PUBLISHED BY THE PROPRIETORS,  
AT 4, LUDGATE HILL, E.C.

## INDEX.

List of sub-headings:—AUTHORS, CITY NOTES, CONTRACTS CLOSED AND OPEN, CORRESPONDENCE, LEGAL, LIGHTING AND POWER NOTES, NEW COMPANIES, NEW ELECTRICAL DEVICES, FITTINGS AND PLANT, OBITUARY, OFFICIAL RETURNS, PARLIAMENTARY, PROCEEDINGS OF SOCIETIES AND INSTITUTIONS, PROSPECTURES, RAILWAY NOTES, REVIEWS, TELEGRAPH NOTES, TELEPHONE NOTES, TRAMWAY NOTES.

- ABBREVIATIONS** and symbols, New units, 693
- Aberdeen** slander action, The, 667
- Wages and conditions at, 657
- Absorption**, A Swiss, 931
- Accession** of electrical engineers to Parliament, The, 921
- Accidents**, 63, 145, 332, 566, 705, 810, 851, 1059
- " and suggestions for preventing them, A French inquiry into, by W. Stewart, 648
- " in electric lifts, The prevention of, 631
- " in mines, The use of electricity and electrical, 251, 820, 407
- " Tramway, 836
- Account**, Payments on, 922
- Accumulator** industry, The German, 923
- " The "Alkum," 145
- Accumulators** for submarines, 10
- Admiralty** electrical engineers, 184
- Advancing**, On phase, by Dr. G. Kapp, 784, 831
- Advertising**, Electric light in, 33
- " electricity, 330
- " electric, by H. C. Palmer, 367
- Agreement** between electrical undertakers, An, 686
- " for "hire" and "hire-purchase," by "Excelsior," 1002
- Agriculture**, Electricity in, 946, 1002
- Air**, Electricity from, the, 765
- " filtration, cooling and ventilation of electrical machinery, by J. Christie, 1083
- " gaps in moving-coil instruments, by C. C. Garrard, 1035
- Alkum** accumulator, The, 145
- Allmänna Elektriska A.B.**, Sweden, The progress of the, 654
- Aluminium**, 144
- " cables, Insulated, 506
- " conductors, 1029
- " for power transmission, 569
- " in European electrical undertakings, 277
- " in 1912, 184
- " The financial position of, 89
- " wire prices, 931
- American** cement mill installations, Some, 645
- " electrical installations, by T. Harding Churton, 825
- " electrical machinery exports, British and, 212
- " heating loads, 626
- " Society for Electrical Development, 1067
- " underwriters and Canadian trade, The, 2
- Ampere**, The International, 197
- Anglo-German** Exhibition in London, 630
- Antarctic** Expedition telephones, British, 288
- Apparatus** for improving the power factor of a.c. systems, The design of, by Miles Walker, 155
- " for signalling thunderstorms, An, 275
- Standardisation of, 287
- Applications** for situations, by "Whistlefield," 321
- Appointments** vacant, 25, 64, 104, 145, 186, 267, 304, 353, 390, 459, 477, 527, 566, 611, 651, 690, 728, 766, 811, 851, 896, 940, 992, 1029, 1073
- Apprentices**, Scarcity of, 684
- Apprenticeship** systems, 246
- " Arc, Electric, The, by W. B. Hird, 409
- " lamps for the outside lighting of shops, by W. Fennell, 243
- " Area of supply, Supply to premises situate outside, 405
- Argentina**, British trade in, 547
- Electrical Congress in, 1045
- Argentine Republic**, Electricity works in, the, 566
- Articles** from the technical journals, Filing, by "Whistlefield," 630
- Artificers** in the Royal Navy, 247, 251
- Association** of Electrical Station Engineers, 144, 287, 439, 478, 518, 566, 611, 659, 728, 991, 1029, 1068
- Associations**, New, 353
- Asylum** installation, An Essex, 899
- Atmospheric** nitrogen, The fixation of, by P. H. S. Kempton, 1061
- Australia**, British manufacturers in, 347
- " by wireless, Bridging, by Dr. A. Gradenwitz, 19
- " Exhibition in, 638
- " Postal electricians in, 922
- " Trade statistics of, 37
- Australia**, Tramway labour conditions in, 286
- Australian** development in electric cooking, 666
- " tariffs, 57
- " tramway companies and their employees, 133, 292, 863
- " wireless telegraphy, 159
- Austria**, Cable works in, 637
- Electrotechnie in, 123
- Austrian** Bergmann Co., The, 185
- electrical mail vans, 1027
- Austria's** foreign trade, 371
- AUTHORS—**
- Ainsworth**, Joseph S., on Wages and holidays in central stations, 384
- Aldous**, F. C., on Starting and speed control of induction motors, 322
- Anderson**, W. T., on Colliery cables, 619, 659
- " Attendant, On the electricity show-room, 1001
- Austin**, E. P., on Practical notes on earthing factory apparatus, 457
- Bailey**, Frank, on Electric supply in London, 651, 701
- Barham**, G. B., on Electrodes for electric furnaces, 628
- Belcher**, E. A., on Hints for electricians, 375
- Bonsfield**, Arthur J., on Tramway curves, 712
- Broadbent**, Frank, on Modern methods of electric wiring, 10
- Brown**, S. G., on Some methods of magnifying feeble signalling current, 334
- Bucher**, P., on Electric resistance welding, 495
- Caldwell**, J., on The lighting of small country houses, 629
- Christie**, J., on Air filtration, ventilation and cooling of electrical machinery, 1083
- Churton**, T. Harding, on American electrical installations, 325
- Collier**, J. Douglas, on New electricity works at Fusan, Korea, 772
- Cox**, K., on Internal combustion engines, 453
- Creedy**, F., on The turbo-converter, 10
- Crouch**, L., on Relative efficiency and advantages of direct, semi-direct and indirect lighting, 493
- " On Cost and efficiency of display lighting, 504
- Cunliffe**, J. E. G. and R. G., on Tramway feeding networks, 9, 75, 169
- Damoiseau**, J. B. G., on Petrol-electric motor vehicles, 969
- Dary**, Georges, on The electrical industry in France, 738, 872, 897
- " Delta, On The progress of three-phase traction on railways, 969
- Dexter**, W. A., on Independent steam condensing plants, 209
- Edwards**, E. H., on The possibilities of increasing profits on interurban tramways, 1012
- " Element, On Electric cooking apparatus, 575
- Elliott**, G. H., on Electric laundry irons, 797
- Everest**, A. R., on Some factors in parallel operation, 455
- " Excelsior, On Agreements for "hire" and "hire-purchase," 1002
- Feranti**, S. Z. de, on The steam-gas turbine, 154
- " on Prime movers for electric power, 1019
- Garrard**, C. C., on Air gaps on moving-coil instruments, 1035
- Gifford**, R. D., on Some methods of detecting leakages on alternating and continuous-current systems, 1042
- Goodman**, Joseph, on Dumping: a note on a particular case of discriminative charges, 577
- Gradenwitz**, Dr. Alfred, on Bridging Australia by wireless, 19
- " on Crane equipment of an Italian steel-works, 450
- Gratzmiller**, Monsieur, on High-tension continuous-current traction, 883
- Hadley**, A. E., on Power supply on the Rand, 538, 888
- Highfield**, J. S., on The transmission of electrical energy by continuous current on the series system, 1046
- Hird**, W. B., on The "Electric Arc," 409
- Hsi C' Hung Chi**, on The future of British electrical industry in North China, 10
- Ingham**, Edward, on Increasing steam plant efficiencies, 1
- " Interested, on Inventory of plant in municipal electricity works, 71
- AUTHORS—continued.**
- Jenks**, A. R. C., on The mechanical design of switches, 678
- Jones**, G. Lloyd, on Kent coal, 893
- Julian**, M., on The electrification schemes of the Chemin de Fer du Midi, 968
- Kapp**, Dr. Gisbert, on Phase advancing, 784, 831
- Kempton**, P. H. S., on The fixation of atmospheric nitrogen, 561
- Lamberton**, Andrew, on A new form of electrically driven two-high continuous-running reversing mill, 865
- Latour**, M., on Single-phase traction, 926
- Lees**, S., on Electrical dangers, 195
- Mazen**, A. N., on The electrification of the State railways: the Paris suburban lines, 927
- Michie**, Dr., on The formation of deposits in oil-cooled transformers, 912
- Milns**, W. E., on Economies in the use of electric power, 829
- Morgan**, J. B., on A method of taking load tests on mains, 506
- Murphy**, Leonard, on The installation of power-factor indicators, 420
- Palmer**, H. Clifford, on Advertising electricity, 367
- Parodi**, H., on Railway electrification problems in the United States, 1045
- Pasquier**, A. E. du, on Electric winding engines, 171
- Pearce**, S. L., and H. A. Ratcliff, on Recent developments in the street lighting of Manchester, 497, 581, 617, 963
- Peck**, J. S., on Earthen v. unearthed neutrals on a.c. systems, 78
- Powell**, S. M., on Electrical transmission of colour photographs, 458
- Ratcliff**, H. A., and S. L. Pearce, on Recent developments in the street lighting of Manchester, 497, 581, 617, 963
- Raymond-Barker**, E., on Graphs in a cable-ship drum-room: notes for junior assistants, 113, 172, 238, 276; on The sounder in submarine telegraphy, 337
- Roles**, Thomas, on Electric heating and cooking, 578
- Rosenberg**, Dr. E., on Self-synchronising machines, 744
- Rye**, A. N., on Gas and oil engines for electric supply stations, 739
- Ryder-Jones**, J., on Electrostatic capacity and insulation resistance measured by direct-reading methods, 671
- Scott**, E. K., on Cables for shafts in mines, 365
- Shawfield**, C. E. C., Address to I.M.E.A., 1019
- Simpson**, Sidney, on Prices charged for electric power, 961
- Slingo**, W., on Application of mechanical devices to the assistance of manual operating in telephone exchanges, 1046
- Smith**, Prof. C. A. M., on "Gentlemen—we thank you!" 72
- Spurr**, R. D., on The means for securing reliability and maintaining the continuity of supply, 452
- Stansfield**, Jos. J. H., on The National Insurance Act, 1911, 72, 124, 495
- Stenard**, W., on A French inquiry into electrical accidents, and suggestions for preventing them, 548
- Thompson**, Prof. S. P., on The secret of the permanent magnet, 961
- Thornton**, W. M., on The change of energy loss with speed in direct-current machines, 88
- Toppin**, W. A., on Electrical apparatus and standardisation, 316
- Trotter**, A. P., on Standard clauses for street lighting specifications, 703, 742, 787, 832
- Walker**, Miles, on The design of apparatus for improving the power factor of a.c. systems, 155
- Wardale**, W. T., on Another view on the co-partnership question, 58; on The electric lighting of villages, 43
- " Whistlefield, on Applications for situations, 321; on A Plea for the domestic load, 406; on Filing articles from technical journals, 630
- Whysall**, F. H., on The use of a large lighting battery in connection with central station supply, 275
- AUTHORS—continued.**
- Wickes**, C. Hamilton, Report to the Board of Trade on the Order-writers' Laboratories (Irel.), Chicago, 81
- " Wiggam, on Business method in New Zealand, 967
- Wilmshurst**, T. P., on The commercial aspect of electric cooking and heating, 110
- Automatic** telephone system, The Petrolander, 448
- Award**, The telephone, 81
- BALL**, The Midland Electrical Engineers', 25
- Bankruptcy** proceedings, 11, 97, 175, 179, 214, 237, 255, 304, 340, 381, 431, 470, 511, 557, 597, 638, 677, 720, 759, 801, 845, 888, 978, 1022, 1061
- Bankside**, Reconstruction at, 623
- Barrow-in-Furness**, "Tricity" kitchen at, 836
- Bath**, The curative waters of, 123
- Batik** work, Electric, 711
- Battery**, Another new, 105
- " in connection with central station supply, The use of a large lighting, by F. H. Whysall, 275
- " manufacture in France, 470
- " The household, 163
- Belfast**, Electrical wages in, 347
- Benevolence**, Electrical, 5-7
- Benevolent** Institution and life insurance, The Electrical Trades, 220
- " Institution and National Insurance, 847
- " Institution, Electrical Trades, 144, 438, 508, 554, 651, 667
- " Institution dinner, Electrical Trades, 706
- " Institution Whist Drive, Electrical Trades, 25
- Bergmann** Co., The Austrian, 185
- Berlin** railway conversion scheme, The, 8
- Bettlender** automatic telephone system, The, 813
- Bills**, Proposed expenditure on electrical works under private, 61
- Birmingham** Electric Club, 768
- Birmingham's** proposed new power station, 789
- Bitumen** strip, New vulcanised, 14
- Blackburn** extensions, The, 163
- Board** of Trade and electric lighting, 69
- " of Trade regulations for overheads
- " of Trade regulations, New, 877
- Boiler** feed, Electric control of, 349
- Boilers**, Bonecourt, 714
- " in Canada, Water-tube, 511
- Bolton** vacancy, The, 940
- Bombardment** at Earl's Court, 940
- Bonecourt** boilers, 714
- Boom**, The trade, 113
- Bradford** strike, 25, 402, 885
- Brest**, Radiophones near, 457
- British** and American electrical machinery exports, 212
- " Association meeting, Birmingham, 1913, 438, 754
- " Electrical and Allied Manufacturers' Association, The, 111, 172, 728, 946
- " Electrical Superannuation Fund, 122
- " Engineers' Association, 650, 1028
- " Engineers' Association and merchant firms, 979
- " Government and British Firms, 104
- " Guinea, British trade in, 844
- " India, Trade statistics of, 117
- " manufacturers in Australia, 347, 931
- Brompton** and Kensington Electric Restaurant, The, 768
- B.T.H.** rotary converters, 933
- Building** Trades Exhibition, International, 650
- Burns**, First aid in case of electrical, 666
- Business** methods in New Zealand, by "Wiggam," 957
- CABLE** discounts, 894
- " installation, A 60,000-volt underground, 413
- " laying, by "Antipodes," 63
- " making, Japan, 1027
- " manufacture, Cinematograph films of, 571

Cable ship drum room, Graphs in a, by E. Raymond Barker, 113, 152, 238, 276  
 " stealing on the Rand, 1028  
 " works in Austria, 637  
 Cables, Colliery, by W. T. Anderson, 619, 659  
 " for shafts in mines, by E. K. Scott, 365  
 " High-pressure underground, 657  
 " Insulated aluminium, 506  
 Callender's Hospital, 181  
 Campaign in America, Co-operative electrical, 424  
 Canada, 392  
 " Electric stoves for, 527  
 " English steel works in, 1021  
 " Notes from, 237, 238, 459, 519, 606, 757, 918, 1040  
 " Water-tub boilers in, 811  
 Canadian correspondence think of Canada, What, 810  
 " electrical farming plant, A, 646  
 " trade, Chicago laboratories and, 683  
 " tariff on electric stoves, The, 930, 1003  
 " trade, The American underwriters and, 2  
 Capacity and insulation resistance measured by direct-reading methods, Electrostatic, by J. Rymer-Jones, 671  
 Car construction in Great Britain, 478  
 " lighting competition, Electric, 475  
 " lighting system, The Edison, 213  
 Carleoun train-lighting dynamo, The, 649  
 Cars with enamel baked electrically, Painting, 641  
 Celluloid regulations, 502, 940  
 Cement mill installations, Some American, 645  
 Census of production, The, 81  
 Central station supply, The use of a large lighting battery in connection with, by F. H. Whysall, 278  
 " stations, Wages and holidays in, by J. S. Ainsworth, 364  
 " Centralians " and cable-laying in the Antipodes, 62  
 " Old, 185  
 Change of energy loss with speed in direct-current machines, The, by W. M. Thornton, 88  
 Charge, The value of the elementary electric, 36  
 Chelsea railway power station, The, 867  
 Chemin de Fer du Midi, The electrification schemes of the, by M. Julian, 963  
 Chicago laboratories and Canadian trade, 632  
 Chile, Electric and copper works in, 756  
 China, 838  
 " British electrical developments in, 379  
 " The future of British electrical industry in North, by Hsi C'hing Chi, 376  
 Cinders, Electricity from, 389  
 Cinematograph Exhibition, The first International, 664, 621, 655  
 " films of cable manufacture, 871

## CITY NOTES—

Aberdeen Suburban Tramways Co., 358, 393  
 A.E.G., 66  
 African Trans-Continental Telegraph Co., 311  
 Alderley and Wilmsham Electric Supply, 777  
 Alldays & Onions Pneumatic Engineering Co., 653  
 Alley & MacLellan, 443

WHEN these lines appear in print, the majority of our readers will be too busily engaged about their business to study a detailed review of the electrical doings of a past year. Everybody specialises nowadays, and therefore every reader knows what has been happening in his own particular line. Nevertheless, it is as well for us all to take a comprehensive view of the whole of the departments of the science and industry occasionally, and the passing of one year and the opening of another provide a fitting opportunity for brief general retrospection or review. To meet this need, and this alone, do we touch the subject here.

Notwithstanding the depressing influences of the recent Christmas weather, we approach the subject in a satisfied mood whether we look backward over the achievements in 1912 or venture forward into 1913. Our satisfaction is modified somewhat by the recollection that 1912, like the year that preceded it, was a period when the relations of employers and employed were seriously disturbed. The increasing cost of living coupled with the prevalence of excellent trade and the continuance in office of a Government credited with a willingness to grant legislation in a hurry at the bidding of organised labour, brought clamour from many sides for a larger share of the profits, and without here entering into the merits of such questions, we must remember them here as factors which during the year brought grave disquiet and handicap to those representing the control of Industry. Electrical engineering firms remember only too well how the strikes among the colliery workers, the transport workers, and the "not-in-the-Police-Court-sense" railway men, have harassed them in their productive and distributive operations, and all of us will profoundly hope that in view of the large concessions granted, or the lessons severely learned, industry will be allowed to settle down peacefully for awhile to handling a record volume of business. While it is right that the interests of the worker should be studied in our schemes of social legislation, nothing is so serious a disturbing factor in industrial affairs as sweeping legislative reforms passed without mature deliberation. If we appear to dwell too fully upon this point, it is because nobody can either faithfully record the past, or intelligently anticipate the future, without recognising how important an influence labour disaffection must ever have.

Passing now from larger matters and those which have a general bearing upon all sections of electrical and engineering activity, we may turn with the greatest possible satisfaction to the position of individual electrical departments. It does not matter which way we turn—with the solitary exception of the tramway field—there are evidences of a splendid improvement having taken place during the past year, and as we start out upon 1913, not only is there no falling-off in the rate of progress, but there is in prospect more business, in both the larger and smaller classes of manu-

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEEKA, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

4, Ludgate Hill, London, E.C.

factures, than ever before. One's thoughts naturally turn to the gratifying progress in electric heating and cooking, as the result of the cultivation of the domestic and trade consumer: to the large requirements of electrical supply authorities for new plant, and in some cases entire new stations; to the great headway that is being made in the wireless telegraph sphere; to the progress of railless electric traction and the petrol-electric 'bus; to the new telephone situation following the transfer, which is giving, and must continue to give, rise to very big requirements for apparatus and equipments both for new exchanges and for the users' premises (automatic working is the outstanding development of the year); to the extraordinary advance that was made in the electric power department, both independently of, and as a result of, the miners' strike, when hundreds of industrial works turned to public supplies of electricity for the first time; and finally, and quite as encouraging, if not more so than all the rest, the long-delayed movement in the railway electrification department which has come at last, as witness the great triple event of the closing months of 1912—the decisions to proceed with the equipment of 150 route miles of electric railway at Melbourne, of 79 track miles on the L. & N.W. Railway, and of 73 track miles on the L. & S.W. Railway. All of these will be worked on the direct-current system. The Central London tube extension to Liverpool Street was completed in 1912, and the East London is at last in the electrical contractors' hands, while the L.B. & S.C. Railway has brought the single-phase system into operation on some additional lines.

Now that we have got so far in the railway department, there is every reason to believe that even in this long prayed-for circle, widespread revival and conversion will speedily spread. Closer working arrangements have been entered into by many of the metropolitan tube, motor-'bus and tramway companies, which, it seems, must make for increased efficiency and convenience.

The triumphant progress of the steam turbine, which is now being built of no less than 30,000 kw. capacity, and the increasing use of the Diesel engine, which is being rapidly developed for ship propulsion, and will therefore soon be available in large sizes for central-station work, call for notice, and we should not omit mention of the start which has been made in the adoption of electric transmission on board ship.

Each of these items would make an excellent text for an article devoted solely to its own development and prospects, but we think the mere recital given above serves sufficiently to indicate broadly how general is the electrical advance that is now proceeding.

That the reorganisation of the Institution of Electrical Engineers, with the establishment of standing committees to deal with industry and research, will strengthen the position of the Institution and promote the best interests of all engaged in electrical work we all hope and believe, and we look forward confidently to a continuance of that prosperity with which the New Year has commenced.

---

## THE AMERICAN UNDERWRITERS AND CANADIAN TRADE.

---

WE publish elsewhere in this issue an exhaustive report to the Board of Trade, prepared by Mr. C. Hamilton Wickes, on the American Underwriters' Laboratories (Inc.), its constitution and the scope of its operations, and their effect upon the importation of British manufactures into the Dominion of Canada. As we have already indicated, this is one of the first pieces of work to result from Mr. Hamilton Wickes's appointment as H.M. Trade Commissioner in the Dominion, and we

commend it, together with the conclusions and recommendations which it contains, to the serious study of all who are interested in the promotion and extension of British electrical trade across the Atlantic; more especially do we ask our manufacturers to weigh the whole matter as one concerning which it is their duty to have a conviction, and to express an opinion. Indeed, let all of us determine that, the matter having been carried thus far by one of His Majesty's representatives, whatever lies in human power to give the question a full hearing and a fair discussion shall be done; and if the definite proposal that is advanced commends itself as the best method of dealing with the situation that has arisen, let us all strive to ensure that something very tangible shall emerge.

Every student of the Canadian electrical trade position has something to say about the Underwriters' organisation and its adverse influence from the British electrical manufacturer's point of view; but perhaps, if we get to understand better, as this report may enable us to do, the reasons which gave birth to this undertaking, and the work that it has done in the way of fire prevention, and the absence of British electrotechnical co-operation and guidance in connection with its procedure, we may be able to clear away prejudices, the removal of which may prepare the way for the introduction of influences which will tell in favour of British manufacturers in the future.

At this juncture it is not our intention to pronounce any very definite view respecting the details of the new scheme, though we do not hesitate to say that in principle the proposal appears to contain very reasonable advice. The right thing for us to do at this moment is to invite opinions from those who are actively engaged in manufacturing and exporting. The Trade Commissioner has done his part, we have done ours in giving the matter such complete publicity, and it now remains for our firms—their principals, managers, and other experienced representatives—to express themselves and to get to work on this side considering the wisdom of the proposal, and devising means for carrying it into effect.

Briefly stated, what is recommended is that British electrical engineers should take a leaf out of the American book and equip their own laboratories in the United Kingdom, on the same lines as the American. The more the suggested British laboratory works in conjunction with the Chicago authority, obtaining the right to use its labels, the more likely is it that British manufacturers will gain the advantage not only in meeting the wants of Canada, but in even opening up to themselves the United States electrical market, for the use of the labels mentioned would carry equal commendation to all inspectors throughout North America. The necessity for co-operation must be emphasised. Independent British action in such a case would be fatal. It would seem that nothing short of a laboratory in England, which will be *practically an offshoot of the Underwriters' Laboratories (Inc.), of Chicago*, will meet the case. It must be run on similar lines, utilising the experience gained at Chicago, employing equally competent, but British, consulting and technical engineers. It is suggested that the article approved by label or tab should be accepted by both the British and the Chicago laboratories, the same careful system of experiments and tests being followed by the consideration of reports before they are issued, and

the adoption of the same, or a similar, system of labelling, tabs and inspection.

The foregoing is in barest outline the idea now advanced, but there are many reasons why the entire report should be read before anyone attempts to criticise it, for there are various details which, if ignored, would leave one with an incomplete idea of the position. One word more—let it be remembered that the Chicago organisation will welcome any such movement as is suggested in the hope of minimising fire risks, and is in no sense to be regarded as having hostile interests. British apparatus possessing outstanding fire preventive qualities will be welcomed on their merits if they bear the stamp or label of authority, and knowing the high quality of the material that our electrical manufacturers are in the habit of producing in the interests of public safety, we feel that it should stand a good chance of passing the test and report stages satisfactorily.

### The Berlin Railway Conversion Scheme.

THE Government scheme for the conversion to electric traction of the Berlin City, circle and suburban railways, has recently been engaging the attention of a Commission of the Prussian Diet. The project was brought forward in the last session of the Diet, but was postponed in consequence of the doubts expressed in various quarters, and also because proof was desired that the same results could not be attained by the use of more powerful steam locomotives and at a smaller expenditure than £6,300,000, the sum contemplated under the electrical scheme. In the meantime a fresh memorandum has been prepared and submitted for the consideration of the Commission. It appears that the steam interests have presented a scheme for a six-axle tender locomotive weighing about 100 tons, and working with superheated steam. The document states that a comparison of this type with the proposed electrical system shows that the former cannot compete with the latter either from a working or an economical point of view. If guarantees could be obtained for the certain carrying-out of the services it would only be possible to operate 32 steam trains per hour in either direction on the City railway, with a seating capacity for 19,500 passengers, whereas electrical working will permit of 40 trains per hour with accommodation for 24,400 persons. The introduction of heavier locomotives would involve an outlay of £4,450,000, as compared with £6,300,000 in the case of electricity, but the annual expenses, including interest and depreciation on the new capital, would be £295,000 less in the case of electrical working. The deficiency on operating the railways in 1910 was £18,000 and it was £23,000 in 1911, whilst in 1916 the deficit, without providing for depreciation and interest on capital, would amount to £117,000 with electricity, and as much as £498,000 with steam locomotion. It is therefore considered that the latter can no longer be taken into consideration. An increase in the passenger fares is foreshadowed on the ground that at least the deficiency in working must be avoided and 4 per cent. interest obtained on the new capital expenditure. A further point of interest relates to the supply of power for the operation of the railways. As will be remembered, a private group of manufacturers have offered to furnish the necessary energy for a period of 30 years by the erection of central stations, at least one of which would utilise lignite as fuel. The offer ranges from 3·3 pence to 3·8 pence (387d. to 446d.) per kw.-hour delivered on the railway side of the station, and according to the quantity required.

It appears that the State railway authorities have the option of purchasing the whole of the generating plant and transmission lines during the term of the agreement, on certain conditions which have been formulated. This is a new proposal, the object of which is presumably to disarm the opposition which has been aroused by the possibility of the creation of a monopoly in the supply to the railways. No obligations have, however, been assumed by the State railway authorities in the matter, and it is, therefore, possible to enter into negotiations with other undertakings for the supply of energy, as occasion may arise. The proceedings before the Commission of the Prussian Diet elicited the statement that trials have already been made of new types of steam locomotives, but that electrical working is more economical, and that the possibility exists of an extension of the latter method on other railways, apart from those in Berlin.

### Train Lighting and Burning.

IN our issue of September 27th we drew attention once more to the dangers of lighting railway trains with gas, referring particularly to the accident at Ditton Junction, whereby 15 persons lost their lives, and several were burnt. We had no hesitation, in view of the evidence then available, in ascribing the burning of the wrecked coaches to the use of gas, and the report of Lieut.-Col. Sir H. A. Yorke to the Board of Trade, of which we give extracts on another page, fully confirms our conclusion. The Inspector recalls that Major Pringle, reporting on the Hawes Junction accident in 1911, expressed the view that electric lighting should be adopted in place of gas, and he supports this recommendation, stating that "so far as safety is concerned, there can hardly exist in anyone's mind a doubt that electricity is the better." He thinks that the railway companies would be wise to recognise this fact, and to adopt electricity on all their main-line trains before they are compelled to do so by the pressure of public opinion.

We gather from the report that, after the previous accident, the Board of Trade made representations to the railway companies to the same effect, and we welcome this praiseworthy action. Our contemporary, the *Gas World*, objects that the Board of Trade, in doing so, has gone ahead of public opinion, but surely this is a matter for congratulation rather than reproach—it is a pity the phenomenon is so rare! Our contemporary makes a mysterious reference to "the more than doubtful record of the proposed substitute, electricity," which, we must confess, has left us dumbfounded.

We challenge the *Gas World* to cite a single instance, in any part of the world, where the electric lighting equipment of a railway train has even been *accused* of causing a fire after a collision. It should know better than to remark that "the contemplation of an express train rushing through the night for two hours without a stop with a short-circuit at work is not consoling." If fire were to break out—from any cause—on a train in motion, common sense would stop the train and let the passengers get out. But who ever heard of a short-circuit on a train enduring for even two minutes?

Major Pringle's report referred to the Hawes Junction disaster as the first occasion on which it could be "proved beyond question" that the fire was caused by burning gas; but on previous occasions Board of Trade inspectors had pointed out the dangers of gas, and we have before us a list of no fewer than 13 instances since the year 1887 in which railway accidents abroad were followed by fires ascribed to the presence of gas. We are glad to know that the number of British coaches lighted with electricity is increasing yearly, but may not the process of reform be hastened by the teachings of foreign experience, as well as by our insular holocausts?

## INCREASING STEAM PLANT EFFICIENCIES.

BY EDWARD INGHAM, A.M.I.M.E.

CONSIDERING the high working efficiencies of the boilers, and the low steam consumptions of the engines and turbines at electric lighting and power stations which are obtained at the present time, it would appear that the scope for further improvement is somewhat limited. With regard to the engines and turbines, this is, perhaps, to a large extent the case; but as regards the boilers, there are various ways in which it seems possible to increase the present efficiencies, and in this article it is proposed to point out how such improvements may be effected.

The proper combustion of the fuel is, of course, a point of the first importance; but so much has been written bearing on this question, that little need be said about it here. There can be no question that excessive losses may, and do, occur as a result of imperfect combustion, the admission of excessive quantities of air to the furnaces, &c. Indeed, in a great many instances the working efficiency might easily be improved by 5 or even 10 per cent. by properly regulating the air supply. As illustrating what can be done in certain cases by careful attention to the boiler plant, it might be mentioned that at the Loughborough Electricity Works the generating costs per unit were reduced by no less than 44 per cent. merely by using a more suitable class of fuel, reducing air leakage and generally obtaining more perfect combustion of the fuel.

Where many boilers are concerned, as is the case at all large central stations, it is certainly advisable to install a CO<sub>2</sub> recorder in the boiler room, as such an instrument provides the fireman with a means of ascertaining whether or not he is getting the best results, and he can then regulate the air supply, &c., accordingly. After all, the fireman is a most important factor in the attainment of high boiler efficiencies, particularly where hand-firing is practised, and for this reason it will, generally speaking, pay to adopt a bonus system for the fireman, as a pecuniary incentive will certainly go a long way towards reducing the coal bill. The large influence the fireman has on the working results is well illustrated by tests which have been carried out from time to time. In one instance four good stokers were made to fire a large Lancashire boiler, one after the other, the conditions being maintained as far as possible the same, and it was found that there was a difference in economy of as much as 23 per cent. between the best and the worst fireman. In another test, carried out by Messrs. Davy Bros., of Sheffield, five men were made to fire the same boiler, and whereas the best man evaporated 9 lb. of water per lb. of coal, the worst only succeeded in evaporating 7.4 lb., representing a difference of 22 per cent.

Considerable savings may often be made by carrying out calorific tests of the various fuels available, combined with practical trials extended over a few days' supply to the station. This enables the engineer to choose the fuel which costs least per unit, and by so doing the annual coal bill may often be reduced very considerably. Coals having high calorific values, and free from dirt, are not always the cheapest to use.

Mechanical stoking, whilst it may not show much advantage over hand stoking in the case of a small station, will certainly do so where large stations are concerned, as by its adoption the firing is more even and regular, and the combustion, therefore, more efficient, whilst the losses arising from the admission of large quantities of cold excess air through the fire-doors and through holes in the bed of fuel are avoided.

The cost of labour is also greatly reduced, especially when the machine stokers are used in conjunction with coal elevating and conveying plant.

Good draught is another important factor, as without such, perfect combustion is impossible. Mechanical draught, either forced or induced, possesses a great advantage over natural draught, inasmuch as it enables the fires to be worked thicker, which tends towards economy, whilst the air required for combustion is brought into more intimate contact with the fuel, and more coal per sq. ft. of fire-grate can be burned than would otherwise be possible.

At electric generating stations in particular, mechanical draught is of great advantage, because at such places the load frequently changes quickly and to a large extent, owing to fogs, dark clouds, &c. With mechanical draught the intensity of the draught can be regulated according to requirements.

One way in which it seems possible to increase steam boiler efficiencies is by heating the air required for the combustion of the fuel before admitting it to the furnaces, the heat in the products of combustion being utilised for this purpose. It has indeed been found possible to effect an economy of 15 per cent. in this way by suitably arranging the boiler house and flues, and there is, no doubt, considerable scope for improvement in this direction.

It has been frequently suggested that the furnace of a steam boiler should be separated from the boiler itself, and the fuel burned in a producer. There is every reason to believe that the adoption of this suggestion would result in much higher efficiencies. A producer is certainly better adapted for the proper combustion of coal than a fire-grate, as it would permit of better regulation of the gas and air supply with less draught, whilst losses from radiation could be much reduced. In a paper read before the International Association for the Prevention of Smoke, some years ago, by Prof. C. H. Benjamin, it was pointed out that "when we compare the comparatively sluggish and badly-regulated coal fire of the power plant with the perfect combustion and intense heat of the open-hearth steel furnace, we are justified in predicting an improvement in the former."

It was further stated that "when the coal fire is removed from its inconvenient and uneconomical position under the boiler, and the combustion is perfected in a brick-lined reverberatory furnace operated under forced blast with air heated by regenerators, the heat efficiency and the evaporative capacity of steam boilers will be enormously increased. The secret of good combustion in boiler work, as in metallurgy, is complete combustion of the coal in a separate receptacle and the maintaining of the gases at a very high temperature before coming in contact with any cooling surface whatsoever."

The fundamental reason why gas and air can be burned more economically than coal and air is that both the former are gases. Air cannot be intimately co-mingled with solid pieces of coal, but air and gas can be brought into intimate contact with one another in the correct proportions at the proper time and place for the chemical combinations known as "combustion" to take place. This means that there is little or no useless residual "free" air to be wastefully heated up. By gasifying the coal in a separate brick furnace close to the boiler, and then burning it with all the sensible heat of its production by the introduction of heated air in such a way as to thoroughly intermingle the two, an enormous gain is obtained. The combinations of combustion can also be completed prior to the gases coming into contact with the water-cooled boiler plates, which is another reason why great gain results. Further, the whole of the boiler flue surfaces are usefully employed in absorbing heat instead of acting more as cooling surfaces as in the ordinary ashpit.

An external furnace has recently been designed on these lines by Mr. E. C. Mills, of Manchester, and in tests made on a Cornish boiler, with and without this furnace, by Mr. J. B. C. Kershaw, F.I.C., of Liverpool, the following results were obtained:—

	Ordinary furnace.	Mills' furnace.
Lb. of water evaporated per lb. of coal		
from and at 212° F. ... ..	6.99	11.2
CO <sub>2</sub> in flue gases ... ..	7.32	14.6
Thermal efficiency ... ..	51.85 %	77.1
Temperature of chimney gases ... ..	518° F.	372° F.

It should be mentioned that no economiser was used in connection with the boiler tested, the efficiency of which with the ordinary furnace is low. The increase in efficiency which resulted from the adoption of the external furnace is, however, very considerable, even when the great scope for improvement in this particular case is taken into account. The writer understands that further tests on larger and more efficient boilers are about to be made with the object of further proving the merits of the external furnace, and in a subsequent article he hopes to give the results of these tests, together with a description and an illustration of the furnace.

Some reference should be made to the adoption of liquid fuel for steam generation purposes. With such fuel it is much easier to regulate the quantity of air required for combustion, and losses due to the admission of much excess air may be thus reduced to a minimum. It is stated that 10 or 15 per cent. increase in efficiency is possible by the employment of liquid fuel instead of coal, but it is doubtful if such is the case. The writer holds the opinion that, as far as economy is concerned, liquid fuel, owing to its high cost, is not likely to take the place of coal, but it may certainly be used to great advantage in certain cases. Thus, at an electric generating station, where sudden demands for steam may be made at any moment, it will be obvious that, if the fires could be made to respond quickly to any such demand, great benefit would result. This, of course, is not possible with solid fuel, but by means of suitable burners oil fuel could be blown on to the fires, and the necessary sudden accession of the fires thus obtained just when desired.

The heat generated in the boiler furnaces has to pass through the plates before it can be usefully employed for evaporating the water into steam. It is obvious that the transmission of heat from the hot furnace gases to the water in the boiler should be as free from resistance as possible, and hence it is absolutely necessary that the plates should be kept clean both on the water side and the fire side. It is quite impossible to obtain high efficiencies if the plates be allowed to get coated over with scale on the water side and soot and dirt on the fire side. According to Mr. Stromeyer, of the Manchester Steam Users' Association, a layer of average scale  $\frac{1}{4}$  in. thick offers as much resistance to the passage of heat as a plate of steel 10 in. thick, whilst grease is ten times worse than scale. Hence the importance of keeping the plates clean. The figures quoted by different writers to show the losses due to scale should be taken with the proverbial "grain of salt," because so much depends upon the nature of the scale. Excessive thicknesses of some forms of scale have less effect in impeding heat transmission than thin layers of other scales.

Recent experiments and researches have shown that even with thoroughly clean plates, steam boiler efficiencies are not nearly so high as they might be. This is apparently due to the fact that under working conditions a stationary non-conducting film of gas clings to the fire side of the plates, whilst a similar film of water attaches itself to the water side of the plates. These films seriously impede the free transmission of heat from the hot gases to the water and so materially reduce the efficiency of working. It has been demonstrated repeatedly that if the hot gases and the water be moved rapidly over the plates, the rate of heat transmission is enormously increased, this being in all probability due to the fact that by so doing the non-conducting films referred to are removed from the plates.

The question of moving the hot gases and the water over the plates at high speeds is therefore one to which designers of steam boilers might in the future give serious consideration, as there is no doubt a large field open for improvement in this direction.

In his book on the "Steam Engine and other Heat Engines," Prof. Perry states that "Whether a tube be made of copper or iron or brass is of no consequence, except as to convenience and oxidation by the flame. The real resistance to the passage of heat is not due to the bad conductivity of the metal; it is due to the fact that the particles of hot gases will not come up fast enough to the surface to get cooled, and the particles of water will not come up fast enough on the other side to get heated."

Again: "We want the surfaces of the metal wall to be scrubbed, the one with hot gases and the other with circulating water, and the student who pays most attention to simple experiments on convection is most likely to invent the best boiler. Probably the best boiler will be one in which a flame or hot gas tube surrounds or is surrounded by a water tube, the gas and water flowing fast in opposite directions."

Efficient circulation and agitation of the water in steam boilers are very important factors in the attainment of high efficiencies. The rate at which heat is transmitted from the hot furnace gases to the water in a boiler depends upon the rate at which the water can carry the heat away from the heating surface, and hence the more efficient the circulation,

the more efficient will be the heat transmission. In ordinary boilers, such as the vertical and the Lancashire, the circulation is defective, whereas in a well-designed water-tube boiler it is systematic and thorough. Experience appears to show that water-tube boilers are slightly more efficient than Lancashire boilers, this being due, no doubt, very largely to the better circulation which obtains in the former. When it is remembered that a Lancashire boiler, notwithstanding its defective circulation, will give an efficiency of nearly 80 per cent., it will be obvious that this type of boiler might be made extremely efficient if some method of improving the circulation could be satisfactorily applied. Special circulating devices have been patented, suitable for such boilers, by means of which, it is claimed, the working efficiencies may be increased by from 5 to 10 per cent.

Agitation of the water in boilers, as might be expected from what has been said with regard to circulation, is another way in which greater efficiency could be obtained. Thus, it is a well-known fact that water placed in a pan over a jet can be made to boil much more quickly by constantly stirring the water than when the water is allowed to remain still. A locomotive boiler, when used on the railroad, will evaporate a far greater quantity of water in a given time than it will when used as a stationary boiler, this being, no doubt, due to the shaking and agitation the water receives during transit. If it were possible to rock our boilers mechanically, we might reasonably expect to obtain better results.

The setting of steam boilers is not always carried out to the best advantage, in consequence of which much avoidable loss often occurs. Those parts of the setting which rest in contact with the boiler plates should be reduced in width to the absolute minimum, so that as little heating surface as possible will be covered up. The best setting is that in which all the parts in contact with the plates are made of a rounded form, as in the "Poulton" system. With such a form, practically no useful heating surface is lost. In a Lancashire boiler, with the ordinary form of setting, as much as 80 sq. ft. of heating surface is lost in some instances. It may be mentioned that there is no necessity to make the seatings 3 or 4 in. in width, as is usually done. A width of  $1\frac{1}{2}$  in. is quite sufficient to support the heaviest Lancashire boiler when full of water.

In building the side walls of the setting it is always advisable to provide an air cavity in the walls, with the object of preventing loss of heat by radiation through the setting. Air is a very good insulator, and the provision of a stagnant air cavity round the setting effectually prevents loss. The makers of the "Poulton" setting, in addition to building a cavity in the side walls, also provide one underneath the boiler, the importance of doing so being well illustrated by the following example:—"At a large electric light and power station where a range of 10 boilers is installed, it was found that the temperature of the clay underneath the concrete foundations, 10 ft. below the bottom of the boilers, was as high as 280° F. These particular boilers were worked night and day by means of forced draught. A huge mass of material was thus maintained at this high temperature day and night, by a direct waste of useful heat"—which, of course, was constantly flowing into the subsoil and being dispersed.

A certain amount of loss by radiation is unavoidable, but by providing air cavities in the way pointed out, covering the boilers and steam pipes with good non-conducting composition, &c., the losses may be reduced to very small dimensions. As a further preventive against radiation, the brick walls may be carried up to the top of the boilers and then roofed over so as to form a hot-air chamber, in addition to the non-conducting covering.

Much loss frequently occurs through allowing the non-conducting covering to become defective. Many types of covering are perishable, and it is therefore advisable to examine the material periodically to see that it is in good condition.

Generally speaking, the quantity of heat lost by radiation from a hot boiler averages about 10 per cent. of the total heat of combustion. This figure might easily, in a great many instances, be reduced to 7 or 5 per cent., so it is obvious that this question of radiation is one of considerable importance.

It is not generally realised to what extent loss may occur through constant fluctuations of the water level in steam

boilers. By maintaining a constant water level and feeding regularly, a more uniform steam pressure, drier steam, and an improved circulation may be obtained, all of which tend to effect economy in working. Hence, great care should be exercised on the part of those in charge of steam plant to prevent fluctuations of water level and to feed regularly.

This is not a difficult matter when the load is a steady one, as at a cotton mill, but at power stations such conditions do not prevail, and hence the adoption of an efficient automatic feed-water regulator will prove to be of great advantage at these places. From comparative tests which have been made on boilers with and without automatic feed regulators, it appears that an economy of 5 to 10 per cent. may be effected by means of the regulators, the best results being obtained where the load fluctuates a good deal.

In conclusion, some reference should, of course, be made to the importance of utilising some of the waste heat from steam boilers. A large proportion of the heat generated by the combustion of the fuel in the furnace is not used in evaporating water into steam in the boiler, and passes away towards the chimney stack, and it is, therefore, necessary to employ suitable means of utilising some of this heat. Fuel economisers, superheaters, &c., are employed for this purpose, and by their adoption the fuel consumption may be reduced by anything up to 15 per cent., depending on conditions. These accessories are so well known and familiar to station engineers that little need be said about them, except that the remarks already made regarding clean plates, both on the water side and the fire side, high rates of flow of gases and water, &c., apply equally to economisers as they do to steam boilers.

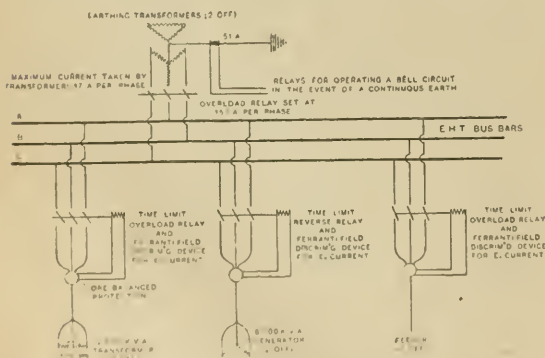

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Earthing the Neutral.

Mr. Peck's paper upon "Earthed and Unearthed Neutrals on Alternating-Current Systems" has raised an interesting discussion. The majority of the speakers agreed upon the question of earthing, but none of them appear to give reasons why the current should be limited or unlimited. The question of earthing had to be settled here some 18 months ago owing to the adoption of a three-phase supply, and I think the following information will be interesting to your readers.

The two and three-phase systems are interconnected by

Scott-connected transformers, and the first point I had to decide was to provide an earth when the transformers were supplying three-phase current. The capacity of the transformers is 1,000 K.V.A. each, and at light loads they supply three-phase current to several feeders.

It was undesirable to earth the three-phase system through the neutral connections of the transformers, the chief reason being that should an earth develop on any of the

feeders, the overload relays on the transformers would operate and thus cut off all the supply, including the earth connections, without indicating the faulty feeder. Up to the present, earthing through a resistance on A.C. systems only follows a similar arrangement with a D.C. three-wire system at 500 volts.

The use of limiting devices now generally employed on E.M.T. three-phase systems causes an abnormal rise in pressure in the neighbourhood of the fault. On the other hand, to allow 500 amperes to stray between the fault and the neutral point of the system is not beneficial either to gas, water and telephone companies' property, or to the distribution system. It was, therefore, necessary to adopt some other method of overcoming these difficulties.

I give below the advantages of the arrangement that has been in use in Sheffield during the past 18 months. The diagram of connections is shown herewith, which, I think, is self-explanatory:—

1. The personal element of switching a working generator or transformer to earth is obviated.
2. No expensive automatic selecting device is required.
3. The earth current is limited to 51 amperes, which is sufficient to trip the Ferranti-Field discriminating device.
4. The earthing device was built by the British Electric Transformer Co., and is in the form of a transformer arranged with primary star-connected and secondary delta-connected. Having the secondary delta-connected ensures that the neutral point on the primary is always at earth potential, as proved by experiment.
5. The earthing transformers are arranged to operate the trip coils of the respective switches in parallel with the overload and reverse relays.
6. The units per hour taken by the earthing transformer are 1,250 watts. The capital cost was approximately £150.

S. E. Fedden, *Manager.*

Electric Supply Department, Sheffield,

December 21st, 1912.

[This arrangement was referred to in our article on the Sheffield undertaking, on September 6th last.—Eds. E.R.]

### Electric Cranes.

I was rather interested in an article appearing in a recent issue dealing with electric cranes, and would be glad if the author would further enlighten me on this important subject. The controlling gear of the D.C. crane consists of a double-pole distribution board, controllers that can be wired for either single or double pole, and eight trolley wires between the girders.

Why is the crane wired single pole?

I understand that the overwinding arrangement is a knife switch erected on the crab, and at the proper time this switch opens and breaks the main circuit.

If I am correct in this assumption, I should hardly call it modern practice; most cranes have a circuit-breaker connected in the hoisting-motor circuit, and, erected in the control cabin; this is held in position by means of a coil which, when short-circuited, trips and opens the breaker. A small switch, which takes the form of a push-button, is erected on the crab, and employed to do this.

This means more trolley wires, I know, but I think it is worth the extra expense as opening the main circuit on the crab has some objectionable features.

Regarding the crane wired for alternating current, I should obviate the use of a common main by putting up another trolley wire.

The practice of having a main common to two or more motors is one not to be commended, because faults may arise in the wiring which would greatly increase the danger of the hoisting motor brake operating when cross travelling or long travelling.

My remarks regarding the hoisting limit switch on the D.C. crane hold good for the A.C. one, and finally, I think there are more efficient controllers on the market for controlling three-phase asynchronous motors than those shown in the diagram; in any case the wiring at the controllers is obviously wrong, because we have a short circuit between two phases of the supply on all controllers.

J. L.

Glasgow, December 26th, 1912.

### The Case of the Sub-Man.

I and other members of the E.T.U. have been interested readers of the correspondence which has appeared in the columns of the REVIEW during the past weeks, from sub-station and shiftmen, about their woe-begone condition.

The whole correspondence bristles with contradictions; they first of all assume that they occupy a unique position, being a sort of aristocracy of the electrical industry, upon whom shines the reflected glory of the chief engineers (I see the Burgh of Paisley requires the services of one of these embryo Faradays at £1 5s. per week), and in the next sentence they say that milkmen, yardmen and others can, and do, accomplish their work.

They are all agreed that Trade Union principles are not applicable to their grade, and the unanimity with which they refrain from telling us why is certainly convincing.

The objective apparently is, *vide* "Motor-Generator," to form an association, to be called "The Electrical Shift Engineers' Association," the object being the furthering of the living wage cause (rate not stated), and to be recognised as a body of men of education and training; the association not to be run on Trade Union principles. The I.E.E. is to be approached for "recognition," and the trick is done. "O the brave music of a distant drum."

The more one reads this correspondence; the more apparent does it become that, however well-intentioned the writers may be, they lack a true appreciation of the factors which govern the wages and working conditions of any industry, and the sooner they get rid of the shibboleth "profession," and the snobbishness attaching thereto, the better it will be for themselves.

The "chief" is merely a deputy for the employer, and, from the nature of his position, has to show a return on the undertaking, and the price of labour, especially unorganised, is more easily squeezed than the price of Osram lamps.

If "Motor-Generator" and his colleagues are really serious in their contention that "to strike one blow for this great cause" is to form an "Association" to obtain "recognition" from the I.E.E., they had first better visit a local menagerie, obtain access to the lion's den just before feeding time, say a few prayers, and await the result.

The interests of the station attendant and the wireman are identical; both sections are necessary for the efficient working of the industry, they are interdependent, their economic circumstances are due to the same primary causes, and a multiplicity of organisations will not find the solution. The Electrical Trades Union is an accomplished fact, has a considerable body of central station men in its ranks, has improved conditions for large numbers of electrical workers in the various grades, and will welcome recruits on the principle of "each for all and all for each."

J. Potter,

District Secretary, Electrical Trades Union.

London, N.W., December 28th, 1912.

### High-Tension D.C. in Mines.

I am much interested in Mr. Sydney Walker's article entitled "A Plea for the use of High-Tension Constant Continuous Currents in Mines." Under the heading "Questions of Economy," he states that with a three-phase system at a working pressure of 3,000 volts in a mine having five miles of cable the combined losses are in the neighbourhood of 500,000 Board of Trade units per annum. I have no doubt Mr. Walker has gone very carefully into these figures, and do not in any way wish to criticise them, although they appear somewhat high. What I should like to know is—

1. What percentage loss this is of the total Board of Trade units consumed?

2. What Mr. Walker estimates the loss would be in a high-tension continuous-current system having a proportionate length of cables with, as I understand from his article, full-load current circulating throughout the whole system continuously?

Unless some such information is to hand, it is difficult to form any idea of the merits of the two systems from an economic point of view.

Civil Engineer.

The title of Mr. S. F. Walker's article in your issue dated December 27th, 1912, as above, disarms any criticism on the point that he writes as an advocate and not as an impartial judge. Nevertheless, as an engineer who has devoted some few years to electrical work in mines, the writer would like to put forward a few points which appear to discount somewhat the advantages claimed on behalf of the above system, taking these *seriatim*:—

*Two Cables versus Three.*—Since three-core cables must (and should) always be used underground on the three-phase system, the great advantages of and greater simplicity in making connection to the concentric cables advocated for the N.T. C.C.C. system are not very apparent. In neither case must any attempt ever be made to joint the cables when alive. The majority of jointers prefer jointing three-core cables, and these have the additional advantage that the cores need not be jointed in order to take off a branch circuit.

*Pressure Variation between the two cores at Different Points.*—The writer grants that should this difference of pressure in any particular district (say, at the coal face) be so small that a shock would be harmless, some advantage might be claimed, but this hardly appears probable, as any difference of pressure above, say, 100 volts, should be regarded as dangerous from a "shock" point of view. The spark danger would exist at any pressure. A distinct disadvantage would appear to be, that although the cable on the C.C.C. system would normally carry the constant current at a certain difference of pressure between the cores, it would be neither advisable nor practical to grade the various cables to withstand this pressure only, as the pressure might vary to such a large extent when alterations or additions to the motors were made. In fact, it seems to the writer that the whole of the cables should be built to withstand the maximum pressure likely to be generated, otherwise continual change of cables would be necessary, and great liability to serious accidents incurred through the breakdown of cables under higher voltages than they were built for. A similar problem will have to be faced if the total load at any time exceeded that contemplated when laying down the plant. This compares disadvantageously with the three-phase system, where the sectional area of the cables can be increased by simply putting others in parallel at any part of the system required.

*Liability to "Short."*—Surely, Mr. Walker is not serious in his statement that, because there are three cores as against two, liability to "short" is increased sixfold?

Cables made by any of the leading firms in this country are not likely to "short" (barring misuse) unless mechanically damaged, say, by a fall of roof, in which case there is little, if any, advantage in a two-core over a three-core cable.

Again, if a "short" occur in a C.C.C. system all apparatus beyond the "short" is put out of action, as Mr. Walker states; but, on the other hand, a similar occurrence on a three-phase system will not necessarily put the whole service out of gear, as Mr. Walker suggests. Part of the system only will be cut off in this case also, owing to the operation of a trip coil or fuse controlling the section containing the fault. Yet again, in the C.C.C. system, surely local heating can take place at a "short," since this will carry the whole current? The contact is not likely to be so good that heating never takes place.

*Armouring.*—The difficulty of repairing armouring is not so great as Mr. Walker imagines. The best way (apart from putting in a new length of cable) is undoubtedly to use a joint box. It must be remembered that on a large system there will be a number of these boxes, say, 100 yd. apart with a very heavy cable, and 400 or 500 yd. apart with a light one. One extra joint box where the cable has been damaged, is not a very serious matter. It may be of interest to state here that joint boxes which *efficiently* bond the armouring can be obtained from cable firms who have made a special study of mining work. Serious damage to the armouring is not a frequent occurrence where the cables have been installed in the right way, and are properly looked after.

*Danger from Shock.*—Cases of shock, similar to those mentioned by Mr. Walker, are not inherent in, or peculiar to, the three-phase or any other system, but are usually caused by the lack of knowledge or carelessness on the part of those who are responsible for the installation or the working of the system. The writer cordially endorses the opinion that

a great deal of the trouble in the past has been due to the fact that many of the designers of electrical appliances for use in mines had very little practical knowledge of mining conditions. This, however, was to some extent the fault of the mining people themselves, sufficient discrimination not always having been employed by them in placing their contracts, the question of first cost frequently determining their choice.

*Economy.*—It is rather disappointing to find under this heading that no attempt has been made to compare the two systems. The author does not say how he arrives at the high figure given for hysteresis and magnetising losses.

As against this, too, must be taken into consideration the fact that the  $C^2R$  losses in the c.c.c. system will be proportionately greater when only a few motors are in use, more particularly when they happen to be at the far end of the line.

Again, while on the subject of economy, the first cost of the cables in the c.c.c. system would appear to be rather high, since their sectional area must be the same throughout, and, in the writer's opinion, to grade the dielectric strength would be likely to lead to trouble in the future when alterations or additions were made.

Other disadvantages suggest themselves, but for the present purpose space and time have limits.

As the subject of electrical work in mines must be of great interest to a large number of your readers, further articles on the subject would probably be welcomed.

L. C. Trevor-Roper.

Sheffield, December 30th, 1912.

Having had some experience of mining electrical appliances, I read with some interest the contribution by Mr. Walker in your current issue which naturally attracted my attention, especially as some of the statements appear so wide of what my experience points to, that I think, for the sake of the many more or less connected with mining work who read your paper, they should not be allowed to go unchallenged.

This is my excuse for writing on the subject, and airing some views which are my own, and which I shall think correct till some one proves them otherwise.

On one matter I agree with Mr. Walker, viz., the unreliability of armoured cables carrying several conductors of greatly varying potential and phase.

A remedy, however, for this, suggested long ago, which would, I believe, have been tried but for the bugbear of a little experimental initial cost, is as follows:—

Adopting an alternating system, either single-phase or polyphase, with transformers, run separate well-insulated and braided conductors in iron tubing—not of just the ordinary house-wiring strength, but more resembling the pipes used for carrying steam or compressed air, but, of course, smaller, so as to give equal, or even greater, tensile strength, with, of course, only a fraction of the cost of the steam or air pipes. The joints to be safe ones, both electrically and mechanically, by using either faced flanges, screwed couplings, or some other reliable arrangement. Junction-boxes and transformer-boxes of equally strong mechanical construction to be similarly joined to the tubes, and the whole casing to be well "earthed" on the surface, and at as many places on the way in the mine as reliable "earth" can be found.

The two advantages claimed for this arrangement are:—(1) Being entirely enclosed, high-tension currents (up to 5,000 volts or more) could safely be employed; (2) the cables being separate, could easily be tested for "earthing" or breakage from the surface, and the fault easily rectified. The cables from the transformers to motors, if only carrying current at 100 volts or thereabout, could be given the flexibility required for coal cutters, &c., without danger or much risk of the insulation giving way.

This system, too, would get over most of the variable potential difficulties to which Mr. Walker refers.

With direct current (or continuous, whichever term you prefer; I prefer the former, being shorter, and generally understood to mean the same) we have not yet any system or practical means of reducing to low pressure that can be enclosed efficiently without the difficulties inherent to

running machinery enclosed, or at the same very small loss as obtains in a transformer. On this point, iron losses in transformers of reasonable size and decent construction rarely exceed 2 per cent. of the energy transmitted, and an instance came before me where one of 500 watts capacity, 200 to 50 volts, 50 cycles, tested by a Leeds Corporation inspector, showed only 2 watts iron loss.

Then, coming to the working of a direct-current motor with a by-pass, which is used to cut it out by short-circuiting, if not working, this must be either automatic or under hand control—I presume the latter; this requires, it seems to me, very reliable and conscientious use for one machine not to interfere with others on the same mains, and the beautiful conception of the voltage and consequent shock risk lowering as one gets further in the mine, can only hold good whilst all is in apple-pie order. Past experience does not warrant the assumption, however, that series apparatus can be relied on to keep in good order.

On the other, both transformers and alternating motors are amongst the electrical items of which the maintenance is easiest and least expensive, and seem to give the lasting solution which will, I believe, when those who have the choice of the electrical plant are sufficiently educated, be more and more used.

Apologising for the length of this, which, however, but briefly explains what could be further demonstrated—

A. W. Bennett.

Leeds, December 30th, 1912.

## NOTES FROM INDIA.

[FROM OUR SPECIAL CORRESPONDENT.]

*Calcutta.*—An effort is being made to bring together the members of the I.E.E.; invitations have been sent out to the various members, associate members, &c., to foregather at Peliti's restaurant at dinner with a view to having a preliminary talk as to the best way to arrange for frequent meetings and discussion. This is a step in the right direction, because, even though members of the Institution may be rivals in business, there is no reason why they should not meet outside business hours, on neutral ground, and have friendly discussions on technical points of interest to all. The last meeting of Calcutta members was held in 1903, with the late Father Lafont, C.I.E., in the chair, when an interesting paper on "Electrical Instruments for India" was read by Prof. Bruhl, of Sibpur Engineering College.

*Lahore Electric Supply Co.*—The official opening of the new electrical power house of this company took place recently, and there is every prospect of a good load coming on soon. Mr. Jensen, the chief engineer, is responsible for the design and working of the installation, and in him the directors have been fortunate in finding a capable and enterprising young engineer who will leave nothing undone to ensure the success of the undertaking.

*Simla.*—While the Imperial Government is down in Delhi for the cold-weather months until March, 1913, a good deal of installation work is certain to be carried out in Government buildings and private bungalows in Simla. Even at present a couple of local small wiring contractors are reaping a good harvest before the bigger firms of Calcutta and Bombay send representatives up there. The municipality have prepared very rigid rules for wiring work, and are open to register the name of any reputable firm who bind themselves to adhere to these rules when carrying out work. This is a wise precaution, as many of the Simla buildings are wooden ones, where a fire caused by an arc or a short would lead to disaster.

*Ranpur.*—Messrs. Siemens Bros. have been successful in obtaining the contract for the city lighting; the machinery will consist of Ruston crude-oil engines and Siemens dynamos, with accumulators. About 14 miles of streets are to be electrically lighted.

## PROCEEDINGS OF INSTITUTIONS.

## Tramway Feeding Networks.

By J. G. CUNLIFFE, M.Sc.Tech., and R. G. CUNLIFFE, M.Sc.Tech.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, December 3rd, 1912.)

The object of the paper is to present a suggestive treatment of the modifications which, as a result of continued development, are rapidly becoming necessary in the design of the feeding networks of many large street railway undertakings, and in the legislative limitations imposed thereon.

Larger and more powerful cars are continually being adopted, and are run at closer intervals. Traffic stops increase in frequency, necessitating a quicker acceleration in order to maintain the schedule speed, and the rate of consumption of energy per car is greatly increased. The net result of this increased rate of consumption and of the reduced headway is to cause a still greater

Curve A, kw.-hours per car-mile; Curve B, car-mile run; Curve C, kw.-hours per ton-mile; Curve D, average weight per car.

FIG. 1.—OPERATING STATISTICS FOR MANCHESTER.

increase in the intensity of electrical loading as expressed in kilowatts per mile. These effects are illustrated by the curves on fig. 1. At Manchester, owing to the small extent of the "city area," the rate of electrical loading at the centre is some 1,500 kw. per mile of route, and the rate of energy consumption of a car is some 38 per cent. greater at the city end than at the suburban end of a route. Special references are made to Chicago, owing to its very heavy loading.

Several of the sub-stations are designed for an ultimate capacity of 18,000 kw., whilst sub-stations of 12,000-kw. capacity are not uncommon. These large stations are interconnected by heavy cables, which generally serve also as feeders.

It is obvious that, under these circumstances, in view of the strict limitation of the line pressure, the governing factor in the feeder designs must, at some stage in the development, change from overheating to pressure drop, and that boosting must ultimately be resorted to. As the intensity of loading increases, special

The conductivity of the trolley wires is a matter of importance with the feeding system illustrated in fig. 2, A, and at Manchester their section is increased, on renewal, according to the distance between feeders and to the intensity of loading, this being a temporary provision until such time as installation of additional feeders is justified by the increased intensity of loading, the rate of consumption of energy being reduced by this and similar means as shown by the shaded area in fig. 1.

Several feeders are often operated in parallel for the purpose of preventing too frequent opening of the circuit breakers controlling very heavily loaded sections; and, even with very short sections. It is observed that, owing to the relatively high conductivity of the feeders as compared with that of the trolley wires, the feeders do not share the load equally, the centre of gravity of the load moving over a range of quite half the length of the section. As the whole of the copper must be fully utilised, this has led to the use of heavy feeders with several short sub-feeders radiating to the adjacent feed points. This method is becoming very common, more especially for the feeding of complicated networks. It is equivalent to the installation of equalising cables between the feeders.

Little relief can be afforded long feeders by over-compounding, as the permissible pressure rise at the bus-bar is limited by the pressure rise which may be allowed at the feed points of the shorter feeders, and this should not exceed 10 per cent. If a pressure drop materially in excess of 10 per cent. is, for economical design, required in the long feeders, therefore, it becomes necessary to employ separate positive boosters.

It is unsafe to operate a group of separate feeders from a common booster owing to the risk of abnormal pressure rise at the feed point of a temporarily lightly loaded section, and although, by parallel operation of the feeders, this risk may be avoided, the practice leads to unequal distribution of the load amongst the feeders, the shorter ones being overloaded. For satisfactory operation, therefore, a separate booster ought to be installed in each long and heavily loaded feeder, and with the heavy loading under consideration this would often be practicable. In order, however, to avoid the installation of a large number of boosters of varying capacity the authors suggest that advantage be taken of the method already described of employing main feeders, each having several short sub-feeders. The arrangement is illustrated in fig. 3, and the pressure drop in the main feeder alone would be compensated by the booster, so that the sub-feeder bus-bar would be maintained at a constant potential, the design of the sub-feeders being governed by considerations of overheating alone, and their load fluctuations not materially affecting the pressures at the feed points.

Automatic circuit-breakers with tell-tale indicators at the generating station, whence they could, if desirable, be operated by

FIG. 3.—SYSTEM OF FEEDING BY SUB-FEEDERS, WITH MAIN FEEDER ONLY COMPENSATED FOR PRESSURE DROP.

FIG. 2.—METHODS OF POSITIVE FEEDING.

means become necessary in order to maintain the rail drop at a sufficiently low value, and negative boosters must ultimately be adopted.

With light loading and few supply stations the system of feeding illustrated in fig. 2, A, is generally employed, and consists of feeders supported by distributors, which may or may not be graded in size according to the nature of the load variation and to the special duties which they may be required to fulfil. With a large number of supply stations, as at Manchester and Liverpool, the simple feeder system shown in fig. 2, B, is employed, since, even with the short lengths of feeding section available, with economical distribution through the trolley wires alone the feed points are nearer to the stations than to each other. As the intensity of electrical loading increases, the length of feeding section rapidly diminishes, and with very heavy loading, owing to the reluctance of engineers to employ feeders much larger than 1 sq. in. in cross-section, the simple feeder system of feeding is universally adopted, although, in many cases, with modifications, as at Chicago, where the feeder is continued throughout the whole length of the section and tapped on to the trolley wires at intervals of from three to six spans, the conductivity of the trolley wires being ignored in the design.

remote control, might be installed as shown in order to confine the area affected by a feeder breakdown, and would immediately localise the fault.

The general method of negative feeding is by means of separate feeders, as illustrated by fig. 4. It is impossible mechanically to divide the rails into definite feeding sections as is done in the case of the "line," and all negative feeders from any station must be operated in parallel, the difficulties encountered arising from the resulting lack of exact control of the load distribution in the rails. The conditions are exactly the reverse of those applying to the parallel operation of positive feeders, the conductivity of the four rails of a double track being equal to that of some 4 sq. in. of copper, and hence greatly superior to that of any individual negative feeder. It follows, therefore, that with light loading the amounts of current returning by the respective feeders, if of the same size, will be almost inversely proportional to their lengths, and in order to compel the longer feeders to do their duty they are in some cases made heavier than the shorter ones. In other cases resistance is inserted in the shorter feeders.

However carefully the negative feed points may be selected, the distribution of the return current amongst the feeders is, with very heavy loading, to a great extent governed by the nature of the load distribution, and there cannot be, without excessive outlay in copper, more than one point in the track on each side of the supply station at which there is no current flow, i.e., the rails on each side of the station cannot be divided into more than two feeding sections in which the directions of current flow are mutually opposed, the direction near the station being outwards from it. It is merely a question of the balance of potential following Kirchhoff's laws. The balance point between the two sections can, for fixed loading conditions, be moved farther from the station by increasing the resistance of the shorter negative feeders or by reducing that of the longer ones, and *vice versa*, but the extent to which, with heavy loading, this can be done, is limited by the pressure loss in the feeders, since the latter alternative is too expensive in copper. For a given length of track with increasing loading the maximum permissible rail drop is ultimately attained when copper must be provided to carry any additional current, and as this copper is operated at a very low current density, its use is very uneconomical.

At Chicago, the 129-lb. rails are reinforced by bare copper cable, in increasing section from 500,000 cm. (0.3927 sq. in.) on the outskirts of the sub-station area to 10,000,000 cm. (7.854 sq. in.) in the neighbourhood of the station, and even with this great outlay there is much electrolytic trouble. The direction of flow is uninterrupted, and if the bonds were cut and the cables separated, the longer ones would bring back more current.

FIG. 1.—METHOD OF NEGATIVE FEEDING ON BRITISH STREET RAILWAYS.

By the use of negative boosters the track may be divided into definite feeding sections almost as perfectly as is the line, and the flow of current in the rails may be controlled in a manner which is almost ideal; but in the few cases in which negative boosters are in use, this has not been done. No definite principle has been adopted, the boosters serving merely as a means of compelling long negative feeders to do their duty without excessive outlay in copper, the principles underlying the application being the same as in positive boosting.

Thus, Glasgow has a negative booster mounted on the shaft of each rotary converter at the sub-stations, and provision is made, as at Sheffield, for switching any booster on to any one of the long negative feeders, or on to a group of long negatives. At Glasgow and Sheffield the negative boosters are excited from positive feeders, but at Leeds there is a large negative booster, capable of being switched on to a group of long negative feeders, excited from a shorter negative feeder, whilst several smaller boosters, used on occasions of heavy traffic, are excited from positive feeders. A negative booster has been in use for some time at Birmingham in order to maintain the feed point on a route served by a long negative feeder at the same potential as that on another route fed by a shorter negative from the same station, whilst the authors know of no case of the use of negative boosters in America, and of only two cases on the Continent.

(To be continued.)

### The Turbo-Converter.

THE paper on this subject, by MR. F. CREEDY, of which an abstract was given in our issue of November 8th, 1912, p. 765, was read before the meeting of the SCOTTISH SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, at Edinburgh, on December 10th.

PROF. BAILEY (Edinburgh) said he took it that with the contrivance they required plant of, say, 1,000 kW. to turn out 500 kW. of power. That was a serious matter, and could only be allowed if they could not work the commutating machine at all. He could not see where this elaborate arrangement could be more satisfactory than simple mechanical gearing. It cost a great deal more and must be distinctly less efficient. Mechanical gearing would run up to 95 per cent. efficiency in large sizes at least, and this machine could not manage that; 92 or 93 per cent. would be the greatest that the induction generator would reach. He gathered that any suitable ratio could be used, and it might have particular applications in certain cases, although he did not see its application for ordinary central station work, where they wanted to run a D.C. machine at a lower speed than the turbine speed. He commended the introduction of the squirrel-cage motor and the application of the spinner idea.

MR. J. A. ROBERTSON asked Mr. Creedy for the combined efficiency of the set. He would not agree with the author in describing the direct-current turbo-generator as a mechanical monstrosity. A great change has taken place in the design of these machines, and he had seen a 1,000-kw. D.C. machine with carbon brushes, which had been running for about two years without the brushes having to be renewed. If they could get a D.C. turbo-generator to work satisfactorily, it would be preferable to this complicated design. Looking at the matter from the commercial point of view, he pointed out that they very rarely in present practice required D.C. in the central station. Modern practice was tending towards large generating units, and the transmission of energy in large quantities, which meant high-pressure transmission, and they were all agreed that the only practicable method of doing this at all was the three-phase A.C. system. He had found in recent years that remarkable efficiency could be obtained in generating with A.C. and utilising the rotary or motor-converter in sub-stations. As for the three-wire system, he thought the figures given by Mr. Creedy were better than anything that had been got from the usual arrangement of tapping a neutral point in a transformer, and carrying it through to the middle wire of the D.C. system, and quite lately he had adopted the expedient of putting in automatic reversible boosters on the end of the rotary shaft: as one side or the other was out of balance, they found this gave good compensation for the drop in voltage.

MR. F. A. NEWINGTON (Edinburgh) thought the arrangement would be more reliable for large sizes than mechanical gearing. He did not see how they could get a reliable machine with cut gearing to

run at 3,000 or 4,000 revolutions per minute, while he would not agree with Mr. Robertson that there was no use for D.C. plant in large power houses, it seemed that they would be driven into the adoption of A.C. simply because of commutator troubles. It was not the system, but the plant that was at fault.

MR. BUNTING (Edinburgh) asked if the actual machine had been constructed of any particular size.

MR. WILFRID L. SPENCE (Edinburgh) said he saw the greatest difficulties with the proposed bearings, and an almost insuperable difficulty in keeping them oiled. They got a reduction of the overhang in one of the diagrams submitted, but they also got the ends of the bearings right into the centre of the electrical windings. The spinner ideas were, commercially speaking, almost impossible. He could get mechanical gearing to work well at high speeds, and this was simply due to perfection of cutting and lubrication.

MR. SAM MAVOR (Glasgow) said it might interest Mr. Creedy and others to know that his firm (Messrs. Mavor & Coulson) were in communication at present with one of the most experienced builders of large marine turbines on the Clyde, with special reference to mechanical defects involved in the spinner motor, especially in large sizes, and those engineers had said most emphatically that they saw no insuperable difficulty in the mechanical design of the spinner motor in large sizes. They considered that they had overcome difficulties much greater.

THE CHAIRMAN said he had seen a good deal of trouble with commutators at high speeds.

In the course of his reply, MR. CREEDY pointed out that the device was got up on purpose to avoid a machine of 1,000-kw. capacity to give a 500-kw. result. This was the result they got if they used an A.C. generator to drive a rotary converter. The arrangement he had described bore the same relation to that as the motor-converter bore to the motor-generator. The capacity of the set was the sum of the capacity of the elements, not twice that. As to the three-wire system, Mr. Robertson had answered the question about the compounding of it, for which there was no way except by a booster. He considered the percentage of drop quite reasonable. He agreed with Mr. Robertson that the thing to do was to abolish D.C., but failing that, he thought there was some use for that apparatus. He had not got any definite figures to offer on efficiency. He was glad to hear Mr. Mavor's statement that large marine turbine builders saw no insuperable difficulty in the spinner idea. In this respect he thought mechanical engineers less conservative than their electrical brethren, who sometimes failed to admit the utility of a design which mechanical engineers were familiar with. The apparatus described was free from the possibility of gear stripping in the case of sudden short-circuits, and while the gearing might be less expensive than the induction generator, they saved on the converter, which was cheaper than the generator.

### Modern Methods of Electric Wiring.

ON December 11th MR. FRANK BROADBENT, M.I.E.E., read a paper on this subject before the ASSOCIATION OF ENGINEERS-IN-CHARGE. Referring to the earlier methods, the author pointed out that in 1874 a Canadian patent of Woodward described both the tree system and the distribution system of wiring, on which all modern developments were based. For interior wiring, he said, the distribution system was now practically universal in this country; in rare cases a pair of conductors were run to each individual light, and in motor installations this system was undoubtedly the best, as it facilitated testing and caused the least possible derangement in the event of the motor being overloaded or faulty. In large installations subdivision was necessary, carrying the distribution system a stage further; from the main switchboard feeders were run to main distribution boxes, and from these in turn sub-distribution boxes were fed, followed by smaller sub-boxes, if necessary, before the branches were run to the various groups of lights. In planning an installation, it was often the best plan to work back from the lighting points to the main switchboard, rather than *vice versa*. The Institution Wiring Rules, which were now generally recognised as the minimum standard to which good electrical installation work should conform, prescribed a limit of 600 watts for a branch circuit and fuse, but even this small value, with modern lamps, represented more than one might care to control by one fuse. In public buildings it might be necessary to run two circuits where one would suffice from the point of view of current-carrying capacity, in order to prevent the possibility of plunging a room in darkness through the failure of one fuse. The principal circuits might, with advantage, be limited to 5,000 watts, fixing the number of ways in the sub-distribution boxes at 10 or 12. The main distribution boxes should not control more than about six circuits each. The largest installation thus consisted of a number of small installations linked up to a central distribution point. The same principles applied to motor installations, treating each motor like a group of lights.

Joins in wiring were to be avoided, looping being preferable, within limits; but the latter was frequently carried to excess, causing unnecessary expense, complication and risk, as the wires were not really looped in actual practice, but were cut and held together in the terminals, and the mechanical connections thus made were not always above reproach.

While the Institution rules allowed small wires to be run at current densities up to thousands of amperes per square inch, on the basis of temperature rise alone, it was not possible to use such high densities unless the length of conductor was very short, as the voltage drop would be excessive. For lighting circuits a drop of 2 or 3 per cent. might be allowed, but for power circuits the current density was the only limit. Not more than half the drop

should take place between the main switchboard and the distribution boxes.

Regarding the quality of conductors employed, owing to the fact that the smaller cables of a given grade had a higher insulation resistance than the larger ones, it was possible, when a specification called for a given minimum insulation resistance, as in the Phoenix Rules, to use cables of different grades of insulation on a job without any of them falling below the proscribed minimum. On the other hand, the Institution Rule No. 41 made it clear that for all work up to 250 volts the cables must be of at least the 600-megohm grade, in which the smallest cables had an insulation resistance of 1,250 megohms per mile. The grades referred to were those of the Cable-Makers' Association, and the "Association" label was a hall-mark as to quality. The "non-Association" quality was listed as a 600-megohm class, and nothing above 600 appeared to be guaranteed in any size. The only simple test of rubber insulation was the stretching test, and the only safe practice to use well-known British manufactures.

For feeders and main circuits, paper or fibre-insulated lead-sheathed cables might be used with advantage.

For low pressures and in dry situations, wood casing had done very good service, and even in damp places it had been extensively and successfully used when treated inside and out with waterproof paint or varnish. The chief objection to it was its combustible nature. For moist places, good lead-covered cable, properly installed, was hard to beat, but it must be properly supported throughout its length. It must never be used in tanneries or breweries, or underground near the roots of trees, unless specially protected. It could be run along dry brickwork with comparative safety, but not along a damp wall or in contact with moist lime. The creeping of the lead sheathing must be guarded against by continuous support, and in the case of vertical runs, lugs should be soldered to the sheath. Lead-covered cables must not be laid in contact with iron.

For factory wiring and public buildings, screwed barrel was very largely used, and, when well done, made a sound engineering job. Slip socket conduit was not recommended. The choice of system for use in moisture-laden atmospheres was a difficult question; pipes tended to become water-logged, with disastrous consequences. For such cases open work on insulators was preferable, the vertical runs to switch positions being in conduit sealed with compound at the top and open at the bottom. Electrically speaking, there was no such thing as a watertight piping system.

Using screwed piping installations in "fireproof" buildings, the author had never had any trouble due to condensation in the pipes, owing to the fact that he insisted on a clear space being left between the pipes and the walls or ceilings. The piping must be metallically continuous and earthed, and the joints must not be made with red or white lead, but the screw threads should be painted with aluminium paint and put together whilst wet. The earth connection was often quite inadequately performed. After filing a clean place on the conduit, it should be painted with aluminium paint, and a substantial earthing grip should be attached to the prepared place. The same method should be applied to the waterpipe which formed the earth. Serrated earth grips made a very good contact.

All switch boxes, motors and other metal must be earthed, but manufacturers, with few exceptions, never fully appreciated the fact.

"Thus we have small ironclad switches and fuses with two smooth inlets and outlets for the cables, instead of one tapped boss top and bottom to receive a screwed pipe. When only one hole is provided, it is in rare cases that sufficient room is provided to permit of leading the cables into the terminals without dangerous cramping. In some designs, even by the most reputable firms, the iron cases are split across the cable inlets, which are provided with porcelain insulators to pass the cables through. This involves stopping off the pipes on each side of such boxes, bushing the ends, attaching earthing clips to them, and connecting these to the boxes by wires in any convenient way, which is generally by twisting them under the heads of the fixing screws. It is a tinker's job when all is done. Again, motor makers turn out motors intended for 400-volt circuits without terminal boxes. In some cases they adopt the hateful American practice of leaving tailpieces sticking out with brass sweating sockets on the ends. How in this world they expect a wireman to connect his cables up to these, and at the same time maintain metallic continuity between the pipework and the motor case, in accordance with Home Office requirements, is known only to themselves. I am afraid I speak rather feelingly on these points, as I have seen so much of it, and cannot help sympathising with the wiremen and erectors, who get thoroughly disheartened when, after taking special pains to maintain metallic continuity throughout the piping system, they find that the fittings supplied have been designed in entire disregard of all regulations, and that they have to make a patchwork job at the finish.

"One is tempted to go on to criticise those fittings, and they are legion, which are so designed as to make it impossible to wire them without stripping the conductors of their protective coverings; to comment on those distribution switch and fuse-boxes which need to be entirely dismantled in order to erect them; to point out the absurdity of placing terminal screws in such positions that it is impossible to apply a screwdriver to them, and so on."

Wood distribution boxes were preferable for domestic purposes; the continuity of the piping could be preserved by fixing iron plates top and bottom to receive the pipes, and bonding them together. The common practice of connecting fuses directly to the bus-bars in the boxes prevented them from being made dead without making the box dead, when replacing a fuse. When knife switches were used with the current passing through the hinges, the live ends of the cables must be connected to the clip contacts and not to the hinges, otherwise the blades were alive when the switches were off.

For dry interiors the Stannos and Henley systems of wiring were finding wide application, as they made a much neater job than steel conduit for surface work. The St. Helens Cab-tire sheathing was also useful for specially bad situations.

## THE PHYSICAL SOCIETY EXHIBITION.

(Continued from Vol. 71, page 1034.)

Robt. W. Paul.

A large number of instruments were exhibited by Mr. Robt. W. Paul, most of which were of quite recent design.

We illustrate (fig. 3) a sensitive microammeter, indicating one-fifth of a microampere and arranged with suitable internal resistances and shunts for measuring pressures from '02 to 600 volts and insulations up to 3,000 megohms. The shunt switch is fitted with a clutch which prevents the instrument from being closed unless

FIG. 3.—PAUL UNIPIVOT TESTING SET.

the switch is left in the least sensitive position, and connection may be made directly to the galvanometer by means of detachable plugs. This test set has advantages in respect of simplicity and compactness of design.

A still simpler form of testing set was shown (fig. 4) no larger than a lineman's detector; it consists of a Unipivot with two scales, one of which is graduated in megohms. This galvanometer

FIG. 4.—UNIPIVOT DETECTOR.

meter is a separate unit, and can be detached for other tests when required. When it is in position in the set, any insulation resistance connected to the terminals I, E, is read off directly on the scale.

Another exhibit was the Unipivot series of D.C. millivoltmeters adapted for the measurement of high-frequency and alternating current by the addition of a heater, which is crossed at its centre by a small thermo-junction; the alternating current being passed

through the heater, the thermo-junction indicates the value of the high-frequency current or pressure direct on a square-law scale. The device is enclosed in an exhausted bulb which, by means of suitable resistances put up in the same case, can be standardised, and in that form is called a thermal converter. These thermal converters may be fitted with interchangeable multipliers, so that current or pressure up to any value may be read by a system already well known in connection with the D.C. instruments.

Dynamometer Unipivots have now been developed as single or multirange ammeters, voltmeters or wattmeters, in a form convenient for portable precision instruments for alternating current of frequencies up to 400 per second.

An improved dynamometer was shown, which was recently invented by Mr. J. T. Irwin, and contains an astatic moving coil, whereby errors due to extraneous fields, even of considerable

about .002 mm. diameter, and the instrument can be used with a reading microscope, or by projecting curves on a travelling photographic plate for recording wireless telegraph signals and for physiological work.

The Irwin Optiphone was shown recording speech waves, and among other telephone measuring apparatus was a cross-talk meter and an artificial telephone cable. The latter, which we illustrate (fig. 6), was designed by Mr. B. S. Cohen. Each section can be separately removed, it being shielded from the remainder by aluminium plates. Each section is thrown into action by operating a four-pole switch, thus obviating the necessity for the manipulation of a number of switches or plugs, and rendering speedy adjustment possible.

#### H. Tinsley & Co.

THE principal features of this firm's exhibit were the various instruments devised by Dr. C. V. Drysdale for alternating-current work. The A.C. potentiometer which has been evolved by their co-operation, for frequencies between 25 and 500 cycles per second, was

FIG. 5.—PORTABLE BRIDGE.

FIG. 7.—DRYSDALE A.C. POTENTIOMETER.

intensity, are eliminated. This dynamometer is made as an ammeter, voltmeter or wattmeter in a convenient portable form, and also as a reflecting instrument of high sensitivity. It can be set up as a standard for calibrating A.C. apparatus.

Among numerous improvements in resistance measuring apparatus may be mentioned an extremely compact and portable self-contained Wheatstone bridge (fig. 5), weighing a little over 2 lb., and containing four decade sets of coils, together with multiplying ratios, which are put into action by depressing one of three keys. These keys are arranged so that the small battery, which is enclosed in the set, shall not be unnecessarily exhausted. On pressing the key lightly a resistance is put in the battery circuit, and thus the sensitivity of the bridge is reduced. When the balance is nearly obtained the key is pressed harder, and the resistance is then short-circuited, so that the full sensitivity is obtained. The battery can be easily renewed, as it is of a kind kept by most dealers in electrical

shown (fig. 7). As the result of five years' work, the readings of this instrument, in its most improved form, are accurate within 0.1 per cent., and the phase angles within 0.1 of a degree; the phase-shifting transformer now gives a pure sine wave at all angles, in spite of the presence of iron, the harmonics being almost entirely eliminated. This instrument fills the gap in alternating-current work corresponding to the indispensable potentiometer in D.C. work, and we understand that it is being adopted by large electricity works for the measurement of alternating currents up to thousands of amperes, in the same way as the D.C. potentiometer.

A high-frequency A.C. potentiometer for telephonic research was also shown, having a range up to 2,000 cycles per second, and, in conjunction with this, an artificial telephone line, 100 miles long, was exhibited. One of the most interesting features of the exhibit was a diagram plotted from readings obtained with this instrument over a 50-mile telephone cable; the attenuation of this line at 1,000 cycles per second was enormous, but the readings were obtained on the potentiometer with ease and certainty; the effect of the inductance of the receiving instrument in compensating for the capacity of the line at the receiving end was clearly demonstrated. The phase displacement in this instance amounted to as much as 360°, as regards the voltage, and the current twist was 376°.

Other exhibits included Dr. Drysdale's stroboscopic slip indicator, the principle of which has been fully described by the author in our pages, and which is the only instrument of its kind that gives by direct reading the percentage slip to within 1/100th per cent.; standard wattmeters with astatic coils and fields with an accuracy well within 0.1 per cent.; and the Drysdale phase-shifting transformer for meter-testing, a new pattern which is guaranteed to give an absolutely pure sine wave at all phase angles as well as a constant voltage, the phase angle being also guaranteed correct to a fraction of a degree. Many other instruments were contained in this very interesting exhibit.

#### Harry W. Cox & Co., Ltd.

This firm showed a collection of X-ray apparatus, interrupters, fluorescent screens, &c.

#### The Edison Storage Battery Co.

Edison accumulators, complete and in parts, were shown by this company.

#### Elliott Bros.

The latest patterns of the Century testing sets, P.P. dynamometer instruments, and instruments of various types for portable and switchboard use, were shown.

#### A. Gallenkamp & Co., Ltd.

Furnaces for temperatures up to 1,100° C., of the resistance type, with silica heating surfaces, were the electrical features of this exhibit.

(To be continued.)

FIG. 6.—ARTIFICIAL TELEPHONE CABLE.

novelties. As in the case of the insulation meter, the galvanometer can be detached and put into a leather case for pocket use.

A number of new types of electrostatic voltmeters and pyrometers were shown, as well as some new instruments of the Harris ohmmeter class, the working parts of which are similar to those of the Omega described in our issue of October 18th last. Of these ohmmeters, one was exhibited having separate ranges and reading from 1 microhm upwards.

Mr. Campbell's apparatus for high-frequency measurement of inductance and capacity was shown in action, the latter measurement being made by the Carey Foster method, which gives direct readings from 1 micro-microfarad up to 10 microfarads.

Important improvements have been made in the string galvanometer, which has now been reduced to its simplest and most accessible form, the design being based on that of Dr. H. S. Souttar; in this instrument the string consists of a glass tube

## LEGAL.

OSHAM LAMP CO. v. D. SMITH &amp; CO.

IN the Chancery Court on Friday, December 20th, before Mr. Justice Warrington, Mr. Colefax, K.C., on behalf of the Osham Lamp Co., applied for an injunction to restrain Messrs. David Smith and Co., Red Lion Court, Fleet Street, E.C., from dealing in certain electric lamps which were an infringement of two of their patents, namely, No. 23,899 of 1904, and No. 18,622 of 1906.

Counsel stated that defendants had traded in certain electric lamps which they said were made in Dresden, but which the plaintiffs alleged were an infringement of their two patents in the treatment of the filaments. In November the defendants were approached, and 150 lamps which were described as "Goblin" lamps, were purchased, and some of these were handed over to Dr. Oberlander, who analysed them. Others were sent to Sir James Dewar, and an analysis of the filaments convinced both gentlemen that these had been made of tungsten with a compound of binding material, and that the carbon had been removed by the process which was an infringement of the plaintiffs' patents. His Lordship would remember that the whole matter was dealt with in a previous action. So far as the evidence of the defendant was concerned, it amounted to this, that this Dresden company from whom he obtained his lamps had simply informed him that the lamps had been made in a way that was not an infringement of the plaintiffs' patent, and the only other evidence was that of Mr. Bevan, who had stated that in his belief there was another process by which they could extract carbon from the filaments by the use of hydrogen. Counsel read affidavits of the results of the examination of the lamps by Dr. Oberlander and Sir James Dewar, and asked, having regard to these, that an injunction should be granted.

MR. TERRELL, K.C., for the defendants, stated that after the trial of the action to which Mr. Colefax had referred, everyone was particularly anxious that there should be no infringement of these patents, and the defendants had obtained specifications of them and forwarded them to Dresden asking if there would be any infringement of the English patents in connection with the Goblin lamp. In reply he had been assured that they did not infringe these patents in any way. At the trial of the previous action the question raised was whether the carbon was removed physically or chemically, and, of course, after the judgment in that instance, everybody had taken care what method was used. Why should it be presumed that in the present instance moisture had been used? Supposing there were three ways of dealing with filaments; one by using nitrogen, one by using moist hydrogen, and a third by which the carbon could be removed physically by electric current at a high temperature. If his learned friend said that the first two came within his patents, he still had to prove that it had not been done in the third way. That carbon could be taken out of the filament by this means there could be no doubt.

HIS LORDSHIP said he thought, on the whole, he ought to grant an interlocutory injunction. There had been no evidence at all from the manufacturers of the Goblin lamp as to their process. All he had was a general statement that they did not infringe the patent. A specification of the second patent was sent to the German manufacturers, but it was not said in their answer that they treated their filaments by chemical process purely, and they did treat them with hydrogen. It was just possible that they might treat them with hydrogen in such a way as to expel the carbon physically and not chemically, but that was all, and he thought he ought, on the evidence of Sir James Dewar and Dr. Oberlander, to treat that as being so doubtful that it would be better that he granted an injunction for infringement rather than let the defendants go on selling the lamps, which might possibly be a serious matter for the plaintiffs.

HIS LORDSHIP granted the injunction accordingly.

## DUNDEE TRAMWAY CLAIM.

A PECULIAR point arising out of the working of the Dundee-Monifeth Tramway has been decided by Sheriff Neish. A farmer sued the Dundee, Broughty Ferry and District Tramway Co. for £60 in respect of loss and damage sustained by him through one of the defenders' cars coming in violent contact with a cart and two horses belonging to him. For the company it was contended that the motorman and conductor of the car were at the time of the accident acting as servants of the Dundee Corporation, and the Sheriff finds in fact and in law that they were, and dismisses the action, with expenses to the defenders. His Lordship thinks pursuer's remedy was to sue both the company and the Corporation, and let them fight out the question of liability. He feared, however, the pursuer was now too late to sue the Corporation.

**The Numbering of Tramway Routes.**—In reference to a decision by the London County Council, on July 30th last, that the routes on the tramways should be numbered, the routes to be indicated by means of numbers fixed to the cars, the Highways Committee recently reported that since that date an improved type of plate, manufactured by VENNER'S SIGNS, LTD., had been brought to their notice. To fit all the cars with this type of plate and the necessary reflector, lamp, &c., would cost about £1,570 more than in the case of the plates originally contemplated. The Committee recommended, and it was agreed, that the plate manufactured by Venner's Signs, Ltd., should be adopted.

## BUSINESS NOTES.

**Calendars and Diaries.**—THE ARMORDUCT MANUFACTURING CO., LTD., of Farringdon Avenue, London, E.C., have sent us a set of refills for their perpetual desk calendar circulated a few years ago. We shall find these refills useful in 1913. The Armorduct Co. has also sent us one of its desk blotting pads which might have been more serviceable if the top pocket border had been just a little quieter. Each sheet of blotting contains a calendar for the year.

THE DIAMOND COAL CUTTER CO., of Wakefield, have prepared a wall calendar with monthly slips for 1913. The design includes a picture of one of their coal-cutting equipments.

From MESSRS. VENNER & CO., of 6, Old Queen Street, Westminster, London, S.W., whose new year souvenirs are always useful, and last well, we have received a handy little key-ring, accompanied by an appropriate folder written in characteristic Venner style. If any of the firm's usual recipients have been inadvertently overlooked, they are asked to notify the fact, and so long as the stock lasts they will prevent disappointment.

MESSRS. ALFRED HERBERT, LTD., of Coventry, have again issued a most serviceable monthly sheet calendar for the New Year, each sheet bearing an art illustration of one of their machine tools, and boldly-printed dates.

THE D.P. BATTERY CO., LTD., have again drawn upon the beauties of the country in which their works are situated for a picture wherewith to adorn their 1913 calendar. A charming view in colour of Water-cum-Jolly on the River Wye, which provides the company's water power, so takes one's interest that the set of small monthly slips is almost lost sight of.

THE HART ACCUMULATOR CO., LTD., of Marshgate Lane, Stratford, London, have once more prepared as a New Year souvenir for their friends a handy desk blotting pad.

From the GENERAL ELECTRIC CO., LTD., of Queen Victoria Street, London, we have received another of their serviceable desk reminder stands, with a set of turn-over engagement slips for the year 1913.

From MESSRS. PIRELLI, LTD., we have received an ingenious hanging or desk perpetual type calendar. Daily and monthly changes are effected by turning a couple of brass knobs, the name of month and date figures being clearly brought out within the circle of a Pirelli tire which stands out quite realistically against a green and blue watery background, with waterfalls and a sky of golden glory beyond.

The insulating varnish department of Mr. CHAS. H. BLUME (White Building, Sheffield) will be remembered during 1913 by all who receive their excellent wall calendar, for above the monthly date slips there is a charming reproduction of the well-known picture by Millais in which two boys—Sir Walter Raleigh and another—are under the early spell of tales of the sea and what lies beyond it. Together with the calendar Mr. Blume has also sent us a handy size memoranda and pocket engagement book (one line per day) for the year. A number of useful tables and an "Ocean" insurance coupon are contained therein.

THE SUN ELECTRICAL CO., LTD., of 118 and 120, Charing Cross Road, W.C., have sent to their friends a pocket propelling pencil and case of refills for obvious purposes during 1913. If perchance any pencils have gone astray, a line dropped to the company will at once bring another to take its place.

A calendar of serviceable size and interesting design has been received from the WESTERN ELECTRIC CO., LTD., of Norfolk House, London, W.C. It is suitable either for hanging or for desk use, and has monthly tear-off slips with clear figuring.

MESSRS. THERMIT, LTD., of 27, Martin's Lane, London, W.C., have issued one of their useful pocket note-books with 1913 and 1914 calendars, also a number of pages of descriptive and other matter relating to the Themit system.

MR. H. A. WESTMARCOTT, electrical contractor, of 280, Geswell Road, London, E.C., has circulated a wall calendar with monthly slips.

A wall calendar in which both the perpetual and the monthly tear-off slip arrangements are employed has been prepared by POPE'S ELECTRIC LAMP CO., and they will send a copy to anybody who may perchance have been overlooked, on receipt of application. "Elasta" wire lamps are, of course, well in evidence in the design.

Friends of MESSRS. FALK, STADELMANN & CO., LTD., 83-87, Farringdon Road, London, E.C., have received an "Efesca" scribbling pad, which, we imagine, will be a very serviceable desk companion for some time to come. Calendars for 1913 and 1914 appear inside the cover, and the pad is of the renewable class. Any of our readers can have one on application to the firm.

MESSRS. NEALE & WILKINSON, LTD., shipping and forwarding agents, 32, St. Mary Axe, London, E.C., have issued a wall card for 1913, showing conveniently a calendar for the entire year, in addition to which there is a block of daily date slips, with bold red figuring. Copies will be sent on application.

THE DUSSEK BITUMEN CO., of Canal Bank, Deptford, London, S.E., have made an excellent improvement in their pocket-book and diary for 1913. This time, instead of the accustomed cover, we have a letter and card case with refill diary (Letts), also an accident insurance coupon.

**Concert.**—On Saturday next, January 11th, at 7.30 p.m., the St. James' Electric Athletic Club will hold its 12th annual smoking concert at the Pillar Hall, Victoria Station Restaurant.

**Book Notices.**—*The Practical Electrician's Pocket-Book and Diary* for 1913. Edited by H. T. Crewe, M.I.Mech.E. London: S. Rentell & Co. Price 1s. net.—This well-known pocket-book has been improved by the omission of superfluous matter, and the addition of new sections dealing with coal-cutters, cables, power and lighting installations, wireless telegraph stations, the new Home Office Mining Rules, &c., making a net increase of 44 pages. It is a handy size for the pocket, and contains a vast amount of information useful to the electrician engaged in practical work.

"Boletín de Ingenieros." Vol. III, No. 3. November 16th, 1912. Mexico: Departamento de Ingenieros de la Secretaría de Guerra.

**Catalogues and Lists.**—THE BRITISH THOMSON-ROUSTON CO., LTD., 77, Upper Thames Street, London, E.C.—We have received eight sections of the recently-issued complete catalogue of the B.T.H. lamp and wiring supplies. As the book was fully noticed here at the time, we need only mention the titles of the separately-bound sections:—A. Wiring Accessories (holders, ceiling roses, wall plugs, distribution boxes, &c.); B. Bells, Telephones and Batteries; C. Electric Light Fittings; D. Incandescent Electric Lamps; E. Theatrical Apparatus, Flashers, Signs and Motor-Car Accessories; F. S. Shades and Reflectors; G. Conduits and Accessories; H. Wires, Cables and Accessories. Each of the sections has a different coloured cover of stiff art paper, and, in order to protect the edges of the inside pages, the covers are of such a size as to overlap the latter.

MESSRS. J. KIRBY & CO., Alpha Street, Dewsbury Road, Leeds.—Illustrated pamphlet of eight pages relating to water-pressure driven pumping engines and Ramsbottom triple-ram water engines for mining and other purposes; also a four-page list showing and briefly describing their electric outfits for organ-blowing. Prices are stated in some cases.

THE SCHNIEWINDT ELECTRIC CO., 40 and 41, Stannforth Street, Birmingham.—New lists of resistance wires made by the Kratos-Werke Erlau, for whom they are sole agents in this country Nickel-chrome heating wires in all sizes are stocked.

MESSRS. NATIONAL ALLOYS, LTD., Altior Foundry, 38, The Hill, Ilford, London, E.—Twenty-four-page catalogue describing their various manufactures, which include "Ivanium" aluminium alloys, "Cupranium" brasses and bronze, "Bear-ring" anti-friction metals, "Altior" manganese, aluminium and phosphor bronze, &c. A table is given of physical properties of metals.

**Trade Announcements.**—MESSRS. LODGE BROS. AND Co. have built large offices adjoining their works in Wrentham Street, off the Bristol Road, Birmingham, and during the holidays they removed into them. The change was imperative, owing to business expansion. All communications should be sent to Wrentham Street in future. Telephone No.: "Midland 2200" (two lines). We have received an illustrated leaflet of the "Lodge" sparking plug.

MR. GEORGE E. PIGGOTT, who has for the last 15 years made the subject of elevating a special study, has now associated himself with Messrs. Etchells, Congdon & Muir, Ltd., of Manchester, and will manage their London and South-Eastern Counties business at his present address—24, New Bridge Street, London, E.C. Samples of the various parts of apparatus are on view, including the automatic speed governor and collapsible gates.

MR. C. FRANKLIN TUBES has increased his manufacturing accommodation, and taken new premises in Carlton Mills, Leeds, which cover a floor space about four times that of the old workshop. The extension was necessitated by increasing demand for "Nonpareil" apparatus, and prompt delivery of all classes of A.C. switchgear and other specialities will now be ensured. All correspondence should be addressed to 2, Craven Terrace, Carlton Hill, Leeds, as previously.

MR. P. S. DOHERTY, of 25, Victoria Street, London, S.W., has been appointed sole British agent for the sale of locomotives manufactured by the Société Anonyme de Saint Léonard, of Liège, and also for railway bridges, points and crossings manufactured by the Société Anonyme du Nord de Liège.

THE ARMORCUT MANUFACTURING CO., LTD., are making further large extensions at their Witton Works to cope with the increasing demand for their specialities.

Our Bradford correspondent writes that the PHOENIX DYNAMO MANUFACTURING CO., LTD., of Thornbury Works, Bradford, announce their intention to double the capacity of their works, and state that the cause of the necessity of this extension is the success of their specialised system of textile driving.

THE ELECTRICAL APPARATUS CO., LTD., of Vauxhall Works, South Lambeth Road, London, announce that, owing to the large increase in the sales of E.A.C. high torque electricity meters, and both D.C. and A.C. motor control gear, they are again obliged to arrange for works extensions. A contract has just been entered into for the building of three additional shops, which will principally be devoted to the manufacture of the above apparatus. The present factory, built early in 1911, was a very large extension as compared with the old premises at Milford Works, and now the company have again practically doubled their premises. During the year 1912 they successfully introduced their apparatus abroad, and we understand that their export trade with Canada, South America, Australia, New Zealand, China and Italy is beginning to take on large proportions.

THE ELECTRIC AND ORDNANCE ACCESSORIES CO., LTD., of Cheston Road, Aston, Birmingham, advise us that they have just appointed Mr. W. Ogden Dayson, of 1, Mount Street, Swansea, to represent them for their electrical manufactures in South Wales. Mr. Dayson succeeds Mr. C. R. Hough, of Swansea, who has given up the agency in order to start business for himself in the Midlands. Mr. Dayson's telephone number is "914 Central."

THE NORTHERN ELECTRICAL AND VENTILATING CO., LTD., removed on 31st ult. from Dale Street, Liverpool, to 6, Williamson Square. New telephone number, "Royal 4364." A large selection of electric light fittings, shades, &c., will be on view in the new showrooms early in the New Year.

**New Vulcanised Bitumen Strip.**—A new form of vulcanised bitumen strip has just been introduced by MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Blomfield Street, E.C., with which a homogeneous joint can be made in the insulation of V.B. cables, the difficulties hitherto met with in making a satisfactory joint having been overcome. The new material, which is called the "Clyde" tape, is of such a nature that the simple process of warming the lapped joint with a blow lamp causes it to become thoroughly adherent and to form a perfectly homogeneous joint. It is supplied in any of the usual widths, from  $\frac{1}{2}$  in. upwards, in rolls of about 1 lb., and in three thicknesses, packed in air-tight tins.

**For Sale.**—The Bristol electricity department has for disposal a 30-ft. electric launch, and a quantity of electrical plant and material. See our advertisement pages in this issue.

**Dissolutions and Liquidations.**—LIGHT RAILWAYS SYNDICATE, LTD.—This company, meeting at the offices of the New General Traction Co., Ltd., London, on November 25th and December 2nd, resolved to wind up voluntarily.

INTERNATIONAL "Z" LAMP ASSOCIATION, LTD.—This company is winding up voluntarily with Mr. C. Field, Broad Street Avenue, E.C., as liquidator. A meeting of creditors is called for January 6th. Creditors must send in particulars of their debts, &c., by January 31st.

SUPERHEATERS, LTD.—A meeting is called for February 3rd at 19, Southampton Street, London, W.C., to hear an account of the winding up from the liquidator, Mr. G. W. F. Dawes.

**Bankruptcy Proceedings.**—WESLEY SUTTON, 62, Dale Street, Liverpool, lately trading in partnership with Samuel Lord and John William Garsden, under the style of the Howe Electrical Engineering Co.—This debtor attended at the Court House, Government Buildings, Victoria Street, Liverpool, last Monday, before Mr. Registrar Howarth, for his public examination. In reply to questions, the debtor disputed the allegation made that he had anything more to do with the books of the firm than Mr. Lord had, so far as investigating the condition of the business was concerned. When he left the partnership, the £100 he received was a figure arrived at by a balance-sheet, and at that time he was not aware that in law he was liable for certain amounts for which he had since been held liable. He attributed the failure of the company to the large amount of money spent on the development of certain patents, out of which they had expected to make their fortunes. From 1876, when he returned to England from America, to 1893, he was engaged in an engine-packing manufacturing business in London, Castleton and Manchester, from which he retired with about £2,000. Later, he had an interest in an "outside" stockbroking business in Manchester, in which he lost considerably. Afterwards he had another business in Birmingham, which he sold for about the same figure as he had given for it, and about 1895 he went to Liverpool and joined the Howe Electrical Engineering Co., into which he paid £300 capital. In October, 1909, that business was sold to a limited company. The case was adjourned, and certain accounts were ordered.

ALBERT EDWARD MARTIN (trading as the Midland Electrical Supply Co.), electrical engineer, 39, Great Charles Street, Birmingham.—January 8th is the last day for the receipt of proofs for dividend. Trustee, Mr. A. S. Cully, 191, Corporation Street, Birmingham.

**SAMUEL LORD**, director of a limited company, 18, James Street, Liverpool.—Mr. Registrar Howarth also held a sitting at Liverpool last Monday for the public examination of this debtor. Mr. Percy Martin appeared for the debtor, whose statement of affairs showed liabilities amounting to £3,312, and assets estimated at £5 10s., which sum was insufficient to cover the claims of the preferential creditors. Questioned by the Official Receiver, the debtor stated that he had formerly been in partnership with Wesley Sutton, who was his father-in-law. He (Lord) was at present manager of an electrical engineering company at a salary of £3 a week. About 18 years ago he joined two others in partnership under the style of the Howe Electrical Co. He brought in £600, obtained by an advance on a reversionary interest in his father's estate, and later he brought in further capital. About three years later one of the partners retired, and the business, which was carried on at Redcross Street, Liverpool, was continued by himself and Mr. Wesley Sutton, the other partner. At that time a Mr. Garsden was admitted a partner, and a branch of the business was opened at Blackburn. This gentleman also brought in capital. In September, 1909, the partnership assets, with the exception of the outstanding book debts, were sold to a company called the Howe Electrical Engineering Co., Ltd., for £1,200 in cash and £2,400 in shares, but the partnership liabilities were not to be taken over by the limited company. The partnership was dissolved in the following month, and he (the debtor) and Mr. Garsden paid Mr. Sutton £100 as his interest, and by the deed of dissolution agreed to indemnify him against all liabilities in respect of the late partnership. In February, 1911, the limited company went into voluntary liquidation, and part of the assets were acquired by a new company, of which he (the debtor) was now the manager. The debtor was questioned as to various sums borrowed from private persons and as to the overdrafts that were guaranteed at the bank and had been paid by the guarantors. He asserted that he knew very little about the financial affairs of the firm, as he left that mainly to Mr. Sutton, in whom he placed implicit confidence. In regard to the sale to the company, he stated that he knew very little about the figures, nor did he know how various amounts owing by the partnership were treated in the books of the firm. The Registrar ordered the case to stand adjourned, and intimated that the debtor must come prepared to give further information than he had given on the present occasion.

## LIGHTING and POWER NOTES.

**Argentina.**—Referring to the concession question in Buenos Ayres, the *Review of the River Plate* says:—In view of the fact that Messrs. Lacroze Bros. have now applied direct to the municipality for a concession under the same terms as those granted to the Alemana and Italo-Argentino Companies, we do not think that anything further will now be done in connection with this matter. By their application for a concession Messrs. Lacroze evidently do not intend to stand by the rights given them by the Government decree, and, therefore, if they do not adhere to those rights, in our opinion, no other company can claim the privileges established by that decree.

The Italian Argentina Electric Co. has secured, after a lively struggle, its concession to supply the city of Buenos Ayres with electric light. The society has, says *La Lumière Electrique*, a capital of 125 million francs.

**Australia.**—When the mail left Tasmania the works of the Hydro-Electric Co., Hobart, were about to be temporarily stopped. The explanation given was that more capital was needed to complete the works. "There is no doubt," said Mr. Ewing, one of the local directors of the company, in an interview with a Press man, "that the undertaking was under-capitalised considering the magnitude of the work that was contemplated."

A scheme for generating electricity by utilising the waters of the Yarra has just been under the notice of Mr. Graham, Minister for Agriculture and Water Supply. Power could be obtained from the Yarra between Evelyn and Horse Shoe Bend, 15 miles from Melbourne. A deputation on the subject pointed out to Mr. Graham that the Government should consider this in connection with the proposed electrification of the local railways. The Minister said that the suggestion would be laid before the State Rivers and Water Supply Commission for report.

**Baldon.**—The U.D.C. has sealed a memorial to the B. of T. applying for a prov. order for electric lighting.

**Ballyconnell (County Cavan).**—A scheme is on foot for the electric lighting of this village. The matter is in the hands of Messrs. T. McGovern and T. O'Reilly.

**Barking.**—Subject to the British Anti-Fouling Commission and Paint Co. guaranteeing a minimum consumption of 30,000 units per annum for a period of five years, the necessary extensions of mains are to be carried out to give the company an increased power supply. The Council's service main is to be extended across the Creek at an estimated cost of £225 to supply the northern outfall works of the L.C.C., subject to a guaranteed minimum revenue of £80 therefrom, plus interest on capital outlay.

**Basingstoke.**—With reference to the electricity scheme prepared by the borough surveyor, the T.C. has decided to obtain the services of an electrical engineer to report on the matter, and, if necessary, attend at the B. of T. in support of the application for a prov. order.

**Bentley (Works).**—The Urban District Council has agreed to the suggestion that the Doncaster Corporation should supply electricity to Bentley at similar rates to those in vogue in Doncaster, and subject to arrangements being made between the Corporation and the local colliery company, which at present supplies electricity to certain parts of the Bentley district.

**Berwick-on-Tweed.**—The scheme of the Electric Supply Co. for a complete electrical installation at the barracks, has been accepted by the military headquarters. Under the scheme the entire premises will be lit by the electric light.

**Billerica (Essex).**—The R.D.C. has decided to have the electric light installed at the new hospital, at an estimated cost of £300, instead of purchasing a petrol air gas plant. The architect, Mr. Bird, has been instructed to obtain tenders.

**Bridlington.**—The T.C. has referred back to the Electricity Committee for further consideration a recommendation to apply to the B. of T. for consent to supply current outside the borough.

**Brighton.**—The engineer has been authorised to experiment with series high candle-power metal lamps for street lighting in place of series arc lighting.

It has been agreed to give the Brighton Railway a supply for lighting purposes on payment of £3 per kw. installed lighting demand per annum in addition to the charge registered through the power meter.

**Buxton.**—The U.D.C., with the idea of obtaining new consumers, has decided to distribute 1,000 circulars, which are to be followed up by a personal call. Sample radiators and other electrical appliances are to be fixed at the engineer's office for inspection by consumers.

The Council has decided to extend the mains to Buxton College, the necessary guarantee to meet interest on the outlay having been given.

**Canada.**—The operation of the Winnipeg electrical plant gives ample ground for hope that a 3 c. per kw.-hour rate may be established in that city during the next few months. The profit for the month of November, under the present low rates—about the lowest in Canada—was \$10,000. Prof. L. A. Herdt submitted to the Board of Control his recommendation for the erection of a second transmission line to Point Du Bois, adding two units to the plant there and enlarging the facilities at the McPhillips Street substation. The whole project would cost \$700,000, and would protect the city against all trouble that might occur.

Old Quebec City is rapidly becoming the centre of hydro-electric development. The Quebec Light, Heat and Power Co. had the field almost to itself up to a short time ago, but lately two new hydro-electric companies entered the field. The Stadacona Hydraulic Co. will be supplying energy about the middle of 1913, with some 10,000 H.P., practically all of which has been disposed of.

**SASKATCHEWAN.**—Mr. George Harrison, manager of the Saskatchewan Ironworks, states that there are about 10 million tons of good steam coal accessible at the Lake of the Rivers, and prophesies that, in due time, a great power station will be erected there to supply current to Regina, Moose Jaw and smaller towns. The Legislature has received the report of Mr. Wynn-Roberts on the feasibility of developing power at the Souris Valley coalfields.

**Castle Eden.**—The B. of T. has been applied to by the Cleveland and Durham County Electric Power Co. for consent to erect overhead mains at Castle Eden and Parklands, for the supply of current under the Acts of 1901 and 1903, at a pressure of 440 volts.

**Chile.**—Plans submitted for the establishment of an electric lighting installation in the city of Ancud have been approved.

**Cobham.**—The Epsom R.D.C. has declined the offer of the Leatherhead Electricity Co. to install electrically-worked pumps at the Cobham sewage works.

**Colne.**—Under the Colne Corporation Bill of 1913, powers are being sought to extend the area of supply of electricity, so as to include the districts of Trawden and Foulridge.

**Continental Notes.**—**AUSTRIA.**—Plans are being prepared for the establishment at Faal a. d. Drau, Styria, of what is expected to be the largest electricity generating station in Austria and Hungary. The Steiermarkische Electricitäts Gesellschaft is interested in the new undertaking.

**FRANCE.**—A company has lately been formed at Roisel (Somme) with a capital of \$8,000, and the title *La Société Co-operative d'Electricité du Secteur de Roisel*, "to facilitate the agricultural industry by the supply of electrical energy for all purposes."

**ITALY.**—Under the auspices of the Società A.E.G. Thomson-Houston, of Milan, and a number of banks, a company has just been formed in Brussels with a capital of £60,000, to acquire an interest in electric tramway, light railway and electricity supply undertakings in Italy.

The new water-power generating station on the River Lima, belonging to the Società Ligure-Toscane d'Electricità has recently been completed, two 3,200 H.P. sets of turbines and dynamos being now in operation and connected up to the company's distributing plants at Luques, Leghorn, Pisa, Viareggio and Pescia. A new 1,000-H.P. Diesel engine has also been installed at the station at Luques and a new 2,000-kw. turbine and generator are being installed at the Leghorn plant. In addition, plans have been completed for a new generating station at Le Serchio.

**RUSSIA.**—A company has lately been formed at Bjalistock with a capital of 2,000,000 roubles and the title Die Bjalistocker Electricitäts Gesellschaft, to carry on the central electric lighting station which has been established in the town by the Deutsche Gesellschaft für Electricische Unternehmungen.

In order to meet the increasing demand for current, it has been found necessary to order a third gas engine and dynamo for the electrical power station in connection with the works of the Société Metallurgique Russe-Belge. When the new set is installed the plant will have a capacity of 11,000 H.P.

**Darlington.**—The Electricity Committee of the T.C. has adopted the recommendation of the engineer (Mr. J. R. P. Lunn) to carry out extensions to the electricity works, at an estimated cost of £10,790, and also to apply for loans of £8,000 for mains and services, and £1,500 for static transformers, for three years.

**Devizes.**—The T.C. has deferred until February consideration of an electricity scheme for the town submitted by a London firm.

**Edinburgh.**—The Inspector of Cleaning and Lighting for the city, after remarking on the efficiency of the street lighting, states that among the factors which have contributed to the present satisfactory condition of affairs may be said to be the electric lighting of the tramway routes, the erection of lamps on the islands at the car stopping places and the lighting of the garden side of Princes Street. The total lighting expenditure was £44,591.

**Epsom.**—The R.D.C. has appointed a Committee to consider the application of the Leatherhead and District Electricity Co. for powers to supply current in the parishes of Stoke, Cobham, Great Bookham and Little Bookham.

**Fareham.**—The accounts, just issued, of the Council's electric undertaking for the year ended March 31st last, show a revenue of £2,428, and gross profit of £1,387, with which to meet interest and sinking fund payments amounting to £1,426. The deficit of £39 was made good from the reserve fund. Altogether 103,996 units were sold, and the maximum load was 86 kw.

**Farnworth.**—During the last two months the electric lighting of the main streets has been undergoing complete alterations. After exhaustive tests and experiments, it has been decided to adopt two 300-c.p. Osram drawn-wire lamps of 220 volts, in place of each of the Brockie-Pell 10-ampere arc lamps formerly used, and to fix them to the same poles by means of a two-armed bracket having a projection of some 36 in. from the pole, and fastened to it by cast-iron clamps. The lamps are now arranged at a height of 20 ft. centre of the lamp to ground, and are provided with suitable reflectors. The whole lighting scheme has been designed by Mr. Hutchinson, the engineer, and all the former feeders have been utilised.

**Glasgow.**—The T.C. has agreed to the proposal of the Electricity Committee to give very large supplies of power to Messrs. Beardmore & Co., Fairfield Shipbuilding Co., Messrs. Collins and Co., Messrs. Braby & Co., and other firms, on the basis of a fixed charge per kw. per annum, to cover charges plus a low-running cost charge, in lieu of a charge per unit. In connection with those and other applications a report was recently presented by Mr. W. W. Luckie, the chief engineer, in which he pointed out the maximum demand on the generating stations this winter had, so far, been 28,000 kw. (37,000 H.P.). This was the figure he estimated it would be in his report of September, 1912, and it was the maximum load the stations were capable of meeting. It was, therefore, absolutely necessary to put on order now, generating plant, not only for the winter of 1913-14, but for the winter of 1914-15, as the new works at Dalmarnock might not be available for the winter of 1914-15. The plant now proposed to be ordered would be installed in one of the existing generating stations and removed later to the Dalmarnock works. They already had two units of 4,000 kw. each, running at 750 R.P.M., but he recommended the T.C. to purchase the largest units of plant commercially available, running at 1,500 R.P.M., which would be found to be 7,500 kw. With a unit of this size they would get the lowest price per kw. of plant, and the maximum economy in steam and coal consumption. Quotations for two such units of plant should be got in at once, as the manufacturers were asking 12 months for the manufacture and delivery of such units, and the demand during the winter of 1913-14 would be at least 31,500 kw., and during the winter of 1914-15 at least 35,000 kw. These figures were exclusive of the idea of shutting down the steam plant at the Govan and Partick electricity works, and these works would continue to be called upon to meet their peak load with their own steam plant. The report was approved, and the engineer instructed to prepare the necessary schedules and specifications.

The T.C. has also approved of application for the consent of the Secretary for Scotland to borrow a further sum of £500,000 for the execution of capital works, which would raise the sum borrowed for that purpose to £2,500,000.

A deputation from the Birmingham Corporation is to make a tour of inspection of the Corporation electricity works and the power stations.

**Harrogate.**—The T.C. proposes to open a showroom, in which to exhibit and demonstrate the utility of electrical apparatus, in Swan Road. The B. of T. has been applied to for permission for the Council to supply current to premises outside the borough area.

**Herne Bay.**—The U.D.C. has adopted electric power for pumping purposes, and has entered into a seven years' agreement with Messrs. A. E. Hunt & Sons, for a supply of energy at 3d. per unit.

**Hoyland (near Barnsley).**—The U.D.C. has been recommended by the Lighting Committee to defer for six months consideration of the question of lighting the township by electricity.

**Japan.**—One of the recommendations of the Special Committee of the Industrial Investigation Commission, which is at present holding an inquiry in Tokio as to the best means to be adopted for the encouragement of domestic industries, is that "the utilisation of hydraulic electric power should be carried to the furthest limits."

**Leeds.**—There is a proposal to extend the Whitehall Road Electricity Works, and a committee has been appointed to obtain the advice of a consulting electrical engineer. Mr. C. N. Hefford has been appointed temporarily as engineer of the electricity works.

**Liverpool.**—A large extension building has been opened by the *Daily Post and Echo* newspaper, in which, as in the old building, the plant is electrically driven. With a view to safeguarding the production of the paper, two Mirreles-Diesel engines coupled to Crompton generators have been installed in the basement, as a standby to the Corporation supply which is normally used.

**London.**—**POPULAR.**—The Electricity Committee reports having had under consideration the subject of the relationship of electric lighting contractors to the Council's undertaking. Contractors now canvass for custom for wiring and fittings, the work being carried out by the Council's staff, but as the Committee feels that the contractors should be encouraged to assist the undertaking by canvassing without the fear of losing work in this way, it has decided to place some orders with the contractors, to be carried out under the supervision of the department, for a period of three months, provided that all materials shall be obtained from the department; that the contractors work to a price list; add for labour and profit; pay Trade Union rates of wages, and that the acceptance of any estimate shall be at the discretion of the department. The question of lighting side streets is also under consideration. With regard to the breakdown which occurred recently to a 500-kw. engine at the generating station, the Committee states that it was not unlooked for, in view of the fact that the whole plant has been working for the past two months excessively overloaded in consequence of the unprecedented increase in the demand.

**ISLINGTON.**—The existing low-tension mains in Tufnell Park Road are to be extended, and provision is to be made at the same time for lighting that thoroughfare by means of flame arc lamps at an estimated total cost of £1,326—£968 for cable, and £357 for 13 arc lamps and columns.

**Maidstone.**—The Electricity Works Committee of the T.C. has recommended the installation of a new reciprocating engine at a cost of £5,260, and the extension of the engine house, &c., at a cost of £500.

**Perthshire.**—Messrs. Nicoll & Co., Dundee, have completed an installation of electric light for Stanley Parish Church, Perthshire.

**Portrush.**—The Coleraine Rural Council has declined to give consent to the inclusion in an order which the Portrush Urban Council is seeking of the right, in the event of its boundary being extended, of the latter to supply electric light to certain areas on the outskirts of the township, which are now situated in the Coleraine rural district.

**Portuguese East Africa.**—The Portuguese Government has signed a contract with an English capitalist group, for the supply of electric current for lighting and industrial uses in Lourenço Marques and neighbouring districts. The trust is bound to provide from 10 to 12 million units per year, at agreed prices. The charges are considered likely to stimulate the growth of local industries hitherto held back owing to the cost of imported coal.—*La Revue Electrique*.

**Rawtenstall.**—The Corporation has had under consideration a statement showing the present cost of street lighting, and the estimated cost of same when the main roads are lighted by electricity, on the basis of the charges submitted by a special sub-committee of the Tramways and Electricity Committee. It was decided that the borough electrical and tramways manager proceed with the electric lighting of Bacup Road, and that the Tramways and Electricity Committee be requested to state the terms on which it would be prepared to light and maintain the electric street lamps, provided the system of lighting is amended by not lighting the full number of lamps before 5.30 p.m.

**Romford.**—The County of London Electric Supply Co. has informed the R.D.C. that it intends acquiring compulsorily land at Dagenham on which to erect a generating station.

**Smethwick.**—The T.C. has decided to oppose the proposed transfer of the Smethwick E.L. Order from the Birmingham and Midland Tramway Co., to the Shropshire, Worcestershire, and Staffordshire Electric Power Co.

**South Africa.**—The Cape Town Municipal Council has considered a report from its electrical engineer, stating that general extensions of the electric lighting service in Cape Town

and its suburbs had become necessary, and submitting a list of wires and cables sufficient for six months, which he considers should be kept in stock. The list includes 33 miles of aerial braided wire, 15 miles of vulcanised rubber wire, one mile of concentric high-tension cable and 1,100 yards of three-core high-tension cable. The engineer states that it will also become necessary to increase the size of the sub-station for Green Point and Sea Point, and provide an additional feeder panel and two more transformer pillars. In addition, some 2½ miles of various sized armoured cables are required for underground services in Cape Town. It is proposed to invite tenders.—*Board of Trade Journal*.

**Stalybridge.**—The Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board, on Monday, decided to apply to the L.G.B. for a loan of £20,000 for additional generating plant, owing to the plant at the power station being taxed to its limit.

**Todmorden.**—The T.C. has decided to advertise for an electrical engineer at £150 per annum.

**Turo.**—The T.C. has formally approved of the electric lighting scheme of Dr. Purves, of Exeter. The capital expenditure is estimated at £8,000.

**U.S.A.**—A recent *Times* article quotes the Census Bureau statistics for 1907, showing that there were then 4,711 central stations in the States, supplying during that year nearly 6,000 million units. Estimates as to the progress made in recent years place the number of stations in 1911 at 6,000, and the output at 10,000 million units. The *Financier* in a recent article states that the Southern Power Co. serves an area containing 420 cotton mills, with an equipment of 6 million spindles and 125,000 looms. Of these, current is supplied to 160 mills, with 2,373,000 spindles and 71,000 looms.

**Watford.**—The U.D.C. has decided to apply for a prov. order to enable current to be supplied to the parishes of Abbots Langley, Sarrat, and portions of Watford Rural.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—Mr. R. H. Rathland has applied to the Buenos Ayres Municipality for a concession for a service of electric trolley omnibuses between Flores, Belgrano, Plaza Constitucion and the Port.—*Review of the River Plate*.

**Belfast.**—On Monday afternoon, cars were run over the new extensions on the Stranmillis Road, Donegall Road, Ligonell and Oldpark Road, and everything passed off satisfactorily. The remaining extensions will be tested this week, and it is expected that all the routes will be open to traffic in about a fortnight.

**Burnley.**—The manager of the Corporation electrical tramways has reported upon the working of a goods wagon on the Harle-Syke section for three months, and the Committee has, as a consequence of the nature of that report, decided to continue the experiment, and extend it to the main line from Padisham through Burnley to Nelson. The town clerk has been instructed to make application for the B. of T. consent.

The Tramways Sub-Committee has considered the means of communication to the Stoneholme and Burnley Wood districts. There has been a suggestion that branch lines should be run.

**Bury.**—After considering the report of a sub-committee on the question of car accommodation, and particularly the week-end requirements, the Tramways Committee has decided to purchase four small cars.

**Canada.**—Already running over 50 miles of track, the Ottawa Electric Railway Co. is planning an outlay of \$30,000 for an extension early next spring, to Ottawa South, an additional area taken into the city. Twenty new cars, of the pay-as-you-enter type, embodying all the latest ideas in steel construction, are being built at the Ottawa Car Works, one-half of which will be delivered on May 15th next. Owing to the interference of frost or needle ice with the water generating system of the company's power plant, a steam auxiliary turbine has been ordered and will be installed near the present site, at the Chaudiere, at an estimated cost of \$200,000.

**Cardiff.**—Mr. Arthur Ellis, the Corporation tramway manager, has reported to the T.C. as to the provision of additional travelling facilities outside the city boundaries. He suggests that powers should be obtained for the running of petrol-electric buses or that railless electric traction should be adopted, which could ultimately be replaced by ordinary tramways when the traffic developed.

**Chesterfield.**—The Parliamentary agents to the Corporation have deposited for introduction into Parliament next session a Bill to authorise the Corporation "to provide and run vehicles by means of railless traction and for other purposes" at an estimated cost of £38,180.

**Conisborough.**—The Mexborough and Swinton Trackless Tramways Co. has deposited with the P.C. plans of the proposed tramway system to Rotherham. The Council has deferred consideration of the matter.

**Continental Notes.**—**BELGIUM.**—A new electric tramway network is projected in the suburbs of Brussels, which will be joined to the Brussels city network, and the existing steam suburban line from Overysche to Groendael will be converted to electric traction. The new network will have an extent of about 20 km., and is estimated to cost 2,500,000 fr., which will be jointly subscribed by the State, the Province, and the Communes interested. The Brussels Tramway Co. will permit the passage of the suburban cars as far as the boulevards of Brussels.

Electric tramway extensions are also projected on the outskirts of the city of Mons. As a preliminary, the Société Nationale des Chemins de fer Vicinaux have been requested to extend their Mons to Framerie line as far as the centre of the city, i.e., to the Grand Place. In the second place the several existing steam lines are to be electrified successively. It is proposed, in addition, to construct four new lines. The total disbursement contemplated is about 1,500,000 fr., which will be shared by the State, the Province and the Communes concerned.

**RUSSIA.**—A company has lately been formed at Anaya, with a capital of 600,000 roubles and the title, Die Gesellschaft für Electriche Trambahnen in Anaya und Umgegend, to construct an electric tramway in the town and district of Anaya.

**Dewsbury.**—The General Purposes Committee of the Corporation has had under consideration a proposal to extend the tramways to Dewsbury Moor and Shawcross, at an estimated cost of something like £50,000. The Committee came to the conclusion that the Corporation's powers are inadequate to meet in a successful and satisfactory manner, the requirements of Shawcross and Westborough, and the Committee is to consider the advisability of a physical junction being formed between the two tramways. Negotiations are also to be opened with the Batley Corporation for an extension of tramways from the borough boundary in Staincliffe Road to the Butcher's Arms.

A trial trip was recently made by the members and officials of the Corporation in a 40-H.P. Daimler omnibus. The demonstration was made at the request of the Daimler Co., and from the routes traversed, it appears possible that alternatives may be considered to the two tramways schemes, although the matter has not yet been discussed by the Electricity and Tramways Committee.

**Glasgow.**—As previously indicated in the REVIEW, the T.C.'s Special Committee has had under consideration further extensions of the tramways system; with the recent inclusion of several suburban burghs and rural territory into the municipal area, the understanding was that the present routes would be lengthened and others added, and the Committee now propose an extension which, if approved by Parliament, will mean the laying down of anything up to 20 miles of double track. Among the proposed extensions are Burnside to Cathkin Braes, about 2 miles; Reddie to Millerston, 1½ miles; Annisland via Scotstoun Hill to Dumbarton Road, about 2 miles; Baillieston to Coatbridge, 3 miles; and Clarkston to Busby, 3 miles. Application—should the T.C. approve—will be made to Parliament next November for construction powers, which, if granted, will permit the lines being completed within five years.

The Tramways Department still keeps piling up new records in connection with passengers carried and mileage run, since the doubling of the half-penny stage, though the total receipts are yet somewhat below those for the corresponding period of the last financial year. Since the beginning of the financial year on June 1st, 168,252,111 passengers have been carried, against 144,877,730, while the receipts have been £549,272, against £556,725. For the past week the takings were £20,016, and while the total number of passengers were not available, it was estimated that about 6½ millions were carried.

**Halifax.**—The Tramways Committee has decided to introduce a motor-omnibus service for Siddal, a suburb of the borough which is not reached by the tramways.

**Holmebridge.**—The Council has asked the Huddersfield Corporation to extend its tramways, and offered the same terms and conditions as the Corporation had approved with reference to the extension to Marsden.

**Huddersfield.**—It has been decided, subject to the Elland D.C. carrying out the necessary widenings on the route from the Elland Town Hall to West Vale, to continue the Elland tramway extension to West Vale: and that the Marsden extension be carried out at the original cost, viz., £14,500, the line to be double. The question of extending the tramways to Lepton and Whitley Upper has been before the Tramways Committee, and the matter has been referred to the Extension Sub Committee for consideration and report.

**India.**—The Karachi Port Trustees have resolved to ask Mr. C. H. Merz, who has been engaged by the Bombay Port trustees to advise as to the electrification of the port railways, whether he is willing to visit Karachi and report on the electrification of the port railways there. The manager of the North-Western Railway is also to be asked if the railways are prepared to share the cost of a report by Mr. Merz.

**London.**—On Monday morning a defective motor led to the holding up of the Piccadilly tube line for about half-an-hour, while later a somewhat similar mishap held up the Wimbledon service of the District Railway for an hour, in both cases causing great inconvenience to the numerous travellers at that hour.

**Margate.**—A modern system of electric signalling it to be installed at the Margate West Station by the South-Eastern and Chatham Railway Co.

**Railway Power Proposals.**—According to a financial contemporary, it is proposed to form a syndicate of railway directors to draw up a Bill to empower associated railway companies to produce electrical power on a large scale for their own use and that of the towns and villages along their routes.

**Rochdale.**—The traffic receipts on the tramways since the commencement of the financial year are £58,580, against £53,815 last year, an increase of £4,600. There were 9,350,000 passengers carried, an increase of half-a-million; the mileage was 1,196,000, an increase of 113,700. Ten new cars have been delivered, making 69 in stock. All the cars are being fitted with side guards as an additional precaution against serious accident.

**Southampton.**—Boxing day will be remembered at Southampton for a very high tide in the Solent, which invaded the Corporation electricity works on the western shore, and led to the electric tramway service being suspended for three hours.

**Stirling.**—It is stated that for financial reasons the Corporation is not prepared to go into an electric tramway scheme for the town and district. The opportunity seems a good one for a private company, as the need for a more up-to-date system should ensure no obstacles being put in the way of such an enterprise.

**Swansea.**—Negotiations are to be entered into with the Swansea Improvements and Tramways Co., with a view to arrangements being made whereby the extension of the tramways system authorised under the Swansea Corporation Act, 1912, which deals practically with the connecting-up of all the existing tramways, shall be carried out jointly by the company and the Corporation. The engineer is of opinion that by adopting this course many difficulties will be overcome.

**Todmorden.**—There were angry recriminations at the T.C. last week, over a proposal to purchase more motor-buses. Alderman John Dawson declared it had cost £7,000 to keep buses running, which originally only cost £4,000. Mr. Rigby Dawson replied that Todmorden and Eastbourne had lost heavily by being the pioneers of municipal motor-buses, but the makers had profited by their experience. The Council had better buy more buses than spend money on powers to run railless cars, which would cost a 2s. rate. The proposal to purchase was adopted.

week-end cable letters to Australia and New Zealand is 18s. for 24 words and 9d. a word beyond 24, and for week-end cable letters for places in South and Central Africa, 15s. for 30 words and 2s. 6d. for each group of five words beyond 30. These rates include the charge for delivery by post from the offices of the cable companies in Australia, New Zealand and South Africa.

**Spain.**—A movement is on foot at Bilbao, the great re-exporting centre of Spain, to secure the establishment of a direct telephone line between that town and Paris.

**The Damaged P. & O. Liner.**—The *Narrung*, on her voyage through the Bay of Biscay, was badly damaged by the extraordinarily violent seas on Boxing Day, and sent out the wireless call for help. Mr. H. A. Reynolds, the wireless operator, was at work in the Marconi room for 40 or 50 hours on end. He stated that all through the gale the apparatus worked steadily, and there was little interference with messages. The "S.O.S." signal was responded to freely, and communication was established with a considerable number of vessels. None of them came nearer than about 60 miles, for the vessel was got under control and cancelled the call, returning to port under her own steam.

**The Marconi Agreement.**—On Monday Mr. F. Hall asked the Postmaster-General whether he would say what was the extent of the punishment inflicted on Mr. J. E. Taylor, staff engineer at the Post Office, owing to his purchase of Marconi shares; and were any other civil servants similarly punished for dealing in these shares?—Capt. Norton replied that Mr. Taylor had been reduced from the rank of staff engineer to that of assistant superintending engineer, the respective scales being £520 by £20 to £700, and £420 by £20 to £500. His actual salary was reduced from £540 to £500. No other officer of the department, so far as the Postmaster-General was aware, had dealt in the shares.

**Trans-Atlantic Wireless.**—For the first time the time signals emitted from the Eiffel Tower station were received in the early morning on Tuesday by the United States Government station at Washington, at a distance of 4,000 miles.

## CONTRACTS OPEN and CLOSED.

### OPEN

**Atherton.**—January 29th. One E.H.T. switchboard and one H.T. switchboard for the U.D.C. See "Official Notices" December 27th.

**Australia.**—VICTORIA.—January 10th. 14,500 metal-filament lamps, for the Melbourne City Council. See "Official Notices" December 27th.

January 28th.—Paper-insulated lead-covered cable for the P.M.G.'s department. See "Official Notices" December 20th.

February 21st.—Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

February 4th. Thirty-six Morse keys, for the P.M.G.'s Department. See "Official Notices" to-day.

January 24th.—Portable ammeters, voltmeters, transformers, &c. for the Melbourne City Council. See "Official Notices" to-day.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" to-day.

**QUEENSLAND.**—January 29th. Detectors (Schedule 242), for the P.M.G.'s Department. See "Official Notices" December 20th.

**Belgium.**—February 28th. The municipal authorities of Lierre are inviting tenders for the concession for the establishment of a central station for the supply of electrical energy for lighting and power purposes in the town. Full particulars of the concession can be obtained for five francs from Le Secrétariat de la Ville, Lierre.

**Birmingham.**—January 27th. Stores for a year for the Corporation Tramways Department. Mr. A. Baker, manager, Congreve Street.

**Bispham-with-Norbreck.**—January 18th. One oil or gas engine direct coupled to a 100-kw. dynamo, for the U.D.C. See "Official Notices" to-day.

**Chile.**—September 10th. An advertisement appeared in the *Times* on Wednesday stating that tenders are invited for the establishment of an electric central station and the distribution of electrical energy at the port of Valparaiso. The basis and specifications of the works can be obtained at the offices of the Chilean Legation, 48, Grosvenor Square, W.

**Eastbourne.**—January 14th. One 1,000-kw. horizontal steam turbine and alternator, without condensing plant, for the Corporation. See "Official Notices" December 20th.

**France.**—COMPIEGNE.—January 20th. Tenders are invited for the supply of the following plant:—70-h.p. effective hydraulic turbine, sets of electric motors, high and low-pressure centrifugal pumps, three 75-h.p. oil engines and 480-volt continuous-current dynamos, and the mechanical and electric transmissions needed for the working of the whole plant. Particulars of the Mairie of Compiègne.

(Continued on page 23.)

## TELEGRAPH and TELEPHONE NOTES.

**Japan.**—Owing to the inclemency of the weather and other difficulties, it is announced by the Japanese Department of Communications that the work of repairing the submarine telegraph cable between Japan and the United States has been suspended until August, 1913.

**London-Paris Telephone.**—There was no communication with Paris by telephone on Boxing Day owing to the gale; telegraphic communication with Jersey was also interrupted.

**Marconi Wireless Patents in France.**—We are informed that judgment has just been delivered in the High Courts of Justice of France in the action for infringement brought by Marconi's Wireless Telegraph Co. against La Société Française Radio-Électrique, La Compagnie Générale Radio-Télégraphique, and La Société des Transports Maritimes à Vapeur. The case was heard by three judges, and the judgment was unanimous. In the result the Court declares the validity of all the claims of the Marconi patent of 1900. All the defendants are declared to be infringers, and an investigation of their accounts has been ordered, to arrive at the amount to be paid as damages to the Marconi Co. The Court further orders the confiscation of all infringing apparatus supplied by the defendant companies, and a perpetual injunction, the defendants to pay the costs. This judgment is of the highest importance, and will have far-reaching effects, for the defendant companies have supplied all the wireless installations to all the departments of the French Government, including the Post Office, the Colonies, the Navy, and the Army, which embraces the station of the Eiffel Tower.

**Reduced Telegraph Charges.**—On January 1st, the following reductions in the charges for telegrams came into operation:—

The rate for deferred telegrams to Canada, Newfoundland and the United States is reduced by 1½d. a word for messages sent *via* the Anglo-American, Direct United States and Western Union Companies' cables. In the case of day-cable letters (which will in future be known as "night-cable letters") the rates for places in the east of Canada and the United States are reduced from 6s. for 21 words to 3s. for 13 words, and instead of being delivered on the second day after dispatch, they will reach the addressees on the day after they are sent. In the case of "week-end cable letters," for which the charge was 6s. for 31 words, the new rate is 4s. 6d. for 25 words, and they will be delivered on Monday instead of on Tuesday as at present. The rates for both classes of telegrams to other places in Canada and the United States vary according to distance.

Services of week-end cable letters are introduced with Australia, New Zealand, the South African Union, Rhodesia, and British Central Africa (Nyassaland). These messages, which must be presented for dispatch not later than Saturday evening, will be delivered on the following Tuesday, except in the case of distant places, where delivery may be somewhat later. The charge for

## BRIDGING AUSTRALIA BY WIRELESS.

BY DR. ALFRED GRADENWITZ.

SHORTLY after the completion of the large Telefunken station at Pennant Hills, near Sydney, another powerful wireless

GENERATING PLANT.

station ordered by the Commonwealth of Australia was installed at Fremantle, and has now opened communication with Sydney across Australia, over a distance of about 2,500 miles.

The new station is situated on a hill between Fremantle and Perth, on the southern bank of the Swan River. The hill, 136 ft. in height, is one of the highest in the neighbourhood, and is covered with woods, like the surrounding country. The station covers an area of 600 square metres, and is situated  $4\frac{1}{2}$  miles from the sea.

While mainly intended for purposes of defence, the new station is controlled in time of peace by the Postal Department, and is used almost exclusively for commercial telegraphic service with merchant ships and for the meteorological intelligence service. Since Fremantle is an important harbour, being the first point of connection for traffic *via* Colombo and Cape Town, the station is likely to render valuable services to navigation.

The centre of the area covered by the station is the highest point, and the tower there installed serves to carry the antennae. This iron tower, 120 metres in height, is designed on the well-known Telefunken system, standing on a ball

bearing, insulated from the ground by means of glass insulators, and is kept in equilibrium by three pairs of cables moored to concrete blocks, 150 tons in weight. Glass plates are used as insulators, and the antenna system, insulated from the tower, is arranged in umbrella fashion and comprises phosphor-bronze wires 3 mm. in diameter, joined up in three sets.

The leads enter the tower at 10 m. apart, parallel to one another. Each of the three sets is arranged between two pairs of tower cables, thus allowing the wires to be readily kept clear of these cables with a minimum elastic stress in the wires.

Since the sandy soil is extremely dry in summer (there is absolutely no rain during the six or seven summer months), while the underground water is at a depth of 42 m., much difficulty was experienced in establishing a satisfactory earth connection. An insulated counterpoise was therefore used, consisting of about 100 wires, 300 m. in length (phosphor-bronze of 2 mm. diameter), which radiate from the tower at 9 m. height, being insulated by means of four insulators arranged in series.

The wires are supported by three bronze wire circles suspended from telegraph poles, at 100, 200 and 300 m. respectively from the tower. The first circle comprises 12,

RECEIVING APPARATUS.

and each of the others 24 telegraph poles; the first is 7.2 m., the second 5.4 m. and the third 3.6 m. in height, so that the counterpoise gradually approaches the ground, which assists in endowing the vibratory circuit formed by the antenna and counterpoise with a more open shape, thus ensuring a more satisfactory radiation and a more outward reflection of the wave from the counterpoise.

In 16 wires of the counterpoise, the first 100 m. have been left out, and the free space thus obtained contains the buildings and the wires connecting the antenna with the apparatus house. In addition to the large umbrella antenna ( $\lambda = 1,400$  m.;  $c = 4,450$  cm.), which serves for the sending and receiving of waves upwards of 1,600 m. in length, two T-antennae for waves of 600 to 900 m. and a T-antenna for waves of 900 to 1,600 m. have been provided. The T-antennae are arranged opposite one another, thus eliminating any screening effect of the tower and allowing

HIGH-PRESSURE ROOM: SENDING APPARATUS

the antenna situated in the most favourable direction with regard to the corresponding station to be used. One end of these antennae is fixed to, but insulated from, the tower, the other being attached to a steel wire subdivided by insulators and stretched out from the tower. The points of suspension are situated at a height of 60 m., the horizontal part being  $2 \times 25$  m. in length. The constants of the two-wire antenna for waves of 600 to 900 m. are :  $\lambda = 570$  m. :  $c = 1,000$  cm., and those of the four-wire antennae for 900 to 1,600 m. :  $\lambda = 750$  m. :  $c = 1,600$  cm.

WIRELESS STATION, AND BASE OF TELEFUNKEN TOWER.

The station has its own generating plant, which is installed in a special room 25 m. from the reception building, so that the noise of the machinery and driving belts does not interfere with the receiving of telegrams.

The power plant includes an alternator of 60 K.V.A., at 500 volts and 500 cycles, driven by a four-cylinder Gardner oil engine of 75 H.P. The engine runs at a speed of 500 R.P.M., and the alternator at 1,500 R.P.M. Leather belts are used for power transmission, the distance between centres being 9.6 m. The engine can be fed with kerosene or gasoline, and compressed air is used for starting. Three water tanks are provided for cooling the cylinder. A continuous-current dynamo of 3 kW., also driven from the oil engine, serves to excite the alternator and to actuate the relays.

The wireless apparatus is installed in two rooms in a special building. One of these rooms contains the receiving table and switchboard, the Morse keys and switches actuating the high-pressure senders in the other room being installed on and beside the table.

The operator is able to control from his table the whole of the apparatus, while getting through a window a good

view of the high-pressure apparatus and antenna ammeter. On the left hand is arranged the receiver, and on the right the key actuating the sender relay and the pressure regulator of the high-frequency machine. To the right on the front wall is situated the remote controlling gear of the variometer, and the sound tester and emergency receiving

ELECTRICAL CAPSTAN, SS. "FAUVETTE."

coils are suspended from the side wall. Other apparatus installed on the table are the call bell, the wave meter for testing the received signals and a contact button for actuating a signal bell in the power house. The receiver is equipped with an intermediary circuit and three parallel antenna condensers filled with oil.

