cannot entertain the proposal.

## TELEGRAPH and TELEPHONE NOTES.

**Argentina.**—Shares are being placed in Rosario for the construction of a network of telephone lines which will join up Galvez, Rafaela, Esperanza, Serodino, Irigoyen, Maciel, Caboto and San Carlos with Rosario.—*Review of the River Plate.*

**Canada.**—The Navy Department intends to erect a wireless station in Toronto, a link in a chain of wireless stations, designed to communicate with shipping on the Great Lakes.

**Dutch East Indies.**—Rapid progress is being made in the Dutch East Indies with the erection of wireless stations. The most powerful station is at Sabang, an island and coaling station north of Sumatra, with a minimum range of 1,000 miles, which brings it within reach of Colombo on one side, and Batavia on the other. Other wireless stations have been installed, and are now working at Batavia, Sitoebondo (East Java), Koepang (the capital of Dutch Timor), and Amboina (Moluccas), and a sixth is to be erected at Menado (Celebes). Koepang lies within 500 miles of Darwin, and could, therefore, communicate with the proposed station at this port, which would then give Australia direct wireless communication with the Dutch East Indies.

**France.**—A new telephone cable is to be laid between Marseilles and Algiers.—*African Engineering.*

**South Africa.**—A submarine bell worked by electricity has been fixed near the Green Point Lighthouse, Cape Colony.

**Telephone Service.**—The Council of the London Chamber of Commerce, at a meeting last week, decided to make representations to the Postmaster-General on the questions of the terms of telephone contracts; the system of registering calls; the provision of additional junction lines; the desirability of modernising the London telephone exchanges; improvements in the trunk line service; the need for greater efficiency and supervision of telephone operators; and the inconvenience of the "pillar" instrument.—*Daily Telegraph.*

**Wireless Telephony.**—Last week experiments were carried on between Northampton and Letchworth, a distance of 42 miles, with the Grindell-Matthews system of wireless telephony, by representatives of the *Daily Express*, who reported that they were very successful.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—**VICTORIA.**—July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" May 23rd.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" June 6th.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" May 30th.

July 29th.—Detectors, for the P.M.G.'s Department. See "Official Notices" to-day.

August 4th. (a) Twin surface condensers, hotwells, piping and sundries; (b) air and water extraction pumps and motors; (c) circulating water and sump pumps, with motors, for the Melbourne Suburban Railways power house. See "Official Notices" June 13th.

September 16th.—Switchboard, C.B. or automatic or semi-automatic, at Collingwood. See "Official Notices" to-day.

**QUEENSLAND.**—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

**WESTERN AUSTRALIA.**—July 30th and August 6th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" to-day.

July 30th.—Cable, switchboard, for the P.M.G. See "Official Notices" to-day.

**SOUTH AUSTRALIA.**—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

**NEW SOUTH WALES.**—July 9th. Switchboards, for the P.M.G. See "Official Notices" May 30th.

**Austria-Hungary.**—**CRACOW.**—July 5th. The Magistrate of Krakau calls for tenders for the supply of two steam turbines, two boilers, piping, feed pumps, a turbo-generator, a switchboard, ironwork, &c. Particulars and plans (10 kronen) from the Bureau des Städtischen Elektrizitätswerke, Krakau.

**Belgium.**—September 9th. The municipal authorities of Antwerp are inviting tenders for the supply and erection of 30 electrically-operated cranes for the extension of the Bassin Canal.

July 2nd.—The Belgian Telegraph authorities invite tenders for 1,255 metres of armoured, lead-covered, paper-insulated cable with accessories, as per Cahier des charges spécial No. 152. It is advisable to send in tenders by June 28th. Deposit 1,300 fr. Apply Administration des Télégraphes, Salle de la Madeleine, Brussels.

July 2nd.—Telephone cable and accessories for the city of Antwerp. Deposit 10,000 fr. Price of plans 21-30 fr. Cahier des charges spécial No. 146. It is recommended to forward tenders on June 28th. Salle de la Madeleine, Brussels.

**Carlisle.**—June 23rd. (a) Extensions to coal storage and conveying plant; (b) extensions to steam and water piping, for the City Electricity Department. Mr. F. W. Purse, City Electrical Engineer, Victoria Viaduct.

**Eccles.**—June 28th. Electric lighting of Green Lane Council School, Patricroft. Mr. S. H. Neave, Secretary to the Education Committee.

**Elland.**—July 2nd. Street lighting lanterns, for the U.D.C. See "Official Notices" June 13th.

**France.**—June 30th. The French State Railway authorities in Paris (Bureaux du Service Electrique, 43, Rue de Rome) are inviting tenders for the supply of 18 electrically-operated capstans for the St. Lazare Station.

July 5th.—Telegraph office instruments. Particulars, and leave to compete, from the Ministère du Commerce, de l'Industrie, des Postes et des Télégraphes, 103, Rue de Grenoble, Paris, before June 26th.

**Leeds.**—June 23rd. Electric light installation in Church and School, for the Trustees of Clowes Primitive Methodist Church, Meanwood Road. Mr. F. S. Morland, Secretary, 18, Cambridge Road, Leeds.

**Leyton.**—June 24th. Electric lighting and hot-water heating for the new Church Road Schools, for the U.D.C. See "Official Notices" June 13th.

**Limerick.**—July 3rd. Switchboard and gallery, battery, motor-driven booster, balancer, &c., for the County Borough Council. See "Official Notices" June 13th.

**London.**—**L.C.C.**—June 24th. One 50-ton overhead travelling crane for Greenwich generating station. See "Official Notices" June 6th.

June 25th.—Electrical installation at Randall Place Elementary School, Greenwich, S.E. See "Official Notices" June 6th.

July 2nd.—Electrical installation at the Caldecot Road Elementary School, Denmark Hill, Camberwell (192 lighting points). See "Official Notices" June 13th.

**STEPNEY.**—July 3rd. The Electricity Committee invites tenders for two E.H.T. converting plants suitable for 6,000-volt three-phase A.C. to L.T., D.C., for Limehouse and Whitechapel stations. See "Official Notices" June 13th.

June 30th. Arc lamp carbons, for a year, for the Borough Council. See "Official Notices" June 13th.

**ROYAL MINT.**—June 26th. 100 tons of copper in ingots. See "Official Notices" to-day.

**HACKNEY.**—July 24th. Extra-H.T. ring main conduits, substation plant, switchgear and cranes, for the B.C. electricity department. See "Official Notices" to-day.

**H.M. OFFICE OF WORKS.**—Incandescent electric lamps for one year. See "Official Notices" to-day.

**Newcastle-under-Lyme.**—June 21st. Supply and laying of cables, for the Corporation. See "Official Notices" June 6th.

**Newport (Mon.).**—July 1st. Refuse destructor for the T.C. Borough Engineer, Town Hall.

**Norway.**—June 26th. The electrical department of the Municipal Council of Christiania is inviting tenders for the supply of a 25-ton travelling crane.

June 28th.—Norwegian State Telegraph Department. 400,000 metres of double wire.—*Board of Trade Journal.*

**Oldham.**—One 2,000-kw. steam turbine, coupled to extra-H.P. A.C. generator, also barometric condenser, pumps, &c., for the Corporation. See "Official Notices" to-day.

**Ramsey (Hunts.).**—June 30th. Street lighting, for the U.D.C. Mr. R. F. Serjeant, Clerk.

**Rotherham.**—July 8th. Tramway stores, coal, cable and meters, for the Corporation. See "Official Notices" to-day.

**Salford.**—June 23rd. 4,000 steel tie-bars, for the Tramways Committee. General Manager, 32, Blackfriars Street.

**South Africa.**—CAPE TOWN.—July 4th. High-tension switchgear, feeder pillars and three-phase transformers, for the Corporation. Particulars from the City Electrical Engineer on payment of deposit of £1 ls. per section (three sections).

**Spain.**—August 1st. The Harbour Works authorities at Barcelona are inviting tenders for the conversion to electric operation of 10 hydraulic cranes.

The municipal authorities of Sax (Province of Alicante) have just invited tenders for the concession for the electric lighting of the town during a period of 10 years.

**Swindon.**—June 23rd. Cooling tower, water softening plant and flamed cast-iron piping, for the Electricity Department. See "Official Notices" June 6th.

**Wakefield.**—June 21st. Calder Vale electricity works. Tenders for 1,000 tons of good round slack, or alternatively "through" coal. Town Clerk, Town Hall, Wakefield.

**West Stanley (Co. Durham).**—Electrical work for new Royal Hippodrome Theatre of Varieties. Mr. Frank Sinclair, lessee and manager, The Rink, West Stanley.

### CLOSED.

**Bradford.**—The tender of Messrs. J. Dyson & Co. has been accepted by the Guardians for the supply of an E.P.S. battery, for £140, less £15 for old material.

**Colchester.**—The T.C. has accepted the following tenders for coal for the electricity works:—

Wm. Cory & Co., Ltd.—About 8,500 tons of Shirebrook, 15s. 11d. per ton.  
A. J. Hayward.—About 1,500 tons of Digby Gilding, 15s. 4d. per ton.

**Chile.**—It was recently mentioned that the Siemens-Schuckert Works had secured a large contract for the equipment of a central station and sub-station in Chile, of the value of £600,000. The contract, which has been obtained in competition with the large electrical firms in the United States, has now been signed, the order having been placed by the Chile Exploration Co., which has been formed by the Guggenheim syndicate for the working of copper ore in the north of Chile, and in anticipation of the great development of trade which is expected to occur on the west coast of South America after the opening of the Panama Canal. It is understood that the order comprises boilers, machinery, transformers and switchboards, and four turbo-generators of 10,000 kw. will first be installed at the coastal generating station. The transmission to the sub-station at the mines, which are situated about 124 miles distant, is to be effected at 110,000 volts, and the sub-station will be equipped with seven rotary converters of 2,500 kw. at the beginning of working.

**France.**—The French Post and Telegraph authorities in Paris last week gave out orders as follows:—

La Société des Tréfileries du Havre.—50 tons of bronze wire 11/10 mm. dia.; 10 tons ditto 15/10 mm. dia. and 700 tons of high conductivity copper wire, 2½ mm. dia.  
M. Grammont, of Pont-de-Cheruy.—50 tons of bronze wire, 11/10 mm. dia. and 600 tons of high conductivity copper wire, 2½ mm. dia.  
La Compagnie Générale d'Electricité, Paris.—60 tons of bronze wire, 15/10 mm. dia. and 50 tons of high conductivity copper, 2½ mm. dia.  
La Compagnie Française du Minéral, Paris.—30 tons of high conductivity copper wire, 2 mm. dia. and 160 tons ditto, 4 mm. dia.  
La Société d'Electrometallurgie de Lèves.—200 tons ditto, 3 mm. dia.  
La Compagnie Française des Metaux, Paris.—300 tons ditto.  
La Société de Pontgibaud.—100 tons ditto, 4 mm. dia.

**Government Contracts.**—The following tenders have been accepted during the past month by the Government departments named:—

#### ADMIRALTY—CONTRACT DEPARTMENT.

Steel masts for wireless telegraphy.—Siemens Bros. & Co., Ltd.

#### INDIA OFFICE.

Cells.—J. Stone & Co.  
Telephone exchange.—Automatic Telephone Manufacturing Co.  
Copper wire.—Callender's Cable, & Co.

#### CROWN AGENTS FOR THE COLONIES.

Underground telegraph cable.—W. T. Henley & Telegraph Works Co.  
Armoured telegraph cable.—Siemens Bros. & Co., Ltd.  
Porcelain insulators.—Bullers, Ltd.  
Steel telegraph poles.—Bullers, Ltd.

#### POST OFFICE.

Telephonic apparatus.—Automatic Telephone Manufacturing Co., Ltd.; D. H. Bonnell & Son, Ltd.; B.J. and Helsby Cables, Ltd.; British L. M. Ericsson Manufacturing Co., Ltd.; Karabon Co., Ltd.; London Electric Wire Co. and Smiths, Ltd.; Peel-Comer Telephone Works, Ltd.; Siemens Bros. & Co., Ltd.; Sterling Telephone and Electric Co., Ltd.; Western Electric Co., Ltd.  
Telegraphic apparatus.—Gell Tele. Appliances Syndicate, Ltd.  
Wood arms.—R. Lander & Co.  
Silence cabinets.—Siemens Br. & Co., Ltd.  
Telephonic cable.—B.J. and Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Western Electric Co., Ltd.  
Telegraph cable.—Callender's Cable and Construction Co., Ltd.  
No. 2 detectors.—General Electric Co., Ltd.  
Solder.—B.J. and Helsby Cables, Ltd.  
Bronze wire.—Horton & Sons, Ltd.; Shropshire Iron Co., Ltd.; F. Smith and Co., Ltd.  
G.I. strand wire.—Rylands Bros., Ltd.  
Armoured copper wire.—T. Bolton & Sons, Ltd.  
Parapneumatic wire.—Macintosh & Co., Ltd.; London Electric Wire Co. and Smiths, Ltd.

Leclanché rod zincs.—Siemens Bros. & Co., Ltd.  
Steel mast, Malin Head, co. Donegal.—Marconi Wireless Telegraph Co., Ltd.  
Telephone exchange equipment, Tunbridge Wells.—Western Electric Co., Ltd.

**Great Yarmouth.**—The T.C. has accepted the tender of Messrs. E. Foster & Co., Ltd., for slack coal for the electricity works, at 14s. 5d. per ton.

**London.**—L.C.C.—The Highways Committee received the following tenders from selected firms for two hydraulic accumulators and a pump for the third section of the central car repair depot:—

Leeds Engineering and Hydraulic Co., Ltd., (accepted), £206.  
W. H. Bailey & Co., Ltd.  
Glensfield & Kennedy, Ltd.

**L. AND S.-W. RAILWAY.**—With further reference to this matter, the *Railway Gazette* states that the London and South-Western Railway has let the contract for motors and train equipment for the first portion of its electrification scheme to the British Westinghouse Electric and Manufacturing Co., Ltd. The conductor rails it is purchasing from Messrs. Bolckow, Vaughan & Co., Middlesbrough, and these will be laid down under the supervision of Mr. J. W. Jacobb Hood, M.L.S.C.E., and his department. The high-tension cables are being obtained from Messrs. Siemens Bros. & Co., Ltd., Woolwich. The contract for the power house has not yet been let, but it is understood that 10,000 kw. and 5,000 kw. units will be installed, generating at a pressure of 11,000 volts. The sub-station equipments have been placed with the British Thomson-Houston Co., Ltd. The first section to be completed will be the two lines to Hampton Court. The electrical work is being carried out by the company's electrical engineer, Mr. Herbert Jones, the whole of the work being under the supervision of Messrs. Kennedy & Jenkin.

**MARYLENE.**—The B.C. has accepted the tender of Messrs. J. Simpson & Son, at £234, for carrying out certain alterations at the Aybrook Street sub-station in order to house the new rotary converters. The tenders of Messrs. Pirelli and Messrs. Siemens have also been accepted for a supply of rubber tubing and rubber gloves respectively.

The Metropolitan Asylums Board has received the following tenders for installing internal telephones at the Western Hospital:—

S. W. Vaughan & Co., Ltd. . . . .	(accepted) £284
Toy & Winslow . . . . .	318
Electrical Installations, Ltd. . . . .	336
Electrical Contracts and Maintenance Co., Ltd. . . . .	320
Private Telephone Co., Ltd. . . . .	380
C. H. Cathcart & Co. . . . .	357
J. W. Gray & Son . . . . .	450
British Home and Office Telephone Co. . . . .	453
Thomas Williams & Co. . . . .	489

**SHOREDITCH.**—The B.C. Lighting Committee has accepted the tender of Messrs. Harrison, Tidswell & Co. for a nine months' supply of Manners Kilburn D/S nuts, at 17s. 6d. per ton, and Whitwick D/S nuts, at 17s. 5d. per ton.

**BERMONDSEY.**—The B.C. Electricity Committee has accepted the tender of Messrs. G. Hinchliffe & Co. for an annual supply of Stockingford nutty slack, at 13s. 11d. per ton; also the tender of A. Usher & Co., Ltd., for a supply of Exhall D/S nuts, at 17s. per ton.

**FULHAM.**—The following tenders have been accepted by the B.C. for supplies of coal to the electricity department:—

Gilman & Co.—3,000 tons of Mapper ey, 15s. 4d. per ton.  
Cory Bros.—2,000 tons of Geddings, 13s. 11d. per ton.  
Harrison & Tidswell.—1,000 tons of Bedworth, 18s. 11d. per ton.

**HAMMERSMITH.**—Mr. E. C. Berridge is to supply, at £105, a 16-in. twin strainer for fitting to the condenser of set No. 12 at the generating station, that already fitted to another set having proved of very great advantage in enabling the rubbish contained in the river water to be cleared away without shutting down.

**Southampton.**—The Post Office has submitted an estimate of the cost of installing the "Gamewell" fire alarm system between Cobden Bridge, Bitterne Park; the junction of St. Denys Road with Kent Road and the Brigade headquarters in St. Mary's Road. For wiring only, £22 10s. per annum is quoted, with £36 10s. per annum for apparatus only; and £2 2s. 6d. per annum for providing two pedestals for carrying the apparatus at the first two points. The terms are stated to be inclusive and cover all charges for provision and maintenance under agreement for 10 years. Twelve fire helmets are to be fitted with electric lamps, at 11s. per helmet, and a quotation is to be obtained from the patentee for the equipment of the whole of the helmets of the Brigade.

**Southport.**—The T.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for steel pipes and valves for the boilers at the electricity works, at £1,032.

**Swindon.**—The T.C. has accepted the tender of the Bruh Electrical Engineering Co., Ltd., for a 500-kw. turbo-generator with surface condensing plant, at £5,567.

**Woolwich.**—The tender of Messrs. Switchgear and Cowans, Ltd., has been accepted by the B.C., at £106, for two complete panels, with all the necessary controller gear mounted thereon, required in centralising the switchboard in connection with the Woolwich works extensions.

**Workshop.**—The U.D.C. has accepted the tender of the Wigan Coal and Iron Co., Ltd., for nutty slack coal for the electricity works; and that of the tender of the British Insulated and Helsby Cables, Ltd., for materials for overhead wiring, &c.

## FORTHCOMING EVENTS.

- Municipal Electrical Association.**—Eighteenth Annual Convention, Friday, June 20th. At 10 a.m. At the I.E.E. Annual general meeting. Saturday, June 21st. At 9.30 a.m. Leave for visit to Chingford reservoir.
- Association of Electrical Station Engineers (Newcastle-on-Tyne Section).**—Monday, June 23rd. At 7.30 p.m. At the Drawing Room Cafe, Northumberland Street. General meeting, to form a branch.
- (London Section).**—Tuesday, June 24th. At 8 p.m. At Chandos Hall, Malden Lane, Strand, W.C. General meeting. Paper on "The Status of Electrical Station Engineers, and the Need of an Association," by Mr. J. W. Thomas.
- Institution of Municipal Engineers.**—Wednesday, June 25th. At 10.30 a.m. to 1 p.m. At the Institution Offices, 31, Victoria Street, S.W. An informal meeting to facilitate intercourse between members coming to London for the International Road Congress. At 7.45 p.m. In the Council Chamber, 4, Southampton Row, W.C. Paper on "The Relations of the Engineer and the Municipal Engineer," by Mr. H. C. H. Shenton (member).
- National Physical Laboratory.**—Thursday, June 26th. At 3 p.m. Opening of the new buildings by Mr. A. J. Bullour.
- Institution of Electrical Engineers.**—Thursday, June 26th. At 9 p.m. At the Natural History Museum, S.W. Annual Conversazione.

THE ELECTRICAL ENGINEERS  
(LONDON DIVISION).

Commanding Officer—Lieut.-Col. H. M. LEAF.

The following orders have been issued for the current week:—

- Monday, June 23rd.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 5th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.
- Tuesday, June 24th.—"B" Company. Ditto.
- Thursday, June 25th.—"C" Company. Ditto.
- Friday, June 27th.—"D" Company. Ditto.
- Saturday, June 28th.—All Companies. The whole corps will parade at Headquarters at 6 p.m. Ceremonial parade on Wimbledon Common. Dress: Drill order, service dress, black boots and puttees will be worn. The Officers' Drill Cup Competition will be decided on the turn-out for this and the Royal Review Parade. Members are requested to turn up at Headquarters as early as possible, on account of the great number of arms to be issued. Regimental business will be transacted from 10 a.m. to 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., Adjutant.  
For Officer commanding L.E.E.

## NOTES.

## Wanted—Two Hundred and Fifty Pounds.—

Three-fourths of the £1,000 which it is hoped to bring to the Electrical Trades Benevolent Fund, consequent upon the movement set on foot at the annual dinner, is now promised, and the list of donors given below includes an amount generously offered by Messrs. A. P. Lundberg & Sons, on condition that other offers aggregating £250 are forthcoming before the closing date.

It seems to us that, with both Mr. Byng's and Messrs. Lundberg's offers as an inducement, there should be little difficulty in obtaining this further £250. We are sure that good resolutions have been formed, or half-formed, by a number of our well-to-do readers during the past few weeks as they have read our appeals: but they have been too busy, or it has been too hot, or they have been to Ghent or to Paris, or to Blackpool or the I.M.E.A., and their good intentions have been unwittingly smothered up by a hundred pressing matters. We trust that, as to-day they open out their ELECTRICAL REVIEW, and, suddenly remembering the Fund, turn over to this note to see what progress is being made, they will take out that cheque-book and draw a crossed cheque for £100 or £50, payable to "The Electrical Trades Benevolent Institution," and dispatch it—before interviewing even that man who is waiting to see them—to Mr. F. B. O. Hawes, the secretary (18, Park Mansions, Vauxhall Park, South Lambeth Road, S.W.), or to us.

The terms of Messrs. Lundberg's offer are as under:—

"We are surprised to notice the very poor response to the appeal to subscribe the £1,000 for the Electrical Trades Benevolent Institution, of which £700 has already been promised, for we quite thought the few hundreds necessary would have been immediately forthcoming.

"Possibly were it made more widely known that donations of £50 would be thankfully accepted to make up the required amount, the difficulty might be overcome.

"In order to start the ball rolling, we will follow on Mr. Byng's offer to the effect that we will give £50, providing the remaining £250 is made up in amounts of not less than £50 before the time stated at the Dinner.

"As only a few weeks now remain, may we ask you to make a special appeal on these lines.

A. P. LUNDBERG &amp; SONS.

"Liverpool Road, N."

The following is the list down to date:—

1	Mr. E. G. Byng	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	£100
5	Sir W. H. Preece, K.C.B., F.R.S.	...	...	...	...	£100
6	Mr. Justus Eck	...	...	...	...	£100
7	Mr. Dane Sinclair	...	...	...	...	£100
8	Messrs. A. P. Lundberg & Sons	...	...	...	...	£50
9	*	...	...	...	...	...
10	*	...	...	...	...	...

**Imperial Motor Transport Conference.**—The following are the subjects to be discussed at the forthcoming conference

Monday, July 21st.—The fuel question and the possibilities of creating an adequate fuel supply for internal combustion engines within the Empire. Particular stress will be laid on questions relating to the production and use of alcohol as a fuel. Papers will be submitted by Sir Beverton Redwood, Prof. Vivian Lewes, Mr. A. J. Butterfield, and Dr. W. R. Ormandy.

On Wednesday, July 23rd.—Motor vehicles for military use, and the production of vehicles suitable for military purposes, and also for ordinary industrial use throughout the Empire. Official statements will be made on behalf of the Army Council by Col. H. C. L. Holden and Capt. A. L. Davidson, secretary of the Mechanical Transport Technical Committee. Further papers will be submitted by Col. R. E. Crompton and others.

On Friday, July 25th.—The discussion will be upon the subject of the carriage of goods and passengers by motor vehicle. Papers will be submitted by Mr. W. Worby Beaumont, Col. R. E. Crompton, C.B., and others.

The President of the Conference is H.R.H. Prince Arthur of Connaught, K.G., and the chairman of the Executive Committee is the Hon. Arthur Stanley, M.P., chairman of the Royal Automobile Club. The Conference opens on July 18th, when the delegates will be entertained at luncheon at Olympia, Kensington, by the President and Council of the Society of Motor Manufacturers and Traders, on the occasion of the opening of the Exhibition of Industrial Motor Vehicles organised by that Society.

In the list of overseas representatives we observe the following names:—Mr. Matthew G. Coates, A.M.I.E.E., consulting engineer, Melbourne; Mr. Stephens, electrical engineer to the Public Works Department, South Africa, and Mr. H. Twycross, under-secretary for Posts and Telegraphs, South Africa; Mr. J. Morley Lamb, town electrical engineer and tramway manager, East London; and Mr. H. Willsmer, representing the Department of Railways, Telegraphs and Telephones, Saskatchewan.

**German Wire Lamp Prices.**—It was stated at the recent general meeting, held in Berlin, of the Julius Pintsch Co., that the prices of incandescent lamps had recently further receded, and that the reduction would probably become of a more pronounced character in the future. The fact could not be concealed that the industry was now under the influence of a price war, and those who were equipped so as to fight it out would finally become victorious. Quite a number of undertakings would probably be unable to hold out, but the company would be able to retain its position. It was added that the contest appeared to be driving in the direction of the formation of a syndicate for this type of lamp.

**Kelvin Memorials.**—The statue of Lord Kelvin, executed by Mr. Albert Bruce-Joy, was unveiled at Belfast yesterday. The *Times* states that the Kelvin memorial window in Westminster Abbey is to be unveiled on July 15th, and that Mr. Birrell will unveil a statue at Glasgow University on October 8th, when Mr. Balfour will deliver an appreciation of the great scientist.

**Annual Outings.**—The annual outing of the employees of the Siemens "Wotan" and "Tantalum" Lamp Works, Dalston, was held on Saturday last, 14th inst., when a party of over 500 made a journey to Ramsgate. The firm made a new departure on this occasion, bearing the expense of travel, and thus leaving the members of the party free to make their own arrangements for refreshments and entertainment. As there was no organised programme, visitors were not invited, but everybody had a right royal time. The company went down by a specially chartered train, which left London Bridge at 7.15 a.m.

**Austrian Electrical Mail Vans.**—Thirty new electric motor mail vans have just been put in service in Vienna by the Austrian postal authorities. The vehicles are mainly employed in transporting the mails to and from the railway stations. A new Post Office garage, for the storage of 50 electric vans, is being erected in the Austrian capital.

**Japan Cable Making.**—It is reported from Japan that the Yokohama Cable Manufacturing Co. has decided to establish a branch factory, with a view to starting the manufacture of wire rope as an addition to its operations.

**The Strike at Leeds.**—The reports in the local newspapers of the strike of Leeds municipal employees have been somewhat exaggerated. We understand that the following accurately represents what has occurred:—

The strike originated amongst labourers in the Highways Department, who sought an increase of wages and other concessions, and ultimately the Gas Workers' and General Labourers' Union called upon all its members employed by the Corporation to cease work. The call was pretty generally responded to, but the only effect upon the operations of the Electric Lighting Department was to cause a suspension of cable laying for a few days. A number of members of the Union engaged inside the generating station also ceased work, but their places were readily filled by loyal officials and workmen usually engaged in the outdoor operations of the department, with the result that no occasion was given for a moment's anxiety as to the maintenance of the supply. Threats were flying broadcast as to the cessation of work by the remaining workmen of the Corporation, but the department was fully prepared to maintain a complete supply of energy for all purposes for an in-

definite period. Many offers of help were received, and although it was not necessary to take advantage of these, the gratitude of the department and of Mr. C. Nelson Ifford, the manager, is none the less sincere. The strike was settled at the end of three or four days by substantial concessions to the workmen in other departments.

**Cable-Stealing on the Rand.**—Reports received by this week's mail show that there have been further large thefts by a gang of "copper thieves." As a result of their operations, the Kleinfontein Group have been robbed in the most audacious fashion of something like 5 miles of copper wire, valued at over £300, and weighing approximately 4 tons. The private wire connection of the New Boksburg Gold Mines with the Kleinfontein Group central administrations was entirely removed from the standards and carried away. Some 2½ miles of copper wire, of the value, roughly, of £175, had been stolen. The New Kleinfontein Gold Mining Co. later discovered that four drums of copper, weighing in the neighbourhood of ½-ton each, had been stolen from the stores-yard. The thieves broke off the locks of the stores, and rolled the drums out of the yard, over the railway line to a point where they were loaded on a trolley and carted off. Two native police boys patrol round the stores every night!

**Report of the Marconi Committee.**—On Friday last the report of the Select Committee of the House of Commons on the Marconi Contract, dealing only with the rumours regarding the actions of Ministers, was published, together with the minutes of proceedings. The official report is that of the majority of the Committee; it states that the allegations reflecting on the conduct of Ministers ranged themselves under two heads: that they had exercised undue influence to procure for the company a Government contract, and that they had made use of knowledge acquired in their official capacity, and had purchased shares in the English company with a view to selling them later at a profit. On October 11th, 1912, Sir Rufus Isaacs, on behalf of himself and his colleagues, the Postmaster-General and the Chancellor of the Exchequer, described the allegations as baseless fabrications, and the report states that "it has been proved to the Committee that there is no foundation for any of the charges made against these Ministers." The Committee publicly invited evidence relevant to the subject matter of the inquiry, and summoned various journalists and others responsible for the publication of the charges. The papers in which the charges appeared are named. The report states that there is no foundation for the suggestion that the contract was obtained through the influence of the Attorney-General, and the latter had no negotiations with any official or member of the Government. No evidence has been submitted to the Committee to justify any of the charges regarding alleged transactions by Ministers in shares of the English company during the course of the negotiations prior to the acceptance and publication of the company's tender on March 8th, 1912, and these charges have been denied on oath by the Ministers concerned. The Committee cannot adopt the view that the Postmaster-General unduly pressed for the approval of the agreement before the rising of the House of Commons on August 7th, 1912; the construction of the Imperial Chain of Wireless Telegraphy was declared by the Imperial Defence Committee to be a matter of extreme urgency, and the Committee considers that the P.M.G. was bound to do everything in his power to secure the approval of the agreement at the earliest possible date. No evidence has been forthcoming in support of any suggestion that any member of the Government exercised any influence to procure for the English company a Government contract, or that he took advantage of any knowledge acquired in his official capacity in relation to the purchase or sale of shares in the English company or otherwise.

The Committee reports that the charges made against Sir Rufus Isaacs, Mr. Lloyd George and Mr. Herbert Samuel are absolutely untrue, and strongly condemns the publication in such a way of unfounded charges against the honour and integrity of public men.

Regarding the purchase of shares in the American company by the Attorney-General, Mr. Lloyd George and Lord Murray, the Committee finds that in these transactions there is no ground for any charge of corruption or unfaithfulness to principle; the American company were not parties to the agreement, and could have no interest in the construction of the stations to be erected under it, or in any profit derived by the English company from the contract. Neither the English company nor its managing director, Mr. Godfrey Isaacs, was a party to any of the transactions in question, and the Ministers named received no favour of any kind from the English company or Mr. Godfrey Isaacs.

The report concludes that, on the whole, all the Ministers concerned acted in the sincere belief that there was nothing in their action which would in any way conflict with their duty as Ministers.

In the draft report by the chairman, Sir A. Spicer, the circumstances are reviewed at length, and the conclusions with regard to the contract and the shares of the English company are substantially the same as those of the Committee's majority report; but the draft report states that in view of all the circumstances, Sir Rufus Isaacs would have been well advised if he had had nothing to do with the issue of shares in the American company, and if it had occurred to Ministers on October 11th, 1912, to disclose the facts regarding these shares, their statement would have tended to avert much misunderstanding.

A draft report submitted by Lord Robert Cecil points out that a contract between the Government and the English Marconi Co. would indirectly benefit all the subsidiary companies of the Marconi system, and that an erroneous version of the terms of the contract, circulated by the company on March 7th, 1912, was not

corrected by the P.M.G. Mr. Godfrey Isaacs's account of his position with regard to the American share dealings is not regarded in the draft report as satisfactory; the 500,000 shares in the American company belonged to the English company, and were at the disposal of Mr. Godfrey Isaacs as the agent of that company.

The transaction between the Attorney-General and Mr. Harry Isaacs "appears to us," say the draft report, "to have been gravely improper, because a Minister of the Crown made an advantageous purchase of shares upon advice and information not then fully available to the public, given to him by the managing director of a company which was in course of obtaining from the Government a contract of the greatest importance." The draft report further expresses the view that the new capital was raised for the American company largely on the strength of the indirect advantages conferred by the contract upon the whole Marconi system, and that there was a speculative element in the whole of the transactions of Ministers. The charges alleging corruption are stated to be without foundation, but they were due to a distorted account of the transactions in American shares. Ministerial reticence was mainly to blame, and is described as "a grave error of judgment, and as wanting in frankness and in respect for the House of Commons."

The Committee's report was under discussion in the House of Commons on Wednesday and Thursday this week.

**The British Engineers' Association.**—This Association held its fifth provincial meeting at Glasgow on June 12th. Mr. T. Cuthbert Stewart (Stewarts & Lloyds) was in the chair, and he was supported by Mr. James Downs, member of the council, and several other members; Captain Fitz-Hugh, the Chief Commissioner of the Association in China; Prof. C. A. M. Smith, Dean of the Faculty of Engineering at the Hong-Kong University; Mr. Stafford Ransome, Organiser of the Association, and others. The meeting was well attended by directors and other representatives of the Scottish engineering firms. The chairman said that they had now 170 members representing firms with a capital of about 70 millions sterling, and if they reckoned the many verbal promises they had received from other firms, the membership might be said to have very nearly reached 200. There were 22 Scottish members, which was not a large percentage on the whole, and he hoped that the result of that meeting would be to induce a great many more to join.

Captain Fitz-Hugh first dealt with the progress of events in China, and pointed out how it was bound to become a huge market for engineering plant.

Prof. Smith dealt more particularly with the technical educational problem. When he was sent out to China to take charge of and open the engineering department of that University he was firmly convinced that British engineering interests were paramount in China. He was astounded to find that there was a general impression that British influence was on the wane, and more astonished still to find that British residents in China were not slow to admit that allegation. When they heard that the British Engineers' Association had been started they were enthusiastic at the idea of our manufacturing engineers becoming alive to the trade possibilities of the country. It was essential to our future success that the prestige of British engineering and machinery should be upheld in the eyes of the Chinese, and the Hong-Kong University, purely a British institution, though certain Chinese subscribed largely to the funds, was there to educate the Chinese engineer of the future on British lines, and now they had the British Engineers' Association to strengthen the business interests. These were the two great factors working side by side which should do more than anything else to maintain British engineering prestige. They could rest assured that the Hong-Kong University would do its share, and the British Engineers' Association had already begun to bear a portion of the burden. It remained for British manufacturing engineers throughout the country to support the Association in a manner which would render it all-powerful for the good of their industry.

Mr. James Downs said that the time was ripe for a combination like the British Engineers' Association, as, without it, we could not hope to capture our proper share of the Chinese market. His firm (Messrs. Rose, Downs & Thompson) had spent a good deal of money, and had taken a great deal of trouble to obtain Chinese trade, and he had himself visited the country for the purpose of studying the question on the spot. The result of his investigations had been the conviction that British engineers should combine to retain and increase their trade, and he agreed with the previous speakers that British prestige should be upheld. The Association, which had already done something, would, when supported by all the principal firms in the country, possess a power which would give its voice weight with the Government and in financial circles. A banking system which would advance to an engineering firm £500 on the security of a £1,000 Bank of England note was not one which was likely to promote the interests of its clients, and he considered that it was worth while having an Association even if its effect were only to render British bankers more reasonable in their treatment of engineering propositions. He then dealt with the various reasons why engineering firms should give their support to the Association, and urged all those Glasgow firms who had the interest of British engineering at heart to become members.

**Aluminium Conductors.**—The use of bare overhead conductors of aluminium was discussed at the recent meeting of the Association of Electricity Works held at Triar. Mr. Henney, who stated that the town of Triar had obtained favourable results from aluminium mains, mentioned that the total length amounted to 322 miles, and the saving as compared with the use of copper reached the sum of £6,750.

**Electrical Contractors' Association (Incorporated).**

—ANNUAL DINNER.—On Tuesday last the annual dinner of the Association was held at Frascati's Restaurant; the President, Mr. W. A. Shaw, occupied the chair, and was supported by Mr. S. H. Webb, President-Elect, Mr. J. E. Edgcome, Mr. A. Bruce Anderson, and other guests and members to the number of about 80.

After the loyal toasts, Mr. M. N. Drucquer proposed "The Electrical Contractors' Association (Incorporated)," recalling bygone battles in which he had acted on behalf of members of the Association, with the invaluable assistance of the secretary, Mr. L. G. Tate, whose lucid explanations in the witness box were irresistible to any judge. The Association never failed to achieve any purpose that it set out to accomplish, and it had now attained a membership of 500, which rendered it a powerful body. He referred to the victories over the Leicester and Sheffield Corporations, and said that if the Association wished to continue its existence, it must present a united opposition to municipal trading. In reply, Mr. Webb said that the Association only took to law in the last resort, and it had always been successful in the Courts. He regretted that the municipal engineers, with whom they wished to cultivate a better feeling, had introduced a Bill that they must oppose. He had never seen a true balance-sheet for the wiring department of a municipality, including all the items of expenditure that were in fact incurred; they felt keenly the competition of these departments, and must fight the Bill, though really their interests were identical with those of the station engineers. It was most desirable that all contractors should join the Association, not only for the strength of union but also to get to know each other.

At the request of the President, Mr. W. R. Rawlings presented to Mr. A. Davidson an illuminated address, remarking that they owed him a great debt for his services to the contractors of Great Britain in leading the successful attack on the Sheffield wiring department. Mr. Davidson expressed his thanks for the honour, which he shared with his colleagues, and stated that he was about to start another fight which would have still more far-reaching consequences. He was going to urge the Chambers of Commerce of the United Kingdom to press for the impartial audit of all municipal accounts, in view of the "disgraceful state" of the accounts of the Corporation of Sheffield. He referred to the great personal merits of the secretary, Mr. Tate, whose policy, at first cold-shouldered, had eventually borne fruit owing to his untiring energy.

The President then presented an illuminated address and a cheque to Mr. Tate, expressing the hearty good wishes of all contractors and station engineers that he and Mrs. Tate should enjoy every happiness. He was a born secretary, and had rendered magnificent services to the Association in Parliament and elsewhere. Mr. Tate briefly expressed his appreciation of the gifts and good wishes, remarking that at times he had been down-hearted, but those times had passed.

Mr. E. C. Wallis, in a humorous speech, proposed "The I.M.E.A., the B.E.A.M.A. and Kindred Associations," hoping the latter would back the Association up in resisting the aggression of municipal authorities. The President pointed out that the contractors had always had a good friend in Mr. J. E. Edgcome (President I.M.E.A.), who, in his reply, said that the questions at issue between their respective Associations were questions that ought to yield to treatment—there must be some way of reconciling their differences. His Council had had full powers since 1900, and had practically acted as bankers, preparing specifications and placing contracts with the lowest tenderer; they advanced the money to pay the contractors, who thus made no bad debts, and they collected the cost from the consumers, to the advantage of all parties. He hoped some means would be found to bury the hatchet.

Mr. A. Bruce Anderson (Chairman B.E.A.M.A.) also replied, reiterating his gospel—that all their interests converged in the common interest of the British electrical industry; they were all interdependent and must work for one another as well as for themselves. The same argument applied to the whole of British industry. When that great fact was realised, they would be doing all in their power to give employment to the working classes of this country.

"The President" was proposed by Mr. R. Tweedy Smith, who remarked that the Association went to the north country for fighting men. In his reply, Mr. Shaw acknowledged his indebtedness to all his colleagues for the great kindnesses accorded to him during his year of office.

An excellent musical entertainment was provided, and the proceedings throughout were "merry and bright."

**Appointments Vacant.**—The appointment of Professor and Head of the Department of Civil Engineering at the Imperial College of Science and Technology (£1,000) is vacant, and applications are invited by the Delegacy (City and Guilds Engineering College); the appointment of Professor of Mechanical Engineering at Manchester Municipal School of Technology (£700), rendered vacant by the death of Prof. J. T. Nicolson, is also advertised in the *Times*; lecturer in wireless telegraphy for Royal Technical College, Glasgow (£150); telegraph inspector for the Posts and Telegraphs Department of Northern Nigeria (£250 + quarters); mechanic for the Middlesex Education Committee (12s.). See "Official Notices" to-day.

**Colliery Fatality at Redhill.**—Referring to the note in our issue of the 6th inst., which stated that the faulty cable was "protected by rubber," we regret to learn from the St. Helens Cable and Rubber Co., Ltd., that this expression has been taken to mean that the cables were of the "cab-tire sheathed" type. In point of fact, the cable was insulated with rubber, and protected with tapes and braids in the ordinary way. The cab-tire rubber

compound with which the company's patent G.T.S. cable is protected has acquired a unique reputation for safety, though it is used under the most severe conditions, and we are pleased to be able to clear it of any imputation in connection with this unfortunate accident.

**Inquiries.**—A correspondent wants small armature-core plates, or the addresses of makers of notching presses for these. Makers of the "T'recht" ceiling fan are asked for.

**Institution and Lecture Notes.**—**INSTITUTE OF MARINE ENGINEERS.**—A party of members of the Institute on June 6th made a visit of inspection to the G.S.N. steamer *Faurette*, at present engaged in the London-Bordeaux service, which is the latest addition to the company's fleet and has been constructed and fitted throughout on a generous scale. A complete installation of electrically-operated windlass, cranes, winches, capstans, &c., has been supplied by Messrs. Clarke, Chapman & Co., Ltd. The windlass has two cast-iron cable holders, each suitable for working two 1½-in. diameter cables. The six cranes, each with a lift of 1½ tons at 120 ft. per minute, or 3 tons at 60 ft., are of the two-motor type, the hoisting and slewing motions each being operated by a separate motor. There are two capstans, and each barrel has two diameters, the larger diameter at the bottom being necessary to give room for the gear case; this also gives a quick speed necessary for hauling in slack rope. They give a pull of 3 tons at 40 ft. per minute. There are two winches, one with a lift of 5 tons at 60 ft. per minute, or 2½ tons at 120 ft., and the other of 3 tons at 60 ft. per minute, or 1½ tons at 120 ft. The pressure of supply from the two 100-KW. power generating sets is 220 volts, and from the lighting plant 110 volts. The power installation is quite separate from the lighting installation as regards both wiring and machines. The absence of deck steampipes is a noticeable feature, and the silent running and absence of vibration are distinct advantages in a passenger vessel of this description. The masthead, stern, anchor and side lights are all electrically operated, and are connected to an electric ship log in the captain's room. The vessel is equipped with a wireless telegraph outfit.

**ROYAL SOCIETY OF ARTS.**—On Tuesday the annual conversation of the Society was held in the galleries of the Natural History Museum, the guests being received by Lord Sanderson, chairman, and the Council. Music was provided by the bands of the Royal Artillery and the University of London O.T.C., and a concert was given; a large number of members and guests were present and passed an enjoyable evening.

**JUNIOR INSTITUTION OF ENGINEERS.**—The second Gustave Canet lecture will be delivered on Monday, June 30th, by Dr. Dagald Clerk, F.R.S. Sir Trevor Dawson, who delivered the first Canet lecture in 1909, is this year the president, and has consented to preside. Visitors wishing to attend should make early application for tickets, which can be obtained from Mr. A. Clifford Swales, secretary, 39, Victoria Street, S.W.

**SOCIETY OF ENGINEERS (INCORPORATED).**—A large party of members of the Society visited the Chingford Reservoir of the Metropolitan Water Board on the 17th inst. to see the Humphrey pumps.

**Association of Electrical Station Engineers.**—At a number of meetings held during the past week at Manchester, Dublin, Glasgow, Bradford, Birmingham, Liverpool and Grimsby, delegates were appointed to attend a Conference with the London Organising Committee to be held in London, June 23rd, the object of which is to ratify a set of rules and finally fix the policy of the Association. The delegates will also attend a general meeting to be held at Chandos Hall, Maiden Lane, London, W.C., June 24th, at 8 p.m., when a report on the result of the Conference will be given.

An informal meeting was held on Friday last at the Y.M.C.A., Newcastle-on-Tyne, with the object of forming a branch. A temporary committee was appointed, which has arranged to hold a general meeting, at which all station engineers will be welcomed, at the Drawing Room Café, Northumberland Street, Newcastle-on-Tyne, on June 23rd. A branch had not been formed previously, owing to the fact that a gentleman could not be found to undertake the onerous duties of hon. secretary, but this difficulty has now been overcome.

**OUR PERSONAL COLUMN.**

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Our Australian exchange, *Tenders*, says that Mr. GEORGE CROWTHER, of the Melbourne City Council electrical engineer's staff, has been appointed electrical engineer to the Inverell municipality, N.S.W.

Mr. L. H. KING, on relinquishing the position of electrical engineer to the Whitby Urban Council, has been presented by the staff with a leather travelling bag.

Mr. G. P. FARRER has been appointed assistant manager of the Brighouse electricity works, of which Mr. A. Aspinall is the manager.

Mr. OLIVER H. BAKER, of Charlton, Kent, has been appointed to fill the post of switchboard attendant at the Portsmouth Corporation electricity works, which was recently advertised.

Mr. HARRY E. BETTS has resigned his position as district representative with the South London Electric Supply Corporation, Ltd., in order to take up a position as engineering representative with the City of Sheffield electric supply department.

The *Mining and Engineering Review* states that Mr. F. J. CARMODY, late of the Melbourne Municipal electrical supply department, has been appointed electrical superintendent to the Footscray (Vic.) Council.

The Whitehaven T.C. has decided to increase the salary of the borough electrical engineer, Mr. B. SANKEY, by £25 a year to £275.

MR. CHAS. F. WELLS, of the staff of the Isle of Wight Electric Light and Power Co., has been appointed commercial representative at the electricity works of the Dundee Corporation.

**Tramway Officials.**—The Southport Electricity and Tramways Committee at the end of May received a letter from Messrs. Brighouse, Jones & Co., claiming damages on behalf of Mr. B. ANDREWS, of Bradford, who had been recommended by the Electricity and Tramways Committee for the position of tramways manager. The Committee approved of the reply thereto of the town clerk, and decided that Messrs. Brighouse, Jones & Co. be informed that the Committee cannot admit any liability, nor agree to make the payment to Mr. Andrews which they suggested.

**General.**—The marriage took place at All Saints' Church, Writtle (Essex), on June 12th, of Mr. FREDK. RICE MARKHAM, eldest son of Col. Markham, of Morland House, Westmorland, and a member of the firm of Bray, Markham & Reiss, electrical engineers and manufacturers of Blackhorse Lane, Walthamstow, London, and Miss Elizabeth W. Woodhouse, daughter of Mr. Robert Woodhouse, of Longmead, Writtle.

Congratulations and best wishes to Mr. W. MURRAY MORRISON, M.I.O.C.E., M.I.E.E., general manager of the British Aluminium Co., Ltd., who was married on Friday last, 13th inst., to Marie Vera, only daughter of K. E. Markel, Ph.D., and Mrs. Markel, of 20, Queen's Gate Terrace, S.W.

MRS. J. DEVONSHIRE, wife of the managing director of the London United Electric Tramways, Ltd., will distribute the prizes at the annual sports of the employees to be held at the Brentford Football Ground on July 9th. One of the leading events will be the tug-of-war for the Lady Robinson Challenge Cup, to be competed for by tramway teams of the United Kingdom.

MR. F. GILL, late engineer-in-chief, and MR. W. W. COOK, late assistant engineer-in-chief for many years to the National Telephone Co., Ltd., have entered into partnership as consulting engineers, specialising particularly in the work of telephone undertakings. Associated with them are MESSRS. D. B. FULTON, J. II. H. BOYD, S. H. POOK, E. WILLIAMS, and H. GREEN, all of the National Telephone Co.'s staff. Messrs. Gill & Cook will remove their offices on the 24th inst. from Hamilton House, Temple Avenue, to Winchester House, Old Broad Street.

MR. R. W. WEEKES, Whit. Sch., M.I.E.E., informs us that he is taking into partnership Mr. Alfred O. Kolkhorst, M.I.E.E., and that in future the name of the firm will be Messrs. Weekes & Kolkhorst. The latter gentleman has resided for many years in Chile, where he has carried out some of the largest electrical undertakings, including the Valparaiso tramways and electricity supply, of which he was general manager from 1903 to 1912, besides being manager of the Chilean Electric Tramways and Light Co., of Santiago. The capital expended on these undertakings and the Chile hydro-electric plant (also under Mr. Kolkhorst's management) was about 3½ millions sterling. As for Mr. Weekes, much of whose work has been done in our midst, no introduction is necessary; but we may remind our readers that amongst the important undertakings with which he has been connected as electrical adviser are the South London, Chiawick, Aberystwyth, and Kandy Electric Supply companies, in addition to numerous large factory installations such as the Tate Sugar Refineries at Liverpool and London, the Xylonite Co.'s two works, Broadwood's and Marshall's piano factories, and various foreign and colonial gas works, mining plant, &c. We join with Mr. Weekes's many friends in wishing him and his partner (one of his oldest electrical friends) all success and prosperity in their joint career.

**Obituary.**—MR. R. S. ERSKINE.—We deeply regret to learn of the death of Mr. Robert Stuart Erskine, secretary of the Kensington and Knightsbridge Electric Lighting Co., Ltd., which occurred on Saturday last, 11th inst., at 10, Ovington Gardens, S.W. The deceased gentleman was only 62 years of age. The funeral service took place at St. Stephen's, Gloucester Road, on Wednesday afternoon, and was followed by interment in Brompton Cemetery. Mr. Erskine was an old Crompton man, and he went straight from the service of that firm many years ago to the Kensington and Knightsbridge Electric Lighting Co., being associated with it from its beginning. He will be remembered by many of our readers by reason of his connection with the Electrical Engineers Volunteers, of which, with Dr. Hopkinson, Col. Crompton and others, he was one of the originators, and in which he was a major. He was a member of the Institution of Electrical Engineers.

MR. OSWALD DEWEY.—We regret to record the death of Mr. Oswald Dewey, which occurred suddenly in Blackpool, the cause being acute pneumonia. The deceased gentleman had been on the representative staff of Messrs. Ferranti, Ltd., and the Ransom Manufacturing Co., and at the time of his death was representing Messrs. Tearla, Ltd. Mr. Dewey's sudden death has come as a shock to his many acquaintances and friends in the electrical profession.

## NEW COMPANIES REGISTERED.

**Electric Utility Co., Ltd.** (129,420).—This company was registered on June 6th, with a capital of £20,000 in 5s. shares, to acquire any invention relating to electric and other lamps and accessories, and generally any invention or business relating to lighting or illuminants, to acquire the business and assets of Electric Lamp Regenerators, Ltd. (in liquidation), and to carry on the business of manufacturers and repairers of and dealers in electric lamps, reflectors, lenses and other articles, &c. The subscribers (with one share each) are:—E. Edwards, 112, Turner's Road, Surbiton, Bow, clerk; H. E. West, 19, Kay Road, Stockwell, S.W., clerk; A. W. Skan, 4, Copthall Chambers, E.C., solicitor; P. H. Brashier, 23, Kila Avenue, Clapham Common, S.W., gentleman; H. E. Skan, 5, Kilburn Priory, Maida Vale, N.W., clerk; F. W. Beard, 23, Summerfield Avenue, Kilburn, N.W., secretary; L. M. Howe, 24, Ellingham Road, Shepherd's Bush, W., clerk. Minimum cash subscription, 30,000 shares; the number of directors is not to be less than three or more than seven; the first are H. A. Herbert, E. B. Barrant, R. Bell, J. M. Longe and H. B. Hohne; qualification (except first directors), 500 shares; remuneration, £150 per annum and 5 per cent. of the net profits, divisible. Registered office, Caxton House, Westminster, S.W.

**Garrett, Hartley & Co., Ltd.** (129,357).—This company was registered on June 4th, with a capital of £1,500 in £1 shares, to take over the business of an electrical engineer and contractor, carried on by C. W. Garrett, at Morena Street, Catford, S.E., as "Garrett's Engineering Co." The subscribers are: C. W. Garrett, 31, Culverley Road, Catford, S.E., electrical engineer, 5/0 shares; S. Hartley, E. E., A.M.I.C.E., Cranford, Great Drive, Kayses Park, S.W., engineer, 100 shares. Private company. The number of directors is not to be less than two or more than five; the first are C. W. Garrett and S. Hartley, secretary. Registered office, Morena Street Works, Catford, S.E.

**W. N. Berry & Co., Ltd.** (129,459).—This company was registered on June 7th, with a capital of £1,000 in £1 shares (10 deferred), to take over the business of electrical and mechanical engineers carried on by W. N. Berry and H. Bamber, at 32, Queen Street, Manchester, as "W. N. Berry and Co.," and to adopt an agreement with W. H. Edge. The subscribers (with one share each) are: W. N. Berry, 40, Edlesmere Road, Didsbury, electrical engineer; H. Bamber, 33, Ansell Street, Chorlton Hill, Manchester, electrical engineer. Private company. The first directors are W. N. Berry and H. Bamber; qualification, £100. Registered office, 32, Queen Street, Albert Square, Manchester.

**L. Apple, Ltd.** (129,396).—This company was registered on June 5th, with a capital of £500 in £1 shares, to take over the business carried on by Lazarus Apple as the West End Ironmongery Stores and Electrical Engineers, at 13, Brewer Street, Soho, W. The subscribers (with one share each) are: L. Apple, 13, Brewer Street, W., ironmonger and electrical engineer; B. Apple, 31, Berwick Street, W., ironmonger's assistant. Private company. Table "A" mainly applies. Registered office, 13, Brewer Street, Soho, W.

**Wireless Telephones, Ltd.** (129,533).—This company was registered on June 11th, with a capital of £500 in £1 shares, to acquire inventions relating to or in connection with telephones, wireless telephones, and the transmission of graphic and acoustic signals, to carry on the business of electricians, manufacturers, generators, accumulators, suppliers of electricity and electrical equipment for lighting, heating, telegraphic and telephonic communications, telegraphists, proprietors and managers of telephone and telegraph works, lines, systems, stations and exchanges, &c. The subscribers (with one share each) are: E. Ronaldson, 4, Brandyville Road, West Drayton, (director), F. Airris, 145, East Dulwich Grove, S.E., clerk; F. A. Cohn, 104, London Wall, E.C., is the first secretary; qualification, £1. Remuneration, £150 each per annum (chairman, £200), and a percentage of the profits. Directors' borrowing powers restricted to the nominal amount of the company's capital for the time being. Registered by F. Airris, 62, London Wall, E.C.

**Globe Cable and Telegraphic Co., Ltd.** (129,166).—This company was registered on June 9th, with a capital of £15,000 in 12,500 preference shares of £1 each, and 50,000 ordinary shares of 1s. each, to carry on and extend the business of cable and telegraphic services as formerly carried on by the Universal Cable Code (Parents) Co., Ltd., at 20 23, Holborn, E.C. The subscribers (with one share each) are: W. Newman, 20, Holborn, preference shares; H. Palmer, Greenwood, Bushey, Herts, assistant manager to Cable Services, 200 preference shares; J. P. Balard, 24, Egmont Avenue, Surbiton, private secretary, 150 preference shares; W. G. Godber, 33, Braemar Avenue, Wood Green, N., supervisor, 150 preference shares; D. S. Carlisle, 114, Palace Gates Road, Alexandra Park, N., supervisor, 150 preference shares; B. A. Brough, 14, Frederick Road, Croydon, independent representative, 150 preference shares; F. E. Griffiths, 69, Ramuz Drive, Westcliff-on-Sea, supervisor, 150 preference shares. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first. W. Newman is the first secretary; qualification (except first directors), 500 shares. Registered office, Holton House, 20 23, Holborn, E.C.

**Continuous Reaction Co., Ltd.** (129,540).—This company was registered on June 12th, with a capital of £15,500 in 30,000 shares of 10s. each, and 30,000 shares of 1s. each, to carry on the business of concentrators, smelters, refiners and treaters of ores, manufacturers of electrical or other furnaces for smelting or other purposes, &c., and to adopt an agreement with W. B. Ballantine and D. C. Lea. The subscribers (with one preference share each) are: W. B. Ballantine, 5, Brunswick Court, Hove, metallurgist; D. C. Lea, 4, Paper Buildings, Temple, E.C., barrister. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first; qualification, £50; remuneration, £150 each per annum. Registered by Ashurst, Morris, Crisp & Co., 17, Throgmorton Avenue, E.C.

**Mudie's Electrical Co., Ltd.** (129,546).—This company was registered on June 12th, with a capital of £1,500 in £1 shares, to take over the business of a manufacturing electrician and electrical engineer, carried on by A. B. Mudie at 117, Sherborne Road, Balsall Heath, Birmingham, as "Mudie's Electrical Co." The subscribers (with one share each) are: A. B. Mudie, 117, Sherborne Road, Balsall Heath, Birmingham, mechanical engineer; H. A. Pepper, 14, Temple Street, Birmingham, accountant. Private company. The number of directors is not to be less than two or more than five; the first are A. B. Mudie and H. A. Pepper (both permanent); qualification, £100; solicitors, Rowlands & Co., 41, Temple Row, Birmingham. Registered by Waterlow Bros. & Layton, Ltd., Birch Lane, E.C.

**Magneta Guarantee Syndicate, Ltd.** (129,585).—This company was registered on June 13th, with a capital of £12,250 in 11,000 ordinary shares of £1 each, and 25,000 deferred shares of 1s. each, to carry on the business of financiers, company promoters, stock and share brokers, concessionaires, contractors, constructors and controllers of roads, tramways, telegraphs, telephones, electrical works, &c., and to adopt an agreement with W. Holt. The subscribers (with one share each) are: W. Holt, 35, Darlington Road, to appoint the first; qualification, £50; remuneration, £150 each per annum (chairman, £250), and 5 per cent. of the net profits divisible. Registered by Syper & Sons, Austin Friars House, E.C.

# OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Asbestos and Asbestile Co., Ltd.**—Deed of hypothec mortgage and trust, executed abroad, and dated April 25th, 1913, to secure £600,000, charged on mines, mining property and rights, buildings and machinery, &c., in Shipton, Canada. Holders: Royal Trust Co., Montreal.

**Reading Electric Supply Co., Ltd.** (35,651).—Return dated April 18th, 1913. Capital £150,000 in 15 shares. 29,195 shares taken up. £147,475 paid. Mortgages and charges: £50,000.

**Para Electric Railways and Lighting Co., Ltd.** (85,368).—Return dated March 11th, 1913. Capital £75,000 in 15 shares (78,000 pref. and 78,000 ord.). 61,000 pref. and 78,000 ord. shares taken up. £5 per share called up on 5,000 pref. and eight ordinary. £25,040 paid. £681,360 considered as paid on 69,000 pref. and 77,994 ord. Mortgages and charges: £681,290 5 per cent. first debenture stock.

**Johnson-Billingham Electricity Meters, Ltd.**—Particulars of £100 debentures, created March 3rd, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £300. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Yorkshire (West Riding) Electric Tramways Co., Ltd.** (81,167).—Return dated February 14th, 1913; capital, £600,000 in 15 shares; 87,238 shares taken up; £136,190 paid. Mortgages and charges: £475,000.