MAIN SWITCHBOARD, SS. "FAUVETTE" (see page 21).

The sending apparatus comprises an A.E.G. high-pressure oil transformer for a ratio of 1 : 120, a condenser battery of 36 Leyden jars connected up in series in six sets, six spark gaps consisting of 16 sections, and a primary variometer. Two primary inductance coils are used to determine the

resonating position between the alternator and the high-pressure transformer, two secondary inductance coils protecting the transformer against high-frequency currents. Variable flat copper coupling coils are used to connect the closed vibratory circuit with the antenna circuit. A hot-wire ammeter in the antenna circuit, which can be observed from the operator's seat, indicates the current intensity in the antenna.

The capacity of the condenser battery is 11,000 cm.; in the case of long-wave operation two sets of jars are cut out, thus increasing the capacity to 16,500 cm. A fan for cooling the plates has been provided for each two sets of spark gaps.

As the high-pressure switch of the receiver and that of the high-pressure compartment are so arranged as to be handled simultaneously with the left and right hands respectively, only a second is required for switching over from "sending" to "receiving," and inversely. The switch at the same time actuates the spark-gap fans and the sender relay.

The new Fremantle station has been in operation since

## ELECTRICAL DECK MACHINERY ON THE SS. "FAUVETTE."

AN interesting addition has recently been made to the fleet of the General Steam Navigation Co. by the arrival in

GENERATING PLANTS FOR ELECTRIC LIGHTING, INSTALLED ON THE SS. "FAUVETTE."

London of the steamer *Fauvette*, which has been built by Sir Raylton Dixon & Co., Ltd., to the order of the owners for their passenger and goods service between London and Bordeaux. The vessel is interesting, as it is probably the

first vessel of the kind built in this country to the order of English owners in which the greater part of the auxiliary machinery is electrically driven.

This machinery has been supplied by Messrs. Clarke, Chapman & Co., Ltd., and consists of one windlass, two winches, six cranes and two warping capstans, with the necessary steam generating plants, switch-board and wiring.

The windlass is arranged to work 2-in. diameter cables, the winches lift 3 and 5 tons respectively, the cranes  $1\frac{1}{2}$  or 3 tons each, and the capstans exert a pull of 3 tons on the rope when warping the vessel.

The machinery has been specially designed for the rapid and quiet discharge of cargo, and, being electrically driven, will be of

greater overall efficiency than steam equipment, as the power is concentrated in one large unit in which steam is used expansively, and the losses in the distribution of the

ELECTRIC CRANES ON THE AFTER DECK, SS. "FAUVETTE."

June last, and will shortly be taken over by the Government. In addition to communication with Sydney and with passing vessels, a regular Press service is carried on twice a day.

THREE-TON WINCH. SHOWING MOTOR, CONTROLLER, &amp;c.

power are smaller than in the case of steam-driven machinery.

All the power cables are led under the deck, which makes a very neat and desirable arrangement for a passenger vessel, as leaking steam pipes along decks or frozen pipes in cold weather are obviated. The various machines will also be ready for starting up immediately steam is available at the generating plants, no warming up being required, as in the case of steam-driven auxiliaries.

The windlass is of the maker's direct-grip type, in which the whole of the power of the motor is transmitted to the cable-holders, arrangements being made, however, to prevent damage in the event of the anchors being drawn too quickly into the hawse pipes. Hand gear is also fitted to the windlass.

The winches are of the worm and spur-gear pattern, with two lifting speeds, the second set of gearing lifting half the normal load at twice the normal speed:

ELECTRICALLY-DRIVEN FIVE-TON WINCH.

MOTOR-DRIVEN WINDLASS.

a clear lead of rope is obtained either forward or aft from the lifting barrel.

In the cranes the load is both lifted and slewed by power, separate motors being fitted for these purposes.

The control of the cranes is very simple, and the operating platform is raised so as to give the driver an uninterrupted view of the load.

The capstans are of the "above deck" type, having the motor and all gearing accommodated inside the capstan barrel which is of larger diameter than usual, and consequently increases the life of the ropes used; two speeds of hauling are obtained with the two diameters of the barrel.

Two generating sets are installed, consisting of enclosed compound engines fitted with forced lubrication to all bearings, each plant being capable of giving an output of 100 kw., which output will meet the normal requirements when loading or discharging. The second generating set, therefore, acts as standby, and can be brought into use when dealing with heavy cargoes at high speed.

The switchboard is of the change-over type, having separate panels for the various machine circuits and arranged to couple the latter to either of the generating sets.

A complete system of circuit-breakers is also fitted to prevent damage in the event of excessive overloads.

The resistances for the various machines are of the electrical contractors' patent "Cracker" type, which are quite unaffected by vibration and are practically indestructible; these are made of an incorrodible metal in continuous strips, and mounted centrally so that each turn is free to expand or contract.

They are, therefore, eminently suitable for their duty, and the old trouble of replacing damaged units in a built-up resistance is entirely overcome.

At the trials all the machinery worked most satisfactorily, the machines lifting their test loads with ease and showing that they possess an ample margin of power. Simplicity of control was a noticeable feature, and the quiet working of the machines was favourably commented upon by the experts present, this being considered a most desirable feature as it would greatly decrease discomfort caused whilst loading or discharging. As cargo will be dealt with regularly at intervals of a few days, the installation will doubtless be a success from a financial as well as from an engineering standpoint, all the parts being carefully designed to withstand the heavy usage to which deck machinery is subjected. The vessel is efficiently lighted by electricity, this installation being supplied by the same contractors, but arranged quite separate from the power installation.

Energy in this case is provided by two generating sets either of which is capable of dealing with the normal load, the engines being of the enclosed type with forced lubrication to all bearings; separate lighting panels are arranged on the switchboard, these also being of the change-over type.

The wiring was carried out on the double-wire distribution-box system, the installation being divided into about 12 lighting circuits and six power circuits for the deck machinery.

The total number of lights is about 350, each cabin being fitted with two-way switches at the door and the bedside and plugs for a portable light and ventilating fan.

The saloon, smoke-room and writing room are also adequately lighted and electrically ventilated, the fittings being of silver-plated white metal to a design which harmonises with the general scheme of decoration in each case.

A wireless telegraph installation has been fitted, and an electrical ship's log with speed indicator on bridge. The signal lights are all controlled from the chart room where a patent signal light indicator is fitted.

The cables throughout the accommodation are lead-covered, the power cables and other wiring throughout the vessel being of the armoured type.

In conclusion, we are indebted to Messrs. Clarke, Chapman for this short description of an interesting installation, and we would add a word of praise for the owners, who are among the very few who have shown practical appreciation of the undoubted advantages of electrical deck machinery. Several of the new oil engine vessels have, and are, adopting this method of driving auxiliary machinery, and its economy and efficiency cannot be disputed now.

## CONTRACTS OPEN.

(Continued from page 18.)

**Cuba.**—January 27th. "Dirección General de Comunicaciones," Havana. Establishment and working of a telephone system within a radius of 6½ miles of Real Campino. Término Municipal de Cienfuegos, Province of Santa Clara.—*Board of Trade Journal*.

**Glasgow.**—January 21st. Two 6,000-kw. turbo-alternators, with condensing plant and accessories, and water-tube boilers, for the Corporation. See "Official Notices" to-day.

**Harwich.**—January 13th. Four motor-driven centrifugal pumps, two motor-driven sewage rakes and screens, with switchgear, and about 400 yd. of 15-in. cast-iron rising main, for the Corporation. See "Official Notices" December 20th.

**Italy.**—The municipal authorities of Rome are about to invite tenders for the supply of the material required for the new electric tramway between the Piazza Indipendenza and the Porta Traionfale; the contract includes 600 tons of tramway rails, Mannesmann poles, the overhead conductors, trailing cars, &c.

**London.**—FULHAM.—January 9th. Steam dynamo, switchboard and connections for the Workhouse, Fulham Palace Road, W., for the Guardians. See "Official Notices" December 6th.

**ISLINGTON.**—January 29th. Electrical and engineer's stores for the year, for the B.C. See "Official Notices" to-day.

**New Zealand.**—January 30th. Two vertical Diesel engines of 150 h.p., each coupled to shunt wound dynamo of 100 kw., switchboard, crane, overhead mains and street lighting equipment, &c., for electric lighting at Thames. Board of Trade Commercial Intelligence Department, London.

January 6th. Switchboards, for the Auckland Harbour Board. See "Official Notices" November 15th.

**Nottingham.**—January 14th. The Corporation Tramways Department is inviting tenders for the supply of (a) 350 tons, steel tramway rails 15 lb 11, 150 tons, steel tramway rails 15 lb 11 (Sandberg), and (b) 5 tons, mild steel tie bars. Specifications and forms of tender (£1 lb, each returnable) from Mr. A. Brown, engineer, Guildhall, Nottingham.

**Plymouth.**—January 23rd. Stores, for a year, for the Corporation Electricity and Street Lighting Departments. See "Official Notices" to-day.

**Rottingdean.**—January 7th. Installation of electrical fire alarms and private telephonic service, Warren Farm Schools, for Brighton B. of G. Mr. P. Coote, engineer, Central Chambers, North Street Quadrant, Brighton.

**Sheffield.**—January 23rd. General stores for the City Tramways Department. See "Official Notices" to-day.

**Southey.**—January 18th. The Fellwell New Fen Commissioners are inviting tenders for the supply, delivery and erection at Southey, Norfolk, of two centrifugal pumps having a capacity of 100 tons per minute, direct-coupled to two steam turbines. Specification and forms of tender (£3 3s., not returnable) from the consulting engineer, Mr. E. G. Crocker, Ely, Cambs.

**Spain.**—The municipal authorities of Torrecampo (province of Cordoba) have just invited tenders for the concession for the electric lighting of the town during a period of ten years.

**Sweden.**—January 8th. Fifty-ton electrically-driven trestle crane, for Alfkärlby power station. Time extended to January 8th.—*Board of Trade Journal*.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C. I. Department in London.

## CLOSED.

**Aldershot.**—The U.D.C. has accepted the tender of Messrs. Wm. Cory & Sons, for 600 tons of coal, for the electricity works, at 17s. per ton.

**Bedford.**—The Borough Education Committee has accepted the tender of Messrs. W. S. Wilton & Co., of Bedford, for electrical work for the ensuing six months.

**Belgium.**—The Belgian military authorities are equipping all the forts and redoubts in the Antwerp district with electric lighting and power plants. In connection with the same, the authorities of the State Gun Works in Liège, opened the tenders for the supply of 46 dynamos, when it was found that the lowest offer was that of the Compagnie Internationale d'Electricité, of Liège.

**BRUSSELS.**—The results of the adjudication on the tenders returnable November 20th, for switchboards are as follows:—The Antwerp Telephone and Telegraph Works, Antwerp, 1,882 fr.; the Bell Telephone Manufacturing Co., Antwerp, 2,173.30 fr.; O. von Millmann, Brussels, 2,458.75 fr.; C. Richez, Brussels, 2,499 fr.

The results of the adjudication on the tenders returnable November 15th, for the installation of bells, telephones and electric clocks at the Ecole Normale d'Industries are as follows:—Société Force et Eclairage à St. Gilles, 3,166.60 fr.; C. Richez, Brussels, 3,327.65 fr.; Biske Livron et Kalinowski, Liège, 3,486.90 fr.; Telephonie Privée, Liège, 4,148.25 fr.; Soc. Belge Siemens and Halske, Brussels, 4,209.30 fr.

**Bexhill-on-Sea.**—The T.C. has accepted the tender of Messrs. Stephenson, Clarke & Co., for 150 tons of coal for the electricity works, at 19s. 7d. per ton.

**Bridlington.**—The T.C. has accepted the tender of Messrs. Stuart & Moore, of Ealing, W., for an installation of electric fire alarms on the hire-purchase system, £14 2s. 6d. to be paid each half-year for seven years.

**Bristol.**—The Council has accepted the tenders of the British Westinghouse Co., Ltd., and Messrs. Bruce Peebles & Co., Ltd., at £903 and £2,187, for extra-high-tension and low-tension switchgear and one three-phase to direct-current converter respectively.

**Dundee.**—The Corporation Electricity Committee last week had under consideration the question of the machinery contracts for the extensions at the Stanvergate station. A Subcommittee was given powers to settle the matter.

**Glasgow.**—The T.C., at its last meeting, on a report by the electrical engineer, decided that the contract with the British Westinghouse Electric and Manufacturing Co., Ltd., for the supply of rotary converters, be extended so as to include two additional rotary converters, with the necessary high and low-tension switchgear.

The T.C. has accepted the following offers for the Tramways Department works:—

Special trackwork.—Titan Trackwork Co., Ltd.  
Rawhide pinions.—Reid Gear Co.  
Traction lamps.—Siemens Bros. Dynamo Works, Ltd.; General Electric Co., Ltd.  
Double cotton-covered wire.—London Electric Wire Co., Ltd.  
Copper and bronze strip.—P. & W. MacLellan, Ltd.

**Greenock.**—The Corporation has accepted the offer of the Westinghouse Co. for 5,000-kw. plant, subject to the latter providing a condenser of 7,650 sq. ft. area. The new machinery will involve an expenditure of over £12,000.

**Halifax.**—The Tramways and Electricity Committee has accepted the following tenders:—

Babcock & Wilcox, Ltd.—Two water-tube boilers and superheaters, £9,080, and chain grate stokers, £810.  
British Thomson-Houston Co., Ltd.—Extra-high-tension feeder cell at electricity works, £82.  
Drakes, Ltd.—Fixing of steel mains and cast-iron bends, £69.  
Babcock & Wilcox, Ltd.—High-pressure steam piping and exhaust piping, £103.

**Luton.**—The T.C. has accepted the tender of Mr. Geo. Newbold, for about 2,500 tons of Whitwick slack coal for the electricity works, at 12s. per ton.

**Preston.**—The B. of G. has accepted the tender of Mr. E. Dewhurst, of Preston, for the renewal of the storage batteries for the electrical lighting plant at Fulwood Workhouse, at £610.

**Rhondda.**—Messrs. Venner & Co. have received an order for equipping the Rhondda Tramways with Chamberlain and Hookham meters.

**Rugby.**—The U.D.C. has accepted the tender of W. T. Henley's Telegraph Works Co., Ltd., for 440 yards of 15 low-tension, three-core, paper-insulated and lead-covered cable.

**Walthamstow.**—The tender of Mr. G. P. Trentham has been accepted by the U.D.C., at £16,692, for carrying out alterations and additions to the permanent way.

## FORTHCOMING EVENTS.

**Junior Institution of Engineers.**—Friday evening, January 3rd. Paper, "Some Notes on the Practical Operation of Electrical Machinery for Power Purposes," by Mr. C. E. Catterston.

Wednesday, January 8th. At 8 p.m. At the I.E.E. Lecture on "Heating of Buildings by Means of Hot Panels," by Capt. H. Riall Sankey.

**Association of Engineers-in-Charge.**—Saturday, January 4th. At St. Bride's Institute, E.C. Social. Dance.

**Institution of Electrical Engineers (Newcastle Students' Section).**—Monday, January 6th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Phasing Out of Alternating-Current Apparatus," by Mr. J. Hacking.

**Institution of Electrical Engineers (Manchester Students' Section).**—Tuesday, January 7th. At 7.30 p.m. At the Municipal School of Technology, Manchester. Paper on "Automatic Circuit Breakers," by Mr. A. N. Haworth.

**Institution of Electrical Engineers (Glasgow Students' Section).**—Tuesday, January 7th. At 8 p.m. At the Royal Technical College, Glasgow. Debate.

**Rugby Engineering Society.**—Tuesday, January 7th. At 8 p.m. At Benn Buildings, Rugby. Paper on "Large Steam-Turbo Units," by Mr. J. P. Chittenden.

**Institution of Electrical Engineers (Birmingham Section).**—Wednesday, January 8th. Meeting at the University, Birmingham.

**Institution of Electrical Engineers (London).**—Thursday, January 9th. At 8 p.m. Paper on "The Design of Apparatus for Improving the Power Factor of A.C. Systems," by Prof. Miles Walker.

**Concrete Institute.**—Thursday, January 9th. At 7.30 p.m. At 256, Vauxhall Bridge Road, S.W. Paper on "Concrete in its Legal Aspect," by Mr. W. Valentine Ball.

**Institution of Electrical Engineers (Dublin Section).**—Friday, January 10th. At 8 p.m. At the Royal College of Science, Dublin. Paper, "Notes on Self-Propelled Cars for Light Railway Work," by Mr. J. P. Tierney.

**Electro-Harmonic Society.**—Friday, January 10th. At 8 p.m. At the Holborn Restaurant. Smoking Concert.

**London Telephone Service.**—With the new year, the Post Office opened new exchanges called the "Regent" and "Park" exchanges, and transferred some thousands of subscribers from one exchange to another. Twelve months hence, the "Charterhouse" exchange will relieve the "City" and "London Wall" exchanges, and the "Museum" exchange in Tottenham Court Road will be opened.

## NOTES.

**Index.**—The Index to Volume 71 of the ELECTRICAL REVIEW, July to December, 1912, will be published with our issue for next week.

**Inquiries.**—The name of the maker of the Harman electric hoist is inquired for; a correspondent wishes to get into touch with the makers of the electric table-cloth.

**Fatalities.**—An inquiry was held on December 26th by Coroner J. T. Proud, at Billy Row, a mining village in the county of Durham, into the death of William Nicholson, 52, a miner, who lived at Billy Row and worked at Bowden Close colliery. From the evidence it appeared that Nicholson was going home on Christmas eve from work at the pit with a man named Hetherington. The night was very stormy, and as the men turned into Institute Terrace, they fell over a live wire which formed part of the electric lighting installation. Both men received severe shocks and fell to the ground. At the same moment the electric light in the house of another pitman went out, and he went out to ascertain the cause of its extinction. Hearing shouts, he went forward a short distance, and saw Nicholson and Hetherington rolling on the ground. Assistance was at once obtained, but when removed from contact with the wire Nicholson was dead, but Hetherington was able, after attention, to go home. Mr. S. Wraith, the chief electrician for Messrs. Pease & Partners, the owners of the colliery, said the voltage of the current was from 225 to 230 alternating. It was not customary to protect such wires. Nicholson's damp clothes and his tin bottle would act as conductors. The jury returned a verdict that deceased had been accidentally killed by an electric current through the wires having been blown down by the storm. They were of the opinion that better means should be found to protect the wires crossing a public thoroughfare.

According to the *Australian Mining Standard*, Mr. A. M. Webb, an electrical engineer employed by the Adelaide Tramway Trust at the Port Adelaide power house, was killed last November through contact with a wire carrying 11,000 volts. When he was discovered he was still living, but all efforts to restore consciousness failed.

A young man named Ernest Lancaster (17) was killed on Saturday, 28th ult., at the Weardale Steel, Coal and Coke Co.'s by-product coke ovens at Tudhoe Ironworks. He was somehow caught by a live electric wire, and his death was instantaneous. He had only been at work a few months when the affair happened.

**A Committee Dissolved.**—Our readers may remember that several years ago there was formed a Committee for the Protection of Electrical Interests. We have just received from Mr. R. Borlase Matthews, the hon. sec., a copy of a circular which has been issued to the members, informing them of the dissolution of the Committee consequent upon the formation of an Industrial Committee by the Institution of Electrical Engineers, to which the work of the Electrical Committee has been transferred. The circular reads thus:—

"I beg to inform you that, in accordance with the directions of the Committee, a letter was addressed to the Institution of Electrical Engineers suggesting that they should take over the work of the Committee by the formation of an Industrial Section or Committee of the Institution.

"I have now the pleasure of advising you that the Council of the Institution, at its meeting on March 28th last, passed the following resolution:—

"1. That an Industrial Committee be appointed by the Council, to which there shall be referred, for consideration and report, all industrial matters coming before the Council, and whose business shall also be to report to the Council on any industrial matters which, in the opinion of the Committee, affect the electrical industry and in respect of which the Institution might usefully take action.

"2. That the Committee consist of:—

"(a) Eighteen Members drawn from the Members, Associate Members and Associates of the Institution, at least six of whom shall be members of the Council:

"(b) And, if so desired by the Council, other persons not exceeding six in number, connected with other organisations, and not necessarily members of the Institution.

"3. That the chairman of the Committee be elected by the Council.

"4. That the Parliamentary Committee be merged into the Industrial Committee, and that the latter take over the work of the existing Parliamentary Committee.

"5. That, subject to the Council's approval on each occasion, the Committee arrange for special meetings of various branches of the electrical industry in the Institution building, at which the chair shall be taken by a chairman appointed by the Council.

"6. That the Council inform other bodies of the appointment and existence of the Committee, and ask them to submit from time to time any matters which they consider should be taken up by the Institution.

"And an announcement has recently been made that the following Committee has been elected:—[These names have already been published in the ELECTRICAL REVIEW.—EDS.]

"... In view of the appointment of the above Committee, it is deemed desirable that our Committee for the Protection of Electrical Interests should be dissolved, and that the small balance of cash in hand be handed to the Institution of Electrical Engineers to be placed to the credit of the Industrial Committee, and unless I hear from you to the contrary, I shall take it for granted that you are in agreement with this course being pursued."

**The Midlands Electrical Engineers' Ball.**—The second annual ball given by the Midlands Electrical Engineers took place at the Grand Hotel, Birmingham, on Friday, the 20th ult., and was, if possible, a still greater success than that of the previous year, in spite of many absences owing to the unavoidable nearness of the event to the Christmas holidays. Many friends were able to be present from London and the North, and Mr. Chattock, who was chairman of the Dance Committee, is to be congratulated on having assembled such a representative gathering, and on providing such an enjoyable evening.

**Entertainment.**—On Saturday evening, December 21st, the Mechanics' Large Hall, Nottingham, presented a most animated appearance, the occasion being the Christmas entertainment provided by Mr. Jardine for the children of the employés at the various factories. This is the twenty-eighth year in succession that Mr. and Mrs. Jardine have entertained the children. The number present was over 1,500.

**E.T.B.E. Whist Drive.**—Mr. F. B. O. Hawes, the secretary, is organising on behalf of the Electrical Trades' Benevolent Institution a Whist Drive, which will be held at Slater's Restaurant, 50, Cannon Street, E.C., on the evening of Friday, January 17th, at 7 o'clock for 7.30. Prizes are being given by the directors of firms interested, and others. Tickets, price 2s. 6d. each, inclusive of music and refreshments, may be obtained from the following members of the Committee:—C. H. Champion, Union Electric Co.; B. E. Crowe, Sterling Telephone Co.; F. B. O. Hawes, Electrical Trades B.I. (18, Park Mansions, Vauxhall Park, South Lambeth Road, S.W.); A. J. Williams, General Electric Co. The object of the event is to make the Institution better known among those who ought to become members, and not to make any money out of the entertainment itself. Mr. Hawes will occupy a few minutes during the evening to explain the objects of the Institution, and the advantages of membership.

**Electricity for Train Lighting.**—Lieut.-Col. Sir H. A. Yorke's report to the B. of T. on the railway accident at Ditton Junction on September 17th, 1912, was issued on December 20th. Regarding the fire which broke out and destroyed several of the coaches, the Inspector says:—

The two horse boxes at the front of the train were lighted by oil lamps, the sixth and ninth carriages by electricity, and the remaining five vehicles by gas. There are two gas cylinders to a coach, each with a capacity (at 100 lb. pressure per sq. in.) of 56 cb. ft. of gas. In this case they were probably not more than half full. The cylinders of the three wrecked coaches, viz., the third, fourth, and fifth, were only dented, and were not broken or pierced in any way, but the pipes and connections leading from them were broken off, and the gas was free to escape. One of the witnesses (Porter Ryan) says that when the engine struck the bridge he saw a volume of flame burst from it, and this probably set fire to any gas that might be escaping from the carriages as they passed the engine. Apart from this, it is well known that a very small spark is sufficient to ignite gas when escaping into the air, and there must have been plenty of red-hot cinders from the engine, and sparks from the wheels, flying about the train during the process of destruction. The immediate appearance of fire, the rapidity with which it spread, the fierceness with which it burnt, and the manner in which it resisted for nearly two hours all the efforts to quench it, can, in my opinion, only be attributed to the presence of gas. The fire first showed itself in the heap of wreckage against the wall which supports the booking office. It soon enveloped the fourth and fifth coaches, which were burnt out. The leading end of the sixth coach, which was lighted by electricity, was also destroyed by fire, owing to the fact that it was entangled in the wreckage of the other two, by which it was set alight.

The arguments for and against the use of gas for lighting trains are fully given in Major Pringle's report dated 31st January, 1911, upon the collision which occurred at Hawes Junction, and it is not necessary for me to repeat them here. Major Pringle came to the conclusion that, although steps might be taken to lessen the risks attendant upon the use of gas, "electric lighting would still be the safer method," and "should be adopted wherever possible." It is to be regretted that up to the present time no unanimous action has been taken by the railway companies to meet the representations of the Board of Trade, which were based upon the above report. Some companies are in favour of electricity, while others champion the use of gas. The chief point on which opinions differ seems to be that of cost. I have been personally assured by responsible railway officers that gas is far the cheaper illuminant of the two, while other officers equally responsible have been confident that the balance is in favour of electricity. In view of these conflicting opinions, it may be assumed that the difference in cost does not amount to much, and depends chiefly upon what items are included in the term "cost." So far as safety is concerned, there can hardly exist in anyone's mind a doubt that electricity is the better, and I think the railway companies would be wise to recognise this fact and adopt electricity as the standard illuminant on all their main-line trains before they are compelled to do so by the pressure of public opinion.

In fairness to the London and North-Western Railway Co., I should say that gas has been used by it on its trains for 30 years, during which period, I am told, 2,937 millions of passengers have been carried, and this is the first occasion on which it has been suggested that gas has been concerned in the burning of one of its trains. A large number of its carriages are already lighted by electricity, and the number is increasing yearly. But the company has not as yet gone so far as to adopt electricity as the standard illuminant.

**University of Hong-Kong.**—We recently published a list of the machines required for the equipment of the engineering departments of the new University of Hong-Kong, of which Prof. C. A. M. Smith is the head, and urged our readers to take advantage of this unique opportunity of securing the finest of all advertisements in the eyes of the embryo engineers who are now joining the University. We have since heard from Prof. Smith that the first to respond to the invitation were the Chloride Electrical Storage Co., Ltd., who telegraphed to him promising to present a complete set of their well-known accumulators; the Hart Accumulator Co. have also presented a number of cells, and the Walsall Electrical Co., Ltd., have presented a quantity of electrical instruments. Messrs. Marshall, Sons & Co., Ltd., have cabled out offering a complete steam engine and condensing plant. Oil engines and all kinds of electrical apparatus are urgently needed by the University, as well as physical and scientific instruments.

Prof. Smith writes that the longer he is in Hong-Kong, the more convinced he is that the place is the "springboard" for British trade with China, and that our manufacturing firms will never get another chance such as this for creating an indelible impression upon the minds of our Oriental customers. Out of 55 new students, 37 are engineers. We may mention that, while the tonnage of shipping cleared at Liverpool in 1910 was 74 millions, that of Hong-Kong was no less than 11 millions—a far greater total than that of any other port in the British Empire, except London. Practically, the island is the gateway of British trade with China and the East, and its further development as the centre of scientific and engineering training in those regions will immensely increase its importance and prestige. There are no tariff walls to hinder our access to the markets of the vast population which is now bestirring itself and is beginning to devise ways and means of utilising the riches with which the country is endowed by Nature; we are on an equality with our rivals in this respect, and superior to them in the quality of our products, but if their manufactures are permitted to pervade the laboratories of the University and to impress themselves upon the student engineers, we shall be greatly handicapped in the battle for trade. As both an individual and national duty, we again urge upon our readers the importance of making those laboratories a first-class showroom and permanent exhibition of British manufactures.

**Appointments Vacant.**—According to an advertisement in the *Times*, the post of superintendent of the Magnetic and Geo-Physical Observatory at Eskdalemuir (Dumfriesshire) is vacant (salary, £400 to £500), and applications have to be lodged by January 31st. Particulars from the Assistant Secretary of the Royal Society, Burlington House, W.C.

One senior switchboard attendant (32s. 6d.), and two junior switchboard attendants (26s.), for the Salford Corporation. Junior telegraph engineer, for the Uganda Protectorate Government (£250). See our advertisement pages in this issue.

**Electricity in Spain.**—A Comisión Permanente Española de Electricidad has just been appointed in Spain, under Government auspices. D. José Echegaray has been invited to become the first president of the new body.

**Billiards.**—The final of the billiard handicap for the Challenge Cup, presented by Mr. J. H. Cowell, manager of Blackburn Corporation Tramways, for competition amongst the employés, was played on Friday evening. The contestants were Inspector G. H. Woods and Mr. D. McEvoy, who was last year's winner. The cup was eventually won by Inspector Woods, who was also presented with a gold medal by Mr. J. L. Redmayne, whilst Mr. McEvoy was given a leather pocket wallet as a consolation prize. Alderman Houliker Watson made the formal presentation.

**Bradford Strike.**—At Bradford City Police Court, last week, Albert L. Raistick, of Idle, was fined 20s. and 23s. costs, for having, as a Trade Union picket, thrown an egg at an electrician named Charlie Mounsey, who had remained at work during the electricians' strike in Bradford.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH LOCAL SECTION).—There was an attendance of about 300 gentlemen at the annual dinner of the Scottish Local Section, which, as mentioned previously, was held on December 17th. Mr. Wm. M. Whirter, the chairman, presided. Engineer Commander Wood, who responded for the Navy after the "Imperial Forces" had been proposed by Mr. Robert Caird, LL.D., spoke of the connection between the electrician and the Navy. The electrician had shown that there was nothing too heavy or too light, nothing too large or too small for him to tackle. He weighed the anchor and mixed the dough for bread. He ventilated the ship and he lighted it. His were the means by which the captain in his cabin could tell the officer on the bridge what he thought of him, and also by which the admiral on the flagship could tell the captain what he thought of him. The electrician warmed the cabins and cooled the magazine. He hoisted the ammunition and the coal. He pumped the bilge water and flooded the seascape with light, and one day, no doubt, would take a hand in driving the ship. Lord Provost Stevenson responded to the toast of "Glasgow Corporation," and had much to say regarding the work of the electricity department of the T.C. in the effort to get rid of the black smoke in the atmosphere. He pointed out that it was the business of the electrical engineers to show the citizens how to carry on their industrial concerns without the smoke pall above them all the time. He understood that since the amalgamation of some of the neighbouring areas the electricity department has been inundated with orders from large manufacturing

concerns, and he could see the smoke fall visibly disappearing, because those orders for large power supplies from the department meant nothing if not a diminution of smoke. The more the electrical engineers convinced the users of power that that power could be supplied through electricity, the sooner would the smoke cloud be dispelled; the Corporation, therefore, looked to the electricians primarily for that evolution. He was delighted to hear from the chief electrical engineer, Mr. Lackie, that he was now developing 37,000 H.P. Mr. Lackie had shown them in the recent Smoke Abatement Exhibition that almost everything under the sun could be done by electricity. The toast of the "Institution of Electrical Engineers" was proposed by the Bishop of Glasgow and Galloway, and Mr. Duddell, the President, in response, said that while it was true that the membership had grown from 700 to about 7,000 after 40 years of existence, that, he took it, was an indication of the growth of the electrical industry, for to-day it was one of the most important industries in the country. As to the part played by electricity on board ship, his opinion was that the day was not far distant when it would play a far greater part. They had heard of the success of the Glasgow electricity department in abating the smoke nuisance, but they had also got to attack the domestic fire, which, after all, was the chief offender in their great cities. At the summer meeting of the Institution in Glasgow, Dr. Silvanus Thompson read a most interesting paper on "Magnetism and the Permanent Magnet." Arising very much out of that paper the Institution had decided to form a Research Committee, which was going to co-ordinate the electrical researches which were going on all over the country, and to start research on electrical subjects. In his paper Dr. Thompson showed very clearly the necessity there is of co-ordinating research on the magnetic properties of steel, and they hoped that that might form part of the work to be dealt with by the Institution. As to internal affairs, they had, he believed, a successful Students' Section in Glasgow; it had come to his knowledge that some of the students did not like being made graduates, and he wished it to be clearly understood that the Council in transferring many young men from the class of student to that of graduate did not wish them to remain permanently in that class. Many young men who had not had sufficient number of years in practice were advised to be transferred into the graduate class, but it was hoped that in due course they would apply to be transferred to associate membership and the other higher classes of the Institution. He was the first president who had climbed the Institution ladder, starting as a student and going through all the various grades, while another curious fact was that he happened to be the same age as the Institution. Acknowledging the Scottish Local Section, proposed by Mr. R. K. Morcom, Mr. McWhirter pointed to the fact that the Institution was growing increasingly useful to the whole membership. Their Local Section at its start 12 years ago had 158 members; to-day it had 400, drawn from all parts of Scotland. The chairman went on to review the growth of electrical industry and the tramways undertaking in Glasgow in the last 20 years, and concluded by urging those concerned to take steps for the provision of improved educational facilities on sensible practical lines, not too highly pitched for their apprentices who were too often hampered and discouraged by an overdose of mathematics at their entrance into a technical college.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS (EAST OF SCOTLAND BRANCH).—**The monthly meeting of the branch was held in Kircaldy on Friday, 20th ult., and took the form of an "open night," to which all interested in the handling of electrical plant were invited. A paper was read by Mr. A. B. Muirhead (Glasgow), on "The Maintenance of Colliery Electrical Plant," addressed particularly to the "authorised persons" under the new Electricity Rules.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS (WEST OF SCOTLAND BRANCH).—**At the last monthly meeting of the Branch Mr. Sidney A. Simon, B.A., Glasgow, read a paper on "The Speed Control of Three-phase Motors." While not holding a brief for the universal adoption of three-phase current, knowing that there were many applications of electric power for which direct current was undeniably superior, the author described the most important of the methods of three-phase speed control which had been successfully developed, and afterwards the methods of imperfect speed control. He did not favour the latter, as in each case the variation of speed was effected in steps, and intermediate speeds were only possible by wasting energy. The discussion was adjourned till the next meeting.

**THE SOCIETY OF ENGINEERS (INCORPORATED).—**The Council of the Society may award in 1913 a premium (the "Statens Prize") to the value of £10 10s., for an approved essay on "A scheme for the registration of Engineers, including particulars concerning the registration of Engineers in British Colonies and foreign countries." The competition is open to all, but, before entering, application for detailed particulars should be made to the Secretary, 17, Victoria Street, Westminster. The last date for receiving essays is May 31st, 1913.

**ROYAL SOCIETY OF ARTS.—**On Monday evening, January 20th, Prof. Vivian B. Lewes will deliver the first of his Cantor Lectures on "Liquid Fuel." On January 27th the second will be delivered. "Co-partnership" is the subject of a lecture to be given on January 29th, by Mr. Aneurin Williams.

**Uniflow Engines.**—A correspondent asks, Why so much fuss about the uniflow engine, as though it were a new idea but recently put into execution? The uniflow engine has acquired a new name, but there its novelty stops. There have been two well-known examples of the principle at work for many years in very great numbers. The chief in point of number was the Willans

engine, which carried out the uniflow principle by means, not of a ring of exhaust ports round the cylinder to be uncovered by the piston, but by a central valve with exhaust ports at the piston face.

It was a well-founded claim of the Willans engine that good drainage was secured, for all water which reached the piston was able quickly to escape by way of the central valve. The engine filled a certain want, viz., the demand for an engine to run as quickly as a dynamo, and so avoid belt driving. The ideas of Mr. Ferranti were not then accepted as they are universally accepted to-day; the ideas which gave the little engine its success were those which produced long engine rooms with the vanishing point perspective view of a long line of engines, each of a few horsepower, exhausting preferably to atmosphere.

Then Mr. Raworth brought out a uniflow engine, in which the exhaust took place through a ring of ports in the cylinder, which were uncovered by the piston. The same idea is carried out in the Körting gas engine.

It is somewhat doubtful if either of the steam engines named gave any better dryness results than the horizontal Corliss engine which collected its water at the exhaust valve to which much of it was shot across the cylinder directly from the inlet valve. But a vertical engine without superheat is bound to be wet on its upper end, and drainage at the piston face level or near the cylinder middle shows good results. But it is very doubtful if the uniflow principle is worth the sacrifice of the double acting principle, for the water drainage ceases to possess any supreme importance when steam is superheated, for there should be none to drain.

It is questionable if a uniflow engine with exhaust only by way of the cylinder middle ports would satisfactorily clear itself of steam in the time these ports are open; that is to say, unless a very excellent vacuum exists, the steam remaining in the cylinder will compress to a considerable pressure on the return stroke. High compression has not usually been beneficial beyond the point at which it produces easy, quiet running of an engine, for, when all is said, power is absorbed in doing the work of compression and cannot all be recovered.

Novelties in steam engines have rarely lived long. The reciprocating engine seems to have reached a fixed type, and to have reached its best in the upright position as a thing with a backbone, just as the animal creation appears to have reached its height in an upstanding vertebrate with limbs. So the engine, which has gone through repeated cycles of horizontalization, appears to have been always at its best when vertical, the locomotive, like all draught animals, being of horizontal type.

The turbine is the one uniflow engine in which the principle is at all fully carried out. No reciprocating engine has carried uniflow into practice better than the Willans or the Raworth, and there are objections to mid-cylinder ports. Indeed, all the advantages of mid-cylinder ports are probably to be got by a system of small drain holes only, to let out water and some of the steam, leaving the remainder of the steam to the usual exhaust valve. Indeed, did not the Raworth engine follow this plan?

**The Cost of Electric Vehicle Operation.**—An American contemporary, quoting investigations made by the Massachusetts Institute of Technology, states that for parcel delivery, with a nine-hour day, three trips, four parcels delivered per mile and with one minute consumed in each delivery, three-quarters of an hour being allowed for loading and the maximum load being half a ton, the horse-drawn vehicle does only two-thirds as much work a day as the electric or gasoline truck, at a cost per delivery of 5.9 cents, 5.4 cents and 6.5 cents, respectively. The cost per mile by horse is likewise between the two other costs. In the delivery of coal, which is a very different kind of delivery, at the heavy end of the scale, with loads of 5 tons, the horse wagon (three horses, one resting every third day) does only about half as much work per day as either of the motor-trucks. The cost per mile here runs in much the same way as with the light work, being 55 c. for horses, 47 c. for electric, and 68 c. for gasoline, while the costs per delivery are in the same order, \$3.91, against \$3.32 and \$1.07. Some experiments have been made in special service requirements as affecting the cost of operation, and for the parcel delivery two minutes per call has been allowed instead of one. This increases the standing time, reduces the mileage per day, lessens the distance factor and raises the cost of delivery.

**Gas Producers.**—Commenting on our article on the slugging type of producer, Messrs. Appleby & Co. call our attention to the Kerpeley gas producer, in which the fuel is supported by a conical rotating grate which automatically discharges ash, and is claimed to be capable of gasifying low-grade fuel, coking or non-coking, and coal of all grades from lump to slime. The lower part of the producer is a water casing, to which clinker cannot adhere, the upper part having the usual refractory lining. The grate stands up in the middle of a water trough, which forms a water bottom to the producer. This water bottom, with the upstanding grate, rotates bodily round a vertical axis upon balls in a circular ball race. A fixed scraper is arranged which discharges the ash from the water bottom over the edge of this, the scraper being fixed at such an angle that the ash slides up its face and drops outside the rotating dish bottom. The cone is not quite concentric with the axis of rotation, but its vertex is a trifle eccentric. As the grate rotates this eccentricity has a moving effect on the fuel, and assists to work the spent fuel downwards and outwards until it drops off the lower edge of the cone into the water bottom. The grate is not circular, but polygonally elliptical, so as effectively to crush up clinker if this forms lumps. Rotation is not rapid—one turn in 2½ to 4 hours. Owing to the cleanliness of the fire and its openness, secured by the effects of rotation, the producer works

freely, and it is said that in one installation of producers the percentage of  $\text{CO}_2$  was only 3.8 per cent. Forced blast is used, even to 30 in. water gauge at times. With a Styrian brown coal a gas of 159 B.T.U. per cu. ft. was obtained. This producer appears to be well calculated to work steadily and continuously, and produce an even and steady quality of gas without waste of fuel and with a high efficiency of operation. So far, this producer appears to have been made as a pressure producer, and of large size, but there appears no *prima facie* reason why the same principles should not be applied to producers of suction type. The air and steam supplies to the producer are controlled separately, and it is stated that the producer will maintain its maximum efficiency when working on dusty, low-grade fuel.

**Will.**—According to the *Times*, Mr. C. D. Phillips, of Newport, to whose death we referred a short time ago, has left estate valued at £78,188.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—The employés of the Leeds Electricity Department held a smoking concert on Saturday at the Grand Central Hotel in order to bid farewell to Mr. DICKINSON, the city electrical engineer. The deputy-chairman of the Tramways and Electricity Committee (Ald. Brown) occupied the chair, and during the evening Ald. Tetley presented Mr. Dickinson with two silver standard lamps and a silver cake basket which had been subscribed for by 350 past and present employés of the department. Ald. Tetley referred to the benefit which the city of Leeds had derived from Mr. Dickinson's 20 years' connection with its electricity supply, and referred to the many improvements which he had been instrumental in introducing to the city. Ald. Brown said that after a number of years' intimate connection with Mr. Dickinson, he was of opinion that there was not a better electrician in the country than the manager of the Leeds electricity undertaking. Mr. Dickinson responded, and, after thanking those present for their gifts, said that the Leeds electricity undertaking first started with a 20-KW. dynamo supplying 20 customers. The business had so extended, that now the capital was nearly £1,000,000, and the capacity of the dynamos 15,400 KW., whilst in 1913, when they obtained the new sets, the capacity would be increased to 22,940 KW. He was looking forward to the time when the railways would be electrified, and the use of electric current would be fully appreciated in the household. Mr. Dickinson was released from his duties on January 1st to take up his appointment in Liverpool, on the understanding that he will pay visits to Leeds for consulting purposes.

MR. H. E. MUNDAY, of Shrewsbury electricity works, has been appointed switchboard attendant at H.M. Dockyard, Devonport.

The Burnley Corporation Electricity Committee has recommended that the salary of Mr. JAMES E. STARKIE, the electrical engineer, be increased from £400 to £500 per annum, as from January 1st.

MR. A. C. BLACK, formerly shift engineer to the Cleveland and Durham Power Co., Ltd., and now charge engineer at the Bootle electricity works, has been married to Dorothy Edith Halsall, daughter of the late John Charles Halsall, of Liverpool.

MR. W. HODGSON INMAN, for 11 years at the Lancaster Corporation electricity works, has commenced business as an electrical engineer, wiring contractor, &c., at 38, North Road, Lancaster. The staff at the Lancaster Corporation electricity works presented him with a combined ammeter and voltmeter.

MR. C. E. C. SHAWFIELD, electrical and consulting tramway engineer to the Wolverhampton Corporation, has given three months' notice to terminate his engagement, the reason being that he has been offered, and has accepted, a much more important appointment with a new local company, which is as yet in its comparative infancy, but in connection with which it is believed there are great possibilities. Mr. Shawfield went to Wolverhampton from Newcastle, and succeeded Mr. Harman Lewis 15 or 16 years ago as borough electrical engineer, and was later appointed consulting tramway engineer, the combined salary being £600 per annum. He saw the inception in Wolverhampton of the Lorain surface contact system of tramway traction, and under his direction the various routes were laid and equipped. At the present time he is President of the Municipal Electrical Association, and he is also President of the Wolverhampton and District Engineering Co. In this latter capacity he delivered his presidential address less than a month ago.

The Bexley U.D.C. has appointed Mr. H. P. STOKES, borough electrical engineer and tramways manager at Ilkeston, as electrical engineer and tramways manager. There were 50 applicants.

The Hastings T.C. has appointed Mr. WM. TRAVIS, of Southport, as chief assistant electrical engineer at £150 a year, rising to a maximum of £180.

**Tramway Officials.**—The Maidstone T.C. has increased the salary of Mr. LAMBERT, tramway manager, from £200 to £225 per annum, as from the New Year.

The Darwen Tramways Committee recommends the appointment of Mr. F. J. S. HOSKEN as tramway manager, at a salary of £200 per annum.

**General.**—The following announcement appeared in the *London Gazette* on December 24th:—

### ROYAL ENGINEERS.

"London Wireless Telegraph Company, London District Telegraph Companies, Royal Engineers (Army Troops).—LIEUT. AARON E. G. ABRAHAMSON resigns his commission. Dated December 25th, 1912."

"Electric Light Company, Dorsetshire (Fortress) Engineers, Royal Engineers.—WILLIAM HENRY UPTON MARSHALL, M.I.E.E., A.M.I.Mech.E., to be Second Lieutenant. Dated December 31st, 1912."

Messrs. Sandycroft, Ltd., announce that they have accepted, with regret, the resignation of Mr. W. O. ROOPER, their technical manager. Mr. Rooper is opening offices at 30, College Street, Cannon Street, London, E.C., where he will act as adviser to several well-known mining companies.

MR. H. L. KIRBY JOHNSON, late of Loxley & Co., Ltd., Leeds, has now joined the British Westinghouse Electric and Manufacturing Co., Ltd., and will be attached to the Glasgow branch in charge of the supplies department for Scotland.

The British Westinghouse Co.'s detail department held their annual supper and smoker on the 20th ult., under the chairmanship of Mr. J. Currie, the general foreman of the department. Advantage of the occasion was taken to "send off" Mr. H. R. SCHULTZ, the chief switchboard designer, who is leaving to take up an important post in Sweden. He was presented with a gold watch on behalf of the office staff, and with a silver-mounted umbrella by the works staff. A silver *entrée* dish and a pipe also were presented to Mr. W. A. COATES, the head of the switchgear sales section, who is leaving for Canada early in the New Year.

MR. R. C. HOUR, of Paris, and Mr. C. W. DAVSON, of London, directors of the Warner International and Overseas Engineering Co., Ltd., were passengers by ss. *Curmania*, which left Liverpool on Saturday for New York.

MR. CLAUDE CROMPTON, manager of the lamp shop of Crompton and Co. Ltd., has severed his connection with the company.

The Postmaster-General has appointed Mr. W. G. C. KIRKWOOD, Principal Clerk in the Secretary's Office of the Post Office, to be Secretary of the Post Office in Scotland, in place of Sir Edward Redford, C.B., who retired from the service on December 31st.

The *Times* states that Mr. ANDREW WILSON TAIT and Mr. HARRY FRED LEE ORCUTT have been elected to the board of Fraser & Chalmers.

The marriage took place on December 26th, at Lostwithiel (Cornwall) Wesleyan Church, of Mr. THOS. HENRY VARCOE and Miss Martha Jennings, younger daughter of the late Mr. John Jennings, of Restormel, Lostwithiel.

MR. ROLLO APPELARY, departmental manager at the works of the India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd., Silvertown, has been appointed a Justice of the Peace for West Ham.

In the New Year Honours List we observe that "PAUL JOHANNES BRUHL, Esq., D.Sc., M.I.E.E., F.G.S., F.C.S., Professor of the Civil Engineering College, Sibpur, Bengal," has been appointed to Companionship of the Imperial Service Order. LIEUT.-COL. H. A. YORKE, C.B., Chief Inspecting Officer of Railways under the B. of T. since 1900, receives the honour of knighthood. DR. FRANCIS DARWIN, F.R.S., president of the British Association in 1908, has also been made a knight. Congratulations to these gentlemen.

**Obituary.**—MR. EDWARD TYER.—We regret to record that the death occurred on Christmas night, in his 83rd year, of Mr. Edward Tyer, of Tunbridge Wells, Assoc. 1861 Inst.C.E., M.I.E.E., F.R.M.S., F.R.G.S., &c., and the funeral took place on Monday last, at Busbridge, near Godalming. The *Times*, in the course of a full obituary of the deceased, published in its issue of December 28th, says that he "did more perhaps than any man now living to ensure by efficient signalling the safety of railways passengers, and . . . also first gave to the people of London the facilities of telegraphic intercommunication." It appears that his first interest in electrical matters was due to a Mr. Dempster, who kept a private school at Chiswick, and the interest thus begun was easily stimulated, and soon became almost a passion. After an attempt at office life, he returned to the interest in electrical apparatus, and in 1852, when he was 22 years of age, he patented an invention "by which an engine driver approaching a station automatically gave to the station inspector an electrical warning of his approach," receiving a reply indicating his right course of action. In association with others he formed the Railway Electric Signals Co., and "invention followed invention, and his system of block signalling became widely known." The *Times* writer continues:—"In 1878 Tyer took out a patent for an improved system of electrical control, which came to be distinctively known as the tablet system, and has been very widely adopted." Further, "he advanced the cause of public telegraphic communication. Before 1859, while trunk lines and cables had their terminal offices in London, they were not linked up with each other. The inhabitants of London could not communicate with each other at all by telegram, and if they wanted to use trunk lines or cables had to go to the offices. Tyer saw the possibility of linking up these offices and of establishing subsidiary offices throughout London from and to which any person could telegraph. The London District Telegraph Co. was formed in January, 1859, under the chairmanship of Samuel Gurney, M.P., with Sir Charles Bright as consulting engineer. To Tyer was given the post of electrical engineer, and the laying down of underground and overhead wires and the manufacture of instruments devolved upon him. Thus was established the foundation of what afterwards was perfected under the

brilliant management of an old signalling competitor, Sir William Preece, and became the postal telegraph service in London, which absorbed all privately-owned systems."

Mr. C. H. GADSBY.—We deeply regret to record the death, which has occurred at the early age of 46 years, after a prolonged illness, of Mr. Chas. Herbert Gadsby, Wh.Sch., M.I.E.E., M.I.M.E., consulting engineer, of 20, Victoria Street, London, S.W. He passed away on December 24th, at Farnham, Surrey. Mr. Gadsby began his career as an apprentice at the Falcon Works, Loughborough, and, winning a scholarship, he went to Nottingham University for a year or two, afterwards returning to the Loughborough Works to finish his term. Later he went to Madras for Messrs. Crompton & Co., Ltd., in connection with the electric tramway system there, after which he came home and started as a consulting engineer. He was responsible in that capacity for work done for the British Electric Traction Co., Ltd., the design and construction of the Devonport tramways, and the Burton and Ashby light electric railway for the Midland Railway Co. His death at so early an age is greatly to be deplored.

Mr. F. A. HAMILTON.—We learn with regret of the death, which occurred at Halifax, Nova Scotia, on December 19th, at the age of 72 years, of Mr. Frederick A. Hamilton. Mr. Hamilton was born in Kent, England, and in his early years he was in the British Mercantile Marine, and visited Sicily in 1860-69. When Garibaldi was organising an army for the liberation of Rome, he joined Garibaldi's "thousand," landed in Italy, and marched on Rome. The Garibaldians were defeated by the French and Pontifical troops; Hamilton was taken prisoner, and held for some time in "honourable detention" by the Italian Government. The unity of Italy under Victor Emmanuel was subsequently effected and the Garibaldians released. Mr. Hamilton was afterwards employed by the Anglo-Mediterranean Telegraph Co. at Messina, from whence at the end of 1869 he returned to London where he joined the electrical staff of the Telegraph Construction and Maintenance Co., and took part in several cable expeditions in different parts of the world. He first visited North America in the summer of 1872 in the cable ship *Vanessa*, belonging to the same company, which laid cables between Placentia, Newfoundland, and Sydney, Cape Breton Island. During this expedition his left hand was injured, and he entered the French Hospital at St. Pierre, Miquelon, where the thumb was amputated. He afterwards joined the Anglo-American service and was chief electrician of the c.s. *Minia* for nearly 20 years. He resigned from that company and started as a consulting electrician at Halifax, Nova Scotia, and was employed by the United States Government for some time on their c.s. *Burnside* in the extension and maintenance of the inter-island submarine cable system in the Philippines. After the completion of this work he joined the service of the Commercial Cable Co. as chief electrician of that company's c.s. *Mackay Bennett*, and held that position until his death. Mr. Hamilton probably tested and repaired more broken cables than any other man in the world. He was highly respected, a general favourite, and had a host of friends. Through his residence in Italy he had a great fondness for Italian literature. He was a man of scholarly and artistic tastes, and was conversant with several modern languages. He leaves a widow, a daughter of Judge Johnson, of Halifax, N.S., to mourn his loss.

## NEW COMPANIES REGISTERED.

**Asuncion Tramway, Light and Power Co., Ltd.** (126,196).—Registered December 28th, by Ashurst, Morris, Crisp & Co., 17, Throgmorton Avenue, E.C. Capital, £200,000 to £1 shares (300,000 preference). Objects: To carry on the business of a tramway, light and power company in all its branches, to apply for, purchase or otherwise acquire, work and turn to account, any Parliamentary, municipal or other concessions, orders, rights and powers in Paraguay or elsewhere, and to adopt an agreement with the Paraguay Central Railway Co., Ltd. The signatories (with one share each) are:—F. W. Cowham, 118, Minard Road, Hither Green, S.E.; S. H. Penwarden, 86, Peterborough Road, Leyton, clerk; F. H. Goodwin, 52, Tottenham Road, Palmer's Green, N., clerk; R. Dolby, 19, Park View Crescent, New Southgate, N., clerk; P. H. Wiggins, 141, Station Road, Finchley, N., clerk; F. J. Prosser, 58, Devonshire Road, Merton, S.W., clerk; A. T. Filer, 83, Helmlinch Road, Stamford Hill, N., clerk. Minimum cash subscription seven shares. The directors are to number not less than three or more than seven. The Paraguay Central Railway Co., Ltd., have the permanent right to appoint and remove two directors. The other first directors are to be appointed by the signatories; qualification, £200; remuneration as fixed by the company. The company takes power to pay not more than 60 per cent. underwriting commission.

**No-Lines Manufacturing Co., Ltd.** (126,075).—This company was registered on December 20th, with a capital of £20,000 in £1 shares, to acquire and develop the patent and other rights relating to a telephone recorder, a "teletype lock," and a calculating machine, the invention of O. C. Chapman, together with the goodwill and assets of the No-Lines Manufacturing Co., of Leicester. The subscribers (with one share each) are:—J. Thomas, Rowton Buildings, 11, Bowling Green Street, Leicester, accountant; G. Ineson, 22, Charles Street, Leicester, rag and waste merchant. Private company. The number of directors is not to be less than two or more than five; the first are O. C. Chapman and G. Ineson; qualification, £50. Registered office, 11, Bowling Green Street, Leicester.

**J. W. Brettall, Ltd.** (126,006).—This company was registered on December 18th, with a capital of £1,000 in £1 shares (500 6 per cent. pref.), to carry on the business of electrical engineers and contractors, and lighting, heating and ventilating specialists, &c. The subscribers (with one share each) are:—J. W. Brettall, 19, Adam Street, W.C.; electrical engineer; F. W. S. Napier, Thistlecroft, Belkirk, N.B., gentleman. Private company. The first directors are J. W. Brettall and F. W. S. Napier. Registered office, 18, Adam Street, W.C.

**McWhirter & Son (Cardiff), Ltd.** (126,098).—This company was registered on December 21st, with a capital of £5,000 in £1 shares (3,000 preference), to carry on the business of electricians, mechanical engineers, suppliers of electricity for light, heat, motive power or otherwise, &c. The subscribers (with one share each) are:—A. S. McWhirter, 214, Holm Street, Glasgow, electrical engineer; Annie Heddie, 214, Holm Street, Glasgow, cashier. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Solicitors, Gattis & Rodger, Glasgow. Registered by Blyth, Dutton, Hartley & Blyth, 112, Gresham House, E.C.

**National Electric and Motor Corporation, Ltd.** (126,074).—This company was registered on December 20th, with a capital of £500 in £1 shares, to take over the business of the Consolidated Electric Works and Appliances, Ltd. (incorporated in 1909), carried on at Northampton Grove, Canonbury, and the vendors' interest in a British patent granted to G. Ottino for improvements in rotary valve engines. The subscribers (with one share each) are:—J. Crawford, 10, Wine Office Court, E.C., publisher; E. S. Fry, 87, Gonder Gardens, Hampstead, clerk; J. McLaren, 8, Harne Grove, Peckham, S.E., traveller; H. P. Collins, 110, Leigh Road West, Leigh-on-Sea, cigar merchant; T. E. Ward, 2, Wallace Gardens, Canonbury, N., company director; F. H. Shimmell, 30A, Gienfeld Road, Balham, S.W., clerk; J. Camp, jun., 14, Sergeants' Inn, E.C., clerk. Minimum cash subscription 26 per cent. of the shares offered to the public. The number of directors is not to be less than two or more than seven; the first are T. E. Ward and four others, to be appointed by the subscribers; qualification, 100 shares. Registered by C. Double, 14, Sergeants' Inn, E.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**United Sherardizing, Ltd.**—Particulars of £10,000 debentures, created September 2nd, 1912, filed pursuant to Sec. 98 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £2,000. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Grindell-Matthews Wireless Telephone Syndicate, Ltd.**—Charge on company's undertaking and property, present and future, dated December 8th, 1912, to secure a premium of 10 per cent. upon an issue of £2,500 debentures, part of a series of £3,800. Holder: Otto Beit, Warford Court, E.C.

**White Bros. & Shaw, Ltd.**—Debenture dated November 25th, 1912, to secure £800, charged on the company's undertaking and property, present and future. Holder: Miss I. A. Andrews, Fair View, Alvestoke, Hants.

**Yorkshire Waste Heat Co., Ltd.**—Particulars of £25,000 debenture stock, created December 8th, and secured by trust deed dated December 4th, 1912, filed pursuant to Sec. 98 (3) of the Companies' (Consolidation) Act, 1908; the whole amount being now issued. Property charged: Land in Barugh Parish, Yorks., with buildings thereon, present and future, &c. (Power is reserved to release part of the mortgaged property, if trustees are satisfied that stockholders' security will not be prejudiced.) Trustees: F. J. Kitson, Gledhow Grove, Leeds; and H. I. Bowring, Blackwood Moor, Alkerton.

**Argentine Tramways and Power Co., Ltd.**—Trust deed dated December 2nd, 1912, to secure £250,000 debenture stock, charged on the company's undertaking and property, present and future, including uncalled capital (if any). Trustees: C. W. Trotter, Basildon House, Moorgate Street, E.C., and W. S. Poole, 8, Prince Street, E.C.

**Aetion Lamp, Ltd.**—Issue on December 11th, 1912, of £800 debentures, part of a series of which particulars have already been filed.

**New Phonopore Telephone Co., Ltd.**—Capital £10,000 in 9,000 ord. and 1,000 founders' shares of £1 each. Return dated November 7th, 1912; 7,141 ord. and 1,000 founders' shares taken up; £1 per share called up on 6,141 ord. and 600 founders' shares; £2,731 paid, leaving £10 in arrears; £1,400 considered as paid on 1,000 founders' and 400 ord. Mortgages and charges: £3,700.

**Pacific and European Telegraph Co., Ltd.**—Capital £100,000 in £10 shares. Return dated November 26th, 1912. All shares taken up; £4 per share called up; £40,000 paid. Mortgages and charges: £72,400.

**New St. Helens and District Tramways Co., Ltd.**—Capital £150,000 in £5 shares (20,000 pref. and 10,000 ord.). Return dated November 9th, 1912. 15,980 pref. and 9,000 ord. shares taken up. £125,410 paid, including £510 on 1,020 forfeited shares. Mortgages and charges: Nil.

**Ferranti, Ltd.**—Trust deed dated November 1st, 1912, supplemental to trust deed dated July 24th, 1905, and February 25th, 1910, securing £50,000 6 per cent. first mortgage debenture stock charged on leasehold hereditaments and premises in Fallowfield and the company's undertakings and property, present and future, including uncalled capital. Trustees: H. R. Boyce, Winchester House, E.C., and W. Jones, manager of Parr's Bank, Manchester. Also trust deed of even date to secure £50,000 6 per cent. notes of £100 each carrying interest at 6 per cent. per annum, charged on above-mentioned 5 per cent. first mortgage debenture stock. Trustees: Trust Union, Ltd., 18, Austin Friars, E.C.

**Titchfield and District Lighting, Ltd.**—A memorandum of satisfaction to the extent of £900 on December 14th, of debentures dated February 27th, 1912, securing £2,600, has been filed.

**Telephone Co. of Egypt, Ltd.**—A memorandum of satisfaction to the extent of £2,800 on December 18th, 1912, of trust deed and supplemental deeds dated from July 27th, 1904, to October 27th, 1909, securing £200,000 debenture stock, has been filed.

**Oriental Telephone and Electric Co., Ltd.**—A memorandum of satisfaction to the extent of £1,000 on December 18th, 1912, of trust deed and supplemental deed of acknowledgment dated June 28th, 1905, and June 1st, 1907, respectively, securing £200,000, has been filed.

## CITY NOTES.

## Metalite, Ltd.

MR. W. STEWART (chairman) presided on Tuesday at 20-22, Christopher Street, E.C., over the second annual meeting of the Metalite Co. There was no report or accounts presented, as it was stated in the notice convening the meeting that the audit was not complete, and it was proposed to adjourn the meeting till February 28th. There were about 20 shareholders present.

The CHAIRMAN said: Ladies and gentlemen, this meeting has been called solely to comply with the terms of the Companies' Consolidation Act, 1908, which necessitates an annual general meeting being held before the end of the calendar year. You will remember that, at the last annual general meeting, a point was made of the fact that this company had then secured the option of the purchase of the exclusive rights in this country for the production of a new filament, which the directors believe will be better than any other existing filament. You will be glad to hear, therefore, that the negotiations have been satisfactorily concluded, and that this company now hold the sole licence for the United Kingdom to manufacture the filament known as the Boran filament. Prior to signing the contract, a great deal of experimental work was done in our own laboratory, and the directors feel assured that once in the position to put the lamps in large quantities on the market, they are on the right road for making a substantial profit. Owing to a notice in a journal, the company has been practically inundated with orders for this new lamp, and it seems only a matter of the company having sufficient funds to turn out the lamps in regular quantities in order to yield very handsome results. For all practical purposes, the manufacture of the new lamp commenced from November 1st, 1912, and thus the directors considered it best that the accounts for the present financial period should be made up to October 31st instead of July 31st, and it is for this reason that we propose to put a resolution to the meeting asking them to adjourn it until February 28th next, when the accounts will be available, and I shall then have much pleasure in giving full particulars regarding them. However, I regret to add that owing to exceptional difficulties and lack of financial resources, the directors will not be able to recommend the payment of a dividend for such period. I now beg to move that this meeting do stand adjourned until Friday, February 28th next, at this warehouse at 11.30.

MR. LEE (a shareholder) seconded the motion.

MR. HARRISON: I will propose an amendment, that the meeting be not adjourned until a Committee of inquiry, or some inquiry into the accounts of the company is made.

A DIRECTOR: That amounts to a direct negative.

The motion was then put and carried, with three dissentients.

The CHAIRMAN: I declare this meeting adjourned accordingly until February 28th next.

MR. HARRISON: Can I ask further questions on the position of the company?

The CHAIRMAN: The meeting is now concluded.

MR. HARRISON: But outside the meeting?

The CHAIRMAN: Mr. Harrison, if you will come to me I shall be pleased to answer questions.

MR. HARRISON: I have asked previous questions and got no satisfaction. This is a serious matter.

MR. DUNLOP (a shareholder): This is quite irregular. If this gentleman wants any information, he is able to ask you for it. It is not to the interests of any member of this company that any person should get up and make statements which may be calculated to injure our interests. We are here to consider our own interests, and I object to allowing any gentleman to injure them, and if it is information he really wants, he can easily obtain it by acquiring it at the proper place.

MR. HARRISON: No, Mr. Dunlop, I can't.

A SHAREHOLDER: Mr. Stewart, allow me to congratulate you on your successful tactics.

The meeting then closed.

**Bryant Trading Syndicate, Ltd.**—The annual meeting of this company was, we understand, held at 8-9, Broad Street Avenue, London, E.C., on Tuesday, and was adjourned until March 7th. In a circular issued under date December 23rd, signed by "Wm. Stewart," it was stated:—"The reason the directors desire the meeting to be adjourned is that they have certain plans and negotiations on hand which will, I believe, mature during the next two months, and which they consider would be of benefit to the shareholders of this syndicate." After referring to other matters in which the syndicate is interested, the circular continued:—"With regard to Metalite shares, as you are aware, we still hold some 30,000 fully-paid shares in this company, in addition to 60,000 partly paid, and as Metalite, Ltd., are in the fortunate position of having a new lamp and in view of the large number of orders offered them, it is believed that they will shortly be sufficiently financed to place them in a sound position, so that that part of the assets of this company should be of considerable value. In conclusion, I wish to point out that my co-directors with myself, in view of their belief in the ultimate success of this company, have personally assisted by way of loans in addition to giving their personal guarantee in many matters in order to enable the company to continue and with a view of its ultimate success, this personal liability amounting to over £20,000." The circular is signed "Yours fraternally."

## Blackpool, Lytham and St. Annes Tramways Co.

At the annual meeting at Blackpool, on Monday last week, Mr. George Nicholson (Liverpool), who presided, said they could not congratulate themselves on the result of the year's working. The year opened with great encouragement, the receipts for the first six months being £1,079 up, but unsettled weather for four months in the summer season caused a decrease in revenue of £2,968, while the expenditure had increased by £1,377 on account of upkeep of permanent way, so that there was a shortage of £1,100, as compared with 1911. He complained that the Corporation of Blackpool charged them 2d. per unit for electrical energy, whereas the average price all over the country was 1'40d. per unit. It was absolutely essential, he continued, that they should renew a portion of the track at a cost of £2,000. They had to face increased cost of materials, and the additional burden imposed by the Insurance Act. The report was adopted, and Mr. T. Blane, of Blackpool, was re-elected chairman of directors. Arising out of a portion of the report announcing that the trustees of the debenture-holders, upon the recommendation of the directors, had intimated their intention of paying 1½ per cent. on account of the arrears of interest due on the debenture stock, and to enable this payment to be made, the annual payment to the sinking fund had been suspended for the year, an animated discussion took place, led by Mr. Thos. Preston, of St. Annes, who suggested that the Blackpool Corporation should take over the tramway. It was, he said, utterly illogical and absurd that shareholders should come to a meeting to manage a concern in which they had not a farthing's worth of interest. The Chairman said the debenture-holders were entitled to the line until they were paid out, and in view of the cost of the line, and the great interest arrears, he thought there was no chance of the shareholders getting a penny. A committee of shareholders was appointed to confer with the directors, to see if some improved position could be devised.

**Mexican Fuel and Power Co.**—The directors' report for the year ended September 30th last, states (according to the *Financial News*) that the company having been engaged upon construction work only during the period covered by the report, no profit and loss account is submitted. The issued capital of the company is £70,000 in 20,000 preference shares of £1 each, and 50,000 ordinary shares of £1 each, leaving 30,000 preference shares in reserve. In December, 1911, the company acquired from the vendors, the Peat Industry Co., a concession granting rights over the large peat deposit situated at Lake Xochimilco, about 12 miles from Mexico City. The area covered by the concession is over 7,000 acres, and contains a practically inexhaustible supply of raw peat. The company also acquired certain plant and machinery for the manufacture of fuel from this peat. The amount expended by the Peat Industry Co. prior to the incorporation of this company on plant, machinery, &c., was estimated at £37,000, and the accounts show a further sum of £9,360 expended up to September 30th, 1912, on additional buildings, machinery, power, plant, &c. The work of erecting the additional plant has been carried on energetically, in the face of considerable difficulties and delays due to the political disturbances in Mexico. The work is now almost completed. The directors anticipate that as soon as the plant is in full working order an output of about 50 tons of fuel a day may be expected. Already several inquiries have been made for the company's products in substantial quantities.

**Stock Exchange Notices.**—Application has been made to the Committee to allow the following security to be quoted in the Official List:—

Cordoba Light, Power and Traction Co., Ltd.—Further issue of 127,553 ordinary shares of £1 each fully paid.

The Committee has (1) appointed special settling days as under:—

Wednesday, January 8th.—British Columbia Electric Railway Co., Ltd.—Further issue of £200,000 deferred ordinary stock; £200,000 preferred ordinary stock; and £200,000 5 per cent. cumulative perpetual preference stock.

Thursday, January 16th.—Compañía de Electricidad de la Provincia de Buenos Ayres, Ltd.—Further issue of £150,000 5 per cent. first mortgage gold bonds of £20 each (Nos. 37,501 to 45,000).

And (2) ordered the undermentioned securities to be quoted in the Official List:—

British Columbia Electric Railway Co., Ltd.—Further issue of £200,000 deferred ordinary stock; £200,000 preferred ordinary stock; and £200,000 5 per cent. cumulative perpetual preference stock.

New York Telephone Co.—£250,000 additional 1½ per cent. first and general mortgage bonds of £100 each (Nos. C37,501 to 40,000).

**Continental.**—GERMANY.—The report of the A.E.G. Lahmeyer-Werke Gesellschaft, of Frankfurt-am-Main, for the last financial year shows a profit of £31,960, as compared with only £28,867 in the preceding 12 months. A dividend of 6 per cent. is being declared.

**Rio de Janeiro Tramway, Light and Power Co., Ltd.**—The directors have declared a dividend of 1½ per cent.

**Sao Paulo Tramway, Light and Power Co., Ltd.**—The directors have declared a dividend of 2½ per cent.

## MARKET QUOTATIONS.

## STOCKS AND SHARES.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

**Llandudno and Colwyn Bay Electric Railway Co. Ltd.**—The directors report that the profit for the year to November 30th, 1912, after providing for operating and administration expenses and interest on debenture stock, amounts to £6,023. The amount brought forward from last account was £714, making (says the *Financial News*) a total available balance of £6,737. Part of this amount has been applied as follows:—In placing to depreciation reserve account (making a total to date of £4,000), £1,000; in writing off part of discount and expenses of issue of debenture stock, £1,000, leaving £4,737, which the directors recommend should be applied as follows:—In payment of a dividend at the rate of 3½ per cent per annum (payable, less income-tax, on January 31st, 1913), £3,179, leaving to be carried forward £1,258. The traffic receipts show an increase of £840 over the previous year.

Tuesday Evening.

The old year finishes up this Tuesday evening, and therefore it is possible to bring our usual lists of comparisons right up to date. Week by week the various features in the markets connected with electrical issues have been duly chronicled, and it remains now only to show the rises and falls during the period and to offer regretful apologies for such sins of commission and omission as have crept in or out of these weekly articles throughout the time.

With which prefatory sentences, let us proceed to unfold the various lists, taking first of all that which embraces the Electric Railway issues. There has been more excitement in these than in any other market, as a whole, connected with the electrical industry, and the extension of the Speyer control has had the effect, it will be noticed, of sharply advancing most of the prices concerned:—

Stock or share.	Jan. 2nd.	Dec. 31st.	Rise or fall.
Central London Railway, Ordinary ..	69	83	+ 14
" " " Preferred ..	85	84	- 1
" " " Deferred ..	68	83	+ 25
City and South London, Ordinary ..	31	36½	+ 5½
Metropolitan Railway, Consol ..	36½	58½	+ 22
Metropolitan District, Ordinary ..	36	40½	+ 4½
Metropolitan Electric Trams, Ordinary ..	3½	4½	+ 1
Underground Electric Railways ..	3½	4½	+ 1
" " " 6% Income ..	73	93	+ 20

Prices have been considerably higher than those set out in the second column above, but they still show material improvement on balance.

Advances, too, are general in the list of electricity supply shares, where sentiment has been swayed by rumours of a general agreement between the companies and the local authorities, as to which no details are yet available. There was much gambling in City of London shares during the summer, but just lately speculation has died down in them to a large extent, and the price has dwindled at the same time. The following shows the course of the market in the Ordinary shares of some of the leading companies:—

Ordinary Share.	Jan. 2nd.	Dec. 31st.	Rise or fall.
Brompton and Kensington ..	8½	9	+ ½
Charing Cross, West End and City ..	3½	4½	+ 1
Chelsea ..	4½	4½	0
City of London ..	12½	17	+ 4½
County of London ..	9½	11½	+ 2
Kensington and Knightsbridge ..	7	7½	+ ½
London Electric ..	15	11	- 4
Metropolitan ..	33	35	+ 2
St. James' and Pall Mall ..	8½	1½	+ 1½
Westminster ..	8½	9	+ ½

Some of the biggest movements in prices have occurred in the Latin-Canadian section, where there has been plenty of business for the greater part of the year, and where those who got in early have been able to take splendid profits. Here again, however, quotations have shown a tendency to sag during the last month or so. Several important schemes of amalgamation have been successfully carried through—the Brazilian Traction Company, for instance, is the outcome of the consolidation of three others—and this is a policy that is likely to be extended. Here are a few of the figures:—

Stock or share.	Jan. 2nd.	Dec. 31st.	Rise or fall.
Anglo Argentine Tram, First Pref. ..	5½	4½	- 1
British Columbia Electric Def. ..	138½	143	+ 4½
Canadian General Electric, Com. ..	112½	115	+ 2½
Mexican Light and Power, Com. ..	90	85	- 5
Mexico Tramways, Com. ..	125	112	- 13
Montreal Light, Heat and Power ..	198	229½	+ 31½
Shawinigan Water, Capital ..	127	116	- 11

Marconi's have been up to 9½ and down to 3½, finishing the old year at 4½, a rise of 30s. on balance. National Telephone Deferred has experienced remarkable adventures, too, flying between 162 and 120, although the net result of the year is a rise of no more than 7½ points. This, with certain other representative examples in the Telegraph market, is shown in the following brief table:—

Stock or share.	Jan. 2nd.	Dec. 31st.	Rise or fall.
Anglo-American Telegraph Deferred ..	26½	26	- ½
Eastern Telegraph Ordinary stock ..	139½	134½	- 5
Eastern Extension ..	13½	13½	0
Marconi Wireless Telegraph ..	84	4½	- 79½
National Telegraph Deferred ..	131	138½	+ 7½
West India and Panama Telegraph ..	31½	38	+ 6½

The manufacturing division has jogged along in rather unexciting fashion, as six or seven of the principal shares will suffice to illustrate:—

Share.	Jan. 2nd.	Dec. 31st.	Rise or fall.
Balchcock & Wilcox ..	6½	2½	- 4
Callender's Cable ..	9½	10½	+ 1
Dick, Kerr & Co. ..	4½	4½	0
General Electric Preference ..	9	10½	+ 1½
Henley's Ordinary ..	12½	12½	0
India-Rubber, G.P. & T. ..	11	10	- 1
Telegraph Construction ..	35	35½	+ ½

Remains it now, but to add the cordial, if conventional, hope of a very prosperous New Year to all who have the patience, and the fortitude, to follow the electrical industry and its industrious—more or less—pen-pushers.

**Chili Telephone Co., Ltd.**—Interim dividend at the rate of 6 per cent, per annum (3s. per share) for the past half-year.

## SHARE LIST OF ELECTRICAL COMPANIES.

THE PROTECTION AND PRESERVATION  
OF STANDING TELEGRAPH AND  
TELEPHONE POLES.\*

PRACTICALLY all poles fail at the ground line because of decay, and on account of this weakening at the base, have to be replaced or cut off and reset, while the top portion is still sound.

In what is known as the "Lamb" pole treatment, the decay which has already started is rendered innocuous, and the ground line portion of the pole is then sealed with an impervious preservative coating, which prevents the evaporation of the preservative previously applied and prevents further decay by entirely excluding air and moisture.

The whole process is simple and inexpensive, and consists of first removing the soil around the base of the pole to a depth of 2 to 2½ ft. and scraping or cutting off the decayed portions of the wood. A hot brush treatment of coal-tar creosote is then applied liberally, which kills the living organisms of decay and penetrates the outer tissues of the wood. A fire-proof casing is then placed around the pole, the upper portion extending about 6 in. above the ground line and the lower portion from 18 in. to 2 ft. below, making a total length of from 2 to 2½ ft. This casing is held out from the pole by spacing rods, which leave about ½ in. opening between the pole and the casing at the solid portions, and a greater space where decay has occurred.

After the casing is in place, the soil is tamped in at the bottom up to the base of the casing, and inside of the form is poured a hot preparation of pitch which will yield a distillate of high-boiling and high-gravity creosote oil. The pitch, after it hardens, will form a perfect bond with the creosoted surface of the wood and entirely prevent the entrance of air, moisture, or other agencies favourable to decay, and at the same time prevent the evaporation of the creosote which was applied by brush treatment to the decayed surface. The creosote in the pitch acts as an additional toxic agent in destroying and preventing all forms of decay. Experiments have shown that this pitch filler will not only form a perfect bond with the wood and remain in absolutely close contact in all climatic changes, but it also entirely fills all surface cracks, and, to a slight degree, penetrates the wood. After the pitch has been poured in and has cooled, the soil is thrown back around the pole and tamped tight, and a protective fireproof covering or a cap of cement is applied; or, if the filler is poured to within only about 2 in. of the top, the edges of the fireproof casing can be bent over and tacked to the pole, thus obviating the use of a cement cap.

Under average conditions, one year's increase in the life of a pole will pay for the treatment. The average pole (cedar) has a life of about 10 years, and the cost of replacement is averaged at \$10; hence the annual charge on a 1 per cent. compound interest basis amounts to about \$1.25 per pole. If properly treated at the ground line, a conservative estimate places the increase in life at from 5 to 10 years.

**Electric Light Advertising.**—A striking means of advertising the existence of an electric power house in a locality and its ability to supply energy to all who require it has been adopted by the Consolidated Gas, Electric Light and Power Co., of Baltimore. This company uses a 24-in. marine type searchlight manufactured by the General Electric Co., mounted on the top of an abandoned smoke stack about 200 ft. from the ground. The projector is motor-driven for revolving in a horizontal plane and also has a motor for operating in a vertical plane. It has been used for about a year for advertising purposes, the lamp revolving continuously in one direction at a fixed elevation, and the searchlight being switched on each night after dark. The structure on the top of which the searchlight is mounted is a square brick erection, on three faces of which there are large electric signs. The idea in placing the searchlight on the stack was to call attention to the signs, causing public question as to the source of light, which could be seen in favourable weather 18 to 20 miles from Baltimore, and so to speak show the public "how far the light will go." During the Democratic Convention which was held at Baltimore recently, the searchlight was removed to the top of one of the largest structures in Baltimore, and used very effectively in connection with the scheme of special decoration adopted by the city during that period. Some experimental work has been done with coloured screens, using sheets of coloured gelatine framed and placed in front of the projector, but owing to the lack of penetration of coloured light the scheme met with only fair success. In the projection of colours, however, it was found that a white centre with a coloured rim of light was very effective. The idea, for particulars of which we are indebted to Mr. E. D. Edmonton, the general superintendent of the company, may be usefully adopted in this country in connection with gala displays in which electricity participates.

**Belfast Electricity Supply.**—At a meeting of the Tramways and Electrical Committee, a motion was moved and seconded for the rescinding of the report of Mr. S. L. Pearce and the electrical engineer on the proposed extension of the electrical undertaking, and was defeated by 8 to 2. It was stated that the extension scheme would be laid before the Finance Committee at an early date. It was reported by Messrs. Dick, Kerr & Co. that they had completed the route on five more roads under their permanent tramway contract. Mr. Nance reported that the Glengormely route had been doubled.

**Manufacture of Potash.**—A Swedish engineer named Lindblad has solved the problem of making potash from felspar, by melting potash felspar together with coal and iron in an electric furnace. There are great quantities of potash felspar in Sweden's rocks.—*Daily Telegraph.*

## REPORT TO THE BOARD OF TRADE ON THE UNDERWRITERS' LABORATORIES (INC.), CHICAGO.

Its Formation, and Scope of Operations, with their Effect on the Importation of British Manufactures into the Dominion of Canada.

By C. HAMILTON WICKES.

### THE UNDERWRITERS' LABORATORIES, CHICAGO, INCORPORATED.

THE U.L.C. is located in a specially-designed building at 207, East Ohio Street, Chicago, Ill., with a plant and equipment valued at £20,000. It was granted a charter in November, 1901. The U.L.C. has one Branch Testing Laboratory (recently erected) at New York.

The establishment of the Underwriters' Laboratories, Chicago, was brought about doubtless by the great and disproportionate destruction of property by fire throughout the United States, and in consequence of the heavy losses that resulted, which fell on the insurance companies (fire underwriters).

It should be understood that the problem the insurance companies had to solve, in view of the conditions prevailing throughout the United States, and it may be said North America, was to evolve some method which would tend to reduce the great danger existing of fire hazard and the consequent restriction of business. Among other difficulties appertaining to the position differing from the United Kingdom was:—(a) The common use of wooden buildings; (b) the great area of the territory; (c) the high voltage of the electric current transmitted by overhead wires, even through the main streets of their cities; (d) the large number of manufacturers, good, indifferent and bad, intent only on selling their products, in many instances to firms with little or no technical knowledge, who styled themselves contractors, architects, &c.; (e) the compelled employment of careless, indifferent and incompetent workmen; (f) together with the practical impossibility of obtaining anything like skilled inspection or supervision of the work, even in the towns.

To use the phraseology of "The National Board of Fire Underwriters (New York)," "it was found necessary to provide means for securing a correct solution of the problems presented by reason of the great and disproportionate losses by fire, and to bring to the 'user' the one best obtainable opinion on the merits or demerits of appliances in respect of fire hazard."

This is a high and proper ideal, but however great the necessity might have been for an institution of this character, that would not in itself necessarily have brought about the inception, nor given the U.L., Chicago, the power, and, practically, the absolute control, it exercises to-day over all articles, appliances, material or devices styled "articles for public utility" affecting fire hazard used in buildings throughout the country. It is due to the hearty support which came to be accorded as the value of the Laboratories' work became recognised by the insurance companies—British, American, German, French and Canadian—carrying on business in the North American Continent.

The Laboratories had quite a humble beginning, and I am informed that at the first they confined their attention to certain classes of electric material and fittings, e.g., the "National Electric Code" standards were first compiled in 1896-7 (see later), but their influence has steadily grown and they cover to-day (*inter alia*):—

(a) Machines and fittings which may be instrumental in carrying a fire, gas and oil appliances, electric fittings, wiring, conduits, fuses, &c. Machines and appurtenances used in lighting or heating chemicals.

(b) Fire extinguishers, automatic sprinklers, pumps, hand fire appliances, hose, hydrants, nozzles, valves, &c.

(c) Material and devices designed to retard spread of fire, structural methods and materials, fire doors and shutters, fire windows, &c.

President of the Corporation, chairman of the Board, Mr. Henry C. Eddy, of Chicago (resident secretary, Commercial Union Assurance Co., and the Palatine Insurance Co.); secretary and treasurer, Mr. Wm. H. Merrill, Chicago. The board of directors consists of 10 other gentlemen, of whom four represent British companies, and six American insurance companies. (Particulars, see Appendix A.)

There are, therefore, including the two British insurance companies represented by the president, six British and six American companies represented on the Board of the U.L.C.

The board constitutes the governing authority, handles its finances, and directs all matters of policy, including appointment of "the Council," the manager and members of the engineering staff.

### TECHNICAL STAFF OF UNDERWRITERS' LABORATORIES (INC.), CHICAGO.

The manager is Mr. W. H. Merrill; the chief engineer, Mr. W. C. Robinson (who recently visited England), and there is a staff of over 50, which includes consulting, electrical, gas and oil, and chemical engineers, with numerous assistant engineers, a superintendent of labels, cashier, &c. (Names, see Appendix B.)

### THE COUNCIL.

A body having important functions connected with the U.L.C. is "the Council." The members are nominated by the "board of directors of the laboratories," as stated above. "The Council"

consists of gentlemen who, either in their individual or corporate capacity, have the requisite knowledge or employ technical men on their staff, able to advise them in respect of "the Reports" forwarded for their consideration by the Underwriters' Laboratories. It will be noted that among the members of the Council are Mr. W. H. Merrill, manager of the Laboratories, Mr. W. C. Robinson, his chief engineer, and Mr. Hadrill, who, as secretary to the Canadian Fire Underwriters' Association, has under him quite a number of technical men.

It is by "the Council" that the technical work at the Laboratories is supervised, and it is not until "the Reports" are approved by "the Council" that they are promulgated.

The Council numbers 22 (names and such particulars as are obtainable will be found in Appendix C).

The technical staff, having carried out the experimental work and tested the merits or demerits of each article, device, appliance, material or system submitted, with a view to their bearing upon fire hazard, proceed to draw up a detailed and extremely elaborate "report." This report is forwarded to each member of the Council, and in due course is returned to the Laboratories with such endorsements, amendments or criticism as each member of the Council may consider necessary or advisable. The points raised, if any, are then printed and again circulated to all the members until a "decision" has been obtained. The final decision, whether favourable or otherwise to the article, device, appliance, material or system, is bulletined, i.e., a summary of the Laboratories' Report is distributed on "printed cards," filed according to classification, to the various insurance organisations and companies subscribing to or co-operating with the Laboratories' work. A copy of the bulletin (printed card, presumably) and the detailed report is furnished to the applicant, who originally submitted the article for inspection.

There can be no doubt that the greatest care is taken in the experimental work and tests carried out by the Laboratories, and equal care in the preparation of the Report in its final shape before any article, appliance, material, device or system receives the final approval of the U.L.C.

It may be observed here that cabinets containing these cards are maintained at the offices of the principal Boards of Underwriters and inspection bureaus in the United States and Canada and a few in other countries, at many of the general offices of insurance companies, certain municipal departments, and at the local offices of the Laboratories in the larger cities. There are also "lists" compiled by the Laboratories, which are freely distributed, of "approved and permitted devices," with the manufacturer's name. (See Appendix D.)

### SPECIFICATIONS, RULES AND REQUIREMENTS UNDER WHICH THE EXPERIMENTAL WORK IS CARRIED ON AT THE LABORATORIES.

The specifications under which the experimental work is carried on by the technical staff of the U.L.C. are based upon the rules and requirements of the National Board of Fire Underwriters, New York, as "recommended by the National Fire Protection Association, New York." This is the present practice; previously the various Committees acted solely under the direction of insurance authorities. These have been transferred to the National Fire Protection Associations, in which "all interests are represented."

Many of "The Rules and Requirements" referred to above are printed in pamphlet form. A list is appended herewith (marked "Appendix E"). Printed copies of these pamphlets are filed with the Board of Trade.

### INSPECTION AT MANUFACTURERS' FACTORIES AND LABELLING.

The article, appliance, device, material or system submitted to the U.L.C. having been tested and approved, the Laboratories step in and say, "Before the article may be 'marketed' it must come under our supervision before we will issue 'a label or tab' to indicate that the same has been inspected and passed by us."

The older form of supervision is: A contract to be entered into between the manufacturer and the U.L.C. whereby the maker agrees to construct appliances in exact duplicate of the sample approved, and to pay a certain fee annually, ranging from \$5 to \$30.

The second or newer form of supervision consists in inspection by Laboratory engineers of the devices and materials at factories, and the labelling of standard goods by stamps, transfers, or metal labels, whereby they can be recognised wherever found. The cost of the service is partially defrayed by charges made for the labels. These vary according to the nature and extent of the inspection needed.

A "schedule" of the charges for labelling certain "standard goods" will be found, as a guide, in Appendix "F," together with specimen lithographed labels. The sale of these labels includes the following costs:—

1. Cost of manufacturing the label.
2. Salaries and expenses of agents and inspectors of branch offices.
3. Salary of supervising engineer at home office.
4. Salary and travelling expenses of special agent.
5. Overhead charges.

\* The various Appendices, &c., mentioned are not reprinted here. They may be seen at the Board of Trade Commercial Intelligence Department, in London.

## INSPECTION.

Throughout the United States the U.L.C. has officers who inspect and pass articles, appliances, devices, material or the system installed in any building which the owner requires to insure. It is these inspectors who accept or refuse articles because they have not the U.L.C. label or tab. So far as the Dominion of Canada is concerned, the inspectors are appointed by the Canadian Fire Underwriters' Association (concerning whom, see later). The contention is that the inspection departments of insurance organizations find it easier to pass upon an installation in which nothing but labelled material is used—and this it is contended tends to a better class of installation.

It should not be inferred that the inspector's duty is confined to checking the labelled material. It is important from the manufacturer's point of view, but from the insurance companies' standpoint, the inspector has to see that the workmanship of the wireman and electrician, for example, is good, and that the work has been carried out in accordance with the Rules and Regulations dealing with the design and layout of the installation. Generally, his skill in judgment and experience is called for in interpreting these rules and requirements in accordance with the particular kind of building which he is inspecting for the time being.

An important factor is the question of danger to life "should a fire occur." This, I fear, is not taken into account, in fact, I understand it cannot come within the inspector's consideration, so long as the installation complies with safeguarding fire hazard.

## COST OF EXPERIMENTS AND TESTS, WITH SOME PARTICULARS TO INTENDING APPLICANTS.

Blank forms for use in making applications for tests will be furnished on request to the U.L.C., 207, East Ohio Street, Chicago, although no fixed form of application is necessary. A letter addressed to the Laboratories, setting forth all the claims made for the article, "enclosing the preliminary fee," and giving notice of shipment, is sufficient. All shipments should be consigned to Underwriters' Laboratories (Inc.), 207, East Ohio Street, Chicago. The latter are not responsible for damage in shipment, and cannot undertake to repair damaged goods, or to assemble or erect apparatus shipped in parts.

Freight or express charges must be prepaid.

Goods from the United Kingdom should be shipped in bond.

It is understood that Customs charges, if any, are paid by the Laboratories.

It will be noted in the particulars given below that in respect of articles coming within Groups A to E, there is "a maximum" cost, which will not, under any circumstances, be exceeded.

The Laboratories will, on receipt of an application accompanied by description of the article to be tested, advise as to necessary charges in each case, and in all instances where the costs do not aggregate the amount of the preliminary fees, the balance will be returned to the applicant, to whom, at the conclusion of the "test," a full and detailed account is rendered, and, as stated above, a copy supplied of "the Bulletin," as well as the "detailed Report." The fees are as follows:—

Group A.	Preliminary fee,	\$100.00	Total cost not to exceed	\$250
" B.	"	50.00	"	100
" C.	"	25.00	"	75
" D.	"	10.00	"	50
" E.	"	5.00	"	25

Group F.—Under this group are classified experimental work and researches covering subjects or appliances for which standard requirements are not accepted. The amount of preliminary fee is \$100.00, and bills are rendered monthly as the work proceeds.

The various articles, appliances, materials, devices and systems thus far tested (1909), are classified into the various Groups A to E. (Particulars will be found in Appendix G.)

## GENERAL REMARKS.

The parent body of the Underwriters' Laboratories, Chicago, is "the National Board of Fire Underwriters, New York," under whose "general direction" the work at the Laboratories is carried on. In practice, however, the power of the parent body may be said to be vested in "The Board of Directors." The chief financial support is derived from the parent body, the Laboratories not being in business for "profit"; it is not believed that it has made any profit; the U.L.C. is a corporation for fire protection and fire prevention and not for profit. The insurance companies are the largest contributors. They receive regular appropriations from the National Board of Fire Underwriters, the Western Insurance Union, and other organizations, as well as from a number of individual companies who desire special service in the matter of reports.

It will be noted in going through the Report that the Rules and Requirements are adopted by the N.B. of F.U. (N.Y.) under the recommendation of the "National Fire Protection Association, of New York" (secretary's office, 87, Milk Street, Boston). This important Association, whose President for the year 1912-13 is Mr. H. L. Phillips, of 5, Haynes Street, Hartford, Conn. (vice-President, Mr. G. M. Robertson, of San Francisco; and secretary-treasurer, Mr. F. H. Wentworth, 87, Milk Street, Boston; with a chairman and executive committee of 15 gentlemen, five of whom retire yearly) dates from the year 1896-7, about which time a "National Conference" was held at New York.

Standard electrical rules were drawn up as the result of the united efforts of the various insurance, electrical, architectural and allied interests; the National Conference was disbanded, the work (of

the Underwriters' National Electrical Association and of the National Conference) being taken over by the National Fire Protection Association. The following Associations, formerly members of the National Conference, are represented on the Electrical Committee of the N.F.P.A.:—

American Electric Railway Association.  
American Institute of Electrical Engineers.  
Associated Factory Mutual Fire Insurance Co.  
National Board of Fire Underwriters.  
National Electric Light Association.  
National Electrical Contractors Association.  
National Electrical Inspection Association.

The work of the National Fire Protection Association, of New York, is directed by "Special Committees," of which there are no less than 29, and covers subjects as wide apart as "safes and vaults" and "hose," "electric railway, light and power properties," "automatic sprinklers," "fire pumps," "gravity tanks," "mine fires," "laws and ordinances," "signalling systems," &c. A list of these Committees giving the names of their chairmen will be found in Appendix H.

The "report" of proceedings of the sixteenth annual meeting held at Chicago, May 11th, 15th and 16th, 1912, accompanies this "report," and "The Year-Book" of the National Fire Protection Association (September, 1912) gives the membership, from which further detailed particulars can be ascertained.

The membership of the N.F.P.A. consists of four classes. Active, who only have the power to vote—membership 102, with a subscription of \$15 per annum; Associate, over 1,200 members, annual subscription \$5; Subscribing, over 600 members, annual subscription \$5; Honorary, 3 life members.

The Active class comprises 102 members, including (1) National Institutes, Societies and Associations interested in the protection of life and property against loss by fire, (2) State Associations, whose principal object is the reduction of fire waste, (3) Insurance Bodies and Insurance Associations having primary jurisdiction. Out of these 102 Active class members 82 are Insurance Companies (fire underwriters) or Associations connected therewith, such as inspection bureaus, actuarial bureaus, &c. Twenty may be styled business associations. Among the latter are the following:—

American Institute of Electrical Engineers, New York.  
American Institute of Consulting Engineers, New York.  
American Electric Railway Association, New York.  
American Institute of Architects.  
American Warehousemen's Association, Pittsburg.  
Canadian Manufacturers' Association.  
Electrical Supply Jobbers' Association, Chicago.  
National Association of Manufacturers, New York.  
National Hardware Association, Philadelphia.  
National Paint, Oil and Varnish Association, New York.  
National Electric Light Association, New York.  
National Electrical Contractors' Association, Utica, New York.  
National Association of Sheet Metal Contractors, Philadelphia.  
Canadian Fire Underwriters' Association, Montreal and Toronto.  
Mainland Fire Underwriters' Association, Vancouver, B.C.  
New Brunswick Board of Fire Underwriters, St. John, N.B.  
Nova Scotia Board of Underwriters, Halifax, N.S.  
Western Canada Fire Underwriters' Association, Winnipeg.

CANADIAN FIRE UNDERWRITERS' ASSOCIATION. Offices, 535, Coristine Building, Montreal. Secretary, Mr. A. W. Hadrill.

At the present time 60 insurance companies are members of this Association. I might mention that while this is by far the most important of the Underwriters' Associations in the Dominion of Canada, there are four others, as stated above.

Of the present list of 60 members of the Canadian Fire Underwriters' Association (full list, Appendix I), 28 are British, or their capital is controlled in Great Britain, 19 are American, 12 Canadian, 1 French.

The British insurance companies—headed by the Royal Insurance Co.—together underwrite some 55 per cent. of the total fire risks in the Dominion of Canada, and therefore occupy an important position in the Associations of Fire Underwriters throughout Canada. Their position and influence in the United States of America are also considerable.

## BRITISH MANUFACTURERS v. THE OPERATIONS OF THE UNDERWRITERS' LABORATORIES, CHICAGO.

The experimental work carried out by the Laboratories at Chicago, their method of drawing up reports and labelling approved articles, followed by inspection, already dealt with, is no doubt advantageous, not only to the fire insurance companies, but also to the American manufacturer carrying on business in the United States. I would also be prepared to concede that the U.L.C. are desirous of not placing difficulties in the way of the foreign manufacturer (which includes British) utilising the facilities offered by them. It is nevertheless an intolerable state of affairs that the British manufacturers, as well as the Canadian, should be compelled to send samples and particulars of their goods to a foreign corporation, to be "approved or rejected," before they are able or permitted to do business in a portion of the British Empire, viz. the Dominion of Canada.

I will briefly outline some of the more salient points which operate to the disadvantage of the British manufacturer desiring to do business in the Dominion:—

1. The British manufacturer has to incur the expense of packing and freighting the articles forwarded to the Laboratories at Chicago, with the consequent delay. Whether the article is approved or otherwise, he is still unable to ship the goods to the Dominion, as no means exist of examination and labelling at the

factory in the United Kingdom, which the Laboratories properly insist on.

The suggestion has been put forward that such goods shipped to Canada might be examined and labelled, as the Laboratories require, at "the port of discharge" in the Dominion. The objection to this course is that besides the expense of maintaining a qualified inspector, there is a real risk incurred of the goods not being passed (rightly or wrongly), with consequent loss to the British shipper, in all probability followed by the return of the goods to the United Kingdom, with the great expense thereby entailed.

2. The Laboratories are officered by consulting and other engineers expert in regard to various lines, as has been shown. It may be conceded that they exercise a wise and discriminating care in the carrying out of their duties in regard to American manufacturers, but when it comes to experimenting and testing articles of British or European manufacture, devised on different lines and manufactured to standards other than the rules, requirements or standards laid down by the N.F.P.A., under which the Laboratories carry out their work, the technical staff, without any experience in regard to the reliability of the article submitted in actual use, not infrequently find themselves obliged to withhold their authorisation. To this the British manufacturer very properly objects, and he feels the more indignant when he is aware that his manufactures in every way meet the more stringent requirements in other parts of the world. I think he should be supported in this objection unless, indeed, we are prepared to concede that the United States engineer is the repository of all the wisdom of the world in regard to every class of article, appliance, system or device dealing with fire hazard, which has been, or is to be, invented in the world. (See Mr. Merrill's letter, giving another reason.)

3. *System of Inspection.*—This amounts, in practice, to the inspectors appointed seeing that certain labels or tabs are appended to articles. In time, no doubt, they become more or less experienced, but the idea is to throw the responsibility of the real inspection of the article on the Laboratories at Chicago. The inspector is, apparently, expected to work on rule-of-thumb lines. He is, I gather, not expected to do otherwise than see that labels or tabs of the U.L.C. are properly attached to the article, device or system to be installed in the various buildings.

The tendency is for this attitude to become accentuated; pressure has been, and is being, exercised by the Laboratories on the Canadian Fire Underwriters' Association not to allow any article to be installed, within their jurisdiction, without the Laboratories' label or tab. In Winnipeg the use of the Laboratories' label has been made the rule by the Western Canadian Fire Underwriters' Association. In Montreal they have been, I am informed, not quite so strict up to the present, but Mr. Hadrill, secretary of the Canadian Fire Underwriters' Association, confesses that their inclination is to draw the line tighter and only permit goods with the label or tab of the U.L.C. to be utilised.

I might mention in this connection that complaints, difficult to prove or disprove, are made by British manufacturers or their representatives of prejudice on the part of inspectors against British goods, and of the necessity, as they allege, of gaining the inspector's goodwill by means of a *douceur* in order to facilitate the passing of material submitted. This difficulty is probably in respect of articles without the customary Laboratories' label or tab.

I would refer to what has been stated before, and that is, that the Inspectors' skill and judgment is called for in regard to the application of the Rules and Requirements, e.g., the workmanship of the wireman or electrician generally regarding the design and lay-out of the installation, taking into consideration the particular kind of building in which the work is being carried out.

I would also repeat that I understand there are no regulations to guide the Inspector with reference to "danger to life" in the event of fire breaking out; in other words, that the wiring and other matters which he inspects are looked at purely and only from the point of view of fire hazard to the building, without regard to the matter of hazard against life (shock fatality, and so forth).

4. It will be readily recognised in view of the manufacturing and other Mercantile Associations which are "active" members of the N.F.P.A. and the American composition of the Council, and the experience practically based on American practice, so far as I know it, of the technical staff of the Laboratories, that the introduction of new methods or fresh standards might meet with considerable opposition, and, in addition, there would probably be a natural reluctance to give a definite finding in respect of articles which may be practically unknown either in respect of their form or in regard to their reliability.

5. It should be mentioned that particulars are filed in this office of instances in which the parties alleged discrimination and unfair treatment, in respect of both electrical and other classes of goods submitted to the Laboratories. Personally, I find it hard to believe that any discrimination has been shown beyond what may be easily explained by the composition of the Laboratories, the council and the associations under whose direction the work is carried on. An incident which happened in Montreal in August last illustrates another phase of the difficulty met with by British goods sent to Canada. A sample of wire was sent to the Chief Electrical Inspector in Montreal, and I have a copy of his letter in which he stated, "the samples of wires enclosed are acceptable." In Toronto the following month, in regard to the same article, I have a copy of the original letter from the Chief Electrical Inspector, in which he writes as follows:—"We beg to advise that neither of the two pieces comply with new code requirements." Of course, in the latter instance, the reason was that the wires were not labelled and tabbed with Laboratory labels.

The above is a sample of a number of similar instances which it can be readily understood cause considerable heart-burning to the

parties injured, particularly where the goods are of high class, and, in fact, manufactured to a much higher standard than is required by the Laboratories themselves. Nevertheless, the inspector must reject them in many parts of Canada if they have not evidence of the approval of the U.L.C.

I will close my remarks on this heading by an extract from a letter from Mr. W. C. Robinson, chief engineer, after his visit to England, to Mr. Merrill, manager of the U.L.C., Chicago:—"As a result of all my conferences in England with manufacturers, insurance men, and others, I am of the belief that in a considerable number of cases English manufacturers will be likely to object to sending their products to any authority in the United States in order to secure insurance approvals for Canada."

The chief engineer of the U.L.C. was in England as recently as August-September last, and saw the managers and representatives of a number of British insurance companies while staying in London—Mr. Robinson having also visited Manchester, Liverpool and Birmingham, in accordance with Mr. Merrill's desire that he should endeavour to ascertain the attitude of English manufacturers towards the Underwriters' Laboratories. A copy of Mr. Robinson's letter or report to Mr. Merrill, dated September 20th (see Appendix J), should be carefully studied. I give the following extract as stated above, in London:—

The following was presented for the consideration of the Insurance Managers, and was discussed to some extent:—

"1. The possible desirability of in some way establishing the Underwriters' Laboratories in England in order to facilitate its business with English manufacturers and avoid misunderstandings relative to the approval of goods shipped into the United States and Canada.

"2. The question of what connections could be made and the best method for the conduct of the business in case it was considered desirable to establish the Underwriters' Laboratories in England."

I am of the opinion that there is a genuine desire on this side, both by the Canadian Fire Underwriters' Association and the U.L.C., to remove any cause for complaint which the British manufacturer labours under, but the insurance companies are not going (I think rightly) to permit uninspected goods to enter and be used from the U.K. or elsewhere, because they consider the risk is too great; an alternative method, therefore, safeguarding the insurance companies operating in Canada, should be evolved. The solution might be by—

1. A laboratory in Canada on the lines of the U.L.C.

2. A purely British laboratory, referred to at the end of Mr. Robinson's letter as "an independent agency."

3. A laboratory in England, to be practically an offshoot of the U.L. Chicago—run on similar lines, utilising the experience gained at Chicago, employing equally competent but British consulting and technical engineers. "The article," approved by label or tab, to be accepted by both the British and Chicago Laboratories. The same system of careful experiment and tests to be followed by careful consideration of reports before they are issued, and the adoption of the same or a similar system of "labelling and tabs," accompanied by some similar system of inspection.

I am of the opinion that the last, No. 3, would be to the advantage of the British manufacturer (No. 1 is open to many of the objections raised against the Chicago Laboratories); it would throw open to our British manufacturers not only the Canadian but the American market (see Mr. Robinson's letter), as the labels or tabs would carry equal consideration by inspectors throughout North America. Moreover, the policy should be extended, I believe, and made operative in Australia, New Zealand, South Africa, India—in fact, throughout the Empire, wherever British insurance companies operate and are in a position to insist on its adoption.

I venture to believe that, if our leading manufacturers are wise, they will join with the insurance companies and contribute towards the initial cost of starting such a laboratory and by annual subscription assist towards its upkeep. An understanding between our manufacturers on the one hand, and the insurance companies on the other, should lead to the happiest results. It should bring about the extension of the trade to British manufacturers of articles, appliances, materials, devices or systems dealing with fire hazard in the overseas markets, and be of advantage to British insurance companies in the direction of reducing the risks of "fire hazard."

### The Value of the Elementary Electric Charge.—

At the meeting of the American Physical Society on November 30th a paper was read on "The Value of the Elementary Electric Charge," by Dr. R. A. Millikan, Professor of Physics in the University of Chicago. Dr. Millikan's demonstration of the ionic theory by the behaviour of droplets of oil in air when subjected to electric forces has attracted wide attention. The present paper gives a report of the results of the redetermination of all the factors that enter into the evaluation of the elementary electric charge by the oil-drop method. The chief modification of the method consists in working at all pressures between 2 cm. and 76 cm. of mercury in order to get an accurate value of the correction term to Stokes's law. The final result was:  $e = 4.774 \times 10^{-10}$  absolute electrostatic units,  $e$  standing for elementary electric charge. The probable error is not more than 0.2 per cent.—*Electrical World*.

## TRADE STATISTICS OF AUSTRALIA.

THE following statement, showing the imports of electrical and similar goods into Australia during the year 1911, is taken from the recently issued official trade statistics. The figures for 1910 are added for purposes of comparison, and notes of any increases or decreases are given:—

	1910.	1911.	Increase or decrease.
	£	£	£
<i>Plumbago or graphite.</i>

**Patent Revocation.**—An order has been made revoking patent No. 26,810 of 1909, granted to the Mining Engineering Co., Ltd., and Charles Christiansen for "Improvements in chucks for rock drills."

## ANOTHER VIEW ON THE CO-PARTNERSHIP QUESTION.

By W. T. WARDALE, A.M.I.E.E.

THE idea of co-partnership is at present the fashionable remedy for all industrial unrest, and there is in many quarters a good deal of surprise expressed that the idea has not caught on with the industrial classes to any very great extent. In the opinion of the writer the cause of this want of enthusiasm, outside of one or two monopolistic trades, is to be found in the fact that whilst the immediate reward in the shape of extra wages is not great, the reward offered in the form of capital interest in the concern is also slowly acquired, and, moreover, for a long time the effect on the weekly income of the workman is quite insignificant. There is also the fact to be recognised that the method in which capital is allotted to the workman savours too often of charity or condescension and carries with it the yielding up of treasured rights in the way of strikes, &c. Now all of these schemes in one way or another tend to make the workman feel that he is under restriction, they do not give him any great incentive to strenuous personal efforts owing to the comparative smallness of the reward, and they are in many cases open to the fatal objections that the capital so obtained must not be disposed of without special permission from the firm, and often in return to some extent for this capital being held up as indicated, the interest is guaranteed. Both the above points are bad; they do not give the workman the elementary right of every holder of property to dispose of it when and how he desires; the man, therefore, has the feeling that the shares do not really belong to him as they should do, and that he has been led into surrendering old-established and valuable rights in return for something and nothing. In the opinion of the writer a most serious objection is that, the interest being guaranteed, the workman does not experience the effect of the ebb and flow of trade through his dividend, and therefore is as far as ever from realising from practical experience that the holding of share capital in any industrial concern does not mean the sure and rapid acquisition of wealth. Given the sympathy of the working classes most of the labour troubles will vanish, but this sympathy cannot be obtained for trifling advances in wages and the holding of small amounts of share capital under privilege. To get the best result it is necessary to make the workman and the shareholder as far as possible into the same person, but the share capital must be his without doubt and free from all restriction. The only way to enable such conditions to obtain is to enable the men to earn by their increased and maintained efforts considerably more than an ordinary week's wage. It will doubtless be at once suggested that piecework and premium bonus systems have been tried, and that where they have been a marked success the workman has through his trade union objected to and got rid of them. Whilst this statement is partly correct, it does not, however, include all the factors which are necessary to properly consider the situation. The reason must be sought as to why the men have been anxious to get rid of these systems. The old stock argument that the men are blinded by their leaders into accepting the opinion of the latter to the effect that these systems are hurtful to the men individually and as a body, is altogether too vague and true of only a small proportion of the men: a large body of men will not allow themselves to be deprived of a much larger income than is usual, merely in order to please their Trade Union leader, without there being some initial grievance to start the matter. In those works in which no advantage has ever been taken of the men in order to drop their prices on the flimsiest of pretexts, bonus and piece systems have, and still do, work well. But where it is a rule that, as soon as a man regularly earns more than a quarter above the usual time wage, the price per piece is dropped, and this game is carried on until the men are working at exceptional speed, merely for a trifle over the wage obtained under day-work terms, trouble is sure to ensue. That this rule held good in a certain district, the writer knows beyond dispute, and also the fact that, in the face of a most definite promise

not to cut the rate under a premium bonus system unless the design had been altered or more efficient tools given to the men, the most trifling and useless differences have been made in the shape of one or two portions of the particular piece, and this piece brought forward as an entirely new job, with a new job number, and, of course, a much lowered price per piece. It is these tactics which have been the means of confirming in the minds of the men the tradition handed down to them, and kept alive by their leaders, that the employer is their natural and inveterate enemy, using his better education to trip up and take advantage of them at every possible chance; we usually then have the spectacle of the persons who have been responsible for these tactics soundly abusing the men because they do not work to turn out and earn as much as they could do.

Would any of us who are in official positions, I wonder, feel encouraged to increase the efficiency of our particular departments, if, by doing so, we found, at the end of the half-year, that we should in future be required to take charge of, and be responsible for, turning out a matter of 50 per cent. more work for no further increase in salary, but a good chance of the work demanded for the same salary again increasing if we had another record half-year?

There must then be established, first of all, in connection with any such scheme the absolute confidence of the men, and it also follows that this confidence must never in any way be shaken. Given this, the writer suggests the establishment of a regular piecework or bonus system depending on the class of work carried out. The men to understand that the man earning the biggest wage will be the man best liked in the place, and that in event of trade becoming bad, the men who are capable of and willing to earn the big wages, will be the men who will be kept on, and that any men not earning the amount they might will be supplanted by others who will. Then offer to take care of any savings the men may make until the amount reaches £10: when this amount is reached, issue in return for it a share certificate for the full amount, the firm paying all charges, such as stamp duties, and hand the certificate over to the man with the absolute right to sell it the next minute if he so desires. If the qualification for a directorship be, say, £100, then allow the shareholding men to elect from amongst their number a representative on the board for every £100 so held. Whilst the men have their money on deposit with the firm, it would pay the firm to allow 5 per cent. interest on the amount deposited, on the understanding that if, when the necessary £10 were saved, the money was not invested with the firm, it must be drawn out and the chance of the 5 per cent. interest lost. A man, of course, could be allowed to invest as many £10 as he could save.

The question then arises, can the men under any such system earn sufficient to enable them to lay by enough money in a short time to accomplish this idea? The answer is undoubtedly in the affirmative.

The following incident will amply illustrate this. About a year ago the writer was invited to read a paper before the Engineering Society in a northern textile town, and chose for his subject the question of factory driving. The only person known in the town was a solicitor, who was good enough to propose tea at his club, and the support his presence would afford at the reading of the paper. During a pleasant chat over tea a gentleman joined us who was, with his brothers, one of the largest textile men in the town, as they owned six large mills. It was not long before my friend mentioned the object of my visit, which at once led to an interesting conversation on power production. Then came the following observation: "It is, of course, always acceptable to us to have you engineers showing us how, by adopting various methods, we can save so much a year: but can you show us how to stop a waste which costs the mills, which belong to our firm alone, thousands of pounds per week?" "I refer," he continued, "to the waste which takes place owing to stuff not being produced, which ought to be produced, and which could be produced by our people if they would." He then unfolded a tale of deepest interest to employer and workman alike. Before one process in their mills could be carried out it was necessary for a pattern card to be made, and these patterns had to be made on hand-worked looms. In going into the matter of their costs of production, he was constantly met by the fact

that they were being delayed time after time by the waiting for patterns.

It was not only inconvenient to the firm to put down further hand looms for this work, but he was convinced that it was quite unnecessary, provided that the men would turn out the amount which they were able to. His firm, he informed me, had always paid for this work 30s. per week, though the district rate was 28s. a week. He announced to his brothers that he intended to take this matter in hand, and to that end called his pattern card men together, and told them that the firm had come to the conclusion that more work could be obtained from those looms than was being done, adding that he had considered what he could offer them as a commercially possible proposition, in order to make it worth their while to turn more work out. He then offered them an advance of 2s. a week, making the wage 32s. a week, and 4s. above the regulation trade rate being paid in the town. Work was settled down to under these conditions, and for a time some increase took place in the amount of work done per loom; but still the amount was less than what the owners thought easily possible. In one or two cases men had to be stopped for definitely refusing to try to turn out more work, though they took the extra money readily enough; to each applicant for a vacancy, and the conditions being known there were numerous applicants, the following statement was made:—"This is the best offer which we can make you for a weekly wage on this class of work, the conditions under which we have to compete for orders prevent us offering any more; we are offering you better terms than anyone else; what, therefore, are you prepared to do for us in return?" The usual reply was, "Well, I can make a pattern card as well as any man, and I am prepared to do so." The man was then greatly surprised to be told that this was not the point, the matter being then stated again definitely, "We are doing the best we can for you; are you in return prepared to do your very best for us—to turn out all the work of which you are capable?" The usual reply was that they would try to make the very best use of their time and abilities. The system settled down, and for a time the output increased, but not to the extent which the proprietors thought to be easily possible.

The next step taken in the matter was to call the pattern card hands together, and to inform them that the cost to the firm of their patterns was too high—viz., 4s. 6d., and that the extra weekly wage was to be abolished. The firm then set the whole of the pattern hands on to work at a piece price of 3s. 6d. per pattern woven. At this point my friend asked if there had been any objection to the price named, the manufacturer replying, "Yes, to some extent, but we have always treated our people fairly, and so they elected to try it. Now then," he said, "mark the result: to-day these same people, who were turning out their utmost—at least, so they assured us—on a weekly wage of 32s., are now drawing regularly, week by week, 42s., 45s., and some even as high as 52s. and 55s. in the case of one or two very expert men. Our patterns now cost us only 3s. 6d. each, we get twice the work through the pattern department at least, and that with the same capital cost for machines as before, the same cost for land value, taxes, rates, lighting and insurance of the buildings, and also for the insurance on account of the Compensation Act, and we have been enabled to set to work a large number of weavers in other departments of our mills whom we could not employ previously, as we could not get the patterns through fast enough to keep them employed."

"Now, then," he finally asked, "what is your remedy, as engineers, for this state of affairs? If it could be applied all round, wherever possible, both our workpeople and our manufacturers would be very much better off, and we should have such a pull in the markets of the world that this country would always be full of work." In bidding him good evening, after listening to his most interesting account, I half answered this question as to what engineers, who seek so strenuously after efficiency, are going to recommend in the matter, by reminding him that it was a totally different matter to come down to a plant which was wrong, and set it right, and to deal with so complex a quantity as human nature in the shape either of workmen or manufacturers. I could not, however, help thinking how great a pity it was

that similar conditions could not be arranged for many other industries.

Just for a moment or two let us consider the effect on the daily life conditions of the people of such a movement. Here is a body of operatives brought up on, and living according to their own ideas on, a weekly income of 28s. By means of some method similar to that just described, the income of each individual operative is increased to say only 40s. a week, is it then impossible to the British workman's nature to act as follows:—Say 7s. per week spent in making life better worth living and more comfortable, and 5s. paid regularly week by week into the share purchasing fund as outlined previously. Surely if the workmen be assured of freedom from the old style iniquitous price-cutting system, the better end of them will soon readily grasp the idea and gladly fall in with it. The workman would thus become a shareholder solely by his own self-denial and in his own rights without any suggestion of charity or condescension about the matter, and with absolute freedom if he so desired to raise a loan at the bank on his share certificate either for backing his favourite at the Derby or any other little foolishness or wisdom.

Doubtless many of the present-day Trade-Union members may object to such a scheme on the grounds that it is only another fancy method of persuading the workman to speed up and ultimately to entice him from the Trade Union. If the Union leaders will not give any such system a trial, then they may depend upon it that they will suffer the loss of the most intelligent of the workers one by one as they make trial of and find such a system a great help and benefit to them in their efforts to obtain something better than a fixed rate of wages on a somewhat low level, which wage and conditions are enjoyed by their fellows, be they far less skilful and willing or not. It must also be remembered that as Government sickness and out-of-work provision may become general to all trades, the benefits to be obtained solely from a Trade Union will not be so numerous as they are to-day, whilst the fact that the policy of the Union is against the better opportunities offered for a man to make himself more independent will take away many possible members. There need be no fear that the Unions would be gradually deprived of their members and also of their usefulness, as there would always be the necessity for the discussion of prices, with the difference from the present day price discussion, that the workers would have amongst their number many who had a distinct interest in the firm, and who would therefore be more inclined to see both sides of the question. There would also be plenty of work for the Unions to do in such matters as encouraging the younger members to fit themselves for managerial positions by providing scholarships at the local technical institutes for such of their members who had passed at least three years in the works and who were developing into reliable craftsmen—youths who had already shown by their efforts at the evening schools that they were capable of something better than a working position, and also that they were ready to do the necessary study to fit themselves for the higher posts. Another way in which the Unions could do useful work would be in making firmer and extending the superannuation benefits.

If, however, the attitude of the unions is to be one of bitter hostility, then they will have to face the fact that the speeding up will nevertheless take place, and that it will take place under the present rates of wages, the workman thus being worse off to the extent of the extra money he could have earned under some such system as indicated. When he finds that this has been the result of following the advice of his leaders, will he still be willing to obey and follow out their further advice? Will not the danger be then that the Unions will fall to pieces owing to the fact that they have rendered things worse and not better for their trade? Depend upon it, that just as the workman of to-day is sufficiently educated to refuse to work under conditions which his father thought to be heaven-sent and inevitable, so will the time soon come when the new generation will see, and see clearly, that it will either be some form of partnership or an increased speed of work for the present rate of wages.

Co-partnership under the above conditions can and does work successfully in more than one industrial works, which

have to compete in the open markets for work. They are successful because they are scrupulously fair to the workman and not in any way charitable.

## NEW PATENTS APPLIED FOR, 1912.

**Accumulators for Submarines.**—The accumulators carried by a submarine are a most important part of its equipment. The battery is charged from petrol-electric generators when the vessel runs awash, and supplies the whole motive power when the vessel is submerged. Absolute reliability on the part of the cells is imperative, and no acid must be spilled, even if the vessel tilts considerably. Maximum energy must be stored in minimum space and weight, and the cells must be capable of maintaining a very high discharge rate for considerable periods, since the speed of the vessel depends on this, and speed is all-important. First cost is not a primary consideration, but it is essential that the storage battery, weighing  $\frac{1}{2}$  ton or so, should need minimum attention and repair, once it is installed in the hull of a submarine. The difficulty of thoroughly inspecting the cells in this confined space (let alone cleaning or repairing them) is enormous.

In 1901-2, the Lab. Centrale d'Electricité (Paris) tested a number of types of cells, in order to determine which was most suitable for use in submarines. Only five among 21 cells withstood 250 discharges. From the best cell 4,040 watt-hours were withdrawn during this period per c. dcm. of cell volume (i.e., 950 watt-hours per kg. of cell weight). One of the five cells had specially large surface positive plates; the others were of pasted construction. The maximum energy output reached 23½ watt-hours per kg. of cell weight (discharge in 54 hours), and the maximum power output was 516 watts per kg.

In some modern submarine cells recently tested, the plates are of grid type, and the positives are surrounded by asbestos sheathing, which greatly increases their durability. The plates are separated by perforated insulating sheets with vertical ribs, and the lugs of similar polarity are connected to lead strips by autogenous welding; two connecting strips per pole are sealed through the cover plate of each cell. The containing vessels are of ebonite, and are mounted in an oak frame. The plates rest on ebonite supports, ample space being left for the collection of sludge. A non-spilling gas escape valve is provided in the cover of each cell.

Tests on the new cells show an energy capacity of 30 watt-hours per kg.—a specific energy capacity 27 per cent. greater than was realised in the best 1901 cells. The progress denoted by this figure is even more remarkable when taken in conjunction with the long life of the new cells. The best result obtained during the recent tests was 456 discharges, corresponding to a total output of 1,336½ KW.-hours, i.e., 6,202 watt-hours per kg. of cell weight, or 23,910 watt-hours per c. dcm. of space occupied. As compared with the 1901 cells, the best of the new types shows a life 6·53 times as long, measured by total watt-hours output per kg., or 5·93 times as long, measured by total output per c. dcm. of space occupied.

WE have for a long time taken a keen interest in the extension of electric lighting to small towns and villages, and have on various occasions drawn attention to the possibilities in this direction, besides publishing descriptions of actual installations whenever the opportunity offered. Since the introduction of the high-voltage metallic-filament lamp the matter has gained very greatly in importance, for obvious reasons, and the gradual relaxation of the dislike evinced by the Board of Trade for overhead wires, as well as of the opposition of the small local authorities, has facilitated the execution of the work on a commercially satisfactory basis. We therefore welcome the article on this subject, written at our request by Mr. W. T. Wardale, which appears elsewhere in this issue, and we commend it to our readers as a remarkably interesting and useful exposition of the methods which ought to be adopted, and the considerations which must be borne in mind by those who contemplate the cultivation of this almost virgin field of operations.

The author points out that such schemes—if properly carried out—are financially sound, and that private enterprise is in a more favourable position to deal with them than the local authority, which is hampered by statutory obligations to a degree inversely proportional to its own importance; moreover, owing to the impossibility of paying an adequate salary to a competent engineer, such an authority could not hope to run the concern on the same economical basis as a private company, which can handle a number of these small undertakings, and thus distribute the cost of superintendence over a large area.

Another point to which our contributor draws attention is that it is absolutely essential for the promoters of the undertaking to carry on the business in its entirety—wiring houses, selling fittings, &c., and even undertaking work in connection with private installations that have no connection with their mains. We know for a fact that such work, under the circumstances, is very lucrative, and we can well believe that its performance makes all the difference between success and failure, while it would be out of the question for a small municipality to handle it.

The shrewd remarks of Mr. Wardale regarding the desirability—indeed, the necessity—of engaging the interest and influence of the local notabilities will be appreciated, and his warning against rash conclusions with regard to the utility of small water-powers should be heeded: for intermittent operations like those of a sawmill or flour mill, such water-power is often perfectly suitable, but where a continuous supply of power is indispensable, as in the case of electricity supply, an independent source of power must usually be installed, and the resultant cost may prove to be much greater than that of a complete steam or gas-engine installation.

The fact that competition has not to be feared in connection with these small undertakings is a feature of great value; the residents are eager to have a supply of electricity, and are willing to pay a fair price for the convenience and safety of the system. They are also well acquainted with each other's doings, and the spirit of emulation which prevails in a small community ensures that the example set by

one consumer will be quickly followed by his neighbours. The truth of this is clearly manifested by the statement that in practice no difficulty is experienced in inducing people to install the electric light.

While continuity of supply is very desirable, it has not the same pre-eminent importance in a rural district as in towns where competition is met with, and, in view of the necessity of keeping down the capital outlay, there is no need or justification for the provision of a large proportion of stand-by plant. We fully agree with Mr. Wardale that there is no better reserve under the circumstances than a storage battery, in conjunction with generating plant of a thoroughly reliable description. The battery also facilitates the economical working of the undertaking to a very great extent, and the objections to the use of storage which have weight in the case of a large undertaking are absent from village lighting.

The importance of the personal element is obvious: the man in charge on the spot is largely responsible for the success or failure of the whole scheme, and it is impossible to be too careful in the selection of a suitable person. Fortunately, the work is of an exceptionally attractive nature, and if generous terms are offered, there should be no difficulty in getting a first-class man to throw his whole energy into the business. There are thousands of British villages waiting to be supplied with electricity, and we look forward to the development of this class of business at a rapid rate during the next few years.

#### L.G.B. Procedure.

ONE of those irritating points of procedure which are so frequently met with in connection with Government offices, was recently raised by an Auditor of the Local Government Board in connection with the accounts of a municipal electricity department. The auditor, while finding no fault with the accounts, laid down the requirement that in future all orders for goods required in the electricity department must be signed by the Clerk to the Council; for years previously they had been signed by the manager, after having been submitted in the form of a requisition to the Stores Committee, and no trouble had arisen. We believe that it is the usual practice for the manager (*i.e.*, the electrical engineer) to sign all such orders below a limit of value imposed by the Council, and we see no reason whatever for objecting to this procedure; the signature of the Clerk to the Council would be a mere formality, for the Clerk could not possibly exercise any discrimination in the matter, being neither technically qualified to do so nor officially authorised to supervise the decisions of the Stores Committee and the electrical engineer. Nor would he be in a position to check the delivery and consumption of the goods, even if he wished to overstep the bounds of his duties to such an extent—which is in the last degree improbable. We see in this new stipulation neither sense nor reason; it could only result in an apparent subordination of the engineer to the clerk, with the inevitable consequences of friction and irritation between two otherwise friendly departments. Perhaps some of our central-station readers would like to express their views on this question before the L.G.B. has committed itself definitely to an undesirable policy.

#### The "Paragon" Oil Engine.

THE ingenious cycle devised by Mr. W. P. Durnall, of which we give a description elsewhere in this issue, shows that there is still scope for invention, even where the ground has been so well trodden. Even if the over-all efficiency of the engine were not increased, the advantage of a cool and noiseless exhaust would be worth having, but the inventor claims a thermal efficiency from 15 to 25 per cent. greater than that of the ordinary type of engine. That a greater proportion of the heat contained in the products of combustion will be converted into work by virtue of their complete expansion is obvious, but whether

the over-all efficiency of the engine will be materially improved appears to be less certain. In this connection, we find Mr. Durnall's comparison of his indicator diagram with that of a Diesel engine rather incomplete, for while he points out that the compression space in the latter type would be twice as great [with the same length of stroke] as in the case of the Paragon cycle, he does not explain that the expansion curve of the Diesel would be higher than that of the Paragon diagram; the compression curve would also be higher, but the net result would be a greater output from a given cylinder, and probably a higher mechanical efficiency, although the consumption of fuel would be greater. With the small compression space of the Paragon engine, the amount of fuel oil that can be completely burnt would appear to be restricted, so that a cylinder of given size could not have the same output as a Diesel cylinder. The inventor states, however, that the weight of his two-cycle engine for a given output is lower than that of most engines that are on the market, and it would be interesting to have from him a more detailed comparison between the old and the new system, throwing light on the points mentioned above.

As regards the cushioning action claimed for the Paragon four-cycle engine, we may point out that this only occurs in every second revolution, and is therefore not so effective as would appear at first sight.

Apart from these minor points, however, the new cycle is certainly interesting; we understand that Paragon engines of considerable power are under construction, and we shall be glad to receive particulars of the results obtained in actual working.

#### The Fire Risk.

THE regrettable fire which recently shut down Salford's electricity supply, following as it did closely on other occurrences of a similar nature, both in this country and abroad, raises a question of considerable moment to electricity supply authorities.

Every business depends more or less on the goodwill of its customers, and electricity supply being a highly competitive business—despite all assertions to the contrary—its dependence on the goodwill of the consumer is absolute.

The consumers really rule the roost, and the collective impression left upon their minds dominates the future of supply work. Whether the impression left by the happenings of the last few weeks will be good or bad, we can safely leave our central-station friends to decide; many of them would barter their souls to ensure continuity of supply, and it is therefore not difficult to estimate their feelings in the matter. One thing is certain: the time has arrived when means must be found for safeguarding the supply generally, and ensuring beyond doubt adequate illumination for the time being of the streets, hospitals, large emporia, theatres, &c., even if a switchboard fire, as at Salford, or a faulty machine, as at Sheffield recently, does cause a temporary shut-down at the generating station.

For some purposes electricity is indispensable, but for a great many of its applications the advantages which have served to popularise its use are not such as entirely to outweigh a general, even though unjustified, impression of unreliability gathered from reading the daily newspapers. We do not wish to create an erroneous impression; complete and even partial shut-downs of electrical stations, considering the total number of plants involved and the years they have been running, are comparatively insignificant in extent—but unfortunately the consumer is unaware of this, and his tabloid news summary is apt to produce an exaggerated idea of the trouble. It is for the central station engineer to appraise the pecuniary value of reliability; our own impression is that any means which will ensure that public lighting, for instance, is not wholly dependent on the perfection of the mechanical, electrical, and human agencies at the power station, is well worth paying handsomely for.

The battery sub-station for special services, for both D.C. and A.C. supply, merits more attention than it has received, and even central-station arrangements are capable of improvement, assuming, of course, that some sacrifice in other ways is justified on the score of reliability.

## THE ELECTRIC LIGHTING OF VILLAGES.

By W. T. WARDALE, A.M.I.E.E.

It is very generally assumed that the electric lighting of country villages, otherwise than from the mains of a large power company whose lines cross the district, or by the plant at a local colliery or other large works, will not pay its way. This opinion, however, is not correct, and provided that the plant is carefully laid out to suit the local conditions, with the capital outlay kept rigorously low, village electric lighting schemes can and do pay their way. For some time past the writer has been interested in such small schemes, and from experiences and results gathered from several such plants, offers the following suggestions as to the lines on which such schemes should be run.

In the first place, it should be recognised that a company can be formed to carry out the work for a considerably less outlay of money than the local governing authority, and for that reason the scheme should, at any rate, be started and established by a small company which must have the active sympathy and encouragement of the local council. The reason for this state of affairs is that whilst a small company having the goodwill of the council can start a supply without an order, and without other expensive preliminary outlays on sanctions and permissions, the local authority must have these inquiries, and on such small jobs they increase the capital expenditure to such an extent that the concern cannot make ends meet. A company, however, should never be formed or start working without an agreement in writing with the local council that the said council will encourage and protect the enterprise of the promoters. If this is not done, then the writer can state from actual being in touch with people whose enterprise has been simply ruined by the iniquitous policy of the local governing body, that the gravest possible risks may have to be encountered. The best course is to get the leading local men and the Council in favour of the scheme. This may be accomplished either by means of private conversations or by arranging a public meeting with an influential local chairman and strong local support, and explaining the advantages of electricity as a means of lighting, heating, cooking, and also as a handy method of working farm, garden, or water supply machinery. Many of the larger houses have plants for lighting by acetylene or petrol gas systems. At the suggested meeting it should be explained that electricity in the home does not involve trouble with burners and pipes which corrode, or if oil lamps are used, it should be pointed out that the labour of servants in trimming such lamps will be saved. At such a meeting it should be possible to enlist financial support from some of the most influential men in the district, and this accomplished, the progress of the concern will, as a rule, be very smooth. This part of the matter has been treated at length, owing to the fact that the writer knows from experience that it is the neglect of these points which generally lands the concern in financial straits.

The goodwill of the Council having been obtained, the necessary capital should then be decided on, and this will be settled by the size of the localities to be supplied. In a locality of from 800 to 1,000 inhabitants, a start can be made with a generating plant of 10 kw. and a battery of 300 ampere-hours, supplying through overhead mains, for an outlay of less than £500. This figure will vary locally to some extent, owing to the cost of obtaining the necessary site and a suitable building in which to house the plant. In one case at least the writer knows of a plant which has started up and run successfully on a less outlay than £500. In drawing up the company's articles, it should, however, always be stated that the company is entitled to raise a capital of at least £1,000 to £2,000. The whole of the capital need not be issued at first, but it will be required when the company has been established a couple of years, and on such small schemes bank interest on loans, and the usual worrying of the bank to have the company's debit account reduced, are extremely trying. Another point to be included in the articles of association, is that the company is authorised to generate and supply electric energy in the districts of X.Y.Z. and elsewhere; this point allows the company to extend its operations to other districts

which promise a return on capital spent. One point is absolutely essential if the company is to pay, and that is that the company is empowered not only to generate and supply electricity, but also to carry on the business of wiring contractors, to deal in and sell fittings and lamps, motors, heaters and cookers, and every electrical appliance. Power should be claimed under the wiring contractor clause to fit up and keep in repair installations at private country seats, as many places too far from the mains will be glad of the services of a competent engineer near at hand. The reason for the wide scope which it is advised to take, is that experience shows that the hours of running in such small plants are so short, and the revenue at first from electricity supply so small, that the cost for attendance would be prohibitive if men were employed on station work alone. Also, it must be remembered, that there is in such small localities, no chance for a resident wiring contractor to make a good living apart from an electricity supply; therefore, if all wiring has to be done by firms sending men from the nearest town, the cost of installing the light would be unnecessarily high, and would thus retard progress.

Overhead mains must, in the majority of places, be used if the concern is to pay, and it is fortunate that to-day there is little objection to them in country places. Another mistake to be avoided, is the use of the three-wire system. Certainly, the writer knows of a village plant which is run successfully with the three-wire system and underground mains, but there are reasons in this case which do not obtain in the usual village; and though the place pays, yet it would naturally pay better with the simpler system. In choosing the site for the generating station, the usual features of nearness to the railway or river, and a plentiful supply of water, should not be overlooked, whilst the roads to the site should be inspected with more than usual care. This latter may seem an obvious point, but it is often overlooked; and in country places the difficulty of getting stuff on to and away from the works may easily be serious. Again, do not assure because there is a supply of water running through or by the site, that the purchase of the site also carries the right to free and full use of the water; the writer has known more than one or two plants let in for quite unexpected rent charges over this point. Perhaps the site which has to be looked on with the greatest amount of suspicion is that of an old water mill, having the apparent advantages of a weir ready made and the water rights. This sort of place should be most carefully inspected, the points to be noted being whether the dam is in good working order, and what is the amount of power which can be depended on throughout the year, when, either due to shortage of water in very hot summers or to heavy floods at any time of the year, the power available is at its lowest. Neglect to note these points has led small village concerns into purchasing an old water mill at a fair price, and then finding out that the necessary repairs to the dam, alterations to the wheel, and awkwardness of the site in regard to the rail and main roads, have so increased the capital cost that the company has never really been able to pay its way, especially as often an oil engine has to be installed ready to take the load when the water-power is not available, due to either floods or shortness of water. The matter of purchasing or leasing the site must be settled locally; perhaps one of the best methods is a 42 years' lease.

The site and system having been settled, the next consideration is the purchase of the generating plant, and in this matter, as in all others connected with village lighting, capital must be kept low. If there is no system of lighting in the locality, except by oil lamps or private lighting plants, a high price per unit can be obtained, and the locality still be benefited by using the electric light. The following investigation carried out some years ago by the writer whilst on the staff of the electricity works in a cathedral city will show the cost under careful use, of lighting by oil lamps in a six-roomed house. The house, though near the main road, had neither wiring nor gas pipes laid, so the lighting was carried out as follows: The second room being the living room was lighted by a swinging lamp suspended from the centre of the room and about 3 ft. 6 in. above the table; this gave a nice soft light to work by on the table or to read by at the fireside, the lamp giving about 30 c.p. As a means of obtaining information, as well as keeping the cost down,

the cost and results were carefully noted. A smaller lamp which rested on the kitchen mantelpiece did duty for the kitchen, and was seldom used for more than 5 or 10 minutes at a time; this and a small hand lamp used for upstairs work comprised the lighting apparatus of the house. In winter it was just possible by very careful use to keep the necessary light going on 1 gallon of paraffin, costing 8d., whilst there was also an expenditure of, say, 2d. for candles, making the weekly lighting bill under the most careful management possible, about 10d. In summer this charge came to 6d. one week and 4d. the next week for oil, so that the average charge was 5d. Taking current at 7d. per unit and a good class metallic-filament lamp of 35-c.p. in the living room and a 20-c.p. lamp in the kitchen, each lamp taking 1.3 watts per candle, the living room lamp could be used for 40 hours and the kitchen lamp for 10 hours per week at a cost for current for 1s. 2d. This, of course, involves careful use of the light, but the writer ventures to say that few people would have run the oil lamps in the same house under that charge. The cost of the electric light can be kept down by switching out for a few minutes when the light is not wanted, a thing which is impossible with oil lighting; also, there is the fact to be considered that the tenant had to do the inside painting and decorating, which item would be much less with electric than with oil or gas lighting, whilst the time saved in doing the necessary trimming to the oil lamp is no small item. Thus, with current at so high a price as 7d. per unit, electric light becomes very attractive. Under such circumstances the generating plant will not need to be of superlative efficiency, but it must be absolutely reliable. It will be apparent that in any place where capital is not too easily raised, and where a fairly early promise of a return must be shown in order to encourage the shareholders, the policy is to keep down the cost of the generating plant, preferring a plant having only moderate economy but low in cost, to one which gives the best possible economy but takes so much of the capital that little is left for development. Many really good second hand plants can be bought for such places at very cheap prices, providing that the buying is done by an engineer, as if a person not an engineer buys such plant there is very grave risk of him getting a very poor bargain.

Concerning the type of plant to be used, this matter will, to a large extent, be settled by the price of coal locally. Where coal can be obtained for 10s. a ton or less, the claims of the self-contained steam plant should always be considered. Even with the most heavy drawbacks, such as working non-condensing, and with cold feed-water, such plants can, where prices as high as 7d. and 8d. per unit can be obtained, pay for their use, and as they can be obtained second-hand for less than half the capital cost of new plant, it is policy in such places to use this type of plant and spend the capital so saved on the development of the load by running extra feeder and service lines. In fact, the writer knows of places where the scheme would have never paid quickly enough to encourage further capital if this policy had not been adopted. When the concern is well on its feet, then capital can be spent in buying the more efficient types of plant for extensions, being more easily obtainable then. Where capital is not too tight and in too great a hurry for its first return, then the best and most efficient type of plant to put down in any concern needing sets of less capacity than 15 kw. at the start, is the internal-combustion engine; but where the first sets installed are of 15 kw. or more, and coal for steam plant can be obtained at 15s. per ton or less, the over-type superheated steam engine, as made by Messrs. Garrett, of Leiston, should be considered. When a good supply of condensing water and water of good quality for boiler feed is available at a reasonable rate, then this engine gives highly economical results, added to which is the certainty of operation which is the distinctive feature of steam plants, and also the fact that these plants have a high overload capacity, which reduces their capital cost per horse-power actually obtainable to a very low figure. The stand-by losses on such a plant are greater than on the suction-gas engine plant, but they need not be excessive if the furnace door and ashpit are fitted with airtight covers to be put on at shutting down, and the chimney damper and engine and boiler lagging kept in good condition. The inquiries for prime movers should, however,

always include three or four different types of internal combustion engines. The deciding factor in most cases will be the cost of suitable fuel for the suction gas plant, or for the crude oil engine. Although the suction gas plant can now be made to use bituminous coal to some extent, the writer prefers to use this type of plant on anthracite, for the following reasons. Anthracite is the cleanest fuel to use, and in spite of all statements to the contrary, the suction or pressure producer working on ordinary coal has always the risk of sending tar over to the engine, and, in any case, needs the engine to be taken down oftener for cleaning of the cylinder liner, piston and valves, than when anthracite is used. There is also the fact that as the tar, which is a valuable heat-containing constituent, has to be taken out of the gas in order to ensure successful working, the amount of coal used per unit is considerably higher than when anthracite is used; hence the lower price for the bituminous coal does not give all the economy which at first is suggested. The gas engine working on a suction producer is, when properly installed, a most reliable prime mover, and if when buying the producer it is specified that the producer shall generate sufficient steam itself to make the use of anthracite peas practical and sure, it will be generally found that the anthracite scheme is in every way the more attractive. It should always be borne in mind in comparing the two types of producer, that not all bituminous coals are safe to use for producer and gas engine work, and that the field to be selected from is not as wide as it appears to be.

In considering the crude-oil engines, whether of the Diesel or semi-Diesel type, two points must always be borne in mind. One, and a most important one, is that the control of the necessary fuel is in the hands of one or two people, the supply at present is strictly limited, and the price has risen very greatly during the past year, and shows signs of still further increase. The other point applies more to the Diesel than to the semi-Diesel engine, and is that this engine cannot be attended to successfully by an ordinary type of engine attendant, thus the wages cost will be increased to some extent; whilst recent happenings have shown that the Diesel has problems of its own in connection with the matter of safe working, causing rates for insurance to be higher than with gas-engine plant. If it were not for the uncertainty of the future of the oil market, the crude oil engine, working on the semi-Diesel principle, would be ideal for the purpose of village lighting plants, there being no stand-by losses and no producer house necessary. The whole matter must be carefully summed up with regard to local circumstances. With any producer-gas engine installation, the effluent from the producers must not be turned into a clear stream; it should be either led into the ashes and clinker, and sent away with them, or should be loosed into the stream when the same is in flood; the stuff is then in so small a proportion to the amount of water in the stream, and so quickly swept away, that no damage will result. With every type of internal-combustion engine, the great point is to buy it large enough for its work. The Institution of Mechanical Engineers' Gas Engine Investigation Committee recommended that, for continuous working loads, a gas or oil engine should be purchased at 15 per cent. above the makers' rated load—that is, if a 20-h.p. load is needed continuously, then select an engine giving, according to the makers' rating, 23 h.p. at the least. This will increase the capital cost, but is the only safe way of ensuring satisfaction. Several of these small village plants with which the writer is in touch are run with suction-gas engines, and the owners speak uniformly well of their performance over periods of five years or more. In any such installation do not overlook the fact that the exhaust silencing arrangements must be more than usually ample.

With every such plant as we are considering, a 24-hour per day continuous supply is contemplated, and for this purpose, and for the economical working of the load, a battery is indispensable. In putting in a battery, the mistake to be avoided is that of installing one so small as to be useless in about two years. Along with the question of the battery must be settled the voltage of supply. Some plants are supplying at 100 volts, but the majority of these places would, if possible, change over to a higher voltage now that the metallic lamp is available at pressures as high as 230 volts. This pressure is about as convenient a pressure for

all-round considerations as any; the generator should be capable of giving 215 volts, as this allows for drop on a possibly heavily-loaded mains system, and gives some amount of room in which to control the station voltage. It is not possible to work the battery down to 1·8 volts per cell, and a battery of 125 cells will give the necessary 230 volts without getting down to the 1·8 limit, and will allow four regulating cells. A good idea of the size of battery to install is to put in, for an installation starting with a 10-kw. set, a battery capable of giving 30 amperes for three hours. Such a size of battery will allow the load in the very early days of the supply to be carried by the engine running, at the most, on four days per week; this feature helps matters considerably, by allowing the greater part of the time of the man in charge to be devoted to getting consumers connected up, whilst, when the load increases to such an extent that the engine must be run every evening, the battery is a good stand-by, and assists economical working. It will, of course, be understood that the three-hour rate of the battery means that it will be able to give a discharge of seven or eight amperes for 20 hours.

The switchboard should be as simple as possible, the number of instruments being as few as will conveniently work the board: in some cases the use of an automatic battery regulator allows the plant to be left to a considerable extent and has been found to give no trouble or risk over a long period.

The cable system should, in the majority of cases, be on the overhead bare-wire system; both copper and aluminium have been found to give satisfaction. The question of wire-leaves over land belonging to various people must be settled by a personal and tactful interview, and to-day permission is rarely refused; needless to say the overhead line, when erected, should be as neat a job as possible and not offensive to the eye; special wire, fittings and insulators are now produced for this work in large quantity, and an example of the stuff used will be given. The services are often taken in through the window frames, and here in particular the neatness of the work will do much to remove any natural prejudices against overhead lines.

On the question of charging, by meter or by contract, it is found that experience and opinions differ: at least one very successful plant prefers the use of meters, and finds them economical and efficient, this installation serving a population of only 800 people. The majority, however, prefer the contract system of payment, and do their utmost to encourage it by quoting favourable rates.

No difficulty is experienced in getting consumers to come on, the obvious advantages of the electric light bringing requests for connection as fast as they can be dealt with; positively every place with which the writer is in touch tells the same story—"We do not find it necessary to offer any special inducement to get people to put in the light." Most places find that a very satisfactory job can be put in for 12s. to 14s. per point, this being done in wood casing and including a plain fitting and metallic-filament lamp; some places find for works and other than house lighting that twin lead-covered rubber gives a serviceable installation at rather less cost. All concerns agree that a cheaper system would be welcome to some extent, and most of them prefer not to use slip-joint conduit, although it is cheaper than most present systems.