**Premier Accumulator Co., Ltd.** (96,121).—Return dated April 3rd, 1913; capital, £25,000 in 25,000 participating pref. shares of £1 each, and 10,000 ord. shares of 1s. each; 9,832 pref. and 10,000 ord. shares taken up; £1 per share called up on 1,321, 10s. on 600, and 6s. on 1,511; £4,024 6s. paid; £7,000 considered as paid on 10,000 ord. and 6,500 pref. Mortgages and charges: Nil.

**Universal Cable Code (Parent) Co., Ltd.**—Mortgage debenture dated April 30th, 1913, to secure £2,500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: W. Newman, Halton House, Holborn, E.C.

**Chelsea Electricity Supply Co., Ltd.** (20,458).—Return dated March 26th, 1913. Capital, £100,000 in 25 shares (6,000 pref.), 49,436 ord. and 6,000 pref. shares taken up; £5 per share called up on 37,770 ord. and 6,000 pref.; £218,850 paid; £28,380 considered as paid on 11,666 ord. Mortgages and charges: £175,000 debenture stock.

**Brompton and Kensington Electricity Supply Co., Ltd.** (25,913).—Return dated March 27th, 1913. Capital, £300,000 in 25 shares (20,000 pref.); 8,468 pref. and 31,532 ord. shares taken up; £5 per share called up on 8,468 pref. and 39,532 ord. shares; £195,000 paid; £5,000 considered as paid on 1,000 ord. Mortgages and charges: Nil.

**Northampton Electric Light and Power Co., Ltd.**—Issue on May 8th, 1913, of £100 debentures, part of a series of which particulars have already been filed.

**Rhondda Tramways Co., Ltd.**—A memorandum of satisfaction to the extent of £700 on May 8th, 1913, of charges dated March 24th, 1911, and November 13th, 1912, securing £240,000, has been filed.

**Metalite, Ltd.**—Mortgage dated April 30th, but executed on May 23rd, 1913, as verified by statutory declaration, to secure £1,306, charged on land at Osmaston, 19 rby, with factory, warehouse and buildings thereon, with fixtures, &c., therein, and the company's undertaking and property, present and future, including uncalled capital. Holders: H. S. Golding, Cambridge, and J. McDougal, Wednesbury.

**Electromobile Co., Ltd.**—Particulars of £6,000 debentures, created May 19th, and secured by trust deed and land registry charge both dated May 21th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £4,000. Property charged: Land in parish of St. George, Hanover square, W., with buildings erected thereon, 93 electromobile carriages and company's other assets, present and future, included uncalled capital. Trustee: L. Fletcher.

**Lamplough & Sons, Ltd.** (in liquidation).—A memorandum of satisfaction in full on February 1st, 1913, of mortgage dated October 29th, 1912, securing £200, has been filed.

**Mills, English & Co., Ltd.**—A memorandum of satisfaction to the extent of £3,000, on May 31st, 1913, of first mortgage debenture, dated November 3rd, 1914, securing £8,000, has been filed.

**Lancashire Power Construction Co., Ltd.**—Particulars of £100,000 5 per cent. prior lien debentures, created April 17th, 1913, and secured by trust deeds dated April 27th, 1911, and May 29th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: Certain debenture stock and shares in Lancashire Electric Power Co., and the company's undertaking and property, present and future, including uncalled capital, ranking *pari passu* with £50,000 existing bonds. Trustees: S. C. Boulter, 41, Threadneedle Street, E.C.; and N. Spens, 12-13, Nicholas Lane, E.C.

**James Keith & Blackman Co., Ltd.**—A memorandum of satisfaction in full on May 15th, 1913, of debentures, dated March 10th and December 8th, 1908, and May 19th, 1910, securing £750, has been filed. Issue on May 30th, 1913, of £100 debentures, part of a series of which particulars have been filed.

Some £23,000 of the 5 per cent. and 14 per cent. debenture stocks has been purchased and cancelled during the year under review, which is a favourable feature, but probably unsatisfactory to the late holders, since the purchases have yielded to the company a profit (difference between nominal amount and purchase price) of £4,367, which has been added to the reserve. Included in the £47,732 indicated in our statement, is £40,000 reserved in respect of investments and undertakings, and £1,000 written off goodwill, which latter item now disappears from the balance-sheet. Perhaps the outstanding item on the liabilities side of the balance sheet is a mortgage on Federation Offices, Kingsway, of £20,000.

Investments appear in the balance-sheet at £5,109,631. Those standing in the books at £1,358,117 did not yield any return in respect of the year, the amount of the non-yielding return investments for the previous year being £1,518,579. Investments standing in the books at £3,751,513, yielded an average of 4.92 per cent., a slight improvement upon 1911-12. At the date of the accounts there are uncalled liabilities on the investments amounting to £100,786. The auditors report that securities standing in the books at £964,455, which had published values, or were dealt in on the London Stock Exchange at March 31st, 1913 showed a depreciation, at middle prices, of £214,511, and that they are unable to form an opinion of the value of the remaining investments. Schedule II—Dividend and interest (receivable in cash) from investments for the year ended March, 1913, is not of value, since it does not disclose the amount of shares and/or debentures and rates in each case whilst the expense of printing Schedule IV, which represents amounts set aside by associated companies for reserves, including balances of profit carried forward, might be avoided, as the statement, as at present prepared, is also valueless.

Amounts due to the company by associated companies and others, less a reserve of £35,207, total £164,392, a figure which is still too large.

During the year there was a profit on the sale of investments of £9,115, but there were losses on sale or realisation of investments and sundry investments written off totalling £124,758, all of which have been dealt with in the reserve, which now stands at £552,457, and which appears in the balance-sheet in reduction of the items of investments and undertakings. From the report, the B.E.T. are still looking out for openings abroad, though not neglecting any suitable home outlets which may be discovered, or which may present themselves.

**Marconi Russian Co. of Wireless Telegraphs and Telephones.**—This company met in St. Petersburg on May 31st. Mr. M. G. Salberg read the directors' report, which showed great improvement for the year, with a gross profit of 250,189 roubles, as compared with 62,850 roubles in the previous year. After making provision for reserve, depreciation, &c., a dividend of 6 per cent. is paid on 1,800,000 roubles. The full report appears in the *Times* for Wednesday last.

**Montreal Light, Heat and Power Co.**—Dividend, 2½ per cent. for the quarter ended July 31st (10 per cent. per annum), as compared with 2½ per cent. last year.

**Reduction of Capital.**—A petition to the Court to confirm the reduction of the capital of Messrs. Bayliss, Jones and Bayliss, Ltd., from £400,000 to £250,000, is to be heard in London on July 4th.

**Aron Electricity Meter, Ltd.**—The directors are stated to have declared a dividend of 7 per cent. for the past year.

**Siemens Brothers & Co., Ltd.**—The directors (says the *Financier*), have declared a dividend of 4 per cent. (4s. per share) for the year to December 31st, £1,489 being carried forward.

**Japanese Electrical Dividends.**—The Tokyo Electric Light Co. is declaring a dividend of 10 per cent. for the last half-year, the Yokohama Electric Light Co. one of 12 per cent., and the Tokyo-Narita Electric Tramway Co. one of 5 per cent.

## CITY NOTES.

WE are glad to note an improvement in the B.E.T. Report, condition of this company since our criticisms during the past few years. The report for the financial year ended March 31st, 1913, which was adopted at last Monday's meeting, exhibits a satisfactory increase on the credit side of the revenue account, at £210,880 (described as "gross profit"), compared with the previous year, the result of the year's operations enabling the directors to satisfy the 6 per cent. dividend on the cumulative preference stock and 3 per cent. for the year on the 7 per cent. non-cumulative preference stock; the preferred ordinary, the deferred ordinary, and the holders of £256,371 non-interest bearing income certificates redeemable out of profits, only looking into space. The position is:—

### Aluminium Corporation, Ltd.

MR. KENNETH M. CLARK presided at the meeting of this company held at Salisbury House, E.C., on Monday. In moving the adoption of the report (see *ELEC. REV.*, page 994), he referred to the addition of £14,000 second mortgage debentures, £6,000 of which had been paid up at the date of the accounts, the whole amount being as explained last year, provided by himself to enable the company to remove its carbon works from Walkend to Dolgarrog. There had been an addition of £13,857 to the capital account. This consisted of £4,997 spent on the erection and equipment of a laboratory at Dolgarrog, additions to the hydraulic works, power house and reduction works, wharf and tramway, together with certain preparatory work in connection with a canal from the river to the works, and a tunnel to connect the Dulya water to the present lake. Also additions to the rolling stock and the purchase of certain necessary freehold land, buildings and water rights. £7,884 had been expended to the date of the accounts on the erection and equipment of the new carbon works and Mendheim furnace at Dolgarrog. £923 had been spent in buying a site and building a new bauxite store at St. Raphael, and making some new roads, together with extensions and improvements found necessary at St. Barnabe Mine. The new laboratory at Dolgarrog had proved a very great advantage to the company. A number of new furnaces had been erected in the reduction works, and it had been decided to proceed with the construction of the tunnel necessary to connect the Dulya water to the company's present lake, as the directors felt confident that they could dispose of the increased metal output which would be obtained thereby upon a profitable basis. The erection and equipment of the new carbon works was taken vigorously in hand in the latter part of last year, and very considerable progress made, but, unfortunately, during the spring of this year, when completion was expected, it was found impossible to obtain deliveries of material from the manufacturers, an experience which was shared by every other trader, and there still remained some two or three weeks' work to be done before the new furnaces could actually be started up, but the benefits that they would obtain from this up-to-date plant would more than compensate for all the anxiety and worry that the work had caused. The bauxite concessions in France would prove of great value to the company. Under the heading of "Investment account" there was a decrease of £14,900. This had been caused by the sale to the British Aluminium Co. of 15,000 shares in the Bauxite Refining Co., and was looked upon by the directors as a most satisfactory arrangement. The works of the Bauxite Refining Co. were designed very much in excess of the capacity of Dolgarrog, and, in consequence, it was found extremely difficult to run these alumina works at a reasonable cost, when only half the output could be consumed. In conjunction with the British Aluminium Co. they were at present engaged in considerably extending the bauxite works, and as soon as these extensions were completed, they would have secured to this corporation a supply of alumina of a quality, and at a price, it was quite impossible for them to obtain under the old conditions. Preliminary expenses they hoped to deal with in the near future. They brought forward a debit balance of £9,989 last year, to which had been added £3,745, the adverse balance on the Bauxite Refining Co., for which under agreement this corporation was liable. The 7 per cent. dividend on the preference stock became cumulative in the year under review, and the directors regretted that it had not been possible for them to earn a sufficient profit to meet this charge. They, however, felt that, in allowing only two years for the bringing of this very complicated and difficult manufacturing concern into full bearing, the time was short enough, but they hoped on the next occasion of meeting to show a more satisfactory result. It was satisfactory that a net profit was shown this year, but this could only be regarded as a start, and the figures must be very considerably increased before they could be considered in any way satisfactory. With regard to the future, he had very great faith in the market price of aluminium being maintained at a reasonable figure, but their first and essential necessity was the increase in the output. They had had many difficulties, but the outlook was very encouraging, and they now considered that the company was about to become a successful trading concern.

The report was adopted.

### Edison & Swan United Electric Light Co., Ltd.—

The meeting of the first debenture-holders was held on Wednesday to consider the resolutions, already referred to in these columns. Mr. Ellice Clarke presided. Mr. Lea Smith said he opposed the entire scheme, and after discussion the resolutions were carried by 9 votes to 8. Mr. Lea Smith then demanded a poll, and it was announced that the result would be declared to-day (Friday). A meeting of the second debentures was subsequently held, when the resolutions were carried with one dissentient. Our report of the proceedings will appear next week.

**James Keith & Blackman Co., Ltd.**—Dividend on ordinary shares 10 per cent. per annum for past year, with £9,000 put to reserve and £3,550 carried forward. Business done exceeds that of any previous year.

**Sheerness and District Electric Power and Traction Co., Ltd.**—The directors' report for the year ended December 31st showed a total revenue of £11,065. After meeting debenture interest and other charges the net profit is £783, and the debit balance brought forward is converted into a credit of £329.

### German South American Telegraph Co.

THE report for 1912 of the Deutsch-Südamerikanische Telegraphen Gesellschaft, of Cologne, states that the company's activity was mainly devoted to the securing of agencies in South America in order to obtain as large a share as possible of the telegraph traffic to Europe. The results were very gratifying, as the traffic considerably increased in both directions and already exceeded the original anticipations, although the greater activity naturally involved larger expenses. A further satisfactory development of business had taken place in the new financial year. The cable station in Liberia was not affected by the political unrest, and the erection of a cable station for the company's account at Pernambuco had been commenced. As is known, the banking group closely associated with the company held 80 per cent. of the share capital of the Compagnia Telegrafica-Telefonica del Plata, of Buenos Ayres, which was only able to pay 5 per cent. in consequence of additional expenses due in part to transitory causes. Nevertheless, the gross receipts of the latter in 1912 seemed better than those for 1911, having regard to the reduction of telegraphic rates in May, 1912. The negotiations for the extension of the South American Co.'s cable from Monrovia, *via* Lome (Togoland) to Duala in the Cameroons were concluded, and the new cable was brought into use on January 19th, 1913, thus raising the total length of the cables to 7,762 miles. New shares of £125,000 and debentures for £192,500 were issued to defray the cost of this extension. The total receipts from traffic and interest amounted to £168,000 in 1912, as compared with £150,000 in 1911. After making provision for working expenses and interest charges on loans, and placing £8,600 to the cable redemption fund, as against £6,000 in 1911, the accounts show net profits of £54,000, as contrasted with £49,000. It is intended to pay a dividend of 6½ per cent. on share capital of £500,000, this comparing with 6 per cent. in 1911.

### Marconi International Marine Communication Co., Ltd.

THE directors report that the business has continued to show very satisfactory progress during the year ended December, 1912. The net profit amounted to £24,436, after deducting £10,781 for depreciation and allowing for debenture interest, as compared with £15,028 in the preceding year. The revenue from ships' telegrams, traffic, subsidies, &c., amounts to £100,325, again show a substantial increase over the amount of £64,160 for the year 1911, and £40,536 for the year 1910. Some further indication of the substantial development of the company's business is shown by the number of telegraph stations owned and worked by the company on board ships on the high seas, the number of which increased from 250 at the end of 1910 to 350 on December 31st, 1911, and on December 31st, 1912, the actual number of stations in work had increased to 580. To the present date progress continues on much the same scale, the number of ships actually equipped by this company being 686, and considerable additional orders are in hand. There are now some 1,700 ships of different nations, exclusive of ships of war, fitted with Marconi wireless stations. With every prospect of the company's business continuing to show further substantial development, for which additional capital will be required, it is the intention of the directors in the early future to place a further portion of the unissued capital, and this in the first instance will be offered to the shareholders. The directors now recommend the payment of a dividend for the year 1912 at the rate of 10 per cent., which will absorb £20,105, and allocate £3,500 to the repayment of debenture account, leaving £3,142 to be carried forward.

**Marconi Wireless Telegraph Co., of America.**—The report for the year ended January 31st, 1913, shows a profit of \$211,245. A dividend of 2 per cent. is announced. The annual meeting was held in Jersey City on Monday, and a report of the proceedings appeared in the *Times* on Wednesday.

**Credenda Conduits Co., Ltd.**—The directors' report for the four months ended April 30th states (says the *Financial Times*) that the profit, after providing for repairs, depreciation, directors' fees and reserve for income-tax, amounts to £2,161. After writing off stamp duties on registration and transfer, £457, there remains a balance of £2,003. The directors recommend a dividend at the rate of 8 per cent. per annum on the ordinary shares for the four months, carrying forward £670.

The directors of Tubes, Ltd., mention in their report that last December they decided to dispose of their electrical conduit business, and in January a company was formed with a capital of £50,000, of which £30,000 was offered to the public, the remaining £20,000 being retained in shares by Tubes, Ltd.

**Prospectus.**—*Ruston, Proctor & Co., Ltd.*—The list of applications is to close next Monday in an issue of 100,000 ordinary shares of £1 each. The turnover of the business continues to increase, and the volume of trade is bigger than ever before, rendering additional capital necessary. For the last seven years the ordinary dividend has been 8 per cent. per annum.

**Winnipeg Electric Railway Co.**—The directors announce a dividend at the rate of 3 per cent. for the quarter ending June 30th.

## British Electric Traction Co., Ltd.

MR. E. GARCKE (chairman) presided at the Holborn Restaurant on Monday over the seventeenth ordinary general meeting of the above company.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 995), said that at the last annual meeting he held out the hope that the company would in future continue to make steady progress, and he was glad to be able on this occasion to offer them a further instalment towards fulfilment of this promise. The net profit made in the year was £189,712. The result of the year's working was better than that of the year before, but the increase in profits was not as great as they had hoped it would be, considering that they had done more work, that was to say, carried more passengers per route mile, and had earned more gross receipts per route mile, and had sold a larger number of units of electricity; in other words, the net profits had not increased in the same ratio as the gross receipts. The explanation of this fact was given in the report. Labour troubles were likely to continue. The return on the investments had steadily improved during the last five years. For 1908 it was 2.8 per cent., for 1909 it was 3 per cent., for 1910 it was 3.1 per cent., for 1911 it was 3.7 per cent., and for the past year it was 4.1 per cent. The proportion of the total investments which were yielding revenue was increasing. The proportion of remunerative investments to the total was now 73.4 per cent., compared with 70.6 per cent. in 1911, 66.8 per cent. in 1910, 65.6 per cent. in 1909, and 58.8 per cent. in 1908. Before recommending the payment of a dividend on the 7 per cent. preference stock, the directors had again carefully weighed the question of the depreciation which had taken place in the assets of the company. The directors had previously stated on several occasions that whilst some depreciation of the investments had undoubtedly taken place, such depreciation was not so great as might be inferred from the decline in the market prices of the company's capital, but the directors had never before expressed even an approximate figure which, in their opinion, represented the actual depreciation of the investments and undertakings. He was now in a position to carry the matter a step further and give the shareholders an idea of what provision would be necessary to meet this depreciation. The directors still maintained that to make an accurate valuation of each undertaking was practically impossible, and, moreover, inadvisable, but every year they were acquiring additional experience as to the basis on which these undertakings would be valued if and when they were taken over by the local authorities, and several of the directors and the managers had made separate estimates of the probable value of their undertakings from the point of view of their present condition and future prospects. These estimates necessarily differed widely in detail, but taken collectively they gave an approximation of the aggregate value of the undertakings. In his opinion and in that of those directors who had made such estimates, the depreciation of the investments, having regard to the reserves which had been made by the Associated Companies themselves, could be met by the existing reserves of this company supplemented by a sum which approximated to between two-thirds and three-quarters of a million pounds, but the board as such had not come to any definite decision on the figure. Large and regrettable though these figures were, they were less than one-third of the present market depreciation of the company's capital. The problem of what was the best way to deal with this depreciation in the book value of the assets required careful consideration. It was a matter which was receiving the earnest consideration of the directors, and they would not hesitate to deal with the situation at such time and in such manner as the best interests of the company dictated. The reserves of the company at March 31st last amounted to £616,756. They had realised the Hartlepool and Leamington undertakings during the past year, and the deficiency in book value on their realisation had been debited to reserve. There were other undertakings in the course of realisation, and the deficiency, when ascertained, would be dealt with in the same way. Investments which had cost them £472,994, were realised during the year, and new investments were acquired during the year at a cost of £404,185. It was by changes of this kind that they hoped to still further improve the position of the company, for it was obviously better that investments yielding no return, or which did not possess the potentiality of improvement, should be sold, even at a loss, and that the proceeds should be re-invested in better yielding and improving investments. The chairman referred to their Associated Company—the Electrical and Industrial Investment Co. They had written off the item of "goodwill" entirely, and had written down to a nominal figure of £1,000 the past expenditure on surveys and negotiations. Apart from the question of depreciation, the balance-sheet now presented would, he felt sure, be recognised as showing a thoroughly sound position, and considering that they owed at the date of the balance-sheet less than £5,000 to sundry outside creditors while they possessed between four and five millions of assets, they were entitled to say that the financial position of the company was a strong one. They had appointed Mr. Dade, the former secretary of the company, and Mr. Howley, who formerly acted as chief inspecting officer, as joint managers of the company. These two gentlemen had been for many years in the service of the company and had an intimate knowledge of the business. They were also well served by Mr. Walmsley, who has been the accountant of the company since its formation, and by the numerous other expert officers and committees of the Federation. If they looked through the particulars and statistics of the Federation, they could not fail to recognise that most of the companies were improving. Of course there were some undertakings which did not admit of great improvement, and they recognised that the right policy in regard to these was to sell them when opportunity offered, rather than allow them to absorb

efforts and energies which were capable of being more profitably employed in other directions. For the first time for many years the aggregate receipts and the passengers carried by the Federated Companies showed a decrease as compared with the preceding year, but this was due to some of the lines—City of Birmingham, Cavell, Leamington and Warwick, and Hartlepool, having been disposed of. It was, however, very encouraging to observe that the average receipts and passengers carried per route mile showed a steady increase. This might be regarded as a very satisfactory feature, for although the rate of increase was accelerated by the prosperous condition of trade in the country, they believed that part of the increase in wages which the working man now received, as compared with a few years ago, was being spent in the more frequent use of the cars, and that a large part of the increased traffic would be maintained, even when a set-back took place in trade. The electricity supply side of the business continued to increase satisfactorily. With one or two exceptions, all their electricity supply undertakings showed a substantial increase in the number of units sold. The development of this branch of the business was even surer than that of the traction side. They looked forward with confidence to a steady increase in the returns from their investments in these small lighting undertakings. The report contained particulars of some of the undertakings abroad in which they had recently taken interest, and negotiations were pending in regard to others which they expected would mature in the course of the current year. Their investment in the Northern Ontario Light and Power Co. was showing a return of 8 per cent. on the cost, and was expected to improve. The Maritime Coal Railway and Power Co. had in it, they believed, the elements of a profitable undertaking. Their representative was now in Brazil in connection with their interests there, and during the past few months he had, together with some of their officers, made several visits to the Continent in connection with new enterprises. Another matter to which he wished to refer was the important bearing which the advent of the modern and improved motor-omnibus had upon the tramway undertakings in London and the provinces, and upon their business generally. On the last occasion when speaking of the metropolitan electric tramways he informed them that they had decided to run motor-omnibuses through London in connection with their tramways, and that they had adopted this policy in order to meet the competition by motor-omnibuses on their tramway routes. The speaker next referred to the London and Suburban Traction Co., Ltd., in which the B.E.T. holding was £850,000. It was too early for him to make any definite statement in regard to the profits which they hoped to derive from their investment in this company, but they had every reason to expect that the return on their investment in the London and Suburban Traction Co. would be larger than it was on the separate undertakings before the amalgamation, and they had no doubt whatever as to the wisdom of the policy which dictated this union of interests, for the only alternative would have been the continuance and accentuation of a destructive competition. He had already explained on other occasions that the motor-omnibus was a severe competitor of the tramways in the Metropolis, because their tramways did not serve the central parts of London and the omnibuses were able to overlap the tramway terminal points. It was interesting to note in this connection that the London County Council had agreed with the Metropolitan Electric Tramways Co. for through running of cars over some lines of the Council and company, and so well were these services appreciated by the public that it was now proposed to extend the policy of through running to other lines. Tramways in the provinces were not so exposed to this danger of over-lapping by motor-omnibuses because there the tramways radiated outwards from the centre of the towns. Nevertheless, there was also scope for the employment of omnibuses in the provinces in conjunction with existing tramways and light railways, and also in districts which were at present not served by tramways. They had constituted the British Automobile Traction Co. for the purpose of organising motor-omnibus services wherever suitable openings presented themselves. It had been said that the situation presented by this company—formed to promote electric traction—adopting motor-omnibuses, was not without its ironical features, and that it was a significant sign of the ever-changing possibilities of mechanical invention, but that was not a complete statement. He still considered that given sensible legislation, electric traction on rails was capable of holding its own, but the feature which he hoped shareholders would recognise and appreciate in their new policy with regard to motor-omnibuses was that the management of the company was moving with the times, and was alert to take advantage of any opportunity which might present itself to compensate for past misfortunes and improve their future prospects. In conclusion, he referred to changes which had been made in the constitution of the British Electrical Friendly Society and the British Electrical Endowment Fund.

MR. C. G. TEGEMEIER seconded the motion.

Several shareholders asked questions and made suggestions. Among them was MR. PARKER, who said that a reduction of capital was hinted at by the chairman, and he suggested it might be considered by the Committee who conferred with the board on the question of the rearrangement of capital some time ago. He trusted also that the board would not be led away by the attractive side of the motor-bus business, because there could be no doubt that the time was coming when the question of rating motor-buses would become a very live one.

The CHAIRMAN, in replying to all questions, said they took the Bideford Railway by way of a bad debt, and the best thing was to hold on to it and wait for better times. They had a perpetual tenure of it. He thought the board would have been subjected to a great

deal of adverse criticism had they proposed to carry money available for dividend to a reserve fund. The item of the Brighton and Shoreham Tramway would appear in the accounts for the last time next year. They had been awarded £1,000 by way of compensation for one portion of the line, and had arranged with the other local authorities for the dismantlement of the line. They had had a sad experience with regard to the line. They bought a steam tramway and submitted a good scheme for an electric tramway, but the opposition of Hove was too great for them. As to Mr. Parker's observations, the board recognised that depreciation had taken place, and that it would have to be dealt with in some way or another, but they would rather not be pressed to take unduly early action in the matter. So long as they recognised the position, it was better to leave the matter to be dealt with at the right time.

The motion was then carried unanimously, and the retiring directors and auditors were re-elected.

### Madras Electric Supply Co., Ltd.

MR. A. M. H. WALROND (chairman) presided at 1, Queen Victoria Street, E.C., on Friday, over the ordinary meeting of the above company.

The CHAIRMAN, in moving the adoption of the report, said that since the last meeting they had issued a further £117,875 six per cent. debentures and 20,000 preference shares of £5 each. The principal capital expenditure had been £6,629 for new mains, £1,984 for quarters for the staff, and £512 for new plant foundations. The revenue account receipts were an encouragement for the future. They showed an actual increase of revenue for units sold of £7,000, the return being £30,316 this year, an increase of over 38 per cent. He intimated last year that their present plant was proving itself expensive in coal consumption, maintenance and wages. This was plainly shown on the other side of the revenue account, as there was an increase in nearly every item of the working costs. The principal item was coal, the expenditure on which had gone up from £7,110 to £11,699, part of which they must attribute to the increased output. They were compelled to purchase a highly volatile coal, the supply of which was limited, and the price high. The price had largely increased, and was still increasing, the average cost during the year being £1 0s. 6d. per ton, against 18s. 2d. per ton the year before, or an increase of 2s. 4d. per ton, this extra charge accounting for £1,350 of the increased expenditure. The new boilers would, however, be capable of burning ordinary Indian coal, at a cheaper price, and with the new plant in full working order, there would be a saving of about 30 per cent. They were also now inserting in all their agreements with large power consumers a coal clause which would protect them to some extent against dearer coal. The repairs of mains and maintenance had increased by a large figure, but £2,000 of this increase was exceptional, being due to the replacement of defective armoured services. The net result was a loss, after paying debenture interest of £2,236. In the general balance-sheet they must add to this a loss of £1,803 for sales of fans, and £563 on sale of investments. They were obliged to realise last year their holding of tramway preference shares in order to pay off moneys they had borrowed. The loss on fans would not occur after this current year, as they now had only 821 left in stock. This left £18,399 against them at suspense account, which would subsequently have to be dealt with. To this they would have to add the loss they would make during the current year, and the shareholders must bear in mind that no allowance had been made for depreciation. As soon as the earning capacity of the undertaking had been gauged, it might be desirable to reorganise the capital of the company. Matters were not going to be improved until the new plant came into operation. The board realised this position, and as they knew, advised the shareholders at their last meeting to take immediate steps to remedy matters by raising money by an issue of debentures to install a new turb-generator plant, with a modern boiler plant which they were advised would be capable of burning ordinary Indian coal. The money was raised, and by the end of the year this plant should be in commission. Certain of the new boilers would, they hope, be connected up in about four months; the present boiler house equipment was giving them a very great deal of trouble, and the difficulties the staff had had to contend with to keep the supply going were very great. They had, in fact, been obliged to put into commission the old tramway plant to help them out. From what he was telling them they would understand what their position would have been if they had not the prospect of the new plant being ready before long. Their consulting engineers informed them that had the new plant been responsible for the balance-sheet now before them, the generating costs, instead of being £19,000, would have been approximately £13,000. The significance of these figures in regard to their future, he need not emphasise. They would see by the report that the increase in consumers and units taken was satisfactory, and they must bear in mind in this connection that they had been afraid to push this side of the business until their new plant was in order. There was no doubt whatever that if they could only generate their current at a reasonable cost, they could secure a large and profitable business. They would have noticed what was said about future management in the report. This matter had had their most serious consideration, but before deciding anything, they thought it advisable to await the result of Mr. Merz's visit to Madras, and for the arrival in England of Mr. Simpson, a member of Messrs. Binny & Co., their managing agents' firm, who particularly attended to their business. They had now had the advantage of fully discussing matters with them, with the result that they had arranged

that the management of the tramways and themselves would be closely identified. Messrs. Binny would generally supervise as managing agents both concerns, and their representative, Mr. Simpson, would be appointed local director. There would be one chief engineer and a commercial engineer for both properties, and the accounts and correspondence would be removed to their own offices. Referring to their holding in the tramways, they would have read in the report that their last year's working was good, there being an available balance of £43,000 more than in the previous year, and that after paying a 4 per cent. dividend they carried forward £3,732, which was equivalent to a further dividend of over 6 per cent. on the ordinary capital.

MR. J. G. B. STONE seconded the motion, and it was carried.

### Trafford Power and Light Supply (1902), Ltd.

THE report for the year ended March, 1913, states (according to the *Financial Times*) that after charging interest on the debenture stock, interest on loans, current expenses, debenture trustees' remuneration, debenture stock redemption fund, transferring to depreciation account £3,000, and writing off plant, &c., £2,322, the accounts show a balance of £1,509, as compared with £512 for the preceding year. The debit balance is thereby reduced to £803. Additional generating plant has been installed in the station in anticipation of increased demand. On June 15th, 1910, to provide for the general growth of the business, £25,000 6 per cent. second mortgage debentures of £100 each were offered to the shareholders and the debenture stockholders. No application being forthcoming, W. T. Glover and Co., Ltd., the largest shareholders of the company, undertook to provide, on loan, at 5 per cent. interest per annum, such an amount as might be required from time to time not exceeding £25,000; and until January 1st last (by which date the loan amounted to £25,000 and was then satisfied by the issue to them of the above-mentioned 6 per cent. debentures to such an amount, redeemable in 1915) the company availed itself of this facility, which, during a period of some 2½ years afforded an advantage to the company of 1 per cent. per annum. The aggregate amount of the ½ per cent. first mortgage debenture stock of the company purchased and cancelled amounted on March 31st last to £13,500. The trustees of this stock have invested £1,519 during the past financial year, and at the end of that period had in hand for a similar purpose or further purchase of the company's first debenture stock a balance of £589. It being considered more expedient that the two joint managing directors of the company should both be resident in the Manchester district, Mr. Atkinson, who resides near London, has already resigned his position as joint managing director (but retains his seat upon the board), and Mr. A. E. Tanner, who resides in Manchester, has been elected a director by the board and appointed a joint managing director with Mr. E. A. Claremont, who has for many years served in that capacity.

### United Electric Tramways of Monte Video, Ltd.

THE ninth ordinary general meeting of the shareholders of the above company was held on Monday at Winchester House, Old Broad Street, Mr. G. A. Touche, M.P., presiding.

The CHAIRMAN, in proposing the adoption of the report (see *ELEC. REV.*, page 996), said that the capital expenditure during the year had amounted to £78,288, increasing the property account to £1,910,269. A portion of this expenditure was forecasted at the last general meeting, viz., the provision of further additional rolling stock; the completion of the extension to Colon, and the erection of new administrative offices, the building of which was now proceeding. These items came to about £36,000. The additional 25 cars had been in use since December last. The extension of the Colon line was inaugurated on June 20th, 1912, and the results of the working so far had been satisfactory. That was the last extension the company was bound to make under concessions. The line showed signs of being successful. Sites had been secured for the erection of two substations, and the renewal car-shed was being erected. The cost of the sites and some of the preliminary expenditure in connection with the cost of sundry additional permanent way, and feeder works accounted for a further £21,000. The balance of the capital expenditure during the year was represented chiefly by the cost of paving and reconstruction of the track. Practically, all that work was still in progress. Considerable sums would have to be expended in the next few years, as under their concession they were obliged to pay for, and keep in repair, the paving between and a certain distance on each side of their track. Expenditure on improvements of one kind or another was practically inevitable and much of it must be borne by revenue. Within the next few years it would be necessary to make still further additions to the plant and the rolling stock, which was only to be expected in a developing city like Monte Video. The increased traffic was due solely to the internal growth of the city and the development of its activities. There had been no further trouble with their employees, and the weather had been decidedly better than in 1911. The traffic receipts for the year had amounted to £316,306, compared with £298,553 during the previous year, an increase of £47,753, or nearly 16 per cent. The passengers carried showed an increase of 6,074,064—about 17½ per cent. The operating expenses showed an increase of 81 per cent. which was partly accounted for by the increase of wages to the staff granted in 1911 which had been in operation during the whole of the year as compared with a period of about five months in the previous year. The wages bill was about £9,150 heavier than in the previous year and fuel costs

increased by £8,872. Repairs and maintenance costs showed an increase of £6,623. Permanent way, plant and rolling stock must be kept in first class order and it was only natural to expect annual increases in maintenance during the first decade of operation. There had been important economies in other directions. The net traffic receipts for the year amounted to £147,401, an increase of £17,931 or 13.85 per cent. For the first half of the current year to April 30th, the traffic receipts amounted to £199,762, an increase of £14,400 or about 7½ per cent. That percentage of increase was not so great as in the previous year when they were favoured with an exceptionally fine summer. The working expenses were 55.5 per cent. as compared with 52.97 per cent. The increase was partly attributable again to an increase in repairs and maintenance charges and fuel expenses. There was an amount available for distribution of £101,187, as compared with £92,933 a year ago. For the redemption of debenture stock an amount of £2,810 had been set aside; and an initial appropriation of £2,500 had been made for the purpose of redeeming the preference and ordinary share capital on the expiry of the company's concessions, which was some 60 or 70 years ahead. A further sum of £30,000 had been placed to renewals and contingency account, making a total of £100,000. There he wished to say that the board did not consider that they had yet reached the limit as regarded that provision. Having referred to the fact that Señor Catt, the general manager in Uruguay, was present, having come to Europe to confer with the board on important matters of policy, the chairman quoted at length from a report which Señor Catt had prepared regarding the prospects of the company, in which that gentleman referred to the possibility of the Uruguayan Government nationalising the means of transport in the country. That proposal, said Mr. Touche, led him to refer to what had happened in London in regard to the tramway service under the L.C.C., the figures respecting the last year's working having just been published. The tramways were acquired on behalf of the ratepayers on a promise that there was going to be a reduction of rates by the application of profits. Some 1½ millions of the ratepayers' money was invested, and now the property was very seriously threatened by competition. Last year 20 million fewer passengers were carried than in the previous year, and there was a decline of £88,000 in the passenger receipts. On all sides they heard a great cry raised in favour of doing something to handicap competing forms of traction. It was not in the public interest that that should be done, but it placed the L.C.C. in a very false position. Their duty and their interest conflicted. Their duty was to exercise judicial control over all forms of traction, and their interest was to handicap competitive forms of traction. That pointed at once to the great danger of these Socialistic methods—the public became tied to some particular method of traction, even after it might have become obsolete. Their electric tramways were very far from that, but it was a very great discouragement to progress, even if it did not mean the death of all progress.

Mr. H. A. Trotter seconded the motion, and the report was adopted without discussion.

**Globe Telegraph and Trust Co., Ltd.**—The net revenue of the company for the year ended May, 1913, after deduction of expenses, amounts to £209,828, and makes, with the balance of £27,997 brought forward, a total of £237,825. From this amount there has been distributed £131,085 in interim dividends, leaving an available balance of £106,739. The directors now recommend the payment of the following final dividends, viz., 3s. per share, less income-tax, on the preference shares, making, with previous distributions, a total dividend for the year on those shares at the rate of 6 per cent. per annum, less income-tax; and 6s. per share net on the ordinary shares, making, with previous distributions, a total dividend on these shares at the rate of 6 per cent. net for the year. These dividends will absorb £79,922, and leave £26,817 to be carried forward. During the year £4,500 Anglo-American Telegraph Co.'s preferred stock has been sold, and 15 of the certificates of the Submarine Cables Trust, belonging to this company, have been drawn for payment at £120 per certificate; part of the proceeds have been, and the remainder will be, reinvested in suitable securities.

**Electric and General Investment Co., Ltd.**—The directors report that the gross profit for the year to May 31st was £14,797. After deducting all general charges, interest on debenture stock, the interim dividends already paid on the preference and ordinary shares, and providing for the proportion of the final dividend accrued on the preference shares to May 31st, there remained a balance of £5,268, plus £2,726 brought forward, making £7,994. Of this amount £3,072 has been carried to the contingencies fund, making the amount to the credit thereof £81,000, leaving a balance of £4,922, which is to be appropriated as follows:—Balance dividend of 1s. per share, which, with the interim dividend of 1s. per share paid in January will make the full rate of 10 per cent. on the capital paid up on the ordinary shares, £1,000; dividend of 6d. a share on the deferred shares, £1,000; leaving to carry forward, £2,922.

**Automatic Telephone Manufacturing Co., Ltd.**—The share and transfer books will be closed from 19th to 26th inst., inclusive, for the purpose of preparing the warrants for the 6 per cent. preference shares for the half-year ending 30th inst., on which date the warrants will be posted.

**National Electric Supply Co., Ltd.**—The directors have declared an interim dividend of 3s. per share, on the ordinary shares for the half-year ending June 30th.

## Traction and Power Securities Co., Ltd.

Mr. H. A. VERNET presided a few days ago at the annual meeting held at 2, Norfolk Street, Strand, W.C. He said that the net income had increased to £33,242, or more than 3½ per cent. on the share capital, but while under ordinary circumstances they would probably have recommended paying dividends, it was thought that under present circumstances it would be well to transfer £30,000 to reserve, and carry forward the balance. The Clyde Valley Co., in which they were the largest shareholders, had advanced considerably in recent years, and the net profit for 1912 was £54,440, as compared with £45,781 in 1911. In a few years he expected to see regular dividends on the ordinary shares in that company. During March last the Clyde Co. made a public issue of £300,000 in 6 per cent. preference shares at par, and was able to repay this company's loan in full. The Mersey Railway was also showing progress. When the company was formed in 1901 a large portion of its capital was subscribed by a strong group of Americans who were familiar with the operations of the Westinghouse Electric and Manufacturing Co., at Pittsburgh. The idea was that it would work with, and be of assistance to, the British Westinghouse Co., which at that time had recently started taking contracts which involved accepting payments, in whole or in part, in securities rather than in cash. This idea was duly carried out. The securities proved not to be worth the money paid for them, and the shareholders had had to go without dividends for a great number of years, the depreciation in their investments having necessitated carrying to reserve the meagre revenue received, instead of paying it out in dividends. The surplus revenues which had been kept in the company had enabled it to finance the Clyde Valley Co. until it could take care of itself. In recent years the British Westinghouse Co. had not been taking contracts involving payment to any large extent in securities, but there was a wide field of investment which was open to their company just as it was to other investment trust companies which had done well for their shareholders. Had the shareholders so willed they could have reinvested the money received from the Clyde Valley loan to advantage and have paid moderate (probably increasing) dividends with the prospect that the shares would become saleable at par in shorter time than by adopting any other course. An alternative had, however, been put forward by some of the American shareholders, namely, that the greater part of the available cash should be distributed in the form of a return of capital. These shareholders argued that the original purpose of the company was at an end. Had the board been able to induce their American friends to see eye to eye with them they would have preferred carrying on the company as an investment trust company, because he believed that in that way the shareholders would get their money back most quickly, but as these important shareholders took the opposite view, and as majorities controlled, they were proposing to proceed with the other alternative, and ask the shareholders' assent to the resolution for the reduction of capital.

A resolution was passed to reduce the capital from £2,000,000 to £1,829,180 by returning to the holders of the 85,410 shares that had been issued paid-up capital to the extent of £2 per share.

**Venezuela Telephone and Electrical Appliances Co., Ltd.**—Meetings of the holders of the first and second debentures were called for yesterday to consider resolutions authorising the creation and issue of additional first debentures for a total of £80,000, carrying interest at the rate of 5 per cent. per annum, the first £30,000 to be applied in discharging prior lien bonds.

## STOCKS AND SHARES.

Tuesday Evening.

THE stormy settlement of the mid-June account passed off with fewer failures than had been expected. Prices recovered substantially from the lowest; members began to talk hopefully of a return of confidence; the bargain-hunter was seen in the land. A good sign is the maintenance of the investment securities, although prices of the speculative stocks and shares swing erratically. An evening newspaper amused the city with a placard on Monday announcing a "burst of activity" in the Stock Exchange. Prices are higher, but of public activity there has been all too little. In fact, so slender has been the outside support accorded to markets, that general opinion throughout the House was somewhat inclined to regard the swiftness of the rise as in some measure evanescent. It is noticeable that Consols remain depressed. The approach of the end of June is a reminder that the window-dressing process may bring about some degree of stringency in the money market at the time of the next Stock Exchange settlement. All things considered, see-saw markets are only what can be expected for some time to come, and Tuesday's setback surprised nobody.

One of the principal features in the sections with which we deal has been the improvement in Underground Electric Railways. Metropolitan, after touching 45, sprouted to 49, and Districts, which had fallen to 32½, jumped up to 35½. The full extent of

these recoveries was not maintained, but both prices show rises on the week. The Central London group failed to recover from its last week's depression: East London made a rapid rally to 8½ before reacting to 8. Underground Electric Railway "A" shares came into favour. From 8s. the price jumped to 10s. 6d., while the 6 per cent. stocks of both kinds improved, the income bonds being 2½ points higher at 90. Tuesday's depression brought relapses from the best. The £10 shares fell ¼ to 3½. Considerable speculation as to the probable dividend on the shilling shares is rife, and all kinds of estimates are being made as to what the profits of the Bus Company must be at the present time.

The London County Council has just issued the report on its tramways system for the past year, and it must be admitted that the showing is a sorry one. There is scarcely a redeeming feature to be found in the statement, and this is an indirect factor which holders of the omnibus issues will do well to bear in mind. For it would be against human nature were the L.C.C. to submit to the losses now being made on their tramways system without drawing comparisons between these and the profits of the Bus Company. To redress the balance, it is at least possible that the municipal authorities may take repressive action against the prosperous motor-buses, and some of the ways in which they could do this were set out here not very long ago.

Metropolitan Electric Tramways shares have been withdrawn from the Stock Exchange Official List, since they are now practically incorporated in the London and Suburban Traction shares. The Suburban Ordinary are quoted at 6s. 3d., the Preference about 11s. 6d., while the 4½ per cent. First Debenture stock stands at 80, at which price the return works out to £5 12s. 6d. on the money.

The Telegraph market has thrown off some of its recent depression, and the cessation of sales of real shares has caused recoveries of ½ in Eastern Extension shares, ½ in Western Telegraphs, and so on. The Anglo-American group continues dull, consequent upon the uncertainty which is felt with regard to the American position, and some of the other higher-priced shares have given way. Great Northern at 31 are 10s. down. Indo-Europeans at 56 are 1 lower. West India and Panamas have further receded. Amongst the telephone stocks, American Telephones regained a point, the feature in this section, however, being a smart recovery in National Telephone Deferred, where the price jumped to 21. Reuters went back to 10½, a fall of 10s. New York Telephone Bonds are ¼ down at 96½, although this is one of the securities which the investor has been picking up as being well secured and showing a fair rate of interest on the money.

The Marconi market has been alternately good and dull. On the week, the parent shares show a rise at 3½, this being due to the circulation of estimates as to the forthcoming dividend. Two or three weeks ago, when the shares stood about 3, rumour scoffed at the idea of the Company paying anything at all; now the report goes that it will declare anything up to 35 per cent. Between these two boundaries there is ample scope for the directors to surprise the market. We should say that the one estimate is just about as unlikely to be consummated as the other. The Marconi subsidiaries moved in sympathy with the parent shares. Canadians touched 11s. and Americans £1, the price in both cases going back a little from the top. South American Telephone shares are steady.

Rises in the electric lighting market have been secured by Bournemouth and Poole Ordinary and Preference, in consequence of a little demand that there has been from local inquirers, who possibly think that there is a chance of the company being taken over by the municipal authorities. The rest of the market, however, is very dull, and there are falls of 1s. 8d. to ¼ in City Preference, London Preference and the Ordinary shares of the Westminster, Metropolitan, St. James', and Brompton Companies. London Electric Preference can be picked up at about 4½, at which the return is the handsome one of £6 6s. per cent. on the money. The decline in their case was brought about by pressure to realise, which, although not undue, came upon an unwilling market; and the shares are thought by some people to look attractive, in view of the high yield which they pay. Obviously, however, with so many other good investments to be obtained on which the return ranges from 5 to 6 per cent., it requires especially strong attraction to induce purchases of industrial shares at present. It will be noticed from our lists that the ordinary shares of the best electric lighting companies can be bought to yield nearly 5½ per cent. on the money. Moreover, the market in illumination shares is always a dull one during the summer.

The Latin-Canadian group remains fairly steady, and no net changes of importance have occurred in the Mexican division. Sao Paulo Debentures are a little better. The report of the Montreal Light & Power Company shows steadily increasing progress, and the dividend has been put on a 9 per cent. basis for the year recently ended, while the new year starts with 2½ per cent. for the quarter. The Shawinigan Company, whose shares have been lately particularly depressed, and which show another fall of 3 this week, issues a report, showing an increase in the profit of 300,000 dollars; and the dividend in its case is raised to 5½ per cent. for the year, an advance of the fraction. Montreals have not recovered the 10 points which they were marked down last week. The Anglo-Argentine Tramways group is dull, and blocks of the 5 per cent. Debenture Stock keep on coming to market. This security can be obtained at 96½, and (in view of the ample margin for its interest and principal) is being recommended as one of the bargains to be obtained at the present time. The Company's 4 per cent. Debenture is ½ higher on the week.

A rise of 2 wiped out half last week's loss in Brazilian Traction shares, and the Company's new 6 per cent. Preference, from being 97, moved up to 99. In their case also the security, according to the prospectus issued last month, is ample. Calcutta

Trams fell ½, and Madras Ordinary went down the same amount upon a mere handful of shares being offered. City of Buenos Ayres Trams are a good market. British Columbia Electric Deferred fell a further two points, but the Preferred and the Preference stocks are both 1 up. There has been some inquiry for the West Australian Tramways shares. Kalgoorlie Preference, for instance, were ½ up, and Perth Ordinary hardened to 1½.

The Miscellaneous group is steady. Arons have advanced, both as regards the Ordinary and Preference. Castner-Kellners are ¾ higher at 3½. There is no change in the Edison & Swan issues, the battle which is raging over the reconstruction proposals not affecting the market prices, although, of course, it is difficult to deal. British Westinghouse Debenture at 68 is 1 lower, and the public announcement of the company's having secured the London and South-Western electrification contract has aroused no further demand for its issues.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, June 18th

CHEMICALS, &c.	Latest Price.	Fortnight's Inc. or Dec

## REVIEWS.

*Handbuch der Elektrizität und des Magnetismus.* Edited by Dr. L. GRAETZ. Vol. I, Section I. Price 6 M. Vol. II, Section I. Price 13 M. Leipzig: J. A. Barth.

This work, which is to be completed in five volumes, is intended as a complete survey of the theoretical and experimental field of electricity and magnetism, giving the latest information on the subject and all necessary references to enable the reader to follow up any particular point thoroughly. The engineering and technical side of the subject is not dealt with.

The various sections are to be handled by experts, the list of names including those of some of the foremost German physicists.

As far as can be judged from the present portions of the first two volumes, the treatment is thorough and complete. At the same time, a fair knowledge of the ordinary theory of the subject is assumed, so that the matter can be dealt with concisely as is, of course, necessary in a book of moderate price covering so large a ground.

The first section of Vol. I contains articles on "Frictional Electricity," by Dr. L. Graetz; on "Electrical Machines and Apparatus," by Dr. W. H. Schmidt; and on "Electrostatic Apparatus and Measurements," by Dr. P. Cermak.

In the first section of Vol. II are articles on "Stationary Electric Currents," by Dr. Felix Auerbach; on "Measuring Instruments and Methods," and on "Absolute Measurements and Units," by Dr. W. Jaeger.

It is intended to publish the whole of the remaining sections and volumes within a period of two years.

*The Practice of Electrical Wiring.* By DONALD SMEATON MUNRO. London: H. Alabaster, Gatehouse & Co. Price 3s. net.

A good many books have been written on wiring, some intended for the householder or consumer, others for the wireman or plumber, others for the contractor, and others for no one in particular.

In the introductory chapter, the author tells us that his book is not intended for the non-electrical reader, but rather for those who have had, or are now receiving, a certain amount of practical training in applied wiring. It is intended also to prove useful to architects, engineers and others who are interested in this branch of electrical work.

The author has succeeded uncommonly well in writing a book which in every way fulfils his intentions, and the reader will find something of practical interest on almost every page.

Glancing through the pages which deal with early installations, one cannot help remarking on the differences between modern practice, and the crude methods of 30 years ago when bare wires were run on varnished wood battens. This method was followed by the zinc tubing system, two tubes at first being employed, each containing one conductor insulated with pure rubber. The tubes were kept separate from each other, just as though they were the actual conductors.

Some of these pioneer installations, erected in the early eighties, are still in satisfactory use, although the pressures have been raised to a much higher figure than was ever contemplated. Such an installation put up nowadays would be considered quite unsafe, and would not be passed by any fire office. No doubt the safety of those early installations is due largely to the fact that they were put up by electricians, men who to-day would be regarded as amateurs.

Turning, however, to present-day practice, one is pleased to note the author's criticism of the "looping" system, which is often carried to absurd lengths: to save a soldered joint, we may have to put up with the disadvantage of a plurality of insecure connections.

Discussing conduit wiring on page 17, the author recommends us to "Keep away from hot pipes, keep far away from gas pipes, and avoid possibility of contact with all other metal work." This sounds very much like an extract from the rules of an insurance company, and it is advice which cannot always be followed. Take the case of a modern factory. The electrical conduits must be fixed to

the steel girders, stanchions, &c., which form the constructional framework, and whilst they may be kept quite clear of gas or other pipes, these pipes are also fixed to the same metal work, and are, therefore, in metallic contact with each other. The rule on which this advice is founded has always struck us as illogical, and it would be better to insist on efficient earthing and mechanical bonding together of all pipes and metal work than to recommend that they should be kept apart—a separation which is generally only apparent and not real.

The author rightly points out that "with A.C. the sum of all currents flowing at any moment in the conductors within a metal tube, or near other metal, must be zero," but is not this put rather too academically in a book of this character? It will be double Dutch to some readers.

The remarks on the treatment of cables are very sound, and some of these might with advantage be reprinted by wiring contractors and handed out to their men, as it is almost heart-breaking to see the careless manner in which cables are generally treated prior to erection.

There is an excellent section on jointing, and the remarks on jointing flexibles to solid wires are particularly interesting. The author appears to apply to the term "married" joint, a specialised meaning. South of the Border "married" and "spliced" are practically synonymous terms, whether applied to cables or to human beings, and the terms "brush" and "spigot" joint would also appear to be localised terms. Married, or spliced, and telescopic are the more usual terms employed.

The author has a good word to say for wood casing, and there is no doubt that for some classes of work it is quite good, and is preferable under practically any circumstances to slip-joint conduit.

There is some extremely practical advice to be found in the conduit section—but why particularise further? The book is good from cover to cover, and is obviously the outcome of an intimate acquaintance with practical wiring as applied to electric lighting, for there is no mention of motors.—F.B.

*Design of Polyphase Generators and Motors.* By H. M. HOBART. London: Hill Publishing Co. Price 12s. 6d. net.

Mr. Hobart is a most energetic producer of books on electrical subjects, and his works cover a remarkably wide range—from electrical propulsion of ships, electric railways, and books on design similar to the one under review, to elementary text-books on the principles of electricity. Occasionally, the author—or compiler—of this mass of literature does not pay the slightest regard to conventional methods or terms; he strongly "says his say" on highly controversial matters, and, in consequence, some of his books are rather painful reading in places, and altogether unreasonably expensive at the price asked for them. Others are fairly welcome, and, on the whole, this latest treatise is of this character.

Mr. Hobart commences by giving his views, based on the experience gained at three of the technical schools in London, at which he recently lectured on the design of electrical machinery, on methods of teaching and the "sandwich" system of engineering education. Briefly, it may be stated that he favours the "sandwich" system, and thinks that it is the function of the professional teacher to supply the student with essential preparatory information, and for an outside practitioner to lecture on subjects with which he has occasion to be especially familiar. In the same preface he gives a list of subjects relating to the subject matter of this book, but which he does not discuss. These include the stresses called into play when generators are short-circuited or put to work partly unsynchronised, parallel operation, and wave form, which is rather a pity since, although there have been a number of papers recently read dealing with these subjects, the information is not accessible to students in a text-book, while the bulk of the information contained in this book already exists in text-book form.

Chapter I is introductory, and might have been omitted without disadvantage.

Chapter II deals with the design of three-phase alternators. It contains a large number of formulæ and tables,

and the design of a low-speed alternator is worked through as an example. The method of determining the fundamental dimensions is by means of a table giving the pole pitch, and by an output coefficient. A table of specific loadings is given, but this is only used for finding the number of conductors required. The reviewer has checked a number of these constants, and they appear to be well on the safe side. A quantity of quite elementary matter is to be found in this chapter, e.g., how to find the number of poles required for an alternator, dynamic induction, &c.

Polyphase generators with distributed field windings are discussed in Chapter III. The treatment is very meagre—the whole chapter only consisting of five pages. Since the modern tendency is almost entirely towards using this type of rotor for high-speed alternators, more attention should have been given to the subject even in a text-book for technical schools.

The design of squirrel-cage induction motors is treated in the succeeding chapter. A table of pole pitches and output coefficients is again used for determining the leading dimensions. For predetermining the dispersion coefficient, or "circle ratio" as the author calls it, a lengthy table is given, and also a formula. Stress is rightly laid on the approximate character of this predetermination. A small amount of information is given in this chapter on works cost, together with some useful data regarding the total weight in relation to weight of effective material. The design of totally enclosed motors receives no attention whatever.

Following this we have eight pages devoted to the design of slip-ring motors. We are afraid that the information given relating to rotor windings will be insufficient for the average student. The method of calculating the necessary external resistance for obtaining maximum starting torque should also have been given.

Chapter VI is a reprint of certain portions of articles contributed by the author to the *General Electric Review* dealing with synchronous motors *v.* induction motors, and is very good. An outline of the design of an induction generator is given in Chapter VII, and as far as it goes, is remarkably good. Some useful methods of ventilating this type of machine are given.

In connection with the lecture courses given by the author, he has had occasion to set a number of examination papers, and some of these papers are reproduced in Chapter VIII. These examples comprise various problems connected with the design of alternators and motors, and should prove useful to teachers and students.

There are four appendices to the book giving bibliographies connected with the subject-matter, trigonometrical and wire tables. As is becoming common in books of this character, several coloured winding diagrams are included.

The reviewer would have liked to see some information regarding the mechanical design of machines incorporated in the book, since this class of work is at least as important as the purely electrical design, and is often quite ignored, or receives inadequate treatment in books on the design of electrical machinery.—H. G. S.

---

**University of Hong-Kong.**—We have received from Prof. C. A. M. Smith, Dean of the Faculty of Engineering, a brochure containing particulars regarding the Faculty of Engineering at the University—explaining the scheme of study, regulations for the degree of B.Sc.Eng., the syllabus of subjects, and the cost of instruction, residence, &c. An historical sketch of the University is included. An important section of the volume gives details of the engineering equipment already presented to the University, with the names of the donors, which we are glad to see makes a very good show; particulars are also given of other apparatus which are urgently needed for the engineering laboratories and workshops. In an introduction by the Dean two important facts are emphasised: the almost complete absence of science in China, and the insatiable desire of the Chinese for scientific knowledge. The University is in its infancy; it may become an immense power in the development of British trade in the East, and if we at home support it as we ought, undoubtedly it will. Hong-Kong is already a noted centre for general education, and if we see to it that it becomes the focus of engineering training, drawing towards it the young men who have been awakened by the revolution to the need for acquiring "Western learning," the supremacy of British engineering in the East will be assured.

## NOTES FROM CANADA.

[FROM OUR OWN CORRESPONDENT.]

THE Mayor of Vancouver has just issued a public warning, according to the daily papers, that "too many people are coming to Vancouver seeking work, giving up good positions in the Old Country." The Mayor is afraid that there will be many of the new arrivals out of work next winter.

The Campbell River Power Co. proposes to erect a hydro-electric power plant to supply electricity all over Vancouver Island. Three hundred thousand horse-power is to be developed at a cost of from £2,400,000 to £3,000,000.

Petrol-electric cars are to be used by the Pacific Great Eastern Railway on a new section of line now being constructed.

The plant of the Dawson Electric Light and Power Co., of Dawson City, in the Yukon, was totally destroyed by fire last month. The loss must have been very serious, as all light and power, and even the water supply, were dependent on the supply of electricity. The money loss is placed at about £40,000.

The town of Edmonton, Alberta, has decided to lay about 21 miles of track for tramways this summer; extra cars also have just been ordered.

The question of technical education has been reported on recently by the Royal Commission on Industrial Training and Technical Education. The chief recommendation is that the Dominion Government should annually, for ten years, furnish £600,000, to be divided among the Provinces on a basis of population. The establishment, or extension, and maintenance of classes for industrial training and technical education; the provision of suitable appliances, &c.; and the publication of scholarships, are among the recommendations of the Commission. The importance of having the manufacturing and commercial interests of any locality ready and able to co-operate in carrying out the work is also emphasised.

The Commission states that:—

1. Secondary vocational education should be provided for those who follow manual industry vocations.
2. Such persons should have opportunities for acquiring secondary education which would be as fully advantageous to them in their vocations as the secondary education provides. General school system has been advantageous to those who enter into learned occupations.

Secondary education for those who have gone to work should be provided in day and evening classes in close co-relation with their occupations, while they are still learners, also when they have become skilled workmen or journeymen, or have come to fill positions as foremen, superintendents, or managers.

It is to be hoped that these recommendations will be acted upon, as in this country the facilities for technical education, outside of the large cities, are few and far between, and, apart from the correspondence schools, there is no way by which the younger generation of residents in the rural districts can gain much knowledge beyond the mere rudiments. Of course, those whose parents can afford to do so, send their children to the technical schools and colleges in the big towns, but there are many young people for whom such a course is impossible, and who have to start work at an early age, having little or no chance of fitting themselves for the higher positions. Distances between towns, absence of good roads, the severe winters and the poor train services (due to scanty population) are some of the difficulties which militate against young men and women living outside the towns getting any secondary education at present, but these proposals are a decided step in advance and in the right direction.