A point of the utmost importance in such places is the arrangement of the men to work the place. The man chosen to take the lead is often a local man having a good training in running such small plants, and in the proper wiring of premises. Many such men are to be found who have obtained their experience mostly in the running of country house plants, and in wiring the same. It might be thought that sufficient money could not be offered to attract any but the man looking for experience. This mistake, however, arises from the fact that the wiring side of the business is left out of the reckoning; on the generating side alone the money cannot be provided, but when it is realised how very little the up-to-date small plant requires in the way of attention, and that the salary is earned on the installation side as well, the matter becomes plain. Some companies find that they prefer to pay a regular salary, increasing with the number of units generated, and a salary as manager of the wiring department; others

pay a contract price per unit generated to the responsible man, and find that it pays both them and him; he also has the proportion of the profits due to him as manager of the installation work. The combined salary is in most cases one which many chief assistants in towns having a population of 50,000 inhabitants would be glad to earn, whilst the position allows most valuable experience to be gained; the secretarial work is generally carried out in the office of a local solicitor having an interest in the company.

A brief mention of one or two plants will be of value in showing what is actually being carried out.

The Caergwrle and District Electricity Supply Co., Ltd., supplies the village of Caergwrle, near Wrexham, the population being 800. The supply is at 100 volts, two-wire. A simple Davey-Paxman under-type steam plant is used, which works to atmosphere and on cold feed. Two Johnson & Phillips dynamos of 7 kw. and 3·8 kw. respectively, and a 200 ampere-hour Chloride battery comprise the plant. The mains are of bare copper run overhead on wooden poles. The company has no provisional order, but its relations with the Parish Council are very good; the matter of the company doing the street lighting is at present under consideration, and should the Council decide to take over the concern, it will be on terms fair to both parties. The company was started by a few local public spirited gentlemen, and it is encouraging to know that they declare the financial result to be decidedly satisfactory. The price charged is 8d. per unit, and consumers are coming on faster than they can be dealt with. The mains system is interesting, and will be briefly described.

Wooden poles 31 or 32 ft. long  $\times$  9 in. diameter at the ground level, tapering to 7 in. at the top, are planted about 5 ft. 9 in. in the ground, at distances apart of 50 yards on straight runs. On some lengths this distance has been shortened to 40 yards to avoid causing annoyance by the poles coming in front of gates or windows. This distance is observed in the case of the main wires, which are No. 1 s.w.g., but in the case of a very light distributor of No. 11 s.w.g., the span has been lengthened to 72 yards. Each pole carries an oak cross-arm, 4 in.  $\times$  3 in. section, on which the insulators for the feeders are set 2 ft. apart. These insulators are made by the British Insulated and Helsby Cables Ltd., and are their K. 45 Indian pattern, shown in fig. 1. For services a double J insulator bolt with arms at 60°, shown in fig. 2, is used. The bolt on the

FIG. 1.

FIG. 2.

FIG. 3.

pole carries ordinary insulators, that on the houses the "Sinclair-Aitken" No. 1 pattern. This is shown in fig. 3, and is used as follows:—For a length from A to B, the lead of the twin lead-covered rubber-insulated cable is removed and the cable is pushed up into the groove as shown, the outer cover of the insulator is then put on and the service from the pole can be attached. Mr. Griffiths, the company's engineer, has adopted this method in order to get a dry patch between the bare copper at c, and the lead covering of the twin service cable, as he found that unless this precaution was taken, electrolytic action between the lead and copper corroded away some of the positive wires. Since this method has been used the trouble has vanished. The lead-covered twin service is then stapled along the house wall and taken in through the window. There is no gas supply in the village, and last year the total units generated were 5,000. Mr. Griffiths, unlike most engineers controlling small plants, prefers to use and charge by meter. The staff are paid under a contract, and find it mutually satisfactory.

Encouraged by the success of Mr. Griffiths at Caergwrle, Mr. Richard Edwards started a supply at Llanuwchllyn. Lear

Bala. The population is 500, the supply being at 100 volts, two-wire, mostly overhead. The plant is driven from the surplus power available from a water-wheel which works a mill. Mr. Edwards is himself an engineer and millwright, and works the lighting supply in conjunction with his other business. The surplus power available is only  $1\frac{1}{2}$  h.p., this being helped by a 200-ampere-hour battery. The price per unit sold is 5d.: the village street and library are lighted under a yearly contract, and the total output last year was 1,500 units. The capacity of the plant is about 50 units per day, and more consumers are asking to be connected than the present plant can accommodate. Mr. Edwards states that the financial result is quite satisfactory.

The supply works put down at Cald, near West Kirby, in Cheshire, show another phase of village supply work. The "Cald Manor Estate Co." have full charge of the development of the district, which is a high-class and somewhat exclusive residential village about three or four miles from Hoylake, the "Mecca" of English golfers, and within an hour from Liverpool. The writer has spent two summer holidays in the district, and can testify to the quiet, restful nature of the place, situated on the Dee estuary, and looking across to the Welsh mountains. As a quiet residence for a city man, the place is ideal. Gas could easily have been brought in from Hoylake, but the estate company meant to be satisfied with nothing but the best. The electric lighting plant was, therefore, put down, but although it belongs to the estate company, the accounts are kept quite separately, and the venture pays a satisfactory return on the capital invested. The capital available in this case was fairly ample, and in order that the village should not be disfigured by the electric light station, the well-known London architect, Mr. Guy Dawber, was instructed to design the generating station buildings, and the result is an admitted ornament to the district. The present population is 200: no overhead wires are used, the system being a three-wire one at 115 and 230 volts. A 32-kw. Siemens dynamo, direct driven by an 85-h.p. suction-gas engine plant, and a 540-ampere-hour Tudor battery, comprise the plant, the battery having an automatic controller fitted. The plant is at present too large for the needs of the place, but in spite of this drawback, the total generating costs, including all capital costs, come to 1.8d. per unit—a highly creditable figure. The price per unit for lighting is 6d., and for power 3d. per unit. Last year 6,100 units were sold. Here then we have a village supply in which capital has been spent freely and in order not to spoil the appearance of the district, yet which, on a very small output, pays.

At Wornit, a suburb of Dundee, the electric light is successfully competing with gas at 3s. 3d. per 1,000 cb. ft. The village has about 200 houses and 1,000 inhabitants. At present 90 of the houses are supplied, the size of house ranging from 5 to 12 rooms; wiring costs on the average about £3 10s. The generating plant is a belt-driven suction gas plant, and overhead mains are used. Most of the consumers are supplied by contract on the basis of 4d. per unit; a few of the consumers prefer to pay by meter, and for their convenience the company provides a meter when required, making the price per unit 6d. The supply is at present chiefly lighting, but arrangements are being made for a campaign to capture the cooking load which, during off-peak load hours, will be supplied at 1d. per unit. The voltage of supply is 230 with a two-wire system. The company is managed by Mr. E. A. Stewart, and was founded on a previous company; since Mr. Stewart has taken charge of matters the company has turned the corner, and it is encouraging to know that Mr. E. Stewart, the engineer to the company, is at present in Ireland carrying out the reconstruction of another similar village lighting project.

At Lyme Regis, in Dorsetshire, we have a rather larger community of 2,300 people—this size of township, however, being generally thought too small for an electric light scheme to pay. The plant here is driven by oil engines using ordinary paraffin at a cost of 6d. per gallon. This price for fuel oil is to-day very high as compared to the crude oil so much in use, but the company paid 4 per cent. in its second year. The oil engines are of Messrs. L. Gardner and Sons' make, and have given every satisfaction; they are assisted by a turbine driven from a small stream. The total cost of running and managing the place is 3d. per

unit; 6d. per unit is charged for lighting and 4½d. per unit for power. Last year 26,500 units were sold. An interesting feature is that overhead aluminium mains are used—two-wire at 110 volts. There is also an agreement in force with the local authority to light the public lamps for 10 years from June 1st, 1909.

These are not by any means all the examples which could have been chosen. They have, however, been described, because they illustrate the different aspects of village lighting very clearly.

## THE EYERMANN STEAM TURBINE.

[BY OUR BERLIN CORRESPONDENT.]

THOUGH nearly all steam turbines in practical operation are worked on the axial-flow system, radial-flow turbines possess some undoubted advantages of their own. The concentric arrangement of blade rings on one disk, in fact, utilises more satisfactorily the available material, the two faces in addition to the edges being used for the arrangement of active elements. Another advantage obtained in the case of steam

EYERMANN 1,200-H.P. RADIAL-FLOW TURBINE.

admission from the inside outwards is due to the increasing circumference of blading, which allows increasing cross-sections to be provided for the passage of the steam, with growing expansion. Another essential point in the economy of radial-flow turbines is a far more advantageous mode of working of the steam. In fact, in axial-flow turbines, the steam in the rotating blades is thrown outwards by centrifugal force, thus assuming higher pressures, and returns inwards in guides free from centrifugal force, which obviously impairs the efficiency of the blading. Furthermore, in any fairly long blades there are considerable differences inside and outside respectively in the average steam cross-section, as compared with the cross-section of the blade material and the peripheral speed, so that the blade angles frequently show considerable departures from the most advantageous positions. All these drawbacks are done away with in the radial-flow turbine which, on account of its homogeneous steam passages, gives rise to no harmful secondary motion of the steam.

The fact that in spite of all this the axial-flow turbine has gained its present supremacy is due, on one hand, to the serious constructive difficulties offered by radial-flow turbines, and, on the other, to the prevailing opinion that one or two disks would not be sufficient for the arrangement of a sufficient number of rings of blades. This, however, is quite possible when designing the first pressure stage fairly large (e.g., from 12 to 2 atmospheres abs.), the resulting speed energy being converted in one or two rotating blade rings, and the remainder of the gradient being utilised in a limited number of blade-ring pairs working on the reaction principle.

Much attention has been recently given to the radial-flow turbine designed by Mr. W. H. Eyermann, of Steglitz, Germany, which has achieved remarkable success. This turbine has its blade rings arranged concentrically on a

The following data relate to the steam consumption of some turbines recently constructed, as ascertained from official tests. A back-pressure turbo-dynamo of 100 kw., the exhaust steam from which is used for heating, gave the following data:—

Output eff. h.p.	Admission pressure, lb. Atmos. abs.	Admission temperature °C.	Back pressure, lb. Atmos. abs.	Steam con- sumption kg. of h.p.-hour.
150 ... ..	9.24	305	1.01	12.5
112 ... ..	9.36	287	1.01	13.6
75 ... ..	9.54	286	1.01	15.1

The 1,200-kw. (1,700-h.p.) turbine of Messrs. Gebrüder Otto, Unterhohingen, gave the following results:—

k.w.	Atmos. abs.	C.	Atmos. abs.	Kg. kw. hour
1,200 ... ..	12.35	331	0.025	6.18
720 ... ..	11.25	325	0.022	7.25

Turbines of up to 1,700 h.p. have so far been constructed, and there seems to be nothing to prevent the design of much larger units on the same system. The most

DISMANTLED TURBINE SHOWING BLADED DISK.

single disk, which, of course, involved a number of constructive difficulties. In order to reduce the weight of the rotor, such strains as would result in the disk being bent had to be balanced by counter-forces. The steam expanding on its way through the blading exerts a very

EYERMANN 1,200-H.P. STEAM-TURBINE SET.

ARRANGEMENT FOR AXIAL THRUST COMPENSATION.

considerable axial pressure on the disk. This pressure is balanced by a small amount of steam expanding at the back of the disk in a number of labyrinth grooves, in a similar way to the working steam on the front side. In

SECTION SHOWING BALANCING GROOVES BEHIND DISK.

order to allow the amount of balancing steam to be adjusted, the turbine shaft is so arranged as to allow an axial displacement of about 1/2 to 1 mm., thus altering the width of an annular throttling slot constituted by the stuffing box and the turbine disk, which slot is traversed by the balancing steam. Another factor liable to result in the bending of the disk is the centrifugal force of the blading arranged on one side. In order to compensate this, counter-weights, which also carry the labyrinth grooves, are arranged on the back in a similar manner to the blades provided on the front of the disk.

stringent tests made by the foremost turbine experts have borne out the claims of the inventor, showing the superiority his turbine possesses in many respects over the axial-flow turbine.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Kelvin.

With reference to the remark made by Mr. A. P. Trotter at the Institution of Electrical Engineers, reported in your issue of the 27th Dec., may I make some comment? Unfortunately, it is impossible to snub a Government department, or at least, it seems so—perhaps, in this case, because it is represented by such a charming man. The rebuff the Board of Trade have received to their efforts, during the past 20 years, to introduce the name Kelvin instead of kw.-hour, would have silenced any self-respecting individual, but not so the Board. They tell us that in 1882 they graciously gave us permission to use the word Kelvin, and nothing more need be said—and this in the face of Lord Kelvin's obvious disapproval.

I trust that the industry will show its officials that, when it desires a new name for anything, it is able to dictate to them, and that it has too great an appreciation of the magnificent work done by Lord Kelvin to flout his obvious wishes—wishes both relative to this particular use and, in general, to the use of a non-decimal system.

So strongly did Lord Kelvin feel about the latter, that he said at Philadelphia, in 1884, "I look upon the English system as a wickedly brain-destroying piece of bondage under which we suffer. I say this seriously; I do not think that anyone knows how seriously I speak of it."

I have previously suggested as an alternative a more logical unit, viz., 10<sup>7</sup> joules, but this, I think, fails to do complete justice to the clear thinker whose memory we wish to honour, although it does not flout it.

The only proper excuse for the introduction of a new

name is the saving of mental energy. No honour is conferred on Lord Kelvin by giving his name, unless this result is brought about. Particularly in the case of such a thinker as Lord Kelvin does this apply, as he, of all people, would be gratified at anything which conserves "brain."

There must be some much more appropriate unit. Do the advocates of the use of Kelvin for kilowatt-hour know that before many years have passed we shall have got so far advanced in the use of electricity, that names will have had to be found for many quantities at present not in common use, that they are willing to waste Kelvin's name upon a crude multiple, adding to instead of reducing mental effort! It is as though we had erected a statue upside down, for all who pass to scoff and jeer at.

Percy Good.

London, S.E., January 1st, 1913.

### High-Tension D.C. in Mines.

I should like to thank the gentlemen who have written to you upon the above subject for their criticisms upon my article, and to say that I should gladly welcome any further criticism. I am preparing a paper to be read before the Western Section of the Institution of Electrical Engineers upon the subject, in which I shall be able to deal very much more fully with the whole matter than I could possibly do within the limits of the article you were good enough to print. You were very kind, indeed, to allow me so much space, seeing the demand there is for space in your columns; but as I think everyone will recognise, even that space was only sufficient to touch the fringe of the subject. As in the paper I am preparing I shall not be limited as to length, I hope to deal with the whole matter very fully. I may mention also that it was partly with the hope that some criticisms might be forthcoming in your columns, that I requested their hospitality in opening the campaign.

I may, perhaps, be allowed to say that I have no pecuniary interest whatever in the Thury system. I have been watching its development for a long time, and it has occurred to me that it would be more suitable for mines than three-phase.

I should like to deal very shortly with two points raised by Mr. Roper. He asks whether I am serious in saying that the liability to short, with three cores, is six times that with two cores. I thought I had made it clear that I referred to the case of a three-cored cable, either inside of lead casing, or armoured, or both: the armour being earthed and the neutral earthed. With that arrangement, as I understand the matter, there are three chances of shorts between the cores themselves; and there are three chances of shorts between the individual cores and the casing.

The other point I should like to deal with is the question of joint-boxes. Will Mr. Roper give the size and weight of the smallest joint-box that he would consider satisfactory for the cable supplying a coal-cutting machine, and having to be taken through a gate road, in a seam with a bad roof? The coal-cutting machine will take normally from 12 h.p. up to 30 h.p., and on occasion may take as much as 50 h.p. Gate roads are made as short as possible, but under the conditions I have in mind, there might be several joints required within the length of one gate road.

Sydney F. Walker.

Bath, January 4th, 1913.

I am quite unable to follow Mr. Sydney F. Walker's idea in proposing the use of the Thury D.C. series system in mines, with concentric cables.

It is true that the P.D. across each individual motor would be comparatively low, but the same would not apply to the P.D. between the whole motor and earth, which would depend upon what part of the circuit the motor was connected in. Let us suppose, for the sake of example, that we have 30 motors in the mine, each taking on an average 200 volts, or a maximum of 6,000 volts when all the motors were running. Then, if the circuit were earthed at one end, a motor at the other end of the circuit would have both terminals, and the whole of its windings, at a pressure of almost 6,000 volts above earth.

In the same way, while the P.D. between the two conductors supplying any motor, and in particular one of the smaller motors near the face of the coal, would be comparatively small, both the conductors might be at a high potential as compared with earth. The concentric type of cable is not suitable for these conditions at all; it is suited for cases where the outer conductor is at earth potential, and not for cases like that under consideration, where the outer would be, not at earth potential, but at a potential not greatly differing from that of the inner.

Mr. Walker appears to suggest that the proposed system would obviate the necessity for earthing the frames of motors, or for providing the cables with earthed armouring. How so? If you have a motor, the whole of whose windings are at a pressure of, say, nearly 6,000 volts above earth, surely it would not be safe to leave its frame unearthed, even though the P.D. across the terminals of the motor were only 200 volts? On the other hand, it would be very difficult, if not impossible, to construct D.C. motors, at any rate, at a reasonable price, which would stand a working pressure of thousands of volts between windings and frame, such as would occur if the frame were earthed. I believe that with the Thury system it is the practice to insulate the frames of all the motors, as well as of the generators, by mounting them on insulating supports and surrounding them by insulated floors, which would obviously be impossible in a mine. But unless these impossible precautions were taken, it would not be safe to touch the motors—unless the frames were earthed. And even if the frames could be earthed, precisely the same difficulties and dangers would then present themselves as with the three-phase system.

In a large mine the maximum voltage would have to be very high, to keep the main current (which, as your correspondents in your last week's issue have pointed out, would flow through every part of the circuit) within reasonable limits. Take the case of the 5,000-kw. plant suggested by Mr. Walker. With a pressure of 20,000 volts, the main current would be 250 amperes, and this current would have to be conveyed to every motor, large and small. Think of the cost of cables and the copper losses. Then imagine a D.C. motor with its windings and commutator at a pressure of 20,000 volts and its frame earthed—or, if you prefer, not earthed. I am assuming that the motor is at one end of the circuit and the earth at the other; by earthing the circuit in the centre the maximum pressure to earth could be limited to 10,000 volts, but that would be bad enough.

I believe the speed of the motors in the Thury system is regulated by shifting the brushes round the commutator—not a method that strikes one as being particularly suited to mining conditions, especially in a mine that is at all fiery.

Altogether, it seems to me that mining work is about as unpromising a field for the Thury series D.C. system as could well be imagined.

G. C. Allingham.

Golders Green, N.W., January 6th, 1913.

### Earthing the Neutral.

In your current issue, Mr. Fedden gives an interesting description of the earthing arrangements in use at Sheffield, and as the subject is now so much to the fore, I feel that it would be of great service to all of us if he would give some further details of its working, in the light of his experience.

Mr. Fedden says that the earthing transformer has a delta-connected secondary, which ensures that the neutral point of the primary shall always be at earth's potential. By this he means, I presume, under normal working conditions, since it does not seem possible that, on the occurrence of a fault on one of the feeders, resulting in a dead earth, a transformer taking, say, 50 amperes out-of-balance current, could "anchor" the neutral point.

This being so, I am not altogether clear as to how the arrangement differs in its effect from a resistance connected to the neutral points of the generators or transformers, and so proportioned as to allow 50 amperes to pass in the event of an earth. On the other hand, the latter arrangement has one distinct advantage of its own, namely, that no power is consumed under normal conditions.

The use of the resistance, moreover, need not be subject to the disadvantage suggested by Mr. Fedden, namely, that with an earth on a feeder, the supply would be cut off, since the discriminating devices used at Sheffield could equally well be employed, or the still simpler arrangement outlined in fig. 1 of Mr. Peck's paper, which, as I pointed out in the discussion, admits by a slight modification of the inclusion of overload protection, as well as protection against earths, and this, moreover, without the use of any additional gear. The overload and earth fault relays are quite independent of one another, so that the latter can be set to trip with as small a current as may be required, without interfering with the overload settings.

The cost of the earthing resistance arranged for 50 amperes in the way suggested would not be more than a fifth of that of the corresponding transformer, as installed at Sheffield.

As Mr. Fedden points out, there are three questions which have to be decided in this connection.

1. Whether to earth the neutral at all?
2. If so, whether to earth through a resistance?
3. In that case, what should be the value of this resistance, or, in other words, what should be the value of the current to earth, on the occurrence of a dead earth?

As to questions 1 and 2, I think that all engineers are now pretty well agreed that they should be answered in the affirmative.

As regards the third question, there may be some differences of opinion on the subject, but I am personally in entire agreement with Mr. Fedden in his contention that so long as the earth current is sufficient to trip the feeder breakers, the smaller it is the better for the system.

Kenelm Edgcombe.

London, S.W., January 6th, 1913.

#### The Case of the Sub-Man.

As a result of the recent correspondence in the *ELECTRICAL REVIEW*, it has been decided to form an Association, and a meeting is to be held in London during the coming week (as advertised). Inquiries have come in from all over the British Isles, and the idea has been enthusiastically received.

It has been suggested that the "Association" should include shift engineers, switchboard attendants, sub-station attendants, mains assistants, &c., and it is hoped that as many as possible will attend the meeting.

Owing to the large amount of work entailed in answering the many correspondents, inquiries are being answered in strict rotation.

J. W. Ebben.

London, E., January 6th, 1913.

I am not one of those worms that take a pleasure in that interesting pastime of personal abuse, but I cannot but pass some remark on Mr. Potter's letter which appeared in last week's *REVIEW*. Amongst several remarks, he states that the correspondence of a few weeks ago bristles with contradictions; that we assume we are "a sort of aristocracy," and then he finishes up with the milkman and yardman question.

Well, in the first place, this Association of Electrical Shiftmen intends to put a stop to such as milkmen and yardmen taking charge of sub-stations, or having anything to do with our branch of the profession. As regards a "sort of aristocracy," it might be information for Mr. Potter to know that there are gentlemen in power and sub-stations, and that these are not entirely run by milkmen and such. The majority of attendants are well educated, have had a college training, some hold Honours Certificates from the City and Guilds of London Institute, while several have University degrees. I, therefore, cannot see how they can be compared to the common wiremen, who more or less are from the middle and lower class. I, myself, started by serving my time with wiring contractors (for which I am not sorry), and as an apprentice was sent out with the professionals. I remember one particular case where we were working in a flour mill, and one morning the professional whom I was with asked the foreman for 2d. to buy candles, which he said he required when working in a dark corner; he was given the 2d., and on

arriving at the mill I asked him whether he had bought the candles. The reply I received was: "Sure we don't want candles at all—wasn't it for a pint I got the 2d.?"

There is a specimen of your wiremen. Do they try to improve their knowledge as regards their trade? No, but they attend the technical schools, not to learn anything, but to increase their kit of tools at the expense of the workshop, and the result is that they do not know the difference between an ampere and a volt.

Then how would it possibly be practicable to be a member of the same Trade Union as the wiremen who are working under our direction in the stations? There would be no respect for us, and the result would be "Hey! Bill, is this right?" and discipline would be all awry. Another reason is that if we started an ordinary Trade Union we should be just as ordinary tradesmen (not that that is a disgrace to any man), but we hope, with Mr. Potter's permission, that we are a step above the average tradesman.

One cannot but think that Mr. Potter is of a Socialistic turn of mind from the tone of his letter. In a study of human nature Mr. Potter will see that in every class, from the very poorest to the millionaire, snobishness is to be found; it cannot be helped, for it is born with man, and even the electrical shift engineers are no exception.

The close of Mr. Potter's letter very much resembles a well-thought-out advertisement. Is he afraid that the Association of Electrical Shiftmen will rise in opposition to the Electrical Trades Union? Let him not tremble, we will not affect him financially or otherwise, and he may be sure that we will keep as far away from Trade Unionism as possible, even though the House of Commons dabbles in it.

Perhaps it will interest Mr. Potter to know that I have heard that hundreds of individuals have already joined the Association of Shiftmen.

I take this opportunity of making it clear to readers of this *REVIEW* that the "Association of Shift Engineers" and the "Association of Shiftmen" are identical. It was a mistake of mine that changed the name of the former.

#### Motor-Generator.

With reference to the letter of Mr. J. Potter in last week's issue of the *REVIEW* on this subject, there are two things that must have been noticed by your readers in his letter, namely:—First, it is typical of the majority of the effusions that have emanated from the E.T.U.; secondly, it is remarkable by being so wide of the mark, and offering no feasible or workable suggestions.

Mr. Potter touches on a number of points, and is careful to avoid following them out too far. He speaks of yardmen, &c., carrying out central-station engineers' duties, as though this state of things were peculiar to the central-station staffs; but he does not mention anything about those members of the E.T.U. who, a few years ago, were navvies, and such like. Mr. Potter would have us believe that the only thing to do for our benefit is to join the excellent organisation with which he is connected; but if we look back a little on the achievements of the E.T.U., and upon its methods, we cannot find the slightest reason why those members of the profession who are now seeking to improve their position should join its ranks.

What a brilliant success the E.T.U. was in the recent events at Bradford and Glasgow (success, I don't think!). Again, Mr. Potter states that there are already central station men in the E.T.U., but he does not mention anything as to the status of these members: seeing that it is only necessary to show that one has been three years at the trade in order to qualify for membership of the E.T.U., I can quite believe his statement about having central-station men as members—station wiremen, jointers, and such like. As to the question of Trade-Union methods not being applicable to the profession, I think any person who is at all conversant with central-station work will see the reasons for this. If it were to serve any useful purpose, I could enumerate a good many reasons, but central-station men are conversant enough with the question, also the matter of wage rates, and such are a question for consideration and adjustment, and not to be settled rashly or haphazardly. As I am sorry to say, is done by some Trade Unions.

The best work Mr. Potter and his friends could do is to set about making the E.T.U. what it is not at present—an efficient organisation, and one whose ranks would contain only qualified men. Then, and only then, will the E.T.U. obtain the recognition and respect which it is aiming so blindly for at present. Mr. Potter shows up his object very clearly in concluding his letter, by saying that the "E.T.U. will welcome recruits": this seems to be about the only decided line of the organisation—"gather 'em in"—but to talk of central-station shift engineers finding a remedy for their grievances by joining this Union is too rich altogether. The shiftmen can, and intend to, form an independent Association, and can do so very nicely without the assistance of Mr. Potter and his friends.

There are many other points in question which could be gone into in print, but to attempt to discuss the matter with those who are wandering so wide of the mark as Mr. Potter is doing would be only a waste of time and space. Let him get some first-hand knowledge of the subject, and he will find that his organisation is as far removed from the business of the shiftmen, as Jupiter is from the place where they don't use radiators.

Zantha.

I have read with interest Mr. Potter's letter in last week's issue, and, being a subman myself, I cannot agree with him in a lot of things he states.

According to Mr. Potter, the interests of wiremen and station engineers are alike, or both classes are trades, and Trade-Union principles apply to both.

We unfortunates in sub-stations are badly enough off without putting ourselves on the same level as the tradesmen; in the first place, the average shiftman is a man of some education, and a very large number of them are gentlemen. They have some technical training, and they are socially well above the average wireman. The average wireman, on the other hand, is usually a man drawn from the lower classes; he has practically no education worth talking of, he does his work, no doubt, all right, but the most elementary question in electricity would stagger him.

Again, the average wireman can never become more than a wireman on account of his lack of education and technical knowledge; he will get his Union pay (with luck) all right, but will he ever rise beyond that? For that reason the E.T.U. is of no use to us.

Mr. Potter accuses us of "snobbishness": but, personally, I fail to see how we are guilty in that respect. It is no crime for gentlemen to keep apart from men who do not enjoy the same social position as they do, even if it is their misfortune to be "shiftmen."

How many of us, I should like to know, would like to get our start in life again at any of the other professions which, at least, protect their men, if we only knew then what a miserable business was in store for us, where money and influence, not brains, was the principal road to success.

As to the engineers who have joined the E.T.U., what have they to look forward to? A wireman's wage at the outside, with luck, and it is quite enough for them if they class themselves as such.

I am glad to see that the "Association of Shiftmen" is being formed, and the idea is being taken up in all parts of the country.

Booster.

#### The Preservation of Telegraph Poles.

We notice an article on page 33 of your issue of January 3rd, which, of course, refers to uncreosoted or un-preserved cedar poles in America, and we think this is not made quite clear, as the method suggested of preserving the same is no doubt excellent, but should be quite unnecessary with properly creosoted poles in this or other countries.

For Richard Wade, Sons & Co., Ltd.,

CHRISTOPHER WADE, Managing Director.

Hall, January 6th, 1913.

#### THE PHYSICAL SOCIETY EXHIBITION.

(Concluded from page 12.)

##### Crompton & Co., Ltd.

Besides their standard potentiometer, and various patterns of switchboard instruments, this firm exhibited a new D.C. testing set (fig. 8). This instrument consists of a moving-coil indicator

FIG. 8.—CROMPTON D.C. TESTING SET.

mounted in a light and strong portable oak case. It can be used either as an amperemeter or as a voltmeter, a selector switch being provided for coupling the instrument. The voltage range is altered by means of a volt-range switch, so arranged that on closing the case the switch is automatically and certainly set to the highest range; this reduces the risk of applying a high voltage to a low-voltage range. The shunts are specially designed, and are of manganin, the smaller shunt being inside the instrument. The 150-ampere shunt is used externally, but is fixed inside the lid when the instrument is being carried about. The instrument is magnetically shielded, and is adjusted to a definite resistance and degree of sensibility. Without its shunts or resistances it forms a milliamperemeter reading up to 15 milliamperes, or a millivoltmeter reading up to 75 millivolts. Any slight change of zero which may take place can be corrected from outside by turning a screw buried in a bush near the lock or catch: a suitable screw-driver is fitted in the lid. The apparatus is standardised as a voltmeter for six ranges, from millivolts to 600 volts, and as an ammeter from milliamperes to 150 amperes. Additional external shunts can be provided for higher ranges.

##### Marconi's Wireless Telegraph Co., Ltd.

Several interesting novelties were shown by this company. Amongst these was the radiogoniometer in its fully-developed form, or, in other words, the wireless direction-finder on the Marconi-Bellini-Tosi system; this device, when installed on board ship, enables the direction from which signals are received to be determined within a few degrees, a matter of great importance in time of

FIG. 9.—CONNECTIONS OF THE RADIOGONIOMETER.  
1, 2, Terminals of first aerial loop; 3, 4, Terminals of second aerial loop; 5, Protecting gap for first aerial; 6, Protecting gap for second aerial; 7, Switch for first aerial circuit; 8, Switch for second aerial circuit; 9, Fixed coil of first aerial circuit; 10, Fixed coil of second aerial circuit; 11, Condenser for first aerial circuit; 12, Condenser for second aerial circuit; 13, Exploring coil; 14, 15, Terminals for connection to detector; 16, 17, Terminals for connection to direction finder; 18, 19, Blocking condensers; 20, Crystal holder; 21, 22, Terminals for connecting to telephones; 23, Potentiometer; 24, Battery of dry cells; 25, Battery switch.

FIG. 9.—CONNECTIONS OF THE RADIOGONIOMETER.

fog or when seeking a vessel in distress. It can also be used for directive signalling over a moderate range. The special aerial employed consists of two equal loops suspended in vertical planes and crossing one another at right angles; each of these is connected in series with a coil and a condenser. The coils are of equal size and cross at right angles; the condensers are also equal, and can be simultaneously adjusted for tuning the aereals. A third

coil, inside the crossed coils (see fig. 9), is called the exploring coil, and is mounted on a vertical spindle; it is connected with a detector consisting of a pair of telephones and a crystal rectifier. The principle of the instrument is as follows: Each aerial loop is a directional aerial, which receives best when its plane is in the direction of the sending station, and receives nothing when its plane is at right angles to that direction. Usually both aeriels are more or less inclined to the direction of the signals, and receive signals of corresponding intensity, the resultant effect of which is communicated to the exploring coil; when the latter is in the position which gives the maximum strength of signals, the pointer attached to the spindle indicates the direction of the sending station—assuming, of course, that the instrument has been properly fixed with regard to the aeriels. A simple testing instrument is used to verify the orientation, resistance and insulation of the aeriels.

Improved adjustable ebonite disk and air condensers were exhibited, and a complete portable outfit for communicating up to 15 miles, to be carried in knapsacks by four men. A new "Universal Crystal Receiver" was also shown, intended for a range of 300 to 3,000 m. wave-length, and provided with adjustable condensers in the aerial and detector circuits.

#### Nalder Bros. & Thompson, Ltd.

In addition to the well-known ammeters, voltmeters, insulation testing set and other instruments shown by this firm, there was a novel device in the form of an insulation recorder and leakage-current indicator for A.C. circuits. The principle involved is that of applying a direct-current E.M.F. from a battery or exciter between the A.C. mains and earth as illustrated in fig. 10, which refers to an unearthed three-phase system. The choking coil limits the alternating current to earth in case of a bad fault. The recorder and relay, which are permanent-magnet instruments, are operated by the direct current flowing round the circuit *via* the insulation resist-

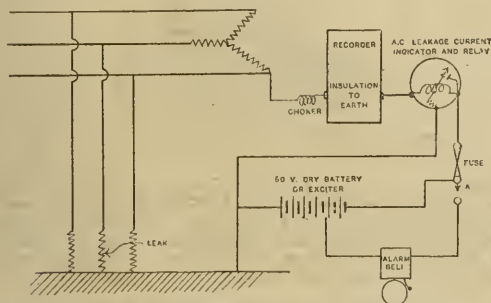

FIG. 10.—CONNECTIONS OF NALDER INSULATION RECORDER AND LEAKAGE INDICATOR.

ance. The recorder is calibrated to register the insulation to earth, and operates on the tapping principle. The relay is calibrated to indicate the maximum A.C. leakage current flowing from main to main consistent with the resistance recorded at the moment.

When the insulation resistance falls below a predetermined value, the relay makes contact, throwing the fuse directly across the battery; the fuse blows, allowing the alarm-bell circuit to be completed at A, and cutting the instruments out of circuit. These sets of apparatus have already been installed in many high and low-pressure systems both with and without the neutral earthed.

#### Helsby Wireless Telegraph Co., Ltd.

The Helsby vibration-proof crystal detector and rotary quenched-spark discharger were shown.

#### Weston Electrical Instrument Co.

This company showed a great variety of switchboard and portable instruments of the Weston type, as well as testing sets, laboratory instruments, frequency and power-factor meters and synchroscopes.

#### Cambridge Scientific Instrument Co., Ltd.

The Fery bomb calorimeter, and various instruments for the measurement of temperature, were shown. The principal feature, perhaps, was the Cardiograph, which consists of an Einthoven galvanometer, photographic apparatus for making records either on plates or on a continuous roll of paper, an automatic projection are lamp, a switchboard and time-marker. The whole forms a very convenient outfit for producing records of the heart's action over any desired length of time, with the minimum amount of trouble. With the aid of an auxiliary microphone apparatus, graphic records of the sounds of the heart can be made.

#### Kelvin & James White, Ltd.

The Kelvin balances and other familiar standard instruments were shown, with the Aitken portable dust counter. The Fullarton vibrometer was also exhibited; this is a simple little instrument with a vibrating reed, which can be tuned by various adjustments to resonance with the vibration to be determined, and gives a comparative indication of the intensity of vibration in any given plane.

#### Dubilier Electrical Syndicate, Ltd.

This exhibit included condensers of mica and tinfoil, for working pressures up to 15,000 volts, as well as a quantity of high-frequency apparatus for therapeutic purposes, which could be used on any public supply system.

### THE "PARAGON" CYCLE INTERNAL-COMBUSTION ENGINE.

NOT content with devising the "Paragon" system of electric propulsion of vehicles and ships, Mr. W. P. Durnall has invented a new cycle for internal-combustion engines, which appears to possess marked advantages over the well-known systems in current use. His purpose is to expand the products of combustion down to atmospheric pressure, thus obtaining more useful work from a given quantity of fuel, and discharging the gases noiselessly at a low temperature. According to a descriptive article by the inventor in the *Railway Times* of December 28th, his attention was drawn to the subject by the need for a suitable prime mover for use in combination with his Paragon system of oil-electric locomotive for hauling railway trains, in place of steam locomotives; his colleagues, Messrs. H. H. B. Deane and G. T. Bowles, were associated with him in the development of the new system.

In fig. 1 is given a diagrammatic section of the Paragon internal combustion engine as arranged on the two-cycle Diesel principle for use with crude oil. It will be noted that the exhaust ports

FIG. 1.—DIAGRAMMATIC SECTION OF PARAGON ENGINE.

FIG. 2.—TWO-CYCLE DIAGRAM.

FIG. 3.—FOUR-CYCLE DIAGRAM.

cc are situated at the middle of the stroke of the piston, and are covered by a sleeve E, which is operated from the crankshaft by a rod F. Also a pipe H<sup>1</sup> supplies air at a pressure slightly above atmospheric pressure, through a valve H.

In the figure the piston B is at the top of the compression stroke, and the compression space is supposed to be filled with air at a pressure of 500 lb. per sq. in., and at a temperature of about 1,000° F. As the crank turns the centre, the fuel oil is sprayed into the cylinder through the valve K, and burns during a portion of the stroke; afterwards expansion takes place, but the exhaust ports are kept closed by the sleeve until the end of the stroke, so that the gases expand almost to atmospheric pressure. The ports are then opened, and as the piston returns, the air in H<sup>1</sup>, being at a higher pressure than the contents of the cylinder, opens the valve H and scours the cylinder, so that when the piston covers the exhaust ports the cylinder contains only pure air, which is then compressed, as before.

The indicator diagram obtained is shown in fig. 2; here E G is the compression space, while E H is said to represent the corresponding compression space in an ordinary Diesel engine; E C is the atmospheric pressure line, and compression starts at D, the shaded area F representing the work of compression.

The principle can be applied also to the four-cycle type of engine, in which case the scavenging air supply is not required. Fig. 3 shows the diagram in this case. Here, on the suction stroke, the air induction valve is closed at the point B, and the piston runs on to D, expanding the air to a point below atmospheric pressure by the amount C D; the difference of pressures inside and outside the cylinder cushions the stroke and helps the working parts to turn the outer centre without shock, also accelerating the parts on the return stroke. On arriving at B, the piston commences to compress the air, bringing it up to 500 lb. at E; injection of fuel takes place, followed by expansion down to C, and on the return stroke the piston expels the burnt gases. Engines working with gas on the four-cycle system, with compression only to about 80 lb., can be operated on similar lines.

Particulars are given in the article quoted of engines which have been designed of 230 B.H.P. at 900 R.P.M. on the author's system.

for Colonial orders, to be used in conjunction with the Paragon system of electric transmission. A 300-H.P. petroleum-electric locomotive for passenger train service on one of the leading British railways, weighing 35 tons, is also described and illustrated; each of the four axles is driven by an induction motor, with a gear ratio of 3.35 to 1, and 10 running speeds are provided, while the engine runs always at constant speed. The fuel consumption per axle horse-power-hour is estimated to be 0.6 lb. of crude oil. A small exciter is provided, as well as a small storage battery capable of lighting, heating and ventilating the locomotive and train. The cooling water is carried in a radiator on the top of the locomotive, and special means are employed to vary the rate of circulation, so as to keep the water at a constant temperature. The author states that the system can be applied to locomotives up to 1,000 H.P., weighing 80 tons, with a drawbar pull at starting of 15 tons.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### The Record Patent D.C. Moving-Coil Instrument.

The desirability of a long scale in a measuring instrument is well understood, but hitherto the angular deflection of the pointer of a D.C. moving-coil instrument has been limited to an arc of 90° or so by the requirements of design of the coil and the poles of the magnet, many attempts have been made to overcome this drawback, but with indifferent success. The usual design, moreover, necessitates either a very long air-gap (with no core to the coil) or

FIG. 1.—NEW "RECORD" AMMETER.

two air-gaps in series, the latter being the customary arrangement. The attempt to shorten the air-gaps has led to marvellous accuracy in the construction of the coil and pole-pieces, but the coil is large and has a fairly high moment of inertia, and any defect in manufacture or fitting leads to fouling.

THE RECORD ELECTRICAL CO., LTD., of Caxton House, S.W., have now developed an entirely new design, giving a scale subtending 300° not far from a complete revolution of the pointer—and avoiding the difficulties above-mentioned. Fig. 1 shows this feature in the case of an ammeter, and it will be noticed that the scale, which is sensibly uniform throughout, is remarkably clear and easily read; moreover, the divided scale is placed outside the bold figures, thus giving the largest possible

FIG. 2.—MAGNET SYSTEM.

space for the divisions and facilitating accuracy of reading. The scale of the 8-in. dial switchboard instrument illustrated is 17 in. long, and that of the 15-in. instrument is no less than 3 ft. long—in each case about three times as long as in the usual type.

The method by which this large deflection—which can be increased to 330° if necessary—is obtained is shown in figs. 2 to 4. Fig. 2 shows the magnet and pole pieces, which are arranged on the sandwich plan, so to speak, one ring-shaped pole (which also forms the core of the coil) being placed between the two extensions of the other; the shape of the magnet is eminently suited to enable it also to form the backbone of the instrument, carrying the lighter portions. The inner pole-piece is made in halves to admit the coil. There are two air-gaps, bounded by flat surfaces, which are therefore easily made true, and of large area;

these also are not in series but in parallel, so that the magnetic reluctance is very low, and this enables a strong working field to be secured, together with great permanence of the magnet and freedom from external interference.

The coil is shown in fig. 3; the active conductors are the upper and lower ones, and the idle length of conductor is short compared with the useful portions; the small coil is therefore of very low resistance, and can be used with shunts giving the usual drop of

FIG. 3.—MOVING-COIL SYSTEM.

0.075 volt. The pointer acts as a counterbalance to the coil, and the moving system is very light and well damped, being almost dead-beat. Large clearance is provided at the ends of the coil, and a considerable slackening of the bearing will not cause fouling. The instrument assembled is shown in fig. 4.

These meters are made both for switchboard and laboratory use, with suitable modifications, the latter type having a mirror and knife-edge pointer. In conclusion, we are informed that the three-fold deflection is obtained without any increase in the expenditure

FIG. 4.—INTERIOR OF RECORD INSTRUMENT.

of energy, or, if preferred, advantage may be taken of the long scale to enable the same range to be obtained with one shunt as the ordinary type gives with three shunts. The workmanship is of a very high order, and we were much impressed with the merits of the instrument which was submitted to us for examination. Ammeters and voltmeters are made of all the usual ranges.

### "One-Part" Lampholder and Plug.

We have received from MESSRS. G. ST. JOHN DAY & CO., of Mumps Electrical Works, Oldham, samples of their One-part lampholder and One-part plug, both of which represent a marked advance in simplified construction on previous efforts of the kind.

It may be remembered that, last year, we described in these columns one or two ingenious lampholders which, by comparison

FIGS. 5 AND 6.—"ONE-PART" LAMPHOLDER, AND ARRANGEMENT OF TERMINAL.

with the ordinary pattern, were a considerable improvement, and that one of them was the "Mumps" lampholder by the same firm.

The One-part holder consists merely of a porcelain interior with two holes running through from top to bottom, each hole enclosing one wire of the flexible and a terminal plunger, while a standard screwed barrel with bayonet sockets and shade ring is permanently secured to the lower part of the porcelain.

The terminal parts are a sliding fit in their holes and are withdrawn for the purpose of wiring, the bared wire being first pushed through the porcelain and attached to the terminal top by a screw, which has a peculiarly shaped head, projecting some  $\frac{1}{2}$  in., with notches on either side, round which the wire is looped for greater security; the terminals, once wired, are simply drawn up into their respective cavities by pulling the flex, above the holder.

The above description also applies practically to the plug, which consists of a plain wood or porcelain body with two through holes for wires and plain terminal contacts (instead of plungers). These are also wired in a similar manner to the above.

In either case it will be noted that there is practically no chance of a "short," the leads being separated throughout; the wiring is easy and no tool is required beyond that necessary for preparing the wire itself; the two terminal fittings are the only detachable parts in either holder or plug.

#### A Cavity-head Screw.

A screw with a head of a novel pattern is being placed on the market by MR. S. SUTCLIFFE, of 3, Central Street, Halifax. As shown in the accompanying fig 7, the head is cupped, and the groove is cut to a larger radius than that of the cup. To turn these screws, a screw-driver with a curved edge is used. Everyone who has had to drive a screw knows the annoyance, and often the

FIG. 7.—CAVITY-HEAD SCREW.

damage, that results when the driver slips laterally out of the groove, but it will be seen at once that these new screws can be driven with ease and certainty, even in the dark. Care is taken to design them so that the head is not weakened, and the spherical cavity is polished, giving a handsome appearance to the finished work. There is less chance, too, of the driver slipping and defacing the head of the screw.

#### New E.A.C. Car-switch Lift Controller.

THE ELECTRICAL APPARATUS CO., LTD., of Vauxhall Works, South Lambeth Road, S.W., have devised a controller for high-speed passenger lifts, consisting of automatic reversing gear interlocked with an automatic starter on the same panel. The two

FIG. 8.—E.A.C. LIFT CONTROLLER.

smaller solenoids seen in fig. 8, are for up and down direction respectively, and the centrally pivoted switch at the bottom of the controller (operated by the same solenoids) is for reversing the armature connections. The long solenoid cuts out the starting resistance, the operation being as follows:—When the

lift attendant moves the car switch to the "up" or "down" position, the corresponding solenoid on the controller is energised, and its plunger pulled up. During its upward movement the armature reversing switch is closed in the right direction, and finally the circuits to the brake magnet, the starter solenoid and line are completed, and the motor is started with all resistance in. Resistance is cut out step by step by the automatic starter, the speed of which is retarded by a dashpot. The rate of acceleration can be varied by turning a screw on the outside of the dashpot. Current is never made or broken on the armature reversing switch or on the rheostat, the contact-making parts being the cross arms fitted with renewable copper rollers, which engage with large renewable carbon blocks, cushioned and partially hollowed, in order to ensure a definite contact.

As an additional security, a powerful magnetic blow-out is employed, the front shield of which is seen in the illustration, hiding the two line contactors from view. By changing one link on the panel, the control can be removed from the lift cage to two push buttons in the top left-hand corner of the panel, so as to enable the lift to be tested from the motor room with the cage empty. The apparatus is completely interlocked, and it is impossible to start up the motor until the starting resistance is all inserted. An electrical as well as mechanical interlock prevents any possibility of the up and down solenoids lifting together.

#### New G.E.C. House Service Cut-Out.

The accompanying illustration shows the new pattern of house service cut-out, recently introduced by the GENERAL ELECTRIC CO., LTD. In this design, Home Office requirements have been strictly adhered to; the case is of cast-iron, enclosing the fittings in a very neat manner. There is efficient insulation between the case and

FIG. 9.—G.E.C. HOUSE SERVICE CUT-OUT.

the fittings, and a liberal rating of metal parts. The contacts are sunk in a recessed porcelain block, thus rendering it impossible to make accidental contact with live parts when replacing the fuse holder. The fixing holes are drilled under the porcelain cable bushes. The capacity of the cut-out is 10 amperes.

#### B.T.H. Theatre Dimmers.

THE BRITISH THOMSON-HOUSTON CO., LTD., of 77, Upper Thames Street, E.C., are supplying metallic dimmers in several types, for fixing flat against, or at right angles to, wall or switchboard, and

FIG. 10.—B.T.H. THEATRE DIMMER.

for mounting in dimmer banks. Dimmers consisting of two or more plates may have a single lever for the control of all plates, interlocking individual levers, or non-interlocking individual levers.

Every dimmer is made up of one or more standard plates, which can be added to or decreased in the same way as a sectional book-case. It is thus possible to modify the equipment without waste of time, material or money.

In the B.T.H. design, fig. 10, a perforated cast-iron plate encases a special composition, embodying resistance elements having a negligible temperature coefficient, which are held firmly in place by

cement, which is a highly efficient heat conductor and electric insulator. The contact segments are arranged to ensure against the possibility of arcing from point to point, and to prevent the accumulation of dirt between the segments. The use of wall type dimmers is recommended where only a few lamps are to be controlled, as in small cinematograph theatres, churches, &c. In the interlocking two-wire type each plate has an individual lever, which can be interlocked by a slight twist of the handles, so that any one or all of the plates can be operated by the master lever. In the interlocking three-wire type, each pair of plates is controlled by a small lever which, when interlocked, can be operated by the master lever in a similar manner. The levers are attached to a shaft which is carried on self-centring bearings and an extension of the horizontal arm of the end frame. This method of mounting is used for both the interlocking and non-interlocking types.

## BUSINESS NOTES.

**Consular Notes.—Russia.**—The Austrian Consul at Kieff reports that quite small electric motors find a very good sale in his district, and there is also a fair market for large dynamos. There are quite a number of purchasers who prefer foreign machinery to the home constructed variety. In consequence of the high duty on steam engines and dynamos, steam turbines coupled to dynamos have recently been imported. These machines actively compete with separate steam engines, Diesel motors, &c. Incandescent and arc lamps are being imported in larger quantities, but it must be borne in mind that the home production of carbon incandescent lamps is showing an important development. There are two works in Moscow and one in Warsaw for the production of these lamps, which have also taken up the manufacture of metal-filament lamps, and have dealt a serious blow to foreign manufacturers. The result will be that one or other of the large foreign works will establish branch establishments in Russia. The demand for arc lamps has been appreciably affected by the high power metal-filament lamps. For lighting materials in general, Germany is the chief supplier, but Austria has recently begun to show active competition, one Vienna firm having achieved considerable success. Imports of dynamos, electric motors of every kind, and transformers, in 1911 amounted to 234,000 pounds, valued at 5,838,000 roubles, as compared with 162,000 pounds, valued at 4,471,000 roubles, in 1910.

**Russia.**—The British Consul at Riga reports that imports of machinery, which rose considerably in 1910, increased still further in 1911. The greater part of the machinery imported is destined for industrial use, and goes in transit for the interior. If we compare the years 1910 and 1911, we find that in the former year 5,690 tons of agricultural machinery, and 10,478 tons of industrial machinery were imported into Riga, whereas for 1911 the figures were 6,349 and 18,992 tons respectively. If we go back as far as 1901, we find the respective figures given as 824 and 5,248 tons; this serves to indicate the great advance in imports of machinery in late years. The United Kingdom is by far the greatest supplier of industrial machinery. According to available statistics, Sweden holds first place in the supply of agricultural machinery at Riga. She is improving her position in the production of industrial machinery, and thus threatens Germany's position as the country second in importance to the United Kingdom in this branch of Riga's imports.

Later in his report the Consul states that the consumption of electrical energy has developed each year from 1906 to the present time. The electric station has met a greatly increased demand for light, but the most notable feature in 1911, as in the previous year, was the increased demand for electricity for power. In 1911 more than 2,000 electric meters came into use, or nearly as many as the total number in use in the first four years of the electric station's existence (1905-9). The increased demand for electricity made it necessary to extend the electric station, and a turbine-generator of about 3,000 H.P. was accordingly added. This was supplied by a German company. The total length of the electric trams at the end of 1911 was estimated roughly at 42 km. No new lines were constructed during the year.

**Brazil.**—The Austrian Consul at Sao Paulo reports that in 1911 18 new concessions for telephones were granted, so that the number of existing telephone companies increased to 61. The system covers over 4,500 km. The Government proposes to bring about the further improvement of the telephone service, and to help to remove existing difficulties which result from poor material, thin wires, and faulty personnel. Moreover, a reduction of the subscription is proposed, the present annual subscription within the kilometre radius being 160 milreis.

Later, in his report the Consul states that the extraordinarily favourable industrial condition of Sao Paulo must naturally lead to a large expansion of trade. Most of the business is done through large importing merchants, and the investment of capital in the district has been an important factor in securing trade. A firm wishing to establish itself in Brazil, and to participate in the trade, must be so well capitalised that it can make considerable sacrifices to begin with, can undertake a strenuous advertising campaign, and—what is particularly important in the machinery trade—give long credits, as well as share in financing new undertakings from which orders may be looked for. Almost daily, at the present time, details of new undertakings appear in the papers, of which only about 50 per cent. are more than unformed ideas. Readers of

such notices are apt to take it for granted that these notices all refer to *bona fide* undertakings, and may just happen to pitch on one that is not. Experience leads them to ignore these notices in future, and thereby they may miss an excellent opportunity. All that is required is a knowledge of local conditions, and a power of discrimination, and these requirements can only be obtained on the spot by means of an efficient representative.

**Uruguay.**—The British Consul at Monte Video reports that on January 8th, 1912, a decree was published making obligatory wireless telegraphy installations on all passenger ships carrying passengers between Uruguay and other ports from May 1st, 1912, but the operation of the decree was subsequently postponed to August 15th, 1912. By the decree, ocean-going steamers must have apparatus powerful enough to receive and transmit messages from and to a distance of 400 km. (248½ miles). The Marconi station at Maldonado was closed down on March 23rd, its work being taken over by the Government installation at Cerrito (Telefunken system). The proposed installation in Lobos Island, referred to last year, has not yet been taken in hand, and the erection of a lighthouse on English Bank has also been deferred; but the wireless station on English Bank is now working, and will be a great boon in stormy weather.

Elsewhere in his report, the Consul points out that the principal impediment in the way of British firms not already established in the Uruguay market is the difficulty of finding British agents in Monte Video. The British firms already existing in Monte Video are, in most cases, so occupied with their present business that they have little desire to take up new agencies, especially if the goods are new to the market and the terms nothing exceptional. This applies also to Uruguayan firms, with whom there is the further difficulty of dealing in Spanish. Accordingly, letters from British firms to traders in Uruguay offering agencies frequently find their way to the waste paper basket, or meet with an evasive reply, for it is now axiomatic in Monte Video that if a foreign firm has business worth offering, it will send a competent member of the firm to choose an agent. The fact is well known to British importers to South America, whose commercial travellers now include Monte Video in their South American itinerary. Some, however, have concentrated on the larger market of the neighbouring metropolis of Buenos Ayres without seriously considering the possibilities of business in Uruguay. Where British agents are unobtainable in Uruguay it is better policy to appoint Uruguayans, in preference to any of the firms of the nationalities of our competitors. It would seem hardly necessary to repeat the perennial warning that the metric system is enforced by law in Uruguay, where tradesmen are fined for using any other system, and that correspondence with Uruguayan firms should be conducted in Spanish, were it not that catalogues and circulars are still sent to Monte Video, printed in English, with quotations in British weights and measures. Perhaps the greatest obstacle to the expansion of the import trade is the high protectionist Customs tariff, which dates from 1870, with subsequent alterations imposing in most cases additional duties. The United Kingdom is, however, on the same footing as her European and North American competitors, as there is practically one uniform tariff for all countries, without any preferential scale. In 1907 a new Customs tariff was published, further increasing the duties, but was not adopted. In view of the recent increases in public expenditure, it is feared that no remission of Customs duties is to be hoped for, although the best authorities are of the opinion that the Customs revenue would not suffer by a reduction by 10 per cent. of the present duties. The Customs duties at present provide over 60 per cent. of the public revenue. A Bill was introduced in July, 1912, for raising considerably the duties on iron and steel and certain other goods. The main purpose of the Bill, as explained by the proposer, was to enable local manufacturers to carry on business without loss in the event of an Eight Hours' Bill becoming law. The tendency is to meet the expenses of new public works by means of temporary additional Customs duties, but unfortunately when the work is completed and paid for, the temporary duty remains as a permanent one. This policy has done much to increase the cost of living, which is now alarmingly high—having increased by about 50 per cent. in 10 years.

**Germany and the Sales of Large Gas Engines.**—A Sales Syndicate has recently been established in Cologne by all the German builders of large gas engines. The object of the syndicate, which has been formed for a period of six years, is to equalise the orders given out between the different builders, and to institute a uniform set of sale and delivery conditions.

**Spain.**—La Sociedad Espanola de Electricidad Alemana Svenska is the name of a new company which has lately been formed in Madrid, with a capital of £30,000, to develop the sale of the Swedish Electrical Co.'s productions in Spain.

**Calendars and Diaries.**—FROM MESSRS. ALFRED GRAHAM & Co., St. Andrew's Works, Crofton Park, London, S.E., we have received a blotting pad worthy of a place on any desk, with a blotter diary at left hand, with ample daily spaces and calendars for 1913-4. Another souvenir of equally practical value from this firm takes the form of a useful pocket volume of some 250 pages containing speed and tide tables for 1913—daily tide tables for the principal seaports of the United Kingdom, port charges, knot tables, distance tables, electrical terms, engineers' tables, weights and measures, postal information and blank pages for memoranda.

THE WESTINGHOUSE BRAKE CO., LTD., of 82, York Road, King's Cross, London, N., has issued a wall calendar for 1913, with tear-off monthly sheets, each of which contains a half-tone illustration of a Westinghouse-Morse chain drive.

MESSRS. W. H. WILCOX & Co., of 38, Southwark Street, London, S.E., have issued their usual date remembrancer for the year. Each

monthly sheet being conspicuous for the abundance of illustrations of the manufactures supplied by them.

MESSRS. NALDER BROS. & THOMPSON, LTD., of 34, Queen Street, London, E.C., have issued one of their new quite familiar handy-sized calendars, with monthly tear-off slips for 1913.

From MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., of Blomfield Street, London Wall, E.C., we have received a wall calendar of artistic design, with date slips for the year, each of which gives six working days, these slips being for the most part appropriately illustrated with pictures of the company's manufactures, &c.

Considered from some standpoints, the 1913 calendar of the JANDUS ARC LAMP AND ELECTRIC CO., LTD., is as "taking" as anything we have this year seen, though others, as we have already stated, are excellent from their special point of view. The picture, we understand, is reproduced from an original water-colour drawing, prepared for the firm by M. Connorton. It is quite different in style from their productions of the last year or two, and as there is no title or explanatory note we are left to guess the nature of the thoughts which give the charming damsel such heavenly satisfaction. We will resist the temptation to break forth into poetry concerning my lady's eyebrows, pretty lips, a thornless rose, and other features which move the soul even of the prosaic technical journalist. The Jandus Co. (Hartham Road, London, N.) will be pleased to send a copy to anybody interested in their manufactures.

MESSRS. MAJOR & COULSON, LTD., of 47, Broad Street, Mile End, Glasgow, have prepared a wall calendar for the year with monthly date slips with very plain figuring. An illustration of the "Pick-Quick" electric coal-cutter adorns the card.

THE BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, have issued a wall calendar consisting of 13 large monthly sheets up to, and including, January, 1914. Each sheet has the current month's dates in large type, and the previous and following months above in smaller type on the left and right hands respectively. Between these upper date spaces there is, on each sheet, a photographic half-tone reproduction of a colliery power station or textile installation, haulage gear, or other feature of the company's manufactures.

From the LIVERPOOL ELECTRIC CABLE CO., LTD., of Liverpool, we have received a very neat wall calendar for 1913. The monthly tear-off slips have very plain figuring. The upper half of the card contains a general view of the company's new works which were opened in June last.

As a New Year souvenir the BENJAMIN ELECTRIC, LTD., of 117, Victoria Street, London, S.W., have issued to all the London central station engineers and contractors one of their Benjamin telephone cards, wherein are printed the names and telephone numbers of all the leading wholesale distributors of electrical supplies to whom the engineer or contractor can telephone for his requirements. Spaces are left wherein to add the names and numbers of other firms with whom the recipient does business.

**Book Notices.**—*Willing's Press Guide*, 1913. London: 125, Strand. Fortieth annual issue.—Nothing new occurs to us in regard to this book. As we have said repeatedly, we find it a very conveniently arranged guide to the Press, whose cost (1s.) brings it within the reach of everybody having a use for such a publication.

"The Märksche Electricität Works." By Prof. Dr. G. Klingenberg. Fully illustrated description. From the Allgemeine Electricitäts-Gesellschaft, Berlin.

**Dissolutions and Liquidations.**—VACUUM ENGINEERING CO., LTD.—This company is winding up voluntarily, with Mr. J. A. Heiron, 30, Moorgate Street, E.C., as liquidator. A meeting of creditors is called for January 16th.

GEORGE REED, heating and electrical engineers, 11, Chapel Ash, Wolverhampton.—Messrs. G. Reed and F. W. Stubbs have dissolved partnership. Mr. Reed will continue the business, and attend to debts.

ELECTRICAL ADVERTISING CO., LTD.—This company is winding up voluntarily, with Mr. N. C. Meredith, 13 and 14, Abchurch Lane, London, E.C., as liquidator.

NATIONAL TELEPHONE CO., LTD.—Creditors must send particulars of their debts, &c., to the liquidator, Mr. Geo. Franklin, Telephone House, Victoria Embankment, E.C., by February 1st.

MICA SUPPLY CO., LTD.—A meeting is to be held at 19, St. Dunstan's Hill, London, E.C., on February 6th, to hear an account of the winding up from the liquidator, Mr. P. Farnan.

**Catalogues and Lists.**—THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—Revised edition of the firm's telephone list (between 60 and 70 pages). This list differs from the last edition mainly in respect to the prices quoted, most of them being completely changed; contractors and others interested should, therefore, secure copies at once. The list is fully illustrated, and the contents cover direct-working, battery call and intercommunication telephones, central battery, military, navy and traction telephones, fire alarms, water level indicators, watchmen's tell-tales, &c. Also new small leaflets relating to "Magnet" nursery requisites, "Ideal" electric toasters, and Holophone office shades.

THE BRITISH INSULATED AND HELSBY CABLES, LTD., Prescot.—New leaflet (P. 122) containing illustrated description with prices of the Prescot automatic motor starters for continuous-current motors.

THE ENOLITHIC MANUFACTURING CO., 61½, Fore Street, London, E.C.—Leaflets with samples of their metal, ivory and bone labels; also a sample of a metal advertising knife, with 6-in. rule marked thereon.

THE METALLIC SEAMLESS TUBE CO., LTD., Meta House, Birmingham.—Illustrated and priced leaflets relating to their popular lines of glass lamp shades.

MESSRS. SIMPLEX CONDUCITS, LTD., 118, Charing Cross Road, London, W.C.—Four-page supplementary list, V2(453), in which they give prices and illustrated description of C.C. dynamos and motors, starters and shunt regulators. They are now introducing a range of these motors up to 20 H.P. and dynamos up to 17 kW. Another publication, Z1(460), contains particulars and prices of the firm's new types of electricity meters, in addition to those shown in the recently issued general catalogue. Prices have been revised.

MESSRS. D. H. BONNELLA & SON, LTD., 58 and 60, Mortimer Street, Cavendish Square, London, E.C.—Electric bell catalogue, containing 44 pages of illustrations and clearly stated prices of a great variety of electric bell accessories, bells, indicators, batteries, wires, pushes, and so on.

MESSRS. AUSTIN WALTERS & SON, 57, Lower Mosley Street, Manchester.—22-page well illustrated and descriptive price list relating to their stage arc lamps, flame lamps, bunch lights for theatres and music halls, theatre dimmers, theatre battens, cinematograph stand-by resistances, &c. The firm have put down new machinery for the manufacture of electrical signs, and the list shows some of these—interchangeable letter signs, cinema signs, &c.

MESSRS. LANDIS & GYR, LTD., 28, Denman Street, London, S.E.—16-page catalogue containing illustrated particulars with tabulated prices of D.C. ampere-hour and watt-hour meters, single-phase and polyphase meters, A.C. indicating wattmeters, special-tariff meters, change-over switches, time switches, and other manufactures of the same class. Diagrams of connections, also dimension sketches, are given.

MESSRS. WILSON HARTNELL & CO., LTD., Volt Works, Leeds.—New eight-page catalogue, containing general and technical description of their polyphase induction motors, with tabulated prices, dimensions, shipping weights, &c., for sizes from 2 to 160 H.P. A couple of pictures of the works are included.

**Trade Announcements.**—Mr. J. W. F. WARREN has left the service of the British Westinghouse Electric and Manufacturing Co., Ltd., to take up the management of Messrs. George Craddock & Co., Ltd., wire rope manufacturers, Wakefield. Messrs. Craddock have had a branch office in Johannesburg since 1897, and in addition to selling their own products have represented other British firms. We understand that they are now prepared to further represent electrical firms. Mr. Warren will sail for South Africa about the middle of February.

THE ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., of 109/111, New Oxford Street, London, W.C., announce that from 1st inst. they have taken over the agency of the Vereinigte Isolatorwerke, of Berlin, covering the whole of their manufactures with the exception of traction material, viz., Ambroin handles, shields, washers, bushes, terminal blocks, circuit-breaker and controller, arcing shields, insulated bolts, switch bases, meter boards, &c.

Owing to increased business, the STANDARD ELECTRICAL ENGINEERING CO. have acquired larger premises. Their address is now 39, Eastcheap, E.C. Telephone: "4934 Avenue."

MESSRS. V. V. WAITE & CO., LTD., have now established themselves at the Alpha Works, Taffs Well, Glam. They have concluded an agreement with Messrs. W. Partington & Co., of Taffs Well (who have for some years carried on business in electrical repair work), for whom they will now act as sole concessionaires.

THE "RADIUM" ELECTRIC CO., of 82, Hatton Garden, London, E.C., announce that in order to avoid patent litigation they have given up the sale of their "Radeo" squirted filament lamp—except for export—and have now been appointed special factors by the Tungsten Lamp Association for drawn-wire Osram, tantalum, Mazda, Wotan, or any other conference lamps, which they can offer at the full conference discounts. They will hold large stocks of all these makes.

MESSRS. FITTERS PATENTS, LTD., have taken additional offices in the City in order to cope with increasing business. All communications in future should be addressed to 20, Bishopsgate, London, E.C. Telephone No.: "London Wall 6779."

THE ARMORDUCT MANUFACTURING CO., LTD., of Farringdon Avenue, London, E.C., have acquired the sole licence for the manufacture and sale of Mr. Napier Prentice's "Lightning" cooking oven, which will be on the market some time in February.

**Annual Dinner.**—The Annual Dinner of the drawing office staff of MESSRS. WILLANS & ROBINSON, LTD., was held at the Grand Hotel, Rugby, on Friday, December 20th. The chair was taken by the chief draughtsman, Mr. E. R. Briggs, who presided over a large and representative gathering, including Mr. Peache, Mr. Davenport, Mr. Bennett, and representatives from all departments. Telegrams of regret were received from Mr. Hemmings, who was away on the company's business, and from Mr. Symonds (an old Willans man), of the Brush Co.; Mr. Cox and Mr. Elborne were also unavoidably absent. After the usual loyal toast, the chairman proposed the health of "The Directors," and expressed great satisfaction in being able to welcome two directors this year to their dinner. Mr. Davenport, in the course of an appreciative reply dealing with the company's work, bore special testimony to the spirit of loyalty and honest work that was so prominent a feature in all ranks of the company's staff, and expressed the opinion that such an asset, coupled with the confidence which customers were exhibiting, were hopeful omens for the company's future. Mr. Peache also spoke, and said that Mr. Briggs had told them that he had made a special journey to Rugby on purpose to be present at the dinner, and he could only say that in finding himself among them all he felt fully rewarded. His connection

with the company dated back many years, to the days when the building of steam launches on the Thames constituted its main business. It was a regret to him that he saw to-night so few of the old faces round him. It rested with each one to do his level best and back up Mr. Davenport in his arduous task, and to see that so far as in him lay the company should win back to its old prosperity. Mr. Prosser proposed the health of "Friends, Absent and Present," and noted that the company was losing the services of Messrs. F. W. Stokes, J. Burns and the Brothers Pfeleiderer. He wished them every success in their new sphere of work. Mr. Wood responded to the toast. Mr. Pocock and Mr. Wells, who represented the company in Australia and Canada, were remembered by letters of greeting, which were signed by everyone present. The toast of "The Ladies" was proposed by Mr. Bennett, and Mr. Nitschke responded on their behalf. An excellent musical programme was arranged by the secretaries, Mr. Gardner and Mr. Seymour.

**Trade in 1912.**—We have received an advance proof of the "Annual Trade Review of the *Chamber of Commerce Journal*." It is an interesting and valuable document, and in the Section relating to electrical trade statistics the following values and weights are given to show the course of the export and import trade in electrical goods for the 11 months ended November 30th, 1911 and 1912 :—

**EXPORTS :—**

Electrical goods and apparatus (other than machinery and telegraph and telephone wire)—	1911.	1912.
British ... ..	£2,607,052	£4,049,758
Foreign ... ..	179,588	205,699
Electrical machinery—		
British ... ..	20,601 tons	21,838 tons
Foreign ... ..	£1,638,849	£1,780,832
Foreign ... ..	530 tons	5,242 tons
Foreign ... ..	£54,136	£63,486

**IMPORTS :—**

Electrical goods and apparatus (other than machinery and telegraph and telephone wire) ... ..	1911.	1912.
Electrical machinery ... ..	£1,296,848	£1,320,182
Electrical machinery ... ..	974,627	1,056,181
" " ... ..	8,673 tons	8,145 tons

Messrs. Switchgear & Cowans, Ltd., of Salford, report that their works in Springfield Lane were fully occupied during 1912. The more interesting items constructed included E.H.T. transformers ranging from 40,000 volts to 60,000 volts and from 5 to 50 kW. Remote-control oil switches for very large capacities operating chiefly at 6,600 volts and at 12,000 volts also deserve to be mentioned as forming a feature of last year's output. The firm's patterns of mining switchgear have been standardised, and a draw-out system has been developed. Star-delta and automatic transformer starters have been remodelled and their operation made entirely independent of the attendant, who has merely to switch on. A new patent has been applied for, for improvements in the Statter patent time lag, and patterns have been standardised, providing for independent adjustment both of the time and the current settings. Complete central-station equipments of switchgear for several important stations at home and abroad have been completed during the year, and the contracts in hand include switchgear equipments for Manchester, the London County Council, Hull, Kingston-upon-Thames, Montreal, Windermere, Seville and other places.

Messrs. Leopold Farmer & Sons, surveyors, auctioneers and factory specialists, London, report that the sales and letting of factory property, wharves, land, &c., in the year under review, show better results than was the case in 1911, the boom in trade in the industrial world having given a great impetus to the development of new industries, and the consequent establishment of new works. Prices have been maintained, and sales transacted at good times prices. They would not, however, convey to the reader that the standard of values has been kept up, as hardly two factory properties are alike. The tendency is for the price to rise, consequent on the improvement by development in certain manufacturing areas which have special advantages in rail, waterside and other facilities, but the migratory movement amongst manufacturers is to districts outside large towns where the lowest possible cost of manufacture can be obtained. The values of industrial properties have not to any great degree been affected by the Budget Taxation of 1909, but as regards other securities in landed property, a shrinkage is noticeable. It is difficult to say which branch of any particular manufacture more than any other has progressed in the year 1912, as there are many influences affecting industrial operations and the development of commercial enterprise. Acquiring of factories, &c., building of works consequent on re-organisation and extension in many trades, are always in progress. Owing to the flourishing state of trade, great developments have taken place in the year under review, especially in the following :—Engineering, milling, chemical, spinning, motor and rubber trades. The effects of the Patents and Designs Act are still well to the front, a sum amounting to about 1½ millions having been expended in the acquiring of land, building of factories and plant, and machinery equipment, and the consequent employment of some thousands of workpeople. Foreign holders of English patents are still on the lookout for factory property to comply with the requirements of the Act, and several areas in and around London and the provinces have been developed in consequence of the establishment of important industries which give employment to thousands, and additional rates to local and other attendant authorities. The out-

look ahead for further deals in factory property is good, as there is every likelihood of a continuance of prosperous activity in the industrial world.

A Scottish correspondent writes :—"Electrical engineering firms in the West of Scotland are active and have an excellent order book. Trade has been good of late months, particularly with firms who specialise in work of a distinctive type. Messrs. D. and J. Tullis, Ltd., Glasgow, have in hand important contracts in connection with the equipment of electrically-driven steam laundries on board large passenger ocean liners. Another Glasgow firm, Messrs. Drysdale and Co., Ltd., do a large trade in fitting up electrical-driven pumping sets for power stations. They have work in hand to supply establishments at home and abroad, and look forward to the new year with satisfaction. In connection with marine work the introduction of electricity as applied to steering gear is taking a firm hold. Especially is the patent electric hydraulic steering getting into favour with marine engineers. A set is at present being supplied to a British warship now building. Messrs. John Hastie & Co., Greenock, are doing a considerable amount of work with the "Hele-Shaw-Martineau" electric hydraulic steering gear : and are executing orders for motor-driven ships. Messrs. Davis and Primrose, Leith, specialise in bevelling machines, for which they hold the patent. One of their bevelling machines for the British Naval Dockyards is for dealing with angle and other sections up to 14 in. broad and 1½ in. thick. This machine weighs more than 20 tons, and is driven by two electric motors. Another machine is on its way to Japan ; and machines have been supplied to Portuguese, French, Russian and Norwegian shipyards. Messrs. Mavor & Coulson, Glasgow, are busily engaged upon electrical mining apparatus. At present an extension of workshop accommodation is in hand. Messrs. Osborne & Hunter, of Glasgow, are equipping a factory with a 100-H.P. Diesel oil engine to drive the electric generating plant. Messrs. Anderson & Munro, Ltd., Glasgow, have a considerable amount of work on the domestic side of electric power. The Electric Control, Ltd., have shipped abroad a large number of automatic lift controllers of all types. The automatic control gear, with special speed-regulating and unloading devices, is being supplied to the Admiralty and to shipbuilding firms for the economical control of compressed air plants. Messrs. Frederick Braby & Co., Ltd., Glasgow, have had their electric-welding department working at the highest pressure. They turn out large quantities of large steel-riveted and welded cylinders, cisterns and tanks for oil, petrol, and other purposes. Sir William Arrol & Co., Glasgow, have a considerable amount of work in hand at their crane works, Parkhead. Messrs. Brown Brothers & Co., Ltd., Edinburgh, have an extensive order department for their steering gears, particular attention being given to the electro-hydraulic type. In the textile engineering trade electricity is being introduced in various ways in connection with improvements in detail of spinning and weaving machinery. One of the most recent is the electric rove-stop motion for the spinning frame. Demonstrations in Dundee have been very satisfactory, and the apparatus is now seen in several of the Dundee mills."

## LIGHTING and POWER NOTES.

**Accrington.**—At a meeting of the Electricity Committee it was reported that the L.G.B. had sanctioned the borrowing of £300, repayable within 30 years, for the erection of the Clayton-Le-Moors electrical sub-station.

The question of adopting an improved system of lighting in the Accrington Market is to be gone into by the Town Hall and Market Sub-Committee in consultation with the electrical engineer.

The B. of T. has consented to the scheme of overhead street lighting and wiring, subject to the work being in accordance with regulations, the Board reserving the right to review at the end of five years. The electrical engineer reports that the gas-making plant is almost complete. Last week the plant was run 10 hours daily under full-load conditions with not one involuntary stop, and all indications point to a successful issue of the installation.

**Batley.**—Very active opposition is being displayed against the proposals of the Corporation Electricity Committee to expend £16,000 in extensions to the electricity works, and the controversy is arousing considerable interest in the heavy woollen district. Ald. Blackburn, one of the opponents, maintains that the advocates of extension, upon their own estimates, if they spend £16,000 on new steam generating plant cannot hope to reduce their bare generating costs to less than 0·583d. per unit, exclusive of management, distribution, interest, depreciation and sinking fund charges.

**Bath.**—A L.G.B. inquiry has been held into an application by the Corporation to borrow £8,000—£3,000 for extension to Weston (being part of the added area under the boundaries extension scheme) and £5,000 for prospective expenditure in the next three years—in respect of the city's electrical undertaking. The application was stoutly opposed by the Bath Gas Light and Coke Co. The town clerk, replying to the criticisms of counsel, pointed out various directions in which the undertaking was hampered, and he trusted the Inspector would report to the L.G.B.

that the undertaking was suffering from certain serious disadvantages, that they were entitled to sympathy, that they had struggled for a long period against adverse circumstances, and when substantial loans matured they hoped to be able to put into the pockets of the ratepayers some dividend.

The E.L. Committee has decided to recommend the Council to accept from the Diesel Engine Co., Ltd., the engine supplied, as one of 340 kW. (instead of 450 kW. as originally contemplated), at the cost of £4,240, instead of the original price of £5,451, the company also paying the Corporation the sum of £1,730 as compensation for the delay which has taken place, and for the loss of economics resulting from the reduction of capacity. The Council is also recommended to apply to the L.G.B. for the necessary modification of consent to borrow, which has been issued for the sum of £7,500 and will be now required only for the sum of £6,289, covering cost of engine, auxiliaries, foundations and fitting.

**Belfast.**—An influential deputation representing large ratepayers attended before the T.C. last week in connection with the proposed extension of the Corporation's generating plant. A memorial was presented asking that the matter should be delayed, partly because the present time was unfavourable for borrowing large sums of money, and partly because the rapid development of the Diesel engine might, in a year or two, enable the Corporation to effect substantial savings if it were adopted. It was pointed out that Messrs. Harland & Wolff were taking a great interest in the Diesel engine, and that their view of its future could not be ignored. The chairman promised to give the matter full consideration.

**Bridlington.**—The Overseers have decided to ask the B. of G. to call in the services of an expert to reassess the undertakings of the Bridlington T.C., including the electricity works.

**Continental Notes.**—**GERMANY.**—The Newmark Electrical Union (Elektrizitäts-Verband Neumark) will have, on the 1st of the current year, no fewer than 62 localities connected to its high-pressure distribution system in the province of Brandenburg. —*Elektro. Zeitschrift.*

A union of municipal electricity undertakings in Saxony has lately been formed in Dresden. Among its objects are (1) the maintenance of municipal ownership; (2) to endeavour to prevent monopolies being secured by private capital; and (3) the establishment of a joint purchasing office.

**NORWAY.**—The municipal authorities of Christiania have decided to develop the water power of the Hallfred-Sollberg Falls, situated some 40 km. from that city. Their capacity is equal to 27,000 H.P. The installation costs, including that of the long-distance mains, are estimated at 11,000,000 marks. In connection with this departure the T.C. intends to disburse a sum of 1,750,000 marks in the extension of the equipment of the municipal power station, including the acquisition of two three-phase turbo-generators of 5,000 and 6,000 kW. each.

**BELGIUM.**—Two new engines and dynamos, each of 2,000-kw. capacity, have recently been added to the central station of the Société d'Electricité du Brabant, at Oisquereq. The company has now secured the concession for the supply of current to 15 small towns and villages in the district, its power station having a capacity of 6,000 kW.

**Conway.**—At a meeting of the Lighting Committee the question of electric lighting came up for consideration, and it was decided, before adopting any particular scheme, to inspect the electrical plant at the Oakwood Park Hotel.

**Cromer.**—At a ratepayers' meeting on Friday, convened by opponents of the proposed transfer of the electric light undertaking by the U.D.C., there was a majority of 53 against the proposal. The votes registered numbered 133, three of which were invalid.

**Cuckfield (Sussex).**—Subject to certain stipulations, the U.D.C. has decided to give its consent to the prov. order for electric supply being applied for by the Mid-Sussex Electric Light Co.

**Dartford.**—A supply is to be given Messrs. Vickers, Ltd., at their works at Crayford, over the light railway cables, at a charge of 1d. per unit for a guaranteed consumption of 100,000 units per annum.

**Dewsbury.**—The Corporation has come to an arrangement with the Yorkshire Electric Power Co. under which the latter agrees to give the supply of electricity for lighting purposes in Thornhill through the Corporation.

**Eccles.**—The L.G.B. has sanctioned the borrowing of £870 for the purposes of the electricity undertaking.

The Electricity Supply and Public Lighting Committee has decided to ask the Member for the Division to support the Sheffield Members of Parliament in the endeavour to re-instate in the House of Commons, Clause 83 of the Sheffield Corporation Bill, 1912, dealing with electrical fittings.

**Hebburn and Felling.**—The Northern Counties' Electricity Supply Co., Ltd., is seeking powers to purchase the electrical undertakings of the Hebburn and Felling U.D.Cs., which it is at present working under agreements.

**Kettlewell (Yorks).**—The formation of a private company, composed of villagers and including the local postmaster and schoolmaster, at Kettlewell, a village high up in the Yorkshire Craven hills, adds one more to the growing list of small places

which, for their lighting facilities, are jumping straight from the use of the primitive oil to electricity. Amongst these places the Craven district already contributes Ingletton, Gillingham, Clapham and Horton-in-Ribblesdale. In the case of Kettlewell a capital of £625 has been gathered by the company. As is usual in such places the village stream is to be harnessed as the means of generating current.

**London.**—**WOOLWICH.**—The Electricity Committee reports having considered the desirability of arranging reciprocal supplies with adjoining electricity supply undertakers, in order that applicants in outlying districts of the borough and also in adjoining areas may be supplied at a minimum of cost to the undertakers concerned in the laying of feeders, &c. To carry out this proposal, it has been decided to make application to the B. of T. for its permission to give and take a bulk supply from the West Kent Electric Co., and for a give-and-take supply from the South Metropolitan Electric Light and Power Co. £19,000 is to be borrowed on account of carrying out extensions at the Globe Lane works.

**Northwich.**—The R.D.C. has consented to the application to the B. of T. by the Weaverham Electricity Supply Co., for a prov. order for electric supply within the Council's area.

**Nottingham.**—Some time ago we referred to the proposal by a member of the Corporation, that expert advice should be obtained as to the hydro-electric possibilities of the Trent near the city. In the result, Mr. E. W. Monkhouse has now reported on the proposal, showing that to equip plants at Beeston and Colwick weirs would cost £52,869; that these plants, working at 61 per cent. load factor, should yield a profit of over £12,000, but if working at 22 per cent. load factor a loss of £191—while a modern steam station at the same capital cost and 22 per cent. load factor would yield a profit of about £9,000 per annum.

Taking into account the uncertainty of the hydraulic conditions and other circumstances, Mr. Monkhouse considers that the Corporation would be well advised to give up the idea of utilising the Trent and to utilise modern steam plant.

In view of the extraordinary ideas as to water power which prevail, it is interesting to note that Mr. Monkhouse finds that 160 B.H.P. can be obtained from the Trent at Beeston and 180 B.H.P. at Colwick, at low water; the power increases to a certain point with higher water and then decreases to nothing as the weirs are "drowned."

**Nova Scotia.**—According to the *Financier*, steps are being taken to develop the local River Mersey, from which it is estimated that about 30,000 H.P. can be obtained. Four power plants already exist in the lower reaches, and it is now proposed to raise the level of First Lake some 20 ft. and build three other dams at intervals, with a view to making further use of the water power.

**Oldham.**—The Electricity Committee has had under consideration a report by Mr. Newington, the engineer, embodying proposals for an extension of the plant which has become necessary owing to the exceptional increase this year in the maximum demand for lighting and power purposes, and to an application having been received from two mills for a supply of energy for power purposes, requiring in all about 800 or 900 H.P., or, say, 650 kW. The engineer recommends the immediate installation of one turbo-alternator of 1,500 kW., and two motor alternators of 500 kW. each, together with the necessary condensing plant, switchboards, foundations, &c., and one additional motor-driven pump for raising the water to the cooling towers, at a cost estimated in round figures at £13,000. The Committee decided to recommend that application be made to the L.G.B. for sanction to borrow £30,000, which is made up as follows:—Additional plant at the station, £13,000; mains, £9,500; transformers and switchgear, £1,200; future mains, £5,000; future transformers, £1,300.

**Reigate.**—The T.C. has decided to extend the lighting mains to the Reigate Lodge estate, which is being developed, on condition that current is used for all the public lighting there.

**St. Helens.**—The Electricity Committee of the T.C. has decided to supply current for heating purposes at 1d. per unit.

**South Africa.**—Two more sets of turbines and generators, each of 10,000 kW. capacity, have just been completed by the A.E.G., of Berlin, at the Vereeniging station of the Victoria Falls and Transvaal Power Co.; two additional 12,000 kW. sets are nearly ready, and when completed the capacity of this station alone will be about 70,000 H.P. The total generating capacity of all the stations erected and equipped by the A.E.G. for the Victoria Falls and Transvaal Power Co. will then be no less than 230,000 H.P.

**South Africa.**—The Durban Corporation is proposing to spend £176,000 on electrical construction and plant during the year. Electric lighting schemes are being promoted in Ladybrand, Somerset West, and Umtali (Rhodesia), and an extension of the town supply to adjoining areas at Pretoria.—*South African Export Gazette.*

**Tilbury.**—The U.D.C. has now given its consent to the application of the County of London Electric Supply Co. Ltd., for a prov. order for electric supply.

**Tyldesley.**—The Power Co., which holds the rights of supply of electricity in the township, has made arrangements with the Tramways Co. to give it a supply of current in bulk, and a plot of land in Castle Street has been taken for the erection of a transformer station.

**Turton (near Bolton).**—The U.D.C. has agreed to the Lancashire Electric Power Co. laying a trunk main cable from Horrobin Mill to Belmont Bleachworks.

**Wakefield.**—A Committee of the West Riding C.C. has accepted the offer of the Wakefield Corporation to supply electricity for the County Offices and adjacent offices, at the current rate for the time being, provided the rate does not exceed 4d. per unit, and subject to a discount of 11 per cent. Consideration had been given to a scheme for the C.C. to generate the electricity needed.

**York.**—A recent debate in the York City Council on the proposed purchase of the Gas Co.'s undertaking is of more than usual interest, as the leading advocates of this purchase are the chairman, vice-chairman and other members of the Electricity Committee. We cannot pretend to understand the reason for their attitude, as the electricity supply department will be the loser by the stifling of competition which naturally follows when both electric and gas supplies are controlled by the Corporation. Moreover, there is every indication that the price of electricity can and will be greatly reduced in the near future, and that the prospects of competing gas undertakings will be correspondingly affected—this being already apparent in some localities.

The manager having reported that he can undertake the electrification of the proposed tramways extension at a saving of £353 on the lowest tender received, the Committee has decided to recommend the Corporation that the work be carried out by its own staff.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—The Buenos Ayres correspondent of the *Daily Telegraph* writes as follows:—"There is a startling sequel to the recent decision in the injunction proceedings of the Anglo-Argentine Tramways Co. v. the Metropolitan Railway, which were decided in favour of the plaintiffs, on grounds that permission was never given to the defendants to make tunnels, and that the municipality so certified. The Metropolitan Railway now produces a certificate of Intendente Giraldez, showing a decree of Intendente Bullrich in 1901 authorising the tunnelling; and also correspondence with the Director of Public Works referring to the opening of shafts. Evidently a serious mistake has been made, and the vexed question as to who owns the real right to construct underground lines is still undecided."

**Australia.**—According to the *Financier*, the New South Wales Minister for Works announces that steps will be immediately taken to put into operation a portion of the scheme drafted by Mr. Hay, for dealing with Sydney's traffic. It is proposed to carry out the first section of the city underground railway, at a cost of between £250,000 and £300,000. In view of the completeness of Mr. Hay's report upon Sydney's traffic problem, the Minister considers a reference to the Works Committee unnecessary, and proposes to introduce a short enabling Bill in Parliament in lieu thereof, which will effect a considerable saving of time and money.

**Bristol.**—At the last meeting of the C.C. the question was debated as to the desirability of tramway purchase by the municipality. After some discussion, a committee was appointed to deal specially with the matter, and to report as to the desirability or otherwise of exercising the option vested in the Corporation of purchasing the tramway undertaking within the city.

**Barton-upon-Irwell.**—The Board of Guardians has decided to approve the recommendation of the Assessment Committee to appear as respondents in the appeal of the Salford Corporation Tramways Committee against the present valuation and assessment of the tramways in the Eccles and Swinton areas. Mr. Everett (chairman of the Assessment Committee) said there had been several objections by Salford during the past two or three years as to the amount of the tramways assessment, and last year a temporary arrangement was arrived at involving considerable loss to the rates. There had been conferences with the Salford Tramways Committee, and the town clerk had formulated a new scheme that all tramways ought to be valued for assessment on the parochial system, i.e., a method whereby inspectors take a special census of the tickets issued to and from the localities concerned, and then it is decided what proportionate value of such tickets is due to Swinton and Eccles. This had been done on a given day by the tramways authority, and on the basis of that result they were appealing against the assessment. Barton Union covers an area through which three tramway authorities have running powers, and the point at issue is a very important one for both rating authorities and tramway committees.

**Clayton-le-Moors.**—There has been a good deal of talk in the Clayton-le-Moors district of Lancashire about a scheme for the construction of a light railway connecting Clayton with the Lancashire and Yorkshire Co.'s main line between Accrington and Huncoat, but the railway company (who agreed, after the scheme had been set on foot locally, to take the project over and secure the necessary Parliamentary powers) have now intimated that owing to "financial and other considerations" there is no immediate prospect of the construction of the line.

**Cuba.**—La Sociedad Tranvias de Matanza has secured a concession for the construction and working of an electric tramway—on the overhead trolley system—in the town of Matanza.

**Continental Notes.**—**FRANCE.**—A new company has lately been formed at Bayonne, with a capital of £40,000, and the title *La Compagnie des Tramways Electriques de la Ville de Bayonne*.

**ITALY.**—La Società Tranviaria Elettrica Littoranea Viareggio-Versilia has entered into an arrangement with the municipal authorities of Carrara for the construction and working of an electric tramway to connect the town of Carrara with the sea-coast. A scheme for the construction of an electric tramway between Viareggio and Carrara is also at present under consideration.

The proposed conversion to electric traction of the railway between Napoli Pozznoli and Torre Gaveto, with the doubling of the track between Terme and Fuorigrotta, has received Government sanction.—*Giornale dei Lavori Pubblici*.

**SWITZERLAND.**—A company has lately been formed in Andermatt with a capital of £48,000, and the title *Die Schollenbahn Gesellschaft*, to construct and work an electric railway between Schollenen and Goschenen.

The Berner Alpen Railway authorities, who are electrifying their Lotschberg section, are reported to have placed orders with the Oerlikon Co. and with Messrs. Brown, Boveri & Co., of Baden, for the electrical equipment for 12 2,500-H.P. electric locomotives.

**HUNGARY.**—Plans have been completed for the construction of an electric railway between Czinkota and Ratosliget for the Budapest Local Railway Co. The work is expected to be commenced in the spring.

**RUSSIA.**—According to the local Press, the Commission for New Railways has approved the project for an electric railway from Riga to Riga Strand, subject, however, to the assent of the Riga Municipality being obtained. This condition was inserted because a section of the proposed line would run through the suburbs of the town.—*Board of Trade Journal*.

**GERMANY.**—An electrically-operated ventilating installation is being carried out at the Kaiser Wilhelm railway tunnel near Treves. A shaft is being sunk from the mountain top to the centre of the tunnel, which is described as being the longest in Germany. The plant, which will be of several hundred horse-power, will be located on the mountain, and will draw the foul air from the tunnel up the shaft. The necessary electrical energy for the plant is to be supplied from the Treves Municipal electric lighting station.

**Eccles.**—A deputation has been appointed to meet the Salford Tramway Committee with a view to discussion of the terms of future supply to avoid, if possible, the costs of an arbitration.

**Halifax.**—The Corporation Parliamentary Bill, which has been issued in printed form to the members of the Council, includes application for borrowing powers for tramways, amounting to £147,738, for electrical equipment and other works in connection with the said tramways, £25,000; and rolling stock, £22,200. The most important clause in the Bill provides that notwithstanding anything to the contrary in Sec. 13 of the Tramways Act, 1870, a local authority shall not purchase the tramways in its district before the expiration of 31 years from the passing of this Act. The tramways embodied in the Act are to be completed within five years, and the Corporation's powers shall then lapse. In the case of Brighouse, it is agreed between the Halifax and Brighouse Corporations, that the extension to Raistrick shall be carried out within 18 months. Agreements are set out in the schedules of the Bill with Brighouse, Soyland, Stainland, Greetland, the Halifax Rural District Council, Shelf, Sowerby Bridge, and Hipperholme, but not with Hebden Bridge or Elland.

**Lanes. and Yorks. Electrical Lines.**—The newly-electrified (H.T., D.C.) line between Bury and Holcombe Brook is expected to be completed in the course of the next month.

**Liverpool.**—Another remarkable increase is shown in the Corporation tramway receipts for 1912. The full returns are not yet published, but from January 1st to December 28th the receipts amounted to £625,163, an increase over 1911 (which was a record) of £26,977. The passengers carried numbered 133,228,898, as against 128,206,669, an increase of 5,022,229. The mileage in 1912 was 12,496,300, being an increase of 141,968 miles as compared with 1911.

**London.**—With a view to facilitating the loading and unloading of the trains during rush hours, the Piccadilly Tube authorities have been experimenting with systems of centre doors on the coaches, and have apparently satisfied themselves as to the merits of a type of double swing door, with electrical indicating lamps, to show when shut or open, on the conductors' and drivers' platforms. If the arrangement is adopted it is assumed that the other Tube lines will take it up.

**Manchester.**—The question of the provision of light glass shelters over the pathways at the principal car-stopping places in the city is to be brought before the City Council, with a view to securing the consideration of the Tramways Committee.

**Nelson.**—At the T.C. on January 2nd the chairman of the Tramways Committee said that he and the tramways manager discussed recently the question of providing a double track between the centre and Hildrop Road. A lot of time was lost through cars having to wait on the loop, and people could walk the length in the time.

**Rotherham.**—The Parliamentary Committee reports having had under consideration the proposal of the Mexboro' and Swinton Tramways Co., to apply for powers to run trolley vehicles in certain districts adjoining the town. The Committee has decided

to obtain from the company an undertaking that if, in the event of the Corporation not opposing its application to run trolley vehicles to Conisburgh, it will agree, if the Corporation applies for powers to run trolley vehicles to the same place, not to oppose the proposal of the Corporation.

**Sheffield.**—The Joint Sub-Committee of representatives of the Tramways and Electric Light Committee has issued its report as to whether, in connection with providing an additional supply of energy for the tramways, the two separate generating stations at Kelham Island and Neepsend should continue to be extended on different systems, entirely isolated, so that the tramways could not obtain any assistance from the large Neepsend station, or matters should be so arranged that these two large supply stations would both be available for supplying energy to the tramways. After going into the matter fully, the Sub-Committee recommends:—(1) That it is not advisable to continue to develop the Kelham Island power station as a separate and isolated unit, but that it is advisable to take steps at once to connect the two stations and install converting plant at Kelham Island; and that a supply of energy be taken as and when thought necessary and advisable by the tramways department from the Neepsend station, by which means both stations will in future be available for the supply of energy to the tramways; (2) that two 1,500-KW. converter sets be put down at Kelham Island as early as possible to deal with the power supply from the Neepsend station; (3) that the prices and conditions which the electric supply department offer for this purpose be adopted. [The charge is based on £4 per KW. per annum plus 25d. per unit supplied, and ranges from '615d., 30 per cent. L.F., to '360d. 100 per cent. L.F.] (4) That tenders be obtained for the necessary plant, &c., for the carrying out of the arrangements. In arriving at its decision the Sub-Committee states that whilst the supply from Kelham station has been regularly maintained at a low working cost, the tramways had developed on larger lines than was originally expected when the Kelham site was decided upon and plant first installed there. The position of the Kelham station is such that there must always be a considerable handicap attached to the working of the station. The Neepsend site and station has been developed on larger lines as a result of more modern experience gained during recent years, and can now supply and provide in the future the additional power required for the tramways.

It has been decided by the Tramways Committee, by resolution, to recommend the grant of £2,000 from the special purposes fund of the tramways, towards the cost of the extension buildings in connection with the Applied Science Department of the Sheffield University. The decision to make the grant is the outcome of a letter from Sir Joseph Jonas to Sir Wm. Clegg, in which Sir Joseph stated that the efforts to obtain from the Treasury a special grant had been unsuccessful, and it was therefore necessary to raise what was required from other sources. The total sum required is £12,000, and this amount Sir Joseph has set out to obtain.

**Siam.**—It is reported that La Compagnie Mutuelle de Tramways, of Brussels, is negotiating the formation of a large new company to undertake the establishment of an electricity station in Bangkok for the supply of current for lighting and power purposes, and for tramway operation in the Siamese capital.

**South Africa.**—According to the *South African Export Gazette*, the Durban Corporation has decided to spend £150,000 on tramway extensions; the extension of the Pretoria municipal area will involve further tramway construction; the Krugersdorp Council, although considering the preliminary use of petrol-electric buses, has earmarked £45,000 for a future tramway scheme.

**U.S.A.**—According to the *Financial News*, the beginning of the electrification of the trans-Continental railways is marked by the grant to the Great Falls (Montana) Power Co. of permission to transmit power for the electrification of 450 miles of track on the main line of the Chicago, Milwaukee and Puget Sound Railway between two points in Montana and Idaho.

**Warrington.**—The Electricity and Tramways Committee has decided that the tramways manager prepare a map showing the existing tramways and his suggestions for new routes for the proposed motor-omnibuses, and that a copy thereof be supplied to each member of the Committee.

## TELEGRAPH and TELEPHONE NOTES.

**Brazil.**—The Brazilian Government has concluded an important contract with Marconi's Wireless Telegraph Co. for the provision of powerful stations at Rio de Janeiro, Santa Martha, Bauru, and Ladario, the two last-named being important towns in the Sao Paulo and Matto Grosso regions. These stations will form the Southern nucleus of the Brazilian internal wireless network first proposed by Dr. Bhering, the delegate of the Brazilian Government to the recent London Radiotelegraphic Conference. In all, not fewer than 30 such wireless stations will be required for the main lines of Dr. Bhering's scheme to be realised, and the Marconi Co.'s success in obtaining the contract for the four stations now to be erected in the South is the result of the very satisfactory working of the Manaus and Porto Velho stations which form the Northern nucleus of the general scheme. These stations are situated in the tropics on the Amazon River, where severe electrical storms are almost continuously experienced.

**France.**—The French Post and Telegraph authorities have decided on the establishment of a large new telephone exchange in Paris, on the site of part of the old Cherche-Midi Military Prison.

**Japan.**—Some difficulty is being experienced by the Japanese telegraph service owing to the damage caused to the submarine cables off the coast of Japan by fishing trawlers. Owing to the profitable nature of the business, there has recently been a large increase in the number of trawlers, with the result that an interruption of the cable service is frequently caused. The authorities of the Government Telegraphs and Agriculture Departments are at present conferring as to the steps to be taken to overcome the difficulty.

**Persia.**—The Minister of Posts and Telegraphs has authorised the Indo-European Telegraph Department to reconstruct the Arabian telegraph lines with iron poles. The result will be to ensure reliable international telegraphic communication with such places as Ahwaz, Shusht, and Mohamerah. All the existing concessions of the Department have been renewed until 1915.

**New Zealand.**—Our Wellington correspondent reports that owing to the rapid rate at which subscribers are being added at the four principal cities, it has been decided to make any future extensions such that the exchanges can ultimately be converted to automatic working.

The Wellington and Auckland exchanges are nearing the limit of their capacity, and the Minister of Post and Telegraphs has announced that tenders are to be called immediately for automatic exchange apparatus to be so constructed that it can be used in conjunction with the existing magneto system. The chief electrician of the Department made an extended tour recently through the United States, England and the Continent, and has reported very favourably on automatic systems generally. The Strowger Co. erected a demonstration board of about 20 lines in Wellington, and this has been in operation for several months with satisfactory results. The growth of several of the smaller towns is proceeding at such a rapid rate that there is a probability of several of them also being served on the automatic or semi-automatic systems.

**South Africa.**—Telephone developments to cost £8,000 are contemplated at Durban.—*British and South African Export Gazette*.

**The Imperial Wireless System.**—On Wednesday, January 1st, the Select Committee of the House of Commons resumed the inquiry into the Marconi contract. Major Archer-Shee, M.P., gave evidence, repeating his contention that the Marconi Co. had received special consideration from the Post Office, and stigmatising as a monstrosity the clause which bound the Government for five years to adhere to the Marconi system (the clause has been dropped). If the Marconi Co. received £60,000 a year from the royalty, he said they would be able to buy up rival patents. He suggested that the agreement of 1909 gave the Postmaster-General power to use any Marconi patent, and said that the Government should invite tenders, and have the stations built under their own control. He had been offered shares in the Poulsen Syndicate in 1911, and again last year, but refused them, being interested in a State-owned Atlantic cable. Mr. Gandil, who represented the Danish owners of the patents, had informed him of the way in which the Post Office had dealt with the offer of the Poulsen Co. He had no interest in any wireless company. The speed of transmission contracted for was totally inadequate. The Poulsen Co. had proved that they could send messages over 2,000 miles at a speed exceeding 100 words a minute. Other systems were, or soon would be, capable of sending at the same rate. The speed contracted for should be subject to revision after five years. In December, 1911, by trial he found that the Marconi trans-Atlantic service took three times as long as the cable to transmit a message; but on December 30th, 1912, it got through much more quickly. In his opinion, the cable system was more efficient, but wireless would be a most valuable auxiliary. He suggested that the Committee should present an interim report, recommending that the acquisition of sites and the erection of buildings should be proceeded with immediately, while the best system was selected at leisure by a technical Committee. Under the agreement the Marconi Co. would be able to create a great wireless trust.

Mr. Viggo Gandil, representing the owners of the Poulsen-Pedersen patents, said that early in 1911 he was forming a British company to work the system, and to establish a service between the United Kingdom and Canada. Learning in October, 1911, that an Imperial scheme was under consideration, he asked the Post Office for an opportunity to tender, and on January 11th, 1912, he voluntarily submitted an offer to build six stations for £40,000 per station, including the power house and foundations. For the wireless equipment alone of the Indian station he named a price of £22,000. On January 18th, 1912, he met the Postmaster-General, and offered to give a demonstration of wireless telegraphy across the Atlantic in six or, at most, eight months; he pointed out that it was impossible to raise capital for a wireless scheme without a guarantee that the Government would grant a licence, that the stations would not be liable to be acquired by Government on its own terms, and that the Government would not erect competing stations. On January 19th, on behalf of the Postmaster-General, Mr. Farnall asked if he would sell all the unsold Poulsen patent rights for the whole world, but he declined. He further offered, on January 29th, to build stations in Ireland, Cyprus and Canada, provided that if these were satisfactory the Government would adopt his system for the first six stations. On February 19th, the offer was refused. He was then in touch

with financiers who could have provided funds to carry out the Imperial scheme, and had since formed a British company primarily for trans-Atlantic work; but it was always told him that nobody but Marconi would be allowed to do Government work. He had made it clear to the Postmaster-General in January, 1912, that if he were allowed to tender he could prove that he had the necessary financial support, and that he would ask for no payment from the Government unless the latter were satisfied with the stations. Dr. Poulsen and Prof. Pedersen were scientists of the highest eminence, and had a staff of experienced engineers; they had almost completed the designs for two trans-Atlantic stations for the Universal Radio Syndicate, Ltd., which was registered in September last, with £100,000 capital, and would own all the Poulsen rights except for Germany and the United States.

On Thursday Mr. Gandil was closely cross-examined on a statement which he had made to the effect that Sir Alex. King's assertion that he had been told by Government experts that the Poulsen Co. had not communicated, and never could communicate, over a distance of 2,000 miles need not be taken seriously, in view of the evidence of the experts themselves. He admitted that at the time they had no regular service over 2,000 miles, but had pointed out always that they undoubtedly could do it. He could not name any places between which his company was communicating regularly by day. The system could be tested between Honolulu and San Francisco. Sir Alex. King knew nothing about wireless; Mr. Madge and Mr. J. E. Taylor, the Government experts, had expressed the opinion that his company could do it. It was true that his company had not yet communicated over 2,000 miles, but the system had done it. At the time they could have taken a contract for six stations at £40,000 each. The syndicate was called the Continental Syndicate for Poulsen Radio-Telegraphy, with headquarters in Copenhagen, and it had the right by the contract of sale to all improvements made in America. He learnt from Sir W. Hall-Jones, the High Commissioner for New Zealand, that the stations were to be 2,000 miles apart, and that the Marconi Co. had not got the contract, before he wrote the letter of January 11th, 1912. He was not told by the Postmaster-General on January 18th that the conditions laid down by the Imperial Wireless Committee were a demonstration of working over 2,000 miles and a waiver of the restriction in communication with foreign countries; had he known, he could have given the demonstration within the time allowed, and would have seriously considered the question of the waiver.

He would have been prepared to erect the stations at a less cost than £60,000 each, and to guarantee that the system would work at high speed, at a lower working cost, and without reservation regarding atmospheric disturbances, as well as to guarantee financial ability to carry out the work, but he never had the opportunity to tender. There was no difficulty, to an engineer, in extending the range from 1,000 to 2,000 miles. They might be able to have the stations in Ireland and Canada at work in August, and could give a demonstration of practical working over 2,000 miles within six months. He had not heard until that day the conditions prescribed by the Committee.

**The P.O. Telephone Staff.**—Great dissatisfaction has arisen among the Post Office Telephone outside staff at Leeds, and the trouble threatens to become national. The allegations are that they have been deprived of "walking time," and can only earn 22s. per week, and that a system of espionage is permitted, with the result that men are dismissed without explanation.

**Venezuela.**—Owing to the frequent interruptions in the submarine telegraphic connections with Venezuela, the Government of that country, at the instance of the Chamber of Commerce of Caracas, has established a daily steamer service between the Port of Cristobal Colon (Macuro) and the Island of Trinidad, in order that cables for Venezuela may be transmitted to Trinidad and then conveyed by steamers to Venezuela, so ensuring a minimum of delay.

## CONTRACTS OPEN and CLOSED.

### OPEN

**Atberton.**—January 29th. One E.H.T. switchboard and one H.T. switchboard for the U.D.C. See "Official Notices" December 27th.

**Australia.**—VICTORIA.—January 28th. Paper-insulated lead-covered cable for the P.M.G.'s department. See "Official Notices" December 20th.

February 21st.—Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" to-day.

**Birmingham.**—January 27th. Stores for a year for the Corporation Tramways. Mr. A. Baker, manager.

**Bispham-with-Norbreck.**—January 18th. One oil or gas engine direct coupled to a 100-kw. dynamo, for the U.D.C. See "Official Notices" January 3rd.

**Canada.**—January 24th. Chairman, Winnipeg Board of Control; three 2,700-kw. step-down transformers. Plans, &c., Civic Light and Power Department, Winnipeg. Tenders endorsed "Tender for step-down transformers."

February 13th.—Machines, motors, cranes, &c., for Transcona Railway shops. Specifications, forms of tender, Mr. W. J. Press, engineer, Ottawa.

February 10th.—One 1,500-kw. steam turbine and generator for the City of Moose Jaw, Sask. See "Official Notices" to-day.

**Chile.**—September 10th. Tenders are invited for the establishment of an electric central station and the distribution of electrical energy at the port of Valparaiso. Inquire at the offices of the Chilean Legation, 48, Grosvenor Square, W.

**Clacton-on-Sea.**—January 29th. One 250-kw. Diesel oil engine, generator, switchboard, &c., for the U.D.C. See "Official Notices" to-day.

**Eastbourne.**—January 14th. One 1,000-kw. horizontal steam turbine and alternator, without condensing plant, for the Corporation. See "Official Notices" December 20th.

**Glasgow.**—January 21st. Two 6,000-kw. turbo-alternators, with condensing plant and accessories, and water-tube boilers, for the Corporation. See "Official Notices" January 3rd.

**Harwich.**—January 13th. Four motor-driven centrifugal pumps, two motor-driven sewage rakes and screens, with switchgear, and about 400 yd. of 15-in. cast-iron rising main, for the Corporation. See "Official Notices" December 20th.

**India.**—January 24th. Bombay, Baroda and Central India Railway invites tenders for rotary converter plant. See "Official Notices" to-day.

**London.**—STEPNEY.—The B.C. Electricity Committee is about to invite tenders for two 5,000-kw. turbo-alternators, four water-tube boilers, condensers, switchgear, &c.

**L.C.**—January 20th. Electrical installations at Camberwell School of Arts (with fire-alarm bells and wiring for power and electrical clocks), and at Vauxhall Street Elementary Schol. See "Official Notices" to-day.

**Nelson.**—February 3rd. One traction battery, one automatic reversible booster and switchgear, one D.C. motor-generator and switchgear, for the Electricity and Tramways Committee. See "Official Notices" to-day.

**Norway.**—CHRISTIANIA.—The T.C. will shortly be in the market for the purchase of two three-phase turbo-generators of 5,000 and 6,000 kw., respectively, for the municipal power station. Particulars from the T.C.

**Nuneaton.**—January 21st. One water-tube boiler, with valves, fittings, &c., for the Corporation Electricity Department. See "Official Notices" to-day.

**Plymouth.**—January 23rd. Stores, for a year, for the Corporation Electricity and Street Lighting Departments. See "Official Notices" January 3rd.

**Sheffield.**—January 23rd. General stores for the City Tramways Department. See "Official Notices" January 3rd.

**South Africa.**—February 3rd. Cables, trolley wire, fittings, poles, converters, switchgear, &c., for the Germiston municipal trackless trolley scheme. Specification, &c., can be seen at the Board of Trade Commercial Intelligence Department in London.—*Board of Trade Journal*.

**Spain.**—January 18th. Municipal authorities of Riaza (province of Segovia). Concession for the electric lighting of the town during a period of ten years. Tenders invited.

January 18th. Municipal authorities of Suria (province of Barcelona). Concession for the electric lighting of the town during a period of ten years. Tenders invited.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**West Ham.**—January 24th. Engine-room stores, chemicals and A.C. house service wattmeters, for the Council's electricity department. See "Official Notices" to-day.

### CLOSED.

**Batley.**—The Corporation has accepted the tender of the Tudor Accumulator Co., Ltd., for the maintenance, for a period of 12 years, of the battery which it supplied to the electricity works.

**Bristol.**—The Electricity Committee has accepted the following tenders:—

British Westinghouse Co., Ltd.—Extra-high-tension and low-tension switchgear for Temple Back sub-station, at £408.  
Bruce Peebles & Co., Ltd.—One three-phase to direct-current converter (No. 1) for Temple Back sub-station (ol 1,000 aw.), £2,187.

**Canada.**—The Hart Accumulator Co., Ltd., have secured the contract for the supply of the storage battery, 1,190 ampere-hours capacity, required for Yellowgrass electricity works, Saskatchewan, Canada.

**Chile.**—TALCAHUANO.—Messrs. Gillespie & Beales, purchasing engineers for Messrs. Martin Bros., Valparaiso, have placed the following orders for this electric lighting scheme:—

Generators.—Laurence, Scott & Co.  
Battery, &c.—Hart Accumulator Co.  
Switchboard.—Ferranti, Ltd.  
Cable.—W. T. Glover & Co.  
Crane.—Holt & Willitta.  
Steel poles.—Stewarts & Lloyds.  
Lanterns and fittings.—Haden Harrison.  
Asphalte flooring.—Limmer Asphalte Paving Co., Ltd.

**Colchester.**—The T.C. has accepted the tender of Messrs. H. G. Merry & Co. for 550 tons of Gelling and Shirebrook nutty slack coal for the electric light works, at 14s. 8d. and 14s. 10d. per ton respectively.

**Eccles.**—The Corporation has accepted the tender of the British Westinghouse Electric & Manufacturing Co., Ltd., for 12 months' supply of consumers' electricity meters.

**Guildford.**—The tender of Messrs. Carling, Gill and Carling, Ltd., of Guildford, has been accepted for the electric light installation at the new schools.

**London.**—**STEPNEY.**—The B.C. Electricity Committee received tenders for the supply of cable during the period ending December, 1915, from which the engineer has prepared the following statement:—

W. T. Henley's Telegraph Works Co., Ltd. (accepted)	£8,886
British Insulated and Helsby Cables, Ltd.	9,069
Callender's Cable and Construction Co., Ltd.	9,100
W. T. Glover & Co., Ltd.	9,176
Western Electric Co., Ltd.	9,198
Siemens Bros. Dynamo Works, Ltd.	9,265
St. Helena Cable Co., Ltd.	Unable to tender.

The specification includes a clause which provides for the adjustment of the price of cable according to the market prices of copper and lead at the time of ordering. The Council, consequently, does not guarantee to purchase any minimum quantity of cable, but the amounts of the tenders are calculated on the estimated quantities required.

For the supply of conduits, troughs and covers required during the same period, the engineer prepared the following statement on tenders received:—

	Stoneware conduits.	Fibre conduits.	Troughs and covers.
<b>Albion Clay Co., Ltd. (recommended)</b>	<b>£2,481</b>	—	—
Henley's Telegr. Works Co., Ltd.	2,664	£2,713	£1,269
Key Engineering Co., Ltd.	2,754	2,530	—
<b>Siemens Bros. &amp; Co., Ltd. (recommended)</b>	<b>2,754</b>	<b>2,530</b>	<b>1,268</b>
	(Less 2½ %)	Unable to tender	(Less 2½ %)
B.I. and Helsby Cables, Ltd.	Do.	Do.	Do.
Callender's Cable, &c., Co., Ltd.	Do.	Do.	Do.
W. T. Glover & Co., Ltd.	Do.	Do.	Do.
I.R., G.P. & Telegr. Wks. Co., Ltd.	Do.	Do.	Do.
Western Electric Co., Ltd.	Do.	Do.	Do.

The specification provides either for the supply of stoneware conduits or fibre conduits, and, having regard to the difference in the amounts of the tenders for the two kinds of conduits, and to the suitability of the stoneware conduit, the last-mentioned is recommended, the Albion Clay Co., Ltd., to supply the stoneware conduits, and Messrs. Siemens Bros. & Co., Ltd., the troughs and covers.

**HACKNEY.**—The B.C. Electricity Committee has accepted the tender of Messrs. Geipel & Co. for fume arc carbons, at £2 15s. per 1,000 pairs; also that of the Sloan Electrical Co., Ltd., for long open type arc carbons, at £3 8s. per 1,000 pairs, and for short open type carbons, at £2 17s. per 1,000 pairs. The other tenderers were the G.E. Co., Ltd., Crompton & Co., Ltd., Siemens Bros., Ltd. Messrs. Ship Carbons, Ltd., were unable to quote for open type, as their entire production up to the end of February, 1913, was already sold.

According to the *Railway Gazette*, the L. and N.W. Railway has placed a contract (valued at £500,000) with the firm of Walter Scott & Middleton, Ltd., for widenings and alterations, also 16 ft. 4 in. diameter cast-iron tube railways, in connection with its suburban electrification scheme. The same firm is also carrying out work on the extension of the Bakerloo tube from Paddington to Queen's Park, where it will link up with the L. and N.W. electric lines.

**Runcorn.**—The B. of G., which accepted the tender of Messrs. F. W. Smith & Co., of Manchester, for an engine for the electric light plant to be installed in the Children's Home, has given an order to the same firm for a duplicate engine.

**Salford.**—The following tenders have been accepted by the T.C.:—

A. E. Dean & Co.—Additions to switchboard, &c., at dispensary, £60.
General Electric Co., Ltd.—Electric fittings, £75.
E. M. Evans & Sons.—Wiring and fixing electric fittings, £26.
Clifton and Kersley Coal Co., Ltd.—500 tons No. 4 washed steam nuts, for the electricity works, at 12s. 11d. per ton.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAP.

The following orders have been issued for the current week:—

Monday, January 13th.—"A" Company.	Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.
Tuesday, January 14th.—"B" Company.	Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.
Thursday, January 16th.—"C" Company.	Company training, 7 to 10 p.m.
Friday, January 17th.—"D" Company.	Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.
Saturday, January 18th.—"D" Company.	Week-end run at Fort Coalhouse. Dress—Service dress, putties and greatcoat. No arms or equipment will be taken. Parade at Fenchurch Street Station, Midland, London and Tilbury station, at 3 p.m., for Low Street Station. Railway tickets will be issued by the senior N.C.O. present.
Headquarters will be opened for regimental business from 10 a.m. till 12 noon.	

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.,  
For Officer commanding L.E.E.

## PROPOSED EXPENDITURE ON ELECTRICAL WORKS UNDER PRIVATE BILLS.

The following estimates of proposed expenditure on electrical undertakings under powers sought in Private Bills this year appear in either the deposited estimates or the Bills:—

<b>London County Council.</b> —Tramways £311,500; subway £91,000; street widenings £216,820 ... ..	£655,320
<b>Hove Corporation</b> (H. H. Scott, borough engineer).—Extension of electrical undertaking of the Corporation after the date of the transfer to the Corporation of the undertaking of the Hove Electric Lighting Co., Ltd., and the construction and provision of mains, works, fittings and apparatus, and additions to plant for and in connection with the electricity undertaking of the Corporation ... ..	30,000
<b>Huddersfield Corporation</b> (K. F. Campbell, engineer for tramways and street improvements, and R. H. Wilkinson, electrical engineer).—Permanent way for tramways £83,575; electrical equipment for tramways, £33,845; tramway rolling stock, £11,250; electrical equipment of trolley vehicles, £2,804; trolley vehicles, £1,500; motor-buses, £7,500; street works, £2,530 ... ..	143,004
<b>London Electric Railway</b> (H. H. Dalrymple Hay and A. R. Cooper, engineers).—No. 1 railway, 6 furlongs 140 chains, double, £220,784; No. 2, 1 furlong 225 chains, single, £33,682; No. 3, 1 furlong 2 chains, single, £23,299; No. 4, 1 furlong 450 chains, single, £45,566; No. 5, 1 furlong 53 chains, single, £59,351; deviation railway, No. 1, 1.65 chains, single, £5,496; deviation railway, No. 2, 1.75 chains, single, £5,751; No. 6 railway, 4 furlongs 490 chains, single, £238,635; No. 7 railway, 3 furlongs 535 chains, single, £32,664 ... ..	465,231
<b>Central London Railway</b> (Mott & Hay, engineers).—No. 1 railway, 2 furlongs 11 chain, single, £32,363; No. 2, 1 furlong 916 chains, single, £175,545; No. 3, 1 furlong, single, £23,302; No. 4, 2 miles 15 chains, double, £597,248; No. 5, 3 furlongs 39 chains, double, £88,614 ... ..	759,072
<b>Leeds Corporation</b> (J. B. Hamilton, general manager of tramways).—Construction of tramways, £63,958; provision of tramcars, £6,000; provision of trolley vehicles, £22,500; provision of electrical equipment and construction of other works necessary for the tramways and trolley vehicles, £43,645; land for sub-station and depot for tramways and trolley vehicles, £3,000; sub-station and depot and plant and cables in connection therewith, £34,438 ... ..	173,541
<b>City and South London Railway</b> (Basil Mott and D. Hay, engineers).—Enlargement of 7 miles 3 furlongs 68 chains of tunnels, £346,000; contingencies, 15 per cent., £51,900; easements, £992 ... ..	398,892
<b>Chesterfield Corporation Railways Traction</b> (R. L. Acland, electrical engineer).—Buildings, car-sheds, depôts, £2,000; overhead equipment and the construction of other works necessary for the working and lighting of trolley vehicles, £33,780; provision of trolley vehicles, £6,400; motor-omnibuses and expenses in connection with running thereof, £16,000 ... ..	58,180
<b>Derby Corporation</b> (J. Ward, borough engineer).—Construction of tramways, £24,000; provision and erection of posts, standards, brackets, and other apparatus for the purpose of the tramways, £6,000; provision and equipment of motor-buses, £5,000; street works, &c., £79,000 ... ..	114,000
<b>Dundee Corporation.</b> —(J. Thompson, engineer)—Tramways ... ..	13,000
<b>Halifax Corporation</b> (J. Lord, W. M. Rogerson, and J. W. Galloway, engineers).—Permanent way of tramways and tram-road, £147,738; tramway rolling stock, £22,200; electrical equipment, £24,975; motor-buses, £11,000; street works, £50,055 ... ..	255,968
<b>Nottingham Corporation</b> (A. Brown, city engineer; J. Aldworth, tramways manager; and H. Talbot, electrical engineer).—Construction of tramways, £19,250; tramway rolling stock, £14,600; electrical equipment and other works, £9,950; provision of trolley vehicles, £15,500; electrical equipment and construction of works necessary for trolley vehicles, £8,950; provision of motor-omnibuses, £39,375; land and buildings for trolley vehicles and motor-buses, £8,775 ... ..	116,400
<b>Mezborough and Swinton Tramways</b> (F. E. Stanley, engineer) ... ..	600
<b>Metropolitan District Railway</b> (A. R. Cooper, engineer).—Widening of Fulham extension ... ..	26,739
<b>Metropolitan Railway</b> (W. Wilcox, engineer).—Railways and lands ... ..	552,165
<b>Southport Corporation</b> (A. S. Black, electrical engineer and tramways manager).—Trolley vehicles, £3,000; electrical equipment for trolley vehicles, £6,500; motor-buses £2,000 ... ..	13,500

<i>Western Valleys (Mon.) Railless Electric Traction</i> (J. W. Szlumper, engineer).—Roads, £300 ... ..	£300
<i>West Bromwich Corporation</i> (A. D. Greatorex, engineer).—Provision of trolley vehicles, £20,000; provision of motor-houses, £8,000; lands and street improvements, £15,000 ... ..	43,000
<i>Leicester Corporation</i> (E. G. Mawbey, engineer).—Tramways, £69,627 ... ..	69,627
<i>Brighton Corporation</i> .—Purchase of land and construction of sheds with underground cableways and cables, £9,000; overhead line equipment, shelters, &c., £5,300; trolley vehicles, £4,900 ... ..	19,200
<i>Colne Corporation</i> .—Working capital of light railway to be acquired, £2,000; reconstruction and improvement of light railway, £10,000 ... ..	12,000
<i>East Ham Corporation</i> .—Purchase of equipment of trailer cars ... ..	1,000

### FORTHCOMING EVENTS.

**Institution of Electrical Engineers (Dublin Section).**—Friday, January 10th. At 8 p.m. At the Royal College of Science, Dublin. Paper, "Notes on Self-Propelled Cars for Light Railway Work," by Mr. J. P. Tierney.

**(Western Section).**—Monday, January 13th. At 4 p.m. At the South Wales Institute of Engineers, Cardiff. Discussion on paper on "Overhead Transmission Lines" to be resumed. Address on "Automatic Telephones," by Mr. W. Aitken.

At 6.30 p.m. At the Park Hotel, Cardiff. Dinner.

**(Manchester Section).**—Tuesday, January 14th. At 7.30 p.m. At the University, Manchester. Paper on "Starting and Speed Control on Induction Motors," by Mr. F. C. Aldous.

**(Scottish Section).**—Tuesday, January 14th. Meeting at 8 p.m. At 207, Bath Street, Glasgow.

**(Yorkshire Section).**—Wednesday, January 15th. At 7.15 p.m. At the University, Leeds. Lecture on "Comparative Notes on Independent Steam Condensing Plants," by Mr. W. A. Dexter.

**(Students' Section).**—Wednesday, January 15th. At 7.45 p.m. Paper on "The Conditions Influencing the Design and Minimum Manufacturing Cost of Induction Motors," by Mr. E. T. Driver.

**Electro-Harmonic Society.**—Friday, January 10th. At 8 p.m. At the Holborn Restaurant. Smoking Concert.

**Institution of Post Office Engineers (Metropolitan Section).**—Monday, January 13th. At 6 p.m. At the I.E.E. Paper on "The Electrophone Service," by Mr. J. H. Pattman.

**Institution of Mechanical Engineers (Graduates' Association).**—Monday, January 13th. At 8 p.m. Paper on "Electric Accumulators," by Mr. W. C. Paddock.

**Institution of Mechanical Engineers.** Friday, January 17th. At 8 p.m. Paper on "Indicators," by Mr. J. G. Stewart.

**Association of Mining Electrical Engineers (West of Scotland Branch).**—Saturday, January 18th. Meeting at 4.30 p.m. At the Royal Technical College, Glasgow.

### NOTES.

**Metallic Illusions.**—Mr. T. Vaughan Hughes A.R.S.M., writes pointing out that users of metals and alloys in general do not sufficiently realise that many cases of corrosion of their copper pans and boilers, mysterious breakages of chains and railway accessories, and sudden failures of condenser tubes and copper pipes are due to two easily preventable causes described below.

In order to satisfy the demand for beauty of form, or the modern craving for cheapness, many ingenious mechanical devices have been evolved by manufacturers' works staffs, which put upon the metallic articles while being made uneven strains, or introduce in antiquated furnacing appliances deleterious compounds, which ultimately render the articles useless, and often enough dangerous to human life and property. An attempt is made to remove these strains by annealing in unevenly heated furnaces.

A few manufacturers, whose products are subject to constant physical tests, are quite alive to the situation. It must also be conceded that manufacturers of ferrous and non-ferrous metals and alloys spare no pains to free them while in the molten state from deleterious substances. They employ expensive deoxidisers—ingenious devices to prevent contact of the liquid metal with the air during the casting operations, all tending to produce soundness in the ingots or castings, i.e., to free them from blow-holes and segregations.

No sooner is this desirable end attained, than the metal or alloy is introduced into furnaces wherein hot gases containing free oxygen, sulphur and other objectionable elements are allowed to impinge upon, or envelop, the metal. While hot they are brought out of the furnace into the air and mechanically treated in an atmosphere containing oxygen. This operation is often repeated several times. In cases of cold working the metal is, with few exceptions, annealed between processes in furnaces in which the air has access. After this heat treatment it is withdrawn and allowed to cool, sometimes in approximately closed receptacles—often in the air. Not only is the surface of the metal oxidised or tarnished, but during the whole time of heating, and partly in cooling, evolution of oxygen and other gases takes place, with formation of compounds in intergranular spaces, or in the body of the

metal or alloy, which form centres or areas of corrosion when in use. In the last year or two exact investigations and experience have proved beyond doubt that both the above defects in heat treatment are prolific causes of corrosion and other breakdowns.

Mr. Hughes therefore submits that the time has arrived for all engineers and users of metals and alloys to insist and specify that, at least, two causes of failure of metals and alloys under the control of the makers shall be removed, namely, (a) Uneven heating appliances; (b) Antiquated heat treatment in chemically and physically active atmospheres.

Incidentally, the public health will benefit, because all the appliances on the market capable of bringing about the above results are smokeless when in operation. The present unnecessary and wicked waste of one of our natural resources, viz., coal, will also be curtailed.

### "Centralians" and Cable Laying at the Antipodes.

—Graduates of the Central Technical College, South Kensington, now called the City and Guilds (Engineering) College, are, as is well known in the engineering world, at work "keen in their vocation" in all quarters of the globe. It is not, however, a common occurrence that five Associates of three different years find themselves together on a single job. This recently happened on the occasion of laying submarine telegraph cables between Sydney and Auckland (N.Z.), 1,200 miles, and Doubtless Bay (N.Z.) and Auckland, 140 miles. The photograph reproduced here

shows the group on board the cable steamship *Silvertown*, owned by the India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd., the contractors for the manufacture and laying of the cables. Starting from the left-hand side, the men are: Bernard S. Lion (1909-12), Frank P. Swann (1906-9), Nelson J. Perryman (1908-10), Edgar A. Beavis (1909-12), and Thomas H. Solomon (1909-12). Mr. Perryman went out as representative of the consulting engineers, Messrs. Clark, Forde & Taylor, and the other four were employed by the contractors as assistant electricians on the *Silvertown*. The work of laying the cables was completed early in December, 1912, and the photograph reached the College as a Christmas card.

**Electricity in Mines.**—Part 2 of the Report of the Chief Inspector of Mines, just issued by the Home Office, is rather a belated document, as it only deals with 1911, but there is a good deal of interesting information in it, especially with regard to the use of electricity in mines. Mr. Nelson, the Electrical Inspector of Mines, who during the year made a number of underground and surface inspections of electric plant in mines, besides investigating accidents at mines due to electricity, reports that electricity was newly introduced into 46 mines in 1911, as against 40 in 1910. The districts were:—Scotland, 20; Newcastle, 1; Durham, 2; Liverpool and North Wales, 2; South Wales, 13; and Midland and Southern, 5. The electricity special rules in force during 1911 merely required that the introduction of electricity should be notified, but this has been remedied by the Coal Mines Act, and a complete classification of the different systems of distribution, together with a measure of the growth of the use of electricity in mines, will be made possible for the future. Such particulars as are now available show that the high-pressure alternating-current system was introduced into five mines, the medium-pressure alternating-current system into 11 mines, the medium-pressure direct-current system into 13 mines, and the low-pressure direct-current system into four mines. In the latter case the current was introduced in each instance for lighting purposes only. The number of electrically-driven coal-cutting machines in use at the end of 1911 was 998, an increase of 125 over those in use at the end of 1910. During the year 14 fatal accidents were reported and investigated, causing in all 15 deaths, but of these two, causing three deaths, strictly speaking, had no connection with the use of electricity in or about mines. In 1910 there were 21 fatal accidents. Of the 12 deaths in 1911, all but one were electric shock accidents, the remaining one being due to an ignition of fire-damp by electricity. Three underground fires were reported to have been due to electricity. It is also stated that the possibility of the application of wireless telegraphy to mines opens out an interesting field for speculation, and it is obvious that it might prove a valuable aid during rescue operations. We shall refer to the matter more fully in a later issue.

**International Time Conference.**—In connection with the proceedings of the recent conference on wireless time signals, *La Technique Moderne* quotes a note of M. G. Bigburdan communicated to the Academy of Sciences, giving the following list of stations which will probably be in a position by July 1st, 1913, to act as centres for the emission of time signals, at the hours named.

	Hours (Greenwich time).
Paris ... ..	0 midnight
San Fernando (Brazil) ... ..	2
Arlington (United States) ... ..	3
Manilla ... ..	4 (provisional)
Mogadiseio (Italian Somaliland) ... ..	4
Timbuktou ... ..	6
Paris ... ..	10
Norddeich-Wilhelmshaven ... ..	12 (noon)
San Fernando (Brazil) ... ..	16
Arlington (United States) ... ..	17
Masseonah (Erythrea) ... ..	18
San Francisco ... ..	20
Norddeich-Wilhelmshaven ... ..	22

The signals will be sent out in accordance with the plan here illustrated, covering the four minutes immediately preceding the hour of the signal; these signals consist of "dashes" lasting one second and dots lasting  $\frac{1}{4}$  second, with intervals of one second. The wave-length employed will be about 2,500 m.

the close of which marks the beginning of the 59th minute. The time signals then follow every 10 seconds for two minutes, ending precisely at the hour; these signals consist of "dashes" lasting one second and dots lasting  $\frac{1}{4}$  second, with intervals of one second. The wave-length employed will be about 2,500 m.

**Electricity Supply Rifle League.**—The following are the results of the matches shot during December in connection with the above League:—Westminster (H. A. Pearman, 98), 572, r. Stepney (Jager, 99), 554; Westminster (Neville, 98), 572, r. Central (Brackley, 94), 550; Stepney (Barber, 99), 547, r. Shoreditch (Weekes, 99), 571; Ilford (Haeger, 96), 554, r. Central (Gaze, Cope, Wells, 96), 567.

#### FINAL POSITION OF CLUBS.

Club.	Shot.	Won.	Lost.	Drawn.	Points.	For.	Against.
Westminster ...	10	10	0	0	20	5,685	5,499
Central ...	10	7	3	0	14	5,552	5,520
Shoreditch ...	10	6	4	0	12	5,614	5,519
Stepney ...	10	3	6	1	7	5,470	5,552
Ilford ...	10	2	8	0	4	5,403	5,557
Hackney ...	10	1	8	1	3	5,426	5,503

**Automatic Pipe Cleaner.**—The latest development of the penny-in-the-slot machine is a device in which is incorporated a small electric motor, driving a self-adjusting revolving scraper, to clean the bowl of a tobacco pipe; a jet of compressed air cleans the stem. We understand that these machines are about to be placed about London.

**R.A.C. Trial of an Electrical Delivery Van.**—We are glad to learn that a trial of an electrical delivery van is this week being carried out under the supervision of the Royal Automobile Club. The vehicle, which has been entered by Mr. J. F. Monnot, of 41, Great Portland Street, W.C., is fitted with a battery of Edison accumulators. The trial, which started on Monday last, will extend for six days.

**National Physical Laboratory.**—The exhibit of the N.P.L. at the Ghent Exhibition this year will relate to the special researches which have been carried on at the Laboratory in connection with aviation. Remarkable and important results have been obtained with the elaborate equipment provided for this purpose, which will exert a considerable influence on the design and construction of aeroplanes, and the exhibit will be of great interest and novelty.

**Accident.**—A daily paper reports that at Sunderland last week a boy was badly burned about the neck, by a burning carbon falling from an electric arc lamp on to his celluloid collar.

**Electro-Harmonic Society.**—To-night at 8 p.m. there will be a smoking concert of this Society at the Holborn Restaurant (King's Hall), with Mr. David Smith in the chair. The preliminary programme is as follows:—Vocalists: Mr. Gwilym Richards, tenor; Mr. Norman Williams, baritone; Mr. Robert MacLachlan, bass. Flute and harp: Messrs. Arthur Hands and Lorenzi. Character impersonator: Mr. Ernest Cherry. Stories and imitations of actors: Mr. Lewis Benet. Entertainer at the piano: Mr. Harold Montague. Solo pianoforte and accompanist: Mr. Bernard Flanders, A.R.A.M.

**Eviction.**—The *Times* and other papers report that on New Year's day there was a *mêlée* at the headquarters of the Amalgamated Society of Engineers in Peckham Road, London, when, in consequence of the dispute arising out of the proceedings of the recent delegate meeting in Manchester, the executive council was forcibly evicted from the offices. The eviction was carried out by a number of members of the Union connected with branches in and about London, said to be acting on behalf of the trustees recently dismissed by the executive. Four persons sustained injuries.

**Provisional Orders.**—The Board of Trade (Harbour Department) has issued a printed list of applications for provisional orders that have been deposited with the Board for consideration during the 1913 Session. Names of promoters and agents are given.

**How to Become an Electrical Engineer.**—At the meeting of the Trim Board of Guardians, on Saturday, a letter was read from the Local Government Board relative to the proposal to allow a sum of £20 a year to the master for superintending the electric light, asking to be informed whether the master possessed the technical knowledge necessary for the performance of the work in question, and when he acquired it. Mr. Shannon: Tell them that he was with the man erecting the plant, and that the Board are satisfied that he possesses a sufficient knowledge of the working of the plant.

**Board of Trade and Electric Lighting.**—The *Journal of Gas Lighting* is greatly chagrined to discover that the B. of T. will have nothing to do with obsolete systems of lighting (such as gas) when it can obtain electric light. It appears that a local gas manager offered his assistance in rearranging the lighting in a new labour exchange in the North; to his surprise he was officially notified from Westminster that it was impossible to use gas as the Board had decided that "electric light should be installed wherever available throughout the country."

**Davis Cup Football League.**—The majority of the matches in this League, composed of large electrical firms in London, have now been played. The present standing of the teams is as follows:—

	P.	W.	L.	D.	Goals for.	Goals against.	Points.
G.E.C. ...	4	4	0	0	16	0	8
Ediswan ...	3	1	1	1	5	8	3
St. James' ...	4	1	2	1	10	9	3
Drake & Gorham ...	2	1	1	0	4	7	2
Elec. Installations ...	3	1	2	0	4	5	2
Glengall Works ...	2	0	2	0	1	11	0

**Fatalities.**—PRUDHOE-ON-TYNE.—An inquiry was held at Prudhoe-on-Tyne on December 31st, by Coroner Rutherford, into the circumstances of the death of Joseph Wormald, the driver of an electric motor. Mr. J. E. Forster said he was the contractor for a new coal drift at Hedley Park, near Prudhoe. He was in the blacksmith's shop on the preceding morning, 30th ult., and Wormald was standing at his motor 5 yards away, with his hand on the lever. Witness turned his back to him for a minute, and when he turned round again deceased was lying on his back, partly on the platform on which he worked, and partly on the floor. Witness went to him and found him unconscious. Deceased had evidently touched something through which electric current was passing. Mr. John Graham, electrical engineer, said the current was supplied from Mickley Colliery,  $\frac{1}{2}$  miles away, at an average pressure of 450 volts D.C. Wormald was working a small 10-H.P. motor (portable haulage). His duty was to put the clutch into the gears, and start his motor. Witness examined the motor after Wormald's death, and found nothing wrong. In his opinion, Wormald's right hand must have come into contact with the live part of the switch. He thought the man had touched the live part in inadvertence. Dr. Robert Blair Lockhart said there were no marks on Wormald's body. In his opinion death was due to an electric shock. The jury found that the deceased died from electric shock caused by coming into contact with electric machinery at which he was working, and recommended that some protective means should be at once adopted to prevent similar accidents.

NEWCASTLE-ON-TYNE.—An inquiry was held on the 3rd inst. into the circumstances of the death of William David Varley, a fitter, who died at the motor works of Armstrong, Whitworth and Co., Elswick, Newcastle-on-Tyne, on December 23rd, while using an electric drill. Evidence by a fellow-workman showed that Varley was working a portable electric drilling machine when suddenly he fell backwards on to the floor. Artificial respiration was tried, without effect. James McKinnell, foreman electrician, said he examined the machine and found it all right. He showed how a shock could be received from the machine. Dr. Snowdon said Varley's heart weighed 20 oz., whereas a normal one weighed

11 cz. Death was due to heart failure, brought about by some external cause (such as an electric shock), or by the condition of the heart itself. The heart had been in that condition for many years, and the man might have died at any time. The jury returned a verdict that death was due to heart failure, but how brought about there was not sufficient evidence to show.

**LEEDS.**—Elijah Jackson, aged 36 years, of St. James' Place, Holbeck, Leeds, an electrician employed by the British Thomson-Houston Co., Ltd., died in the Leeds Infirmary on Saturday from injuries received in an accident at the works, when both his legs were broken.

**TUDHOE.**—An inquest was held last week at Spennymoor (County Durham) on the body of Emmerson Lancaster (57), who was killed whilst working at the Weardale Steel, Coal and Coke Co.'s coke ovens, Tudhoe. William Birken, a fellow workman, said he saw deceased near a wire rope, connected with a winch. He heard Lancaster scream, and on going to his assistance, found him in a stooping position, and holding the winch rope. Deceased shouted, "Don't touch me, but go for someone else." William Robertson, in charge of the chemical works adjoining, said that the winch was used for taking down a large casting for a superheater. He could not tell how the live wire came in contact with the winch rope. William John Shand, electrician, said he went to the scene shortly after the accident, and found that the wire rope had been in contact with a live wire. He could not form any idea how the wire came in contact with the winch rope. The jury returned a verdict of "Accidental death," attributing no blame to anyone.

**Educational Notes.**—CITY AND GUILDS OF LONDON INSTITUTE.—At the Technical College, Finsbury, a special course of six advanced lectures on "Induction Motors" will be given by Mr. J. K. Catterton-Smith, M.I.E.E., on Monday evenings, commencing January 27th, at 8 o'clock.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS.—The annual dinner and reunion of the Institution will be held at the Hotel Cecil, Strand, London, on Thursday, February 6th, 1913, under the presidency of Mr. W. Duddell, F.R.S., supported by the Council. Early application for tickets should be made; the charge is 10s. 6d. each.

**INSTITUTION OF ELECTRICAL ENGINEERS (BIRMINGHAM SECTION).**—A meeting was held on Wednesday, at the University, Edmund Street, Birmingham, to hear and discuss a paper by Prof. Miles Walker, entitled "The Design of Apparatus for improving the Power Factor of Alternating-Current Systems."

**For Sale.**—The Winchester Corporation has for disposal one 200-KW. and two 50-KW. Belliss-Parker generating sets. See our advertisement pages in this issue.

**International Electrotechnical Commission.**—The meetings of the Special Committees will be held at Zürich on the following days: Symbols, January 13th and 14th; Rating, January 15th, 16th and 17th; Prime Movers in Connection with Electrical Plant, January 18th and 19th. The Committees are constituted as follows:—

Country.	Special committee on		
	Symbols.	Rating.	Prime movers.
Austria ...	—	Prof. Pichelmayer	Dr. K. Kobes
Belgium ...	Prof. E. Gerard	Prof. E. Gerard	—
France ...	Prof. Paul Janet	M. P. Boucherot	M. Ad. Bochet
Germany ...	Geh. Dr. K. Strecker	Herr Leo Schüller	Direktor H. Tonnmacher
Great Britain	Dr. R. T. Glazebrook, C.B.	Dr. Gisbert Kapp	Mr. G. Stoney, M.Inst.C.E.
Holland ...	Prof. Dr. de Haas M. G. J. Van de Well	—	—
Italy ...	Prof. M. Ascoli	Prof. E. Morelli Sig. G. Semenza	Sig. G. Semenza
Norway ...	—	—	Mr. W. Fougnez
Spain ...	Sr. L. de la Peña	Sr. L. de la Peña	Sr. L. de la Peña (to be appointed)
Sweden ...	—	Mr. J. L. la Cour	Dr. H. Zoelly
Switzerland	Prof. Dr. Wyss-lirg	Herr Huter-Stockar	—
U.S.A. ...	Mr. C. O. Mailloux	Mr. C. O. Mailloux	Mr. H. G. Stott

With regard to the rating question, much of the time of the delegates will naturally be occupied in dealing with the numerous amendments to Report 17 of the I.E.C., issued by the Central Office in June, 1912, as the result of the work accomplished in Paris in May last, when, after much preliminary discussion, certain definite proposals were put forward.

The subject of international rating is undoubtedly of importance to the electrical industry of this country, with its growing foreign trade; the co-operation of the Manufacturers' Association, the B.E.A.M.A., has, therefore, been of considerable value to the Joint Committee (of the Engineering Standards Committee and the British Electrotechnical Committee), by which the Paris proposals, referred to above, have been fully discussed in detail. The representative of the makers (Mr. A. R. Everest) is to accompany Dr. Gisbert Kapp to Zürich. Although he is not going as a delegate, Mr. Everest's intimate knowledge of manufacturing details, as well as difficulties, will be of no small value to the delegate of the British Committee.

## Petrol-Electric Railway Car for Wellington, N.Z.

—Our Wellington, N.Z., correspondent states that the New Zealand Government Railways Department has placed an order with Messrs. Grapes & Riley, of Wellington, for a self-propelled car, of which the body will be built in New Zealand. The gearing is to be on the Thomas transmission system. The estimated weight, fully loaded, is 32 tons, and the car is to be capable of hauling a trailer weighing 25 tons loaded. The truck is to be built by the Leyland Motors, Ltd., and to have an engine developing 160 H.P. at 900 R.P.M., but capable of being worked up to 200 H.P., with two electrical machines, each rated at 50 H.P. at 500 R.P.M., for half an hour. The general design is similar to that of the car, which has been giving such good results in South Africa, and it is to maintain a speed, with trailer, of 25 miles per hour on the level, and 10 miles on a gradient of 1 in 40. It is understood that a further order is to be placed with the British Westinghouse Co. for a car on their system, and that tests will be made between them with a view to determining which type is the most suitable for the Dominion.

**'Tricity House.**—A complete and up-to-date electrical restaurant has been opened by Messrs. Modern Kitchens, Ltd., at 48, Oxford Street, W., and a demonstration of its capabilities was given on Tuesday last. The equipment consists of the well-known "Tricity" apparatus, with which the whole of the cooking is done. The promoters are to be congratulated upon their enterprise, which will undoubtedly prove highly beneficial to the electric cooking business as a whole, and to their own specialties in particular. We hope to give a description of the installation in an early issue.

**On Reading Papers.**—We have often remarked that few authors of papers are capable of reading them, and we have urged that the often painful and always time-wasting process should be discontinued. Some day that will be done, and the members of British technical societies will receive the printed papers in advance, like their more fortunate American confrères. But in the meantime we commend to the perusal of our author-readers the letter reprinted below, for which we are indebted to our American contemporary, *Science*. People take lessons in singing, in dancing, in playing musical instruments—but everyone seems to think he is a born elocutionist!—

### IN THE INTERESTS OF BETTER SPEAKING.

To the Editor of *Science*: Would it be at all worth while, now that the innumerable scientific papers of the midwinter are about to be read, to urge their readers to take a few elementary lessons in elocution before they ascend their platforms? It is difficult to compute to what extent aesthetic pleasure, as well as facility of comprehension, would be added to if men of science understood better the art of putting their communications before the public. The main work of the professional elocutionist would be to show the prospective reader how to produce full, clear, round chest tones, instead of the thin, clouded, head tones which they too often adopt. If the dozen or so of precious hours that this would take is too much to demand, perhaps the following simple rules might be of some assistance; I am sorry that they are so very elementary, but in point of fact they are rules which are violated by fully one-half of those who read:—

1. Stand erect, with chest expanded, and not contracted.
2. Consult a physician, and see that the nasal bones do not obstruct the nasal passages.
3. If manuscript is to be read from, hold it in the hand (and hold it high). Manuscript which is stationary on a desk causes a rigidity of the body which should be avoided.
4. The length of the line of type-written manuscript must be short—not more than 7 in. This is very important. The long line of the ordinary typed manuscript is convenient for the typewriter, but it is fatal to the reader. The effort necessary to catch the right line as the eye returns to the left-hand margin of the paper consumes energy which should be devoted to securing that mysterious *rapport* that must be established between reader and hearer if the function is not to be a painful one. For the same reason the type must be good and black, and the lines far apart. Whatever contributes to the physical ease of the speaker conduces also to that free and undistracted state of mind which is indispensable to the securing of the desired *rapport*.
5. Better still—make a mental note of the *Art und Weise* of those men of science (half our number, perhaps), who, whether by instinct or by early training, know how to address an audience effectively. There is a subtle mental attitude about them, quite aside from physical details, which can, perhaps, be better caught by instinctive imitation than by conscious intention. May their tribe increase!
6. If, in addition, every individual reader would, in his own interest, see to it that there is enough oxygen in the audience-room to permit of ready comprehension on the part of his hearers, then, indeed, would the mid-winter scientific meeting become such a joy to the spirit as would brighten, in retrospect, many a coming month of solitary hard labour.

The essential matter of inspiring papers is always at hand; a little freshening-up of method of presentation is all that is needed to make that matter far more effective, in the way of presentation, than it is, too often, at present. Of this the reader may be certain—if he insists upon beginning his paper with his voice thin, low and veiled, and directed downwards upon the floor instead of outwards towards the level of his hearers' ears, the spirits of his auditors, so far as they have any aesthetic quality at all, will also descend to their boots, and will remain there until another speaker gives them a chance of better nourishment.—X.Y.Z.

**Quietness Preferred.**—In the backblocks of New Zealand, where roads are bad and in wet weather at times almost impassable, telephonic communication on the party-line system is extensively used. Investigating a fault on a line with seven or eight subscribers recently, it was found that a lady had tired of the continual ringing in the evenings amongst her neighbours, and had adopted a method of her own to stop it. She took down the microtelephone and inserted a large cork in the transmitter mouthpiece.

**Appointments Vacant.**—Telegraph and telephone line superintendent, for the Government of Jamaica, Public Works Department (£250); laboratory assistant in the electrical engineering department of the South-Western Polytechnic. See our advertisement pages in this issue.

**Parliamentary Notes.**—**TRINIDAD WHEEL TAX.**—In Monday's Parliamentary Papers Mr. Pointer asked the Secretary of State for the Colonies whether his attention had been drawn to the Wheel Tax Ordinance recently brought before the Legislative Council of Trinidad; whether it had been passed by the Council; whether it had come within his notice that the provisions of the ordinance would not apply to the vehicles of the tramway company, who exercised their monopoly powers without any payment of any kind for the valuable monopoly held by them; and whether he was able to offer advice to the Trinidad Government, suggesting that the provisions of the ordinance should apply to the tramway company. Mr. Harcourt replied that the hon. member no doubt referred to the Port-of-Spain Carriage Licences Ordinance, 1912. That Ordinance had been passed by the Legislative Council, but had not yet been submitted to him for His Majesty's pleasure to be taken with regard to it.

**AUCKLAND PARK COLLIERY EXPLOSION.**—Sir H. Havelock Allen asked the Home Secretary whether he had yet received the report of the Inspector who investigated the explosion which took place at Auckland Park Colliery, County Durham, on October 29th last. In reply, Mr. McKenna said he had received a further report from the District Inspector, stating that the examination of the cable under the large fall showed conclusively that the cable was not the originating cause of the explosion. The origin of the explosion remained a mystery.

**Electrical Imports and Exports in 1912.**—The returns issued on Tuesday for the month of December, and for the complete year 1912, show the following figures:—

	Dec., 1912.	Dec., 1911.	Complete year, 1912.	Complete year, 1911.
<b>Imports.</b>	£	£	£	£
Electrical goods and apparatus (other than machinery and telegraph and telephone wire) .. .. .	137,464	138,681	1,457,646	1,495,492
Machinery .. .. .	614,619	453,718	6,820,744	5,768,062
<b>Exports.</b>				
Electrical goods and apparatus (as above) .. .. .	320,119	217,219	4,369,877	2,819,374
Machinery .. .. .	2,743,334	2,650,903	33,161,772	30,960,678

**Copper.**—A rather more cheerful tone in respect of European politics, and the prospect of better economical conditions at home, had their influence at the end of December on this as on other markets. The European visible supply (including stocks in Rotterdam and Hamburg) is shown by Messrs. Merton's statistical circular to have decreased during December from 43,281 tons to 43,241, a difference of 40 tons only. Withdrawals from English ports during the month have, apparently, been small, and covered by incomings, the quantity standing to home supplies being considerably higher than that for the end of November. Rotterdam has brought up its stocks (which were low) to 1,000 tons, while Hamburg registers 1,882 tons, a decrease of 333 tons during the month. In detailed supplies European arrivals from America are on the average, the quantity from Spain and Portugal to England and France is rather low, but the amount is compensated by increase in supplies from other countries. Chile shipments are well up, and Australian high (4,400, against an average of 3,780). Deliveries are brisk at 42,817 tons. American stocks (American Copper Producers' Association figures) increased during November 4,205 tons. The world's supply for the same date (November 30th, 1912) was 81,747 tons, an increase over the return for October 31st of 1,145 tons. The large withdrawals from stock last year in the United States were during January, according to figures.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—We are pleased to learn that Mr. W. J. U. SOWTER has now sufficiently recovered from the effects of his serious accident of July last to enable him to resume charge of the Bray U.D.C. electricity undertaking. All communications should, therefore, now be addressed to him. We understand that Mr. McDONNELL, assistant engineer, has now left the service of the Council, and Mr. V. DEMPSEY, of the Galway Electric Supply Co., has been appointed to succeed him, at a commencing salary of £104 per annum.

Mr. DUNDAS FOX, manager of the Penrith Electric Supply Co. has resigned his connection with the company, and will shortly proceed to Calgary, Alberta, Canada, accompanied by Mr. J. W. BLEASDALE, his assistant engineer at Penrith, where they will commence business as consulting engineers. The directors of the company, at a recent meeting in Manchester, accepted Mr. Fox's resignation with regret. Mr. Fox is to be succeeded at Penrith by Mr. SPEIGHT, of St. Anne's, the company's consulting engineer.

The Burnley T.C. has increased the salary of Mr. JAMES E. STARKIE, electrical engineer, from £100 to £500 per annum, as from January 1st.

The Electricity Committee of the Manchester Corporation has recommended to the City Council, that an agreement with Mr. H. LAMB be prepared, appointing him resident engineer at the Stuart Street generating station, at a commencing salary of £350.

The Nelson (Lancs.) T.C. last week decided to increase the salary of Mr. G. F. NAYLER, chief assistant electrical engineer, from £110 to £156 per annum.

**Tramway Officials.**—The employees of the Southport Tramways Co., Ltd. have presented a framed photograph of themselves to the general manager, Mr. J. LLOYD, as a token of esteem.

**General.**—Mr. H. R. KEMPE, M.Inst.C.E., M.I.Mech.E., M.I.E.E., and late Electrician to the Post Office, who has commenced work as a consulting engineer, notifies that his temporary address is 4, Ludgate Hill, London, E.C.

Mr. C. D. FALCKE, who recently resigned the position of resident engineer to the Stratford-on-Avon Electric Supply Co., Ltd., has opened an office as consulting electrical and mechanical engineer at 410, Mansion House Chambers, Queen Victoria Street, London, E.C. Mr. Falcke went to Stratford-on-Avon six years ago to lay down the electricity works, and he subsequently acted as resident engineer. On his resigning that position, the directors appointed him to be their consulting engineer. We understand that he is now occupied with an interesting patent.

Mr. H. W. POWER, engineering publicity expert, has removed from 180, Eswyn Road, London, S.W., to 31, Queen Victoria Street, E.C., where his telephone number is "City 8590."

Mr. S. L. LORD, of the staff of Messrs. Crompton & Co., electrical engineers, of Chelmsford, who has been married to Miss K. M. Gaffney, daughter of Mr. J. N. Gaffney, of Broadstairs, has been presented by his colleagues at the Arc Works with a barometer.

At St. Cuthbert's Church, Darlington, on January 2nd, the marriage took place of Mr. RUPERT STANLEY ALLEN, fifth son of Mr. W. H. Allen, J.P., D.L., of Bromham House, Beds., and of Messrs. W. H. Allen, Sons & Co., Ltd., electrical engineers, Queen's Engineering Works, Bedford, and Miss Gladys Marion Hill, elder daughter of Dr. Eustace Hill, of Birchfield, Darlington. The presents included a large silver salver from the staff of the Queen's Engineering Works.

Mr. F. J. TEAGO, B.Sc., lecturer in electrical machinery and assistant lecturer and demonstrator in electrical engineering at Liverpool University, was married at Newcastle on January 2nd to Miss Annie Middlemiss, of Morpeth.

Mr. WILLIAM WHITTLE, the chief accountant of the Metropolitan District Railway, has just retired, after 42 years in the service of the railway. The directors and officers presented him with a service of silver plate, and the staff, together with friends, gave an illuminated address and a gold watch. A farewell dinner was held at the Café Royal, with Lord George Hamilton, chairman of the company, presiding.

Mr. HERBERT J. G. WEBB has been appointed manager of the apparatus department with the Electrical Co., his position as representative engineer in Yorkshire and the North of England for the same firm being taken by Mr. HERBERT FOSTER, late with the York Corporation.

Messrs. Jaeger Bros., of 18, Christopher Street, London, E.C., announce that Mr. H. STEINBACH has resigned the position of London manager to the firm, and Mr. ERNEST JAEGER is taking up that appointment.

The COMTE DE BAILLEHACHE has been appointed director of our Paris contemporary, *La Lumière Electrique*, dating from January 1st.

Mr. LEE MURRAY has been appointed to the seat on the board of directors of Messrs. Bruce Peebles & Co., Ltd., recently vacated by Mr. Charles H. McEuen. Mr. S. E. BASTOW and Mr. J. H. BUNTING have been appointed joint managers in the place of Mr. Murray, who has retired from the position of general manager of the company.

Mr. C. H. WRIGHT is giving up his position with Messrs. Crompton & Co., Ltd., in order to take up an engagement with the National Steam Car Co. Ltd.

Mr. W. C. MOUNTAIN has opened an office at 131, West Regent Street, Glasgow, in connection with his consulting engineering practice, and Mr. J. E. MACEWAN will act there as his resident engineer in Scotland.

**Obituary.**—Mr. SYDNEY WOODFIELD.—We learn with the deepest regret of the death of Mr. Sydney Woodfield, A.M.I.E.E., which occurred on December 3rd. Mr. Woodfield was a contributor to our pages whose services were most highly appreciated by us, and we greatly deplore his untimely death, which occurred under peculiarly sad circumstances. Our readers will remember that, eight months ago, he was appointed chief engineer to the Lacroze Co.'s electric traction undertakings in Buenos Ayres. He had prepared a home there in readiness for the arrival of Mrs. Woodfield, but just before her sailing day he cabled to England that he was seriously ill and had booked his return passage. He arrived in this country on November 24th, and he lived only until December 3rd.

The deceased gentleman was at different periods of his career connected with Messrs J. G. White & Co. Ltd., the British Thomson-Houston Co., Ltd., the Glasgow Corporation Tramways Department, Leeds Corporation Tramways Department, and several of the technical institutions. We tender our sincere sympathy to his relatives.

## NEW COMPANIES REGISTERED.

**Eckstein, Heap & Co., Ltd.** (126,262).—This company was registered on January 1st, with a capital of £50,000 in £1 shares, to take over the business of an electrical engineer and manufacturer of electrical apparatus, carried on by A. Eckstein, at Caroline Street, Broughton Lane, Salford, and at 5, Chapel Walks, Manchester, as Eckstein, Heap & Co. The subscribers (with one share each) are:—A. Eckstein, Brantwood, Oak Drive, Fallowfield, Manchester, electrical engineer, J. Hamer, Low Croft, Bow-acre Lane, Gos Cross, Cheshire, chartered accountant, P. B. Hall, Neshfield, Marple Grove, Prestwich, near Manchester, manager; D. B. Mellis, 4, Burlington Road, Altrincham, Cheshire, manager. Private company. The number of directors is not to be less than three or more than seven; the first are A. Eckstein (chairman and governing director), J. Hamer, P. B. Hall, and D. B. Mellis; qualification of J. Hamer, £5,000 shares; of other directors, £1,000 shares; remuneration (except managing director) as fixed by the company. Solicitor, P. H. Jordan, 1, Princess Street, Manchester. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

**Javal Patents, Ltd.** (126,273).—This company was registered on January 1st, with a capital of £2,000 in 1s. shares, to carry on the business of manufacturers of and dealers in hydraulic, electric and steam machinery and appliances, engineers, founders, &c., and to adopt an agreement with E. Cremon-Javal. The subscribers (with one share each) are:—F. Samuelson, 71A, Queen Victoria Street, E.C., solicitor; R. C. E. Poulter, Midland Bank Chambers, Queen Victoria Street, E.C., solicitor. Private company. The first directors are not named; qualification, £10. Registered office, 44, Basinghall Street, E.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Harry W. Cox & Co., Ltd.**—Particulars of £1,000 debentures, created October 10th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £500. Property charged: The company's property, present and future. No trustees.

**United Sherardising Co., Ltd.**—Issues on December 12th, 17th and 25th, 1912, of £100, £400 and £200 debentures, parts of a series of which particulars have already been filed.

**Salford Electrical Instruments, Ltd.** (112,599).—Capital, £20,000 in £1 shares (10,000 preference); return dated May 16th (filed October 25th, 1912); 10,000 preference shares taken up; £10,000 paid. Mortgages and charges: Nil.

**Forster & Sons, Ltd.**—Particulars of £20,000 second debentures, created December 14th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £2,000. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Sheppey Water and Lighting Co., Ltd.**—Charge on land and hereditaments at Minster-on-Sea, Sheppey, dated December 19th, 1912, to secure all moneys due or to become due from the company to London County and Westminster Bank, Ltd., 21, Lombard Street, E.C., stamped to cover £1,500.

**Rawlings Bros., Ltd.** (67,908).—Capital, £100,000 in £1 shares (90,000 preference and 10,000 ordinary). Return dated October 22nd, 1912, 20,685 preference and 33,169 ordinary shares taken up, £58,854 paid. Mortgages and charges: £6,812.

## CITY NOTES.

### Llandudno and Colwyn Bay Electric Railway, Ltd.

The seventh ordinary general meeting of the above company was held on January 2nd, at the offices, Basilidon House, Moorgate Street, E.C., Mr. A. W. Tait presiding.

The CHAIRMAN, in moving the adoption of the report, said the profit for the year was £6,023, as compared with £5,784 for the preceding year, an increase of £239. That increase was on the top of an increase of £2,172 for 1911, as compared with 1910. The traffic receipts amounted to £16,199, as compared with £15,359 last year, an increase of £840, or over 5 per cent. That increase would have been greater but for the disappointing weather during the summer, particularly during the month of August. The traffic during the winter months showed a steady improvement, which was due to the increase in the resident population along the route and to the improvement in the time and running of the service, and because of the increased facilities they were able to give owing to the double tracking of a considerable portion of the line. Turning to the debit side of the profit and loss account, it would be observed that the power expenses were £2,271, as against £2,530 last year—a saving of £259, or approximately 10 per cent. That was particularly satisfactory when he mentioned that that economy was effected in spite of an increase in the number of car-miles run of 8,899. The saving in units was 62,272, or approximately 13 per cent. The saving was really more than it appeared, because, owing to the sliding scale in their power-supply agreement, the less electricity they took, the higher they had to pay

for it. The economies which they had effected during the last two years had been very great, and he thought they had now reached their maximum in that respect. The reductions which had been effected in the past two years amply justified the expenditure on double tracking, and credit was also due to the manager for the better inspection and lubrication of the motors and the general conduct of the service. There were small increases in the amounts charged for traffic expenses and interest, and there were small decreases in the amounts of general expenses and depreciation of equipment. The only other item calling for comment was that of repairs and maintenance. The amount this year was £1,481, as compared with £783 last year. Of that sum, approximately £657 represented expenditure upon permanent way, and approximately £656 upon cars, both of which items were in excess of the amounts charged under these heads last year. Part of that might be regarded as expenditure of a special nature. The large expenditure on the permanent way was due to some heavy repair work on the track in Colwyn Bay, where it had subsided owing to the track being laid over a green sewer trench. He was afraid that they could not expect to have any reduction of expenditure under that head for some time owing to the exceptional local conditions, and the wet summer and excessively wet autumn of last year had, of course, tended to make those conditions worse as regards the year under review. Wherever possible efforts were being made to render the condition of the track more satisfactory, and they would see that when the doubling work over Bodafon Fields was carried out a certain amount of regrading and reconstruction work was done at the same time, which had greatly improved that part of the line. They had also completed arrangements to double track the line at the top of Penrhyn Hill and from the end of Mostyn Avenue to a point beyond the North-Eastern Hotel in Llandudno. When that work was completed, the double track would extend for, approximately, four miles, which would enable them to cope more expeditiously and economically with the traffic, especially in the summer. Included under the cost of repairs, too, was the cost of repainting practically the whole of the cars and the complete overhauling of their equipments so that, at the end of the year, they were in excellent condition, and he thought they might expect to see some reduction in that item next year, because such an extensive overhaul should not be necessary. It would be observed that the company had expended during the year about £6,700 on additions of a capital nature, which he had already explained. The variations in the other assets were self-explanatory. With regard to the liabilities they had issued £3,175 additional debenture stock, and they owed to sundry creditors and on bills payable, approximately, £1,800 more. It would be necessary in order to pay the dividend which the directors recommended, and for other purposes, to issue a further amount of debenture stock. The order for the extension to Old Colwyn had now been confirmed by the Board of Trade, and arrangements with the Colwyn Bay Council as regards road widenings, were in progress. The terms upon which the company were willing to proceed with that extension had been clearly indicated to the Council, and he hoped that those would be accepted by them, as otherwise the construction of that extension must be held over. The balance available for distribution after adding another £1,000 to depreciation reserve account—making a total of £4,000 to date—and writing off £1,000 from discount and expenses of issue of debenture stock, amounted to £4,737, which included £714 brought in from the previous year. That sum the directors proposed should be applied in the following manner:—In payment on January 31st of a dividend at the rate of 3½ per cent. per annum (less income-tax), which would absorb £3,479, leaving £1,258 to be carried forward. He should, perhaps, point out that the sinking fund for the redemption of the debenture stock came into operation on the 1st inst., and in future the amount required for that purpose each year would appear as a debit to profit and loss account, and would take the place of the previous debits on account of depreciation reserve, because to all intents and purposes it was in substitution of that charge. He thought that the shareholders would agree that, particularly in the view of the unsettled weather, the net result for this year might be considered satisfactory, and he thought their thanks were due to Mr. Balfour and his firm, and to the manager at Llandudno for the careful supervision which had been exercised. There was one further point which he would like to mention before putting the resolution, and that was "Sunday running." He was glad to tell them that several local residents and visitors to North Wales had, during the past year, approached the company with regard to the matter, and there had also been some correspondence in the local Press. As he pointed out at the last general meeting, the restriction under which the company at present laboured did not affect the local residents, and it was for them to see that the great need for that service, which was evidently desired by many local people and by the large majority of the visitors to Colwyn Bay and Llandudno, was clearly impressed upon the local Councils.

MR. A. BALFOUR seconded the motion, and the report was adopted.

### The A.E.G. Annual Meeting.

THE recent annual meeting of the A.E.G., as previously announced, sanctioned the proposed increase of £1,250,000 in the share capital to £7,750,000. Dr. Walter Rathenau, who presided, stated that the augmentation was materially influenced by the great pressure of new orders which could only be carried out with extreme difficulty, and it was therefore necessary to extend the workshops. In reply to questions, it was mentioned that the company did not hold a considerable portion of the shares in the Berlin Electricity Works, but the company's interest in the undertaking was exceptionally great. The real problems before the undertaking applied to the future;

It was no longer merely a lighting enterprise, but was already one for the supply of power on a larger scale, and it was submitted that the future programme would be one for the electrical incorporation of the suburbs and the province of Brandenburg, within the scope of the electricity works. The war in the Balkans had affected the A.E.G. comparatively to a much less extent than other undertakings, as the Balkans were not really an electrical hinterland for the company. The Constantinople express railway, for which a concession was expected, remained an important project, and would presumably be realised when quiet and order had been re-established. The company's business had also been but little affected by the Presidential election in the United States. The chief business was with South America, which was in favourable course of development, and had already yielded large orders. Concerning the transactions with the Victoria Falls and Transvaal Power Co., the speaker stated that the debentures taken over by the company were successfully disposed of some time ago. The sale prices for manufactures had not become worse, but rather slightly better. It was added that since the completion of the annual report, the position of orders and turnover had increased from £19,550,000 to £22,850,000, as compared with £18,100,000 at the end of September, 1911.

### Continental Electrical Companies.

*The Fabrik Isolierter Drähte (Insulated Wire Works, late C. G. Vogel), of Berlin*, have allocated £6,500 to depreciation in 1911-12, as contrasted with £5,300 in 1910-11. It is intended to distribute 13 per cent. on the share capital, this comparing with 11 per cent. in the previous year.

*The Siemens Elektrische Betriebe A.G.*, which manages a number of electricity works, earned considerably larger gross profits in 1911-12 than in the previous year. As net profits the accounts indicate the sum of £37,700, as against £27,700 in 1910-11. It is proposed to pay a dividend of 6½ per cent. on the old share capital, as in the preceding year, whilst the new capital of £250,000 will participate to the extent of 3½ per cent. for the year.

*The Deutsche Gasglühlicht A.G., of Berlin*, which manufactures wire lamps as well as incandescent gas lighting appliances, states that the Osram lamp department was extended during 1911-12, and the turnover increased. The foreign Osram lamp companies in London and Paris also obtained favourable results, although the profits were not included, as the balance-sheets had not yet been closed. The net profits of the Berlin company were £441,000, as contrasted with £278,000 in 1910-11, and the dividend on the ordinary shares is at the rate of 25 per cent.

*The A.G. für Elektrizitäts Anlagen (Electrical Investment Co.), of Berlin*, which owns various central stations, as well as being financially interested in others, reports gross profits of £61,000 in 1911-12, as compared with £36,000 in the previous year. Including the balance forward, the net profits are returned at £32,000, as against £32,000 in 1910-11, and a dividend of 8 per cent. has been declared on share capital of £350,000, being at the same rate as in the preceding year. During the year the extension of the company's scope of activity necessitated an increase of £150,000 in the share capital, whilst at the same time a ½ per cent. loan of £300,000 was also raised for the same purpose.

*The Elektrische Licht und Kraft-Anlagen A.G. (Light and Power Investment Co.), of Berlin*, has just declared a dividend at the rate of 7½ per cent. for 1911-12 on the ordinary share capital of £1,500,000, as contrasted with 7 per cent. in the preceding year. According to the directors' report presented at the recent general meeting, most of the undertakings in which the company is interested made further progress during the year, and a share was also taken in various new enterprises having a promising future. The gross profits reached £208,000, as against £197,000 in 1910-11. After defraying general expenses, taxes and interest charges on the loan of £1,181,000, the accounts show net profits and balance forward of £136,000, as contrasted with £124,000 in 1910-11. The payment of the dividend absorbs £112,500, the reserve fund receives £12,900, and the sum of £8,000 has been carried forward. Among the list of advances made to electrical companies appear the names of two English undertakings.

*The Telefonsfabrik A.G. vorm. G. Berliner, of Hanover*, reports that the turnover in 1911-12 experienced an increase. The Buda-Pesth Co., whose share capital is held by the Hanover Co., was satisfactorily employed during the year. Government orders also showing an advance over the previous year. A dividend of 10 per cent. was proposed by the Buda-Pesth Co., as compared with 9 per cent. in 1910-11, and that company's factory was in full operation. The branches of the Hanover Co. were well employed, and participation in foreign transactions again yielded satisfactory profits. The gross profits from sales and investments amounted to £70,000, as contrasted with £64,000 in 1910-11. After meeting general expenses and allocating £12,000 to depreciation, as against £8,800, the accounts indicate net profits and a balance forward of £24,700, as compared with £23,600 in 1910-11. It is intended to pay a dividend of 8 per cent., being at the same rate as in the previous year. The share capital is to be raised by £50,000 to £250,000.

### SIEMENS & HALSKE.

[The inter-relationship of the Siemens & Schuckert Companies explains the mutual references and information contained in the annual reports of the undertakings forming this group.]

The report of Siemens & Halske, A.G., for the year ended with

July 31st, 1912, states that a considerable extension of the undertakings of the company and its group took place and the number of officials and workmen employed by the company and the Siemens-Schuckert Works increased from 66,000 in 1910-11, to 77,000 in 1911-12. The growth was comparatively the greatest in connection with the German and Russian works, and the expenditure on plant correspondingly advanced. This development in association with the comprehensive technical progress rendered necessary a very fully connected and expensive organisation, whilst competition between the individual firms was very keen. An improvement in this respect was hoped for from the effect of the Verband Deutscher Elektrotechniker, which had already been successful in many directions. The report repudiates the idea of the establishment of any kind of monopolistic structure. As to the question of profits on financial transactions, it is stated that these play no noteworthy part in the company's scope. The latter had, of course, financially participated in individual undertakings or created such enterprises but as a rule they related to new departments which required to be opened up. The volume of orders thereby resulting to the company and also from some companies closely associated with it, only formed a comparatively small portion of the total turnover of the group. A considerable increase in the orders was obtained for all the departments at the Werner Works, and an extension of the works had become necessary. Among the orders were those for automatic and semi-automatic telephone exchanges for Dresden, Leipzig and Rome, as well as an extension for Munich; and the Imperial telegraph authorities ordered a 50-twin telephone cable on the Pöpin system for laying between Berlin and Magdeburg, which was proposed to be extended later on through the industrial district to the Rhine. Two of the State cable lines had been equipped with the company's new system of high-speed telegraphy, and it was expected to be further introduced. The Wireless Telegraphy Co. (Ges. für Drahtlose Telegraphie) had made further progress, and had formed, in conjunction with the German-Netherlands Telegraph Co., the German South Sea Wireless Telegraph Co., which was to connect the German Colonies in the South Sea with the world's cable system. Concerning the manufacture of incandescent lamps, the report states that the glow lamp factory was abundantly provided with orders, and the new wolfram lamp had been well introduced, whilst the tantalum lamp maintained its special value. The department for railway safety appliances experienced an increased turnover in signalling installations and accessory apparatus, and, among others, the St. Petersburg branch obtained considerable orders from the Russian Government for the Siberian Railway. The first section of the elevated railway in Hamburg was set in operation on February 15th, 1912, and the whole of the circle railway, which is 10½ miles long, was inaugurated on June 29th, 1912, whilst the completion of the branch lines was being continued. The accounts show the following results for the two years:—

	1911-12.	1910-11.
Share capital ... ..	£3,150,000	£3,150,000
Loan capital ... ..	2,265,000	1,287,000
Gross profits ... ..	722,000	691,000
General expenses ... ..	75,000	53,000
Interest on loans ... ..	60,000	51,000
Depreciation ... ..	20,000	22,000
Net profits and balance forward	620,000	616,000
Dividends ... ..	378,000	378,000
„ per cent. ... ..	12	12
Carried forward ... ..	63,000	54,000

It will be seen that the loan capital has largely increased, the company having made an issue of £1,000,000 in 4½ per cent. bonds in May for the purpose of making an advance to the Siemens-Schuckert works. The sum of £100,000 has been placed to the special reserve fund, as against £110,000 in 1910-11, and £17,500 to the provident fund, as in the previous year, whilst the bonuses to officials and workmen has been raised from £40,000 in 1910-11 to £45,000 last year.

### SIEMENS-SCHUCKERT WERKE.

The directors state in their report for 1911-12 that the programme of extensions of works mentioned a year ago had been carried out, and the extensions in the meantime had been brought into operation. unusually large expenditure having been incurred on erection and equipment with machinery and the cost of removal. Nevertheless the arrival of orders was largely in advance of the completion of the new works, and extraordinary endeavours were therefore necessary in order to comply with the conditions of delivery. Difficulty was experienced in this respect owing to the circumstance that it was frequently impossible to obtain the requisite raw materials by the proper time. It was therefore all the more noteworthy that the German and ex-German works delivered 134,539 machines, motors and transformers, of a total of 3,737,674 H.P. The rising line of activity, which had only suffered one interruption since the formation of the company, took the same course in the past year, and this explained why the provision of additional funds in rapid succession had to receive attention. During the year a loan of £1,000,000 was obtained from the two proprietary companies, and the amount received from the latter in ordinary capital and loans was now £7,000,000. The proceeds of a new 4½ per cent. loan of £1,500,000, which was issued in the current year, were intended to further strengthen the working capital. The employment provided for the company by the development of overland central stations was very considerable as a result of the energetic enterprise which was manifested by all interested in that department. The works were well occupied on deliveries for tramways, light railways, colliery and works' railways, the elevated and under-

ground railways in Berlin and Hamburg and the various State railways proposed to be converted to electric traction. The following items are extracted from the accounts for the past two years:—

	1911-12.	1910-11.
Ordinary capital ... ..	£1,500,000	£1,500,000
Terminable loan ... ..	2,432,000	2,458,000
Non-terminable loan ... ..	2,500,000	1,500,000
Gross profits ... ..	1,048,000	913,000
General expenses ... ..	88,000	95,000
Depreciation ... ..	60,000	50,000
Net profits and balance forward ...	673,000	671,000
Reserve fund ... ..	125,000	125,000
Dividend ... ..	450,000	450,000
" per cent. ... ..	10	10
Carried forward ... ..	15,000	14,000

It will be observed that the total of ordinary and loan capital amounts to £9,432,000, and to this has since been added a new loan of £1,500,000, making an aggregate of £10,932,000. The bonus granted to officials and workmen in 1911-12 were £65,000, being the same amount as in the previous year, whilst the provident fund received an addition of £17,500 as in 1910-11. The report mentions the financial interest of £425,000 taken in the Bergmann Electricity Works Co., and states that this event is not to be considered as a step in the direction of a proposed future amalgamation.

#### ELEKTRIZITÄTS GESELLSCHAFT VOM. SCHUCKERT & CO.

The report for 1911-12, after referring to the financial requirements of the Siemens-Schuckert Works in respect of a further loan of £1,000,000, states that the company's share of £500,000 of that sum was provided by an increase in the share capital of £500,000 to £3,500,000, the premium of £155,000 realised on the issue having been placed to the reserve fund. The Austrian Siemens-Schuckert Works, of Vienna, were well employed in 1911-12, and again made a distribution of 6 per cent., although on increased share capital, whilst the Russian Schuckert Co., which was compelled to extend its plant in order to cope with the growth in orders, raised its rate from 4 per cent. in 1910 to 5 per cent. last year, and had since resolved to make a capital issue of £100,000 to £300,000. The report proceeds to deal in detail with other undertakings in which the company is interested in different countries. The accounts indicate the following results for the two years:—

	1911-12.	1910-11.
Share capital ... ..	£3,500,000	£3,000,000
Loan capital ... ..	1,785,000	1,855,000
Gross profits ... ..	428,000	362,000
General expenses ... ..	20,000	15,000
Interest on loans ... ..	79,000	82,000
Depreciation ... ..	783	100
Net profits and balance forward ...	352,000	293,000
Dividend ... ..	260,000	206,000
" per cent. ... ..	8	7½
Carried forward ... ..	62,000	62,000

The sum of £15,000 has been allocated to the special reserve fund as in the previous year, and this fund now stands at £45,000, whilst the ordinary reserve fund has been raised to £485,000 by the addition of the premium realised on the new issue of shares. The central stations under the company's control represent £75,000, and other investments £1,890,000, but it has not been deemed necessary to make any provision for depreciation of the latter during the past three years.

**Mexico Tramways Co., Ltd.**—The directors have declared a dividend of 1½ per cent.

**British Coalite Co., Ltd.**—The directors' report, as quoted in the *Financial*, states that the loss entailed on the operations for the 12 months to September 30th amounts to £11,192, in comparison with £26,265 for the previous year. The greater portion of this loss is due to contracts which matured during the year, and which could not previously be cancelled.

## STOCKS AND SHARES.

Tuesday Evening.

THE Stock Exchange markets were not greatly upset by the various postponements of the Peace Conference, although the ultimatum published last Saturday morning had the effect of disturbing prices for a time. The view is now taken, however, that intervention by the Great Powers is practically assured, and on this theory prices in most of the investment—as well as the speculative—departments have quietly improved.

The feature in the Home Railway market is renewed strength in Metropolitan and Districts. The quotations of both went up with a run on the reassembling of the markets after their New Year holiday, and the only reasons which dealers could find to explain the sudden jump was the old one of syndicate buying. This, no doubt, had something to do with it in the case of Districts, while in regard to Metropolitan the market for some time past has been so restricted that a little extra demand or supply has sufficed to move the price sharply. Central London and City & South

London are good, and there has been some improvement in East London Ordinary, attention being redirected to this stock on a steady rise in the price of Great Easterns. With the dividend announcements and distributions just at hand, and with the prospect of money becoming a little easier, it is not surprising that proprietors of Home Railway stocks should be chary about selling at present, and this naturally makes for strength in the market.

The Electricity Supply section waits upon fresh developments in connection with the linking-up negotiations. These, it is said, are by no means broken off; and in anticipation of some news or other becoming available before long, prices of the principal Electric Lighting shares are holding with noticeable steadiness, having regard to the probably increased costs which the next balance-sheets are likely to show in consequence of the rise in fuel and other items of expenditure. The winter so far has been a bad one from the point of view of the illumination industries, however pleasant it may have proved to those who suffer from fog. Changes on the week are unimportant, but a better tone in City Lights deserves notice, and there seems to be an idea about that speculation in these may be renewed. That, however, is a matter which only the insiders can prophesy with any attempt at accuracy.

It is a little surprising that investors should not pay more attention to the 4½ per cent. Debenture stock of the Urban Electric Supply Company, which can be bought in the market at about 86½, with dividends payable on April 1st and October 1st. The amount required every year for the service of the stock is £13,380, and the net profits have risen steadily from £26,000 in 1905 to £47,600 in 1911, while the estimates for the next three years look for further increases. The company, of course, is not popular, because of its recent unhappy history; and it is still in debt to the Edmondsons' Electricity Corporation. But for those who care for a stock that yields a steady 5½ per cent., with a chance of improving in value, Urban Debenture looks reasonably attractive.

The Latin-Canadian group shows several dramatic rises. Montreal Light, Heat and Power put on 10 points. Shawinigan Water Common has risen 6. Brazilian Traction is 4½ to the good. A good deal of strength has developed in Georgia Light and Power shares on the expectation that the first quarterly dividend—at the rate of 4 per cent. per annum—will be declared in March or April this year. A bet was made in the Stock Exchange the other day that Georgias would be 75 before the year is out, but this must not be taken as a tip to buy them.

The British Columbia Electric Railway issue was favourably received, and it had no chastening effect upon the prices of the existing securities—in fact, the company's Preferred Ordinary is up 1, and the 4½ per cent. First Mortgage Debenture stock rose 1½, the publication in the prospectus of the progress which the company has made during the past half-decade, evidently directing fresh notice to the undertaking. The Mexican group is strong, Mexican Light and Power Common being up 1½, while the Preferred and the First Mortgage Bonds are both better. Monterey Fives improved 1½. Mexico Trams and the First Bonds gained 1½ each, and similar rises have been frequent. The Anglo-Argentine Tramways group is steady. Brisbane Trams Investment Ordinary are nominally ½ easier. Victoria Falls Preferred hardened to 19s. 6d.

Perth Electric Trams Debenture spurred ½ on a small demand. River Plate Electricity Common shed 10 points, there being fears of reduced earnings in consequence of competition.

The Telegraph market is quiet, with comparatively few movements. Eastern Ordinary put on ½, and Great Northern Telegraphs gained a similar amount. The feature, however, is the strength of West India and Panama Telegraphs: the shares enjoyed a sharp rise on the attitude taken by President Taft on the question of the Panama Canal, and it is devoutly hoped that some arrangement more beneficial to this country than that originally proposed will be arrived at without outside intervention. The Preference shares hardened in sympathy. Western Telegraphs are a little better, and there has been a steady demand for Anglo-American, with the result that the Deferred stock at 26½ shows a rise of the fraction.

Marconis went ahead in lively mood upon the news that the Brazilian Government had concluded an important contract with the company. The price was run up to 5½, from which there was a slight recession, and the shares of the subsidiaries moved on lines very similar—that is to say, after being good they went back a little. National Telephone Deferred is disposed to sag, and the quotation shows a loss on the week.

In the Manufacturing division, Babcocks hardened to 3½, and the armament shares generally improved upon the official announcement of the Budget for 1913, with its provision of fifty millions sterling for the Navy. The Cable Companies' shares are better, British Insulated and Henleys both showing gains, while India-Rubber rose 10s. to 10½ middle. The Rubber share market continues to exhibit surprising strength and vitality, there being a big volume of business every day, and little present indication of its slackening.

**Mexican Light and Power Co., Ltd.**—The directors have declared a dividend of 1 per cent. for the quarter ending December 31st on the ordinary shares:

**Prospectus.**—*British Columbia Electric Railway Co., Ltd.*—This company has been inviting subscriptions for £750,000 4½ per cent. perpetual consolidated debenture stock at 98 per cent. The proceeds are to be devoted to extensions and general purposes of the company, which, as the last annual report showed, is developing at a remarkable rate. The list was to close on Wednesday.

INVENTORY OF PLANT IN MUNICIPAL  
ELECTRICITY WORKS.

By "INTERESTED."

"I WANT an inventory of all plant installed purchased from capital, together with a certificate signed by the engineer, stating that the whole is in commission and of useful service as means of profit earning." A tall order that; and there is more in it than meets the eye at first glance, too. It is one of the latest requests made by our old friend, Mr. Auditor, for a certified detailed statement of the value of plant actually in commission, and not merely of scrap value only. In reality, the request amounts to a guarantee that machinery, boilers, auxiliary apparatus, mains, switchgear, &c., are not standing idle awaiting the precise moment when their particular loan is redeemed, in order to be relegated to the scrap heap.

In most stations owned by local authorities the absence of detail records in the early period of their existence accentuates the difficulty now experienced in preparing a true statement of the whole capital expenditure in detail, and likewise that of allocating expenditure to each separate mortgage. Speaking generally, loans have ever been increasing; repayments have been made over varying periods at many different rates of interest; and occasionally here and there small loans have been redeemed, more through force of circumstances than otherwise. Some works have plant installed purchased from revenue and, perhaps, small floating balances of loans on account of plant scrapped, in order to make room for that purchased from revenue. Mr. Auditor requests all these transactions properly and clearly set out in tabulated form.

In some cases a systematic balancing-up for the purpose of preparing a detailed summary of capital account reveals the necessity for immediately writing off numerous small outstanding amounts. This procedure is caused by the fact that goods for which loans have been taken up either cannot be justly certified as useful profit-earning units, or have entirely disappeared owing to various causes.

What seems now to be imperative is a clear, lucid, up-to-date statement of capital expenditure and redemption made up from the commencement of the undertaking. Just how this should be done, and the best manner of showing the present state of affairs, is rather a vexed question. In this short article I propose illustrating one method for carrying out the work, which may prove of use to not a few readers.

The whole matter is in the form of a book printed and ruled after the fashion illustrated below. This is in actual use in a certain London station, and will, I think, with little alteration, prove suitable for many others. The pattern runs right across each opening, and a four-letter index at the front of the book serves the purpose of enabling any particular item to be found without delay. In the pattern shown a few imaginary figures are filled in for the purpose of explanation. As will be seen, entries are made and a balance shown annually, so that once the bulk of information is collated, very little time is needed to keep the record up to date. The right-hand side of the illustration is really of a revenue nature, but serves the purpose of showing the amount expended over and above depreciation, i.e., repayment of capital, so that the true value of the plant as it stands can be ascertained (see illustration No. 1).

The repairs and maintenance, or revenue, side of an undertaking is one affecting the engineering staff generally, and the "Chief" in particular. He it is who frequently requests information respecting repairs executed upon the different plant units of which the whole works is composed. In order to be in a position to present such information immediately it is called for, without unnecessary delay and a hurried search through innumerable log-books, sheets, &c., a systematic entry of important breakdowns, repairs and replacements is obviously necessary: not simply a conglomeration of foolscap sheets of writing and figures arranged in no particular order, with an index noticeable by its absence, but a simple, quick and ready means of recording occurrences. Such a system

DESCRIPTION OF PLANT: No. 12 B. & W. BOILER FITTED  
WITH MECHANICAL STOKERS.  
Nos. and Marks. BR. 12 & 12A.

Date.	Work calling for attention.	S-in-C's initials	Date.	Work done.	Remarks.	Engr's Sig.
23/1/12	Left-hand furnace arch wants re-pairing.	A. P.	6 to 9/2/12	Boiler cleaned out. Wire brush through tubes. B.D. cock overhauled and repacked.	Tested and found all O.K.

No. 2.

should be arranged so that anyone can refer thereto easily and quickly, and find there briefly described all work of much account in the nature of repairs, replacements, renewals and alterations made from time to time. Also there should be added notes of any work calling for attention at the first possible opportunity.

I do not suggest that every minute detail is or should be recorded, but merely work of sufficient size and importance, reference to which at any later time might conduce to a saving in time or material. In order to afford a clear illustration let me take a concrete example by way of explanation. A battery of say five boilers is "off" for some trivial repairs, opportunity being taken at the time to clean them internally. Whilst it is impossible thoroughly to overhaul the five boilers in such a short period, there are most likely a few points which require examination, and time and worry will be saved by reference to notes (which would be found in the below-mentioned system) in order to observe those few important details demanding attention. A casual examination will suffice generally for other points provided the annual period for thorough examination is not near at hand, for if anything worthy of attention was noticed during the time these boilers were in commission previously to being temporarily shut down, note would certainly be found in the proper place in the system. A glance at the five places in the book, i.e., one for each boiler, would reveal all that should receive attention.

The arrangement is simply a foolscap book of about five quires, with printed headings, as per illustration No. 2. One page is allotted to each unit in the works, and entries are made from time to time, whenever necessary. The last column is for the signature of the engineer or works superintendent directly the repair, alteration or replacement is

General Description.—3,500-kw. turbo-alternator.  
Detail Description.—Turbine, by Williams & Co.  
Alternator, by Brown & Co., Ltd.  
H.T. motor-driven exoiter, by Electric, Ltd.

Total value, £9,400.  
Mortgage Nos., 146 and 147.  
Period for repayment, 20 and 15 years.  
No. and marks, E20, E21.

Remarks.—Foundations included in capital value.  
Balance of £3,000 paid out of revenue.

		£6,073 12		£326 8	£5,747 4				

No. 1.

made. An index is, of course, included at the front of the book.

This simple book will be found quite adequate to meet all demands, whereas entries in a daily or weekly log book fail to show the required information at the right time. The details require summarising and analysing, and putting forward in such a way as to be observed at the right time.

In effect, this revenue plant record is a summary of the log book, with notes and instructions added, and from this book particulars are abstracted for entering on the right-hand side of the above-mentioned Plant Inventory.

## "GENTLEMEN—WE THANK YOU!"

HOW THE GOOD NEWS CAME TO HONG-KONG.

By PROF. C. A. M. SMITH, M.Sc.

"THE Mail is in!" We heard the boom of the gun about two hours ago, and even the Chinese undergraduates, who are but slightly interested in mails, looked up from their drawing boards to take a glimpse of the great liner as she slowly steamed among the junks and sampans which cover the most wonderful harbour in the world. There are 37 of these engineering undergraduates—when last I wrote, in October, there were only 25, but the score climbs steadily up. How long before we reach 500? If the present symptoms can be taken as indicative of what the Chinese mean to do, it will not be very long before Hong-Kong is as famous in China for its University as is Cambridge in England. We have 37 engineering students out of a total new entry of 55. That is as it should be. Medicine and other subjects are being, and will be, studied by the Chinese. But what the nation seeks after, as a thirsty man seeks something for his parched lips, is applied science. We offer them that in full at this University.

### THE GREAT DAY.

"The mail is in." As soon as I could, with decency, leave the drawing office, I hastened to my room. Yes, there was the familiar bundle—the good old ELECTRICAL REVIEW. Had it published my appeal? Had it backed it with the incisiveness of the pen which the Editor or some of his staff keep stowed away in a special cupboard above which must be writ large King George's watchword, "Wake up, England!" These, and a thousand other, thoughts rushed through my brain as I tore open the wrapper, and then—

Then I knew that the spade work—the digging in the trenches—of the last few weary months had not been in vain. For I opened the blue cover and I turned to the index . . . but before I did so I saw the word "China" on the page which is sacred to the statement of editorial policy. And I knew that whoever else failed us, the great-hearted friend in Ludgate Hill was true. And a wave of feeling swept over me, such as I suppose comes to few men, for never before had it been my lot to carry anxiety single-handed, or to feel responsibility to such extent that it seemed impossible to win success. And now the message had come. After all, those at home had answered the call! Now can we go forth boldly into the struggle once again. China is hungry for knowledge—yes, but we will supply it, and the British Empire shall still lead in the teeth of twentieth-century competition.

### "DO IT NOW."

I frankly confess that there are lines—the closing lines—in the leader which ought never to have been written. But I cannot find it in my heart to upbraid the REVIEW after its magnificent appeal. That clarion call has been echoed up and down the China coast, and now we who are at work for the future know that we can rely upon those at home to help us.

But there are yet readers of the REVIEW who have done nothing. Ponder over the following extract from the *Hong-Kong Daily Press* of October 28th:—"The University is already a success beyond the dreams of its most

sanguine sponsors. . . . The majority of the first-year students at the University have elected to be trained in Engineering Science. That is only what we expected. China needs above all else, at the present time, and will continue to need for very many years to come, engineers for waterworks, the development of her mines, the extension of her railways and other modes of communication, so that the trade of this great country can be effectively opened up. The need of engineers is recognised in China."

Reader, what have you done? Have you thrown aside this golden opportunity—it will never return—to advertise your goods in the Far Eastern market? Won't you strike a blow for freedom and progress? Send that cable or write that letter which will tell us in this little island by the Canton River that you recognise your responsibilities. *Do it now!*

Let me take this opportunity to pay my humble tribute to the British Engineers' Association, whose coming will be greatly welcomed in China. To it we look for substantial help, and I can now suggest that it should endow one of our chairs when it is firmly at work.

It is because I am certain that the electrical firms of Great Britain will see to it that we have an electrical equipment in the beautiful laboratories of this University, that I say with heartfelt gratitude, "Gentlemen, we thank you!" We have done our work for you out here: we are cutting through the jungle of ignorance and superstition. Under the tropical sun we are carving for you a pathway that you and your countrymen may use. If you have not already sent that cable or written the letter—please, for the love of your profession, for the love of your country, for the sacred cause of scientific progress, *Do it now.* What matter your doubts, write—we will advise.

## NATIONAL INSURANCE ACT, 1911.

FURTHER DECISIONS OF THE UMPIRE. REFUNDMENT OF CONTRIBUTIONS. QUARTERLY STAMPING.

By JOS. J. H. STANSFIELD, F.C.I.S.

IN the ELECTRICAL REVIEW of August 16th and October 4th last the decisions of the Umpire appointed under the provisions of the Unemployment Part of the National Insurance Act, 1911, were given, and the present article brings up the decisions to the close of 1912.

The rush of applications to the Umpire appears to be over. From May 16th to June 27th 223 decisions were advertised in the *Board of Trade Journal*, whilst the decisions given therein for the quarters ending September 30th and December 31st, 1912, were 846 and 158 respectively, bringing up the total decisions to the end of the year to 1,227.

The numbers in various sections follow on from the previous articles.

*Mechanical Engineering.*—Contributions are payable in respect of the following:—

27. Hoistmen or lift attendants (for passengers or goods), employed in factories and workshops, or in stores immediately connected therewith (but not in offices), when the aforesaid factories and workshops are engaged wholly or mainly in carrying on any of the trades set out in Schedule VI of the National Insurance Act, 1911 (A. 1,088). (Note.—Mechanical engineering is one of these trades.)

28. Labourers engaged in assisting millwrights, either in excavating foundations for the erection of engines or machinery, or in dismantling machinery or otherwise (A. 1,105).

29. Workmen and their helpers and labourers employed in factories and workshops which are engaged wholly or mainly in the manufacture of castings of aluminium for use as parts of the products of a mechanical engineering establishment (A. 1,110).

30. Workmen employed in businesses carrying on an insured trade, and engaged wholly or mainly in setting out the work in detail from the architect's or draughtsmen's

drawings on board, paper or other material, or in making working sketches from the drawings for the use of the workmen and not engaged wholly or mainly as supervising foremen (A. 1,121).

31. A workman described as a locomotive crane driver and engaged wholly or mainly in loading or unloading materials in a wharf siding forming part of a mechanical engineering establishment (A. 1,132).

32. Workmen engaged in making metal patterns for the use of iron, steel, brass or other foundries which are engaged wholly or mainly in making castings for use as parts of the products of a mechanical engineering establishment (A. 1,139).

33. Workmen employed in a mechanical engineering establishment and engaged wholly or mainly in repairing and screwing couplings and chains as part of the work of making or of repairing vehicles, cranes and machinery (A. 1,141).

34. A workman described as an inspector employed in a mechanical engineering establishment wholly or mainly in testing materials with straight-edge and other gauges (A. 1,160).

35. Tube benders employed in a mechanical engineering establishment (A. 1,163).

36. Twiners and other machinists engaged wholly or mainly in producing ebonite or vulcanised fibre parts for use as parts of the product of a mechanical engineering establishment (A. 1,169).

37. Workmen engaged wholly or mainly in connection with insured trades and employed as sketchers and progress men (A. 1,212).

38. Workmen engaged wholly or mainly in making, finishing or fixing ferro-concrete and artificial stone in connection with any insured trade, whether on the site or in a workshop or yard (A. 1,216).

39. Workmen engaged wholly or mainly in making moulds for ferro-concrete or artificial stone mentioned in A. 1,216 (A. 1,217).

40. Workmen engaged wholly or mainly as tool setters for general brasswork on capstan lathes and machine tools (A. 1,219).

41. Workmen employed in a mechanical engineering establishment and engaged wholly or mainly in machining and assembling metal windows (A. 1,225).

42. Workmen engaged in marking out timber in connection with an insured trade (A. 1,227).

Contributions are *not* payable in respect of—

11. Workmen engaged in making metal patterns (other than cast-iron patterns) not being for the use of iron, steel, brass or other foundries, who are engaged wholly or mainly in making castings for use as parts of the products of a mechanical engineering establishment (B. 1,138).

*Electrical Engineering.*—Contributions are *not* payable in respect of—

13. Workmen engaged in making lead accumulator boxes or lead linings for accumulator boxes (B. 1,134).

44. Workmen engaged wholly or mainly in wiring electroliers and similar electrical fittings, and not engaged in the installation or fixing of same (B. 1,150).

45. Workmen engaged wholly or mainly in making ebonite or vulcanised fibre parts of scientific instruments, telephones, or electric light fittings (B. 1,170).

*Cables, Overhead Lines, and Street Lighting.*—Contributions are payable in respect of:—(4) Workmen engaged wholly or mainly in driving or attending steam road rollers in connection with the construction of new roads, and not merely the resurfacing of existing roads (A. 1,076).

Contributions are *not* payable for:—(18) Workmen engaged wholly or mainly in making sills for lids of man-holes in streets (B. 1,089).

*Generation and Supply of Energy.*—Contributions are payable in respect of:—

7. Workmen engaged in erecting and connecting necessary wires to run and control electric time service (A. 1,115).

Contributions are *not* payable for:—

15. Chauffeurs employed wholly or mainly in driving and cleaning motor-cars and in doing occasional adjustments and repairs thereto (B. 1,108).

*Tramways.*—Contributions are payable in respect of:—

9. Workmen employed in a vehicle constructing or re-

pairing establishment, and engaged wholly or mainly in repairing and screwing couplings and chains as part of the work of making or of repairing vehicles, cranes and machinery (A. 1,141).

*Refundment of Contributions.*—The Unemployment Part of the Insurance Act, by Sec. 91, provides that the Board of Trade shall, on the application of any employer, made within one month after the termination of any prescribed period of 12 months, refund one-third of the contributions paid by him on his own behalf in respect of workmen who have been continuously in his service during the period and in respect of whom not less than 15 contributions have been paid during the period.

A refund of contributions paid in respect of unemployment insurance may also be claimed under Sec. 96, where any employer satisfies the Board of Trade that during any period of depression in his business his workmen have been systematically working short time and he has paid the workman's share of the insurance in addition to his own.

Sec. 100 of the Act provides that any regulations made by the Board of Trade must provide for the return to a workman who is not in an insured trade, and to his employer, of any contributions paid under the belief that the workman was in an insured trade, subject, of course, in the case of a workman, to the deduction of any unemployment benefit that may have been paid.

Forms to be signed by workmen and employers applying for the return of contributions paid in error may be obtained from Labour Exchanges.

No provision is made in the Health part of the Insurance Act for the repayment of contributions paid in error, but upon application being made to the Commissioners, forms can be obtained to claim repayment.

*Quarterly Stamping.*—A revised circular with respect to the quarterly stamping of Contribution Cards has been issued (Circular No. 105 (3)) by the English Health Commissioners. The alterations are not serious, the main one being that where there are less than 100 employees, Methods 3 and 5 (see ELECTRICAL REVIEW of November 8th, 1912) will not be approved. These methods allow for weekly cheques being sent to the Accountant-General, instead of depositing the whole quarter's contribution in advance.

## REVIEWS.

*Vapours for Heat Engines.* By W. D. ENNIS. London: Constable & Co., Ltd. 1912. Price 6s. net.

This is a very thorough investigation into the theory of what it has been customary to call the binary vapour engine. This binary engine is very tempting to the untutored engineer, who knows that certain liquids boil at a lower temperature than water, and give greater pressures at lower temperatures. But these are not the only desiderata, and when we learn that the few vapours which are, under circumstances, better than steam, are those of alcohol, chloroform, acetone, carbon bisulphide and carbon chloride, our joy in binaries, or even in the primary use of these liquids, is somewhat tempered. Was not carbon chloride the stuff, or something like the stuff, that was used by one Guittari as an economical liquid?\*

The author has worked out a series of curves, giving the pressure-temperature relations of what he terms the engineering vapours—ammonia, sulphur dioxide, ether,  $CS_2$ , acetone, chloroform, carbon chloride, ethyl alcohol, and steam. Except the last two in suitable combination, they do not sound attractive to engineers, but are more reminiscent of the operating theatre. They are at least dangerous. Of all the vapours that of steam has the least pressure for a given temperature, and its best ideal efficiency at modern temperatures is at present 0.47; the best recorded efficiency is 0.25, or little over half the theoretical.

The author attacks the problem on the grounds that (1) another vapour might give a higher temperature at 250 lb. pressure (the present steam limit) without superheat; or (2) a temperature of 600° with superheat might

\* Guittari used a mixture of carbonic acid gas and ethene chloride.—EDS. ELEC. REV.

give an efficiency better than steam : or (3) at 28 in. vacuum a lower temperature might be attained.

No vapour is known that will fill the first two conditions, which demand a  $t/p$  curve crossing that of steam. Other vapours do cross, as ethyl alcohol and carbon chloride at 190° F. It is easy to meet condition (1), but not at the same time (3). Condition (3), in any case, is dependent upon a supply of cooling water at, say, 60°, and then the limit of efficiency for any vapour would be 0.51, or 8 per cent. over present steam limits.

Only four vapours fit this condition (3), namely, carbon bisulphide (poisonous and offensive), chloroform (dangerous), acetone, carbon chloride, and possibly a fifth—alcohol. The best is carbon chloride with a pressure of 88 lb. at 302° F. as compared with 69 lb. for steam, and the pressure curve may even cross that of steam at 400° F.

Between 302° and 68° steam stands first in order of merit as a first approximation, but only four of the vapours could be condensed down to 68°, and both alcohol and steam would be slightly inferior to the other four vapours. If high initial pressure is got by superheat no advantage appears to be possible with the four vapours, and steam and alcohol stand first. The author finds no advantage in the binary principle to offset its complications.

For the whole of the six vapours named there is not an enormous difference in the relative sizes of either the boiler or the condenser, but considerable differences are found in the time to get up steam. In Chapter XI the author finds with the so-called Rankine cycle that the cycle efficiency may decrease with an increase of temperature range. With three of the vapours an engine will give equal power with a steam engine of nearly and fully double the cylinder capacity, when working with four expansions.

The substitute vapours probably lose more than steam in cylinder condensation effects, and they have very heavy pressures which are balanced, it may be to some extent, by the possible use of smaller cylinders.

There appears nothing "inherently absurd" in the use of vapours other than steam, and their use, as the primary liquid, is more promising by far than their use as binary vapours heated by the exhaust from a steam engine. We regard this as a very useful book for the student who might be led away by too much enthusiasm for other vapours. There is very little that can be said on behalf of them, and when their various characteristics are taken into the balance, there does not appear to be any real balance in their favour as compared with steam.

*Studies in Radio-activity.* By W. H. BRAGG, M.A., F.R.S. London : Macmillan & Co., Ltd. Price 5s. net.

This book deals chiefly with the phenomena attending the passage of the  $\alpha$ ,  $\beta$ , and  $\gamma$  or X-rays through matter. It embodies a record of experiments carried out in this branch of radio-activity by the author, together with an account of what has been done in this particular field by other investigators. It is, therefore, not a text-book on radio-activity in a general sense, but an account of a more or less limited portion of the subject only. The author has been struck by the absence of any evidence of true secondary radiation, that is, of an ionising radiation which derives its energy from matter under the prompting of primary rays. He concludes, as a result of his investigations, that we can claim no power of causing the atoms to unlock and distribute any stores of energy they may possess. This, of course, is also the conclusion of many other experimenters, though there are some who are not quite satisfied. The author also considers it remarkable that there should be so little evidence of the influence of molecular association upon radio-active phenomena. When an atom acts upon a passing  $\alpha$  or  $\beta$  or  $\gamma$ -ray, it is unsupported by any other atom, even of those belonging to the same molecule.

Particular attention is drawn to the strong family likeness which the three types of radiation,  $\alpha$ ,  $\beta$  and X or  $\gamma$ -rays bear to each other. The  $\alpha$ -rays are positively charged, the  $\beta$ -rays negatively, the X or  $\gamma$ -rays are uninfluenced by electric or magnetic fields. But putting aside these differences and their immediate consequences, in their laws of penetration and scattering, in their actions on matter, and the reactions which they suffer themselves, the three forms of

radiation differ in degree rather than in kind. If it is assumed that the action of each form is direct and requires no assistance from any other form, it is difficult to believe at the same time, that the  $\alpha$  and  $\beta$  radiations are corpuscular, and that the X and  $\gamma$ -rays are spreading pulses in the ether. The author comes to the conclusion that the assumption is wrong, and that the X and  $\gamma$ -rays act only through the intervention of the  $\beta$ -rays. He finds that this is accomplished by means of a complete interchangeability between the X or  $\gamma$ -ray on the one hand, and the moving electron on the other, a change which may be brought about during the passage of the ray or the electron through the atom. He shows that such a change must take place with little or no loss of energy.

The somewhat original conception of the interchangeability of the two primary rays is then declared to lead to a corpuscular hypothesis of X and  $\gamma$ -rays ; and this is said to be convenient, as the ether pulse idea has been for some time unproductive. It is better, therefore, to put it aside provisionally, and take the interchangeability of the X-ray and the electron as a new starting point.

From the preliminary sets of experiments the following conclusions are drawn :—

1. The  $\alpha$  particle is not appreciably scattered in passing through matter, but is "absorbed" only through the expenditure of its energy on ionisation.

2. The  $\alpha$  particle has a definite range in any given material depending upon its initial velocity.

3. Radium in a state of equilibrium contains four substances, each of which ejects  $\alpha$  particles at the same rate, but with different initial velocities.

4. The range of the  $\alpha$  particle of radium itself is about 3.3 cm.

5. The  $\alpha$  particle produces more ionisation as its speed diminishes.

Chapter II describes the range-finding apparatus. Chapter III shows how the ionisation curve of the  $\alpha$ -ray is obtained. Chapter IV gives an interpretation of certain peculiarities of the  $\alpha$ -ray curve. Chapter V deals with the quantitative results of stopping power exhibited by matter to the rays. Chapter VI is on the ionisation produced by the  $\alpha$  particle in different gases. Chapter VII deals with initial recombination ; Chapter VIII, with the  $\beta$ -ray and the law of its scattering ; Chapter IX, with the loss of energy of the  $\beta$ -ray ; Chapter X, with the general case of "absorption" of the  $\beta$ -ray ; Chapter XI, with the general properties of X and  $\gamma$ -rays ; Chapter XII, with the production of the secondary  $\beta$ -ray by the X-ray ; Chapter XIII, with the corpuscular form of the X-ray ; Chapter XIV, with the energy of the X-ray ; Chapter XV, with the calculation of the ionisation current under given conditions ; Chapter XVI, with the scattering of X and  $\gamma$ -rays ; and Chapter XVII, with the nature of X and  $\gamma$ -rays.

The book is well worth study by those interested in the subject, as it is evidently the record of an able experimenter.

*Electrical Injuries.* By C. A. LAUFFER, M.D. London : Chapman & Hall. Price 2s. net.

This little book is the work of the medical director of the relief department of the Westinghouse E. & M. Co., Pittsburg, and deals with the causation, prevention and treatment of electrical injuries in a manner to be understood by electrical men. Having acquired great experience and trained 1,000 men in the methods of artificial respiration, the author is well qualified to handle this subject, which is constantly growing in importance. He deals first with flash burns, which are not necessarily very dangerous, but need very careful treatment, and the author gives full details of the proper methods. Under this head are included "flashed eyes," a condition which can be developed by exposure of the eyes to arcs even at a considerable distance, as many an inquisitive electrical neophyte has learnt by painful experience. Burns of the skin are more serious on account of the danger of bacterial infection, which is sometimes fatal. The strangely contradictory phenomena that are met with, such as death from a shock at 110 volts and recovery from one of 15,000 volts, are noted, and a case is quoted in which a lineman died of pure fright on touching a high-voltage line which was not charged at all. Full

instructions are given for the resuscitation of victims of shocks, according to the Schaefer method, which is strongly recommended. An electrician in the employ of the Westinghouse Co. has rescued six lives by this means in as many years, not losing one case. Extreme promptitude in commencing the treatment is of the utmost importance. Short sections are given on minor surgery and first aid, and on infections, and the author concludes with a much longer one on the effects of occupation on health, one of the best in the book. Every engineer in charge of electrical works or machinery ought to have a copy of this excellent manual and make himself familiar with its contents, and everyone without exception ought to be acquainted with the teachings of the last section.

*Examples in Applied Electricity.* By G. C. LAMB, M.A., B.Sc., Cambridge University Press. Price 2s. 6d. net.

This collection of examples has been compiled mainly from tests set to engineering students at Cambridge, and includes some good exercises, both numerical and graphical, on electrical machines, transformers and power distribution. Probably most engineering colleges possess as useful a set of examples in a more or less collected form, and most teachers would map out exercises on the lines of their own lectures in preference to adopting those of another school.

So far from encouraging originality and experimentation, the publication of such sets of examples would appear to tend rather to the stereotyping of engineering courses and ultimately to the stereotyping of electrical engineers. It must, however, be admitted that this particular book contains examples of a really practical type, which is perhaps a tolerably good excuse for its existence.—P.H.S.K.

## PROCEEDINGS OF INSTITUTIONS.

### Tramway Feeding Networks.

By J. G. CUNLIFFE, M.Sc.Tech., and R. G. CUNLIFFE, M.Sc.Tech.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, December 3rd, 1912.)

(Concluded from page 10.)

IN order to understand the correct principles of negative feeding, it is necessary to study the effects on the flow of vagabond current of the various methods of feeding, since protection from electrolysis is the first object of the design.

With a uniformly distributed load, such as is approximately obtained with cars spaced at short intervals, the potential of the rails at any point with respect to the negative feed point is represented by a parabolic law, and if the curve of potential gradient in the rail is dropped until the two areas enclosed between it and the datum line are equal, as shown by the broken lines in fig. 5, A, the area enclosed above the rail will represent the amount of vagabond current leaving the rail, whilst the area enclosed below the rail will represent the amount of current re-entering, the curve itself then representing the absolute potential of the rail, and also the vagabond current density, at any point, the point *o* of intersection being the point at which the rail is at normal earth potential.

The broken lines shown in fig. 5, A, represent, neglecting any mutual effects, such curves of absolute potential for the two sub-sections of rail, the left-hand one of which is supposed to have (whether owing to greater length or to heavier loading is immaterial) a higher value of rail drop than the right-hand one. The point *x*, however, being common to the two sub-sections, must have a potential represented by a point on both curves which will accordingly be shifted to some positions such as those represented by the full lines, when it is evident that the two neutral points must be moved to the right and that there must be an interchange of vagabond current between the two sub-sections as shown in fig. 5, B. The higher rail drop will be reduced and the lower one increased, the tendency being to reduce their values to equality.

In considering the absolute potential conditions of any sub-section, full allowance must be made for the effects of other sections at a different absolute potential, and a sub-section may from this cause be rendered wholly negative with respect to earth, whilst safety and danger zones may be situated at totally unexpected places. Evidently then it is of importance that all sub-sections should have approximately the same value of rail drop, i.e., that all negative feed points should be at the same absolute potential. This conclusion, based on the authors' researches into vagabond current phenomena described in a previous paper, also forms one of the recommendations of the recent joint Commission which will govern future German practice.

For a given rail drop the authors have previously shown the vagabond current to be proportional roughly to the square of the length of sub-section, so that it is of importance that such length should be a minimum.

The general use of negative boosters alone permits of the attainment of the two ideal conditions, viz.:

1. Uniform absolute potential at the negative feed points, and hence no interchange of vagabond current.
2. Minimum length of sub-section, and hence minimum vagabond current.

Further, full advantage is taken of the high conductivity of the track: the rail drop is easily maintained at a low value, the pressure loss in the negative feeders is no longer subtracted from the supply pressure; great potential difference between the negative bus-bar and earth is avoided, and, finally, with heavy loading

In A.—Broken line = absolute potential gradients of sections considered independently.  
Full line = absolute potential gradients of sections considered jointly.

FIG. 5.—UNBALANCED SECTIONS.

a very material reduction may be obtained in the amount of return copper as compared with the amount required to obtain satisfactory conditions, even if they could possibly be obtained, without boosters. The saving in cost over the installation of additional sub-stations would be very considerable.

Economy in copper, however, must on no account be allowed to influence the amount of current to be brought back by any individual booster or the number of boosters to be employed. A maximum permissible value of rail drop must be adopted, and the amount of current to be returned must be determined solely by such rail drop considered in conjunction with the maximum

FIG. 6.—NEGATIVE BOOSTING CONDITIONS.

intensity of loading and the specific conductivity of the track, with due allowance for increase of traffic, and it is in the determination of the booster voltage that the saving in copper may be balanced against the cost of dissipated energy.

The problem is—knowing the maximum and average intensities of loading at all points along the routes—to divide each route into negative feeding sections, each of such length that its own current flowing to its selected feed point shall split it up into two sub-sections having equal rail drop opposed in direction as shown in fig. 6, A, which illustrates the absolute potential gradients, and shows by means of arrows the direction of current flow in each of the sub-sections of rails of lengths *L* and *l* respectively, the con-

ditions illustrated being applicable to sub-sections of equal lengths, equally loaded. This rail drop must have the same value on all sub-sections. Fig. 6, B, illustrates the conditions to be obtained in cases of unequal intensity of loading in the two sub-sections. The lengths  $L$  and  $l$  must each be such as to give the common rail drop, with their different conditions of loading, when there will be no interchange of varabond current. The length of each sub-section may be determined by the following considerations. Let—

- $i$  = maximum intensity of loading in amperes per mile on the respective sub-sections,  
 $R$  = specific resistance of track in ohms per mile,  
 $l$  = respective lengths of sub-sections in miles,  
 $V$  = maximum permissible rail drop in volts.

$$\text{Then—} \quad V = \frac{1}{2} i \cdot R \cdot l^2 = \frac{1}{2} \cdot I \cdot R \cdot L^2$$

$$\therefore L = \sqrt{2V/iR}, \text{ and } l = \sqrt{2V/I R}$$

$$\text{hence—} \quad L : l :: \sqrt{I} : \sqrt{i}$$

Typical values of the length  $L$  of sub-section and of the booster current, with two such sub-sections, are given in fig. 7 for various

NOTE.—With a limit of 9 amperes per sq. in. the limit of loading is 200 amperes per mile.  
 Contrast above limits with the value of 400 amperes per mile taken from actual American practice, and upwards of 2,000 amperes per mile from British and Continental practice.

FIG. 7.—NEGATIVE BOOSTING.

intensities of loading with double track composed of 105-lb. rails of British standard section and corresponding to a rail drop of 7 volts. The values of current show that the boosters would be quite large enough to justify a separate one to each negative feeder with heavy loading, whilst, if a higher rail drop than 7 volts were allowed, or if rails of a heavier section were employed, both current and length of section would be larger, i.e., the size of the boosters would be increased and their number reduced. The total length of section if the sub-sections were equally loaded would be twice the value shown in fig. 7.

In practice, however, the feeders would, in the majority of cases, be run to junctions, when the values given in fig. 7 would be doubled and the number of boosters almost halved, a slight sacrifice

FIG. 8.—NEGATIVE BOOSTING (ALL DOUBLE TRACK.)

being made in the resulting conditions to effect this end. The ideal conditions could not in any case be perfectly obtained, owing to imperfect distribution of the load, regulation of the boosters, &c., but the conditions actually attained would be greatly superior to the best that could be obtained in any other way. Many unboosted feeders could still be retained where favourably situated. Each booster should be excited from the grouped positive feeders serving the same area.

The application of the negative booster is not likely to become sufficiently general to permit of the attainment of the ideal conditions, but the latter should be kept in mind. In the most general cases a booster is required either occasionally or continuously to operate a long negative feeder in parallel with shorter ones, and gives satisfaction provided the permissible maximum rail drop is not exceeded.

An installation of this kind, designed by the authors to deal with very heavy football traffic, is illustrated in fig. 8. The heavy loading was experienced between the football ground shown and the boundary at A, B, C, and the rail drop between these points

and the point D was found to be below 7 volts. The negative booster was so designed, that an artificial dividing point was created at x and moved with varying load distribution over a range such that it never reached the point D of attachment of the booster feeder. In this way the section was split up into three sub-sections, the direction of flow of current in each being indicated by the arrows. The rail drop in each sub-section was maintained below 6 volts, and although the total drop from D to E could not be reduced to zero—the ideal value—it was reduced to 2 volts as against 18 volts without the boosted feeder. This imperfect balance was due to the loading of the sub-section E F, which was beyond the control of the booster. In this way alone, by splitting up the section into sub-sections with their directions of flow mutually opposed under all conditions of loading, could the rail drop under such difficult conditions be maintained below 7 volts. The practice of connecting a group of long negative feeders to a single booster would not be possible with really heavy loading, nor would that of exciting the booster from a shorter negative feeder, and in any case with such methods the track sectionalisation is not definitely assured.

The authors have known cases where return current from a section fed by long feeders from one station entered another station by its negative feeder, flowed through its generators along its trolley wires, and through the equipments of its distant cars to re-enter the former station by a shorter negative feeder on another route. This would not occur if the potential at the negative feed points were uniform, and cannot be prevented by merely equalising the resistances of the negative feeders, although it can be minimised, since such equalising is correct for one value only of the load distribution. With boosters it is correct for all values.

It has been shown by the authors in their previous paper that one regulation alone is of any use in assisting in the prevention of electrolysis, viz., limitation of the maximum permissible rail drop, and other regulations are not merely useless, and often contradictory, but may impede progress. Thus, for instance, for a given rail drop, the potential difference between the rail and a pipe at any point is definitely fixed and is beyond control.

There are two regulations in particular which would effectually prevent the use of the ideal system of negative boosting, viz., the British limit of 9 amperes per square inch in current density in the rails, and the present Chicago limit of steepness of potential gradient in the rails, which must not exceed 1 volt per 1,000 ft. in the downtown sections and 1 volt per 700 ft. in other places. The latter is a reflection of the old French administrative rule of 1 volt per kilometre also adopted for suburban lines by the German Commission.

The maximum values of current density and rate of fall of potential in the rail with the ideal boosting conditions, British standard 105-lb. rails and 7-volt rail drop, are illustrated by the curves B and C given in fig. 7, whence it is obvious that the above values would be far too low. And yet the conditions in fig. 7 represent the maximum of safety. The limitation of current density in the rails has been adopted as the most practical way of limiting the local steepness of the potential gradient to a maximum of 0.5 volt per 100 yd., so that the two regulations are really identical in nature and are based on the fear that with a potential difference of, say, 1 volt per 100 yd., there would be a heavy flow of current in any metallic structure which happened to approach the rails at two points several hundred yards apart. It is clear however, from the curves shown in fig. 6 that these high values are obtained only in the neighbourhood of the negative feed points, where at no single point could current leave the rails, and the danger is purely imaginary.

It is widely believed that with very heavy loading the British limit of 7-volt rail drop would be prohibitive, but with negative boosting this would not be the case. The German Commission already referred to recommends a maximum value of 2.5 volts; but this is too low, as the 7-volt limit has proved to be a reasonable insurance against damage, which is all that should be expected. A value recently incorporated into the City ordinances at Chicago of 12 volts maximum is considered very harsh, but the pressure drop along a pipe situated within 3 ft. of the rails may easily exceed 10 per cent. of the total rail drop, and so values greatly in excess of 7 volts are not to be encouraged.

Legislation alone cannot provide complete protection against electrolysis. It must be assisted by careful construction. Metallic structures must not approach within 3 ft. of the rails (the German Commission recommends 1 metre), and in a new construction or reconstruction, care must be taken to reduce to a minimum the number of section-box frames, poles, &c., which require to be bonded to the rails as these pass down amongst the pipes beneath the footpath. Guard wires ought to be insulated from the poles and "earthed" by means of insulated cables passing down the interior of the poles to the rails, and poles carrying gas-lamps ought to have triple insulation rather than be bonded to the track, as the latter is equivalent to bonding the pipes themselves to the track, which is bad practice.

#### DISCUSSION.

MR. B. WELBOURN agreed that they should endeavour to bring the point of connection of the feeder to the rails to zero potential throughout, so that the negative feeder should be used in the most economical manner; this would make electrolysis an entirely negligible quantity. Had the authors considered the raising of the pressure on the trolley wire? If the pressure were raised they would enormously decrease the expense in feeders, both positive and negative, and would also have a great many other advantages in that the number of sub-stations would be reduced, and so on. There was no inherent difficulty in making trolley wires perfectly

safe, even if an auxiliary suspension had to be employed to prevent a broken wire from falling into the street. It was for the designer of tramway equipment to say what the limit was that tramway motors and controllers could be arranged for.

Mr. S. L. PEARCE said it would have been very interesting if they could have had some concrete figures dealing with the Manchester tramway system, showing how the increased service—the proportion of the larger to the smaller cars—had affected the question of power. A striking increase of power had been required. The authors stated that “in view of the strict limitation of the line pressure the governing factor in the feeder designs must, at some stage in the development, change from overheating to pressure drop, and that boosting must ultimately be resorted to.” That was a rather sweeping statement, and he took it that it entirely referred to D.C. 600-volt systems; it would not be correct in the case of mixed systems. The authors referred to the reluctance of engineers to employ feeders much larger than 1 sq. in. in cross-section. He recently had occasion to look into that, and had come to the conclusion that where it was necessary to use a total of 1 sq. in., it was better to use two halves rather than 1 in.; it enabled the current density to be pushed up much higher with two halves than by using one 1 in., and even after allowing for the slightly increased cost of the cable, and so forth, it was still a commercial proposition. The authors stated that the amounts of current returning by the respective feeders, if of the same size, would be almost inversely proportional to their length, and they went on to say that the distribution of the return current amongst the feeders was governed by the nature of the load distribution. His experience was that the low-resistance rails would to a very great extent swamp the load distribution, and that by employing resistances in the short negative returns to a limited extent, the current did return by the respective negative feeders in inverse proportion to their lengths. If the resistance of a short negative was increased the effect was the same as reducing the resistance of a longer one, and the balance point was moved only in one direction. Frequently it would be found that it was far better to cut the bonds and allow the separate negative feeders to bring back their own currents respectively. He entirely agreed with the statement that “for a given length of track, with increasing loading, the maximum permissible rail drop is ultimately attained, when copper must be provided to carry any additional current, and as this copper is operated at a very low current density, its use is very uneconomical”; it was quite a mistake to attempt to put copper in parallel with the rails; if there was any copper to spare it should go into the negative feeders. The authors stated that by the use of negative boosters the flow of current in the rails might be controlled in a manner which was almost ideal; but was it commercial? There was a very great difference between necessary conditions and ideal conditions. There was no electrolysis in Manchester. In many cases a resistance in short negatives was used to secure all that was really necessary or desirable. The strongest point for the use of negative boosters, apart from the ease of load distribution, was the fact that pressure loss in the negative feeders was no longer subtracted from the negative section. Fig. 7 would be of very great value when tackling other problems. No one would pretend for a moment that it was possible to install the negative booster for such low capital expenditure as resistances. The authors referred to the necessity of having treble insulation when tramway standards carried gas lamps; obviously the correct thing was to move the gas lamps.

Mr. J. S. PECK said that some of his friends in America had never heard of negative boosters, and did not know what they were at all, evidently owing to their having no laws in America until recently regarding the allowable drop in rails. There was very little attention given to the matter as long as the current got back somehow in the cheapest and easiest way; but they would suffer for that in the long run. The reason why electrolysis was coming more into effect in some cities, and of the increasing advance with feeders, both positive and negative, as had been pointed out by the authors, was the general tendency to force up the schedule speed and the general increase in car weight.

Mr. H. A. RATCLIFF thought that the negative resistance was not always understood. As an energy-converting device, the resistance had precisely 100 per cent. efficiency, and a booster never approached that efficiency. The resistance had practically no maintenance charges or running cost, and no capital cost; it would not fulfil the ideal conditions, but it would fulfil the necessary conditions.

Mr. E. M. HOLLINGSWORTH said he tried running negative feeders without boosting some years ago, but they were absolutely useless. Later on, owing to the increased service, it was found that the drop was excessive, so negative boosters were put in, though they could not possibly get the ideal conditions, for the reason that Mr. Pearce had pointed out. At St. Helens they had had one or two bad cases, though, perhaps, they were rather peculiarly placed on account of chemical works at that place. Two fires had occurred owing to guard wires being pulled down and the water pipes being in contact with the gas service, which was, perhaps, 150 yards away; and on another occasion a subway caught fire, due to an electric telephone cable which was carried down one of the standards. The guard wire was again the cause of the trouble, and he agreed with the authors' remarks that guard wires should be earth-connected by means of insulated cables; this also applied to gas lamps. He had tried connecting the lead-covered cables for a tramway system to the rails, and found that they were getting electrolysis, so he disconnected them, and since that time he had not experienced any trouble.

Mr. C. C. ATCHISON said as time went on schedules were

altered, conditions of working were different, and the negative feeders, which were big enough to suit the original conditions, were at the present moment almost useless. Many of the large undertakings might have been able to straighten them out, but difficulties arose in small undertakings. He did not think radiating sub-feeders were as good as separate feeders in a busy area. If sub-feeders were supplied by one big feeder, and the big feeder was put in on a busy route, every driver on that route would be trying to start at the same time, and it was almost impossible to keep the breakers in. He had a very disrespectful opinion of guard wires as a whole. He did not approve of insulating guard wires and trying to keep the poles and pipes insulated and separate from the rails, because, after all, one wanted to protect the pipes. In towns where the municipality worked the tramways, it should be an instruction to any department that was laying pipes that they should be kept at such a distance as to be safe. Mr. Pearce had pointed out that two 0.5 cables were better than one of 1 sq. in., and from past experience he endorsed the statement entirely.

Mr. A. G. COOPER said they ought to put down heavier rails so as to minimise the rail drop, because the extra price for the rails would be cheaper than putting down copper feeders. He quite agreed that it was much better to put down two small feeders than one large one on account of the current density.

Mr. R. ROWLANDS referred to fig. 8. He had arranged to put all the feeders through the booster, and in the event of the breakers coming out, if only one feeder was coupled up, there would still be the load to be dealt with on the remaining section, as in this case there were two separate positive feeders. He had arranged for an electrical control governor to be placed on the end of the shaft, which cut out the booster before it reached a dangerous speed. They had in this case run two negative 0.8 in. feeders instead of one 1.6 in. With regard to the point of connection, fig. 8, he thought that the connection at “D” was not at the right point.

Mr. C. G. L. PREECE believed Glasgow was the first to adopt the negative booster, and had paid a great deal of attention to limiting the rail drop. At one time a very large system of potential wires was used in its system of negative feeders, and the function of these was similar to what the authors described in the paper. As far as he remembered, the positions of the negative feeders were fixed from results obtained from the system of potential wires, and on a visit to a sub-station, he was shown the drop of a great number of sub-sections in the city, and noticed that it did not exceed 2 volts in any of those sections.

Dr. E. ROSENBERG said he could not follow why resistance had 100 per cent. efficiency and the booster only 80 per cent., for after all if they wanted to generate heat, everything had 100 per cent. efficiency. The resistance drop was a dead loss, but if the dead loss was only for a few hours during the whole year the yearly annual efficiency might, of course, be better than that of a machine with 20 per cent. less efficiency.

Mr. H. E. YERBURY (in a communication) said that the deplorable state of things formerly existing in Chicago and other American cities could not have existed under B. of T. rules and regulations, and he saw no reason to fear any trouble now that overloading conditions prevailed in many of our large towns. The Sheffield Corporation Act of 1901 had a protective provision inserted by the Sheffield Gas Co., relative to possible electrolytic injury or damage to mains, pipes, &c., and although the loading and output in units had been more than trebled since that year, it had been demonstrated to the satisfaction of the company that no trouble had taken place, and that they were still able to work within the B. of T. limits. With respect to positive feeding, he thought the system of feeding with graded distributors was preferable in point of efficiency and economy to the Manchester system, as shown in fig. 2. He saw nothing new in what was called the authors' design (fig. 8). The correct principles of negative boosters and returns were dealt with by himself in an informal paper read before the Leeds Local Section of the I.E.E. on April 13th, 1905, which was published in the technical journals. With regard to present legislation, taken as a whole the results were satisfactory to all concerned. Still, he thought the limit of 9 amperes per sq. in. for the current density in the rails could be exceeded under certain conditions, without harmful results.

The AUTHORS, in reply, said that boosters were not recommended for cases where other and cheaper methods were available, but there were conditions of loading where only boosters would enable the requirements to be fulfilled. Where possible with economy, the control of return circuits by the balancing of feeders was advisable, but was limited, with extra heavy loading, by the loss of pressure in the return feeders. This loss was not obtained if negative boosters were used. With respect to Mr. Pearce's remarks as to the use of two ½ sq. in. feeders in place of a 1 sq. in. feeder, they referred more particularly to heavier feeders than those, and advised multiple feeders on grounds of greater facility in handling and laying, greater reliability in operation, and greater factor of safety, with the advantage that breakdown of one component did not cut out the whole feeder. There were objections to the use of a large number of boosters in a single station, and the compound feeder was put forward to minimise the number of boosters. They again emphasised the importance of keeping pipes and metal work at least 3 ft. distant from the rails. The Chicago rails were bonded at all possible places to the elevated railway structure, and the result had not been such as to support the principle of such bonding. In addition the pipes were bonded to the rail at all parts of the system, yet the resulting damage from electrolysis was notorious. It was of greater importance to know what currents the negative feeders were carrying than was the case with positive feeders. The suggestion to use heavier rails so as to utilise steel in place of copper, presupposed the advisability of employing bare conductors

in parallel with the rail, which they had stated to be inadvisable on account of the low efficiency and heavy expense. The results indicated the correctness of the design in fig. 8.

### Earthed v. Unearthed Neutrals on Alternating-Current Systems.

[The paper on this subject, by MR. J. S. PECK, of which an abstract was given in our issue of December 6th, 1912, was read before the NEWCASTLE LOCAL SECTION of the INSTITUTION OF ELECTRICAL ENGINEERS on December 9th, 1912.]

MR. W. C. MOUNTAIN, chairman, in opening the discussion, said for private installation work he favoured unearthed neutrals, and from a colliery engineer's point of view he thought that this system was advisable. The confusion which would result from a sudden cutting-off of all power and light would be far worse than an earth on an insulated system. He had always hesitated about putting automatic features underground, and preferred a leakage indicator.

MR. C. VERNIER (N.E.S. Co.) said that he was a firm believer in earthing everywhere, without exception. A cable generally broke down to earth first, and it was advisable to isolate it as quickly as possible, and before it had time to develop a fault to earth. On an insulated system some time was required to locate the fault, and while this was being done there was always the risk of another fault occurring on another phase. While small systems might be left unearthed, at the discretion of the engineer, he considered that those systems which were at present running satisfactorily without earthing would eventually find it advantageous to earth when they reached a certain size. Telephone disturbances were almost entirely due to electrostatic induction, and with one phase earthed the whole electrostatic balance of the system was upset. In his opinion the neutral should be earthed for distribution circuits, and he attributed the freedom from serious accidents in this country to the usual practice of earthing in such cases. The reduced cost of insulation by earthing the neutral was not worth considering for voltages up to 50,000, but above this it might be worth while, especially where corona effects were present to take care of pressure rises. He strongly disagreed with the suggestion that in order to maintain continuity of supply, high-tension lines should not necessarily be cut off in the event of a fault, as this was simply balancing the cost of a duplicate supply against the danger to life. Whatever views might be held in other countries, this was considered most important in this one, and there was already quite sufficient prejudice against overhead work without introducing any doubts regarding safety. "Split-conductor" protection, which was the latest development in protective devices, promised to be of great importance, as it operated in the most positive manner on the breakage of a conductor wire.

PROF. W. M. THORNTON (Armstrong College) mentioned that in every electrical circuit the resultant current was zero, and he could not understand why it should be considered necessary to raise this point so often. Referring to fig. 1, he asked what was the smallest earth current at which the system would operate.

MR. HUNTER said that it could be made to operate with 1 per cent. of the line current, but a delicate relay was necessary.

PROF. THORNTON (continuing) remarked that the opinion was held, especially amongst mining men, that the risk of breakdown was increased by earthing the neutral, and it was interesting to note that the author's opinion was to the contrary. Regarding the presence of surges following arcing between phases, he put forward the theory that these were due to the condenser action of the incandescent metallic vapour in conjunction with the reactance of the line, thus forming a circuit which would resonate with great violence. Instead of using resistances for earthing the neutral, he suggested the use of choke coils, on the assumption that the cost of these would not prove prohibitive.

MR. P. V. HUNTER (Merz & McLellan) said that he had had experience of unearthed neutrals in the early days of the Durham Collieries system, and had found that when one fault occurred other faults occurred simultaneously at one or more parts of the system, probably due to the free energy liberated when one phase went to earth. He had known cases where high voltages had occurred on low-voltage systems having insulated neutrals; in one case a 600-volt system fed through a transformer from 6,000 volts, sparked through a paper disk which would stand at least 1,200 volts. With regard to "potential front," he had come across one case where sparking took place over a 10-in. gap on a boosting transformer which normally could not have more than 2,000 volts across its terminals. Such sparking could only be explained by "potential front" when switching the cable and booster together.

MR. F. O. HUNT referred to a device brought out by Mr. M. B. Field, which worked on the same principle as that shown in fig. 1, but in that case the magnetic fields were balanced and not the currents. He thought that a choking coil in the earth connection might form a resonating circuit with very low resistance, in conjunction with the capacity of the cable network.

### THE JOHANNESBURG TURBINE CONTRACT.

JUDGMENT was given by Mr. Justice Ward on December 3rd in the Witwatersrand Division of the Supreme Court, in the action for libel brought by Mr. John Taylor against the *Rand Daily Mail, Ltd.*, and his decision was published in the *Johannesburg* newspapers.

His Lordship said: The plaintiff in this case is a solicitor, and has been since 1907 the town clerk of Johannesburg. Among other enterprises carried on by the Municipality of Johannesburg is the manufacture of electricity for the purpose of running its own tramcars, and of supplying the inhabitants with light and power. The first plant contracted for by the Council consisted of certain gas engines, which proved an absolute failure, and in April, 1907, it became necessary to install a new plant as quickly as possible. The Council then had an advisory board of expert engineers in connection with the gas engines, and, under the advice of this board, a steam plant was purchased from Messrs. Reunert & Lenz. Rapidity of delivery was essential, and the contractors tendered to deliver in eight weeks, as against the next tender of 13 weeks. In 1907 another set was purchased, and here again rapidity of delivery was essential, and the order was given to Messrs. Reunert & Lenz, who contracted to deliver in 16 weeks, as against the next tender of 36 weeks. A third order for 1,000-kw. and 500-kw. sets was considered in February, 1908; quick delivery was again an essential, and the order was again given to Messrs. Reunert & Lenz, who undertook delivery two months earlier than next tender. A fourth order was also given to Messrs. Reunert & Lenz for a 1,000-kw. set. There was no question of rapid delivery in this case. Tenders were called for a 1,000-kw. set, and the choice lay between the plant accepted for £12,695, or a 1,800-kw. Parsons turbine set for £13,450, both of which were on exhibition and ready for delivery. The latter set was recommended by the manager, as also by the Tramway Committee of the Council. The Council, however, accepted the tender of Messrs. Reunert & Lenz. The defendants, in their issue of August 4th, 1908, commended the Council for its action, on the ground that direct current turbines were still experimental so far as Johannesburg was concerned, and that the Council was consequently taking the safer course. In the case of the second set, a board of technical advisers recommended a Parsons turbine. But the Council rejected the advice, and ordered a set from Messrs. Reunert & Lenz on account of the rapidity of delivery. The plaintiff had nothing to do with any of these purchases. He was the town clerk, but as I understand the matter was decided by the Council independently of him, and in the case of the fourth order he was away in England. An engineer named Thomas was at the time these orders were placed the manager of the electrical department. In September, 1911, the Council decided to order further plant and to call for tenders for that purpose. Prof. Dobson, the manager of the electrical department, was entrusted with the duty of making out the specifications and conditions of tender. As it was desired to have the plant ready for the Christmas load of 1912, it was decided to make the period for delivery 45 weeks.

On January 31st, 1912, Prof. Dobson, the Council's manager, reported on the various tenders received, and recommended the acceptance of the tender of Messrs. Reunert & Lenz. This was reported on by the Tramway Committee on February 2nd, 1912, and sent forward to the Council. On February 13th, 1912, a letter was sent to the Council by the Chamber of Commerce, criticising Prof. Dobson's report. The matter was referred back to the Tramway Committee, with a recommendation to have the tenders reported on by a Government electrical engineer or three experts appointed by the Council. On March 11th, 1912, the Tramway Committee met the Chamber of Commerce representatives, who were, in fact, the unsuccessful tenderers, as their representatives and the representative of the successful tenderer. Naturally, therefore, the representatives were not quite unanimous in their views. Certain letters and criticisms were then sent to the Council by these representatives. T. Dobson, the general manager, made a report in reply. On March 26th, 1912, Messrs. Rider and Tippet, the former an eminent electrical and mechanical engineer, and the latter a civil engineer who holds the position of chief engineer of the South African Railways, and has had considerable experience in contracts, were appointed as a board to report as to which was the most advantageous tender for the Council to accept, the board bearing in mind the condition of affairs at the power station; and, further, Prof. Dobson's three reports referred to in the criticisms of the Chamber of Commerce, and on those criticisms, Prof. Dobson's reply to these criticisms; to report generally on any matter at the power station which, in the opinion of the board, affected the questions submitted to it. On April 17th, 1912, Messrs. Rider and Tippet reported at considerable length. On April 19th, 1912, the Tramway Committee instructed the town clerk to report upon the engineers' report. On April 22nd, 1912, the plaintiff reported at great length on the situation and on the engineers' (i.e., Messrs. Rider and Tippet's) report. He had the assistance of two technical advisers on the town staff. Prof. Dobson was at this time ill. The plaintiff says that if this had not been so, Prof. Dobson would have been asked to report instead of himself. The engineers recommended the acceptance of the tender of Messrs. Sykes & Co. The plaintiff's report was considered by the Tramway Committee, who recommended the acceptance of the tender of Messrs. Reunert & Lenz, recommended by Prof. Dobson. This recommendation was accepted by the Council on April 23rd, 1912. On April 25th, 1912, a motion was brought before the Council to rescind this resolution, but it was lost. A great deal of excitement and comment was caused in the town, and the action of the Town Council was freely discussed. On

**Norway's Electrical Imports.**—According to the latest statistics published, Norway was an importer in 1911 of cable and insulated wire to the value of 1,919,000 kr.; of accumulators and accessories to 79,000 kr.; of electric apparatus, including telephones and telegraphic instruments to 363,000 kr.; of glow lamps, to 498,000 kr. and arc lamps, 10,000 kr. About three-fourths of these goods were supplied by Germany.—*Elek. Zeitschrift.*

June 21st, 1912, the defendants published in their issue of that date an article taken from the *ELECTRICAL REVIEW*, London, which is the article complained of in this action.

The plaintiff has set forth certain passages in his declaration to which he attaches certain innuendoes, and the Court is asked to hold that the passages bear the meaning alleged, taking into consideration the whole tenor of the article and the surrounding circumstances. The surrounding circumstances relied upon are that charges of bribery and corruption were being freely made in speeches by town councillors, which were published in the defendants' paper. Thus on June 14th, 1912, a Mr. Bernberg, who appears to have at that time been the general secretary of the South African Labour Party, is reported to have said, at a meeting of a branch of that party for the purpose of expelling a Mr. Jackson from the party for his action in connection with "the turbine trouble," which I presume refers to the contract in question "If they had any Labour principles at all, those principles were that they should be solid on all matters in which there was a reasonable suspicion of bribery and corruption." On June 27th, 1912, a leading article was published in the defendants' paper in which it was stated: "The meetings of the Council degenerate into scenes of turbulence, in which charges of jobbery and graft are hurled with distressing frequency," and suggested that new men must be sent to the Council able to transact business with dignity and in a manner not calculated to arouse suspicion. On March 24th, 1912, a Mr. Mulvey, is reported in defendants' issue of that date to have said in the Council: "He had heard of graft in America, but he thought that Johannesburg could give the average American city points." Then, after referring to Messrs. Rider and Tippet, he continues: "The time has come for a Government inquiry upon oath into the affairs of the Johannesburg Town Council." On July 2nd, 1912, a Mr. Benson, another councillor, is reported to have said: "He had never accused Prof. Dobson of taking bribes;" then, after quoting from the *ELECTRICAL REVIEW* (i.e., the article complained of), to have added that his position was supported by that article. He had submitted the urgency report to judicial authorities, and they had one and all asked, "Who's getting something out of it?" On June 26th, 1912, Mr. Mulvey, again moved that, in view of the serious allegations contained in the *ELECTRICAL REVIEW* on May 30th *re* the management of the town of Johannesburg's business affairs and other allegations made from time to time, "we approach the Government for an independent inquiry." I have set forth these circumstances at this juncture, as it is perhaps more convenient to have collected before one the circumstances on which the plaintiff relies as proving his innuendo before dealing with the actual words. These may be divided into three classes:—(1) The defendants' own attitude as shown by the article calling attention to the matter complained of, and to the reply to the letter of demand. (2) The fact that prior to the publication of the article charges were made in public in connection with this particular contract that there was corruption somewhere. (3) The fact that the same charges were made after the publication of the article, and that speakers referred to the article as containing grave charges.

That the article contained grave charges of mismanagement was stated by Mr. Mulvey. Mr. Benson's position, which he says was justified by the article, it is rather difficult to find, but I do not see any charge of bribery made except as a deduction by certain judicial authorities from the urgency report. It was contended that the defendants are bound by a meaning attached to the words in speeches of third parties, seeing that they have reported such speeches without contradiction. But in the case of a newspaper it cannot be said that the editor is cognisant of the meaning attached to words used, although there may be a report of a speech in his paper which gives that meaning to them. This point, and the fact that one or two individuals attach a certain meaning to the words, may be considered by the Court sitting as a jury, but the jury are entitled to reject such meaning. Coming now to the article complained of, this starts by giving a history of the first four contracts, which is fairly accurate until we come to the summing-up of the situation, when we read: "Thus we see four contracts given away to one firm at prices far in excess of what need have been paid and in face of the best engineering advice procurable, which advice was not offered in an officious manner, but was solicited, and we presume paid for by this Council." This statement is not true. Only one of the contracts was given contrary to the technical advice outside the municipality's own advisers. With regard to three of the contracts, time of delivery was the most important factor. In one case, the Council refused to make an experiment by using turbines, and, in the other, they refrained from taking an 1,800-kw. set which was ready for delivery in favour of a 1,000-kw. set which was also ready. Tenders had been called for a 1,000-kw. set. The article goes on then to give an account, not inaccurate, of the history of the last tender, with some account of the board's report (i.e., of the report of Messrs. Rider and Tippet). Then it goes on: "The town clerk of Johannesburg, to whom, as the executive head of the Corporation staff, the report was sent, took it upon himself to criticise it." This is not true. The plaintiff was instructed by his Committee to make a report upon the report. It is said that this does not mean criticising it, and consequently he did take it upon himself to criticise it. He was asked to make his report, and I do not see how he was to do so without criticising the report. It was his duty to give his views; his views may or may not have been inept, but it was his duty to give them. Messrs. Rider and Tippet considered that their report, being technical, would not be understood by the Council, and did not think it should be criticised; they would never have made it if they had thought it was to be criticised, so they say. And the attitude of the article is that Messrs. Rider and Tippet's report was from the nature of the case beyond criticism, especially by laymen. But after a careful

perusal of both the report and the criticism of the plaintiff in so far as the business portion of it is concerned apart from the technical portion, the observations of the plaintiff appear to me to have been quite called for and just. He is pointing out to his Committee the practice laid down previously as he was obliged to do; the question, for instance, of having a separate tender for foundations or erecting them departmentally might make a vital difference in the Council's view. There is no doubt that the correct course then was to call the board's attention to the Council's attitude on these points, so that the Council could get the benefit of its advice from that point of view. With regard to the technical point, it is impossible to judge of the merits, but, although differences may be only a matter of opinion, the Council certainly should have borne in mind that they had eminent independent technical advice on one side as opposed to that of their servants on the other. They may have paid attention to this for all I know whether they did or not. I cannot see that the plaintiff was in any way to blame for putting before them the views of their technical advisers, seeing that he was asked to report. To proceed with the article: "His criticism extends over 35 pages of typewritten matter, and for a thoroughly bumptious, consequential and extravagantly-absurd concoction, we have never seen its equal." This is said to be libellous, and the innuendo is that either the plaintiff is incompetent as a town clerk, or that he was dishonest in his criticism of the report. But I do not think the words can be made to bear that construction. The writer is entitled to express his opinion of the merits of the town clerk's report as a literary or technical production provided he does not impute dishonest or disgraceful motives. The view of the writer of the article is clearly largely influenced by the fact that a layman was exhibiting the audacity to criticise a technical report. But that does not affect the question as to whether the words are defamatory. In my opinion, they do not, as they stand, bear out the innuendo alleged. The article proceeds with the history of the breaking down of a certain turbine. The plaintiff called attention to the fact that the board had concluded, from the papers before them, that Messrs. Reunert & Lenz were entirely responsible for the breakdown, and remarks that they are not in a position to give a judgment on the point, inasmuch as Messrs. Reunert & Lenz's answer was not before them. It is not necessary to decide whether he was right or wrong in this; the view, from a legal standpoint, is not without merits, though a board of experienced technical experts doubtless thought they had sufficient to form a judgment on the matter. The article says:—"We hope these words, which we presume, express the considered opinion of the town clerk, as the legal adviser of the Corporation, will be duly noted by the manufacturers." I have been unable to find what is meant by this; no explanation was offered in argument by either side; but I take it the writer is commending to the notice of the manufacturers the fact that the town clerk's view is that a Belliss turbine should not be condemned as defective mechanically until it is established that the accident to the No. 2 turbine was caused by mechanical defects. This does not appear to me to be defamatory.

The article proceeds:—"Next we find this chologenic genius arguing over the meaning of the word dismantled. They saw No. 2 turbine dismantled, said Messrs. Rider and Tippet. The town clerk pretends to think that this might lead people to suppose that it was being taken down as useless and condemn the board's report on this account." It is said the sting in this is in the use of the word "pretends." I do not think that this is defamatory. The words "pretends to think" quite clearly are capable of meaning that the defendant falsely states that he thinks, whereas he does not, which would certainly be defamatory and bear out the innuendo that he was dishonest in his criticism. But the expression also means "professes to think," which does not mean he puts in a claim falsely. The expression is a rhetorical one, which is used to express strongly the view of the writer that an expression which has been criticised cannot bear the meaning attached to it by the critic. In my opinion, that is all that the expression means here, and is not, in my opinion, speaking as a jurymen, defamatory. The writer does not think that anyone can take the view that the words used in the report by the board were open to misconstruction. For my part, I must say that I think the words were quite capable of bearing the construction to a lay mind that Mr. Taylor says they bore to more than one town councillor. The expression, "We saw dismantled," is certainly open to the construction, "We saw in a dismantled state." The report is not condemned on this account, but the expression is explained for the benefit of the readers who Mr. Rider said he never expected would understand his report. But though I am satisfied there was no pretence at all in the town clerk elucidating the expression by a reference to the facts—I do not think this passage defamatory. The expression is purely rhetorical, and does not, in my opinion, convey any imputation against the plaintiff's character. The next passage set forth in the declaration, and which follows immediately in the article is this:—"He then goes on to prate of professional conduct and the fact that Prof. Dobson's reputation was in their hands. Now the board treated him with quite as much consideration as he deserved, and quite as much, to judge from our prefatory remarks on the contracts, as he was accustomed to obtain." This passage contains a very serious misstatement of fact—in that it suggests Prof. Dobson was connected with the former contracts, when, as a fact, he was not in the employ of the Council at that time—but the whole passage appears to be more an attack on Prof. Dobson than on the plaintiff; but the sentence clearly shows that the writer was not careful to inquire who was connected with the other contracts, and it may be of importance, when one comes to examine the meaning of the text of the articles as a whole.

(To be concluded.)

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**MEXICO.**—With reference to a notice which appeared in these columns recently regarding proposed increases in the rates of duty on imported goods levied under the Mexican Customs Tariff, the Board of Trade have received telegraphic information from the British Legation in Mexico to the effect that the previous Bill has not been passed, and that the Mexican Government intend to present to Congress a modified project providing for the increase of the Customs duties by 7 per cent. in addition to the increase of 5 per cent. which was previously proposed. If Congress does not pass the new Bill during the present session a special session will be called to deal with the matter.

**ROUMANIA.**—A considerable amount of trade with Roumania is carried on *rio certain* European ports which possess what are known as "free zones"—i.e., sections of the open port which are in the nature of bonded districts. When goods are transhipped at these ports for final destination in Roumania, it is often difficult to determine the actual country in which they originated, and as the Roumanian tariff is divided into two parts, one the General (higher) tariff, applicable to countries not entitled to most favoured nation treatment, and the other, the Conventional (lower) tariff, applicable to countries having treaty arrangements with Roumania, the duties to be levied on the goods are open to doubt. The Customs Authorities have therefore, decided that goods arriving in Roumania from the undermentioned European ports possessing a "free zone" cannot be assessed for duty under the Roumanian "Conventional" Tariff unless they are accompanied by a certificate of origin which specifies the country of production or manufacture of the goods:—

*Austria-Hungary.*—Trieste and Fiume.

*Italy.*—Genoa, Leghona, Oneglia and Venice.

*Germany.*—Hamburg, Cuxhaven, Bremerhaven, Geestemünde, Emden, Neufahrwasser, Stettin, Altona, Bremen and Brake.

*France.*—Marseilles.

*Denmark.*—Copenhagen.

From February 1st, 1913, all goods arriving in Roumania from the foregoing ports, unaccompanied by a certificate of origin, will be assessed for duty under the Roumanian "General" Tariff.

**SWEDEN.**—The British Consul at Stockholm, in a recent report, states that he again wishes to point out that if imported goods bear the name of a place, property, industrial establishment or tradesman in Sweden, or any marking in the Swedish language to explain the nature of the goods—even consisting only of a single word—they must also bear the word "import" or the name and domicile of the foreign manufacturer, applied in a distinct and conspicuous manner, so that removal or effacement cannot be effected easily or without injury to the goods. Goods not so marked are liable to confiscation. The Customs Authorities will not permit goods to be marked *subsequent* to confiscation, and it is therefore impossible to get them restored once they have been condemned by the Court. The Consul adds that goods which are packed and imported in bulk, but can be sold singly, must themselves be properly marked so as to show their foreign origin: the fact that such marking may have been applied to the packing or covering in which the goods are imported will not of itself constitute a sufficient compliance with the Swedish regulations.

**AUSTRALIA.**—The Commonwealth Customs Authorities have issued the following decisions as to the duties to be levied on certain electrical and similar goods on importation; the rates of duty quoted are in all cases the preferential duties applicable to goods of British origin accompanied by a certificate to that effect in the proper form:—

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & CO., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1911.

- ELECTRIC FURNACES. N. TESTUP and T. RIGBY. 19,923. September 7th.
- TYPE-PRINTING ELECTRIC TELEGRAPH SYSTEMS. W. S. BIELJES. 20,105. September 11th.
- TYPOGRAPHIC AND LINE RECEIVING INSTRUMENTS FOR ELECTRIC TELEGRAPH SYSTEMS. W. S. BIELJES. 20,107. September 11th.
- ELECTRICALLY-OPERATED TIME INDICATING DEVICES. L. J. ATON and C. E. HARTISON. 20,264. September 12th.
- APPARATUS FOR AUTOMATICALLY OPERATING GAS OR ELECTRIC LAMPS. C. R. OLIVER. 23,789. October 27th. (April 23th, 1912.)
- AUTOMATIC ELECTRIC FIRE-EXTINGUISHERS. S. B. FRIEDEL. 27,163. December 4th.
- MEANS FOR, AND METHODS OF, CLEARING FAULTS ON ALTERNATING-CURRENT SYSTEMS. A. M. TAYLOR. 27,660. December 4th. (Cognate applications, Nos. 11,560 and 12,609 of 1912.)
- DEVICES FOR REGULATING THE SPEED OF MACHINERY. SIEMENS BROS. DYNAMO WORKS, LTD. (SIEMENS-SCHUCKERTWERKE G.S.) 27,688. December 8th.
- PREFRATTEN ATTACHMENTS FOR ELECTRIC CURRENT LIMITING DEVICES. H. B. E. NORDELT. 27,801. December 11th.
- ELECTRIC REGULATING OR EQUALISING APPARATUS. R. RANKIN and CHLORIDE ELECTRICAL STORAGE CO. 28,913. December 22nd.

## NEW PATENTS APPLIED FOR, 1912.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & CO., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

- 29,522. "Electric machines." SOC. DITE S.T.A.R. (Système de Traction Auto-Regulateur.) (Convention date, December 21st, 1911, France.) December 23rd. (Complete.)
- 29,533. "Frothing or obscuring glass globes, chimneys, electric lamps and the like for use with gas, oil and electric light." W. SHARP. December 23rd.
- 29,536. "Telegraphy and telephony." H. W. SULLIVAN. December 23rd.
- 29,568. "Method of adjusting electric meters." O. T. BLATHY. (Convention date, June 20th, 1912, Hungary.) December 23rd. (Complete.)
- 29,569. "Electric heaters." L. H. MAYRA. December 23rd. (Complete.)
- 29,579. "Telephone systems and the registration of calls and messages therein." H. HAWTHORN and H. T. McNALLY. December 23rd.
- 29,581. "Magnetoelectric machines for combined ignition and illuminating purposes." F. R. SIMMS. December 23rd.

## 1913 EDITION

In the Press.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

The judgment of the Railway and Canal Commission was delivered on Monday morning last in the case of the National Telephone Co., Ltd., v. His Majesty's Postmaster-General, and thus another stage was reached in the passing of the pioneer company, to whose enterprise is due the telephone system of the country. The system itself passed into the hands of the Post Office on January 1st, 1912, so that a little over a year has been required to determine its value. In the interim has been prepared, fought, and decided, one of the largest and most complex cases ever submitted to a judicial tribunal. The taking of the "inventory" occupied a small army for many months. The material thus acquired had to be put into shape, the attack of the company to be formulated, and the defence of the Department to be organised. The hearing commenced on June 10th, 1912, and continued till July 30th, when the Court adjourned for the Long Vacation; it was resumed on October 15th, and occupied altogether 74 days.

In the earlier stages a large amount of evidence was taken on points of detail which the Tribunal considered should be the subject of agreement, and the Long Vacation was taken advantage of to reach such an agreement in the case of plant cost; but for this the case might still be proceeding.

As will be seen from the lucid judgment of Mr. Justice Lawrence, published in another column, one of the essential differences between the parties was whether the value should be assessed on a basis which could be determined by actual experience, or by the estimates embodied in "contractors' so-called 'tenders.'" Whilst unable to adopt the percentages claimed by the National Co., the Court followed their system in reaching the awarded figure, rejecting the contractors' estimates as entirely inapplicable under the circumstances of the case.

The very interesting subject of depreciation was another case in which divergent views were submitted. The company claimed that depreciation should be arrived at on a method analogous to a sinking fund. "It takes the life of the plant and then ascertains the sum which, paid into a sinking fund at compound interest, would replace the cost at the end of the life, and it is suggested that if the amount in the sinking fund in any year of the life be deducted from the cost of the plant, the remainder will give you the cost of the plant at that moment." The Post Office submitted that the straight-line method, whereby "the value is reduced in the ratio which the age bears to the life of the plant," should be adopted. The latter is more general, and was adopted by the Court, though Mr. Justice Lawrence expressed the view that the sinking-fund method is a proper one to adopt in a going concern, especially where revenue is largely used for capital purposes.

The inclusion in the value of an amount representing the cost of raising capital, approved by Mr. Justice Lawrence and Mr. Gathorne Hardy, was dissented from by Sir James Woodhouse, who delivered a separate judgment mainly on this point. The question to which much of the earlier discussion was directed—the suitability of the plant for the Postmaster-General's telephonic service—was determined by the Court in a manner generally favourable to the company's contention. But whilst much of the comment in the case is of this character, the results in figures are not proportionately favourable to the company, who claimed 20 millions, and have been awarded £12,515,264.

The expectations of the Stock Exchange were higher, and on the announcement of the award the deferred stock of the company made a sensational decline. The higher price, however, was purely speculative, and the warnings of Mr. Franklin, the chairman of the company at the shareholders' meetings, may be recalled in this connection. The policy which has for so many years past added to the reserve in spite of the efforts of shareholders for increased dividends, is a further indication of the prudent management of the company. In the result, the State has acquired a most valuable system at a price which, though just, is certainly moderate.

Of the principal witnesses on either hand, it is pleasant to note the comments of the Judge that "Mr. Gill's evidence was as remarkable for the care and ability he had brought to bear on the inquiry, as it was for his fairness and candour in the witness box;" whilst "Mr. Snell did not compare unfavourably with Mr. Gill, but he had been cramped by his instructions."

The strain on the engineering, legal and administrative *personnel* of the parties to this historic case must have been severe, and the relief afforded by its cessation proportionately great.

## HONOURS FOR ENGINEERS.

THE Honours List, which was published in accordance with custom on January 1st, contained the names of two persons whose distinction will rejoice the hearts of those connected with the engineering world. The first is Lieutenant-Colonel Yorke, of the Board of Trade, while the second is Mr. Corbet Woodall. Each of these gentlemen is admitted to the order of knighthood; each has won a well-merited reward.

Sir Corbet Woodall has presumably been honoured in relation to the centenary of the Gas Light and Coke Co. It was on January 28th, 1807, that the first street of any city was illuminated by gas. Pall Mall was so lit on that night. A gas company, however, was not formed until 1810. Its first shareholders were pitied as idiots, and it had a formidable mass of popular prejudice to overcome. Thus it was generally assumed that the pipes conveying gas would be hot, and therefore apt to produce conflagration! The company persevered, and on the night of December 31st, 1812, Westminster Bridge was lit with the new illuminant. Exactly 100 years later a distinguished official of the Gas Light and Coke Co. is knighted. It would almost seem as if those who

are charged with the duty of advising the King as to the disposal of honours thought it right to wait for the period which, in the Roman Church, must elapse before a distinguished ecclesiastic can be made into a saint!

Having regard to the above facts, one is led to wonder when the great men who have done so much for this country in the wide domain of electrical science will be regarded as deserving of New Year or Birthday honours.

So far as public benefits are concerned, there is no applied science which has conferred greater boons on the community than that with which this paper is concerned. Every industry in the country depends to a greater or less extent on electricity in some form or another. Again, there are myriads of houses—not only the mansions of the great, but the cottages of the poor—in which its merits are appreciated day by day. Yet, ever since the time when Faraday groped, so to speak, in the dark amongst his instruments, honours have been sparingly bestowed: and such honours as have been given have generally been awarded to inventors and discoverers, not to those who have laboured to apply invention and discovery to the needs of a great manufacturing community.

The explanation of this state of things is not far to seek. It was pointed out in a leading article recently published in this REVIEW, that engineers find it difficult to take any active part in Parliamentary government. Rendering, therefore, no services which are of direct advantage to Ministers and politicians, they are out of the running when the prizes for political services come to be awarded.

The electrical engineer may design and take an active part in the erection of a huge power station, from which a supply of energy can be obtained at ridiculously low prices. In this manner, he may labour to the direct advantage of a hundred thousand voters; but he will not influence their votes. If, on the other hand, he had devoted his keen intellect to the inculcation among the voters of doctrines agreeable to the Government of the day, he might have become a knight on the King's Birthday, or at the dawn of a New Year.

Again, if he were one of those who saw that the popularity of an existing Government was on the wane, and he took active steps to hasten its defeat, the next Government might go so far as to make him a baronet or even a peer.

We have said enough to indicate our view as to the true market value of the honours which are so generously conferred upon persons who have political claims. We are far from saying that a title is never a title to fame. Many members of the learned professions, many men distinguished in art and literature are rewarded in this manner, wholly irrespective of their political services or opinions. Our complaint is that men who are distinguished in the domain of engineering are considered of so little account that they are disregarded, while the back politician whose game is "one for the party or the State and two for myself," is frequently the recipient of honours.

Nor is the complaint merely the complaint of the English electrical engineer. In the Sister Isle, which has its Lord-Lieutenant, its sham "Court" and sham "Court Circular," the same rule obtains. "Fill up the honours list with politicians, and if there is a line left in the second column insert the name of a professor." It is only when the list

runs into two pages that the engineer has any chance at all.

It may be said, and with considerable force, that the value of an honour depends very largely upon the kind of person who already enjoys it. If everyone had K.C.B. after his name, the letters would have no value. Granted, then, that there is no particular virtue in many of the orders and decorations which are so liberally conferred, it seems to us that certain titles might well be created and set specially apart for those who have acquired eminence along the difficult paths of applied science. The Order of Merit has been bestowed on men of distinction in every rank and walk of life. No taint of political bias has tarnished it up to the present time. Some kindred order might be founded which, in the course of a few years, would come to be regarded as the blue ribbon of the electrical profession. Its bestowal would excite no animosity, and would occasion no disappointment to your party hack, because he would never be qualified to receive it. Once it was established it would enable the Government of the day to recognise merit in electricity, at any rate, a little sooner than they have been able to recognise it amongst those who have done so much for the coal-gas industry.

#### The Financial Position of Aluminium.

As a substitute for copper for transmission purposes, or for conducting electricity in any other capacity, it is sufficiently accurate to reckon aluminium as having half the weight for equal conductance of copper. Thus, where a ton of copper is required, half a ton of aluminium could be substituted. It will be seen, therefore, that aluminium should be able to compete with copper at a considerably higher price than it commands at present. The reasons why the demand is not greater, and the price consequently higher, are discussed in a recent (December 31st) article in the *Times*. The writer of the article points out that, four years ago, when the price of aluminium dropped in the United States, it was predicted that the consumption would rise rapidly to something like 100,000 tons, and goes on to show that, actually, the consumption at the present time probably does not reach the half of that quantity. When the relation of the price of aluminium to that of tin is considered, it seems surprising that more processes have not been evolved in which the one could be replaced by the other.

According to the *Times* article, the only important sphere in which the metal is predominant at the moment would appear to be the manufacture of military equipments on the Continent of Europe. Considering what a great recommendation is the lightness of this metal for bulk in this application, it would appear that this field must be capable of considerable extension. Against this, it is noted that the leading producing companies have not, on the whole, realised much from their enterprise. The great American company does not show a higher average return than  $4\frac{1}{2}$  per cent. on its capital, and the corresponding British company was unable to make sufficient profit to render it worth while to continue trading, and accordingly was wound up, and reconstructed; although considerable sums have since been spent on works, it has not yet been successful in paying a dividend, interest on preferential shares being reckoned as interest merely. The hope for the producing concerns appears at present to lie in their output of by-products, such as sulphate of ammonia.

A reason for the comparatively unimportant position of the metal is suggested by the writer as being the natural distrust that exists towards a new metal as a container or conveyor of foodstuffs and drinking-water, until it has been proved by exhaustive experiment that no injurious compounds will result. Also, the fact that mankind has for many centuries been educating itself in the art of working in tougher and heavier metals, but is not thoroughly used to this one as yet.

The production of aluminium at present is given as 50,000 tons, of which the United States and Canadian factories turn out 14,000 tons, France 12,000, England 7,000, and the remainder is provided by Switzerland, Germany, Austria, Italy and Scandinavia. During the first year of the present century only 7,000 tons were available. Taking it by volume, the quantity would be much greater. As it might be used for piping, if compared with lead on this basis, 50,000 tons would go as far as 212,000 of the heavy metal. In very large-sized pipes, if the substitution were satisfactory, the advantages in handling would be considerable. With so small a production, and so many advantages, it is curious that the price has been down so long.

#### Telephone Wires and Tramways.

DURING the recent storms much damage has been done to overhead telephone and telegraph wires; unfortunately some of the former have fallen on trolley wires, with serious results. At Sheffield, for example, two cab horses were struck by the broken wires and instantly killed, the drivers also receiving shocks, as well as those who went to their assistance. It was, indeed, a wonder that no person was killed, for two men received severe burns. The accident recalls to mind the terrible occurrence at Liverpool in 1901, when two persons were killed and a large number were injured under somewhat similar circumstances.

Such incidents revive the old question of telephone wires crossing tramways. At Sheffield the National Telephone Co. by arrangement agreed to take measures of precaution, but the transfer of the telephone system to the State has brought into force the arbitrary powers of the Postmaster-General; he requires the tramway authorities to provide the necessary protection or to bear the cost of putting the wires underground, and this they refuse to do. We see no reason whatever why the Postmaster-General in this connection should be in a more privileged position than a private concern; he has taken charge of a commercial undertaking, practically by force, and seeks to impose his arbitrary will, not only upon private owners of tramway systems, but also upon public bodies. Where the telephone wires precede the trolley wires, the latter may not unreasonably be called upon to pay for the work necessitated by their presence, but if the tramway is the first in the field, it seems but fair that any later arrival should look after himself.

Guard wires, it is well known, are the greatest nuisance that tramway managers have to put up with; moreover, they are by far the most unsightly part of the overhead construction, and are costly to erect and maintain. Automatic devices to cut off the connections of fallen telephone wires suffer from the drawbacks of all automatic appliances, and act only after the fall. On the principle that prevention is better than cure, it appears to us that all telephone wires which cross the route of a tramway either should be put out of harm's way (underground), or ought to be erected in such a fashion that falling on the trolley wires is impossible. Either of these alternatives is practicable, and both are preferable to the use of guard wires, which afford a poor and unsatisfactory solution to the problem.

## THE CENSUS OF PRODUCTION.

In our issue of January 28th, 1910, we published the preliminary table relating to electrical engineering, which summarised the results of the returns received under the Census of Production Act, 1906. This Act provided for the taking of a census in the year 1908 of the production for the calendar year 1907, or the business year most closely corresponding thereto of the firms reporting.

The preliminary tables have since been carefully revised, and are issued, with a final report of the census, as a Blue Book (Cd. 6,320), price 7s. 6d.

The completed tables for general engineering show an output of £89,055,000, instead of £87,817,000 given in the preliminary tables.

The table relating to electrical engineering we give in full below :—

## ELECTRICAL ENGINEERING.

Electrical machinery and parts :—	
Direct and alternating current generators ... ..	£815,000
Direct and alternating current motors ... ..	1,729,000
Motor-generators, converters and transformers ... ..	421,000
Switches, rheostats ... ..	502,000
Switchboards ... ..	697,000
Other descriptions ... ..	50,000
<b>Total—Electrical machinery</b> ... ..	<b>£4,214,000</b>
Electrical instruments of all kinds (meters, measuring instruments, &c.) ... ..	
Primary batteries ... ..	£520,000
Secondary batteries ... ..	109,000
Lamps and parts (except carbons) :—	
Glow lamps ... ..	236,000
Arc lamps and searchlights ... ..	229,000
<b>Total—Lamps</b> ... ..	<b>£465,000</b>
Telegraph and telephone cables :—	
Submarine ... ..	£1,102,000
Land ... ..	809,000
<b>Total—Telegraph and telephone cables</b> ... ..	<b>£1,911,000</b>
Electrical power and lighting cables :—	
Paper and bitumen insulation ... ..	£1,322,000
Rubber insulation ... ..	1,300,000
Other and unclassified insulation ... ..	729,000
<b>Total—Electrical power and lighting cables</b> ... ..	<b>£3,351,000</b>
Transmission apparatus and plant (including insulators, conduits, poles, &c.) ... ..	
Electrical accessories ... ..	£539,000
Telegraph and telephone accessories ... ..	374,000
Contract work in United Kingdom (generally exclusive of materials made by the firm) :—	
Telegraphic or telephonic lines or works ... ..	45,000
Electric power or lighting works ... ..	1,277,000
Repairs and maintenance work for customers ... ..	337,000
<b>Total—Electrical engineering</b> ... ..	<b>£13,897,000</b>

To this table should be added the statement (page 130) that the gross value of the products of the electrical engineering trades returned on all schedules is £14,098,000. Making allowances for work given out and for duplication, "the value of the output of the electrical engineering trade, taken as a whole, may be taken at about £14,400,000."

The preliminary total was £13,782,000, so that it will be seen but little adjustment has been found necessary in the returns of electrical manufacturers, but cable makers are to be credited with returns of such accuracy that no variation exists between the preliminary and the completed figures.

The total figure for general and electrical engineering combined is £102,952,000.

In cost of materials used there is a slight increase to £48,535,000, as also in the amount paid to other firms for work given out, £3,922,000.

The value of output is £102,952,000, and the value of output less cost of materials and work given out, £50,495,000. These figures, we may remark, as in our first report, relate to the engineering industries as a whole, no separate figures being given for electrical engineering.

The number of persons employed in engineering industries is corrected to 461,703, instead of 455,561.

In the General Report will be found (p. 93) a valuable table summarising certain particulars, which, for engineering trades (including electrical engineering), are as follows :—

## Gross output—

Selling value or value of work done ... ..	£102,952,000
Materials used, cost ... ..	£48,535,000

## Work given out—

Amount paid to other firms ... ..	£3,922,000
Net output ... ..	£50,495,000
Persons employed except outworkers... ..	461,703
Net output per person employed ... ..	£109
Horse-power of engines at factories ... ..	331,251

The average numbers of persons employed in factories and workshops in engineering trades are classified as follows (p. 94) :—

## WAGE EARNERS.

Males under 18 years of age... ..	59,515
" over " ... ..	348,875
Females under " ... ..	4,593
" over " ... ..	9,444

## SALARIED PERSONS.

Males under 18 years of age... ..	4,839
" over " ... ..	31,571
Females under " ... ..	488
" over " ... ..	2,378

All firms owning factories were asked to make a voluntary statement respecting the quantity of fuel consumed by them. Replies were received from engineering firms whose net output was £32,632,000, 64·6 per cent, of the total, and their fuel consumption was—coal 1,400,171 tons, and coke 468,503 tons.

In order to obtain a measure of the cable industry, manufacturers were requested to state voluntarily the quantity of copper used by them. Firms whose output of cables was valued at £3,794,000, or 72·1 per cent, of the value of the total output of cables of all kinds, stated that they used about 14,900 tons of copper in making cables; the remaining firms did not supply the desired information.

The horse-power of engines at factories, mines, &c., so far as they relate to the industries dealt with in the Census of Production Office, was 10,755,009 (page III), and about one-quarter of this total was required for driving dynamos for the production of electricity for power and lighting purposes.

The total amount of electricity purchased was returned as 444,473,000 Board of Trade units. Of this 125,000,000 units were used by railway and tramway companies for traction purposes.

The total quantity of electricity produced by electricity supply undertakings was returned as (page 16) 1,432,101,000 Board of Trade units, of which 240,138,000 units were known to have been sold in 1907 for power purposes, excluding traction.

In the section relating to public utility services, it is stated (page 831) that the gross output—selling value or value of work done by gas undertakings—was: Companies £20,844,000, and public authorities £10,767,000; for electricity undertakings: Companies £3,182,000, and public authorities £5,731,000. The horse-power of engines owned by electricity undertakings was :—Companies, 569,405 h.p.; public authorities, 990,669 h.p.

The fuel consumed by electricity undertakings was as follows :—

Companies' coal 797,023 tons. Coke 2,191 tons.
Public authorities' coal 1,973,066 tons. Coke 26,762 tons.

The net output of gas undertakings (page 837) was £11,557,000, and of electricity undertakings (page 845) £5,588,000.

The average number of persons employed by gas undertakings was 54,866, and by electricity undertakings 22,618.

His Majesty's Post Office returned an output of the total value of £2,872,639, and the National Telephone Co. £1,503,784.

The whole report will be carefully studied by those interested, and we must, for considerations of space, refer our readers to it for much additional information which it contains on electrical industries.

Comparisons cannot yet be made, since the 1907 census was the first of its kind, but this is a drawback which will, before very long, be remedied. Arrangements for the 1912 census are well forward, and the schedules will shortly be issued. The organisation of the Department having been developed by the experience of the first census, there is no doubt that the results of the second will be more promptly issued and their value proportionately increased.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## Village Lighting.

Your article dealing with village lighting in this week's ELECTRICAL REVIEW was both interesting and instructive; but no mention was made of the numerous small undertakings in successful operation in the neighbourhood of Exmoor and Dartmoor. All of these are good examples of their kind, and show that such small undertakings are sound financial propositions.

Probably one of the smallest public services is in the pocket edition of a hamlet called Bridgetown, between Dunster and Dulverton. Here an enterprising wheelwright supplies himself and his neighbours—i.e., practically every cottage in the hamlet. His power plant—a small dynamo and set of accumulators—is driven by the oil engine used for his workshops: the battery charging is done when the engine would otherwise be working with light load. He regards the plant as a good investment, and it is a great convenience to his neighbours. Among the other villages supplied by local companies, we can mention Porlock, Dulverton, Brauton, Dunster in the Exmoor district, and Chagford, Bovey Tracey, Bradninch and other places in the Dartmoor district. All of these have taken on well, and the plant, although small, is in all cases ample for present requirements.

Another successful undertaking is that of Lynton and Lynmouth, one of the old pioneer concerns, having been at work 23 years: in its early days its road to success was both rough and thorny, but it went ahead, and now has an exceptionally heavy output for the population. According to the ELECTRICAL REVIEW list of electricity works, it has an output of 170,000 units. The total connections are 199 kW., and the resident population is less than 1,900.

There is another supply at Okehampton (a town small enough to be rated as a village) worked in connection with a sawmill. This also is an old concern, having been at work something like 24 years. The mill turbines drive the plant as long as they can; but water power is not sufficient, and the make-up power is a steam engine, the boiler being fired chiefly with the sawmill refuse, and the two attendants being sawmill mechanics.

Knowing that there is generally a sawmill in most villages, often combined with a wheelwright's shop, when reading your recent article on the sawmills at Maldon, and their producer plant for wood gas, it occurred to me that a similar, but smaller, arrangement would be a good proposition for many small towns and villages.

Devonian.

## Lifting Magnets.

Can any reader tell me where I can procure a book or paper dealing with the design and construction of lifting magnets?

Enquirer.

[A long article on this subject recently appeared in the *Elektrotechnische Zeitschrift*.—Eds. E.R.]

## Operations of Electric Railways.

Could any of your readers inform me the usual rate of acceleration and retardation which obtains on the District and Tube trains?

J. F. C.

## The Case of the Sub-Man.

Having read with some interest, and a great deal of amusement, the letters of "Motor-Generator" and "Booster" in last week's REVIEW, I should like to point out a few obvious misstatements, made, I trust, in ignorance, by both these gentlemen.

There is no need to make any remarks with reference to the inherent snobbery of the shabby genteel, everyone

knows that that is, unfortunately, a very real factor in human affairs.

"Motor Generator" cannot see why he should be compared to a "common wireman"—neither can I, but for quite a different reason.

Has he ever realised, I wonder, that the average wireman can take over shift duties with very little preparation other than a good look round, while the average sub-man, asked to find a small but troublesome earth on an apparently sound installation, would be very badly lost? Then, no doubt, he would find his extensive knowledge of the difference between the volt and the ampere a source of great mental comfort, if little practical assistance.

A few years ago I was honoured by the friendship of a sub-man—how highly honoured I had not fully realised until to-day—and I should like to give an example of the way he carried out his high calling. First, however, I must not forget to add, for the benefit of "Motor-Generator," that he had received a college education, together with the usual cramming associated with the majority of technical institutes. After starting up his machine, it was his practice to wedge his switch in position; then he would foregather around the corner with certain females of his acquaintance, whose intellect, it is to be hoped, was of the same high order as his own.

Being of an inquiring disposition, I naturally wanted to know why he indulged in what appeared to my weak intelligence to be a particularly foolish practice, and I was told that if the switch came out, and he was not there to replace it, there would be trouble, but if, owing to the switch failing to act, the machine burned, well—could he, on his salary (22s.), be expected to know of, and prepare for, such a contingency? Surely not!

An isolated instance? Maybe, but not, I think, more so than that of the thirsty wireman quoted by "Motor-Generator."

One other remark of "Motor-Generator's" calls for comment, and it is this. "They (the wiremen) attend the technical schools, not to learn anything, but to increase their kit of tools at the expense of the workshop." That, my dear sir, savours of the insolent, and, no doubt, any of the "common wiremen" who are honoured by receiving instructions from you, would have great pleasure in convincing you of it, to his entire satisfaction—if not to yours.

When "Booster's" salary has reached the level of the average wireman's "wages," he will, no doubt, be a great deal older, and, I trust, wiser, but until then, I should advise him to cultivate the acquaintance of a few of his social inferiors, the common wiremen, and then I expect that he will stagger at the amount of electrical information they, of their charity, will give him.

A Wireman.

In reply to "Motor-Generator's" letter, the writer does not agree with him in justifying shiftmen being snobs. He does not seem to realise that the age in which we live is a democratic one. Accident of birth does not count. A shiftman receives his salary in exchange for what he accomplishes or should accomplish. As regards shiftmen being gentlemen, there are gentlemen in all walks of life.

Let "Motor-Generator" look back to the infancy of engineering development. He will find that Geordie Stephenson, Edison, Clifton Robinson, and many others were men of lowly birth, and it is probably due to those men's discoveries and developments that "Motor-Generator" obtains his livelihood to-day. In his justification of shiftmen being snobs, I note "Motor-Generator" states that snobbishness is born in a man, but with a man of "Motor-Generator's" refinement, one would expect to find all traces eliminated. If "Motor-Generator" and his colleagues wish to advertise the fact that they are gentlemen, let them adopt the principles of such. Putting on a superior air, boasting of their University education, and the amount of money their deluded parents have spent on the same, are items which they should keep in the background, for, in the writer's opinion, a man with University and shops' experience should be able to obtain a healthier and more lucrative position than that of shiftman. Of course, it is admitted that nowadays a man with no private means must keep up appearances.

Probably the gentlemen referred to by "Motor-Generator" are some of those who bring their cold mutton sandwiches to the station in a dispatch case, but, in the writer's opinion, it does not make them one whit more an engineer than it made a young lady whom the writer used to see at South Kensington taking home potatoes in a mandolin case a musician. As regards the slur cast on wiremen by "Motor-Generator," and his doleful tale of the candles and beer, I suppose he has never heard the tale of the shiftman who used to stop the battery discharge meter and pump the battery dry to get a low coal consumption on his shift, leaving nothing for the next man on, or of the sub-station attendant who burnt out the transformer by taking the shift on the seat of his pants instead of the soles of his feet. Alas! there are fallen brothers in all professions. I agree with him that wiremen are made up from the lower and middle classes. And so are shiftmen. I knew one wireman, a doctor's son, who used to come to work in a cab. Another was a clergyman's son, who, in addition, was a fluent linguist; also two who had been 150-guinea premium pupils to a pioneer firm of electrical engineers, and were working under a foreman who had been yard boy in the days of their pupilage, so that "Motor-Generator" will see that, like shiftmen, wiremen are sometimes quite well connected.

It appears to the writer it is quite time the Government compelled men in charge of electrical and mechanical machinery to pass an examination similar to that of the marine engineer, so that none could take charge without a certificate proving their theoretical and practical knowledge. This would eliminate the caste question, and also weed out the purely University-trained men who will take a job at any price to gain experience, and are mostly as much good on a breakdown in a station as the son from College of 2  $\pi$  fame, in Harry Tate's motoring sketch, is in repairing the car.

We should then have common-sense men and have no more grumbling than there is among marine engineers.

G. F. Sullivan.

Birkenhead, January 13th, 1913.

I have read with great interest the correspondence respecting the case of the sub-man, which has been appearing in your columns during the past few weeks. A year or two ago I was a sub-man myself, and so can heartily endorse the strong remarks made by other correspondents, ament totally unqualified men running, or attempting to run, expensive plant. Considering, too, that every boy starting with a wiring contractor can graduate finally into a full-blown wireman, it does not seem fair of Mr. Potter to place such men on a level of efficiency with men in sub-stations, who have been through an engineering college, and probably served their time in the shops as well. Qualifications should count for something (although chief engineers of supply undertakings consistently refuse to pay living wages for them), and apparently the sole idea of the Electrical Trades Union is to grind all down to a common level of efficiency, or rather inefficiency.

At the same time, however, I must register a mild protest against your correspondents who seem to have a horror of being thought "tradesmen." Surely to be a tradesman is nothing to be ashamed of, but rather something to be desired. No higher praise can be given to a man than to say that he is a good tradesman, whether he be draughtsman, fitter or sub-station attendant. Each to his own trade is a good motto.

Where I am at present employed there are engine fitters who are Inter.Sc.'s of the University of London, and others who have taken first-class honours in the Board of Education and City and Guilds Examinations. These men can well be compared with the excellent men "Motor-Generator" mentions.

Let us give Mr. Potter and his magnificent offer a wide berth—we can afford to do without it. Surely, however, an engineer should be broadminded enough to keep clear of the unpleasant classifications of "gentleman," "middle class," and "lower class" mentioned by "Motor-Generator." If a man has the blood of a hundred Kings in his veins, he

will not be a better engineer for it, and when he has achieved any position at all in the profession, his birth and upbringing become matters of secondary importance. It is *what* a man is, not *who* a man is, which counts in engineering nowadays.

Switchboard.

[We are pleased to publish this letter, the tone of which is very different from that of some recent communications on this subject. In fact, the correspondence was degenerating into an irrelevant discussion of social position not unmixd with personalities verging upon abuse, and we must ask our correspondents to endeavour to keep it on the higher plane marked by this letter.—Eds. E.R.]

#### Screw Caps for Radiator Lamps.

I have recently experienced a lot of trouble with radiator lamps and lampholders, which are of the ordinary bayonet type, owing to the spring in the lampholder getting tired after the continuous application of heat and allowing the bayonet point to fall away from the lamp cap, which sets up arcing and spoils both lamp and lampholder.

I would suggest to manufacturers that this trouble would be very much reduced by using the Edison screw and cap and lampholder; the contact would be firmer, there would be greater contact area and the lamp would be better supported from the cap, making it almost unnecessary to put in a further support about the middle.

The metal-filament lamp manufacturers recommend screw caps for their high-candle-power lamps: surely there is as much necessity for a radiator lamp to be so fitted.

#### The Salford Fire.

In your issue of January 10th. under the heading "Fire Risk," you referred to the recent fire at Salford as a "switchboard fire." We have no exception to take to the general tenor of your remarks, but in describing the fire as a "Switchboard Fire," an impression is produced which is incorrect and damaging.

The switchboard was totally destroyed by a fire which originated in the basement and spread upwards through two floors, and destroyed the switchroom and its contents, which are on the first floor. The fire did not in any respect originate upon the switchboard itself. The switchboard was, in actual fact, of extremely modern construction, and has been designed with special reference to safety, and the elimination of any such risks as those which you deprecate.

Bertram Thomas.

Manchester, January 11th, 1913.

#### High-Tension Direct Current in Mines.

To reply briefly to the two points referred to by Mr. Walker:—

*Liability to Short.*—I fully realised the conditions as stated by Mr. Walker, but my point was that the probability of a short occurring through mechanical damage was not in the ratio stated. If cable-making were in the experimental stage, and shorts due to faulty manufacture likely to occur, I would put the ratio at less than three to one, but this point is not worth labouring, since these shorts need never occur, provided, as I stated previously, that "cheap" (?) cables are "taboo."

*Joint Boxes.*—I take it Mr. Walker refers to a "straight-through" box for, say, a three-core .035 sq. in. wire-armoured cable for 500 volts or so. The boxes would be about 16 in. long  $\times$  8 in. wide  $\times$  5 in. deep, and would include provision for efficiently bonding the armouring at each end, the conductivity of boxes and bonds being greater than that required under the new mining rules. Weight complete, about 15 lb.

Similar boxes (hundreds of which have been installed on contracts under my supervision) give complete satisfaction—attention to details in laying cable and boxes, with particular regard to local conditions, being all that is necessary.

May I point out as relevant to this question the unsuitability of lead-sheathed cables as a general rule in mining work—vulcanised bitumen sheaths being generally preferable, the dielectric being either bitumenised fibre or paper.

I shall be much interested in Mr. Walker's forthcoming paper, though I may not be able to attend the discussion.

L. C. Trevor-Roper.

Nottingham, January 11th, 1913.

#### British Laboratories for Electrical Goods.

Having read the report by Mr. C. Hamilton Wickes, H.M. Trade Commissioner for Canada and Newfoundland, in the ELECTRICAL REVIEW of January 3rd, it has occurred to me that there is a lot to be said in favour of a standard laboratory for electrical goods to prevent fire risk. Judging from his remarks, it is quite clear that America is creating a protective policy for her own goods in Canada, and a similar laboratory which would be recognised by the insurance companies here would prevent a very large quantity of cheap foreign accessories and fittings being used in this country. From the writer's experience the accessories used generally in this country and manufactured in this country would have no difficulty in passing such a laboratory, the requirements of our own consulting engineers being far more stringent than the American practice. Of course, there are difficulties to be overcome which are not met with by American manufacturers, seeing that factories in America specialise more on certain articles than is the case with manufacturers here. One has only to refer to an American catalogue to appreciate this. For instance, items like knife switches are catalogued in cases containing, say, 25, 50 or 100. The English buyer is not accustomed to ordering in these quantities and usually purchases one or two at a time. Should such a laboratory be formed, it is the writer's opinion that it should be run under the guidance of the State. It is well-known that bribery is resorted to in many instances where goods have to be passed in a country like America, and if a laboratory is formed in this country, it should be based on a reputation which, as Mr. Wickes suggests, should be recognised not only here and in America, but throughout the whole of the British Empire.

With regard to the inspection of installations, the writer is of the opinion that this should be dealt with by the fire insurance companies themselves, and should not be connected in any way with the testing laboratory for electrical apparatus. From a fire prevention standpoint, it is a national duty to see that only such apparatus is used as will reduce the possibilities of fire to a minimum, and the writer is quite sure that we should hear very little about fires being caused by defective electrical goods if such a laboratory were brought into existence. It would be most unfair to the electrical contractor if there was a possibility of competition taking place owing to some contractors using approved material and others not using approved material where the fire insurance company was not directly concerned, and that is the reason why the writer urges that it should be imperative by law to use only such material as has received the approval of the laboratory.

V. Delebecque.

Walsall, January 13th, 1913.

#### THE TRICITY HOUSE.

It is with considerable pleasure that we record the inauguration of the first public restaurant in London in which the whole of the cooking, as well as the lighting and heating, is done by electricity. We say "first" advisedly, for we are sure it will not be the last; and we feel that this younger branch of the industry is greatly indebted to the enterprise of Messrs. Modern Kitchens, Ltd., who have adopted this effective method of bringing home to the general public the advantages and capabilities of electricity in its domestic applications. As our readers are aware, the promoters of this new venture have been indefatigable in demonstrating the merits of electric cooking, and of the "Tricity" cooking appliances in particular, both in London and in the Provinces, and their expert demonstrator, Mr. F. S. Grogan, who combines with a thorough training in electrical engineering a remarkable aptitude for the culinary art, and a natural gift of lucid exposition, has earned a well-merited reputation as an electrical chef throughout the country. In more than a score of towns, we understand, the "Tricity" cookers can now be obtained on hire from the supply authorities, and electricity for cooking can be had for 1d. a unit, or even less, in over 50 districts. A campaign has now been opened in the Metropolis, which has not yet been generally enlightened upon the subject of electric cooking, and we wish it all success.

The new restaurant is situated at 48, Oxford Street, between Tottenham Court Road and Oxford Circus, and is marked by an electric sign, which is visible as far as the Circus. The equipment comprises ovens, grills and boiling hot-plates capable of dealing with the whole of the cooking, but occupying a remarkably small space—only 15 x 12 ft.—which implies a very considerable saving in rent as compared with the older systems of cooking. Beginning in a modest way, at present only luncheons and teas are served, but later on it is intended to provide dinners and suppers. Meals are served on three floors, which are tastefully decorated in various styles and comfortably furnished. Each floor is in communication with the kitchen (which is on the top floor) by a service lift, and on each floor there is a service counter, provided with electric cookers for making tea, coffee, toast, &c., the kitchen being reserved for the heavier work. A considerable amount of the cooking is thus performed in view of the customers, who are thereby enabled to observe the perfect cleanliness of the system and the absence of unpleasant fumes and odours.

The employment of so many appliances in the restaurant rendered it advisable to install indicators to show when each cooker was on high or low heat, or off. The indicator measures 12 x 3 in., and projects about 4 in. from the wall. A plug socket is attached horizontally to the projecting base, and on the front are mounted a fuse, main switch, and indicating lamp. The lamp is connected in parallel with a compound resistance element, which is in series with the main current, and consists of a spiral of wire ending in two clips, between which a small stick of carbon is connected; when the full current is on, the carbon heats and its resistance falls, while with the low current the resistance of the carbon is greater. The result is that the lamp glows on either heat, but its brilliancy is so varied that the cook can tell at a glance which heat is in use.