---

**Terrestrial Magnetism.**—In the report of Greenwich Observatory for the past year, it is stated that the magnetic elements for 1912 were:—Declination,  $15^{\circ} 24' 3''$  west; horizontal force,  $0.18528$  (C.G.S. units); dip,  $66^{\circ} 51' 46''$ . It has been decided to build a new magnetic observatory in the park.

Wireless time signals are received daily from the Eiffel Tower and Norddeich, and can be read with an error not exceeding 0.05 second. Both the French and the German times appear to be 0.3 second late on the average, as compared with the Greenwich determinations.

## SOME METHODS OF DETECTING LEAKAGES ON ALTERNATING AND CONTINUOUS-CURRENT SYSTEMS.

By R. D. GIFFORD, M.Sc., A.M.I.E.E.

IN view of the interesting discussion on the subject of "Earthed *v.* Unearthed Neutrals," arising from a paper recently read before the Institution, the writer feels that this would be an appropriate time to bring before those interested some methods of detecting leakages in electrical power circuits.

That this matter is one of importance is attested by the fact that several members in the discussion made direct reference to the necessity for some means of ascertaining, at

FIG. 1.—ELECTROSTATIC THREE-PHASE GROUND DETECTOR.

all times, the condition of the insulation of the system, and of cutting off the supply in cases of dangerous faults.

Many attempts have been made to find a simple and satisfactory solution to this problem, and have been met with varying degrees of success.

### ELECTROSTATIC GROUND DETECTOR.

On high-tension alternating-current systems, one of the most usual forms of apparatus is the electrostatic ground detector. An instrument of the type suitable for use on three-phase circuits is illustrated in fig. 1. The internal arrangement consists of two electrostatic movements, each having two fixed quadrants and a moving needle. One quadrant of each movement is connected to Phase A, and

FIG. 2.—A.C. LEAKAGE INDICATOR ARRANGED FOR SYSTEM WITH INSULATED NEUTRAL.

the other quadrants to Phases B and C respectively. Both needles are earthed. Under these conditions it will be seen that if a fault occurs on Phase A, the needles will move towards quadrants B and C, the pointers, therefore, taking up the position marked "Fault on Phase A."

If a fault occurs on Phase B or C, a corresponding movement takes place on one or the other of the pointers.

Although this form of instrument is to some extent discriminating it is not altogether so, for if the insulation of all three phases becomes impaired but remains equal in each

(a very improbable condition) the needles will not be deflected. It will, therefore, be seen that these instruments cannot be calibrated to read in definite units of insulation resistance or leakage current, nor do they lend themselves readily to function as relays for opening the circuit in cases of dangerous faults.

### LEAKAGE CURRENT INDICATOR AND RECORDER FOR A.C. SYSTEMS.

An alternative method, applicable to both insulated and earthed systems, and one that gives highly accurate results will now be described.

The principle involved is that of superimposing on the A.C. mains a small direct current supplied from a battery of dry cells or other source.

Fig. 2 shows the connections for an insulated system. Between one bus-bar and earth are connected in series a choking coil, circuit breaker, insulation recorder, an indicating relay, and the battery.

In case of a fault arising on the system as shown at 1, a direct-current flows *via* the fault through the apparatus. The choking coil is designed to have a comparatively low resistance and very high impedance, so that the apparatus, although connected between the mains and earth, cannot be

FIG. 3.—INSULATION RECORDER.

considered as earthing the system. An actual choking coil of this type was found to pass only a few milliamps. with the full line voltage of 3,300 volts across it, which condition can only arise if one of the other mains goes dead to earth.

The recorder and relay are of the moving-coil pattern, and therefore are unaffected by the alternating current passing through them, but respond only to the D.C. detecting current.

The recorder is calibrated to read the insulation resistance of the system to earth, and the indicating relay indicates the maximum leakage current flowing between mains, consistent with the resistance recorded at the moment. This statement may be explained as follows:—

It will be seen that the insulation to earth may be due to the imperfect insulation of one main only, any two mains, or all three mains. Each of these possibilities can give rise to somewhat different currents flowing between mains for a given insulation resistance to earth. The condition chosen for calibrating the indicator is that one which gives the maximum leakage current, so that at all times the engineer

can be certain that there is never more leaking current than is being indicated. Combined with the indicator is a relay of special design, so arranged that when the insulation resistance falls below a predetermined value the relay operates, connecting terminals 2 and 3, thus throwing the battery directly across the circuit-breaker. This opens the instrument and relay circuits  $\gamma$ , closes the alarm bell circuit  $x$ , and, if necessary, it can also be arranged to trip the circuit-breakers or oil switches.

Fig. 3 shows the recorder, which is of special design, as it is essential that it should be extremely sensitive and free from the usual pen friction errors, &c. These have been eliminated by allowing the pen to swing clear of the chart. The pen is kept moist by capillary feed from the trough, and

FIG. 4.—A.C. LEAKAGE INDICATOR ARRANGED FOR SYSTEM WITH NEUTRAL POINT EARTHED.

is electromagnetically tapped on to the chart at frequent intervals. The result is a series of semi-superimposed dots having the appearance of a continuous line.

In the case of earthed neutrals a modification is made in the connections, as shown in fig. 4. No choking coil is necessary, the recorder and indicating relay being connected directly between neutral and earth until the resistance falls below the allowable value, when the auto switch cuts the instruments out of circuit and puts the neutral point to earth, either directly or through a limiting resistance. This automatic may be made to trip the circuit-breakers if desired, the limiting resistance in that case being unnecessary.

#### GROUND DETECTOR FOR CONTINUOUS-CURRENT SYSTEMS.

We may turn now to means employed for the detection of leakage current on continuous-current mains. A method which has been adopted largely is shown in fig. 5.

A suitably calibrated voltmeter with central zero has one terminal permanently earthed, and the other connected to a

FIG. 5.—GROUND DETECTOR FOR D.C. SYSTEMS.

FIG. 6.—D.C. THREE-WIRE SYSTEM: DIAGRAM OF CONNECTIONS FOR LEAKAGE CURRENT RECORDER.

three-way switch, as indicated. The resistance  $rr$  has an extremely high value, and is placed directly across the mains,  $c$  being a mid-point tapping.

Normally the switch is on contact  $c$ , and, therefore, when the resistance of one main to earth falls below that of the other, a deflection is produced to right or left, according to which main is faulty. When it is desired to take the actual insulation resistance of each main to earth, readings are taken on the meter with the switch successively on  $A$  and  $B$ . Let these readings be respectively  $V_A$  and  $V_B$ .

If  $\rho$  be the resistance of the meter, it can be shown that—

$$\text{Insulation resistance } R_1 = \rho \frac{(E - V_A - V_B)}{V_B},$$

$$\text{and similarly, } R_2 = \rho \frac{(E - V_A - V_B)}{V_A}.$$

The total insulation resistance of the system to earth will be—

$$\Omega = \rho \left( \frac{E}{V_A + V_B} - 1 \right),$$

and the leakage current from  $+$  to  $-$  main is—

$$i = \frac{E V_A V_B}{\rho (V_A + V_B) (E - V_A - V_B)} = \frac{E}{R_1 + R_2}.$$

It will be seen that it is not possible to calibrate the instrument directly in any of these required quantities, but by assuming various successive values of  $V_A$  and  $V_B$  the resulting values of  $R_1$ ,  $R_2$ ,  $\Omega$ , and  $i$  can be found and tabulated on a chart accompanying the instrument.

FIG. 7.

As an example, take the case of a 220-volt system. The instrument would be adjusted to have a full deflection from central zero to right and left with 220 volts. Suppose the resistance to be 10,000 ohms. Then, if readings  $V_A = 100$  and  $V_B = 20$  are obtained, we have—

$$R_1 = \frac{10,000 (220 - 120)}{20} = 50,000,$$

$$R_2 = \frac{10,000 (220 - 120)}{100} = 10,000.$$

Total insulation to earth = 8,350 ohms, and leakage current = 3.7 milliamperes.

A recording instrument is now made operating on this principle, the switching being performed by the recorder clock at regular intervals.

#### THREE-WIRE SYSTEM.

For the detection of leakage current to earth occurring on three-wire systems in which the mid-wire is always earthed, the usual method is to place a central zero indicating or recording ammeter in the earth connection.

The recording instrument should preferably be of the type shown in fig. 3, this being sufficiently sensitive accurately to record small earth currents without introducing any appreciable resistance into the earth connection.

In order to protect the instrument from damage in the event of a heavy fault on either outer, it is provided with a relay circuit as described above, which places the tripping coil across the mains, opens the instrument circuit, puts the mid-wire direct to earth, and rings the alarm bell, as shown in fig. 6. Fig. 7 shows the automatic switch used in the last diagram and in fig. 4.

It will be understood that these notes do not claim to be a complete survey of the means at the disposal of the central station or colliery engineer for safeguarding both the public

and the continuity of supply from the danger of faulty insulation, but it is hoped that the methods described may be of interest to those who recognise the necessity of keeping a watchful eye on the condition of the insulation of the circuit.

In conclusion, the writer wishes to acknowledge the kindness of Messrs. Nalder Bros. & Thompson in lending the electrotypes illustrating this article.

NEW ELECTRICAL DEVICES, FITTINGS  
AND PLANT.

Generator Protection for Chicago.

The accompanying illustrations will be of interest at the moment, as showing the details of the protective gear apparatus which Messrs. A. REYROLLE & CO., LTD., Highbury, are supplying for the 25,000-kw. turbo alternator, which is now being made in England for the Chicago Edison Co. The system of protection

adopted is the well-known invention of Messrs. Chas. Merz and Bernard Price. A diagram of connections is shown in fig. 1. The actual current transformers are enclosed in iron cases and are filled in solid with compound. It will be seen from fig. 2 that provision is made for a single-turn primary conductor which will pass straight through the centre of the core. Fuses are used for the purpose of providing a time-limit overload protection. As shown in the diagram, the fuses are connected in the main secondary circuit. Under ordinary circumstances the fuses would be set to blow at a heavy current, so that they would only melt in the event of a persistent bus-bar fault. The relay is connected to the main secondary circuit across phases at points which are normally at equal potential, and it is set to release the switch for a fault to earth or between phases on the armature or on the connections between the machine and the current transformer, which is fixed on the switchboard. The operation of the relay is instantaneous, therefore, in the event of a fault between phases or to earth occurring, the generator will be cleared from the bus-bars, and the whole operation will take no more time than that required by the switch in moving the mass of its mechanical moving parts from the positions which correspond to the "closed" and "open" positions of the sparking contacts. This time lag is exceedingly small, and, in accordance with the experience obtained elsewhere on the Merz-Price protection, it is expected that a faulty machine will be cleared from the system without causing a disturbance to the sound running plant, other than throwing additional load on the sound generators.

FIG. 1.—MERZ-PRICE CURRENT  
BALANCE CONNECTIONS.

FIG. 2.—RETROLLE CURRENT TRANSFORMERS.

FIG. 3.—RELAYS FOR MERZ-PRICE SYSTEM.

Arc Welding Plant.

THE PARSONS MOTOR CO., LTD., of Town Quay, Southampton, have sent us particulars of an arc welding plant which they have just supplied to an important firm of engineers and shipbuilders on the Continent. From the illustration it will be seen that the whole plant is self-contained, and can be placed where required. The engine is a 28-h.p. four-cylinder standard pattern Parson's

FIG. 4.—PARSONS 28-H.P. PARAFFIN ENGINE AND SELF-  
CONTAINED ARC WELDING SET.

paraffin engine, fitted with magneto ignition and patent timing drive, having an enclosed sensitive vertical type governor driven by enclosed gears at the forward end, which regulates the speed within 1.05 per cent. The lubricating oil tank, with sight feeds, is at the back of the engine, and the brackets for the blow lamps for starting up on paraffin are seen on the bedplate. The cooling water is circulated by a Parsons pump at the forward end of the engine, and the fuel is carried in the tank situated above the engine.

The dynamo has an output of 250 amps. at 65 volts, and in this case is of the Holmes type. The voltmeter and ammeter are placed on a teak board at the forward end of the engine; the resistance is on the opposite side to that seen in the view, also carried on a board at the top, and next to it will be seen the main switch and cut-outs.

At the commutator end of the dynamo there is a pulley-driven fan fixed at the back of the radiator, running in a casing. Having a very wide experience of the difficulties connected with the efficient cooling of these arc welding sets on stationary work, the makers have made provision for ample cooling surface and a large displacement of cold air, so that even on long runs at full power the water never boils, although there is no reservoir beyond that formed in the radiator.

The silencer itself, seen in front, is of the ordinary type, with the usual diaphragms, &c., and is carried from the upper frame. The six columns are securely attached to the cast-iron base plate, and the upper frame is of welded construction. The makers have turned out many of these plants, and are in a position to appreciate the difficulties that have to be overcome in order that the results may be absolutely satisfactory. There are many instances where such a plant would effect an enormous saving in connection with dock work, ship work, boiler work, &c.

### The Polish-Grinding Machine.

MESSRS. A. T. MURRAY & SONS, of 30, Great Charlotte Street, Liverpool, have introduced a little machine for putting a straight polish on to metallic and other articles. It is impossible to obtain this straight polish from disk grinders or emery wheels, their grinding lines being curved. In this case an endless emery band

FIG. 5.—THE POLISH-GRINDING MACHINE.

4 in. wide and running at 350-500 R.P.M., is employed; this is supported on overhung pulleys and kept taut by means of a tension pulley, and it can be removed without loosening a single screw. The part of the band on which the grinding is done is supported by a table to ensure accurate results, the arrangement being shown in fig. 5.

### The "Orlona" Lamp.

A lamp in which the metal filament is held stretched in the horizontal plane is described in a recent issue of *l'Electricien*. It is made by M. M. DU MOULIN, 86, Boulevard Léopold, Tournai (Belgium). In a plane at right angles to the filaments the candle-power curve approximates to a complete circle. The spherical candle-power cannot, of course, be increased by this device, but for certain purposes, such as street or passage lighting, with a suitable reflector, the lamp presents advantages.

### Electric Lighting for Motor Cars.

We have received from MESSRS. RICHARD PAPE, LTD., of Belvedere, Kent, their catalogues of car and launch lighting equipments. Messrs. Pape have introduced a simple system, which includes a constant voltage dynamo and a Fors car lighting battery, which together with the head and side lights, tail lights and dash light in series with the latter, are wired up to a small switchboard consisting of a volt and ammeter and four push-button switches, one of which connects the dynamo to the battery, and one each for controlling the headlights, side lights and tail light. The wiring system uses a special armoured braided concentric cable, the outer braiding being used as the negative wire, in conjunction with

specially designed fuse and junction boxes; in fact, the complete installation is standardised, and can be fitted to any type of car and make use of any type of lamp.

Our illustration gives a good idea of a Pape car lighting equipment; the arrangement has been successfully applied for yacht

FIG. 6.—ARRANGEMENT OF "PAPE" EQUIPMENT FOR CAR LIGHTING.

lighting, and in this case includes dynamo, accumulator, switchboard, together with cabin lamps, port, starboard, masthead and searchlights.

### "Magic" Electric Blower.

© MESSRS. MAGIC APPLIANCES, LTD., of 6, Farringdon Avenue, E.C., have introduced the "Magic" electric blower, for blowing dust out of any kind of machinery, and for a variety of other uses in factories and workshops. The blower is fitted with two handles for convenience in operation. One of the handles serves as a foot,

FIG. 7.—"MAGIC" BLOWER.

upon which the machine may rest when not in use. Connection to the lighting circuit is obtained by means of a flexible specially designed for rough usage, and a switch plug or R.C. adaptor. The power consumption is 110 watts, and the total weight is 10 lb. It is a handy little thing, as will be gathered from the illustration.

**Fire Brigade Competition.**—The fire department of the British Thomson-Houston Co., recruited from members of their staff and works, have been drilling assiduously with a view to reaching the highest possible state of efficiency, and have attained a remarkable degree of proficiency which is evidenced by their success in the recent firemen's competition at the National Fire Brigade Union camp, held at the Crystal Palace on June 2nd and 5th, where they secured three first prizes and one second. In the Ponocrot Ambulance, Silvester's method of artificial respiration, their representative, 3rd Officer Moseley, secured first prize with the maximum number of marks obtainable. In the Junior Escape they were first, doing the drill in 57½ sec., as against 60½ sec., by last year's winners. In the Sacks Hose Cart Drill they were first, doing the drill in 25½ sec., as against last year's winner in 27½ sec. In the Hosed Escape they were second, doing the drill in 64½ sec., as against last year's first in 68½ sec. In the Dixon Memorial Shield combined Steamer Escape and Hose Cart, owing to their horses bolting, they were placed fifth, the winners' time being 2 min. 18½ sec., as against their time of 3 min. 32 sec.

## THE INSTITUTION OF ELECTRICAL ENGINEERS IN PARIS.

(Abstracts of Papers discussed in Paris at the Joint Meeting of the INSTITUTION OF ELECTRICAL ENGINEERS and the SOCIÉTÉ INTERNATIONALE DES ÉLECTRICIENS, 21st-24th May, 1913.)

(Concluded from page 971.)

### Railway Electrification Problems in the United States.

By MONSIEUR H. PARODI.

IN this paper the author considers the various aspects of the problems met with in electrifying railways in the United States, where the conditions are very different from those obtaining on the Continent of Europe. Numerous statistical tables are given, and the author shows that the tendency on the long lines is constantly to increase the power of the steam locomotives and the length and weight of the trains, to reduce working expenses as much as possible, while on the urban railways and tramways, on the contrary, electric traction is almost exclusively employed with frequent trains or cars. Traffic on urban transport systems grows in proportion to the square of the population of the area served, a fact of immense importance in America, where in certain towns the population has doubled in less than 10 years. In 1910 the United States, with a population of 90 millions, had railways aggregating 400,000 km., while France, with a population of 39 millions, had 40,438 km. of railway, and Germany 55,731 km. In France the average capacity of a goods truck is 10 tons; in America it is 33 tons.

The cost of electrification of a railway ranges between 100,000 and 200,000 fr. per kilometre of single track, according to conditions. The total net cost of working with continuous current on the Camden-Atlantic City Railway in 1910 was 0.58 fr. per car-kilometre, compared with 0.80 fr. for steam operation. Companies which use single-phase alternating current are reticent as to their costs. In the case of tramways using D.C. and A.C. under comparable conditions, the costs are available. Excluding the cost of energy, on account of the great differences in the generating conditions, the average cost per car-kilometre for repairs and maintenance of the cars and the working conductors, with the cost of running the sub-stations, is for D.C. 0.0795 fr. and for A.C. 0.176 fr. The total cost for the former averages 0.5 fr., so that the total for the latter should come to 0.59 or 0.6 fr., working conditions being supposed to be the same in both cases.

The problem of the electrification of suburban railways presents no technical difficulty, and has become almost exclusively financial and economic in its nature. Even when the substitution of electric for steam traction might appear financially unsound, the increase in traffic resulting from the improved service would often justify the change.

The suburban lines of the New York Central Railway are worked with D.C. motor-car trains of variable composition, while those of the New York, New Haven and Hartford Railway are worked with single-phase A.C. locomotives; on the latter line four single-phase motor-cars are used, but it is believed that their number has not been increased on account of the weight and high price of these cars. With D.C. motor-cars, 6.8 H.P. per ton of train is available; with A.C. only 3.5 H.P. The dead weight per seat in the former case is 670 kg., and in the latter 750 kg. The single-phase service is the more expensive, owing to this greater weight, and is inferior owing to the lack of power of the motor-cars. The motor-cars used in the Lötschberg tunnel were to weigh 55 tons and to carry four motors of 250 H.P. each, but it was found impossible to equip them with more than half that power. Similarly the New Haven and Hartford S.P. locomotives have only half the power of the D.C. locomotives, and their maintenance cost 18,000 fr. each in 1911, as compared with 4,750 fr. for the latter. The maintenance cost per locomotive-kilometre for the former was 0.225 fr. in 1911, and for the latter 0.106 fr. in 1912, though the former are of 1,000 H.P. and the latter of 2,000 H.P. Steam locomotives in 1911, on the Pennsylvania Railway, cost 0.47 fr. per locomotive kilometre.

There exist scarcely any examples of the application of electric traction to the main lines of the United States railways.

The only systems of traction actually considered in America to be capable of giving satisfactory results in drawing heavy trains over considerable distances are the high-tension continuous-current system at 1,200, 1,500, or 2,400 volts, and the simple alternating-current system at 11,000 or 22,000 volts and a frequency of 25 periods. Three-phase traction seems systematically excluded in the United States.

As regards ordinary alternating-current, there is reason to believe that a method of supplying current will be adopted similar to the three-wire continuous-current distribution by connecting the running rails to the centre of a transformer winding at 22,000 volts, of which the terminals would be connected to the two overhead conductors serving adjacent lines. This arrangement will allow a reduction of the very considerable fall of pressure which occurs even in the case of single-phase distribution at 11,000 volts.

Serious electrostatic and electromagnetic inductive effects on neighbouring telegraph and telephone wires are experienced, due to the presence in their neighbourhood of conductors carrying large high-tension single-phase currents; and both in America and Germany it has been necessary to replace the overhead network of telegraph and telephone wires by underground cables near railway lines. The cost of installing single-phase traction has thereby been increased to a considerable extent.

Whatever system of traction is adopted, the older method of working railways ought to be retained, and the trains should be drawn by as powerful, light, and fast a locomotive as possible.

In respect of power, weight and first cost, the advantage without a doubt lies with steam locomotives. The very powerful "Pacific" and "Atlantic" types of locomotive actually in use in America, which, at a speed of 120 km. per hour, can give continuously about 2,600 I.H.P. and 1,800 draw-bar H.P., weigh only 113 tons, with 90 tons for adhesion. Their power can probably be still further increased by the use of grates of 7.8 sq. m., provided with automatic stokers.

The electric locomotives of the Pennsylvania Railway, weighing 150 tons, with 90 tons for adhesion, can only develop at speeds of 100-110 km. per hour, 1,300 H.P. at the axles, and about 800 draw-bar H.P. The most recent express single-phase locomotives of the New York, New Haven and Hartford Railway, weighing 92 tons, scarcely give at 90 km. per hour 700 H.P. at the axles, and 400 draw-bar H.P.

In the United States there are no continuous-current or single-phase locomotives which are really very powerful at their maximum running speed. The three-phase locomotives now in use in the Simplon Tunnel develop at 70 km. per hour a draw-bar pull of 6,000 kg.; the new locomotives which are under construction, however, will weigh 86 tons, and will develop 3,000 H.P. at this speed. The Italian State Railways, also using three-phase equipment, have ordered 10 locomotives able to develop 2,000-2,400 H.P. at 100 km.

Whilst the three-phase locomotives can develop their maximum power at full speed, continuous or single-phase locomotives, i.e., machines with a series characteristic, only develop their maximum power at a speed of 50 or 60 per cent. of their maximum speed. Whilst tractors having a series characteristic appear quite suitable for suburban service, i.e., for drawing comparatively light trains at a high acceleration and at a low mean speed, those tractors with a shunt characteristic are likewise perfectly adapted for main line working, i.e., to drawing heavy trains at high speeds on long stretches of track where the gradients are small, and where acceleration is only of secondary importance.

The obtaining of high-speed locomotives with total adhesion and as light as possible appears to be the vital problem of main line traction. The New York Central Railway and the General Electric Co. are actually experimenting with 2,400-H.P. 600-1,200-volt total-adhesion locomotives.

The Pennsylvania Railway has been making interesting tests to measure the lateral force to which the rails are subjected when heavy locomotives of various types are passing at various speeds. In steam locomotives having a very high centre of gravity and with the axles distributed in an unsymmetrical arrangement, the shocks are feeble and distributed in an irregular manner throughout the length of the track, the highest value corresponding with a steady force of about 2,400 kg. With electric locomotives having a low centre of gravity the conditions are no longer the same, and it is proved that not only are the blows much more violent but they are produced at a regular frequency, showing that resonance is present. With an experimental electric locomotive of the "gearless" type, the maximum blows corresponding with a steady force of 12,000 kg. in the case of locomotives with gear, were still dangerous, and of the order of about 6,000 or 7,000 kg. In view of these results the Pennsylvania Railway have decided to construct locomotives with a very high centre of gravity. These locomotives are formed in two parts, each part carrying four driving wheels and a supporting bogie. The axles of the wheels are driven through connecting rods, cranks and intermediate shafts by a 1,000-H.P. motor. On test, the machines have given satisfactory results. We thus see that in America, as in Europe, those railway companies who themselves make a study of electric locomotives seem to prefer the connecting-rod drive which proves so satisfactory for steam locomotives.

To sum up, it seems that the problem of the electrification of main lines can still not be considered either in America or Europe from an entirely financial or economic point of view. A large number of technical problems are still waiting a definite solution.

The advantages offered by electric traction on mountain lines are of the same nature as those pointed out for suburban lines. The problems are very similar, since in both cases a large draw-bar pull must be obtained at a comparatively low speed, but whilst the working of suburban lines seems to tend more and more towards motor-cars, the operation of mountain lines calls for two or three locomotives in the case of long trains.

The construction of locomotives of low speed and large power no longer seems to offer any particular technical difficulty. A large number of three-phase locomotives exist of a power equal to or greater than 2,000 H.P. Such locomotives can make use of the whole of their weight for adhesion. The electrification of a line having steep gradients thus seems to be purely an economic and financial problem.

Whilst with electric traction the maximum draw-bar pull allowable with the given adhesion can be made use of up to a speed of about 35 km. per hour, with steam locomotives the maximum pull can only be maintained up to speeds of 6 km. or 12 km. per hour.

The Cascade Tunnel trains weighing 2,100 tons are hauled by three electric locomotives, each of 102 tons weight, one being placed at the front and two at the back of the train. With electric traction it will be possible in some cases to deal with a traffic two or three times greater than that possible with steam traction.

As the weight increases, the cost of steam traction rises much more rapidly than in the case of electric traction. There is thus a certain weight above which electrical working is much more economical than steam working.

After the electrification of the Giovi Tunnel, near Genoa, in Italy, a notable decrease in the cost of track maintenance was found, due to a reduction in the wear of the running rails and the brake gear. Three-phase working allows, owing to the powerful braking provided by automatic regeneration, of the descent of the long gradients of 35 mm. per metre almost without the application of mechanical brakes. The saving in upkeep and repairs to the track—particularly the down track—appears to be sufficient to pay for a considerable part of the initial cost of the electrification.

### Application of Mechanical Devices to the Assistance of Manual Operating in Telephone Exchanges.

By W. SLINGO, M.I.E.E.

IN ordinary circumstances an operator at a manual telephone exchange has the load of her position so arranged that she is left with a fairly large percentage of unoccupied time in the busy hour; this is necessary to enable her to cope with the traffic during short rush periods. Also during the slack periods, when several positions are coupled, the conditions of operating are such that the load efficiency per position is considerably reduced. Some consideration, therefore, has been given to the feasibility of utilising automatic equipment in such a manner that when a subscriber lifts his receiver his call will be transferred immediately to an idle operator. By this means it is expected that the percentage of idle operating time in the busy hour will be considerably reduced, and also, as it will be arranged that a position can be rendered inoperative, when not required, the whole of the traffic during slack periods can be thrown on to one or two positions which will be operated with the same efficiency as obtained during the busy hour.

The experimental arrangement which will shortly be installed in one of the London exchanges will provide for the replacement of the existing lamps and jacks, individual to the subscribers on each position, by others, say 10 to 20 in number, common to the traffic-distributing apparatus. Each position will only be able to receive one call at a time, i.e., whilst an operator is answering one call one further glow can be received. All further traffic will pass forward to other positions.

The proposal outlined above provides only for the introduction of traffic-distributing equipment such as can be readily introduced at an existing exchange, and such as will permit of the continued utilisation of the existing cord circuits. If such a scheme proves satisfactory in practice, future installations involving traffic-distribution apparatus will be designed on the basis of single cord connecting circuits without answering jacks. The traffic distributor will pass the call direct to the answering side of the cord circuit, and a single operation only will be involved in completing the connection with the subscribers' multiple.

Much difficulty has been experienced during recent years in large cities owing to the poor transmission conditions involved when several underground call-wires are connected to the same "B" position. It is proposed to install experimentally a simple automatic call-seeking device which will enable one call-wire at a time to have access to the "B" operator. It will be arranged so that the "B" operator can trip the apparatus in order that only one call can be passed by a particular exchange before the other exchanges working to the same position have each had an opportunity of passing a call. The "B" operator will be made aware of the necessity for using this tripping apparatus by the glowing of a lamp on her position, which will indicate the fact that an outlying exchange wishes to pass a call. By giving improved transmission it is expected that quicker operating will result, with comparative immunity from "wrong numbers."

On groups of outgoing call-wires between very busy exchanges much trouble has been experienced as a result of—

- (a) Confusion during busy periods owing to one operator interrupting another in their desire to dispose of the traffic; and
- (b) Delay experienced by the "A" operators in finding a slack call-wire at such periods.

Both these troubles result in reducing the load efficiency of the "A" operator and increasing the liability to "wrong numbers." An automatic call-wire selecting equipment has been installed at the Central Exchange, London, which has for its object the selection and isolation of a call-wire when one is required by an "A" operator. There are 10 call-wires in the group affected, and they were, before the introduction of the new conditions, operated from 10 call-wire keys, the circuits of which were multiplied over 160 "A" positions. When the selecting equipment was introduced the 10 keys per position were replaced by 1 key per position. Each operator is given a selector which rotates when she depresses her call-wire key. The rotation continues until the wipers find an idle "B" operator, when the "A" operator is able to pass her call. The following are some of the facilities thus obtained:—

When an "A" operator depresses her call-wire key, she is automatically connected to a disengaged "B" operator.

More than one "A" operator cannot obtain connection with the same "B" operator at the same time.

A click is heard in the "A" operator's receiver when a disengaged call-wire is obtained.

During periods when none of the "B" positions are open a calling lamp on the "B" position switchboard glows when any of the call-wire keys on the "A" positions are depressed. The night bell also rings under these conditions.

Any "B" position is capable of being rendered inaccessible to the "A" operators by throwing a call-wire circuit key situated on the "B" operator's keyboard; as, for instance, in cases where the

position is closed or when all the junctions terminating on the positions are engaged.

The motor interrupter which supplies driving current to the selectors can be closed down during the period of night-working, but will be restarted automatically when a call-wire key on an "A" position is depressed, and will continue running until the selector has found and stopped on the contacts corresponding to an accessible and disengaged "B" position, or until the call-wire key is released.

An alarm is given when any of the spring sets belonging to the interrupter in use fail to make proper contact. Also in this case a lamp lights, indicating which spring set requires attention.

The experimental equipment has been installed for the British Post Office by Messrs. Siemens Brothers & Co., Ltd.

### The Transmission of Electrical Energy by Continuous Current on the Series System.

By J. S. HIGHFIELD, M.I.E.E.

It is due to the skill and persistence of M. Thury that a practical method of using the constant-current series system for long transmissions has been evolved, and he has carried out many schemes of considerable magnitude. There has been a tendency in discussing the use of the continuous-current series system to treat it as a rival of the alternating-current parallel system. It is a very natural point of view, but it is not a correct one. When existing methods and standard apparatus offer a satisfactory commercial and technical solution to an engineering problem, there is no reason to depart from existing practice. In the transmission of electrical energy over very long distances, the cost of the transmission line is often the most important element in determining the commercial success of the scheme, and it is notably in such cases that the continuous-current series system offers advantages. The schemes carried out by M. Thury, and also that carried out by the author, were decided on only after the fullest consideration of all the factors in each case, and they have all resulted in most satisfactory operation. Many schemes for the electric transmission of power necessitate the use of an underground line, and in others, although an underground line is not absolutely necessary, it is desirable. It would be commercially and technically most difficult to carry out some of these schemes with underground cables, except by the use of continuous current. In short, there are limiting conditions where it is less costly to carry fuel than to carry electricity by means of an expensive transmission line, and these limiting conditions are reached at a much less distance with alternating current than with continuous current.

The chief characteristic of the machinery used in all parallel systems is that it generally tends to run at nearly constant speed from the inherent qualities of its design. Where from the nature of the work, variable-speed motors are required—as, for instance, in mining work—considerable difficulties and complications are introduced with the parallel system. The constant-current series machine is naturally capable of running at variable speeds without complicated regulators and with high efficiency. In a mine the ventilating fans, pumps, winders, hoisting, and air-compressing machinery are all preferably driven with variable-speed motors. Air compressors can be driven with constant-current series motors without any regulating gear; as the pressure rises the motor will slow down, and will stop when the pressure exceeds any predetermined limit, which can be adjusted by giving the brushes of the motor the proper lead. Such an arrangement is more efficient and less complicated than any of the parallel systems for driving compressors. There is no doubt that in many cases where variable-speed motors are required, a local constant-current series plant would give excellent service. The system is inherently suited to such work, and the author is of opinion that it requires only careful development to be used to an increasing extent for such purposes.

The plant and apparatus described in the paper are mainly those used by the author in the Western area of the Metropolitan Electric Supply Co., and were fully described by him in a paper read at Glasgow last year at the summer meeting of the Institution of Electrical Engineers.

With the continuous-current series system it is usually convenient to use one line from a small station, and perhaps two lines from a large station, and the system does not lend itself to a large number of automatic contrivances such as are generally used in the parallel system. It is necessary, therefore, to install the cable system in the strongest possible way, so that the chances of failure are removed. Similar care should be taken in the design of the station plant and of the little switchgear and accessory apparatus required.

The generators are provided with a short-circuiting switch, which is closed mechanically and automatically should the generators reverse their direction of rotation due to a breakdown of the prime mover. A slipping coupling protects the prime mover from the generator in the event of a very sudden short-circuit.

The line current is kept constant by a form of regulator which may vary either the speed of the prime mover or the position of the brushes where constant speed is required.

The Montier-Lyons cable has been in use since 1906, first at a pressure of 57,600 volts and recently at 75,000 volts.

The whole of the Western area cables have been subjected to a

steady pressure of 150,000 volts for a period of about 30 minutes. The joints have been tested at alternating pressures up to 150,000 volts. The cables are intended for a regular working pressure of 100,000 volts, and it is anticipated that there would be no difficulty in working them at a still higher pressure. For making these tests two special machines have been built. The first consists of an influence machine giving a direct pressure of rather over 130,000 volts. The second machine consists of a contact maker working in conjunction with condensers and a step-up transformer, and is expected to give pressures up to 300,000 volts.

The Western Area underground system consists of the two single cables referred to above, laid in cast-iron pipes. This cable system, at a pressure of 100,000 volts, will carry a load of 12,000 kw. In addition to the cables, provision is made for working with an earth return, and for considerable periods the whole of the power has been supplied through a single cable and the earth. The two cables with the earth return provide a system having a capacity of 12,000 kw. in complete duplicate.

The difficulties of running in parallel are entirely avoided, so that several power stations may be connected to the same ring as the total load increases, thus allowing the effective working pressure to be raised far above any figure possible with any other system. In this respect the uniform section of the cable renders the series system far more flexible than any parallel system.

Difficulties due to the capacity and inductance of the line are eliminated, and where an underground system is necessary, owing to the high pressure that can be used with continuous current, energy can be transmitted to a far greater distance than is possible with alternating current.

Broadly, it may be said that where, owing to the great length of the line, the cost thereof is the dominating factor from a commercial point of view, then the continuous-current series system will show an advantage over the alternating-current parallel system. Where, however, the cost of the line is not the important point, the latter system will usually show to the greatest advantage.

At the present time the maximum pressure for underground cables for alternating current over a long transmission is probably 25,000 volts, and even when working with a frequency of 25 cycles the capacity current presents considerable difficulties.

The cost of an overhead three-phase line, even at equal pressure, is greater than that of a series continuous-current line.

In many cases the cost per kilowatt-mile of overhead lines is greater than the cost of the underground continuous-current cable system.

Quite apart from the question of cost, the underground system offers definite advantages over the overhead system. It is possible to run underground cables in urban districts where overhead lines would not be permitted. Then the overhead system is more subject to wilful damage, and suffers far more harm from storms and lightning; also the cost of maintenance is much heavier with overhead lines, the cost of maintaining underground lines being an almost negligible quantity. Therefore, other things being equal, where continuity of supply is of the first importance, the underground system will usually be chosen.

Where continuous current is used, the earth can be employed as part of the circuit. The earth may be used either as a permanent conductor for the return current, or it may be used as a stand-by in the event of the failure of one of the insulated lines. In either case, but particularly in the former, this use of the earth on a long transmission is of immense commercial importance. When the earth is used as the return circuit two single lines in parallel would take the place of four, thus reducing the weight of copper and the number of insulators by one-half.

Before making use of the earth connections near London careful experiments had to be made in order to prove that no damage was caused to other users of the soil. These experiments were described by the author in June, 1912. It is of interest that the Board of Trade and the Post Office Authorities will allow the earth connections to be used in the case of a breakdown.

It is a simple matter to make earth connections having a joint resistance of not more than 1 ohm. The total resistance of a line 100 miles long with two conductors of 0.125 sq. in. section, including the resistance of the earth connections, would be 18 ohms, and the number of kilowatts required to keep the line charged would be 180, or 15 per cent. of the capacity of one of the conductors of which the line consists, so that complete duplicate transmission is provided for. With the two lines in series, without the earth connections, the total resistance would be 68.3 ohms, and the number of kilowatts required to keep the line charged would be 683, or nearly 6 per cent. of the maximum capacity of the line.

The chief difficulties in the series system arise in connection with the power station. The generator is subject to rigid restrictions as to size. It is possible to build machines giving 100 to 200 amperes at a pressure of 5,000 volts; it may be possible to go up to a pressure of 6,000 volts if suitable speeds can be chosen. For generators of 300 amperes probably a lower pressure would be necessary, say, 4,000 volts. Consequently, the maximum size of a generator at the present time may be taken to be 1,200-1,500 kw., the larger machines running at 250-300 R.P.M., and the smaller ones at about 400-500 R.P.M. Consequently, to make up a large power unit, it is necessary to couple two or more generators to a single prime mover.

In the case of an hydraulic power station where the turbine speed is suited to the generators, the overall cost of the power station will be similar to that of an alternating-current station. When it is necessary to drive the generators by means of steam turbines or high-speed hydraulic turbines, double-helical gear provides a satisfactory means of reducing the high speed of the prime mover to the most suitable speed for the generators. The power station would, in this case, generally cost more than a power

station of similar size for alternating current. Where the size of the units is very large, the cost of the power house on the series system will be considerably higher than that of a similar station containing alternating-current plant.

The energy lost in the line with constant current will usually be higher than with the constant-pressure systems. The high-load factor with which most long-distance transmission systems must work in order to show commercial advantage makes the large amount of energy represented by the constant losses a comparatively small percentage of the energy transmitted. Where the frequency of the transmission system is different from the frequency required in the distributing circuits, the continuous and alternating-current sub-stations will be equal in cost. In other cases the alternating-current station will usually have the advantage.

There are certain clearly defined cases where the series system offers an advantage; for instance, where a load of about 7,000 kw. had to be supplied at various points in a scattered district, involving a length of approximately 100 miles, by underground mains and where the cost of energy was comparatively small, the series system was the only system commercially possible.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**COLUMBIA.**—The Board of Trade have received a copy of a resolution of the Columbian Ministry of Finance, in which it is provided that all materials which are necessary for the establishment or extension of electric plants, so far as they can be considered as forming part of one and the same installation, and provided that the weight of each importation exceeds 3,000 kg. (about 59 cwt.), are entitled to duty free admission into Columbia. The following list of articles entitled to duty free admission in virtue of the above provision is given in the resolution:—Generators (dynamoes) and electromotors, with their rheostats, accessories, and measuring, safety, regulating and governing apparatus; mechanical cranes, with their support blocks and running tracks; wires, cables and bars of copper, uncovered or insulated; insulators weighing over 50 grammes each, and iron supports therefor; cloth and bands of rubber and insulating materials and substances, in forms for use in electrical industry; transformers, and oil for the same; fusible wires of metallic alloys; switches, cut-outs and valves, which are not expressly excepted; accumulators and condensers; lightning conductors; sheets of marble or slate, smooth, not carved nor ornamented, suitable for the mounting of switchboards. The resolution also contains a list of certain materials and elements for electric installations inside buildings in respect of which duty free admission cannot be claimed.

**AUSTRALIA.**—The Australian Commonwealth Customs authorities have issued the following decisions as to the duties to be levied on certain electrical goods on importation. The duties in each case are those leviable under the preferential tariff for British goods:—

Earth detectors:	
Which merely indicate without measuring	10 %
Which indicate earth and measure the insulating resistance	free
Indicators, ringing:	
Telephone types	free
House bell indicators	10 % ad val.
Rods, ebonite	20 "
Tubes, ebonite	20 "
Magnetos for use on home cinematograph or similar machines	20 "

**SWEDEN.**—A Swedish Royal Decree provides that private merchants and firms and companies carrying on commercial operations in Sweden may be accorded the right of receiving a refund of Customs duty on the re-exportation from Sweden of goods on which duty was paid when they were imported. The Customs authorities are to grant permission to reputable merchants and firms that avail themselves of this right for certain classes of goods. In the case of some goods, refund of duty is to be allowed only when the person re-exporting them makes a sworn declaration that to his knowledge the goods are not intended to be returned to the country of production or purchase, or to the agent of the producer or of the original seller in another country. In order to receive a refund of duty under this decree, merchants must, when entering the goods for payment of duty, declare their intention of claiming such refund. In this case a special tax, amounting to  $\frac{1}{2}$  per cent. of the import duty, will be levied at the same time as the latter.

**BRITISH GUIANA.**—The Government of British Guiana have been authorised to make regulations for the carrying into effect of the Canada-West Indies treaty, which provided for the establishment of a preferential tariff for British and Canadian goods on importation into the West Indies.

**SOUTH AFRICA.**—The South African Customs authorities have decided that lamp-lamps and keys are to be dutiable at the rate of 3 per cent. *ad valorem* if of other than British origin, whereas British goods of the same class are to be admitted free of duty.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & Co.,  
Electrical Patent Agents, 285, High Holborn, London, W.C., and at  
Liverpool and Bradford, to whom all inquiries should be addressed.

- 12,753. "Supports for the filaments of glow-lamps." WOLFRAM LAMPEN Akt. Ges. (Convention date, June 3rd, 1912, Germany.) June 2nd. (Complete.)
- 12,839. "Generators for high-frequency currents." E. GIRARDEAU. (Convention date, June 3rd, 1912, France.) June 2nd. (Complete.)
- 12,813. "Electrical mine-igniting machine." ELEKTROTECHNISCHE FABRIK SCHAFER & Co. (Convention date, February 6th, 1913, Germany.) June 2nd. (Complete.)
- 12,827. "Means for overcoming electrical disturbances." J. S. WITHERS. (E. S. HEURLEY, Germany.) June 2nd.
- 12,837. "Method of construction of electrical heating resistances particularly applicable to electrical furnaces." Soc. GENERALE DES NITRUBES. (Convention date, July 26th, 1912, France.) June 2nd. (Complete.)
- 12,839. "Electrical measuring-instruments." BRITISH THOMSON-HOUSTON Co., Ltd., and F. HOLDER. June 2nd.
- 12,841. "Power-transmission and control apparatus on motor-vehicles." J. G. P. THOMAS and THOMAS TRANSMISSION, LTD. (Divided Application on 17,130.12. July 23rd.) June 2nd.

- CONNECTING TERMINAL FOR HIGH-VOLTAGE CIRCUITS. E. BAEFELY. 119 January 2nd.
- COMBINED MECHANICAL LOCKS AND ELECTRIC CIRCUIT BREAKERS FOR LIFT DOORS AND GATES. Electromotor Equipment Co. and W. B. BIENDER. 1,438. January 17th.
- DEVICES FOR ELECTROCUTTING ANIMALS. H. SMITH. 2,152. January 27th. (February 3rd, 1912.)
- APPARATUS FOR ELECTROCUTTING ANIMALS. H. SMITH. 2,159. January 27th. (February 17th, 1912.)
- PROCESS OF MAKING AN ALKALINE GELATINOUS ELECTROLYTE FOR GALVANIC BATTERIES. G. S. ENGLE. 2,395. January 29th. (October 8th, 1912.)
- COPPER OXIDE PLATE FOR USE IN ELECTRIC BATTERIES AND PROCESS OF PRODUCING SAME. G. S. ENGLE. 2,396. January 29th. (October 8th, 1912.)
- DEVICES FOR AUTOMATICALLY ADJUSTING THE TIME OF IGNITION IN INTERNAL-COMBUSTION ENGINES. Robert Bosch (Firm of). 4,693. February 24th. (March 14th, 1912.)
- PENDULUM INDICATORS FOR USE WITH ELECTRIC BELL SYSTEMS OR FOR LIKE PURPOSES. I. H. PARSONS and H. R. WADDINGTON. 4,890. February 26th.
- ELECTRIC ALARM SIGNALLING APPARATUS FOR ORDNANCE. Fried. Krupp Akt. Ges. 5,872. March 10th. (April 2nd, 1912.)
- WINDINGS OF ALTERNATING-CURRENT DYNAMO-ELECTRIC MACHINES. Allmanna Svenska Elektriska Aktiebolaget. 7,776. April 2nd. (April 6th, 1912.)

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

## 1911.

DYNAMO-ELECTRIC MACHINES. J. LECOCHÉ. 22,766. December 21st. (May 23rd, 1912.)

**Driving Chains.**—MESSRS. HANS RENOLD, LTD., have sent us particulars of recent tests on two identical gear-cutting machines in their shops, one belt-driven and the other fitted with their silent chain drive. It is found that the chain-driven machine gives 60 per cent. more output for 10 per cent. more power, or at equal output requires 14½ per cent. less power. It is claimed also that the tools last longer. The drives fitted with their chains are increasing at the rate of about 25,000 H.P. a year.

## THE L.C.C. TRAMWAYS REPORT.

By the time that this article appears in print our readers will be well aware of the result of the year's working of London's tramway system. This result is welcomed in different ways by different papers. The fact that under company management there would have been a surplus for dividends, renewals, and depreciation (but probably dividends) of £739,053, is hailed with delight by advocates of municipal ownership. The fact that £738,556 of this is swallowed up by debt charges, leaving only £497 net surplus, is hailed with a great air of "I told you so" by the opposite party. We have, then, at once, the first and greatest argument against public ownership—that is, that any result at all is used as a peg to hang party politics upon. Moreover, in the case of public ownership of property of any kind, the caprice of the individual is as powerful as it is in private ownership; and continuity of policy is difficult to preserve, because the process of educating a kaleidoscopic succession of inexperienced people aspiring to local honours has to be repeated over and over again.

Apart altogether from the political aspect of the matter, the financial result cannot be regarded as satisfactory. By the Council's own resolution the renewals fund should receive a contribution of £150,309—and it gets £497. The primary cause of the whole trouble is to be found in the enormous and unnecessary capitalisation of the system. The installation of the conduit system involved a vast expense which might have been avoided by the use of the overhead system; and in the Minutes now under consideration we learn that the Bermondsey Metropolitan Borough Council refuses its consent to the use of the latter in its area. If Berlin can put up with the overhead system, surely Bermondsey should be able to do so. Aberdeen and Liverpool, both stately cities, use the trolley. It ought not to be possible for obstacles to be placed in the way of the development of a huge and necessary system of rapid transit in this unreasonable manner. The use of the conduit system renders the roadways at points such as the Elephant and Castle positively dangerous to pedestrians and horsed vehicles. The road is covered with interlacing steel plates, all highly polished and slightly rounded, half of which are due to the conduit.

The cost of street widenings has added much to the capital expenditure, and the only offset against this burden is the fact that it is yearly diminishing and must, in course of time, disappear. The fact that the tramways have to pay for the maintenance of the middle part of the roadway, which they do not use, is a long-standing grievance, which is, in general, admitted to be just.

We say "in general." Our contemporary *Engineering*, in its issue of June 20th last, does not admit the justice of the complaint at all. It refers to the tramways as "a system of transport which is being rapidly rendered

obsolescent by the march of progress." It refers, none too graciously, to what it describes as the "whining" and "peevish whimpering" of those who are responsible for the construction and working of the tramways. Everyone knew, it is said, that these charges would have to be met, and in this knowledge promises were made of lavish financial assistance to the rates. Our readers will remember that we have never failed to point out the unfairness of saddling the tramways with such liabilities, nor have we ever countenanced the paying over of either tramway or electricity profits in aid of rates. The case of the railways is entirely different. They have a monopoly of the use of their track, and they can, and generally do, charge higher fares. Farther, they do not have to repay their capital, but always issue more for extensions—sometimes for objects properly chargeable to obsolescence. They pay for the property they demolish in constructing their lines, and rightly so, because they leave in its place a tract of private land. The tramways, on the other hand, leave a better road, and a wider, than existed before; and it is not private, but is there for the use of everyone—including their severest competitor, the motor-bus. *Engineering* objects to the use of stone setts between the rails, and we candidly admit that we do not know why they are necessary. We seem to have seen, however, stone setts recently laid in Oxford Street and Holborn, with which the tramways have not been concerned. The contention as to injury of road surfaces is summarily dismissed with the remark that the motor-buses are no more destructive than the fast motor delivery vans. It should be remembered that there are many more of them.

For good or for ill, we have got the tramways, and we must make them pay. The money has been spent, and must be repaid. Competition must, therefore, be made fairer, and there must be no factitious difficulties placed in the way of the undertaking, either as regards development and extension, or working. We note that between January 1st of this year and June 10th the police issued 29 summonses, the alleged offence being failure to stop in time to avoid an accident. Of these 29, no fewer than 19 were dismissed: in one case the magistrate awarded a guinea costs against the police.

It should be borne in mind that the tramways are heavily burdened with the obligation to carry workmen at fares which entail an enormous annual loss; if the tramways were shut down, would the motor-buses fill their place in this respect? We think not. The cost of providing a night service—a great boon to many workers—and the loss on half-penny fares, are other items contributing to the deficit. The advocates of motor-buses fail to take account of the heavy handicap imposed upon the tramways as a public undertaking, from which their rivals are free, to say nothing of the fact that at least twice as many buses would be required to deal with the same traffic as the tramcars in fine weather, and four times as many in wet.

London has no local patriotism. Let anyone try to start and work a system of motor-buses in Glasgow: nobody is likely to do so, for it could never be made to pay. When the horse-drawn tramcars became public property, an attempt was made to compete with them by means of horse-buses. The attempt met with no success at all.

The present financial position is unsatisfactory, but it cannot be said to be unnatural, or even unexpected. There is no need to be despondent about the future, provided that the concern continues to run on business lines. There is room for all systems of traction in London—train, tramcar and motor-bus—and in the course of a few years they will all settle down nicely into their stride. Censure is equally out of place with "peevish whimpering."

Let all extensions be made as cheaply as possible. Let none be made that will not, either now or in the near future, pay their way. Let no money be spent outside the undertaking, even if there be a surplus. Finally, let the people of London support what is their own. If these things be done, the position cannot fail to improve.

### Ministers and Marconis.

THE publication of the interim report and minority reports of the Marconi Committee enabled the House of Commons last week to debate the issue, so far as Ministers were concerned. Efforts by old Parliamentary hands to carry the discussion on a high plane and remove it from the party groove were unsuccessful. The party character of the Committee proceedings was reflected in the reports, and the House eventually decided the issue by a party vote.

The essential difference lay in the expression of regrets. The Ministers concerned expressed theirs in no measured terms, and it was desired by the Opposition that the House should record their regret also. As this would have been a vote of censure which the majority were not prepared to endorse, it was decided to be content with the expressions of the Ministers. The sincerity of those expressions is beyond question, and the generously minded would hardly desire to press matters further. The Ministers have had a lesson, and the whole incident should have a healthy effect on public life. Accused of corruption by irresponsible, and of indiscretion by responsible, persons, the Ministers, unhappily, attached undue importance to the former, and only tardily realised the gravity of the latter. The incident ends with the recognition of the fault and the expression of regret, and it only remains to draw useful lessons from it. One of these lessons is to emphasise the utility of the expert. Politicians whose activities and interests extend over a wide sphere should recognise their limitations, and acquire the habit of leaning to some extent at least on others. In their confessional speeches both the Attorney-General and the Chancellor of the Exchequer revealed the extent to which they had absorbed a view of wireless telegraphy, which may be described, without offence, as the "Marconi atmosphere." Sir Rufus Isaacs thought wireless telegraphy and Marconi were synonymous terms. In the midst of his own troubles, Mr. Lloyd George interpolated a quite unnecessary reference to the illustrious inventor and the verdict of history. These are features upon which from the nature of the case they could not be fully informed. Wireless telegraphy as a science is one thing: as a business it is another. There are experts capable of properly appraising the merits, historically, scientifically and financially. Their judgment would be free from bias by reason of any mysteries or marvels upon which the lay mind loves to dwell. Amongst the mass of evidence given before the Committee, that of Mr. Lloyd George's own broker stands out in its clearness and frankness. It shows the value of the expert with a sense of responsibility and illustrates the general lesson which we wish to draw, though necessarily our remarks apply more particularly to the scientific and engineering side. The layman and the politician must cultivate a mistrust of his own judgment on points beyond his experience and place himself more fully in the hands of the best experts that are available on any technical or scientific question that may present itself for solution. The earlier application of this principle would probably have avoided much unpleasant controversy, and the failure to apply it in the future will be inexcusable.

### Copper.

COPPER prices have had a very nasty fall within the past week or so, and the market has at times verged upon a condition of semi-demoralisation. For some little time consumers have not been at all too well satisfied with the position, even though it was not easy to put a finger on a really weak spot, the favourite argument being that the statistics issued for the information of the trade were not reliable. There certainly is not, however, the slightest ground for impugning their good faith, and all attempts to discredit their accuracy have failed in the matter of proof. As to surmise, it is always easy to cast doubts, and a much more difficult matter to carry conviction. Really there is not the slightest reason to be sceptical as to the essential correctness of the European returns, and the American statistics are also quite reliable so far as they go; but in times such as those just passed through there is no

room for even moderate optimism, the market having been infected with rank distrust of everything, and selling pressure on a large scale finding an entire lack of support on the part of strong houses whose attitude has for a long period been one of friendliness towards the metal. What really brought about the *débacle* was a succession of unfavourable outside influences, notably the weakness of the New York and Paris Bourses, on each of which drives were made against copper shares, especially Tintos and Amalgamateds; this, together with the restriction of credit facilities and the heavy realising of speculative commitments, combined to bring about a flood of selling, and prices broke sharply.

So far as the statistical situation is concerned, matters have improved very considerably this year, for the world's visible supply has decreased from 98,101 tons at the end of January to 71,809 tons at the end of May, but it may well be considered whether the best of the returns has not now been seen. For one thing, the production in the United States is apparently increasing, notwithstanding certain local difficulties, caused in part by the Mexican Revolution, and output seems to be headed for a fresh new record, the highest figure yet reached being 65,012 tons in August of last year, while the total last month was 63,089 tons. This is one thing which gives pause to those who entertain a moderately good opinion of the market. Another is the huge deliveries of the last three months—68,877 tons in March, 73,239 tons in April, and 71,809 tons in May. It is felt, and with reason, that the world cannot go on taking copper at this rate. The total American home trade deliveries and exports for the five completed months of this year were 323,737 tons, against 291,567 tons last year, an increase of some 32,000 tons, or 6,400 tons a month. The average of March, April and May, is, however, over 66,000 tons a month, and this surely implies a falling off in the takings during the next few months, even though consumption remains as good as ever. With a reduction in the deliveries by the American producers, we shall be brought face to face with increasing stocks either in America or Europe, and either contingency in the present temper of the markets might be sufficient to give prices a further twist downwards. It is a question, however, whether the events of the past week or so have not pretty well discounted bad figures at the end of this month, in which event, especially if the outside conditions which have been such a drag on the market improve, there might easily be a rather sharp recovery.

The reduction in prices recently declared by the Amalgamated Copper Co., and later followed by other leading interests, further unsettled the market, not so much because of the cut, but because the reduction was not sufficient to stimulate buying. At all events, the producers have not, so far, made any sales worth considering; and what business is about, has gone to the dealers. That there is buying to be done, however, nobody doubts, and a restoration of confidence in trade and financial circles would work wonders as regards the appearance of the market, which, moreover, is greatly oversold speculatively.

**The L.C.C. and its Employés.** THE Central Conciliation Board, consisting of representatives of both the Council and its employés, has just prepared an amended scheme for the tramway department. The scheme has been presented to the Council by the Highways Committee, which is responsible for the working of this section of the Council's activities.

The questions which may be dealt with under the new scheme relate to differences in rates of wages, hours of labour and general conditions exclusive of discipline and management. It is proposed to classify the various workers into four sections: one dealing with traffic, one with rolling stock, one with the electrical operatives, and the fourth with permanent way and buildings. Each section is to have 12

members, six appointed by the Council, of whom not more than two are to be officers of the Council and the remaining six are to be chosen by the men. For the purpose of choosing their representatives the employés in each section are divided into groups, each of which elects one or two representatives. Each side selects its own secretary, and the arrangements for electing the representatives are left in their hands. On the men's side those nominated must belong to the group they wish to represent, and must have the support of six or, in some cases, 20 of their colleagues. At each meeting of the sections each side appoints its own chairman, and after discussions the sides vote apart, all binding decisions being arrived at by agreement between the two sides. If after full discussion the two sides of a board fail to arrive at any agreement, the matter is left for decision by a court of arbitration, to be appointed by the Board of Trade; each side of a sectional board is to have the right to present its case, but, except in the case of a joint request by the two parties and the consent of the Board of Trade, no legal assistance is to be obtained.

The sectional boards are not to be called on to meet oftener than every two months, and the question of payment for loss of time and expenses of the workers' representatives is left to their discretion.

In the event of any decision arrived at by any of the sectional boards involving increased expense, the matter is to be brought before the Council for its decision by the Highways Committee within 28 days.

The scheme is to remain in force until six months after March 31st, 1916, unless terminated earlier by mutual consent. No decision arrived at by a board is to be reopened for a period of 12 months.

We think that the scheme outlined above has in it the groundwork of an acceptable working plan. Much will depend upon the spirit in which the parties enter upon it, but given the determination on both sides to be fair and reasonable, it should provide a means for settling the disputes which are sure to arise in any large undertaking. This principle of conciliation boards is now on its trial; if it succeeds it may be found applicable to smaller undertakings where disputes of the same class have to be settled.

---

## THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION'S ANNUAL CONGRESS.

---

(Concluded from page 1013.)

MR. FRED BLAND, M.I.Mech.E., gave a *résumé* from a manufacturer's standpoint of "Tramway Track, 1883 to 1913"—a subject with which he was familiar, having been closely identified with tramway construction for 30 years. He mentioned that steel-tired wheels had been generally adopted in preference to chilled iron, an American importation to which he had been opposed from the commencement. Since 1907, 125,895 tons of British Standard section rails had been rolled in this country, as against 38,537 tons of other sections; but the matter was again under revision by the Engineering Standards Committee. The general tendency was towards more massive construction. Now manganese steel was the rule for points. The paper contains a mass of information regarding old-time practice, showing also the tendencies of modern designs.

In submitting his paper, Mr. Bland said he would like the members, as tramway men, to consider the following points:—

1. Why should they have so many rail sections? Why not have two or at the outside, three, say 6 in., 6½ in., and 7 in., and adopt these generally? This would simplify matters for manufacturers, and there would be cheaper production and improved deliveries, as they could stock with some degree of safety. Personally, he selected No. 4, 7 in. rails as the best standard at present.