All is now ready; we need only recall the well-worn adage about the proof of the pudding, and recommend our readers to go and try it for themselves—and send their doubting clients also.

**Sentences.**—The 16 young employes of the London Electric Railway Co. who, as already reported, were recently before the Court charged with irregularities in connection with unpunched tickets, were before the Common Serjeant on 10th inst. Eleven of them were bound over to come up for sentence if called upon, and the others were sentenced to periods of imprisonment varying from three months' hard labour, to one month in the second division.

**Australian Tariffs.**—The Australian Customs authorities have recently given a decision, to the effect that "Electrical appliances, conduit electric fittings for—plain tee and elbow inspection pieces" are to be classified under No. 178 (D) of the tariff, the duty being 17½ per cent. *ad valorem* on foreign manufacturers and 10 per cent. on British goods.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"INQUIRER" asks:—"I shall be glad if you could refer me to any judgment that has been given in the course of law on the following question:—

"A consumer's meter stops between the dates of reading, and in rendering the account a fair average is made on the assumption that current has been consumed during the period the meter has ceased to read. The consumer states that he had used no current over the period covered by two meter readings, although the meter read for a portion of the time."

"The Electric Lighting Clauses Act, 1899, contains no provision which expressly covers the point suggested in this query. Assuming that the consumer was able to prove absolutely that he had had no current during the period mentioned, it is difficult to see how he could be made legally liable to pay for a supply, either as by the ordinary law, or by an arbitrator acting pursuant to the Schedule to the above Act, Clause 57. It is there provided that if any difference arises between any consumer and the undertakers as to whether any meter, whereby the value of the supply is ascertained (whether belonging to the consumer or to the undertakers), is or is not in proper order for correctly registering that value, or as to whether the value has been correctly registered in any case by any meter, that difference shall be determined upon the application of either party by an electrical inspector, or, where the local authority are the consumers, by an inspector to be appointed by the Board of Trade, and the inspector shall also order by which of the parties the costs, and incidental to, the proceedings before him shall be paid, and the decision of the inspector shall be final and binding on all parties. If an inspector were to arbitrate under this section, and had power to award an amount (the question whether he has such power appearing to be somewhat doubtful) it would appear that he would be entitled to consider emphatic evidence to the effect that no current was supplied.

## PROCEEDINGS OF INSTITUTIONS.

## The Change of Energy Loss with Speed in Direct-Current Machines.

By W. M. THORNTON, D.Sc., D.Eng.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Newcastle, November 11th, 1912.)

THE present note deals with measurements for the purpose of examining the dependence of loss on speed made upon a 7½-H.P. Westinghouse D.C. four-pole motor, running at a normal speed of 1,500 R.P.M. The windage tests are novel, in that they were made by running the machine in air and *in vacuo*.

A large cast-iron tank specially made for the tests, which could be exhausted to a pressure of a few millimetres of mercury, was fitted to contain the tested machine. The latter was driven from an external motor by a 1-in. steel shaft passing through a stuffing box. The efficiency of the motor at the power and speed used was determined with great accuracy, and the power supplied to it during the tests measured by standard instruments. After each change in speed four to five hours were allowed to elapse before taking a reading, in order that bearing temperatures might become steady and that the temperature of the driving motor might also adjust itself to the change of load upon it.

The loss caused by bearing friction and windage together is most usually taken to obey a law of the form  $W = a n^x$ , where  $x$  has been found to be nearly 1.5. Neither of the components, however, obeys a simple law. Arnold gives for bearing friction the relation  $W = 9.8 \kappa l d r / T$ , in which  $r$  is the velocity of rubbing in metres per second,  $l$  the length and  $d$  the diameter of the bearing in centimetres,  $T$  the temperature in degrees C., and  $\kappa$  a coefficient, numerically about 2, depending on the oil. At lower velocities, from 0.5 to 4 metres a second,  $W = 9.8 \kappa l d r^{1.5} / T$ .

There is, therefore, a period of transition from one law to the other.

The power required to drive air through a large machine is not negligible. All that design can do is to remove the loss by wind eddies, where these have no cooling influence, and to direct the air to where it can be most usefully applied as a cooling agent. The laws of gaseous eddies would lead to an expression in which the resistance to movement varies as the square of the velocity, or the power as its cube, and all windage loss is generally taken to follow this law. There is, however, in the present experiments, evidence of loss corresponding to a lower index.

The variation of loss with speed derived from the figures cannot be made to fit exactly any expression of the form  $W = a n^x$ .

Following the usage of the Kapp-Hausmann diagram and plotting  $W/n$  against speed, the curve of fig. 1 is obtained, which, intercepting the vertical axis above zero, confirms the existence in these experiments of a term proportional to the first power of the speed. Perhaps the most interesting feature of this curve is that it is straight over a long range of speed, and that there is a remarkable increase in the value of  $W/n$ , beginning in this case at about 1,100 R.P.M. This long straight portion, which corresponds to a

term in the power of the form  $b n^2$ , may explain the straightness of the line usually found in the running-light method of testing losses. Windage would then fall in with eddy-current loss over this range of speed. The fact that this line is sometimes curved from the base is explained later in the consideration of eddy-current loss, and that it is more often bent upwards at high speeds is to be expected from the prominence of the higher power windage loss only developing at some critical speed, peculiar, no doubt, to each machine or type of design. The mean index corresponding to the rising part of fig. 1 is, however, nearly 2 from 1,200 to 2,000 R.P.M. The complete expression for the power absorbed would then appear to be here of the form  $W = a n + b n^2 + c n^3$ , in which the first term corresponds to a resistance of constant amount, the second to one proportional to the speed, and the third to the square of the speed.

FIG. 1.—WIND RESISTANCE INDEX AND SPEED.

As a first and rough approximation the curve can be represented by  $W = 5.5 \cdot 10^{-6} n^3$ , though with this the values are at first low, and at intermediate speeds high.

This is the law generally taken to represent windage loss, and is always characteristic of loss of power by turbulent motion, in which the resistance is proportional to the square of the speed. Any resistance proportional to the speed can only be caused by opposing forces of the nature of *skin friction*, in which the energy is communicated to the surrounding medium through disturbances of the nature of collisions rather than eddies. The existence of a constant resistance is, so far as I know, a new feature in wind resistance experiments, and should, therefore, only be received after further experimental evidence.

The conclusion from the present experiments is that there are at least two terms in the wind resistance of electrical machines, one corresponding to the formation of eddies, the other to a skin friction. For modern types of covered armature, the former only becomes important at high speeds, whilst, for smooth covered surfaces, the latter is not negligible at low speeds.

The same machine removed from the vacuum tank and driven by the same motor was tested by the measured-power and running-down method under three conditions: with solid poles, with solid poles and

FIG. 2.—CHANGE OF COEFFICIENT OF EDDY-CURRENT LOSS WITH SPEED.

laminated pole-shoes, and with poles laminated throughout. In each case the friction plus windage loss was separately measured, and since there was no change other than the removal of end bearings to permit the armature to be drawn and the poles changed, the mechanical conditions should have been the same in each case. It was, however, found that the three winding and friction lines did not coincide. This illustrates the effect on bearing friction which may arise in practice from exceedingly small changes in alignment.

The figures, as far as they go, show that the shaft friction index does perceptibly change with speed, between  $W = b n^1$  at low speeds and  $W = b n^2$  at high.

These tests were repeated with the fields magnetised to give a gap flux density of 5,800 lines per sq. cm., and taking as before the ratio  $W/n$  as ordinate, a further set of curves (fig. 2) was obtained which are of interest. Each consists of two distinct parts, and the

point of flexure is in each case at a speed of 830. Below this the curves are parallel; above it they diverge in order of lamination. The intercepts on the vertical axis correspond to the hysteresis loss in each case or one proportional to the speed. If the hysteresis loss in laminated poles can be neglected in comparison with that in the armature, we have the result that even with laminated shoes and solid poles there is an increase of 20 per cent. in the total first power loss, and with solid poles and shoes 87 per cent. increase, as distinct from second power loss. The ratio of slot opening to air-gap is 3.5, the large value of which might be expected to give rise to larger than usual pulsations in the pole flux.

Since the lines of fig. 2 are straight the eddy current index derived from them is in each case 2, both for speeds above and below the point of flexure. Apart from eddy-current loss in the armature, which is known to follow the square law, this shows that there is "turbulent" magnetic movement in the poles rather than symmetrical pulsation in the solid yoke. But though the speed index is the same for each curve, the coefficients are not. The cause of the change in the eddy-current coefficient at, in this case, 830 R.P.M., is to be sought either in the amplitude or in the type of magnetic oscillation in the poles.

The conclusion from these tests is that they agree very fairly well with those *in vacuo* as regards windage, and that the bearing friction loss is relatively higher at low speeds than at high, the index decreasing with rise of speed. Pole lamination has apparently an effect upon hysteresis as well as upon eddy-current loss. The index of the latter is in all cases 2, but the coefficients change at some critical speed, being the same in all cases at low speeds.

#### DISCUSSION.

MR. A. H. LAW remarked upon the important bearing which windage loss had upon the design of high-speed machinery, and mentioned that in some cases, where the windage had been found to be excessive, it had been possible to reduce greatly the ventilation without appreciably increasing the temperature rise, on account of the reduction of the losses caused by the air eddies. In alternators designed for very low temperature rises it had been found advantageous to put the ventilating fan at the outlet in order to avoid heating up the air before it reached the windings. Surface speed was also an important factor, as it had been found that shortening a given carcass for a smaller output did not result in a proportional decrease in the windage loss.

MR. C. H. DAVIDSON regretted that Dr. Thornton's experiments had been made on such a small machine. He had windage-loss curves for plants of various sizes, but in no case could he find a simple expression to agree with any of them, some varying approximately as the square and others as the cube of the speed. This meant that a formula worked out for one machine could not be applied to another having different proportions of length to diameter, different surface speed and different construction, and the matter was further complicated by such items as the shape of the slots and air passages. A curve giving windage plus bearing losses was obtained from a 250-kw. D.C. armature, and by assuming that the bearing losses varied directly as the speed it was found that the windage loss varied very nearly as the speed squared. This armature was smooth and covered with binding wire and centrifugal fan action would be almost entirely absent. Of course it was not correct to assume that the bearing loss went up directly as the speed, because it really went up faster than in strict proportion, and so the true windage loss would show the existence of the  $an$  term as well as the  $b n^2$  term. On these high-speed armatures there was always a skin of air being carried round and round by the armature, which seemed to stick to it, and he suggested that Dr. Thornton might be able to trace in this the origin of the  $an$  term. In some cases, this skin of air could be got rid of by fitting scrapers when the pole-pieces did not have this effect themselves. In another case, that of an old 250-kw. armature specially built for single-phase work and having an "H" type revolving field, it was found that the windage loss varied very nearly as the cube of the speed. In that case the rotor had an enormous centrifugal effect, which would account for the largeness of the third power term in the equation. In high-speed turbine plants the accurate determination of the windage losses was of the utmost importance, as they formed such a large proportion of the total losses. In some cases, the windage losses in direct-current machines, where the speed was high and resort had to be made to powerful ventilation for carrying away the heat, amounted to as much as 40 per cent. of the total losses. In the case of alternators the percentage was considerably lower, but where the speed was high, the windage loss often amounted to as much as 25 per cent. to 30 per cent. of the total losses. Windage losses were greater in machines which depended for their ventilation upon fans mounted upon the rotor, as it was difficult to design such fans to have anything approaching a really high efficiency. One of the 5,000-kw. alternators at Carville had a windage loss as low as 26 kw. = 16 per cent. of the total losses, but in this case the ventilation was produced by externally-driven fans which consumed approximately 17 kw., so that the total ventilation and windage loss amounted to about 27 per cent. of the total losses of the machine. In another case a 500-kw. single-phase alternator was found to have a windage loss amounting to almost 50 per cent. of the total losses, while at the same time the temperature rises were quite moderate. The quantity of air passing through the rotor was reduced with the result that the windage loss was halved, and the temperature rise was practically the same as before.

MR. C. TURNBULL said that even small losses in central stations were of importance. A 20-kw. loss in a generator might not seem large, but nevertheless it equalled 160,000 units in a year of 8,000 running hours.

MR. T. CARTER said that in low-speed machines the exact windage coefficient was not of great importance; the windage and friction losses might amount to only 2 per cent. or 3 per cent. of the output, so that an error of, say, 10 per cent. in estimating these losses was quite negligible. He mentioned a case of a motor-generator, in which it was found that there was an extra loss, on overload, which seem to depend upon the load of the machine. The loss varied as the square of the speed, and he suggested that some experiments to find out exactly what it was might form a useful continuation of the present record.

MR. F. O. HUNT said that previously he had not felt that anything like the truth had been arrived at in accounting for the upward curve found at the top end of the Kapp-Hausmann diagram.

MR. W. BAXTER asked if precautions had been taken to get rid of all residual field, as otherwise the results could not be accurate. With regard to trapped air, he did not think that any reasonably good designer would be likely to leave "pockets" in which air could be imprisoned, as one of the chief points in design was to ensure that air circulated through every part of the windings. The curves showed that there was not a great deal to be gained by carrying the laminations beyond the pole faces, at least with a ratio of slot opening to air-gap of 3.5 to 1. That ratio was not very excessive, as a ratio of 5 to 1 was often found in small crane motors. He felt certain that the loss mentioned by Mr. Carter was due to brush losses. As an example of the magnitude to which these losses due to commutation currents in the brushes might attain, he mentioned the great variations which were observed in the no-load current of a D.C. motor when the brushes were moved away from the neutral position.

DR. W. M. THORNTON, in reply, said that the remarks of the first speakers were interesting, as showing the real gain which could be effected by shrouding end-connectors wherever possible. Some tests were under way which seemed to show that great variations in bearing losses were possible with even small changes in the dimensions. He agreed that Mr. Carter's overload loss might be a commutation effect. Some years ago Prof. Threlfall had shown that in alternators there was an increase of 7 per cent. in the iron loss as the load came on. A suggestion by Mr. Hunt regarding quasi-rigidity should, he thought, be further considered. If the effect was a real one and not derived from some undetected change in the mechanical friction, it was difficult to see a better explanation than that it might be due to the shearing of the air blast entering the armature axially.

#### DISCUSSION AT MIDDLESBROUGH ON NOVEMBER 8TH, 1912.

MR. LONGMAN suggested that the large windage losses in high-speed machines might lead to other means being adopted to get rid of the heat, such as water or oil cooling of the stator. Referring to bearing friction, the machine in the first case was run unexcited, and no pull due to want of magnetic balance would be experienced, but with many machines, especially high-speed ones, bearing troubles occurred under load due to this cause and to circulating currents in the shafts and bearings.

MR. CHRISTIANSON said that, so long as iron and copper losses took place in machines, the windage loss could be looked upon as a useful loss, with the exception of the wind-eddy component.

MR. MARSHALL closed the discussion with a few remarks, and DR. THORNTON briefly replied to the various speakers.

#### Röntgen Society.

AT the meeting of the Röntgen Society on January 7th, PROF. A. W. PORTER delivered an address on the subject of electric discharges at high gas pressures, as recorded photographically. The spark photographs were obtained in the usual manner by connecting the terminals of an induction coil to two electrodes, one of which was placed on each side of a photographic plate, and an arrangement made by which a single spark was passed, the plate being subsequently developed. The negative spark—that is, the spark obtained when the negative terminal was in contact with the sensitive side of the plate—in air at ordinary pressure had as its characteristic feature certain fan-like expansions, like the blades of a palm leaf; but at higher pressures some fine filaments developed, and the appearance then resembled that of the fronds of a fern. These little filaments changed again at still higher pressures, and at a pressure of 14 atmospheres they were represented simply by a fluffy appearance all along the main lines of the discharge. The fan-like expansions characteristic of the negative spark seemed to be dependent upon the presence of free nitrogen in the gas through which the discharge was taking place. Oxygen and carbon dioxide gave no trace of the fans. Oxygen also differed from nitrogen in the fact that, while in the case of the latter the negative discharge would scarcely pass if the pressure were increased a little, in the case of oxygen at similar pressures the effect was as conspicuous as ever. The discharge in hydrogen was always very small, though he was not certain whether this was due to the electrical properties of hydrogen, or to its high thermal conductivity. The positive discharges seemed to be less worthy of note than the negative, because the differences in different gases were comparatively small, so far as general appearances went. He hazarded the conjecture that these fan-like expansions obtainable with the negative discharge represented in some sense or another what might be called an explosion or a disintegration set up in the surrounding gas by the discharge. Then each of the points from which the filaments of the fan emanated would be the centre of the explosion, and the different blades of the fan would represent the paths of ions or of ion aggregates.

In the discussion which followed, Mr. A. A. CAMPBELL SWINTON remarked that the negative discharges generally seemed to go in straight lines or in long, sweeping curves, such as one would expect from projectiles which were having a free course, which the very small negative electrons might be supposed to have. The positive figures resembled rather the wriggling path of larger bodies which had a tendency to be sucked in. That more or less fitted in with the modern electron theory, namely, that the negative electrons were very small, and the positive carriers very much larger.

Mr. W. DUDELL said that, supposing the discharge really did pass through the gas, the method seemed to furnish a new means of analysing gases, and an insight into the molecular structure of gases might possibly be forthcoming by means of the fine detail visible in the discharges.

In his reply, PROF. PORTER dealt at some length with the influence of the magnetic field on these effects. There were difficulties, he said, in getting a sufficiently strong field in such cumbersome apparatus as one was compelled to use for the high pressures, but at ordinary pressures it was found that the magnetic field had no sensible influence whatever on the main figure that was obtained. He thought the results indicated that the negative discharge was not carried by free electrons, but by loaded electrons. If it were carried by free electrons one would get the same deflection for the magnetic field as one got with the cathodic stream.

### Faraday Society.

At the December meeting of the Society, DR. A. P. LAURIE, Principal of the Heriot-Watt College, Edinburgh, delivered a lecture on "Concentration Cells," embodying his researches of the last few years on the particular type of cell in which the same salt is dissolved in two different solvents.

If a salt is shaken up with two different liquids which do not mix, the salt is shared between the two solvents in a definite proportion, which is constant for dilute solution, and known as the partition coefficient. If after so shaking up, the liquids are allowed to separate, and a similar electrode introduced into each, there will be no E.M.F. between the electrodes. If a different concentration of salt be taken, at the boundary the concentrations will be such as to fall under the relation of the partition coefficient, and each cell can therefore be regarded as an ordinary concentration cell. If instead of two liquids which do not mix, one selects liquids which do mix, the problem becomes much more complicated, but the study of it is simplified by imagining the liquids separated by a third solvent which mixes with neither of the others.

Dr. Laurie's experiments on such cells were carried out by using little stoppered vessels inverted and plunged in the solution, and a Dolezalek electrometer. The stoppers not being greased, there was sufficient contact between the liquids outside and inside the bottles to give electrical connection, and yet there was no mixing. The combinations used were potassium iodide and iodine dissolved in water and nitrobenzene, with platinum electrodes; potassium iodide and iodine dissolved in water and ethyl alcohol, with platinum electrodes; and potassium iodide in water and ethyl alcohol, with silver-silver iodide electrodes.

The first experiments described with these cells were on the effect of temperature on E.M.F. In ordinary concentration cells, if the concentration on one side is kept constant and that on the other side varied, and the concentration E.M.F. curve plotted, this will be found to cut the zero E.M.F. line at the same point at whatever temperature the experiments are made, and with the reversal of the E.M.F. the temperature co-efficient is reversed, the cells being always endothermic. The peculiarity of the present cells is that the concentration E.M.F. curves at different temperatures do not meet on the zero E.M.F. line, and with the reversal of the E.M.F. the temperature co-efficient is not reversed, the cells becoming exothermic, giving out heat as well as producing current. For example, in the case of potassium iodide in water and alcohol, the cell is exothermic when the current is in the direction of transferring potassium iodide from water to alcohol, the ratio of about 1 to 20 being the concentration at zero E.M.F. If a cell which has no E.M.F. at some particular temperature  $T_1$  is heated to a temperature  $T_2$ , a current will flow so as to transfer potassium iodide from alcohol to water, and the cell will be endothermic. On cooling again to  $T_1$ , the current is reversed, the cell becomes exothermic, and potassium iodide is transferred back from water to alcohol. Thus the cell forms a very interesting reversible heat engine.

The conditions which make the cells endothermic or exothermic are easily stated.

Define unit current as that required to transfer a molecule of potassium iodide from one solution to the other. If then  $\lambda$  is the latent heat of solution of 1 gramme molecule of potassium iodide in water (calling heat absorbed positive), and  $\lambda$  the latent heat of solution of an equal quantity in alcohol, then when the salt is transferred from alcohol to water—

$$E = \lambda' - \lambda + T \frac{d\lambda}{dT} \quad \dots \quad (1)$$

As heat is absorbed when potassium iodide is dissolved, then if  $\lambda'$  is greater than  $\lambda$ , heat is absorbed in the cell during the change, and the cell is endothermic. If, however, the concentrations are so arranged as to transfer the salt from water to alcohol, then the equation becomes—

$$E = \lambda - \lambda' + T \frac{d\lambda}{dT} \quad \dots \quad (2)$$

and the cell is exothermic.

For equation (1)  $T \frac{d\lambda}{dT}$  has a positive value, the E.M.F. rising with increase of temperature, and for equation (2)  $T \frac{d\lambda}{dT}$  is negative.

If the transfer number of the ions is known, enabling what is here called unit current to be defined, these equations enable us to measure the difference between the latent heats of solution in very dilute solutions of a salt in two different solvents.

The above results suppose that alcohol behaves like a solvent that does not mix with water. The case of water-alcohol-potassium iodide cells with silver-silver iodide electrodes was therefore studied, and a modified definition of the partition coefficient was arrived at for liquids which inter-diffuse and one of which is able partly to precipitate salt out of the other (alcohol partially precipitates potassium iodide from a strong solution of the latter in water). Two such solutions are in partition equilibrium when the ratio of the strength of solution is such that when the weaker solvent is saturated, the stronger solution is sufficiently diluted to prevent any preventable precipitation of salt by inter-diffusion.

Dr. Laurie suggests that the source of energy in such a cell when the salt is saturated on both sides, and yet the cell is exothermic, is to be looked for in the heat set free by the ionic mixing of water and alcohol, due to the carriage of water and alcohol across the boundaries combined with the respective ions.

## LEGAL.

### THE TELEPHONE ARBITRATION.—JUDGMENT.

THE Railway and Canal Commission, composed of Mr. Justice Lawrence, Mr. A. E. Gaythorne Hardy, and Sir James Woodhouse, delivered its judgment on Monday in respect of the application by the National Telephone Co., asking the Court to determine what amount should be paid by the Postmaster-General for the whole of the company's plant and undertaking which has been acquired by the State.

The arbitration proceedings, which have been reported week by week in our columns, lasted, in all, over 70 days, the hearing of the case having commenced in June last, the last sitting concluding shortly before the Christmas adjournment.

MR. JUSTICE A. T. LAWRENCE, in delivering the award of the Court, said he had to determine the value of the property of the National Telephone Co. upon its transfer to the Postmaster-General at the expiration of the company's licence on December 31st, 1911. The company was the pioneer in the introduction of the telephone into this country, and had a system which, at the time of the transfer, was serving 561,356 stations. The total amount claimed was £20,924,700. At the outset the parties agreed to deal first with the plant of the undertaking. The governing clause of the purchase agreement was in these words:—"The value on the 31st day of December, 1911, of all plant, land, buildings, stores and furniture purchased by the Postmaster-General in pursuance of the provisions hereof, shall be the then value (exclusive of any allowance for past or future profits of the undertaking, or any compensation for compulsory sale or other consideration whatever) of such plant, land, buildings, stores and furniture, having regard to its suitability for the purpose of the Postmaster-General's telephonic service, and in determining the value of any plant, no advantage arising from the construction of such plant by leave of the Postmaster-General upon any railway or canal over which the Postmaster-General possesses exclusive rights of way for telegraphic lines shall be taken into account." The method adopted of presenting the matter to the Court was to divide the plant into classes such as "underground" and "overhead," to divide each class into sub-divisions, and to value a unit of each sub-division, viz., a mile of conduit, a mile of bare wire, or a pole. The value of the unit, when ascertained, could be multiplied by the number of such units in the inventory. The valuation of the unit proceeded as follows:—It assessed first the price of the material, then the cost of the labour of placing it in position, up to, and including the "gang foremen"; this was called the plant cost, and to this was added, by means of percentages, the cost of every additional item of expense to which it was alleged a constructor of the system would be put to in the matter. The company based its case on its own experience. For materials they took the average price paid for a period of 12 years, and for labour the average cost for six years. After some time it became apparent that the chief conflict between the parties would turn on the percentages to be added to the plant cost, and the parties came to an agreement, the result of which was to relieve the Court from the necessity of determining the plant cost of this property *in situ*. The agreed sum, together with an agreed item for casualty insurance, became the "fundamental cost." It amounted to £10,313,765. It left over for the consideration of the Court the highly controversial questions of percentages, which should be properly added to this sum, and the depreciation to which the whole cost of construction when ascertained should be subjected. It was agreed that in cases of this character, the true method of ascertaining value was to consider what it would cost to construct and establish plant in position, if it did not exist, and then to depreciate such cost, according to the age of its respective parts. This was assessing value on what was called tramway terms. It could, he thought, be demonstrated that this was the only possible way of arriving at the fair value in cases where the present owner had no further right to work it. It was unnecessary for him to further illustrate this, because the House of Lords had clearly laid down the method to be adopted in such cases. The Tramway Act contained the words "having regard to its suitability for the purposes of the

Postmaster-General's telephonic service." Each side relied upon those words in support of certain of its arguments; but neither contended that it had the effect of changing the method of valuation to which he had referred. In applying this method, it was clear that every expense which it was necessary to incur in order to establish the plant in position formed an item in the calculation which was to result in finding its value. Both parties agreed that some percentage addition must be made to the agreed fundamental cost, and they further agreed that nothing had been included in that sum for ordering and storing material other than certain temporary storage, obtaining wayleaves, local engineering supervision, head office administration, contractors' profits as distinguished from manufacturers' profits, rent of premises, for erection of exchange equipment, wayleave payments, maintenance and endurance of plant, contingencies, interest during construction and cost of raising capital. A further head of claim—viz., "obtaining subscribers' agreements"—was not mentioned in the document. But the Postmaster-General did not by the agreement admit as a fact that anything was due in respect of any of the above heads; he merely admitted that nothing had been included in the fundamental in respect of either of those matters. Here the agreement of the parties terminated, and a wide divergence of view was presented. It was unfortunate that this agreement was not come to until after the 35th day of the hearing, for the evidence during that period had been largely concentrated on cost of materials, cost of freights, tools and labour. Evidence on these topics now became, to a large extent, immaterial, and the crucial points had to be picked out from the mass of evidence. However, the Court must be thankful that the case had, to some extent, been shortened by the agreement. The percentage additions appeared to him to be entirely questions of fact and not of law. In each case the questions had to be asked, "Is this alleged item of expense a necessary step in the construction and establishment of this piece of plant?" "If so, what is the true amount to be added in respect thereof?" These were pure questions of fact, and they had in no case added anything without having first asked themselves and answered these questions. The second question was, from the nature of the case, largely one of business experience. The computation had, in each case, to be made with due regard to the allowance made for other items in the calculation, that probably no two minds would independently arrive by identical routes at exactly the same figure. The company's case upon the percentages was shaped in this way: They professed to take their own actual experience of what it had cost them to perform the services, and asked the Court to infer that, as they had been well and economically managed, that it would cost the Postmaster-General or anyone else at least as much. The Postmaster-General, on the other hand, asked the Court to accept the view that a contractor would do the work for a percentage of 20 per cent. on the cost of labour alone, plus a profit of 10 per cent., to which he added 5 per cent. for the services of the engineer. The company purported to get at what it had cost them by taking a period of time alleged to be typical and by investigating this period and distributing their total expenses for the particular service during this period between maintenance and construction in proportion to the time devoted to each by their employes. This gave the ratio which the cost of the service bore to the construction work executed during the period in the form of a percentage, and this percentage they sought to add to each class of plant. The Solicitor-General contested each point in the process, and some of his criticisms were certainly very cogent. It was plain that the percentage of cost of any service obtained in this way was open to many errors, no matter how well intentioned the conduct of the investigation might have been. The investigation was made under the direction and superintendence of Mr. Gill, the engineer-in-chief of the company. His evidence was as remarkable for the skill and ability he had brought to bear on the inquiry as for his fairness and candour in the witness box. Notwithstanding this, his results were not completely satisfactory. This was chiefly due to the fact that the typical period was one during which construction was less than it had been in previous years, for the company was then beginning to approach the termination of its licence, whereas the staff was not materially diminished. This tended to increase the ratio which general charges bore to construction. Again the allotment of time to maintenance and construction respectively was made by Mr. Gill's subordinates from their memories and what had happened in preceding months—a method manifestly open to error. This method involved a comparison of construction by the company with the construction by a hypothetical constructor, and that was comparing piecemeal construction with continuous construction. This was a favourite subject of attack by the Solicitor-General, but he placed too much weight on it. In the two matters of preparing the estimates and "ordering" it did undoubtedly increase the expense, and in other respects it afforded an opportunity for possible error in the apportionment of time between construction and maintenance. This objection to the company's experience was incapable of exact measurement, and in that respect it resembled a claim put forward by the company to an additional allowance called separate establishment charge. He had come to the conclusion that any increased cost by reason of piecemeal construction, might well be set against the claim for separate establishment allowances. In regard to the cost of "storage," his Lordship thought that the gentlemen who had prepared the returns had, through not fathoming the true meaning of the instructions, unduly increased the expense of storage. Mr. Gill had again introduced his percentage additions into the calculations at different stages, and this the Postmaster-General had named a "snowball fallacy." It was clear that in this way any error that might have crept into an earlier percentage would have been magnified by subsequent percentages based on

such error. He would have felt greater confidence in the calculations of both parties if the cost of all services had been taken at the ratio which their cost bore to labour and materials or plant cost. He felt that Mr. Gill's percentages must be reduced. His method when they were properly reduced was satisfactory, in that it was based on actual experience, but the Postmaster-General's evidence was not so satisfactory. It was true that his lending witness, Mr. Snell, did not compare unfavourably with Mr. Gill, but he had been cramped by his instructions, and instead of being supplied with a firm foothold of experience, of which the Post Office authorities had ample, he was supplied with contractors' so-called "tenders." The method of approaching this question by asking what would a contractor do the work for, was perfectly sound if they had contractors of experience in executing similar contracts. To provide the telephone plant of this company would be a perfectly unique experience, and no contractor called before the Court had had any experience extending beyond mere fragments of similar work. Most of them objected to producing the figures resulting from the carrying out of any contract executed by them, basing their objections on the wish not to disclose their business. The percentage which the contractors to the Post Office spoke to was one of about 20 per cent. on labour alone, which it was said would cover any charge, and leave to be added only 10 per cent. for contractors' profits and 5 per cent. for engineering, or, as it was subsequently called, "employers' burden." This 20 per cent. appeared to him to have been deduced from an investigation in the North Wales district during 11 months of 1907-8, but he did not think an investigation of that character, and in that district, was at all a safe guide to apply to the company's whole system, much of which was in London and other populous places. He was unable to adopt the percentages put forward by the Post Office, and he was driven in these circumstances to frame other percentages. He had tried in doing so to give due weight to, and be guided by, the evidence given. The amount of the percentages was essentially a question of fact in which one had to be guided by experience and a sense of business touch. Before he stated the amount he had determined to be due, he wished to deal with the heads of claim in respect to which the Postmaster-General said no percentage allowances should be made. The cost of obtaining subscribers' agreements was an item which had been disputed by the Postmaster-General as to amount, and as to its being an admissible element of cost. He confessed he was surprised at this, not only because it seemed to him to be within the principle of the case allowing the expenses of obtaining Parliamentary powers for a tramway, but also because it was plain that the Postmaster-General had elected to treat the transfer of the company's system as having the effect of an assignment, by operation of law of these very agreements. So he had taken up these inconsistent positions; as between himself and the company's subscribers he took all the benefits conferred by the agreements on the company; but as between himself and the company, he said: "I claim to be entitled to refuse to pay you anything in respect of the expense to which you have been put in obtaining and entering into these agreements." That did not seem to be right, and it would follow that an instrument in a house vacant at midnight on December 31st, 1911, was as valuable and as suitable to the service of the Postmaster-General, as one in a house the agreement for which continued and poured its tariff or rent into his coffers without interruption. He could not see how the bare cost of getting the agreements could be excluded. The instruments and their connections would constitute trespasses, but for the fact that they were erected pursuant to these agreements. The consent of the subscriber embodied in the agreement was as necessary in order to make the erection of the instrument a lawful act, as the Parliamentary powers were in order to legalise the breaking up of the surface of the highway for the purpose of a tramway. He was not now dealing with the quantum of cost. The evidence on that was scanty, but he thought it was to be inferred that other expenses had been included in the claim beyond those that could be properly attributed to the obtaining of the agreements in force for the instruments *in situ* at the date of the transfer. Sir A. Cripps had felt this, and suggested that one half of the amount claimed should be allowed. They must reduce this claim, and the amount they allowed, after depreciation, stood in round figures at £150,000. Next it was said that the cost of raising capital necessary to construct the plant was not an item to be taken into account in finding the cost of its construction. This meant the cost to which anyone must be put who attempted to construct this plant. The method prescribed by the House of Lords for ascertaining value was to consider what it would cost to construct the plant—that was, what it would, as a fact, cost. Would it, in fact, cost anything to provide the necessary capital? The company had given evidence, by way of example, that it cost them £41 per cent. to raise  $5\frac{1}{2}$  millions of pounds. No one had given evidence that it would not cost anything, nor had that proposition been put forward even in argument. He knew of no commodity and no service that could be procured as a right for nothing, and he was clear that as a fact money could not be procured for nothing. They had nothing to do with the cost of raising any capital other than the amount which would be necessary in order to construct. But it was said that it could not be an element adding to the value of the plant. The thing transferred—here was the plant *in situ*, and the cost of construction, less depreciation, was the method by which the value had to be ascertained. It, therefore, followed that every expense necessary to construct was an element to be considered, and it had to be considered because it was necessary in the process of construction. The thing to be transferred, say, a pole, must be procured, transported, and erected each of these steps was necessary to the existence of the po

*in situ*; each of these steps cost money, and the raising of this money was in itself an expense, and was one as necessary to the existence of the pole as any of the other steps. This was clear even in the case of a pole, but when the money required amounted to millions, it became clearer, for no one had millions of pounds in his pockets, or even on current accounts with his bankers. The result of this was that the cost stood out, and was seen clearly. The price of all things in which there was competition was governed by the market price. It was not true to say that this involved a proposition that the value of the plant varied with the credit of the constructor. The cost to be considered was the cost to the hypothetical constructor, who was a person of good credit; or, in other words, what it must cost any constructor, even the Postmaster-General, who had the credit of the State on which to raise the necessary capital. Nor did it involve the conclusion that the cost of raising capital should be added to the price. That it must be included was apparent if it were tested in a case in which the sale took place immediately upon the completion of the construction. Assuming the plant to cost £10,000,000 to construct, out of which £300,000 had been properly spent in raising the capital required to pay for its construction, if the contractor were to receive the cost, less the £300,000, he would receive £9,700,000 and would lose £300,000 on the transaction. Whoever raised the money necessary to pay for materials, labour, plant, &c., was put to the expense of raising that money, and, if necessary, the cost must appear in the value, otherwise no sane person would ever knowingly contract. He had come to the conclusion that a reasonable amount must be allowed under this head of the claim. He had cut the item down to a low figure, and the amount stood after depreciation at £247,189. Coming to the question of depreciation, it was admitted that the figure for construction cost had to be depreciated in view of the fact that the plant was not new at the moment of transfer. Two methods of depreciation had been put before the Court—the sinking fund method put forward by the company, and the straight-line method put forward by the Postmaster-General. He had come to the conclusion that the Postmaster-General's method of depreciation was the method which should be applied in this case. By this method the value was reduced in the ratio which age bore to the life of the plant. The next point in dispute was as to the mode of computing the life of the plant. The company adopted the physical life, but the Postmaster-General had adopted a life which in the course of the case had received a great variety of names, but which had a shorter life than the physical life. What was the service of the Postmaster-General when he took this plant? It was the affording of means of telephonic communication between the then subscribers to the combined system. It was quite possible that some of the then existing plant might have varying degrees of suitability to that service, and the evidence which showed that must receive due consideration. The Court found themselves in this position. The general evidence by the company of the good condition of the plant was met by instances of defects in particular classes of plant. They were satisfied that defects existed, but they had no evidence gauging the effect which ought to be given to those defects. The Post Office witnesses had not discriminated between the effect of their several causes for shortening physical life; they had lumped them together. They gave no evidence from which it could be reasonably inferred that their estimate of growth of business was correct. They took the growth of the company in the past as their measure. No ground was given for this. There must be a limit to the capacity of every community to provide subscribers. He was not satisfied that there would be any large expansion of the combined systems unless the rates were lowered or the service improved. In that event the increase might become enormous. He did not consider that a ground for depreciating the value of the existing plant. He had been driven to reduce somewhat the physical life he would otherwise have given to several classes of plant. He had made certain allowances and depreciated the value according to the straight-line method, by reference to the physical life so reduced. The result he arrived at was that the construction value of the plant under headings one to four inclusive in the particulars of claim was £13,457,016.

MR. GATHORNE HARDY concurred.

SIR J. WOODHOUSE said that on the cost of issuing capital for plant construction he differed from his colleagues. The company included in their claim the sum of £757,657 under that head, and his learned colleagues had awarded the company £247,189. He did not see his way to regard that item as one which they could rightly include in the value to be ascertained. If he were wrong he had no objection to the amount of £247,189, which his colleagues had allowed. The final judgment of the Court was that the sum of £12,515,264 should be paid by the Postmaster-General to the company.

The ATTORNEY-GENERAL said it was necessary that the decision of the Court should be entered in a particular form. According to the purchase agreement, the money would be payable as to not more than one-fourth in cash. There were other stipulations, which he would not trouble the Court with. He suggested the decision of the Court should be in the form of a declaration that the amount to be paid should be the sum suggested by the Court.

HIS LORDSHIP said he had not mentioned anything about the payment of the money. He meant an order should be drawn up for the amount of the award which would be included in the order in accordance with the usual practice of the Court. He did not mean that money should be paid as distinguished from some other agreed security.

SIR A. CRIPPS said that under the Telegraph Arbitration Act, 1909, the cost of the proceedings before the Commission should

be at the discretion of the Commission. Therefore, the company were clearly entitled to the costs of the inquiry.

The ATTORNEY-GENERAL said his submission was that the proper order would be that neither party should have costs. The total claim by the company was £20,900,000, and the decision of the Court was that they were only entitled to £12,515,264.

HIS LORDSHIP said that in the opinion of the Court, the company were entitled to the amount awarded, and that the costs would follow the event.

The ATTORNEY-GENERAL, on behalf of the Crown, expressed indebtedness to the Court for the promptness with which the decision had been given. He knew what stupendous labours must have been involved, and he was afraid the vacation had been devoted to work instead of to recreation.

SIR A. CRIPPS said he echoed the sentiments of the Attorney-General. All parties were most grateful for the attention which had been given to the case by the Court and for the promptitude with which the decision had been given.

## AN INTERESTING COLONIAL TELEPHONE PROBLEM.

For some years there has been an interesting dispute in progress between the municipal Corporation of Port Louis in the island of Mauritius and the Oriental Telephone and Electric Co., Ltd., which owns the telephone system in the city.

As far back as 1883 the Telephone Co. asked and obtained permission from the Municipality to erect poles and carry wires for the purpose of establishing a telephone exchange. The exchange was established, and for 22 years, that is, until 1905, carried on without any interference. At that date the Corporation decided to erect an electric lighting system using overhead wires, and on November 27th, 1905, this information was given to the company in a letter from the Mayor, who advised them to take whatever steps were necessary to guard against accident or troubles arising from induction. At the same time the company were asked to keep their wires as far as possible in the side and more private streets, as requested in the original permission granted by the Corporation. The company took no notice of this letter.

In March, 1907, a notice as required by the Electric Lighting Ordinance of 1902 was published in the Government Gazette, intimating that it was the intention of the Municipality to undertake the electric lighting of the town, and stating that the system of distribution would be by overhead wires generally and by underground where necessary for safety against contact with aerial wires of other systems.

Shortly after this the Corporation commenced to erect the lighting wires, and moved the Supreme Court for an injunction ordering the Telephone Co. to at once remove all the dead wires which crossed the streets and rested on municipal buildings, to lower their wires where they crossed the lighting distributors and to take all necessary precautions to prevent trouble from induction.

The Telephone Co. then brought an action to determine who was to pay for this work, claiming that the Corporation were responsible. The Corporation denied liability, but insisted that the work should be put in hand. Both parties agreed to an interim decree by the Court that, pending the trial of the action, the Telephone Co. should, within six weeks, remove all dead wires, and, within nine months, lower and alter the position of the wires interfering with the run of the lighting-wires, and establish a double-wire circuit throughout their entire system, to prevent any induction trouble.

The Corporation, during this period of nine months, undertook not to run their generating plant between the hours of 6.30 a.m. and 5.30 p.m. The Telephone Co. were to keep separate the cost of the work they had to carry out, and this sum was to form the claim at the trial of the action. This work was carried out by the Telephone Co. at a cost of £1,031 (15,462 rs. 39 cts.), which sum they claimed from the Corporation.

At the trial which took place last year, the Telephone Co. argued that the Corporation had no special privileges in regard to powers for putting up or taking down electrical wires, but were in the position of ordinary undertakers,

amenable, like other people, to the provisions of the Electric Lighting Ordinance of 1902. Article 6 of this Ordinance was very clear as it bound all undertakers to take all reasonable precautions in constructing electrical lines, so as not to injuriously affect, whether by induction or otherwise, the working of any wire or line from time to time used for the purpose, among other things, of telephonic or telegraphic communication, or the currents of such lines.

The Corporation maintained that they were not bound by the provisions of this clause, inasmuch as the powers under which the Telephone Co. operated were obtained from them and could be revoked by their instructing the Telephone Co. to remove them altogether. If the company wanted to override the Corporation's powers they would have to obtain a licence from the Government, which licence would not be granted to such an antiquated, old fashioned and obsolete system as the one used by the company, but only to such a metallic return system, which was all that was now required by the ordinance.

The case came before the Court and was fully argued, a number of witnesses appearing on each side.

The Judge, in giving judgment against the Corporation, stated that, in his view, the Corporation were undertakers under the ordinance, and as such were bound by the very stringent provisions of Article 6. This article demanded that they should take all reasonable precautions to prevent interference or induction with existing telephone or telegraph lines. The lighting wires might have been placed underground, but if carried overhead the provision of a metallic return to the telephone system was essential. He, therefore, held that the Corporation were responsible, and decided they should pay the Telephone Co. £1,000 (Rs. 15,000), the remaining £31<sup>1</sup>/<sub>2</sub> being, in his opinion, for unnecessary work. Had it not been for the explicit wording of Article 6 of the ordinance, he felt that the fact the Telephone Co. would, under normal circumstances, have had to modernise their plant, would have had an important bearing on the case.

As it was, the Corporation were fully aware of the risk they ran in erecting the lighting overhead wires. This was proved by the minutes of a Council meeting and the publication of a letter on the subject written then in October, 1905, by their electrician.

This is a most interesting case, for while at first sight it does not seem equitable that a new electric light undertaking should be saddled with the cost of bringing up to date an old-fashioned existing telephone exchange, yet a perusal of the circumstances in this particular case points to the justice of the decision. The ordinance under which the lighting undertaking was established was explicit in its wording; it was open to the Corporation to avoid trouble by using an underground system of mains, and the Telephone Co. had been in existence for 22 years without serious complaint; all these points told heavily against the Corporation. As a result the Telephone Co. were able to modernise their plant and turn what might have caused them a good deal of trouble into a means of establishing their business on up-to-date lines. It is not at all surprising to find that they have now applied for, and obtained, a Government licence to continue the working of their modernised metallic return telephone system.

## SMOKE AND DUST PRECIPITATION.

IN spite of the vast improvements in fire-grate construction and the regulation of industrial coal combustion in recent years, factory chimneys still belch forth volumes of black smoke, and even with the widespread use of electric power our manufacturing towns are but little freer from soot than they were a decade ago. In addition to detracting from the appearance and health of our towns, this deposition of soot on the roadways and housetops marks a sad waste of fuel, and should be of equal or greater interest to the works engineer as to the health officer or the local inspector of nuisances.

In this connection an investigation of "The Electrical

Precipitation of Suspended Matter in Gases,"\* by Prof. W. W. Strong, of Pittsburg University, is of considerable interest. The purpose of the investigation was to study the electrical properties of gases containing solid and liquid matter in suspension (especially smoke from soft coal), and to ascertain the manner by means of which an electrostatic or an electromagnetic field will cause a separation of the suspended solid or liquid matter from a gas.

This article reviews Prof. Strong's experiments, and some of the more important conclusions to be drawn from his research.

The precipitation of suspended matter from gases by means of electrical discharges was suggested by Hohlfeld in 1824 and by Guizard in 1850. Lodge and Clark were the first investigators to go into the problem extensively. Lodge states that the discharge from points kept charged to a high potential by means of an electrostatic machine produced a clearance of the suspended matter in the neighbourhood of the points. This clearance seemed to be independent of the nature of the suspended material and of the sign of electrification at the point. Walker patented the above "process for separating and collecting particles of metals or metallic compounds, applicable for condensing fumes from smelting furnaces and for other purposes." According to Walker's arrangement, one electrode of the electrostatic machine was earthed, while the other was connected to an electrode covered with metallic points, against which the fumes made contact. This is the "active" electrode.

Apparatus of the above type was installed in the Dee Bank Lead Works, but on account of the unreliability of the source of electricity—Wimshurst electrostatic machines—the method was apparently a failure. Thwaites took out a patent in 1899, in which a barbed wire was used as the active electrode. In the description this is mentioned as being positively charged.

It is to F. G. Cottrell and his co-workers that we owe the recent commercial development of electrical precipitation. In his 1908 patent he claimed the following conditions to be favourable to successful operation: First, the current should be unidirectional, or, at least, the time occupied by its reversal should be large compared with the time of deposition of the individual suspended particles; second, the particles should be charged at or near the electrode about which the brush discharge appears (the "active" electrode); fourth, the suspended particles in the gas should be subjected to as uniform treatment as possible. High-voltage alternating current was made unidirectional by the use of a synchronously driven rotating commutator. In order to make the brush or glow discharge as great as possible, the active electrode was wound with asbestos threads, strips of mica, &c. The surface of the asbestos is usually moist enough to act as a conductor, so that the exposed fibres give point discharges into the gas. Such electrodes Cottrell calls "pubescent." The patent includes claims to the maintenance of the insulation of the pubescent electrodes by means of currents of clean gas and by heating. Howard took out a patent on the use of horizontal plate electrodes for precipitating fumes. Nothing is stated concerning the electrical conditions necessary.

In a patent taken out by Dion the action of the electrical current is that of aggregating the fume particles and then allowing them to settle. It is stated that under the same conditions metallic particles of different kinds are precipitated to a different degree, and this fact is stated as affording a means of separating the various fume materials. Metallic plate electrodes are described, the electrodes being of a composition determined by the kind of fumes to be precipitated.

Strong's experimental apparatus was constructed for the purpose of applying the various electrical precipitation methods to the smoke from soft coal, and consisted of a small furnace which, "on account of its construction, proved to be a most efficient smoke producer." An underground pipe served to convey the smoke along various paths which could be regulated by dampers, and the flow was assisted by a small fan run by an a.c. motor. One smoke circuit was through a series of pipes (which could be either insulated or earthed)

\* Communicated to the *Journal of the Franklin Institute*, September, 1912.

in which an active wire electrode was suspended. The electrification of this electrode was effected in various ways, the apparatus used in these experiments including a Wimshurst electrostatic machine, a pneumatic influence machine capable of giving an 11-in. spark, a Fessenden induction coil, a Westinghouse transformer rated at 60,000 volts and other smaller transformers. Another smoke circuit contained an adjustable spark gap and was used for experiments on flue gases at different temperatures, velocities and smoke-content, the variations being produced by altering the condition of the furnace combustion, speed of the fan or the dimensions of the pipe.

Suspended solid and liquid particles in gases may be acted upon in various ways by an electric field, so that some or all of the particles are drawn from the gas to the electrodes. (1) If the particles are conducting, the effect of the electric field is to polarise the particles, inducing a positive charge on one side and a negative charge on the other side. This action of the field probably plays an important rôle in producing aggregates of fine particles that are close to each other. (2) If the suspended particles are non-conductors their dielectric constant will be greater than that of the gas, and in an electric field that is not uniform the particles will move into the more intense part of the field. (3) Gaseous ions may be present in the gas, and some of these will combine with the suspended particles. Such charged particles are the large ions, and these move very slowly in the weaker fields. Large ions are always gaining and losing charges, and this process may aid in aggregating together the smaller particles. (4) The above processes, by means of which suspended particles can be removed from a gas, apply only to cases where the gases move very slowly between the electrodes. When there is intense ionisation and an intense electric field, streams of ions will be created between the electrodes. Under these conditions, the streams of ions carry the suspended particles in the gas with them to the electrodes, to which they give up their charge. Streams of ions are produced in the various point, brush, and corona discharges.

The relative importance of these effects in removing suspended particles is difficult to estimate, especially as some distinction must be drawn between mere *aggregation* and *fine precipitation* on the electrodes. The effects numbered (1) and (3) probably function chiefly as aggregators, while the ionic streams produced in the high-tension discharges (probably by collision or secondary ionisation in stronger parts of the field) undoubtedly sweep the suspended particles, whether aggregated or not, to the electrodes. But it has been found that the precipitation due to the formation of an electrical "wind," or ionic stream, is accompanied by more or less aggregation and a settling of the larger particles.

The causes of aggregation are not well known, but there is no doubt that the sound waves radiating from the discharge have some effect. The sound waves act in a similar manner to the phenomena in the ordinary Kundt's tube, used in measuring the wave length of sound waves.

Some writers claim that electromagnetic waves produce an aggregating effect upon the small water drops in fogs and mists for comparatively long distances from the source of the waves. M. Dibos claims that he has succeeded in clearing fog for distances of 50 or 60 yards by means of high potential discharges from points (140,000 volts) and Lodge is said to have made clearances by means of electromagnetic waves.

The action of electromagnetic waves upon suspended particles in gases may be of the same nature as the action on the Branly and other coherers made of carbon or metallic filings. Sound waves cause the particles of smoke or fume to be set into motion. Moving particles that are near each other experience an attraction or a repulsion, depending upon their relative motion. An effect of this kind is shown in Kundt's tube, where particles of lycopodium, or any kind of dust, are caused to collect together when stationary waves are produced in the tubes. It has been suggested by Dr. Speyers that a scheme might be devised to clean gases of suspended particles by producing a stationary wave in the gas and providing outlets for the gas between the regions where the particles were caused to collect by the Kundt's tube effect.

What rôle electromagnetic and sound waves, and the

polarising action of an electrical field, play in the electrical precipitation of smoke is not known, but these effects are probably subsidiary.

Having considered the probable ways in which particles may be acted upon by an electrical field, Prof. Strong proceeded to test the capabilities of electrification of fine particles of carbon and sprays from various liquids. To do this he connected the spray nozzle to one pole of a 45,000-volt machine, and earthed the other pole. The earthed pole, was perforated to allow the spray to be blown through it on to the electrode of an electroscope. He found that various kinds of dust were electrified with varying degrees of ease, calcium-oxide dust being most easily electrified, followed in order by carbon dust, alcohol, ether, and toluol.

The actual effects of electrical fields in promoting precipitation of particles having been demonstrated, it remains to investigate the best experimental conditions, both as regards type of electrification and physical condition of the dust-laden gases. The kind of discharge used may be of two types, a point discharge producing an electrical "wind," or a stream of ions produced by the secondary ionisation of a corona discharge from a wire carrying a high-voltage current. The former of these is used in the Cottrell method, one of the essential features of which is the use of wire electrodes interwoven with asbestos or mica.

Fine threads of asbestos or the sharp edges of the mica cause the production of secondary ionisation at lower voltages than could be obtained from the wire electrodes themselves. For this reason it is not necessary to have such accurate spacing of the electrodes to prevent the formation of sparks and arcs. There is usually sufficient moisture or other conducting deposits on the asbestos or the mica to make the surface a fairly good conductor at high potentials. At high temperatures it is difficult to keep the surfaces conducting, and this trouble was experienced in the plant set up by the Balaklala Copper Co., at Coram, California.

In the Coram plant the active electrodes consisted of two No. 10 iron wires twisted on mica strips about a centimetre wide and with serrated edges. A treating unit consisted of eight rows of these electrodes, 24 electrodes being in a row. The units were 30 ft. in length, 10 ft. wide and 10 ft. high. The grounded electrodes were made of No. 10 sheet-iron, 6 in. wide and 10 ft. high, and were connected directly to the frames of the units themselves. The active electrodes were kept stretched by springs between a system of bus-bars supported outside the precipitating chamber on wooden insulators; in order to prevent a deposit from short-circuiting the insulators, a current of air could be passed over the insulators into the precipitation chamber, thus preventing any of the fumes from coming in contact with the insulators. The cleaning of the electrodes was done by mechanical shaking.

At the Coram plant three units were kept charged by a single rectifier using from 0.3 to 0.4 ampere. Each unit treated about 10,000 cu. ft. of fumes per minute, the fumes passing through about 30 ft. of the electrical field with a velocity of about 5 ft. per second. The suspended matter remains about 6 seconds in the electrical field. About 30 lb. of fumes were precipitated per hour per unit.

The corona discharge is not greatly affected by the presence of dirt (an important consideration in the practical application of precipitation), and is independent of the air velocity and of humidity.

An example of the use of the corona type of discharge is the application of electrical precipitation to the cement dust from the kilns of the Riverside Portland Cement Works at Riverside, Calif., U.S.A. In this plant the gases to be treated are at temperatures of about 150° C. The cement dust is non-conducting, so that no conducting surface would be formed over the mica or asbestos. The use of the corona discharge requires higher voltages than those used in the point discharge. These voltages range in the neighbourhood of 40,000, according to Cottrell. The clearance of dust is in general from 95 to 98 per cent. The construction of the treating units at Riverside is almost identical to those used at Coram.

Some of the most important results of the investigations, particularly on coal smoke precipitation, are given in Prof. Strong's own words as follows:—

1. "Very little difference was obtained in the precipitation

of dense coal smoke in cylindrical pipes, between an alternating current and unidirectional current, when a similar corona form of discharge was used. The precipitation seemed to be comparatively greater for a dense smoke than for a light smoke. From this it would follow that dilution of the fume, or smoke-laden gases, should be prevented as much as possible.

2. "Clearances of 90 and 95 percent. have been obtained by passing extremely dense smoke through a corona discharge less than 2 ft. in length. These experiments indicate that the greatest efficiency of precipitation can be obtained by keeping the suspended matter from being diluted and by exposing it as much as possible to the streams of ions flowing from the corona by passing the gases through a uniform discharge. Shadows can be obtained from objects placed near the collecting electrodes, indicating that the matter being deposited moves in straight lines.

3. "Some kinds of smoke show selective precipitation, a thin cloud of white or bluish particles coming out from the corona discharge. Part of this is water vapour which may have condensed after the carbon and tarry matter had been precipitated. Whether this selective action is due to a difference in the size of the suspended particles, or due to a difference in their composition, has not yet been determined, although the former view is the more probable.

4. "Experiments would indicate that temperature does not play much of a rôle in electrical precipitation. On the other hand, the state of ionisation of the gases probably does play a very important part.

5. "The application of electrical precipitation to the smoke problem has not as yet been tried on a commercial scale. Laboratory experiments indicate that the problem is essentially the same as that of the precipitation of fumes and dust. While the brush form of discharge from points is only a good precipitation agent when the current of gas is small, the corona discharge is effective for much greater velocities of the gas containing the suspended particles. Under these conditions the suspended particles need remain but a short time in the region where the corona discharge is taking place, so that the size of the precipitation chamber can be greatly reduced. The mechanical difficulties of keeping the electrodes properly adjusted and cleaned, are probably as great as the electrical part of the problem."

## CAN A LIGHTING AUTHORITY SURRENDER ITS POWERS?

[FROM A LEGAL CONTRIBUTOR.]

IN view of the fact that the supply of electricity for lighting purposes is not always a complete success from the financial point of view, those responsible for such undertakings may sometimes have to consider whether the burden of supplying current can be transferred to other shoulders.

The law on this subject has recently undergone a certain amount of modification to which it may be convenient to advert. By Sec. 11 of the Electric Lighting Act, 1882, it was provided that: "Any local authority who have obtained a licence, order, or special Act for the supply of electricity, may contract with any company or person for the execution and maintenance of any works needed for the purposes of such supply or for the supply of electricity within any area mentioned in such licence, order, or special Act, or in any part of such area; but no local authority, company, or person shall by any contract or assignment transfer to any other company or person or divest themselves of any legal powers given to them, or any legal liabilities imposed upon them by this Act, or by any licence, order, or special Act, without the consent of the Board of Trade."

The italics are ours. It will be seen that the first part of the section confers certain rights upon local authorities. They might, *e.g.*, sub-contract for the execution and maintenance of works, or even for the supply, of electricity

within an area; these being rights which apparently could not be exercised by a company supplying electricity pursuant to the terms of a provisional order. As to the second half of the section, which we have printed in italics, this is now repealed and replaced by Sec. 14 (1) of the Electric Lighting Act, 1909, which provides as follows:—

A local authority, company, or person who have obtained a licence, order, or special Act for the supply of electricity shall not, by transfer or otherwise, divest themselves of any of the powers, rights, or obligations conferred or imposed upon them by the Electric Lighting Acts, or by any licence, order, or special Act otherwise than under and in accordance with a provision contained in a licence, order, or special Act authorising such divestiture.

It will be seen that the effect of the amendment is to prevent all classes of undertakers from transferring any of the legal powers conferred upon them without the authority of a licence, order, or special Act. The Board of Trade no longer has power to grant any leave.

These limiting clauses do not, of course, mean that undertakers may not employ contractors for the purpose of, *e.g.*, building a generating station. Again, the laying of the necessary mains in a street is clearly a duty which undertakers must hand over to the care of an independent contractor, and is quite lawful. It should be observed, however, that by handing over the performance of work to a contractor, undertakers cannot get rid of any statutory duty which the execution of that work imposes upon them. For instance, the laying of mains in a street may involve risk to passers-by. That is a risk necessarily incident to the laying of mains, and to lay mains is a duty cast upon the undertakers who are to supply electricity. In one case which is a leading authority on the subject (*Hardaker v. Idle District Council* (1896) 1 Q.B. 335), it appeared that the defendant local authority entered into an agreement with a contractor to lay a sewer. In carrying out the work he failed to give proper support to a gas pipe, which became fractured. The gas escaped into a house, and the consequent explosion wrecked the furniture and injured the plaintiff's wife. In an action against the District Council it was held that that body was liable, although it had apparently delegated its duty. The principle applied by the Court of Appeal was that laid down by Lord Blackburn in *Dalton v. Angus* (1881), 6 A.C. 740—*e.g.*, "Ever since *Quarman v. Burnett* (6 M. & W. 499) it has been considered settled law that one employing another is not liable for his collateral negligence, unless the relation of master and servant existed between them. So that a person employing a contractor to do work is not liable for the negligence of that contractor or his servants. On the other hand, a person causing something to be done, the doing of which casts upon him a duty, cannot escape from the responsibility attaching on him of seeing that duty performed by delegating it to a contractor. He may bargain with the contractor that he shall perform the duty, and stipulate for an indemnity from him if it is not performed; but he cannot thereby relieve himself from liability to those injured by the failure to perform it." Lord Lindley then defined the position of the local authority thus:—"Their duty in sewerage the street was not performed by the constructing a proper sewer. Their duty was not only to do that, but also to take care not to break any gas pipes which they cut under; this involved supporting them. This duty was not performed." In the words of Lord Justice Rigby, "I consider it has always been, on the balance of authority, and is now clearly recognised as the law, that no one can get rid of such a duty by imposing it upon an independent contractor." It was accordingly held that the defendants were liable to the plaintiff.

**West Ham Electricity Supply.**—A letter has been received from the Barking U.D.C., inquiring whether the Corporation would be prepared to give it a supply of electricity in bulk, and, if so, upon what terms, or alternatively, whether it would be prepared to consider the question of the transfer to West Ham of the Barking Council's electric lighting order, and the work, executed thereunder, upon terms. Having regard to the fact that the East Ham Council has under consideration the desirability of giving a bulk supply to Barking, it has been decided to defer the consideration of the matter until a definite decision has been arrived at by that Council.

## BUSINESS NOTES.

**Consular Notes.—Japan.**—The American Consul at Nagasaki reports that in connection with the coal mines at Miike, in the Nagasaki district, and the erection of patent coke ovens, it is proposed to operate, with a part of the gas produced, a large electric power plant, driven by powerful gas engines made by the Nuremberg Gas Engine Works, of Nuremberg, Bavaria. These engines are capable of developing over 7,000 H.P., and with the duplicate set to be installed, if the first set proves satisfactory, this plant will have almost 15,000 H.P., and will be capable of supplying light and power for the mines, machine shops, shiploading conveyors, and cranes of the company, and for the electric lighting of the towns of Omuta and Miike.

**Russian Far East.**—The American Consul at Vladivostok reports that the erection of wireless stations in Okhotsk, Naihau, and Novo-Marijnsk has been much handicapped by difficult conditions of navigation in these seas, especially in the Okhotsk, where several sections of the heliograph towers were lost overboard, and their recovery will cause a great deal of delay in completing the stations. A Far-Eastern rumour is to the effect that the six new steamers of the Russian Volunteer Fleet for the Vladivostok-Okhotsk-Kamchatka line are to be supplied with a new system of wireless telegraphy, which will enable them to communicate in plain language without the use of a code.

**Arabia.**—The American Consul at Muscat reports that the installation of a 500 lamp electric lighting plant in the palace of the Sultan of Oman has recently been completed by N. S. Bayanker, formerly with the Deccan Electric Co., of Hyderabad, India. This is the first instance of the operation of any kind of electrical machinery in the country. Mr. Bayanker has also received permission to operate a commercial lighting and power plant, and will proceed to erect the same at once, his intention being to use two 30-kw. dynamos capable of supplying current for 6,000 lamps. One set of machines will be run at night and the other in the day, principally for the purpose of driving fans, which, on account of the great heat and the difficulty of securing energetic punkah-pullers, are much needed. Power will be furnished by oil engines and direct current will be used. All equipment will probably be of German manufacture, partly owing to the desire of having the system in operation before the close of the hot weather.

One of the recent purchases made at Cairo, Egypt, by the Sultan of Lahej is a dynamo for supplying light in His Highness's palace at Lahej, an Arabian town 18 miles north-west of Aden. A large number of electric lamps, wires, and other fittings, have also been bought. An electrical engineer has been specially engaged to look after the plant.

**Manchuria.**—The American Consul at Dalny reports that the electric power station of the South Manchuria Railway department of electricity has now under installation a fourth generator of 1,500 kw., ordered from the United States. At present the power station has three generators, of three phase, 25 cycles, each of 1,000 kw., in addition to two exciter sets of 75 kw. each. Two 1,000-kw. generators are used in the daytime for the supply of motor power to the different plants and the tramway service. These are supplemented by the remaining generator at night to answer the wants for lighting purposes. The Manchuria Electricity Co., a private concern, with head office at Dairen, being organised, has had nearly all the required shares subscribed, and has applied for a franchise; when it is granted, the first quarter of the capital is to be paid and work will be started before winter, first at Kungchuling.

**Sicily.**—The American Consul at Catania (Sicily) reports that the most important innovation in the way of public utilities in that district during 1911 was the completion of two large water power electric generating plants and the power transmission and transformer installations of the Societa Electrica, per Sicilia Orientale. The plants are located at Alcantra, in the Province of Messina, and at Cassibile, in the Province of Syracuse. The former has a generating power of 5,000 H.P., and the latter of 7,000 H.P. The new company has already supplanted the older local companies in supplying energy in the cities of Catania, Syracuse, and Messina besides supplying initial electric power to the small towns and agricultural districts of Eastern Sicily.

Two concessions have been let to Belgian companies to construct electric railways, one to La Galatea for a railway between Catania and Acireale, and the other to Les Chemins de fer Electrique, for an additional double track system in the city of Catania.

Later in his report the Consul states that opportunities for the extension of American trade appear to lie in the direction of electrical supplies, small motor and man-power machines for wood and metal working, &c. The business at Messina in building and construction material and appliances might also be increased. These lines are now principally drawn from northern Italy, Germany and England. However, the introduction of new goods and the establishing of business relations can be accomplished only through personal canvases by well-equipped salesmen who speak Italian. The utility of sending catalogues and descriptive matter to a country in a language foreign to it has been adequately set forth in Consular reports. The conditions in this district in that respect are not unlike others.

**Serbia.**—The Austrian Consul at Belgrade reports that the several electrical stations in Belgrade and elsewhere in Serbia are working satisfactorily. New lighting plants have been installed at Gradiste and Paracin. When it has been found possible to raise new capital for the works in Ovcar Kablar in order to bring the station to completion, it is anticipated that new industries will soon

spring up, as the works will be capable of supplying 2,000 H.P. The electrical works in Nisch, which are run by the municipality, have developed on right lines, and now form an important factor in the production of revenue for the town. They have not yet reached full capacity, however. The electrical works in Leskovac, a private undertaking, were able to show a not inconsiderable profit in 1911. There are excellent opportunities for the erection of electrical plants in the district of Nisch, as some of the townships, such as Alexinac, Prokuplje and Sokobanja, are favourably disposed towards such works.

Later in his report the Consul points out that the imports into Serbia of machinery, apparatus, electrical appliances, &c., in 1911 were valued at 11,860,746 dinars (25 dinars = £1) as compared with a value of only 5,973,383 dinars in 1910. There was thus an increase last year of nearly 6,000,000 dinars. This large increase is due for the most part to the rapid development of Serbian industries and the increasing tendency to erect new works and extend existing plant. The imports of steam boilers were valued at 542,075 dinars, as compared with 107,433 dinars in 1910. The imports from the United Kingdom have decreased; the other chief suppliers are Germany, Austria and Belgium. The imports of stationary and non-stationary steam engines, locomobiles, turbines, &c., were valued at 2,103,183 dinars, as compared with 1,103,575 dinars in 1910. Of the 1911 imports, Germany supplied about half, Austria about one-quarter, and Great Britain and America almost all the remaining quarter. Imports of oil motors consist chiefly of 1 to 2-H.P. motors, Sweden is the largest supplier. The imports of electrical apparatus, dynamos, and motors, and accessories were valued at 317,847 dinars, as compared with 213,851 dinars in 1910; Germany and Austria are the largest suppliers, and Switzerland, France and Belgium do a fair trade. In transformers, condensers, accumulators, &c., the imports were valued at 68,585 dinars, as compared with 51,854 dinars in 1910, Austria practically monopolising the trade. Cables and other transmission material were imported to a value of 68,761 dinars, as compared with 74,237 dinars in 1910, and in this line also Austria took practically the whole of the trade, having usurped the position held by Germany in the previous year. Telegraph and telephone apparatus, bells, rheostats, &c., were imported to a value of 295,460 dinars, as compared with 115,390 dinars in 1910. Austria and Germany took the greater part of the trade, though France and Belgium also supplied a certain quantity. Arc lamps were imported to a value of 8,148 dinars, and other electric lamps to a value of 134,122 dinars, as compared with 5,502 dinars and 109,719 dinars respectively in 1910; Austria and Germany are the largest suppliers. Accessories for lighting insulators, &c., accounted for 126,729 dinars, as compared with 62,234 dinars in 1910. The demand for dynamos and motors is not very great, as at the Belgrade station favourable arrangements for the use of such machines do not exist, and in the interior, where electric controls are run with cheap water-power, this branch of the business has not been sufficiently developed. Nisch is however, taking steps in this direction.

**1912.**—The *Yorkshire Observer* in an annual trade review for the year 1912, contains a vast quantity of information respecting textile industries, iron and steel trades, engineering and other subjects. Mr. P. J. Pybus, M.I.E.E., has an illustrated article on "Electric Driving in Textile Factories," the Bradford Corporation electricity department has an effective two-page advertisement including a picture of Valley Road power station, and a progress diagram showing supply to textile mills, factories, &c., from 1903 onwards.

**MESSRS. S. DIXON & SON, LTD.**, of Swinigate, Leeds, report having had a satisfactory year in their electrical department. Amongst the different installations carried out, and still in hand, are the following:—

Beckett's Park Training College.—Seven hostels and five houses, 4,000 lights. Bingley Training College.—Five hostels, 2,000 lights, 800 houses.

New residence at Aysgarth, for Mr. H. Tunstall.—150 lights, petrol engine and dynamo.

New Georgian residence, for Mr. Sam Ambler.—150 lights, gas engine, dynamo and accumulators.

Askham Richard Hall, for Mr. Wallis-Fairbairn.—200 lights.

They report a total of 11,000 lights installed or orders in hand during the 12 months.

**Condensing Plant Contracts.**—Among the orders recently received by the MIRRLEES WATSON CO., LTD., for independent steam condensing plant are the following:—

Barometric Jet Plant.—Umhloti Valley, Natal, and Messrs. S. Lister, Ltd., Bradford, per Messrs. Greenwood & Batley, Leeds.

Surface Plant.—Torquay Corporation, per British Thomson-Houston Co., Ltd.; Messrs. Alex. Henderson, Dundee, per Messrs. James Howden & Co.; the Tharsis Sulphur and Copper Co., Spanish Mines.

The above are fitted with reciprocating air pumps.

The following are for plants fitted with Mirrlees-Leblanc rotary air pumps:—

Surface Plant.—Bolkow, Vaughan, Southbank, 11th set; Smith & McLean, Ltd., Gartoosh Ironworks; Tullis Russell & Co., Markinch, per Christy Bros., Chelmsford; Mexborough U.D.C., per Messrs. Jas. Howden.

Mirrlees-Leblanc Multi-Jet Plant.—Vickers, Ltd., Erith, per Fraser and Chalmers; Sutton Heath and Lea Green Collieries, per Jas. Howden & Co.; Parkside Mining Co., per the A.E.G. Electric Co., Newcastle; J. S. White and Co., East Cowes; Fraser & Chalmers, Ltd., London. Also repeat orders for low level jet plant for the Dalton Main Colliery Co., Ltd., per the British Thomson-Houston Co.

**Liquidations.**—NEW SUPERHEATER CO., LTD.—This company is winding up voluntarily, with Mr. S. G. Bruff, 155, Salisbury House, London, E.C., as liquidator. A meeting of creditors is called for January 21st. Particulars of debts, &c., must be sent to Mr. Bruff by February 25th.

MR. P. F. BRITAIN, of the Langdon-Davies Motor Co., 110, Cannon Street, London, E.C., writes to point out that the Langdon-Davies Motor Co., Ltd., which we announced as holding a meeting of creditors at the offices of Mr. Cape, at Coleman Street, E.C., to hear an account of the winding up, is, of course, the old Langdon-Davies Motor Co., which went into liquidation some two years ago. Our readers are aware that the present firm acquired the assets, &c., from the liquidator as a going concern, and are carrying on the business, as heretofore, at their new works at Lowisham. They report that they are turning out more motors now than at any time in the history of the old company.

**Book Notices.**—“Elementary Manual on Applied Mechanics.” By Prof. Andrew Jamieson. Tenth edition. 1912. London: Charles Griffin & Co., Ltd. Price 3s. 6d.

“Foundations and Machinery Fixing.” By Francis H. Davies. London: Constable & Co., Ltd. Price 2s. net.

“The Russian Year-Book, 1913.” By H. P. Kennard. London: Eyre & Spottiswoode, Ltd. Price 10s. 6d. net.

“An Elementary Course of Magnetism and Electricity.” By Charles H. Draper. London: Blackie & Son, Ltd. Price 2s.

“Science Abstracts.” Vol. 15, part 12. December 31st, 1912. Sections A and B. London: E. & F. N. Spon, Ltd. Price 1s. 6d. net each.

“Transactions of the Institution of Engineers and Shipbuilders in Scotland.” Part III, 1912-13. Glasgow: The Institution.

“Atti della Associazione Elettrotecnica Italiana.” December 31st, 1912. Milan: Stucchi, Ceretti & C.

**Calendars.**—The *Chemical Trade Journal* has issued a wall calendar for 1913 with large monthly tear-off sheets.

From the FOSTER ENGINEERING CO., LTD., of Wimbledon, London, we have received a wall card with calendar for the whole year. The design and style are excellent, the ten items of Foster manufacture being so embodied in the scheme as to be essential parts of it, and by no means obtrusive.

A pamphlet entitled “The Past Year and Prospects for 1913” has been issued by MESSRS. JOHN BIRCH & CO., LTD., 2, London Wall Buildings, E.C., discussing in turn the coal strike, the trade boom, the prospect, the “coming motor” (the Diesel), the London agent, and the value of having personal travelling agents abroad.

**Catalogues and Lists.**—FROM MESSRS. VICKERS, LTD., of Vickers House, Broadway, Westminster, we have received a handsome brochure—“The Vickers’ Book”—in which there are some 64 pages of excellent half-tone prints on art paper showing warships, floating docks, turbine steamships and dredgers built and fitted out by them, gun mountings and gun-mounting shops, turbines, finished guns, guns firing, motor-cars and motor-car parts, 1,000-KW. D.C. turbo-generators, 5,000-KW. three-phase generators for Winnipeg, automatic reversing gear for planers, motor-driven tools, monoplanes, electric control pillars, motors from  $\frac{1}{4}$  to 50 H.P., the Vickers train-lighting system, roller bearings, Duralumin and other features of their multifarious operations carried on at Barrow, Sheffield and Birmingham. A number of pictures show interior and exterior views of the works and other premises of this gigantic concern.

MESSRS. OZONAIR, LTD., 96, Victoria Street, Westminster, London, S.W.—Eight-page pamphlet (No. 8) giving useful information relating to the Ozonair system of food preservation, and its application to the purification of water in ice factories. A list of installations coming under these classes, testimonials, and diagrammatic explanations of the arrangement of the system, are included.

THE WESTINGHOUSE COOPER-HEWITT CO., LTD., 80, York Road, King’s Cross, London, N.—Four-page list, No. 24, giving illustrated particulars of their mercury vapour converters for cinematograph projection arc lamp work, with prices, and notes on maintenance expenses. Similar converters are in extensive use for telegraph and telephone exchanges, and for charging commercial batteries. The list is specially prepared for electricians in charge of cinematograph plant.

MESSRS. ISARIA, LTD., 208, Tower Bridge Road, London, S.E.—Two four-page lists containing brief descriptions, with tabulated particulars and prices, of small C.C. dynamos and polishing motors.

THE METALLIC SEAMLESS TUBE CO., LTD., Corporation Street, Birmingham.—Postal card giving prices and brief particulars of “Swingback” fuseboards.

THE ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., 109-111, New Oxford Street, London, W.C.—List CB1, containing tabulated particulars and prices of different qualities and types of carbon brushes manufactured by Dr. Albert Lessing, for whom the firm are sole selling agents for Great Britain and the Colonies.

MESSRS. DONOVAN & CO., Cornwall Street, Birmingham—New catalogue containing particulars of a very wide range of electrical supplies and material, including standard lines in conduit, cables, insulators, motor starting switches, fan regulators, shunt regulators, switchgear, Board of Trade fuses and hand lamps, ironclad switchgear and fuses, accessories, bell and telephone material, electric fittings, &c. We understand—we have not counted—that prices are given of about 10,000 articles, and there is an abundance of illustrations. The copy received by us is of the special export edition on thin art paper, and copies will be forwarded to any reader abroad who is interested. The edition for Home use is on a thicker paper. Every effort has been made to facilitate reference by providing a full index in addition to a finger index to sections.

MESSRS. SCHOLEY & CO., LTD., 151, Queen Victoria Street, London, E.C.—Twenty-four page catalogue containing a full descriptive account of the Graham electric lifts (concerning which some particulars were recently given in these pages) admirably illustrated on a good art paper. Full technical notes with detailed diagrams are also given.

**Trade Announcements.**—It is stated in the *Standard* that the BRITISH THOMSON-HOUSTON CO. propose to transfer the switchboard department of their factory from Rugby to Willesden. “Recently the firm built a factory there, in order to cope with the increased demand for Mazda lamps, at the same time retaining their lamp factory at Rugby. The removal of the switchboard department to Willesden is not difficult to understand. Whilst extensive building operations have been carried out during the past six years in Rugby, they have been nothing like sufficient to meet the greatly increased population, which is to a large extent accounted for by extensions at the B.T.H. In fact, the local Council is being urged to put up municipal dwellings with all speed. The preliminary arrangements for the transfer of the switchboard department to Willesden are to be pushed forward with all speed, and it is expected that the men will be installed in North London by Easter.”

MESSRS. HASLAM & SCHONTHEIL, 11, Windsor Place, Cardiff, have been appointed by Messrs. Callender’s Cable and Construction Co., Ltd., to be their sales agents for South Wales, Monmouthshire, and the Bristol district. Callender’s rubber cables will be stocked.

MESSRS. HERMANN STEINBACH and MAX HOHN (who were for many years with Messrs. Jaeger Bros.) have commenced business as suppliers of electrical accessories at 669, Mansion House Chambers, Bucklersbury, London, E.C., under the style of Steinbach and Hohn.

MESSRS. MATHER & PLATT, LTD., announce the removal of their registered office and publicity department to Park Works, Newton Heath, Manchester.

“A. FATTORI & CO.” is the title of a firm recently registered at 104, Via Tomacelli, Rome, to act as agents for the sale of electrical material.

**Bankruptcy Proceedings.**—A. F. MANDER, electrical engineer and cycle dealer, Victoria Road, Aston, Birmingham.—First and final dividend, 2s. 3d. in the £. payable January 20th, at Official Receiver’s office, 191, Corporation Street, Birmingham.

THEODORE HENRY MEAKIN, electrical fitter, Quarry View, Four Mile Bridge, Valley, Anglesey.—First meeting, January 18th at Chester: public examination, February 6th, at Bangor.

**For Sale.**—The Secretary of State for War is offering for sale a quantity of electric lighting and steam pumping machinery and accessories at Bordon Camp, Hampshire. The Belfast Corporation has for disposal a quantity of Hopkinson steam valves and flanged steam pipes. See our advertisement pages in this issue.

**New Zealand.**—H.M. Trade Commissioner reports that an Auckland firm seek the representation of British manufacturers of wire and cable, and also of electrical heating apparatus. *Board of Trade Journal*.

**Ignition Magnetos.**—MESSRS. DUNCAN WATSON and CO., of 62, Berners Street, London, W., have acquired the British concession in a new ignition magneto, known as the “Mafan” made by MESSRS. HARTMANN & BRAUN, of Frankfurt-am-Main.

## LIGHTING AND POWER NOTES.

**Altrincham.**—At a meeting of the District Council last week, it was stated that the plans for the proposed electric street lighting were now in the hands of the manager of the Altrincham Electric Supply Co., who was giving the matter attention.

**Argentina.**—Messrs. Gambarini & Co. have applied to the San Luis Government for a concession for an electric tramway in the city of Mercedes. The concession is to be for 60 years.

The chief of the Public Works Department of the Rosario Municipality has presented to the mayor his report on the various tenders received for public electric lighting of that city. He is of the opinion that the concession should be for 20 years, and terminates his report by recommending that the tender of the Rosario Electricity Co. be accepted as, in his opinion, it is the most advantageous to the

city, if the company eliminated from its offer that clause of obliging the municipality to pay in ten years the costs of all the installation. He calculates that this tender would be a saving to the Corporation during the 20 years of the concession of the sum of \$554,729.70. The report has now been sent to the City Council.—*Review of the River Plate.*

**Australia.**—According to the *Mining and Engineering Review*, a scheme has been outlined, and a preliminary report furnished by Mr. Wm. Corin, electrical engineer, of the Public Works Department, for the supply of electric power by the Government to the more populous areas of the State, to cover existing and future needs, including a supply of light, heat and power for all public and private purposes; the establishment in Australia of larger electro-thermic and electrolytic industries, such as the manufacture of calcium carbide and cyanamide; and, eventually, for a complete electrification of the State Railways. The scheme provides for the utilisation of the State coal and water-power resources by the establishment of power stations in each of the important coalfields, and on those rivers which may be depended upon to provide power in sufficiently large quantities to make their development commercially feasible. In the report it is suggested that a beginning might be made by the establishment of a large power station at some convenient point on the southern coalfield, and that this should eventually be linked with stations at Burrinjuck, on the Shoalhaven River, and in other coalfields. Transmission lines would supply power to all the towns along their route, or within a reasonable distance of them. A comprehensive scheme on such lines, it is stated, would enable power to be provided at a very low price, ranging, according to the character of the load, from 1d. to 1½d. per unit.

The North Sydney Council has agreed to adopt the first report of Mr. G. A. Julius in regard to providing electricity and erecting a refuse destructor, the scheme being that of the Northern Suburbs E.L. and P.S. Corporation. The Mayor's recommendation was, however, only carried by his own casting vote, and the matter has been reopened in Council, as it is understood to be the opinion of the expert that the offers of the Sydney Council and Public Works Department are well worth greater consideration.

Last year the Melbourne City Council reduced its charges for electric supply, and estimated a revenue reduction on lighting of £12,500, and on power of £3,000. The difference has, however, amounted to £22,500, in spite of the fact that a great increase in supply took place, which has led the Electricity Committee to consider still further reductions in the price of power.

**Blackburn.**—An accident at Messrs. Baynes' extensive Cioely Bridge Mills, Blackburn, led to the firm deciding to install special electric motors to enable an early start to be made. It will be several months before the defective engine is repaired.

**Blackpool.**—At the T.C. on January 9th, a letter was read from owners of property adjoining the electricity works complaining about the noise caused by the machinery which, they understood, had been newly installed. A property owner said he must look after his tenants, and if the nuisance was not abated, he would have no option but to take such steps as would abate it. Ald. Brodie said the electricity works had been established 20 years, and the property of Mr. Alex. Moore (the person to complain) had been occupied 12 months.

**Blackrock.**—A special meeting of the Urban Council was held to consider what action should be taken as to a petition to the B. of T. embodying the Council's objections to the Dublin Southern Electric Lighting Order, promoted by the Dublin and Southern District Electric Supply Co. The town clerk said the object of the proposed order was to give the company power to light Dalkey, Kingstown and Blackrock with electricity. He suggested that the first thing to be done was to employ an expert electrical engineer to report upon the scheme of the company as it concerned Blackrock. It was mentioned that Blackrock had an Electric Lighting Order covering certain areas. The intention was to use that order to the best advantage of the ratepayers. This company wanted the Council to waive its powers and give them the Electric Lighting Order. The area the company marked did not touch more than half what was scheduled in the Council's Order. The town clerk said the company's area covered about the same mileage. After further discussion, it was decided to employ Mr. Price as an expert to report on the company's scheme for lighting Blackrock.

**Bognor.**—The U.D.C. is considering the advisability of adopting electricity for driving the new pumps at the sewage outfall works. The gas company has offered to supply current at 1d. per unit.

**Bolton.**—The Corporation has arranged terms with Messrs. Joseph Crook & Co. for giving a supply of electricity for power purposes to Eagle Mill, and with Messrs. Greenhalgh and Shaw for giving a supply of electricity to their Halliwell mills.

**Bournemouth.**—At the last meeting of the Council the question of the lighting of the Undercliff Drive and West Promenade was discussed at great length, there being a wordy conflict as to whether gas or electricity should be used. The Lighting Committee recommended that the tender of the Bournemouth and Poole Electricity Supply Co., Ltd., at £5 2s. 10d. per lamp per annum for a term of five years be accepted, but the question was referred back. In the course of the discussion the borough engineer stated that he had been in communication with other towns on the subject, and he had received replies from Brighton, Clacton-on-Sea, Eastbourne, Folkestone, Great Yarmouth, Hastings, Lowestoft,

Margate, Ramsgate, Scarborough, Southend-on-Sea, Southport, Torquay and Weymouth. Eleven of these used electric lamps on the sea front, three used gas, and five both gas and electricity.

**Brighton.**—The Lighting Committee of the T.C., on the advice of the town clerk, recommends opposition to the Bill of the Hove T.C. as regards the supply of current outside the borough of Hove, as it is considered that such powers will prejudicially affect the rights and powers of Brighton. The parishes mentioned in the proposed extended area of supply are Portslade, Preston Rural, West Blatchington and Hangleton.

**Caerphilly.**—At a meeting of residents recently a resolution was passed requesting the U.D.C. to petition against the granting of a prov. order for electric light to a private company. It was stated that the Council proposed to support the application.

**Chalfont St. Peter.**—The Amersham R.D.C. has consented to the electric lighting mains being extended to Chalfont St. Peter in connection with the promotion of a prov. order by a company.

**China.**—A steadily increasing demand for electric lighting equipment and electric fans is reported from Swatow in China.

**Continental Notes.**—**BELGIUM.**—La Société des Centrales Electriques des Flandres has secured the concession for the electric lighting of 17 villages in the neighbourhood of Ghent. Work is well in hand on the establishment of the company's central station, which will, primarily, have a capacity of 4,000 kw., and is situated at Langerbrugge, on the banks of the Ghent Maritime Canal.

**FRANCE.**—The Government engineers are now engaged in making investigations in connection with the alternative schemes of dams suggested with a view to the electric utilisation of the water power of the Upper Rhone. The schemes put forward are a single large dam at Génissiat, or two dams, one at Malpertuis and the other at Perte du Rhone, on the frontier.

The Havre Chamber of Commerce has approved a scheme for the disbursement of 4,200,000 fr. for the installation of 15 electric cranes and the construction of an electric line for the service of the cranes and the lighting of a warehouse; 50,000 fr. additional is also approved for the installation of 16 electric winches on the Colbert Quay.—*La Lumière Electrique.*

**GERMANY.**—Work is approaching completion of the new water-utilisation plant of the Glambocksee Kraftwerke Gesellschaft, at Stolp, Pomerania. Altogether six 850 H.P. turbines and generators are to be installed, three of which, as also an exciting set, have been supplied by Messrs. Brieleb, Hanson & Co., of Gotha.

**SPAIN.**—A new undertaking, with a capital of £50,000, and the title La Sociedad Co-operativa Electrica Donostiarra, has lately been formed in San Sebastian to undertake the supply of electrical energy for lighting purposes in the district.

**Coventry.**—A meeting of parochial electors has been held, when resolutions were passed approving of the insertion in the proposed Corporation Bill of clauses providing for, among other things, the supply of gas and electricity to several villages.

**Douglas (Isle of Man).**—In connection with the new kursaal, which is nearing completion, in the Public Gardens, it has been decided to install electric lighting at a cost of £3,000.

**Dover.**—The T.C. has decided to apply to the L.G.B. for a loan of £300 for transformers.

Barton Road Schools are to be wired for the electric light in the coming summer.

**Dungarvan.**—The T.C. of this Irish town has decided to light it with electricity if the necessary funds can be raised, in lieu of the present gas lighting system. Permission is to be asked for a loan of £2,000 to float the scheme.

**Eccles.**—Replying to a question at the T.C. meeting last week, Ald. Pearson said his Committee was in favour of supplying electrical fittings. Councillor Ogden expressed the hope that the Committee would not, without taking the Council into its confidence, embark on anything which would lead to municipal trading in electrical fittings in opposition to private enterprise, and he was assured that before anything of the sort could be done the Council would have an opportunity of saying what it thought on the matter.

**Edinburgh.**—A Corporation Committee has instructed the Town Clerk to prepare a report on the general question of supplying electricity to suburban districts, and to have a conference with the military authorities on the subject of supplying electric power to Redford Barracks.

**Felixstowe.**—According to the *East Anglian Daily Times*, a Dr. C. H. Liebrand has a scheme on foot for the acquisition of the Suffolk E.S. Co., which supplies the town. The scheme apparently contemplates a central station (on the German plan) for supplying the agricultural townships scattered round Ipswich, and, of course, including Felixstowe.

**Gravesend.**—The T.C. has received from the L.G.B. sanction to loans of £4,500 for E.L. mains, £1,200 for house services, £500 for a coal store at the electricity works, and £300 for an automatic stoker.

**Hayward's Heath (Sussex).**—The U.D.C. on Monday consented to waive the statutory notice of the application for a

prov. order for electricity supply by the Mid-Sussex Electric Light and Power Co., Ltd., on condition that a satisfactory purchase clause is inserted in the Order.

**Hove.**—At a special meeting of the T.C. on January 10th, the recent decision to promote a Bill for the acquisition of the undertaking of the Hove E.L. Co., Ltd., was confirmed by 28 votes to 4.

**Kendal.**—A Sub-Committee has been appointed to make arrangements for the electric lighting, in lieu of gas, of the court room and magistrate's room at the Town Hall.

**Knighton (Radnorshire).**—The U.D.C. has had an application from, and an interview with, Mr. L. J. Simons, electrical engineer, in reference to the granting of permission by the Council to open the streets for the laying of a cable for the proposed electric lighting scheme. Prior to the Council meeting, a public meeting had been held at the Norton Arms, when it was suggested that the Council should carry out the scheme, or, failing this, that a private company should do so. It was decided to hold a special meeting, followed by a public meeting, to ascertain the views of the ratepayers on the subject.

**Lincoln.**—The T.C. has decided, owing to the great increase in the price of oil, not to install an oil engine at the electricity works, but to purchase a steam turbine plant.

**Llanfairfechan.**—A communication has been received from Mr. W. R. Walton, the consulting engineer, in connection with the electric lighting scheme, stating that the original expenditure at Llangollen was £2,220, including legal expenses, and suggesting the holding of an electrical exhibition, with a view to ascertaining whether there is any real demand for electricity in the town. The U.D.C. has decided to provide a building free for a week's exhibition.

**London.**—**MARYLEBONE.**—At the last meeting of the Council, the Electricity Committee brought up a report with regard to the supply for next winter. In this connection, Mr. J. F. C. Snell, as consulting engineer, prepared a preliminary report in which he stated that he was certain that the load would grow beyond the economical transmission by 600-volt continuous current. After careful consideration of the various load curves, he agreed that a 3,000-kw. turbo-alternator was the convenient size of machine to install. He approved the pressure proposed, namely, 6,600 volts, and the speed of 3,000 R.P.M. As the tender of the Oerlikon Co. was so extraordinarily low, he was of opinion that it would be sounder policy to accept their tender and install a second set practically at once. The Council would then have a complete stand-by to its three-phase plant, which he thought advisable. On this report, the Electricity Committee stated that the question of the period of delivery of any turbine-alternators which it might be decided to order was the most pressing part of the problem, and it had authorised the general manager and Mr. Snell to give a prov. order for one such apparatus, if they came to the conclusion that such a course was advisable, such order to be subject to confirmation by the Council. This was duly done, the order being given to the Oerlikon Co., but as the installation of a second set as a complete stand-by was recommended, they had extended that authority to cover a prov. order for two sets, which would provide 6,000 additional kW. The Committee accordingly recommended the Council to confirm their action, and that a contract be entered into for the purchase of two turbo-alternators, each of 3,750 K.V.A., at a total cost of £8,600. In the discussion on this recommendation, Alderman Hopkins said that the position was that the load was increasing at a very rapid rate, and that it was necessary that steps should be taken to provide for the next winter so that there might be no difficulty in supplying the current. It had been found that existing arrangements were not economical, and would not meet requirements. The recommendation was eventually adopted.

**ST. PANCRAS.**—Sanction has been received from the L.C.C. to the borrowing of £13,176, made up as follows:—£5,329 for mains; £5,310 for generating plant; £2,006 for house services, and £621 for meters. This sum is to be invested out of the Electricity Reserve Fund account, repayment of principal being annually upon the instalment system and interest at the rate of 3½ per cent. per annum. In connection with the putting in of new feeding mains from the King's Road Electricity Station to the Camden Broadway, mains are to be laid for street lighting by incandescent electric lamps in the thoroughfares concerned, at an estimated cost of £93.

**LONDON.**—At a meeting of the Guardians last week, the question of introducing electric light and power (as mentioned in our issue of December 20th) came up for discussion. Various proposals with a view to adhering to gas lighting were considered, the Gas Co. having offered to fix inverted burners throughout for £725, and to replace all old gas piping. In the end the electric lighting scheme was adopted by 14 votes to 8, but a clause providing for a minimum payment of £1,000 per annum for the supply, was rejected on an amendment.

**Maidenhead.**—The T.C. has applied to the L.G.B. for a loan of £1,700 for new buildings and plant at the electric light works, and for £2,000 for mains.

**Northumberland.**—By a serious fire at Ashington Colliery on the 12th inst., haulage machinery, electric plant, &c., of the value of £3,000, was destroyed. Only one seam was affected, and there were only two men at work at the time. Some 80 ponies were killed. Ashington Colliery is the largest in the county.

**Oldham.**—The T.C. has confirmed the recommendation of the Electricity Committee, to apply to the L.G.B. for sanction to borrow £30,000 to cover the cost of additional plant, &c.

**Rhyl.**—Mr. Wright, the electrical engineer to the U.D.C., has recommended to the Council the desirability of encouraging the use of electricity for heating and cooking purposes in the district. An additional output of 50,000 units at 1½d. would mean an additional revenue of £300, and would add practically nothing to the working expenses, which had been decreasing for the last two years. The working costs of the Diesel engine set, by which this load would be supplied, are 1½d. per unit generated, or 1d. unit including all the charges except line charges. It would be necessary to have a new form of tariff, and the rateable value scale would be the best for Rhyl: say a fixed charge of 15 per cent. on the rateable value of the house, and 1½d. per unit used. A consumer willing to install separate wiring could, of course, be charged by an additional meter at 1½d., but in that case it would be advisable to fix a minimum consumption per quarter of, say, 250 units.

**Rushden.**—The U.D.C. on January 8th passed plans of electricity works which are to be erected in the town.

**Salford.**—The T.C. has expressed warm appreciation of the assistance of neighbouring authorities at the time of the recent disastrous fire at the electricity works. The disaster, said Councillor Billington, was a lesson not only to Salford, but to electrical undertakings generally, not to have their eggs all in one basket. The Corporation had received an order from the fire insurance people for £3,100 for a new switchboard, which would be placed in hand at once. The cause of the occurrence would be investigated as soon as possible.

The T.C. on January 8th decided to apply for a loan of £750 for installing electric light in the extensions to the town hall buildings.

**Scarborough.**—The T.C. has appointed a special sub-committee to consider the question of the Council's right to purchase the undertaking of the electric supply company.

**Shrewsbury.**—The Lighting Committee contemplates that extensions will need to be made at the electricity works in the near future.

**South Africa.**—According to *African Engineering*, in five years the output of the Electric Department of the Johannesburg municipality has risen from nearly 8½ million units to upwards of 18½ million units. The cost per unit sold to-day is 2½66d. In 1907-8 the working expenses of the Tramways Department for almost 2 million car-miles came to £217,495, or 27½02d. per car-mile; last year the expenses totalled £285,706, but the mileage had increased by a million, making the cost per car-mile 23½08d.

When the extension of the Cape Town electricity supply to Green Point and Sea Point was decided upon, it was estimated that the consumers would require about 5,580 16-c.p. lamps. The demand has, however, already amounted to over 7,000 lamps.

**Southampton.**—Application is to be made to the L.G.B. for sanction to borrow £3,000 for mains. Tenders are to be invited for the provision of a balancer.

**Stirling.**—Owing to the Parliamentary regulation restricting it from supplying current outside the burgh boundaries, the Corporation electricity undertaking is losing one of its best customers, viz. Messrs. Robert Walls & Sons, Springkerse. The T.C.'s loss, however, is the Scottish Central Co.'s gain, and as it is now supplying the Forthbank Carpet Works, it is able to supply the Kerse mills Works which are within its area.

**Stretford.**—During the past eight months a total of 1,395,779 units have been sold. This is an increase of 129,448, compared with an increase of 65,300 during the previous year's working.

**Tollesbury.**—An electric light scheme for the town was explained at a meeting of residents on January 6th by Mr. H. P. Girling, M.I.E.E., of Malden, who estimated the cost of plant, dynamos, accumulators, street lamps, &c., with the necessary working capital, at £1,500. The matter is to be fully gone into at the annual parish meeting in March.

**Tunbridge Wells.**—Last week a series of electrical cooking demonstrations was held at the Town Hall, the lectures being given by Mr. Norman Miller, on the "Eclipse" stoves, manufactured by the Electrical and Ordnance Accessories Co., Ltd. The opening ceremony was performed by the Mayoress (Mrs. Silcock), and the lectures and demonstrations throughout the week were extremely well patronised. Artistically furnished dining and bedrooms, erected at the end of the Town Hall by Messrs. Waymarks, Ltd., were wired throughout with "Stannos" by the Electrical Installation Co. (Mr. J. P. Strange), and they attracted thousands of visitors. Mr. H. A. Stonham gave practical demonstrations with the "Imperial" vacuum cleaner. At the close of the demonstrations, on Friday night, a dinner, which was entirely cooked by electricity in the "Eclipse" stove, was served to a dozen or so members of the Corporation electricity works staff, who had been in attendance at the hall during the week. In the absence of Mr. R. N. Torpy (the borough electrical engineer), Mr. J. Bemrose occupied the chair, and was supported by Mr. W. H. Hayden and Mr. Norman Miller. A hint was given that it was quite probable that further reductions would be made in the heating and cooking charges, which were lowered only a short time ago.

**Venezuela.**—The Harbour of Caracas is to be the object of extensive improvements, among other works the construction of 7 km. of quays being planned. These are to be lit by electricity, which will also supply the motive power for numerous cranes which are to be installed there. A generating station is also to be constructed. The works are to be carried out by the municipality. —*Elek. u. Masch.*

**West Hartlepool.**—The costs connected with the recent inquiries into the proposed extension of the electricity undertaking totalled £1,963, and for this sum the L.G.B. has sanctioned a loan.

**Whitehaven.**—The T.C. has decided to apply to the L.G.B. for a loan of £1,565 for electricity purposes.

**York.**—The City Council has passed a resolution confirming the promotion of the Bill under which the Corporation proposes to acquire the undertaking of the York Gas Co., and to acquire lands for the electricity undertaking and for other purposes.

## TRAMWAY and RAILWAY NOTES.

**Australia.**—The Victorian Railways Standing Committee has reported favourably on electric tramway extensions in South Melbourne, Richmond, Camberwell, Hawthorn, &c., and recommends that the required authority to carry out the work should be vested in a trust representing these Councils.

**Birmingham.**—The City Tramways Committee contemplates making at an early date a junction between Villa Road and the main Handsworth line. When this is completed, passengers will be able to ride by car from the New Luns or West Bromwich, along Villa Road to Aston, without going into the city.

**Canary Islands.**—Work is shortly to be commenced at Las Palmas in the Canary Isles, on the new electric tramway in the San Jose quarter of that town, to join up the San Francisco road, the Verduga bridge and the Obispo Codina.

**Colne.**—The T.C. last week formally confirmed the promotion of the Colne Corporation Bill, which includes provision for the taking over of the Colne and Trawden Light Railway undertaking, and the extension of the electric lighting area.

**Continental Notes.**—**AUSTRIA.**—According to a recent utterance of the Minister of Railways, the delay in the electrification of the Vienna municipal railway and in the building of the underground express line is owing, firstly, to the time needed for the preparation of the plans; secondly, the condition of the money market and the political situation have been causes of some delay. The plans have now, however, been completed, and the improvement in the financial and political situations gives ground for believing that the two groups who have the schemes in hand will shortly proceed to their realisation. —*Zeit. des Oest. Ing. und A.V.*

**BOSNIA.**—Plans are being prepared in respect of a projected electric tramway between Sarajevo and Ilidze.

**ITALY.**—The municipal authorities of Milan, following the example of great cities in other parts of the world, are contemplating the introduction of an electric underground railway which they propose to achieve by means of a building and working concession for a term of years. The narrowness of the streets in the inner parts of the city prevents, it seems, the establishment of an ordinary tramway, while the congestion of population and traffic render additional means of locomotion a necessity. The nature of the sub-soil of the city does not lend itself so well as elsewhere to the construction of an underground line on which account construction by stages is favoured. Contractors contemplating submitting schemes must do so during the month of March, and additional particulars may be obtained from the Ufficio Tecnico di Municipio di Milan.

**SPAIN.**—La Sociedad de Tranvías Electricos de Granada has applied for a concession for a projected electric tramway between Granada and Santa Fé.

**East Ham.**—A communication has been received from the Postmaster-General stating that he was prepared to erect insulated wires wherever the wires of his department crossed the Council's trolley wires, thereby relieving the Council of the necessity to erect guard wires, providing it would agree to pay half the cost. A reply is to be sent that the Council cannot comply with this request.

**Glasgow.**—Since the beginning of the Tramway Department's financial year on June 1st there have been 181,413,000 passengers, against 156,907,760 in the corresponding period of 1911-12, an increase of 24,505,220, while the drawings have been £592,372, as compared with £596,875, a decrease of £4,503.

**Huddersfield.**—The financial statement of the borough treasurer respecting the Corporation tramways for the nine months ended December 31st, 1912, states that the capital outlay to date is £416,985. The miles run were 1,780,522, compared with 1,687,596 for the corresponding period of the previous year. The income amounted to £82,443, or 11'1d. per car-mile, compared with £80,253, or 11'4d. The total working expenditure was £49,056, or 6'1d., compared with £44,311, or 6'30d. Interest on capital

absorbs £9,873, and redemption of debt, £7,620, leaving a surplus of £15,894, or 2'14d., compared with £18,476, or 2'62d. After provision is made for depreciation at 3 per cent, there is a net surplus of £6,512, or '87d. compared with £9,191, or 1'30d. The balance brought forward on the reserve or renewal account was £13,253, and interest on investments amounted to £262, while the transfer for the nine months (depreciation) amounted to £9,382, making a total of £22,897. The payments totalled £8,034, leaving the fund at £14,863.

**Hull.**—The Tramways Committee has had under consideration a report from the city engineer regarding new tramways in the neighbourhood of the Paragon station, and has agreed to recommend the carrying out of certain work in connection with the proposal, with the consent of the B. of T. and N.E. Railway Co.

**Leeds.**—The attitude of several of the local authorities affected by the proposed tramway extensions of the Corporation has been under consideration. Objections were raised to the introduction of railless traction in Wharfedale. After a meeting between the representatives of the Drighlington R.D.C. and the Tramways Committee, terms were suggested which it is believed will be acceptable to the various Councils and the Leeds Corporation. The Committee recommends that the Parliamentary Committee should abandon the application for powers to extend the system to Ilkley (beyond Burley) and to Calverley and Farsley.

**Liverpool.**—On the proceedings of the Tramways and Electricity Committee at the Council meeting on January 8th, Councillor Miller moved that application be made to the B. of T. for a provisional order authorising the construction of a tramway line connecting Aigburth Road with Princes Road, *via* Belvidere Road and Devonshire Road. Pursuant to standing orders, this motion was formally referred without debate to the Committee for consideration and report.

**London.**—**HAMMERSMITH.**—Petitions are to be presented against the London Electric Railway Bill and the Central London Railway Bill for the preservation and protection of the interests of the borough. Both Bills seek power to acquire and interfere with property belonging to the Council, while in the former Bill the rateable value of the property in the borough which the company seeks to acquire is £10,754, of which £7,631 represents property which will necessarily be disturbed along the line of the proposed railway. A deputation is to wait upon the L.C.C. to urge the necessity for arrangements being made for the early reconstruction of the tramway track in King Street and Goldhawk Road.

**LEWISHAM.**—With the view of saving, as far as possible, expense in the matter of opposition, the L.C.C. is to be asked to take the necessary steps for withdrawing its proposals to run railless trolley vehicles on certain routes in the borough, from the Bill to be considered in the next session of Parliament.

**Mexborough.**—The Mexborough and Swinton Tramways Co. has deposited a Bill for introduction into Parliament next session for powers to provide and work railless trolley vehicles in connection with its existing tramway system. The five routes proposed to be authorised will pass into or through Conisboro' and the rural district of Doncaster.

**Sheffield.**—During the severe snowstorms of the week end, a telephone wire over one of the tramway routes broke and fell across the trolley wires and into the road. Two cab horses which came into contact with the wire, were instantly killed, while the drivers jumping on to the snow, received severe shocks, owing apparently to the immediate area being electrically alive. Two men who went to assist, shared the same fate, and were badly burned, but all were eventually rescued by two other men, who adopted the expedient of walking on a coat layed on the snow in the danger zone. At Blackpool a somewhat similar occurrence took place, but with less serious consequences, two men receiving shocks, while at Blaydon a displaced overhead wire (not used for traction purposes) caused the death of a horse, and shock to its rider.

**Shoreham-by-Sea.**—At a meeting of the U.D.C. on January 7th, a letter was read from the B.E.T. Co. suggesting that the Council should acquire the tramway powers in the district. It was decided to take no action in the matter.

**South Lancashire.**—At a meeting of the employees of the South Lancashire Tramways Co. held last week, it was unanimously decided to tender notices to cease work in order to secure higher pay and improved working conditions. The terms offered by the company were considered unsatisfactory, and were rejected. An application has been placed before the Executive Council of the Tramwaymen's Association for leave to cease work on the 24th inst. pending a settlement of the men's grievances.

**Stockport.**—At a meeting of the T.C. last week, Ald. Sharples said the Tramways Committee had not yet been able to get delivery of the trackless cars required. One which had been received had required alteration as to height to make it suitable for the route. The cars would probably be running, however, before the end of the present month.

**Torquay.**—The figures of last year's tramway traffic show large increases compared with those for 1911. The comparative totals of the passengers carried were as follows:—1912, 4,207,619; 1911, 3,594,317, an increase of 613,302. Receipts: 1912, £28,111; 1911, £22,634; increase, £5,477. Car-miles: 1912, 627,479; 1911, 494,468; increase, 133,011. The cars cover eight different routes.

## TELEGRAPH and TELEPHONE NOTES.

**Australia.**—The litigation between the Marconi Co. and the Commonwealth Government proceeds by slow stages. Some time ago the company renewed its application to the Courts for an order for inspection of the wireless plant installed by the Federal Government, without success. On the other hand, the Government recently asked the Court to direct that further particulars of the alleged infringements should be supplied by the company, and this application was also refused. The actual hearing of the case has not yet appeared in the Australian papers received in this country.

The Commonwealth lighthouse expert, Commander Brewis, says the *Australian Mining Standard*, has advised the Minister of Customs to install wireless telegraphy in all lighthouses that are not provided with telephone communication.

**German Wireless Patent Rights.**—In the nullity suit against one of the chief patents owned by the C. Lorenz Aktien-Gesellschaft, of Berlin, relating to the creation of undamped electric oscillations by means of an arc burning in a hydrogen atmosphere, the Court of First Instance declared the patent void in all but what relates to a sub-claim. The Imperial Court, however, in its verdict of November 9th last, upheld the essential portions of the patent, and only declared one claim void, because the claimant, V. Poulsen, had obtained a Danish patent only a few days before Germany entered the International Patent Union. The voided claim related to the arrangement of the arc in a hydrogen atmosphere. The arrangement of the arc in a closed chamber, the cooling of the electrodes, and the use of rotation and a magnetic field, were upheld to the fullest extent by the Imperial Court.—*E.T.Z.*

**The Imperial Wireless System.**—On January 6th, the Select Committee of the House of Commons resumed the inquiry into the Marconi agreement, continuing the examination of Mr. Gandil, who stated that he sent in the tender of January 11th, 1912, to the Postmaster-General entirely on his own responsibility. On June 7th, he applied for permission for the Poulsen Co. to be represented at the International Radio-Telegraph Conference, Signor Marconi having been permitted to attend, but it was refused. It would have been of great importance to his company for him to meet the foreign delegates. In January, 1912, there was no British company or capital for working the Poulsen patents. He did not agree that he could not have got financial assistance to put up trial stations, unless he got a conditional contract with the Government. He admitted that a delay of 12 months would probably have been incurred in erecting the trial stations. The Marconi Co., he said, had not yet communicated 2,000 miles overland.

Mr. R. H. Eggar, solicitor to the owners of the Poulsen system, stated that the Poulsen patent rights for the United States remained vested in the inventors; those for the British Empire were owned by the Amalgamated Radio-Telegraph Co., Ltd., which also had the right to all improvements made by the owners at any time of the United States patents. The rights for all other countries belonged to the Continental Syndicate, but the Amalgamated Co. had the right to overseas communication with and between all foreign countries other than the German Empire. In 1911, Mr. Gandil was forming a British company, but was unable to obtain an assurance from the Postmaster-General that his company would be allowed to tender for the contract; if Canada had taken part in the contract, it would have been impossible to obtain a licence for a trans-Atlantic service competing with the Imperial system. The licences held by the company expired in 1909, and the Postmaster-General would not grant others until a British company was formed, but this was found to be impracticable. It had been shown in the evidence that Capt. Loring was anxious that the Marconi Co. should purchase the Poulsen patents, and therefore witness suggested that, when the Postmaster-General endeavoured to buy these patents for the whole world, he was acting on behalf of the Marconi Co., with a view to the Government having the benefit of them without extra payment. The Poulsen Co. believed that any information given to the British Government got into the hands of the Marconi Co. He was informed by Capt. Loring that the Department would not give the business to a foreign company; he must first form a British company. He suggested that Clause 3 was inserted, giving the Marconi Co. a five-year monopoly, in order to make the Poulsen patents worthless, so that they could be bought up cheaply.

On the 8th inst., Mr. Eggar's examination was resumed. He said that the owners of the Poulsen patents were preparing copies of their agreements with the American Co. for circulation to the Committee. The German purchasers of the Poulsen rights were, like the American, compelled by agreement to give the Danish inventors the benefit of any improvements they might make, but the English company were under no such obligation. Mr. Beach Thomson came over to acquire the Poulsen rights for the whole world, but was too late—the English syndicate had purchased them; Mr. Thomson was wrong when he said that the English company was not entitled to the American improvements. If the British Government had entered into an agreement with the Poulsen Co., they could not have used the system for communicating with Germany or the United States.

On the 9th inst., Mr. Eggar was further examined. He said the Post Office purchased the Cullercoats station because the licence having expired, the owner (Mr. Hage) had no use for it. In May, 1909, the Amalgamated Radio-Telegraph Co. went into liquidation, and Mr. Hage bought the station. The Poulsen Co. had been trying

to get a licence for trans-Atlantic communication since December, 1909, but the Post Office required them first to form a British company, and as the Post Office would not specify the terms of the licence, it was impossible to form the company. The Post Office did not give them a chance.

Sir G. C. Marks, M.P., recalled, stated that eight articles in the apparatus covered by the agreement with the Marconi Co. were proper to the system, but 15 were not, and the latter need not have been made the subject of a contract. Out of the £60,000 to be paid for each station, £50,000 was for things not properly belonging to the Marconi system. There were two main Marconi patents, one of which would expire in 14 months. This was practically a master patent. The contract was an extraordinary example of wrong-headedness on the part of the advisers of the Government, as the agreement of September, 1909, gave the Postmaster-General the right to use the Marconi inventions. The contract would close the door to independent invention. There were plenty of experts outside the company who could do the work. He objected to the ratification of the agreement. The foreign patents of the Marconi Co. would not interfere with the erection of any of the six stations. A royalty on profits was the proper course to take.

On Monday the Committee considered a draft interim report, and the Postmaster-General was invited to attend. The chairman (Sir Albert Spicer) stated that the Committee had been impressed with the great urgency of the matter and with the difficulties connected with the technical questions; as regarded the hearing of scientific evidence, it felt itself hardly competent to deal with that side of the question. The interim report was to the effect that it was a matter of urgency that a chain of Imperial wireless stations should be established as proposed in the agreement:

"They therefore recommend that steps should be at once taken for the purchase of sites for wireless stations large enough for Marconi installations in the countries or places mentioned.

"They further think that, with respect to the construction and installation of such wireless stations, one of two solutions must be adopted—either a particular company must be selected, and their system accepted, or else the Government must leave themselves free to adopt or reject from time to time any system. . . .

"Whichever solution is ultimately recommended by the Committee, it will be necessary either for the Committee or the Government to come to a conclusion as to the technical and scientific merits of the various systems. For this purpose, the Committee believe that the best result could be reached by the immediate appointment of a highly qualified technical committee, similar in character to the Explosives Committee."

Mr. Samuel, asked for his opinion on the draft report, said the Government would at once act on the suggestion that steps should be taken to select the sites; but as the contracting company would have to bear the whole of the risk of failure in the working of the stations, and would therefore have to be given a voice in the choice of sites, all that could be done was to secure options on suitable sites, and to defer the actual purchase until a company had secured the contract—if there was to be a contract. Suitable sites on Crown land had been selected in England. He would at once send out the Commission to Egypt, and two months ought to suffice for the selection of the sites in England and Egypt for the first two stations, which ought not to be delayed pending the choice of the more distant stations. The Admiralty were more disinclined than ever to undertake the erection of the stations, and informed him that they now considered themselves not in a position to do so at all. The Post Office staff was not qualified to undertake the work. There was a danger that a technical committee, unless limited in point of time in the making of a report, would increase the delay. It would not be proper to postpone a decision on this matter until the foundations were completed and the masts erected, as had been suggested. The experts would want to make tests, and on the point of arriving at a decision, would probably find some other system for which superiority was claimed, and therefore they should be asked to report by a fixed date, lest the investigation should be indefinitely prolonged. He suggested that Parliament would not be justified in sanctioning a contract with any company whose system had not been submitted to practical long-distance tests. The question was, therefore, what systems were in a position to undergo adequate tests within a short period. All other systems must be ruled out, whatever their theoretical merits. He did not think the technical committee would go in person to San Francisco to investigate the Poulsen system—they would send representatives, and those tests could quite well be made without a technical committee. Technical matters were not the only considerations to be taken into account. Would it be in the interests of the State to place the contract for these primarily strategic stations in the hands of a foreign company? The matter could not be disposed of by reference to a technical committee—but this fact was not pointed out in the draft report. The Government attached importance to three points—to getting the stations soon, to having stations that would work day and night, and to having complete freedom to change the system for a better one. The efficiency of the system and the price of the stations were of less importance. He foresaw the greatest difficulties in selecting for the technical committee persons who were independent both of the Government and of the various wireless systems, but who nevertheless were really experts in wireless telegraphy.

Sir G. C. Marks was then further examined, and criticised the terms of the contract, alleging that the price was extraordinarily unreasonable.

On Tuesday the Committee revised the interim report, and submitted it to the House of Commons, expressing the desire that it should be endorsed by the House, pending which the sittings were suspended. The report followed the lines of the draft, recommend-

ing that a highly qualified committee of eminent scientific experts should be appointed to report within three months on the merits of the respective systems. On Wednesday, in the House of Commons, the P.M.G. stated that the Government would immediately give effect to the Committee's recommendations.

In reply to a question in the House of Commons, the Postmaster-General stated that Messrs. Siemens Bros. & Co. did not tender for long-distance stations on the Telefunken system, but in answer to an inquiry they stated that the cost would be £23,000 for the equipment of a single simplex station in England, without duplicate plant and without automatic reception. It was not on a basis comparable with that adopted for the stations of the Imperial system.

**Mexico.**—The construction and equipment of the wireless station at Chapultepec has now been completed. The plant was supplied by the Compagnie Générale Radiotélégraphique, and is wholly of French manufacture.—*Revue Pratique de l'Electricité*.

**Norway.**—The investigations of the Select Committee appointed by the House of Commons into the English Marconi contract have placed the bargain of the Norwegian Government in a new light, and the Director-General of the Norwegian State Telegraphs announces that, in the near future, he will put before the Storting all the particulars regarding the Norwegian Marconi contract.

**Peru.**—Congress is considering the question of setting aside a credit for £17,750 for the installation of two wireless telegraph stations. One is to be situated on the north coast and the other on the south.

**The Recent Storms.**—Numerous interruptions and delays in telegraphic and telephonic communication were caused by the storms of snow and wind which raged last week end, especially in the North.

**Telephone Call Offices.**—In reply to a question, the Postmaster-General stated that the number of automatic telephone call boxes in London at the end of March, 1912, was 2,867. The cash collected from the boxes for the year ending March, 1912, was £79,032. The difference between the cash collected and the number of calls registered was slight.

**Underground Telegraph Cables.**—In reply to a deputation from cities in the North of Scotland, the Postmaster-General recently stated that he could not agree to the extension of the underground cable system to Aberdeen and Dundee, but he had in contemplation the use of phantom circuits over the trunk telephone wires, and the adoption of wireless telegraphy to prevent interruption of communication.

**United States.**—The six naval wireless telegraph stations in Alaska—at St. Paul, Dutch Harbour, Unalga, Kodiak, Cordova and Sitka—were to be opened for commercial business on Wednesday last.

**Wireless on Board ship.**—The U.S. prosecution against the captains of the *Numidian* and *Winifredian*, who were charged with violation of the law concerning the wireless equipment of vessels, has been withdrawn. The companies pleaded that they were unable to comply with the regulations, owing to the delay of the contractors in completing the orders for the equipment. The Government has, therefore, given them further time to make the installation.

## CONTRACTS OPEN and CLOSED.

### OPEN

**Atherton.**—January 29th. One E.H.T. switchboard and one H.T. switchboard for the U.D.C. See "Official Notices" December 27th

**Australia.**—VICTORIA.—February 21st. Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" January 10th.

**SYDNEY.**—March 17th. Motors for the City Corporation.

**Belgium.**—LIERRE.—February 28th. Tenders are invited for a concession to install and work an electric lighting service. Particulars, Hôtel de Ville, Liège.

**Birmingham.**—January 27th. Stores for a year for the Corporation Tramways. Mr. A. Baker, manager.

**Bispham-with-Norbreck.**—January 18th. One oil or gas engine direct coupled to a 100-kw. dynamo, for the U.D.C. See "Official Notices" January 3rd.

**Canada.**—January 24th. The Winnipeg Board of Control requires three 2,700-kw. step-down transformers. Plans, &c., Civic Light and Power Department, Winnipeg. Tenders endorsed "Tender for step-down transformers."

**February 13th.**—Machines, motors, cranes, &c., for Transcona Railway shops. Specifications, forms of tender, Mr. W. J. Press, engineer, Ottawa

**February 10th.**—One 1,500-kw. steam turbine and generator for the City of Moose Jaw, Sask. See "Official Notices" January 10th.

**Chile.**—September 10th. Tenders are invited for the establishment of a central electric station and the distribution of electrical energy at the port of Valparaiso. Inquire at the offices of the Chilean Legation, 48, Grosvenor Square, W.

**China.**—January 30th. High and low-tension underground cable, for the Shanghai Municipal Council. See "Official Notices" to-day.

**Clacton-on-Sea.**—January 29th. One 250-kw. Diesel oil engine, generator, switchboard, &c., for the U.D.C. See "Official Notices" January 10th.

**Eccles.**—The Electricity Supply Committee has invited tenders for the erection of an extension to the present boiler house at the electricity works, Cawdor Street, Patricroft.

**Edinburgh.**—January 20th. Electric light, power, telephone and bell installation at Boroughmuir New School. Plans, &c., at office of Messrs. Crawford & Cummins, consulting engineers, 41, George Street, Edinburgh.

**France.**—PARIS.—Tenders will shortly be invited by the Chemins-de-fer de l'Etat for 260 electric automobiles. Particulars from the Bureau de l'Administration, Paris.

**Glasgow.**—January 21st. Two 6,000-kw. turbo-alternators, with condensing plant and accessories, and water-tube boilers, for the Corporation. See "Official Notices" January 3rd.

**Hoylelake and West Kirby.**—January 31st. High-tension single-phase switchgear (eight panels) and one 50-K.V.A. single-phase transformer, for the U.D.C. See "Official Notices" to-day.

**India.**—January 24th. Bombay, Baroda and Central India Railway invites tenders for rotary converter plant. See "Official Notices" January 10th.

The intention of the Government of Mysore to establish an electric tramway system in Bangalore will involve the placing of orders for the necessary material. Further particulars from the Chief Electrical Engineer to the Mysore Government, Bangalore, or the Indian States and Eastern Agency, 25, Victoria Street, S.W.

**Llanelli.**—January 20th. Electric light installation at Moriah Church. Messrs. J. & B. E. Evans, architects, 47, Stepney Street, Llanelli.

**London.**—HAMMERSMITH.—The Electricity Committee is to buy new cables for drawing into ducts to be laid from Scrubbs Lane to Hythe Road (£700); and is also to invite tenders for annual contracts for electrical stores.

**CAMBERWELL.**—January 20th. The B.C. is inviting tenders for (h) maintenance of private telephones at the Town Hall and Grove Vale depot; and (s) electric lamps for a period of one or three years, at option. Specifications and forms of tender from Mr. W. Oxtoby, borough engineer, Town Hall, Camberwell, S.E.

**February 4th.**—The Metropolitan Water Board is inviting tenders for Sec. 25, electric lamps and accessories, for one year. Specifications and forms of tender from the Clerk of the Board, Savoy Court, Strand, W.C.

**L.C.C.**—January 20th. Electrical installations at Camberwell School of Arts (with fire-alarm bells and wiring for power and electrical clocks), and at Vauxhall Street Elementary School. See "Official Notices" January 10th.

**January 20th.**—Electrical installation at Cook's Ground Elementary School, Chelsea, S.W. See "Official Notices" to-day.

**Nelson.**—February 3rd. One traction battery, one automatic reversible booster and switchgear, one D.C. motor-generator and switchgear, for the Electricity and Tramways Committee. See "Official Notices" January 10th.

**New Zealand.**—Announcements of the following open contracts appear in *Tenders (Mining and Engineering Review)*:—

**February 6th.**—Wellington Electric Tramways. Supply of Weir pump, steam piping, &c.

**February 18th.**—Auckland Harbour Board. Supply of switchboards, &c., for wharf lighting and power.

**Nuneaton.**—January 21st. One water-tube boiler, with valves, fittings, &c., for the Corporation Electricity Department. See "Official Notices" January 10th.

**Panama.**—The Acting British Consul at Colon intimates that tenders will shortly be called for the towers and equipment for a transmission line across the isthmus. Owing to the unfavourable prices in the States, British manufacturers are invited to compete. Particulars, Commercial Intelligence Branch, B. of T.

**Plymouth.**—January 23rd. Stores for a year, for the Corporation Electricity and Street Lighting Departments. See "Official Notices" January 3rd.

**Servia.**—BELGRADE.—Orders will be shortly given out for the electric light and power plant, electric cranes and other equipment required for the new port projected near Prohova.

**Sheffield.**—January 23rd. General stores for the City Tramways Department. See "Official Notices" January 3rd.  
February 5th.—General stores for two years, for the City Electricity Supply Department. See "Official Notices" to-day.

**South Africa.**—February 3rd. Cables, trolley wire, fittings, poles, converters, switchgear, &c., for the Germiston municipal trackless trolley scheme. Specification, &c., can be seen at the Board of Trade Commercial Intelligence Department in London.—*Board of Trade Journal.*

**Spain.**—January 30th. The municipal authorities of Cullerhaza (province of Granada) are inviting tenders for the concession for the electric lighting of the town during a period of six years.

Tenders have lately been invited by the municipal authorities of San Pedro de Torello (province of Barcelona) for the concession for the electric lighting of the town during a period of 10 years.

**Uruguay.**—March 29th. Five electric gantry cranes for customs warehouses at Monte Video. B. of T. C.I. Department in London.

**West Ham.**—January 24th. Engine-room stores, chemicals and A.C. house-service wattmeters, for the Council's electricity department. See "Official Notices" January 10th.

## CLOSED.

**Ashton-under-Lyne.**—The Tramways Committee has accepted the following tenders:—

United Electric Car Co., Ltd.—Two double-deck cars, with top covers and trucks.  
Siemens Bros.—Two complete car equipments and spare parts.

**Australia.**—According to the *Australian Mining Standard*, the following contracts have been placed:—

MELBOURNE.—P.M.G.'s Department:—

100,000 porcelain insulators, at 2½d. each.—I.R., G.P. and T. Works.  
222,500, at 2½d. each, and 135,000, at 5½d. each.—Dalgely & Co., Ltd.

According to *Tenders (Mining and Engineering Review)*, the following orders have been given out:—

New PLYMOUTH (N.Z.).—Borough Council:—

Supply of turbo-generator set, £1,251.—Turnbull & Jones.

VICTORIA.—City of Brunswick:—

Erection of main station and three sub-stations, £373 and £198 respectively.—Thomas Coates.

12 s.p. transformers, £791.—Noyes Bros.  
Three c.c. transformers, £331.—Australian General Electric Co.  
Switchgear, £338; wires and cables, certain rates.—Noyes Bros.  
Lamps, £84.—Australian General Electric Co.  
Street fittings, £565.—Warburton, Franki, Ltd.  
200 meters, £285.—Australian Metal Co.

*Tenders* also gives the following list of accepted tenders for the Jamestown Municipality (South Australia):—

Semi-Diesel oil engine and 30-kw. Phoenix generator, £721; spares for generator, £32; booster, £291; consumers' meters, £96; street brackets, £21; erection of whole plant, £428.—Warburton, Franki, Ltd.  
Tudor storage battery, size V5, £576; aluminium wire and cable, £260.—Wm. McLean & Co.

Switchboard equipment, comprising switches, £34; fuses, £1 7s. 6d.; switchboard instruments, £46 12s. 6d.; service fuses, £12; insulators and bolts, £20 16s. 8d.; testing instruments, £39 15s.—Noyes Bros. Pty., Ltd.  
Supply of poles, £237.—H. Hyatt & Sons.

An Australian exchange states that the Woods-Gilbert Rail Co., Ltd., Melbourne, have secured a contract to treat the corrugations and worn joints throughout the Sydney electric tramway system. The work will take about 12 months.

**Bradford.**—The T.C. has accepted the tender of Ferranti, Ltd., at £305, for the supply and delivery of switchgear and accessories required in connection with the new 1,500-kw. rotary converter about to be erected at the Valley Road works.

**Brighton.**—The B. of G. has accepted the tender of Messrs. George Virgo & Sons, for the installation of an electric fire alarm with call points and bells, and of a private telephone service at the Warren Farm Schools, at £70.

**Douglas (Isle of Man).**—The T.C., on January 8th, accepted the tender of Mr. Hanson Perry for the electric light installation at the Villa Marina, at £543; and that of the General Electric Co., Ltd., for generating plant, at £1,411.

**Dover.**—The T.C. has accepted the tender of Messrs. J. Wright & Son, of Dover, for electric wiring at St. Martin's School, at £42. Mr. Pinto tendered at £43 10s.

**Glasgow.**—Messrs. John Bennie & Co. have secured the contract for supplying and erecting an electric hoist at Tradeston Gas Works, at a cost of £262.

**Keighley.**—In connection with the extensions of the Corporation electricity works, the tender has been accepted of Messrs. Willans & Robinson, Ltd., at £5,827, for a 2,000-kw. turbo-alternator, with exciter and surface condenser (the alternator to be made by Messrs. Dick, Kerr & Co., Ltd.).

**Musselburgh.**—Messrs. Vanner & Co. have received an order to equip the Musselburgh cars with Chamberlain & Hookham motors.

**Nuneaton.**—The T.C. has accepted the tender of the British Westinghouse Electric and Manufacturing Co., Ltd., for a 17-h.p. motor and accessories, at £17.

**Ramshotton.**—The U.D.C., on January 9th, decided to accept the tender of the Railless Electric Traction Co., Ltd., for the supply of four cars, and that of Messrs. Clough, Smith & Co. of London, for the overhead electrical equipment. It is proposed to run the cars from Holescombe Brook to Edenfield, a distance of about four miles, and it is hoped to have the cars running in about four months.

**Ramsgate.**—The T.C. has sealed a contract with Messrs. Vitty & Hopper, Ltd., for the supply and maintenance of fire-call bells.

**Sunderland.**—The T.C. last week approved of the following contracts on behalf of the Electricity and Lighting Committee:—

Dick, Kerr & Co., Ltd.—Alternator slip rings.  
Electrical Co.—F.H.T. fuses.  
R. O. Heslop & Son.—Block tin.  
W. G. Farrow & Co.—Box frames and covers.  
H. Tomkinson & Sons.—Cast-iron boiler fittings.  
Babcock & Wilcox.—Babcock fittings.  
British Insulated & Helsby Cables, Ltd.—House service boxes, fuse boxes.

**Wakefield.**—The tender of the Victoria Coal and Coke Co., Ltd., for the supply of coal to the electricity and destructor works for 1913, has been accepted by the Corporation.

**Walsall.**—The tenders of Callender's Co., Ltd., and the British Thomson-Houston Co., Ltd., have been accepted by the T.C. for providing and laying high-tension mains required in connection with the extension to the Caldmore district, and for sub-station switchgear, respectively.

**West Bromwich.**—The T.C. has accepted the tender of the Electric Construction Co., Ltd., for a dynamo, and that of the National Gas Engine Co., Ltd., for a gas engine.

**Wolverhampton.**—The Electricity Committee of the Corporation has purchased three coal-measuring drums from Messrs. Babcock & Wilcox, Ltd., at a cost of £105.

**Worcester.**—The City Council has accepted the following tenders:—

British Thomson-Houston Co., Ltd.—One 1,500-kw. steam turbo-alternator, exciter and Worthington condenser for two-phase supply, £5,261; regulator and water recorder, £172, for the Hylton Road station.  
British Insulated and Helsby Cables, Ltd.—Three years' supply of paper cables, at same prices as hitherto.

## FORTHCOMING EVENTS.

**Institution of Mechanical Engineers.** Friday, January 17th. At 8 p.m. Paper on "Indicators," by Mr. J. G. Stewart.

**Association of Mining Electrical Engineers (West of Scotland Branch).**—Saturday, January 18th. Meeting at 4.30 p.m. At the Royal Technical College, Glasgow.

**Salford Technical and Engineering Association.**—Saturday, January 18th. At 7 p.m. At the Royal Technical Institute, Salford. Presidential address by Mr. J. Morris. Musical social evening.

**Institution of Electrical Engineers (Newcastle Section).**—Monday, January 20th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Electric Resistance Welding," by Mr. P. Bucher.

Tuesday, January 21st. At 7.30 p.m. At the Lit. and Phil., Middlesbrough. The above paper will be read.

**(Manchester Students' Section).**—Tuesday, January 21st. At 7.30 p.m. At the Municipal School of Technology, Manchester. Paper on "Street Photometry," by Mr. S. E. W. Taylor.

**(London).**—Thursday, January 23rd. At 8 p.m. Paper on "The Use of a Large Lighting Battery in Connection with Central Station Supply," by Mr. F. H. Whysall.

**Royal Society of Arts.**—Monday, January 20th. At 8 p.m. Cantor lectures on "Liquid Fuel," by Prof. V. B. Lewes. (Lecture I.)

**Institution of Civil Engineers.**—Tuesday, January 21st. At 8 p.m. At the Institution of Mechanical Engineers. Paper on "The London and South-Western and Metropolitan District Railways' Widening between Acton Lane and Galena Road," by Mr. E. A. Ogilvie.

**British Electrical and Allied Manufacturers' Association.** Friday, January 21st. At 7 for 7.30 p.m. At the Savoy Hotel. Dinner.

**Royal Institution.**—Friday, January 21st. At 9 p.m. Discourse on "Recent Advances in Scientific Steel Metallurgy," by Prof. J. O. Arnold.

**Physical Society.**—Friday, January 21st. At 5 p.m. At the Imperial College of Science, South Kensington. Papers on "The Electrical Conductivity and Fluidity of Strong Solutions," by Mr. W. S. Tucker; "The Resistance of Electrolytes," by Messrs. S. W. J. Smith and H. Moss; and "The Recalescence of Iron Carbide," by Messrs. S. W. J. Smith and J. Guild.

**Junior Institution of Engineers.**—Saturday, January 25th. At 11 a.m. Visit to the Houses of Parliament for inspection of heating, ventilation, &c.

**Will.**—It is stated in the *Times* that the late Mr. Edward Tyrer, inventor of electric appliances for railway signalling, whose death was recently announced, left estate valued at £20,400 gross, with net personality £15,759.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, January 20th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.  
Tuesday, January 21st.—"B" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.  
Thursday, January 23rd.—"C" Company. Company training, 7 to 10 p.m.  
Friday, January 24th.—"D" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.  
Saturday, January 25th.—"A" Company. Week-end run at Fort Coalhouse. Dress:—Service dress, putties and gaiters. No arms or equipment will be taken. Parade at Fenchurch Street Station, Midland, London and Tilbury section, at 5 p.m., for Low Street Station.  
Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj.,  
For Officer commanding L.E.E.

### NOTES.

#### Melbourne Railway Electrification Contracts.—

We understand that contracts have been placed with the following firms in connection with the Melbourne Railways electrification:—  
Boilers and buildings: Babcock & Wilcox, Ltd.  
Turbo-alternators: C. A. Parsons & Co.  
Electrical equipment of rolling stock: British Thomson-Houston Co., Ltd.  
Sub-station machinery: Siemens Bros.

**Appointments Vacant.**—Assistant electrical and mechanical engineer, for an English electricity supply undertaking in China; charge engineer, for the City Electricity Department, York (£91); junior assistant engineers, for the Newcastle-upon-Tyne Electric Supply Co., Ltd. (10s.). See our advertisement pages in this issue.

**Educational Notes.**—CITY AND GUILDS TECHNICAL COLLEGE, FINSBURY, E.C.—A course of six advanced lectures on "Induction Motors" will be given by Mr. J. K. Catterson-Smith, on Mondays, commencing on January 27th. See our advertisement pages in this issue.

**Blackburn Extensions.**—On Friday next, January 21th, the new generating plant at the Corporation electricity works, Jubilee Street, will be started up by the Mayor.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS (NEWCASTLE LOCAL SECTION).—The preliminary programme of this Section shows the following as the subjects for the next few months:—

February 10th.—"The Need for an Authority to test and certify Electrical Apparatus and Materials," by C. Turnbull.  
March 10th.—"Electrical Equipment of a foreign-built Battleship," by G. G. Mallinson.  
March 21st.—"Telephonic Development," by J. R. Andrews.  
April 21st.—"Notes on Gas Engines," by A. P. Pyne.

On Monday, 27th inst., the Students' Section will meet in the Armstrong College to hear a paper by Mr. S. I. Ellis, on "The Application of Electricity to the Lighting of Residences, Business Premises and Factories."

**SALFORD TECHNICAL AND ENGINEERING ASSOCIATION.**—We have received a copy of the 1913 syllabus of this Association, whose meetings are held monthly at the Royal Technical Institute, Peel Park, at 7 p.m. To-morrow night Mr. John Morris will deliver his presidential address, and later arrangements include "Wireless Telegraphy," by Mr. J. McKeever, on March 1st; "Modern Gas Engines," by Mr. K. Cox, on April 5th; and a visit to the works of Messrs. E. Green & Son, Ltd., at Wakefield, on May 3rd. Whitsun week will be spent in touring Wales, and visits to works have been arranged for the summer months. Mr. A. H. L. Lucas, 9, Ellastone Road, Pendleton, is hon. secretary to the Association.

**JUNIOR INSTITUTION OF ENGINEERS.**—At a recent meeting, Capt. H. Riall Sankey gave the hon. member's lecture, taking for his subject the "Hot-Panel and Hot-Floor-Board System of Heating," in which the dominant feature is the use of radiant heat rather than the heating of the air.

**THE CONCRETE INSTITUTE.**—The total membership of the Institute is now 955. When the membership reaches 1,000, an entrance fee, which at present is not required, will be imposed.

**INSTITUTION OF ELECTRICAL ENGINEERS (MANCHESTER SECTION).**—A meeting of the Section was held on Tuesday, when a paper was read by Mr. F. C. Aldous on "Starting and Speed Control of Induction Motors." A discussion followed, and was replied to by the author.

**INSTITUTION OF ELECTRICAL ENGINEERS (YORKSHIRE SECTION).**—A lecture was given by Mr. W. A. Dexter on "Comparative Notes on Independent Steam Condensing Plants" on Wednesday last, and was followed by a discussion.

**INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS (LONDON CENTRE).**—On January 13th a paper was read on "The Electrophone Service," by Mr. J. H. Patman, A.M.I.E.E.

**The British Government and British firms.**—A correspondent in Shanghai writes protesting vigorously against the treatment accorded to British firms by the Office of Works in connection with the heating and electric lighting of the Peking Legation. In the first instance, it was stated that only British firms were to be allowed to tender for the work; but on the outbreak of the recent disturbances in China all those who had made offers were informed that the work could not be proceeded with. Shortly afterwards our correspondent returned to London, and called at the Office of Works, when the chief engineer definitely stated that fresh tenders were to be called for later on. The end of the matter was that no fresh tenders were invited, and the work was given to a German firm trading under an English name in Shanghai. Our correspondent ironically states that this will give us an idea how the British Government assists its nationals and upholds British prestige in China.

**East London Railway Electrification.**—Messrs. Johnson & Phillips inform us that they are carrying out certain cable work in connection with the above line. These cables are being laid between the existing Whitechapel sub-station on the District Railway and a new sub-station at Deptford; they are made for 11,000 volts working pressure, three-phase, and are paper-insulated, lead-covered and double-wire armoured. The wire armouring is

specially protected against corrosion by being passed through a bath of compound, and then covered with a substantial compound impregnated tape. Two cables are being laid on hangers, one on each side of the tunnel, and this work is being carried out at night, as illustrated herewith, so as not to interfere with the normal working of the trains. The cables are to be tested at 20,000 volts when laid and jointed.

**English-made Motor Spirit.**—The current issue of *The Motor* points out that while an excellent Diesel-type engine fuel and a high-grade motor spirit are now being made as commercial propositions in this country, the all-important question is whether a process can be found which will enable the production of internal-combustion engine fuel to be carried on successfully on a really large scale in this country, so rendering us independent of imported fuel. Through the instrumentality of *The Motor*, the three great motor organisations have co-operated to constitute a Committee of Inquiry into the possibilities of benzol production for motor spirit in this country. There will be three delegates from each of the organisations, and £1,000 is provided to pay a secretary and start the work of collating data. The work is to be undertaken without delay.

**Business Announcements.**—Since our "Business Notice" pages went to press, we have received the following:—The Phoenix Electric Heating Co., 17, Morwell Street, Tottenham Court Road, W.C., have acquired the goodwill, stock and plant of Messrs. Plumstead & Co., brass finishers and electrical fittings manufacturers, together with the services of Mr. F. Plumstead, whose experience extends over a period of more than 30 years. Telephone number "Gerrard 8939."

The Stearn Electric Lamp Co., Ltd., 47, Victoria Street, London, S.W., have issued some new illustrated price lists of their Leconium metal-filament lamps. These lamps are now made and sold under licence from the Osram Lamp Works, Ltd., the Stearn Co. having joined the ring.

The Electric and Ordnance Accessories Co., Ltd., of Aston Birmingham, advise us that their agency agreement with Messrs. Baxter & Canter, Ltd., of 219, Tottenham Court Road, W.C., terminated on December 31st, 1912, and that as from January 1st, 1913, all business in the company's electrical manufactures in the London district will be handled at the London Office Electrical Department, at Vickers House, Broadway, Westminster, S.W., to which address all inquiries and other communications should be addressed. Mr. C. S. Thomson, M.Sc., M.I.E.E., is in charge of the Electrical Department at Vickers House, and has a staff of qualified engineers under him. His telephone number is 10110 Gerrard (10 lines).

**Fatalities.**—WEDNESBURY.—On Monday, Mr. G. C. Lewis, coroner, held an inquiry at the Town Hall, Wednesbury, on the body of Thomas James Brownell (38), 53, Upper Darlington Street, King's Hill, Wednesbury, who it is supposed was electrically killed on the previous Thursday at the Old Park Works of the Patent Shaft and Axle Tree Co., Ltd., Wednesbury. Harry Bates, a driller, employed at the Old Park Works, stated that deceased's occupation was that of a general oiler of the machinery. Between 6.30 and 7 p.m. on the 9th inst., deceased was oiling witness's machine, which he left for a minute, and upon hearing Brownell groan, he turned and saw him hanging on a switch with his left hand. Witness went for assistance, and when he came back he found a man named Hawkes there, who had attended to deceased. Questioned by the Factory Inspector (Mr. H. T. Thomas), witness said that the plug was covered up to a fortnight ago, and he reported the fact that the cover was missing to the night charge hand. In reply to Mr. Hosgood, solicitor, who represented the company, witness said he was told by the charge hand to tell the electrician that the cover of the plug was missing, but he failed to find him, and the matter went clean out of his mind the next day. He admitted that he should have reported it. William Charles Hawkes, night charge-man of the drilling machines, stated that he heard a commotion, and thought there had been an accident, so he immediately switched off the motive power. He saw deceased lying on his back in a belt, and as he was still breathing, witness slapped his face to try and bring him round, but without success. He was told by Bates that the cover was missing from the plug, and he thought the electrician would attend to it. He did not learn until later that Bates had failed to find the electrician. Dr. Garman said that when he was called at 7.30 p.m. the man was dead, although artificial respiration had been tried for fully an hour. He found that the man died from shock, and the absence of any marks on the hand might be accounted for by the thickness of the skin and the rapidity of death.

Wm. Boffey, Brunswick Park Road, Wednesbury, the electrical engineer, was questioned by the Factory Inspector, and said he and his assistants went round the works and examined the protection of the wires about every week. They did not have periodical examinations of small things to see if the safeguards were in working order. He admitted that the cover of this particular switch had not been maintained as required by the regulations. Answering Mr. Hosgood, witness said it was the rule for the men on the machines to report such things, and notices were posted in the works to this effect.

Replying to Mr. F. A. Platt, solicitor, who represented the widow, witness said that an inspection of all the switches had since been made.

The Coroner: You rely on broken reeds apparently. This switch has been broken a fortnight and not attended to. If the system is not efficient, it is for you to find some system that is more efficient.

A notice similar to those posted in the works was produced, and stated that if any workman experienced a shock, however slight, he should at once report the fact to his foreman or the timekeeper. Witness said that it was the duty of an employé to inform the charge hand if there was anything wrong, and he in turn should report the matter to his (witness's) department. The Coroner said that this fact was only implied in the notice; he thought it would be as well if an amended notice were put up, so as to make it more clear. The jury returned a verdict of "Accidental Death." Mr. Hosgood expressed the sympathy of the company with the widow, and promised that the Coroner's suggestion should be attended to.

**Mexican Lamp Factory.**—Mexico will shortly possess a glow lamp factory, a concession having been applied for by a Mr. Ignacio Galvan, who anticipates being able to sell his products at 50 per cent. below the price of the imported articles.—*La Revue Pratique de l'Electricité.*

**Annual Taxes on Electric Motor Vehicles.**—Hitherto electric motor vehicles, for the purpose of the annual licences of motor-cars, have been regarded as being of from 12 to 15 H.P., the annual tax being £4 4s. Under the revised rules, which came into force on the 1st inst., a concession has been made to electric vehicles, which are now regarded as being of from 6½ to 12 H.P., the annual tax being thus reduced to £3 3s.

**The B.E.A.M.A. Dinner.**—The dinner of the British Electrical and Allied Manufacturers' Association (Inc.) will take place at the Savoy Hotel, W.C. (new Banqueting Hall), on Friday next week, January 21st, at 7 o'clock for 7.30.

**Electrical Trades Union.**—On Tuesday next, January 21st, at 9 p.m., a lecture will be delivered at the North-West branch of the Electrical Trades Union, Princess of Wales Hotel, corner of Belsize Road and Abbey Road, Hampstead, on "Transformation of Alternating Current to Direct Current." There will be questions and discussion—time permitting. We are asked to say that all electrical workers are invited.