2. Adopt standard radius points in renewals; take 150 ft. radius as the standard as experience showed that this radius would replace their old loops the most economically. Then have, say 100 ft. and 200 ft. for special work, and either 200 ft. or 240 ft. equilateral for diamond loops.

3. Adopt standard types of points—automatic and open mates on country roads; double-tongue points in towns (where the points were constantly cleaned) and upon all facing points.

4. Should the tongue be fitted with a heel pin, or be pinless? He advised a pin with a heel adjuster, as the tongue could not then work forward.

5. Raise all grooves of open points and crossings on turn-outs, &c., to ½ in. deep, but in double junctions where cast connected crossings were used, as at present, he suggested carrying the raised groove throughout, and, if they would pay more, then carry the grooves out square across the track. This would ensure easier running.

6. He advocated the use of a rail with a raised groove rolled in for curves, &c.

7. What type of renewable guard was most suitable for sharp curves?

8. On emergency crossovers, otherwise than terminals, abolish the old crossings, and put in an unbroken tread, or use a long rail and bolt on wing crossings for the crossover track. They would thereby reduce their repairs and give easier running.

MR. H. M. SAYERS (Brazil), in opening the discussion, said the main thing on which improvements were required, in his view, was the special work, points and crossings. During the last three years he had been using crossings for grooved rails made by two English manufacturers, and for Vignoles rails by an American manufacturer. He had had to send all the crossings into the machine shop before they could be put into the track, because the raising of the grooves was insufficient or misplaced, so that the wheel flanges caught the points of the diamond. Manufacturers succeeded very well in constructing special work for curves, crossings and junctions, where they were given the full elements. During the period mentioned he had had to put in about 96 crossings and junctions of various sorts, all of which were constructed in England—the drawings being sent from Brazil—and in very few cases had any adjustment had to be made when they came to fit them together. He was very well satisfied as to the groove rails with the British standards, but all the heads should be similar in width and inclination, so that they would butt up and meet.

MR. W. B. PICKERING (Sheffield) said that the difficulty of renewing point tongues was a matter which tramway engineers themselves were responsible for in great measure. The manufacturers to-day turned out tongues from the same pattern which were absolutely interchangeable. In regard to the standardisation of the rail section, he hoped that the Standards Committee would not increase the present number of sections. The question of raised grooves on curves was a very debatable one. He had talked with engineers abroad, particularly where the raised groove had been carried right through the grade of the curve, and he believed they were gradually dropping the idea altogether.

MR. E. H. EDWARDS (Atherton) said that whereas in 1882 the length of points was 7 ft. 6 in., they had got the length to 15 ft. in 1912. There must be some advantage to the manufacturer of points, but there was not a great amount of advantage to the user, and they were getting very expensive. His experience of silencers had not been satisfactory.

MR. F. HEWER (Lorain Co.) said it had been proved in several places that insert work stood up and was more economical than solid manganese. He thought that 9 in. manganese tongues in practice gave bad results. Manganese steel, although having high resistance to abrasion, had a tendency to flow, or cold-roll, and did not possess the resilience necessary for a tongue, unless it was reinforced to give lateral stiffness. The ordinary single tongue in manganese steel was liable to be bent by the car wheel and would cause derailment.

MR. CHARLES FURNES (Blackpool) said that more than 70 per cent. of the trouble experienced by tramway managers in track maintenance was due to bad foundations; he had endeavoured to persuade the Blackpool surveyor to lay his track on a cushion foundation, *i.e.*, placing a timber medium between the rail and the concrete. They had a length in Station Road, and he was watching it very closely; there had been no movement of the rails during the last 2½ years, since the track was laid down. It was laid on timber about 9 x 5, and was a very good job.

MR. R. HUMPHRIES (Black Country) said they had a great deal of track that ran over pit subsidences, and in some cases they lost their concrete years ago. The track was originally laid on a concrete bed, but now they ran on sleeper construction for miles, and they found that the permanent way laid on that type of construction gave them less trouble, the cars ran far sweeter, and they could maintain it far cheaper than the tracks where concrete was used. Since they had scrapped their chilled wheels and equipped everything with tired wheels, the trouble on their special work had wonderfully decreased.

MR. C. G. TEGEMEIER (British Electric Traction Co.) said that, as chairman of the Auckland Tramways Co., he could corroborate the remarks of previous speakers upon the foundation of track. Sleepers laid upon broken-up masses of concrete formed an ideal track. The running of the cars was much more easy and the cost of repairs very much less. The main street in Auckland was originally the bed of a creek. There was about 20 ft. of made ground on which the track was laid. The track, originally laid upon longitudinal concrete sleepers, subsided, and the remedy was to reconstruct the track entirely, driving into the ground wooden piles 20 ft. to 40 ft. in length. These were driven until they reached a solid bottom, and upon them a longitudinal 18-in. sleeper was put. Between the sleeper and the base of the rail, which was laid over the sleeper, there was about 2½ to 3½ in. of concrete. That was about seven years ago. Now the concrete between the rails and the longitudinal wooden sleeper, resting upon the 20 to 30-ft. wooden piles, had all disintegrated, and the track had to be reconstructed again. The method now was to put an additional long wooden sleeper upon the top of the previous one, and to lay the rail direct upon the wood, resting upon the wooden piles. The cost of course had been very considerable, but when the work was completed, they thought they would have a track that would last a good many years. There was no concrete used in the process.

MR. A. W. A. CHIVERS (E.T.Co.) said the method of construction advised by the permanent-way engineer of the British Electrical Federation was a combination of the concrete foundation with sleepers, and had been so devised that they got a very sound foundation, which was very satisfactory for heavy vehicular traffic, and at the same time there was sufficient resilience to give a

very even running. That track was advised with a view to meeting all conditions where they were not subject to subsidences.

MR. BLAND, in reply to the discussion, said that they did not want to make any longer points, but they had to meet the demands of engineers. As to inserts and manganese, the Sheffield manufacturers made both, and it was immaterial which was used. He thought that if maintenance engineers would consult constructional engineers on the actual road itself, they would possibly meet difficulties better.

On Thursday evening the members of the Association were the guests of the Mayor and Corporation at dinner at the Imperial Hydro. The Mayor (Councillor M. G. Wilde) presided, and was supported by members of the Corporation and officials of the Association.

The MAYOR proposed "The Tramways and Light Railways Association," and said it was appropriate that the Congress should be held in Blackpool, as the borough was almost the pioneer of electric street tramways, as it was also a pioneer of the lighting of streets by electricity. MR. HARRY ENGLAND responded to the toast.

THE HON. ARTHUR STANLEY, M.P. (chairman of the Association), proposed "The Blackpool Corporation." ALDERMAN BRODIE (chairman of the Tramways Committee), in responding, said the electric cars had been running in Blackpool for about 28 years. He had thought that no other town would adopt the conduit system, but London had seen fit to do so. The conduit was a costly system, and the overhead system was the only one that would pay at the present time. COUNCILLOR COLLINS (ex-Mayor), who also responded, said the members would readily understand the difficulty of making a concern such as the Blackpool tramways successful when they were told that they had to deal with 300,000 people at one time of the year, although at another time they had to meet the requirements of a population of only 60,000. They had a capital expenditure of half a million, and last year their cars travelled a million miles and carried 12½ million passengers. Tramways had led to the extension and improvement of rural areas, and it was likely that in the future they would perform an even more important function than they had done in the past.

MR. CHARLES FURNES (manager of the Blackpool Corporation Tramways) also responded, and pointed to the fact that the Corporation could afford to lay up during nine months of the year practically 75 per cent. of the rolling stock.

SIR EDWARD WHITE (chairman of the Highways Committee of the L.C.C.), who proposed "The Mayor," said that unfortunately in London they had very serious competition with the motor-buses, and the result was that there had been a considerable falling off in their revenue, but he hoped that it was only temporary, and that in the near future they would recover the prosperous position they formerly held. He strongly advised Blackpool not to have 1d. fares. In London they carried 26 per cent. of the passengers at 1d. fares; they also carried a large body of workmen by early cars, and they ran all-night cars; on those services alone they were losing £100,000 a year.

The MAYOR briefly acknowledged the toast, and the proceedings ended.

The Congress resumed on Friday, June 13th, under the chairmanship of the Hon. Arthur Stanley, M.P.

MR. HARRY ENGLAND presented his paper on "Railless Traction Legislation," and explained that he held no brief for railless traction; he did not entertain the idea that railless trolley cars were superior to motor-buses under all conditions, and certainly he would not admit the converse. Touching upon road maintenance, he said that whether their leanings were to motor-buses or trolley cars they would agree that a tax which was applicable to one particular form of mechanical traction only was inequitable. Further promotions and extensions of the railless trolley system would be governed largely by the amount of the tax which Parliament put upon the industry for road maintenance purposes. By some means or other all forms of traction should pay for the road they used, according to the weight and speed of the vehicle, and the mileage run. He referred to the mutilation of the Government Light Railway Act last year, whereby the attempt to facilitate the construction of railless trolley systems was defeated, and the position remained unchanged. There was a crying need, he said, for legislation to cheapen and accelerate applications for powers to run trolley cars, which, at present, cost practically 12 months' time and hundreds or thousands of pounds, so that companies were driven to use motor-buses in preference to applying for powers. Eighteen private Acts had received the sanction of Parliament, 15 promoted by local authorities and three by companies. The time allowed for completion ranged from two to five years. The type of vehicle was generally left open, subject to the approval of the Board of Trade. Powers to carry goods were usually restricted, only Brighton and Stockport having full powers; as the railless systems penetrated into districts where other transport facilities were lacking, adequate powers in this respect were very desirable, more especially as the railless system enabled connection to be provided to manufacturers' premises at small cost. It would be to the advantage of the railways to cease their opposition to these facilities, as road motor vehicles were rapidly multiplying and would capture much of the railway traffic if the railways did not co-operate with the railless trolley promoters. Several local authorities had taken powers to use trolley vehicles for the conveyance of sanitary refuse, road metal, &c. The powers of the Board of Trade in some cases to sanction the extension of authorised trolley vehicle systems were valuable, and should be incorporated in all future Acts. Powers to convert the system into a tramway when the traffic

proved sufficient would be useful. Facilities for through running and interchange of traffic between adjoining systems should be obtained. Usually no provision was made for running trailers. Practice varied as regarded the cost of road widenings and paving. Railless systems ought not to be singled out from all other forms of road traffic for a special road tax, which was strongly objected to; in several cases a liability to this end had been laid upon the promoters. When this liability was strictly defined (as at Rhondda, 4d. per car-mile) the cost of operating trolley cars could be definitely estimated, but where the liability was indefinite investors would not provide the necessary capital. Railway authorities should not be given special protection against the owners of trolley vehicles using their bridges, and the same applied to county bridges, the mains of gas companies, and sewers, for heavy motor traffic was increasing, and was likely to do far more damage than trolley vehicles. The removal of snow from the road was the duty of the local authorities, and should not be imposed upon railless traction systems. The competition of motor-omnibuses ought to be prohibited on all routes where trolley vehicles were installed, as in the Brighton Corporation's Act. The author proceeded to quote in abstract the Acts relating to the 18 undertakings referred to, and gave a summarized account of their route mileage, number of vehicles, &c. Those in operation are at Dundee, Leeds, Bradford, Rotherham and Stockport, and several have been described in the ELECTRICAL REVIEW. The others are at Chiswick, Halifax, Northampton, Aberdare, Brighton (company), Hove, Brighton (Corporation), Sheffield, Keighley, Ormesby, Ramsbottom, Chesterfield and Rhondda. In all cases the maximum fare is 1d. per mile or less; in four cases a minimum fare of 2d. is authorised, the minimum otherwise being 1d. Workmen's fares are at the rate of 4d. per mile. The periods for repayment of loans under the various Acts are as follows:—

Trolley vehicles ...	10 years.	Land for street im-	
Electrical equipment		provements ...	50 years.
of line ...	20 "	Land for depôts ...	55 "
Cost of Act ...	5 "	Depôt accom'tn. ...	20 "

The cost of operating railless trolley vehicles at Bradford, Leeds and Rotherham was given:—

#### BRADFORD CORPORATION, APRIL 1ST, 1911—MARCH 31ST, 1912.

Traffic expenses ...	3'860d.
General ...	0'448d.
Repairs and maintenance ...	1'087d.
Power expenses (1d. per unit) ...	1'228d.
Total working expenses per car-mile ...	6'623d.
Car-miles run ...	28,485
Average revenue per car-mile ...	7'148d.
Route mileage ...	1½ miles
Passengers carried ...	332,800
Units per car-mile ...	1'26
Average fare charged per mile ...	0'8d.
Cost of overhead equipment ...	£1,381 per mile
Total cost per mile ...	£1,654

#### LEEDS CORPORATION, APRIL 1ST, 1912—MARCH 31ST, 1913.

Traffic expenses ...	1'98d.
General ...	0'15d.
Repairs ...	2'12d.
Power expenses (4d. per unit) ...	0'40d.
Total working expenses per car-mile ...	4'65d.
Miles run ...	80,605
Route mileage ...	4½
Passengers carried ...	379,271
Interest and sinking fund per car-mile ...	2'11d.
Units per car-mile ...	0'87
Average fare charged per mile ...	0'5d.
Cost of electrical equipment ...	£4,723
Cost of four railless vehicles ...	£3,048

#### ROTHERHAM CORPORATION, OCTOBER 3RD, 1912—JANUARY 31ST, 1913.

Working expenses per car-mile ...	6'61d.
Miles run ...	38,918
Receipts per car-mile ...	10'07d.
Passengers carried ...	126,028
Interest and sinking fund per car-mile ...	1'20d.
Net profit per car-mile ...	2'26d.

The rest of Mr. England's paper was devoted to brief descriptions of the Cedes-Stoll, R.E.T., Bremen, and Filovia railless systems.

In opening the discussion, ALDERMAN IVEY (London) said that if they could only get the Government to treat motor-buses and railless trolley cars in exactly the same way as they treated tramways, the greater part of their troubles would disappear. What they felt in London was the excessive and unfair competition which was brought about by the privileged user, such as the proprietor of motor-buses and—when they came—railless trolley cars. As to working costs, he thought it was distinctly unfair to saddle a tramway undertaking with a large addition in the way of running and administrative work, as had been done in connection with the railless cars at Leeds. It was not a fair return of costs at all, and when they added the management costs he did not think the

railless system presented a position which was much better than that of the tramways. Personally, he thought that if they wanted any addition to their existing tramways, as a feeder to their existing systems, they could do better than go in for motor-buses. They were still looking to Parliament to promote a general Bill in the interests of all road traffic, which would really bring some uniformity, and remove many of the disabilities from which they suffered.

MR. R. M. DICK-PEDDIE (Edinburgh) said he represented the Cable Tramway Co., of Edinburgh, and would like information as to the probable results, economically and otherwise, of working self-propelled vehicles.

MR. W. CLOUGH (Bury) remarked that Mr. England had stated that there was a stipulation placed in all Corporation Acts to the effect that the accounts of the railless car undertakings should be kept separate. He would like to know how Leeds managed to get outside that stipulation. Mr. Hamilton made it quite plain that he never intended to put certain costs in, such as the superintendent's office and depot expenses, and even the ticket check he had only charged at the rate of 2s. per week. They should have the matter quite clear, because if those figures went forth some little urban district might base its expenditure on the Leeds figures with serious results. He noticed that the wages of motormen and conductors in Bradford were extraordinarily high—2'836d. The vehicles got a good speed per hour, in Bradford 7'56, and in Leeds 8 miles per hour. The wages of motormen and conductors ought to come out more like 1'8d. than 2'8d. There was also a big difference in the number of units per car-mile. In the case of Bradford they got 1'26, and in the case of Leeds '87 unit per car-mile. Again, in Leeds the cost of electricity was 1'1d. per unit, an extremely low figure. That also was a misleading figure without some explanation. Taking the total working expenses, they found that the Bradford figure was 6'623d. per car-mile. They were not given the interest and sinking fund, but they had the Leeds interest and sinking fund, and there would not be much difference between them. If they added 2'110d. to 6'623d. they got 8'733d., and on to that they had to put road maintenance, which he did not think they could get out of with less than 3'75d. That gave them 9'108d. for working the railless trolley system. He thought Mr. England was quite right when he said that it was hopeless to expect investors to put money into an undertaking of that description. Whilst they got a railless trolley system worked as part of an existing system, there must and would be expenses that were not put in the railless trolley accounts. At Ramsbottom, three miles from his own system, a railless trolley system was being put up, and he intended to get the railless trolley system figures quite separate from any other figures. He was sorry the through running system arrangement they had in regard to cars had not been included in the railless trolley system.

MR. SHEPHERD (Edinburgh) observed that the railless trolley system at Leeds came almost to the centre of the city. From the Monday to the Friday he believed the earnings came out at something like 2½d. per car-mile, and on the Saturday and Sunday they went as high as 2s. 6d. and 2s. 7d. per car-mile. He contended that wherever railless trolley vehicles could be used, the motor-bus would always be more favourable.

COUNCILLOR ISHERWOOD (Oldham) said that in his town they had motor-buses working to a residential district, where there were no tramlines, and also to another district where there had been no house property at all. In the first case they were getting a revenue of 13d. per 'bus-mile; in the other district, where the property was not built but where rapid developments were taking place, they were getting 12d. to 13d. per 'bus-mile, made up chiefly of traffic at the week-ends. The rateable value of the town was being increased very greatly in the part of the borough in which the 'buses were running. Although they had had several complaints from residents about the shaking caused by the 'buses, and the splashing of mud from the want of some effective mud-guard, he thought that instead of removing the 'buses they would be compelled to put more on the roads.

COUNCILLOR J. H. RODGERS said that in Newcastle they were running Tilling-Stevens motor-buses simply as feeders to their tramcars. They ran 3½ miles into the country, to a place with a population of about 2,000, they were handicapped last year because they commenced with only one 'bus, but they had carried no fewer than 277,000 people in the 12 months ending May 24th last. Their earnings had been 10d. per 'bus-mile, and their expenses worked out to between 7d. and 8d., including depreciation for a five years' write down; the service had proved an excellent feeder for their tramways. The 'buses ran to a tram terminus, where the greater proportion of the passengers got out and boarded the tramcar for the city. The income from that source, which they reckoned at £20 per week, went to the credit of the tramcars, but he thought it should go to the credit of the 'bus. So far as his experience was concerned he voted for the motor-bus.

MR. R. HUMPHRIES (Birmingham) said that steady progress was being made in the Black Country with the use of motor-buses, in some instances, as feeders to existing tramways. A great pull that the motor-bus had over the railless trolley car was its mobility. Recently a route was laid down, and it was found a little later that it was not the right thing. Consequently the route was altered, and the result was a wonderful improvement.

SIR EDWARD WHITE (L.C.C.) said that the other day, in giving evidence before a Committee of the House of Commons now inquiring into the question of London traffic, he made the suggestion that either motor-buses should be called upon to pay something towards the maintenance of the roads, which they destroyed much more than did the tramcars, or that the tramway authorities should be relieved of the cost of maintaining their thoroughfares. He was glad to hear that Mr. England had advocated that. To-day

tramways did practically no damage whatever to the roadway. He was all in favour of a cheap service of locomotion, and therefore he objected to any tax being put either on motor-buses or on trams. He had urged upon a Committee of the House of Commons that instead of having to go before the Board and two Committees, and employ counsel, one step in the direction of lessening the cost would be that a Joint Committee of the House of Commons and the House of Lords should sit and hear the evidence. Practically the same evidence was now given before both Committees, and it was a duplication of work which might well be avoided, whilst the saving would be substantial. In many respects London could not be compared with the provinces, the conditions were so different. They had to contend with no fewer than 28 local road authorities, all of whom were anxious to get something out of the tramways, and if a road authority objected to a Bill, their veto was fatal, and the scheme was stillborn. Those were difficulties which they thought were very unfair; they wanted as much freedom in dealing with those matters as possible.

MR. DE TURCKHEIM (secretary) read a letter which Mr. England had received from Mr. Edward Cross, engineer and manager of the Rotherham Tramways Department, in which he said that in their case the estimate for their proportion of the cost of road widenings was tremendous, and would, no doubt, have the effect of the Corporation reluctantly abandoning two routes out of the three. There was no doubt in his mind that county councils, urban and rural authorities were combining to obtain precedents enormously beneficial to themselves, and which would be of great benefit to them in opposing in subsequent years.

In another letter which was read from MR. STEPHEN SELLON (London), the writer pointed out that there was no obligation on the part of the Aberdeen Council to construct any bridges, or maintain the same, over the Great Western Railway, as stated in the paper. The Aberdeen Act of 1911 was an Omnibus Act, and by the fault of the Parliamentary Agent, Sec. 43 thereof was inserted under Part III (viz., Railless Traction) instead of, as it should have been, under Part V (street improvements and bridge works). The statement in the paper was not, of course, an error on the part of Mr. England.

THE HON. ARTHUR STANLEY, M.P., in expressing thanks to Mr. England, said that for all forms of traction in regard to which application had to be made for sanction, Parliament was the very worst body before whom those things could go. In the present state of business, and until they had a very radical change in the system in which the House of Commons did its business, it was possible for almost any obstinate member to make the carrying of a new Tramway Act so difficult and so expensive, that it gave the promoters reason to wonder whether it was a good thing to bring forward a Bill at all. He believed that the only way of dealing with this problem was that there should be one central road authority, which would be free from all local jealousies, and would be able to decide on the general merits of the case. Once that had been decided they would have to look into the local conditions to see that all received fair play, but, as they knew, it would be a very different thing dealing with local and individual interests after they had once got permission to have a particular form of traction upon a particular road. He felt very strongly that as far as possible they ought to get some fair system of taxation from all who used the roads, and that that taxation ought to go not only to the improvement of roads, but to the maintenance of roads. There was not the slightest doubt that they, as tramway men, were unfairly taxed.

MR. ENGLAND, in reply to the discussion, said that Mr. Hamilton contended that he had charged against his railless system every penny that system had cost. As a tramway man, he did not want to employ highly skilled labour in his repair shops if he could get other labour. If he got motor-buses, he would want an entirely different class of mechanic—an expert on engines, ignition and carburettors and the like. They could not afford that. He was quite prepared to discuss the cost of capital charges of both systems, and he thought he could substantiate his contention that it was much cheaper to run railless cars than motor-buses in provincial towns. The costs at Bradford were very high, but wages were very high; and, Bradford being an exceedingly hilly city, the costs were accounted for to some extent by that.

MR. A. V. MASON, M.I.E.E. (general manager of the South Metropolitan Electric Tramways and Lighting Co.), then read his paper on "Standard Rules for Motormen and Conductors," explaining the basis on which they were compiled. No rule was included that could not be reasonably enforced, and the rules for inspectors were omitted because they were of a private nature. Forms of instructions for dealing with various eventualities were included. A written agreement was necessary to legalise the proposed deductions. The author considered that every man taken on as a conductor should be prepared to qualify as a driver within a given period. In view of the increase of speed of all vehicles, drivers should pass a medical examination on joining, and subsequently periodically, especially for eyesight.

MR. A. W. A. CHIVERS said he thought deviation from certain rules might be allowed under certain circumstances, and he thought if provision was made in the rules to allow a little flexibility, it would be a good thing.

MR. C. D. STANLEY (St. Helena) asked what they could do with persons who, having committed an offence, gave a false name and address.

MR. MASON replied, that if a man who had committed an offence against a by-law gave a name and address, they had to be content

with it. If they had reason to think it might be false they might instruct an inspector to follow the person. They could only detain a man for assault or wilful damage.

The business proceedings closed with an expression of thanks to the Corporation and the local tramway companies for their hospitality, and a vote of thanks to the chairman.

Subsequently the members went by special cars to the Norbreck Hydro, where they were entertained at luncheon by the Blackpool and Fleetwood Tramroad Co.

THE HON. ARTHUR STANLEY, M.P., proposed "Our Hosts," to which MR. R. H. PRESTWICH and MR. JOHN CAMERON responded; and later on, by invitation of the Blackpool and Fleetwood Tramroad Co., the delegates and lady friends enjoyed an outing to Barrow and Furness Abbey. The social functions concluded the same evening with a members' supper and dance.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### The Mutual Protection of Engineers.

I beg to direct attention to a matter that might well claim the notice of the new Association. That is the disability we all more or less labour under owing to employers advertising for engineers and draughtsmen under an office number. This undoubtedly places the applicant at a serious disadvantage. In the usual formula he is requested to "state full particulars" (essentially of a private and confidential character), without having the faintest idea into whose hands his application may fall. For aught he knows, he may be applying for the very post he at present fills, or wasting time and paper in seeking service with some company of which he has no desire to become a member. To such an extent is this *sub rosa* business carried, that even should the firm to which he has applied have occasion to communicate with him the name is not disclosed, unless he has been successful.

I am more than a little surprised that a body of self-respecting and educated men—such as, I think, the average engineer may claim to represent—should have submitted to this indignity so long. Surely we have, collectively, the remedy in our own hands by undertaking not to recognise any advertisement which is not accompanied by the necessary *bona fides*.

To be perfectly just, I ought to add that firms of the highest status in the profession usually do advertise under their own names, but these are remarkably few.

Vertebra.

June 16th, 1913.

### The Prevention of Accidents In Electric Lifts.

I am glad to see the matter of lift safety locks taken up at last by one well-known firm of lift manufacturers. Messrs. Smith, Major & Stevens, Ltd., in their letter which appeared in the June 13th issue of this journal, make many startling assumptions, and from these assumptions, by a process of reasoning peculiar to themselves, arrive at the conclusions which they particularly desire; in other words, "the wish is father to the thought."

In the third paragraph of their letter they refer to the new lock mentioned by myself, assuming that the locking operation is effected by switching current on to the controller; further on, we are told that "in any case the duty of locking and unlocking is shifted to the controller." Before remarking further on this assumption and deduction therefrom, I would suggest that it is a little indiscreet to criticise, make assumptions and definite statements, about something of which it is acknowledged no definite particulars are available. I have no hesitation in informing my correspondents that their assumptions and arguments in this particular case are like beating the air, and as far from being in accordance with facts as it is possible to be.

Messrs. S. M. & S. then go on to discuss the merits and demerits of solenoids. Of course, there is no harm in this, but the matter is quite irrelevant. As our friends themselves are apparently obsessed by solenoids, I may say that

the lock in question may be constructed to work equally well with or without the assistance of these useful appliances.

Coming to the paragraph in which our friends mention their invention for making a fractured spring act as effectively as when intact, most people will admit, I think, that a piece of mechanism which dispenses with springs and appliances for dealing with their failures, is superior thus far to one which includes both these adjuncts. Therefore, from this standpoint alone, the new lock mentioned is superior to one which includes springs.

Referring again to the third paragraph of their letter, they say that they are bound, by the context, to suppose that gravity and springs are barred. Why? This is another pure assumption. Gravity and springs may, if desired, both be used in the example of the lock which I have seen, and, assuming for argument's sake that both these elements are present, if either of them fail, the gate will not be locked, and therefore the cage cannot move. Again, should the supposed failure take place after the cage has commenced to move, the worst that can happen is that the lift will stop at the first floor it arrives at.

Messrs. S. M. & S. state that "it is difficult to see how the lock in question advances matters in the direction of security against the only danger he (myself) describes, that of the interlocking failing to act." I think I have made it clear in my previous letters that with this new lock, if the interlocking does not take place, the lift cannot move. If my correspondents will carefully read the short specification which was given in my second letter, they will see that I laid it down as a condition to be fulfilled that "cage cannot move until the gates are both mechanically and electrically locked." The new lock is in accord with this, and therefore it should be easily seen that if for any reason the lock fails to act, the lift cannot move away, and consequently no danger exists.

On really serious consideration, I think it will be seen that the paragraph in which our friends discuss this matter has no point, and that they have completely failed to grasp the implications of the condition mentioned above. Again, referring to the 1905 patent. Is not this lock covered by the description which I gave in the second paragraph of my first letter? Of course it is, and whether small details have been altered since the first pattern was produced or whether the patent is eight or eight hundred years old matters not one iota. Therefore, it is quite fair to claim this 1905 specification as representing modern practice generally. Further, I am aware of at least one lift installed by our friends nothing approaching eight years ago, the locks of which bear the patent number 2,766. If these locks are not covered by the patent in question, what right has this number on the locks at all? But if these said locks have been made and sold under this patent, I again fail to see the force of their remarks as to whether it is fair to quote the 1905 patent. They claim to have improved their lock seventeen times in fifteen years. One can only think that for so many improvements to be possible considerable scope must have been allowed in the original design, and hope that its evolution is not yet ended.

It is claimed that one of our friends' many locks accords precisely with the specification given by myself. If this is so, I must conclude that it had some defect either in design or manufacture which precluded it from general use, for it must be acknowledged that a lock which conforms to the specification quoted must be vastly superior, if properly designed, to one which does not.

Again, we are informed that in Continental cities for about two years past locks have been working on two different systems, which achieve the same results with more or less success. Messrs. S. M. & S., as pointed out earlier in this letter, are not quite clear on the working of the new lock, and all the functions which it fulfils, therefore their statement of any similarity between this lock and any others must be taken with considerable reserve.

Going a little further, we are told that "unlocking the latch at the proper time is often more important than detecting the correct moment for locking it." Surely we are not to believe that it is seriously contended that it is better in the majority of cases to risk a broken neck rather than a shock to the nerves? Their remark on an unlocked

zone also call for comment. Nothing is easier with the new lock than to give not only any length of unlocked zone desired, but give it at the right time; that is to say, the gate is not unlocked every time the cage happens to pass it, but only when required. Should the lift for any reason stop between floors, the lock can be released in a manner similar to that used in other types of locks.

With regard to the Duc de Lorge's death, perhaps Messrs. S. M. & S. will be good enough to furnish me with correct details, but I find in an account of the inquest that two witnesses agreed that "the Duc had his hand on the handle of the door and was pulling it towards him when the lift touched the clip. The pulling open of the door would stop the cage, and no doubt the Duc, thinking the cage was at the door, stepped into the pit." Whether an unlocked zone of 2 ft. 6 in. more or less is desirable, does not affect my argument, that if it had not been possible for the Duc to stop the lift by opening the door when the cage tripped the lock instead of being obliged to wait until the cage stopped at the floor, he might have been alive to-day.

I regret that I am unable to go into other points raised without making the length of this letter prohibitive; but sufficient has been said to show that Mr. G. W. Newman's remarks on the necessity of exercising caution when accepting the advice of lift makers are amply justified.

As regards the new lock in question, I can say that the set which I have examined (not 5 miles from Finsbury Pavement) are giving every satisfaction, and I understand from the inventor that the time will not be long before the details become public property.

W. J. F. Cooper.

London, June 17th, 1913.

[We must urge our correspondents to exercise brevity in their communications.—Eds. E.R.]

Our first letter was written chiefly by way of protest against a comparison drawn between a lock patented by us eight years ago, and one discovered by your correspondent "a few weeks back."

We were able to show that during the intervening eight years we had made many improvements, including a realisation of all the results catalogued in praise of the new discovery, and therefore thought the comparison scarcely fair.

Mr. Carroll, on the 16th inst., in a letter, the general fairness of which we fully recognise, argues that a lock installed two years ago, and which was probably manufactured three years ago, must be "practically up to date." This is not so bad as Mr. Cooper's logic, but still does not take account of the rapid pace of modern progress.

In the interests of clearness, may we digress for a moment to protest against some confusing words. "Locking" is frequently used where latching is meant. "Electrical locking" is used for closing a switch.

"Electrical interlocking" is used to indicate a mechanical inert connection between a switch and a latch. "Interlocking" sometimes means the action of fixing a latch, sometimes of fixing a switch and sometimes both.

With all respect, we suggest that the terms "latching," "closing the switch," and "counterlocking" more correctly cover the ground, without leading to so much confusion.

Resuming, eight years ago we were the only lift makers pressing the desirability of first latching; secondly, closing the switch; and, lastly, counterlocking. We believe at that date every other maker omitted either the latch or the counterlock.

Later that omission was corrected by one or two makers, but there was still no certainty about the order of latching and closing the switch. It was pure chance which happened first; and still hundreds of locks were going out without any counterlock at all.

That was the state of affairs three years ago, the date of the lock now arraigned by Mr. Carroll on account of a broken spring in the counterlock.

But from the first we were perfectly alive to the shortcomings of springs, and never ceased experimenting and improving till we were able to make the statement contained in our first letter, to the effect that in our latest patterns a spring in several fragments is still effective for its purpose.

That stage was reached long before this correspondence commenced.

"Helicon" considers our "methods of discussion adventurous." But Mr. Cooper's magnificent edifice of claim was based on such a minute foundation of description, that we were compelled to be "adventurous" or dumb, and the reference to our own patent left us but little choice.

As to the result, which we avowedly put forward as inductive reasoning, we are content to let it stand as a working hypothesis till more details are forthcoming.

"Helicon" appears to understand what "danger" was in Mr. Cooper's mind when writing about the moment at which the counterlocking is effected. Frankly, we do not, nor can we find it defined in that gentleman's letters. Mr. Cooper certainly started out to describe a danger, but what followed referred merely to an irritating annoyance.

If, for instance, someone writes of the "death traps" arising out of leaving your umbrella on the landing, and proceeds to point out that all such dangers could be avoided by not buying umbrellas, no one is bound by that argument to believe in the alleged danger.

Be that as it may, an "uncounterlocked zone" is demanded by experience; Mr. Carroll joins us in "not quarrelling with a good margin for the un(counter)-locking of gates"; and Mr. Harmsworth, who is certainly not without experience either as lift manufacturer or an advertiser, says "there would be no real danger."

On another point, "Helicon" has misread our letter. We made no reference to passengers "stopping between floors."

Smith, Major & Stevens, Ltd.

Northampton, June 23rd, 1913.

As the inventor of the lock to which Mr. Cooper alludes, I am naturally very interested in the discussion which is taking place under the above heading, and have in mind Messrs. Waygood's letter. I notice that the main points claimed for my lock, as set out by Mr. Cooper, have not been fully grasped by those who would now criticise. This is not surprising considering that Mr. Cooper (at my express wish) made no attempt to describe the lock in detail, obviously to avoid advertisement (in which case our sales manager would have wanted to say something).

Much of the discussion is centred round the use of springs, which, of course, cannot be relied upon and are, in most cases, a source of danger in themselves. Realising this (and agreeing with Messrs. Smith, Major & Stevens that the spring should be arranged to do duty after breakage), I turn to Patent No. 13,183, 1911, and notice that this lock is provided with five springs and two flexible connections, which means that with an average lift of eight floors, as many as 40 springs and 16 flexes with necessary attachments would be used.

Taking this lock as a fair example of modern practice, it is difficult to see how Mr. Harmsworth can be satisfied with a lock of this description, but, perhaps, he is not in touch with the Repairs Department. So much for springs; Needless to say, I do not find them necessary in my lock.

It should be thoroughly understood that as the lift passes the floor, the gate is unlocked and locked again, but should the locking action fail, it is quite obvious that the lift moves away leaving the gate unlocked. In these circumstances anyone may open the gate in the ordinary manner, possibly with disastrous results. Unlike other essential parts of the lift, the defect is not at once apparent, and the lift may continue to work with the lock or locks out of order, thus constituting a death-trap. Assuming that Mr. Harmsworth is thoroughly familiar with all the points in connection with lift locks, it is difficult for one to understand how he comes to state that his locking gear (which does not provide against the above defects), "meets all likely contingencies." I believe very few people realise this danger, and I thoroughly endorse Mr. Carroll's remarks on this point.

I am pleased to say I have succeeded in producing a lock which excludes all the objectionable features above referred to, and hope to furnish particulars in this journal at a later date.

I might add that I have a set of locks working on a busy lift in the city, and they are giving every satisfaction.

Frank Barlow, Engineer.

London, N.

#### Ventilation of Electrical Machinery.

In your paper of September 15th, 1911, there was a review of my book "Ventilation of Electrical Machinery" (Whittaker & Co.).

The reviewer quotes the passage which occurs in the section dealing with the refrigerator as a cooling agent, viz., "that the author is very hopeful that refrigeration may form a useful adjunct to the generator," and adds that "the reviewer thinks it will be rather a long time before we find an ammonia or carbonic acid refrigerator used to cool turbo-generators."

It is interesting to note that Mr. Christie, in his paper at Kingston, considers that with wet cooling and a small refrigerator 25 per cent. increased output will be obtained. This was not pooh-poohed by any one of the engineers present.

W. H. F. Murdoch.

Mill Hill, June 21st, 1913.

#### Bedstead Antenna.

With reference to the query in your last issue, as to the effect on arc lamps of wireless signals, I might mention that I have noticed an arc lamp acted upon by what would undoubtedly be, wireless signals, in the following circumstances. A few months ago, I was burning an enclosed type lamp under open type conditions in the test room, with an abnormal arc voltage, approximately 90, coupled between positive and neutral, when the arc emitted sounds, unquestionably in Morse, at the equivalent rate of wireless sending, and pitched in like tune.

I have since endeavoured to obtain a repetition of this phenomenon, but the results obtained have not been so positive as on this particular occasion.

A. H. B.

[The idea of distributing time signals by means of public arc lamps was suggested, we believe, by Mr. Duddell himself, years ago; but their use as detectors of the wireless time signals appears to be novel.—EDS. E.R.]

#### Proposed British General Engineering Staff Association.

At last the lethargy of the "middle man"—between the capitalist on the one hand and the workman on the other, the man of brains and education—seems to be passing away and he is awakening from his slumber of disastrous isolation and individualism.

We see before us Unions amongst capitalists—the very essence of selfishness and commercial tyranny; foes to all honourable men. The idea of the strong and wealthy combining together to subdue those by whom their wealth and comfort have been obtained, those from whose ranks they have for the most part arisen, is a ghastly spectacle. That the strong should combine with the strong to protect their delicate selves at the expense of those who are really their benefactors is, I say, repugnant to the mind of every true Britisher. The Germans would not stand it, and they have their protective association; are we going to be so foolish and blind as to neglect this golden opportunity that now presents itself to us? Remember, "there is a tide in the affairs of men"; let us take it at the flood.

The time has come to act, and abandon mere words and *laissez-faire* policies—or rather, impolicies. All who can should give wide publicity to the cause, and might I suggest, as one on an engineering staff, that not only fully qualified engineers be admitted to the association, but also those employed on the staffs of engineering firms and who have a useful and thorough knowledge of the engineering business field. These, if not admitted at the same rate as qualified engineers, should be enrolled as members at a lower rate if necessary, with corresponding benefits. This could apply to those below a certain salary, or arranged according to some other agreed proposition. This would augment both the ranks and

funds of the association, and would bring in many who could not, perhaps, afford a very large sum.

If, as suggested in the last issue of the REVIEW, only a £1 ls. or 25s. subscription per annum was fixed upon, the above distinction may not be deemed a wise one, as most can afford that sum.

May I also suggest that a circular letter be prepared, and distributed *individually* in sufficient quantities to all the staff men with the various firms, in order to stimulate interest, invite membership, and obtain support. These could be sent to the supporters of the movement for distribution in their firms.

If this Association fails, and there is no excuse if it does, then we shall deserve all the plagues of Egypt, and our best men will go abroad and get on better. For the sake of our manly honour, then let us shake off this deathly lethargy, and protect our citadel.

S. Douglas.

The proposed formation of an Association for the Mutual Protection of Engineers savours rather of Trade Unionism, and would tend, if anything, to lower the prestige of the engineer. Why not at once enter into an arrangement with a large society to look after their interests, pay a higher premium, and be done with it? There is no doubt that engineers are often placed in more or less difficult positions, but, at the same time, the status of an engineer very often depends, to a very great extent, on himself, his general behaviour and his abilities.

The law of supply and demand holds good in electrical work as in other professions, and may possibly account for the low salaries offered; but there are positions which do not require to be filled by a highly trained man, and the latter takes it for lack of any other very often.

In some few works there may be wanting that cohesive spirit mentioned in one of the letters in this week's issue, which is so essential to the successful working of all industrial concerns. It may be due to the individual competition of a certain type which prevails in some places, where so many are criticised adversely by some members of the staff—sometimes, perhaps, unconsciously, but still uselessly—and casting reflection unnecessarily. Not that it is worth much, but that it exists; for to a man of average strength, certain kinds of criticism would probably be like water on a duck's back!

It is hardly feasible to have an Engineering Association analogous to the B.M.A. under present conditions, for, let an unskilled man attempt to operate on human beings, with, perhaps, fatal results, and the State will no doubt have something to say on the matter. On the other hand, let him operate on inanimate bodies, and the case has a different aspect, whatever the results.

A reasonable suggestion, which has probably been already made, would be to have an amalgamated committee of the I.C.E., Mech.E. and I.E.E., partly composed of the permanent staff of each, to deal with certain matters intended to further the interests of engineers in the various ways desired.

W. E. P.

## LEGAL.

THE XL ELECTRIC CO. v. ARON.

IN the Chancery Division, before Mr. Justice Neville, the motion by which the plaintiffs sought to prevent the abandonment of protection for certain inventions said to have been sold by the defendant to the company, was again mentioned on June 20th.

MR. MORITZ (plaintiffs' counsel) said that the motion was for an injunction to restrain the defendant from interfering with or delaying the completion of British patent rights. His Lordship had granted an injunction not precisely in the terms of the notice of motion, but giving the plaintiffs what they asked for. Before the injunction was granted, however, the Court had exacted from the plaintiffs an undertaking in accordance with the contract to pay the expenses that the defendant would be put to in carrying out his obligations. On attending to settle the terms of the order a difficulty had arisen; the plaintiffs sought to limit their undertaking to expenses that might arise, while the defendant, on the other hand, sought to have included expenses that he had incurred prior to the contract.

HIS LORDSHIP said that the undertaking ought to follow the terms of the contract. That was what he intended should be done. It should be that the plaintiffs undertake to pay the expenses properly to be borne by them under the contract.

MR. SIMMONS, for the defendant, said that his contention was that there was a clause in the contract which covered the prior expenses.

MR. MORITZ said that was the point between them. The whole point was, could the defendant make them liable for all the costs incurred prior to their entering into the contract?

MR. SIMMONS: Not the whole of the costs.

HIS LORDSHIP said he was not going into the terms of the contract at that stage of the proceedings. The undertaking the plaintiffs had to give was, as he took it, that they would fulfil their part of the contract, that was to say, they would pay such part of the costs as they were liable to pay under the terms of the agreement. The order would be that there should be an injunction as granted, on the company's undertaking to pay such expenses, if any, as the defendant might incur, as they had contracted with him to pay.

MR. SIMMONS suggested that the words of the injunction restraining the defendant, not only from "delaying or preventing," but also from "allowing to be delayed or prevented," were too wide. It amounted, he suggested, to a mandatory injunction.

HIS LORDSHIP said it was not intended to do so.

## THE RATING OF TRAMWAYS.

IN the House of Lords before the Lord Chancellor and Lords Shaw and Moulton, arguments were begun on Friday (June 20th) in an appeal by the Urban District Council of Tottenham against an order of the Court of Appeal, dated February 8th, 1912, in favour of the respondents, the Metropolitan Electric Tramways, Ltd.

The decision of their Lordships will be one of far-reaching importance to all tramway companies throughout the kingdom as it will decide the moot point whether the land used by tramway companies for their lines is to be treated as "land used only as a railway." In that case, as hitherto, such tramway companies can claim to be rated for the general district rate under Sec. 211 (1) (B) of the Public Health Act, 1875, in respect of their lines in the proportion of one-fourth part only of the net value thereof. The appellants contend that the word "railway" in the section ought to be read so as to exclude what is ordinarily understood as a "tramway," and on various grounds they submit that the respondent company ought to be assessed at the higher value.

MR. MACMORRAN, K.C., Mr. Walter Hyde, K.C., and Mr. Cartwright Sharp appeared in support of the appeal (instructed by Mr. Francis Shelton); while Mr. Danckwerts, K.C., and Mr. C. C. Hutchinson, (instructed by Messrs. Ashurst, Morris, Crisp & Co.), were for the respondent company.

MR. MACMORRAN, in opening the case, said that the tramway was constructed under Parliamentary powers obtained for its construction as a "tramway" and not as a light railway. The man in the street might not be able to say whether he came to business by a light railway or a tramway, because to the man in the street, the appearance of the two being identical, he would have no means of deciding the point. The true test as pointed out in the Swansea case was what powers did the private Acts confer on the undertakers? Their Lordships would bear in mind that when power was obtained to construct these tramways, they were to be propelled by horse-power. The Acts he should have to refer the Court to were the North London Tramways Acts of 1882, 1897 and 1902; the North London Suburban Tramways Order, 1879 (confirmed by the Tramways Orders Confirmation Act, 1879), and the Tottenham Improvement Act, 1902. In all of those Acts the lines were dealt with as tramway lines. They purported to incorporate the Tramway Act: there was no mention in any of them of the Railway Clauses Consolidation Act. Later, horse-power was replaced by electrical traction, but it was still a tramway. Light railways were constructed under Acts of Parliament which were differently drawn to Acts of Parliament for the construction of tramways. In the present case their Lordships would have to consider the County of Middlesex Light Railway Orders of 1901 and 1903, both made and confirmed under the Light Railways Act, 1896. His submission was that this case was governed by the Wakefield case, 1908, A.C. 293. That was a decision as to light railways, and it was held that by virtue of the Light Railways Act, 1896, the light railway was a railway to which Sec. 211 (1) (B) of the Public Health Act, 1875, applied. The decision in that case went on the ground that the undertaking was not constructed originally as a tramway, and was, therefore, a light railway, and the House of Lords adopted the view expressed by the Court of Appeal. The Swansea case which was then decided—it was reported, 1892 (1 Q.B. 357)—on which the Divisional Court acted, presumably was brought to the notice of this House when the Wakefield case was argued, and if they had thought it not good law their Lordships would have overruled it.

THE LORD CHANCELLOR: You invite us to hold that the Swansea case governs this case, and that the Court of Appeal were wrong in overruling it, and following the case of Thornton Urban District Council v. Blackpool and Fleetwood Tramways Co. decided in 1909.

MR. MACMORRAN replied in the affirmative, and went on to explain the history of the Tottenham Tramways. He mentioned that the tramway and light railway had a junction with each other and had junctions with other tramways and railways outside the district, and all of them were worked by the respondents as one connected system. The carriages or cars used on each were the same, the wheels had the same flange and

would run over all parts of the system. The electrical energy used now for working the system was generated at one power station, and thence transmitted over a common system of cables and mains to sub-stations. Prior to 1904 the respondents, in respect of the tramway, were assessed by the appellants to the general rate of the district as a railway was assessed under Sec. 211 (1) (B) of the Act of 1875—namely, in the proportion of one-fourth part only of the net annual value; they then came to the conclusion that they were tramways, and therefore not entitled to the reduction. Accordingly, in the assessment appealed against they assessed them at the full net annual value—namely, £495 12s. 6d. The respondents paid £123 18s. 2d., but refused to pay the balance, £371 14s. 4d. On a complaint by the Council to the Justices, the Justices made an order for payment by the respondents of the balance of this £371 14s. 4d., and costs of the complaint were ordered to be borne by them. The Divisional Court affirmed the Justices' order, but the Court of Appeal reversed their decision. Hence this appeal. On Monday, June 23rd, the learned counsel continued his argument, and was followed by Mr. Ryde.

MR. DANCKWERTS, K.C., then opened the case for the respondents. There was nothing mysterious in the word "railway." Rails fixed to sleepers on the ground were as much a railway if used for carriages to pass over whether the undertaking was promoted under a private Bill for a tramway or a light railway. Mr. Ryde had tried to make out that in several respects there was a difference between the two. For himself, he thought the learned counsel for the appellants had drawn legislative distinctions which in no way affected the question before the House. The important point was that the railway was constructed on the land under powers of an Act of Parliament. That distinguished it from a railway put down by a company, for example, to link up their colliery with a railway company's sidings. The tramways and light railways described in the case were identical, and their user and working were identical and as one system, and each was used under statutory powers, and it was an unreasonable conclusion to hold that the light railways were land used only as a railway constructed under statute, while the tramway was not. He submitted that the decision of the Court of Appeal was right, and the appeal should be dismissed on the facts as found or admitted by the appellants. But apart from that ground for dismissing the appeal, it was quite clear that the respondents were, in law, entitled to this partial exemption. In all the early statutes, a railway was always spoken of as a "railway or tram road." Therefore, when the legislature used the words "the occupier of any land used as a railway," they must have contemplated a railway as being a railway or "tramroad." He dealt with the judgments in the Swansea case, and submitted that they were not in accordance with various other cases which he cited. The true view of the matter was that taken by this house in the Thornton case, and applying that principle here, the tramway was a railway within the meaning of Sec. 211 of the Public Health Act, 1875.

The hearing was adjourned to Thursday, June 26th, subject to a part heard case being finished.

#### BELL v. MILNE.

LORD HUNTER and a jury, in the Court of Session, this week began the trial of an action by James A. Bell, electrical engineer, of the city of Aberdeen, against Alfred Edward Milne, solicitor, Aberdeen, hon. secretary of the Aberdeen branch of the Electrical Contractors' Association of Scotland, for £1,000 damages in respect of alleged slander, said to be contained in a letter written by the defender to the town clerk of Aberdeen. The matter has already been fully referred to in our pages.

Pursuer says that the statements in the letter are false and slanderous, and that the letter contains serious reflections on his ability, and imply ignorance, incompetence, and want of professional skill. The letter, he contends, further falsely states that the pursuer was guilty of making grave and slanderous charges against Aberdeen contractors, reflecting upon their honesty. The defender pleads privilege, and says he was instructed to write the letter by the Association, for the purpose of its being submitted to the Town Council. He says that the letter does not represent that the pursuer was ignorant, incompetent, and had no professional skill.

Counsel are:—For the pursuer, Mr. Cooper, K.C., and Mr. Lippe. Agents—Scott & Glover, W.S. For the defender, Mr. Murray, K.C., and Mr. Wilton. Agents—Davidson & Syme, W.S.

(To be continued.)

#### LAUBACH v. KINZBRUNNER.

At the Barnet County Court on Tuesday, an action, remitted from the High Court, was heard, in which Philip Laubach, 26, West End Lane, West Hampstead, electrical engineer, was plaintiff, and Charles Kinzbrunner, 12, Fortune Temple Lane, Hendon, defendant. Plaintiff claimed the sum of £35 6s., which he reduced to £34 10s. Mr. Salter was counsel for plaintiff. Defendant was not professionally represented. The claim was for translating into English, Prof. Edler's German work on "Electrical Switches and Switchgears," and for typing the manuscript.

PLAINTIFF said that in consequence of the time occupied in the translation, he paid out of his own pocket to his brother £15 for assistance in his office, and never received a penny from the defendant. He paid also £4 9s. for typing.

DEFENDANT said the agreement was that he should pay plaintiff on the publication of the book. He had a letter from the publishers that the book would be out on the following day. The action, he added, ought never to have been brought.

Plaintiff said there was no such agreement. Nothing was said about the publishers or the time of publication.

Defendant stated that originally his name was to have appeared on the title page of the book as joint translator with the plaintiff, but he consented later, at the request of the plaintiff, to only the plaintiff's name appearing. This was to be part compensation for his (plaintiff's) work as translator. It meant, added defendant, a great deal to the plaintiff to be the sole translator of the book. Plaintiff denied the statement of the defendant, who said he was to get £50 for the book, which had cost him so far £52.

HIS HONOUR said upon the evidence he must find for the plaintiff. He could not find that payment was to be delayed. As to the typing, that was an expense, not for the benefit of the translator, but for the benefit of the owner of the copyright.

Defendant (interposing): But I am not the owner.

HIS HONOUR: You are the person who made the contract with the publishers.

Judgment was entered for plaintiff for £34 10s. and costs.

#### POULSEN PATENT.

IN the Chancery Division on Tuesday, on the application of Mr. Byrne, Mr. Justice Warrington directed that the petition for the extension of the Poulsen patent relating to a dictating machine worked by electricity, should be heard on July 1st, subject to another case he had fixed for that date. Counsel stated that the Crown officers would be able to attend on that day. Some witnesses had to come from Denmark.

#### THE TELEPHONE TRANSFER SETTLEMENT.

IN the Court of Appeal on Monday, before the Master of the Rolls and Lords Justices Kennedy and Swinfen Eady, the matter of the National Telephone Co., Ltd., against His Majesty's Postmaster-General, was down for hearing upon the appeal of the Postmaster-General and the cross appeal of the company, from the judgment of the Railway and Canal Commission (Mr. Justice Lawrence, the Hon. A. Gathorne Hardy and Sir James Woodhouse), upon the application of the National Telephone Co. to have determined the differences which had arisen between the company and the Postmaster-General as to the terms on which the business of the company should be taken over by the State.

Shortly before 11 a.m. the Attorney-General and the Solicitor-General representing the Postmaster-General, and the leading counsel representing the National Telephone Co., together with the solicitors of both parties, had an interview with their Lordships in the private room of the Master of the Rolls.

Upon their Lordships coming into Court, the Attorney-General stated that he was very much indebted to their Lordships for the time granted to them, and for the assistance they had all received, and the result was that they had arrived at a compromise in all the outstanding matters. He would not trouble their Lordships with details, but he must ask their Lordships' indulgence to allow the formal application to stand out until Tuesday next. Their Lordships would appreciate that there were certain formalities to be gone through, and the result of their deliberation had to be put in writing, which would take some little time. He thought, however, their Lordships would not be troubled with the appeal or cross-appeal, and if their Lordships would allow the matter to be put on the list for Tuesday next to be mentioned, that would meet the situation.

SIR ALFRED CRIPPS, K.C., on behalf of the company, said that he desired to associate himself with everything the Attorney-General had said, and that he thought all the differences were settled. Certain formalities had to be gone through, which could be done by Tuesday next.

Their LORDSHIPS agreed to this arrangement.

#### BRAULIK v. VAUGHAN.

IN the City of London Court, on Tuesday, before his Honour Judge Rentoul, K.C., Mr. George Braulik sought to recover £6 12s. 8d. from Messrs. T. W. Vaughan & Co., Ltd., electrical engineers, Islington, balance of account for eight arc lamps supplied. The claim was admitted, but defendants raised a counterclaim for £48 6s. as damages sustained by them through the lamps being defective. Mr. Lever appeared for the plaintiff, and Mr. Given for the defendants.

MR. GIVEN stated that, in 1911, plaintiff used to sell a certain type, now extinct, of German arc lamps for using outside picture palaces. Defendants had a contract for the installation of electric lamps at the Holloway Picture Palace. The plaintiff knew the purpose for which the defendants wanted the lamps which were now in dispute. Under the Sale of Goods Act there was an implied condition that the plaintiff should supply arc lamps reasonably fit for the purpose for which they were required. In January 18th, 1911, defendants ordered from the plaintiff four arc lamps, but there had been a long series of disasters in connection with them. They were to be alternating-current flame arc lamps, 10 amperes, 10 hours, suitable and to be burnt four in series on 200 volts, 50 periods (Islington supply), and supplied with necessary resistance. In consequence of the coils not being fit to take the current, when the lamps were started two of the coils at the top burnt out. Plaintiff's engineer came down and "had a shot at them." Defendants did everything they possibly could to make the lamps go

right, but they never all worked properly together. The defendants bought a number of new coils and had spent £20 in trying to make the lamps go right. They were charging plaintiff with £12 of the £20. The theatre people became discontented with the lamps and the defendants had to take them down, putting in new ones, which were bought elsewhere for £31. Two of the lamps which were taken down were used elsewhere, but with disastrous results.

One of the defendants' electricians, named Mister, said in all they had eight lamps from the plaintiffs, but some of the coils were thoroughly charred and burnt after use. When the silk-covered wire was burnt there was simply a solid mass of copper. For no lengthened period did the lamps burn together, certainly not more than a month at a time. He and other electricians continually had to go down to the theatre from time to time. In cross-examination, witness denied that the defects in the lamps were caused by their workmanship, or by the way in which the lamps were treated by the people at the theatre.

In answer to the counterclaim, one of the plaintiffs' electrical engineers, named Berners, was called, and he said that there was no truth in the suggestion that the lamp was obsolete. They were still supplying it in the ordinary course of business. The plaintiff was one of the largest arc lamp manufacturers, and the lamp in question was the Eclipse. There was absolutely nothing to complain about in regard to the lamp itself, as he found whenever he tested it after complaints. It was only the fusing of the coils about which there could be any complaints, and that was not the plaintiff's fault. They were insulated as well as any coils could possibly be. Until they came into Court there had never been any suggestion that the coils were not properly insulated. The lamps were badly used through the mechanism being stuck up so that the shunt coils could not feed the carbons. He found in one instance that the flexible connector had been put round the wrong side of the carbon, and he called the defendants' attention to that fact. Several times he advised the defendants to have safety coils, but they did not do so. The defendants had no business to take off the top part of the lamp at all. Then, again, he found that a broken carbon was the cause of the lamps not burning. They had supplied 200 lamps of the same type to other customers in various places, and they had always had satisfaction from them. There had been very few complaints about Eclipse lamps, and that was the first occasion on which he had known so many fuses to burn out since he had been in the trade.

At this stage the further hearing was adjourned until a date to be fixed, JUDGE RENTOUL, K.C., observing if the parties in the meantime could settle the case amongst themselves they would be taking a sensible course. Mr. Lever hoped they might.

#### JOHNSON-BILLINGTON ELECTRICITY METERS, LTD.

THE petition presented by W. H. Johnson for the winding-up of this company was again before Mr. Justice Neville in the Companies' Court on Tuesday, June 24th. Counsel, however, stated that further evidence had been filed, which raised contentious matter, and it was desirable that the new affidavits should be answered.

With the consent of all parties the petition stood over for a week.

#### JOHNSON-BILLINGTON ELECTRICITY METERS, LTD., v. BILLINGTON.

IN the Court of Appeal on Monday, June 23rd, before Lordes Justices Vaughan Williams, Buckley and Hamilton, an application was made in this case, in which the defendant had given notice of appeal against a verdict and judgment entered at the trial before Mr. Justice Coleridge and a special jury. The company sued the defendant, Mr. Arthur Marston Billington (formerly one of its directors), for damages for alleged negligence and breach of duty. The defence was a denial of the allegations.

COUNSEL, on behalf of the defendant, applied with the consent of the company that the time allowed to the defendant for giving security for costs of his appeal should be extended by 14 days. The reason, said counsel, was that the parties had very nearly come to an arrangement which would dispose of the appeal.

Their Lordships assented.

**Accident.**—Whilst engaged on altering points and changing the trolley of a tramcar in St. George's Square, Huddersfield, last week, James Armitage, tramway inspector, and J. H. Oldham, tram conductor, were knocked down by a passing motor-wagon. Armitage was rendered unconscious, and had his shoulder dislocated, and one of Oldham's arms was crushed and bruised.

**Trade Openings at Smyrna.**—According to the report to the directors of the representative of the Deutsche Levant Line, at Smyrna, that city has escaped the effects of the late war, and the credit of local firms stands high. Among articles whose importation will pay at present, are electric motors, electric transmission and installation plants, &c.

**Sun Power.**—It is reported that several installations are at work in California employing solar heat for generating steam with the aid of reflectors; the steam is used for pumping water for the purpose of irrigation.

## PARLIAMENTARY.

### London County Council Tramways and Improvements Bill.

ON this Bill coming up for the adjustment of clauses, the question arose as to Clause 44 giving the County Council power to work the London United Tramways in Askew Road and Paddenswick Road, Hammermith, which are within the L.C.C. boundary. The Committee gave the clause, but added the condition that the County Council should give the Tramway Co. the power to run over these routes on terms to be fixed by agreement, or, failing agreement, by arbitration.

MR. E. POLLOCK, K.C., pointed out that, having regard to the circumstances of London, which was surrounded by authorities working tramways, the County Council could not accept the conditions, and asked leave to withdraw the clause.

MR. BALFOUR BROWNE, K.C., argued that unless the clause was inserted as added to by the Committee, the public would be deprived of facilities which the Committee said should be given them.

THE CHAIRMAN said that Mr. Pollock must understand that if the clause was withdrawn, it would mean that the preamble of the Bill was dropped, because the clause was included in the preamble of the Bill. Either the clause must be put in to protect the public, or the Bill would not go through.

MR. POLLOCK thereupon said he would leave the matter to the Committee, and the CHAIRMAN said the Committee had decided that the clause should be inserted.

ON June 17th the Committee passed the preamble of the Bill. Practically all the powers for the construction of new tramways were dropped from the Bill owing to the refusal of the local authorities to consent to the proposed tramway from the Marble Arch to Cricklewood; and, owing to the decision of the House of Commons regarding the veto of the road authorities, the trackless trolley provisions were withdrawn. The Committee passed a number of street widenings, and in connection with the miscellaneous tramway clauses, allowed a clause by which the Commissioner of Police on special occasions may permit passengers to stand inside the tramcars.

**Various Bills.**—In the House of Commons on 23rd inst. the Mexborough and Swinton Tramways (Railless Traction) Bill was ordered for third reading, and the following were read a second time:—Central London Railway, City and South London Railway.

## BUSINESS NOTES.

**Consular Notes.—Australia.**—In a recent report the American Consul at Sydney refers to the fact that in 1912 the first automatic telephone switchboard was installed in Australia, the work being carried out under the supervision of a representative of an American firm, to whom is due the credit of the introduction of the system to the Commonwealth. Geelong, in Victoria, was selected by the authorities for the initial experiment. As the result of the satisfactory working of that exchange 20 suburban exchanges near Sydney are to be similarly equipped, and there is every probability that before the end of the present year still further expansions of the automatic system will have been inaugurated. At present there are eight high-powered wireless stations in the Commonwealth transmitting public messages. These are at Sydney, Melbourne, Adelaide, Fremantle, Hobart, Brisbane, Thursday Island and Port Moresby. The near future will see stations opened at Townsville, Cooktown, Rockhampton, Mount Gambier, Geraldton and Esperance, and a little later at Rosburne, Wyndham and Broome, on the Gulf of Carpentaria. The appropriation passed by the Federal Government for the fiscal year 1912-13 was £50,000, and of that £40,000 had been spent by January, 1913. There is hardly a steamer of any size trading on the Australian coast to-day, either in the inter-State or foreign-going service, that is not equipped with wireless apparatus. The small boats, however, have not yet fallen into line, but this is probably due to the absence of a law making such equipment compulsory.

**South America.**—A Canadian Government representative at Buenos Ayres in a recent report refers to the importance of credit and packing in export trade with Argentina. As regards the former, he states that it is a source of some complaint amongst South American business men that North American shippers will not grant their customers the terms of credit given by large European houses. It is a well-known fact that a house which can easily purchase on a three months' draft from a European exporter, has not infrequently to furnish a bank credit before a United States firm will consent to do business. This predilection for ready cash on the part of United States firms should certainly suit European shippers, as, on anything like equal terms, the latter will get the business. It is convenient for the South American to have the accommodation so readily granted to reliable firms by European shippers, and it hurts his pride to some extent that so many United States firms demand to see his money before dealing with him. There is also a need for credit in South

America, owing to the fact that it is a new land, and, therefore, cash is not always abundant. It imports most of the manufactured goods which it consumes, and, being a long way from the source of supply, it is necessary to carry large stocks. Some firms may argue that it is not because they do not trust South American business men that they require cash payments, but because the extent of their capital does not permit of their standing out of their money for, say, four to six months. Granting that the former is *bona fide*, the latter can only be the result of a lack of familiarity with international banking operations or the lack of adequate bank credit. The usual methods of paying for merchandise are not more than four in number:—(1) The importer can open a bank credit in favour of the exporters; (2) he can remit with order; (3) he can, if he is buying on open account, remit at his convenience; (4) he can pay by accepting a bill drawn on him by the shipper at sight, or allowing whatever interval of time may have been previously arranged. To the North American manufacturer, it is needless to say, the first two methods would be most satisfactory, and particularly the second one, but it is so disadvantageous to the payer as to be almost negligible in practical business. The first is only a little less unpopular than the second, because the firms who have to put up the credit are restricted in their business thereby. It means that from the time the credit has been drawn upon by the shipper, until the goods are disposed of, the credit representing the value involved is dead unless, of course, the goods have been sold previously on negotiable security. The fourth is the most general, and as a rule the fairest method. The exporter draws a bill on his customers at, say, three months' sight, or what is more general locally, three months from arrival of shipment. The question of credit as it affects international trading, is a large one, and has naturally been reduced to a more exact science amongst European and Eastern traders than amongst those of the Western Hemisphere. A most important factor in deciding upon a question of granting credit abroad is the present and future economic condition of the country under consideration. Credit can be granted much more readily when a country is enjoying an extraordinary wave of prosperity than at other times. If discrimination, based upon the advice of reliable correspondents, be employed in choosing customers, if economic conditions be carefully studied from various points of view and diligence be exercised in sifting all reports from the country under review, there is no more reason to apprehend losses from overseas than from home trade.

The question of packing, too, is of very great importance. Packing in Europe has reached a very much higher state of efficiency than in either the United States or Canada, whose exporters show much indifference as to the fate of their shipments when once they have left the factory. In Europe, however, the subject is much more closely studied, with the result that each consignment is more often given just the kind of casing that best suits the goods which it contains, and the country to which they are to be sent. It is a waste of material and money to put light goods into heavy cases, and the contrary practice generally entails actual loss. For machinery, special cases should be designed. Large cases should be braced in one or more places, and round them a band painted plainly on the outside, and in English, and also in the language of the country "chain," "sling," or some such word should be plainly stencilled, also a note to the effect that the sling is to be adjusted at those bands. Failure to do this, results in the pinching in or smashing of the case when the sling takes the strain. At most of the ports in South America, the discharging is done into lighters, sometimes in rather open roadsteads where the sea may be rough. At the best, stowage is not gentle, and in this part of the world the sling is used freely, often to drag a box from the corner of the hold when it might properly be moved by hand. It is very essential that every case be numbered, and the contents plainly stated. If this is not done, the Customs may insist on opening the cases to the damage of the contents, and entailing a waste of time. One of the very best examples of packing was recently inspected. It was part of a shipment of calculating machines consigned from a factory in the United States. Each box was of bright new wood, and splendidly made, and was practically as intact as on the day when it left the works. Each case bore the name of the consignee plainly stencilled, also the name of the makers. Furthermore, there was securely tacked on to one of the faces a card bearing a list of the contents. The list printed legibly, contained the name of each article, even to the literature accompanying the machine. Against each of these was typed, not written, the number of that particular article which the case held. There was no need to open the case, and in another part of the town a day or two after, the same cases were seen being shipped from the agent's place of business, apparently without having been distributed in any way. There have been, and are to-day, complaints about United States' packing, but it is noticeable that when an American exporter gives his mind to the details of his work, he does it in a manner which leaves very little to be desired.

**The Glasgow Electrical Exhibition.**—This exhibition, to which full reference was made in our issue of April 11th, is now an assured success. We have before us a plan showing that by far the larger part of the space is let, though there are still some good positions open. We understand from the manager that the B.E.A.M.A. has agreed to give its support in regard to all sections of the industry concerned. From the names of the exhibitors (see below) we judge that an excellent display is certain, but we have no doubt that this list will speedily be added to by other firms who will desire to benefit from a really good exhibition under the auspices of the Corporation at the beginning of the next lighting season (opening day, October 23rd):—

Glasgow Corporation Electricity Supply Department; B.I. and Helby Cables, Ltd.; Verity's Ltd.; Edison & Swan Co.; Callender's Cable Co.; Simplex Conduits, Ltd.; Brown, Boveri & Co.; Electric Appliances Co., Ltd.; The Electric Co., Ltd.; M. K. Cooper & Co.; Electric Control, Ltd.; British Electric Plant Co., Ltd.; Scottish Vacuum Cleaner Co.; Magic Appliances, Ltd.; James Keith & Blackman; Siemens Bros.; B.T.H. Co.; Fraser & Borthwick; W. T. Henley's Telegraph Wire Co.; General Electric Co.; British Westinghouse Co.; Kelvin & James White; Andersen & Munro; Bonham, Scott & Co.; British Heaters Co., Ltd.; Carron Co.; Yates Bros.; J. Dugdill & Co.; Edward & Sons; and Waygoods.

**German Exports.**—Some figures have just been published in relation to the course of the German import and export trade in electrical and other machinery and cables in recent years. It is shown, in the first place, that the value of the imports of all classes of machinery and electrical manufactures has decreased from £7,700,000 in 1907 to £6,450,000 in 1912, whereas the exports have advanced from £36,750,000 in 1907 to £52,800,000 in 1912. The figures for the electrical trade alone are as follows:—

Imports:—	1912.	1907.
Dynamoes, motors, transformers, &c. ...	£107,000	£94,000
Electric cables ...	49,800	76,000
Exports:—		
Dynamoes, motors, transformers, &c. ...	£2,506,000	£1,716,000
Electric cables ...	1,643,000	2,200,000

It is claimed by a Frankfurt newspaper that Germany now occupies the first position in the supply of the markets of the world with all classes of machinery, including electrical, and that the United States holds the second place and Great Britain the third. As compared with 1909, the German exports have increased in value by 54 per cent., and those of the United States by 82 per cent., whereas those from Great Britain are credited with a decline of 1 per cent. as against 1909.

**Automatic Brake Adjuster.**—THE ANGER MANUFACTURING AND SUPPLY CO., LTD., of Fishergate, Preston, have received a number of contracts for their Anger improved automatic brake adjuster recently described in our pages, including the following:—

Sheffield Corporation Tramways.—Additional order for 64 sets, making a total of 100 sets; all of the new trucks being built, are to be fitted with the brake adjuster.

One hundred sets for new bogie trucks, for Birmingham Corporation Tramways.

One hundred and thirty sets for Cardiff Corporation Tramways, being both single and bogie trucks.

Santos Development Co.—Sixty sets for the Santos Tramways, Brazil.

The specifications also include the brake adjuster for the new trucks for York, East London, Walthamstow, Darlington, &c., and duplicate orders have been received from Huddersfield, Hastings, Walsall, Dundee, Aberdeen, Cape-town, &c.

They have also received further orders from Blackpool, for six bogie trucks to be equipped, and for seven more sets for the bogie trucks for Preston Corporation Tramways.

They have made shipments to Japan, amounting to 80 sets; and have further orders for bogie trucks for several systems in Japan.

The company has recently made arrangements with another factory to manufacture the various parts of the device at Hapton, near Burnley, and the specialities are also handled at factories at Newton Heath, Brussels, and Paris. The company has just made agreements with the Ackley Brake and Supply Co., of New York City, who will manufacture and sell the device in the United States, Mexico, Cuba, Porto Rica, Central America and Philippine Islands.

**Catalogues Wanted Abroad.**—Manufacturers of electrical supplies and appliances for domestic and office use (heaters, cookers, fans, irons, &c.), and also manufacturers of tramway supplies, workshop plant and tools, are invited to send recent catalogues (with prices and discounts) to the manager of each of the following companies:—

Pará Electric Railways and Lighting Co., Ltd., Caixa No Correio No. 29, Pará, Brazil.

Maracá Tramways and Light Co., Ltd., Caixa No Correio No. 148, Maracá, Brazil.

Venezuela Electric Light Co., Ltd., Apartado 175, Caracas, Venezuela.

Compania de Luz y Fuerza Motriz de Cordoba, Calle Rivera Indarte 155, Cordoba, Argentine Republic.

Compania Luz y Fuerza de Paraná, Paraná, Entre Rios, Argentine Republic.

Compania de Electricidad de Mérida, S.A., Mérida de Yucatan, Mexico.

North Melbourne Electric Tramways and Lighting Co., Ltd., Mount Alexander Road, Ascot Vale, Victoria, Australia.

**Lead.**—Following upon our recent comments upon the position of lead, we may quote a report on the matter issued by Messrs. James Forster & Co., of 141, Fenchurch Street, London, E.C., under date June 21st:—

"The course of the market this week has amply confirmed all we have written for a long time past. We have urged that the position is due to consumption overlapping production; others affirm that it is due to restriction of output in Mexico, a country producing normally 120,000 tons a year. We think we can conclusively prove that this is not the explanation.

"Imports into this country, January to May 31st, for the last two years, are:—1912, 91,221 tons; 1913, 91,417 tons. From Mexico: 1912, 9,315 tons; 1913, 8,033 tons. Our imports, therefore, are practically the same as for the same period last year.

"We give our opinion for what it is worth, and affirm that the scarcity of prompt lead, which has been more or less in evidence for 12 months past, is due almost entirely to the increase in consumption in the electrical trades. Copper and lead run together in this respect. What do we find in the former article? The production has increased 50 per cent. in the last few years, and has

not even kept up with consumption, whereas the production of lead is stationary. The largely-increased demands of Russia for lead this year are due to the extension of electrical work. Stocks in England and America two years ago amounted to 50,000 tons; American stocks in bond to-day are 9,000 tons, and there are none in England. The serious position is intensified by the restriction in Mexico due to the revolutionary troubles, and unless a normal condition rapidly supervenes there, it is impossible to put a limit to values. Further, there is a big 'bear' account on this market for July and August. Values increased daily this week until yesterday, when £21 10s. was done for June and £21 for July. At the close we had a considerable setback, June selling at £21 and July at £20 10s.; sellers for August at £20, and September £19 7s. 6d."

**Book Notices.**—*La Télégraphie sans fil, la Télé-mécanique et la Téléphonie sans fil.* By E. Monier. Seventh edition. Paris: Dunod et Pinat. Price 2 fr. 50 c.—The new edition has been revised and enlarged, and now includes sections on musical sparks, directive aërials, coastal signal stations for the guidance of ships in fogs, &c. The Eiffel Tower installation receives special attention, in view of its growing importance as one of the most powerful stations in the world, and the official centre of the international wireless time service. The control of operations at a distance, styled *télé-mécanique* by Prof. Branly, and the possibility of television by wireless, are among the subjects dealt with in this brightly-written little book.

*Manual of Wireless Telegraphy and Telephony.* By A. F. Collins. Third edition. London: Chapman & Hall. Price 6s. 6d. net.—The developments constantly taking place in wireless systems have necessitated a revision of Mr. Collins's manual, and the opportunity has been taken to rearrange the contents. The book deals with the theory, the apparatus employed for sending and receiving, the aerial wire system, wiring diagrams for transmitters and receivers, and the methods of operation. Various types of equipment are described, and chapters are included on "Suggestions to operators" and wireless telephony. The book is well illustrated, and contains a great deal of useful information.

*"Journal of the Institution of Electrical Engineers."* Vol. 50, No. 219, with Index to Vol. 50. London: E. & P. N. Spon, Ltd. Price 5s.—The issue for May, 1913, contains the following papers: "Parallel Operation of Alternators," by A. R. Everest; "The Ohm, the Ampere and the Volt: a Memory of 50 Years, 1862-1912," by R. T. Glazebrook; "Developments in the Street Lighting of Manchester," by S. L. Pearce and H. A. Ratcliff; "Tramway Feeding Networks," by J. G. and R. G. Cunliffe; "The 'Knight' Fire Alarm System," by E. E. Moore; "The Nature of Dielectric Fatigue," by W. Holtum.

"Annual Tables of Constants and Numerical Data—Chemical, Physical and Technological." Vol. II, 1911. London: J. & A. Churchill. Price 28s. 6d. net.

"Modern Electrical Theory." By N. R. Campbell. 1913. London: Cambridge University Press. Price 9s. net.

"Practical Alternating Currents and Alternating Current Testing." By C. F. Smith. Price 6s. net. "Engineering Tables and Data." By W. W. F. Pullen. Price 1s. 6d. net. Manchester: Scientific Publishing Co.

"Logarithms for Beginners." By C. N. Pickworth. Fourth Edition. 1912. London: Whittaker & Co. Price 1s. net.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXII, No. 6. June, 1913. New York: The Institute. Price \$1.00.

"Transactions of the Illuminating Engineering Society." Vol. VIII, No. 5. May, 1913. New York: The Society. Price 75 cents.

"Journal of the Franklin Institute." Vol. CLXXV, No. 6. June, 1913. Philadelphia, Pa.: The Institute. Price 50 cents.

"Atti della Associazione Elettrotecnica Italiana." Vol. XVII, No. 11. June 15th, 1913. Milan: Stucchi, Ceretti & Co. Price L 150.

"Memoria leida en la Junta General de Senores Accionistas de la Compania Electrica de Alumbrado y Traccion de Santiago." February, 1913. Havana: Rambla, Bouza y Ca.

**X.L. Electric Company v. Aron.**—Mr. H. S. Chamberlain, solicitor for the plaintiff in this case, writes as follows:—"Referring to the article appearing in the legal column of your issue of June 13th, I have been directed to draw your attention to the fact that Mr. Aron does not hold two-thirds of the shares, but is the registered holder of 4,604 ordinary shares, and 25 founders' shares out of a total issue of about 12,000. Will you kindly correct the statement in your next issue?"

**Australia.**—The principal of a Sydney firm, visiting London, wishes to get into touch with United Kingdom manufacturers of all classes of electrical goods and machinery.—*Board of Trade Journal.*

**Annual Outings.**—On Saturday last about 70 of the employés of MESSRS. E. BROOK, LTD., of Huddersfield went for their ninth annual excursion to Workson, and had a drive round the Dukeries. The day proved exceptionally fine, and everything was carried out in a first-class manner by Messrs. Dean and Dawson, Ltd.

The office staff of the **STERLING TELEPHONE AND ELECTRIC CO., LTD.**, had their annual outing on Saturday last, when they were invited to spend the day at the residence of the managing director, Mr. Guy Burney, at Westcliff-on-Sea. Ample facilities were provided for sailing, motoring and sports. Mr. and Mrs. Burney were quite ideal as host and hostess, and a most enjoyable day resulted.

A large number of the members of the head office staff of **W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.**, participated in the annual trip up the river on Saturday last. The party, consisting of about 100 ladies and gentlemen, left Paddington Station by the 9.15 a.m.

train for Bourne End, and embarked there on the steam launch *H.M. Majesty*, proceeding up the river to Shipplake. Lunch was served on board, and at intervals a musical programme was provided by members of the party. On the return journey a stop was made at Henley and also at Marlow, in order to view the Regatta which was in progress there. The launch then proceeded to Maidenhead, where the company entrained for Paddington. Altogether it was an exceedingly enjoyable outing. The weather was gloriously fine, the river was at its best, and great praise was due to the stewards, who admirably carried out the arrangements.

**Dissolutions and Liquidations.**—**JOHNSON SECRET WIRELESS TELEGRAPH AND TELEPHONE TESTING SYNDICATE, LTD.**—This company is winding up voluntarily, with Mr. J. A. Robertson, 38 and 39, Billiter Square Buildings, E.C., as liquidator. A meeting of creditors is called for June 26th at 40, King Street, E.C.

**DIRECT GAS FUEL, LTD.**—A meeting will be held at 318, Moor-gate Station Chambers, E.C., on July 21st, to hear an account of the winding up from the liquidator, Mr. A. W. Good.

**PERNY & CO.**, gas and electric light fitting manufacturers and electricians, 21, Grafton Street, and Avery Row, Brook Street, London.—Messrs. R. Wason, J. F. Fiddling, J. St. J. Smith and B. G. St. J. Smith have dissolved partnership, Mr. Fiddling retiring. Debts, &c., will be attended to by Mr. Wason, who will continue the business with the other two partners under the old style.

**Catalogues and Lists.**—**MESSRS. ERCOLE MARELLI AND CO.**, 26, Garlick Hill, London, E.C.—Catalogue No. 81 giving full information describing their centrifugal electric pumps with excellent illustrations and a great deal of tabulated detail, including dimensions, weights, and prices.

**THE GENERAL ELECTRIC CO., LTD.**, 67, Queen Victoria Street, London, E.C.—Leaflet, No. O 1701, giving illustrated particulars and price of the "Victor" electric battery fan for motor-boat, motor-bus and other service.

**THE BRITISH THOMSON-HOUSTON CO., LTD.**, Rugby.—Price list, No. 4,125, describing the B.T.H. field discharge switches; also an attractive folder particularising and pricing their electric fans—desk and bracket types.

**Trade Announcements.**—**THE ARC LAMP-LOWERING GEAR CO.**, Darlington, have appointed, as their sole agents for London and district, for the sale of their lowering gear and accessories, Messrs. Neale & Freund, Ltd., who will keep samples at their offices at 31, Budge Row, Cannon Street, London, E.C.

**THE KOREFUND CO.** have removed their offices and warehouses to 329, Bank Chambers, High Holborn, W.C., where all communications should be addressed. We have received a list reprinting a number of testimonials from users of their special foundation plates.

**MESSRS. BALFOUR, BEATTY & CO., LTD.**, have removed to 66, Queen Street, London, E.C. New telephone No. "503 City."

The telephone numbers of **MESSRS. OSRAM LAMP WORKS, LTD.**, Hammersmith, have been altered to "Hammersmith 1500 and 1501."

**Bankruptcy Proceedings.**—**JAMES EDWIN STOTT (James E. Stott & Co.)**, electrician, Huddersfield.—Application for discharge to be heard on July 31st at Huddersfield.

At the public examination in bankruptcy of **MESSRS. TANNETT-WALKER, LTD.**, of Hunslet, Leeds, Mr. Arthur Tannett-Walker, in answer to questions by the Official Receiver, said that he attributed the failure of the firm to the fact that there were cleverer people than they were, and people were going in more for electric than for hydraulic power. The liabilities of the firm are given at £85,295, and the assets are estimated at £2,051.

## LIGHTING and POWER NOTES.

**Abingdon.**—Progress is being made with the electric light scheme by Mr. J. H. Edwards, of Bristol, who has acquired from the T.C. its rights under a prov. order. A local Electric Light and Supply Co. has been formed, and a contract entered into for the erection of the necessary buildings.

**Algeria.**—A proposal to establish a central electric lighting station in the little town of Stoueli is at present under consideration.

**Bath.**—The E.L. Committee of the T.C. has recommended the Council to open a showroom and offices in connection with the electricity undertaking in Dorchester Street.

**Batley.**—In the annual report upon the working of the electricity department during the year ended March 31st, which has been presented to the Electricity Committee, it is stated that whereas a deficit was made a year ago, the last 12 months have yielded a small net profit. The revenue had increased from £7,934 to £8,626, there being increases of £431 in the lighting receipts and an increase of £742 in the receipts from the power supply, whilst the traction supply had increased by £75. The net cost of working was £5,354, and the gross profit was £3,271, a decrease of about £207.

**Bexhill.**—A L.G.B. inquiry respecting the application of the Council for sanction to borrow £400 for land, and two sums of £1,500 for mains and house services during the next two years, has been held. The Town Clerk stated that the new sub-station was required owing to the rapid development of Cooden Beach and the west of Bexhill generally. Commander Loane, chairman of the Electric Light Committee, in answering a question, said they were carrying forward £1,200 this year, but the question of the relief of the rates depended largely on the assessment of the undertaking which, in this case, was very high. The Council had appealed, but had only succeeded in getting the amount reduced by £100.

**Bingley.**—The District Council has decided to apply for powers to borrow a further £1,500, for the purposes of the electric supply to be obtained from Keighley, and to apply for sanction for the laying of cables and mains from the Keighley boundary to various points in Bingley. Mr. W. Emmott has been appointed consulting engineer.

**Birmingham.**—In order to provide means of cooling the circulating water for the two 5,000-KW. turbo-generators which will shortly be erected at the Summer Lane Station, the Electricity Committee recommends that it be allowed to expend £6,300 on two additional cooling towers, and that sanction to a loan for this amount be obtained.

**Blackpool.**—Arrangements have been made with the L. & Y. and L. & N.W. Railway Co.'s whereby the latter have agreed to continue with a few exceptions the summer train service to October 15th, and keep on a better service than hitherto to the end of October. This will enable the Corporation to carry out an ambitious scheme of electrical illumination, commencing in the middle of September and continuing till the end of October. The scheme, which provides for the electrical illumination of the whole of the promenade from the Gynn to South Shore, with special effects at the various squares *en route*, is expected to cost several thousand pounds.

**Bridlington.**—The report of the past year's work in connection with the Corporation's electrical undertaking states that the gross income for the twelvemonth amounted to £7,449, as compared with £6,889 for the previous year. The net profit is returned at £1,324. Of this sum £198 is to be expended on meters, £500 allocated to a machinery and batteries renewal fund and the remainder to a floating balance fund.

**Brierfield.**—The U.D.C. has decided to apply to the L.G.B. for a further loan of £200 for electrical purposes.

**Brighton.**—The net profit on the Corporation electricity department for the past year was £1,406, as compared with £8,450 in the previous year. The falling off is attributed to decreased revenue both from lighting and tramways, due in the former case to the Early Closing Act. On the other hand fuel charges and taxes were higher. Over 10 million units were sold, and the revenue was £91,231. Curiously enough, the Finance Committee had already arranged to appropriate £2,300 from electricity profits in aid of the rates, against the wishes of the Electricity Committee, with the usual object in view—to keep the rates from "going up." However, it appears that the balance will probably find its way into the right place, viz., the reserve fund.

**Bury.**—Important alterations and mill extensions at Bury promise to be of immense benefit to the electricity undertaking. The Bury Papermaking Co., Ltd., of Gigg Mills, has applied to the Corporation Electricity Committee for a supply of current for about 1,000 H.P. of motors. The proposal will mean abolishing the present steam drive, and the substitution of electricity for driving and lighting. It is estimated that electrical driving will mean a considerable saving in cost of production. It is understood that the new system will be installed at the earliest possible moment. The Peel Spinning and Manufacturing Co., Ltd., proposes to erect a third mill, which will be electrically driven by about 1,000 H.P. of motors. It will be one of the largest electrically-driven works in Lancashire. The two firms will probably consume about 7 million units a year between them.

**Chester.**—The proposal of the Corporation to borrow £7,550 for the provision of a storage battery in connection with the works in course of erection on the site of the Old Dee Mills, has formed the subject of an inquiry by Mr. Hooper, of the L.G.B. In making the application, the town clerk said the Committee, after carefully considering the reports of the electrical engineer, had come to the conclusion that the most economical course to adopt was to provide a storage battery at the Crane Street works, with a net capacity of 550 kw. for three hours, at an estimated cost of £11,550, made up as follows: Building, £1,700; battery, £8,100; battery booster, £1,200; switchgear and instruments, £300; connections, £250. Of the amount named it was intended to defray £4,000 from the reserve fund. The Corporation asked that the loan in respect of the battery should be for a period of 30 years, and in respect of the other items for a period of 7 years. Particulars of the scheme, and evidence supporting the previous speaker's observations, were given by Mr. S. E. Britton, the electrical engineer. At the close of the inquiry the Inspector visited the site of the new works.

**Clones.**—Messrs. Henry Jenkinson & Co., Belfast, are promoting a company to introduce electric light into the town of Clones. Mr. Charles Ferguson, of Clones, has consented to act as managing director.

**Continental Notes.**—**SWEDEN.**—The British Vice-Consul at Nyköping reports that a powerful syndicate under the auspices of the Traffic Co. of Grängesberg-Oxelösund Ltd., the most important limited company in Sweden, is planning the erection of large iron works, electricity works, and coke ovens in Oxelösund, which may be considered as an exterior port of Nyköping.

The electric power plant will be of large capacity, able to supply electric power at a great distance and at cheap rates.

The capital necessary for all these undertakings amounts to between £400,000 and £450,000, and has already been fully guaranteed.—*Board of Trade Journal.*

**RUSSIA.**—The Société des Tramways de Koursk which supplies current for lighting purposes, as well as running the tramways in the town of Koursk, is adding a new 225-H.P. Diesel engine and generator to its central station with the view of meeting the increased demand.

**ITALY.**—The projected construction of a great ship canal between Milan and Venice, in which much activity is now being shown by the organising committee, will have an electrical aspect, as it is expected that considerable electrical power will thereby be provided, which will set off about one-quarter of the aggregate cost of the undertaking. The salient items of the scheme are the construction of two canals, the one connecting Milan with the River Po and the other connecting that river with the Venetian Lagoon. The length of the new waterway will be 380 km. It is stated that electric locomotive trains will work traffic on the canals, rackwork steam trains on the Rivers Adige and Po and steam tugs on the Lagoon.—*Zeitschr. des Oest. Ing. und Arch.*

A new co-operative association, with the title *La Associazione Italiana fra Consumatori di Energi Elettrica*, has just been formed in Milan to protect the interests of consumers of electrical energy, and possibly, to establish a power supply station on its own account.

**FRANCE.**—The authors of the two schemes for developing the water-powers of the Upper Rhone, namely, the Blondel-Harlé-Mahl scheme and the Bellegarde-Malpertuis scheme, have come to an understanding to work together the one chosen by the *Ministre des Travaux Publics* for execution.

*La Société Electricité et Gaz du Nord*, which has an electric generating station of 19,000 kw. capacity at Jeumont (Nord), proposes to establish a new power station near Maubeuge, which will be connected up to the same network of mains, in order to guarantee an uninterrupted supply of electrical energy for power purposes to the large number of industrial establishments in the district.

**DENMARK.**—According to some statistics recently published in the *Elektroteknikeren*, of Copenhagen, the official organ of the Danish Society of Electrical Engineers, 57 new central electric lighting stations were established in Denmark during 1911, representing a total of 4,645 H.P., these figures comparing with 46 new plants, of an aggregate of 2,462 H.P., in 1910. Of the 57 stations mentioned, 10 were erected for town supply and 47 in country districts. During the year extensions representing an expenditure of £198,000 were made to existing stations, the similar outlay in 1910 being only £99,000. Excluding the stations in Copenhagen and Fredericksberg, which have a total capacity of 33,240 H.P., there were altogether in Denmark at the end of 1911, 293 electric lighting stations, representing 31,100 H.P., and an outlay of about £3,500,000, these figures comparing with respectively 234, 24,650 H.P., and £1,325,000 at the end of 1910. The article concludes with the statement that now that central stations have been established at Silkeborg and Hilsbaek, every town in Denmark with over 5,000 inhabitants is provided with electric lighting.

**Dundalk.**—At the bi-monthly meeting of the Urban Council, Mr. P. A. Spalding, resident electrical engineer, in his report, stated that the total number of services in connection with the electric lighting of the town amounted to 276 to date.

**Dundee.**—The Corporation has fixed the price of electricity for each unit in the first 2,500 units per quarter at 3½d., in the second 2,500 units 3d., in the third 2,500 units 2½d., in the fourth 2,500 units 2½d., in the fifth 2,500 units 2½d., and above that 2d. per unit. The ordinary rates for power supply for the first 10,000 units are 1½d. per unit, between 10,000 and 50,000 2½d., and above that 3d. For heating and cooking 1½d. per unit is charged for the first 100 units, and 1½d. per unit above that.

**Dewsbury.**—The Assessment Committee of the local B. of G., in considering the classes of property in the borough which shall form the subject of a new valuation, has decided to include in that category telephones (a) call offices, (b) wires; electric power; (a) stations, (b) cables; pumping station, mains, electricity works; and tramways (a) depôts, (b) lines of rails.

**East Ham.**—Negotiations are being carried out with a view of supplying power to sewage works of the Wanstead U.D.C.

**Glasgow.**—Extensive additions are being made in connection with the electricity department. The Corporation is modernising the plant and greatly increasing the output. For this year the output is estimated at 63,000,000 units. The total plant at present installed in the power stations amounts to 37,000 kw. Since June, 1912, applications have been received for supplies equivalent to 12,000 kw., but a considerable proportion of this, however, has not yet been connected to the mains.

Orders have been placed for two 6,000-KW. turbo-alternators, one with the Westinghouse Co., and the other with Messrs. Howden; and two pairs of marine water-tube boilers are on order from Messrs. Babcock, and two pairs from the Howden Boiler Co. The whole of this plant is due for delivery in time to meet next winter's load. A new generating station is also to be erected on a site near the Dalmarnock Bridge, which, when complete, will have

a plant capacity of 100,000 kw. This new station will, so far as the plans have gone, be probably erected in three sections. When the full complement of plant is installed it is anticipated that the new works will take over the bulk of the supply for the whole area, and that the present main generating stations at Port Dundas and St. Andrew's Cross will be used for peak load purposes only during the winter months. The generating stations at Partick and Govan will then have been converted into sub-stations.

The consumption of coal per unit generated has been reduced during the past seven years from 5½ lb. to 3¼ lb.; this, on a total consumption of 100,000 tons, is equal to a saving of £19,000 per annum.

The supply of electrical energy in Glasgow is to ordinary consumers a low-tension supply at 250 and 500 volts, and to consumers who make a large demand there is also available extra-high-tension energy at 6,500 volts. The Corporation has done much to encourage the use of electrical energy for power purposes. About 44,000 H.P. of motors at work in private premises take current from the Corporation mains. Where the energy is metered on the high-tension side the charge may be as low as £3 10s. per kw. of maximum demand per annum plus 15d. per unit consumed, and if the energy is metered on the low-tension side the charge may be at the rate of £5 10s. per kw. of maximum demand per annum plus 18d. per unit consumed. In certain cases these charges bring the average price per unit below a halfpenny. The charge in Glasgow for public street arc lamps is £12 10s. per lamp per annum.

**Greenock.**—At a meeting of the Corporation it was agreed, in view of the agreements having been signed by the power users in Port Glasgow, to apply for the order by the B. of T., and to negotiate for suitable sites for sub-stations in Port Glasgow. The meeting also authorised the signing of the agreements by the Corporation. It was reported that the electricity generated in May, compared with the same month last year, showed an increase of 90,283 units.

**Hertford.**—The R.D.C. has decided to assent to the application of the North Metropolitan Electric Power Supply Co. for powers to supply electricity within the Council's area.

**Holmfirth (Yorkshire).**—In reference to the invitation issued by the District Council for competitive schemes for generation and supply of electricity in the Council's area, the offer of Mr. Mountain, consulting engineer, of Huddersfield, to adjudge the schemes, has been accepted by the Council. Three schemes and tenders have been submitted by the firms of T. W. Broadbent, Huddersfield, F. Parkinson & Co., Leeds, and Drake & Gorham, Ltd., Manchester.

**Hornsey.**—The L.G.B. has sanctioned the borrowing of £3,000, repayable in 15 years, for house services in connection with the electricity undertaking. The total receipts from the electricity undertaking for the year ending March 31st last, amount to £22,336, as against £21,215 for the previous year, or an increase of £1,121. The receipts from private consumers total £20,469, as against £19,401, or an increase of £1,068. Distribution and management expenses, &c., amounted during the year to £9,843, as against £8,510, or an increase of £1,333, of which £633 was for coal. The amount to be transferred to net revenue account is put at £11,790, as against £12,015 in the previous year, or a decrease of £225. The net revenue account shows that during the period under review the repayment of loans and interest accounts for £10,639, as against £10,083, and that the net profit for the year is £1,289, as against £2,038, or a decrease of £748. The amount brought forward last year was £4,156; this year it is proposed to carry forward £5,446, of which about £4,000 is required for working capital.

**Hoyle and West Kirby.**—The Electric Supply Committee of the U.D.C. has approved of an estimate submitted by the engineer, amounting to £1,010, for structural alterations to the generating station and the laying of foundations for the engine beds and the condensing plant. Application is to be made to the L.G.B. for sanction to borrow an additional sum of £440, with a further £60 for contingencies, making a total of £6,000 in respect of proposed extensions.

**Japan.**—It is reported that the Anglo-Japanese Water Power Co. is in negotiation for the purchase of the Tomoyegawa power station of the Nagoya Electric Co. If the deal is consummated the company will be able to supply electrical energy for lighting and power purposes to the extent of 4,200 H.P. to the town of Hamamatsu from November next. The dams, power station and transformer sub-stations of the Katsuragawa Water Power Co. have just been completed and passed by the Government inspectors.

**Kettering.**—A L.G.B. inquiry has been held into the application of the U.D.C. for a loan of £1,600 for the laying of a new feeder, and there was no opposition.

**Kingstown (Co. Dublin).**—The preliminary arrangements in connection with the proposed electric supply at Kingstown are being actively pushed forward by the company incorporated to proceed with the undertaking. Several sites for the erection of a power station have been visited and inspected at Sandycove by the company's engineer, Mr. Tatlow, and it is understood the erection of the building will commence in or before October.

**Lincoln.**—The chairman of the Electricity Committee, in presenting the annual report of the department, recently said they had sold 2,236,587 units, an increase of over 21 per cent.; the gross profit amounted to £6,502, a decrease of £448 on the previous

year, and the net profit, after subsidising the rates to the extent of £1,500, was £1,038. This was carried to depreciation account, which now stands at £8,836. He commented on the increased cost of coal and the extensions being made to plant.

**Littleborough (near Rochdale).**—The Tramways and Electricity Committee has decided that, subject to the Rochdale Canal Co.'s being agreeable to take current for power, the scheme for the laying of a cable from the kiosk in the square to the canal wharf in Canal Street be proceeded with at once.

**London.**—**St. Pancras.**—Modern flame arcs are to be substituted for eleven old arc lamps on the circuit in Tottenham Court Road and along Euston Road to Portland Road Station at an approximate cost of £150.

The Rees Roturbo Manufacturing Co. has been asked to submit a scheme and estimate for placing a high speed, electrically-driven pump in the warehouse well at or near the water level.

**Loughborough.**—The General Purposes Committee has agreed to a scheme for making extensions at the electricity works at a cost of £11,000 and for extending the mains at a cost of £3,000. The Brush Electrical Engineering Co. is the only maker of the special generator required, and is prepared, if this is put down, to let out on hire machinery to carry over the next winter's load. It is proposed that the electrical engineer be entrusted with the carrying out of the work, and that his salary be increased from £250 to £350 for the next three years, the increase to cover his remuneration for all extensions during that period. The scheme is, of course, subject to confirmation by the T.C. and the L.G.B., to whom application will be made for a loan.

**Mark (Somerset).**—A representative Committee of ratepayers has been appointed to ascertain what number of prospective consumers of electricity there are in the village, with a view to the Wedmore Electric Lighting Co. extending the mains to the parish.

**Mexborough.**—The L.G.B. has sanctioned the application of the U.D.C. to borrow £4,082 for a turbo-generator, excluding spares; £3,914 for buildings; £1,600 for boilers, &c.; £1,060 for cooling tower; £300 for expenditure on proposed public lighting works; and £300 for the provision of services in connection with the proposed public lighting works.

**Oldham.**—The Corporation Electricity Committee has decided to grant free electricity for illuminations after 9 p.m. on the day of the King's visit, to consumers willing to provide and fix devices.

**Peterboro'.**—The sanction of the L.G.B. has been received for borrowing £4,430 for a generating set, and £2,570 for boilers and mechanical stokers.

On consideration of the price charged to the Electric Traction Co. for power, it was decided to make no change up to 170,000 units per annum; but that the price for the next 30,000 be reduced from 1'2d. to 1'12½d. per unit, and that the price for any quantity beyond 200,000 units (as regards such excess) be 1d. per unit.

**Rawtenstall.**—The Health Sub-Committee, after consideration of a report by the borough surveyor relative to the installation of gas or electricity for the lighting of the workmen's cottages at Hall Carr, has resolved that electricity be installed, and that Mr. Stewart, the Council's electrical engineer, be instructed to proceed with the carrying out of the work. The T.C. has confirmed the recommendation.

**Sheffield.**—Mr. H. R. Hooper will on July 2nd and 3rd hold an inquiry into the application of the T.C. for loans, including one of £130,860, for electricity purposes.

**Swanage.**—The U.D.C. has approved of plans submitted by Dr. Purves, of Exeter, for the erection of a generating station in the town, but has requested that gentleman to postpone the laying of cables until the autumn.

**Surbiton.**—The District Council, at its last meeting, considered a report from Mr. J. F. C. Snell, upon the electricity undertaking for the half-year ended March 31st last. Mr. Snell states that so far as he could see the plant had been maintained in excellent working order and had run satisfactorily since his last inspection. There was a substantial increase in the number of units generated and sold, lamps connected and consumers added, and in spite of the continued replacement of carbon filament lamps by the metal filament, there had been an increase of 9'6 per cent. in the sale of units during the year.

**Swinton.**—In connection with the proposals for lighting the streets by electricity, an experimental test of the Barrow system, which is reported to have had good results in many districts, is to be made on Manchester Road.

**Tilbury.**—The U.D.C. has decided to request the Hon. Rupert Guinness, M.P., to oppose in Parliament the application of the County of London Electric Supply Co., Ltd., for a prov. order for electric lighting, unless the company agrees to insert a clause to the effect that its employees will be paid the Trade Union rate of wages.

**Tempo (Co. Fermanagh).**—The inhabitants of Tempo have decided to have a plant for electric lighting purposes installed. A company has been formed, and the necessary capital subscribed. At a meeting of the directors just held, it was decided to accept the tender of Mr. J. S. Loughlin, Bundoran, for the installation of the plant, which will be proceeded with immediately.

**Troon.**—At a special meeting of the T.C. a deputation was received from a number of ratepayers, who are in favour of the introduction of a system of electric lighting into the town.

**Whitworth.**—The D.C. has decided to apply to the L.G.B. for sanction to borrow £10,065, the estimated cost of setting up an electric lighting plant. Whitworth has had an E.L. order since 1905, but nothing has been done.

**Wisbech.**—The T.C. has been informed that the plant for the electric light undertaking in the town has been purchased by the National Electric Construction Co., Ltd., and that it will be in a position to supply current by the close of the present year.

## TRAMWAY and RAILWAY NOTES.

**Aberdeen.**—The T.C. has confirmed a recommendation of the Tramways Committee that in the scheme of extension for which a provisional order is to be sought, there should be added another new route, viz., a double line from the existing line at Queen's Cross, along St. Swithin Street and Union Grove, to Holborn Street. The estimated cost of this additional line is £13,803, and the borrowing powers will, therefore, have to be increased from £50,000 to £63,803.

**Birmingham.**—In connection with the scheme mentioned in our issue of the 20th inst., for linking up the various tramway routes in the centre of the city, the Tramways Committee has decided to recommend the Council to carry out the following extensions to the system:—(1) New line from the Five Ways, down Broad Street, to Paradise Street; (2) New line along Paradise Street, Victoria Square, Colmore Row, connecting with the Handsworth route; (3) New line along Suffolk Street, Easy Road, Great Charles Street, connecting Bristol Road and Dudley Road routes; (4) New line along Navigation Street, Stephenson Street, Stephenson Place, Corporation Street, Martineau Street, connecting the Moseley and district with Aston and other routes; (5) Present track in Corporation Street to be doubled and carried the full length of the street, to join the Aston route in Aston Road; (6) Track in Dale end to be doubled; (7) New line from Hagley Road, Monument Road, Icknield Street, Waistone Lane, Vyse Street, to join the Handsworth route at Hockley; (8) New line from Selly Oak to Northfield, Longbridge and Rednal; (9) New line from Gravelly Hill, across Erdington Hall estate, to Tyburn.

**Bradford.**—A local correspondent says that the newly established system of collecting the tramway fares of upper deck passengers, in Bradford, is not working very smoothly, chiefly because of the stupidity of some of the conductors, who insist on taking the fare on the platform of every passenger, even though the car may be standing at a terminus and a great crush of people endeavouring, in slow and painful fashion, to board the car. The instructions of the authorities allow latitude on the part of the conductors at crowded termini, but many of the men do not appear to realise this, and, to their own and the passengers' inconvenience, danger to those waiting in the road, and delay in starting the cars, insist on struggling with fares and change before allowing passengers to mount the steps. Prior to the establishment of the system most upstairs passengers who boarded the cars *en route* were very willing to pay before going upstairs, but the practice is now very roundly grumbled at.

The substantial decrease in the Corporation Tramway profits for the last year has resulted in considerable controversy as to whether or not the cause has been the adoption of 3d. fares on all cars boarded before 9 o'clock in the morning. It is fully recognised that, however much this system may have reduced receipts in one direction, it has had the effect of greatly augmenting the volume of traffic, and the conclusion has been accepted pretty generally that the chief cause of the decrease in profits during the past year was the bad weather of last summer, which meant little use of the many routes which take townspeople into the surrounding country. Even in that bad year the profit was £40,000, and it is not expected that the authorities will return to the all-penny fare system.

A meeting of the residents of Woodlands has passed a resolution calling upon the Tramways Committee to proceed at once to fulfil a long-delayed promise to establish a tramway service between Odsal and Oakenshaw.

**Chile.**—The Minister for Railways will shortly apply to Congress for funds for the electrification of the railway between Santiago and Valparaíso. *—Review of River Plate.*

**Continental Notes.**—**AUSTRIA.**—The engineers of the Austrian State Railway authorities are at present engaged in considering two projects for the establishment of electricity-generating stations for the supply of the necessary energy for the railways in the Southern and Eastern parts of the Tyrol. One plan is to utilise the power of the River Eisack, on the Klausen-Waidbrunn line, where from 5,000 to 16,000 H.P. is said to be available; the other proposal is to establish a plant to utilise the power of the

River Sadebach near St. Lorenzen, in the Puster Valley, from 3,000 to 9,000 H.P. being in this case available.

**RUSSIA.**—The authorities of the Moscow-Kasan Railway are reported to be considering the question of electrifying the section of the line between Moscow and Ramenskoye. It is proposed to utilise the water power of the River Pechorka in the generation of the necessary electrical energy.

La Société Tramways et Electricité en Russie has prepared plans in respect of a projected electric railway between Riga and a number of seaside pleasure resorts on the Baltic.

Among electric transit schemes whose realisation is impending is an electric railway between Irkutsk and Bodaibo, to serve the mining fields on the Lena; an electric tramway installation in the former town; and a similar installation at Vilna, the cost of which is put at about 5,000,000 roubles.

The traffic at St. Petersburg in the suburbs, on both sides of the Neva, has hitherto been inadequately catered for by steam and electric trams and omnibuses. With a view to an increased service, the Minister of Traffic has introduced into the Duma a Bill providing 16 million roubles for the construction of a complete network of electric tramways throughout the suburbs. It is considered that the Duma, at its reassembling, will pass this Bill, as the relief of the traffic has become an urgent necessity. *—Zeit. für Elek. und Masch.*

**SWITZERLAND.**—The Swiss State Railway authorities are reported to have decided on the electrification of the railway between Erstfeld and Bellinzona. Two power stations—one at Amsteg and one on Lake Rüdum—are to be established in connection with the scheme.

**SWEDEN.**—A fairly comprehensive plan already exists for the electrification of all the trunk lines of the State railways in Sweden, based chiefly on the waterfalls which belong to the State, or have been acquired for that purpose. It is expected that the electrification will be completed during the period 1914-20, at least, on the busiest sections of the system. Work has already been started on the Kiruna-Rikegransen section of the frontier line. The necessary power will be obtained from a water-power station at Porjus, which is now being completed. The work is being executed by the Allmänna Svenska Elektriska Aktiebolaget, in conjunction with the Siemens-Schuckertwerke. The estimated expenditure, together with the cost of introducing electric traction on the Kiruna-Rikegransen railway, was computed at £1,181,000, which sum was sanctioned by Parliament. The work was then commenced, and has so far proceeded that the power station, which is claimed to be the most northerly large station in the world, is to be brought into operation in the autumn of 1914. The station will contain five generating sets each of 12,500 H.P., and two of these will be for railway working, two for industrial purposes, and one as reserve. It is considered that the new electric line will prove economical in comparison with steam traction from the beginning, having regard to the regular and increasing traffic on the line. The severe Northern climate will also be a thorough test of the system, so that the experience gained will be of advantage when the electrification of the lines further south is undertaken.

Some discussion has recently taken place in Sweden as to whether it is justifiable to reserve the waterfalls for so many years for future railway traffic, thereby rendering their utilisation impossible, especially in Southern Sweden, for industrial development. There are, however, other waterfalls in that part of the country besides those reserved by the State; and, furthermore, the water power available can be increased by the regulation of the lakes. The reserved falls are specially chosen, so that they may be encircled by large dams and basins, by which the power required can be regulated without any waste of water.

**GERMANY.**—Good progress is being made with the conversion of the railway between Magdeburg, Leipzig and Halle for single-phase electric traction, and it is expected the line will be ready for traffic under the new conditions early next year. The trials on the converted section are to be extended with the view of gaining further experience, and also of training the train staff. The voltage of the working current is being increased from 10,000 to 15,000 volts, and the distance between the gantries supporting the overhead work extended from 245 ft. to 328 ft., an arrangement which will not only enable the signals to be seen more clearly, but will reduce the cost of porcelain insulators. Work at the power station at Muldenstein is well advanced. Separate buildings are being provided for the boilers, turbines, generators and switchboard. The generating plant will comprise seven turbo-alternator sets, of which four, each of 4,000-kw. capacity, will supply current for the line. The electrical energy will be transmitted as single-phase alternating current at a voltage of 60,000 to three transformer stations located at Wehren, Marke and Gommern, the latter being the maximum distance (44 miles) away. More than half the masts and cross girders are already erected, and the 60,000-volt transmission is nearly complete. The length of the section is about 94 miles, representing a total of, approximately, 310 miles of track.

The work in connection with the introduction of electric traction on the Lauban-Königszell-Hirschberg-Grünthal and other mountain railways in Silesia is making good progress, and the generating station at Mittelsteina is approaching completion. Altogether there will be 72 electric locomotives and five motor-car trains, and 50 of the former and all the latter have already been ordered. The maximum speed of the passenger trains will be 56 miles an hour. Orders for 20 of the heavy goods locomotives have been placed with the Siemens-Schuckert Works, and with Brown, Boveri & Co., for 10 further locomotives, whilst five motor-car trains are to be delivered by the A.E.G., in conjunction with the Linke-Hofmann Works. It is expected that trials will begin on one of the lines in

the autumn, and the other sections will be brought into operation gradually as from the spring of 1914.

**GREECE.**—The Société des Tramways et Eclairage Electriques de Salonique has secured a concession for the construction and working of about eight miles of new electric tramways in the town of Salonica.

**POLAND.**—A scheme has been submitted to the authorities of the Government of Petrikau for the construction of a system of electric tramways in the town and district of Sosnowice.

**HOLLAND.**—It is proposed to convert the steam tramway between the Haguo and Delft for electric traction.

**SPAIN.**—A scheme is under consideration in Barcelona for the construction of an electric tube railway in that city.

**FRANCE.**—La Société des Ateliers de Constructions Electriques du Nord et de l'Est, of Jeumont (Nord), have secured an order from the Midi Railway Co., of France, for eight 1,500-h.p. electric locomotives.

**ITALY.**—The Supervising Council in the Italian Ministry of Public Works has given an affirmative vote in regard to the application for a concession to construct an underground electric railway between Sampierdarena, Genoa and Quarto. It is, therefore, expected that the concession, which is asked for 70 years, will shortly be granted. The promoters are Emilio Rava and the Marquis Cattaneo Adorno, who are supported by a Franco-Belgian group of financiers. It is intended to establish 12 intermediate stations on the railway, which is to be 6.3 miles in length, and the cost of construction is estimated at £1,200,000. The railway is to be operated on the direct-current system, and the power is to be supplied by the Maira Hydraulic Power Co., which was formed by the Motor Co., of Baden.

**Dover.**—Some time ago Messrs. Chamberlain & Hookham offered the Corporation the use, free of cost and for a given period, of 24 meters for the purpose of checking the current consumption on tramcars. This period has now expired, and, according to the general manager, the saving effected is more than sufficient to cover the cost of purchasing the instruments, which he advises the Council to do. The Council has decided to adopt this course. The tramway track in High Street is to be relaid immediately.

**Edinburgh.**—The T.C. is considering the question of tramway facilities in the suburbs, and last week several of the members inspected a Tilling-Stevens petrol-electric 'bus. Tests were satisfactorily carried out on several steep gradients, and the Councillors appeared to be satisfied in regard to the adaptability of the vehicle for suburban traffic.

**Ealing.**—A recommendation by the Tramways Special Committee that the date of the purchase period of the London United Tramways be extended for a period of 14 years, subject to certain conditions embodying the relaying of the whole of the track, was considered at the last meeting of the T.C. Councillor Schofield moved an amendment that the Committee's recommendations be accepted with the addition that all the centre standards be removed, that the rails be contracted, and that a further clause be added in the agreement giving the Council greater power to enforce the proper repair of the track. This amendment was carried by 11 votes to 8. Councillor Farr said the amendment was somewhat indefinite, and moved that the whole matter be referred back for the purpose of considering what provisions should be inserted in the agreement. The amendment was carried as a substantive motion.

**Glasgow.**—The nineteenth annual report of the Tramways Committee has just been issued, and contains a number of points which were not included in the earlier summaries supplied to the REVIEW. These include the statement that the gross revenue for the year shows an increase of £29,327, compared with that of the preceding year, and that the average traffic revenue per car-mile has decreased from 10.561d. to 10.361d. The working expenses show an increase of £36,706, equal to 1.37d. per car-mile, mainly due to increased wages, extra expenditure incurred in permanent way maintenance, fuel, and amount paid in local taxation. The total amount of expenditure on capital account at May 31st, 1913, was £3,694,143. The balance of tramway debt owing to the Common Good now amounts to £2,479,407. The balance at the credit of the depreciation and permanent way account was £2,010,282, while the credit balance in the general reserve fund was £39,362. The total mileage of single track is now 196 miles. During the year £74,071 had been expended on the upkeep of the track in ordinary repairs, and £85,675 had been set aside out of the year's revenue to meet track renewal. The total cost of the ordinary repairs to the power plant and sundry machinery during the year was £5,627, and £35,584 was charged against revenue to meet depreciation. There were 843 cars in stock, 769 being top covered.

**London.**—It is reported that the Great Northern Railway has come to an agreement with the Metropolitan Co. regarding the future working of the Great Northern and City Line, and that the original intention of constructing a junction with the G.N. Co.'s main line at Finsbury Park, will now be carried out, presumably to allow that company's trains to run through to Moorgate Street Station.

**Paisley.**—The Paisley District Tramway Co. has completed an extension of the main tramway line to the centre of Kilbarchan.

**Walthamstow.**—With a view to overcoming the swaying and galloping of the cars, the whole of the latter are to be fitted with half-elliptic springs, at a cost of £5 10s. per car, the work to be spread over a period of two years. New ends are to be fitted to

all the tramcar axles. The tramways engineer has been instructed to obtain quotations for the supply of additional malleable steel bearing shells.

**Whickham.**—The Gateshead and District Electric Tramways Co. has informed the Council of its intention to operate an experimental service of motor-buses in the Council's district. It adds, however, that owing to the exceeding difficulty of obtaining delivery of 'buses, it does not expect to be able to inaugurate the service before next spring.

**Wigan.**—The report of the traffic manager of the tramways for the year ended March 31st shows that the past year has been the most successful yet recorded since the inception of the electric tramway undertaking. On the year's working there is a profit of £1,178, as compared with a deficit of £1,089 during the year 1911-12. The receipts amounted to £71,268, as against £66,328, an increase of £4,939. The average receipts per car-mile worked out to 11.80d., as compared with 11d. last year.

## TELEGRAPH and TELEPHONE NOTES.

**Argentina.**—A Bill is before Congress making it obligatory for all steamers carrying passengers, arriving at or leaving Argentine ports, to be fitted with wireless telegraphy.

**Australia.**—The automatic exchange installed at Geelong, Victoria, proved a success, and the Government has now intimated that it intends to install similar exchanges at Balmain, Newtown and Glebe, in this State; at Perth, in Western Australia; and at Brighton, in Victoria. Altogether these and other outstanding tenders will run into about £200,000.

**Canada.**—A Bill before the Canadian Parliament provides that from July 1st, 1913, vessels trading from any Canadian port carrying 50 or more persons, and plying between ports more than 200 miles apart; or carrying 250 or more persons and plying between ports more than 90 miles apart; or carrying 500 or more persons and plying between ports more than 20 miles apart, must be equipped with radio-telegraphic apparatus, capable of receiving and transmitting messages at least 100 miles.—*Telegraph and Telephone Age.*

**Norway.**—A Committee of the Storting has unanimously recommended that provided that certain modifications are obtainable, sanction be given to the contract made by the previous Government, subject to the Storting's sanction, with the Marconi Co. to erect a large wireless telegraph station near Stavanger at a cost of 2,000,000 kroner, to communicate with the wireless station erected by the Marconi Co. near Boston.

**Puerto Rico.**—The U.S. Government wireless telegraph station at San Juan is to be provided with two additional 300-ft. steel towers. The importance of this station will be greatly increased with the opening of the Panama Canal.

**United States.**—The *Telegraph and Telephone Age* states that there are now over 500,000 telephones in service in New York City, and 67 telephone exchanges. The New York Telephone Co. has reduced its rates between certain sections of the city from 10 to 5 cents per message, and between other sections from 15 to 10 cents.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aldershot.**—July 1st. Electric fire-alarm call posts with telephone services to each, for the U.D.C. Mr. F. C. Uren, surveyor.

**Australia.**—VICTORIA.—July 29th. Detectors, for the P.M.G.'s Department. See "Official Notices" June 20th.

August 4th. (a) Twin surface condensers, hotwells, piping and sundries; (b) air and water extraction pumps and motors; (c) circulating water and sump pumps, with motors, for the Melbourne Suburban Railways power house. See "Official Notices" June 13th.

September 16th.—Switchboard, c.b. or automatic or semi-automatic, at Collingwood. See "Official Notices" to-day.

QUEENSLAND.—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

WESTERN AUSTRALIA.—July 30th and August 6th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" June 20th.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" June 20th.

July 30th.—Cable, switchboard, for the P.M.G. See "Official Notices" to-day.

July 19th.—Switchgear and accessories for an electric power station at Perth. See "Official Notices" to-day.

SOUTH AUSTRALIA.—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" June 20th.

August 13th.—Common battery switchboards and telephone parts for Adelaide. See "Official Notices" to-day.

NEW SOUTH WALES.—July 9th. Switchboards, for the P.M.G. See "Official Notices" May 30th.

Austria.—VIENNA.—July 3rd. Tenders are required for the supply of an electric pumping plant with current transmission lines for the Gmünd water station. Particulars, plans, &c., from the Abteilung für Zugsförderung und Werkstattdienst der k. Staatsbahn-direktion, Wien.

July 7th.—Tenders will be received for a variety of machine tools and accessories for the boiler smithy of the Simmering machine shops, including one three-ton electric travelling crane; one 25-ton ditto; two ironsmith's hearths with electric fans; two portable electric hand boring machines, &c. Particulars (2 kronen) from the Abteilung TV/4, Fachabteilung der Zugsförderung und Werkstattdienst in Vienna.

Belgium.—July 25th. The Fonderie Royale de Canons, Liège (80, Quai Saint Leonard). Tenders for (1) The supply and laying of the cables in connection with the electric lighting of 12 forts in the Liège district and nine in the Namur area; (2) Forty-two dynamos and 17 D.C. motors for the forts in the Antwerp and Liège districts; also 21 switchboards.