**Another New Battery?**—A local correspondent states that the Halifax Market is shortly to be supplied with a new electric storage battery by Messrs. Worsnop & Co. of Halifax. The battery is known as the "Alkum." Messrs. Worsnop have already received orders for the supply of the battery to various English and Continental railways, and a European power has given an order for one to be supplied for a submarine. The British Government are now engaged in experiments with the new battery.

**Inquiries.**—The makers of an electrical machine for manufacturing ice cream (not a refrigerating apparatus) are asked for.

**Shocks for Snakes.**—The following communication was recently received by one of our readers in Australia:—"I have had some very narrow squeaks with snakes lately, and to avoid being bitten I should like to have some device that would let me have a bit of safety, the place where I live on the Western Line being infested with various kinds of snakes."

"If you have a small battery, with a wire about 7 ft. long, so that I could fix the wire on to a long thin pointed stick or bamboo and place same on the snake, then turn the current on and so electrocute, or at least make him insensible, I think that that would be the best way to fix him up; a shot gun being too heavy to carry with you, as you are not always going shooting, and you have to be a good shot with a revolver to hit him, while at the same time it is too dangerous, as he might spring on to you before the smoke cleared away; and you cannot always get a good stick to finish him if you have neither of these articles."

"If you have the battery, and think it would be strong enough while at the same time fitting into a big pocket, I would take it as a favour if you would send me a catalogue with the price at your earliest convenience. The battery would not have to be too dangerous, as the children would have to use it if it was a success."

This interesting letter throws a new light on the conditions of living in some parts of the Commonwealth. The remedy for snakes seems to savour somewhat of the salt-on-the-bird's-tail idea, and one wonders what the snake would be doing while one was trying to tickle him with the electric wire; the completion of the lethal circuit also presents difficulties. But if these details can be arranged, it is possible that quite a small induction coil and battery would kill a snake, for the lower animals are very sensitive to electric shocks. Personally, we should prefer to do the shocking by deputy.

**Electrically Operated Motor-Tire Inflators.**—The Ingersoll Rand Co., Ltd., of 165, Queen Victoria Street, London, E.C., have lately brought out an electrically operated motor-tire inflator for garage or private motor-house use. The arrangement is made in two models, and has been designed with the object of enabling tires to be pumped up quickly and with a minimum of trouble. The outfit comprises a small electric motor coupled to an air compressor and mounted on a small hand truck, complete with connections, pressure gauge, switch, &c. The motor is designed to work off either direct or alternating-current circuits, at 110 or 220 volts, the connection being made to the lighting installation by a wall plug. In the larger model, instead of the motor driving the compressor direct, a short belt drive is introduced.

**Electricity and Cotton Growing.**—At a representative meeting of members of the Textile Managers' Association held in Manchester on Saturday, Mr. W. Bleakley, dealing with the question of bad spinning, contended that there ought to be no bad cotton grown or delivered. The application of electricity to the soil should be extended, and the quality of the cotton would be improved.

**University College.—Students' Dinner.**—The 18th annual dinner of Past and Present Students of the Engineering Department, University College, London, will take place on February 7th next at the Imperial Restaurant, Regent Street. Sir Alexander B. W. Kennedy, LL.D., F.R.S., Emeritus Professor of Engineering, U.C.L., has kindly consented to take the chair. Old students who have not yet received advice of this are requested to communicate with Mr. R. A. Bell, Past Students' Secretary, 166, Worpole Road, Wimbledon, or with the Secretary, Engineering Society, U.C.L., Gower Street. An attempt is being made to compile a complete register of Past Engineering Students, and the secretary will be pleased to receive any information as to the whereabouts of any U.C.L. Engineering Students.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—On Saturday, January 4th, two pleasing and informal gatherings took place in honour of Mr. F. J. DELVES, who has for the past three years held the position of constructional superintendent in the Sales Department of the West Ham Corporation electric undertaking, which he has just resigned on being appointed electrical engineer to the United Malaysian Rubber Co., Ltd., Singapore. Previously to looking after the constructional work at West Ham, he was one of the assistant engineers at the generating station, Canning Town. The first of the gatherings was held at the headquarters of the Department, 84, Romford Road, Stratford, where, in the presence of large numbers of the staff employed in various departments, Mr. J. W. Beauchamp, engineer and manager, wished good luck and God-speed to Mr. Delves, and presented him on behalf of the staff with a pair of binocular field glasses, wherewith, among other purposes, he might locate the position of any distant tiger that might be moving in his direction whilst he was out supervising the laying of mains or similar work in his tropical area. The second gathering took place in the evening, when Mr. Delves was well feasted and feted by a number of his late colleagues at the Connaught Rooms, Great Queen Street, W.C., under the presidency of Mr. F. Farnon, sales manager of the West Ham Electricity Department, who proposed the health of their guest; Mr. Delves responded in brief

but feeling tones to this toast, thanking Mr. Farndon and the late engineer and manager, Mr. H. H. Couzens, for the very great assistance they had always given him in his work. Mr. Couzens proposed the toast of "The Prosperity of the West Ham Corporation Electric Supply undertaking," and said he felt sure that, although they had done big things already, there were still greater things to be achieved by them in the near future, and he emphasised the necessity, which every man placed in the enviable or unenviable position of chief engineer of an electricity undertaking felt, of having an absolutely loyal staff around him, such as he had had whilst at West Ham. Mr. Delves, sen., engineer-in-charge at the West Ham Corporation's pumping station, and father of the guest of the evening, then proposed the health of Mr. Farndon, the chairman. A short concert of an impromptu character followed. Mr. W. F. Edgerton carried out the duties of hon. sec.

The Islington Electricity Department staff held their annual dinner last Saturday evening at the Cock Hotel, Highbury, Mr. A. P. MacAlister, chief assistant electrical engineer, presiding, in the absence, through indisposition, of Mr. A. Gay. Mr. T. A. G. Margary, superintendent of the distribution department, occupied the vice-chair. Some 60 members of different departments sat down, and after dinner had been served, a very acceptable programme of music and song was rendered, members of the staff contributing. The vice-chairman, during the interval, proposed "Success to the Department," and in doing so referred with regret to the absence of Mr. Gay, and to the absence through death of two of their members, Mr. Cummings and Mr. Barley. He also mentioned that the Islington Electricity Department weathered the colliers' strike without once being short of coal, and referred to the fire which occurred at the station last September, adding that if water had not been splashed about, running would have been resumed in a few minutes instead of in an hour or two.

Mr. W. JONES has resigned, owing to ill-health, the position of superintendent of the Bradford Corporation electricity works. Mr. JAMES FAIRBAIRN deputy works superintendent, has been appointed to succeed him, whilst Mr. C. R. BROWN, generating engineer, takes the position vacated by Mr. Fairbairn.

Mr. LLOYD LEWIS, of Newport, has been appointed a charge engineer at the Cheltenham Electricity Works in place of Mr. SPENCER, who has received a position at Devonport.

Mr. F. HURST has resigned his position as shift engineer with the Mersey Power Co., to take up the post of engineer-in-charge at the Stoke-on-Trent Electricity Works.

Mr. T. C. PARSONS, M.I.E.E., who has had 22 years' central station experience, and for the last 9½ years was burch electrical engineer of Govan, retired from that office in November, 1912, as, owing to the annexation of Govan by Glasgow, his post was abolished. For the last completed year of working the works costs were £74d., and the total costs £68d. per unit. He has had experience with D.C. and A.C., one and three-phase tramways, and a considerable amount of power work, and is at present open to accept an engagement.

The Port Elizabeth Council has granted Mr. H. J. HOLDER, its electrical engineer, leave of absence for four months from March 1st, in order that he may visit England, Germany, and perhaps the U.S., to enable him to inquire at first hand into the economy, behaviour, cost of maintenance, &c., of plant such as will be found the most suitable to recommend for the town.

Mr. K. K. BENSON, who has been mains superintendent in the Swansea Corporation Electricity Department for about 9½ years, has resigned his position for the purpose of starting as an electrical engineer on his own account, and at the last meeting of the Electric Lighting and Tramways Committee, Col. A. Sinclair, the chairman, said they could only accept the resignation with regret. Mr. Benson had held a very responsible position, and he had given the Committee and Mr. Prussmann, the borough electrical engineer, complete satisfaction. They could not speak too highly of him. It was resolved to put on record the Committee's great appreciation of the excellent services rendered by Mr. Benson, their regret at losing him, and their wishes for success and prosperity in his new undertaking. A slight rearrangement of the staff was also agreed to, and it was further decided to advertise for a new mains superintendent.

Mr. J. P. BOWEN, of the Llandrindod Wells Electric Light and Power Co., Ltd., has resigned his position of resident engineer, and Mr. T. WILLIAMS, who has been Mr. Bowen's chief assistant for several years, is the present engineer.

Mr. J. W. MCINNES, manager of the light railways at Colwyn Bay, has resigned, and will be succeeded by Mr. A. G. BALFOUR.

The salary of Mr. V. J. ALLAN, engineer-in-charge, Corporation electricity works, Southampton, has been increased by £13 per annum.

**General.**—We understand that Mr. R. BORLASE MATTHEWS, WhEx., M.I.E.E., Assoc. M.Inst.C.E., has resigned his position with the General Electric Co., Ltd., to accept a directorship with his father's old-established firm of Letricheux & David, Ltd., Swansea and Cardiff, together with a seat on the boards of several allied shipping companies.

Mr. A. J. ROBINSON, of the outside contract department of Messrs. Christy Bros. & Co., Ltd., of Chelmsford, who was recently married, has been presented by his colleagues with a case of cutlery.

According to the *Australian Mining Standard*, Mr. J. T. FAHY, chief electrician of the New Zealand railways, recently arrived in Sydney on a tour of inspection of the railway systems of the Commonwealth.

**Obituary.**—MR. R. T. PRESTON.—The death has occurred, at his residence, Hayes Court, Kent, of Mr. Reuben Thomas Preston, senior director of the firm of J. Stone & Co., Ltd.,

electrical and general engineers, of Deptford, S.E. The deceased gentleman, who had been ill for over 18 months, was 66 years of age, and had been associated with the firm for upwards of 40 years.

MR. JAMES PATTERSON, secretary of the Newcastle and District Electric Lighting Co., died at his residence at Newcastle-on-Tyne on the 12th inst. The deceased gentleman, who was 52 years of age, was a native of the city, and commenced his business career in the offices of Messrs. J. P. Scott, colliery owners at Newcastle. Subsequently he went to Messrs. Clarke, Chapman & Gurney, electrical engineers, Gateshead, where he held a responsible position in the commercial department for about six years. When the Newcastle and District Electric Lighting Co. was formed in 1889, he was appointed secretary.

## NEW COMPANIES REGISTERED.

**Credenda Conduits Co., Ltd. (126,340).**—Registered January 6th, by Waterlow Bros. & Layton, Ltd., Birchin Lane, E.C. Capital, £50,000 in £1 shares. Objects: To take over the business of manufacturers of and dealers in conduit tubes and fittings and other electric lighting and power apparatus carried on in Birmingham, as a branch of the business of Tubes, Ltd., as the "Credenda Conduits Co., Ltd." Tubes, Ltd., guarantee 8 per cent. profit on the paid-up capital (not exceeding £50,000) until April, 1916, and so long as they discharge this obligation they may have two of their directors or managers on the board. The signatories are:—J. Chamberlain, Beechcroft, Edgbaston, director, Tubes, Ltd., 1 share; J. H. Aston, Drayton House, Erdington, director, Tubes, Ltd., 1 share; E. A. Edwards, Penns Lane, Erdington, manager, Credenda Conduits Co., 100 shares; J. W. Barratt, Central House, 75, New Street, Birmingham, chartered accountant, 1 share; C. E. Cope, 2, Florence Road, Chester Road, Erdington, secretary, Tubes, Ltd., 1 share; O. H. Bankers, 8, Cregoe Street, Birmingham, clerk, 1 share; A. E. Kirk, 29, Redditch Road, King's Norton, Birmingham, manager, 1 share. Minimum cash subscription 7 shares: the first directors (to number not less than two or more than five) are J. Chamberlain, J. H. Aston and E. A. Edwards (managing director); the two first named are nominees of Tubes, Ltd.: the qualification, 500 shares, provided (a) that so long as Tubes, Ltd., hold 10,000 shares, any director or manager of that company may, until the ordinary general meeting in 1916, be appointed as a director of this company without qualification, and (b) that the qualification of a managing director shall be 100 shares only.

**H. L. Morton & Partner, Ltd. (126,437).**—This company was registered on January 10th, with a capital of £1,000 in £1 shares, to take over the business of repoussé art metal, electric and other sign designers and workers, art craftsmen, colour schemists, poster and showcard designers, &c., carried on at the Empire Sign Works, 23, Union Street, Sheffield. The subscribers (with one share each) are:—H. L. Morton, 18, Clarke Street, Sheffield, manager; J. B. Taylor, 19, Gainsborough Road, Sheffield, manager; H. Ramsden, 18, Clarke Street, Sheffield, manager; J. H. Freeborough, 25, Figure Lane, Sheffield, incorporated accountant. Private company. The number of directors is not to be less than two or more than five; the first are to be appointed by the company or by subscribers; qualification, £20; remuneration as fixed by the company. Registered by Alfred H. Atkins, Ltd., 27-8, Fetter Lane, E.C.

**Compania Constructora del Pacifico, Ltd. (126,415).**—This company was registered on January 9th, with a capital of £25,000 in £1 shares, to carry on the business of a construction company in British Columbia, in relation to railways, tramways, docks, harbours, piers, wharves, canals, irrigation, sewage, water gas, electric light, telegraphs, telephones and other works or conveniences of public utility or otherwise. The subscribers (with one share each) are:—J. Davis, 123, Pall Mall, S.W., contractor; G. Lorette, 1-2, Great Winchester Street, E.C., company director; L. Chabot, 6, bis de Chateaudun, Paris, financial agent; W. Warren, 4, Lloyd's Avenue, E.C., consulting, mining and metallurgical engineer; R. E. Moore, 5, St. Margaret's Road, Tottenham, clerk; A. Bal, 28, St. Dunstan's House, Stepney, E., clerk; H. E. King, 13, St. John's Road, Richmond, S.W., gentleman. Minimum cash subscription, seven shares. The number of directors is not to be less than three or more than 10; the first are G. Lorette, L. Chabot and W. Warren; qualification, one share; remuneration of chairman, £100 per annum; of others, £50 each per annum. Registered office, 6, Lechbury, E.C.

**B. & C. Foil Syndicate, Ltd. (126,383).**—This company was registered on January 8th, with a capital of £100 in 1s. shares, to acquire (1) a segment of the benefit of certain secret processes for the United Kingdom and the British Dominions (except Canada); (2) sub-licence under Patent No. 2,146, of 1906, for the manufacture of aluminium foil or sheet; and (3) sub-licence to use rolling mills in accordance with the British Patent No. 18,821, of 1909, for the purpose of rolling aluminium foil or sheet. The subscribers (with one share each) are:—R. Petherbridge, Crooms Hill House, S.E., secretary of a public company; J. M. Banks, 75, Edith Road, West Kensington, W., secretary. Private company. The number of directors is not to be less than two or more than ten; the subscribers are to appoint the first. Registered by Warren & Warren, 4, Broad Street Place, E.C.

**J. W. Smith, Ltd. (126,438).**—This company was registered on January 10th, with a capital of £1,000 in £1 shares, to carry on the business of electricians, motive power and light, &c. The subscribers (with one share each) are:—W. Langley, 7, St. Ann's Hill Road, Nottingham, retired civil servant; J. S. Smith, 534, Mansfield Road, Sherwood, Nottingham, tobacconist. Private company. The number of directors is not to be less than three; the first are W. Langley and J. S. Smith (both permanent, subject to holding £50 shares each). Solicitors, Beck & Beck, 2, King's Walk, Nottingham. Registered by Waterlow Bros. & Layton, Ltd., Birchin Lane, E.C.

**Oswald Stott, Ltd. (126,348).**—This company was registered on January 6th with a capital of £2,000 in £1 shares (1,000 preference), to carry on the business of designers, manufacturers and vendors of fans and ventilating appliances, electrical and general engineers, &c. The subscribers are: O. Stott, 79, Grantham Road, Sparkbrook, Birmingham, engineer, one ordinary share; E. R. Jones, Hanbury House, Stourbridge, engineer, one ordinary share. Private company. The first directors are O. Stott and E. R. Jones, each of whom may retain office while holding one share; qualification of other directors £50; remuneration as fixed by the company. Registered by Waterlow Bros. & Layton, Ltd., Birchin Lane, E.C. Solicitors, Harwards and Evans, Stourbridge.

**C. Goodman & Co., Ltd. (126,387).**—This company was registered on January 8th with a capital of £24,000 in £1 shares, to carry on the business of foundrymen, mechanical and electrical engineers, manufacturers of machinery, tool makers, metal workers, &c., and to adopt an agreement with C. W. Bailey and A. Weir. The subscribers (with one share each) are:—C. W. Bailey, 20, Royal Road, Custom House, E., electrical engineer; A. Weir, 110, Wansted Park Avenue, Manor Park, E., engineer. Private company. The number of directors is not to be less than two or more than five; the first are C. W. Bailey and A. Weir & A. Stewart. Registered by A. W. Osmond, 6, South Square, Gray's Inn, W.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Asuncion Tramway, Light and Power Co., Ltd.** (126,196).—Articulate of £300,000 first mortgage debenture stock, created January 3rd, 1913, and secured by trust deed of even date, filed pursuant to Sec. 93 (b) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including unallocated capital and immovable property (tramways system, and buildings). Trustees: Union of London and Smith's Bank, Ltd.

**British Columbia Electric Railway Co., Ltd.** (51,953).—Issue on December 31st, 1912, of £750,000 4 per cent. perpetual consolidated debenture stock, part of a series of which particulars have already been filed.

**James Keith & Blackman Co., Ltd.**—Issue on January 6th, 1913, of £1,700 debentures, part of a series of which particulars have already been filed.

**Hunt & Moscrop, Ltd.**—Particulars of £4,000 debentures, dated December 30th, 1912, filed pursuant to Sec. 93 (b) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £800. Property charged: The company's undertaking and property, present and future, including unallocated capital. No trustees.

**X.I. Electric Co., Ltd.**—Debenture dated January 6th, 1913, secured £1,000, charged on the company's undertaking and present property, including unallocated capital (subject to prior charges). Holder: Capt. C. Wigner, well Castle, Ewell, Surrey.

**Brecknell, Munro & Rogers, Ltd.**—Third mortgage debenture, dated December 5th, 1912, to secure £500, charged on the general assets. Holders: Mrs. F. Rogers, A. E. Rogers and Dr. K. Rogers.

**South Staffordshire Tramways (Lessee) Co., Ltd.**—Particulars of £100,000 debentures, created by resolutions, August 3rd, 1904, and December 11th, 1912, and secured by trust deeds dated November 1st, 1904, and December 11th, 1912, filed pursuant to Sec. 93 (b) of the Companies (Consolidation) Act, 1908; the amount of the present issue being £145,300. Property charged: Company's leasehold interest in the South Staffordshire tramways; certain rights, powers and privileges with respect to the working of the said tramways; interest in an indenture dated April 25th, 1900; certain land, buildings, fixed plant and machinery at Wednesbury, Walsall and Dudley; preference shares and ordinary stock in South Staffordshire Tramways Co., and company's undertaking and general assets, present and future. Trustees: Law Guarantee Trust and Accident Society, Ltd. (in liquidation), 7, Chancery Lane, W.C.

**Venezuela Telephone and Electrical Appliances Co., Ltd.** (11,305).—Capital, £85,000 in 70,000 ord. shares of £1 each and 1,500 pref. shares of £10 each. Return dated December 6th, 1912; 70,000 ord. and 860 pref. shares taken up; £1 per share called up on 19,494 ord. and £10 per share on 860 pref.; £22,094 paid; £56,506 considered as paid on 56,506 ord. Mortgages and charges: £120,000.

**United Electric Car Co., Ltd.** (57,082).—Capital, £300,000 in 50,000 ord. and 160,000 6 per cent. pref. shares of £1 each. Return dated October 2nd, 1912 (filed December 18th); 150,000 ord. and 100,000 pref. shares taken up; £250,000 paid. Mortgages and charges: £15,657.

**Bullers, Ltd.** (62,020).—Capital £40,000 in 20,000 ord. and 1,000 pref. shares of £10 each. Return dated December 25th, 1912; 16,000 ord. and 15,000 ord. shares taken up; £10 per share called up on ord. and 5,000 pref.; £150,070 paid; £149,930 considered as paid on 14,993 ord. Mortgages and charges: Nil.

**Carlton Engineering Co., Ltd.** (111,787).—Capital £6,000 in 12 shares. Return dated December 9th, 1912; 5,153 shares taken up; £2,153 paid; £3,000 considered as paid. Mortgages and charges: Nil.

## CITY NOTES.

**Direct United States Cable Co., Ltd.**—An interim dividend of 2s. per share, less income-tax, being at the rate of 4 per cent. per annum for the quarter ending December 31st, 1912, is payable on and after 31st inst.

**Stock Exchange Notice.**—Application has been made to the Committee to appoint a special settling day in—

**Casra Tramway, Light and Power Co., Ltd.**—85,007 ordinary shares of £1 each fully paid, Nos. 200,001 to 285,007; and scrip fully paid for £125,000 5 per cent. first debenture stock.

**Central London Railway Co.**—It is officially announced that the holders of over 75 per cent. in the aggregate of the ordinary, preferred ordinary, and deferred ordinary stock of the Central London Railway Co. have agreed to transfer their holdings pursuant to the proposals recently made by the Underground Electric Railways Co. of London, and the scheme has therefore become operative.—*The Times*.

**"Harper" Electric Piano Co., Ltd.**—The directors have declared an interim dividend at the rate of 4 per cent. per annum on the participating ordinary shares for the half-year ended December 1st.

**Suffolk Electricity Supply Co.**—At a meeting of shareholders held at Ipswich last Friday, a resolution was passed granting to Dr. C. H. Liebbrand an option to purchase the undertaking on certain terms.

**Kaministiquia Power Co.**—The directors have declared a dividend at the rate of 5 per cent. per annum for the quarter ending January 31st.

## Willans & Robinson, Ltd.

WE are informed that the ordinary general meeting of this company was held at Cannon Street Hotel, E.C., on 9th inst. We understand that the meeting was treated as a private one, but the report and accounts for the year ending June last were adopted. The directors report indicated that towards the close of 1911 necessity arose for exercising the borrowing powers given in 1910, to meet heavy payments incurred over the Queen's Ferry lawsuit, and to finance the increasing volume of work. The loss shown on the year's trading to June last continues to reflect the low level of prices in the electrical industry and insolvency of work. Larger contracts under better conditions, and at somewhat better prices, have been secured during the year, and the company's shops are now well supplied with work. More working capital is, however, required. The Queen's Ferry Works are under the consideration of one or two parties, but the figure at which they stand in the balance-sheet is unlikely to be realised. In view of negotiations which vitally concerned the company's future, it was found advisable to dispense with the customary half-yearly meeting in April. These negotiations have now been concluded. The proposals are as follows: The 4 per cent. and 5 per cent. mortgage debentures to remain at the present total of £218,828. Issue of £30,000 new preference stock 6 per cent. cumulative (Class A), with option to subscribers to take up one 1s. ordinary share with each £5 allotted (this new stock to be offered, in the first instance, to the existing shareholders). Issue of Class B preference stock 4 per cent. cumulative to be allotted to existing shareholders in exchange for present shares as follows:—Preference shares, £2 stock for every share of £5 nominal value; ordinary shares, 2s. 6d. stock for every share of £1 nominal value. This means the writing down of £333,330 preference shares and £66,666 ordinary shares, making a total of £399,996, to a total of £141,665. There will be an issue of 30,000 new ordinary 1s. shares, 6,000 of which are to be reserved for subscribers of Class A and 24,000 will be subscribed by incoming parties, whom it is proposed shall be associated with the company. The revised capital will, therefore, be £121,993, as against the present capital of £618,824. At a subsequent extraordinary general meeting, resolutions were passed agreeing to the proposed rearrangement of share capital.

## STOCKS AND SHARES.

Tuesday Evening.

THE great event in the Stock Exchange this week has been the announcement of the award of the Railway and Canal Commissioners in the case of the National Telephone Company. The declaration that the Company would receive £12,515,264 took the market by surprise, and was followed by a slant in the price of the stock such as the Stock Exchange has not seen for years past. The price fell from 140 to 106 in a day, with hardly a check in between, and the market was the scene of wild excitement.

As the price gave way, so more and more stock was forced out, until it became evident that at least part of the selling was on account of holders who had pledged stock with their bankers and saw themselves faced with the necessity for paying out large extra sums in the way of cover this week. The prophets who not long ago were talking airily of 180 as the probable price that would be paid by the Government for the Deferred stock, have now revised their estimates, and talk as pessimistically as before they had been hopeful. It is more than probable that, before Friday, when this paper appears, more definite information will be available as to the amount which the Deferred stockholders are likely to receive; but, writing on Tuesday, the utmost confusion and perplexity exist. Cautious calculation puts the ultimate figure between 105 and 115. Nominally, the stock on the week shows a fall of 33½ points, but on the morning of the announcement one buyer gave 140 for it, and it was not long ago, of course, that the price was run up above 160. The perplexity and confusion are underlined with considerable indignation, while rumour was busy with further estimates as to how many members of the Stock Exchange would be hammered on the pay-day—that is, Thursday—as the direct outcome of this slump.

Other markets are distinguished by no special features. The political situation abroad has been worsened by the break up of the Peace Conference and the departure of the delegates, though it is felt that all the loopholes are not yet closed to peace, and that even at the eleventh hour some way can be found out of the deadlock, whereby the Allies could be satisfied and Turkey could feel that she was not giving away too much.

The Home Railway market felt the influence of the political clouds as much as any of the other departments, and speculators sold stock in disgust at the turn which events had taken. Districts and Metropolitans both fell back, though neither stock lost all the substantial rise gathered during the previous week. City and South London rose a point, and Central London Ordinary at 84 hardened into line with the quotations for the company's Preferred and Deferred stocks upon the confirmation of the stockholders' agreement to the terms of purchase made by the Underground Electric group. Later, however, the rise was lost, and the Deferred went back to 83 at the same time.

Underground Electric shares continue in demand. The price at one time rose to 5, easing off later to 4½, at which it shows a rise of ½ on the week; while the 6 per cent. Income bonds, after dipping

to 94½, rose to 95½, thus marking an improvement of a point. British Electric Traction gave way slightly, and Yorkshire West Riding Preference shares are ½ down, there being few quotable changes beyond this. Business has sprung up in the £10 shares of the London Electric Railways Company, and a fair number changed hands on the basis of £3. The shares are still a long way from the dividend point, but the buyers contend that there is plenty of scope for improvement, and those who are content to wait for some period have been picking up shares to put away.

In the lighting market, Monday's severe fog in the City cheered up some of the principal prices. Chelsea, Charing Cross Preference, and Westminster Ordinary and Preference rose ½ to ½. City of London Second Debenture gained ½, the Company's Ordinary shares remaining about 17. The market as a whole, however, is described as somewhat heavy, and there is not much trade doing in the shares. One large holder of Electric Lighting issues announced that nothing short of a week's fog would make him really happy, but he was careful not to mention this except to those whom he knew to be interested in the same market as himself. The National Telephone award has given rise to some heart-searching in the electricity supply department, though it had no effect upon quotations.

The market for Latin-Canadian securities was a little upset by the general depression caused by foreign politics. Brazilian Traction shares, in which there is a lot of business doing, fell from 100 to 97½, regaining a point of the fall afterwards, so that on balance they have only shed ½ out of the 4½ points gained last week. Georgia Light and Power jumped to 51, and came back to 48½. Mexican Light and Power and Mexico Trams are both easier, disquieting reports reaching this side as to warnings having been issued by some of the mining companies in Mexico that it would be safer for women and children to be removed into less troublous districts. Monterey Debenture, however, at 90 is a point to the good. Montreal Common stock retains its rise of 10, and Shawinigan, after their big jump, are no more than a point off.

Buyers have come along for several of the Debenture stocks in this section. Cordoba Light and Power Debenture, Cochabamba bonds, Ontario bonds, and Toronto Debentures are all higher. Canadian General Electrics show rises in the Ordinary and Preference. On the other hand, Madras Ordinary fell ½. Melbourne Debenture is another of those in request, and the price has risen to 102½, while the Electric supply of Victoria Debentures are 2 up. The Anglo-Argentine Tramways group improved. United Electric Trams of Monte Video and Para Electric Ordinary are both higher, and the only change in the British Columbia sextet is a rise of ½ in the Preferred stock. Inquiries are being made for Pacific shares, several influential firms having taken substantial lines of the bonds for account of trust companies and other clients; and it may be surmised that before long a market will be started in the Common stock of the company.

Marconi shares have been flat. It was reported that a failure had occurred in Dublin, which would mean the liquidation of a large line of Marconis, but to this ostensible cause of the depression not much importance was attached. What is more troubling the market and Marconi shareholders is the evidence given before the Commission, from which it would appear that there is at least the possibility of a second commission being formed to deal with the question of the agreement between the Government and the Company. If the agreement with the Government should be upset, probably Marconis would fall still further, and it has to be remembered that there are yet many people left who paid fanciful prices for their Marconis when the boom was proceeding so merrily.

Indo-Europeans are ½ higher, and Reuters rose ½. Cuba Telegraphs are 10s. easier. Investment demand is responsible for further improvement in the price of Anglo-American Telegraph Preferred, and there has been another small rise in American Telephone and Telegraph Capital stock. The Eastern group is steady, and no changes of consequence have occurred in the Trust Companies issues.

Of the Manufacturing shares, Callender's Ordinary and Preference and Henley's Ordinary are better, while Castner-Kellners hardened to 3½. Armament shares are advancing by reason of the 50 millions sterling budgeted for naval requirements this year. The Rubber share market gave way on a little scattered selling before the settlement, though the price of the raw material keeps very steady, and some of the firms interested in this department have to deal this week with one of the heaviest settlements since the boom of three years ago. The amount of the raw material offered at the Mincing Lane auctions this week was 1,130 tons, the largest on record for these fortnightly sales.

**Dublin United Tramways Co., Ltd.**—The directors have declared a dividend for the half-year ended December 31st at the rate of 6 per cent. per annum, less income-tax, on both the preference and ordinary shares, after setting aside £10,000 towards renewal of rails, £2,000 to accident insurance reserve, £5,000 to reserve and renewals fund. £11,257 is carried forward.

**Continental.**—FRANCE.—The report of the Société Industrielle des Téléphones. of Paris, for the last financial year shows a net profit of £64,194, as compared with £61,375 in the preceding 12 months.

**RUSSIA.**—La Société de l'Usine Electrolytique de Moscou is the name of a new company which has just been formed with a capital of 1,200,000 roubles to establish works near Moscow for the electrolytical production of copper and other metals.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, January 16th.

CHEMICALS, &c.	Latest Price.	Fortnight's Inc. or Dec.
a Acid, Hydrochloric .. .. per cwt.	5/-	..

**Anglo-American Telegraph Co., Ltd.**—The directors have resolved to pay the following dividends to the close of the year 1912, viz.: A balance dividend of £1 10s. per cent. upon the ordinary consolidated stock for the year; a balance dividend of £1 10s. per cent. upon the preferred stock for the year; a first and final dividend of £1 10s. per cent. upon the deferred stock for the year—all payable on February 1st next, less income-tax. The above dividends, together with those already paid, will amount to £3 15s. per cent. on the ordinary consolidated stock, 6 per cent. on the preferred stock, and £1 10s. per cent. on the deferred stock.

**Japan.**—The Yokohama Electric Railway Co., which has just declared a dividend at the rate of 8 per cent. per annum for the last half-year, is increasing its capital from £300,000 to £600,000.

## WIRELESS TELEGRAPHY WITHOUT SPARKS.

THAT emission of Hertzian waves on which wireless telegraphy depends is obtained by the setting up of suitable oscillations in a conducting antenna. Corresponding to the industrial frequency of 50 cycles per sec., is a wave length of 6,000 km. and, since the maximum wave length which can yet be obtained from an aerial is about 10 times the length of the wires employed, a 600-km. antenna would be required to utilise 50-cycle current. An aerial 0.6 km. (600 yd.), in length corresponds to exciting frequency of 50 kilocycles per sec. Currents of such frequency are easily obtained by employing the oscillatory discharge from condensers, but numerous endeavours have been made to construct machines which should generate currents of sufficiently high frequency (say, 50 key.) for direct excitation of the aerial without intermediate condensers. Another line of research has been directed towards the designing of a form of aerial, which should occupy very small space, but yield a very long wave (say, 30-60 km., corresponding to an exciting frequency of 10-5 key., for which dynamo-electric machines can now be easily constructed).

American endeavour has been concentrated on the evolution of high-frequency generators. Alexanderson has built machines providing 200 key. frequency (corresponding to antennæ with 1,500 m. wave). Unfortunately, such a machine runs at 20 kilorevs. per min., and presents mechanical features which prevent its general use. Finally, its efficiency is less than 5 per cent. A number of German engineers, starting from the assumption that the length of ground occupied by the aerial should not exceed 1 km., and the area, 20 hectares, have endeavoured to design satisfactory 50-key. alternators. Count Arco's machine, recently exhibited in London, actually realised 10 per cent. efficiency (though the Telefunken Co. claim 24 per cent. efficiency under favourable circumstances). The constructional details of this machine are secret up to the present, but better results have already been obtained with other machines. The Goldschmidt alternator (ELECTRICAL REVIEW, November 24th, 1911, page 880) realises 50 per cent. efficiency, but its arrangement is hardly adapted for continued use in an ordinary radio-telegraph station.

Our contemporary, *Génie Civil*, announces results which have been obtained by M. J. Béthénod, who has sought to obtain economically a very long wave, thus making possible the use of low-frequency alternators, which have the important practical advantages of low cost and high efficiency and reliability.

The velocity of propagation of Hertzian waves = 300,000 km. per sec. =  $\lambda \times F$  = wave length  $\times$  frequency. American and German investigators have endeavoured to reduce  $\lambda$  by increasing  $F$ , whereas M. Béthénod has endeavoured to increase  $\lambda$  as far as possible (while retaining a small aerial structure), thus securing a more reasonable value for  $F$ .

The Blondel sheet antenna (1903) makes possible wave lengths 10 times as great as are obtainable from a single wire. Slaby endeavoured to increase the wave length of radiations by introducing capacity and inductance in the aerial (1905), but was not able to obtain satisfactory results. In 1908, Athearn (New York) proposed a sheet aerial in which the conductors were arranged as a zig-zag grid; long waves were obtained, but such a confusion of wave lengths was generated that the aerial was of no practical value.

The difficulty in increasing the capacity and inductance of an aerial arises from the formation of nodes at the points where high inductance is inserted; the wave length generated then corresponds to part only of the aerial, and may actually be shorter than that of the original simple antenna. Although full particulars cannot yet be disclosed, owing to patent negotiations, M. Béthénod claims to have designed a type of aerial providing about 10 times as great a wave length as can be obtained from an ordinary sheet aerial of similar size. Preliminary tests show that the method adopted for adding capacity and inductance provides an increase in wave length corresponding exactly to the theoretical

results obtained by summing convergent series, the terms of which represent the elementary capacities and inductances.

To obtain a 60-km. wave requires about 1 km. of aerial under the Béthénod system as compared with 10 km. under the Marconi, Telefunken and Goldschmidt-Lorenz systems. In large stations, the aerial towers must be about 100 m. in height; and whereas six or eight are required for a Béthénod aerial yielding a 60-km. wave, 30 would be required for an ordinary aerial providing the same wave length. Other things being equal, the antenna for a 6,000-m. wave would require 10 towers and a strip of ground 1 km. in length using present types of aeriæ, as compared with four towers under the Béthénod system. It appears unnecessary to use towers higher than 80 m. in the latter system, whereas, to reduce the number of towers where ordinary aeriæ are used, the umbrella type of antenna, carried by a central tower of enormous height (250 m. in the new Nanen station), has been adopted.

If the inventor's hopes are realised, 10 key. per sec. alternators will suffice for the direct excitation of Béthénod aeriæ. Such alternators can be of reasonable mechanical and electrical design and of high efficiency: probably poly-phase machines will be used with advantage. The use of two-phase current in important stations has hitherto been prevented by the necessity for two aeriæ set at right-angles, but M. Béthénod claims to have evolved a method of connection enabling efficient inversion of one phase, so that a two-phase alternator can be directly connected to a single aerial.

In the absence of those details which will determine the success or failure of the new system, we can at least say that France appears to have come nearest to a practical system of sparkless wireless telegraphy. In spite of all syntonic precautions, a pure wave cannot be practically obtained from a spark system of wireless telegraphy: by the direct excitation of the aerial from an alternator, however, a sustained and practically pure train of waves can be emitted, thus improving syntonic reception, increasing the distance of transmission and avoiding interference between stations. Multiplex working should be a possibility, the problems of wireless telephony would be greatly simplified, and it is probable that new phenomena and laws would be discovered in the generation and application of the long Béthénod waves. If these hopes are realised, there is no reason why speeds up to 200 words per min. (ten times the speed of simple trans-Atlantic cable working and six times the speed of duplex cable transmission) should not be reached. In short, the scope and utilisation of wireless telegraphy would be literally revolutionised. A tremendous amount of labour has been expended in seeking a solution to the problem of practical and efficient aerial excitation, and it is to be hoped that this has now been found.

## REVIEWS.

*Electricity made Plain.* By G. R. PEERS. Manchester: J. Heywood, Ltd. Price 1s. net.

The author's object is to explain the various uses of "practical electricity" in a general way intelligible to the average reader without scientific knowledge. The ambitious scope of the work naturally condemns many most important applications of electrical energy to a very cursory treatment, thus, electricity on ships and electricity in newspaper offices are each treated in less than one page. Electric welding, the lighting of small houses, electricity in agriculture and horticulture, and other important applications are dismissed even more briefly. In contrast to this, 40 pages are devoted to medical applications of electricity. Undoubtedly the latter are very important, but in a work intended to present the non-technical reader with a well-balanced review of present day uses of electricity, it is, to say the least, unjust to dismiss each of a number of applications, involving a vast capital expenditure and revolutionising so many phases of industry, in about one-fiftieth of the space devoted to medical electricity. The information given in the various sections should certainly be intelligible and interesting to the layman, but it will be obvious that under the above space limita-

tions the merest skeleton outline has had to suffice in the treatment of many important branches. Within the space limitations imposed, the industrial sections are, with few exceptions, excellent.

The arrangement of the work is open to criticism. Chapter III mentions arc lamps and arc furnaces, and abruptly terminates by a statement of the capital invested in electrical undertakings in the United Kingdom. Then, after dealing with electric traction in Chapter IV, the generation of electricity is considered in Chapter V, instead of following immediately after the paragraphs on galvanic electricity, as had better have been the case. That any historical basis has been adopted in the arrangement cannot be maintained, since telegraphs are dealt with in Chapter VII—after the notes on electric lighting, traction, generation, public supply, heating, cooking and ice-making. Railless traction and the uses of electricity on railways are mentioned in Chapter XIV, and are immediately followed by sections dealing with the electrical transmission of photographs, writing and time signals. The chapter on wireless telegraphy is very good, but it is not clear why a section on the storage of electricity should be tacked on to the end of it. Also, why are heating pads, electric saucepans, irons, vacuum cleaners and ovens mentioned without pause or dissociation in the section entitled, "The electric light bath"? Further mention of agricultural electroculture is made in the section on medical electricity, and the information there given should certainly be transferred to the special section on electricity in agriculture.

The opening paragraph of Chapter III describes the arc lamp as the most efficient form of artificial illuminant, but only claims for it an efficiency of 1 watt per c.p. The author speaks of a consumption of 500 watts *per hour*, and an efficiency of 1 watt per c.p. *per hour*. Both these expressions are utterly meaningless. We are strongly of the opinion that more space should have been devoted to electric lighting—encouraging the use of the latter, and explaining the choice and application of various types of lamps. Similarly, we do not agree with the dismissal of electric heating and cooking in a couple of dozen lines.

Considering the short space occupied, the notes on the generation of electricity are excellent, but we do not think that the mistake of assuming generation, for lighting and power purposes, to be by atmospheric collection or frictional generation, is as prevalent as the author supposes.

The statement that the human voice is the vehicle of transmission of messages in the telephone is distinctly misleading, and the risk of misunderstanding is aggravated by the phrase "The human voice could be transmitted . . . through a wire" (Chapter IX); in later paragraphs, however, the true action is clearly explained.

The author states that the whole human system must be brought under electrical influence to attain "full effects," supporting this argument by the fact that the effects of quinine, strychnine, and other drugs penetrate to every part of the body. He at once vitiates his reasoning, however, by remarking that if these drugs "could be localised in a single limb, only that limb would be directly influenced by them." Electrical treatment can be thus localised, and its success in connection with cases of partial paralysis, &c., depends on the correct local application of current with regard to nerve centres. With the exception of the rather too positive tone adopted in asserting the beneficial effects of various electrical treatments, the medical section of the book is very good.

The grammatical style adopted is careless in many places, and the selection of wording is at times bad. Instances of lax construction are as follows:—"The simplest method of producing electricity which can be put to practical uses is that obtained by the action of certain chemicals upon metal." "This is analogous to the steam pressure in a boiler in order to obtain a certain amount of work or power out of the steam engine." ". . . The expert . . . would be able to advise the customer of the advantages taking place in the efficient means of illumination. . . ." ". . . If this is correct, it is to be hoped that, in view of the important results already obtained, there are strong grounds for believing that, in many cases, valuable improvements can be effected in the yield of agricultural crops." "The following list of diseases treated by Wesley with electricity, with

beneficial results, is given below, which seems to cover a large range. . . ."

The volume concludes with a useful glossary of electrical terms and a detachable inquiry form for use by readers. The latter is a valuable innovation, but one which is likely to commit the author to an enormous amount of additional labour. We trust that the author's willingness to supply explanations and additional information will not be abused.

Any handbook attempting to treat the whole field of electrical engineering in a popular manner is bound to be open to considerable criticism: but a purchaser of the present volume will certainly get excellent value for his money, and a good popular groundwork from which to commence a more precise and detailed study.

*Life Understood: from a scientific and religious point of view, and the practical method of destroying sin, disease, and death.* By F. L. RAWSON. London: The Crystal Press, Ltd. 1912. Price 7s. 6d. net.

Without doubt this is the most extraordinary production that has ever appeared from the pen of a practical man. It is indescribable, in the sense that it is such a mixture of mystery, imagination, quotation, and reference, that one scarcely knows where to begin with it. In a pamphlet sent out by the publishers, "Life Understood" is called an "epoch-making" book, and "its interest is not lessened by the curious fact that it does not reach the world as the work of a dreamy, abstract philosopher, but through a business man of wide and varied activities, one of the most successful engineers of the day, whose previous training has eminently suited him for the present task."

The main practical points elucidated are said to be as follows:—

1. The mysteries of birth and death are explained, and sin, disease, and death shown to be merely crude mistakes, resulting from ignorance of real laws.
2. God is one ever living, ever active and an unalterable Principle, the Principle of good, the omnipotence of which can be instantly utilised at any moment for any good purpose, by ceasing wrong thinking, and thinking rightly.
3. Man's possibilities are limitless.
4. Each reader is shown how he himself can at once put into practice, in some degree, the scientific, and, therefore, infallible and instantaneous method of obtaining revolutionary results, ultimating in deliverance from every kind of difficulty, including sin, disease and death.
5. The overcoming of limitations of all kinds is proved to be merely a matter of proportionate obedience to well-defined laws.
6. Freedom from all worries and troubles and perfect peace of mind can be rapidly and permanently gained.
7. No tortuous, difficult process is necessary to obtain such results. The method is simplicity itself, merely that of right thinking.

After perusing this startling pronouncement, we settled down in our arm-chair, and with the comfortable thought that we had at last unearthed the eighth wonder of the world, prepared to enjoy ourselves thoroughly. Our author had evidently written "finis" to age-long speculations, had solved the problem so long held to be unsolvable, had explained in a mere six hundred pages or so the mystery of the Universe. We started therefore at Chapter I, and soon came across many interesting things. The main point, however, seemed elusive. The chapters grew and grew, and the vital secret seemed to us as far off as ever; and at the end of the 600 pages the matter was, to our mind, no nearer solution. Sixty words will probably suffice for an adequate explanation of life when the secret is really known.

To the man of scientific training who critically reads through the work, the whole thing must seem stupefying. The author is delving in unearthly regions. He is making acquaintance with things metaphysical. Sir Ray Lankester likens this self-contained Universe with its known and unbreakable laws to a quantity within brackets; there may or may not be a factor outside. Our author appears to be working with this factor, and to be manipulating it by something akin to the laws of algebra; a factor which, if it exists

at all, has hitherto only been seen in the dim shadows. It belongs to the realm of things that, as Mr. Soddy says, cannot be "conserved."

The author has certainly written a book that is unique. He deals with a vast array of subjects, but not always with the pen of a specialist. For instance, hypnotism, according to his idea, is everything that is bad and useless. He does not seem to be aware of the wonderful mental cures that are being effected every day by means of this truly extraordinary science; a science which is undergoing investigation by medical men throughout the civilised world. Far from being a terror to mankind, all the omens point to its becoming one of the greatest blessings lent by Providence to humanity.

The author's treatment of spiritualism is also somewhat general. The whole of the phenomena connected with it are luminously explained as follows:—"The sub-conscious mind or basic false 'mentality' of the material man is always in etheral touch with every thought in the material world, past, present, and future, and a mixed medley of etheral thoughts of every kind and description, with and without any logical sequence or benefit to mankind, are intensified on the so-called 'mind' of the medium until they are manifested more materially in the form of what are called the spirits or the flowers or other things that these spirits are supposed to bring or produce. Thoughts are also similarly intensified so that you may hear what sounds like the voice of a human being, or see visions of the past or future."

We don't know whether there is any truth in spiritualism or not, but at any rate, we would lay odds against this as the correct explanation of the phenomena.

Throughout the book weird terms, such as "no-mind," "false mentality," &c., flit about like butterflies in a tropical foliage. We become confused and lose the thread of the argument. Perhaps our scientific training is against an unprejudiced understanding.

---

## THE TRADE BOOM.

[COMMUNICATED.]

IN spite of gloomy and superstitious prognostications, the trade boom is continuing to develop, even though we have entered the thirteenth year of the twentieth century. We hear from all quarters of scarcity of materials and labour; of works choked with orders, of high wages and big dividends. A record budget both as regards receipts and expenditure is forecast.

In the case of the British Empire, a profound peace coincides with the heaviest warlike preparations in its history.

A strong public opinion is supporting the strenuous efforts of Sir Edward Grey and the ambassadors of the Great Powers to restore the blessings of peace to Europe, and it is to be hoped that those efforts will be successful.

It would seem as if even the armaments men were beginning to perceive that the Dove of Peace is a better customer, and has more money to spend than the Vulture of War, which is, after all, a lean and savage bird.

It may be that the disturbed state of public feeling in Austria and Russia, and, to a lesser degree, in Germany, is diverting trade to us. But making allowance for that, there appears to be every probability of the continuance of the boom.

The outlook for manufacturers in the engineering trade is, however, not without keen anxiety. As usual at such times, the coal and ironmasters are grabbing more than their share; and the rapid advances in the price of fuel and raw materials, coupled with outrageous delays in delivery, are putting many manufacturing engineers into a most difficult position. There are only too many big firms in the hands of receivers, or almost there, in spite of the boom. In very few cases have the prices of the finished article been put up proportionately. That always takes longer to come about than a rise in price of iron, coal and steel, because of the lack of combination among engineers. The coal and iron producers always get their heads together in good time.

Labour is still somewhat sullen and threatening, on account of the great increase in the cost of living, and the widespread conviction that labour is not even yet getting its due. It is said that: "Prices go up in the elevator, while wages creep up the stairs."

The increased cost of living, however, hits no one harder than that great class of salary earners who originate, design, and carry through the whole business. Salaries do not rise; and the supply of young men, able and ambitious and well educated, constantly increases, and tends rather to reduce them. In times like the present these salaried men are working all hours without any payment for overtime, and in many cases actually taking home less money than the workmen they direct.

The difficulty of organising brain workers is well exemplified in the case of the doctors, who certainly had a better chance of working on Trade Union lines than any other profession.

The law is equally well protected, but it is at present suffering from the fact that the trades are much too busy to quarrel. There seems to be a pause in the race of improvement and invention, as capitalists and banks can get out all their money on every-day business, and they resolutely turn a deaf ear to the suggestions of genius, so that the inventors' garrets are rather more overcrowded than usual.

The high price of coal and oil, and the fact that fear of "corners" prevents anyone from relying on any given cost for oil for more than a few months ahead, are factors handicapping power producers very seriously.

Fear of motor-buses checks tramway enterprise. With abundant traffic, and labour in a less threatening attitude, the railways are not making many new departures. In the great questions of power production and distribution, little headway is being made. The Government is far too busy with politics of another kind, to tackle such a problem, and yet its very magnitude necessitates legislation on a bold scale. This great boon of cheap power might do more for the prosperity of the country than even a restoration of the canals, which seems to be as far off as ever.

It appears as if Parliament would never have time for practical affairs, nor a party leader arise to adopt such a policy as his main plank.

The times are strenuous, the pressure severe, and there seems to be less leisure than ever for engineers to cultivate what the Scots called "the amenities."

Literature and art and even science may suffer from a prolonged trade boom, and perhaps the epitaph of this generation may prove to be simply: "It made money."

Would that it might be added: "It distributed the money fairly; it encouraged genius and industry, and discouraged the wastrel. It curbed usury, stopped waste, saved and developed its sources of power; it promoted health and strengthened the race; it lived simply, thought clearly, provided wisely for its successors, and made the world a better cradle for the human race."

---

## GRAPHS IN A CABLE-SHIP DRUM-ROOM: NOTES FOR JUNIOR ASSISTANTS.

By EDWARD RAYMOND-BARKER.

1. HITHERTO, in the treatment of graphs as applied to practical problems in submarine telegraphy, the writer has confined himself to the electrical side of cable work: that is to say, to what, during his past professional life, has been his own side.

2. Having been chief electrician on various cable-laying expeditions, the writer naturally has had the advantage of working in close association with colleagues responsible for the effective carrying out of other branches of cable-ship routine. Cable-laying viewed in its entirety affords a striking instance of well-organised division of important duties, all sections of the staff and ship's personnel co-operating in carrying out a general plan in a manner con-

ductive to eventual success in what often proves to be—owing to climatic drawbacks and adverse weather conditions—an arduous enterprise.

3. In view of this recognition of indebtedness to association with colleagues responsible for departments of work other than his own, the writer is sure that none other than a cordial reception will be extended to certain tentative suggestions on his part in the direction of graphic methods applicable to "Drum-Room" or "Paying-Out Office" routine work. In any case, graphic methods afford a fascinating illustration of concrete data—as a rule confined to tabular compilations of dry figures.

4. Graphic treatment will be applied, first of all, to the variation in cable-drum *constants*, with different types of cable, and later on, to questions relating to the percentage of slack paid out, in the course of cable-laying operations, at any given moment, or for any given period of time.

5. A new form of transparent disc calculator also will be described in these notes, a device for instantaneous confirmation of cable-slack data, and for many other purposes.

6. True it is that mechanical contrivances have been devised—such, *e.g.*, as that described on page 310 of Comendatore Dr. Italo Brunelli's notable work on telegraph construction\*—for indicating automatically the percentage of cable-slack in course of being paid out; nevertheless, the graph methods, and the new transparent disc calculator suggested by the writer, will not be without their uses.

7. It will be well, first of all, here to examine the mechanical means commonly used for measuring the length of a telegraph cable, whether the said measurements be carried out for days and weeks during the laying of a cable across an ocean, or whether it be question, merely, of transferring cable, say, from a factory tank into a ship's tank. In the latter case, not only has the correct cable length to be verified, but on important occasions—*e.g.*, the first shipment of a new cable—the positions of joint marks and mile marks put on the cable in course of manufacture, have to be verified, and entered up in "tank books," with particulars as to the whereabouts of each one in any given "turn" of any given "flake" of cable coiled into a ship's tank.

8. It follows, also, that accurate measurement of the cable in motion necessarily affords data for computing speed rate; for instance, so many miles of cable paid out, or shipped—as the case may be—*per hour*. It stands to reason, therefore, that, in any of the afore-mentioned operations, cable-length measurements must be carried out with great exactitude.

9. Many useful data relating to these and cognate matters may be found by the young assistant in such well-known books as Bright's "Submarine Telegraphs"; Clark and Sabine's "Tables and Formule"; Munro and Jamieson's "Pocket Book"; and Wilkinson's new and revised edition of "Submarine Cable Laying and Repairing," pages 228-230, and-235-246, in the last-mentioned work being especially useful.

10. The following notes, however, will be found to be off the beaten track of the text-books to an extent not without advantage to the young reader, whose work with the books, therefore, will be supplemented by a parallel series of exercises, so to speak, and, later on in this series, by concrete cases developed by graph methods, in a manner both useful and novel.

11. The length of cable paid out during laying, or picked up during repair operations—likewise the rate of paying out or of picking up—all this is accurately measured "by drum indicator."

12. The cable whether paid out or picked up, for greater security and avoidance of slip, is caused to make not only one, but three or four turns round a large iron wheel or drum with a wide periphery, and about 18 ft. in circumference.

13. This cable drum may be put in or out of gear with a steam engine. A common practice on big ships is to have one drum astern for paying out, and two drums "for'ard," port and starboard, for picking up.

14. A cable drum is controlled by powerful brakes under

easy manual control, and, in the case of the paying-out drum, capable of nice adjustment by addition or subtraction of movable weights.

15. One revolution of the drum may be said to be the primary unit of length in cable measurement. A counter, or train of wheels contained in a neat brass box, is attached and tooth-wheel-gearred on to the drum shafting. This device goes by the name of the drum indicator.

16. The train of wheels inside the brass box actuate five sets of figures on brass counters. These figures are severally displayed at five small apertures or windows in the face of the brass box. These figures are in terms of drum revolutions, and, at the five apertures, show—from right to left—units, tens, hundreds, thousands and tens of thousands.

At each complete turn of the drum the "units" indicator advances 1. On the completion of 10 turns the "tens" indicator goes forward 1, and so on.

17. Thus, in fig. 1 here shown, the drum indicator reading is seen to be 14,208 revolutions.

FIG. 1.

18. The reading following on 99999 will be five "noughts," which, in this instance, signify 100,000 revolutions. Thus the train of wheels, after going through all the figures, automatically pass to zero, and start a fresh series, so that, in the foregoing case, the subsequent reading 00001 would signify 100,001 drum-revs.

19. In a certain concrete example, the mean of several careful tape measurements round a drum periphery, gave 17 ft. 8½ in. = 17.688 ft. = 212.24 in.

20. Fig. 2 shows three end-on views of one and the same cable drum with exaggerated sectional representations of three different sizes or types of cable encircling the drum, and demonstrates the fact that the cable length equivalent of a drum revolution must vary according to the sectional dimensions of the cable.

FIG. 2.

Clearly, therefore, the greater the diameter of a cable, the greater becomes the distance across the drum between cable centres, and, consequently, the greater the length of cable carried over by one complete revolution of the drum.

21. Distance between cable centres is seen to be—

Drum dia. + twice ½ dia. of cable, or  
Drum dia. + cable dia.

The sum of these two values  $\times \pi$  (that is, 3.1416) would give the true circumference of one complete turn or encirclement of this particular type of cable.

22. It is more simple, however, and easier in execution, to arrive at a similar result by dealing with circumferences straight away from the beginning. So drum circumference + cable circumference, expressed in convenient units of length—say, inches and decimals of an inch—may be

\* "La Costruzione delle Linee Elettriche Aeree . . . Con una Appendice sui cavi . . . sottomarini." Dott. Ing. Italo Brunelli, Editore Generale dei Telegrafi, Roma. Stabilimento cromo-tip di Carlo Colombo, 1912.

taken as giving the true cable-drum circumference, corrected for that particular dimension or type of cable. Example :—

23. Drum circumference has been seen to be 212.24 in.  
Circumference of cable say type D<sub>1</sub> ... 2.60 in.

$$\left. \begin{array}{l} \text{Total drum circumference, corrected for} \\ \text{cable, type D,} \end{array} \right\} = 214.81 \text{ in.}$$

73,044 in. go to the nautical mile (N.M.),

		Logs.
SO	$\frac{78,044 \text{ in.}}{214.81 \text{ in.}}$	$= \begin{array}{r} 4.86358 \\ 2.33212 \end{array}$

$$2.53146 = 339.99 \text{ drum-revs. per N.M.,}$$

this being the *drum constant* for this particular type of cable. Supposing the drum indicator to register 4,234 revs., this reading is equivalent to—

	Logs.
4,284	3.62675
<u>339.99</u>	= 2.53146

$$1.09529 = 12.454 \text{ N.M. of cable, type D,}$$

In short, drum constant divided into drum-indicator revs. gives length in N.M. of cable passed over drum.

24. Sometimes—especially in slide-rule work—it is convenient to multiply instead of dividing. Then a result similar to the above may be obtained by multiplying drum-indicator revs. by the *reciprocal* of the *drum constant*, viz. :—

$$\begin{array}{r} 1 \\ \hline 339.99 \end{array} = \begin{array}{r} \text{Logs.} \\ 0.00000 \\ \hline 2.53146 \end{array}$$

$$\bar{3.46854} = 0.0029413 \text{ N.M. per drum rev.}$$

Then, supposing the drum indicator to register, as before,  
4,234 revs.—

	Logs.
$4,234 \times 0.0029413$	$3.62675$
	$3.46854$

$$1.09529 = 12.454 \text{ N.M., type D}_1.$$

25. Naturally, the drum circumference corrected for any given type of cable, divided by 12 in., gives the equivalent of one drum rev. in terms of feet—a useful figure to have.

26. N.B. :—6 ft. = 1 fathom, the generally accepted unit for short lengths of cable or core cut off for splices, damaged ends, or what not. In three-figure decimals 1 fathom = 0.001 N.M.

27. The exact circumference of any particular type of cable is obtained from the mean of several measurements. In practice, a dozen slips of white paper may be prepared. Siphon-recorder slip is excellent for the purpose. Each slip is folded tightly at right angles with, and round, the cable, at some given position. A pencil mark is made across two overlapping edges of the slip. Thus, two marks appear on the slip when it is laid out straight. The distance between the marks is measured with compass and rule, and the mean of a dozen such measurements made at different points along the cable is taken as the true circumference of that particular type of cable. Measurements may have to be made with an ordinary tape or rule giving eighths, sixteenths, thirty-seconds of an inch, but matters will be simplified if all such fractions be converted to decimals.

28. On the occasion of each cable-laying expedition, a table may be prepared for each one of the two or three cable drums in use on the ship, giving the drum constants, and various other values, not only for all the different types of cable on board, but also for the different sizes of grappling and buoy ropes. All these various data for each cable drum may be tabulated in columns under the following headings:—

29: (1) Type.

(2) Factory No.

(3) Circumference (inches).—See 27.

(4) Length of 1 revolution (ft.).—See 25.

(5) Drum revolutions per N.M.—See 23.

(6) Logarithm of same.—See 23.

(7) Reciprocal of 5, viz., N.M. per drum revolution.—  
Sec 24.

(8) Logarithm of same.—See 21.

30. The following two examples give an idea of the difference made by the drum-circumference correction for various types of cable. In a certain cable, type "E" (circumference 4.68 in.) equivalent inches to 9,150 revs. of the drum already mentioned (circumference 212.24 in.) was laid. Taking correction into account:—(See 21 and 22).

$$\text{Drum-constant} = \frac{73,044 \text{ in.}}{212.24 + 4.68} = 336.72 \text{ revs. per in.}$$

Type "E" paid out =  $9,150/336.72 = 27.175$  S.M.

Without correction, drum-constant =  $73,044/212.21 = 344.15$  revs. per N.M.

Type "E" paid out =  $9,150/344.15 = 26.588$  N.M.,  
or 0.587 N.M.; that is, 2.21 per cent. too little.

In the same cable, type "B" (circumference 3.564 in.) to the extent of 184,710 drum-revs., was laid.

With drum corrected, type "B" paid out = 545.75 N.M.  
Without correction, " " " " = 536.72 "  
or 9.03 N.M. ; that is, 1.68 per cent. too low.

31. Fig. 3—with *uncorrected* drum circumference, and *zero* percentage of increase as bases of comparison—shows graphically the relationship between (*abscisse*) drum-constants in terms of revs. per N.M. corrected for any given type of

FIG. 3.

cable, and (*ordinates*) increase per cent. of cable-length per drum-rev., due to increase of drum + cable working circumference consequent on the addition of the cable.  $d_1$ ,  $d_2$  and  $d_3$  are curves pertaining to three cable drums on a certain ship. *Cross* and *circle* plottings respectively indicate *corrected* drum constants of various cable types from tabular records of *two* different expeditions. Curves  $d_1$ ,  $d_2$ ,  $d_3$  cut the line of abscissae at the three several *uncorrected* drum constants.

Examples.—Drum  $d_1$  with a certain type of cable has a corrected constant of 333.1 R.P.N.M. This is shown by dotted line co-ordinates in fig. 3 to be equivalent to 1.4 per cent. increase due to the addition of cable to the drum.

(To be continued.)

**Bradford Tramways.**—It has been decided to fit 100 tramcars with side life-guards of the pattern supplied by the National Railway and Tramway Appliances Co., Ltd. A portion of Queen's Road is to be equipped for railless trolley vehicle traffic, in order to experiment with the Mercedes-Stoll railless trolley vehicle which is about to be delivered. The Electricity Committee has decided to agree to undertake the lighting of Tong Street, at the same annual cost (about £150 per annum) as is now entailed in the lighting of the street with gas, and the Tramways Committee is to be asked to give permission to fix the necessary lamps to tramway poles or standards. The Committee is also to be asked to grant the use of tramway poles or standards for the like purposes, in all cases where the Committee undertakes the lighting of thoroughfares in the city.

## THE JOHANNESBURG TURBINE CONTRACT.

(Concluded from page 79.)

THE article proceeds:—"Then the town clerk deals with technical matters. Words fail us to deal satisfactorily with such crass stupidity. Rushing in 'where angels fear to tread,' he discusses vacuum, steam consumption and other engineering details, and remarks: 'I am more than astonished that Messrs. Rider and Tippet have fallen into these blunders.'" This is not, to my mind, defamatory; it is an unfair statement, because the writer fails to point out that the town clerk stated that he had had technical assistance. This probably would not alter the writer's views, but it might the reader's. To quote again: "The contract went to Messrs. Reunert & Lenz at the price of £12,469. We are not surprised to hear that the feeling out there is so strong that the Government is being asked to intervene. If there is the equivalent of our Local Government Board out there, we shall soon have some lively proceedings." It is clear from this passage that the plaintiff is being implicated in the giving of the contract to Messrs. Reunert and Lenz, and that it has been given to that firm under such circumstances that the Local Government Board would intervene, if it had happened in England. No evidence was led before me to show in what circumstances the Local Government Board would intervene, nor do I know. The article proceeds then with the words which were in the main complained of, and about which there was a considerable amount of argument during the course of the case.

"The impudence—there is no other word—of the town clerk and the laymen on the Council, who asked for expert advice (on five occasions) and then deliberately flouted it, is almost beyond belief, and such conduct on the part of the so-called representatives of the public interest is absolutely iniquitous. We have always endeavoured, so far as lay in our power, to assist in keeping clean and free from suspicion of evil practices the municipal government of this country. We have often had to express criticism of this or that action, when possibly the tendency to specialise in the goods of one firm was becoming too pronounced. But the effect of healthy publicity has made short work of such tendencies over here. In the interests of sound government, we are glad of the opportunity, though more sorry for the necessity, of laying this matter before our readers, and, through them, before the public of Great Britain. If the Corporation of Johannesburg cares at all for its good name; if the town clerk and the engineer care for their good names; if they have any regard for the welfare of the public for whom they are the trustees; if they wish to avoid suspicion of having been tempted into undue favouritism, they will reconsider this matter, and attend to the recommendations of the eminent men who have not shrunk from facing obloquy and derision to do their best for the public of Johannesburg. The result of it all is that the wisdom of the remark about the displaying of precious stones before an unappreciative audience is borne out once more. They 'turn again and rend you.' Well, the only consolation is that it was the same sort of audience that 'ran violently down a steep place and were choked.' It is this rushing that we want to stop, and we cordially hope that the government of the Colony will bring the erring municipality to a right feeling."

The innuendoes alleged are:—(1) The plaintiff, contrary to his duty as town clerk and without any regard for his good name and the welfare of the public, deliberately flouted the advice of the experts, appointed by the Council, not only in respect of the acceptance of the tender of Messrs. Reunert & Lenz for the said engine and electricity generating plant, but also on four other occasions when dealing with tenders before the Council when Messrs. Reunert and Lenz were tenderers. (2) That the plaintiff was dishonest in his criticism of Messrs. Rider and Tippet's report. (3) That in his conduct in dealing with the report of Messrs. Rider and Tippet and with the acceptance of the tender of Messrs. Reunert & Lenz, he was actuated by improper and unworthy motives, and that his conduct was not free from the suspicion of evil practices and was disgraceful. (4) That the plaintiff repeatedly and unduly and dishonestly favoured the acceptance of the tender of Messrs. Reunert and Lenz in preference to other more advantageous tenders. (5) That the plaintiff was incompetent in his profession or office of town clerk. Now, the decision as to whether these innuendoes have been proved is divided into two parts: First, Are the words capable of bearing a defamatory meaning, which I must decide as a judge? secondly, Do they bear that meaning? Now, in my opinion, the words are capable of a defamatory meaning, and this is essentially a case in which the jury must decide whether the words are defamatory or not. Sitting as a juror, I have to decide what the readers of the *Rand Daily Mail* understood by the words, assuming them to be persons of ordinary intelligence, who gave the words their ordinary meaning except in so far as they have been proved to bear a different meaning. In arriving at a conclusion on this point, I have to take the article as a whole and the words as a whole. Doing this to the best of my ability I have come to the conclusion that the article attacks the Town Council for deliberately flouting—i.e., treating with contempt—the advice of experts appointed to give it advice on several occasions, and without any regard for its good name or the interests of the citizens of the town, unduly favouring the tenders of Messrs. Reunert & Lenz. This, I think, fairly summarises the attack on the Town Council. The question then arises: what was the attack on the town clerk? Was it in any way different from the attack on the Town Council? I must say that I think not. It was argued that the words "who asked for expert advice and then deliberately flouted it," referred only to the Town Council. Gram-

matically, there is great force in this argument. But I do not find that there is any differentiation of the Town Council and the town clerk in the matter. It is the town clerk as well as the Town Council who is called upon to reconsider this matter; it is the town clerk as well as the Town Council who is asked to regard his good name; and it is the town clerk as well as the Town Council who is alleged to have no appreciation of the pearls of wisdom, and whom the writer of the article wishes to protect from the fate of the Gadarene swine. I am therefore of opinion that the words accuse the town clerk with conduct which is unworthy of him in his position of town clerk. A person who deliberately flouts the opinion of the Council's experts, and who uses his position to unduly favour the tenders of one firm in disregard of his own good name and the interests of the ratepayers, is not fit to be town clerk, and the words are an attack not only upon his character but upon him in his position of town clerk.

In arriving at this conclusion, I have not taken into account the vague charges of bribery being made against undefined persons at the time the article was published, nor the meanings alleged to have been assigned by various persons in the Council and at political meetings in the town. I do not think the former would influence an ordinary reader in arriving at the meaning of an article, and I do not see that the defendant could in any way be bound by the latter. Some importance might be attached to the letter of Mr. Ward Jackson, of July 5th, 1912, as to what meaning he attached to the article in question, in that he considers the plaintiff's action in regard to the incident referred to in the article such as might cause him damage. The statement is, I think, too vague to be of any use in arriving at the meaning of the article itself. Coming now to the contention that the article, if defamatory, does not exceed the limits of fair comment. The plea says the words complained of, so far as they contain allegations of fact, are true in substance and in fact, and so far as they contain expressions of opinion are fair comment made in good faith and without malice on the said facts, being matters of public interest. The facts alleged are: That the Town Council asked Messrs. Rider and Tippet to report for them on the matters above referred to. That the plaintiff took it upon himself to criticise it. That he, being a layman, dealt with technical matters. That he and the laymen on the Council who asked for expert advice on five occasions deliberately flouted it. If these facts were true, in my opinion the article ought not to be considered as being beyond the limits of fair criticism. If the facts so stated were true, I think the defendants would have been quite within the limits of fair criticism in saying that the town clerk did not have sufficient regard for his own character, and that he laid himself open to suspicion of unfair dealing. But the facts are not true. In the first place, the town clerk was asked to report. In the second place, he had the assistance of technical advice in framing his report on technical matters. In the third place, he had nothing whatsoever to do with the previous orders for turbines, and I do not think it can be said that he flouted the expert advice. And I think that this want of accuracy in the allegations of fact in the article is fatal to the plea of fair comment. In the case of *Peter Walker & Son, Ltd., v. Hodgson* (1909; 1, K.B., at page 257), Lord Justice Vaughan Williams says, quoting from *M. R. Collins* in the case of *Digby v. Financial News*: "Comments, in order to be fair, must be based upon the facts; and if a defendant cannot show that his comments contain no misstatements of facts, he cannot prove a defence of fair comment. If the defendant makes a misstatement of any of the facts upon which he comments, it at once negatives the possibility of the comment being fair." Lord Justice Moulton, in *Hunt v. Star Newspaper Co., Ltd.* (1908; K.K., at page 319), says: "In the first place comment, in order to be justifiable as fair comment, must appear as comment, and must not be so mixed up with the facts that the reader cannot distinguish between what is report and what is comment. . . . Any matter, therefore, which does not indicate with a reasonable clearness that it purports to be comment, and not statement of fact, cannot be protected by the plea of fair comment. In the next place, in order to give room for the plea of fair comment, the facts must be truly stated." In the present case, as I have said, the facts are not truly stated, and consequently a reader of the article is not in a proper position to judge whether the inferences drawn from those facts are proper inferences to be drawn or not. In my opinion, therefore, their plea fails."

We next come to the difficult question of damages. The matter was no doubt one of the highest public importance. The fact that the Town Council, after obtaining the advice of two men of high position, then disregarded the advice was certainly matter for comment, and there is no doubt that the report of the plaintiff to some extent caused the Council to adopt that course. Some portion of the plaintiff's report was devoted to a defence of Mr. Dobson against a statement made by the Board, which, if meant in the sense in which it was taken by the plaintiff, was an attack upon the probity of Mr. Dobson, and was outside the terms of reference to the Board. I refer to the statement that Mr. Dobson appears to be straining points on several matters in order to be able to recommend the tender of Messrs. Reunert & Lenz. I do not think that the Board meant to accuse Mr. Dobson of intentionally straining matters for the purpose of obtaining the contract for Messrs. Reunert & Lenz. Such a finding is, as I have stated, outside the scope of the reference, and should not have been arrived at without giving Mr. Dobson a hearing. But I think it was only intended to say that there was a straining of points which resulted in the recommendation of the tender of Messrs. Reunert & Lenz, which recommendation could not have been made except for such straining. That was clearly within the reference. For the purpose of brevity, the Board, in their report, used, perhaps, an unfortunate phrase, and the plaintiff, in consequence, reported on some matters at greater length, and

more vehemently, probably, in order, as he says, to defend Mr. Dobson, who was ill. The fact remains that the Board's report, instead of being sent back to them for revision, if necessary, after having the policy of the Council on certain matters pointed out to them, was rejected—a course which inevitably led to considerable criticism. It is clear that no actual pecuniary harm has been inflicted upon the plaintiff by the article. He stands no lower in the esteem of his employers than before. At the same time, the letter of the editor of the defendants' paper did nothing to soothe or allay the natural irritation caused by the article, nor was anything done by the defendant to mitigate the damages. I think, on the whole, damages should be assessed at £150, which sum the defendants will be ordered to pay, with costs.

—JOHN TAYLOR & JOHN HALL RIDER.

His Lordship, in delivering judgment in this action, said that the same libel was complained of as in the last case, and publication was admitted. It was only necessary, therefore, to consider the plea of privilege which had been set up. The defendant sent a copy of the ELECTRICAL REVIEW containing the article complained of to Mr. Hofmeyr, and he said that this publication was made *bona fide* and without malice, and in circumstances which made the communication and the occasion thereof a privileged one, in that more particularly the said Hofmeyr was a member of the Council which employed the defendant (with Tippet) to report; that Hofmeyr took a prominent part in securing the defendant's services for the purpose of the report; that the article complained of was a comment, *inter alia*, upon the respective merits of the defendants' report on the one hand, and upon the plaintiff's report thereon on the other; that Hofmeyr as a member of the employing Council, and the defendant as an employee, had a common interest in the subject matter of the article, and the defendant had a duty to make known the contents thereof to his employer, and it was in pursuance thereof that he delivered the article. His Lordship said an occasion was privileged where the person who made a communication had an interest or a duty (legal, moral or social, of perfect or imperfect obligation) to make it to the person to whom he does make it, and the person to whom he does make it had a corresponding interest or duty to receive it. He had been unable to discover any duty, either social or moral, and certainly not legal, cast upon the defendant to make the communication in this case. This defence, therefore, failed, and he could not see that in this case any damage had been sustained, and he thought a verdict for £5 was sufficient, with Resident Magistrates' Court costs. No doubt the defendant did at one time feel sore at the report being made on his own report, which he understood was to have been final; and when the article appeared, it was not unnatural that he should forward it to Hofmeyr as in a measure an apology for, or defence of, his report, and his Lordship did not think he was actuated by ill-feeling.

At the request of Prof. J. H. Dobson, the general manager of the Johannesburg Gas, Electric Supply and Tramways Department, we reprint the following editorial from the issue of the *Rand Daily Mail* for December 9th:—

#### "THE LIBEL ACTION.

"Judgment having been given in the case in which the Town Clerk of Johannesburg sued the *Rand Daily Mail* for libel in connection with the reprinting of an article which appeared in the ELECTRICAL REVIEW, we are now able to allude to the matter. We opposed the attitude taken up by the Town Council on the Rider and Tippet report, and we still think that the wrong policy was pursued. But we never cast the slightest imputation upon the character or the honesty of the Town Clerk, or the electrical engineer, or any member of the Town Council, and we regret that it has been held that the criticism reproduced from a London technical journal was in one respect of a slanderous character as far as the Town Clerk was concerned. We dissociate ourselves entirely from the expressions of opinions which gave rise to irritation, and apologise frankly for circulating the statement through the medium of our columns. From time to time we have deemed it necessary in the public interest to disagree with several schemes proposed in the Town Council—notably the turbine purchase, the asphalt proposal, and the location site scheme. But it has never been our wish to reflect in any way upon the motives either of the Town Clerk or Prof. Dobson, or any individual member of the Town Council. Although disagreeing with a number of Councillors and officials, we felt that they on their side believed they were doing their best for the town, and were actuated throughout by the best motives, and we sincerely regret the publication of the passage in the ELECTRICAL REVIEW article which has been held to be slanderous, and unreservedly withdraw the imputation Mr. Justice Ward has found to be contained in it. Mr. John Taylor and Prof.

Dobson stand high in the esteem of the ratepayers, and we have often had pleasure in calling attention to the splendid work they have done for the town. When we disagreed with them on one point, it was certainly not our wish to reflect in any way upon their personal or professional character, and no one is more sorry than we that the article we reprinted was held to be of an objectionable nature in one particular. In closing the controversy, therefore, we wish to dissociate ourselves from, and express regret for the publication of, any imputation of wrong motives which may have been read into the ELECTRICAL REVIEW article on the lines laid down by Mr. Justice Ward."

#### TRADE STATISTICS OF BRITISH INDIA.

The following figures, showing the imports of electrical and similar materials into India during the year ended March 31st, 1912, are taken from the recently issued official trade statistics: the details for the year ended March 31st, 1911, are added for purposes of comparison, and notes of any increases or decreases are given. Values are now given in pounds sterling, and not in rupees as formerly. It should also be noted that imports are now credited to countries of original consignment, and not to countries from which they were last shipped to India. This has largely affected the appearance of the trade of Belgium, Holland, Germany and Austria-Hungary in particular, by decreasing the amounts credited to the two former countries and increasing those credited to the two latter.

## THE JAPANESE ELECTRICAL INDUSTRY.

### LARGE EXPANSION IN RECENT YEARS.

THE use of electric power in Japan has made extensive progress during the past 10 years, and one-third of the industrial establishments in the country are now operated by means of this agency. According to an article published in the *Elektrotechnische Zeitschrift*, by Mr. Ludwig W. Schmidt, the great expansion of the electric motor in Japan is not only due to the advantages of electrical energy as a distributor of power in factories, but also largely to the surprisingly rapid development of Japanese industries, which has succeeded in trebling the number of factories in the past decade; and the predominance of this form of power now seems assured for factory working. Where electric tramways or central stations exist the energy for the driving of the motors is usually supplied from these stations, this being of special advantage in the towns, where the lighting and tramway load permits of a fairly cheap supply being afforded to the users of power. In many cases, however, the factory owners have installed their own generating plant, especially in the textile industry, the shipyards, metal refining works, and the mines. This fact is explained, in the instance of the mines, by the great distance which separates most of them from the real centres of industry, and the metal refineries have been compelled to establish individual plant mostly for the same reason.

The development in the use of electric power has been accompanied by the simultaneous extension of electric lighting. From the beginning of 1900 to 1910 the number of lighting companies has risen from 49 to 122; the buildings electrically lighted have increased from 47,701 in 1901 to over 600,000 in 1910; and the number of private lamps in use has advanced from 300,000 to 1,900,000, whilst the street lighting lamps have grown from 6,460 to 59,300 in the same period of years. Many of the lighting companies are also owners of tramways, and their total net receipts have increased nine-fold in the 10 years ended with 1910. Not only so, but the ratio of net profits to expenditure has constantly improved. It formerly stood at 3 to 1, but at present almost 50 per cent. of the total profits represents net profits. The electric tramways have found a specially favoured sphere of activity. As in almost all new industrial countries, so in Japan have the manufacturers begun to locate themselves as near to the coast as possible, and in this way a number of densely-populated industrial centres has arisen, where the transport of the workers to and from their place of employment has become a similar problem to that in New York, Berlin, and London. During the 10 years the number of towns provided with electric tramways has advanced from 11 to 40, the length of line from 72 to 692 miles, and the passengers from 46,477,000 in 1901, to 395,666,000 in 1911, and the invested capital from £1,500,000 to £18,700,000.

### THE POSITION OF NATIVE MANUFACTURING FIRMS.

The development in all branches of the consumption of electricity has naturally had a favourable influence on the sale of electrical manufactures, and the electrical trade of Japan for this reason has made a large advance since the beginning of the century. Until nearly the end of the past century, by far the greatest part of the turnover was effected by the importers; but

during the decade under consideration, the situation has become more favourable for the native manufacturing works. The history of the domestic industry is full of reactions and of successes only obtained after great trouble, and even in the present century the progress made by the native works has frequently been accompanied by failures. In particular it has turned out that many of the large works were equipped with inadequate capital, and this has led to financial losses in many cases, as it was impossible to bring the works quickly enough to the capacity for which they were designed. Various works which were projected with foreign capital either had to be abandoned before they were actually established, or they could only be successfully carried out after great difficulties had been overcome. Nevertheless, the industry has managed to reach a sound basis to some extent in the course of years, and it can now be regarded as having attained an assured position, although many works have not yet quite fully surmounted their juvenile defects.

The local demand has been greater than the capacity in many cases, and extensions had to be undertaken without sufficient capital being available. But the greatest want has been the lack of good and trained workers. It is true that the Japanese despatched engineers to Germany, England, and the United States in order to study the latest methods. As a result of the knowledge thereby gained no money has been spared in introducing the newest types of machinery, but the Japanese have been unable to impart the theoretical knowledge to their workmen. This difficulty has been specially noticed in the cable works, of which a number have arisen in recent years. In general, the cable factories work under tolerably favourable conditions, as they are usually in close relations with a large copper mine from which raw material is obtained at the lowest prices, and they are also protected by a high import duty. Nevertheless, they are not able to shake off foreign competition because the quality of the imported cables is generally better than that of the native product. The reason for this occurrence, according to a British Consular report, lies in the lack of sufficiently trained chemists in regard to rubber. Certain of the owners of cable factories have therefore adopted the course of obtaining the services of qualified foreign workers, but the latter are hampered by the fact that they are unable to make themselves sufficiently understood by the Japanese workers. While the imports of telegraph cables are, as will be seen, irregular, the imports of insulated wires show a constant advance, and the requirements have increased tenfold since the beginning of the century. The accompanying table illustrates the general course of the import trade during the past 14 years:—

#### IMPORTS OF ELECTRICAL MACHINERY, CABLES AND INSULATED WIRES.

	Machinery.	Telegraph cables.	Insulated wires.
1898 ...	£69,700	£18,500	£32,100
1899 ...	45,000	19,400	14,500
1900 ...	97,600	104,900	38,100
1901 ...	97,900	49,800	42,900
1902 ...	132,300	8,500	67,400
1903 ...	111,400	33,200	33,900
1904 ...	165,200	103,700	75,000
1905 ...	301,500	256,900	78,700
1906 ...	181,100	20,800	95,700
1907 ...	254,300	133,300	112,900
1908 ...	372,100	42,000	144,700
1909 ...	300,000	35,900	151,700
1910 ...	219,200	159,500	163,700
1911 ...	571,100	37,700	370,000

The manufacture of lamps and similar articles has largely increased. But although the domestic industry is at an advantage in relation to foreign competition through the import duties, the imports have not experienced any decline, and the business undertaken by Germany in this direction has been doubled in the past three years. Several of the large electricity companies have adopted the policy of importing certain parts from Europe or the United States and assembling them in Japan. This practice probably explains the fluctuations in certain articles of import in recent years. In conclusion, the author gives the following tables showing the respective exports to Japan of Germany, Great Britain and the United States in recent years:—

#### GERMAN EXPORTS TO JAPAN.

	1908.	1909.	1910.
Dynamos ...	£67,600	£58,550	£56,400
Armatures ...	7,150	1,650	4,800
Accumulators ...	2,400	2,400	20,300
Cables ...	94,150	28,500	163,950

#### JAPANESE STATISTICS.

The foregoing information is amplified by Mr. Arthur A. Brandt in the same journal, by extracts from the statistical annual which was recently issued by the Japanese Government, although the opinion is expressed that some of the figures contained in it rather underestimate the actual position of affairs in regard to certain branches of the industry. It appears that the total horse-power used in the whole of the Japanese industries increased from 316,000 in 1905, to 470,000 in 1908, 603,000 in 1909, and 816,000 H.P. in 1910. Of the latter, 938 dynamos represented 247,500 H.P., and 1,912 motors 66,844 H.P., although these are considered to be computed on too low a scale. Steam engines rank second with 308,000 H.P., and turbines and Pelton water-wheels third with about 90,000 H.P., the balance being formed by gas engines and petroleum engines. As to the apportionment of the forms of power among the different industries, the lead in the horse-power of dynamos and motors is taken with 177,000 H.P. by the special works, which include the mines and mining operations; the second position is held by the electrical works with 103,000 H.P., and the third by the textile mills with 38,000 H.P. in 1910, whilst these are followed by the chemical works and the machinery and ironworks. The total number of industrial workers is returned at 717,161, of whom only 3,145 are employed at electrical engineering works, thus showing that very few works exist which produce machines and apparatus, notwithstanding the great progress made in the applications of electricity.

It should, however, not be overlooked that the Japanese are busily occupied in endeavouring to manufacture to an increasing extent. Installation materials and small transformers and motors are already produced on a large scale, and the principle of cheapness rather than that of quality prevails in regard to native manufactures. The industry is supported by the Protectionist policy of the Government, and the increase in duties brought into operation in 1911 has led to rates which are prohibitive for certain articles. Under the effect of the Protectionist policy, for instance, the domestic glow lamp branch has already rendered itself independent of foreign manufacturers. Carbon-filament lamps, of which about 5,000,000 are probably required every year, are made exclusively in the country by three firms, as a duty of 40 per cent. *ad valorem* prevents foreign firms from competing with the Japanese. In the case of metal-filament lamps, which are not largely used for the time being, about 500,000 per annum are made in the country, but it will not be long before these lamps supersede the carbon lamps, owing to the supply works introducing the system of meters instead of fixed charges for supply. The wire filament is obtained from the United States, and the fact has to be reckoned with that the export possibilities for wire lamps also will soon come to an end.

The development of electric lighting next receives consideration. It is shown that the companies increased from 111 in 1909, to 122 in 1910, the paid-up capital from £5,539,100 to £12,242,000, and the number of connections from 437,104 to 602,681 in the same years respectively. Although the number of incandescent lamps in use in 1910 is stated at 1,900,000, Mr. Brandt declares that other sources represent a total of 2,000,000 of S.C.P. in 1910, and 3,000,000 in 1911. Concerning the progress of electric tramways it is found that the number of companies advanced from 34 in 1910, to 40 in 1911, the length from 363 miles to 431 miles, and the mileage under construction from 180 to 221 in the same years respectively, whilst the paid-up capital has risen from £9,438,000 to £16,087,900. As most of the large centres have now been provided with electric tramways, it is considered that the rate of progress in new construction will be slower in the future. As far as concerns the main railways, which are now almost entirely in the possession of the State, it is mentioned that the Government is making experiments with electric traction, and the section between Tokio and Yokohama is already in course of construction. In conclusion, it is submitted that it is difficult for Japan to provisionally maintain the level of development which has hitherto prevailed in consequence of the strained financial resources of the Government and private individuals. On the other hand, the electrical industry experienced a favourable expansion in 1911; and as the country is specially suitable for the applications of electricity, it is possible to reckon upon a further development of this industry in the future.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**COSTA RICA.**—The Customs authorities have recently decided that electric lamp-stands of basket work without ornaments and without silk linings are to be dutiable at the rate of 40 centavos per kg. gross weight. (100 centavos = 1s. 10½d.; kg. = 2'204 lb.)

**SOUTH AFRICA.**—H.M. Trade Commissioner in South Africa has recently called the attention of British exporters to the fact that duty in South Africa is levied on the "current value of the goods for home consumption at the place of purchase, including packing," under Article 20 of the South African Customs Union Convention, which is as follows:—

"The current value of such goods shall be taken to be the true current value for home consumption in the open market of similar goods at the place of purchase, bought in the ordinary way from the manufacturer or supplier, in normal quantities, including the cost of packing and packages, but not including agent's commission if it does not exceed 5 per cent., provided that in no case shall the true current value, as above defined, be less than the cost of the goods to the importer at the place of purchase."

In addition, therefore, to the actual selling price c.i.f. South Africa, importers should state on their invoices the current value for home consumption in the United Kingdom, "including the cost of packing and packages."

H.M. Trade Commissioner has also received complaints from importers in South Africa as to the manner in which quotations are made by some British exporting firms. One or two cases have recently come to his notice in which importers in South Africa, having based their calculations on c.i.f. quotations made to them by British firms, have found out on receipt of the invoice that these quotations did not include packing charges. It should be remembered that c.i.f. means the cost placed on board plus freight and insurance, and the omission, whether in a cable offer or in a catalogue, of any item which goes to make up that cost should be stated, e.g., "packing extra, so much," or, if necessary, "packing extra, estimated at so much."

**VENEZUELA.**—The Customs Authorities have decided that electric lamps including the bulbs are to be declared on the Consular invoice, which must accompany them, as "Lamparas para alumbrado electrico inclusive los bombillos" and will be dutiable at the rate of 1'174 bolivares per kg. gross (25 bolivars = £1; kg. = 2'204 lb.). Fancy or other articles included in more highly taxed classes by reason of their nature, will not be classed as lamps merely because they are provided with a wire for lighting and a socket to hold the bulb. It should be noted that in filling up the Consular invoice, exporters must adhere to the wording in Spanish as laid down by the Customs.

A recent circular issued by the Customs Authorities points out how necessary it is that shippers should take the greatest care in filling up invoices. It has recently been their habit, when entering several parcels of the same goods on the same invoice to state particulars as to the number of the parcels, bracketing these together and entering the nature of the goods once only for all the parcels. This is not in accordance with the regulations and will not be allowed; the description of the goods must be repeated for each parcel. Another practice is to declare the goods by giving only a reference to the number of the item of the tariff under which they are dutiable, e.g.:—

Una caja aparatos comprendido in el No. 2 del Arancel.

(One case of apparatus included under No. 2 of the Tariff.)

The contents of each package must be declared by giving the name of each article contained therein without using abbreviations, dittos, or commas signifying dittos, the materials of which the goods are made, and the quality which distinguishes the goods from other articles of the same name, dutiable under a different number of the Tariff, e.g., "Una caja aparatos para generar vapor del residuo del petroleo, (a case of machinery for generating steam from the residues of petroleum)."

In future heavy penalties will be incurred unless the regulations are strictly complied with.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

8. "Non-spring two-way magneto control for motor-cycles." R. J. PRIDEY. January 1st.
19. "Gears for electrically operating machine tools and the like." J. P. HALL. January 1st.
43. "Apparatus for electrically operating planing-machines and the like reciprocating tools." LANCASHIRE DYNAMO & MOTOR CO., LTD., A. P. WOOD and R. S. MCLEOD. January 1st.
47. "Electrical apparatus for heating liquids." M. RUTZENBURG. January 1st.
78. "Mechanical grips for electrical wires." S. W. MARTYN. January 1st.
79. "Electrical terminals." S. W. MARTYN. January 1st.
80. "Electric incandescent lampholders." S. W. MARTYN. January 1st.
88. "Electric switches." F. BREMER. January 1st. (Complete.)
100. "Coupling for ships' telegraph and controlling shafting." A. M. PARKSONS. January 2nd.
119. "Connecting terminal for high-voltage circuits." E. HAEKEL. January 2nd. (Complete.)
130. "Apparatus for transmitting movements or positions of indices by means of multiphase-wound bodies." E. BECKMANN. January 2nd. (Complete.)
148. "Electric oil switches." BRITISH THOMPSON-HOUSTON CO., LTD. (Allgemeine Elektrizitäts Ges. Germany.) January 2nd.
171. "Means for maintaining high-frequency electrical oscillations in resonant circuits." CROMPTON & CO., LTD., and H. BUSGE. January 2nd.
178. "Electrical testing apparatus." A. W. BROWN. January 3rd. (Complete.)
203. "Supports for incandescent electric lamps." C. G. TAYLOR. January 3rd.
212. "Casings for electrical switches." P. S. TURNER. January 3rd.
232. "Electric water heaters." J. W. EWART. January 3rd.
297. "Electric arc lamps." CROMPTON & CO., LTD., and C. CROMPTON. January 3rd. (Complete.)
252. "Metallic conduits for electric light cables and the like." T. TAYLOR. January 4th.
253. "Trimming indicator for arc lamps." KORTING & MATHERSON AKT. GES. (Convention date, July 29th, 1912, Germany.) January 4th. (Complete.)
260. "Telephonic receivers, transmitters and other diaphragm instruments." A. MARA. January 4th.
313. "Electro-magnetically operated sound-emitting or calling means." E. A. GRAHAM. January 4th.
316. "Telegraphy." E. E. HEURLEY. January 4th.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1911.

- ELECTRIC CONDUCTORS. Q.M. Kallmann. 28,459. December 18th. (December 16th, 1910.)
- VOLTAGE REGULATION OF DIRECT-CURRENT GENERATORS. Akt.-Ges. Brown, Boveri & Co. 28,486. December 18th. (December 31st, 1910.)
- HOISTING OR WINDING GEAR FOR ARC LAMPS AND OTHER USES. F. S. Worsley. 28,668. December 20th.
- STORAGE BATTERY SEPARATORS. W. Taylor. 28,858. December 21st.
- STORAGE BATTERY SEPARATORS. W. Taylor. 28,859. December 21st.
- INTERCOMMUNICATION TELEPHONE SYSTEMS. G. H. Nash and Western Electric Co. 29,027. December 22nd.
- ELECTRIC IGNITION APPARATUS FOR INTERNAL-COMBUSTION ENGINES. G. Cowcher. 29,326. December 30th.

### 1912.

- METHOD OF, AND APPARATUS FOR, CONDUCTING AND CONNECTING CABLES, FLEXIBLE TUBING AND THE LIKE TO ROTARY OR MOVABLE MACHINERY. H. M. Ackery. 889. January 11th.
- PROCESS FOR THE PRODUCTION OF NON-POROUS ELECTRO-DEPOSITED COATINGS UPON METAL SHEETS. B. Lowy and F. Muller. 2,423. January 30th.
- DYNAMO-ELECTRIC GENERATORS FOR VELOCIPED LAMPS AND THE LIKE. C. Schlick. 3,650. February 13th.
- ARC LAMPS. R. H. Burkh. 4,417. February 22nd.
- APPARATUS FOR CONNECTING CONDUCTING WIRES, CABLES AND THE LIKE. A. Fodor. 5,534. March 5th.
- ELECTRIC INSULATORS. Bullers, Ltd., and G. V. Twiss. 6,296. March 13th.
- ELECTRICAL CONDENSER. A. C. Cossor, Ltd., and H. J. Steening. 6,987. March 21st.
- INDUCTOR ALTERNATOR. E. Podlesak. 6,988. March 21st.
- SIGNALING APPARATUS FOR USE IN SCREW CUTTING LATHES. C. G. M. Bennett and L. S. Fosbrooke. 7,486. March 27th.
- ELECTRIC INCANDESCENT LAMPS WITH BIPARTITE BULBS. P. Welss. 8,058. April 3rd. (April 6th, 1911.)
- FORM OF ZINC FOR GALVANIC BATTERIES. E. E. Moore. 8,767. April 13th.
- TERMINALS FOR ELECTRIC CONDUCTORS. J. D. Anderson and C. E. Fritts. 13,111. June 4th.
- PORTABLE ELECTRIC BATTERY LAMPS. K. R. Smith. 15,531. June 10th. (Divided application on No. 13,578 of 1911, December 8th.)
- DEVICES FOR MEASURING ELECTRIC RESISTANCES. Siemens Bros. & Co. (Siemens & Halske Akt.-Ges.) 15,862. July 1st.
- ELECTRODES FOR USE IN ARC LAMPS. A. A. Low. 17,678. July 30th.
- RECEIVING APPARATUS FOR ELECTRIC WAVES. F. Schneider. 18,086. August 6th. (April 15th, 1912.)
- TERMINALS SUCH AS CONTACTS AND ELECTRODES IN ELECTRICAL APPARATUS. British Thomson-Houston Co. (General Electric Co.) 535. January 6th.
- TELEPHONE SERVICE METERS. P. W. Wall. 1,167. January 15th.
- WIRELESS TELEGRAPH RECEIVING APPARATUS. Marconi's Wireless Telegraph Co. and H. J. Round. 3,055. February 6th.
- RECEPTION OF "CALL UP" SIGNALS IN WIRELESS TELEGRAPHY AND OTHER PURPOSES. F. L. Muirhead. 3,445. February 12th.
- ELECTRIC DISTRIBUTION SYSTEMS. British Thomson-Houston Co., H. W. Taylor, F. P. Whitaker and H. N. Spörborg. 8,532. February 12th.

**Bang goes Tuppence.**—Lossiemouth is a little burgh—in more senses than one. We confess that its fame had seldom reached our ears until September last, when in the interests of its 4,198 inhabitants it invited manufacturers to tender for an electrical installation. Prolonged deliberations no doubt have occupied the intervening months 'twixt then and now, for as recently as 10 days ago those who were privileged to tender, were informed that no decision had been come to in regard to the offers. Enclosed with this intimation, they have been favoured with the return of their guinea deposit—with a deduction of two-pence! The assumption is that this is made up as to two bawbees for postage, and another two for the cost of the postal order. The incident would be ludicrous were it not unfortunately indicative of a great deal that public tenderers have to put up with. We doubt whether the burgh has any electric lighting powers, and, may be, this is why nothing has been done.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION

In the Press.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

THE letter addressed by the managing director of the Marconi Co. to the Postmaster-General, and by him communicated to the Select Committee which is now inquiring into the contract provisionally signed, is a somewhat exceptional document. Its object is to express the company's desire that they may be relieved from the obligations of that contract, a proceeding to which no exception can be taken as an ordinary business operation, but the rhetoric by which the intimation is accompanied will seem to most people to be somewhat misplaced. Anticipating, as the managing director naively says, that the tender delivered on March 7th would be promptly submitted to Parliament and ratified, they retained "a very large responsible and experienced staff of engineers" in readiness to undertake the work. When the provisional contract was signed on July 19th they were, they think, reasonably entitled to expect that it would be forthwith submitted to Parliament for ratification, but a Select Committee was appointed instead.

Over three months have elapsed, 28 public sittings have been held and many witnesses called, but the Committee has had no evidence "from those best qualified to speak with experience on the subject," and in the meantime erroneous statements, technical and otherwise, "reproduced in the Press of nearly every country in the world," have been detrimental to the company's interests. And now it is proposed to appoint a technical Committee to inquire as to which is the best system, which the company would welcome, provided proper facilities were afforded for testing the evidence to be called before it, though they regret that it was not appointed three months ago. The delays were not contemplated by either party; it is inequitable, says Mr. Godfrey Isaacs, that his company should remain bound, and in order to continue to maintain the company's position "in an important industry developed in and conducted from this country, employing over 2,000 British workers, our engineers must be released, and Mr. Marconi and I must be free to attend to other important work."

The interim report of the Committee made it tolerably clear that the contract would not go through in its original form, so that the company cannot be said to be doing anything particularly heroic in withdrawing from the contract, and expressing their readiness to consider other terms when they are offered.

According to the City editor of the *Westminster Gazette*, the course taken by the company "is generally applauded in Stock Exchange quarters, because it is considered that it is good policy on the part of the company to force the pace as much as they can." To force the pace by unreasoned criticism of the proceedings of a Committee appointed by Parliament which has the decision in the matter seems to us to be of doubtful wisdom, whilst the general tone of the letter is, we fear,

calculated to enlarge the circle of those who hesitate to entrust an important Imperial undertaking to private hands. There is, no doubt, some occasion for irritation to the parties who entered into the contract, but it should be realised that confidence is more likely to be restored by calmness and patience than by a display of irritation. The position and the opportunities of the Marconi Co. may be unrivalled, but they should be used with discretion, at least where Parliament is concerned.

#### The Ferranti Steam-Gas Turbine.

It has been common knowledge amongst his friends for some years that Dr. Ferranti was engaged upon important investigations in connection with the utilisation of "steam-gas"—i.e., steam superheated to a temperature far above its saturation point—in turbines, but little has hitherto been divulged regarding the details of the work, or the degree of success which had been attained. We are glad, therefore, to be able to reproduce from the James Watt lecture, which he delivered at Greenock last week—a lecture of deep interest throughout—some particulars which indicate the progress that he has made.

The fact that Dr. Ferranti's views have been embodied in a turbine of no less than 5,000 H.P. bears witness to the large scale upon which his experiments have been carried out, and preserves them from the suggestion that laboratory results may not be realised in practice. We are still without information as to the details of the construction which renders stripping impossible in spite of the use of extremely small clearances, but the statement that the H.P.-hour can be obtained with an expenditure of no more than 7 lb. of water at two-thirds load at once stamps the invention as one of the first importance. Not long ago Sir Charles Parsons himself, upon whose foundation modern turbine practice has been built up, expressed the view that the steam turbine had approached the limit of possible economy, but clearly there are still great possibilities of progress.

It will be observed that Dr. Ferranti strongly deprecates the construction of large oil engines, maintaining that the turbine is the right thing for large powers, and in view of the economy he has attained—taking capital cost into consideration also—it seems probable that the incentive to effort in this direction will in future be lacking. The suggestion that the power station of the future will embrace a large gas plant with by-product recovery plant, supplying gas to the boilers and heavy oil and petrol for the use of internal-combustion engines, recalls the views enunciated in "the Ferranti address" of 1910, and indicates that Dr. Ferranti looks forward with undiminished confidence to the dawning of the electrical age then foreshadowed. It will be remembered, too, that he then hinted at the possible successful development of the steam-gas turbine as one of the factors in producing that result. We wish him all success in the realisation of his prophecy.

#### British Electrical Superannuation Fund.

THE British Electrical Superannuation Fund, which was formed about 1900, appears to have had but a short life as such, for we understand that during the past year it was resolved to wind it up as on December 31st, 1911. It would seem that if all retirements took place at the earliest optional age of 60, instead of being spread mainly over the ages from 60 to 65, a deficiency of some £15,000 would be disclosed. When originally formulating the fund it was, we believe, the wish and endeavour of the British Electric Traction Co. to adopt a superannuation scheme capable of application to the possible needs or requirements of the electrical industry generally. The industry, however, with the exception of the City of London Electric Lighting Co., seems to have

ignored the idea, and its operations were therefore practically confined to the salaried employes of the British Electric Traction Co. and its subsidiary companies. We understand that in place of the British Electrical Superannuation Fund, a new fund has been constituted and inaugurated called the British Electrical Endowment Fund, which, however, we gather the City of London Electric Lighting Company has not joined, that company apparently being quite capable of carrying on a fund similar to the British Electrical Endowment Fund. The secession of the City of London Co. means the payment by the British Electrical Superannuation Fund to the City Co. of some £9,000. The managing trustees and the investment trustees of the Endowment Fund are empowered to hold all moneys recently belonging to the Superannuation Fund or investments representing the same, for the purposes of the Endowment Fund, and to apply them as provided by the rules of that fund, which we believe came into operation as from January 1st, 1912.

#### Copper.

THE total European visible supply still keeps fairly level, the figures given in Messrs. Merton's statistical circular being 43,160 tons for January 15th, 1913, against 43,241 tons for December 31st, 1912, the difference of 81 tons being a balance between the decrease in English stocks (1,499 tons), and on quantities afloat (100 tons), and the increase in French, Dutch and German stocks. The supplies are thus close up to deliveries, and show a fair figure (23,371 tons) for the half-month. The North American deliveries to Europe are fairly high; Spain and Portugal send the average quantity to England and France. Chile shipments are high, and Australian just average. If the deliveries were doubled the figures for the month would be fairly good; this, of course, depends upon whether the drop in price is maintained or not.

The world's supplies, including Holland and Germany, stood, at the end of December, at 90,225 tons, an advance on the figure for November of 8,478 tons. American producers' stocks, according to the Association, stood, on the same date, at 47,014 tons, an advance of 8,548 tons on the preceding month. The December production in the States, from the same source, was 64,000 tons, the home consumption taking 25,100 and export 29,330, leaving a surplus to stock.

The figures for each month in the year are given by the *Financial News* for January 9th, showing that this production was only exceeded in August and October, that July was fairly well up to it, the other months being lower, January and February showing least. The home consumption was brisk the first part of the year, reaching its maximum in October at 37,550 tons. The total production for 1912 is given at 706,000 tons, a quantity considerably higher than the 639,000 tons credited to 1911.

The reason for the drop in price, which amounts to £3 15s. since December 31st, is discussed in the *Financial Times* for 17th inst. The writer of the article is not inclined to consider the increase in American stocks a determining factor, but rather attributes it to the situation created by anticipations of continued expansion in commerce generally, and consumption of copper particularly, which have not been realised, tending to overload the market. The consumer also appears to have been apprehensive of a market showing signs of artificial prices, such as could be traced in those of September. Messrs. James Lewis summarise the conditions of trade in 1912, by dividing the year into two periods of six months, in the first of which prices improved, after falling to £61 per ton, under the influence of good trade and decreasing supplies.

The highest point was reached on June 20th, when standard was quoted at £80 cash. Prices were maintained, probably artificially, till the outbreak of war in the Balkans,

with the subsequent uncertainty and trade depression. Messrs. Lewis give the total home consumption of the United States at 110,100 tons, an increase of 113,500 tons over the preceding year. Consumption in Germany also increased by 31,000 tons, or 25 per cent., England and France being, apparently, the only considerable countries which lost ground. The world's consumption is given at 939,000 tons, as against 811,300 tons in 1911. The total production of the world, however, is estimated at 1,015,000 tons, an advance on 1911 of 110,000 tons. The United States increased its output by 71,000 tons, or over 14·5 per cent., and further expansion in low-grade ores is anticipated. Chile has increased her output by 8,000 tons; Mexico, 11,000 tons; Spain and Portugal, 9,700 tons; and Canada, 7,000 tons. Russia and Australia are both increasing production, and much is expected from Central Africa.

Taking into account the upward tendency of production, and the present fairly high price, it seems probable that the average for standard in 1913 will be lower, unless the settlement of the Balkan trouble and improved commercial conditions in this country should unite to give an impetus to consumption.

**"The Surveyor."**—We note with pleasure that our valued contemporary, *The Surveyor*, arrived at its majority last week, and celebrated the occasion with a special issue dated January 17th. Since its first year, the journal has greatly increased in bulk and circulation, and has attained to a very high standing as the organ of the professions included within its full title—*The Surveyor and Municipal and County Engineer*. During the past 21 years, *The Surveyor* has witnessed vast changes in municipal engineering and in the organisation of municipal government, and has been enabled to play a prominent part in safeguarding the interests of municipal engineers. We believe, too, that, throughout its existence, it has remained in the hands of the original proprietor.

In the special issue, besides a general survey of the period, there are given special reviews of the advances made in electricity supply, highways—a subject which our contemporary has made its own—public buildings, refuse disposal, sewerage, street lighting, tramway progress, water supply, and legislation, the whole constituting a valuable and interesting résumé of the remarkable developments which have taken place in each of these important branches of municipal activity.

We congratulate the proprietor and all concerned in the production of this issue and on the attainment of the twenty-first milestone, and hope they will celebrate their jubilee under conditions no less auspicious.

**The Curative Waters of Bath.**—Last week a number of London doctors visited Bath and attended an informal conference on the radio-active waters of the city. According to the *Times*, Sir William Ramsay, in opening the conference, said the gas from the waters was now bottled up in steel bottles under pressure and used in spraying. There were three methods of profiting by the curative properties of the waters. If they were drunk they should be taken in small quantities and often. In the case of baths, the patient should be made negative in order that the particles given off by the radium could be absorbed through the skin. Where the method of spraying and breathing was adopted the patient should be made negative also, in order that the particles might decompose.

**Electroculture in Austria.**—An interesting account of results obtained by electroculture at Petrovic (near Prague), appears in a recent issue of the *Elektrotechnische Zeitschrift*. The experiments were carried out during the exceptionally dry summer of 1911, but, on a number of patches under the same management and subject to the same treatment in every respect except electrification, the yield of some crops was twice as great on the electrified as on the "control" areas. The high-tension discharge system was employed, steel wires being stretched across the fields at intervals of 100 yards between insulators mounted on wooden poles; 60 poles were in use in an area of 90 acres. On these steel wires rested a radiating network of 0·2 mm. diameter steel wires placed 10 yards apart. The height of the network was 12 ft. above ground level, so that ordinary carting operations were not hindered. In the small stations supplying the network, a high-frequency current (obtained by the aid of mercury interrupters), was transformed up to 100,000 volts and then rectified before admission to the radiating network. The total power consumption for the 90 acres was 2 amperes at 120 volts. The discharge was maintained only for a few hours per diem, and was necessarily entirely suspended in wet weather: it was purposely interrupted during very hot weather (since experience shows that the discharge treatment is useless or even injurious in the latter case).

The quality as well as the yield of the crops was much improved by the electrical treatment, and it is claimed that, if the radiating network is so designed as to take full advantage of the output from the transformer station, the capital cost of the whole equipment can be recouped by the increased returns during the first year of working.

## ELECTRICAL DEVICES FOR MEASURING THE INFLAMMABILITY OF COAL DUST.

The second Report of the Explosions in Mines Committee to the Home Secretary has been issued, and deals with experiments made to determine the inflammability of various coal dusts.

The degree of "inflammability" of any combustible material can be defined as the degree of ease with which its oxidation can be effected so as to produce flame. It will be seen from this definition that the inflammability of any combustible material depends essentially on its chemical affinity for oxygen. The inflammability must also, however, be affected to a large extent by the physical condition of the combustible material, whereby it is rendered more or less open to attack by the oxygen.

When considering the relative degrees of inflammability of coal dusts, it can be accepted as an axiom that the finer the dust from any particular coal the greater its inflammability. This has been confirmed by a large number of experiments. Bearing this in mind, the consideration of the more important and more complicated problem of the influence of the chemical nature of the coal on the inflammability of the dust from it can at once be proceeded with.

The method of investigation chiefly followed by the Committee has depended upon the destructive distillation of different varieties of coal under different conditions. The apparatus used by the investigators is described below. Accurately weighed quantities of the dust were blown upon

FIG. 1.

a platinum spiral maintained at the same temperature in each case, and their relative inflammabilities were judged by the impulses given to a ballistic pendulum by the sudden expansion consequent on the inflammation of the dust clouds.

Referring to fig. 1, A is a glass cylinder, 8 cm. in diameter and 140 cm. long, open at both ends. A platinum coil of No. 32 gauge wire, closely wound on to a tube of thin-walled quartz of capillary bore, passes horizontally across a diameter of the cylinder at a point 40 cm. from one end. Through the bore of the quartz tube a platinum and platinum-rhodium thermo-couple passes, and is connected to a milli-voltmeter calibrated so as to read temperatures on the Centigrade scale. By means of suitable connections, an electric current can be passed through the spiral, so that it can be heated to any temperature up to about 1,400 °C., and maintained at a constant temperature by the adjustment of an external resistance. The length of the spiral is 17 mm., and its diameter 1·5 mm. The coal dust to be tested is blown across the heated spiral as a cloud of a fairly uniform density, successive trials being made until a temperature is found at which general inflammation of the dust cloud takes place.

To obtain the dust cloud, about 2 gm. of the sieved and dried dust is placed in a glass tube of 2·5 cm. internal diameter and 45 cm. long. This tube is closed at one end by a rubber stopper carrying a glass tap of 1 cm. bore. It is supported so that the open end is at a distance of 30 cm.

from the spiral. The tap is connected with an arrangement for giving a constant puff of air.

The method of making the determination is as follows:—The dried and sieved dust is introduced into the tube B so that it lies evenly over its whole length, and the tube is then closed by the rubber stopping and tap, and clamped in position. The platinum coil is then raised to such a temperature as previous trials may have indicated to be about that required. The dust cloud is then produced by suddenly opening the tap C. The air blast passing over the surface of the dust raises the top layer and carries it into the larger tube, and over the heated coil in a cloud that remains uniform during the stroke of the piston. If ignition takes place, the temperature of the platinum coil is lowered 10° or 20° C., and a fresh trial is made, and so on, until two temperatures are obtained, differing by 10° C., at

relative ease with which inflammable gases are evolved. The order of inflammability so obtained corresponds in a remarkable degree with the percentage of inflammable matter extracted from the same coals by pyridine. The Committee is of opinion that these two methods form a valuable means of discriminating between different coals in respect of the sensitiveness of their dusts to ignition. It must, however, be noted that these tests have been made with dusts artificially ground and sieved to an equal degree of fineness, and since coals differ considerably in their power of resistance to pulverisation, the friability of a coal must be taken into account.

There are three appendices to the report, dealing with the volatile constituents of coal, the extraction of coal by pyridine, and analyses of coals and their relative ignition temperatures.

FIG. 2.

one of which inflammation takes place, whilst at the other the dust cloud passes over unignited. The mean temperature is then taken to be the ignition temperature of the dust under the conditions of the experiments.

The French mining authorities have carried out experiments dealing with the same problem, and their index of inflammability is the size or length of the flame produced when a given quantity of the dust is blown through a vertical porcelain tube of 25 mm. internal diameter and 10 cm. long, heated to a temperature of 900° C. The Home Office Committee has made similar experiments, employing the apparatus shown in fig. 2.

The dust, carefully sieved and dried, is introduced into the horizontal dust tube, its weight being 0.2 gm. The wide portion of this dust tube is then placed vertically in the small electric furnace, a slip of copper gauze being introduced between the furnace tube and the dust tube. The temperature, measured by a platinum and platinum-rhodium thermo-couple passing through the furnace and in contact with its walls, is then raised to 900° C. and maintained constant. A tap, which connects the dust tube to the apparatus for giving a constant puff of air, is now quickly opened. All the dust in the dust tube is thus projected downwards through the furnace. It ignites, and a flame appears underneath. This flame is photographed, the experiments being made in the dark, and the sensitised plate being exposed a little time before the tap is opened and allowed to remain exposed until all flame has disappeared. It is from the appearance of such flames that the French experimenters judge the relative inflammabilities of the different dusts.

In making these experiments the Committee found that, provided all the experimental conditions were maintained rigidly constant, the size and type of flame obtained from one particular coal remained remarkably constant from one experiment to another. Comparison between one coal and another by means of the photographs of their flames can, therefore, be relied on.

The experiments show that the relative inflammability does not depend upon the total volatile matter, but on the

## THE NATIONAL INSURANCE ACT. 1911.

### OUTWORKERS. CONTRACT OF SERVICE.

By JOS. J. H. STANSFIELD, F.C.I.S.

THE first schedule to the National Insurance Act, 1911, consists of two parts, the first containing a list of employments within the meaning of that part of the Act referring to health insurance, and the second a list of exceptions.

Paragraph (c) of the first part provides that insured persons includes outworkers—that is, persons to whom articles or materials are given out to be made up, cleaned, washed, altered, ornamented, finished or repaired, or adapted for sale in the home or other premises not under the control or management of the person who gave out the articles or materials, unless the Insurance Commissioners have by Special Order excluded any particular class or description of such outworkers.

The amount of insurance payable for outworkers in many cases causes difficulty. Where a person is continuously employed by one employer the difficulty is not great, and no hardship is laid either upon employer or worker beyond that entailed by the ordinary employer whose workpeople are engaged upon the premises of the employer, but many outworkers work for more than one employer, or only work at intervals, or are assisted by other members of their family. In such cases both employer and worker are placed at a disadvantage; the employer because of the intermittency of the employment entailing the insurance of a proportionately larger number of employes, and the outworker because more than one contribution per week would be payable, or because deductions would be made when employment might have been available only for a few hours during the week.

Official explanatory leaflet No. 26 shows how this difficulty may be overcome, contributions being payable under two methods. Method A is the ordinary method applicable to insured persons working on the premises of the employer, one contribution being payable for each calendar week (Monday to Sunday) or part of a week in which work is done.

Method B is called the "unit" system of payment, and by this system contributions are payable not according to weeks, but on the basis of the amount of the work done, special cards (A.O. for men and E.O. for women) being issued.

Where outworkers are working for more than one employer and Method A is adopted, the employers may agree to stamp the card in rotation, but if they do not so agree, each employer must, whenever work is brought in, stamp the card for each week or part of a week that has passed since the work was given out, unless contributions in respect of those weeks have been paid by some other employer.

Under Method A, only one contribution is payable for each week, but where Method B is also used and an outworker works for more than one employer, one card must be used for the one or more employers who use Method A, and a separate card for each employer using Method B.

Under this regulation more than one contribution may be payable for the same week, but after 52 contributions have been paid in any year, no further contributions need be paid for the year if the outworker applies to his or her approved society, or to the Insurance Commissioners for a certificate to this effect. On the other hand, an outworker regularly employed by an employer who is using Method A, and by another employer who is using Method B, may call upon the latter employer to also use Method A after the end of any quarter.

Under Method B one contribution is payable for each unit of work, however long or short a time the work may have taken. This unit is an amount of work which earns a certain sum fixed by the Commissioners for each trade, and it is intended to represent the amount an ordinary worker would earn if a full week were worked.

The following are a few samples of "units":—

1. Hand-hammered chain making up to and including  $\frac{1}{2}$  in. (i.e., small sizes) 10s.
2. Dotted or tommed chain making and hand-hammered chain making of  $\frac{3}{8}$  in. diameter and over—up to  $\frac{1}{2}$  in. inclusive—20s.
3. The making of boxes or parts thereof made wholly or partially of paper, cardboard, chip and similar material. For female workers 12s.

Where no units have so far been fixed for any particular class of work a general unit of 15s. for male workers and 8s. 9d. for female workers has been fixed by the Commissioners, but where these general units are considered to be under or over the work value of a week, the Secretary of the Insurance Commissioners may be written to and unit values of a different amount may then be prescribed if thought desirable.

If a unit is, say 10s., and a worker brings in work for which 10s. 9d. is payable, two stamps need not be paid, and the extra 9d. may be carried forward towards the next unit. On the other hand, if work is for the first time brought in below the value of a unit, a stamp must be affixed, but no further stamp is payable until the total value of the unit is made up. In reckoning the value of work, any expenses incurred in doing the work must be deducted before arriving at the unit value.

The regulations as to employment of outworkers have recently been amended, and the amended regulations came into force on January 13th of this year. The Official Explanatory Leaflets, Nos. 25 and 26 (revised), deal with the question of outworkers in England.

The second part of the first schedule to the Act provides that outworkers who are the wives of insured persons are not insurable. This exception placed such workers in a better position than other outworkers, and an order has been made by the Commissioners, with the approval of the Treasury, to include such persons.

It is, however, pointed out that the Act provides (Sec. 2) that if she is ordinarily and mainly dependent for her livelihood upon some other person, a certificate of exemption can be obtained by applying to the nearest Customs and Excise officer. No contribution will then be payable by the worker, but the employer will still have to pay his own share of the contributions.

*Contract of Service.*—Paragraph (a) of the first part of the First Schedule to the Act uses the words "contract of service" in determining whether an employé is insurable or not, and cases occur where the Insurance Commissioners are asked to determine whether any particular class of worker comes within the Act.

Such an application was recently made by a number of insurance companies and friendly societies, who wished to know whether agents paid by commission or fees for part time or spare time service to canvass for business or to collect moneys, were employed under a contract for service.

On December 9th last the Commissioners held a public hearing, and decided that agents engaged under the agreements handed in by the companies and societies had to be insured, unless paragraphs (e) and (g) of the second part of the first schedule to the Act applied.

Paragraph (e) provides that agents paid by commission or fees, or by a share in the profits, or partly in one and partly in another such way, are not insurable as agents where they are mainly dependent on earnings from some other occupation or where they are ordinarily employed as agent by more than

one employer, and his employment under no one of such employers is that on which he is mainly dependent for his livelihood.

Paragraph (g) provides that employment otherwise than by way of manual labour at a rate of remuneration exceeding £160 a year, or employment involving part time service only, at a rate of remuneration which, in the opinion of the Commissioners, is equivalent to a rate exceeding £160 a year for whole time service, is not insurable.

## THE ELECTRIC DRIVE IN THE WOOD- WORKING YARD.

FEW to-day question the increased economy and efficiency to be obtained by the application of electrical power, but perhaps it has not made such strides in the wood-working industry as in other directions. This is chiefly because the proprietor, as a rule, has had too limited an idea of the benefits to be derived from electric driving. He has looked only for a decreased power bill, and has been quite unaware that an electrical power equipment would enable him to improve and quicken his processes, increase his output, and reduce his labour bill.

Where there is a public electrical supply available, very advantageous terms can often be arranged. But the important economies mentioned above make it advisable to use electrical power, even when no public supply is at hand. In such cases the steam boiler and engine may still be retained (and, if necessary, the wood waste still used as fuel), but instead of mechanically distributing the power through

GENERAL VIEW OF SAWMILL.

shafting and belts, the engine should be used to drive a dynamo, supplying current to drive motors coupled to individual machines or groups of machines.

Wood-working machines are very diverse in their characteristics, and require individual consideration in order to secure the best results. In nearly all cases the load is a very fluctuating one, due to knots, uneven sawing, and nipping of the timber, while there is always the liability of sudden overloads due to these causes. Gradual starting of the tools is a necessity owing to their very high working speed and heavy starting load, as in four-center planing and moulding machines, and it is equally necessary to be able to stop immediately in cases of emergency.

These conditions demand that the switchgear should be simple to manipulate, or it will absorb attention on the part of the workman which should be given to his work.

The motor must be automatically protected by the controlling device against damage arising from failure of voltage or from overloads, and the switchgear must be capable of frequently opening circuit on the occurrence of dangerous overloads, without itself sustaining damage.

It is also advisable completely to enclose the switchgear in one substantial housing, as, in spite of the elaborate system of suction pipes, the atmosphere is more or less charged with dust, which tends to percolate everywhere.

A conspicuous example of what may be achieved by a well-planned installation, embodying the most suitable form

LEA VALLEY MILLS: 30-H.P. MOTORS AND "CONSPED" CONTROLLERS DRIVING LINE SHAFTS.

of control, is afforded by Messrs. Lathom's Lea Valley Mills, of which the following is a brief description:—

The whole lay-out was arranged by the engineers of the Hackney Borough Council's Electricity Installation and Sales Department. The total horse-power at present installed is 280, and the voltage 240 and 480 volts D.C. The largest motor is of 50 H.P., and the smallest 2 H.P.

All the motors are shunt-wound, fitted with interpoles, and of the enclosed ventilated type, by Messrs. J. H. Holmes and Co., of Newcastle-on-Tyne. One 50-H.P. motor drives a line of shafting, which drives four 36-in. circular saw-benches. The second 50-H.P. motor drives two log frames of the vertical reciprocating type, by Messrs. Robinson, of Rochdale, each machine being capable of making any number of vertical cuts up to 24 simultaneously from logs up to 30 in. sq. and 12 ft. long.

One 15-H.P. motor drives a log-frame saw of the horizontal reciprocating type, by Messrs. J. Pickle & Son, of Hebden Bridge, which is capable of making one cut up to 48 in., cutting at the rate of 2 in. per minute.

Four 30-H.P. motors each drive a length of shafting, from which various moulding and planing machines, vertical spindles, circular saws and band saws are driven.

Other smaller machines are fixed for working saw-sharpening tools, &c.

The control panels at Messrs. Lathom's mills are all made by the Adams Manufacturing Co., Ltd., of London and Bedford, and of the well-known "Adams Igranite Conspede" type; they can be clearly seen in the illustrations. Each panel is enclosed in an iron housing of pillar form, and special precautions are taken in enclosing the control gear to exclude the dust effectively.

In individual driving it is even more essential than in group driving to provide means for rendering sudden overloads harmless, because in individual driving the motor has only power sufficient for the one machine that it drives, and no assistance is available from fly-wheels or countershaft pulleys, while the amount of kinetic energy stored in the moving parts of the machine and the motor is practically negligible. For instance, if a saw sticks, as it is always liable to do, the electric motor, in order to cope with the increased load, demands an abnormal amount of power from the mains. When this demand reaches a value likely to be injurious to the motor, the machine should be automatically stopped and the overload removed.

Automatic stopping under an overload is very trying to the control gear, and this is a point at which unsuitable controllers invariably fail and give trouble. The only satisfactory method of breaking a large overload current is to remove the actual break from the contacts of the starter altogether, and allow it to take place on a specially designed circuit-breaker, which should be fitted with very powerful magnetic blow-out and carbon circuit-breaking contacts.

In the "Conspede" controllers the circuit-breakers are made to be self-resetting. They have no handle, the whole operation being entirely automatic, and no further attention is required to restart the motor after being stopped by an overload than simply to reduce the load to safe dimensions, and start again in the ordinary way.

The circuit-breaker and starter are so interlocked that the first movement of the starter handle in the direction for starting causes the circuit-breaker to close automatically, and should an overload occur, either through too-rapid starting or from any other cause, it will reopen, and no effort on the part of the operator will avail to keep it closed until the load is lightened. Furthermore, having opened, the circuit-breaker will not close again until all the starting resistance has been re-inserted. A backward movement of the starter-handle immediately stops the motor by opening the circuit-breaker, thereby making the contacts

dead and protecting them against sparking and burning.

The panels have the great advantage of having only one handle, so that there is no possibility of the various operations being performed in improper sequence, as might occur if there were two or more handles, and the attendant were to operate them in incorrect order.

Each panel is provided with a stopping button at the side of the housing. These buttons are arranged to open the circuit-breaker, not to short-circuit the no-volt spools.

LOG FRAME, SAW OF THE VERTICAL RECIPROCATING TYPE, AND CONTROL PANEL.

This feature makes the panels equally suitable for stopping the machines as for starting them, as the main circuit is never broken on the starter contacts. Any number of these buttons may be fitted round the various machines, thus placing them entirely under the control of the workmen, so that the machines can be stopped immediately on emergency from any position.

We understand that since this plant was installed, over six months ago, the Council's engineers have not had to replace a single fuse.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## Screw Caps for Radiator Lamps.

Replying to Mr. W. H. Allen's letter in your issue of January 17th, respecting the trouble with radiator lamps and lampholders, I agree that the ordinary bayonet type is quite unsatisfactory. The screw holder would be an improvement, but for some reason this type of holder is not popular in this country.

I have experienced the burning away of the plungers of the holders, and also the contact plates of the lamps continually, as many radiators pass through this department in

HORIZONTAL RECIPROCATING LOG FRAME SAW AT LEA VALLEY MILLS.

the course of a year. I think, however, I have overcome the difficulty by using "Mumps" holders, which lock the lamps in the holder. The porcelain body carrying the connections can be pressed forward to the lamp cap by means of a threaded ring to such an extent that the plunger sleeves engage with the lamp connections, thus forming a solid contact with the lamp. I have tested this form of lamp-holder since last September, and, in fact, all radiators now issued from this department are fitted with this particular type of holder. The holders cost nearly three times as much as the ordinary bayonet type, but the difference in cost is nothing compared with the saving in upkeep and satisfaction to the user.

S. E. Fedden, *Manager*.

Electricity Supply Department, Sheffield.

## The Case of the Sub-Man.

I was very pleased to see your remarks *re* personalities, and feel sure the stale "old chestnuts" apply neither to the average present-day wireman nor to the sub-man. But what has struck me is the abhorrence which every sub-man has to membership of the Electrical Trades Union, and I trust you will let me say a word in defence of that society. Allow me, first of all, to welcome the movement to bring together our central station men. Of course I should prefer them to be members of our Union, but failing that, I hope a good strong organisation will be built up. The E.T.U. has always fought for the betterment of the conditions of the workers in our industry, no-matter in what

capacity, and if, up to now, no great success has been effected, that is because the men outside our ranks have not seen the benefits of organisation. Yet, at quite a large number of central stations in London alone, the E.T.U. has been the means of getting the men employed there fairly large increases, and, honestly, I do not like to see this biting the hand, which (if it does not feed) at any rate helps it. The men employed at the stations at Poplar, West Ham, Battersea, L.C.C., &c., have had their wages largely increased through the efforts of the E.T.U., and that, too, Mr. Editor, without a strike. The minute books of these various concerns will prove whether I speak the truth or not. How many of the men employed at these stations are members of the E.T.U.? I wonder! How many would join to help pay for the benefits they are receiving, and to help keep them up? I wonder! Too degrading, I suppose. I have yet to learn of any of these

increases of 5s., 7s., and in some cases even more per week, being refused because they were the outcome of actions taken by the E.T.U.

So I trust the sub-man will not run down quite so much the Electrical Trades Union, the members of which are trying to better the conditions of those who are employed in this industry of ours—and as regards the sub-man, it requires some bettering. We have it on the word of Mr. Balfour, Mr. Lloyd George, the Bishops of Hereford and London, &c., and all the leading scientists of to-day, that the first charge upon any industry should be a living wage for *all* the persons employed in that industry. If any industry was not able to stand that, it should be swept away, as it was a menace and danger to the community. If this is true, and I, for one, should not care to disagree in this case with the eminent persons named, then half of these islands would be without light and power, apart from anything else. So, sub-men, organise, join this Association, try to improve your status, and get a living wage, but don't be snobs. In conclusion, I will relate a little incident, *which is absolutely true*, and happened only a few months ago.

At a large mill in Lancashire all the hands were in their Trade Unions, except the engine room staff (about a dozen in number). But in these days of industrial unrest no one is safe, and the men and women employed at this mill demanded that the engine room staff should join their Union—viz., the E.T.U. The fiat went forth from the manager that this should be so, and the engine room men were irate. A deputation met the manager and directors, and stated that *all* the men had conscientious objections to joining the E.T.U. Said the manager, "I have conscientious objections to *all* Trade Unions, but my conscience cannot stand in the way of my business. You will have to be like me—give your conscience a rest." They joined the Electrical Trades Union to a man, and their wages now are a bit more than they used to be, and their conscience is still resting.

So don't be snobs; we are not exactly mice, and even they have been known to help lions.

W. J. Webb.

London, W., January 18th, 1913.

Having read with considerable interest the many letters on central-station and sub-station engineers' grievances during the past few weeks, I am not at all surprised at the rather heated remarks. I myself being a central-station engineer agree with my fellow engineers and sub-station men. I might point out to Mr. Potter and his friends that the greater portion of the central-station engineers, &c., are men who have been through the shops of firms who manufacture the electrical and mechanical machinery used in central

stations. These men are the fit and proper persons to take charge because of their personal and practical knowledge of the machinery under their care. I understand that Mr. Potter is under the impression that wiremen are also fit and qualified men to enter upon central-station duties. I should like to point out that the wireman is a man used to wiring, erection of small motors, and occasional small factory work. As to central stations, his ideas are wrong. Where would the wireman be on a high-tension board? Another point is that central and sub-stations are in the first onset erected and fitted up by firms supplying the equipment and not by wiremen. As to the Association of Central-Station Shift Engineers, and Submen, &c., I quite agree that it is a thing much needed.

I will give the E.S.E.A. my support, and I hope that the secretary or a member will communicate with me as soon as possible. Mr. Potter need not be afraid that we shall upset the E.T.U., as I can assure him that the less we have to do with that society the better for all; we require trained men as engineers, not linemen or recruits. I consider that all engineers ought to pass an examination and hold a certificate as to qualifications.

Central-Station Engineer.

I have read with interest the recent letters *re* the association of submen. Why this should be necessary, I cannot say. Why not at once form an electrical association and include all grades who are connected with the running and maintenance of electrical plant? The submen are only a small section compared with the men who have charge of large plants in works, &c., where electrical power is used.

I have charge of plant for one of our leading newspapers, and there must be a large number in similar positions, and from experience I must say that to hold these positions requires highly skilled men and practical electricians; also there must be hundreds, if not thousands, of men in charge of plants in large works and business establishments in the British Isles. I know, personally, men who hold positions of this description whose salaries are from £3 to £6 per week, and I cannot say that it requires a college education to secure and keep these positions. A practical man is what masters require to-day. I have had my wiring experience with a firm of contractors, and very glad I am to know that I can do this class of work when required, and I cannot understand anyone classing himself an electrician who has not spent some time in wiring.

My point is this. The Electrical Trades Union only cater for the wiremen and armature winders, and their rules and rates of wages are for them alone; they have no rates for plant electricians, so, therefore, it is useless to join them. They may have a few in the society, but not many.

What I suggest to plant men (including submen) is to form an association or union, and not have it split into sections.

This correspondence was introduced in your paper some two years ago, and I think fell through owing to a certain section not wishing to come into contact with the other, and to make a successful start this time snobbishness must be left out.

I offered two years ago to do my share in Lancashire to form an association, and shall be pleased to do so now, and am sure should anyone write the editors of the REVIEW we could get into touch with each other.

Unity is Strength.

I have read with much interest the correspondence in this paper with regard to the case of the sub-man, and it seems to me that we are getting very wide of the mark at which this correspondence was started. Now, it is nothing more or less than an argument as to who is the greater "gentleman," a "sub-man" or a "wireman." Speaking from experience, I can say there are as good "wiremen" with breeding and training as there are sub-men. I myself have been a much looked-down-upon wireman for several years, although I have had a good college training, and technical and practical experience in sub-stations and power stations of every description. I heartily endorse "Switchboard's" remarks that a man to make a good engineer is not necessarily the man of good birth and upbringing, but what a man is in himself. If "Motor-Generator" and "Booster"

have had such an excellent training and experience, why do we find them in the position that presumably they are in? Why accept positions, in the first place, at such a low salary, when, with all their qualifications, they should be able to obtain better ones? If they accept responsible positions at a low salary to gain experience, and can afford to do so, why grumble? Also, if they have now obtained the experience they accepted the position to gain, why not leave and prove their worth by obtaining a more lucrative position elsewhere? If submen spent more time in trying to improve their positions, and themselves, by carrying out their duties conscientiously, and less time in running down people they consider to be their inferiors, perhaps they would find they would not have so much to complain about. Perhaps you think by the tone of this letter I am a wireman: I am not, but only trying to be fair to both sides. There is nothing to be ashamed of in being a wireman or a sub-man, as long as he proves himself to act as a gentleman. A good many so-called sub-station engineers would find it more advantageous if they knew a little more about wiring than they do now, and it would help them to understand their own positions a little better.

Old Sub-Man.

#### The Association of Electrical Station Engineers.

As acting chairman of the new Association of Electrical Station Engineers, I should like to make a few comments upon the correspondence that has been taking place in the REVIEW between enthusiasts on the side of the Association, and others who have not the necessary qualifications for membership.

With regard to the latter I have nothing to say, except that one cannot expect persons of dissimilar interests to be capable of seeing "eye-to-eye" in the matter in question.

As to the former gentlemen, with whom this letter is concerned, I think it would be better now for them to cease from exchanging uncomplimentary references with the "other side," as this behaviour will only serve to lessen the dignity of the, as yet, embryo Association, and act as a deterrent to a large number of very desirable potential members.

So far as I am empowered to offer advice on the subject, it would appear to be better now that unofficial correspondence on the Association and its objects should cease, for the tone of the majority of the letters is not calculated to inspire that respect for the organisation to which it should be entitled from the very beginning. Neither is it fair to Mr. Ebben and the others who are striving for the success of our Association that they should be hampered in their efforts by any prejudices that may arise, due to the over-enthusiastic effusions of a few supporters, however well intentioned they may be.

I trust that my desires as above-mentioned will receive thoughtful consideration from those to whom they are directed, so that the already very numerous difficulties with which the promoters are beset may not be increased by a few irresponsible remarks, which, perhaps, after a little thought, might not have been given publicity.

In conclusion, may I suggest that the best work that can be done for the Association at the present moment, is to canvass and persuade as many as possible of our colleagues and professional friends and acquaintances to be present at the next open General Meeting, to be held on February 6th, at the same hour and place as before.

Turbo-Alternator.

#### Village Lighting.

When you introduce your readers to special articles in your valuable paper by a leaderette, and say that anything has been written at your request, one at least hopes to derive some useful information from a perusal of such matter, for the burden of keeping pace with all the weekly engineering journals is very considerable to busy men, so that when seven columns of your paper are devoted to a subject of great interest to the industry generally, it is disappointing to find such a lot of unreliable matter filling your paper, as occurs in your current issue.

You suggest that "the work of small supply stations is very attractive, and if generous terms are offered, there

should be no difficulty in getting first-class men to throw their whole energy in the business."

I should like to know how long the energy of this first-class man would be required in loading up a 10-kw. generating station, which, I presume, would be made up of second-hand plant, mains and buildings, if it is to cost only £500, and further, what would become of this fortunate individual's energy after, say, one year's work in a district of 1,000 inhabitants, and what his remuneration would then amount to? Mr. Wurdale says that these men make as much money as chief assistants in towns with a population of 50,000 (I hope they make it honestly, for they would have much humble work to do), but do they?

I need not refer to many statements in the article which are as doubtfully correct as they are elementary, but surely, if the writer had any real knowledge of his subject, he would never have committed himself to the half-truths that he presumably picked up during his "fortnight's holiday" here and there, for on page 46 he describes a plant upon which he says no expense was spared, and must therefore have cost well over £1,000, having an output of 6,100 units per annum, and the total costs, including capital charges, work out at 1·8d. per unit.

Now, Sir, 6,100 units at 1·8d. amounts to £45 15s., and as the investor would expect at least £50 as interest on £1,000, where do the generous terms or the wages of the engineer come in? The whole thing is so absurd as to be valueless, and the article would have found a better place in a 3d. paper, notwithstanding the description of an undertaking with an output of 26,000 units, and an average cost of 3d. per unit, for while this may be accepted as reasonable, the article savours of so much second-hand information as to make the whole appear doubtful.

My only excuse for these few remarks is that, having carried out a number of installations in all sizes for such purposes as the writer describes, I know that many of his statements are unreliable, and that people contemplating such installations would do well to have more information before embarking upon even a 10-kw. equipment for public supply purposes.

January 14th, 1913.

Willesden.

I am obliged to you for an advance copy of "Willesden's" letter. If he will read either your leader or the article again, he will see how the man in charge finds work and wages to last him more than 12 months; at that particular place it has lasted over five years, and is still increasing—i.e., general work in the district. Regarding the costs at Caldý coming out at £45 odd total, if he will read the article he will observe that it is stated distinctly that such a station cannot find a decent wage for a man, but other duties do, and this plant runs three days a week only. The figure of 1·8d. per unit is not the total cost including all capital costs, but including all *maintenance* costs, and I regret that the error slipped in.

Those elementary matters against which I have uttered warnings, are matters which have, in my experience, caused the failure of many such schemes. The lines which I recommend are those which have proved successful, and of this I have first-hand knowledge, carefully filed and tabulated, and am able to prove every statement. When "Willesden" can become courteous, I will discuss the matter with him.

W. T. Wardale.

I have read with great interest the article by your correspondent dealing with village lighting schemes, and I would like to mention that there are in Ireland several quite small village schemes which are working successfully. I myself carried out recently what I think is really the smallest public lighting scheme in the United Kingdom. This was the lighting of a village in Co. Fermanagh, having a population of only 250. At one end of the main street there was a disused corn mill with a plentiful supply of water and a good fall. I pointed out its advantages as a potential generating station to some of the principal residents, who immediately took the matter up and formed a company.

The total output of the plant is 6 kw., and it consists simply of a 10-B.H.P. turbine driving a Newton dynamo, the turbine being fitted with a governor; no attendant is

required. The turbine is started up half an hour before lighting time, and left running all night. In order to reduce noise to a minimum the drive from the vertical shaft of the turbine to the dynamo shaft is worked with a quarter twist belt; this also had the advantage of keeping down initial expense, which is the main feature in schemes in this country. Current is supplied by meter at 6d. per unit. The plant has been working now for nearly 12 months, and has certainly paid its way handsomely.

J. S. Loughnan.

#### The Regulation of Street Traffic.

A policeman has been killed by a motor-bus at Ludgate Circus. Research into London history teaches us that the last accident to a policeman at Ludgate Circus took place after the Battle of Parliament Hill, and was caused by the scythe on Queen Boadicea's chariot, which formed a part of the procession of the Roman Army when returning victorious from that bloody fight.

I may point out that Ludgate Circus was then no circus, but was laid out as such after that accident in order to render unnecessary the presence of a traffic controller. The circus dropped into desuetude on the introduction of four-wheeled vehicles. These had no lock or swivel, and were thus unsuitable for a circus. Having dropped out of use, although the reason has disappeared, yet our authorities, having no reason, cannot resuscitate the circus, but prefer to kill policemen. If, however, a semaphore signal is necessary, need it be a living one?

Some years ago a man named Faraday invented electricity. By means of this agent a man placed, say, 12 ft. above the middle of a street, say, at the foot of Ludgate Hill, could by means of press buttons direct the traffic by means of a wooden semaphore. To please our conservative authorities, it might be painted and shaped to resemble a policeman, and thus serve to secure, at once, safety and beauty, and harmonise with the conservative mind of unduly constituted authority. As you, Sir, know something about electricity, perhaps you would be so good as to acquaint Scotland Yard with the properties and powers of that substance, so that, before the sun grows cold and the ice age is again upon us, and Ludgate Hill becomes a glacier down which police-destroying vans will skid violently like Gadarene swine, that noble institution may awaken to the fact that we have moved since Thorneycroft's models passed so violently off the stage.

B.

#### British Laboratories for Electrical Goods.

The very interesting and valuable report to the B.O.T. by Mr. C. Hamilton Wickes—published in your issue of January 3rd—should not be allowed to pass into oblivion, hence my few comments thereon. I had expected abler writers to take the matter up.

Consider the case broadly: In the U.S.A. and Canada where these regulations are in force, there is an English-speaking population two and a-half times that of Britain, and their purchasing power of electrical commodities is at least proportionately large.

The underwriters' capital is to a very large extent British, but the technical staff which drafts the regulations, and which adjudicates on the merits of appliances submitted, is entirely American, and this staff can impose its veto on British-made goods destined for Canada.

Now, if U.S. officials will impose a tariff on other nations' goods in order to favour native manufacturers, it is a fair presumption that they will have a tendency to utilise their inspectorial veto to secure the same result. This is scarcely a fair or satisfactory position to Britishers, as we impose neither tariff nor veto on their goods which are imported here.

Really, in equity, we should have a similar testing laboratory mainly controlled by the insurance companies (underwriters) in Britain—the two working under identical rules, and the certificate of either being accepted by the other.

There appears no insurmountable reason why we should not do a larger export trade with the U.S.A. The tariffs they impose on electrical goods are heavy (about 45 per cent. *ad valorem*), but the protective influence of tariffs is in

general a diminishing influence, and 45 per cent. tariff does not mean anything like a 45 per cent. handicap *now*. Speaking broadly, since that 45 per cent. duty was imposed, American manufacturing costs have been rising steadily in a greater ratio than our own as a result partly of the tariff, until perhaps to-day the handicap against us is very small comparatively, and unless the tariffs are again raised against us there is approaching a time when we will be able to send manufactured goods there quite as freely as they now send here.

This is my reason for regarding the present as an opportune time for establishing a testing and certifying laboratory in this country.

I think Mr. Wickes is in error in stating that each individual article must bear the stamp or label of the U.L.C. A moment's reflection must reveal its impracticability. Nor could each article be tested.

Fancy, say, are lamps made in New Jersey and wanted in Boston. Must they all go to the Chicago Laboratory for test and label and travel an extra 1,600 miles in so doing? Apply the same idea to heavy machinery.

No. What probably happens (or is intended to happen as the rules have not yet obtained full sway) is that one appliance of a type is submitted for test and, if approved, is advertised in some recognised gazette or journal. The writer has very recently bought appliances—American made—and used them in a building in the States under close fire inspection, and they were not labelled or marked, nor was any mark obvious on hundreds of other appliances in use there. There were, however, notices in some cases which read "passed by the underwriters."

A testing authority in this country should be mainly under the control of insurance companies, so far as fire risk is concerned, and supported partly by manufacturing subscribers and others interested and by fees for testing and certifying as in the U.S.A.

As the insurance companies have evidently found the system of value in the States, they would doubtless find it an advantage here also.

The problem is—how to induce them to make a start here.

John Dugdill.

Fairsworth, *January 20th, 1913.*

#### Electrical Trade in China.

I read your leading article, *re* China, and Mr. Williams's contribution in your edition of November 8th with considerable interest, but speaking with some experience of the electrical trade in China, I cannot do otherwise than feel that both your goodselves and Mr. Williams leave out two very essential features in your paeans of enthusiasm for the China trade.

Of course, the trade will come and you know from our many conversations that it would be hard to find anyone with a more firm belief in the future of the electrical trade in China than myself.

The two greatest difficulties to be contended with are, first, finance, and secondly, German competition.

In dealing with the question of finance, it is necessary to realise that if a firm is fortunate enough to secure a contract, it requires a plentiful supply of cash to carry it through.

The best terms it is possible to secure from Home manufacturers are for them to draw on the firm in China at so many days' sight, but in many cases cash against documents in London is insisted upon. Now on these terms you will see that in the former case the importer in China does not have to pay for his goods until they arrive or at some time during the usance of the manufacturer's bill. This means that the goods are financed for the voyage out, for which interest at 6 per cent. is charged.

The latter system of payment in London is very hard indeed on the importer, as he is then out of his money for about 60 days longer than he otherwise would be, while it saves only the 6 per cent. on the sight draft, so you will appreciate that if there is much cargo afloat being paid for in this manner, it is apt to leave the importer in China with his capital tied up.

The terms of payment obtainable from the Chinese have become very stringent, and the period required by them so

long, that it is very difficult for a firm with a moderate capital to accept contracts at all.