July 7th.—Tenders are being invited by the municipal authorities of Fleron (province of Liège) for the concession for the public and private electric lighting of the town.

July 13th.—Belgian State Railway authorities at Gand-Sud, Belgium. Establishment of two transformer stations at Ostend.

Birkenhead.—July 14th. Low-tension main cable, and india-rubber lead-covered and armoured service cable for the Corporation. See "Official Notices" to-day.

Canterbury.—June 30th. Small coal and large Welsh seam navigation coal (about 1,750 and 350 tons respectively), for the Corporation electricity works. Mr. H. Fielding, Town Clerk.

Costa Rica.—September. Municipality of Limon. Hydro-electric plant, comprising two Pelton turbines of 414 H.P., 400-KW. generators, and six transformers. Plans and particulars from the Ingeniero Municipal, Limon. A copy of the *Boletín*, containing some particulars in Spanish, can be seen at the Board of Trade Commercial Intelligence Department in London.

Denmark.—A Danish firm wishes to secure the representation of United Kingdom manufacturers of armatures and other electrical machinery. Another Danish firm wishes to be put into touch with United Kingdom makers of electric fittings of porcelain or faience with gold decorations for fixing to ceilings. Communications regarding these inquiries should be addressed to the Danish Consulate-General in London, 8 and 9, Byward Street, Great Tower Street, E.C.—*Board of Trade Journal*.

ALTONA.—The Harbour authorities will be shortly placing orders for electric cranes, &c. Particulars of the Havencommission, Altona, Denmark.

Derby.—Steam coal for the Electricity Department. Borough Electrical Engineer, Full Street, Derby.

Eccles.—June 28th. Electric lighting of Green Lane Council School, Patricroft. Mr. S. H. Neave, Secretary to the Education Committee.

Elland.—July 2nd. Street lighting lanterns, for the U.D.C. See "Official Notices" June 13th.

Fleetwood.—June 30th. Extension of boiler house at the electricity works, Copse Road. Surveyor to U.D.C., Town Hall.

France.—July 22nd. The French State Railway authorities (Service Electrique, 2me division), 43, Rue de Rome, Paris, are inviting tenders for the supply of the necessary plant for the Paris-Vaugrard transformer sub-station.

Limerick.—July 3rd. Switchboard and gallery, battery, motor-driven booster, balancer, &c., for the County Borough Council. See "Official Notices" June 13th.

Lincoln.—June 30th. Cobbles and slack coal, for the Corporation electricity works, for a year. Electrical Engineer, Rayford Side North.

London.—L.C.C.—July 2nd. Electrical installation at the Caldecot Road Elementary School, Denmark Hill, Camberwell (192 lighting points). See "Official Notices" June 13th.

STEPNEY.—July 3rd. The Electricity Committee invites tenders for two E.H.T. converting plants suitable for 6,000-volt three-phase A.C. to L.T., D.C., for Limehouse and Whitechapel stations. See "Official Notices" June 13th.

June 30th.—Arc lamp carbons, for a year, for the Borough Council. See "Official Notices" June 13th.

HACKNEY.—July 24th. Extra-H.T. ring main conduits, sub-station plant, switchgear and cranes, for the B.C. electricity department. See "Official Notices" June 20th.

I.L.M. OFFICE OF WORKS.—Incandescent electric lamps for one year. See "Official Notices" June 20th.

Luton.—July 2nd. Extensions to the electricity works for the T.C. Mr. W. H. Cooke, electrical engineer, St. Mary's Road.

Manchester.—July 2nd. Stuart Street Generating Station: water-softening and filtering plant. Mr. S. L. Pearce, chief electrical engineer; Mr. F. E. Hughes, secretary, Electricity Department.

Newport (Mon.).—July 1st. Refuse destructor for the T.C. Borough Engineer, Town Hall.

Oldham.—One 2,000-KW. steam turbine, coupled to extra-H.T. A.C. generator, also barometric condenser, pumps, &c., for the Corporation. See "Official Notices" June 20th.

June 30th.—Electric light installation at Richmond Street new schools, for the Borough Education Committee. Mr. Thos. Hilton, architect, 7, Union Street, Oldham.

Ramsey (Hunts.).—June 30th. Street lighting, for the U.D.C. Mr. R. F. Serjeant, Clerk.

Roscrea.—July 11th. Roscrea Bacon Factory, Ltd., invite tenders for buildings, gas engine and suction plant, dynamos, battery, switchboard, overhead feeders, mains and street lamps, for the electric lighting of the town. See "Official Notices" to-day.

Rotherham.—July 8th. Tramway stores, coal, cable and meters, for the Corporation. See "Official Notices" June 20th.

Salford.—July 9th. Two-phase switchgear, Scott transformers and regulators, for the Electricity Department. See "Official Notices" to-day.

Scarborough.—July 12th. Electric light installation at the Workhouse and Infirmary, for the B.G. (about 360 lights). Tennant and Barrs, consulting engineers, Cathedral Buildings, Dean Street, Newcastle-on-Tyne (returnable deposit of £5).

Spain.—July 6th. Municipal authorities of Almedinelli (Province of Cordoba) for the concession for the electric lighting of the town during a period of 10 years.

Stoke-on-Trent.—Coal and slack for a year for the Corporation electricity works. Electrical Engineer, St. Peter's Chambers, Glebe Street, Stoke.

West Ham.—July 10th. Electric light installations for the Forest House branch workhouse and Forest House cottages, Leytonstone, for the Union. See "Official Notices" to-day.

## CLOSED.

Barnes.—The U.D.C. has accepted the tender of Messrs. Siemens Bros. Dynamo Works, Ltd., for an extension to the switchboard, at £150; and that of the Albion Clay Co., Ltd., for ducts for feeder extensions at East Sheen, at 3s. 5d. per yard.

Belgium.—Nine concerns—five German, one British (W. T. Henley's Telegraph Works, London), two Belgian and one French—last week submitted tenders to the Belgian telegraph authorities in Brussels for the supply of 5,234 metres of telegraph cable, the lowest being that of the Rheydt Kabelwerk Gesellschaft, of Rheydt, Germany.

Buenos Ayres.—The Auer Gesellschaft (Berlin) have secured the contract for the supply of 70,000 Osram lamps for the street lighting of the city.

China.—Messrs. Hick-Diesel Oil Engines, Ltd., have received a contract for one 200-KW. Hick-Diesel set for the Kwang Tung Electric Supply Co., Ltd., Canton.

Glasgow.—The T.C. Electricity Committee has recommended acceptance of the following contracts for the year 1913-14:—

Single cables and low-tension cables.—Callender's Cable and Construction Co., Ltd.

Extra-high-tension cables.—W. T. Glover & Co., Ltd.

Rubber-covered cables.—Craigpark Electric Cable Co., Ltd.

Flexibles.—Callender's Cable and Construction Co., Ltd.

Arc lamp carbons.—Sloan Electric Co., Ltd.

Yellow flame arc lamp carbons.—C. W. Webster.

Meters.—British Thomson-Houston Co., Ltd.; Chamberlain & Hookham,

Ltd.; Ferranti, Ltd.

For providing and erecting economisers at Port Dundas and St. Andrew's Cross generating stations the offers of Messrs. E. Green and Sons, Ltd., amounting to £2,705 and £1,848 respectively, have been accepted, while the tenders of Messrs. Musgrave & Co., amounting to £675 and £679 respectively, for providing and erecting induced-draught fans for the new boilers at Port Dundas and St. Andrew's Cross stations have also been accepted. The Baloke Co.'s offer to provide air filters for the two stations mentioned, at £220 each, has been closed with.

The T.C. Tramways, Works and Stores Committee recommends the acceptance of the following:—

Gear wheels.—E. W. Bliss Co. and W. C. Yuths & Co., Ltd.  
Cast-iron gutters, &c., for Fleming Street.—W. MacFarlane & Co., Ltd.  
Car equipments, motors, &c.—British Westinghouse Co., Ltd.  
Car equipments, controllers.—British Thomson-Houston Co., Ltd.

**Hastings.**—The T.C., on June 20th, accepted the tender of the Oliver Aro Lamp Co., Ltd., for 100,000 pairs of carbons for Oriflammé arc lamps, at £2 18s. per 1,000 pairs.

**Huddersfield.**—The Electricity Committee has accepted the following tenders:—

Cable, service and bitumen.—I. Frankenburg & Co.; concentric, W. T. Glover & Co.

**London.**—Messrs. Siemens Bros. Dynamo Works, Ltd., of Dalston, have secured the following contracts:—

Great Northern Railway Co.—Drawn-wire metal-filament lamps and carbon-filament lamps for 12 months.  
War Office.—Standard carbon-filament lamps.  
Further contract from the Royal Mail Steam Packet Co. for marine traction type tatalum lamps for 12 months.

**ST. PANCRAS.**—The B.C. has accepted the tender of Messrs. E. F. Moy, Ltd., at £98, for a supply of testing panels; also the tender of the Electrical Power Storage Co., at £86, for cells. For an annual supply of coal the Electricity Committee has accepted the tender of Messrs. J. H. Beattie & Co., Ltd., as follows:—10,000 tons Haunchwood best hard, 18s. 1d. per ton; 15,000 tons Mansfield nutty slack, 15s. 7d. per ton.

**STEPNEY.**—The B.C. has accepted the tender of Messrs. Forbes, Abbott & Lennard, Ltd., for a supply of 50 tons of moulded pitch for use in the electricity department, at 54s. per ton.

**SOUTHWARK.**—The B.C. has received the following tenders for annual supplies of various cables, &c.:—

Electrical Engineering and Equipment Co., Ltd.	..	..	..	..	£5,189
Johnson & Phillips	..	..	..	..	5,298
Western Electric Co., Ltd.	..	..	..	..	5,116
W. T. G. Over & Co., Ltd.	..	..	..	..	5,210
Pirelli, Ltd.	..	..	..	..	5,577
General Cable Manufacturing Co.	..	..	..	..	4,635
Hen'ey's Telegraph Co., Ltd. (out of order, and not considered)	..	..	..	..	5,153
Callender's Cable and Construction Co., Ltd. (out of order, and not considered)	..	..	..	..	5,530
Siemens Bros. & Co., Ltd.	..	..	..	..	5,112
R. R. Todd	..	..	..	..	5,169
British Insulated and Helsby Cables, Ltd.	..	..	..	(accepted)	5,031
Union Cable Co., Ltd.	..	..	..	..	5,358

**Orkney.**—Messrs. S. Baillie & Son, Ltd., Kirkwall, have secured the Admiralty contract for the erection of a wireless signal station at Brough, South Ronaldshay.

**Peterborough.**—At Tuesday's T.C. meeting a report was submitted by a committee, also one by Dr. J. A. Fleming, with regard to tenders for the extensions to the works. Dr. Fleming advised the acceptance of the lowest tenders in each case. These were:—Messrs. F. Danks for Lancashire boilers, £1,163 (16 tenders submitted); for turbo-generator of 500-kw. capacity, Messrs. Willans & Robinson, and Siemens—disk and drum turbine, coupled direct to Siemens direct current generator (price not stated, eight tenders). The consulting engineer wrote in highly eulogistic terms of the firms mentioned, and of the proved reliability of their manufactures. He also added that on examining the works, of which he was the original consultant, he found the plant in good order and repair, and giving excellent results from an economical point of view.

**Rochdale.**—The Corporation tramways department has ordered tatalum traction type lamps for the ensuing 12 months from Messrs. Siemens Bros. Dynamo Works, Ltd.

**Walthamstow.**—The U.D.C. has received the following tenders for a natural draught cooling tower at the electricity works:—

Midland Engineering Co.	..	..	..	..	£1,145
Klein Engineering Co. (1908), Ltd.	..	..	..	..	1,142
Worthington Pump Co., Ltd.	..	..	..	..	1,800
Zylba Engineering Co.	..	..	..	..	1,300
Hudson Economiser Co. (1907), Ltd.	..	..	..	..	1,706
Balcke & Co., Ltd.	..	..	..	..	1,254
Davenport Engineering Co.	..	..	..	..	1,928
Jarvis Bros., Ltd.	..	..	..	..	1,423
Blasberg Engineering Co., Ltd.	..	..	..	..	950
Kater & Ankersmit	..	..	..	(accepted)	800

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—Lieut.-Col. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, June 30th.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 5th rate, and for all candidates for higher rating, 7 to 9 p.m.

Tuesday, July 1st.—"B" Company. Ditto.

Thursday, July 3rd.—"C" Company. Ditto.

Friday, July 4th.—"D" Company. Ditto.

Saturday, July 5th.—All Companies. Royal Review. The corps will parade at Headquarters at a time to be notified later. Dress: Service dress—cap, jacket, trousers, putties, black boots, haversack, water-bottle (filled), belt, rifle and sling, bayonet, great-coat rolled, carried on back of belt by two great-coat straps (these must be obtained from Headquarters as early as possible). A haversack ration will be issued to all N.C.O.'s and men on arrival at Headquarters.

(Signed) P. H. CAMPBELL, Capt. R.E., Adjutant,  
For Officer commanding L.E.E.

## FORTHCOMING EVENTS.

**Physical Society of London.**—Friday, June 27th. At 5.30 p.m. At the National Physical Laboratory, Teddington. Inspection of work in progress.

**Junior Institution of Engineers.**—Friday, July 4th. Leave London for excursion to Brussels.

Saturday, July 5th. Visit to Ghent Exhibition.

Sunday, July 6th. Excursion to Dinant, the Valley of the Meuse, the Field of Waterloo and Antwerp.

Monday, July 7th. Visit to places of interest in Brussels. Return to London in the evening.

**Salford Technical and Engineering Association.**—Saturday, July 5th. Visit to Central Fire Station, London Road, Manchester.

## NOTES.

**An I.M.E.A. Photograph.**—On page 1070 we reproduce a group of Municipal Electrical visitors taken at Hampton Court during the recent Convention. The original photograph, which was taken by Messrs. Geo. T. Jones & Son, of Surbiton Park Terrace, Kingston-on-Thames, is a really excellent specimen of photographic art, copies of which can be obtained from the firm mentioned.

**£250 Still Required.**—We have no definite news this week regarding further promises for the Electrical Trades Benevolent Institution. There is, therefore, still £250 wanted in order to complete the sum necessary. The time is getting short now.

**Copper.**—The visible supplies continue to diminish without, apparently, affecting the market. Messrs. Merton's mid-monthly circular shows stocks in England, France, and afloat thereto, 29,271 tons, a reduction of 323 tons for the fortnight. English stocks having transferred 578 tons, the difference is made up by increased quantities afloat. The more extended European supplies (including Rotterdam, Hamburg, Bremen and estimates for other ports) were at 41,173 tons, a drop of 514 tons on the same for May 31st. The existence of this substantial quantity may explain the apparent alteration in influence of European supplies.

Arrivals from North America to Europe were low at 12,991 tons, and Spain and Portugal have given a small quantity during the fortnight. Chile shipments are about average; Australian the same. Total deliveries are low, as would be expected after the heavy turnover of last month.

Stock in American producers' hands for May 31st, as published by the American Producers' Association, was 30,122 tons, a reduction of 3,606 tons on the preceding month. The total visible supply (May 31st) amounted to 70,309 tons, or 7,247 tons less than for the end of April.

## The American Society for Electrical Development.

At this Society's annual meeting, held in Chicago on June 2nd, some of the by-laws of the Society were amended, the most important being an amendment of Article IV, upon which is based the subscription payable by the members of the Society. Manufacturers and central stations have been paying one-fifth of 1 per cent. of their annual business, contractors and jobbers one-twentieth of 1 per cent. of their annual business. Some considerable objection has been raised to this plan because it discloses the amount of the annual business of the member. A new system of classification has been worked out which enables a man to go into the Society without divulging too closely what his annual business amounts to, and at the same time permits of fluctuations in his business from year to year without disclosing the same in his annual subscription.

During the Friday morning session of the National Electric Light Association Convention, June 6th, Mr. Wakeman read a paper on the plans and aims of the Society for Electrical Development. During the discussion which followed, Mr. Henry L. Doherty, the President of the Society, delivered an address upon the necessity for the full co-operation of the central stations with the movement.

During the recent slogan contest, inaugurated by the Society for the purpose of obtaining a slogan, 2,675 replies were received from all over the United States, indicating the widespread interest taken in it by the public. The slogan selected was "Do it Electrically." It is expected that all the members of the Society will use the slogan in all their advertising, also upon their stationery, &c. The membership of the Society now numbers 198, and we are informed that the success of the Society is assured.

**Electricity in Brazilian Mines.**—The directors of the St. John Del Rey Mining Co., Ltd., in their report, say that the demand for skilled workers is increasing in Brazil, and the difficulty of obtaining the full supply of labour necessary for working the mine to the greatest advantage under present conditions may continue or recur. Mr. Chalmers is, therefore, of opinion that further labour-saving appliances should be introduced. With this object in view, he and the staff have given a large amount of study to the existing arrangement of the machinery and plant below and above ground, and he has forwarded special reports making various important suggestions. One proposal is to drive the winding and hauling engines at and below horizon VIII directly by electric power instead of by compressed air. Mr. Chalmers estimates that the saving of power to be effected by this change would be sufficient to drive machine drills for the whole of the rock drilling, thus saving a number of hand borers. As highly technical questions arise in connection with this proposal, the opinions of electrical

engineers most experienced in the class of work under consideration, have been obtained and forwarded to Morro Velho. Mr. Chalmers will now report finally with specifications of plant required, as the board have approved in principle his suggestion to convert in the first instance the "G" shaft engines and one winch engine to electric drive. If, after thorough trial, the results are satisfactory, the question of converting other underground engines will be considered. The saving of power is valuable, even apart from the shortage of labour.

**International Engineering Congress, 1915.**—In connection with the Panama-Pacific International Exposition which will be held in San Francisco in 1915, there will be an International Engineering Congress, in which engineers throughout the world will be invited to participate. The Congress is to be conducted under the auspices of the following five National engineering societies:—The American Society of Civil Engineers, American Institute of Mining Engineers, American Society of Mechanical Engineers, American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers. These societies, acting in co-operation, have appointed a permanent Committee of Management, consisting of the presidents and secretaries of each of these societies, and 18 members resident in San Francisco.

The papers presented at the Congress will naturally be divided into groups or sections. During the Congress each section will hold independent sessions, which will be presided over by a chairman eminent in the branches of engineering covered by his section. The scope of the Congress has not as yet been definitely determined, but it is hoped to make it widely representative of the best engineering practice throughout the world, and it is intended that the papers, discussions and proceedings shall constitute an adequate review of the progress made during the past decade and an authoritative presentation of the latest developments and most approved practices in the various branches of engineering work. Prof. W. Durand is chairman of the Committee, and Mr. W. A. Cattell, secretary-treasurer. The executive offices are at Foxcroft Building, 68, Post Street, San Francisco.

**Fatalities.**—The inquiry into the cause of the death of Mr. Frederick D. Hasdell, engineer at the Blaydon sub-station of the Newcastle-on-Tyne Electric Supply Co., was concluded before Deputy-Coroner Lisle, at Newcastle Infirmary, on June 18th. The deceased died as the result of an accident at the station on May 1st. Mr. M. F. Sheedy, an electrical engineer, stated that before Hasdell went to Blaydon, he was assistant engineer at Jarrow and at Pandon Dene (Newcastle). He was a most reliable worker, and had been with the Electric Supply Co. since 1906. Witness produced a plan of Blaydon sub-station, and explained the working of two transformers. One of these had only just been put in, and it was while deceased was connecting the cables from the new transformer to the switchboard that the accident occurred. On the morning of May 1st, witness rang up Hasdell, and asked how the work was going on. Hasdell replied that he had got the high-tension side connected, and that all that remained was to connect up the low-tension side. Witness asked him how he intended to do it, and he said he would do it at the back of the low-tension board. Witness told Hasdell that it ought not to be there, but ought to be done in the transformer chamber; he should not go behind the panels. On receiving notice of an accident an hour later, he went to the sub-station and found two transformer switches fused. An arc had been set up, and a great flame must have been caused which had burned Hasdell. The top of the step-ladder also was burned. Robert Lynd, an electrician, who was working with Hasdell, said he knew it was dangerous to go behind the switchboard, but he had to obey Hasdell. The first time they went in, the connections were wrong, and the two of them went out again. When they went back, Hasdell asked witness to push the step-ladder along under the terminals. While the testing was going on for a third time, Hasdell said, "I think they are all right now." Then there was a great flash and a terrible noise. Witness was burned about the face and arms, but was able to go out for help. When he returned he saw Hasdell creeping out in flames. Two men arrived with a carpet with which the flames were extinguished. Philip Williams, the engineer who preceded Hasdell at the Blaydon sub-station, said he told deceased that he must not go behind the switchboard. He had received this order from the company, and it was filed at Blaydon. The infirmary house-surgeon said death was due to shock following the burns. A juror expressed the opinion that the Supply Co. should have boards exhibited at the sub-stations warning employes against going behind the switchboard, and a representative of the company said that this was being done. The jury found a verdict of "Accidental death."

An inquest was held last week into the death of Fredk. C. Ward, of Acton Green, who fell from a scaffold whilst employed at the electric generating station, Canning Town. The medical evidence showed that death was due to apoplexy and a contracted kidney, accelerated by the accident. A verdict was returned accordingly.

#### Association of Electrical (Station) Engineers.

A general meeting was held at Chandos Hall, London, on Tuesday last. Mr. Chas. F. Wade was in the chair, supported by the London Organising Committee and the delegates from the provinces.

The meeting was opened with the secretary's report of the conference of delegates (representing the United Kingdom), with the London Organising Committee. He stated that the following representatives were present: Mr. G. D. Coe (Manchester), Mr. A. W. Lamont (Glasgow), Mr. E. A. Gordon (Birmingham), Mr. A. C. Black (Liverpool), Mr. R. D. Spurr (Bradford), Mr. W. M. Fowler (Grimsby), and Mr. J. H. Thomas (Manchester), and that

a number of alterations had been made in the rules as submitted to the last general meeting, the principal alteration being that the word station was deleted from the title of the Association, which became the *Association of Electrical Engineers*; the principal reason for this was that a large number of men in positions closely allied to station work were anxious to join the Association, but could hardly be termed "station engineers." The unanimous opinion of the Conference was that it would be advantageous to the general welfare of all engineers holding responsible positions in electrical undertakings if these men were admitted to the Association.

The Secretary also stated that the policy of the Association, as shown by the "objects," was as follows:—

1. To raise the efficiency and general status of members of this Association.
2. To obtain adequate remuneration compatible with local conditions and responsibility.
3. To obtain a 6-day week of employment for employes of all electrical stations, the maximum average week to consist of 48 hours, and that where better conditions prevail they be upheld.
4. To endeavour to obtain legislation to enforce the giving of personal testimonials.
5. To enforce that the Home Office Regulations be carried out in every case with regard to electrical stations.
6. To abolish the employment of pupils and apprentices in responsible positions in electrical stations.
7. To form an information bureau for the general assistance of members and employers.
8. To provide legal assistance for members when necessary (so far as is allowed by law) in matters appertaining to their employment, and for receiving compensation for members who suffer injury by accident in their employment.
9. To obtain for all men in electrical stations who are on duty on all public holidays, including Christmas Day and Good Friday, time off in lieu thereof, and to obtain a minimum of 14 consecutive days' annual leave.
10. To endeavour to obtain facilities for shift men to attend classes, lectures, &c.
11. To provide means for social intercourse amongst its members for their improvement, advancement and recreation.

A paper was read by Mr. J. W. Thomas, entitled "The Status of Electrical Station Engineers and the Need of an Association," which was followed by a very interesting discussion.

The following resolution was put to the meeting and carried unanimously:—"That this meeting of electrical engineers, representing stations, &c., throughout the United Kingdom, welcomes the advent of the Association of Electrical Engineers, realising that only by such an Association, and by thorough organisation, will the conditions of electrical engineers be improved. Further, we pledge ourselves to support the Association in every practicable way possible."

A vote of thanks was passed to the chief engineers who kindly granted leave of absence to the various delegates to enable them to attend the conference and general meeting.

Votes of thanks were also passed to Mr. J. H. Thomas for his paper, to the delegates, and to the indefatigable secretary, Mr. W. J. Ebben, for their services on behalf of the Association.

Receiving this report whilst going to press, we are unable to comment upon it at length; but we take the first opportunity of expressing our opinion that the adoption of a new title, differing only slightly from that of the Institution of Electrical Engineers, was a very unfortunate and ill-advised proceeding, and is likely to prove highly detrimental to the future of the Association. If any attempt is made to incorporate the latter, there can be little doubt that the Board of Trade will insist upon a change of title.—  
EDS. ELEC. REV.]

**Errors of Supply Meters.**—The Board of Trade has issued the following statement regarding the limits of error for meters:—The Board of Trade hereby allow the following limits of error for electricity meters, the construction and pattern of which have already been or may hereafter be approved by the Board of Trade, and which belong to the classes of meters capable of ascertaining the value of the supply on continuous-current or on single-phase alternating-current circuits:—

Meters in which the maximum current for full load:—

- (a) Does not exceed 3 amperes, the error at any point from one-tenth load to full load must not exceed 3½ per cent. plus or minus.
- (b) Exceeds 3 amperes, but does not exceed 50 amperes, the error at any point from one-tenth load to full load must not exceed 2½ per cent. plus or minus.
- (c) Exceeds 50 amperes, the error at any point from one-twentieth load to one-tenth load must not exceed 2½ per cent. plus; and at any point from one-tenth load to full load must not exceed 2½ per cent. plus or minus.

**The Marconi Committee's Report.**—The result of the debate on the report of the Select Committee in the House of Commons last week was a party division on a Liberal amendment to a motion put forward by the Opposition. The amendment stated that the House, after hearing the statements of the Attorney-General and the Chancellor of the Exchequer in reference to their purchase of shares in the Marconi Co. of America, accepted their expressions of regret that such purchases were made and were not mentioned in the debate of October 11th; acquitted them of acting otherwise than in good faith; and reprobated the charges of corruption brought against Ministers, which had been proved to be wholly false. It was passed by a majority of 78.

(Continued on page 1073.)

## MEMORIALS TO LORD KELVIN.

It will be six years next December since William Thomson, Baron Kelvin of Largs, died. Since then nothing has occurred to lessen the world's appreciation of his unparalleled scientific greatness or to spoil in those who had the privilege to know him, the memory of his personal humility, gentleness, and charm. Always regarded with affection in his

life by his intimates, even when there were differences of opinion—Huxley transferred to him the expression "Gentler knight there never broke a lance"—it may be said that it is with personal affection, as much as reverence for his wonderful scientific mind, that his memory is still cherished to-day. To us who remember him, no memorial in marble or in glass is needed, but our children and our children's children will hear and read in their schools and colleges of his great work and character, and hear his studies referred to in lectures and papers, and they will think of Kelvin chiefly as one among a hundred other remarkable men of the past. To us he still remains *the* scientist of our day. But for their sakes, as well as for the reason that it is right and proper for us to show our recognition in some tangible and permanent form amid appropriate surroundings, we are this year witnessing the setting up of a number of memorials which will ever keep the name of Kelvin in mind and emphasise to coming generations that this age knew when to appreciate at its true worth a combination of real greatness and gentleness—indeed, we are not sure that the latter quality is not essential to the former in its best sense.

Belfast, the place of his birth; Glasgow University, for more than 50 years the scene of constant labour and research in science, where thousands of men came lastingly under his spell as Professor of Natural Philosophy, and where admirers of every clime came to take part in his triumphant jubilee celebrations in 1896; Westminster Abbey—the closing scene of all, where the world did him homage—all of these will before the end of 1913 contain unveiled memorials.

When we think of Belfast, and read Prof. Silvanus Thompson's references to the early life of the Thomson family, human nature makes us children again, and in our fancy we whip our tops with the future Lord Kelvin and his brother James on the flags in front of the house where the Thomsons lived in College Square East. Here the two boys "doubtless became familiar with the phenomenon of the precession of a spinning body."\* It was in the aforesaid house which, we believe, still stands (and if we may express an opinion, has more claim to be preserved than some), the house that William's father specially built, that all the children except the eldest daughter were born. William was born there in the year 1824—only six years later his mother Margaret passed to her rest. With an

indomitable spirit the father took up the added duty consequent upon that loss. William of six and James of eight should be his special care; he would educate them, train them, they should sleep in his own bedroom, he would personally devote himself to them. We need not apologise for touching upon what might be thought by some to be trivial matters, for they form a large part of the whole Kelvin connection with Belfast, which has made that city proud to remember one of its sons, and those very early years in close connection with so remarkable a father undoubtedly had much to do with the moulding of the Kelvin character.

The statue which was unveiled in the Botanic Gardens Park, Belfast, on Thursday last week by Sir Joseph Larmor, M.P., F.R.S., was subscribed for by the people of the city. It was executed by Mr. Albert Bruce-Joy. We understand that the relatives of the late Lord Kelvin and members of the Committee, and others who have seen the work, have been greatly pleased with it. The figure is about 10 ft. high, and stands on a granite pedestal about 13 ft. in height. It represents the subject standing erect, with the left hand extended and holding in it a design of one of his discoveries—an adaptation of the gyroscope. In the right hand is a pencil pointing to the drawing. Mr. Bruce-Joy has depicted the illustrious scientist in the prime of life and intellectual power. The personality of the man is clearly brought out. The general pose is that of one keenly interested in the subject; he is supposed to be explaining the discovery he has just made. By the side of the figure, which is draped in the doctor's gown, stands a representation of the well-known Kelvin compass. The statue itself (the bronze) was shown in the Royal Society at the Coronation Soirée, in July, 1911; ever since that time it has been ready, but it was only comparatively recently that the site was decided on. We are indebted to Mr. Bruce-Joy for the photographs here reproduced.

At the unveiling ceremony, Sir Joseph Larmor, the charm of whose manner of speech in public will be remembered by all who have heard him, delivered a tribute

well suited to the occasion, dealing with his home training, life at Cambridge and Paris, achievement and fame in the scientific world, the legacy in physical science that he has left to ages yet to be, his personal qualities, and finally his distinction "as a patriot as well as a man of science."

The Glasgow University statue is to be unveiled in October by Mr. Birrell, as Lord Rector, and the address will be delivered by Mr. Balfour, the Gifford Lecturer. The Westminster Abbey memorial, which takes the form of a stained glass window, will be unveiled next month.

\* "Life of Lord Kelvin," by Silvanus P. Thompson.

### THE I.M.E.A. AT HAMPTON COURT.

On the facing page we reproduce a large group of Municipal Electrical visitors at Hampton Court last week, which contains many familiar faces.

The original photograph is an excellent one, and we trust that our reproduction will do justice both to it and to the event which it pictorially records.

Further details of the convention will be found on page 1086 and succeeding pages, to which we must refer our readers for information as to the week's doings.

### RECENT DEVELOPMENTS AT STUART STREET STATION, MANCHESTER.

THE subject of Manchester's electricity supply is, at all times, an interesting one; industrially, the area supplied by the Corporation is, for its size, probably the most important in Great Britain, and as the output of electricity sold during the past 12 months exceeded 100 million units—a figure considerably in excess of that of any other municipal undertaking in the country—and appears to be advancing at the rate of from 10 to 15 million units per annum, it can be understood that the department, of which Mr. S. L. Pearce is the well-known chief engineer, is faced with problems of a somewhat special character.

For one thing, the three existing stations are approaching the limits of their capacity with the existing plant; the most recent station, Stuart Street, huge as it is in comparison with the average generating station, will be almost fully occupied with plant when the next turbine unit and necessary boiler equipment, which the department has on order, are delivered.

This latest addition\* will have a normal capacity of 15,000 kw., and will be, we believe, the largest turbine unit in the country; one may add that it will form a worthy addition to a generating station, which has long shown the way in the matter of large plant installed.

In the meantime, the large amount of reciprocating plant comprising the original installation at Stuart Street station, offered considerable scope for the utilisation of exhaust steam

turbines, and quite recently a large turbine unit of this type, working in conjunction with existing Yates & Thorn 2,500-h.p. Corliss engines was brought into use.

In the earliest portion of this station, six cross-compound engines coupled to 1,500-kw. generators, were installed,\* exhausting into barometric condensers which occupied a central bay.

A portion of this condensing plant at one end of the bay was removed and a 4,500-kw. Howden-Siemens exhaust steam turbine set, together with barometric condensing plant, installed in its place.

The turbine operates on steam from three engines, and has an output of 4,250-kw, when the former are on normal full load (1,500 kw.).

To supply steam to the new plant, the exhausts from six adjacent engines (three on either side) were connected to 36-in. dia. headers below floor level, with branches leading up to an oil separator, after leaving which the steam is passed through a horizontal tubular superheater, and enters the turbine by way of a 32-in. inlet pipe.

The superheater, which is a product of the department's own ingenuity, is fed with live steam at 200 lb. pressure, superheated 600° F., and gives 40° to 50° of superheat to the steam entering the turbine at about 16 lb. pressure absolute.

The turbine is of the well-known Zoelly impulse type, the diameter of its smallest disk wheel being 6 ft. 5 in. and of the largest, 7 ft.; it is fitted with an emergency governor only, which trips a double-beat inlet valve.

The alternator, to which it is coupled rigidly, has a solid cylindrical rotor, and is fitted with two fans, one for drawing in the cooling air through an air filter in the basement and the other for expelling it into the engine room; the machine bearings are provided with forced-oil lubrication, an oil pump being provided on the turbine shaft.

The exhaust turbine set runs at 1,500 R.P.M., delivering 50-cycle three-phase current

at 6,500 volts to the H.T. bus-bars, and it is interesting to notice that, while it was originally intended that it should operate in conjunction with four of the 1,500-kw. reciprocating sets, in practice three of the latter have been found sufficient for the purpose.

The exhaust from the turbine leads upwards to a motor-driven 66-in. sluice valve, above which the exhaust column divides into two vertical branches each ending in a jet condenser, the condensing plant, of the barometric type, having been supplied by the Mirreles Watson Co.

4,500-KW. HOWDEN-SIEMENS EXHAUST-STEAM TURBINE SET AND BAROMETRIC CONDENSING PLANT, MANCHESTER.

\* ELECTRICAL REVIEW, November 1st, 1912, page 710.

\* See ELECTRICAL REVIEW, June 26th, 1903. page 1085.

The two engines adjacent to the turbine are provided with alternative exhaust connections direct to the new condensers, so that they can be run as previously in the event of the exhaust turbine being shut down; all the other Yates and Thom engines have their original barometric condensing plants, coupled up as in the case of the new plant to a cooling tower and canal.

In connection with the new plant, two twin-cylinder air pumps, gear driven from 46 H.P. direct-current motors (speed 680 R.P.M.) are installed, also three 50-H.P. motor-driven circulating pumps which will deliver 600,000 gallons of water per hour to a central rising main with connections to the two condenser heads.

A small ironclad switchboard adjacent to the motors contains the necessary starting and controlling gear.

In addition to the generating plant already mentioned, the Stuart Street station contains the two 3,750-kw. vertical triple-expansion engine sets installed when the

second portion of the station was originally opened, and three high-pressure turbo-alternators added by Mr. Pearce. Of

The third unit is also a Howden-Siemens combination, with a capacity of 8,000 kW.; both the Howden

TURBINE-DRIVEN KINETIC ROTARY AIR PUMP AND TANK FOR 8,000-KW. TURBINE SET, STUART STREET STATION, MANCHESTER.

these, the first, a Willans-Siemens set of 6,000-kw. capacity installed in 1907, and the second, a Howden-Siemens set of 7,000-kw. capacity, have been referred to in our pages.

It is well known that the rarefying effect of a steam jet in a condenser is greater than can be produced by a mechanical air pump, except the pump is artificially cooled

turbines are of the Zoelly impulse type, and the Siemens alternators are totally enclosed machines, ventilated with filtered air from external electrically-driven blowers, three of which are installed.

An interesting feature of the last turbine plant installed is the condensing plant, of the Contraflo Kinetic type, made by Messrs. Richardsons, Westgarth and Co., and in connection with which both the air and circulating pumps are steam-turbine driven.

The Contraflo condenser is similar to several already installed in Stuart Street, and has a cooling surface of 10,500 sq. ft. Formerly Edwards air pumps have been used in the station, but in this case Mr. Pearce decided to adopt the Kinetic rotary air pump.

In this system the air is withdrawn by a steam jet and expelled by a special arrangement of water jets known as the "Kinetic ejector." The pump supplying the water to these jets is driven by a small turbine, the exhaust from which is used in the steam jet for withdrawing the air from the condenser, and as the water is the condensate or feed water, the thermal efficiency of the apparatus is exceedingly high.

and of abnormal size. Therefore, a very high efficiency of tube surface can be obtained when a steam jet is employed.

Water jets alone are incapable of withdrawing large quantities of highly attenuated air by reason of its large volume and are consequently unsuitable for the production of high vacuum when the air leakage is appreciable. But if a steam jet is placed in advance of the water jets, the air mixes with the steam, and when this aerated mixture comes in contact with the water jets, the steam is condensed and the air is as it were automatically deposited on the water surfaces. It is, therefore, easily expelled. The steam jet also acts as a booster, and when air is present in abnormal quantities, the boosting has the effect of increasing the air density, so that the layer of air deposited on the water surfaces is of increased weight and yet of a volume within the discharging capacity of the jets.

(To be concluded.)

## NOTES.

(Continued from page 1068.)

**Institution and Lecture Notes.**—**PHYSICAL SOCIETY OF LONDON.**—At the meeting held on June 13th a paper on "Some Experiments on Tinfoil Contact with Dielectrics" was read by Mr. G. E. Bairsto. This paper describes some experiments showing how the accuracy of the different kinds of electrical measurements that are made on condensers is influenced by the use of an imperfect tinfoil contact. In connection with the measurement of the direct-current conductivity of a condenser having tinfoil armatures, the experiments of Mr. Appleyard, in which the current a minute or two after the first switching on of the current was greater than that at the time of switching on, are referred to. These experiments go into the matter in more detail. By choosing a suitable dielectric—celluloid, which has a conduction current of a greater value than the rate of change of displacement current—it was found possible greatly to increase the magnitude of these secondary increases in current. Voltage has quite as much effect as mechanical pressure in bringing about an intimate contact and acts independently of it. While considerable errors are liable to be made in deducing the specific direct-current conductivity of a dielectric between tinfoil armatures, the same is not true for measurements of the alternating-current conductivity. It is shown experimentally, even under the worst possible circumstances, the dielectric being only lightly bound up with the interleaved tinfoil, that for telephonic frequencies the maximum difference between the observed conductivity and true conductivity is 15 per cent. and of capacity is 5 per cent. Finally, the influence of imperfect contact upon the accumulation of residual charge is considered.

A paper "On a Method of Measuring the Pressure of Radiation by Means of Thin Metal Foil" was read by Mr. Gilbert D. West.

The pressure of the radiation emitted by a carbon filament lamp at a distance of a few centimetres is sufficient to cause a microscopically measurable deflection of the end of a suspended strip of gold or aluminium foil, and by this means the radiation pressure can be calculated knowing the weight of the strip. The results agree to within about 10 per cent. with the energy content per cubic centimetre as measured by the initial rate of rise of temperature of a copper plate exposed to the radiation.

A paper "On the Emission of Electricity from Hot Bodies and the Quantum Theory" was read by Dr. W. Wilson.

**Deaths by Lightning.**—Most people, says Mr. Marriott, the secretary of the Royal Meteorological Society, in *Knowledge* for June, imagine that the number of persons killed by lightning each year is very great. This impression is far from being correct. Statistics show that during the 10 years 1901-10 the Registrar-General reported 124 fatal instances of lightning stroke in England and Wales—a yearly average of only 12.4 deaths, or 0.36 per million living. In the 29 years 1852-80 there were 516 such deaths, the yearly average for that period being 18.8, or 0.88 per annum per million living. The numbers of these deaths varied widely in different years; three people were killed by lightning in 1863 and 46 in 1872. The annual death-rate from lightning also varies widely in different parts of England. In the north Midlands from 1852-80 it was 1.8 annually per million living, in the Metropolitan district only 0.13. On the Continent much higher yearly death-rates are found. In Hungary the annual death-rate from lightning is said to be 16 per million living; in Styria and Carinthia about 10 per million; in Prussia, 4.4; in France and in Sweden, 3; in Belgium, 2, so far as the imperfect statistics available go. In the United States of America the annual death-rate per million is high—about 10—in consequence of the frequency of thunderstorms on the one hand and of the large percentage of the inhabitants engaged in outdoor labour on the other; about 700 or 800 deaths from lightning were estimated to occur in the United States every year by Henry in 1900 in a population of 76 millions. Many more people are struck by lightning than are killed.

**Private Fire Brigade Championship.**—This competition was held at the Guildhall on Saturday last, June 21st, and as a result the Robertson Lamp Section Brigade took second place and won the Bronze Medals; the Oram Lamp Section Brigade obtained the fourth place. There were 23 brigades competing.

**Appointments Vacant.**—Senior draughtsman for the Birmingham Corporation electric supply department (£130); assistant engineer for Southwark B.C. electricity works (£150). See our advertisement pages to-day.

**The Electric Lighting of Motor-Buses.**—In the course of a paper on "Steam Motor-Omnibuses," read at a joint meeting in New York of the American Society of Automobile Engineers and the British Institution of Automobile Engineers, by Mr. Thomas Clarkson, of Chelmsford, the author referred to the question of the lighting of such vehicles, which had been a very troublesome problem, neither oil nor acetylene having proved satisfactory. Mr. Clarkson stated that he first experimented with electric lighting for bus illumination about ten years ago, the original lighting being worked off a storage battery. This not proving satisfactory, a scheme was subsequently devised whereby a small storage battery was used in combination with a special dynamo driven by the car, and with cut-outs, similar to the lighting systems now used on pleasure cars. After running this combination for several years, he abandoned it in favour of a dynamo of the ordinary type directly attached to a small steam engine, no batteries or cut-outs being employed. The little engine runs at a constant speed of 900 R.P.M., and the equipment provides current for 150 C.P. per bus. Mr. Clarkson, who, as is well-known, is associated with the National steam buses running in the metropolis, states that the equipment has proved completely satisfactory. The cost and weight of the installation have been reduced, as well as cost of maintenance, at the same time greater brilliance of illumination has been secured.

**Educational Notes.**—The Senate of London University has appointed Mr. E. H. Lamb, M.Sc. (Vict.), A.M.Inst.C.E., to the University Chair of Civil and Mechanical Engineering tenable at the East London College. Mr. Lamb had a distinguished career at Owens College, Manchester, and graduated with first-class honours and the University Scholarship in Engineering in 1899. Since 1903 he has been technical and scientific adviser to Messrs. W. H. Allen, Son & Co., of Bedford, and demonstrator to the pupils and apprentices of the firm. He is the author of a paper on "The Torsional Vibrations of Shafting," for which he was awarded a premium by the Institution of Electrical Engineers.—*Times*.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Mr. W. WYLD, who has been appointed electrical engineer at Hampstead, was on Saturday the recipient of a presentation from the employés of the Birkenhead Corporation tramways department. The proceedings were presided over by Mr. J. Dudleston, traffic superintendent. Appropriate speeches were made by the chairman, Messrs. R. Chadwick, J. Gunn Wallace, G. H. Godding, S. Edge, E. Evans, T. Crawshaw and F. T. Coram, after which Mr. Clarke presented Mr. Wyld with a silver tea service, as a token of esteem from the employés of the department. Mr. Wyld expressed his thanks, and asked the men to give the same loyal support to Mr. Clarke, his successor, as they had given to him. The staff of the Electricity Department presented Mr. Wyld with a barometer, the presentation being made by Mr. Shallcross, the borough electrical engineer.

At Maltby (Yorks), on June 18th, the marriage took place of Mr. HENRY NEVILLE ROGERS, of the Rotherham Corporation electricity staff, and Miss Annie Fearby Brown, elder daughter of Mr. Richard Brown, of Roche Abbey Mill, Maltby.

The General Purposes Committee of the Crewe T.C. has recommended that the salary of Mr. H. H. DENTON, chief electrical engineer, be increased by £50 a year; and that of Mr. HOOLEY, his assistant, by £25 a year.

On the occasion of his marriage to Miss Elsie R. Jourd, of Belvedere, Mr. VICTOR R. LOWRY has been presented with a brass and oak clog by the staff of the Farnham electricity works.

The Rugby U.D.C. has increased the salary of Mr. T. S. SHENTON, manager of the electricity works, from £200 to £225 per annum.

Mr. L. H. C. WEBSTER has been appointed assistant mains engineer to the Dover Municipal electricity undertaking. There were 37 applications. The appointment was previously offered to Mr. J. L. H. Cooper, who subsequently withdrew.

**Tramway Officials.**—It is proposed to increase the salary of Mr. R. S. PILCHER, manager of the Aberdeen Corporation Tramways, from £400 to £500.

A financial daily says that Mr. H. E. BLAIN, late general manager of the West Ham Corporation Tramways, has now taken up the appointment of assistant purchasing agent to the Underground Electric Railways and their allied companies.

**General.**—A Canadian exchange states that Mr. H. H. COUZENS, the new manager of the Toronto hydro-electric system, arrived in Canada from England during the first week of this month. He takes actual charge of the system on July 1st.

CAPTAIN TERRICK CHARLES FITZ HUGH, M.V.O., the Chief Commissioner in the Far East, recently appointed by the British Engineers' Association, left London for Peking, *via* Siberia, on Saturday, June 21st, accompanied by his technical secretary, Mr. L. B. Stevens, M.A.

MR. W. MURRAY MORRISON, M.I.E.E., general manager of the British Aluminium Co., Ltd., whose marriage was announced in the last issue of the ELECTRICAL REVIEW, has been presented by the staff and employees with a solid silver cigar box and cigarette box.

MR. JOHN HOWARD HOWARD, of Clapham Park, Bedford, only son of Sir Fred. Howard, of J. & F. Howard, Ltd., electrical and general engineers, of Bedford, and his wife, celebrated their silver wedding on June 19th, and were the recipients of many cordial congratulations.

MR. HERBERT BERRY (Messrs. Berry, Skinner & Co.) will be leaving England on July 25th, by the *Empress of Britain* for Canada, arriving at Montreal on August 1st. He will subsequently visit Toronto, Niagara, Winnipeg, Calgary, Edmonton, Vancouver and Victoria; returning through the United States—Minneapolis, Chicago, Detroit, Pittsburg and New York.

MR. C. V. BIGGS has removed from 28, Victoria Street, S.W., to 48, Westminster Palace Gardens, Artillery Row, Victoria Street, S.W.

MR. MARCONI arrived in New York on June 11th to give evidence in a patent action in connection with his company, and to inspect the installations at Belmar, N.J., and Glace Bay.

MR. TOM WESTGARTH, on resigning the position of managing director of Messrs. Richardsons, Westgarth, & Co., Ltd., of Middlesbrough, has been presented by the officials, foremen, and workmen with an illuminated address in album form, and a gold bracelet for Mrs. Westgarth.

On Saturday last, MR. SEYMOUR C. TOYE, who has been for some time in the employ of Messrs. J. H. Tucker & Co., electrical accessories manufacturers, of Birmingham, was presented with a suit case as a mark of esteem, upon his leaving the firm to take up a position on the commercial staff of the General Electric Co., High Street, Birmingham.

**Obituary.**—The death is reported from Amble, Northumberland, after a prolonged illness, of Mr. Robert Wanless, electrician to the Port and Harbour Commissioners. Over a quarter of a century ago deceased was engaged for the installation of electric light at Warkworth Harbour, and upon the completion of his contract continued in the service of the Commissioners. He manifested an active interest in local affairs, and, as a Freeman, was a Past Provincial Grand Officer of the Province of Northumberland. He was in his 67th year.

**Wills.**—The late Mr. JOHN TROTTER, chairman of Crompton & Co., Ltd., left estate valued at £37,865 gross and £27,723 net.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Electric Ignition Co. (1913), Ltd.**—Particulars of £2,500 debentures created May 24th, 1913, filed pursuant to Sec. 33 (3) of the Companies' (Consolidation) Acts, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**British Union Lamp Works, Ltd.**—Charge on company's undertaking and property, present and future, dated May 7th, 1913, to secure all moneys not exceeding £3,000, for which the charges may become liable to pay under a guarantee to the company's bankers. Holders: T. Griffiths, Thirfield, Moorland Road, Didsbury, near Manchester; and G. E. Jowett, Yew Tree House, Eccles, Manchester.

**Browett, Lindley & Co., Ltd. (63,128).**—Return dated April 7th, 1913. Capital, £120,000 in £1 shares (40,000 pref.), 50,000 pref. and 50,000 ord. shares taken up. £1 per share called up on 42,000 pref. and 23,478 ord. £65,478 paid. £34,522 considered as paid on the remainder. Debenture stock outstanding: To sundry holders, £20,000; as security for sundry loans and bank overdraft, £27,165; total, £47,165.

**A. Reyrolle & Co., Ltd. (70,210).**—Return dated April 10th, 1913. Capital £40,000 in £1 shares (20,000 pref.), 20,000 ord. and 19,346 pref. shares taken up. £1 per share called up on 19,000 ord., and 19,346 pref. £39,346 paid. £7,000 considered as paid on 7,000 ord. Mortgages and charges: £16,300.

**Electrolite, Ltd.**—Particulars of £500 debentures, created April 10th, 1913, filed pursuant to Sec. 33 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's property, present and future, including uncalled capital. No trustees.

**Altrincham Electric Supply, Ltd. (46,795).**—Return dated May 22nd, 1913. Capital, £50,000 in £1 shares: 35,000 shares taken up; £35,000 considered as paid. Mortgages and charges: £35,000.

**Garrett, Hartley & Co., Ltd.**—Debenture dated June 17th, 1913, to secure £350, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: S. Hartley, Cranford, Grand Drive, Raynes Park, S.W.

**Anglo-Portuguese Telephone Co., Ltd. (22,545).**—Return dated May 23rd, 1913. Capital £150,000 in £1 shares. 100,000 shares taken up. £1 per share called up on 1,046 shares. £1,046 paid. £98,954 considered as paid on remainder. Mortgages and charges: £43,625.

**Bournemouth and Poole Electricity Supply Co., Ltd. (55,189).**—Return dated March 27th, 1913. Capital £500,000 in £10 shares (25,000 ordinary, 7,500  $\frac{1}{2}$  per cent. preference and 17,500 6 per cent. second preference). 15,000 ordinary, 7,500  $\frac{1}{2}$  per cent. preference and 15,000 6 per cent. second preference shares taken up. £375,000 paid. Mortgages and charges: £157,500.

**Beck & Moss, Ltd. (69,298).**—Return dated April 19th, 1913. Capital, £2,500 in £1 shares. All shares taken up. £1 per share called up on 525. £525 paid. £1,975 considered as paid on remainder. Mortgages and charges: Nil.

## CITY NOTES.

### Shawinigan Water and Power Co.

THE directors' report for the year ended December 31st, 1912, states (says the *Financial News*) that the gross income for 1912 shows an increase over that of 1911 of \$349,814, and the net revenue an increase of \$249,706. The average percentage of operation and general expense to gross income has been, for the past five years, on a basis of 10½ per cent. The ratio for the year 1912 is 9·4½ per cent. The operations of the company during the year have been carried on without abnormal interruption, with the exception of one occurrence in the month of September, when, through the breaking of a turbine end casting, considerable water escaped into the power house, and through its reaching some of the generators, delay was occasioned owing to the drying-out of field coils, &c. In the last annual report the directors advised of the completion of the new development with machinery installed in station No. 2 up to a capacity of 30,000 H.P. In August last it was decided to install a third unit of 15,000 H.P. and this installation is nearing completion. With this unit the total electrical capacity of the two stations will be 100,000 H.P. The continued demand for power makes it evident that this addition to the plant will be required for use at an early date. The rapid industrial development of the city of Three Rivers makes it expedient to provide for further demands from that point, and the directors have in contemplation, in the spring of 1913, the erection of a third transmission line to Three Rivers. The Cedars Rapids Development Co. has acquired from the Dominion and Provincial Governments the right to take from the St. Lawrence River, at Cedars Rapids, about 30 miles above the City of Montreal, sufficient water to develop 160,000 H.P. The development work for this plant has been in operation since early in 1912, and the first installation of 100,000 H.P. will be completed in the fall of 1914. The control of this company is vested in the Shawinigan Water and Power Co. and the Montreal Light, Heat and Power Co. This power will be, to a large extent, used for electro-mechanical and electro-metallurgical processes at Cedars Rapids and elsewhere, while a considerable portion will be available for distribution through the Montreal Light, Heat and Power Co. in the section of the city furthest removed from the terminals where power is obtained from the Shawinigan Co.

## NEW COMPANIES REGISTERED.

**Crompton & Co., Ltd. (129,649)**—Registered June 19th, by Deacon & Co., 9, Great St. Helena, E.C. Capital, £221,007 in £1 shares (126,000 7 per cent. non-cumulative preference). Objects: To carry on the business of electrical engineers, workers in metals, contractors for the supply of electrical plant, producers and distributors of electrical energy, manufacturers of electrical, steam, petrol and other motors, trams, tramcars and locomotives, &c., to acquire the assets and liabilities of Crompton & Co., Ltd. (incorporated in 1883), and to adopt an agreement with the said old company and the liquidator thereof. The signatories (with one share each) are:—G. F. Medcalf, 9, Great St. Helena, E.C., solicitor; R. C. Allen, 258, Dunstons Road, East Dulwich, S.E., gentleman; R. Gibson, 8, Great St. Helena, E.C., solicitor; T. J. Bowles, 118, South Park Road, Forest Gate, gentleman; W. Escott, 118, Addison Gardens, W., gentleman; W. J. Park, 4, Aberdeen Road, Highbury, N., gentleman; H. C. Blackborow, 24, Elsham Road, Leytonstone, gentleman. Minimum cash subscription, seven shares. The first directors (to number not less than three or more than eight) are to be appointed by the signatories; qualification, 500 shares. Remuneration, £200 each per annum (chairman, £300) and 5 per cent. of the distributed profits, divisible (maximum additional remuneration, £1,000). Registered office, Salisbury House, London Wall, E.C.

**North British Wireless Schools, Ltd. (8,711)**—This company was registered in Edinburgh on June 20th, with a capital of £12,000 in £1 shares (9,000 cumulative preference participating), to establish day or boarding schools or colleges, and to carry on the business indicated by the title. The subscribers (with one preference share each) are:—T. H. McEwen, 105, West George Street, Glasgow, law clerk; W. Y. Chrystal, 226, St. Vincent Street, Glasgow, chartered accountant; H. J. Stevenson, 160, Onslow Drive, Dennistown, Glasgow, clerk; J. B. Dunlop, 101, Douglas Street, Glasgow, clerk; K. Patrick, Trafalgar Park, Bishopbriggs, clerk; M. D. Dolz, 9, Palmoral Crescent, Green's Park, Glasgow. The first directors are W. J. Kerr, G. Ritchie and W. N. Mackay, all of Glasgow. Registered office, 226, St. Vincent Street, Glasgow.

**Hales, Hancock & Co., Ltd. (129,634)**—This company was registered on June 21st, with a capital of £100 in £1 shares, to carry on the business of manufacturers, importers and exporters of china, porcelain, earthenware, pottery, terra-cotta, sanitary ware, fireclay, drain and water-pipes, electrical and art pottery, &c. The subscribers (with 25 shares each) are:—E. C. Hales, Gamage Buildings Holborn, E.C., merchant; P. Hancock, Gamage Buildings, Holborn, E.C., traveller. Private company. Table "A" mainly applies. Registered office, Gamage Buildings, Holborn, E.C.

**Electric and General Investment Co., Ltd.**

The annual meeting was held on Tuesday at Winchester House, E.C., Mr. J. B. Braithwaite presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 1035), said the story they had to tell the shareholders for the past year was a very simple one. They had made a profit of £11,797, which was about £3,000 less than last year, but in view of the very disturbed state of financial affairs during the greater part of the year, the Balkan trouble and various things of that kind, he thought they would agree that the company had done fairly well under the circumstances. After charging the various amounts stated on the debit side of the profit and loss account against it, they were left with a balance of £4,922 to deal with. That sum they proposed, subject to the shareholders' approval, should be dealt with by paying the balance of the 10 per cent. dividend on the preference shares of the company, by paying 6d. a share on the deferred shares and by carrying forward to next year £2,922. They were distributing £3,000 in dividends this year, and were proposing to carry forward, approximately, £3,000 to next year, so as to make the position as sound as they could. In addition, during the year they had redeemed and cancelled £963 of debentures, so that that amount was reduced to £19,570. During the year they had realised some old investments, involving a loss of £4,119, which they deducted from the contingency fund, which was provided to meet such losses. Out of the profit and loss account for the current year they had transferred to the credit of the contingency fund £3,071, raising it now to £81,000; and with the reduction of nearly £1,000 in the debenture stock outstanding, they practically reinstated it exactly where it was before they realised those old losses to which he had alluded. One gentleman wanted to know why they did not pay more in dividends under the circumstances, but he thought the shareholders would agree with him that their policy was to put the company into a thoroughly sound financial position, by carrying forward the amount they had done, and endeavouring to strengthen their reserves. In this way they believed they were acting in the best interests of their shareholders. There was a considerable amount of fair business which did not appear in the accounts, a profit on which should be realised during the current year. He hoped the year would not be quite so unsettled financially as this year had been, that it would be a year of greater prosperity, in which case they would spare no effort to see that the shareholders shared in that prosperity. He moved the adoption of the report.

MR. J. CECIL BULL seconded the motion, which was carried without any questions being asked.

The CHAIRMAN next moved the payment of dividends.

This was seconded and carried.

**J. G. White & Co., Ltd.**

THE annual meeting was held yesterday at Cannon Street Hotel. The report of directors for the year ended February 28th, 1913, showed that the results of the business continued to be satisfactory, the net profit on the year's trading being £88,797. A further £10,000 was allocated out of profits to the special dividend equalisation reserve, making this reserve £50,000. £20,000 was also added to general reserve. The directors again recommended a dividend of 12 per cent. per annum on both classes of shares, and, in addition, an extra dividend of 10s. per share on the ordinary shares. The balance to the credit of profit and loss, after bringing in £21,212 from the previous account, deducting the interim dividend paid on the preferred and ordinary shares at January 1st, 1913, and making provision for percentages due to directors and staff, was £89,904. The directors recommended a dividend of 6 per cent., less income-tax, on the cumulative preferred shares for the half-year to February 28th, 1913 (making 12 per cent. for the year), £9,000; a dividend of 6 per cent., less income-tax, on the ordinary shares for the half-year to February 28th, 1913 (making 12 per cent. for the year), £3,000; extra dividend of 10s. per share, less income-tax, on the ordinary share capital for the year, £25,000; to general reserve, £20,000; special reserve for equalisation of dividends, £10,000; to be carried forward, £22,904.

**R. Waygood & Co., Ltd.**—The directors report that the profits for the year ended March 31st, including £6,254 brought forward, amounted to £31,541. The managing director's and directors' fees absorb £2,800, and after paying the preference dividend, and putting to reserve £1,500, a further dividend is to be declared at the rate of 9 per cent. per annum for the six months to March 31st, making, with the interim dividend already paid, 7 per cent. for the year on the ordinary shares, leaving £9,691 to carry forward.

**Calcutta Electric Supply Corporation, Ltd.**—The number of units delivered to consumers during the four weeks ended April 25th, 1913, amounted to 1,204,906, compared with 884,966 units in the corresponding four weeks of 1912.