The reason for these long credits it is more or less easy to find, and one need not look outside the offices of the huge Continental manufacturers in this country, who have found that the only way to beat down competition is to give such credit as no agent could possibly grant.

The wealthy Continental trusts, as they really are, being able to sell complete installations without going outside their group for any material whatever, are, of course, able to outbid our British manufacturers of whom not one is capable of supplying from his whole works everything that is necessary for a plant, and besides this, a nicely protected home market is reserved for them, and a brisk healthy market is presented to them for nothing in our own island, so that there is a very large playground for our Continental friends to enjoy. Our own manufacturers, who are too numerous, have to fight for their own market, and, speaking electrically, are, with one or two exceptions, such as the great cable companies and a large Lancashire house, hard up and have no money for pushing and creating a practically new market; a glance through the electrical share quotations in your own journal clearly indicates the state of the electrical manufacturing concerns in Great Britain.

Now, as to the competition, I have culled from the *Official Gazette* of the Shanghai municipality the last three examples: In May last, 16 60-B.H.P. three-phase motors were purchased; the results were—British, £756, £636, £633; German, A.E.G., £573; Siemens, £492.

The next tender was called for in September for 18 motors. British prices were—£1,133, £1,166, £938; American, £1,083; German, A.E.G., £906; Siemens, £790. In October tenders for 13 motors brought out the following: British, £1,383, £1,345, £1,327, £1,218, £1,232; American, £1,320; German, A.E.G., £1,097; Siemens, £1,047. These figures will give you a good idea as to the competition to be faced by British manufacturers in China.

Why our British prices are so high, I do not know, unless they are due to the competition in our own country, the number of small companies which each have their directors, offices, staff, &c., and which could be run so much cheaper if they were amalgamated.

Besides the difficulties I have already outlined, it is a cruel blow to us British representatives when our own Government give our strongest competitors their patronage. It is not difficult to imagine the advertisement which will no doubt be used to the fullest extent by our German friends, by their being able to say that even the British Government gives us work, so our material must be better than that made in their own country.

Edgumbe Brighten.

Shanghai, *December 27th, 1912.*

#### Small Power Installations.

May I suggest that it would be eminently interesting to station engineers and other power users to hear representative views on the respective merits of the Marshall economic steam power plant, as compared with those of suction gas and oil, for small power units?

Station Engineer.

**Siemens Rifle Club Dance.**—Although a comparatively new institution, the Siemens Dalston Rifle Club, is thoroughly appreciated by both male and female members of the staff. In connection with this club a dance and social was held on Friday evening at Northampton House, Highbury, which was specially engaged for the purpose, and a party of between 100 and 150 thoroughly enjoyed their first social gathering under the auspices of the shooting men. The dancing hall, refreshment room and card room were illuminated with "Wotan" lamps in Holophane reflectors. A set of 14 dances figured on the programme, with four extras. The proceedings commenced at 7 o'clock and finished shortly after midnight—the whole of the time being well occupied. In the social section of the entertainment, Messrs. A. and B. McFarlane, Hicks, Bardell and Higgins all contributed interesting items. Mr. Hayden (the secretary of the club) acted as M.C. This "sighting shot" was restricted to members of the Dalston staff.

NEW ELECTRICAL DEVICES, FITTINGS  
AND PLANT.

New Calculating Device.

We have received from Mr. H. W. BROWN, of 169, Cathall Road, Leytonstone, N.E., a novel device for calculating the combined resistance of two or more shunt circuits, which we illustrate herewith. The mode of operation is as follows:—Take as an example two circuits, one of 75 watts and the other of 25 watts. The thread hanging from A would be stretched across to 75 on the right-hand side of the scale, and that from B to 25 on the left-hand

FIG. 1.—DEVICE FOR CALCULATING THE JOINT RESISTANCE OF TWO CIRCUITS IN PARALLEL.

side. Where these two threads cross, the combined resistance of the two circuits can be read off by means of the horizontal lines. It will be seen that the range of the device can be extended, and that the percentage of current in each circuit could be read off by means of the vertical lines.

It is easy to see how the device is constructed; the theory of its operation may afford an interesting problem for readers who are not mathematicians—the latter will see it at a glance.

Carron Cooking and Heating Appliances.

THE CARRON CO., of Carron, Stirlingshire, have recently issued a well-illustrated booklet dealing with their electrical cooking and heating appliances, consisting of cooking ranges, grillers, hotplates,

FIG. 2.—CARRON ELECTRIC COOKING RANGE.

steaming ovens, urns, and a variety of designs of luminous radiators and convectors. The company has a reputation of over 150 years'

standing in iron manufacturing, and it is a matter for congratulation that its extended knowledge of cooking and heating apparatus is now being applied with a view to furthering the latent development in connection with such apparatus, viz.—Electric cooking and heating.

While space does not permit us to deal at length with the firm's electrical productions, we illustrate one or two typical pieces of apparatus produced by it. Thus fig. 2 is an electric range, consisting of an oven with a grill, hot closet, two circular boiling plates and a warming plate mounted over it. The oven and hot closet are white porcelain enamelled inside, and the former is fitted with removable hangers and grid shelves and provided with an inspection window in the door to enable the progress of the cooking to be watched. The cooking temperature can also be

FIG. 3.—ELECTRIC URN.

ascertained without opening the door by means of a thermometer provided, and the heating elements can easily be replaced *in situ*. The oven is rated at 3,000 watts, the grill at 1,300 watts, and each boiling plate at 800 watts.

The company also makes a more expensive combination cooking range, consisting of an oven—with a full-sized inner glass oven door, to allow of inspection while cooking, without heat loss—and beside it a double grill and toaster with a hot closet beneath, while

FIG. 4.—CARRON THREE-LAMP RADIATOR.

on the top of the range are hot-plates for boiling, &c. Three heats are provided, and, in connection with the switches, two plugs and sockets for connecting to the main cable.

We further illustrate in fig. 3 a brass and copper urn, electrically heated, and suitable for restaurant use. This is claimed to boil 2 gals. of water in 22 min., the minimum heat being obtained on 1,500 watts and the maximum on 3,000 watts. The company has a number of registered radiator designs in cast-iron, brass or copper, one of which, built in black, copper or brass finish and for two, three or four lamps, we illustrate in fig. 4.

In the case of the convector heaters, built for any number of heating elements up to six, the latter are guaranteed for two years.

A Single-Phase Prepayment Watt-Hour Meter.

THE BRITISH THOMSON-HOUSTON CO., of Rugby, are introducing an A.C. prepayment watt-hour meter, which is claimed to represent a distinct advance in the design of watt-hour meters of the induction type. It is manufactured in the 3 and 5-ampere sizes for any voltage required, and so that the rate of payment can be easily

changed without recalibrating the instrument or taking the dial to pieces.

The mechanism and the meter element are mounted in a cast-iron case and are protected by a dust-proof cover, and a window is fitted in the latter, through which the dial and coin indicator may be read. The indicator records the number of coins standing to

FIG. 5.—THE B.T.H. PREPAYMENT METER.

the credit of the consumer and the meter dial registers the total number of units consumed. The prepayment mechanism consists of a main control switch of the single-pole, quick-break, knife-blade type, which is closed mechanically when a coin is paid into the meter. This switch is held closed so long as there is any current remaining to the credit of the consumer, but opens automatically when the coin indicator reaches zero. The coin box is capable of containing 120 pennies and can easily be

FIG. 6.—B.T.H. PREPAYMENT METER, OPEN.

emptied by withdrawing the till, which is secured either by a seal or padlock, as desired. A separate cover protects the terminal box, enabling this portion to be sealed independently of the other parts of the meter.

In operating the meter, the coin handle is turned to the right, the coin inserted, and the handle turned back again; this closes the switch and the coin indicator advances one division, and so on for each coin inserted, while the indicator travels back towards zero as current is consumed, the switch opening when zero is reached.

#### Brooke Emergency Ship-Lighting Set.

Our illustration, fig. 7, shows a 20-KW. generating set by MESSRS. J. W. BROOKE & CO., LTD. of Lowestoft, supplied for emergency ship lighting and deck lighting on board a new vessel being built for the Union Steamship Co. of New Zealand.

The engine is a 28-H.P. nominal four-cylinder motor, with dual magneto ignition and centrifugal governor, which controls the speed from no load to full load within 1½ per cent. variation.

The engine is coupled to a Siemens compound-wound dynamo, producing current at 110 volts.

The plant is self-contained, with its own radiator; this is in order that it will not be necessary in emergency to have to suck

FIG. 7.—BROOKE EMERGENCY SHIP-LIGHTING SET.

water from the sea level, which, of course, is often, in big ships, below the limit of suction distance.

The engine is arranged to run on petrol, as it is very preferable to paraffin, owing to the greater handiness and more rapid starting up and greater reliability.

#### The "Globus" Lamp.

A new pattern of glow lamp has been introduced by the "GLOBUS" BELEUCHTUNG- UND HEIZUNGS-INDUSTRIE G.M.B.H., of Fontane Promenade No. 14, Berlin S. 59. It is intended especially for signs and illuminations, and is illustrated in fig. 8; it is made for 14 volts, so that on 110 volts eight lamps can be run in series, and is rated at 1 watt per candle, although the filament is of carbon, the light being concentrated along the axis of the lamp as shown in fig. 9. This effect is not obtained by silvering the back of the bulb, but by the special form of the bulb and the central collector, so that a 2-C.P. lamp is made to give 8 C.P. along

FIG. 8.—THE "GLOBUS" SIGN LAMP.

FIG. 9.—ILLUMINATION CURVE OF "GLOBUS" LAMP.

the axis in a conical pencil of light. The figure shows (dotted) the ordinary shape of the illumination curve, as well as the special shape of the curve of the "Globus" lamp, whence it will be seen that the usual type of incandescent lamp is ill adapted for end-on illumination. Carbon filaments are used because, unlike metallic filaments, they do not take an excessive rush of current at the moment of switching on, and it is claimed that in the case of flashing signs this enables the carbon filament to be as economical as the tungsten. The form of the bulb, it is said, renders it almost unbreakable.

#### New G.E.C. Ironclad Reversing Switches.

For the control of small motors, particularly such as are used in connection with portable tools, the GENERAL ELECTRIC CO., LTD., have recently devised appropriate switchgear which is an improvement over that now in use. The new "push-on" and "push-off" switch is specially recommended for attaching to portable electric tools, and the like, where a quick make-and-break action is required. The contacts of this switch are massive, and supported on ebonite insulation; they are run on small wheels which reduce friction to a minimum and thus give a free-and-easy action to the "on" or "off" movement. The case is of aluminium. This switch is suitable for any current up to 8 amperes, 110 volts. The dimensions (overall) are 7½ in. × 3½ in. × 2½ in. The small drum type reversing switch (illustrated in fig. 10) has also been designed by the company especially for use with Witton-Kramer tools. This switch is constructed with a portable handle; its glands are

arranged to serve as efficient cord grips to hold securely the indicator cables. The fingers are renewable. The revolving drum is of cast-iron, and the entire switch is rainproof; it is suitable

FIG. 10.—G.E.C. DRUM-TYPE REVERSING SWITCH.

for any motor up to 2 H.P. at 240 volts. Its dimensions are 4 in. x 8½ in. x 5½ in.

“Tricity” Ship Heaters.

THE BRITISH ELECTRIC TRANSFORMER CO., LTD., of Hayes, are introducing a type of non-luminous low-temperature heater, making very small power, for ship heating.

FIG. 11.—BULKHEAD TYPE “TRICITY” METER.

The heater unit consists of a strong, heavily webbed, cast-iron grid, containing the Berry patent element, giving an effective heating surface of about 4½ sq. ft. This grid breaks up the air

FIG. 12.—MULTIPLE UNIT HEATER.

FIG. 13.—PEDESTAL HEATER.

particles to give the best heating of the air by convection. The grids attain a temperature of about 600° F. in 15 to 20 minutes, with a consumption of 250 watts, which is the wattage consumption of a single lamp of a four-light luminous radiator and the apparatus is covered by an ornamental cover or guard, to form the funnel for the heated air. The heaters are made for all standard voltages from 100 to 250, and can be supplied, as illustrated, either bulkhead pedestal or multiple-unit pattern, and suitable for any form of wiring.

When it is desired to use them in saloons, they can be installed in groups under settees, a special “settee” type 750-watt heater being supplied, with an overall height of only 8 in.

LEGAL.

ELLIS v. THE OSRAM LAMP WORKS, LTD.

By this action, which was tried by Mr. Justice Neville in the Chancery Division last week, the plaintiff, as lessee of Poplar House, Hammersmith, claimed an injunction and damages in respect of an alleged nuisance of noise, smell, and vibration caused by the defendants’ works, which were adjacent.

From the opening statement of MR. CAVENAGH, who appeared for the plaintiffs, it appeared that negotiations for a tenancy of the house were entered into in 1908 with the Robertson Electric Lamp Co., who were the then owners, and who were also the predecessors in title of the defendant company. The rent was to be a weekly one, increasing from year to year for three years; but subsequently an arrangement was come to for a fixed weekly rent on a three years’ agreement. Bad smells emanated from the defendants’ works, accompanied by loud explosions, which had recently become so bad that the plaintiff had had to vacate the premises, and damages were claimed in respect of both that and also in respect of damage alleged to have been done to some outbuildings used for storing theatrical scenery.

Evidence was called in support of the plaintiff’s case, and MR. JENKIN, K.C., for the defence, contended that, on the true construction of the agreement, the tenancy was merely a weekly one, and, further, that there had been no appreciable nuisance.

Evidence was called for the defence to prove that, though some nuisance did exist in the years 1908 and 1909, new plant was installed, and since 1910 any nuisance that there might have been had ceased to exist.

His LORDSHIP, in giving judgment, said that the conclusion he came to upon the evidence was that there was no such nuisance as to render the plaintiff’s house uninhabitable, and as it was upon that the case for damages was principally based, the action must fail. There appeared, however, to be some damage in respect of the outbuildings, but it was small, and he would estimate it at £7. The costs of the action would be the defendants’, but a counterclaim raised by them would be dismissed without costs.

GRAETZIN LAMP AGENCY.

MR. JUSTICE SCRUTTON was occupied during January 15th, 16th 17th and 20th in the Commercial Court of King’s Bench, in hearing an action brought by Mr. Bernard Braunstein, trading as Jaques, Braunstein & Co., of Carthusian Street, E.C., against Mr. Max Graetz, trading in Berlin as Ehrlich & Graetz, manufacturers of electric appliances, to recover damages for breach of agreement of agency for the sale in this country of the defendant’s electric lamps.

MR. DUKE, K.C., appearing for the plaintiff, said, in the course of his opening address, that the plaintiff was a gentleman who had been engaged for many years in London in the sale of gas fittings and fittings for electric lighting. The defendant was a manufacturer of electric light fittings in Germany, and he entered into an agreement with the plaintiff, under which he (plaintiff) was to have the exclusive agency for the sale of the defendant’s goods in this country for a period of years. It was for a breach of that agreement that the plaintiff claimed damages. What had happened was that the defendant had himself set up in business in this country by forming a limited company to carry on the business, of which the plaintiff was to have the sole agency. At the beginning of 1907 an agreement was entered into, under which plaintiff for a period of six years was to have the exclusive agency for the sale of the defendant’s electric lamps. The business was successful and a large trade was done. In December, 1908, the defendant, who had become patentee of a new metal-filament lamp called the Graetzin lamp, approached the plaintiff with a view to his taking up the agency for the sale of that lamp. An agreement was entered into under which, if the plaintiff was able to sell in this country £5,000 worth of the Graetzin lamps within a year from the time he received the final samples, he should have the exclusive agency for two years, and if in the course of the second year he was able to make sales to the extent of £10,000, he was to have the exclusive right for a further period of five years. Under the events which happened the plaintiff became entitled to an exclusive right for the term of two years and an additional five years which began at the end of the first period. The first two years would expire in June, 1911, and the additional five years would therefore carry the agency on until June, 1916. The events which put an end to the agency occurred in the summer of last

year. In the electric lamp business it was necessary to be in the market with the goods in the spring of the year, but the defendants had not their samples ready in time. To give plaintiff a fair prospect of doing a substantial business in the following winter, he ought to have had the samples in February, as the custom was to take the orders in the spring and deliver in the autumn. Agreements were made by the plaintiff with other firms, but while they were given the right to sell, they did not interfere with his business. It was arranged with Krupka & Jacoby that they should take up an agency, but their business did not come up to the minimum, and subsequently the defendant arranged with them that they should form an English company to carry on the whole of the defendant's business in England, including the business then being carried on by the plaintiff, and that they should have the sole agency for the sale of the defendant's electric lamps. In August of last year the defendant wrote to the plaintiff a letter purporting to cancel the plaintiff's agency, and informing him of the agreement with Krupka & Jacoby, and requesting him to cease taking orders.

Mr. JUSTICE SCRUTTON said that as there was no jury, he would like to hear what the defence was before the plaintiff's witnesses were called, in order that he might better understand the bearing of the evidence.

Mr. ATKIN, K.C., appearing for the defendant, said that, in the first place, he contended that there had been no breach of the agreement, and that the plaintiff had not duly performed all the conditions under the agreement. The agreement with Krupka & Jacoby was no breach of the agreement between the plaintiff and the defendant, and the defendant had always been ready and willing to employ the plaintiff.

Mr. BERNARD BRAUNSTEIN, the plaintiff, was then called, and gave evidence generally bearing out his counsel's opening. He said that he had long acted as an agent in this country for the sale of foreign gas and electric fittings. Until the end of 1905 he had been acting for Spinn & Sohn, and had a considerable connection amongst the purchasers of gas and electric goods. In 1906 he was introduced to the defendant firm, and at that time he was doing business to the amount of 100,000 marks a year. In 1908 he was approached by Graetz with regard to putting an electric lamp upon the market. He went to Berlin and entered into an agreement with defendant, and as the result of a discussion, he subsequently negotiated a sub-agreement with the Welsbach Co. for the sale of the lamps. That was in March, 1910. The agreement continued for two seasons, and was very successful. He did not receive the prices and samples from the defendant until it was too late to take advantage of the season. All business was practically done before April, and he did not get his prices until May. The firms with which he dealt complained of the price because Jacoby's were selling lower. When he was in Berlin he had pointed out to the defendant that improvements in the lamp were necessary.

Mr. DUKE: What do you value the business at—what have you lost by the breach of agreement?—I made 100,000 marks in the first year, and in the second year I made four times as much.

Witness, continuing, said that the sale of electric lamps was an increasing quantity, because they had been much improved, and they were 25 per cent. cheaper than they were six years ago. The current was cheaper also, with the result that, while gas lighting was going down, electric lighting was going up.

Asked as to the increase in the sale of the metallic-filament lamps, the witness said that, on the basis of the contract, he would have been able to obtain from £3,000 to £4,000 a year.

In cross-examination by Mr. ATKIN, K.C., for the defence, witness said that, in respect of the electric lamp agency, the agreement stipulated that he was to introduce the goods into England at his own expense. The business was not a very easy one to introduce at the beginning, as others had possession of the market. The only commission earned by him on his electric agreement was upon the Welsbach orders. In 1912 he was not able to sell, because he could not get the prices from the defendant.

Re-examined: He found from the invoices that five times as many unstamped lamps were sold as those which were stamped, because the unstamped, although the same article, could be sold at a cheaper rate.

This was the plaintiff's case.

Mr. ATKIN submitted that there had been no breach of agreement. The plaintiff soon found that he was unable to do much unless he could get the lamp known on the market, and hence he was willing to fall in with the suggestion of the defendants to let Krupka & Jacoby take up the business, and the agreement with that firm was negotiated by plaintiff. It was a term of the arrangement that his commission should be reduced from  $\frac{3}{4}$  to  $\frac{2}{4}$  per cent.

Continuing his address on Jan. 16th, Counsel submitted that there had been no breach of agreement, because the only arrangements entered into were those with Krupka & Jacoby, to which Mr. Braunstein had consented. Messrs. Graetz, he said, were entitled to sell goods to Krupka before the agreement, and all that had happened was that they had continued to sell goods as before. There had been no breach in relation to the payment of commission, as the plaintiff alleged, because at the time the writ was issued no commission was due.

His LORDSHIP said it occurred to him as a possibility that there had not been a final repudiation of the agreement, and that the plaintiff had jumped at a conclusion when he issued the writ. In that case there might be another action arising, to determine the position of the parties. When the evidence was over he would formally ask whether it was desired to amend, as "two bites at a cherry" in an action of this description seemed to be rather undesirable.

Mr. MAX SCHULTZ, general manager to Ehrich & Graetz in Berlin, was called, and gave evidence as to the making of the contract with Krupka & Jacoby, and said that when he came to London to see them in 1910 in connection with closing the agreement for the contract, the plaintiff complained about the price of the lamps being too high for him to compete successfully with others. He did not complain of not having received price lists. He (witness) came over to this country again in January, 1912, and saw Mr. Jacoby and Mr. Braunstein, when they discussed the question of the cost of the lamps. Competition was very severe at that time owing to the German Incandescent Co. making a reduction in price. That was, he thought, at the beginning of 1911, and the English manufacturers soon followed by making reductions also.

In cross-examination, Witness said that he assisted in making agreements with Mr. Braunstein in reference to gas as well as electric fittings, and prices were always discussed when they met. The prices submitted to Krupka & Jacoby were not the same as those submitted to the other accepted firms. They were somewhat lower.

Had the firm special prices for the non-stamped metallic-filament lamps?—No difference was made. The supply of non-stamped lamps to England was smaller than that of the stamped lamps. There was no difference between the stamped and unstamped lamps. Cheaper prices were first quoted to Krupka & Jacoby about November, 1912. Reductions had been made to Mr. Braunstein in some instances.

Witness was further closely cross-examined as to the reduction in price which the defendants had made, and he would not deny that a reduction of 10 per cent. in the price of 16 to 50-c.p. lamps had been made to Lott, Abbott & Co. some time before the plaintiff was informed of the reduction.

In re-examination, Witness said that he was a director of the Graetz Light, Ltd., which dealt entirely with gas, the object of the company being to take over the British business in gas lighting as carried on by Messrs. Graetz. It was proposed that the Krupka and Jacoby Co., Ltd., should deal with the electric lighting.

Mr. HORACE BARRETT, a member of the firm of solicitors acting for the defendant and for Krupka & Jacoby, gave evidence of the circumstances under which the agreements with Ehrich & Graetz were drawn up, and as to the steps taken for the purpose of forming the two companies.

Mr. MAX GRAETZ, the defendant, said he carried on business in Berlin in incandescent lamps, high-pressure lamps, and oil lamps under the title of Ehrich & Graetz. It was a very large business, and he employed thousands of hands. The plaintiff had been his agent for some years, and from time to time he came to Berlin to discuss business. In April, 1912, there was a discussion with regard to gas lamps, and witness at that time told him that his services as agent for gas would not be continued. Nothing had been done to terminate his agency for electric lamps.

On the case being resumed on Friday, January 17th, Mr. BARRETT, the solicitor, was recalled for cross-examination by Mr. DUKE. He said that premises were taken on behalf of the company at 26 to 36, Chapter Street, Westminster, and it was there that the whole of the English business was to be done. They were held in trust for Graetz in the name of Jacoby. The premises had been reconstructed, the money for which had been provided by Messrs. Ehrich & Graetz under the name of Krupka & Jacoby.

Mr. DUKE: Was the only object in forming the two companies in England to be wide awake in case of any alleged infringement of patent?—So far as Krupka & Jacoby were concerned, that was the primary object. In substance, the £5,000 capital and £8,000 debentures in the company were to be held in trust for Ehrich & Graetz, but ultimately for the British Electric Light Co.

Mr. MAX GRAETZ, the defendant, was recalled and cross-examined by Mr. DUKE. He said that during the past six months he had not been doing more business than in former years. The business had not all been done through Messrs. Krupka & Jacoby. Mr. Braunstein was still his agent for electric lamps and fittings, and would continue in that position during the current year.

Has any action been brought against you for infringement of patent?—Yes, by the General Electric Co. They threatened an action against us by letter.

Did you send that letter on to Mr. Braunstein?—No. That was at a time when Mr. Braunstein had ceased to answer us. It was after August 6th, 1912. The first threat reached us in October or November of that year.

Can you tell why you did not communicate to Mr. Braunstein the arrangement you were making with Krupka & Jacoby during the first part of 1912?—The main reason was that the profit which Mr. Braunstein derived from the gas business was as much as the salary of Krupka & Jacoby.

Is the salary of Krupka & Jacoby £1,200 a year each?—It was something more than that—25,000 marks.

Continuing, witness said that the business done through Mr. Braunstein had dropped during recent years, and in dealing with the gas themselves they were able to raise the business again. He had had experience which told him that it was not wise for one company to deal with both gas and electric lighting, and therefore it had been determined to form two companies.

Mr. OSCAR KRUPKA, a member of the firm of Krupka & Jacoby, Ltd., gave evidence as to the agreement between the company and the defendant, and said that he was a large dealer in electric lamps.

Mr. DUKE: Has any action been brought against you for infringement of patents?—Yes, by the Osram Lamp Co. The action was brought, said the witness, against him personally, as well as against Krupka & Jacoby, Ltd. He did not consider that his lamp was similar to the Z lamp. The writ in the action was issued in

November of last year. The Graetz lamps bearing trade-marks were 75 per cent. of the whole amount received.

DR. J. DUNCAN, a German advocate, was called to prove the German law in relation to the termination of an agency. He said that in German law an agent had no actionable right to work, but was confined to his claim for commission. The German law did not recognise a sole agency. In view of Patent disputes, the principal would stop an agency, because the German law regarded patent infringement as a criminal offence, and the principal might be subjected to very heavy damages. If an agent turned his business into a company, of which he was to be managing director, the employé could not interfere, but if some other person was appointed manager, the position might be different.

On the case being resumed on Monday, further evidence was given as to the German law relating to agreements.

MR. ATKIN, K.C., addressed the Court upon the evidence, dealing at length with the terms of the contract, and the interpretation put upon them by German law and by English law. In either case, he argued, there had been no breach. As to the damages, assuming that the contract had been broken, his Lordship, in considering the amount, would have to take into account the fact that Mr. Braunstein had admitted that he could not get the goods at a price which would suit the customers. Further, he could not forecast the result of the patent actions, because if the defendant's goods were an infringement of patent, the sale would be destroyed, and the business taken out of the hands of the defendant. The agency would thus come to an end.

MR. DUKE, K.C., for the plaintiff, contended that the agreement was governed by the law of the place where it was carried out, which was England. On the question of damages, counsel said that the business of the defendant was a very valuable one, and the suggestion that they were frightened about patentees bringing actions was "all moonshine." The trade in electric lighting was increasing from year to year, and the privileges purporting to be secured by the agreement of 1908 were increasingly valuable.

His LORDSHIP reserved judgment.

#### ELECTRICITY IN MINES.—APPEAL.

JUDGMENT was delivered on Friday by the Lord Chief Justice and Justices Coleridge and Rowlatt in the King's Bench Divisional Court, in the appeal by Mr. John Atkinson, an Inspector of Mines, against a decision of the Gateshead Magistrates, who had declined to convict Mr. H. M. Imrie, manager of the Chopwell Colliery, near Gateshead, for an alleged offence under the Coal Mines Regulation Act (Electricity Rules).

The charge was that Mr. Imrie had contravened the rules by not having an electric switch-box earthed, and the Magistrates refused to convict, holding that no offence had been committed. It was pointed out that the whole question was whether earthing of the switch-box was construction or installation. Mr. Imrie's contention was that it was construction, while the Inspector argued to the contrary. If it was construction then the rules did not apply, because the apparatus had been constructed before 1911, and they applied to apparatus erected after that year. It was stated that the switch-box in question was for controlling a portable electric motor, which worked a conveyor for carrying coal, and it was alleged that the box was not earthed to the insulation system. On May 3rd, 1912, the box was out of order, and a workman, touching it, received a shock which proved fatal. Counsel argued that, if the box had been earthed, this might not have happened.

The Court now dismissed the appeal, with costs.

THE LORD CHIEF JUSTICE said he had read the judgment of Mr. Justice Coleridge, and agreed to it, so there was very little he could add. The point for decision was whether the apparatus in question came within the exemption in Provision 20 (B) of the Act, and whether earthing it would be construction or installation. The two things ran very close together, so that the point was rather difficult to decide. He had looked at the description of the apparatus which was in use before June, 1911, and came to the conclusion that it came within the meaning of "construction," and he, therefore, could not come to any other conclusion than that arrived at by the Justices, viz., that no offence had been committed by the respondent.

MR. JUSTICE COLERIDGE said the case for the appellant was that a switch-box was not earthed in connection with the insulation system in contravention of Sec. 8, Sub-Sec. 8, of the Coal Mines Regulation Act (electricity rules). Respondent claimed exemption under Sec. 20, Sub-Sec. 6, which excepted from the provisions of Sec. 8 any apparatus which was in use prior to June, 1911, so constructed or adapted so as to comply with the requirements in vogue relating to the construction of electrical apparatus in mines before that date. If earthing by connection with an earthing system meant construction of electrical apparatus, the exemption applied; otherwise it did not. In order to earth a switch-box it had been found necessary to connect it with another cable in addition to the one already connected with it. Was that an alteration or addition or construction of electrical apparatus? Apparatus, according to the definition clause, included all machines and fittings in which conductors were used, or in which they formed part. A switch-box was, therefore, apparatus. For the earthing of a switch-box a different apparatus was necessary. The Magistrates, after viewing the apparatus, came to the conclusion that to connect one with the other you must reconstruct. It was said for the appellant that if you add you do not reconstruct but install. If by adding to the apparatus the addition formed part of the whole, then he came to the conclusion that you construct, and to construct was to put parts of the whole together according to some regular and definite plan. The added cable would be, in his opinion, part of

the whole electrical apparatus, and therefore part of a construction, and as construction brought the apparatus within the exemption, there could be no offence, seeing that the switch-box was constructed before June, 1911.

MR. JUSTICE ROWLATT agreed, and the appeal was dismissed with costs, as before stated.

#### TRAMWAY ACCIDENT CLAIMS.

IN an action against the Dumbarton Burgh and County Tramways Co., Ltd., Dumbarton, for personal injuries, a jury in the Court of Session awarded a widow £50.

A jury under Lord Skerrington in the Court of Session last week, also awarded £200 damages to a grocer in respect of injuries sustained by his child through being knocked down by an Edinburgh cable car. The pursuer attributed fault to the defenders in respect that the driver of the car failed to keep a proper look-out and give warning of the approach of the car. The defenders denied fault and pleaded contributory negligence. The claim originally was for £1,000.

#### SMITH & IMPERIAL LIGHTING CO.

IN the City of London Court on Tuesday, before Judge Lumley Smith, K.C., Mr. David Smith, trading as David Smith & Co., 3, Red Lion Court, Fleet Street, claimed £3 10s. 2d. against the Imperial Lighting Co. for electric lamps supplied.

Defendants' representative said that the lamps would only burn for a few hours, and then went out. They were put up at the Society of Motor Manufacturers' Show at Olympia. In all, 53 bad lamps were returned.

Plaintiffs said they sent 600 lamps to the defendants; they were all tested. About 32 were returned; they had burned for 200 or 300 hours. When a metal-filament lamp was touched, the filament shortened, and then double the amount of the current had to be passed through it. They might go out or blacken at once. The lamps sued for were injured after they were delivered. They were roughly used. They were 1s. 4½d. each. He did not hold himself responsible unless the lamps were returned within three days of delivery.

JUDGE LUMLEY SMITH said he remembered going to the Motor Show and seeing the lamps. Lamps could not be tested in three days, surely?

Plaintiffs said three hours was sufficient.

JUDGE LUMLEY SMITH said he knew the metal filaments were very difficult to carry.

Defendants' representative: We handle a great many.

JUDGE LUMLEY SMITH said they ought to be carried in an ambulance, because, if they were carried in a van, they got broken. He found for the plaintiffs for £3 and costs.

## BUSINESS NOTES.

**Royal Ediswan.**—We note that the EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., of 36, Queen Street, E.C., makers of the Royal Ediswan metal-filament and carbon-filament lamps have received the honour of appointment to Her Majesty Queen Alexandra. The firm now has an attractive poster issued by its Publicity Department displayed on the London hoardings.

**Some Recent Pump and Turbine Orders.**—MESSRS. BOVING & CO., LTD., report having received a considerable number of orders for Victoria turbo pumps, including the following:—The Weardale Steel, Coal and Coke Co., Ltd., one pump to deliver 450 g.p.m. against a head of 520 ft.; the South Bukuru Tin Mines, Ltd., one pump to deliver 600 g.p.m. against a head of 60 ft.; the Rhodesia Katanga Junction Railway and Minerals Co., Ltd., one pump to deliver 1,000 g.p.m. against a head of 200 ft.; the Tharsis Sulphur and Copper Co., Ltd., two units, each delivering 560 g.p.m. against a head of 322 ft. The pump for the South Bukuru Tin Mines is for hydraulic purposes.

Water turbine orders recently received include:—Two units of 1,340 H.P., for the Nippon Chemical Co., Japan; a unit of 265 H.P., Messrs. J. Hoyle & Sons, Lancs.; a unit of 160 H.P., F. H. Walter & Co., Rio de Janeiro; a third unit of 420 H.P., New Plymouth (N.Z.) Council.

An order has also been received from the L.C.C., for four centrifugal sewage pumps, for the Crossness station, each to deliver 22,500 g.p.m. against a head of 30 ft., and each coupled to a forced lubrication engine of 270 H.P.

**Bankruptcy Proceedings.**—WM. ROBERT REYNOLDS, electrical engineer, lately carrying on business at Queen Victoria Street, E.C., and elsewhere.—At a sitting of the London Bankruptcy Court held last week before Mr. Registrar Brongham, this public examination was held. The debtor returned total liabilities £1,253 (unsecured £521) and assets valued at £26. Replying to Mr. J. B. Knight, Official Receiver, the debtor stated that having for many years been in employment as an electrician, he, with a partner, started a similar business in February, 1905, at 17, Queen Victoria Street, under the style of "G. Askey & Co." Witness borrowed £50 from his father to put into the business. The partnership was dissolved in October, 1905, witness taking over all liabilities and assets,

and continuing alone under his own name. The business throughout had consisted entirely of installation work. In March, 1906, he removed to 313, High Street, East Ham, and subsequently to various other addresses in the immediate vicinity. In October, 1911, he opened another shop at 614, Romford Road, and in February, 1912, a further shop at 31, The Promenade, Palmer's Green. Owing to want of capital he was unable to keep all the shops going, and was losing money. In March, 1912, with the object of raising funds, witness sold his businesses to W. R. Reynolds, Ltd., which was formed with a nominal capital of £250. He received £1 share in the company, and the appointment of managing director at £150 per annum. The shop at 614, Romford Road, was closed in June, 1912; the company had traded at a loss, and in October last two judgment creditors levied executions at the remaining shops. Witness added that since August, 1910, he had speculated in freehold and leasehold house properties in the East Ham district. To losses on such speculations and to want of capital he attributed his present position. The examination was concluded.

*Re J. W. MAY & Co. (Jerome Walter May, trading as), importers of lighting and other specialties, 33, Cock Lane, Snow Hill, E.C.—*An application for an order of discharge was made last week at the London Bankruptcy Court by this bankrupt, who failed in October, 1911. The Official Receiver reported that the probable debts amounted to £8,725, the assets valued by the bankrupt at £1,085, had produced £547, and a dividend of 9d. in the £ had been paid to the creditors. The bankrupt came to this country from America in 1905, and for three years acted as manager for a firm dealing in lighting specialties. In May, 1908, he commenced a similar business in partnership with another person, with a capital of £300; the partner retired at the end of that year, and the bankrupt continued the business until July 15th, 1911, when he executed a deed of assignment in favour of a trustee acting on behalf of the creditors generally. The bankrupt attributed his failure to robbery by employes, heavy household expenses through the illness of his wife and family, want of capital, bad debts, and loss of trade by reason of his inability to attend properly to the business. The discharge was suspended for two years on the grounds of (1) insufficiency of assets to equal 10s. in the £ on the amount of the unsecured liabilities; and (2) imperfect books of accounts. Order entered accordingly.

*W. LONGDON & V. G. COBB (Longdon & Cobb), electrical engineers, Nottingham.—*Receiving order made January 15th on debtors' own petition.

*R. E. WALKER, electrical engineer and cycle agent, Hereford.—*Supplemental dividend of 3½d. in the £ payable February 1st at Official Receiver's office, 2, Offa Street, Hereford.

**Sweden.**—The output of the Allmänna Svenska Elektriska A.-B. last year showed a satisfactory increase, 8,000 electric machines having been turned out, of a total capacity of 360,000 H.P. The deliveries for the three foregoing years were:—1909, 105,000 H.P.; 1910, 230,000 H.P.; and 1911, 220,000 H.P.—*Affärsvärlden.*

**Norway.**—THE CHRISTIANIA ELECTRICAL WORKS have quite recently placed an order with the A/S Norwegian & Brown-Boveri for two transforming plants, each consisting of four machines of a capacity of 1,200 H.P. each. The machines are to be built at the company's works at Sköien, and are to be completed by June this year. The company has previously delivered to the municipal works three similar plants.

**Book Notices.**—*The Russian Year-Book, 1913.* Edited by Dr. Howard P. Kennard. London: Eyre & Spottiswoode, Ltd. 10s. 6d. net.—This, the third edition of this valuable work, is, happily, not quite so bulky as the last, as a different paper is used, but it contains quite as vast an amount of information, either written or compiled by experts on Russian affairs, or prepared by the co-operation of those in authority. The development of Russia naturally must promote great increase in engineering requirements, including, of course, electrical, and British firms who look for a larger share of business in that part of Europe and Asia will doubtless be better equipped after making a study of the material here brought together for them in convenient form. Commercial, financial, mining, agricultural, municipal and other affairs have special sections devoted to them, and "Electricity" and "Electrical Dynamos and Motors" have place in the "Trade Reports" section. Customs tariffs are fully tabulated. A calendar for 1913 indicates the dates of Russian fasts, festivals, &c.

*Elementary Manual on Applied Mechanics.* By Prof. A. Jamieson. London: Charles Griffin & Co. Price 8s. 6d.—The tenth edition of this popular work appears just after the lamented death of the author, whose remarkable faculty of exposition to engineering students enabled him to write a series of text-books which obtained a very wide vogue. The present work has been revised and enlarged, and the author has added recent information bearing upon examinations, together with sets of the latest examination papers of various bodies. He has also incorporated in this volume the table of engineering symbols, units and abbreviations employed in his larger text-books, as well as the symbols adopted by the International Electrotechnical Commission at Turin in 1911. One of the leading features of these books is the lavish provision of fully worked examples throughout the work, whereby any difficulty that may be experienced in following the abstract discussion of a proposition is removed by the concrete illustration thus afforded. There is also a wealth of line drawings and half-tone illustrations, constantly reminding the reader that the principles which he is studying have an immediate bearing on the practical applications of engineering to the needs of everyday life, and thus engaging and retaining his interest in a subject which, if improperly treated, can be made as dry as dust.

*Text-book of Applied Mechanics.* Vol. I. Price 6s.—This book, by the same author and publisher as the foregoing, is the first of the five volumes which compose the complete work, now commencing its ninth edition, and as we reviewed the seventh edition less than three years ago, we need neither notice it at length nor demonstrate its obvious popularity. Most of what we have said above regarding the elementary manual applies also to this volume, of which we can hardly speak too highly.

"Lockwood's Builder's, Architect's, Contractor's and Engineer's Price Book for 1913." Edited by F. T. W. Miller. London: Crosby Lockwood & Son. Price 4s.

"Über die Patentsituation in der Automatischen Telephonie." By F. Aldendorff. Berlin: S. Heimann & Sohn.

"Quarterly Trade Journal of the British Chamber of Commerce of Turkey." No. 20, 1912. Constantinople: The Chamber. Price 2s. 6d.

"A Handbook of Wireless Telegraphy." By J. Erskine Murray. Fourth Edition. 1913. London: Crosby Lockwood & Son. Price 10s. 6d. net.

"The Repayment of Local and Other Loans." By Edward Hartley Turner. London: Sherratt & Hughes. Price 21s. net.

"Design and Construction of Steam Turbines." By Harold M. Martin. London: Engineering. Price 25s. net.

"List of Works on Aeronautics in the Science Library." "Catalogue of an Exhibition of Apparatus Illustrating the Application of Scientific Principles to Aeronautics." London: Wyman and Sons, Ltd. Price 4d. and 1d. each.

"Papers and Reports Relating to Minerals and Mining in New Zealand." 1912. Wellington, N.Z.: Government Printer.

"Specifications for and Measurement of Standard Sieves." Washington: Government Printing Office.

"Annales des Postes, Télégraphes et Téléphones." 1912. Paris: A. Dumas. Price 6 fr.

"Elektro-Ingenieur-Kalender, 1913." Berlin: Oscar Cablenitz. Price M. 2.50.

"Transactions of the North-East Coast Institution of Engineers and Shipbuilders." Vol. XXIX, Part 3. January, 1913. Newcastle-on-Tyne: The Institution. Price 5s.

"Boletín de la Sociedad de Fomento Fabril." December, 1912. Santiago de Chile: The Society.

"Bulletin of the Association des Ingenieurs Electriciens." October, 1912. Liège: The Association. Price 5 fr.

"The A.B.C. Fiscal Handbook." 1s. net.; post free, 1s. 3d.

"Two Great Tariff Trials of 1912." By W. E. Dowding. 3d. net. London: Free Trade Union.

**Messrs. Ernest Scott & Mountain's Works Purchased.**—The works of MESSRS. ERNEST SCOTT & MOUNTAIN, LTD., Gateshead, have been purchased on behalf of MESSRS. C. A. PARSONS & Co., of Heaton Works, Newcastle-on-Tyne, together with the more important portions of the plant and machinery and the goodwill. Owing to the large number of inquiries received by Messrs. Parsons, and to some very large contracts recently undertaken by them, the works will, in the first instance, be chiefly engaged in assisting their general manufactures, as well as continuing the business carried on by Messrs. Scott and Mountain.

**River Plate.**—Amongst the principal electrical goods imported during the first nine months of the year we find the following (values in dollars gold):—Accumulators, \$47,370; insulators, \$99,236; cables and wires, \$2,231,293; telephones, \$58,623; arc carbons, \$109,702; dynamos and motors, \$1,391,131; switches, \$88,470; arc lamps, \$106,960; incandescent lamps, \$344,401; meters, \$359,604; lampholders, \$57,647; ventilators, \$22,936. The total value of the electrical goods imported was \$6,941,984, an increase of \$2,066,601.—*Review of the River Plate.*

**Catalogues and Lists.**—THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Advance copy of a new price list describing, illustrating, and giving price and dimensional information respecting, their B.T.H. A.C. pre-payment watt-hour meter, single-phase house service type.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, London, E.C.—12-page pamphlet entitled "A New Way to Sell Fittings"—building them up on the sectional system. The various parts going to make up a complete fitting are illustrated in the list. The tungstolier sectional fitting, it will be remembered, was described in these pages a short time ago. The contractor who is hampered by the cost of keeping large showroom facilities for the display of fittings can keep the separate ready-wired parts of this type of fitting ready for assembling in a few minutes, and thus needs less showroom and stock room accommodation.

MESSRS. E. A. REED & Co., LTD., 14, Victoria Street, London, E.C.—Catalogue consisting of a number of illustrated sheets showing and briefly describing their elevators and conveyors for sacks and boxes, vertical box elevators, tray conveyors for coal and ore, gravity roller conveyors, steel buildings, roofs and chimneys.

THE LONDON ELECTRICAL TRADING CO., LTD., Palmerston House, Old Broad Street, London, E.C.—Illustrated and priced showcard of the "Pygmy" electric heater. We understand that nearly 10,000 of these heaters have been sold since they were first placed on the market last autumn. Copies of the showcard can be obtained from the firm or any of their agents.

THE DUSSEK BITUMEN CO., Canal Bank, Deptford, London, S.E.—Two pamphlets have been received; one of 12 pages gives particulars of their joint box compound (Trinidadite) and tests thereon, while the other of 14 pages contains an imposing list of electric supply authorities in all parts of the kingdom who are using this compound, together with a collection of testimonials from some of

them. Copies of both lists will be sent to anybody interested in mains work.

**MESSRS. DETROIT ENGINE WORKS, 91, Hatton Garden, London, E.C.**—Illustrated price lists relating to the Detroit stationary oil and petrol engines.

**THE HART ACCUMULATOR CO., LTD.,** of Marshgate Lane, Stratford, London, E., have prepared a very effective wall showcard. The pictorial part of the design embodies illustrations of typical Hart central station batteries and batteries for private installations and other purposes.

**MR. A. BURROUGHS, 28, Hatton Wall, London, E.C.**—Illustrated leaflets showing the firm's electric illuminated box signs for outside service, and standing signs for window and counter display.

**THE BRITISH WESTINGHOUSE ELECTRICAL AND MANUFACTURING CO., LTD.,** Trafford Park.—Small folder relating to spare parts for control gear. An illustration of a disassembled controller has a letter index to the separate parts, which can all be supplied from stock. Also a folder dealing with oil-insulated self-cooling transformers.

**THE BRITISH ELECTRIC TRANSFORMER CO., LTD., 29A, Charing Cross Road, London, W.C.**—Illustrated catalogue, No. 29, describing the "Tricity" non-luminous electric heater for service on board ship. Pedestal and settee types are both shown.

**Private Arrangements.**—**R. GREGSON & Co.,** electrical engineers, 12, George Street, Ashton-under-Lyne, and 38, Bank Street, Rawtenstall.—The creditors interested herein were called together recently at the offices of Messrs. Hurst & Hewitt, Commercial Chambers, Corporation Street, Manchester, when a statement of affairs was presented showing liabilities of £680, all of which were due to unsecured creditors. The assets were estimated to realise £714, and a surplus was thus disclosed of £34. The assets consisted of stock-in-trade at Rawtenstall, £42; stock at Ashton-under-Lyne, £50; fixtures, fittings and utensils, £20; book debts at Rawtenstall, £210; and book debts at Ashton-under-Lyne, £392. It was reported that the business had been carried on in partnership, the partners being Richard Gregson and Wm. Gartside. They started trading about three years ago, each having a capital of about £500. Each of the debtors managed one of the businesses. It was stated that the business had been losing money, and the last balance-sheet which was prepared in March, 1912, showed a surplus of a little more than £300. In consequence of proceedings, the debtors consulted their solicitors before Christmas, when they were advised to execute a deed of assignment. Gregson did not attend at the offices to sign the deed, but he had since sent the key of the Ashton-under-Lyne premises to the trustee, together with some money. It was also reported that Gregson had gone away. The accountants subsequently made inquiries, and found that the books had not been properly written up since the date of the last audit. In the absence of Gregson, an application was made to the Registrar of the County Court for leave to register the deed in that debtor's absence. The application was refused, but the matter was taken before the Judge, and after reviewing evidence, he acceded to the application. It was, however, stated that Mr. Gartside owned a dwelling house of the value of £250, and he had deposited the deeds of that property with the trustee, and the assets would be accordingly increased. Sympathy was expressed with Mr. Gartside by the creditors, and after a short discussion it was decided that the deed of assignment already executed should be confirmed. The following are creditors:—

W. T. Henley's Telegraph Works, Ltd. . . . .	£174	Richardson & Co. . . . .	£31
Baxendale & Co. . . . .	100	Eckstein, Heap & Co. . . . .	29
Foster Engineering Co. . . . .	77	Union Electric Co. . . . .	22
Verity, Ltd. . . . .	39	Edison & Swan Co. . . . .	16
		Siemens Bros. & Co., Ltd. . . . .	18

**Dissolutions and Liquidations.**—**NORTH METROPOLITAN TRAMWAYS CO.**—A meeting is called for February 20th at Electrical Federation Offices, London, to hear an account of the winding up from Messrs. Geo. Richardson and J. McLeod.

**COWPER-COLES INVENTIONS DEVELOPMENT CO., LTD.**—A meeting is called for February 25th at 1 and 2, Old Pye Street, Westminster, to hear an account of the winding up from the liquidator, Mr. W. Craddock.

**MERSEY ENGINE AND PRODUCER CO., LTD.**—At a meeting called for February 24th, at 3, Lord Street, Liverpool, Mr. W. E. Mounsey, the liquidator, will give an account of the winding up.

**THE ELECTRICAL WIRING AND ACCESSORIES CO.,** Boot Buildings, Market Street, Aberdeen.—Messrs. J. A. Beshier and R. S. Belsten have dissolved partnership. Mr. Belsten attends to debts, &c.

**Finding Lost Pipes.**—There have been several inquiries regarding the apparatus for this purpose described in our issue of December 20th, 1912. We are now able to state that the makers are Messrs. Edwin A. Mansfield & Co., 12, Beckenham Road, New Brighton, U.S.A., from whom we have received a pamphlet describing the system, and giving a long list of water and gas companies and municipalities who use it.

**Annual Dinner.**—The staff of the **ELECTRIC CONSTRUCTION CO., LTD.**, held their sixth annual dinner on Friday, January 17th, at the Star and Garter Hotel, Wolverhampton. The managing director of the company (Mr. James Gray) presided over a good muster, the vice-chair being occupied by Mr. William Bulloch (a director and general manager of the company). Mr. David Willock (secretary of the company) was also present. After dinner, musical items were rendered by various members of the staff, including a "turn" by "The Shockers," a quintette of pierrots, whose performance—including several topical items written by one of the troupe—was thoroughly enjoyed. The managing director, replying to the toast of "The Company," proposed by Mr. Sam. Antwis—the oldest

member of the staff present, with 30 years' service—referring to the harmonious relations existing between the directors and the staff, said, in these days of labour unrest they prided themselves on the fact that they had never had a serious dispute with their employees, and spoke very hopefully of the prospects of the company. Mr. W. Bulloch, in proposing the toast of "Our Chairman," spoke of the valuable services rendered to the company by Mr. Gray, and of the esteem and affection with which he personally regarded him. The toast of "Our Vice-Chairman" was proposed by Mr. R. Massey, and acknowledged by Mr. Bulloch. The "Dinner Committee and Artists" was proposed by Mr. D. Willock, and responded to by Mr. W. M. Furniss.

**Spain.**—A foreign Consular report from Barcelona says, among other things, that without belittling the success Germany has had in Spain, it can be truly said that, if the dynamos and the larger apparatus are excepted, the goods supplied are often of very moderate quality, and would not readily be disposed of in any other European market. This is the result of the low prices at which German manufacturers are prepared to take the business solely with a view of discouraging competition by the electrical industries of other countries. It is not likely, however, that Spain will continue indefinitely to buy cheap goods which do not wear well, and, therefore, if the German plan of campaign is not altered, it is probable that her manufacturers will lose a great deal of the business that is now in their hands—at any rate as far as accessories are concerned.

**Calendars.**—**MESSRS. W. A. WALBER & Co., 38, Victoria Street, Westminster, S.W.**, have issued a large wall calendar, the central feature of which is a collection of miniature half-tone illustrations of machine tools made by the firms for whom they are agents.

From the **ELECTRICAL ACCESSORIES SUPPLY STORES, OF 9, Queen's Terrace, Sheerness-on-Sea**, we have received a neat little calendar with monthly tear-off slips.

**THE BAT METER CO., LTD., 3, Eden Street, Hampstead Road, London, N.W.**, has likewise issued a wall calendar with monthly slips. The upper half of the sheet shows a large illustration of one of the firm's electrical meters.

\* **MESSRS. BRECKNELL, MUNRO & ROGERS, LTD.,** of Thrissell Street, Bristol, have prepared a calendar with monthly slips for 1913, above which there is a print in colour of "Past and Present—H.M.S. *St. Vincent* leaving Portsmouth Harbour"—always an interesting comparison.

**THE SUN ELECTRICAL CO., LTD.,** of Charing Cross Road, W.C., ask us to say that, in consequence of the extraordinarily large demand for the pencils prepared by them as a New Year souvenir, their stock is exhausted, and they regret inability to comply with all the requests.

**Trade Announcements.**—**Mr. Fred. E. Trill** has entered into partnership with Mr. E. A. Shaw, electrical engineer. The business will be carried on as heretofore under the style of **EDWARD A. SHAW & Co.,** at Cape Town.

**MR. R. E. CONNOLD** has taken over the business formerly carried on at 6A, Parade, Canterbury, by Mr. L. A. Wells, electrical engineer and contractor.

**MESSRS. J. E. ELLIOTT & Co.,** electrical engineers, of Broad Street, Oxford, have recently opened offices at 10, Adam Street, Adelphi, W.C.

**THE SHIPLEY FAN CO.** have removed to Valley Works, Shipley, owing to increased sales of fans and motors. Telephone number, "320 Shipley." Illustrated cards received show their blowing fan, exhausting fan, and Sun electric fan.

## LIGHTING and POWER NOTES.

**Aberdeen.**—**Mr. Bell**, the electrical engineer to the T.C., has reported on the necessity of extending the generating plant of the Corporation at a cost of £15,510. The estimates provide for a 3,000-kw. turbo-alternator with condenser, &c. (£9,750), 1,500 kw. of converting plant (£3,600), switchgear, &c. (£750), and contingencies (£1,410). The new turbine plant will replace two existing 200-kw. engine sets which are out of date.

**Arbroath.**—A difference between the Town Council and the North of Scotland Entertainments, Ltd., regarding the payment of £212 for electrical equipment in connection with the reconstruction of the old Corn Exchange buildings, has been satisfactorily settled.

**Argentina.**—In connection with **La Societa Italo-Argentina di Elettricit **, the new company which has lately been formed in Buenos Ayres under Italian auspices with a capital of £440,000, to establish electricity supply undertakings in Argentina, the **Pirelli Co.,** of Milan, Messrs. **Tosi & Co.,** of Legnano, the well-known Italian turbine builders, and Messrs. **Boveri & Co.,** of Baden, Switzerland, are reported to be interested in this concern.

**Ayrshire.**—More light is wanted at Troon, a popular watering place, and it is suggested that electricity should be introduced. It is believed that the T.C. will consider the matter.

**Blackrock.**—A special meeting of the Council was held on Saturday to consider what action should be taken with regard to the proposal of the Dublin Southern District Electric Supply Co. to apply to the B. of T. for a prov. order giving it liberty to supply the Blackrock district with electric current. The town clerk pointed out that the Dublin Southern Co. would supply electricity at a fraction under 5d. per unit for private purposes to the consumers in the district. The Pembroke Council would also be disposed to favourably consider the supply of electric current at the boundary of the township on terms ranging from 2½d. for 100,000 units per annum to 1½d. for a consumption exceeding 325,000 units, for a period of three years (beyond which the Council would not contract) renewable at the same terms, and it would supply at 2½d. per unit, irrespective of the quantity consumed, up to March 1st, 1914. The position, therefore, appeared to be that the Council could either decline to waive its right to the notice which should have been given by the promoters of the company in July last, with the result that Blackrock must be left out of the proposed order, or it could make an arrangement with the Pembroke Council. The Dublin Southern Co. had written stating that it was not greatly concerned whether Blackrock was included or not in the order. It was decided unanimously not to waive the Council's right to the notice which should have been delivered in July last; and further, that the district should be canvassed for consumers.

**Blackburn.**—The Mayor is to perform an interesting ceremony to-day at the electricity works, when he starts the new generating plant installed at a cost of £9,000. The new plant consists of two turbo alternators, two rotary converters, and the necessary switchboard, &c. These are the first turbines to be put down in Blackburn; when the first one was ordered, 12 months ago, it was got partly to enable the Corporation to start an extra-high-tension supply for cotton mills and large works. Before it was on its bed there was a demand from two mills for half of its capacity of 2,000 kW, and since then practically another 1,000 kW. has been arranged for. With the full capacity of one turbine spoken for, the Electricity Committee decided to put down another. The new plant generates three-phase alternating current at 6,600 volts, and has a speed of 3,000 R.P.M. The two rotary converters are already in position; each has a capacity of 1,000 H.P. and a speed of 600 R.P.M. The two cotton weaving mills to be run by the first turbine are the one at Skew Bridge, which has 1,040 looms, and Cicely Bridge extension, 370 looms; each loom has its own motor. The new plant has been installed by the British Westinghouse Co. A cooling tower, 106 ft. high, is shortly to be erected. The tower foundations and auxiliaries will cost approximately £2,600, and it will be capable of dealing with 200,000 gallons per hour. The order has been placed with the Davenport Engineering Co. The whole of the work has been done to specifications by Mr. Wheelwright, the borough electrical engineer.

**Bolton.**—The Electricity Committee has referred to the chairman and vice-chairman, applications from the following mills and works for current for motive power:—Messrs. Slater & Co., Ltd., Bolton Bleachworks; Messrs. R. Entwistle & Co., Lincoln Mill; Messrs. J. Marsden & Co., Britannia Works; Messrs. Winder and McKean, Bradford Mills, and the Victoria Mill.

**Brighton.**—The T.C. has decided to install an electric cooking outfit, at a cost of £55, on the Crown Street premises of Messrs. Stafford, who are constructing a new staff kitchen. The firm have promised to use electricity if the Council puts in the apparatus.

**Church (near Oswaldtwistle).**—The U.D.C. has decided that Blackburn Road and Market Street be lighted by electricity, and a sub-committee has been appointed to make arrangements and report.

**Continental Notes.**—**FINLAND.**—It is announced from Helsinki that the Finnish Senate has discussed the question of the utilisation of the falls on the River Vuoksia, and that an inter-Departmental Committee has been appointed to draw up the conditions for the immediate utilisation of the Grande Imatra Falls. The electrical energy generated will be utilised for traction purposes on the Saimen Canal, for the electrification of the St. Petersburg-Viborg railway, for lighting and power purposes in the town and district of Viborg, while part will be transmitted to St. Petersburg for a similar purpose. It is estimated that the portion of the falls to be utilised will yield an electrical output of 450 million kW.-hours per year. The necessary plant will be installed on Government account, the Finnish Senate having decided not to hand it over to private concessionaires.

**NORWAY.**—The Municipality of Tromsø has recently contracted for a new electricity works, with equipment by the Elektrisk Bureau of Christiania. Two generators of 600 H.P. each, with the necessary transformers and switches, will be installed. The electric power will be derived from a waterfall situated at some distance from the town, and will be transmitted at 12,000 volts. This undertaking is not a very big one, but it has some very interesting features in regard to the question of transmission. Tromsø is situated on an island, while the waterfall, from which the energy is to be obtained, is situated on the mainland. This necessitates the transmission of power by submarine cables across two sounds, one of which is 550 m. wide, and the other 625 m. The works are to be completed by August next.

The Elektrisk Bureau has also obtained an order from the Sulitelma Copper Mines for the delivery of two generators, to be installed at the Fineide power station, which will be extended.

The municipal authorities of Christiania are reported to be con-

sidering a scheme to establish a plant, 25 miles from the city, to utilise the water power of the Halfred and Solterfos Falls on the River Glommen, in the generation of electrical energy. It is stated that about 27,000 H.P. will be available.

**GERMANY.**—The recently-formed Thüringer Electricitäts Lieferungs Gesellschaft has placed a contract with the A.E.G. for the construction of an overland transmission station for the Duchies of Gotha and Meiningen, and the districts of Schmalkalden and Schleusingen. The power station, which will have a temporary capacity of 14,000 H.P., will be located near Altenbreitungen a.d. Werra.

The municipal authorities of Hagen, Westphalia, are reported to have placed an order with Messrs. Brown, Boveri & Co., of Mannheim, for what it is claimed will be the largest steam turbine and dynamo so far built. It will be of 35,000 H.P., and is to be added to the plant at the municipal central station at Hagen.

**Cromer.**—At a meeting of the U.D.C. on January 13th it was decided that the proposed transfer of the electric lighting undertaking to Messrs. Edmundsons should remain in abeyance with a view to a referendum of all the ratepayers being taken at once on the question.

**Croydon.**—The B.C. has sanctioned the sinking of a well at the electricity works at a cost of £1,200. Owing to the proximity of the River Wandle, the amount of water to be extracted must not exceed an average of 4,000 gallons per hour in any period of 30 days.

**Dawlish.**—The U.D.C. has decided to increase the number of street electric lamps by 30.

**Ealing.**—The chairman and borough electrical engineer have been instructed by the B.C. to make inquiries and report upon a letter received from Messrs. Handcock & Dykes, on behalf of the Fixed Price Lighting Co., for putting its scheme into operation in this district.

The B.C. has decided that in future the charge for electric current supplied for outside illuminated signs and for outside incandescent shop lighting shall be 4d. per unit.

**Edinburgh.**—In spite of protests from the electrical trade of the city, the Corporation has decided to retain in its prov. order the clause which gives it power to sell and hire electrical apparatus. In one respect, however, the recent deputations from the traders heard by the Council has prevailed, for the Corporation will not carry out any wiring. Mr. Walter Finlay, who speaks on behalf of the traders, says what they desire is freedom from rate-aided competition, which is the most serious menace that can be met with so far as they are concerned. They contend that in Edinburgh there are ample showrooms for the consumers to see the most recent electrical appliances.

**Epsom.**—A town's meeting was held on the 15th inst. to consider the Bill which the U.D.C. proposed to promote in Parliament in order to provide further powers in connection with the municipal electricity and water undertakings and other matters. On behalf of the Council, it was stated that the electricity undertaking was costing the town £1,120 less than in 1908, and that a proposal was to be immediately considered to reduce the price of current for power purposes from 2½d. to 1½d. per unit. A vote was taken which showed a majority of about 2 to 1 against the Bill.

The R.D.C., on January 15th, approved of plans for the extension of the mains of the Leatherhead and District Electricity Co. from Fetcham to the Eppingham district. The company has also submitted a draft prov. order for electric light in the parishes of Cobham, Stoke D'Abernon, Great Bookham, and Little Bookham, and this was referred to a Committee.

**Glasgow.**—A special Sub-Committee of the Electricity Committee has been appointed to consider and report on a letter submitted on behalf of a number of electrical firms in Glasgow, for the organisation, under the auspices of the T.C., of an Electrical Manufacturers' Exhibition in the city.

**Guildford.**—An application has been made by the Electricity Supply Co., to the B. of T. for consent to construct a generating station on land adjoining the existing works of the company.

**Helsby.**—The P.C. is considering the advisability of utilising electricity at the sewerage works, and an estimate of the cost, as compared with gas, is being prepared.

**Mendon.**—The Colne Valley Electricity Supply Co. has agreed to the R.D.C.'s suggestions that the price of current should be fixed at 6d. per unit for lighting and 3d. for power, and that a clause should be included in the proposed prov. order giving the Council the option of purchasing the undertaking on the expiration of 21 years. Under these circumstances the Council's opposition to the scheme is to be withdrawn.

**Hoddesdon.**—The B. of T. has revoked the 1901 E.L. Order.

**Hove.**—A statutory town's meeting was held on January 17th to decide whether the Corporation shall promote a Bill in Parliament for the purchase of the Hove E.L. Co.'s undertaking. The Mayor pointed out that the purchase had been decided on, and it was now desired to obtain Parliamentary powers, as it was hoped that the repayment would then be extended over 40 years, while the alternative of L.G.B.'s sanctions would probably mean repayment in 15 to 20 years. The loan repayment for 40 years would only amount to £9,500 per annum, and would be about £14,000 for 20 years. The resolution was lost on a vote, and a poll of the ratepayers has been demanded.

**Knighton (Radnorshire).**—A largely-attended meeting of ratepayers has by an almost unanimous vote resolved that the private company which had applied for permission should undertake the electric lighting scheme, subject to its being acquired by the Council at a future date.

**Liverpool.**—Further extensions are proposed at the Lister-Drive power station, where additions were made in the early part of last year by the installation of two 2,000-kw. D.C. turbo-generators, and two 3,500-kw. turbo-alternators. At the meeting of the Electrical Sub-Committee on January 17th, a report was received from Mr. H. Dickinson, chief electrical engineer, on the proposed further extension of the works. Owing to the laying of additional tramways, and the increase in the number of cars running besides the considerably increased demand for current, the generating plant at Lister-Drive has required to be not only modernised, but considerably increased in capacity. The report recommends an increase capable of meeting present and future needs for many years to come. As the details were considerable, the Committee decided to take time for each member to study the scheme for himself, and it was agreed to deal with it at a subsequent meeting.

**Long Eaton.**—The U.D.C. on Monday gave instructions for plans, specifications and estimates to be prepared for extensions at the electricity works, with a view to a loan of £8,000 being applied for. The proposals are to install a 500-kw. steam dynamo and accessories, a Babcock & Wilcox water-tube boiler, and erect an engine room, boiler room and office extensions.

**London.**—BERMONDSEY.—An addition has been made to the assessment of the undertaking of £1,195 gross, and £530 rateable, in respect of the recent additions to the generating station.

**HACKNEY.**—The Electricity Committee reports having had under consideration the necessity of proceeding with the first part of the system of ring mains, sub-stations and sub-feeders in connection with the scheme adopted in March last for the extension of the undertaking. The maximum demands this year have already exceeded what was anticipated for next January, viz., 4,150 kw., and the strain of the heavy load was being acutely felt upon the mains and plant. A site for the northern sub-station, the Committee states, has been obtained, and immediate steps should be taken to secure sites for the south-eastern and south-western sub-stations. The immediate load that will be dealt with by these sub-stations will be approximately 1,700 kw., and to meet this load plant should be provided having a total capacity of 3,000 kw. With regard to the system of ring mains the Committee proposes to lay fire ducts which will accommodate cables for 12,000 kw., with telephone cable and pilot wires. At present provision was being made for drawing in one cable only to deal with a load of 3,000 kw. when fed from both ends, or 1,500 kw. in the event of a fault occurring in the worst possible position. For the transmission of the low-tension current from the generating and sub-stations, it is proposed to use the existing feeder cables and to run out several new cables from the sub-stations. The general principle of the proposed arrangements is to increase the capacity of the feeders to existing feeding centres by joining existing cables in parallel, so that these centres may still be supplied from the generating works, at low pressure and without excessive loss, while the ends of the longer feeders will be cut off and connected to the sub-stations. The Committee recommends (1) that the proposed scheme of extensions be approved; (2) that tenders be invited for the erection of the three sub-station buildings and the sub-station plant; (3) that the necessary cables and boxes be purchased under the current contracts for these materials, and that tenders be invited for supplying and laying the conduits, &c.; (4) that application be made to the L.C.C. for loans aggregating £53,550.

**POPULAR.**—As loans of £2,885 for buildings, £1,000 for mains, and £2,115 for machinery are required in respect of extensions to the electricity undertaking, and as no better terms than 4 per cent. can be obtained, it has been decided to borrow the machinery amount from the Council's superannuation and pension fund at 4 per cent. interest, and the two remaining items from the L.C.C.

**SHOREDITCH.**—The Lighting Committee reports having carried out experiments over a long period with a new type of flame lamp for the purpose of improving street lighting. The electrical engineer reports that if magazine type flame arc lamps are adopted, not only will a great saving be effected after the new lamps are paid for, but an increase of nearly 100 per cent. will be gained in illuminating power. It is estimated that the saving per annum on a circuit of 21 lamps, including current and attendance, after allowing for the slightly increased cost of carbons, will be about £124. After fully considering the matter and in view of the great increase of vehicular traffic, also in the speed of all kinds of motor traffic, the Committee expresses the opinion that the improved lighting of the streets, especially main thoroughfares, is of urgent importance, and it has decided to purchase 96 lamps as follows:—48 "Metro-flam" arc lamps, burning 70-80 hours, from Johnson & Phillips, at £9 10s. each, and 48 "Angold" arc lamps, burning 90 hours, from the General Electric Co., at £10 each. An expenditure of £300 has been approved for the supply of new meters.

**Lowestoft.**—The electrical engineer reports that the total receipts of the undertaking amounted last year to £15,992, which shows an increase of £163 on the year's work, and which, after paying all working expenses and small extensions, left a gross profit of £7,489, which is equal to 74 per cent. on the outlay. From this amount must be deducted payments made out of appropriation account for some work which it has been found necessary to carry

out. The interest and sinking fund charges have increased from £6,767 to £7,283. This large increase is entirely due to the short loans which the L.C.C. is now only allowing. The total number of units generated amounts to 1,507,990, showing an increase of 99,753.

**Mansfield Woodhouse.**—The U.D.C. has decided to have certain thoroughfares lighted by electricity. Double 100-c.p. lamps will be charged £10 each per annum, and double 50-c.p. lamps £5 10s. per annum. Under agreement with the Mansfield T.C., current will be supplied under the maximum demand system at 7d. and 2d., and on the flat-rate at 4½d. per unit for lighting; and for power at 1d. and 1d.

**Margate.**—The T.C. proposes to install three lifts in the town, one from the Fort Promenade to the Lower Promenade; another at Newgate Gapway; and a third from the Cliffs to the Lower Promenade at Palm Bay. The Works Committee is to prepare a report as to the cost, &c.

**Middleton.**—The application of the T.C. for sanction to borrow £7,200 for the purposes of the electricity undertaking was inquired into by Mr. T. C. Ekin, of the L.G.B., on January 17th. Mr. S. Pauls, borough electrical engineer, gave particulars of the requirements, which showed that out of the £7,200, it was intended to expend £5,200 on cables, and the remainder on a steam dynamo, and accessories. The Committee had been spending some £900 a year on mains, and he estimated that to meet the great demand for current it would have to spend £1,000 in the future. The Garden City accounted for a large increase, as well as the improvements in lighting. He was quite satisfied that they would be able to spend the money within the next three years. There was no opposition. In connection with this scheme, the Council has placed a contract with the Lancashire Dynamo and Motor Co. for a 300-400-kw. dynamo, and with Messrs. Belliss for an engine.

**Orsett.**—The R.D.C. has consented to the application of the County of London Electric Supply Co., Ltd., for a prov. order for electric light in the rural area.

**Portslade.**—The U.D.C. has resolved not to approve of the Bill of the Hove T.C. to purchase the undertaking of the Hove Electric Light Co., owing to Portslade being included in the area of supply, and to request the Hove Corporation to strike out everything contained in the Bill affecting the urban district.

**Queensferry (Ches.).**—The lighting of the district has been under consideration for some time, both by the P.C. and the West Saltney R.D.C., and the latter authority at its last meeting approved a resolution, passed by a ratepayers' meeting, that steps be taken to have Queensferry lighted by electricity. Mr. T. M. Dutton, who was present at the meeting of Queensferry ratepayers, considered that a suitable plant could be put down for about £1,500, and he suggested that a deputation should view the scheme in operation in Caergwile. The estimate referred to had, he said, been sent in by Sandycrofts, Ltd., but he was simply there to explain the scheme as an interested ratepayer, having severed his connection with that company. An amendment, suggesting that the Connahs Quay Gas Co. be again approached before anything definite was done, was rejected by a large majority.

**Rawtenstall.**—A new engine room has been added to the electrical generating station, with a 1,000-h.p. Belliss engine and three-phase alternator. The alternator has been made by the General Electric Co., and supplies current at a pressure of 3,000 volts. A second set which is being placed in the power house is an exact replica of the one above-mentioned. Three condensers of the ejector type have been installed, and a fourth is being added. A new intake, with screening apparatus, has also been installed, and a new boiler by Messrs. Yates & Thom. The demand for current is increasing so fast in both Bacup and Rawtenstall, that there is practically a full load waiting for the extended plant.

**Rochdale.**—At a meeting of the Corporation Gas and Electricity Committee last week, a letter was read from the Salford Corporation thanking the Committee for the help rendered at the time of the disastrous fire at Salford. One of the members of the Committee asked the electrical engineer if the Rochdale works were reasonably safe against such a calamitous outbreak, and Mr. Atchison replied that it was practically impossible for the Rochdale works, constructed as they are, to be burnt out, and as far as human foresight could do it, they were safeguarded against serious results from fire.

**Romford.**—After discussing the matter *in camera*, the Finance and Parliamentary Committee of the U.D.C. has further deferred action with regard to the applications for prov. orders for electric supply by the London Electric Supply Co. and Mr. W. T. Pressland. Further information is to be obtained.

**Sanderstead.**—At the last meeting of the Parochial Committee, it was stated that the County of London Co. had written to the Coulsdon and Beddington Councils, offering to light the streets under their jurisdiction at a moderate rate now that the company was bringing its own H.T. supply from Wandsworth. The Committee decided to write to the company, asking its charges and what roads would be included.

**Scarborough.**—The Corporation has appointed a special committee to consider and report upon the question of the exercise of its right of purchase of the local electric lighting undertaking.

**South Africa.**—The Paarl Cape Province ratepayers have sanctioned the raising of a loan of £35,000 to be expended on an electric light installation. The scheme proposes to use water as the prime motive power, and this is to be obtained from the Nantes and Bethal streams and stored in a reservoir on the mountain. The reservoir will have a storage capacity of 121,000,000 gallons. The engineer for the scheme is Mr. Thomas Stewart, M.I.C.E., of Cape Town. The dam is estimated to cost £22,000, plant and power station £5,100, and 12 miles of street lights and mains for private consumers £7,365.

**Southampton.**—The Corporation electricity department has just issued a well-printed booklet on "Heating by Electricity." A view on the cover shows the exterior of the up-to-date show-rooms at Above Bar, and the contents deal concisely with the various phases of electrical heating, which, as our readers are aware, has been energetically introduced by the local electricity department with very successful results. Included in the booklet is a list of a dozen local contractors.

**Surbiton.**—At the last meeting of the District Council, the report of Mr. J. F. C. Snell on the electricity undertaking for the six months ended September 30th, 1912, was considered. During the half-year 114,848 units were sold at an average price of 4'8d. per unit, as against 98,493 units at 4'9d. in the previous year, or an increase of 16,353 units, equivalent to 16'6 per cent., which he considered most satisfactory.

**Swansea.**—The electrical engineer has been instructed to prepare the necessary specifications, &c., for installing electric light at the new training college, and tenders are to be invited for carrying out the work.

**Swinton.**—An arrangement has been made between the District Council and the Lancashire Electric Power Co. whereby it will soon be possible for the Broad Oak Park area at Swinton to have a supply of electricity for lighting purposes. Subject to the sanction of the L.G.B., it has been arranged that the company shall deliver electricity at high pressure at the Council's boundary at Sindsley, and the Council will erect a transformer and lay supply cables through the park. The clerk has been instructed to make application for the necessary powers and for a loan of £600, and it is expected that the work will be proceeded with as soon as sanction is obtained.

**Uruguay.**—According to the *Review of the River Plate*, the Government has issued specifications for the erection of electric light works in various cities and towns. The 16 installations are divided into five groups; group "A" comprises La Paz and Las Piedras, which will receive their current from the Monte Video station. Group "B" comprises Guadalupe, Pando and Santa Rosa, which will each have their own station. Group "C" comprises San Eugenio and San Fructuoso, each with its own station, and Maldonado, San Carlos and Punta del Este, which would be served from a station at Maldonado. Group "D" comprises Dolores, Nueva Palmira and Rosario, each with their own station. Group "E" comprises Batlle y Ordóñez, Sarandí del Yi and Treinta y Tres, each with their own station.

**Venezuela.**—In our note of last week, for the Harbour of "Caracas" read "Curaçao."

**Wallasey.**—It is anticipated that at the next meeting of the Council the chairman of the Electricity Committee will bring forward a scheme for extending the electricity undertaking at a cost estimated at £65,000. For some considerable time past the demand for current for power purposes has exceeded the supply, in addition to which an application was recently received from a local business concern for an annual supply of 3,000,000 units. The responsible committee in the past has, however, failed to keep abreast with the times, the consequence being that the existing plant at the electricity station in Seaview Road, Liscard, is quite inadequate for present-day requirements. The new Committee proposes to remedy this and to embark upon a policy of a decidedly progressive character. The proposal is to erect, at an estimated expenditure of £60,000-£65,000, a new power station in the Poulton area, whence it is anticipated there will be a goodly number of consumers from the many industrial undertakings situated in the neighbourhood. In addition to this, power could be provided for working the tramway service at a cheaper rate than at the present time. It is thought an adequate extension and development of the electricity undertaking will have an important bearing upon the prosperity of the town.

**Watford.**—A provisional order is to be promoted next autumn for giving a supply to Bushey.

**Whitstable.**—At a meeting of the U.D.C., on January 14th, Messrs. G. Stainton, Campbell and Norman attended respecting the proposed electric lighting scheme. The Council was asked to grant permission for Mr. Campbell, on behalf of a company, to install an electric light system in the town by means of overhead wires, to utilise electricity for public lighting and sewerage pumping, and to undertake not to oppose the application for a prov. order. Mr. Stainton said the company would supply 50 or 60-c.p. lamps at £3 6s. per annum, against £3 10s. at present paid for gas lamps. The Council will consider the matter at a special meeting.

## TRAMWAY and RAILWAY NOTES.

**Blackpool.**—The Tramways and Electricity Committee has decided that application be made to the B. of T. for sanction to borrow £10,000 for the following extensions of the Corporation's tramway undertaking:—Extension of Marton tram depot; extension of workshop accommodation, Blundell Street depot; extension of storage accommodation, Blundell Street depot; six new open-type tramcars and electrical equipment therefor, and cables, sundries and accessories.

**Bournemouth.**—The long-debated question of Sunday running of the cars has at last been decided by a poll of the ratepayers, when 4,716 voted for and 4,268 against the proposal, showing a majority in favour of 448. A similar poll in 1906 resulted in a majority of 903 against Sunday running.

**Continental Notes.**—**AUSTRIA.**—The construction of an electric tramway between the towns of Parbuditz and Sezemitz, Bohemia, has been decided upon.

**FRANCE.**—A company styled the Chemins-de-fer Electriques de la Champagne has been constituted for the building and working of a network of local railways in the Départements de l'Aube et de l'Yonne. The gauge of the railways is 1 metre, and the extent of the system 194 km. Single-phase current is to be used, and the company will draw a portion of its supply from the Société Lyonnaise des Eaux et de l'Eclairage. A concession for 50 years has been secured.—*La Lumière Electrique.*

**Croydon.**—The Tramways Committee of the B.C. reported on Monday that it had considered a proposal from the L.C.C. for the running of through cars between London and Croydon. Having regard to the capital expenditure, estimated at about £60,000, which would be involved in adapting the Croydon system to suit the L.C.C. cars, the Committee recommended that the proposal be not entertained at the present time. The Committee also had under consideration reports by the town clerk and other officials regarding the powers of the Council in the matter of compulsory purchase of the portion of the South Metropolitan Electric Tramways within the borough. Having regard to the whole of the circumstances, the Committee recommended that those powers should not be exercised "at the present period." The routes affected are between the West Croydon terminus and the borough boundary (close to Mitcham Common), and from Church Street to the borough boundary in Stafford Road, Wallington (on the Sutton line). These recommendations were adopted. There was a long discussion over the Whitehorse Road route, which has been run at a loss since November, 1906, except for a period when it was closed. The manager (Mr. T. B. Goodyer) submitted an analysis of receipts, expenses, &c., for December 21st and January 3rd, representing losses of £963 and £1,573 respectively annually.

**Dundee.**—The Corporation Tramway Committee has delayed for three months consideration of the proposal to extend the railless traction system from Clepington Road to Lochee. Mr. P. Fisher, the manager, estimates the cost of equipping the proposed route at £1,000. Two additional cars would be required at £700 each, bringing the estimated total capital expenditure to £2,400. Mr. Fisher says the system has worked smoothly, and is as reliable as an ordinary tramway service. The earnings on certain days, reaching as high as 25'3d. per mile run, proved that with this system heavy traffic could be successfully dealt with. In this quiet winter time, from 2,000 to 3,000 persons were using the cars every week. The service proposed, he states, would be of considerable public benefit, and undoubtedly a traffic would be developed which in time would be a paying one.

**Glasgow.**—The T.C.'s Sub-Committee on Extensions is to consider the advisability, in the event of the route being extended from Baillieston to Coatbridge, of a further extension to Airdrie, as well as an extension from the present line at Clydebank to Duntocher and Hardgate.

**Holywell.**—The U.D.C. has decided to take up £3,000 worth of shares in the Mid-Flintshire Light Railway, subject to approval at a ratepayers' meeting. The R.D.C. has also decided to take shares to the value of £7,000, subject to the approval of the L.G.B.

**Irlam.**—The T.C. has been considering the question of installing a railless trolley system, or running motor-buses, but the matter is not going to be proceeded with at present. The clerk informed the Council last week that a private Act of Parliament, costing anything from £200 to £1,000, would be necessary, and also that the proprietor of the present horse 'bus system declared that the passenger traffic did not pay. In view of those facts, the suggested conference with local employers on the matter was not considered necessary.

**Leith.**—The Tramways Committee of the T.C. has asked the Management Sub-Committee to report upon the proposal to form an extension of the tramways from Seafield terminus to King's Road, Portobello.

**London.**—**ISLINGTON.**—A petition is to be lodged against the L.C.C. (Tramways, Trolley Vehicles and Improvements) Bill, for the protection of the Council's interests. The Committee in charge of the matter states that, as regards the proposal to work trolley vehicles, such powers, if obtained, will create a precedent which may render valueless the power of veto conferred upon Metropolitan Borough Councils by Sec. 23 of the L.C.C. (Electrical Power) Act,

1900, which prohibits the placing of wires in any street for an overhead system of traction unless the Council of the Borough in which such street is situate has consented thereto. It is doubtful whether the Council has a *locus standi* to oppose the present Bill when in Committee of the House of Commons as regards this point, but it may become necessary at a subsequent stage for the Council to take action for the protection of its interests.

**Liverpool.**—The Tramways and Electricity Committee on January 17th considered the estimates for 1913, and found itself in a position to allocate £97,000 to the relief of the rates, a sum equal to a rate of 6½d. in the £. The profit has accrued, as to £67,000 on the tramways undertaking, and as to £30,000 on electric power and lighting. This is compared with £38,000 and £25,000 respectively in 1911.

**Matlock.**—A special meeting of the D.C. is to be held to consider what steps should be taken with regard to the working of the cable tramways.

**Oldham.**—It is stated that the Tramways Committee will probably place the order for two motor-buses shortly.

**Sheffield.**—The City Council has adopted the proposal of the Tramways and Electric Light Joint Committee for connecting the power stations, so that the supply from both may be available for the tramways.

**Southport.**—Mr. Mallins, of the Liverpool Tramways, recently made several recommendations to the Tramways Committee in regard to the reorganisation of the tramway service, and the Sub-Committee on the tramways recommended the abolition of all contracts and preferential fares, except current contracts and statutory charges to the working classes. At the T.C. meeting last week an amendment for the continuance of the contract tickets was defeated by 27 votes to 21. The T.C. decided to purchase two omnibuses at £900 each.

**Whitby.**—The U.D.C. has decided to acquire land for a cliff tramway and lift from the beach.

## TELEGRAPH and TELEPHONE NOTES.

**The Atlantic Cable Combine.**—An article in the *Postal Telegraph*, of New York, suggests that it is only a question of time before the U.S. Government will break up the combination which the Western Union Telegraph Co. has made in the trans-Atlantic cable business, by leasing the cables of the Anglo-American and the Direct United States Cable Companies, on the ground that it constitutes a flagrant violation of the Anti-Trust Act of 1890. In that event the British shareholders would have to resume possession of their cables and work them without an agreement with the Western Union.

**France.**—A large wireless station is shortly to be constructed on the Bay of Bourgneuf, on the west coast of France, at a spot two miles inland.

**Imperial Wireless System.**—The Select Committee on the Marconi agreement resumed its sittings on Monday, when a letter from the Marconi Co. to the Postmaster-General was read. The letter, which was a very long one, stated that when the tender of March 7th was submitted, the company supposed that the agreement would be drawn up and ratified within a few weeks, and accordingly retained in England a large staff of engineers in readiness to commence the work. Instead, however, of ratifying the agreement in July, Parliament appointed a Select Committee which had sat for over three months, but had not yet taken evidence on long-distance wireless telegraphy from those best qualified to give it, while erroneous statements had been published which were very detrimental to the company. The latter regretted that the proposed Technical Committee was not appointed three months ago; the staff of engineers had been kept idle for many months, at great cost to the company, and the cost of materials had risen substantially since the contract was entered into. Mr. Godfrey Isaacs, who signed the letter, submitted that it was inequitable that his company should remain bound whilst investigations never contemplated were continued over an indefinite period, and stated that in order to maintain the company's position here and abroad their engineers must be released, and Mr. Marconi and he must be freed to attend to other important work. He therefore requested the Government to agree to the company's treating the contract as no longer binding upon either party. When the investigations were completed his company would be prepared to devote their whole energy, experience and staff to the construction of the Imperial stations on such terms as might be then agreed, if the Government should so desire.

In the meantime Mr. Marconi and the company's engineers awaited the opportunity of appearing before the proposed Technical Committee. Mr. Marconi, who became a party to the agreement at the express wish of the Department, endorsed this letter so far as it concerned him personally.

The examination of Sir G. C. Marks, M.P., was then resumed. He said that he would recommend the Committee to proceed on entirely new lines, asking the company for a price for the installation independent of royalties, the sum to include the right to use their patents. What the Government had already done on their ships they could do on land; consulting engineers could be asked to prepare specifications and carry out the work. If Clause 3 had remained in the agreement, the whole value of the Marconi patents

would have been destroyed during the existence of the contract, by the operation of Clause 38 of the Patents Act. The witness agreed to prepare a memorandum of the modifications that he would propose in the contract.

Mr. Viggo Gandil was recalled, and repeated his statement that Mr. Farnall, of the Post Office, had definitely offered on behalf of the Postmaster-General to purchase the whole of the Poulsen patent rights. Mr. Farnall was also recalled, and said that he did not make any offer to buy. He was instructed by the Postmaster-General to find out whether the Poulsen people were prepared to sell their patents. He admitted that his previous answer did imply that there was an offer to buy. The Postmaster-General was afraid the Marconi Co. would buy up the Poulsen patents.

On Wednesday the examination of Mr. Farnall was continued and concluded, and Mr. W. R. Lawson, a financial expert, gave evidence.

**Norway.**—The Cabinet has decided to recommend the Storting to approve the Marconi wireless contract arranged on behalf of the State by M. Heftyte, Director of Telegraphs.

**The Recent Storms.**—Some idea of the results of the recent snowstorms may be gathered from the facts that approximately 1,600 miles of telegraph and telephone wires were down in the north-east of England, and that for some days Newcastle-on-Tyne was practically isolated, except for its limited means of communication by underground wires.

**Scottish Telegraphs.**—A deputation recently waited on the Postmaster-General, with a view to inducing him to extend the underground cable to Dundee and Aberdeen, but Mr. Samuel stated that the revenue was only £16,000 a year, whereas the cost of the cable would be £130,000. Questioned in the House of Commons on Monday, Mr. Samuel admitted that the revenue should have been stated as £30,000, but even that would not justify so heavy an expenditure.

**Wireless Telegraphy.**—A contract has been placed by the Great Western Railway Co. for the erection of a wireless station close to Fishguard Harbour, to communicate with the company's cross-Channel steamers.

## CONTRACTS OPEN and CLOSED.

### OPEN

**Aberdeen.**—February 10th. One 3,000-kw. turbo-alternator, with surface condenser and air pump, for the Corporation. See "Official Notices" to-day.

**Atherton.**—January 29th. One E.H.T. switchboard and one H.T. switchboard for the U.D.C. See "Official Notices" December 27th.

**Australia.**—VICTORIA.—February 21st. Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" January 10th.

February 27th.—Buildings and boiler house equipment, turbo-alternators and rotary converters, for a Government power station at Perth. See "Official Notices" to-day.

SYDNEY.—March 17th. Motors for the City Corporation.

**Belgium.**—LIERRE.—February 28th. Tenders are invited for a concession to install and work an electric lighting service. Particulars, Hôtel de Ville, Liège.

**BRUSSELS.**—January 29th. Tenders are required for the supply of cable and accessories for the Administration of the Telegraphs. *Cahier des charges* spécial No. 3,624. Tenders to the Administration des Télégraphes, Salle de la Madeleine, Brussels.

**Birkenhead.**—February 11th. Continuous-current electricity meters and house service fuse boxes, for the Corporation. See "Official Notices" to-day.

**Birmingham.**—January 27th. Stores for a year for the Corporation Tramways. Mr. A. Baker, manager.

**Bolton.**—February 13th. Turbo-alternators with condensing plant, water-tube boilers, economisers, switchgear and steam feed pumps, for the Corporation. See "Official Notices" to-day.

**Bridlington.**—February 8th. One 600-kw. turbo-generator, with switchboard and pipework extensions, for the Corporation. See "Official Notices" to-day.

**Canada.**—February 13th. Machines, motors, cranes, &c., for Transcona Railway shops. Specifications and forms of tender from Mr. W. J. Press, engineer, Ottawa.

February 10th.—One 1,500-kw. steam turbine and generator, for the City of Moose Jaw, Sask. See "Official Notices" January 10th.

**Cheltenham.**—January 30th. Electric light fittings for a year, for the T.C. Mr. J. S. Pickering, borough engineer, Municipal Offices.

**China.**—January 30th. High and low-tension underground cable, for the Shanghai Municipal Council. See "Official Notices" January 17th.

**February 6th.**—Six 625-K.V.A. three-phase oil-cooled transformers, for the Shanghai Municipal Council. See "Official Notices" to-day.

**Clacton-on-Sea.**—January 29th. One 250-KW. Diesel oil engine, generator, switchboard, &c., for the U.D.C. See "Official Notices" January 10th.

**Colchester.**—February 10th. Duplicate motor-driven air-compressor plant, with pipework, cables, switchgear, &c., for the Committee of Visitors, Essex and Colchester Asylums. See "Official Notices" to-day.

**Constantine.**—January 1st, 1914. The contract with the local gas company expiring in 1920, the Mayor is prepared to receive offers from individuals or companies prepared to provide a public and private lighting service either by gas or electricity, together or separately, in separate tenders or jointly. The concession will be for a term of years, and tenderers must offer advantages in the shape of a share in the profits, or free public lighting, and a graduated scale of prices for private consumers. Particulars at the Mairie.

**Costa Rica.**—As only one tender (from a French firm) was submitted for the 50-year electric tramway concession, the date for receipt of offers has been extended to January 31st. Further particulars appear in the last issue of the *Board of Trade Journal*.

**Dublin.**—February 13th. Water-tube boilers, economisers, pumps, conveying plant, pipework, &c., also boiler seatings and flue work, for the Corporation Electricity Supply Committee. See "Official Notices" to-day.

**Edinburgh.**—The Corporation invites tenders for the providing and fixing in position at the Usher Hall, Edinburgh, of a complete vacuum cleaning installation, the plant to include a stationary motor-driven rotary suction pump. Mr. A. Newington, Corporation electrical engineer.

**Egypt.**—March 31st. Section des Municipalités invites tenders for electric light installation at Damietta. Section I: Generating plant and tools and machines for repair shop. Section II: Distributing system, i.e., transformers, H.T. cables, and L.T. aerial lines. Sir A. L. Webb, Queen Anne's Chambers, Broadway, S.W., and Mons. le Directeur de la Section des Municipalités et Commissions Locales, Ministère de l'Intérieur, Cairo.—*Board of Trade Journal*.

**Epsom.**—The Water Co. are advertising for tenders for the installation of an electrical pumping plant at their works. Estimated cost, £465.

**Fleetwood.**—February 4th. One 500-KW. mixed-pressure turbine and continuous-current dynamo, with condensing plant, and one water-tube boiler, superheater and brickwork, for the U.D.C. See "Official Notices" to-day.

**France.**—PERONNE.—February 15th. Tenders are requested for the construction of a reservoir and the supply and erection of motors and pumps. Lot 4, motors and pumps 15,500 fr.; guarantee, 450 fr. Particulars, M. Lagrange, Ingénieur des Ponts et Chaussées, Péronne.

**Germany.**—CHARLOTTENBURG.—The T.C. will shortly be placing orders for a 6,000-KW. turbo-dynamo and necessary boiler plant for the municipal station. Particulars of the Magistrat, Charlottenburg.

**Glasgow.**—The Committee on Tramways, Works and Stores, has decided that in future each car shall carry a lifting jack, and the general manager, Mr. Dalrymple, has been instructed to get orders for the necessary number, over 800.

200 electric hand lamps for members of the police force. Mr. W. W. Lackie, chief electrical engineer, Waterloo Street.

**Grimsby.**—February 11th. One 1,000-KW. mixed-pressure turbine and continuous-current dynamo, with condensing plant, for the Corporation. See "Official Notices" to-day.

**Hoylake and West Kirby.**—January 31st. High-tension single-phase switchgear (eight panels) and one 50-K.V.A. single-phase transformer, for the U.D.C. See "Official Notices" January 17th.

**Italy.**—MILAN.—The scheme to electrify the tramway from Milan to Gallarate having received the sanction of the Consiglio Superiore dei Lavori Pubblici, orders for the necessary equipment may be forthwith expected.

**Leeds.**—February 19th. Coal and general stores for a year, for the Corporation electric lighting department. See "Official Notices" to-day.

**London.**—HACKNEY.—The Council will shortly be inviting tenders for the erection of three sub-station buildings and plant for same, opening ground and supplying and laying conduits, constructing draw-pits, &c., under the scheme set out in Mr. Robinson's recent report.

February 4th.—The Metropolitan Water Board is inviting tenders for Sec. 25, electric lamps and accessories, for one year. Specifications and forms of tender from the Clerk of the Board, Savoy Court, Strand, W.C.

L.C.C.—January 29th. Electrical installation at Cook's Ground Elementary School, Chelsea, S.W. See "Official Notices" January 17th.

**SHOREDITCH.**—The B.C. Lighting Committee will purchase 150 meters of various sizes, from 5 to 100 amperes, as required for new consumers.

**HAMMERSMITH.**—February 5th. General stores for a year, for the B.C. electricity department. See "Official Notices" to-day.

**H.M. OFFICE OF WORKS.**—February 5th. Main switches, main fuses, switch fuse and fuse boards, for three years. See "Official Notices" to-day.

**BERMONDSEY.**—February 17th. Stores for a year, for the B.C. Electricity Department. See "Official Notices" to-day.

**Nelson.**—February 3rd. One traction battery, one automatic reversible booster and switchgear, one D.C. motor-generator and switchgear, for the Electricity and Tramways Committee. See "Official Notices" January 10th.

**Salford.**—February 3rd. Rotary converters for the Corporation. See "Official Notices" to-day.

**Sheffield.**—February 5th. General stores for two years, for the City Electricity Supply Department. See "Official Notices" January 17th.

**Spain.**—February 8th. The Spanish Post and Telegraph authorities in Madrid are inviting tenders for the concession for the establishment and working of a telephone exchange in the town of Ceuta.

The municipal authorities of Toledo have just invited tenders for the concession for the electric lighting of the town during a period of 10 years.

**Switzerland.**—LUGANO.—January 31st. Tenders are required for the installation of the electric light in the Lugano Station, the works including the supply and erection of about 2,000 glow lamps and seven arc lamps, cables, lines, &c. Plans and particulars from Bureau 21, Telegrapheninspektion der Kreisdirektion, 7, der Schweizer Bundesbahn, Lucerne.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Warrington.**—February 3rd. The Corporation is calling for tenders for an electric light installation at the Public Baths. Mr. A. M. Ker, borough electrical engineer.

**West Ham.**—January 24th. Engine-room stores, chemicals and A.C. house-service wattmeters, for the Council's electricity department. See "Official Notices" January 10th.

## CLOSED.

**Blackpool.**—The Tramways and Electricity Committee has decided to order from the United Electric Car Co., Ltd., six open type tramcars, similar to those previously supplied.

**Cape Town.**—The City Council has accepted the following tenders:—

W. T. Glover & Co.—83 miles aerial braided wire, £613; 15 miles vulcanised rubber-insulated wire, £445; various lengths of paper-insulated, lead-covered and steel-armoured cable, £666.  
Telegraph Manufacturing Co.—10,000 yd. 19/14 bare copper wire, £458.

**Ealing.**—Tenders have been received by the B.C. Electricity Committee from the following firms for a new switch-board:—

Crompton & Co., Ltd.	Siemens Bros. & Co., Ltd.
British Westinghouse Co., Ltd.	General Electric Co., Ltd.
Switchgear Co., Ltd.	British Thomson-Houston Co., Ltd.
Ferranti, Ltd.	

Their consideration has been deferred till the next meeting of the Committee, the electrical engineer being instructed to prepare a schedule and report thereon.

**Glasgow.**—The T.C. has accepted the following tenders:—

White lead in oil.—Herd, Hastie & Co.  
Patent filling.—Craig Sharp, Ltd.  
Stopping place sign-posts and brackets.—J. and A. Law, Ltd.; Walter Macfarlane & Co.  
Route number plates.—P. and W. MacLellan, Ltd.  
Arc lamp carbons.—General Electric Co., Ltd.  
Black insulating tape.—A. Avstine.  
Punkton fuel.—Wm. Baird & Co., Ltd.; Wm. Dixon, Ltd.; R. Addie and Sons, Ltd.  
Old rails.—P. and W. MacLellan, Ltd.  
Trolley cord.—W. C. Yuille & Co., Ltd.

The areas recently added to the city are to be fitted with fire alarms, in connection with which the following tenders have been accepted:—W. T. Glover & Co., Ltd., £312, for wiring; and the British Insulated and Helsby Cables, Ltd., £146, for insulators, &c.

The Electricity Committee has renewed the contract with the Tudor Accumulator Co., Ltd., for the maintenance of the battery at the Govan Electricity Works for a further period of 10 years at the rate of £202 per annum.

**Gosport.**—The Education Committee has accepted the tender of Mr. W. N. Walters, Gosport, for installing the electric light at the new school in Stone Lane.

**Hendon.**—Mr. F. R. Garrod has secured the order for electric lighting and heating at the Alexandra Club.

**Government Contracts.**—The following tenders have been accepted during the past month by the Government Departments named :—

**WAR OFFICE.**

Storage batteries.—Tudor Accumulator Co., Ltd.  
Electric cable and wire.—Hooper's Telegraph and India-Rubber Works, Ltd.; London Electric Wire Co., and Smiths, Ltd.; Siemens Bros. and Co., Ltd.  
Heliographs.—W. Ottaway & Co., Ltd.; Siemens Bros. & Co., Ltd.  
Electric lamps.—Brimsdown Lamp Works, Ltd.; Crayke & Co., Ltd.  
Electric motors.—Lancashire Dynamo and Motor Co., Ltd.  
Switchboards, &c.—British Thomson-Houston Co., Ltd.; Cox-Walters, Ltd.  
Switches.—Ward & Goldstone.  
Installation of electric light, &c., Fort Pitt Military Hospital, Chatham.—A. V. Jenkins & Co.  
Laying cable at Royal Military College, Sandhurst.—Siemens Bros. and Co., Ltd.

**INDIA OFFICE: STORE DEPARTMENT.**

Cable.—Liverpool Electric Cable Co.  
Magnet wall sets.—Peel-Conner Telephone Works.

**CHOWN AGENTS FOR THE COLONIES.**

Telegraph poles.—Siemens Bros. & Co., Ltd.  
Wireless telegraph apparatus.—Marconi's Wireless Telegraph Co., Ltd.

**GENERAL POST OFFICE.**

Telephone apparatus.—London Electric Wire Co., and Smiths, Ltd.; Western Electric Co., Ltd.  
Submarine cable.—Siemens Bros. & Co., Ltd.  
Telephonic cable.—British Insulated and Helsby Cables, Ltd.; Callender's Cable and Construction Co., Ltd.; Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Siemens Bros. & Co., Ltd.; Western Electric Co., Ltd.  
Cases for dry cells.—British L.M. Eriksen Manufacturing Co., Ltd.  
Stoneware ducts.—Albion Clay Co., Ltd.  
Insulators.—Taylor, Tunnichiff & Co., Ltd.  
Telegraphic ironwork.—Bullers, Ltd.; Guest, Keen & Nettlefolds, Ltd.  
Bronze wire.—T. Bolton & Sons, Ltd.; British Insulated and Helsby Cables, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., incorporated in the London Electric Wire Co., and Smiths, Ltd.  
Rod zincs.—Siemens Bros. & Co., Ltd.  
Power plant and wiring, Valencina Wireless Telegraph Station, Co. Kerry.—Johnson & Phillips, Ltd.  
Telephone exchange equipment, Mansfield.—Peel-Conner Telephone Works, Ltd.  
Extension of No. 2 Telephone Exchange, Cardiff.—The Automatic Telephone Manufacturing Co., Ltd.  
Extensions to Central Telephone Exchange, London, E.C.—Western Electric Co., Ltd.

**Ipswich.**—The Dock Commission has accepted the tender of Messrs. Ransomes & Rapier, Ltd., for an electric travelling crane, at £1,300.

**London.**—L.C.C.—The Highways Committee received tenders as under for about 3½ miles of grooved trolley wire required for the overhead tramways system :—

		Per mile.
		£ s. d.
T. Bolton & Sons, Ltd.	.. .. . (accepted)	109 4 0
B.I. and Helsby Cables, Ltd.	.. .. .	112 11 6
Thompson & Co.	.. .. .	116 0 0

For the supply of 3,000 pairs of tramway rail fish-plates the offers received were :—

		Per ton.	Total.
		£ s.	£
Cammell, Laird & Co., Ltd.	.. (accepted)	9 15 ..	780
Walter Scott, Ltd.	.. .. .	12 10 ..	869
Alfred Clare & Co.	.. .. .	24 10 per bar	2,621
		(or 17s. 6d. a joint)	

Messrs. Elliott Bros. are to supply 17 instruments for testing magnetic brake coils, at £10 11s. 6d. each.

The Stores and Contracts Committee recommends that contracts with the following be approved :—

Electric fittings.—Accles & Pollock, Ltd.; British Westinghouse Electric and Manufacturing Co., Ltd.; Elliott Bros.; and General Electric Co., Ltd.

The Stores and Contracts Committee reports having accepted tenders as under during the recess :—

Electric fittings.—Atlas Carbon and Battery Co., Ltd.; B.I. and Helsby Cables, Ltd.; Cooper & Roberts; Dorman & Smith; Edison & Swan Co.; Electrical Manufacturing and Supplies Co.; Elliott Bros.; W. Heipel & Co.; General Electric Co., Ltd.; Hart Manufacturing Co.; W. McGeech & Co., Ltd.; A. Round; Verity, Ltd.; W. White & Co.  
Machine belting.—J. Hendry; Hepburn, Gale & Ross, Ltd.

**SHOREDITCH.**—The B.C. Lighting Committee, following a report by the electrical engineer on experiments with new type flame lamps, recommends the purchase of 48 "Metroflam" arc lamps (70-80 hours) from Messrs. Johnson & Phillips, Ltd., and 48 "Angold" arc lamps (90 hours) from the General Electric Co., Ltd., the total cost being £936. The great increase of vehicular, especially motor, traffic necessitates improved lighting of the main thoroughfares without delay, and the adoption of the above lamps will give a greater illuminating power by nearly 100 per cent. as compared with the existing 12½-ampere, 1,500-C.P. lamps. The new type of lamp, for one-third less current, 8 amperes, gives 2,500 C.P., "and has in addition a better fog-penetrating effect." It is estimated that the saving per annum on a circuit of 24 lamps, including current and attendance, after allowing for the slight increase in the cost of carbons, will be about £121. The first cost of the new lamps will be covered in less than two years. The work will not be commenced until the close of the financial year.

For the supply of lead-covered, paper-insulated service cables, the Committee recommends the acceptance of the tender of Messrs. Siemens Bros. & Co., Ltd., the lowest submitted, as under :—  
1 mile 7/16, £70; ½ mile 7/14, £90 per mile; ¼ mile 19/16, £133 per mile; ⅛ mile 19/14, £187 per mile.

**BATTERSEA.**—The B.C. has decided to renew its contract with Callender's Cable and Construction Co., Ltd., for the supply of cables, &c., for a further period of one year.

**Salford.**—The Guardians have accepted the tender of Messrs. Willoughby & Willcox for the installation of electric light and bells at the new offices (#142), and the tender of Mr. Gilbert Matthews for provision of electric fittings for board room, laundry and clerk's office (£25).

**Stockport.**—The T.C. has accepted the tender of Lord Vernon for Warsop and Poynton slack coal for the electricity works at 10s. 10d. per ton; and that of Mr. John Faulkner, of Manchester, for a lightning conductor, at £10 15s.

## FORTHCOMING EVENTS.

British Electrical and Allied Manufacturers' Association. Friday, January 24th. At 7 for 7.30 p.m. At the Savoy Hotel. Dinner.

Royal Institution.—Friday, January 24th. At 9 p.m. Discourse on "Recent Advances in Scientific Steel Metallurgy," by Prof. J. O. Arnold.

Thursday, January 30th.—At 3 p.m. Lecture on "Recent Research on the Gas Engine," by Prof. B. Hopkinson. (Lecture 1.)

Physical Society.—Friday, January 24th. At 5 p.m. At the Imperial College of Science, South Kensington. Papers on "The Electrical Conductivity and Fluidity of Strong Solutions," by Mr. W. S. Tucker; "The Resistance of Electrolytes," by Messrs. E. W. J. Smith and H. Moss; and "The Recalcination of Iron Carbide," by Messrs. E. W. J. Smith and J. Gould.

Junior Institution of Engineers.—Saturday, January 25th. At 11 a.m. Visit to the Houses of Parliament for inspection of heating, ventilation, &c.

Friday, January 31st.—At 8 p.m. At the Great Eastern Hotel, E.C. Institution smoking concert.

Royal Society of Arts.—Monday, January 27th. At 8 p.m. Cantor lecture on "Liquid Fuel," by Prof. V. B. Lewes. (Lecture 11.)

Institution of Electrical Engineers (Newcastle Students' Section).—Monday, January 27th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "The Application of Electricity to the Lighting of Residences, Business Premises and Factories," by Mr. S. I. Ellis.

(Manchester Section).—Tuesday, January 28th. At 7.30 p.m. At the University, Manchester. Paper on "The Use of a Large Lighting Battery in connection with Central Station Supply," by Mr. H. F. Wbyssall.

(Yorkshire Section).—Wednesday, January 28th. At 7 p.m. Meeting at the University, Sheffield.

(Students' Section).—Wednesday, January 29th. At 7.45 p.m. At the Institution. Paper on "The Conditions Influencing the Design and Minimum Manufacturing Cost of Induction Motors," by Mr. E. T. Driver.

Institution of Civil Engineers.—Wednesday Evening, January 29th. Students' visit to the Edgware Road-Paddington extension of the London Electric Railway.

The Electrical Engineers' Ball.—Friday, January 31st. At 9 p.m. Hotel Cecil, London.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—Lieut.-Col. H. M. LEAF.

The following orders have been issued for the current week :—

Monday, January 27th.—"A" Company. Recruit training, 7 to 10 p.m. company training, 7 to 10 p.m.

Tuesday, January 28th.—"B" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Thursday, January 30th.—"C" Company. Company training, 7 to 10 p.m.

Friday, January 31st.—"D" Company. Recruit training, 7 to 10 p.m. company training, 7 to 10 p.m.

Saturday, February 1st.—"B" Company. Week-end run at Fort Coalhouse, East Tilbury. Parade at Fenchurch Street Station at 3 p.m., for train leaving at 3.25 p.m. Dress:—Service dress, putties and greatcoats. No arms will be taken.

"A" Company. A lorry run will take place this day. The lorry crew will parade at Headquarters at 2.30 p.m. Dress:—Service dress, putties and greatcoats. No arms will be taken.

Headquarters will be opened for regimental business only from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj't.,  
For Officer commanding L.E.E.

**The Lighting of Factories and Workshops.**—It is announced that the Home Secretary has appointed a Committee to inquire and report as to the conditions necessary for the adequate and suitable lighting (natural and artificial) of factories and workshops, having regard to the nature of the work carried on, the protection of the eyesight of the persons employed, and the various forms of illumination. The members of the Committee are :—Dr. R. T. Glazebrook, Director of the National Physical Laboratory (chairman); Mr. L. Gaster, Prof. Francis Gotch, Mr. J. Herbert Parsons, Mr. W. C. D. Whetnam, and Sir Arthur Whitelegge, Chief Inspector of Factories. The secretaries of the Committee are Mr. D. R. Wilson, one of His Majesty's Inspectors of Factories, and Mr. C. C. Paterson, of the National Physical Laboratory. Any communications on the subject of the inquiry may be addressed to Mr. D. R. Wilson, at the Home Office.—The Times.

## NOTES.

**Parliamentary Notes.**—**ADMIRALTY CONTRACTS.**—Mr. Barnes, on January 15th, asked the First Lord of the Admiralty whether, in connection with the strike of electrical workers on the Clyde, he could state the result of the inquiry into the alleged violation of the fair-wages clause by the Government contractors in employing apprentices to perform electrical work instead of fully qualified men at the proper rates of wages; and whether the Admiralty was satisfied that no breach of the clause had been made to the benefit of the employers' and the prejudice of the workmen. Dr. Macnamara replied that as the result of the inquiry, it appeared that during the progress of certain work to complete the *New Zealand*, the electricians of the district struck work with a view to obtaining an additional  $\frac{1}{4}$ d. an hour in their rate of wages. It was understood that the Fairfield Co. offered to concede this demand so far as the men engaged on this ship were concerned, in order to avoid interruption in the work, but that offer was declined in the absence of a similar concession throughout the district. The ship had already been delayed, and it was important that there should be no further delay. The company, therefore, employed 14 apprentices to do the work eight of whom were in their fourth or fifth year, and five in their third year. No boys were employed all night after having worked during the day, and only some of the older apprentices employed during the day were allowed to work overtime up to 9.30 p.m. The whole of the work so carried out was finished and tested to the entire satisfaction of the Admiralty representatives. In all the circumstances the Admiralty did not consider it necessary to take any further action in the matter.

**POST OFFICE ELECTRIC LIGHTING DEPARTMENT.**—In Tuesday's Parliamentary Papers, Mr. Barnes asked the Postmaster-General if engineers in the electric lighting department were paid overtime rates, in accordance with the conditions accepted, and generally observed, by the employers and employed; and if they were paid for Sundays and Christmas Day, in accordance with such conditions; namely, were they paid one and a quarter time for the first two hours, one and a half for time after that, excepting the days mentioned, and for those were they paid at the rate of double time? Mr. H. Samuel replied that the honourable member presumably referred to the minor grades of the electric light staff, i.e., shift officers, circuitmen, enginemen, &c. Such men received overtime pay at rate and a quarter on weekdays, and rate and a half for duty in excess of the scheduled attendance on Sundays. Scheduled duty on Sunday was not specially remunerated, as the Post Office scale of pay covers 50½ hours' scheduled attendance on any six days out of the seven. A few men in London, originally employed under factory conditions, retained the privilege of payment for overtime at rate and a quarter for the first two hours, and then at rate and a half, with double rate for duty in excess of the scheduled attendance on Sundays. Extra duty performed on Christmas Day was paid for at Sunday extra duty rates.

**E.T.B.I.**—The whist drive recently mentioned in our pages was held on Friday, January 17th, at Slater's Restaurant, 50, Cannon Street, E.C. The main object of the entertainment was to endeavour to get the members of the staffs of some electrical firms to take an interest in the Institution. It was primarily organised amongst the members of the staffs of the General Electric Co., Sterling Telephone and Electric Co., Ltd., and the Union Electric Co., but, in addition, other ladies and gentlemen came, there being 128 players, in addition to the members of the Committee, &c. The Committee consisted of Mr. Champion (Union Electric Co.), Mr. Crow (Sterling Telephone and Electric Co.), Mr. Williams (General Electric Co.) and the secretary of the Electrical Trades Benevolent Institution. Mr. Crow was elected to be the M.C., and he carried out his duties to everyone's satisfaction, the full programme being completed and the prizes distributed on the stroke of 11 o'clock. The other members of the Committee worked extremely hard, with results which were most thoroughly satisfactory. Immediately after the interval a short address was given by the secretary, Mr. Hawes, dealing in a full and informing way with the essential features of the Institution, its objects, &c., and answering the statements that were sometimes made to the effect that the Old Age Pensions and the National Insurance Act were reasons for not troubling to support the Benevolent Fund. The prize fund was subscribed to by the following:—General Electric Co., Mr. Guy Burney, Mr. Justus Eck, Mr. F. B. O. Hawes; and the prizes were kindly given away by Mrs. Ritchie.

**Miners' Lamps.**—According to the *Times*, the Home Secretary has approved, under Sec. 33 of the Coal Mines Act, 1911, the Hailwood lamp No. 1, and the Oldham emergency electric lamp, the latter only for use in time of accident or by officials, for use in all mines to which the Act applies. Copies of the approving order containing specifications of the lamps will shortly be issued by the Government printers.

**Will.**—The *Daily Mail* states that the late Mr. W. Bottomley, of Glasgow, one of the first directors of Messrs. Kelvin and White, Ltd., and for many years assistant to Lord Kelvin in his scientific work, left £3,788 personal estate.

**Aluminium.**—A neat little booklet setting forth the leading properties of aluminium and the various forms in which it is supplied has been issued by the British Aluminium Co., Ltd., who will send copies to any readers who use the metal. Electrical data are included, and the information will be useful to engineers, draughtsmen and others interested in the subject.

**British Tramway Statistics.**—A Board of Trade return of the finance and traffic of British tramways for 1911-12 contains the following particulars:—

	1910-11.	1911-12.
Miles open ... ..	2,597	2,637
Cars running ... ..	12,709	12,944
Miles run by cars ... ..	310,494,243	323,354,389
Passengers carried ... ..	2,907,477,120	3,127,318,732
Electrical units used ... ..	516,241,612	548,695,979
Gross receipts ... ..	£13,777,001	£14,726,068
Working expenditure ... ..	£8,500,941	£8,924,420
Net receipts ... ..	£5,276,060	£5,801,648
Relief of rates ... ..	£370,435	£488,509
Aid from rates ... ..	£68,055	£62,132

Of the 290 undertakings, 172 belong to local authorities and 118 to companies or individuals. Local authorities made a net profit of £4,233,871 on the year's traffic, out of which, in addition to setting aside £488,509 in relief of rates, they applied £1,247,908 towards the reduction of tramway debt and carried £975,504 to reserve and renewal funds. In the cases of three local authorities and six companies, the returns show an excess of working expenditure over gross receipts.

**Association of Electrical Station Engineers.**—An informal meeting was held on Thursday, January 16th, at 69, Fleet Street, E.C. Twenty-one representatives of electrical stations attended. A report was made on the enormous amount of correspondence received, in reply to an announcement in the *ELECTRICAL REVIEW*. It was stated that the general opinion of the correspondents was that a business-like "Association" should be formed immediately, and that practically the whole of the technical staffs of the undertakings they represented would become members. Previously to January 14th prospective members numbered well over 500, but as a large amount of correspondence containing names of prospective members has been received since the above date, the number has probably reached 1,000. After lengthy discussions, several resolutions were passed, details of an application form were agreed to (which is to be printed at once), and the next general meeting was arranged for February 6th, 1913. The following resolutions were passed:—

1. That the Association be called "Association of Electrical Station Engineers."
2. That the objects of the Association be—  
To raise the efficiency and general status of members of the Association.  
To provide means for social intercourse among its members, for their improvement, advancement, and recreation.  
To form an information bureau for the general assistance of members and employers.
3. That the essential qualification for membership shall be that the prospective member must be qualified for, and hold a responsible position in, an electrical undertaking for power, lighting or traction.
4. That a chartered accountant be approached to take charge of the finances of the "Association."
5. That all announcements with regard to the "Association" be advertised in the *ELECTRICAL REVIEW*.

Mr. W. J. Ebben was elected hon. secretary.

**Motor-Bus Obstruction of Tramear.**—At the Greenwich Police Court last week, W. F. Gilbert was fined 10s. and 23s. costs for wilfully interfering with the London County Council tramway traffic at New Cross Road. Mr. Greenwood, for the L.C.C., said (as reported in the *Standard*) that the case was one of importance to the public who used tramways and motor-omnibuses. The defendant was a driver in the service of the L.G.O. Co. The evidence would show that the motor-omnibuses were not content to go in for fair play; they wanted all the passengers.

Arthur Dunn, conductor of the tramcar, said that on November 9th his car drew up at the "island" at New Cross Gate. The defendant's motor-omnibus pulled up close to the tramcar, the front of the omnibus being close to the step which passengers used to get on and off his car, a very small space being left for people to alight or join the car. The front of the omnibus was practically level with the step of the car, and people would have had to pass in front of the omnibus to get to the car. People waiting on the "island" could not reach his car, and he had to go on and leave them. The defendant declared that the London County Council really obstructed him. The Board of Trade regulation was that when one vehicle came up the one in front should proceed. There was not room for a tramcar and an omnibus, and he could not avoid his omnibus partly covering the step of the car. The car stopped so suddenly that he could not do otherwise.

**Shock Accident Claim.**—The *Glasgow Daily Herald* states that some time ago an action was raised in Paisley Sheriff Court against the Paisley District Tramway Co., for damages in connection with an accident which occurred to a boy who was travelling on one of the company's cars. The boy was barefooted, and was seated on the top near the metal pillar which supports the trolley-pole. The record in the case stated that through defective insulation, or some other cause, the metal pillar became charged with electricity, with the result that when the boy's naked foot touched it he received a severe shock, with serious and painful injuries from burning. In consequence of his injuries the boy was laid up for six weeks. The company has now offered a satisfactory sum in full settlement, which has been accepted, and the action will be taken out of Court by joint minute.

**Accidents.**—**JOHANNESBURG.**—Our Cape correspondent writes:—"At the Bantjes distributing station of the Victoria Falls Power Co. an explosion of an oil switch recently caused serious burning injuries to two engineers. In the first place, one of the feeder switches tripped, and whilst an assistant engineer named Davis was telephoning to the company's control department to report the occurrence another oil switch exploded. The explosion burst open the iron doors between the operating passage and the switch passage. Flames passed into the operating passage, and Davis was severely burnt about the face and hands. A probationer named Jones was also burnt, but to a less degree. The cause of the explosion is believed to be lightning on the transmission line, which caused the first switch to trip and fire the oil. This caused a short-circuit, which in turn caused the explosion of the second oil switch."

**MOTHERWELL.**—Hugh Bird, electrical fitter, of Motherwell, while working at an electrical crane, was seriously injured by being jammed between the carriage and an iron box.

According to a Glasgow paper, Adam Sommerville, a young electrical engineer, was removed to the Western Infirmary, Glasgow, suffering from injuries sustained while at work in Messrs. Hurst, Nelson & Co.'s wagon works, Motherwell. He was passing a machine when he became entangled in the belt, and was thrown violently to the ground.

**Educational Notes.**—A special series of lectures on Illuminating Engineering is now in progress at the Polytechnic, Regent Street. The first section of the course, dealing with gas, electric, acetylene and air gas lighting, &c., has now been concluded. On Friday, January 17th, the first lecture of the second half of the course, dealing with illumination and the eye, was delivered by Dr. W. J. Ettles. The remaining five lectures, commencing to-day, are to be given by Mr. J. S. Dow, and will deal with practical applications, including such questions as the measurement of light and illumination, colour, shades and reflectors and indoor and outdoor illumination.

Prof. Stephen H. Dixon, Professor of Civil Engineering in the University of Birmingham, has accepted an invitation to give a special course of lectures in Municipal engineering at University College during the current term. The course was to begin on Tuesday last, at 4 p.m.

**The Thames Ironworks.**—The appeal of Mr. Arnold F. Hills against Mr. Justice Eve's order of December 20th last, for the immediate closing of the works, was, on Saturday, dismissed by the Court of Appeal.

**Tramway Social.**—On 15th inst., the ninth annual tea and social of the Gateshead and District Tramway Co.'s employés was held at the Parish Hall, Rawling Road, Gateshead, the number present, including ladies, being 150. Mr. W. Morrison, the general manager, made a brief speech, and, in addition to referring to the friendly relations existing between the company and its employés, he mentioned that the employés' Benevolent Society's funds stood at the satisfactory figure of £204. A programme of music and song followed.

**Denial.**—Messrs. Loxley & Co., Ltd., of Leeds, write as follows:—"We have recently heard that rumours are going about that we have obtained an order for electric wiring of the Bordesley Post Office, Birmingham. We wish to deny this absolutely, as we do not quote for electric wiring."

**Marconi Litigation.**—In the King's Bench Division Mr. Justice Scrutton has had before him for several days this week the action of Marconi's Wireless Telegraph Co., Ltd., v. Goukassoff and Tischenko, in which plaintiffs claim damages for breach of contract in respect of an option for sale of shares in the Russian company. On Wednesday his Lordship said that he would give judgment to-day (Friday), but it would be against the defendants for damages, but the amount of the latter would be affected if in the meantime a sufficient number of shares were put under the control of plaintiffs. In another case plaintiffs also claimed damages against one Baruch for having maliciously induced the above defendants to break their contract with the plaintiffs. Judgment was given for the defendant.

**The Alkum Accumulator.**—Referring to the paragraph in our last issue on the new electric storage battery brought out by Messrs. Wrenop & Co., Ltd., of Halifax, we learn that one of its features is that no acid or lead is used in its construction. As its name, "Alkum," implies the fluid employed is of an alkaline nature. Its chief component is nickel, while the containing case is of welded steel. It is claimed that the electrodes and electrolyte are practically permanent, as the liquid is unvariable and only requires making up with distilled water, while the electrodes consist of insoluble material carried in nickel cages. It is further claimed that the cells cannot be overcharged, and that they may remain uncharged for long periods without damage, while jarring and jolting do not affect them. We have seen a charging and discharging curve of the new batteries, which shows that the discharge is not only extremely gradual, but that it maintains its voltage almost to the end. Specimens of the Alkum accumulators can, we understand, be inspected at the depot of the Motor Lighting Co., 13, Pantom Street, Haymarket, London, S.W.

**A Lambeth Lift Contract.**—In connection with applications invited by the Lambeth Board of Guardians for tenders for the installation of two electric lifts at the Infirmary, Brook Street, and another at the Workhouse, Kentrow Road, the following firms sent prices and specifications. The figures represent the price quoted for installing the three lifts, for the two lifts at the infirmary, and for the one at the Workhouse only, respectively. At a meeting of the sub-committee on Wednesday last, the tender of Messrs. Waygoods, Ltd., Falmouth Road, S.E., was accepted.

Aldous & Campbell, Ltd.—£1,460 (17 weeks), £950 (12 weeks), £500 (10 weeks).  
 Easton Lift Co.—£1,690 (12 weeks), £1,115 (12 weeks), £644 (10 weeks).  
 Lift and Hoist Co.—£1,621 (10 weeks), £1,020 (10 weeks), £140 (10 weeks).  
 Medway's Safety Lift Co.—£1,030 (10-18 weeks), £1,107 (12-13 weeks), £583 (10-18 weeks).  
 Otis Elevator Co.—£1,845 (10-12 weeks), £1,255 (10-12 weeks), £500 (10-12 weeks).  
 A. W. Penrose & Co.—£1,128 (15 weeks), £918 (14 weeks), £190 (14 weeks); with extras.  
 Scholey & Co., Ltd.—£1,593, £1,100, £493.  
 Smith, Major & Stevens.—£1,010 (15 weeks), £1,120 (13 weeks), £520 15s. (11 weeks).  
 W. Wadsworth & Son, Ltd.—£1,486 (20 weeks), £1,006 (12 weeks), £190 (eight weeks).  
 Waygoods, Ltd.—£1,666 (15 weeks), £1,084 plus 5 per cent. if divided (12 weeks), £592 plus 5 per cent. if divided (—).

**Institution and Lecture Notes.**—**ASSOCIATION OF MINING ELECTRICAL ENGINEERS (WEST OF SCOTLAND BRANCH).**—The monthly meeting of the Branch was held on January 18th, when discussion was resumed on the papers read by Mr. Campbell King on "The Electrification of a Group of Small Collieries," and by Mr. S. A. Simon, Glasgow, on "Speed Control of Three-phase Motors."

**INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH LOCAL SECTION).**—On January 14th, Messrs. J. S. Nicholson and B. P. Haigh read their paper on "A Single-Phase Motor with Pole-Changing Windings," before the Scottish Local Section at Glasgow, and a discussion followed.

Mr. Halley Craig said that if the authors' work had been done a long time ago there would have been a change in the methods which would have put electricians 20 years in advance of where they now were.

The Chairman said that when they were arranging for the first Electric Lighting Bill, people were very much astonished when Mr. Ferranti announced that he had an alternating motor up his sleeve; they could not believe that.

The members were afterwards conducted over the laboratory, where the motor was exhibited in motion.

Introducing a discussion on the "Mathematical and Scientific Training of Engineers" at a meeting of the WESTERN BRANCH OF THE ASSOCIATION OF SCIENCE TEACHERS OF SCOTLAND in Glasgow on 18th inst., Mr. Henry Mavor argued that mathematics was absolutely essential to the study and understanding of science in every stage of its development. The German educational practice in this respect was compared to our own, to the discredit of the latter, but he thought it was unwise to push the comparison as far as it was often done. The Germans were certainly ahead of us in some special branches of knowledge and industry, but as certainly were not ahead of us as a whole. In electrical affairs, for instance, few inventions were German. His concrete opinion was that the whole training of an engineer must be founded upon the fact that he was an engineer actually engaged in the work of construction in the workshop.

A paper on "Electrical Locomotives for Main Line and Suburban Services" was read at a meeting of the Scientific Society of the Royal Technical College, Glasgow, on Saturday last by Mr. B. P. Haigh, of the Engineering Department of the University of Glasgow.

**Damaging an Electric Meter.**—At Newton Abbot, South Devon Petty Sessions on Tuesday, Wm. Ireland Islesworth was bound over to be of good behaviour for six months and ordered to pay 16s. 6d. costs, for damaging a meter belonging to the Newton Urban Electric Supply Co., Ltd. Defendant tampered with the meter, and abstracted 6s. from it, but the charge of larceny was not gone into. "I fancy it would be a funny thing," said the defendant, "if I wanted to rob the meter, that I should take out 6s. and leave 11s. behind." Mr. Hitchens, solicitor to the company, said "that is an old trick."

**Appointments Vacant.**—Electrical engineer and manager, for the Wolverhampton Corporation (£600); meter tester, for the Shanghai Municipal Council Electrical Department (£21 per month); electrical engineer, for the Burgh of Wishaw; charge engineer, for the Wakefield Corporation Electricity Department (35s.); switchboard attendant for the Newport (Mon.) Electricity Department (25s.). See our advertisement pages in this issue.

**Inquiries.**—A correspondent asks for the names "of firms supplying a complete line in wiring accessories designed for open wiring with ordinary flexible." Makers of brushes for electrically-driven boot-cleaning machines are asked for.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Owing to the appointment of Mr. J. M. DAWSON, who for the last 7 years has been engineer-in-charge at the electricity works, formerly of the Hanley Town Council, and now of the Stoke-on-Trent Town Council, to the position of engineer-in-chief of the Bethnal Green Board of Guardians, London, a vacancy was created on Mr. Yeaman's staff, and as the new power house will shortly be running, two appointments were made from the selected candidates, namely, Mr. F. HURST, who was charge engineer in the Runcorn generating station of the Mersey Power Co. (as already announced here), and Mr. A. McKAY KISSACK, who was erecting engineer for the British Westinghouse Co., Ltd.

MR. JAMES FORSYTH, shift engineer, Motherwell Corporation electricity works, has resigned and taken up similar duties at the Poplar electricity works. MR. SLADE, of London, takes up duties as shift engineer at Motherwell.

The Swinton and Pendlebury U.D.C. has fixed the salary of the electrical engineer, Mr. H. C. BESBRIDGE, at £161 per annum, from December 1st, the date of his appointment.

MR. ERNEST MARKS has been permanently appointed to the position of meter tester to the Islington U.D.C.

MR. K. S. NEBEL has resigned his position with Messrs. Mather and Platt, Ltd., Manchester, in order to take up an appointment in Berlin.

The Aldershot U.D.C. has increased the salary of Mr. F. H. EBERL, first assistant at the electricity works, to £130 per annum.

MR. W. H. TUNNICLIFFE, of the Salt Union (Mersey Power Co.), Runcorn, has been appointed junior shift engineer at the Rotherham Corporation electricity works.

The Stepney B.C. Electricity Committee has recommended that the salary of the borough electrical engineer and manager be increased from £750 to £800 per annum, and by an additional £50 on January 1st, 1914.

**Tramway Officials.**—The Oldham Tramway Committee has recommended the Council to grant an advance from £350 to £400 per year in the tramway manager's salary.

**General.**—MR. GRAHAM MONTAGUE, of Bristol, consulting engineer and surveyor, announces that, having accepted an appointment as engineer to the Egyptian Government P.W.D., he intended sailing yesterday for Cairo, and that all correspondence should be addressed to him care of Public Works Ministry, Cairo, Egypt.

Owing to pressure of business, MR. J. MOULD has found himself obliged to resign the hon. secretaryship of the I.E.E., Students' Section, and MR. GEO. W. P. PAGE has been elected to the position.

MR. J. J. CHISWELL has resigned the position of sales manager with the Brimsdown Lamp Works, Ltd., as from December 31st last.

The engagement is announced of Mr. BRIAN CROSSLEY, youngest son of the late Sir Wm. Crossley, Bart., to Margaret Lilian, elder daughter of Mr. J. W. Sidebotham, of Bowdon, Cheshire.

MR. JOHN COATES, M.Inst.C.E., senior partner of the firm of John Coates & Co., Ltd., of Westminster, has been appointed to carry out the work of the inspection of material purchased for the Commonwealth railway construction and rolling stock in connection with the Australian Trans-Continental Railway.

It is stated in the *Times*, that SIR W. B. FORWOOD, in consequence of continued ill-health, has resigned the chairmanship of the Liverpool Overhead Railway, and Mr. HARVEY CECIL WOODWARD has been appointed in his place.

The *Financier* states that Mr. C. N. MURPHY has joined the board of Universal Cheap Cables, Ltd.

According to the *Times*, the Postmaster-General has appointed MR. J. J. KENNY, of the Dublin Telegraph Office, to be Controller of that office in succession to Mr. Michael O Toole, who has retired.

**Obituary.**—MR. T. THOMPSON.—The death has taken place at Cleckheaton (Yorks.) of Mr. THOS. THOMPSON, late of Dundee, who was for upwards of 31 years the Scottish representative of Messrs. Edward Green & Sons, Ltd., of Wakefield and London. He was 74 years of age.

HERR W. BRAUN.—The death is announced from Frankfurt-am-Main, of Herr Wunibald Braun, one of the founders of the electrical engineering firm of Messrs. Hartmann & Braun.

## NEW COMPANIES REGISTERED.

**Vickstow Cars, Ltd.** (126,511).—This company was registered on January 14th, with a capital of £12,500 in £1 shares, to carry on the business of manufacturers of and dealers in motor-cars, lorries, petrol-electric motors, oil and gas engines, electrical machinery, flying machines, cycles, &c. The subscribers (with one share each) are:—I. M. Henderson, 2, Morgate Street, Biddulph, E.C. chartered accountant; W. J. Bristow, 30, St. James' Street, S.W., automobile engineer. Private company. The number of directors is not to be less than three or more than seven; the first are I. M. Henderson (chairman), N. H. Brandon, C. L. Lowe and F. W. Balmer; qualification, 100 shares; remuneration, £250 each per annum and a percentage of the profits. Registered office, 69, Baughall Street, E.C.

**General Telantograph Co., Ltd.** (126,527).—This company was registered on January 15th, with a capital of £1,000 in £1 shares, to carry on the business of manufacturers of, and dealers in, telewriters, telautographs and other apparatus, dynamos, lamps, wires, cables, insulating materials, accumulators, &c., and to adopt an agreement with the Gray European Telantograph Co., the International Telantograph Co., the Gray National Telantograph Co. and the National Telewriter Co., Ltd., for the acquisition of certain patents and rights relating to an invention known as the Telantograph or Telewriter. The subscribers (with one share each) are:—E. B. Millican, 2, Palace Court, W., civil engineer; P. B. —, 35, Queen Victoria Street, E.C. Private company. The first directors (to number two) are T. Birnbaum (nominated by the Gray European Telantograph Co., the International Telantograph Co. and the Gray National Telantograph Co.), and Sir J. G. Craggs (nominated by the National Telewriter Co., Ltd.); remuneration according to profits. Registered office, 20, Bocklerybury, E.C.

**Strode & Co., Ltd.** (126,543).—This company was registered on January 15th, with a capital of £20,000 in £1 shares (5,000 preference), to carry on the business of mechanical, electrical, hydraulic and general engineers and contractors, &c., to take over the business carried on at 8 and 4, St. Paul's Churchyard, E.C., and 45, Osnaburgh Street, N.W., as "Strode and Co.," and to adopt an agreement with D. M. Strode and G. W. Strode. The subscribers (with one preference share each) are:—D. M. Strode, 43, Osnaburgh Street, N.W., engineer and contractor; G. W. Strode, 45, Osnaburgh Street, N.W., engineer and contractor. Private company. The number of directors is not to be less than two or more than five; the first are D. M. Strode (chairman), G. W. Strode and A. E. Cumberbatch, each of whom may retain office while holding 100 ordinary shares. Registered office, 48, Osnaburgh Street, N.W.

**International Power and Light Trust, Ltd.** (126,531).—Registered January 15th, by Ashurst, Morris, Crisp & Co., 17, Throgmorton Avenue, E.C. Capital £10 in £1 shares. Objects: To carry on the business indicated by the title. In the event of the whole of the shares not being subscribed by March 31st, 1913, the company shall be dissolved. The signatories (with one share each) are:—J. A. Fuller, 110, Sirdar Road, Wood Green, N., clerk; J. H. Chapman, 28, Albanore Crescent, Lewisham, S.E., clerk. Private company. Table "A" mainly applies.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**British Ever-Ready Electrical Co., Ltd.**—A memorandum of satisfaction in full on December 31st, 1912, of debenture dated April 6th, 1904, to July 23rd, 1907, securing £7,600, has been filed.

**English Electrical Co., Ltd.** (112,639).—Capital £5,000, in £1 shares. Return dated March 8th, 1912; 526 shares taken up; £526 paid; mortgages and charges, £10,000.

**Lamplough & Son, Ltd.**—Mortgage on the company's undertaking and property, present and future, including the uncalled capital, dated January 4th, 1912, to secure £703. Holders: Charles Hoare & Co., 37, Fleet Street, E.C.

**Lichtenfield Burglar Alarm, Ltd.** (112,522).—Capital £3,000 in £1 shares. Return dated December 18th, 1912 (filed December 19th), 1,710 shares taken up. £1 per share called up on 1,210. £1,210 paid. £500 considered as paid. Mortgages and charges: Nil.

**South London Electric Supply Corporation, Ltd.**—Issue on January 7th, 1913, of £5,170 debentures, part of a series of which particulars have already been filed.

**Delagoa Bay Development Corporation, Ltd.** (76,099).—Capital, £166,800 in 10s. shares. Return dated November 14th, 1912, 267,400 shares taken up. 10s. per share called up on 177,400. £85,740 paid, including £400 on 100 shares forfeited. £45,000 considered as paid on 90,000 shares. Mortgages and charges: £197,103.

**Nairobi Electric Power and Lighting Co., Ltd.**—Particulars of £2,000 6 per cent. fourth mortgage debentures, created December 4th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital, but excluding certain specified exceptions. No trustees.

## CITY NOTES.

**City and South London Railway Co.**—The accounts for the half-year to December 31st show a balance after providing for the debenture stock interest, the payment of the dividend on the 5 per cent. preference stocks, 1891, 1896, 1901 and 1903, and the transfer to the renewal fund of £1,500, sufficient to allow the payment of a dividend on the consolidated ordinary stock at the rate of 4 per cent. per annum, carrying forward £2,588. The dividend for the corresponding period last year was at the rate of 1½ per cent. per annum, carrying forward £2,814.

**Liverpool Overhead Railway Co.**—The directors recommend the payment of dividends at the rate of 5 per cent. per annum on the preference shares, and 2½ per cent. per annum on the ordinary shares for the half-year ended December 31st last.

**Nairobi Electric Power and Lighting Co., Ltd.**—An interim dividend at the rate of 6 per cent. on the cumulative preference shares, in respect of the years 1906 and 1907, is to be paid.

**Metropolitan District Railway Co.**—The directors announce a dividend at the rate of 2 per cent. per annum on the second preference capital. £10,000 is being placed to renewals account, and £8,500 carried forward, as compared with £2,000 last year.

**Montreal, Light, Heat and Power Co.**—The directors have declared a dividend of 2½ per cent. on the paid-up capital stock, being at the rate of 9 per cent. per annum, for the quarter to January 31st.

**Lanarkshire Tramways Co.**

THE directors' report for the half-year ended December 31st, 1912, says that the revenue was £11,910, and the expenses were £22,190, leaving £19,720. From this the following are deducted:—Contributions payable to local authorities, £852; interest on debentures, £909; interest account, £531; expenses in connection with Lanark County Tramways Act, £818; amounts written off, as per revenue account, £137 = £3,246; leaving £16,471, plus £5,200 brought forward, making a balance of £21,674. Of this amount £9,500 has been placed to reserve for depreciation, and the balance is to be disposed of as follows:—£10,290 to dividend at the rate of 6 per cent. per annum for the half-year on the issued share capital; £307 to directors (being 10 per cent. of net profits after payment of 5 per cent. dividend); £1,577 to revenue new account. The traffic receipts show an increase of £1,890, and the expenses an increase of £1,947, as compared with the corresponding half-year of 1911. The increase in expenses was mainly due to the enhanced price of coal, heavier charges for maintenance of permanent way and for local rates, and to the additional charge created by the National Insurance Act. The directors have transferred £9,500 to reserve for depreciation. Interest has also been credited to the reserve, making a total contribution for the year of £11,448. A dividend for the half-year at the rate of 6 per cent. per annum is recommended, making 5½ per cent. for the year. The company's action against the Lanark County Council to restrain the Council from utilising, for the purpose of building a new road known as Coronation Road, at New Stevenston, part of the £7,500 paid by the company to the County Council under the order of 1903 for road widenings, was successful. The County Council intended appealing, and at its request the matter has been arranged on satisfactory terms. The Lanark County Council will shortly proceed with the construction of tramways from Uddingston to Bellshill, Mossend and New Stevenston, to connect up with the company's lines. These new lines will be leased to the company under the agreement referred to in the directors' report for June 30th, 1912. The expenses in connection with the Lanark County Tramways Act, £818 have been written off. It is the company's intention to shortly inaugurate a service of motor-omnibuses. During the past year 10 additional debentures of £50 each have been issued. A further amount of £4,987 was invested during the half-year in trustee securities.

Half-year ended.	Gross profit.	Divi. dends.	Miles open.	Passengers carried.	Traffic receipts.	Average fare.	Car. mileage.	No. of cars.
June 30, 1911.	£17,173	64 %	21,225	7,074,121	£36,002	1.22d.	885,322	60
Dec. 31, 1911.	19,773	65 %	23,32	7,757,442	39,476	1.22d.	940,607	64
June 30, 1912.	16,625	63 %	23,32	7,032,736	36,570	1.24d.	893,927	64
Dec. 31, 1912.	19,720	6 %	23,32	8,202,018	41,567	1.21d.	955,164	64

**Edinburgh and District Tramways Co., Ltd.**

FROM the annual report it appears that the profit for 1912 is £33,933, as against £35,771 in 1911. The total receipts were £297,468, compared with £292,477 in 1911. The expenditure was £263,535, as against £256,706 a year ago. The traffic receipts per mile run were 10'61d., as against 10'49d. in 1911; other receipts per mile run amounted to 0'08d., the same as the previous year, the total receipts per mile run, therefore, being 10'69d., as against 10'57d. in 1911. The expense per mile in respect of working expenses and general charges was 5'45d., as against 5'27d. in 1911; while in respect of Corporation charges for rent, it was 4'02d., as against 4'01d., a total expenditure per mile run of 9'47d., as compared with 9'28d. in 1911. The profit per mile run was 1'22d., as compared with 1'29d. in 1911. The mileage open was the same as in the previous year (25½), and the miles run were 6,676,755, an increase of 35,870. The total passengers carried (including estimate for season tickets) were 64,034,090, an increase of 1,466,502 over 1911. The sum at the credit of the preference shareholders is £5,112, which the directors recommend should be dealt with as follows:—(1) In payment of ordinary dividend for the half-year to December 31st, 1912, at the rate of 5½ per cent. per annum, £2,062; (2) in payment of additional dividend of 4 per cent., £3,000; (3) in carrying forward to the credit of the preference shareholders £49. The sum at the credit of the deferred shareholders is £7,370, and the directors recommend that it should be dealt with as follows:—(1) In payment of a dividend of 8s. per share for the year to December 31st, 1912, £7,000; (2) and in carrying forward to the credit of the deferred shareholders £370. The motive power expenses (cable) totalled £19,356, and the cost of maintenance of cars, lines, cables, machinery, &c., was £40,156. Corporation charges, in respect of the rent of the tramways, amounted to £104,505. Passengers' fares represented a sum of £291,397.

**Metropolitan Railway Co.**—The directors have declared a dividend on the ordinary stock for the past half-year at the rate of 1½ per cent. per annum, placing £7,500 to renewals and depreciation fund and carrying forward £9,500. A year ago the dividend was the same, £5,000 was set aside for renewals, and £9,200 was carried forward. The dividend on the surplus lands stock is at the rate of 2½ per cent. per annum, the same as a year ago, while £800 is carried forward, against £700.

**Electric Construction Co., Ltd.**—The directors have declared an interim dividend at the rate of 7 per cent. per annum on the preference shares for the half-year ended November 30th.

**London Electric Railway Co.**—The directors have declared a dividend at the rate of 1 per cent. per annum for the past half-year on the ordinary stock, placing £7,500 to renewals and carrying forward £3,000, as compared with £2,400 a year ago.

**Chatham and District Light Railways Co.**

THE directors' report for the half-year ended December 31st, 1912, shows that the revenue was £23,977, and the expenses were £13,276, leaving £10,700, less rent of Rochester Corporation lines £1,872, interest on debentures £1,192, interest account £186 = £3,250, leaving £7,451 plus balance brought forward from June, 1912, £2,111, making a balance of £9,562. Of this amount, £4,500 has been transferred to reserve for depreciation, and the directors recommend a dividend at the rate of 5 per cent. per annum for the half-year on the preference shares, absorbing £2,910, a dividend at the rate of 3 per cent. per annum for the half-year on the ordinary shares requiring £1,590, carrying £552 to revenue new account. The traffic receipts show an increase of £12, and the expenses an increase of £411, as compared with the receipts and expenses for the corresponding half-year of 1911, the increase in expenses being mainly due to the enhanced price of coal. During the half-year £2,100 debentures of the company were purchased and redeemed. The difference between the purchase price and par value has been added to reserve for depreciation. A further amount of £3,500 was invested during the half-year in trustee securities. Two additional cars were purchased and put into service in December.

The meeting will be held at 83, Cannon Street, E.C., on February 4th.

Half-year ended.	Miles open.	Passengers carried.	Traffic receipts.	Average fare.	Car. mileage.	No. of cars.
June, 1911	14.98	4,372,850	£21,101	1.16	551,534	45
Dec., 1911	14.93	4,843,236	23,622	1.17	671,790	45
June, 1912	14.98	4,155,807	21,570	1.16	544,512	45
Dec., 1912	14.98	4,850,273	23,634	1.17	697,202	47

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in—

Universal Cheap Cables, Ltd.—20,000 shares of £1 each fully paid, Nos. 1 to 23,000.

And to allow the following to be quoted in the Official List:—

Cordoba Light, Power and Traction Co., Ltd.—300,000 6 per cent. preference shares of £1 each (special application).

Rhonda Tramways Co., Ltd.—Further Issue of £40,000 5 per cent. first mortgage debentures (registered) of £100 each.

The Committee have ordered the undermentioned securities to be quoted in the Official List:—

Calgary Power Co., Ltd.—Further issue of £31,000 5 per cent. 80-year first mortgage bonds of £100 each (Nos. A3,802 to 4,111).

Pennsylvania Water and Power Co.—Further issue of \$200,000 first mortgage sinking fund 5 per cent. gold bonds, 1940, of \$1,000 each (Nos. 7,681 to 7,850).