**Yorkshire (West Riding) Electric Tramways Co., Ltd.**—The directors have declared an interim dividend on the 6 per cent. cum. preference shares at the rate of 3 per cent. per annum.

**India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.**

A HALF-YEARLY meeting was held at the company's offices, 106, Cannon Street, E.C., on Tuesday, Major Leonard Darwin presiding. The CHAIRMAN said at those half-yearly meetings they gathered together so that the board might have the opportunity of laying before the shareholders some remarks on what had passed in the affairs of the company since the previous annual general meeting. There was usually also a declaration of interim dividends to be made. When he addressed them a year ago he had the unpleasant task imposed upon him of informing them that the board did not see their way, as they thought it imprudent, to pay an interim dividend to the holders of ordinary shares, while they had no hesitation in paying the interim dividend on the preference shares. While making that announcement, he ventured to express the opinion that they were getting into their normal stride, as the abnormal conditions were passing away. On the present occasion he had much pleasure in being able to state that the board felt justified in paying the customary interim dividends on both preference and ordinary shares. They did not wish the shareholders to read into the declaration more than they stated. The raw rubber market was not yet outside the influence of undue speculation, be it for a fall in price, be it for a rise, and the position of the consumers of that product was somewhat dangerous in so far that the ordinary laws of supply and demand were small guides, and might even prove misleading when applied to the short periods of time with which ordinary consumers had to deal. This was all the more true on occasions when all the factors at work for these short periods could not be accurately gauged. The board had recently had before them evidence that several of the combinations which reaped great advantage during the period of artificial values of three years ago, to-day lay waterlogged and broadside on in the trough of the wave they created. He might mention that some of their competitors in the motor-tire trade were making reductions in their selling prices. Those reductions were to take effect from the 16th inst. The board doubted the wisdom of their policy, as their turnover in this line of goods doubtless showed an increase because many manufacturers, and they among the number, had been enlarging their powers of production. At the annual general meeting in December last he mentioned that their cable steamer *Silvertonen* had completed the laying of a submarine cable between Australia and New Zealand, and he had now to say that the period of guarantee then pending, terminated without mishap and the vessel returned to London. She would shortly sail from Queens-town to the Atlantic to carry out some cable repairs in replacement of their *Dacia* which sustained some damage while occupied on the work during abnormally heavy weather. The *Buccaner* had been employed by H.M. Post Office and by the French Government on the West African Coast and also in the neighbourhood of Madagascar. The vessel was now on her way home, and would carry out some further work on the West African coast before reaching London. Their general business had been quite normal.

In conclusion, MAJOR DARWIN moved that on July 1st a dividend be paid to the holders of preference shares of 5s. per share, less income-tax, being the half-yearly dividend due on that date at the rate of 5 per cent. per annum; and further, that on July 1st a payment of 5s. per share, free of income-tax, be made to the holders of ordinary shares, being an interim dividend of 2½ per cent.

MR. R. K. GRAY seconded the motion, which was adopted.

**Stock Exchange Notices.**—Applications have made to the Committee to allow the following to be quoted in the Official List:—

Automatic Telephone Manufacturing Co., Ltd.—100,000 ordinary shares of £1 each, fully paid (Nos. 1 to 100,000) (renewed special application).

The Committee has ordered the undermentioned securities to be quoted in the Official List:—

Madras Electric Tramways (1904) Ltd.—20,000 6 per cent. cumulative preference shares of £5 each, fully paid (Nos. 1 to 15,000 and 30,001 to 35,000).  
Sao Paulo Electric Co., Ltd.—£120,000 additional 5 per cent. 50-year first mortgage bonds of £100 each (Nos. B 1 to B1,200).

**J. Stone & Co., Ltd.**—A financial contemporary says that the accounts for 1912 show that, after full allowance for depreciation, the profits amounted to £143,661, plus £19,380 brought forward, making £193,041. The directors recommend a dividend of 10 per cent. on the ordinary shares and a bonus of 2s. 6d. per share, placing £70,000 to the reserve and carrying forward £77,996.

**Greenwood & Batley Co., Ltd.**—After providing for interest on the debentures, expenses and management and doubtful debts, the accounts for the year ended March, 1912, show a profit of £15,275, plus £3,648 brought forward, making £18,924, out of which the directors have appropriated to depreciation £7,000, provision for charges under the National Insurance Act £500. After paying 7 per cent. on the cumulative preference shares there is carried forward £4,396.

**Japan.**—The Kyoto Electric Light Co. is declaring a dividend at the rate of 12 per cent. for the last half-year.

**W. & T. Avery, Ltd.**—Dividend for the second half of the year ended March 31st at the rate of 15 per cent. per annum on the ordinary shares, 10 per cent. for the year.

## Manila Electric Railroad and Lighting Corporation.

As European Fiscal Agents, the Municipal and General Securities, Ltd., have issued the eighth annual report of the Manila Electric Railroad and Lighting Corporation. The report states that the gross earnings for the year ending December 31st, 1912, were \$1,597,674, being an increase over the previous year of \$144,986 or 9.98 per cent.; operating expenses and taxes increased \$82,648, or 12.87 per cent., while the net earnings from operation were \$873,187, an increase of \$62,338, or 7.68 per cent. Interest charges during the year were \$277,500, and sinking fund requirements were \$28,250, leaving surplus earnings for the year of \$567,437. The annual appropriation for the replacement and renewal fund of \$80,000 has been maintained, and deducting this from the year's surplus earnings, there remains an available surplus for the year of \$487,437, being an increase of \$61,613 over the previous year. From this amount there have been paid four dividends of 1½ per cent. each, and an additional dividend of 1 per cent., making 7 per cent. for the year, aggregating \$350,000, leaving \$137,437 over all disbursements and reserves, which has been transferred to surplus account, making the total accumulated surplus with reserves at December 31st, 1912, \$1,362,140, an increase over 1911 of \$282,062. The Company has no floating debt, the current liabilities consisting of accrued interest and monthly operating accounts. During the year 1912 the operating expenses included \$160,574 for maintenance, and \$103,800 was expended on new construction. Charges to maintenance were higher than in the previous year on account of a thorough overhauling of the road and heavy replacements of ties and ballast. A total of 2.38 miles has been added to the company's trackage. At the beginning of 1912 the company voluntarily made a reduction in the then existing lighting rates, notwithstanding which there was a gross increase for the year from lighting and power of \$83,487. The directors also concluded it would be good policy, in respect to the Company's relations with the public, to make a still further reduction in the lighting rates, effective January 1st, 1913, which reduction, it is estimated, will stimulate business, and will not adversely affect the net earnings of the Company. The contract for street lighting in the city of Manila will shortly expire, and negotiations are now in progress towards renewal on terms satisfactory to the Company. Business conditions were somewhat unsettled during the last six months of 1912, a strike and boycott in the tobacco industry was in progress and weather conditions were unfavourable. Dividends have been paid as follows: 1903, 3 per cent.; 1907, 3 per cent.; 1908, 4 per cent.; 1909, 4 per cent.; 1910, 4 per cent.; 1911, 5½ per cent.; 1912, 7 per cent. Beginning with the quarter ended March 31st, 1913, the directors increased the dividend rates from 6 per cent. to 7 per cent. per annum. Since the beginning of the current fiscal year, there has been added \$33,000 face value of the 5 per cent. Fifty-year First Lien and Collateral Trust Sinking Fund Gold Bonds to the sinking fund, making the total bonds in that fund \$183,000.

## Paris Metropolitan Railway.

THE report of the Compagnie du Chemin de Fer Métropolitain de Paris states that down to the end of 1912 no line had been handed over by the City of Paris since the Place Péreire de Champeret line in 1910, which was opened for traffic in February, 1911, although one section had been rendered available in April, 1913, and a second was pending. Nevertheless, the company had not remained inactive, as advantage had been taken of the stoppage in the development of the network to complete and improve the lines already in operation, and to prepare for the rapid execution of various works. These included permanent-way works, the construction of further ventilating bays, the erection of additional vertical lifts, works at the generating and sub-stations, and the laying of new three-phase cables, which will permit of all the sub-stations being supplied from the Saint Denis station of the Paris Electrical Distribution Co. The length of the railway in operation remained at 44 miles throughout the year, and the average net receipts amounted to £12,801 per mile, as compared with £12,468 in 1911. It is submitted that the increase would have been considerably greater had it not been for the new and very active competition of motor-omnibuses, particularly in the final months of the year. Whilst the transformation had yielded to the Omnibus Co. an excess of £352,000 in receipts, as contrasted with the preceding year, the Metropolitan Co.'s receipts advanced by £41,000, with a network which practically experienced no change. Since the motor-omnibuses entirely replaced the older 'buses—that is, since the last days in December, 1912—a slight reduction in the receipts had taken place. The decline only averaged £29 per day in the first four months of 1913, notwithstanding that the railway company benefited from the strike of the taxi-cab drivers in the corresponding period in 1912, but in the last six weeks of the four months the deficiency had given place to an increase of £77 per day. There was consequently no retrogression, but merely a temporary stagnation, and there was no doubt that the increasing progression would soon be resumed.

The total receipts, including sundry items, amounted to £2,216,000 in 1912, and the working expenses were £942,000, the ratio of expenses to receipts having been 42.52 per cent., as compared with 42.01 per cent. in 1911. After deducting the contractual payment of £711,000 to the City of Paris, meeting general expenses, loan charges, &c., the net profits are returned at £345,000, as against £342,000 in 1911, and a dividend of 17s. 2d. (8.6 per cent.) per share has been declared, as compared with 16s. 9½d. in the previous year. The ordinary and deferred shares

represent a capital of £3,000,000, and the loan capital totals £4,000,000. Application has now been made to the responsible authorities for permission to make a fresh issue of £1,000,000 in bonds out of the emission of £3,000,000 which was approved in general meeting in 1910, and it is expected that the loan will be offered for subscription in the current half-year. During 1912 the bonuses granted to the *personnel* for the purpose of interesting them in the efficient working of the railway reached the sum of £37,100, this comparing with £35,900 in 1911, and the number of employés and agents rose from 5,262 at the end of 1911 to 5,308 at the close of 1912. A second matter in which the company takes an interest in its workers relates to the provision, in conjunction with the Cheap Dwellings Co., which was formed in 1910 with the financial assistance of the Metropolitan Co., of block dwellings for the railway workers, whilst at the same time the company has now advanced loans totalling £40,000, at from 2½ to 3 per cent., for the erection of small houses in Paris and the suburbs. A five-storey block has just been completed at Saint-Onen for the accommodation of 47 families—of those workers who have the largest families and the lowest wages—the rents ranging from 4s. to 5s. 7d. per week, for three or four rooms.

**Continental.**—FRANCE.—Another large company has been formed in France in connection with the supply of electrical energy for power purposes. The latest is the Société de l'Électricité de la Région Valenciennes-Anzin, the capital of the concern being £800,000.

The report of the Société Westinghouse, of Paris, for the last financial year shows a profit of £4,230, as against the loss of £7,663 in the preceding 12 months.

La Société Générale d'Entreprises Electriques is the name of a new company which has just been formed in Paris (71, Boulevard Raspail), with a capital of £12,000.

The balance sheet of La Société Continental Edison, of Paris, for the last financial year, shows a profit of £147,348, as compared with £154,420 in the preceding 12 months.

La Société des Ateliers Electriques Roche-Grandjean is the name of a new company which has just been formed in Paris (27, Boulevard de la Chapelle) with a capital of £13,400, to carry on the electrical engineering works known by the same name.

Just recently there has been quite a rush in the formation of new companies in connection with electricity supply undertakings in France. Among the new concerns are the Société des Forces Motrices de la Loue, which has been organised in Paris (69, Rue de Miromesnil) with a capital of £44,000, to put down a plant to utilise the water power of the River La Loue, at Mouthier (Doubs), in the generation of electrical energy for lighting and power purposes; La Société Electro-Industrielle de Chorges, formed at Chorges in the Hautes Alpes, with a capital of £3,000, to establish a small plant to utilise certain available water power near that little town; and the Compagnie de l'Electricité d'Ivry-le-Pré to establish a small central electric lighting station in the little town of Ivry-le-Pré (Cher.).

La Société des Forces Motrices du Breda et de la Grande Valloire is the name of a new company which has lately been formed at Lancy (Isère), with a capital of £44,000, to establish a plant to utilise the water power of the rivers Breda and Grande Valloire, in the 1-ère Department, in the generation of electrical energy for lighting and power purposes. Another new concern is the Société Sarthoise d'Electricité, formed at Le Mans (Sarthe), with a capital of £16,000, to establish a small central electric lighting station in that town.

**BELGIUM.**—The balance-sheet of the Antwerp Telephone and Electrical Works, of Berchem, Antwerp, for the last financial year shows a loss of £5,886.

La Société Belge pour la Fabrication des Cables et Fils Electriques, of Brussels, reports a net profit of £9,294 for the last financial year.

**GERMANY.**—The Deutsch Ueberseeische Electricitäts Gesellschaft, of Berlin, reports a net profit of £863,990 for the last financial year, an increase of £137,180 over the preceding 12 months. The dividend is being increased from 10 to 11 per cent.

The Elektro-Mobil Gesellschaft is the name of a new company which has just been formed in Berlin, with a capital of £5,000, to start a new service of electric motor cabs in the German capital.

**HUNGARY.**—La Société Auxiliaire d'Éclairage et de Transport de Force de Kolozvar is the name of a new company which has just been formed in Brussels with a capital of £43,600 to acquire and carry on the central electric lighting station of the Société d'Éclairage de Clausenbourg at Kolozvar, Hungary.

**ITALY.**—The Società Elettrica Coloniale Italiana is the style of a company which has just been formed at Milan with the object of erecting electric installations in Lybia and other Italian colonies. Its capital is 1,000,000 lire, with power to increase to 2,000,000 lire.

## Chilian Electric Tramway and Light Co., Ltd.

The directors report that for the year 1912 (including £11,357 brought forward and after placing £60,000 to renewals reserve account and £7,000 to insurance account), there is an available balance of £107,851, out of which a dividend of 6 per cent. on the preference shares in respect of the year 1912, amounting to £39,000, has been declared. Further dividends in respect of the arrears of interest on these shares have also been declared—viz., 6 per cent. for 1901 and 5 per cent. on account of 1902, amounting in all to £60,500, leaving £8,351 to be carried forward.

### German Electrical Companies.

**THE Elektrizitäts-Gesellschaft vorm W. Lahmeyer & Co., of Frankfurt-on-Main,** reports net profits, after deducting interest on loans and banking charges and meeting general expenses, amounting to £81,000 in 1912, as compared with £70,000 in the previous year. The directors recommend a dividend of 6 per cent., as against 5 per cent. in 1911.

The accounts of the *Elektro-Trauchand A.G., of Berlin*, show receipts of £41,250 in 1912 as dividend on the company's holding of shares of £750,000 in the Hamburg elevated railway, and interest amounting to £15,600, making a total of £56,850. On the other hand, interest on loans absorbed £33,850, leaving net profits of £23,000, as the general expenses were borne by the founders, the A.E.G. and the Siemens-Schuckert Works.

The report of *Hartmann & Braun, A.G., of Frankfurt-on-Main*, states that the departments were abundantly provided with orders in 1912, and the number of employes had to be increased, namely, from 766 in 1911, to 850 last year. As gross profits the accounts exhibit the sum of £93,000, as compared with £81,000 in 1911, and the amount of £9,700 has been placed to depreciation, as against £7,500 in the previous year. After defraying general expenses, interest on loans, and making other appropriations, the net profits are returned at £29,000 as contrasted with £21,000 in 1911. The dividend in contemplation is 10 per cent. on share capital of £85,000, being the same rate as in each of the two preceding years.

The report for 1912 of the *Deutsche Pope Lampen, of Ais-la-Chapelle*, indicates a further deficiency, which is chiefly attributed to the fall in prices which was mainly due to over-production. The new manufactures which were undertaken during the year, afforded no compensation for the decline, and the battery department was still unable to yield any return. The "ductile lamp" brought out according to the company's own process, had not answered the purpose, and a reversion took place to the former type of lamp which had stood the test. Including the loss of £1,400 incurred in 1910 and 1911, the total deficiency amounts to £13,400, which has been carried forward. It is added that the cost of producing the Pope lamp has been considerably reduced in the current financial year.

### Austrian Electrical Companies.

**THE Hungarian Siemens-Schuckert-Works Co., of Buda-Pesth**, which has works at Pressburg and Gyomro, realised net profits of £13,100 in 1912, as contrasted with £12,500 in the preceding year, and proposes to distribute 6 per cent., as in 1911, on a share capital of £166,000. It is now intended to raise the share capital to £333,000, in order to defray the cost of the newly erected cable factory, and the issue will be carried out by the syndicate headed by the Austrian Landerbank.

The accounts of the *Austrian Siemens-Schuckert Works Co.* show net profits and balance forward of £83,590 for 1912, as compared with £75,000 in the previous year. It is proposed to pay a dividend of 7 per cent. on the share capital of £1,000,000, this contrasting with 6 per cent. in 1911. During the present year, the report states that new contracts have become slower, although the stock of orders still remains satisfactory. It has been decided to increase the share capital to £1,333,000 by the issue of new shares of £333,000.

The directors of the *A.E.G. Union Gesellschaft, of Vienna*, state in their report for 1912 that the works were fully employed during the favourable situation of trade in general last year, and the orders brought forward in the new year would afford an abundance of work for several months. The company was not affected by the results of the political events in the final quarter of the year. The considerable turnover in 1912 and the incidental large increase in stocks, the deliveries not yet brought into account, and the extension of the works, gave occasion to the issue of the previously authorised new capital of £160,000, and this also rendered it possible for the company to undertake the manufacture of other products. The gross profits reached £129,000, as contrasted with £110,000 in 1911, and the net profits were £50,400 as against £44,700. It is proposed to pay 8 per cent. for 1912 as compared with 7 per cent. in the previous year. The completion of the Pressburg-Vienna Railway is expected to take place this year.

### Continental Electrical Companies.

**Swiss-Italian Enterprise.**—The *Gesellschaft Columbus für Elektrische Unternehmungen* has just been formed at Glarus, Switzerland, with a nominal share capital of £1,000,000, of which £640,000 has been issued, and on which 20 per cent. has been paid. The object is to invest in and carry out electrical undertakings of all kinds, particularly in the Argentine Republic, and the company is credited with having already acquired three-fourths of the shares in the Italian-Argentine Electricity Co., of Buenos Ayres. The board of directors includes representatives of Brown, Boveri & Co., the Swiss Railway Bank of Basle, the banking firm of Len & Co., the Swiss Bank Co., of Zurich, the *Credito Italiano* and the *Compañía Italo-Argentina de Electricidad*, of Buenos Ayres.

**The Paris North-South Railway.**—The working receipts of the *Chemin de Fer Electrique Nord-Sud*, of Paris, amounted to £342,000 in 1912, or £60,000 in excess of the preceding year, and the ratio of working expenses to gross receipts was 51.80 per cent., as compared with 52 per cent. in 1911. The net profits were £80,000, as against £69,000, and the dividend remains at 5s.

per share on an ordinary share capital of £3,000,000, as in the preceding year.

The report of the *Ateliers de Constructions Electriques du Nord et de l'Est, of Jeumont*, states that the turnover in 1912 exceeded that of the previous year by 28 per cent, notwithstanding the prevalence of excessively keen competition. Extensions of the large machine shops were carried out so as to be able to construct the largest machines, and the 12,000 kw. alternator delivered to the Saint Denis station of the Paris Electricity Co. had been put into operation with complete success. The locomotive of 1,500 h.p., which was supplied to the *Compagnie du Midi* for the haulage of heavy and high-speed trains on mountain lines, had yielded results which had induced the railway company to order eight further locomotives of the same type. As a result of the increasing number of customers in the vicinity of Paris, the company had thought it advantageous to have shops within easy reach of the city, and the works of the *Société des Procédés Claret and Vuilleumier* had been acquired for the purpose. The pig-iron, bronze and steel foundries were in full operation, and the company's steel castings, in particular, were much appreciated. Concerning the cable factory, the report mentions that it was very well occupied despite competition, and the turnover in armoured cables was 35 per cent. in excess of 1911. The production and sale of rubber insulated wires and cables were extended and the factory for insulated tubes is fully employed; whilst the rolling mill and wire-drawing mill were brought into use in April, 1912. The accounts indicate a gross surplus of £144,000 and profits, after defraying general expenses and setting aside £60,000 for depreciation, as against £22,000 in 1911, amounting to £81,000, as contrasted with £59,000 in 1911. A dividend at the rate of 6.4 per cent. has been declared on share capital of £1,000,000, this comparing with 6 per cent. in the previous year.

The greatest overseas electricity supply undertaking—that of the *German Transmarine Electricity Co., of Berlin*—experienced a further course of favourable development at Buenos Ayres in 1912. Not only so, but as all the parts of the city upon which buildings have been erected will be equipped with distributing mains in the present year, the directors entertain no apprehensions that the prosperity of the enterprise will be prejudiced by the competition of the *Italo-Argentine Electricity Co.*, which was granted a lighting concession by the municipal council in 1912, or of the *Lacroze Tramway Co.*, which also applied for a similar concession. Apart from the supply of electrical energy for lighting and power purposes in Buenos Ayres, for the operation of tramways and for the working of the underground railway which is to be opened this year, the company also owns supply works at Santiago and is likewise financially interested in other lighting undertakings and tramways in Buenos Ayres, the *Chilian Electric Tramway and Light Co.*, the *Valparaiso tramway* and the *Trans-Atlantica tramway* at Monte Video. The total of these investments amounts to £1,398,000, whilst the advances made to these and other companies represent a further sum of £2,655,000. The capacity of the company's works at Buenos Ayres increased from 74,760 kw. in 1911, to 100,300 kw. in 1912, and the length of mains from 1900 to 2,213 miles; the connections rose by 19,000 kw. to 134,980 kw., apart from 22,820 kw. for the tramways; and the production advanced from 193,350,000 kw.-hours in 1911, to 209,970,000 last year. As gross profits from working, dividends, &c., the accounts show the amount of £1,474,000, as compared with £1,203,000 in 1911, and after meeting general expenses and taxes, interest on loans (£210,000), and depreciation (£308,000), the net profits are returned at £663,000, as contrasted with £526,000 in the previous year. It is proposed to pay a dividend of 11 per cent. on the ordinary share capital of £5,000,000, and 5½ per cent. on new capital of £1,000,000, leaving £14,000 to be carried forward. This result compares with 10 per cent. in each of the three preceding years. The loan capital in 1912 amounted to £4,213,000, and had recently been increased to £5,463,000 by the issue of £1,250,000 in new bonds.

### Mexican Light and Power Co., Ltd.

THE accounts for the year ended December 31st, 1912, shows that the net revenue in gold, after paying all expenses and fixed charges, amounted to \$1,372,686, which, with \$984,127 brought forward, makes a total credit balance to profit and loss account of \$2,356,813. Of this the directors have paid a dividend of 7 per cent. on the preferred shares, and 4 per cent. on the ordinary shares, absorbing \$963,400, and have placed to reserve account \$209,008, and there remains a balance to the credit of profit and loss account of \$1,184,405. The reserve account, after crediting the amount carried from profit and loss account, has been reduced to \$300,000 by debiting to such account \$336,892 for extraordinary expenses incurred during the year. In order to ensure proper protection of the company's properties, and the continuous operation of its service during the recent disturbance in Mexico, the management was obliged to incur a considerable amount of extraordinary expenditure, and the company was able to maintain its services in a very satisfactory manner, and did not sustain any serious damage to its property. The statistics show an increase in the sale of power over the previous years, but not so great as it should have been if the condition of the Republic had been normal. The operating expenses, however, show a reduction from 31.06 per cent. in 1911, to 24.68 per cent. in 1912. The extension of the system of canals and tunnels to divert several rivers into the Necaxa watershed has been proceeded with as rapidly as the conditions have permitted, and although the work has not been completed quite as soon as was anticipated, the board expect that the entire system will be finished and in operation during the course of the year.

During the year the Mexican Light and Power Co., Ltd., acquired the El Oro Light and Power Co. (Cia. de Luz y Fuerza de El Oro, S.A.), which the board believe will prove a profitable investment. The storage in all the reservoirs at December, 1912, was 68,400,768 cb. metres, or an increase of 13,958,489 cb. metres, and greater than ever in the history of the company. Since the beginning of 1913 Mr. R. C. Brown has been appointed vice-president of the company, and Mr. Harro Harrsen, after being elected a director, has been appointed managing director, resident in Mexico City, Mr. C. B. Graves, late vice-president and general manager of the Manila Electric Railway and Light Co., being appointed general manager. The directors express their great appreciation of the services during the past year of Mr. R. C. Brown, managing director, and also of the officials resident in Mexico during a very trying period, especially Mr. H. Harrsen, general manager, and Mr. Luis Riba, legal representative.

The capacity of generating plants is as follows:—Necaxa, 94,000 H.P.; San Ildefonso and other small plants, 10,777 H.P.; Pachuca Light and Power Co., 12,140 H.P.—Total, 116,917 H.P.

Reserve steam plants in Mexico City, including Mexico Tramways Co. plant, 14,250 H.P.—Grand total, 131,167 H.P.

Installations connected.—The number of arc lamps has decreased from 3,914 to 3,055; incandescent lamps have advanced from 400,422 (33,246 H.P.) to 466,256 (31,042 H.P.), and motors from 88,532 H.P. to 99,631 H.P. The total connected is 130,673 H.P., as compared with 121,778 H.P.

	1911.	1912.
Gross earnings ... ..	\$7,581,027	\$8,034,539
Operating expenses and maintenance	2,193,028	1,853,143
Net earnings ... ..	\$5,388,999	\$6,181,396

(Mexican currency.)

### Mexico Tramways Co.

THE sixth annual report, for the year ended December, 1912, states that the operation of the company's undertaking during the year has shown a satisfactory increase. The net revenue in gold for 1912, after paying all expenses and fixed charges, amounted to \$1,830,480, which, with the balance brought forward from 1911, makes a total credit balance to profit and loss account for the year of \$2,617,046, out of which the directors have paid four quarterly dividends at the rate of 7 per cent. per annum, leaving a balance in the profit and loss account of \$1,462,928, which has been carried forward. The ratio of operating expenses to gross income for the year 1912 was 47 per cent., as compared with 48.57 per cent. in 1911. In order to ensure proper protection of the company's properties and the continuous operation of its service during the recent disturbance in Mexico, the management was obliged to incur a considerable amount of extraordinary expenditure, and as a result the company was able to maintain its services in a very satisfactory manner, and did not sustain any serious damage to its property. At December, 1912, the tramway system consisted of 208.30 miles of single track, of which 193.30 miles were operated by electricity, and 15 miles by mules—the electric track mileage having been increased by 17.80 miles and the mule track mileage having been reduced by 4.55 miles. The first sections of the suburban lines to Toluca and Puebla, respectively, have been placed in operation; the Toluca section as far as Cuajimalpa, a distance of 5.405 miles from Santa Fe, and the Puebla section as far as Tulyehualco, a distance of 6.878 miles from Xochimilco. The mule lines were electrified during the year from Ixtacalco to Ixtapalapa, and from Tacubaya to Santa Fe. The physical condition of the company's undertaking in all departments is satisfactory. The property has been maintained in excellent condition and repair, and for this purpose \$735,076, Mexican currency, has been expended during the year. The company has constructed 11 first-class electric passenger cars, as well as eight other cars.

Since the beginning of 1913, Mr. R. C. Brown has been appointed vice-president, and Mr. H. Harrsen, after being elected a director, has been appointed managing director, resident in Mexico city, Mr. C. B. Graves, late vice-president and general manager of the Manila Electric Railway and Light Co., being appointed general manager.

The directors express their appreciation of the services of Mr. R. C. Brown, managing director, and also of the officials resident in Mexico during a very trying period, particularly of Mr. Harro Harrsen, general manager, and Mr. Luis Riba, legal representative.

### Aron Electricity Meter, Ltd.

THE directors' report for the year ended March 31st, 1913, shows, after providing for general charges and depreciation, a net profit of £32,653, making, with £4,456 brought forward, a total available profit of £37,109. Out of this the directors distributed in December last a dividend of 3 per cent. on the preference shares, absorbing £3,747, leaving to be disposed of £33,362. The directors recommend a further 3 per cent. on the preference shares, making a total for the year of 6 per cent., absorbing £3,747, a dividend of 7 per cent. on the ordinary shares, absorbing £8,750, transfer to reserve towards goodwill and patents of £15,000 (making this reserve £55,000), carrying forward £5,865. The past year's trading in electricity meters and taximeters has again been most satisfactory, the sales having exceeded those of any previous year. The company's factories have been fully employed, and the necessary extensions to cope with the increased business are being carried out. The meeting is called for July 1st.

### Edison & Swan United Electric Light Co., Ltd.

MR. ELLICE CLARK presided at the Cannon Street Hotel on June 18th, over a meeting of the first debenture stock of the above company, for the purpose of considering, and if thought fit, passing the resolution which appeared in the *ELEC. REV.* for June 6th, p. 951.

The CHAIRMAN said he was in the chair as the surviving trustee. Some attention had been called in the Press to the fact that he occupied the dual position of a director of the company and a trustee for the debenture-holders. It was only due to him to state the circumstance under which he became their trustee. The late Mr. Forbes, who was chairman for many years of Edison & Swan, resigned the position of trustee for the debenture-holders, and for the purpose of economy he (the speaker) was appointed a trustee in his place without receiving any remuneration. Whilst the late Lord Avebury, who was a trustee, was alive, that was a satisfactory arrangement, but now that arrangement must be subject to revision, and he proposed, in the course of a few days, to resign his position as trustee. He did not propose to make any remarks as to the scheme himself, but would leave that to Mr. Ford, the chairman of the company.

MR. C. J. FORD said they had all had before them the circular, but he would like to give some further information respecting the position of the company, and the reasons which had induced the board to ask their assent to the proposals. He was approached some three years ago by an influential body of shareholders, with a view to becoming director and chairman of the company; he gathered, amongst other things, that the company was in want of funds, and he informed the parties that no one could be expected to take up the position unless both the share and debenture stock-holders were prepared to support him in some scheme with the object of providing further capital. After many discussions, the only apparent means available was the uncalled capital upon the "A" shares which was pledged to the debenture-holders. So far as he could judge, there was no other practical course open to him except that which they proposed to adopt. It had been suggested that they might dispose of their interest in the Altrincham Co., and there were at least two objections to that. It could only be done by forming a company to take over the whole undertaking of the Altrincham Co., and if this were done the Edison & Swan Co., as the promoter and vendor, would have to take a large proportion of the purchase price in securities of the new company. On the other hand, whatever cash they might receive would have to be secured by way of underwriting the new shares, and they would also have to underwrite the working capital. This would be expensive, and the fullest benefit they could possibly derive from the whole transaction would not furnish them with sufficient cash to meet their requirements. Then, again, the Altrincham Co. was progressing very favourably, and last year the net profit, before paying debenture interest, which absorbed £1,250, was £5,750. This year it was calculated the profit would not fall short of £7,250. This being so, it was extremely advantageous to retain the Altrincham securities. As to the necessity of raising further money, as they knew, the company were originally the sole owners of the patents relating to the incandescent carbon lamp, and practically held a monopoly until the year 1893, when the patents expired. During that time large profits were made, but so far as he could judge, far too large dividends were distributed. After the expiry of the patents the manufacture of electric incandescent lamps was thrown open to competition, and the company's profits began to fall away. In 1901 the metallic-filament lamp came in, and this necessitated the expenditure of a large sum of money on new plant, which, he was informed, had amounted to upwards of £30,000. The plant had hardly been installed when the metallic-filament lamp was, in part, superseded by the drawn-wire filament, and about £15,000 was expended in new plant to manufacture this type of lamp. They had also an extensive plant at Ponder's End works for the general fittings business, and this side of the business had been constantly extending. The engineer, however, told him that he found the greatest difficulty in handling profitable orders with which they were entrusted, because he had not sufficient plant to cope with them. He did not want them to think that, should they obtain the money they wanted, they were undoubtedly going to run into heavy expenditure in new plant, for as far as he was able to judge, about £6,000 would do all they wanted. One of the most important matters was that of properly bringing their products before the public. If they obtained this money they would enter on a scheme of consistent advertising. A moderate amount of money prudently employed could do a great deal, and as they found their sales increase they would increase their advertising. It was the only way for a commercial concern to live, and if they could not adopt the course pursued by others the business would not progress, and they would be lucky if they did not recede. They had a good name, and with push and publicity he felt confident that the company could maintain its place in the front rank of the electrical industry. Since he had acted as chairman economies had been effected, and the general expenses had been reduced to the extent of about £6,000 per annum. Arrangements had been made to remove the London premises from Queen Street, and they were looking out for premises possessing a good show-room in one of the leading City thoroughfares. They were advised that there would be no difficulty in letting the Queen Street premises at a substantial rent. With regard to the scheme itself, Clause 1 dealt with the consolidation of the existing first and second debenture stock. It provided for the merging of the £135,602 5 per cent. second debenture stock with the £313,872 4 per cent. first debenture stock. As a matter of fact, £5,977 of the first debenture stock and £67,000 of the second debenture stock, which was included in the figure he had mentioned, had been deposited as security for loans amounting to

£22,000, and if the new money was available, these would be paid off and the stock handed back to the trustees. They would then only have a total issue of about £370,000 consolidated debentures. The stock redeemed could not be issued without the consent of the new trustees. Clause 2 related to the handing over to the trustees of the debenture holders of 25,000 5 per cent. debentures and 33,346 shares of £1 each, fully paid, in the Altrincham Electric Supply, Ltd. The debentures were the total amount issued at the present moment, and the total shares of the company at present issued were 35,000, so that the trustees would hold practically the whole of the capital of this company. He was told that some time back the Altrincham municipality opened up negotiations with the Edison & Swan Co. for the purchase of the Altrincham undertaking, and that the company considered they were entitled to £100,000 or thereabouts in cash for the undertaking. The business had made substantial profits and was an increasing one and should be worth close on £100,000, and the debenture-holders in obtaining this security in place of the £1 per share uncalled were getting a very fair exchange. Further, under the scheme, whenever a sale did take place of the Altrincham undertaking, the whole of the sum realised would be available for the redemption of the debenture stock. Since the original issue of the scheme, in order to meet the views of some of the stock holders who thought they were not getting a sufficient *quid pro quo* for giving up the call, it had been agreed also to specifically charge to the trustees the freehold and leasehold property of the Edison and Swan Co. These stood in the books at £76,000, after writing off depreciation from time to time. Clause 3 dealt with the formation of a sinking fund for the redemption of debentures. As things now stood there was no time fixed for the redemption of the stock; now, if only a few thousands per annum were applied in redemption either by purchase in the market or by drawings, it all helped to raise the price of the stock. Clause 4 gave the company the right to call up an amount not exceeding £1 of the uncalled liability of £2 per "A" share. If the whole of this amount was ultimately collected it would produce £99,261. Some of them no doubt were shareholders as well as holders of the debenture stock, and no one regretted the necessity for the call more than the board. He might remind shareholders that it was far better for them to pay up the £1 of the liability when it was going into the coffers of the company and would considerably strengthen the position of the company, than to let things drag on as they were now with a liability always hanging over their heads of having to pay £2 per share to the debenture holders if things should go wrong with the company. To sum up the points for and against the scheme: he would say that on the one hand they had £67,000 second stock to rank *pari passu* with the first, and they gave up the right of what it was worth to perhaps some day call up £1 per share on 99,000 shares. On the other hand they had specifically charged to them £146,000 of security; the knowledge that when Altrincham was sold the proceeds would go to pay off the stock; an additional one-half per cent. interest; a sinking fund to redeem yearly a portion of the debentures; and a strong company. If the scheme was defeated he supposed they would muddle along as heretofore with the stock unsaleable at 60. He asked them to support the board by agreeing to the present proposals. They had a difficult task before them, that they fully realised, but with the assistance of the debenture holders they were not afraid of the future.

MR. LEA SMITH said he opposed the whole scheme on principle. They knew that the rights of preference shareholders had been wiped out, and the preference shareholders were sick of the whole thing, and he did hope they were not going to start the same thing with debenture-holders. The debenture-holders subscribed their money on the faith of the security of the uncalled capital, and now they were going to have this taken away. He said deliberately that if those who were opposing were beaten, they would see what they could do. This was not a question of compromise, but a question of principle. He asked if it was fair and right for the directors, without calling their shareholders together, to spring this on the debenture holders. He would do all he could to stop it, and as an ordinary shareholder he would not pay any call on his shares which the first debentures were entitled to, unless he was forced to do so by law.

MR. LOCK agreed generally with Mr. Lea Smith that the rights of debenture-holders should not be interfered with, but in this case he thought there was good cause stated for moderating their rights. He was satisfied that their security would be much improved by the proposed scheme.

MR. E. ATKIN said that years ago he was a severe critic of the company, and he had intended that day supporting Mr. Lea Smith, but the statement of the chairman had converted him.

MR. TRENCH, whilst sympathising with the board, opposed the scheme on principle, and wished to move an amendment to the effect that the meeting be adjourned until the new trustee had been appointed and had reported on the scheme.

The CHAIRMAN said they could adjourn the meeting, but they would only be able to discuss the matter before the meeting.

MR. CLAY urged an adjournment to enable the board to confer with some of the opponents of the scheme.

After further discussion, MR. FORD said he entirely agreed on principle that the merging of the second debentures with the first was wrong. He also agreed that tampering with the security of the debenture-holders was wrong. If, however, they looked on the other side of the picture, he contended that the propositions of the board altogether outweighed the disadvantages. He considered that the opposition took great responsibility if they defeated the scheme.

The resolutions were then proposed by MR. FORD and seconded

by MR. QUILTER, and on a show of hands, were carried by nine votes to eight.

MR. LEA SMITH demanded a poll, and it was announced that the result would be declared on the following Friday.

In the afternoon MR. W. DOUGLAS HARRIS presided over a meeting of the second debenture holders, and MR. FORD again explained the scheme.

The resolutions were carried with one dissentient.

The result of the poll of the first debenture stockholders, on the scheme for the consolidation of the first and second debenture stocks shows that there were 16,235 votes (representing £162,602 of stock) in favour of the scheme and 7,212 votes (representing £72,478) against. Stockholders attending the meeting holding 60 votes (representing £600) did not vote. Under the terms of the trust deed a three-fourths majority of the votes in the room (which would be 17,652 votes) was necessary for the adoption of the scheme, and the voting showed 1,117 votes short of this.

### Puebla Tramway, Light and Power Co.

THE report of the directors for the year ended December 31st, 1912, states that further improvement is shown in the results of trading. The net profits in Mexico in 1912 amounted to £76,931, as compared with £67,039 for 1911, £61,678 for 1910, £48,678 for 1909, and £27,354 for 1908. After meeting all expenses, bond interest and first mortgage bond sinking fund, there remains a profit for the year of £354, plus the balance of £6,197 brought forward, making a balance at the credit of profit and loss of £6,551, which it is recommended should be carried forward. All sections of the business show satisfactory increases. Having regard to the disturbed condition of Mexico throughout the period, the directors think that the results of the year's working may be considered as very encouraging. The construction work at the Tuxpango Falls is proceeding satisfactorily, and it is hoped that it will be completed by October next. A contract for the sale of energy to the Vera Cruz Electric Light, Power and Traction, Ltd., has been entered into on terms satisfactory to both companies. Owing to pressure of business engagements, Lord Cowdray has resigned his seat on the board.

Concurrently with the ordinary general meeting of this company in Toronto, a meeting of the shareholders was held on June 18th, at Salisbury House, E.C., Sir Clarendon G. Hyde, the president, in the chair.

Proposing the adoption of the above report, the CHAIRMAN, after explaining that the meeting was held later this year, owing to the recent revolution in Mexico, said that the political situation in that country was still far from satisfactory. It was a matter of congratulation to the directors to know that no damage had resulted to their property, and that business had proceeded throughout the whole period of unrest in a satisfactory manner. Indeed, he was pleased to say they had had an increase of business in all departments. Late in February one of the company's transmission lines was cut by a brigand, who had the assurance to demand a weekly payment in order to permit the company to carry on its business. He need hardly tell them that the directors did not comply with such a demand. The development work upon the Tuxpango Falls had been going on rapidly. Commenced in February of last year, they expected to have had it finished by the end of April of this year. The local disturbances had naturally had the effect of diminishing the supply of labour, and of delaying the arrival of machinery and material, but in spite of those drawbacks, the work was well in hand. The power house was in course of erection, the tunnel was 85 per cent. finished, the pipe line and other masonry works were nearly completed; practically the whole of the pipes and machinery were on the ground, and it was expected that the work would be finished by October 1st. The transmission lines from Tuxpango to Puebla city were already finished and in use. They were able to get a temporary supply from the falls of Orizaba, by arrangement with a local jute mill company. That additional supply was brought into use last December, and would abundantly serve their needs until they were able to dispense with it by the opening of their power house at Tuxpango. In anticipation of the opening of their new power house, they had concluded a contract for the sale of electrical energy to the Vera Cruz Electrical Light, Power and Traction Co., Ltd. That would mean a large increase in their income by the supply of a minimum of 2,000 H.P., and although the rates they were getting were comparatively low, the contract at any rate provided an immediate market for a substantial portion of their new available supply, and whilst relieving their standing charges, would do something more than pay interest on the capital invested. As the demands of the Vera Cruz Co. increased, they hoped that the contract would assume a more profitable shape. Another matter of interest had been the negotiations for the electrification of the city tramways in Puebla. The city authorities were extremely anxious that the present mule trams should be replaced by electrical traction. The directors were not especially anxious in the matter, as the capital involved was heavy, necessitating the entire reconstruction of their present lines, whilst the additional profit to be derived was not likely to be fully commensurate with the expenditure. They must, however, face the fact that the Puebla trams must sooner or later be electrified. After considerable negotiations with the Governor, they arranged a contract in which, in return for a subsidy and certain privileges, they undertook to electrify the tramways within a given period. The revolution in February last changed most of the officials throughout the Republic, and the local State Congress, when the contract came

before them, rejected it. The directors were not, however, on that account discouraged; the demand for electrifying the tramways came from the authorities, and not from the company. They were glad to be relieved, in the present state of the Money Market, from the necessity of raising the additional funds, and they hoped that before the matter again became ripe the restoration of order throughout the Republic, the additional sales at their power house and an improved Money Market here would place the company in a strong position to raise any funds required. Turning to the accounts, they would see that, although they had not yet got any benefit from the capital in the Tuxpango Falls, the net profits had increased by a little under £10,000. He thought they would consider that an eminently satisfactory result, having regard to all the circumstances of the case. The profits in Mexico had increased from £26,000 in 1908 to practically £77,000 in 1912. In the new power house was available they saw no reason why that rate of increase should not at least be maintained.

MR. S. MACKEW seconded the motion, and the report was adopted.

### Marconi International Marine Communication Co., Ltd.

THE thirteenth ordinary general meeting was held on Monday at the office, Marconi House, Strand, Mr. Godfrey Charles Isaacs, the managing director, presiding.

THE CHAIRMAN, in proposing the adoption of the report, said he was pleased to say that the business of the company continued to develop. During the past year there had been a very substantial increase in the receipts and in the number of ships equipped, with the result that the profit was between £9,000 and £10,000 in excess of the previous year. One of the items which was of particular interest was that of ships' telegrams, news service, traffic and ships' subsidies, which during the past year had exceeded £100,000. The number of ships equipped up to the end of last year was 580, and to date it had reached 686, and he was glad to say that the number was continuing to increase in the same ratio. The company was conducting a business which served a very valuable purpose for the mercantile marine. He did not know that there was another industrial business which played a more important part in the world than did wireless telegraphy on ships at sea. During the past 12 months they had had a very large number of instances where it was more than probable that in times past when there was no wireless telegraphy, many ships would have sailed from their ports and would never again have been heard of. In practically all those cases not only had all the passengers been saved, but the ships themselves had been saved. He did not know yet what part that might play in reducing the cost of insurance to shipowners, but it seemed self-evident that whereas in the past a number of ships would have been total losses, in every instance where a ship had been fitted with wireless telegraphy during the past 12 months both the ship and the cargo had been saved. There had been a considerable amount of legislation during the past year in nearly all countries, providing that ships should be fitted with wireless telegraphy. There had been a certain limit to which the law applied. In most cases it only touched ships carrying 50 persons or more, whether passengers and crew or crew alone. He thought that that was likely to be the beginning of much legislation, and that as time went on they would find that the laws would be made to apply to every ship that sailed from a port. Personally, he could not see why that should not be the case, for whether there be 50 persons on a vessel, or 25 or less, it seemed to him that if there be a means of safeguarding the lives of those on board, it should be applied in every instance where it was possible. In this country they were expecting similar legislation. Exactly what line it would take he was not yet in a position to say, but he contemplated that it would go rather further than the laws of other countries.

MR. H. S. SAUNDERS seconded the motion, and the report was adopted without discussion.

## STOCKS AND SHARES.

Tuesday Evening.

MARKETS round the Stock Exchange, with very few exceptions, have undergone further severe falls since our last week's statistics were made up. A lot of forced stock came in for sale, and prices melted like snow under the pressure to realise, although a strong recovery to-day, Tuesday, wiped out much of the previous fall. The trouble is no longer so much political as it is financial, and that there must be distress in many quarters is obvious enough from the depression which prevails in stocks and shares. Quotations for investment securities have kept tolerably steady, but in anything where a bull account exists the process of disintegration went on from day to day for nearly a week. On the eve of the present settlement, happily, a material rally occurred, though the worst of it is there is not much confidence felt with regard to a continuance of the improvement.

Consols went down to nearly the lowest price which they have touched in their present 2½ per cent. condition, but on the quotation picking up Home Rails accepted the cue and also hardened. Metropolitan on Monday was 2½ down on the week, Districts 2½; while the steam stocks showed long catalogues of substantial falls. To-day, Tuesday, has seen the 2½ restored to

Metropolitans, and Districts are only 1½ lower on balance. District Prior Lien Debenture shed 2 points, but Central London Ordinary regained its fall of the week previous. City of London 1903 Preference also rose 2, bringing it into line with the 1901 stock. Underground Electric Railway shares fell to 3½, a drop of ½, and the 1s. shares at 8s. 9d. were ¾ down, while the 6 per cent. income bonds lost 1. Of the slower-moving shares, Potteries Preference eased off to 12s. 6d. The London and Suburban issues are a trifle easier—it will be noticed that we have included these in our over-leaf lists.

Electricity Supply shares have attracted a little attention, because of the fresh fall in City of London Ordinary, where the price has got down to 15½. Vague hints reach us of "something being up"; but whatever that may be, the price is certainly not, and the people who in the ordinary way support the shares, have been holding their hands. With regard to these, however, as in most of the markets, it is not surprising that the price should have given way, because in such troublesome times to attempt a bullish demonstration is simply to invite proprietors to take advantage of the opportunity to get out of their shares at what looks a good price. County Preference fell ½ to 11½, St. James' are a little easier at 6½, and Westminster Ordinary at 8½ are ½ down. Charing Cross Preference lost an equal fraction; and the only rise in the list is one of ½ in Bournemouth and Poole Second Preference shares, which did not participate last week in the advance in the other classes of this company's shares.

The suggested reconstruction of Crompton & Co. served to stimulate a little inquiry for the company's Debenture stock, and the price has risen 2 points. Edison & Swan descriptions are notably unchanged on the battle which has been going on in connection with the reorganisation scheme, which was defeated at the meeting.

The other manufacturing shares are fairly steady, though Henleys and Callenders receded ¼, while Babcock & Wilcox at 2½ are ¼ down. Arons have issued a good report, showing an increase in the dividend from 6 per cent. to 7 per cent.; the company has sold more taximeters in the past year than it has done previously in the course of its history. Upon this the shares hardened to 15s. middle. British Westinghouse 4 per cent. Debenture is 1 up.

Stock and shares in the Latin-Canadian group have been amongst those most affected by the depression, and subsequent recovery, in the markets; at times some of the low-priced shares in this division were almost unsaleable. The market has braced up from the worst, but on balance there is a fairly long list of declines left. British Columbia Electric stocks have been extremely heavy, and the Deferred at 117½ is 6½ down. The Preferred at 106½ shows a loss of ½, and the 5 per cent. Preference is a point lower; though, curiously enough, the 4½ per cent. Debenture at 94 is a point to the good. Mexican Light and Power Common remained at 68½; the Preferred shares fell 2, which raises the yield on them to 7 per cent. on the money.

Montereys and Mexican Electric Light Bonds are both a point down. Canadian General Ordinary fell 3½, but Shawinigan Water and Montreal shares retained their prices. Mexico Trams dropped 3, to regain 2 later on, and Rio First Mortgage Bonds fell ½. In most of these cases the declines are due to causes extrinsic to the undertakings, and there can be little doubt that when these are removed the quotations will recover. That this will be a matter of time may be taken for granted, because the results of such a series of shocks to confidence in Stock Exchange investments cannot be repaired at a few days' notice.

Anglo-Argentine Tramways 4½ per cent. Debenture is a point down. The Fives keep steady about 96½, at which there is a quiet flow of investment going on, the security being considered quite good. It is certainly well covered, according to the last reports issued by the Company. Other South American issues have given way in sympathy with the rest. La Plata Trams, Para Electric Railways Ordinary, and City of Buenos Ayres Trams are all somewhat easier. Brazil Traction shares slumped to 86, rebounded to 90, and show no net change on the week; while the new 6 per cent. Preference shares are being quietly absorbed in the neighbourhood of 98, by those who do not mind running a slight risk for the sake of a good return on the money. According to the prospectus recently issued, the dividend on these is well secured.

There is not much change in the Telegraph market. West India and Panama and Globes are each ½ down. Eastern Telegraph 4 per cent. Debenture stock is ½ higher, a similar fraction being lost by Western Telegraph 4 per cent. Debenture stock. A recovery of ¼ in New York Telephone 4½ per cent. Bonds is evidence of the investor being in the markets, for the security in their case is excellent. Reuters shares are weaker at 10, their par value. National Telephone Deferred stood out as a feature of strength amidst weak markets, the price hardening up to 23; and Marconis, after dipping to 3½, improved to 3½ buyers, when a few "bears" came in on the eve of the account to level up their commitments. In addition to this, the market had the benefit of the news that the company had just concluded an important contract with the Norwegian Government for the supply of an installation, this being taken as testimony to the Marconi system being one of the best. After falling to 2½, the Preference shares recovered to 2½.

The Rubber share market, after being exceedingly flat, experienced a sharp recovery. Earnest discussions are taking place with a view to raising the price of the plantation product—or, at all events, for bringing it more into line with that of Fine Hard Para, the price of which stands about 10d. per lb. higher than plantation rubber. Why there should be this difference between the two classes of material is also a matter of keen debate, for all the recent controversy in connection with the subject leaves it still a conundrum.

## INTERNATIONAL TIME SERVICE.

ON Tuesday next, July 1st, the new arrangements for the distribution of time signals, organised by the Bureau Central International de l'Heure, will take effect, superseding the signals at present issued from the Eiffel Tower and Norddeich. The facility with which accurate time can be transmitted from observatories on land to ships at sea, as well as to other observatories, surveyors, clock makers and others to whom precision in this regard is of the first importance, is by no means the least of the many benefits conferred upon humanity by radio-telegraphy, and it was the demonstration of its capabilities by the French Government station at the Eiffel Tower which led to the International Conference of 1912, appropriately held at Paris. We explained in our issue of January 10th, 1913, the method which has been adopted for the new service, and reproduced the diagram which forms the key to the signals. From the end of the fifty-seventh minute of the hour, warning signals are sent out consisting of the letter x (— . . —) for 50 seconds, followed by silence for five seconds, after which the first time signal is given, consisting of three dashes each lasting for one second, separated by intervals of one second. Thus the end of the third dash coincides precisely with the end of the 58th minute. Afterwards the letter x (— .) is sent every ten seconds, followed by the second time signal, and finally a series of G's (— — .) followed by the third time signal, the last dash ending precisely at the hour. These signals will be sent out from the Eiffel Tower daily at 10 a.m. and midnight, with a wave-length of about 2,500 metres, and from Norddeich at midday and 10 p.m.; both series should be easily received at any part of the United Kingdom. The times of the signals given at other centres are as follows, Greenwich time being stated in each case :—

San Fernando (Brazil) ...	...	...	2 a.m. and 4 p.m.
Arlington (U.S.A.) ...	...	...	3 a.m. and 5 p.m.
Manila and Mogadiscio ...	...	...	4 a.m.
Timbaktu ...	...	...	6 a.m.
Massouah ...	...	...	6 p.m.
San Francisco ...	...	...	8 p.m.

One of the great advantages of wireless time service is the exceedingly short interval between the dispatch and the reception of the signals, which, in most cases, renders any correction on this account unnecessary. There is, however, an appreciable time lag between the initiation of the signal by the standard clock in the originating observatory and the emission of the train of waves which constitutes the dash or dot, owing to the necessary interposition of a relay and other transmitting apparatus in the sending station; this is very carefully determined, and is allowed for at the sending end, so that the actual radio-telegraphic signal is accurately timed.

Reception can be effected with an antenna of modest dimensions, over a range of a few hundred miles from such a station as the Eiffel Tower or Norddeich; indeed, as we recently noted, even an iron bedstead may suffice. The observer listens to the signals, with the clock or watch to be compared before him, and with practice it is not difficult to estimate the difference between the true time as given by the signal and that of the clock to a half or even a quarter second. Beyond this degree of accuracy it is necessary to have recourse to more refined methods of observation, either with the aid of automatic recording apparatus or with the system described later. M. Albert Turpain has succeeded in devising methods whereby a photographic record of the signals can be made simultaneously with a record of the beats of a local chronometer 300 km. from the Eiffel Tower, giving an accuracy of  $\frac{1}{2}$  second; or by speeding up the apparatus so that the photographic film travels at the rate of 100 mm. per second, enabling the arrival of the time signal to be recorded within a millimetre, it is possible to determine the correct time to about  $\frac{1}{100}$  second.

But recording apparatus is not essential to obtain this

degree of accuracy, as we shall show—premising that an accuracy of this order is necessary when, for instance, an observatory which has been prevented by cloudy weather from determining the time by astronomical observations is taking the time from an observatory more favourably situated. Before the ordinary night signals, the Eiffel Tower sends a series of 180 short dots regularly spaced by one second less about  $\frac{1}{10}$  second. In each series the 60th and 120th dots are suppressed, in order to facilitate counting by the observer, who listens to the dots and to the beats of his seconds clock or chronometer. The two series will generally be out of phase, but during the period whilst the 180 dots are being dispatched there must be three coincidences between the dots and the beats, spaced 50 seconds apart. Noting the time indicated by the chronometer at the moment of coincidence, as well as the number of the dot at which the coincidence occurs, it is easy to calculate the time indicated by the chronometer at the instant of the arrival of the first dot. If the time of a coincidence was, for example, 23 hr. 30 m. 25 s., the number of the dot at that moment being 42, the time of the first dot by the chronometer must have been 23 hr. 30 m. 25 s. — 41 ( $1 - \frac{1}{10}$ ) seconds = 23 hr. 29 m. 44.82 s. It will be seen that this "method of coincidences," which has been used for the purpose of comparing clocks and chronometers for generations, is really nothing more or less than the familiar vernier, applied to the measurement of time instead of space, and it enables the true time to be communicated with an accuracy of about  $\frac{1}{100}$  second.

As the determination of the time by astronomical methods involves a knowledge of the longitude of the place at which the observations are made, it follows that if the time can thus be accurately transmitted, the difference of longitude between two places can be accurately measured, and thus the time service becomes of great value to astronomers and surveyors. The system has already been employed for this purpose in France, Belgium, and the French African colonies. As the wireless signals can be received in places difficult of access, such as Central Africa, the surveying of such regions is thereby greatly facilitated. Observations have even been made between Arlington, U.S.A., and the Eiffel Tower, though the low power at present available at these stations (50 or 60 kw.) and the great distance between them (6,000 km.) have made the process difficult. The difference of longitude between Arlington and Paris, to an accuracy of a few hundredths of a second, has thus been determined, and the results will shortly be published; further observations will be made during the coming winter. In the case of so great a distance the time occupied in the transmission, at the speed of light (300,000 km. per second), is not negligible, amounting to 0.02 second.

Unfortunately, Greenwich Observatory, though equipped with receiving apparatus, is unable to transmit the signals, and is, therefore, omitted from the list of international time centres. While every credit is due to the French Government for taking the initiative in this respect (although, as a matter of fact, it was not absolutely the first to employ radio-telegraphy for this purpose, time signals having been distributed from Halifax, Nova Scotia, in 1906), we cannot but agree with Mr. F. Hope-Jones, who recently drew attention to the fact that as Greenwich has hitherto taken the lead in giving the time to the world, the British Government ought to have been the first in the field. As we noted last week, a constant difference has been observed between Greenwich mean time and the time signals from the Eiffel Tower and Norddeich, the latter being on the average 0.3 second late on Greenwich.

One of the applications of the time service which has gained an extended vogue abroad is to the determination of the correct time by watch and clock makers for the purposes of their business. Scores of amateurs in this country take their time from the Eiffel Tower, and there is no reason whatever why our manufacturers should not do the same, as the receiving apparatus is simple and easily managed. The only formality required is to obtain a licence from the Post Office, which presents no difficulty. This licence is necessary even if only receiving apparatus is installed.

We are indebted for much of the foregoing information to the interesting paper read by Commandant Ferrié at the recent Electrical Congress in Paris.

## REVIEWS.

*Toll Telephone Practice.* By J. BERNHARD THIES, B.S., LL.B., and GUY A. JOY, B.E. With an introductory chapter by FRANK F. FOWLE, S.B. London: Constable & Co., Ltd. Price 14s. net.

The rapid developments which are taking place in the art of telephony are forcibly brought home to one by a perusal of this book, which, as indicated by the title, deals exclusively with toll, or, as we may say on this side of the Atlantic, trunk line working.

Not so many years ago, in treatises on telegraphy, the telephone used to be relegated to a single chapter at the end of the book. We then had special text-books on telephony; but the subject has now grown so vast that it would be almost impossible, at the present day, to give in a single volume a detailed account of every phase of the methods and processes employed in the electrical transmission of speech.

Telephony originated in America, and it is to American writers that we are indebted for the best treatises on the subject. This is, to a certain extent, a disadvantage for the British reader, for not only have the various telephone systems been developed here on somewhat different lines from those followed in America, but the technical vocabulary employed in New York differs in many respects from that used in London. It does not take long, however, for the reader to become acquainted with the unfamiliar phraseology, and although the systems described in American books may not be exactly similar to those in use in Great Britain, yet the study of American methods cannot fail to be of help to the telephone engineer in this country, by giving him new ideas and suggestions for the development of the special systems with which he is more immediately concerned.

The introductory chapter of the volume under review gives a brief historical sketch of the development of the subject. The modern systems, from rural lines to large lamp-signalling trunk switchboards, are then described in detail. After a chapter dealing with junction line arrangements between trunk exchanges and local automatic exchanges follow descriptions of the supervisor's desk connections and the equipment of the test-clerk's table. The superposition of telegraph circuits on trunk lines, and the methods used to increase the number of separate trunk connections which can be obtained with a given number of lines, are then discussed.

The remaining chapters of the book deal with test boards, line construction, a brief discussion of the theory of telephone transmission and the advantages to be derived from the use of loading coils, induction troubles and their remedies, the various methods of testing necessary in a trunk exchange, the routine maintenance of trunk circuits, and a description of the telephone relay.

The book is well printed, the diagrams are excellent, and we can confidently recommend it to those telephone engineers who wish to broaden their views on their profession and to keep themselves up-to-date with the developments of the subject.

*Bells, Indicators, Telephones, Fire and Burglar Alarms, &c.* By J. B. REDFERN and J. SATIN. London: Constable and Co., Ltd. Price 1s. 6d. net.

This volume is one of the well-known electrical installation manuals, and, like the others of the series, it is well worth the price asked. The total number of pages is divided among the several subjects treated in the following manner:—Bells, 32; indicators, 10; telephones, 74; fire and burglar alarms, 3. We rather think it would have been better to have devoted one volume to bells, alarms, indicators and primary batteries, and a second to telephones. The text is not divided into chapters, but into 72 paragraphs, by which the various items are indexed. As the paragraphs are mostly one page, or less, in length, the indexing by paragraphs does not introduce any particular inconvenience, though we much prefer references to pages.

As the authors point out, bell-fitting can be reduced to a fine art if only a little common sense be brought to bear upon it, but, owing to the simplicity of electric bells and their circuits, they are apt to be regarded with contempt by the

average wireman. The authors explain, by clear text and illustrations, the construction and relative advantages and spheres of applicability of various types of bells (including the polarised magneto-ringing pattern). Admirable though this section is in other respects, a serious omission seems to be the absence of explanatory and advisory text dealing with the relation between bell resistance and battery power required, &c.

The line illustrations (of which there are 85 in all), are very neat and clear, but in some cases the arrangement of the circuit might have been chosen so as to indicate the fundamental lay-out more clearly. Fig. 15, for instance, is a case in point.

In connection with burglar alarms, it would have been well to illustrate a few inconspicuous and reliable arrangements for mounting contacts on windows, show-cases, &c., and we find no reference to the best types of batteries to be used in closed-circuit alarm installations.

The telephone section deals, under various paragraph headings, with direct working telephones, the construction and function of induction coils, magneto- and intercommunication telephones, location of instruments, cables and wiring, ringing batteries and their location and connections, telephone switchboards, the central-battery system and outside line construction, and includes useful instructions for working the switchboard system. In this section (seeing that the index, though good, is by no means complete), we believe that titles should have been attached to the illustrations, or, at least, parts of the text should have been italicised so as to facilitate reference to any particular topic. There is a general similarity between telephone wiring diagrams which renders such a course particularly desirable. Paragraph 33 extends over 13 pages, and includes 12 figures, and yet has no sub-section headings or illustration titles.

No space is devoted to automatic exchange working—the development of which is surely sufficient to justify its treatment. Probably space limitations precluded the introduction of this subject, thus supporting our view that it would have been advisable to keep the telephone matter in a separate volume. However, the book is to be thoroughly recommended to wiremen and those engaged in the installation or working of telephone equipments. In a later edition we hope to see the index somewhat amplified.

*Iron and Steel.* By O. F. HUDSON, M.Sc., and GUY D. BENGOUGH, M.A., D.Sc. London: Constable & Co., Ltd. Price 6s. net.

To the making of books on the subject of iron and steel there seems to be no end, and the critic might question the need for still another, did not the authors, by their reference to their work as "an introductory text-book for engineers and metallurgists," imply that it was by no means intended to compete with the "classics" on these subjects by Harbord, Turner and others. Both authors are specially fitted to deal with these metals, and especially the effect of mechanical and heat treatment on their properties and on those of their alloys, by virtue of the large amount of original research work that they have done in this direction. They wisely ignore almost entirely in the volume under review the practical details of methods of production, in order that more attention may be directed to matters of greater importance to engineers and other users of these metals, such, for example, as mechanical testing, the properties of cast-iron, foundry practice and the mixing of cast-iron for foundry work. In the section devoted to the latter there is included a useful table showing the composition of cast-iron suitable for different purposes, such as thin ornamental work, medium-sized castings for general work, heavy machinery castings and engine cylinders and hydraulic work. The table shows how careful the engineer must be about the composition of his castings, for while the silicon in light, thin work can be as high as 2.50 per cent., it should not exceed 1.00 per cent. in the case of cylinder castings. Malleable castings are now so largely used in spite, be it noted, of the advent of cast steel, to which an instructive chapter is devoted, that the authors' account of this useful and cheap material, which can be successfully employed for innumerable small castings of thin section, will be read with special interest.

The use of the electric furnace in the manufacture of iron and steel is discussed. It is shown that this type of furnace is not used much in this country at present—owing to high cost of energy—though one might expect its use in the Sheffield district in connection with the production of alloy steels. Both of the authors are expert metallographists, hence we are not surprised to find a number of excellent reproductions of microphotographs, which will enable the reader the more readily to comprehend the somewhat highly technical matter of the composition of iron-carbon alloys.

The volume concludes with a section devoted to the corrosion of iron and steel by Dr. Bengough, who is peculiarly fitted to deal with this very important subject by virtue of his position as Honorary Investigator to the Corrosion Committee of the Institute of Metals, in which capacity he must have had exceptional opportunities of looking into this still mysterious subject.—G. S. S.

*Simple Electric Cookery.* By MAY LITTLE. London: Jarrold & Sons. Price 1s. 6d. net.

This, we believe, is the first electric cookery book; it is a sign of the times, and will be warmly welcomed by two great classes—the suppliers and the consumers of electricity—to say nothing of the manufacturers of electrical cooking apparatus. The author is a highly qualified teacher of cookery, and gives demonstrations at the Norwich electricity department's showrooms. The first 27 pages are devoted to hints and notes on electric cooking, and a variety of apparatus by leading makers is illustrated, but the pages are not loaded with descriptions of these. The convenience and simplicity of electric cooking, which needs no special training; the perfect regularity of the heating and the certainty of always achieving the desired result; and the economy which can be effected by the proper use of the apparatus, are pointed out. The safety from shock and from fire, and the absence of fumes and dirt (due to the absence of fumes) are other advantages which are cited, together with the saving of labour. The author emphatically declares that cooking by electricity is economical in every way, and that if electricity can be had at 1d. a unit or less, the cost compares very favourably with that of gas at 2s. 6d. per 1,000 ft.

The reduction in the loss by shrinkage of meat, with the accompanying gain in digestibility and flavour, is not overlooked. Instructions are given for cleaning an electric cooker, and for carrying on the usual operations, and a few particulars are added as to the cost of cooking by electricity. The remainder of the book—100 pages—is devoted to recipes numbering 185, and covering all the requirements of a large household; these are too highly technical for us to venture on discussing them, but we may note that directions regarding the "heat" to be employed, the use of "residual heat," &c., are of frequent occurrence. In other words, this is not an ordinary cookery book with an introductory chapter on electric cooking; it is a new work, written expressly to guide the user of electric cooking apparatus, by one who is an expert in the art. We have no hesitation in commending it to the notice of all who are concerned with this increasingly important branch of the electrical industry.

**Charging Electroscopes.**—Writing to *Nature*, Mr. R. Whiddington says he finds that a very convenient way of charging an ordinary gold-leaf electroscope is to rub the charging rod with the glass bulb of a glowing carbon-filament lamp. The leaf system becomes negatively charged. It is quite easy to charge a Braun electrostatic voltmeter to several thousand volts in this way.

There appears to be nothing mysterious in the phenomenon. The glass of the lamp is kept hot and free from moisture by the heat supplied from within, and is, therefore, always in a suitable state for producing electricity by friction against metals or other substances. A glass tube filled with hot mercury can be used as successfully as the lamp.

This method of producing electricity by friction is easy to employ and certain in action; the degree of electrification can be regulated to a nicety.

**Electrical Congress in Argentina.**—A scheme is on foot to organise an Electrical Congress in Buenos Ayres, to which all the electrical engineers in Argentina and Brazil would be invited.

## AIR-GAPS IN MOVING-COIL INSTRUMENTS.

By CHARLES C. GARRARD, M.I.E.E.

A MOVING-COIL ammeter or voltmeter consists of a permanent magnet arranged with a narrow air-gap, or gaps, within which a pivoted coil, carrying a current proportional to the quantity to be measured, moves. The torque set up by the electrodynamic action of the current on the magnetism in the air-gap deflects the instrument and causes the same to indicate. The object of this article is to consider the effect of various arrangements of the air-gap on the efficiency of the instrument, and also to deal with several points in the manufacture of such instruments, which may be of interest. In addition, some considerations on the subject of the permanent magnet itself will be dealt with.

1. *Torque Experienced by a Wire carrying a Current in the Field Produced by a Permanent Magnet.*—Let  $l$  be the active length in inches of wire (i.e., within the action of the magnetic field),  $i$  the current in amperes flowing through the wire, and  $B$  the magnetic density (i.e., number of magnetic lines per sq. centimetre in the air-gap), then—

$$\text{Force acting on wire} = L \times 2.54 \times i/10 \times B/981 \text{ grammes.}$$

$$\text{Torque} = \text{force} \times \text{radius in centimetres at which the force acts} = \text{gramme-centimetres torque.}$$

In a good 90° scale moving-coil instrument the torque at full scale deflection is generally about 1 gramme-centimetre.

2. *Magnetising of Permanent Magnets.*—Before magnetising, the magnets should be finished machined, and provided with their cast-iron or mild steel pole pieces, which should not be removed after magnetisation; in fact, as far as possible, the magnetic circuit should not be disturbed after the magnetising and ageing process. Generally, it will be necessary to remove the core round which the moving coil swings. But nothing further should be moved without remagnetising the magnet.

The first process is to magnetise the magnet to saturation. This is most conveniently done as follows:—

A magnetising coil is provided, of, say, 28 turns, so made that each turn is in two halves, an upper and a lower one. The upper halves are arranged on a plate hinged relatively to the plate carrying the bottom halves. Thus the coil can be opened out, a magnet inserted and the coil closed again, and the magnetising circuit is complete round the same.

The joint between the upper and lower halves of each turn can be a mercury one, the coils being thick copper wire of, say, No. 10 S.W.G. The coil so formed is then connected a number of times, as a short-circuit, across a 200 to 250-volt direct-current supply in series with a circuit-breaker, which naturally operates each time a short-circuit is made. As small a resistance is placed in series with the magnetising coil as possible. Naturally, such work may cause some disturbance to the electric supply in the neighbourhood, and in some factories it is found most convenient to carry out magnetising work when the rest of the shops are shut down. The most suitable resistance and setting of the circuit-breaker for the local conditions will, however, be found by trial, the principle being by means of sudden magnetic blows, so to speak, to magnetise the magnet to saturation.

3. *Maximum Value of Magnetisation of the Magnet and Effect of Arrangement of the Air-Gap.*—The saturation value of a good magnet will be about 3,500 lines per square centimetre cross-section of the magnet. It should be noted that this saturation value is the remanent magnetism after the magnetising force has been removed and while the magnet is subjected to the small self-demagnetising action of its own free poles. It is not necessary to go into this minutely, the chief point to bear in mind being that the maximum number of magnetic lines which can be got through the magnetic circuit depends almost wholly upon the character of the steel and the cross-section of the magnet, and not upon the shape or size of the narrow air-gap of the instrument. As, moreover, the magnetic leakage of lines—i.e., lines not passing through the air-gap—is, with a good design of instru-

ment, not more than about 10 per cent., it will be seen that the amount of magnetism available for giving the deflecting torque to the instrument simply depends upon the quality and size of the permanent magnet and not upon the arrangement of the air-gap.

4. *Parallel Arrangement of Air-Gaps.*—This disposes of the claim recently made (see *Electrician*, Vol. LXX, p. 671) that the arrangement of the two air-gaps of a moving coil instrument in parallel (see fig. 1) instead of in

FIG. 1.—AIR-GAPS IN PARALLEL. FIG. 2.—AIR-GAPS IN SERIES. PERMANENT MAGNET SYSTEMS.

series is an advantage. The claims put forward for this arrangement were:—(a) Greater permanence; (b) remarkable freedom from external interferences; (c) exceedingly strong working field.

As regards (a) this cannot be affected by the air-gap, as it simply depends on the magnetic rigidity of the magnet, which will be dealt with later; and (b) and (c) simply depend upon the density of magnetism in the air-gap. As the total magnetic lines available simply depend on the magnet, it will be seen that, with equal magnets, the density in the air-gap of the parallel arrangement is half that in the series arrangement (assuming the air-gaps equal in area). Therefore the effect of exterior fields is double in the parallel-gap instrument and the working field is one-half.

5. *Ageing of Permanent Magnets.*—The process described in paragraph No. 2 has brought the magnet to a state somewhat under complete saturation. Such a magnet cannot, however, be used in an instrument with any hope of constancy of calibration. It is necessary to subject it to the so-called ageing process. Many methods have been proposed for this

nating current around the magnetising coil. When doing this the demagnetising alternating current must be gradually increased to its maximum and then gradually decreased to a small value before breaking the circuit. Thus any ambiguity as to the exact point in the current curve at which the circuit is ruptured is obviated. In order to secure the best results it is necessary to carry the demagnetisation down to a comparatively low figure. Thus the saturated magnetic density in the air-gap of an instrument having a magnet illustrated in fig. 2 would be 1,100 lines per sq. centimetre before removing the central core. After demagnetisation the value should be equal to about 60 per cent. of the saturation value.

The process of demagnetisation affords an excellent test as to the quality of the magnet. The amount of demagnetising current required to reduce the magnetism by the above amount is approximately proportional to the coercive force. Any magnet, therefore, which requires less than a certain demagnetising current should be rejected. For the magnet shown in fig. 2 the demagnetising alternating current should not be less than 390 ampere-turns, equal to an  $H$  of 17 (corresponding to the root mean square value of the current; naturally at the maximum of the alternating current wave the demagnetising  $H$  is proportionally larger).

In addition to the demagnetisation brought about by the alternating current, it is found that mechanical vibration has a certain effect. After, therefore, the treatment with alternating current, the central core  $A$  (fig. 2) is removed, and the magnet system is struck a number of smart blows, afterwards measuring the magnetic flux. This is kept up until no further diminution of flux occurs. A good magnet will only fall a further  $1\frac{1}{2}$  per cent. of the saturation value under this treatment, and this likewise affords a further criterion of the goodness of the magnet, any magnet falling more than this value due to mechanical shock being rejected.

It will be seen that the final magnet, as used in the instrument, will have a working magnetic flux density of about 600 lines per square centimetre. This corresponds to good modern practice. Such an aged magnet, if tested as to the effect of further magnetising and demagnetising forces, will give a result represented in fig. 3. It will be seen that any less magnetic force than that to which it has been subjected during the ageing process is without permanent effect on the calibration of the instrument.

## THE I.M.E.A. CONVENTION, 1913.

(Continued from page 1020.)

WHATEVER else may be said of this year's Convention, it cannot be denied that it provided enough, and to spare, of occupation for those who chose to avail themselves of it. The discussions—those to which the Press were admitted—were interesting, and dealt with matters of moment to municipal electricity suppliers; and we have no reason for supposing that the discussions *in camera* were any less interesting, although whether they realised the expectations of their originators seems to be another matter.

The first day's proceedings were referred to at some length in our last issue, and concluded with a meeting of the "Point Fives" and their friends at the Delico Restaurant. The lengthy discussion on electrical heating and cooking dealt principally with questions of tariff, standardisation of apparatus, and publicity—the first two being subjects on which agreement can scarcely be expected, as between the station engineer and the manufacturer of apparatus, at the present time.

Wednesday morning was given up to a discussion of the I.M.E.A. Bill, and heating and cooking, *in camera*, and in the afternoon a large party visited the Electric Railway Power House, at Lot's Road, Chelsea. In the evening the annual dinner, held at the Hotel Cecil, was very largely attended by the members and their ladies and guests, the latter including Mr. W. Duddell, president of the Institution of Electrical Engineers; Mr. A. L. C. Fell, chief officer, L.C.C. Tramways; Mr. Wm. Bryan, chief engineer, Metro-

FIG. 3.—EFFECT OF MAGNETISING AND DEMAGNETISING FORCES ON AGED MAGNETS.

in the past, but it may be said that the underlying principle of them all is to subject the magnet to a greater demagnetising effect, previous to putting it into the instrument, than it is likely to meet with in use. Lesser demagnetising influences have afterwards no permanent effect on the magnet. This property of the permanent magnet is somewhat extraordinary, and so far as the writer is aware, no satisfactory explanation has been given of it.

The chief part of the ageing process is to demagnetise the magnet from its saturation value by passing an alter-

politan Water Board; Dr. Ferranti; Mr. C. H. Wordingham; and Mr. J. H. Rider. Mr. J. E. Edgcome, president, I.M.E.A., occupied the chair.

Following the loyal toasts, Mr. W. DUDELL proposed "The Association," emphasising the advantages which such meetings as that gave in providing opportunities for discussion, and the pleasure with which he had welcomed them at the Institution on the previous day. The PRESIDENT, in replying, urged that despite its youth, the Association could claim to have done some good work. The combination of technical and civic membership was of great value; the 400 members were approximately equally divided between the engineers and councillors, and it was something that such a huge sum as 120 million pounds had been entrusted to their care. He regretted that Parliamentary duties had called away Sir W. H. Davies and Mr. G. Cave, to whom they were indebted in connection with their Bill. This Bill was, he thought, in their own interests, and would benefit the electrical industry generally; it would mend the present illogical situation, in which certain powers were possessed by some towns and not by others. He appealed to the members to help the Bill forward by bringing local pressure to bear; the Association ought to be able to exercise greater Parliamentary pressure than it had done. He concluded by a reference to Mr. Shawfield, whose position he was occupying that night.

MR. R. A. CHATTOCK, who was originally down for a Parliamentary toast, proposed "Our Past Presidents," coupling with it the names of Mr. C. H. Wordingham, Mr. J. H. Rider, and Mr. J. F. C. Snell, all of whom briefly replied. Mr. WORDINGHAM, mentioned his regard for the Association, of which he claimed to be one of the founders, and his conviction that its success was due to its exclusively municipal membership, while MR. RIDER (also a founder) expressed his great pleasure at meeting them, and MR. SNELL credited the Association with having shaped his career in the early days.

MR. HARRY RICHARDSON proposed "Our Guests," the MAYOR OF KINGSTON (Councillor C. H. Burge), and DR. FERRANTI replying.

The various speeches were interspersed with musical items, this portion of the programme, arranged by Miss Haidee Hamilton, being greatly appreciated by those present.

On Thursday the meeting was resumed at Kingston-on-Thames, where, in the Empire Theatre, the visitors were cordially welcomed by the Mayor, Councillor Burge. The stage effect was all that could be desired, and we congratulate the corner-men on their dignified performance.

Even the Mayor, whose opening evidently had *not* been rehearsed, and who, having too hastily assumed that Mr. Christie's paper covered familiar ground, discoursed on the hygienic advantages of purifying the atmosphere in which we live! provided excellent entertainment, especially when later the real subject of Mr. Christie's paper was emphasised by that gentleman himself. This paper, on "Air Filtration for Electrical Machinery," and the discussion which followed its reading, are dealt with elsewhere; we believe that the consensus of opinion, aided by Dr. Ferranti's masterly exposition of the subject, was all in favour of the wet system of air filtration, so far as the short experience of its use can permit of an opinion being formed. The whole subject has come forward so rapidly that the manufacturer of electrical machines has been taken by surprise, although to do him credit he seems to be quickly grasping the situation.

There appears to be no reason for doubting the efficacy of the system under ordinary running conditions, and provided that circumstances do not arise in which the temperature of the air falls during its passage through the machine.

Following this paper came one on "Electric Vehicles," by Messrs. W. H. L. Watson and Raymond J. Mitchell. Fortunately, the volume which these gentlemen had prepared, and which contains a great deal of interesting matter, was only "introduced," and this allowed of a discussion in which about a dozen speakers took part. This covered questions of tariff and charging arrangements, but perhaps the suggestion of Mr. Ayton, that a Special Committee should be formed to discuss the provision of charging facilities, garaging, &c., was the most helpful contribution.

No doubt the electric vehicle, particularly the heavy commercial vehicle, is attracting the attention of station engineers all over the country, and it is significant that at the annual general meeting, which took place on the following day, a resolution by Mr. Ayton substantially embodying his suggestion for a Committee was adopted by the Association.

In conjunction with this paper a demonstration of various types of electric vehicle was given, for the benefit of the visitors. Included among the cars was the Arrol-Johnson vehicle, which had a few days previously journeyed from Dumfries to London. This trial run was initiated by our friends of *The Electrician*; we gather that 362 miles were

covered and that charging current, reckoned at a fair average rate of 1d. per unit, would have cost 17s. 6d. for the run. The total running time was about 30 hours, the speed averaging between 11 and 12 miles an hour; the vehicle, which was built for town work, proved quite reliable despite its rough journey, and at Kingston attracted considerable attention.

At the conclusion of the meeting, the visitors adjourned to Nuthall's restaurant, where luncheon was served on the lawn; subsequently, the party—numbering, we believe, about 400—enjoyed a short trip on the Thames, a call being made at Hampton Court on the return journey where, however, the brief time at our disposal and the exorbitant demands made upon it by the inevitable photographer, did not allow of more than a passing glance at the beautiful gardens. Our municipal readers will be interested in the view of the party in one of the quadrangles, which we reproduce on page 1070.

The day finished with a dinner in the evening at Nuthall's, at the conclusion of which the President's health was drunk with enthusiasm, somewhat out of phase musically, but none the less sincere.

On Friday morning the annual general meeting of the Association was held.

The first business, the election of a new president, resulted in Mr. R. A. Chattock being elected for the ensuing year, so that to Birmingham will fall the honour of entertaining the Association during its next convention. In passing, we may congratulate the Association on its choice; its new President is an engineer of wide experience and unquestioned ability, full worthy of the honour bestowed.

The feature of the business meeting was undoubtedly the masterly control exercised by the President, Mr. Edgcome. We never remember having seen the annual report and accounts adopted with such celerity before!

We do not know whether Mr. Edgcome has been studying present-day Parliamentary tactics, but certainly his method of taking the report, page by page, mentioning page numbers only and those generally two or three ahead of his audience, had a great, though possibly unintentional, resemblance to the guillotine methods favoured by the "lightning" legislators.

Mr. Ayton's electric vehicle committee proposal, some questions as to publicity expenditure, a request for more "secret" meetings next year, and some sort of an explanation to the Press as to the objects of the latter, were the only items of interest, but a special (private) meeting followed, at which the amendment of the articles of association and other matters were discussed. The rest of Friday was an "off day," so far as the visitors were concerned, and many of them returned to the North during the day. Nevertheless, a goodly muster of visitors, some 70 or 80 strong, started off on Saturday morning to visit the installation of "Humphrey" pumps at the Chingford Reservoir of the Metropolitan Water Board.

This was probably the most interesting visit of the week, from an engineering standpoint, as the Chingford pumps are the only commercial examples of their kind, and, moreover, have some interest to electrical men in view of the suggestions which have been put forward for utilising them in conjunction with hydraulic turbines coupled to generators for producing electricity.

There are five pumps, four of which are each rated at 350 H.P., the other being half that size. The pumps are arranged in wells, with the 7-ft. diameter gas heads, each containing a number of inlet and scavenging valves, a few feet below floor level; the cycles of operations recur with great regularity, and the operation of the pump produces only muffled sounds.

The pumps are fed with gas from Dowson producers, running on anthracite costing about 30s. per ton, and consume 81 lb. fuel per W.H.P. The large pumps make 10 strokes or explosions per minute, each resulting in the lifting of 15 tons of water into their water towers, from which a continuous flow takes place into the reservoir. The visitors were allowed to climb to the top of the water towers, where the rise and fall of the water illustrated the cycle of operations in the pump.

The pumps run for a period of 14 or 15 hours without attention, the pump room being, as a rule, locked at night.

It is interesting to note that coil ignition is fitted and

system. The nozzles project this water in the form of a finely atomised spray directly against the incoming air (this space, when the apparatus is working, having the appearance of a dense steamy bank of cloud), and all solid matter in suspension in the air is caught and precipitated in the tank. Any beads of moisture or grit carried through with the air are effectively trapped by the eliminator, and nothing but pure cool humid air is carried into the machine. In some localities during the winter months with this class of filter it will be desirable to fit a small steam coil in the water tank just sufficient to keep the water from freezing.

The advantages claimed for the water screen filter are:—

1. For equal capacity the space occupied is less, and in the case of large machines only about half that of a cloth filter.

2. No fire risk.

3. The apparatus is quickly and easily cleaned, it being only necessary to drain off the water at intervals depending on the amount of dirt in the air (once every two weeks in our case is often enough), wash out the tank with a hose pipe, fill up and start the pump again. All this can be done in a few minutes and without even taking the machine off load.

4. No costly filter cloths to frequently wash and renew.

5. The resistance to the air is always constant, and is less than one-third that of a cloth filter, so that the power for driving the main fan is proportionately less, whilst the total energy consumed by the outfit as a whole shows a substantial saving over that required by a cloth filter, after making full allowance for driving the water circulating pump.

6. The air after passing through the filter is not only pure, but is generally several degrees colder than the surrounding air, due to its being reduced to wet bulb temperature, consequently its cooling effect on the machine, volume for volume of air, is proportionately greater, this difference in temperature being generally most marked in the summer time just when the extra cooling effect is of the greatest value.

In tropical climates or in situations where the surrounding air is at an abnormally high temperature, it is possible, by introducing a small refrigerating plant into the water circulating system, to "super-cool" and control the temperature of the air down to a degree far below the corresponding wet bulb temperature. Experiments which I have carried out show that it is possible by this means to reduce the temperature of the air to within a few degrees of the temperature of the water through which it is passed.

The first cost of a water screen filter, of course, varies with the size of the alternator to which it is fixed. In machines of, say, up to 3,000 kW., it is some 60 per cent. greater than a cloth filter, but in the case of larger machines of 5,000 kW. and upwards the advantage as regards price lies with the water screen type.

In my opinion, due to the increased cooling effect obtained, especially during hot weather, an extra 10 to 15 per cent. overload can be carried on any machine so equipped without increasing the temperature rise, and if a super-cooling refrigerator is fitted in the water system, this overload capacity can be still further increased to 25 or 30 per cent.; in fact, I firmly believe that in the near future turbines of ample power to carry extra heavy overloads will always be provided. The attendant will then simply load up the alternators to which they are coupled till their temperature attains a predetermined maximum safe limit, and electrically-controlled thermometers on the switchboard for this purpose will supersede the ampere and wattmeters now used. This extra cooling effect is perhaps the chief advantage of this system, especially where large units of plant are concerned, as the additional output obtainable for practically the same capital outlay amply justifies its general adoption.

The Southwick machine is generating three-phase alternating current, 50 periods, at 8,000 volts with 250 volts excitation on the field windings. Our equipment has been running since August last with entire satisfaction, and the insulation resistance has been consistently maintained, showing that any moisture carried through with the air is harmlessly evaporated on the warm windings of the machine, and that this type of filter may with safety be used for ventilating extra high-tension machines or air-cooled transformers without detriment in any way to their insulation. The additional humidity in the air really has a beneficial effect on the insulation, preventing it from being baked to destruction as is not uncommon where machines are run at high temperature and heavy overloads with dry, hot, gritty air constantly circulating through their ventilating ducts.

Several engineers who have extensive installations of cooling towers in close proximity to their ordinary cloth air filter intakes have kindly furnished me with the percentage of humidity in the air as now used. This is often found to be as high as 90 to 100 per cent., so that they are really working almost under the same conditions with their present filters as regards risk, if any, to the insulation due to humidity, but without the cooling and cleansing advantages of the water screen.

With the gigantic units of plant, 10,000 kW. and upwards, now being installed by many of the principal undertakings throughout the country, this system of water screen filter seems to offer, so far as present knowledge goes, the most satisfactory solution of this somewhat difficult problem of suitably conditioning the air to be used for their effective ventilation.

At the conclusion of the reading of his paper, Mr. CHRISTIE asked manufacturers of machines to say what was the minimum insulation resistance considered safe with 10,000 volts.

Mr. HALE (Sturtevant Co.), in opening the discussion, said he had for some time been an advocate of water spray cooling, and could not see that the new system would be worse than the old one,

where in many cases very damp air was drawn in. In one dry filtration plant, spray from cooling towers was drawn in and actually froze the filter cloths, and prevented air from passing through them at all.

Mr. D. BENNETT, criticising the wet filtration system, said the metal baffles would rust away; in Manchester and Leeds the cleaning of the dry filter pockets occurred only six or eight times a year, and the cost was about £8 per annum. The most convenient method was to use a vacuum cleaner, and the condenser vacuum could be used; the fire risk had been exaggerated. Tests of the dry filter system showed a water gauge resistance of 1 mm. when newly put to work, increasing to 5 mm. in six weeks' time, when cleaning took place. For a 3,000-kw. plant the wet system would cost 27 per cent. more than the dry, while the position was reversed for a 5,000-kw. plant, in which case the dry filter would be 10 per cent. more costly.

Mr. R. J. KAULA (Willans & Robinson) said it was possible that with a machine on very light load, some moisture would be deposited with the wet filter system, and it might be better to shut down the water spray a short while before stopping to ensure that dry air was passed through. Forced ventilation would spread a fire in a machine very rapidly, and dampers should be fitted to shut off the ventilation if necessary.

Mr. S. E. FEDDEN (Sheffield) said very little appeared to be known about the ventilation of machines either by internal or external fans. He had a machine which would give 8,000 kW. without, and 12,000 kW. with fan ventilation. The external fan appeared to have to overcome the suction of the rotor fan before it did good work, and it had therefore to be large. He supposed that greater air pressure gave a greater cooling effect. Some manufacturers absolutely refused to guarantee their machines for use with the wet air filter, and it would be interesting to have their reasons.

Mr. A. H. SEABROOK (Marylebone) said the Oerlikon Co. had greatly disliked the idea of the wet filter system being used in connection with plant they were supplying to him, but as a result of investigating the matter they were converted and had adopted it for several plants.

Mr. F. H. CLOUGH (B.T.H. Co.) considered the Brighton installation very convincing, but the mica and asbestos installation used in modern machines was not quite so impervious to moisture as varnished material, and it would be necessary to look into the question. The safe insulation resistance of a machine could be found from the formula: voltage at terminals/(kW. capacity of plant + 1,000).

Mr. FELDMAN (A.E.G.) did not think manufacturers could be asked to accept the wet filter straight away. The experience of his firm was that it was not profitable to connect two fans in series as mentioned in the paper, and he thought the time lag would interfere with the use of thermometers on the switchboard as suggested, as they would not follow load fluctuations closely.

Mr. J. SHEPHERD (L.C.C. Tramways) said that he considered the difference in cost as between the wet and dry air filters was such a small percentage on the cost of a generating plant, that it paid to adopt the better system. The County Council was installing a 100,000 cb. ft. wet filtration plant at Greenwich, which would be the largest in the country. From experiments made he had found at Greenwich that a 10,000-kw. machine would have in one year to deal with 10 cb. ft. of dust, which illustrated the necessity of adopting adequate air filtration.

Dr. FERRANTI pointed out that it was a mistake to think of wet air being introduced into a generator; this was not proposed. Experience in America with air compressed by means of water proved that the air was very dry; it appeared, moreover, that if one wanted to get rid of the small particles of water in air, the latter should be brought into intimate contact with a body of water which would absorb the small water particles and leave the air dry. In the wet filtration system the baffle must have a surface of water flowing over it to obtain this result. Reduction in size of generators led to small air passages, which were easily choked, and this in turn involved filtration of the air. The fire risk with a cloth filter was a real one from his experience; despite the care exercised in its production such a filter was a make-shift. Experience with air-washing plant showed that there was no cleaning or stopping, and it was easy to get over freezing by turning the air from the engine room through the filter in cold weather.

Mr. C. H. WORDINGHAM said there appeared to be very little danger of water being deposited by fairly moist air in a warm machine. In regard to the use of a thermometer on the switchboard, the time lag was not of so much importance, provided a safe temperature limit was not exceeded; but the question was how to measure the temperature of the critical part of the machine?

Mr. THOS. ROLES (Bradford) said his experience with the cloth filter for three 3,300-kw. turbine sets had convinced him that it was unsatisfactory. He found at Bradford that it was dirty after one month's use; in dry weather the dirt could be removed by a vacuum cleaner, but in wet weather the dirt was really slime, and it was often necessary to scrap the filter screens. The humidity at Bradford was often 80 to 90 per cent. He was strongly of opinion that it would pay to replace the dry filters at this station by the wet type, as it was found that the air after passing the present filters was not free from very fine dust, and this was deposited in the machines, so that in time the latter would be dangerously choked.

Mr. JOHN CHRISTIE, in replying, said he was quite satisfied that the resistance of the water spray to the air was negligible in the wet filter. The insulation of his machine was 18 megohms, with small variations up and down, and this appeared quite satisfactory.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Electricity in the Operating Theatre.

A new electrical device for administering anaesthetics during an operation has been developed by DR. EDWARD R. KELLOGG, of Los Angeles, who uses a small motor and pumps, together with an electric heater. The invention not only enables the surgeon to operate with greater dispatch and facility, but eliminates some of the greatest dangers attendant upon operations on the throat. One of the great causes of fatalities following an operation is pneumonia, caused by the lungs becoming chilled through the introduction of the cold ether. The electric heater does away with this by bringing the anaesthetic to blood temperature. The warm vapour is pumped through a rubber tube into the throat of the subject, and a switch regulates with precision the amount of anaesthetic administered, so that there is no risk of giving an excessive amount with the new device. While the patient is under its influence, the operator can work upon the throat with the tube

FIG. 1.—MOTOR AND PUMPS FOR ADMINISTERING ANAESTHETICS.

in place, knowing that there will be no occasion for him to stop in the middle of a delicate operation to replace the mask and give more anaesthetic. This eliminates the danger of the patient strangling from clots in the larynx and bronchial tubes. The blood is drawn off as fast as it flows through a rubber tube used by an assistant, connected with a vacuum bottle; by the action of a pump the vacuum is maintained to the proper degree for drawing away the blood during the operation. This is a great advantage, as it does away with the need of sponging, and allows the operator to see clearly what he is doing. The suction tube is valuable in other ways, such as removing obstructions from the bronchi. Pus can be drawn from the ear, the nose or the bronchi when necessary by this device.

The device in a Los Angeles Hospital has been used with complete success by the inventor and other leading specialists in more than 100 operations. The illustration shows the final perfected model of the apparatus.

### Generator Protection for Chicago.

By an unfortunate slip, the titles of figs. 2 and 3 under this heading in our last issue were interchanged. The error will, of course, be obvious to most readers, but the uninitiated might be misled.

### Magnetising Permanent Magnets.

A new magnetising device for permanent magnets has just been designed by the Witton Kramer Electric Tool and Hoist Co. (for whom the GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, London, E.C., are the sole selling agents) at the request of large manufacturers of permanent magnets with a view to enabling a large magnetising force to be effectively applied to the magnet during the magnetising process. As will be seen from the accompanying illustration, fig. 2, it consists of a strong electromagnet with steel pole-pieces working along slides, machined and fitted with high accuracy. The moving poles may be drawn together by a right and left-handed copper screw. The permanent magnet is gripped between the two pole-pieces by operating the handwheel attached to the screw. The particular magnet shown requires 1 KW. to energise it. The jaws may be opened out from 1 in. to 8 in.

The best procedure to follow is, after putting the magnet in the jaws, switch on the current to its full value. Then the current is reversed and the magnetising force applied in the opposite direction. This is repeated several times, and on the

FIG. 2.—WITTON-KRAMER MAGNETISING DEVICE FOR PERMANENT MAGNETS.

final application of the current in the correct direction for magnetising, the current should not be suddenly switched off, but should be diminished gradually to zero. A number of these magnetising devices have been supplied to various firms for making permanent magnets for electric meters.

### Measuring the Height of Poles.

The height of pole required to keep overhead wires clear of any obstruction, such as trees, buildings or other wires that cross a proposed line, can be ascertained readily by a simple device called the "Teleheight." It is a vest pocket instrument of the simplest construction, with which the object to be cleared is sighted; the spirit level that forms part of the instrument is tilted by means of a thumbscrew until the bubble of the level is shown in a mirror crossing the line of the obstruction. The turning of this screw to the required position brings a pointer to a certain number on the scale attached to the "Teleheight," and this number indicates the height of a pole that will clear the top of the tree or house by 5 ft., allowing for the sinking of the pole to the required depth in the ground. Thus, if the foreman who reads the scale finds the pointer at 50, he knows that a 50-ft. pole, sunk 6½ ft. in the earth, will clear the obstruction by 5 ft. The proper angle of sighting is found readily by measuring off 75 ft. in a straight line from the base of the obstruction, care being taken to remain on a level with the point from which this measurement is made. From this distance the user sights the top of the tree or other obstruction.

It is understood that poles of different height require different depth in the ground, and therefore the calibrated scale allows for the various heights. For instance, a 75-ft. pole will require to be set 8 ft. in the ground, a 60-ft. pole 7 ft., and a 30-ft. pole should be set 5 ft. deep. The foreman does not have to stop to calculate this, as his scale gives him the correct height, allowing for these variations.

The "Teleheight" was invented by two Milwaukee Street Railway and Lighting Co. officials, who had found that much of their time was taken up in adjusting claims made by property owners, whose trees had been ruined by careless trimming. The loss of time and money was so great, that it was recognised that a remedy must be found, and as a result, Mr. S. B. Way, vice-president and general manager, and Mr. John L. Fay, superintendent of lines, put their heads together, and devised this practical instrument, which was tried out to their satisfaction by the foremen of that company. The friction between the corporation and the public was lessened by showing due regard for the property owners' trees, and the success of the device was so pronounced that it is now being manufactured by a firm in St. Louis, W. N. MATTHEWS & BRO., which specialises in telephone supplies. The simplicity of operation makes the "Teleheight" efficient in the hands of the average foreman. The principle employed is familiar to all surveyors.

### Wireless Receivers for Time Signals.

In view of the fact that on and after July 1st wireless time signals will be transmitted daily at 10 a.m. and at 12 midnight from the Eiffel Tower, and at 12 noon and 10 p.m. from Norddeich, the SYNCHRONOME CO., of 32 and 34, Clerkenwell Road, are offering complete wireless receiving sets designed for watch and clock-makers. The necessary instruments are combined on a neat board occupying little space, and the whole outfit is appropriately called a "Hörphone." No technical knowledge in the use of the apparatus is required, and it is very simple in construction.

### E.A.C. Mining Switchboards.

The illustration, fig. 3, shows a typical mining board recently supplied by THE ELECTRICAL APPARATUS CO., LTD. of Vauxhall Works, South Lambeth Road, London, S.W. It will be noticed that this comprises a number of panels, and that the main portion of each is a substantial cast-iron pedestal; the top of this forms a bus-bar chamber, in which the bus-bars are mounted on large moulded mica insulators  $\frac{1}{4}$ -in. thick, and carries the oil switch of

FIG. 3.—E.A.C. MINING SWITCHBOARD.

standard E.A.C. drum pattern. All the usual accessories, such as instruments, interlocks, &c., can be provided, and also isolating links by means of which the oil switches can be rendered "dead" for purposes of inspection and cleaning. Simplicity is a leading feature of the design, and all parts are readily accessible. Extensions are effected by installing extra panels, and are facilitated by the fact that the pedestals for all sizes of switches and bus-bars are of the same general dimensions.

### Astong "F. T." Fireproof Lampholders.

MESSRS. VERITYS, LTD., of 31, King Street, W.C., have introduced a switch lampholder completely encased in an "Astonite" insulating cover, which renders it impossible to touch any part of the metal sleeve, while the rest of the metal casing of the holder is dispensed with entirely. The design is such that the parts are firmly held in position, and the switch is a neat little quick-make and quick-break type, with double break knife contacts completely sunk in the porcelain body, and operative in either direction. The holder fully complies with the Home Office regulations.

### Electric Hot Plates.

THE SCHNIEWINDT ELECTRIC CO., of 40, Stamford Street, Birmingham, have brought out a series of electric hot-plates in a variety of patterns, constructed of cast-iron and "asbestos-cement," with nickel-chrome resistance wire. The plates are very strong and light, and the heating elements are easily replaced if necessary, but are very durable. They are put forward not only for cooking, but also for use in chemical laboratories, and can be made in any shape or size to meet requirements.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"RHEOSTAT" writes:—"In my premises I have a direct current three-wire supply with 460 volts across the outers, motors and lighting on 230 volts. A short while ago, when my motors were running and lamps lit, the Supply Co. had a breakdown on one side, which put 460 volts across my installation, with the result that the lamps and motors blew up. Can I make the Supply Co. pay for this damage? Can I claim for broken lamps if their voltage varies more than (is it) 2 per cent. up or down?"

\* \* The answer to this question depends very much upon the exact facts which "Rheostat" is able to prove. It is provided, by Sec. 86 of the Schedule to the Electric Lighting Clauses Act, 1899, that nothing in their provisional order is to exonerate the undertakers from any indictment, action, or other proceedings for nuisance in the event of any nuisance being caused or permitted by them. Again, they are answerable for all accidents, damages and injuries happening through the act or default of the undertakers or any person in their employment by reason or in consequence of any of the undertaker's works. There is some conflict of judicial and other opinion as to whether actual negligence must be proved to account for an accident happening in circumstances like those described by "Rheostat." Upon the whole, the opinion is expressed that he will have to prove negligence. (See, generally, Electric Lighting Clauses Act, 1899, Sec. 77; Brocklehurst v. Manchester Tram Co., 17 Q.B.D. 118; Midwood v. Manchester Corporation, (1905) 2 K.B. 597.

"CINEMA" writes:—(1) "I shall be glad to know if a case has ever been settled in the Courts, bearing on the question of the different charges of the Electric Light Co. for lighting, power and heating. I have carefully looked up all the Acts, including the

one of 1882, but do not see any reference to the various methods of charging; for instance, in one town we are charged for the motor-generator which is connected to the projection arc lamp used in connection with the cinematograph apparatus, at lighting rate, whereas in another town we are charged at power rate. It always seems to me that this particular machine gives one of the most remunerative types of load, as the load factor usually approximates 50 or 60 per cent. Further, the Act of 1882 states that the undertaker shall not be entitled to prescribe any form of lamp or burner, or in any way control or interfere with the manner in which electricity is used.

"Another instance: with an average load factor of about 35 per cent., we are charged an average of 1.95d. per unit, whereas a man who cooks his chop in his office or boils a kettle at exactly the same time is charged 1d. per unit, and this, of course, seems to me to be a most unreasonable advantage to him, although, of course, his load factor is absolutely infinitesimal, and consequently his units cost very much more to generate. Again in the Act of 1882 in Sec. 18, it is laid down that 'every person is entitled to a supply of electricity on the same terms as any other persons under similar circumstances are to a corresponding supply.'

"In a certain town we start our motor-generator which, as I stated previously, supplies the current of the projection arc lamp used in connection with the cinematograph apparatus, at 11 o'clock in the morning and it is run without interruption until 10.30 at night, and yet we have to pay as much for our current as a man who runs a similar size motor on a circular saw and stops at 5 o'clock in the evening. For the rate of charging to be absolutely fair, it appears that we should both be charged the same price up to 5 or 6 o'clock in the evening, and then if the current cost more to generate, we might reasonably be asked to pay more for same.

"As a rule the companies admit that they cannot give undue preference, and claim that they do not, because they say that they charge all cinematograph theatres the same price, and, in some cases, I admit they do, but does not this argument amount to a claim that they are entitled to give preference to one trade and boycott another? Yet the Act distinctly states that every person must be treated on the same terms, and so far as I know the law treats a public company as a "Person or persons." If the Electric Light Co. can discriminate between the various trades, why cannot the Water Co.; yet so long as we use the same gallons of water per day as any other consumer, we have the advantage of paying for it at the same price. Further, in a certain case an electric supply authority have refused to supply us with electric current for the purpose of driving fans, at the power rate, because they say that the cables are run in capping and casing—the voltage being 230—and if we are to have the benefit of the power rate, we must run the cables in a screwed steel barrel. These requirements seem to me to be absolutely illegal."

\* \* There is no case which bears specially upon the different charges for lighting, power and heating; in other words, there is no decision which says "in these circumstances the undertakers must charge as for power, or in these conditions the undertakers may charge as for light." Further, the practice appears to vary (quite legitimately) in different districts, and so long as the rules about undue preference are observed, there is no reason why the company may not make what charge it likes for cinematograph or other purposes within the statutory limits. It is difficult to see how supply to a cinematograph can be described otherwise than as supply for lighting purposes. With regard to undue preference, it may be mentioned that in the case of Metropolitan Electric Supply Co. v. Ginder (1901), 2 Ch. 799, it was laid down that "uniformity of demand" and "day-time service" were factors to be considered in deciding whether one consumer is preferred to another. As to the refusal to supply current for fans, that seems to be unjustifiable.

## PATENTS EXPIRING IN 1913.

(Concluded from page 1007.)

21,778. "Lifts." H. ROWNTREE. October 31st.—Relates to electrically operated and controlled lifts in which, (1) the cage being at rest at any landing it can be sent to any other landing by pressing a button at any one landing; (2) once started the motion of the cage cannot be arrested or reversed until it has arrived at the landing to which sent; (3) the cage slows down and stops automatically; and (4) the cage cannot be operated so long as a door at any one of the landings is open.

21,881. "Electric lamps; alloys." H. H. LAKE. (See de Commentry-Fourchambault et Decazeville.) November 1st.—Leading-in wires are made of alloys of iron and nickel, and may also contain other metals. A nickel-steel alloy with about 86 per cent. of nickel has a temperature-expansion coefficient nearly zero, and by adding a proper quantity of one metal, preferably nickel, the alloy can be made to have the same coefficient as any glass used for bulbs. The wire is enclosed in thin glass, melted at the lowest possible temperature, so that the wire does not come in contact with the flame.

22,020. "Wireless telegraphy." W. P. THOMPSON and F. BRATN. November 3rd.—Relates to wireless telegraphy in which the spark gap is arranged in the primary of a transformer, the secondary being connected to earth and aerial conductor. A Leyden jar is used as a generator, but an induction coil may be employed.

23,476. "Lamps." A. DUTTON and W. M. GARDNER. November 24th.—Light of the same quality as daylight is obtained from an electric arc or other lamp by passing the light from this through copper-sulphate solution, or through glass coloured with copper oxide or otherwise, or by reflecting the light from a coloured surface, the materials used being such as to absorb rays occurring in excess in the lamplight. The light so obtained is suitable for colour-matching or general lighting.

23,501. "Electric lighting." W. L. WISE. (Moore Electrical Co.) November 24th.—Relates to vacuum-tube lighting. The generator is constructed to produce an alternating electromotive force varying with great abruptness. The generator supplies the lamps, and a condenser and inductive resistance are connected with the circuit. In other arrangements, step-up transformers may be employed.

24,048. "Autographic telegraphs." F. RITCHIE. December 2nd.—Relates to that class of autographic telegraphs in which the levers attached to the transmitting stylus cause the movement of levers over sectional resistances arranged in arcs. At the receiving station the levers connected to the recording pen are actuated by line coils pivoted in strong magnetic fields. An application for the extension of the term of this patent has been made.

24,450. "Electric telegraphs." J. A. L. DEARLOVE and S. G. BROWN. December 8th.—Automatic transmitting apparatus for submarine and other working is arranged with needles pivoted to the ends of levers connected to earth and line. The levers have controlling springs and extensions, with which a spring, forming an extension of a lever carrying stops, engages. The levers can make contact with fixed stops, or with the stops on the lever, these stops being connected directly to the battery or indirectly through the curbing device. The lever carrying the stops is continuously reciprocated by the cam disk, which is also connected by the link and spring with the lever. The contact-lever, together with a fixed stop and connected levers, are mounted on a slide provided with an adjusting screw, the position of the slide determining the curbing action.

24,718. "Telephone systems." J. E. KINGSBURY. (Western Electric Co.) December 12th.—Relates to telephone systems in which a central source of power is employed for both signalling and conversing. In the subscriber's apparatus either transmitter or receiver may be shunted by an impedance coil, which may form an additional circuit on the induction coil. Arrangements are described by which "private" or "exchange" extensions connected to a local exchange may communicate with that exchange, with one another, or the "exchange" extensions with the main exchange through the local exchange by means of a source of power located at the central exchange.

25,186. "Wireless telegraphy." G. MARCONI and MARCONI'S WIRELESS TELEGRAPH CO. December 18th.—Relates to wireless telegraphic apparatus in which the receiving apparatus is arranged as described in specifications No. 12,326, A.D. 1897, and No. 6,982, A.D. 1899. The secondary circuit of the induction coil is connected at each end to the coherer, and is divided in the centre by a condenser. The condenser is also arranged in the local circuit, including the impedance coils, battery, and receiver. The induction coil may be arranged with the halves of the secondary coil wound in a single layer, or in a series of layers increasing outwards in the number of convolutions. The length of the wire in the single layer form corresponds with the height of the aerial conductor.

25,846. "Perforators for automatic telegraphs." A. S. FRAMPTON and F. L. MUEHLER. December 21st.—Relates to improvements in the class of instruments described in specification No. 2,504, A.D. 1897. The key levers are arranged below the surface of the case. The acting portions of the levers are brought up through an opening in the case, and are so bent as to form a vertical series, of which the upper and lower representing the signal form a series of keys or spacing punch, which can act by itself. The keys can co-act with the central or spacing punch, which can act by itself. The punch holders are held back by springs acting on a block, through which the signal punch holders slide, but which is attached to the spacing punch holder. The key levers may be operated by electromagnets, contact keys being employed to close the local circuits.

25,767. "Electric motors, lifts." H. ROWNTREE. December 30th.—Relates to continuous-current motors for operating lifts, &c., and to the means for varying the speed and direction of operation thereof. A motor is employed in which the armature and commutator are independently revolvable, and one of these parts is rotated by an auxiliary motor, which may be an electric, steam, gas, or other motor. The speed and direction of rotation of the main motor are controlled by varying the strength of the current supplied either to its field or armature.

25,768. "Lifts, &c." H. ROWNTREE. December 30th.—In electrically actuated and controlled lifts, the following objects are effected, viz.:—(1) All the movements of the cage are controlled by push-buttons in the cage and at the landings. (2) By the operation of a push-button at a landing, or a corresponding one in the cage, the movement of the cage to, and automatic stopping on, at that landing is effected. (3) The hoisting mechanism cannot be put into action until all the well doors are closed. (4) A push-button having been operated, any subsequent operation of another button is ineffective until the cycle of operations proper to the first button has been completed. (5) The motion of the cage is automatically accelerated and retarded as it is started and stopped respectively. The necessary electric circuits are shown diagrammatically in the specification.

13,428. "Trolley heads for electrically-propelled vehicles." J. T. MAYOR. June 10th.

13,435. "Dynamo-electric machines." FIEMENS' BROS. DYNAMO WORKS, LTD. (Siemens-Schuckertwerke G.m.b.H., Germany.) June 10th. (Complete.)

13,447. "Electric elevator systems." E. M. FRASER. (Convention date, July 29th, 1912, United States.) June 10th. (Complete.)

13,450. "Three-phase differential gear." L. FAX and R. TAINE. (Convention date, June 21st, 1912, France.) June 10th. (Complete.)

13,458. "Electrical device for the selective detection of periodic electrical impulses." R. P. HOWGRAVE-GRAHAM. June 10th.

13,465. "Separation of liquid suspensions." BRITISH THOMSON-HOUSTON CO., LTD. (General Electric Co., United States.) June 10th.

13,480. "Apparatus for testing the specific gravity of acid in cells with seal covers." D.P. BATTERY CO., LTD., and T. C. ELLIOT. June 11th.

13,490. "Vapour electric apparatus." M. VON RECKLINGHAUSEN, A. HELBRONNER and V. HENRI. (Divided application on 24.6.3, 1912, October 28th.) June 11th. (Complete.)

13,541. "A magnetic brush or brcom for separating ferrous metals from non-ferrous metals." J. W. BATANT. June 11th.

13,546. "Pneumatic-electric trackers for electric-mechanically operated musical instruments." C. W. DORRICO. June 11th. (Complete.)

13,587. "Automatic adjustable electrical overload circuit breakers." H. T. HOLMES and J. KEMP-WELCH. June 12th.

13,588. "Fork switches, wall-socket's and brackets." J. B. MEHLFJOHN. June 12th.

13,589. "Means for automatically shutting off steam or electrical current and applying the brakes when the signal is against a railway train." W. S. McEALIN. June 12th.

13,602. "Manufacture of electric cables." C. J. BEAVER and E. A. CLAREMONT. June 12th.

13,610. "Cooling electrical and other apparatus." ART.-GER. BACHW. BOYER et CIE. (Convention date, February 20th, 1913, Germany.) June 12th. (Complete.)

13,616. "Intercommunication telephone systems and apparatus therefor." J. A. ROMER. June 12th.

13,632. "Tungsten filament electric incandescent lamps." A. GRAMMONT. (Convention date, June 13th, 1912, France.) June 12th. (Complete.)

13,636. "Receivers for use in wireless telegraphy and telephony." MARCONI'S WIRELESS TELEGRAPH CO., LTD., and C. S. FRANKLIN. June 12th.

13,654. "Electric switches." E. A. FAGERLUND. (Addition to 13,353 of 1913. Convention date, June 14th, 1912, Sweden.) June 12th. (Complete.)

13,656. "Systems of electric distribution." BRITISH THOMSON-HOUSTON CO., LTD. (General Electric Co., United States.) June 12th.

13,660. "Electric lighting indicator." J. C. HUTTON. June 12th. (Complete.)

13,664. "Magnetic compasses for ships' boats or the like." C. A. BARTLETT and T. W. BAUCE. June 13th.

13,694. "Method of lighting and unlocking miners' safety lamps with alternating current." W. W. GOSDON. June 13th.

13,695. "Incandescent electric lamp filaments." C. W. READ. June 13th.

13,698. "Electric fountains and water display effects and fittings and appliances used in connection with them." H. P. ALLISON. June 13th.

13,715. "Electric clock." J. G. ECCOTT. June 13th.

13,721. "Electric switches." O. LUCAS and F. HANDLEY. June 13th.

13,727. "Electric ignition devices for acetylene or other gas lamps." E. LE FAYE RENOUT. June 13th.

13,748. "Selectors for automatic or semi-automatic telephone systems." SIEMENS & HALSKS ART.-GES. (Convention date, June 22nd, 1912, Germany.) June 13th. (Complete.)

13,755. "Production of high-tension discharges." W. H. WILSON. June 13th.

13,764. "Electrical resistances." W. M. MORDEY. June 13th.

13,769. "Operation of by-pass gas burners by electrical current." E. J. PARSLAW. June 14th. (Complete.)

13,782. "Sparkling plugs." A. DALE. June 14th.

13,791. "Commutator for electrical dynamos and motors." L. HARTMANN. June 14th.

13,793. "Apparatus for causing electrical impulses for transmission to a distance." J. A. GARDNER and A. FERGUSON. (Addition to 27,239/10.) June 14th. (Complete.)

13,820. "Electrical connection devices for railway and like vehicles." L. BOHRLIT. (Convention date, July 29th, 1912, France.) June 14th. (Complete.)

13,822. "Electrical illuminating apparatus or instruments." H. CRENON, H. DOMINICI and R. BUCARD. (Convention date, June 15th, 1912, France.) June 14th. (Complete.)

13,823. "Starting and lighting systems for motor road vehicles." W. H. GLASER. June 14th.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & CO., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

13,275. "Adjustable telephone arms." MCLN J. D. CARTER. June 9th.

13,305. "Electricity meters." G. WALL and FERRANTI, LTD. June 9th.

13,308. "Electromagnetic friction couplings." P. FOISTER. (Convention date, June 8th, 1912, Germany.) June 9th. (Complete.)

13,310. "Systems and apparatus of radio control." J. H. HARMOND, JUN. (Convention date, June 7th, 1912, United States.) June 9th. (Complete.)

13,315. "Alternating-current electromagnets." CRIS ELEVATOR CO., LTD. (General Electric Co. G.m.b.H., Germany.) June 9th. (Complete.)

13,343. "Electric light fittings." J. A. BAYER and A. FORSTNER. June 9th.

13,347. "Governing mechanism for prime movers." BRITISH THOMSON-HOUSTON CO., LTD., and F. S. MILLERSON. (Addition to 9,241/11.) June 9th.

13,358. "Means for automatically operating electrical resistances, more particularly for use in conjunction with contactors, such as lampholders, wall sockets, and the like." J. P. NAYLOR and NAYLORGRAPH, LTD. June 9th.

13,359. "Electric safety devices against house-breaking, burglary, and the like." C. PASTORE. June 9th. (Complete.)

13,373. "Inspection attachments for the cylinders of internal-combustion engines, and sparking plugs for use in connection with such attachments." ELECTRIC IGNITION CO. (1913), LTD., and A. E. FLETCHER. June 10th.

13,577. "System of multiple telephone-call indicators." S. D. WILLIAMS. June 10th.

13,580. "Electrical connectors." C. R. BELLINO. June 10th.

13,606. "Attachment of the filaments of electric glow lamps to the leading-in wires." J. FLECHATT. June 10th. (Complete.)

13,618. "Reverse power relays." E. G. WATERS. June 10th.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & CO., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1912.

TUNGSTEN FILAMENT AND A PROCESS OF MANUFACTURING SAME. J. HUBERS. (Julius Pintsch Akt.-Ges.) 5,626. February 2th. (Cognate application, No. 8,755 of 1912.)

TUNGSTEN FILAMENT AND A PROCESS OF MANUFACTURING SAME. J. HUBERS. (Julius Pintsch Akt.-Ges.) 5,627. February 2th.

DRAWN METAL FILAMENT AND A PROCESS OF MANUFACTURING SAME. J. HUBERS. (Julius Pintsch Akt.-Ges.) 5,628. February 2th. (Cognate application, No. 8,749 of 1912.)

METHODS AND APPARATUS FOR CHARGING STORAGE BATTERIES. D. H. WILSON. 9,735. April 24th. (Addition to No. 9,593 of 1912.)

ELECTRICAL HEATING APPARATUS. R. B. MATTHEWS. 12,3 C. May 24th.

SAFETY APPARATUS FOR SIGNALLING ON AND STOPPING TRAINS INDEPENDENTLY OF THE DRIVER. E. WINKLER. 12,571. May 24th.

ELECTRIC SEARCHLIGHTS. SOC. ANON. CHATE GALLICO. 12,580. May 24th. (May 31st, 1911.)

HOLIFERS FOR INCANDESCENT ELECTRIC LAMPS. J. P. NAYLOR and NAYLORGRAPH, LTD. 12,581. May 24th.

COUPLINGS AND MEANS FOR FASTENING WIRES TOGETHER AND TO TERMINALS OF ELECTRIC BATTERIES, LAMPS, WALL PLUGS AND OTHER APPARATUS OR APPLIANCES. V. C. H. GIBSON. 12,446. May 24th.

DRAWINGS OF WIRES, AND MORE PARTICULARLY OF TUNGSTEN AND OTHER METAL FILAMENTS. L. GLADIZ. 12,449. May 15th.

TELEPHONE EXCHANGE SYSTEMS. E. R. COLEMAN. 12,547. May 28th.

PROCESS FOR THE MANUFACTURE OF FILAMENTS OF ALLOYS OF TUNGSTEN. M. M. HUBERS, executor of the late J. Hubers, deceased. (Julius Pintsch Akt.-Ges.) 12,752. May 28th.