**Great Northern and City Railway Co.**—The report as published in the financial newspapers, states that the total revenue receipts for the six months to December 31st amounted to £39,039, and the cost of working to £21,144, being at the rate of 54'11 per cent. The net revenue, including the balance of £184 brought from last half-year, amounts to £18,099, which is insufficient to meet the company's fixed charges for the half-year. The sum of £5,086, which has been provided from outside sources, has enabled the company duly to meet these charges. The number of passengers for the six months, including season ticket-holders, was 5,968,363, as against 6,119,506 for the corresponding period last year. The number of local season tickets issued during the half-year was 2,191, as against 2,327 for the half-year to December 31st, 1911. The number of three-route season ticket-holders using the company's line during the half-year was 2,889, as against 3,013 for the corresponding half-year. As already notified, the directors have, subject to the consent of the shareholders and to the necessary Parliamentary sanction being obtained, come to an agreement with the Metropolitan Railway Co. for the taking over by the last-named company, as from June 30th, 1913, of the undertaking of the City Co. The agreement came to have been embodied in a Bill which will be submitted in the ensuing session of Parliament. The necessary meetings of the shareholders of the company will be held after the half-yearly meeting for the purpose of submitting the proposals to the acceptance of the proprietors. The arrangement, which involves the dissolution of the company, is one which the directors recommend to the proprietors for their acceptance.

**Fusion of the London United and the Metropolitan Tramway Companies.**—The holders of upwards of 75 per cent. of each class of share in the Metropolitan and the London United Tramway Companies having accepted the scheme for the fusion of their interests in the companies named with the new company formed for giving due effect thereto, viz., The London and Suburban Traction Co., Ltd., the latter company, in a recent circular, now intimates that in consequence of this support the fusion scheme has become binding, and it is forwarding transfer forms to shareholders in the companies indicated to enable them to transfer their holdings to the Suburban Co., so that as soon as practicable after the registration of the transfers the shares and/or debenture stock of the Suburban Co., to which the acceptors of the scheme are entitled may be issued to them with scrip certificates to bearer for the fractions, if any.

**British Columbia Electric Railway Co., Ltd.**—The directors have declared a dividend at the rate of 5 per cent. per annum on the non-cumulative preferred ordinary stock for the half-year to December 31st, together with an additional dividend at the rate of 1 per cent. per annum for the same period.

**Brazilian Traction, Light and Power Co., Ltd.**—The directors have declared a dividend of 1½ per cent.

### Machine Tool and Engineering Association, Ltd.

In their second annual report the directors state that since their last report 23 firms have joined, bringing the membership up to over 100. The financial position is satisfactory, the balance in hand, after meeting all current liabilities, amounting to £3,954. It is proposed to invest £3,000 of this at once, the remainder being left either on deposit or current account at the bank. The directors do not recommend the payment of a dividend, as they consider it necessary that the association should have ample funds at command for future requirements. It has been decided to transfer the offices of the association to Queen Anne's Chambers, Broadway, Westminster, S.W.

The Exhibition at Olympia was successful, both from the point of view of the association as a whole, and, so far as information is available, from that of the individual members who exhibited. The total number of exhibitors was 292, the total attendance of the public about 100,000. The proportion of profit on the Olympia Engineering Exhibition appearing in the account was to December 31st, 1912, £3,998. The association was approached by the Exhibitions' Branch of the Board of Trade with the view of joint action in organising a collective exhibit of machine tools at the Ghent Exhibition, and the suggestion was approved by the association, but when invitations to apply for space were sent out to the members, the response was so inadequate as to make it clear to the directors that a representative display was impossible, and the scheme was, therefore, abandoned.

The annual meeting was to be held yesterday at Caxton Hall, S.W.

**East London Railway Co.**—In their report for the six months ended October 31st, the directors say that it had been hoped that the electrification work in hand would have been completed in time for the line to be opened for electrical working on March 1st. In view, however, of some delays which have unavoidably occurred in the construction of a sub-station the line will probably not be ready for opening until about a month later.

**Japan.**—The Yokohama Electric Co., of Yokohama, reports a profit of £39,088 for the last half-year, out of which a dividend at the rate of 11 per cent. per annum is being declared.

## STOCKS AND SHARES.

Tuesday Evening.

STOCK EXCHANGE markets are confused and obsessed by the complexion of the Near Eastern question. Whereas a couple of months ago delay was supposed to make for peace, at the present time the protracted nature of the negotiations is read rather as a bear factor. It certainly has a very restraining effect upon business, and the inevitable tendency is to let prices sag. Expectation looks for peace to be maintained, but this optimism is of subdued sort, and agreement is unanimous that anything might happen by precipitate action on the part of one of the many parties interested.

The Home Railway dividends which have appeared up to the present are not particularly brilliant performances. So far as the electric lines are concerned, the District declaration was the first. The company announces 2 per cent. on its Second Preference stock, and carries forward £8,500, the former being at the same rate as a year ago, and the latter being increased by £6,500. On the figures being published, however, Districts dropped from 42 to 40½. The Metropolitan declaration, made to-day (Tuesday), is at the rate of 1½ per cent., with £9,500 forward, the dividend being the same as that of a year ago. The Surplus Lands stock receives 2½ per cent. "Mets" fell sharply to 52, but rallied to 53½, thus showing a net gain of ½ on the week.

The London Electric Railways announces a dividend at the rate of 1 per cent. per annum, and the City and South London reduces its 1½ per cent. of a year ago, to 1 per cent., with £2,588 carried forward, against £2,814. The price of the stock, however, was not affected by the declaration.

Underground Electric shares have shown remarkable strength, and the Ordinary at the end of last week touched 5½ bid, reverting later to 5, which still leaves a rise of 2s. 6d. after their previous advances. The 6 per cent. Income Debenture stock is also better, and so are the 1s. shares, but the company's Income Bonds are ½ down. There are no quotable changes in Central London, or in Great Northern and City shares. The latter company has just issued what is likely to be its last report, previous to being taken over by the Metropolitan Railway. London United Tramways retain their prices, and this group as a whole is steady.

The electricity supply market shows firmness in several directions. For example: Bromptons are ½ higher, and so are Edmundsons' Preference and St. James' Ordinary; while rises of ¼ have been secured by Metropolitan Preference and Edmundsons' Non-Commulative Preference. On the other side of the sheet, South London and County Ordinary are both lower, the latter losing ¾. Midland Corporation Debenture has been in demand, and the quotation has risen to par. One or two proposals are in the air for the flotation of provincial electric supply companies, and the latest which has come under our notice is a scheme for uniting several well-known towns on the Sussex coast for this purpose.

The mention of new issues is a reminder of the draft prospectus in circulation with particulars of the Hydro-Electric Concessions, Ltd., a small concern with a capital of £21,000, formed to investigate and organise hydroelectric power and public utility enterprises in various parts of the world. The ultimate purpose, of course, is to form large public companies through this parent. No doubt the success of the hydroelectric power companies in some of the Canadian cities is at least partially responsible for this latest project.

Latin-Canadian enterprises are mostly a firm market, the steady progress which, the best of them are making, leading to quiet absorption of the various issues. The Kaministiquia Power Company, for instance, has just raised its dividend to 5 per cent. for the new quarter, while issuing an excellent report in respect of the past financial twelvemonth. Shawinigan Water has risen 3½. British Columbia Electric stocks are all strong, with rises in the Deferred and Preferred stocks. Rio bonds are ½ better, and so are Sao Paulo bonds. Brazilian Traction shares rose to 102 on strong buying orders from a Brussels group. Southern Electric Trams of Buenos Ayres Debenture put on 2 points, and several prices which were quoted ex-dividend last Thursday have started to recover part of the distributions. Affairs in Mexico, according to the latest intelligence, are still in a very unsettled condition, though this does not appear greatly to trouble proprietors of the utilities companies' shares and bonds. Other foreign tramway and power descriptions are firm, with the exception of Northern Light and Power bonds, the price of which has been marked down from 27½ to 15. A seller apparently forced stock on to an unwilling market, and purchases were made at 10. As a simple gamble, the bonds might be worth buying about 11 for an upward reaction. Kalgoorlie Preferences are ¾ lower at 11s. 3d. Madras Electric Debenture rose 1 to 102.

Excitement has quieted down to a large extent in the market for National Telephone stock, but the price shows a still further depreciation, and stock changed hands several times below par early this week. Estimates of the price at which the stock will be repaid are extremely wide, ranging from about 150, predicted by the *Daily Telegraph*, to 93, which the *Economist* conservatively calculates—the other prophets making various estimates between these figures. The award is condemned indignantly and unsparingly by many disappointed holders, who stigmatise it as sheer robbery and spoliation; but it has a few defenders, and these contend that though the taxpayer may have got a good bargain, it is by no means the absurd one which National Telephone Deferred proprietors in some cases maintain. The *Daily Telegraph*, by the way, informed us on Tuesday that Consols had declined on the previous day to 74½ "per oz," so maybe its Telephone calculation is worked out by some table other than sterling.

The Marconi market has recovered some of its mercurial properties, the price moving very fast between 3½ and 4½. On publication of the letter addressed by the company to the House of Commons' Committee, asking for the contract with the Government to be nullified, the Stock Exchange market was completely puzzled, and, for the moment, the price of the shares dropped. Discussion and debate on the company's object in doing this led to the view that it was a bold policy which might have a very useful effect. The fear that another Committee might be appointed to deal with the agreement alone had led to the idea that it might be many months before any definite agreement was reached, and what the Stock Exchange hates above anything else is suspense. The company's request for the agreement to be voided was, therefore, hailed as likely to whip up matters rapidly; and the bears saw in it sufficient justification for climbing in, because if the agreement is ratified, it is fairly safe to assume that Marconis will not stop at 3½ for long. The Preference shares and the shares of the subsidiary undertakings rallied in sympathy, the whole market taking on a better appearance.

Other Telegraph stocks are quietly firm. There was a slump in American Telephone and Telegraph Capital stock on free offering from New York, and at 137 the price shows a drop of 6. The President-elect's recent fulminations against trusts has caused considerable uneasiness in Wall Street, and fairly substantial falls in American Rails were followed as a natural consequence by declines in other American issues of a trust character. West India and Panamas are more in favour, the price gaining ½; and with the approach of the time for the opening of the Panama Canal, it is expected that these shares will appreciate still further. They are, of course, a very speculative holding. Great Northern Telegraphs rose 10s.; Eastern Extensions are ½ higher, allowing for the dividend; and Eastern Telegraph stock, also ex-dividend, is about ¾ up on balance. Direct United States Cable shares recovered their dividend deduction of 2s. 6d.

The Manufacturing division is inanimate. There has been a good rise in British Insulated and Helsby Cable shares, the Ordinary advancing to 8½, while Callenders are again ½ higher at 11½. One or two buying orders for British Westinghouse Preference had the effect of causing the price to harden to 12s. 6d. middle. A momentary decline in the price of the raw stuff led to the leading speculative shares being put down a little, though for the purely investment descriptions the public demand has not slackened.

**American Telephone and Telegraph Co.**—According to the *Financial*, a special meeting of the stockholders will be held on the 30th inst., in New York, to consider and act upon the question of authorising the issue of convertible bonds.

## CONTROL OF THREE-PHASE VARIABLE SPEED A.C. MOTORS.

THREE-PHASE alternate-current motors are now used in many industrial applications in which some degree of speed regulation is desirable. Such regulation is specially necessary for economy in the case of motors driving pit fans. At the time of opening the pit, the volume of air required for ventilation may be only 40-70 per cent. of the volume ultimately needed. Assuming that the initial requirements are as high as 70 per cent. of the final maximum value, the power required during the earlier stages is only 35-40 per cent. of that required for maximum delivery. It is obviously important that the speed reduction be obtained as efficiently as possible. According to the special conditions of the case, the fan may run at reduced output for one, two, three or more years, hence any system which improves the running efficiency at reduced speed easily recovers the heaviest additional capital outlay which is likely to be involved.

The most obvious method (to the electrical engineer) of controlling the speed of a three-phase slip-ring motor, is to insert more or less external resistance in the rotor circuit. To the mechanical engineer, the most obvious means of controlling the fan delivery is to throttle the inlet passage. Both of these methods are inefficient and involve large dead losses, but of the two the former is far preferable.

In the ELECTRICAL REVIEW, August 23rd, 1912, pp. 285-286, particulars were given of the efficiency of the simple cascade system in connection with pit fan motor control, and it was shown that this system offers considerable advantages as regards efficiency and power factor. The data given below compare throttle and simple resistance control with the Scherbius system in operating a 650-H.P., 2,000-volt, 50 cycles, three-phase motor driving a Rateau fan of present and ultimate capacity, 5,600 and 8,000 cb. m. per min. respectively. The general principle of the Scherbius system is well known. In the present case, the main three-phase slip-ring motor is provided with speed regulation between 150 and 220 R.P.M., and drives the ventilating fan at corresponding speeds ranging from 325 to 475 R.P.M. Speed control is obtained by varying the excitation of an alternating-current commutator motor connected to the main motor rotor, thus applying variable back E.M.F. to the latter. When the speed of the main motor is less than normal (here 485 R.P.M.) slip energy is transferred to the commutator motor which drives an induction generator feeding energy back to the supply mains. The necessary hand and automatic switchgear is provided for starting and controlling purposes; this need not be considered in the present connection, but a full description is to be found in "Gluckauf," 48 pp. 1,668 *et seq.*

A centrifugal governor is mounted on the converter shaft and coupled to an isolating switch, so that energy supply is interrupted in the event of the converter racing, owing to any fault which prevents return of energy to the bus-bars. Special switchgear is provided to enable the stator coils of the main motor to be placed in "star" for low speeds and in "delta" for high speeds; as shown by fig. 2, this conversion considerably improves the overall efficiency at low speeds and improves the commutation of the converter motor by keeping the applied voltage at a low value.

By the use of a phase transformer and switchgear, the power factor of the main motor can be brought to unity or a leading current can be taken if desired (though efficiency is then somewhat sacrificed owing to the higher copper loss). For convenience and efficiency, it is desirable to place the whole equipment within as small a space as possible, but, if so desired, the main and auxiliary parts can be located in separate rooms.

The light losses in the present equipment at various speeds are shown in fig. 1, and the overall efficiency on load (at various speeds and hence volume outputs), is shown by Curve A, fig. 2. This curve clearly shows the gain in efficiency by star connection when running at low speeds (the decreased iron losses then more than compensating for the higher copper loss); at about 330 R.P.M., either connection yields the same efficiency (85.2 per cent.).

The considerable advantage in favour of the Scherbius system, as compared with simple rotor resistance regulation is shown by Curve B, fig. 2.

Fig. 3 compares the above two systems with throttle regulation. The curves for the Scherbius cascade converter system and simple resistance control are transferred from fig. 2 (taking account of the percentage volume output corresponding to various fan speeds). The power curve for the throttle regulation system is determined as follows: The volume of air delivered is, at constant R.P.M., proportional to the equivalent aperture, with which, therefore, varies the driving power so long as the fan efficiency is constant. Fig. 2 shows that the motor H.P. = 650 for a speed of 485 R.P.M., and, corresponding to a speed of 330 R.P.M. =  $\frac{330}{485} \times 650 = 442$  H.P. Taking into account the alteration in fan efficiency, the (power-volume) curve falls linearly from 650

FIG. 1.

FIG. 2.

FIG. 3.

to 495 H.P., and, accounting for motor efficiency, the actual (H.P.-volume) curve is as shown in fig. 3.

Throttle regulation is clearly very inefficient; resistance regulation is much more efficient, and the additional capital outlay required is only the difference in cost between the starter required under the throttle system and the resistance regulator required in the other case.

In this instance, the Scherbius system required a capital outlay nearly £750 higher than would be required by a simple resistance regulator. At first sight, this appears to be a serious matter, but if the fan runs continuously for 18 months at 70 per cent. of its rated volume output, the power saved is 53 kW., and, with electrical energy at 0.3d. per unit, the reduction in the total energy bill more than recoups the additional capital outlay in question.

**A Novel Electro-medical Outfit.**—According to a recent issue of the *Autocar*, Dr. Gamlen, of West Hartlepool, has had his car fitted to his own plans with an electric equipment whereby electrical current can be generated for a portable X-ray equipment. When it is desired to set up the equipment, the near side back wheel is jacked up and removed, and a spare wheel, which is carried minus its tire, is used as a belt pulley and coupled up to the pulley on a portable dynamo by a short flat belt. The dynamo is supported on a small table carried on the car, the table in question being fixed to the running board so as to maintain the tension of the belt drive. The rear mudguard of the car is made readily detachable, so that it shall not be damaged or get in the way of the belt. In addition to providing current for the X-ray equipment, this arrangement, by the aid of a special switchboard, enables various forms of electrical treatment to be administered, the car meanwhile being, of course, outside the patient's house. Plenty of cable is carried to enable the current to be taken to any convenient point.

When sp.  $\frac{E}{H}$  passed, indicator =  $11,481.5 - 2,331.5 = 9,150$  revs.  $\frac{9,150}{344.15} + 2.21$  per cent. =  $26.587 + 0.588 = 27.175$  N.M. (E).

When sp.  $\frac{W}{D}$  passed, indicator =  $16,618.5 - 11,481.5 = 5,137$  revs.  $\frac{5,137}{344.15} + 1.68$  per cent. =  $14.927 + 0.251 = 15.178$  N.M. (W).

At 8 p.m. indicator =  $23,993.5 - 16,618.5 = 7,375$  revs.  $\frac{7,375}{344.15} + 1.23$  per cent. =  $21.429 + 0.263 = 21.692$  N.M. (D).

Total paid out up to 8 p.m. =  $71.036$  N.M.

N.B.—The foregoing percentage corrections are quickly applied with a slide rule.

lying may conveniently be ascertained by the paying out—simultaneously with the cable—of a fine steel wire absolutely taut, the speed rate of which is accurately given by a measuring wheel and counter. This method was first advocated in 1876 by the late Dr. Werner Siemens, but it did not come into general use until a comparatively recent date. The *taut-wire* device may best be described in the words (abridged) of its originator, from a paper read by him before the Society of Telegraph Engineers.

17. "To obtain precisely any desired slack, the only method will be to pay out, with the cable . . . a wire. . . . If this wire . . . be retained with sufficient brake power to be paid out without slack, and, therefore, with tension on the sea bottom, a counter will give the exact progress of

FIG. 5. (Reduced from 2 ft. 5 in.  $\times$  1 ft. 11 in.)

CABLE SLACK PER CENT.

44. One of the many important mechanical data in great request during cable-laying operations is that relating to the percentage of slack laid at any given time, or average slack for any given time period.

The amount of slack required varies with attendant conditions, having regard, chiefly, to the nature and configuration of the sea bottom over which the cable ship is passing.

There are various ways of estimating traversed distance (nautical miles) or speed rate (knots) over ground—i.e., an imaginary line representing the track of the ship from point to point.

45. Given the distance over ground, and the amount of cable actually paid out; or, given the speed (s) of the ship through the water, and that (c) at which the cable is actually paid out, a simple comparison affords the necessary

data for knowing slack per cent. (P), or  $P = 100 \frac{C - S}{S}$ . On

the other hand, given the speed (s) of the ship, and the percentage (P) of slack thought desirable, the speed at which the cable must leave the ship may be calculated, or  $C = S + \frac{PS}{100}$ .

46. The ship's speed through the water during cable-

the vessel, even without the errors caused by currents; therefore the brake has only to be maintained under the pressure that will give any desired ratio between the velocities with which the cable and the wire are run out. . . .

TAUT-WIRE GEAR IN PRACTICE.

48. In recent practice the taut-wire measuring wheel has been given a *circumference* which, allowing for the circumference (see 20 . . . 22) of the 0.032 in. diameter bright steel wire (S.W.G. No. 21) weight 16.74 lb. per N.M., will cause its every revolution when carrying the wire round the wheel's V-section periphery, to be equivalent to exactly one-thousandth of a nautical mile = 0.001 N.M. = 6.087 ft. = 73.044 in. of wire.

49. An equivalent of a speed-rate of one measuring-wheel rev. per min. of course would be  $0.001 \text{ N.M.} \times 60 = 0.060 \text{ N.M. per hour}$ . On this basis a convenient table may be compiled to include all values within likely limits. Example:—

100 revs. per min. = 6.00 N.M. per hour.  
155 " " " = 9.30 " " "

50. Custom varies regarding the appellation of this contrivance which, sometimes, instead of being called the *taut-*

wire, receives the name of *slack wire*, from its use in leading to a knowledge of cable *slack* per cent. paid out.

#### CABLE SLACK PER CENT. GRAPHS.

51. The writer has devised a series of graphs illustrative of the whole question of the ratio between the two velocities, viz., of *haul-wire* and of *cable*.

52. Fig. 5, although unsuitable—as will further be explained—for final adoption in practice, shows the general principle of the cable-slack graph. Under the heading "*slack-wire measuring wheel*," a vertical scale graduated in knots (*i.e.*, N.M. per hour) stands parallel to equivalent slack-wire values in terms of *revs. per hour*, and *revs. per min.*

53. At right angles to the vertical scale lies a horizontal scale graduated in *cable knots*.

54. Parallel with the horizontal cable-distance or cable-speed scale, are spaces in which, on the occasion of each expedition, cable speeds may be pencilled in terms of *paying-out drum revs. per min.* for all the various types of cable on the ship. These pencilled drum-revs. per min. may be erased when done with. Drum-rev. spaces will be shown in more developed form in fig. 7.

55. From the origin of the vertical and the horizontal axes, straight-line "curves" are drawn diagonally across the diagram-sheet to figures in terms of cable-slack per cent., zero per cent. to 20 per cent.

56. *Haul-wire* and *cable* co-ordinates always intersect on, or close to, the corresponding diagonal line indicating *cable slack* per cent.

57. The diagonal line on which any *haul-wire* and *cable* co-ordinates intersect will, at its upper end, indicate *cable slack* per cent.

58. If the co-ordinates intersect between two diagonal lines, the decimal fraction to be added to the lower percentage may easily be appreciated.

59. A black thread—one end pinned at the point of origin, the other held taut in the operator's hand—on being brought to the intersection of *haul-wire* and *cable* co-ordinates, will be found to coincide with the diagonal line indicating *cable slack* per cent.

60. Conversely, if the thread be brought to the intersection of any *haul-wire* co-ordinate with any *slack per cent.* diagonal, that *cable* co-ordinate found to pass through the same intersection will, at its lower end, indicate the *cable speed* necessary to bring about the required *slack per cent.*

Note : Practical examples will be given from later graphs.

61. Fig. 5 includes a supplementary vertical column of ratios *cable/wire* paid out.

A horizontal line, extended from any given ratio, abuts on the zero diagonal line at a point from which a vertical line, at its upper end, will indicate cable slack per cent.

62. Fig. 5 sufficiently indicates general principles, but is weak in regard to practical requirements, inasmuch as, where the diagonal straight-line curves approach to and converge at their common origin, they merge into a useless blur.

(To be continued.)

## PROCEEDINGS OF INSTITUTIONS.

### The Steam-Gas Turbine.

(Abstract of THE JAMES WATT LECTURE, 1913, delivered by DR. S. Z. DE FERRANTI, Past-President I.E.E., at Greenock, before the JAMES WATT CLUB, January 16th, 1913.)

I HAVE chosen the subject of "Prime Movers" for the lecture, and have done so for several reasons. James Watt was practically the inventor of what we know as prime movers. This subject is, I think, the most interesting problem in engineering. It is also a subject which is more than ever interesting to-day on account of the active competition existing between the various systems of power production, and lastly, I have chosen this subject because it is the one which interests me above all others. You have had shown to you what splendid results Watt achieved, and what an immense effect these achievements have had upon the world's progress. You have, however, I think, heard little of what these achievements cost James Watt, and of the enormous difficulties he had to overcome in order to bring about the utilisation of his inventions. When at last he got some measure of assistance, there were endless mechanical difficulties to overcome, as in those days engineering practice was of the crudest possible nature. I consider that one of the greatest things ever achieved by James Watt was his discovery of Matthew Boulton; if it had not been for the magnificent support extended to him by Matthew Boulton, I cannot conceive how his inventions could have resulted in anything but failure and complete despair.

The same sort of thing is going on to-day in many directions. I am also afraid that in this country the difficulties of inventors are very great, owing to the want of interest in anything new. Although I think we have plenty of inventors, we have very few Matthew Boultons, and from the point of view of progress and development of the country, it is men such as he who are wanted to-day. It is generally believed that the immense development which has taken place in Germany is largely due to the intelligent use of her scientific men by the commercial community. In the United States there also appears to be a much better chance for the man who is desirous of developing new things, and this undoubtedly must help these countries to progress and keep ahead in the industrial struggle. It is vital to the progress of the country, in order that we should not fall behind our competitors, that great risks should be taken in the development of new ideas, and it would be a good thing for the country generally, if there were more keenness in this direction. I do not think that to-day this country is spending anything like enough in the development of new ideas.

In steam we have a power the whole of which is available for doing useful work. The power required for pumping the water into the boiler, which is the negative work of the cycle, is so small that it is almost negligible. Whatever the power given by the steam in the cylinder, less the friction of the engine it is available for doing useful work. It is, therefore, clear that however inefficient the engine may be, it will go round and do some useful work.

Although the Newcomen engine was in use before the days of Watt, it was exceedingly uneconomical, and his great work was the improvement of the efficiency of this engine to such an extent that it became useful and economical for general service. The greater part of the work done since his time has been in the same direction—viz., in a continual endeavour to improve the efficiency of conversion of the heat in the fuel into mechanical work.

With this object in view, higher steam pressures involving higher temperatures were introduced and compound engines, and later on triple expansion engines were developed to more effectively utilise the higher ranges of steam pressure. The work of Sir Charles Parsons in the invention and development of the rotary principle to the production of motive power by means of steam must ever be remembered as a great advance in the development of prime movers. The turbine, notwithstanding its very low efficiency as first constructed, was gradually improved until high-mechanical efficiencies of conversion have been reached. Especially is the turbine valuable in the production of large powers and in taking advantage of high degrees of vacuum.

Before, however, the modern turbine had been developed, another idea had been pursued with a view to simplifying the process of power generation, and, at the same time, getting a higher economy. Years ago an engine was invented and built by Lenoir, in which a charge of air and gas was sucked into the cylinder at atmospheric pressure and exploded. The piston speed in this engine was low, the ratio of expansion was low, and, needless to say, the economy was very poor. Still, it was a step in the direction of higher economy, inasmuch as by this system a higher temperature of working fluid was obtainable. Later on, Otto and Langen invented a gas engine, which was an improvement on the previous one as the pressure of explosion was higher and the ratio of expansion was greater. Both these engines, although of the explosion type, came under the heading of "low negative work," as the explosive charge was simply sucked into their cylinders, and was not compressed before firing.

The great move forward, which was next made, was that of compressing the charge of explosive mixture before firing, and to getting a high maximum temperature, a good ratio of expansion and, consequently, much improved economy. Engines of this type belong to a class of prime movers with "high negative work." In this form of engine the positive work of the explosion has to have deducted from it, not only the friction of the engine, but also the amount of work required to compress the charge which constitutes

**Credit and Security.**—A certain amount of ephemeral interest has been excited by the replies of Mr. J. P. Morgan in his examination before the so-called Money Trust Commission at Washington. Mr. Morgan is reported to have said that credit is based primarily upon character, and not upon money or property, otherwise collateral or collateral security. In another place he is alleged to state substantially his practice thus: "I always know the person to whom I lend, or something of him." "If I see there is a loan to Mr. Smith, and I do not like his character, I say, you call that loan right away" (which is very Yankee). "I would not have that loan in the box." "I would not have that loan."

There is nothing that is original in these statements. Naturally if a person has achieved an unenviable notoriety, in other words, whose character is bad, some people would possibly not entertain his proposals on any security; but premising that person to possess a character above suspicion, it is too much to say that his unimpeachable character alone would gain him his object without the production of substantial and the proper kind of collateral. At any rate, generally speaking, neither "Lombard Street" nor "Threadneedle Street" nor any other locality would look at such a proposal. In practice interest and security frequently regard character as a negligible trifle.

the negative work of the cycle. There is a further deduction, viz., that of the friction of the engine or of a separate pump whilst doing negative work. These deductions are very serious and would render this class of motor useless, were it not for the high mechanical efficiency of the parts used for carrying out the cycle.

In the gas engine the negative work is high, but not so high as to form a serious difficulty. In the more economical Diesel engine in which very high pressures are used, so as to get a high enough temperature to burn the oil as sprayed into the cylinder and give a high ratio of expansion, the negative work is a much more serious difficulty.

The development of the internal-combustion engine of high negative work, which was started before the birth of the modern steam turbine, has been vigorously pushed on over a period of years concurrently with the work done on the turbine, and now both are competing for premier place in furnishing the world's power.

It seems, according to present knowledge, to be clear that for small powers the internal-combustion reciprocating engine is in every way the best. At the other end of the scale the turbine is the only means of filling our requirements to-day. In between these two extremes there is a doubtful dividing line where either form of engine may best serve the purpose, according to the conditions of the particular case.

As the turbine gets bigger, so is it easier to construct, and it also becomes more economical. As the gas or oil engine gets bigger I need hardly remind you how the natural difficulties increase. On the other hand, as the turbine is reduced in power its economy falls off badly and it is difficult to make a satisfactory design. The internal combustion engine, on the contrary, becomes a most satisfactory and economical machine in small sizes, as witness the thousands of gas engines in use all over the world and the beautiful engines working on the Diesel cycle which are small enough to avoid water cooling of the pistons.

I think that this division of the means of power production by large and small units between the rotary and reciprocating machine is almost a natural law, and those who seek to evade it must either invent some new principle or court endless trouble, expense and failure.

To-day, with a complete disregard of the above principles, the advocates of the Diesel engine for marine propulsion are spending vast sums of money on its development, but even this usually all-powerful force may not prove enough to make a wrong principle right. The daily Press and also our well-informed technical journals tell us of all the wonderful successes of large oil engines in Germany and elsewhere, but I can assure you that few people have any conception of the failures and breakdowns which have occurred, and which are repeatedly occurring, with the big experimental engines that have been constructed. In Germany, especially, where so much has been done in this direction, they carefully avoid informing the foreigner on these points.

As I mentioned to you at the beginning of this lecture, the subject of prime movers is one in which I have always been most interested, and in following it my constant aim has been to increase the amount of work that can be usefully obtained from a given amount of fuel. It is, of course, well known that the higher the temperature of the working fluid the higher is the economy that can be obtained. High temperatures have, however, proved very difficult to work with, and as an instance of this, the low working temperatures of turbines for marine propulsion may be pointed out. Seeing, however, that the difficulties were mechanical and that great advantage could be derived if these troubles were overcome, I commenced experimenting some years ago, and have now after many failures, and the expenditure of much money and time, produced a turbine which at the highest temperatures, and with great and rapid variations of temperature, is quite free from mechanical troubles. Indeed, I believe that this turbine is perhaps the strongest from a mechanical point of view that has yet been produced. Moreover, contrary to what might have been expected with a high temperature machine, it runs with certainty with a blade end clearance that is so small that it is almost negligible from the point of view of leakage loss, and the fear of the possibility of stripping appears to have been effectively removed.

In this turbine I superheat the steam initially, and after the first expansion, and whilst it is still superheated, resuperheat it before it does its work in the second stage of the turbine. After this it is exhausted in a superheated condition through a regenerator to the condenser. The whole of the blading is electrically welded, so as to avoid the straining due to caulking at the high temperatures that are reached, and also the loosening that occurs due to the same cause. The blading is formed of mild steel with a thin coating of pure sheet-nickel electrically welded on to the surface. The blading is most accurately finished to shape by a process of step-by-step pressing under very heavy pressure.

The blading, the sections of which are very exact, is welded in position with the accuracy of the automatic machine that is used for the purpose, and every opportunity is thus given for realising the best results. Although the turbine is of the reaction type, no balance dummy is used. The whole of the end load is taken on a specially constructed thrust, thus saving steam leakage.

The steam is worked as a gas at high temperature throughout the turbine, and this, coupled with the many improvements above referred to, has given very good results.

The 5,000-H.P. machine, which has now been running for some time, when tested at a load of two-thirds full power, has given a shaft H.P. on 7 lb. of steam, which, if supplied by an oil-fired boiler superheater system of 85 per cent. efficiency, which has already been exceeded in central station practice, would consume less than 625 lb. of oil per shaft horse-power.

From many tests already made, it appears that when this turbine is run at full load under favourable conditions it will take less than 6 lb. of steam per shaft horse power, and that the system under the conditions named will have a thermal efficiency of over 21 per cent. corresponding to an oil consumption of about 55 lb. of oil per shaft horse-power. The tests are being proceeded with, but as the turbine is run continuously in supplying power to a large works with a constantly varying load, it is not easy to do what is necessary to enable tests to be carried out. So far as I can see, this system when applied on a large scale, will be capable of giving an overall thermal efficiency of 29 per cent.

When the advantages of the turbine system in the way of lightness, simplicity and certainty are borne in mind, and when they are compared with what is known of the complicated reciprocating oil engines now being introduced for marine purposes, the possibilities of the new system of high-temperature gas-steam turbine become of great interest.

Steam as a practical motive power so brilliantly invented and applied by James Watt has had a long and most useful application in our civilisation, but it cannot be looked upon as the eventual solution of the power problem even for large powers. It can, however, be immensely improved in efficiency, and as it does not appear that there is any other system at present which will fill the same requirements, it is probable that it will still have an enormous application.

With a high-temperature steam turbine of large size generating electricity to supply power for all purposes on land one has the advantage of a machine of the highest efficiency which is not limited to oil for its fuel. It is probable that as improvements are made the whole of the coal used for firing these large units will be gasified, and the by-products recovered. When this result is brought about we shall have not only an ample and cheap supply of fertiliser for the land, but also a great quantity of the tar oils, which will form a suitable means of firing for naval purposes, and will relieve us from the necessity of purchasing fuel oil abroad and the risk and cost which this process involves. We will also have an ample supply of benzol for all our small motor requirements. This, I think, is the solution of the fuel problem for these motors rather than in the production of alcohol on a large scale from the land, as has lately been advocated. When we are supplied with ample quantities of fertiliser at a low cost, both the land and the labour involved for the production of alcohol will be much better occupied in other ways. After all, the great problem for this country is to so utilise the coal that we produce that we make it fill our every requirement. This, I have shown you, will be done in the not distant future.

The electric motor which gives its power in a rotary form, and which is supplied from very large power stations, is displacing all forms of small engine. It is, therefore, probable that in the future small prime movers will only be required to propel cars and boats, and that all stationary motors will be electric. The electric motor, with its one running part so easily and conveniently applied to all purposes, is a good illustration of the desirability, and even the necessity, of the rotary principle of engine. Reciprocating forms of engine will, no doubt, be used for a long time, but they can only be regarded as makeshifts, and so soon as an equally efficient machine for any particular purpose is developed, it must surely displace the reciprocating motor. No doubt, as knowledge increases, many forms of prime mover will be developed of higher and higher economy. It is difficult to predict the form of the prime mover of the future, but, in search of the highest economy, and with the limitations of temperature imposed by known materials, one is inclined to look to electricity converting the energy of the fuel at low temperatures, and giving its power in rotary form as the most likely eventual solution.

### The Design of Apparatus for Improving the Power Factor of Alternating-Current Systems.

By MILES WALKER, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, London, January 9th, 1913.)

THIS paper will be confined to a short statement of the principles involved and a description of the phase-advancer built by the British Westinghouse Co.

We may look at the cause of the lagging current in the following way:—The energy stored in any magnetic field consists of two factors—(a) the total flux; (b) the magneto-motive force driving that flux.

Now, the total flux when created at a certain frequency produces a certain back E.M.F. in each turn encircling it, and the magneto-motive force requires for its production a certain number of ampere-turns. Thus, from the two factors—flux and magneto-motive power—we arrive at certain factors necessary for the production of the alternating magnetic field at any given frequency. These factors are:—(1) Electromotive force per turn; (2) number of turns; (3) amperes per turn.

Grouping 1 and 2 together, we arrive again at two factors—volts and amperes—whose product represents the idle component of the power required to generate all the alternating fields in the distribution system.

The higher the frequency of the supply the greater will be the idle component of the power required to produce the alternating field. If the field can be produced by a rotating magnet (as, for instance, in a synchronous motor) excited by continuous current, the frequency of the current being zero, no idle component is necessary. Indeed, by supplying more continuous-current turns than

are necessary to produce the magnetic field in any particular machine, it is possible to create in the system a leading current, which will compensate for a lagging current in another part of the system. The field current in the magnet of an alternator may be said to have two functions:—

1. To produce the magnetic field which generates the electromotive force in the alternator itself.
2. To supply an additional magneto-motive force, which by means of a wattless current is communicated to all the machines in the system that have not got continuous-current excitation themselves.

If we are to reduce the wattless current we must either use machinery requiring weak magnetic fields, or we must provide independent means of magnetising the fields. A modern transformer does not take a large wattless component in proportion to its output, because, though the total flux generated may be great, the magneto-motive force required to produce that flux is very small. An induction motor, however, having necessarily an air-gap and coils of considerable magnetic leakage, has in it a magnetic field which requires a wattless component of 25 to 30 per cent. of the kilovolt-ampere rating of the motor. For this reason the induction motor is the main cause of low power-factors in our alternating-current systems.

If now the magnetising current of an induction motor can be supplied at the frequency of the slip (say, one cycle per second), instead of at the frequency of supply (say, 50 cycles per second), the wattless magnetising kilovolt-amperes are very much reduced.

In 1895, M. Leblanc proposed to supply the magnetising current to the rotors of induction motors and generators by means of special exciters, which consisted of commutating alternating-current generators whose magnets were excited by the rotor currents.

The main objection to the method, as described in Leblanc's early patent, is that it requires two or three exciters, and as the currents to be dealt with would in general be large, the cost of these exciters becomes excessive. Leblanc has described an exciter which embodies in one machine all phases, and is of a very simple nature. This is illustrated in figs. 1 and 2, which show two-pole armatures, one arranged for two-phase and one for three-phase.

The armature is made like an ordinary drum-wound continuous-current armature. It is surrounded by a simple ring of laminations, having inwardly projecting poles, but without any field windings. The notches in the field are to aid commutation. If such an armature, as illustrated in fig. 1, be provided with four brushes, placed at  $90^\circ$  to one another on the commutator and connected to the four slip-rings of a two-phase rotor of an induction motor, and is run at a speed which is high as compared with the frequency in the rotor circuits, it will have the effect of producing leading currents in the rotor. The beauty of this exciter is that the armature currents themselves excite the field, and produce a flux in the armature which is in such a phase as to generate an E.M.F. in each circuit, exactly at right angles to the current carried by that circuit. For, at the instant when the maximum current is going into the armature by brush  $A_1$  and out at brush  $A_2$ , the armature will be magnetised with one pole at the top and another pole at the bottom, so that no E.M.F. is generated in phase A, but a

FIG. 1.—LEBLANC'S TWO-PHASE EXCITER.

FIG. 2.—LEBLANC'S THREE-PHASE EXCITER.

maximum E.M.F. is generated in phase B. Thus we see that the E.M.F. in any phase is always at right-angles to the current in that phase. The question whether the E.M.F. leads or lags behind the current depends only on the direction of rotation. Such an exciter can be built for three phases, as illustrated in fig. 2, and would be much cheaper to build than three separate exciters. By proper design, and by using carbon brushes, the commutation can be made sufficiently good; but in view of the fact that the rotors of induction motors of large power usually carry very heavy currents, the commutator of such an exciter, say, for a 1,000-H.P. motor, would be of considerable dimensions.

A. Scherbius, in a recent communication, gave an illustration of a phase advancer of this type made by Messrs. Brown, Boveri & Co., capable of bringing to unity power-factor a 600-H.P. motor. This machine is illustrated in fig. 3. The overall dimensions of this set are 50 in.  $\times$  22 in.  $\times$  25 in., and its weight 750 lb. The c.c.s. curves of a 400-H.P. 32-cycle motor running at 180 R.P.M. both with and without the advancer are given in fig. 4.

It will be recognised that the stationary iron frames in figs. 1 and 2 are not really necessary, except in so far as they may reduce the magnetic reluctance of the magnetic circuit when an open slot-winding is used on the armature. If a winding with closed slots is used, the magnetic circuit may lie wholly within the armature. While the armature rotates, the field remains stationary as long as a continuous current is supplied to one set of brushes. If currents slowly alternating, such as those from a rotor winding, are supplied, the field slowly revolves in space while the rapidly revolving armature conductors cut across this field and generate the necessary

leading electromotive forces. An exciter of this kind, having no external field, has been made by Messrs. Brown, Boveri & Co. The use of the external frame, however, seems to possess several advantages; it enables open slots to be used on the armature, and by fixing the position of the field independently of the currents carried by the armature, enables the commutation to be performed in a thoroughly satisfactory manner.

It should be pointed out that the main reason why the phase-advancer has a fair chance of commercial success is that it is a machine of small output in comparison with the amount of change of wattless load which it is capable of effecting when used in conjunction with an induction motor of suitable size. A phase-advancer of only 30 K.V.A. capacity is capable of changing the power-factor of a 1,300-K.V.A. motor from 0.88 lagging to 0.95 leading. That is to say, the motor instead of requiring to be fed with lagging wattless current to the amount of 600 K.V.A. will relieve the generators supplying the system of a wattless load of 400 K.V.A., making a total change in the wattless power of 1,000 K.V.A. to the good. The reason is that the phase-advancer stands in the same relation to an induction motor as an exciter does to a synchronous motor. An exciter of comparatively small capacity can over-excite a synchronous motor so as to make it supply a wattless load 50 times as great, measured in K.V.A., as the rating of the exciter. Now, if for some mechanical work a large induction motor must be employed, the extra cost of making that motor run at unity or even at a leading, power-factor is not very great. It is merely a question as to the cost of an advancer whose rated output is some 3 to 6 per cent. of the rating of the motor, and the cost of a three-phase double-throw switch for putting it in and out.

FIG. 3.—SCHERBIUS PHASE-ADVANCER.

The armature may either be of the open-circuit star type or of the closed-circuit type. Both kinds of armature commute well. The first (fig. 5) is suitable when the current to be collected on the commutator is very great and the voltage to be generated is small, say not more than 15 volts. It enables a very wide brush (extending

FIG. 4.—POWER-FACTOR CURVE OF A 400-H.P. MOTOR: A, WITHOUT THE PHASE-ADVANCER; B, WITH THE ADVANCER IN CIRCUIT.

over  $0\frac{1}{2}$  of the pole pitch) to be used. The second type (fig. 6) is suitable when the current is not very great and the voltage is higher. The illustration given in fig. 11 relates to a machine with a closed armature winding. The design is identical with that of some smaller machines of 6-K.V.A. rating now running in commercial service, but the dimensions shown are suitable for an advancer of 30-K.V.A. output.

The cases that will be found most suitable for the addition of phase-advancers to induction motors are those where the motors are intended to run continuously in one direction throughout the greater part of the day. If a motor is intended to be started and stopped frequently, or reversed, then it is not suitable.

Let us suppose that we wish to design a phase-advancer to be direct-connected to an 800-H.P. induction motor driving a continuous-current generator. If the motor has already been built, it is necessary to inquire whether its rotor is provided with a winding brought out to slip-rings; and if so, whether the slip-rings and brush gear are designed to carry the full-load current continuously. One could adapt a phase-advancer to almost any normal rotor winding (except, of course, a short-circuited winding); but if the

current is very high and the voltage low, the cost of the advancer will be greater than where the current is fairly small and the voltage higher.

Suppose that the rotor has a three-phase star-connected winding having a stand-still pressure of 800 volts per phase. The working current (that is to say, the current in phase with the voltage) will then be about 255 amperes, which can be collected on a comparatively small collector. To find the rotor current necessary to

FIG. 5.—DIAGRAM OF OPEN-CIRCUIT ARMATURE WITH SEVERAL BRANCHES IN PARALLEL UNDER WIDE BRUSH BELONGING TO EACH PHASE.

FIG. 6.—CLOSED-CIRCUIT ARMATURE FORMING A MESH CONNECTION BETWEEN THE PHASES.

make the motor run at 0.95 leading power factor, proceed as follows:—

Set off a vertical line representing 255 amperes, as shown in fig. 7. The power factor of an 800-H.P. 50-cycle motor running at 490 revs. per minute might be about 0.88, so that without the advancer one would have a lagging current equal to 47 per cent. of the working current. If the advancer caused the rotor to take a leading current of 47 per cent. (that is, 120 amperes), the power factor at the stator terminals would be nearly unity. If now it is desired to make the power factor at the stator terminals 0.95 leading, we must supply to the rotor an additional 31 per cent. of leading current, making 200 amperes wattless in all. Adding as

FIG. 7.—CONSTRUCTION FOR FINDING VALUE OF ROTOR CURRENT REQUIRED TO PRODUCE A GIVEN LEADING POWER FACTOR.

FIG. 8.—CONSTRUCTION FOR FINDING THE VOLTAGE REQUIRED TO BE GENERATED BY ADVANCER.

FIG. 9.—DIAGRAM OF CONNECTIONS.

Mesh-connected phase-advancer armature  $a, b, c$ , field connections  $E, Q$  and  $R$ , and mesh-connected rotor  $A, B, C$  of induction motor.

vectors the 200 amperes wattless to the 255 amperes working current, we get 324 amperes per phase for the rotor when running under these conditions. This is the current for which the advancer must be designed. If we had made the rotor with a voltage per phase of 400, we should have had 650 amperes, which would have made a somewhat more expensive, though perfectly possible, phase-advancer.

Next as to the voltage to be generated by the advancer. As the armature of the advancer is to be mesh connected, it is simpler to take the voltage across the slip-rings than the voltage per phase of the star winding. Indeed, as the motor would work the same whether it were mesh connected or star connected, we may, if we like, consider it mesh connected, as we have done in fig. 9. If the normal slip of the motor at full load be 1.45 per cent., the E.M.F. generated by the slip will be 20 volts measured between rings. Lay off, as in fig. 8, the vertical line  $OE_a$  to represent this voltage generated by the slip in phase  $A$ . In fig. 7 we have found the angle by which the current must lead on this voltage, so we can set off the line  $oa$  to represent the current in phase  $A$  (see fig. 9). Similarly,  $ob$  and  $oc$  represent the currents in the other phases. We should allow about 6 volts for pressure drop in brushes and in the resistance of the advancer. This will be represented by  $E_s R$  in phase with  $oa$ . Then there will be some reactive drop in the field coils of the advancer. We may provisionally allow 5 volts for this, and after the machine is calculated we can make a check calculation to see if it is enough. This is represented by  $R X$ . There is no reactive drop in the armature because the compensating winding wipes out its field. We see that if we add a voltage  $xv$ , parallel to  $ba$ , we shall get a resultant voltage  $ov$  in phase with  $oa$ , and this is what we want. If, therefore, we excite the advancer with a current which is in phase with the sum of  $oa$  and  $-ob$  (shown by the dotted line  $ba$ ), we can make the current lead by the right amount. The voltage to be generated by the advancer is therefore

given by  $xv$ , which, when scaled off, gives us 33 volts. It will be seen that the projection of  $ov$  on the vertical line gives us  $ov$ , which is greater than  $OE_a$ . If this voltage  $ov$ , is greater than is necessary to drive the working current through the rotor circuit, the only effect will be that the slip of the rotor will be reduced until we get the right working current for the load. If it should come out that  $ov$  is not sufficient to drive the working current, then the slip of the motor will be increased.

From fig. 8 it appears that with 33 volts generated by the advancer the slip will be slightly reduced. We thus arrive at the rating of the advancer, namely, 33 volts between terminals and 324 amperes per phase.

It will be found that the series-wound advancer will have more suitable characteristics for the case in hand than a shunt-wound advancer. With a series excitation the amount of leading current taken from the line increases with the load, so that the power factor of the motor remains more nearly constant than where the excitation of the advancer remains constant. We will therefore decide upon a series winding. When the voltage to be generated is of the order of 30 volts or higher, and the current is reasonably low, as in this case, the best kind of armature is that with a closed winding, just like an ordinary continuous-current armature.

Theoretically, three salient poles (equivalent to two magnetic poles) are quite enough for a machine of the rating required in this case, but a machine of six poles (equivalent to four poles magnetically) is more likely to fit in with standard frames and standard punchings. This will give us six brush arms, two in parallel in each phase. There will be 162 amperes per brush arm, and  $162 \div 1.73 = 94$  amperes per conductor.

As the speed of the main motor in this case is quite high, 490 R.P.M., it is quite a good plan to couple the advancer directly to it, just as one would an exciter to a high-speed synchronous motor.

If we take a large  $D^2 L$  constant of  $9.5 \times 10^5$  ch. cm. it will not be excessive, though very ample. A diameter of 46 cm. is suitable for a speed of 49 R.P.M., and the length of iron may be 18 cm.

The easiest way of designing a phase-advancer of this type is to proceed as if it were a continuous-current machine whose voltage is 1.41 times greater than the virtual voltage called for in the specification. The armature need not differ in any particular from a continuous-current armature. The field winding will be provided with series exciting coils and compensating windings connected to the various phases in the manner described below.

The main points to look to, that are not found in a continuous-current design, are:—

1. The machine though having six salient poles is a four-pole machine magnetically, and we must remember this when fixing the dimensions of the iron behind the slots.

2. The voltage to be generated as a continuous-current machine is 1.41 times greater than the virtual voltage called for.

3. The fluxes in the salient poles which constitute magnetically a pole-pair are  $120^\circ$  apart in phase, so that the voltage generated in an armature coil which lies partly under one pole and partly under another is only 0.86 of the voltage that would be generated if the two poles were carrying the maximum flux at the same time.

4. It is necessary to arrange the series winding on each pole so as to cause the flux to lead, by the right amount, ahead of the current carried by the armature conductors passing under the pole.

5. It is desirable to arrange the compensating winding so that its effect is equal and opposite to the armature winding adjacent to it, and for this purpose it is necessary to have regard to the phases of the currents in the armature and field.

6. It is desirable to provide a commutating flux which shall be proportional to, and in phase with, the current to be commutated.

We begin, then, just as we would on a continuous-current generator. The voltage to be generated is  $33 \times 1.41 = 46.5$  volts. There are six ways through the armature, each carrying 94 amperes. If we choose 72 slots with four conductors per slot we get 288 conductors, and these multiplied by 94 give us 27,000 ampere-wires, a fairly easy current-rating for an armature 46 cm. in diameter.

If we denote the area of the cylindrical working face of the armature by  $A_p$  and the maximum flux density in the gap by  $B$ , then we may take the magnetic-loading as proportional to  $A_p B$ . If we have a pole arc equal to 0.72 of the pole pitch, then as there are 48 conductors in series and the speed is 82 revs. per second—

$$46.5 \times 10^8 = 0.72 \times 82 \times 48 \times A_p B \times 0.866.$$

Observe the multiplier 0.866, which comes into the equation on account of the circumstance mentioned in paragraph 3, above.

Thus we arrive at the magnetic-loading  $A_p B = 0.189 \times 10^3$ . If we work the iron in the teeth at 18,500 lines per sq. cm., we shall require a total mean cross-section of all the teeth of 1,020 sq. cm. Our conductors, to carry normally 94 amperes and 25 per cent. overload, may be made 0.23 by 1.27 cm. Four of these will require slots about 0.77 by 3.7 cm. To provide room for 72 slots and give the necessary cross-section to the teeth we shall require a net length of iron of 16.4 cm. Allowing 11 per cent. for paper on the punchings and 0.6 cm. for a ventilating duct, we arrive at a gross length of iron of 19 cm. The rest of the calculation of the armature is the same as for a continuous-current machine, except in the matter of commutation, which we will consider later.

We must now consider how we are to wind the field poles so as

to give to the excitation its proper phase. The first point to note is that the six armature circuits are connected in mesh, while the leads from the brush-holders are connected in star.

In fig. 9 we have a diagram of connections as they would be if the machine had only three brushes. Obviously this diagram applies equally well to the machine with six brushes where brushes at opposite ends of a diameter are in parallel with one another. The inner circle of fig. 9 represents the closed winding of the armature of the advancer. The small letters *a, b, c* show the three phases mesh connected. Three brushes—*p, q* and *r*—bear on the commutator and convey the currents to the outer circle, *A, B, C*, which represents the winding of the rotor of the induction motor taken as mesh connected. The arrowheads show the direction along each conductor which is taken as positive for the purpose of our clock-diagram, fig. 8. *P, Q* and *R* are in star, and it is only in series with them that we can connect the series exciting coils. The voltage in phase *A* of the rotor is the voltage we would measure by connecting a voltmeter to the collecting brushes *p'* and *q'*. In order to make the current in this phase lead, it is necessary to generate a leading electromotive force in the part *a* of the armature circuit. From fig. 8 we found that a suitable E.M.F. to inject into phase *A* was the E.M.F. *NV*, which is in phase with  $(a - b)$ . From fig. 9 we see that the current in *q* is  $(b - a)$ , so that  $-q$  is  $(a - b)$ . We will, therefore, excite the poles under which coils *a* are passing with  $-q$ . The span of the armature coils is almost a pole pitch, so that the coils in phase *a* will be passing under two adjacent poles, which we will call pole *p''* and pole *q''*. Now, it is not convenient to use only the conductor *q* to excite *p''* and *q''*, because we have to arrange for return paths and also for a compensating winding, and we want to make a fairly simple mechanical arrangement of the coils. We, therefore, take advantage of the known fact that currents  $p + q + r = 0$ ; therefore,  $q = -p - r$ . Let us make an arrangement of exciting windings and compensating windings

countershaft in the mill where it is used, or it may be directly connected to an independent motor.

The most important consideration of the design of the phase-advancer is the obtaining of good commutation. It is chiefly for this purpose that the field frame and winding described in this paper are provided. Where, in a continuous-current generator, the voltage between the bars is small, the commutation can generally be forced by the resistance of the carbon brushes; but it is very much more desirable to provide a commutating E.M.F. which shall at all times be proportional to the current to be commutated. In the machine here described this result has been effected by giving each armature coil a span of somewhat less than the full pitch, and arranging the positions of the brushes so that one of the limbs of each coil is moving in the fringing field of a pole excited by a current which is at all times proportional to the current under commutation. The currents in the two branches of the armature, *a* and  $-c$ , which combine to form *p*, are out of phase with one another, and are not directly under control of the commutating flux; but the rate of change of the current in the coil under commutation ought at all times to be proportional to *p*. Now the pole *p''* (fig. 10) is excited so that the fringing field in which the left-hand limb of the coil *a* is moving is at all time proportional to *p*. By making the coil with a short throw, the right-hand limb can be taken out of the influence of the pole *q''*. The exact position for the brushes is, of course, obtained by trial; in practice it is found that the commutation is perfect. The alternation of the current in the armature and field causes a harmful E.M.F. to be set up in each coil under commutation; but as the frequency is so very low (say one cycle per second), this E.M.F. is not sufficiently great to create any disturbance. In the machine under consideration it only amounts to one-sixth of a volt.

In a certain mill in the North of England there is a 250-kw. generator which on account of the low power factor of the motors connected to it is somewhat overloaded. As it would be a rather

FIG. 10.—SHOWING RELATIONS OF EXCITING WINDINGS AND COMPENSATING WINDINGS TO ARMATURE WINDINGS.

FIG. 11.—PART SECTIONAL ELEVATION OF PHASE-ADVANCER.

like that indicated in fig. 10. There the exciting conductors which pass between poles *p''* and *q''* are  $+q, +q, -p, -r$ . That is to say, they are equivalent to  $3q$ . The question whether the excitation  $+q$  gives a forward or a backward E.M.F. in a coil depends upon the direction of rotation, and also upon the question whether the armature is wound right-handedly or left-handedly. It will be seen that this arrangement of conductors lends itself to form mechanically a simple barrel winding. The conductors lie in two layers, and all the end connectors of one layer are bent to the right, and all the end connectors of the other layer are bent to the left.

The letters in fig. 10 which are placed on the salient poles represent the compensating windings. It is easy to prove that these are in direct opposition of phase to the currents in the armature under the pole. For instance, take the pole *p''*. The compensating winding on this is  $+p + p - r - q$ , or  $+3p$ . Now the armature coils which lie under *p''* are *c* and  $-a$ , and we know that  $a - c = +p$ . Moreover, the 16 conductors in the pole face carrying the currents *p, q*, and *r* are equivalent to 12 conductors carrying the *p* current. Opposite the pole *p''* are 12 armature slots each carrying  $-2a$  and  $2c$ . When we remember that there are two paths in parallel per phase in the armature we see that the currents in these 12 slots are exactly balanced magnetically by the 12 *p* currents in the compensating winding.

In practice it will be found unnecessary to adjust the speed exactly, because the particular power-factor at which the motor runs is not a matter of importance. It is not usually necessary to make any provision for the adjustment of the power-factor during running; it is sufficient that the motor shall take a leading current from the line at all loads. If it should be necessary to adjust the power-factor, this can be done either by changing the speed of the advancer or by diverting some of the field current from the series coils.

In cases where the speed of the motor is not great, it is more economical to belt the advancer to it so as to obtain a higher speed. In other cases the advancer may be run from any convenient

costly undertaking to install a new generator, the alternative proposition was put forward of connecting a phase-advancer in circuit with the rotor of a certain 140-H.P. motor in the mill. It was seen that this at least would help matters, although the capacity of the motor and its phase-advancer were not great enough to bring the power factor up to unity. A 5-k.v.a. advancer was installed; with the result shown by the following figures:—

#### TOTAL LOAD ON MILL.

	Ampères per phase.	Volts.	Power factor.
Advancer cut out ...	325	440	0.70 lagging
Advancer connected in ...	240	440	0.92 lagging

#### MOTOR LOAD ONLY.

	Ampères per phase.	Volts.	Power factor.
Advancer out ...	105	440	0.74 lagging
Advancer in ...	97	440	0.96 leading

Whenever the advancer was switched in the volts of the generator rose from 440 to 470. The figures in the above table were taken after the rheostat had been adjusted to make the voltage normal.

Another case that might be quoted is that of three 400-H.P. motors installed for pumping water for the Port of London. As the speed of the motors is low the normal power factor at full load is only 0.55. These machines have been fitted with phase-advancers, with the result that they run on a slightly leading power factor.

The table on page 158 gives the result of tests upon a 750-H.P. motor running under various conditions with and without a phase-advancer.

In the case of readings 1 and 2, the voltage was maintained constant by hand regulation. The rise of voltage between readings 3 and 4 is due to the phase-advancer yielding a leading magnetising current. It will be seen that when the first reading was taken

the phase-advancer was not running, and the power factor of the motor was then 0.6 lagging. The next two readings show that with the aid of the phase-advancer the power factor has been brought up to unity, whilst in the case of some of the lower readings, with the aid of the phase-advancer, the power factor has been changed to 0.5 leading.

Reading.	Volts.	kW.	Power factor.	Remarks.
1	1,840	280	86 % lagging	Phase-advancer not running
2	1,840	300	Unity	Phase-advancer running
3	2,200	375	Unity	Phase-advancer running
4	2,600	375	80 % leading	Phase-advancer running (increased speed)
5	2,000	20	50 % leading	Phase-advancer running (speed as before)
6	2,600	312	40 % leading	Phase-advancer running (increased speed)
7	2,560	20	5 % leading	Phase-advancer running (speed as before)

The motor on which these experiments were tried formed part of a motor-generator set, and it was therefore possible to make it run as an induction generator by speeding up the continuous-current machine. When this was done the terminals of the phase-advancer were reversed so as to give the right rotation phases relatively to the rotor winding. It was found that the induction generator could be run so as to supply a lagging wattless load, the magnetisation of the motor being carried out by means of the rotor current. In another case a phase-advancer was connected to the rotor winding of a 750-H.P. motor driving a rolling mill. The load on this mill was very unsteady, and for considerable intervals of time was so light that the motor was running on an extremely low power factor. The effect of the phase-advancer was to make this induction motor take a small leading current at all loads. Before the installation of the advancer the whole works took a load of about 1,000 K.V.A. at 0.64 power factor; when the advancer was started up this was changed to 800 K.V.A. at 0.8 power factor. In cases where generators are overloaded and it is not desirable to install large machines, a considerable advantage can sometimes be obtained by the use of a phase-advancer in conjunction with a large motor on the system.

variable reactance  $X$ , in each leg. Adjustable condensers  $C$  and  $C'$  are adapted to be varied equally with condensers  $D$  and  $D'$  respectively, the latter being included in closed oscillation circuit, each of which forms a shunt to condensers  $E$  and  $F$  respectively. These circuits are adapted to be tuned in resonance with the absorbing loop, and, therefore, oscillate in the oscillation frequency of the received waves.

The variable inductances  $L$  and  $L'$  respectively included in each shunt circuit, form the primaries of a transformer the secondary  $G$ ,  $G'$  which forms part of a detector circuit which is thus responsive to any oscillation frequency in either shunt circuit through the

FIG. 1.—WIRELESS TRANSMITTER.

FIG. 2.—WIRELESS RECEIVER.

medium of the inductive coupling, but swings in its own time period, which is determined by the adjustment of its condenser, at a rate which corresponds to the group frequency, and not to the oscillation frequency of the received waves.

In an alternative form, one closed oscillating shunt circuit only is shown, to which the detector circuit is inductively coupled, as in fig. 2.—*Australian Mining Standard*.

AUSTRALIAN WIRELESS TELEGRAPHY.

The Commonwealth Commissioner of Patents on October 15th, 1912, granted letters patent to Mr. J. G. Balsillie, the Commonwealth wireless expert, with respect to his system of wireless telegraphy, which is assigned to the use of the Postmaster-General.

The description and drawings of the transmitter and receiver, as published in the Australian Official Journal of Patents, are as follows:—

A transmitting system, in which tuned primary and charging circuits energise an exciting circuit, which, in turn, delivers unidirectional impulses or kicks to an electrostatically-coupled radiator circuit.

The exciting circuit is characterised by being provided with more than two condensers, one of which is common to the radiator circuit.

The unidirectional impulses are obtained from the exciting circuit by the use of an air-blast gap, working with a pressure of 100-105 lb. per sq. in.

In fig. 1 the primary circuit, consisting of the alternator A, key B, primary C of step-up transformer, and reactance D, is inductively coupled to, and in tune with, the charging circuit, consisting of the transformer secondary E, reactance K, and condensers F, G and H.

The exciter circuit comprises the rectifying discharge gap J (consisting of nozzle and plate electrodes L and M), the reactance K, and condensers F, G and H, it being essential that the condensers F and G are arranged symmetrically, one in each connection of the exciting circuit to the radiator circuit.

The radiator circuit consists of the antenna P, variable inductance Q, condenser H, and constant X.

In operation, the constants of the exciting circuit are so adjusted that it has no distinctive frequency of its own, in order that the radiator may freely oscillate in its own time period.

In an alternative form, a rearrangement of the condensers is shown, permitting the omission of the variable inductance Q.

In an absorber of the looped type, fig. 2, the extremities of which are connected to earth, one or both legs include a variable condenser, around which is shunted a closed oscillation circuit, tuned to the oscillation frequency of the received waves, and provided with a variable inductance, forming the primary of a transformer. The secondary of this transformer is included in a detector circuit, adapted to be tuned to the group frequency of the received waves.

The receiver may thus be tuned to receive from any particular transmitter, working on the two-tone principle, and emitting two distinct wave trains of different frequencies, but having a certain predetermined group frequency. The circuit is formed with a

Telephones in Rural Districts.—It will be remembered that, under the present farm telephone system, several persons in rural districts are enabled to share a single telephone line, running through an estate or district, at considerably reduced rates. This party-line system, of course, destroys privacy of communication, but has rendered an important service to agriculturists and others by providing full telephone benefits in other respects at a rate which is, at least, proportioned to some extent to the less urgent need for telephone service in these districts. Though a farmer has not the same kind of need for a telephone as a city man, the value per call is probably greater to him, owing to the greater distances involved and the absence of other rapid means of communication.

In rural areas, the commercial advantages of telephone facilities are great; market fluctuations can be followed, and sales and purchases effected, but it is in commercial transactions that the lack of privacy of the party-line system is really most serious. Socially—where distances between neighbours are great, and other means of communication practically impossible in inclement weather—the telephone comes as a great boon. In at least one case, the tedium of an isolated farmhouse has been relieved by the transmission of gramophone songs and music from the house of a neighbouring subscriber. Finally, the ability to summon prompt assistance in case of fire, accident or other emergency cannot be over-estimated, and must save many lives and much property in the course of a year.

The Western Electric Co. have lately introduced an economical telephone system, suitable for use on large and small estates and holdings, whereby a line is run round the estate, starting at the manor house or office, where a public telephone set is installed side by side with the local or "home" instrument. The occupier of every holding, and the various estate employes, can call any other station in the local circuit, a simple ringing code being arranged to discriminate between the calls intended for one station and these for another. Under the present Post Office regulations, private telephone circuits may not be directly connected to the public telephone system, but arrangements can easily be made to retransmit messages from stations connected only to private telephone lines at a central station connected to the public network, as well as to the party-line, and hence provided with two instruments.

An interesting installation on this system has lately been erected on Messrs. Farrow's general produce farm, near Spalding, Lincs. and various parts of the equipment are illustrated in our contemporary, the *Fruit Grower, Fruiterer and Florist*. Ten stations, including the central office, on this farm (which is considerably over 1,000 acres in extent) are connected by 15 miles of local circuit carried on cross-roted poles varying from 45 to 22 ft. in height. All the telephones are of the magneto-ringing type, and have powerful five-magnet generators. Wall sets are used except in the central office, where a table set is used for convenience, the ringing-magneto and call bell being arranged in a separate box.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

**A Technical Explanation.**—One of the leading Canadian daily newspapers was describing the cause of a street car tie-up which had occurred the day before. The reporter remarked that he interviewed an expert, and in all seriousness he gave the following account of the interruption of service on the transmission line:—"If there is an electric storm in the neighbourhood of the wires, the current on the wire is protected by rotary converters, which transform the alternating current to a direct one. Sometimes the transformers are thrown out of service, and have to be started up again, causing a delay in the systems fed by the power. When this happens, the current is stepped down and out." The moral is: Be careful what you believe when you read the daily newspaper—no matter what a power it wields in the land.

**Electrometallurgy in Norway.**—A company, under the name of "Aktieselskabet Hybinettes Udenlandske Nickel-patenter," has recently been formed at Kristiania with a capital of £5,555, for the purpose of selling foreign patents of Engineer F. Hybinette for the production of nickel by electrolysis from nickel-copper matte, which have been acquired by the company from the inventor. As may be remembered, the Norwegian rights of the above-mentioned method have been acquired by the Kristiansand Electrical Nickel Refining Works, which have already employed the process at their works at Kristiansand for a couple of years, with great success.

At the same time a similar company has been formed at Kristiania under the name of "Aktieselskabet Hybinettes Udenlandske Kobberpatenter," with a capital of £4,177, for the purpose of selling the foreign patent rights of Engineer Hybinette for the electrolytic production of copper from copper ore and from roasted copper ore and pyrites. This process has also been commercially exploited in Norway. It may, however, be mentioned that it deals only with those ores in which the percentage of nickel does not exceed that of copper.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

## THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION.

THE Association is to be congratulated upon the success which attended its annual dinner on Friday last, when Lord Amthill for the first time presided over its proceedings, and the chairman of the Council, Mr. A. Bruce Anderson, with commendable restraint, defined its aims and felicitated the members upon its achievements. The Association, he said, had attained a position in which it must be heard, and on every occasion when it had had to speak, it had been heard with courtesy and consideration. That the Association should occupy an influential position in the affairs of the electrical industry is greatly to be desired, and no one will be found to cavil at the tone of the chairman's speech, which indicated that success was due to grafting the spirit of alliance on the old spirit of self-reliance. The latter in past time has, perhaps, been somewhat too prominent in our industry; individualism has been carried to extremes, with a lamentable lack of foresight, and the consequences of cut-throat competition have been painfully brought home to many firms, the innocent suffering with the guilty.

The times, apparently, are changed; co-operation was the key-note of the gathering, and the text of every speech. Seeing that we have for years, in season and out of season, urged upon our readers the imperative necessity of combination and co-operation in order to rescue the electrical industry from the dangers towards which it was drifting, we may be permitted to claim no small share in bringing about the new order of things, and we rejoice to see our precepts translated into action, and our policy adopted with enthusiasm.

Judging from the report of the Council on the results of the first year's operations, which we reproduce elsewhere in this issue, excellent progress has already been made towards organising the industry and harmonising its apparently discordant elements. The relations between vendors and purchasers of plant have been vigorously taken in hand, and the work of evolving a model set of conditions of contract, with the co-operation of the I.E.E. and the I.M.E.A., is far advanced. In this respect also we led the way, having conducted for some years a critical examination of specifications for public works, with especial reference to the onerous conditions of contract prescribed by the legal advisers of municipal authorities. The unnecessary waste of time and money involved in the practice of cross-tendering, which also has been condemned in our columns, has been tackled by the Association, and an agreement has been reached whereby tenderers, it is hoped, will be relieved of all this trouble and annoyance.

The revision of standards for electrical machinery is urgently needed, and the Association has made good progress in this direction; while this matter is on the table we trust the Council will give serious consideration to the report of Mr. Hamilton Wickes, which we recently published, with a view to establishing a Laboratory dealing with the whole question of standardising and testing electrical accessories.

One of the most delicate matters which have been dealt with is the relationship between the Association and the Electrical Contractors' Association, and we trust that in this case also satisfactory results will be derived from the negotiations which are now in progress.

The suggestion of Mr. Duddell that efforts should be made to co-operate with other important bodies is a valuable one, and we hope it will bear fruit. Co-operation is,

undoubtedly, the right policy—the only policy that affords hope for the future of the British electrical industry, which has had its hard times, and deserves a term of prosperity. In spite of the “boom,” it is a fact that prices still rule low, much lower than they ought to be, though work is plentiful, and by sincere and genuine co-operation this can be remedied. But is the policy of the Association always and wholly co-operative? Has there been no endeavour to apply pressure, to resort to attempted compulsion without so much as a preliminary hint at co-operation, in any of its activities? But, perhaps, that to which we refer was simply the work of a sub-committee. While we congratulate the Association on the good work it has done, and is doing, and heartily approve the creed which it professes, we trust that it will sedulously adhere to the principles of action which its leaders have so earnestly enunciated.

Our friends in the United States are taking the question of standards very seriously. A Joint Committee of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers last month resolved to recommend to the said Societies the use of the myriawatt as a unit of thermal or mechanical power, to be used exclusively in connection with boilers, producers, turbines and engines, in lieu of the term “boiler-horse-power,” from which it is said to differ by only 2 per cent. We are informed that this is an important event, being the first piece of joint standardisation work accomplished between two of the American engineering Societies, and affording a simple and satisfactory method of rating the input and output of turbo-generators in terms of the international watt. We are gravely told that “instead of rating the output of a turbo-generator in kilowatts, and the input in boiler-horse-power or other heat units as at present, it becomes very convenient to rate the electric output in kilowatts and the steam input in myriawatts, because the myriawatt is approximately the same as the boiler-horse-power, while it is also exactly 10 kw. By this means the long existing incongruity of stating the input and output in different and disconnected units of power will be eliminated.” Now, we cannot refrain from pointing out that to “standardise” the myriawatt, which is simply a recognised decimal multiple of the standard watt, is as superfluous as to standardise the number 10—or 10,000. It is not standardisation at all. What the conference really did was to agree to abolish the “boiler-horse-power,” a term which has been disused and obsolete in this country for years and years. For the benefit of our readers we may state that, according to an American handbook, it represents an evaporation of 30 lb. of water per hour from 70° F. to steam at 70 lb. pressure: we are sure that American engineers will be well rid of this clumsy unit. What we cannot understand, however, is why, in the name of common sense, they want to measure the input by a unit ten times that used for the output. Surely the kilowatt is good enough for both ends of the machine. Have our cousins lost their traditional sense of humour?

In accordance with our usual custom towards the end of January, we publish elsewhere in this issue a graphic record of the more important features of British electrical export and import business during the year just ended. The various trade curves which we reproduce are based on the monthly statistics which have formed an exclusive feature of this journal for some years past.

In view of the steady expansion of British overseas electrical trade which has occurred in recent years, there can be

no doubt that information as to the approximate extent and character of requirements of the different markets of the world is extremely useful to the exporter, and this information can be obtained from our monthly statistics.

It is probable, however, that the detailed particulars from which the latter are compiled contain much information of value to particular firms, which it is impossible for us to publish, and to meet cases such as these, we shall have pleasure in allowing those interested to examine these details on application to us.

### Copper.

THE fall in the price of standard has naturally aroused considerable interest, affecting, as it does, not only actual dealers but many important industries, which are influenced by the price in making quotations. Discussed in the *Financier* for January 17th, two theories are quoted, held by “bears” and “bulls” respectively. The bear theory is that the American producers have, in the aggregate, increased the output so substantially that consumption has been overtaken, and stocks have consequently accumulated. Also that, in consequence of enormous electrical schemes in prospect in the States, more low-grade mines have been opened, which help to increase the output. This party also is apprehensive of the effect of further restrictive legislation in future.

The “bulls” have it that, while the producers may be holding stocks, merchants and consumers keep practically none, and that the same conditions prevail in Europe. It is also believed that the political outlook in Europe is less gloomy than is represented. A revival of trade on more settled conditions would force the consumer into the market and cause a smart recovery in price.

Uncertainty, as pointed out by the writer of the *Financier* article, is the disturbing cause on both sides of the Atlantic. Until the want of confidence is overcome, the demand will not be inclined to increase, while production is likely to proceed with regularity. It is anticipated in New York that the price may further come down to about 16 cents, corresponding to about £73 10s. per ton. There is said, however, to be a strong group ready to act in co-operation to prevent anything like a “slump.”

Messrs. James Lewis & Son's résumé of the situation in 1912, quoted by the *Financial News* of January 17th, is well worth studying in connection with the present situation. They say:—“During the first half of the past year standard copper fell from £63 per ton for cash, the value at the close of 1911, to £60 17s. 6d. on January 29th, wire bars selling at £65 5s. With a rapidly-increasing consumption and diminished supplies, large purchases were made by consumers and speculators, and prices steadily advanced until £80 was paid for cash and £80 15s. for three months' prompt standard on June 20th—the highest point of the year—wire bars selling at 17½ cents per pound, or £82 per ton c.i.f. On July 1st European stocks and those held by American refiners had decreased 40,238 tons (from 100,693 tons on January 1st, to 60,455 tons), the increase in European and U.S. consumption being respectively 31,166, and 25,509 tons, or 56,675 tons together. After July 1st, stocks steadily increased from 60,455 to 82,055 tons, production having overtaken consumption, and the policy of the leading American refiners of maintaining their selling price for electrolytic copper at 17½ cents per lb., although cash standard fell to £71 13s. 9d. in August, and rose to £79 15s. in September, being sustained by large purchases believed to have been on American account, caused manufacturers to hold as little copper as possible, and to buy only for their immediate requirements, thus throwing the onus of carrying the increasing stocks on the American refiners. The year ended with cash standard quoted at £76 12s. 6d., and high conductivity wire bars £82 per ton. Production in the U.S. has increased 70,973 tons, or over 14½ per cent., against a decrease of 1,069 tons in 1911.” General deductions are that the price is still one favouring increased production. As any favourable influence tending to lessen the uncertainty of the political outlook would be followed by a marked trade revival, it will be to the interest of consumers that this increase should continue.

### Electrical Exports and Imports during 1912.

## THE BLACKBURN EXTENSIONS.

IN our last issue we referred briefly to the new plant which has recently been installed by the Blackburn electricity department, chiefly in order to meet the demand for industrial power in the town.

The plant previously in use consisted of 15 D.C. engine-

a cooling tower capable of dealing with 200,000 gallons per hour, which is in course of erection.

The two rotary converters, of 800 K.W. capacity each, have been fixed adjoining the turbines, while the transformers, one for each machine, rated at 880 K.V.A., 5,600/180 volts, and of the oil-insulated, self-cooling type, are located in the basement below the rotaries.

The transformers are connected star to double star, for operation in connection with the rotaries, which are six-phase machines, running at 600 R.P.M., with a booster and exciter mounted on the same shaft. The rotaries are started up from the D.C. bus-bars and can be run inverted for supplying the A.C. load when the turbines are shut down.

The extra-high-tension control switchboard is fixed in the main switch-room, and is of the electrically operated remote-control desk type, equipped with the usual indicating lamps, instruments, &c.; it is divided into nine panels made up of two turbo panels, two rotary converter panels, four feeder and one bus-bar coupling panels. Two rotary converter direct-current control boards are also fixed in the main

NEW WESTINGHOUSE TURBINE PLANT AT THE BLACKBURN ELECTRICITY WORKS.

driven generators and a motor-generator for supplying alternating current.

The new plant includes two Westinghouse turbo-alternator sets generating three-phase current at 6,000/6,600 volts and 50 cycles, remote controlled switchgear, and two rotary converters with the necessary transformers, by the same makers, to link up the alternating and direct-current supplies.

The turbines are of the impulse type, running on steam at 180 lb. pressure and 160° F. superheat, and at a speed of 3,000 R.P.M.

One turbo-alternator is already completed, and has been on load, but not officially tested, while the second one will be completed on the arrival of the alternator early in February.

Each set is capable of giving 2,000 K.W. under continuous working conditions. In addition to the usual fittings, &c., a small automatic steam-driven oil pump is provided for flushing the bearings before starting up, a Lea recorder is also provided for each set, and a Triplex Fournier recorder for giving temperatures of condensing water inlet and outlet, together with the extraction water.

The condensers, fixed directly under the turbine, are of the Leblanc type, each with its own Leblanc air pump driven by a vertical turbine which exhausts into the low-pressure end of the main turbine.

The steam supply to the auxiliary turbine is arranged for starting up from the main platform of the turbine, so that it is not necessary in case of emergency to go down into the basement to start up the condenser.

The rotors of the alternators are of the cylindrical type with Miles Walker's patent compensated windings and fans attached for ventilating purposes which draw the air, by means of ducts, from filters fixed outside the engine room through the windings of the machine, the warm air being then, by means of a plate placed on the top or bottom of the alternator casting, exhausted either upwards into the engine room or downwards into the basement.

The water for the condensers can be taken either from a tank over the boiler house, direct from the reservoir, or from

feeder and one bus-bar coupling panels. Two rotary converter direct-current control boards are also fixed in the main

REMOTE CONTROL BOARD FOR THE E.H.T. SWITCHGEAR.

switchroom, on which are fixed throw-over switches for supplying the lighting or traction bus bars.

The extra-high-tension switchgear is built up in brick

cubicles in a special room in another building situated about 60 yards from a control desk. The oil switches are of the three-pole type, with solenoid operating gear, and are interlocked with the doors of the cubicles. Already four feeders have been laid to two mills situated a mile and a half, and half a mile distant respectively, from the works, the demand

The whole of electrical machinery, condensers, pumps, switchgear, &c., has been supplied by the British Westinghouse Co., and the cooling tower is being built by the Davenport Engineering Co. The pumps for the latter are being supplied by the Rees Roturbo Co., and the water piping by the Stanton Ironworks Co., the work of laying the latter being carried out by the electricity department.

WESTINGHOUSE OIL-BREAK SWITCHGEAR.

from which will ultimately exceed 1,000 kW., and arrangements are now well in hand for further extensions to supply another 1,000 kW. demanded by several engineering concerns.

The extensions carried out have been designed, and the installation of the plant carried out to the specification and under the supervision of the borough electrical engineer (Mr. P. Wheelwright), to whom we are indebted for these

800 KW. ROTARY CONVERTER PLANT AT BLACKBURN.

notes. The new plant completes the equipment of the present generating station, as the limit of the supply of water for condensing purposes has been reached, and in the very near future another generating station will have to be built where coal can be delivered by rail or canal, and better provision for water is possible.

## MISTAKES IN TENDERS.

[FROM OUR LEGAL CONTRIBUTOR.]

WHEN preparing the tender for the carrying-out of a large contract, it is by no means difficult for the engineer to make a mistake in his figures. He often has to work against time, and he is bound to entrust some of the detail work to subordinates. Finally, he may have been misled as to the prices at which he can obtain materials.

If a mistake is made, and the tender is accepted, has the contractor any remedy? Of course, if the offer has not been accepted, he may withdraw it; so if he made a tender by post overnight and discovered an error in the morning, he might withdraw the offer by a second letter. In such a case, the withdrawal would be good, unless a letter of acceptance had been written and posted before the letter of withdrawal was received.

As mistakes are not usually discovered until a much later stage, it becomes necessary to consider in what circumstances they can be put right.

It is clear law that if a mistake is unilateral, that is to say, a mistake made by the party tendering, and not known to the person who invited the tender, the contractor cannot escape liability.

For instance, in a Scotch case heard not long since the defender offered to execute work for the pursuers for the lump sum of £859. His offer was accepted. He afterwards found that owing to an error in calculation made by his son, the offer was £326 less than it should have been. In an action for damages for breach of contract, the defender having contended that this mistake released him from his contract, the Court held that he was not released—the mistake having arisen through no fault of the pursuers—and that the pursuers were entitled to damages.

In another case, a tender for the supply of granite to the plaintiffs contained the words, "weather and other circumstances permitting." These words were struck out by the plaintiff's clerk, and the defendant was informed of the fact. No reply having been received from him for several days, the contract was sealed. Delays having occurred owing to bad weather, the plaintiffs sued for breach of contract. It was held that they were entitled to recover.

In another case (*Johnson v. Islington Union*, 1909, 73, J.P. 172) the facts were as follows. The plaintiff saw an advertisement in a newspaper, inviting tenders for the supply of certain goods required by a Board of Guardians. He tendered on a printed form supplied by the Guardians for the supply of a certain disinfectant manufactured by him. The tender was accompanied by a sample of the disinfectant labelled "Anite," which was delivered to an official of the defendants. On the printed tender the defendants had asked for a tender for "Heydozone," and the plaintiff omitted to alter the word "Heydozone" into the word "Anite" on the tender, so as to make the tender agree with the label on the sample delivered. The defendants accepted the tender of the plaintiff for the supply of "Heydozone." It was held on the facts that the plaintiff had failed to show that the minds of the two contracting parties were not *ad idem*, or that the defendants had misled

him in any way, and that consequently the contract was binding upon him.

Where, however, there is a mistake in a tender which being the result of a mutual error has the effect to prevent the contract carrying out the real intention of the parties, the court will intervene to rectify the contract. For instance, in *Neill v. Midland Railway*, 17 W.R. 871, a railway company advertised for tenders, and issued a form of tender and schedule of quantities. The builder signed a contract in 1866 to execute the works required at the prices set forth in his tender and schedule of quantities. The specification for the erection of the building was annexed to this contract. The builder made mistakes in filling up the schedule. In 1868 he discovered them, and filed a bill in equity to have them rectified, alleging knowledge of the mistake by the defendants' engineer, and he obtained rectification.

In *Collin v. Dublin County Council* (1908) Ir. R. 503, the plaintiffs, the building contractors, tendered to the defendants for the building of an asylum. The defendants, deeming the cost too high, directed their quantity surveyors to prepare bills of reductions, showing reduced works and reduced prices. Owing to a reference letter being displaced, there was a error in the total cost as appearing from the bills of reductions, the total sum being put at £830 less than the correct figure. The plaintiffs, in the mistaken belief that the aggregate cost of the reduced works was as stated in the reduced bills of quantities, tendered for one bulk sum and their tender was accepted by the defendants, and the works completed. It was held, in an action for rectification, that the mistake could be rectified to carry out the real intention of the parties.

These few cases serve to illustrate the necessity for taking the utmost care in getting out the figures on which to base a tender. Of course, a mistake may sometimes occur to the benefit of the contractor; but this is unlikely, for the person inviting tenders is able to check the figures of the successful tenderer with those of the other contractors who have made quotations.

Another point to which attention should be directed in preparing the figures for the final tender is the valuation of "prime cost" and "provisional items." A prime cost item is one upon which, on the face of it, the contractor is not to make any profit. A provisional item is one which may at any moment be withdrawn from the control of the contractor altogether. So far as prime cost items are concerned, it may be that the contractor will find it possible to add something to his total in order to enable him to make a profit.

With regard to extras and omission, it is prudent to have words inserted in the contract which will prevent the employer from withdrawing from the contractor more than a certain percentage of the whole work. Thus, he may be invited to omit the most valuable part of the whole work, and make what profit he can on the rest.

### Hydro-electric Scheme for New York State, U.S.A.—

In the *Electrical World* for January 4th particulars are given of an important scheme for the utilisation of the natural resources of the State of New York, based on an article by Mr. A. H. Perkins in the *Engineering Magazine*. At present the power plants of the State aggregate four million H.P., of which 2,200,000 is developed in electricity works, 1,200,000 in private steam power plants, and 700,000 from water power for manufacturing industries. At the present rate of growth the power required will increase to five million H.P. in 1915, and over seven millions in 1920. Of the steam plants, 2½ million H.P. could be replaced by water power, and at an estimated diversity factor of 50 per cent. the latter need only be of 1¼ million H.P. The proposed high-pressure distribution system would be connected with nine hydro-electric stations, aggregating 1,669,000 H.P., with steam auxiliary plant of 809,000 H.P. and a peak load rating of 2,153,000 H.P.

It is estimated that the scheme will halve the cost of house lighting and of motive power, saving \$15,000,000 annually to electric consumers in 10 of the principal cities, and conserving 20 million tons of coal per annum. The similar scheme in operation in Ontario serves 30 cities with 300 miles of high-pressure lines, and has halved the cost of electricity; 99 per cent. of the houses in Ottawa are electrically lighted, compared with one in 35 in New York City. The rate for continuous power supply in Ottawa is \$22.50 per H.P. per annum, and in Toronto the city pays \$18.50 and sells at \$28 per H.P. per annum for 10 hours daily. Nearly all the private supply companies in Ontario are said to have profited by the competition and to have enlarged their business.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Earthing the Neutral.

Since Mr. Kenelm Edgemont's letter in your issue of the 10th inst., I have confirmed the experimental tests taken in the laboratory and enclose you diagram S.D. 1416.

It will be observed from these readings that the neutral point is anchored, or very nearly so. The ammeters used on these tests are commercial instruments, and the readings are correct within a small percentage.

TRANS. 3.50 K.V.A. RATIO 205 TO 11,200. DELTA-CONNECTED ON E.H.T. SIDE AND STAR ON L.T. SIDE AS SHOWN IN SKETCH.

CURRENT READINGS.						PRESSURE READINGS.					
1	2	3	4	F		1&2	1&3	2&3	1&E	2&E	3&E
14	14.75	13.5	13.75	0		382	384	386	219	222	221
10	31.5	39	19	54		380	374	371	216.5	213.5	213

The reading of 54 amps. is the maximum that can continuously flow through the earthing transformer, which is sufficient to operate the patent earthing device controlling the trip coils on the automatic oil-break switches.

An earth developed on the E.H.T. system on two recent occasions, and in each case the fault was isolated, proving that the arrangement is satisfactory.

S. E. Fedden.

Electric Supply Department, Sheffield,  
January 23rd, 1913.

### Testing the Continuity of Earth Conductors.

In the Home Office Rules Relating to the Use of Electricity in Mines, Rule 8 on earthing says, "Where cables are provided with metallic coverings, such metallic coverings may be used as a means of connection to the earthing system. All conductors of an earthing system shall have a conductivity at all parts and at all joints at least equal to 50 per cent. of that of the largest conductor used solely for the supply of apparatus a part of which it is desired to earth"; and Rule 14 (c), "That the electrician shall be responsible for the fulfilment of the following duties: (1) The testing of earthing conductors and metallic coverings for continuity."

Up to the present time I have not been able to find any practical and ready method of testing the continuity of earth conductors, and should be pleased to know if any other colliery electrician has met with the same difficulty, or has any suggestion to make as to a convenient method of fulfilling the requirements of the Act.

Continuity.

### The Chances in England.

In going over the advertisements in the *ELECTRICAL REVIEW* of a recent issue, I was afforded considerable amusement by two plums offered to those out of a job, or desirous of improving their knowledge and finances.

I refer to the mechanical engineer required by the City of Bradford, and the resident electrical engineer required by the Borough of Todmorden. Those who inserted the advertisements offer the pay of a common labourer—a labourer is worth that, anyway, if he is a good one. A first-class Board of Trade certificate is worth £3 per week in England, and, in addition, experience with steam turbines is necessary to land the job. Fine!

In the other case, for a trifle less money, the lucky man is expected to be a fully qualified electrical engineer, and, presumably, familiar with destructor plants. He stays at

the pleasure of the Council—an excellent way to put it—and must devote his whole time to the service of the Corporation. What a great opportunity for someone!

Goodness! what prospects there are in my native land to entice a man back home!

I often wonder why some of the good men in England stand for such treatment. I almost believe the mechanical engineer who was "lucky" enough to secure that Bradford appointment would do his fellow engineers a good service if he wrecked the whole plant.

English.

Newark, N.J., U.S.A.

#### Tariffs for Electricity Supply.

Those of your readers who are concerned with the manufacture and sale of electrical heating and cooking apparatus will be interested to hear of an alteration in our tariff that came into force with the new year. To cater for the heating and cooking business, we now offer the following alternatives:—

1. Domestic Supplies for All Purposes.—A fixed charge per quarter of 8d. in the £ of the rateable value of the premises, plus a running charge per "kelvin" of 1½d. in winter and 1d. in summer.

2. Heating and Cooking, if Separately Metered.—A flat rate per "kelvin" supplied of 1½d. in winter and 1d. in summer.

Applications from lighting consumers are coming in freely for transfer to the assessment tariff, and there is a brisk inquiry for auxiliary domestic apparatus.

With regard to such goods, will manufacturers bear with me if I insist on the importance of two details:—

(a) The heating element must be replaceable easily, and at small cost.

(b) The connector and flexible cord must be able to withstand kitchen handling.

Item (a) has been successfully provided for in some utensils, but the problem involved in item (b) has not, so far as I am aware, been solved, except at a cost comparable with the price of the main article.

The Harrow Electric Light and Power Co., Ltd.

B. HORSLEY, Engineer and Manager.

Harrow, January 27th, 1913.

#### The I.E.E. Discussions.

Although the above is not a new topic by any means, I should like, once again, to call attention to the fact that at many of the meetings proper scope is not allowed for discussion, and that the Institution cannot fail to be a loser through this.

I take it as granted that the main object of the Institution meetings is to allow those well qualified to discuss papers contributed to do so before an audience of members sufficiently interested in the subject matter of the paper to come and hear it discussed. The reading of the paper by the author is quite secondary in importance; he merely reads an abstract, probably indicating what he considers the most important parts. This being so, is it a reasonable thing to apply the closure to a discussion at 9.25 p.m., as was done at the meeting on Thursday evening, the 23rd inst.? In this instance the chairman, immediately he had called on all those who had sent in their names beforehand as wishing to take part in the discussion, said he had several written communications which he would not read, but would now call on the author to reply, which he did.

Now I, for one, wished particularly to take part in this discussion, and, by the foregoing procedure, was absolutely debarred from doing so. It is small consolation that I can send in a written communication; that is all very well in its way, but one can bring home one's arguments by speech in a way in which they cannot be brought home in cold print, and bring more of them.

If a reasonable time is not allowed at the meetings for open discussion, and if we are to be satisfied by sending in a written contribution, what is the use of the meetings? I submit that to stop the discussion of an important paper at

such an hour as 9.25 p.m. is unreasonable. I wonder how many members would consider they had had value for their money if they went to a theatre and found the entertainment winding up at 9.25 p.m. instead of, say, 11.25 p.m.?—not that I am advocating the extension of Institution discussions to the latter hour. The whole proceedings on Thursday evening were over at 9.40 p.m.; for members of a learned Institution we seem to be very easily satisfied indeed with discussion.

I need not enumerate the causes which sometimes prevent a member from sending in his name beforehand, but I may point out that, in the discussion by those who have sent in their names, openings are sometimes given to other members who could utilise those openings for the profit of those members and the meeting generally, and I do think that it should be made a rule that, provided the members who have intimated their desire to the secretary to take part in the discussion, have finished at a reasonable hour, the chairman should invite further contributions to the discussion from the audience. An hour is a totally inadequate time to allow for the discussion of a paper of the interest and scope of Mr. Whysall's.

Battery.

London, January 27th, 1913.

#### The Association of Electrical Station Engineers.

As a central-station man myself, I must confess my surprise at finding a *confrère* who does not religiously peruse the "Situations Vacant" columns of the REVIEW weekly. Nevertheless, in reply to "Central Station Engineer" and any others who may have overlooked the advertisements at the end of the above-mentioned column for the past few weeks, the Hon. Secretary of the Association is:—

Mr. W. J. Ebben,  
7, Vernon Road,  
Stratford, E.

to whom all requests for application forms, provisional rules, &c., should be sent. Also, in case the advertisement in last week's issue has also been overlooked by anyone desirous of attending the general meeting on Thursday next, February 6th, it is to be held at the office of Harmer Rooke & Co., 69, Fleet Street, E.C., at 7 p.m.

We hope to see a very much larger attendance this time than on the 16th inst., and it would be as well that any items that anyone desires to put on the agenda should be forwarded to the Hon. Secretary without delay. Prospective members in the provinces should especially take note of this, and they have my assurance that all such suggestions, &c., will have full and fair discussion.

As to the grades to be included in the membership of the A.E.S.E., it would seem that those mentioned in the following list would about cover the various positions, in whose interests the Association has been formed, viz.:—

Station superintendent.	Repairs and construction engineers.
Mains superintendent.	Boiler house engineers.
Engineers-in-charge.	Switchboard attendants.
Sub-station assistants.	Meter-room assistants.
Mains assistants.	Draughtsmen.
Outside Traction Assistants.	

As regards those in-charge of works or private plants, it would greatly depend upon the particular qualifications of the applicant, as these gentlemen range from highly-trained engineers down to gardeners, stable hands, &c., so that it will be necessary for the permanent Committee (when elected) to decide each individual case upon its own merits.

As reference to the report of our meeting in last week's REVIEW will show, the A.E.S.E. will provide also for a social and recreative side, for at present this has offered the only solution of the difficulty in getting members to become acquainted with each other, so as to render it possible for an open election of officers to be made.

Before I conclude, I notice that "Unity is Strength" is under a slight misapprehension as to the failure of a previous attempt to form a similar association. This was engineered by an individual (not a station man) who had a very real interest in largely adding to the membership of a society whose

jects certainly did not in the slightest degree coincide with our own, under the hazy suggestion that should we care to become members of the said society (annual sub. two guineas, I believe) they might be disposed to consider the advisability of championing our cause, but no promise or undertaking to do so was given.

We want everyone who is interested in the A.E.S.E. to turn up on Thursday next week, when it is hoped that a great deal of good solid business will be got through.

Finally, I should like to remark that the unanimity of the first meeting was very encouraging indeed, and augurs well for the successful future of the A.E.S.E.

Chas. F. Wade,

*Acting hon. chairman.*

London, N., January 27th, 1913.

Having become interested in the correspondence *re* the above, I should like to endorse the remarks made in the letter signed "Unity is Strength" *re* "the inclusion of all grades who are connected with the running and maintenance of electrical plant."

I am at present responsible to the directors of a large manufacturing concern for the efficient working of a large plant amounting to several thousand H.P., and comprising steam, gas and electrical machinery, including intricate plant for special manufacturing purposes, also for the compilation of statistics of power and costs, &c., all requiring skilled attention; if, therefore, the Association of Electrical Station Engineers is going to include men of my status in its ranks, I will gladly give it my support.

Unit.

#### Village Lighting.

I am thoroughly surprised at the supercilious and self-satisfied tone pervading "Willesden's" letter in your last issue. It, at all events, does not give one the impression of a desire to get at the real facts. If "Willesden" throws doubt on Mr. Wardale's "second-hand" information, he may possibly accept my statements, which are first-hand, though I have my doubts, from his attitude. Still, your readers can form their own opinion.

In my own case, the population is less than 1,000, and the plant capacity less even than 10 kW. All the available customers in the village are not yet secured, although I am steadily and surely approaching this condition of things. I have connected premises ranging from a little sweet shop with three lights and 1d. slot meter to a brewery with 72 lights, and both pay a flat rate of 8d. a unit. What is significant is that when people who had electric light have moved into other houses in the village without it, they have invariably asked us to wire the new house. I think this will fairly prove that 8d. per unit is not considered too much by our customers.

Now as to remuneration. When I wrote in October last (ELEC. REV., Vol. 71, p. 646) we had 500 lights; now we have 557. With 500 lights the output per annum was 5,000 units approximately. This, at 3d. per unit, brought me £62. My actual running time for the year was 1,312 hours, less than  $3\frac{3}{4}$  per day; but we may say  $4\frac{1}{4}$  to allow for time making small adjustments and repairs. So I had the greater part of the day for other work. House wiring in 1912 brought me, as payment for labour, £21; work on mains and services about £6. That is £89 so far. Total time on house wiring and services, &c., was 540 hours—call it an average of  $1\frac{1}{2}$  hours per day. So that my total time working for the village lighting syndicate was  $5\frac{3}{4}$  hours per day, and pay, £89 for the year.

In addition to this I put in three country house installations of from 25 to 45 lights. As two of these were 30 miles from home, I put a wireman on the interior wiring, and went over and installed the dynamo, battery and switch-board myself. Average profit on each, after paying wireman, practically £20, making another £60. Each of these jobs took about a month over all, start to finish. Total earnings so far, £149.

I regret I have not a complete record of my earnings from other sources, such as visits to obstinate oil engines on

farms, occasional fees for examining and reporting on second-hand machinery, &c.

But the above will perhaps give a fair idea of what may be expected from a small installation. Of course, in 1913 the output will be much more than 5,000 units, and the pay accordingly; from present prospects I should say at least 6,000, making about £75 for running plant. And I anticipate that the running hours will little exceed the  $3\frac{3}{4}$  hours per day mentioned, if at all, as during 1912 I have run a good deal of the time on part load, the maximum load never having reached the output of the dynamo alone, to say nothing of drawing from the storage battery while the engine was running. I have gone into the earnings of the man in charge at some length. "Willesden" can form his own opinion of the position compared to the assistant engineer's post mentioned. Frankly, I don't know which is the better. But these figures are absolutely correct in an actual case of a smaller plant than his 10-KW. example.

I have given the customer's view and my own position. Now for the owners of the plant. This plant did not cost £500. After paying for fuel, oil, rent, wages and repairs, this particular installation had a surplus for the last financial year of 16 per cent. on the capital. I rather think we could put a fair amount into the sinking fund out of that, and still have a fair dividend. As we shall in the present year sell a deal more current, adding only to mains and services, and not to generating plant, a higher gross profit is inevitable, apart from a serious accident. If "Willesden" thinks we have a jerry plant for our outlay, I can only point out that we are in our fourth year, and have never had a single interruption of supply. We shall probably reduce the price later on, but only to-day a customer told me that he had tested a 10-C.P. lamp with his penny slot-meter and got 11 hours' light for his penny. He wasn't grumbling.

The above are first-hand facts, proof of which I will lay before "Willesden" if he wants it. Your readers must form their own opinions on "Willesden's" airy generalities, and on the figures obtained in actual working.

"Willesden" mentions a plant of 10 kW.—maximum capacity, I suppose. From observations at my own switch-board, a maximum load of 10 kW. would mean, in a village of this type, an annual output of 12,000 units. I should put the cost of plant at £700. Running expenses—fuel, oil, water— $1\frac{1}{2}$ d. per unit (it costs us less). Repairs  $\frac{1}{4}$ d. per unit. Wages of attendant, say, 2d. per unit, giving him practically £2 per week for less than half of the day. Rent, in a country village, practically negligible. Total running costs,  $3\frac{3}{4}$ d. per unit. The above are obviously rough figures, but are reasonably near for present purposes. Put the selling price at 7d. Then the gross profit, 12,000 units at  $3\frac{3}{4}$ d., is £162 odd. Let "Willesden" descend to figures, and show where the miscalculations are. If people can pay 5s. 6d. and 6s. 8d. per thousand for gas, as they do in small towns in the country, these being actual figures for towns not far from here, they will pay 7d. a unit for electricity. I had been discussing the question of village lighting, before I launched into it, with electrical engineers of fair standing, and in many cases they were politely sceptical, and in others almost as bad as "Willesden." They would probably have put in the three-wire system, underground mains, and elaborate balancers, boosters and duplicate plant. Then before long someone else would have put in the bailiffs.

Little Man.

#### The Case of the Sub-Man.

If "Motor-Generator" will only accept advice and information from his equals or superiors, if he has any in his own mind, he will lose sight of one of the most useful sources of information it is possible to find—the practical workman; call him tradesman or what you like. If his experience has been anything like mine, he will have found that equals and superiors are more often than not unable to give him any useful information, and those that are able are more often than not "too busy" or openly unwilling. "If I tell you, you'll know as much as I do" appears to be their motto.

But I have always found the men to whom "Motor-Generator" refers as tradesmen, willing to give of their best quoth in time and trouble to explain anything they can

Not so with the shiftman, however: quite the contrary, except in a few isolated cases.

I had the whole gamut of actions in an engine room full of engines and turbines explained to me by a driver, who never even called me "Bill": he didn't call me anything. When he wanted to explain a particular thing he caught hold of my arm, and, so to speak, put my nose right on the thing under discussion. But I owe that man a debt which increases rather than diminishes as time goes on.

With Mr. Sullivan's idea of examinations I most thoroughly agree: it is, to my mind, the only way to remedy things.

"Switchboard's" trouble is mine also, as he says, "qualifications should count for something," and it does not look fair to any man with an impartial eye that "shiftmen," who are really "trained men," not crammed men that "Wireman" speaks of, but men with good practical knowledge and theory to back it up, should be paid an equivalent wage for a 56-hour week, to what men, such as floor cleaners and under-stokers are receiving for a 48 and 50-hour week, and very little more than labourers.

This is what we want to remedy; not the "Hey, Bill is this right?" There is not a man in the large power-house at which I am employed who is addressed as "sir," from the head shift engineer downwards; and few even as "Mr." We are all known by nicknames, and many of us are addressed by wiremen, fitters, cleaners, &c., by those.

Let us drop cavil and snobbery—it is doing our cause more harm than good; also the badly veiled advertising of Mr. Potter; and if our society is formed, let us go solid for an examination for all "shift-men," such as Mr. Sullivan speaks of.

Being a "shift-man" no more makes a man a gentleman than it ensures his fitness for the position he holds.

**Balancer.**

It is most interesting to read the letters from sub-men and others. But surely they are free agents, and free men. So, if they are dissatisfied and underpaid according to their own valuation of their ability, why not offer it to that section of the trade who require such ability, and always appreciate quality and find it remunerative to pay for qualified practical men?

Looking at the subject as an outsider, while sympathising with them, to some extent, most of the writers miss the practical and most vital point, namely, the commercial value of the individual to the station or firm by which he is employed. Although we as workers may not like it, each year as it passes proves, most unmistakably, that the labour given to the employer is considered from a strictly commercial standpoint, and this principle will increase in weight as time advances. But when does the everyday workman ask himself the question, if he, commercially, is worth more to his employer than he is at present receiving? Provided he is satisfied that he is worth more, and he fails to secure the same in the central station, why not come out of it, and place his ability, or "assumed ability," to the test in the open market? Then he will soon feel his feet, and his salary or wage its commercial level, accordingly.

But if he desires to succeed, he must know his trade "through and through," even "wiring," the modern steam engine, boiler, and all the auxiliaries which go to make up the complement of a modern up-to-date private installation, and how to manage and run it economically. Then he will have no need even to join a society to bolster up a fictitious wage, which he naturally places above the competitive value. This experience will most probably be to his advantage by disabusing him of his present inflated idea of his value.

The first and second sections of the letter signed by "Unity is Strength," are worth more than a passing glance. Here we find a contented electrician, in the sense that his estimate of his commercial and financial value is satisfactory to himself and his employer. The particular cause of so much discontent and complaint from a certain class to-day, is that workers put a much higher value upon their ability, relative to the work they are doing for the firm or station they are engaged by, consequently dissatisfaction and disappointment are the result, and instead of taking advantage of their opportunity and coming into the open market

of competition, they seek out a way to compel their present employers to pay them according to their own and their advisers' valuation, irrespective of the fact, that there must be two sides to this contract and two contracting parties, whose interests are diametrically opposite, except that one desires value for money, the other, money for their value.

However, this is the experience of the writer and his advice is qualify, and again qualify. Come out into the open market, do not live financially above your social status, and all your grievances will disappear, and your interest in yourself, coupled with your interest in your employer, will be eminently satisfactory and financially gratifying to both.

**Agreeably Satisfied.**

I read with great interest the letters *re* shiftmen in last week's REVIEW, and I am sorry to say that some of the nasty things said are true, but as a branch secretary of the Electrical Trades Union, I must take objection to a remark of "Switchboard's." He says, "Apparently the sole idea of the Electrical Trades Union is to grind all down to a common level of efficiency, or rather inefficiency." I take it, by his use of the word apparently, he is not quite sure of what he says, so if he reads this letter, it might help him to see more clearly than the word "apparently" implies. The objects of the E.T.U. are as follows:—

To teach a man that a £4 suit and veins flowing with blue (*i.e.*, vulgar term for dirty) blood, does not earn wealth. To help those inefficient men to become efficient.

To grind all wages below the standard rate up to the standard rate.

Also to be ready to fight as a Trade Union when they see words or phrases such as apparently, as and when required, &c., and to append their name to anything they write.

**E. S. Burslem.**

Liverpool, January 21st, 1913.

## THE HOUSEHOLD BATTERY.

[COMMUNICATED.]

The household battery (by which the writer refers to the couple of primary cells connected in series which are usually employed for operating bells and indicators in private houses) is individually a very humble unit; but yet, when viewed in the light of the enormous number used, and of the fact that the majority of people find them indispensable, their collective importance becomes very great. Perhaps one of the most common household troubles is the failure of the electric bells, and the cause of such failure will amply repay a little investigation.

It may safely be said that, in the majority of cases, the trouble is due to a defective condition of the battery; and it is further safe to say that the defective condition is usually due to the fact that the battery was put to work, in the first instance, whilst in an improper condition. Assuming that the cells are of the wet Leclanché type (and this is the only common type of cell from which prolonged service may be expected), the mistake is commonly made of putting such a quantity of sal-ammoniac in the jars that the solution is not only saturated, but there is a large quantity of excess crystals.

The result of this is that "creeping" takes place, and the terminals are attacked and the connections rendered faulty. It will be found that 2½ oz. of sal-ammoniac is quite sufficient to charge a No. 2, or quart size, battery. Another fruitful source of trouble is the use of zincs which have not been thoroughly amalgamated. However commercially pure the zinc may be, there is bound to be local action unless this point is attended to.

The use of lead caps on the carbon plates is a mistake which is still made by some manufacturers, as these are soon attacked and eaten away. Carbon-capped plates are perfectly satisfactory and should always be selected.

If proper attention is paid to these points, and the battery is set up in a dry position, it will last for years with the occasional addition of water to make good the loss by evaporation.

## PROCEEDINGS OF INSTITUTIONS.

## Tramway Feeding Networks.

THE paper on this subject by MESSRS. J. G. and R. G. CUNLIFFE, of which an abstract was given in our issues of January 3rd and 10th, 1913, was read before the BIRMINGHAM SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS, on December 11th, 1912.

MR. A. P. TROTTER said that scientific experts had argued that because 1 ampere would dissolve 13 lb. of iron in a year, under laboratory conditions, the same action would go on in the case of tramways. If this were the case, the ends of all the tramway rails which were positive to the earth, must have corroded, but no such corrosion had been observed. Fortunately cases of electrolysis in this country were very rare. It was generally acknowledged that this was due to the Board of Trade Regulations, and to the carefulness with which they were generally observed. It was generally recognised among tramway engineers that these Regulations had not hitherto impeded tramway development, and that they had protected pipes from electrolysis to an extent which was not anticipated. The rule that pipes must not approach nearer than 3 ft. to the rails was well intentioned, but excavation was not made to a depth of 3 ft. in building a tramway, and the owners of old gas and water pipes seldom knew the position of them. The only cases of electrolysis that he had known had been at a distance of less than 2 ft. from tramway rails. The suggestion that poles should not be bonded to the rails, either for guard-wire earthing, or to avoid live poles where gas lamps were fixed to them was a good one, but it came too late. It appeared that the use of bare copper negative feeders bonded together, and at many places to the track, was a serious obstacle to the use of boosters in Chicago, and accounted for the proposal to increase the number and size of sub-stations in that city. This was evidently the wrong method, and the copper was not well leaded with current. The authors recommended that each booster should be excited from the feeders serving the same area, but engineers had found that it was difficult in some cases to divide the districts in that manner. Some six years ago he began to look into the elementary principles of the design of negative feeders, and had worked out a number of cases.

MR. E. B. WEDMORE said that, in a paper contributed to the *Instruction Proceedings* of 1902, he produced some data bearing on electrolysis. The further evidence indicated that the fall of potential in the immediate neighbourhood of the track was greater than he estimated. This called for some revision of his estimate of the average specific resistance of the earth, and the data now indicated this to be in the neighbourhood of 50 ohms per yard cube. This revision did not appreciably affect the considerations on electrolytic effect of the leakage current. He had attempted to estimate the resistance of the relative paths through the ground and the pipe. The two paths were from the track through the general body of earth and from the track through the pipe, the latter path including a path through the earth from the track to the pipe and from the pipe to the track. His figures indicated that, in the case of iron pipes, the earth was practically a short-circuit to the pipe, but, in the case of lead pipes or of pipes having a low internal resistance throughout, the resistance of the path through the pipe was low enough to require careful consideration. With a view to bringing out the important features, he had made an estimate bearing on the length of life of the pipe under average conditions, and had assumed corrosion taking place to the depth of  $\frac{1}{16}$  in. uniformly over the surface of the pipe. His calculations applied to pipes lying parallel to the track, and not more than 3 ft. from the rails over the greater part of their length. He had taken an extreme case where the voltage drop was 2 volts per 1,000 ft. of rail, which was twice the limit set by the Chicago rules. With the voltages they were discussing, the evidence was that the electrolysis would correspond, on the average, to only 5 per cent. of that calculated on the assumption that the whole of the observed current flow was electrolytic in effect. Even with 7 volts drop, there was not  $1\frac{1}{2}$  volts difference between the pipe and general body of earth at either end of the pipe, and in considering the effect on short lengths of pipe, the voltage available was some small fraction of 1 volt. Thus, probably, the calculations erred a great deal on the safe side in the case of short pipes. In the case of 6-in. iron pipe 5,000 ft. long, it was estimated that it would take 400,000 years to cause the amount of corrosion he had postulated. This figure was based on the line resistance. An estimate based on the surface resistance would indicate a figure of 600 years. In the case of a similar pipe 500 ft. long, the line resistance gave a corresponding limit, and the surface resistance a limit of about 6,000 years. In the case of lead pipes, the figures were very different. In the case of a 2-in. lead pipe 5,000 ft. long, the estimate based on the data in his 1902 paper was 160 years. The data given by Messrs. Cunliffe indicated a much higher figure, the estimate running between 400 and 1,600 years, based on the line resistance of the pipe. In the case of a pipe 500 ft. long, the line resistance gave a similar limit on the assumed potential gradient, and the surface resistance now gave a limit in the neighbourhood of 160 years. Safety lay in keeping the pipe away from the rail, and the life rapidly increased as the distance exceeded 3 ft. Regulations covering the maximum voltage drop in the rail were all that was required.

DR. KAPP, referring to the calculations of the last speaker, drew attention to the fact that they were made on the supposition that the action was uniform over the whole surface. In reality there was not this uniformity, and the electrolytic attack was concentrated at a few points, with the result that the pipes became pitted, and at certain points holes might be eaten through the pipe. He had himself seen a large amount of old gas piping rendered useless by such pitting and perforation in Hamburg. With negative feeders and boosters properly installed no electrolysis need be feared. He could

not agree with the authors that the use of negative boosters increased capital outlay and working costs. He thought the reverse was usually the case. By the insertion of resistance in a short feeder the ohmic loss in the feeder was artificially increased to that unavoidable in the longest feeder. This extra loss must be more than the losses occurring in boosters, since these would only be put on to the longest feeders, whilst the shorter feeders would have no more than their natural ohmic loss.

MR. GROVES said that in 1905, in connection with the Birmingham tramway system, the alternatives of sub-stations and negative boosters were considered; the necessity for providing local supply for power and lighting in widely-separated districts determined that the former scheme would be the most suitable, consequently no great difficulty had been experienced in conforming to regulations. There was no doubt that with negative boosters and plenty of pilots a very flexible system could be designed, and the track sectioned as desired, but commercial considerations would not permit the universal adoption of this electrically ideal method of controlling vagabond currents. The restriction to 7 volts between any two points required some qualification on a long route consisting of several negative sections, the potential might rise in a series of small steps until it exceeds 7 volts, although the conditions would be quite satisfactory in respect to the safety of pipes.

MR. A. M. TAYLOR said that the authors' statement that the addition of sub-stations for the purpose of splitting up the track into smaller areas was uneconomical, was no doubt intended to apply to the case where the traction and lighting systems of a town were quite distinct. Where they were combined under one management, as at Birmingham, the additional sub-stations were desirable for the lighting scheme. In the case of Birmingham, he had gone very carefully into the use of negative boosters, in order to see whether it was at all possible by their use to feed the whole tramway system direct from one generating station, and had found that some 20 negative boosters would have been necessary. It was then found that the requisite number of rotary converter sub-stations for the traction requirements (without boosters) suited also the lighting requirements, and the combined scheme was adopted. It must be borne in mind that the authors' paper dealt with specially heavy traffic conditions only.

## The Design of Apparatus for Improving the Power Factor of Alternating-Current Systems.

THE paper on this subject by PROF. MILES WALKER, which was abstracted in our issue of January 24th, 1913, was discussed by the INSTITUTION OF ELECTRICAL ENGINEERS (BIRMINGHAM LOCAL SECTION) on January 8th, and in London on January 9th.

## DISCUSSION AT BIRMINGHAM.

DR. KAPP said that the so-called practical engineer seemed to think that anything which was highly scientific was generally also highly unsatisfactory as a commercial proposition. The author had given a few examples showing the vast improvement resulting in the power factor of a system by the addition of his phase-advancer, but he had omitted to draw attention to the fundamental proposition that a motor with a phase-advancer need not be dearer than one without. By using a phase-advancer they were able to do with a smaller motor in all cases where the short-time peak and not the heating was the determining factor. Since the motor was smaller, it did not work underloaded, and therefore with reduced efficiency, and the buyer would find that the saving on his bill for current would represent a high dividend on the outlay for the phase-advancer. It was to the advantage of the power companies to encourage the customer by an extra discount if he took his current at or near unity power factor. Prof. Arno, of Milan, had devised a special meter which would automatically discriminate between bad and good customers in this respect, so that all customers were treated alike. At full load the input into the motor was the same whether a phase-advancer was used or not; some power was, of course, required to keep the phase-advancer going, but some waste of power was saved in the motor; and the two approximately balanced. The author had referred to a phase-advancer made by the speaker, to which he had given the name "Vibrator." The idea of producing a leading E.M.F. by the free swing of an alternating-current conductor in a magnetic field was not new; Mr. Swinburne many years ago had suggested this kind of mechanical condenser to improve the power factor, not of a motor, but of a whole network. The suggestion was impossible of practical application, because the E.M.F. was exceedingly small with the usual frequency of supply. If, however, they had to deal with the rotor current of a non-synchronous motor, they got frequencies of 1 or 2 per second, and then the idea of a mechanical condenser became quite practicable, provided that they did not let a conductor alone swing as suggested by Swinburne and M. Leblanc, but a complete electromagnet. In his vibrator the electromagnet was a drum armature of special proportions, and the A.C. was passed through it by brushes. Since the armature swung freely, it could not permanently take up energy; hence the induced E.M.F., and the current which produced the swing must be in quadrature. The reversal of motion must, therefore, take place when the current passed through crest value. This meant that a growing current retarded the motion and a declining current accelerated it. When the motion was retarded, mechanical energy was converted into electrical energy, which was transferred to the circuit, and when the motion was accelerated energy was given by the circuit to the swinging system. Thus, the circuit lost energy during the time that the current passed from crest value to zero, and it received energy during the time that the current approached crest value. Thus, both the decline and the growth of the current were promoted, which was only another way of saying that the current phase was advanced by the injection of a leading E.M.F. The com-

mutating conditions were very favourable. The frequency of commutation was with a swinging armature very much lower than with an armature which must be driven at high speed. Moreover, the maximum frequency of commutation occurred when the current passed through zero. When the current had crest value the armature stood still. At an intermediate point there was both current and frequency of commutation, but both were less than their maxima. Hence the resistance voltage was low, a fraction of a volt only. The result was a perfectly sparkless commutation, even if solid copper were used for the brush contact. A vibrator to his design had been built at the Sandycroft works, and tested a week ago in connection with a 60-H.P. cascade motor of the type invented by Mr. Hunt. It had two pairs of tappings in each of its three secondary circuits, but as the vibrator had only three armatures, one pair of tappings

winding were fixed in space. Hence, when the ring was driven at the speed  $s$  R.P.S. in the direction in which  $F$  revolved, the relative motion of the field  $F$  and the winding became zero, and this was equivalent to the disappearance of the self-induction effect. The vector diagram of the phase E.M.F.  $E$  at the brushes and the current  $I$  fed into the brushes became as shown in fig. C, i.e., the current was now in phase with the E.M.F. If the ring were driven at a higher speed than  $s$  R.P.S., the  $XI$  component of fig. B became reversed in sign, and the vector diagram was now as shown in fig. D, i.e., the current was leading on the E.M.F. The angle of lead might be adjusted by adjusting the speed at which the apparatus was driven.

MR. N. SHUTTLEWORTH said Prof. Walker's fig. 8 did not agree with his view of the case. They might assume that the phase-advancer had no resistance or reactance, in which case the point  $x$  would coincide with the point  $E_a$ . He understood that  $O E_a$  represented the resistance drop of the full-load watt current in the main rotor; if then they drew a horizontal line from  $E_a$  to cut  $O a$  in  $q$ , they would have  $E_a q$  as the ideal voltage to inject, since it represented the resistance drop of the wattless current required. This voltage was at right angles to the rotor voltage, which was

FIGS. A, B, C AND D.

in each circuit had to be joined by equivalent resistances, so that the motor did not work under the best possible conditions. Notwithstanding this drawback, they obtained a power factor of 0.82 at quarter load, rising to 0.93 at full load, and when the motor was supplied at reduced pressure (400 volts, instead of 500 volts), the power factor rose to 0.98 at half load. When driven at 5 per cent. above synchronism, the machine returned 35 per cent. of its normal input to the line with a power factor of 0.94.

DR. T. F. WALL said the action of the Scherbius type of phase-advancer might be explained as follows:—The apparatus might be represented as shown in fig. A, in which  $a$  was a ring of iron provided with holes in which a winding was arranged, in a manner similar to that of a ring-wound armature of a D.C. machine with embedded active conductors. (In practice the winding was drum, but a ring winding was easier to illustrate in a diagram.) The ring and commutator were fixed on a shaft which might be driven. Three brushes were provided on the commutator, displaced relatively to one another by 120 electrical degrees, and these brushes received the currents of slip frequency from the secondary of the induction motor. If the ring were stationary it acted like a three-phase choking coil, the currents producing a field  $F$ , which revolved in

FIG. E.

FIG. F.

space at a speed of  $s$  R.P.S. corresponding to the frequency of the currents supplied to the brushes. The vector diagram for the phase E.M.F.  $E$  at the brushes, and the current  $I$  fed to the brushes would be as shown in fig. B, in which  $RI$  was the component to overcome resistance, and  $XI$  was the component to overcome the E.M.F. produced by the revolving field  $F$  (i.e., the E.M.F. of self-induction). Supposing the apparatus were driven in the same direction as in that in which the field  $F$  revolved, the speed of rotation of  $F$  in space was independent of the speed of rotation of the ring, because the points at which the currents were led into the

variable according to the slip, hence it would control the wattless current entirely; in other words, they must not introduce a horizontal component greater than  $E_a q$  when full-load watt current was flowing, otherwise they would have a larger wattless current than was desired. They might now represent the phase of the advancer E.M.F. by drawing from  $E_a$  a line parallel to  $a b$ , and by cutting this in  $r$  with a vertical from  $q$ , it was clear that the magnitude  $E_a r$  had the correct horizontal component for producing the wattless current necessary, and the other component  $q r$  would be immediately neutralised by a speeding-up of the main motor. It would seem, therefore, that  $E_a r$  was the correct magnitude for this particular phase to introduce. For any other phase relation it was simply necessary to draw from  $E_a$  a line representing the phase to cut the vertical through  $q$ . According to Prof. Walker's diagram the required magnitude was obtained by the phase line cutting  $O a$ . Prof. Walker referred to the provision of a commutating flux in phase with and proportional to the current to be commutated: there was no further mention of this, and the commutating flux provided was not in the desired phase. In spite of this, the machine would commutate sparklessly, for the reason that the reactance voltage of commutation was only of the order of '5 to '6 volt.

MR. G. SHEARING gave the results of tests made on a Scherbius three-phase induction motor of 25 H.P., 50 frequency, and 450 volts, having a synchronous speed of 1,000 R.P.M. The motor was the primary and the phase-advancer was fixed on one end of the rotor shaft. The advancer itself was a three-phase commutator dynamo with no stator field, the exciting flux being produced by the armature itself. The stator terminals were connected to three brushes on the commutator; in this way, the necessary leading E.M.F. was injected into the secondary winding. Tests were made at 505 and 460 volts. In one test at 505 volts the advancer was cut out, in the other, the advancer was in circuit as well as in the test at 460 volts. The relation between the power factor and kilowatt input were

shown by the curves, fig. F, and the conclusions to be made from the test were very favourable to the use of phase-advancers. The motor was very light for the output. Its net weight was 798 lb., giving 14.5 kg. per horse-power for the rated load. From the maker's figures he found that as a rough average value for a motor of the same output, frequency and speed, but with no advancer, and a power factor from 86 per cent. to 88 per cent., the weight was from 14 to 16 kg. per horse-power. Thus the decrease in weight of the motor resulting from the use of the advancer compensated for the increase due to the weight of the

advancer itself. Without an advancer to secure a high power-factor, the air-gap had to be very small. With its use the air-gap need not be so small, and the mechanical difficulties associated with a small air-gap disappeared. For these reasons the cost of the motor and phase-advancer should not necessarily be greater than that of a motor with no advancer. The efficiency of the motor was 92 per cent. at full load. The additional losses due to brush and ohmic resistance of the advancer were thus small, and the gain resulting from the reduction of the current for a given output was far greater than the additional losses. There was no sparking at the brushes at full load when the stator current was about 80 amperes. The magnitude of the leading E.M.F. was at full load 5.4 volts, at half-load 4.9 volts, and with motor running light 3 volts, showing the tendency to saturation of the magnetic circuit of the advancer. The power factors obtained were less at the higher voltage. This followed from the circle diagram assuming, as an approximation, that the current diagram was a circle. A B C, fig. G, was the current circle for the lower voltage, and A' B' C' that for the higher voltage. For a given input as represented by the height of the horizontal line I, the phase angle was greater for the higher voltage over the working range of the motor. The greatest improvement in the power factor was at the higher loads. When lightly loaded the power factor was somewhat low, and the advantages of the advancer would be increased if, by some means, the power factor could be made higher at light loads with no additional complications. The greater part of the decrease of the leading E.M.F. of the advancer took place between no-load and about one-third full load. For these loads the E.M.F. was approximately proportioned to the current and the power factor decreased considerably.

#### DISCUSSION IN LONDON.

DR. KAPP, in opening the discussion, said the author, in his new design, had used a mesh-coupled machine, and he believed it could be built so as to obviate any sparking, a matter which he had doubted when the author read his last paper on the subject. He felt that the author had not said as much as he might have done as regarded the commercial use of the phase-advancer; the motor with the phase-advancer would give a greater torque than without, which was equivalent to a saving in capital on a new machine to meet a slight increase of load. The efficiency would be improved at all times, representing a continuous saving in cost of energy. He also thought it would be cheaper to build an "iron" machine with a phase-advancer than a copper one without it, and that the cost of the advancer should not hinder its adoption. The right place for it was on the consumer's premises, but it was possible that the supply authorities disliked putting their plant on another man's premises. Possibly if the consumer were tempted by a discount, he might be induced to put the phase-advancer in himself. There was a difference in principle between the author's rotary machine and his (the speaker's) vibrating machine and the latter could not tackle a motor with a very bad slip so well as the author's phase-advancer. The effect of the latter was simply proportional to current, while the former depended on slip, and was adapted for motors which were much under loaded. The phase-advancer would be of great importance in electric traction, especially in such a place as Italy, where coal was dear. There was close on 200,000 H.P. of three-phase motors in locomotives at work there.

MR. W. H. PATCHELL thought the phase-advancer was commercially practicable and it should be put on the consumers' premises. The Scherbius machine had been largely used for fan driving, and the author's arrangement would be valuable in colliery work.

MR. H. W. ASHTON made a comparison between the use of condensers and the phase-advancer, taking the cost of installing the former to deal with 1,000 K.V.A. of wattless current at 50 periods to be £2,800. He assumed that the phase-advancer cost £250, and that its use would involve an extra loss of 25 K.W., and assuming capital charges at 6½ per cent., and energy at £4 per K.W. plus 4d. per unit, he found that at 100 per cent. load factor the condenser would cost £249, and the phase-advancer £489; at 25 per cent. load factor, £206 and £211 respectively; and at 20 per cent. load factor, £203 and £193 respectively, showing a saving in favour of the condenser for anything over 25 per cent. load factor. No doubt the higher first cost of the condenser, and the fact that engineers were unfamiliar with it, accounted for its non-use.

DR. S. P. SMITH said while the idea was ingenious, he thought it wrong to charge against the induction-motor its one vice, in view of its many virtues. As a designer, he could not see how an installation, consisting of an induction-motor and commutating polyphase motor, could be put into unskilled hands on the consumer's premises, and he further considered that if the station engineer wanted his power factor improving he should do it himself, as he had several means at his disposal. In certain systems the phase-advancer might be the only alternative, but generally he did not agree with its use.

PROF. MILES WALKER, in replying, said he thought that in the case of large machines, the total loss when using the phase-advancer, would be less than without it. The important thing was that a smaller motor could be built and worked at a higher rate with the same frequency. The main reason for correcting power factor was on account of the mains cost, which quite overbalanced the cost of machinery. He was glad to hear of the progress of the condenser, but the price mentioned seemed low; he had heard of a quotation of £5 per K.V.A. The condenser had its advantages, as it could be put direct on the mains, but he disagreed that the losses in the phase-advancer would be as high as stated by Mr. Ashton, and this greatly reduced his figure. The phase-advancer was independent of the motor, and could be shut off without affecting it; it was even better in this way than the exciter of the

synchronous motor. If there was such an objection to the extra machine, why did not people scrap the exciter in that case? The synchronous motor could be run all right direct from the mains without the exciter, and would give a power factor of about .2, but nobody did this.

MR. ASHTON writes to say that the cost of suitable condensers, including switches, is now less than mentioned by him, being about £1.9 per K.V.A.

#### Electric Winding Engines.

By A. E. DU PASQUIER.

(Abstract of paper read before the SOUTH WALES INSTITUTE OF ENGINEERS, September, 1912.)

In this paper the author discussed not the relative advantages of steam and electricity, but the principles governing the type of winder for particular conditions, and the influence of drum profile on the results obtained. He pointed out that there was a general trend towards electric driving, and the makers of steam winders were with one accord making their designs more suitable for electrical operation. The tendency was strengthened by the growth of the large power companies, which he regarded with favour as being to the advantage of the consumers rather than to install their own generating plant. A close estimate of the load factor was of the first importance; the smaller it was, the less chance had the local generating plant. Where coke-ovens were used, the use of local plant, however, was essential to economy, provided that the surplus energy could be disposed of by co-operation with a supply company, as in many cases on the North-East Coast.

Comparing A.C. and D.C. winders, the author stated that in the case of the former, speed regulation was effected by inserting resistance in the rotor circuit, a wasteful method, while with D.C. the Ward-Leonard system was always used; the latter showed an economy of energy per wind, but the A.C. winder cost 20 per cent. less, and if the intervals between winds were prolonged, the saving was lost. Regenerative braking was practicable with the Ward-Leonard control, but this had little effect on the total consumption. The equalising effect on the load of a cylindro-conical drum was very marked. The introduction of improved double-helical gearing had benefited the A.C. motor, by enabling it to run at speeds at which high efficiencies and power factors were attainable. The accelerating and retardation periods should be so arranged that the accelerating torque turns will be as nearly as possible equal to the product of the static moment by the number of revolutions made by the drum in the decelerating period. "Equalising" was to be avoided if possible. Valuable assistance could be obtained from a drum with a special profile, and from the use of a tail rope. Table I gives a comparison of the results obtainable with an A.C. motor under various conditions, without equalising:—

TABLE I.

\* Tail rope 10 lb. per ft.

#### Details of Winder.

Depth of shaft ...	...	...	...	1,050 ft.
Load ...	...	...	...	3 tons
Number of decks per cage ...	...	...	...	3
Weight of each cage and chains ...	...	...	...	80 cwt.
Number of tubs per deck ...	...	...	...	2
Weight of each tub ...	...	...	...	6 cwt.
Circumference of rope ...	...	...	...	5½ in.
Weight per yard ...	...	...	...	14 lb.
Winding time ...	...	...	...	47 sec.
Decking time ...	...	...	...	30 sec.
Output per hour ...	...	...	...	140 tons

A hoist of this nature would be quite impossible operated from the ordinary colliery generating station, or small power company, and under such conditions of supply the colliery company would have to adopt an equalised system at a cost of about 50 per cent. more.

With the uniform turning moment of the electric motor tail-ropes gave no trouble; they were in use in some of the Rand mines, with shafts 4,000 ft. deep.

Nowadays, the author said, the maximum peak load affected feeder drop more than generator regulation, and it was often better to spend money on additional feeders than on equalisers, except where the colliery was at a considerable distance from the power station. On the Rand, with thousands of H.P. of electric winding plant in use, there were no equalisers. In any case, there was no need to attempt to get perfect equalisation—a peak of 15 per cent. above the mean demand was permissible. The fly-wheels should be run as fast as possible—peripheral speeds of 100-120 m. per sec. were now quite common—and provided with an excess speed safety cut-off. As the wheels had to be solid castings, not over 12 ft. 6 in. in diameter, on account of transport difficulties, the maximum speed of the motor-generator was thus approximately fixed. Bearing

pressures up to 200 lb. per sq. in. of projected area were satisfactory, with forced lubrication from a tank, at 10 to 15 lb. per sq. in., oil pumps returning the oil to the tank through a cooler. An oil-failure alarm should be provided. The equaliser should be designed for a maximum slip of 12½ to 15 per cent., and should be capable of completing one wind in case of failure of the supply; the fly-wheel should be situated at one end of the set, with a coupling permitting it to be disconnected without shutting-down the plant. A brake for stopping the wheel quickly was necessary.

The Westinghouse equaliser for A.C. winders was in parallel with the load, instead of in series with it, and this involved much smaller losses; the slip could be increased to 30 per cent., enabling a smaller wheel to do the same work, and the equaliser set could be completely shut down without interfering with the winding. In the event of growth of the power station to such an extent that equalising was no longer necessary, the whole of the losses inseparable from the use of such sets could thus be cut out. Table II gave a comparison of the systems considered, the figures being for a complete winding cycle, including decking (see under Table I).

Comparing A.C. and D.C. winding, the author gave preference to the former for simplicity, first cost, maintenance and space occupied, and to the latter for regulation, control and braking, while, in respect of reliability, efficiency, power factor and equalising, there was, on the whole, no great difference between the systems.

The author dealt at some length with the question of drum profile, and commended the practice of lapping the ropes on the drum (winding in two layers), which had been in use on the Rand, for some time. He stated that, as the depth of shaft increased, the load also should be increased; for a depth of 500 yd., the economical lower limit seemed to be 3 tons with a 50-second wind, raising about 200 tons per hour. Drums should be kept as light and small as possible. Drums of unnecessarily large diameter were often used; the ratio of drum diameter to rope diameter might be as low as 41:1, and of drum diameter to the diameter of the individual wires 1,000:1. Small diameter of drum reduced the statical

would generate 10 units, leaving an equivalent of 20 units per wind for the steam winder. The Pengam electric winder dealing with similar loads, 60-sec. winds at 730 yds. took an average of 24 units per wind, but, in the former case, condensation losses between winds were not included, and, in the latter, which included losses in the Ilgner converter, transmission losses were not allowed for.

MR. FOX TALLIS thought that the question of transmission had influenced the adoption of the electric winder rather than any economy over steam winding, and that such winders were generally found at new pits.

MR. W. A. CHAMEN, speaking from the Power Co.'s point of view, urged that the colliery proprietor would benefit by a public supply of energy, costing no more than he could produce it at for himself and freeing a large amount of his capital for other purposes. He further pointed to the advantageous influence of diversity factor on the Power Co.'s supply, the maximum load on which might be only half the total H.P. connected, while a small local station for a colliery would get scarcely any benefit in this direction.

MR. HUGH BRAMWELL dealt with the matter of winding ropes, and mentioned that the electric winder, owing to its even acceleration, was very much less severe on the rope, and that a reduced factor of safety was possible, and MR. F. ANSLOW in a communication, discussed the question of geared motors, holding that there must be considerable advantage for them to replace the direct-coupled drive. He had had satisfactory gearing in use for purposes comparable with winding.

### THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION (INCORPORATED).

ON Friday last the annual dinner of the "Beams" was held at the Savoy Hotel; the chair was occupied by the Lt. Hon. Lord Amthill, G.C.S.I., President of the Association, and there were present about 300 guests, including members of the Association, central-station engineers, consulting engineers and contractors, as well as many distinguished guests.

After the loyal toasts, Mr. Samuel Insull, President of the Commonwealth Edison Co., Chicago, proposed "The British Electrical and Allied Manufacturers' Association." First remarking that he knew but few of the audience, though born in London, he said that one of the great obstacles to the progress of electrical business in this country was the lack of co-operation between electrical men in general and between the manufacturers of electrical apparatus and the suppliers of electrical energy in particular. The results achieved in the United States and Canada were, to a large extent, due to the closest co-operation between manufacturers and suppliers, and while the Association was formed more especially to look after the interests of the former, if it was to accomplish its purpose, it must also take care of the interests of the users of electrical apparatus. Undertakings and combinations were useless unless they were reasonable—so reasonable as to safeguard the interests of the user as well as of the maker. Nothing would add so greatly to the prosperity of the electricity supply business of the United Kingdom as a greater appreciation on the part of those engaged in it of the true mission before them. In London alone, 200,000 H.P. was awaiting the attention of the electricity supply authorities. In the County of London, with a population of 7½ millions, 750 million units a year were manufactured for all purposes; in Chicago, a population of 2½ millions in 1912 consumed 800 million units. The conditions of life and purchasing power in the two places were the same, yet there was this great difference in consumption per capita. His message was that, if they wished to see their great industry prosper, the main thing necessary was the massing of the production and of the distribution of energy. The pursuit of that policy would bring prosperity to the Association.

Responding, Mr. A. Bruce Anderson, chairman of the Council, first apologised for the length of his speech last year, which he ascribed to inexperience and enthusiasm. As for the aspirations of the Association, in the words of "The Road Mender," all they asked was "leave to serve." They wished to carry their fellow men, light them, heat them, cook for them, and help them out of this world, if justice so decreed; to do this the world over, but especially where their own flag flew. The Association had achieved a position in which they expected to be heard—and so long as they spoke truly, they must be heard. Whenever they had found it necessary to speak, either on behalf of individual members or of the Association as a whole, they had invariably been received with courtesy and consideration. That position had been achieved by a reasonable growth of that spirit of alliance which they had grafted on to, without impairing, their old spirit of self-reliance; by the careful deliberations of the council and committees, and by the ability and tact of their secretary, Mr. Dunlop. During the year they had obtained the services of Lord Amthill as president of the Association; they regarded his presidency as a high honour, and a clear indication to their friends of the reasonableness of their desires and of the purity of their intentions. As the visitors by their presence recognised the importance of the Association, so the latter would recognise and endeavour to fulfil their obligations.

Proposing "British Industry," Mr. L. W. Evans, M.P., referred to the prosperity of trade the world over, and said that the mainprings

TABLE II.

	Price ratio.	Units per wind.	Average power factor.	No load losses during night.	Weight of fly-wheel, tons.	R.P.M. of fly-wheel.	Average demand from line, E.H.P.	Max. demand from line, E.H.P.	Heating capacity of motor, H.P.

moment and the first cost, increased the drum speed, and, with scroll drums, greatly assisted in equalising the winding diagram without unduly increasing the inertia. The author submitted that with modern conditions, using electric winding engines, a factor of safety of 10 for the ropes was no longer necessary; at the De Beers mines a factor of safety, omitting bending and acceleration stresses of 5·2 was employed, and allowing for these stresses, the actual factor of safety was 2·33. The use of the Thury high-pressure D.C. system in the case of three small winders was mentioned. The effect of suitably designing the profile of the drum on the winding diagram was fully dealt with in the paper, with the aid of numerous diagrams.

The discussion on this paper (on December 19th, 1912) was reported in the *Iron and Coal Trades Review*, to which we are indebted also for the foregoing abstract.

MR. B. J. DAY considered that the high power required for the large outputs of present-day pits was in favour of the modern steam winder, which, for purposes of comparison with the electric winder, must be considered in conjunction with the exhaust steam turbine. Mr. W. C. MOUNTAIN communicated similar views to the meeting. MR. W. TRIMMER, however, disagreed, pointing out that, in South Africa, electric winding was displacing the steam winding where heavy loads had to be hoisted from great depths. He further gave his opinion that in South Wales the steam winder would be displaced by the electric winder, when power supply on an adequate scale was available.

MR. GEO. HANN thought that, if a fresh start could be made in the South Wales area, it would be agreed that the most efficient arrangement would be central power stations and electrically equipped collieries. Under present conditions, with existing steam plant, however, mixed-pressure turbine-driven generators supplying auxiliary plant, was a possibly good solution of the problem. Assuming a modern installation of this kind, power from outside would not have to exceed in cost 3d. per unit—a price which had not yet been reached.

He favoured the electric winder, providing the conditions were favourable to its use, but careful investigations of its cost compared with the steam winder were required.

As an example, he mentioned that the Penallta steam winder consumed 450 lb. steam per wind, calculated from the indicator; load 6 tons, depth 750 yds., time of wind 50 secs. This quantity of steam used in a live steam turbine plant, at 15 lb. per KW.-hour, would generate 30 units; while the same amount of exhaust steam used in an exhaust turbine plant at the rate of 45 lb. per KW.-hour

of British industry were capital and brains. It was an excellent thing for British capital to go abroad provided that enough remained to develop home industries; the surplus capital only should go abroad, and so long as there was reasonable co-operation between those who found the capital and those who supplied material, British industry was benefited. There must be closer co-operation between them—that was where they were weakest. The Rand power scheme a few years ago was a notable example; the money was found not in London, but in Germany, and the Germans got the work. The necessity of closer co-operation had brought that Association into existence, and everywhere they saw the increasing effect of combination. In Lord Amthill, who had had wide experience and occupied great positions, they had secured an ideal president.

Lord Amthill, in his reply, said he was a casual labourer in various branches of public work, and he could sympathise with those who did not share in the advantages due to the unquestioned boom in trade. They might well be proud of the achievements of British Industry in the past and thankful to Providence that these blessings had been showered on the nation. Their most urgent need was to see that all classes shared in their good fortune. Could they disregard the efforts of their rivals and go on in the same old way? Often in business a complete change of methods was necessary. Cobden thought we should always be the workshop of the world, but other nations had become workshops, and as they did not copy our methods as Cobden expected, we should adapt ourselves to their methods. Our Parliament ought to be attending to these matters—the things they were busy with at present would not help industry. Our prosperity had had a deteriorating effect on political life; they must look not to the politicians but to the people of this country. The people looked after themselves by Trade Unionism, a system of co-operation to protect their interests; why not extend the system to the nation—why not have a Federation of Trade Unions of the Empire? How could they reconcile the system of protection of Labour with Free Trade in goods? Foreign manufacturers could protect themselves; British manufacturers should be able to compete with them, not for their own sakes, but for the sake of the workmen. They were not in need of it at present, but must look to the future. He congratulated them on the wonderful success of the industry; by the skill of the workmen and the courage and devotion of the employers they had recovered their lost ground and pulled up level with their competitors. But they must not forget the 12 millions of people on the verge of starvation—the white slave traffic—the discontent of labour—the unmanly decadence which held back their citizens from preparing themselves to defend their great heritage—and the humiliating outbreaks of feminism. There was nothing like work to inculcate the spirit of duty and discipline and to bring about the social reform that was so necessary. What was wanted above everything else was far-sighted promotion of British industry.

Dr. S. Z. de Ferranti, vice-president, proposed "Kindred Institutions and Our Guests." He said that a few years ago to have called the Institution of Electrical Engineers a "kindred institution" would have been very difficult, but now they could go very much closer to the idea, because the Association existed for the protection of the members and their interests, and the I.E.E. was not only a scientific institution, but had also taken up the idea of protecting and supporting its members. The presence of Sir N. J. Moore was a sign of the times and of their desire; they wanted him to help them on with the great work they had to do—to promote the applications of electricity throughout the Empire. Mr. Ineull was a great benefactor to the industry, as he had shown them in Chicago the wonderful results that could be attained in the supply of electricity to the community by skilful organisation. Mr. Evans had shown the desirability of capital, when going abroad, conferring benefits upon British industry; but, in the case he mentioned, the Germans got the English to find the money, while they got the work.

Mr. W. Duddell, President I.E.E., responded, and in pointing out that the toast included many other institutions besides the I.E.E., said that no country had more institutions per cap. than this; it would be a great thing if they could devise some scheme of co-operation between those bodies. It was not good either for the manufacturer or the consumer that goods should be sold at unremunerative prices, nor was it good for the institutions to work without co-operation.

Sir N. J. Moore, Agent-General for Western Australia, also replying to the toast, said there was an undoubted commercial link with the Dominions beyond the seas; they never forgot that industry was the lifeblood of commerce, and the Dominions were doing all they could to see that the British manufacturer had a look-in. Three-quarters of the trade of the three Dominions south of the line came to England; one of them was spending £50 per cap. on British goods. What was wanted besides capital and brains was labour, without which they could not develop their vast territories. Out of 12 millions' worth of imports, over 8 millions came from the United Kingdom, only £1,100,000 from Germany, and 2½ millions from the United States. All parties in Australia were in favour of preference and compulsory service. The preferential tariff applied to more than half their imports. Between 1906, when preference was introduced, and 1910, the electrical imports from the United Kingdom had increased by 58 per cent. There was a strong commercial tie between the United Kingdom and the Dominions, largely due to the preferential tariff. Melbourne had placed orders for three millions; New Zealand was calling for tenders for electrical plant of 20,000 H.P. Never was there a stronger sentiment of universal patriotism. All the Dominions were preparing to share in Imperial defence—they were as proud of the Empire as the native Britons. Nothing short of national military preparation sufficed nowadays, and the British people should consider closely

the reasons which led 15 millions of their brothers to adopt this Imperial policy.

Mr. H. Hirst, vice-president, proposed "The Health of the Chairman," remarking that Lord Amthill was the distinguished son of a distinguished father, and had inscribed his name on the roll of Empire-builders. With Lord Curzon, Lord Roberts and Viscount Milner, he had been relegated to the position of a casual labourer, in the debating society called the House of Lords. The ship of State was in the hands of windy orators; it was now in smooth waters, but what would happen in time of trouble? The manufacturers also had been drifting, but Lord Amthill was willing to help them, and in their wider aims he would be a safe guide. He must preach the great difference between commerce and industry; commerce led to internationalism, manufacture to nationalism. It was peculiar that every society had some honour thrust upon it, but no one cared for the manufacturer—he was left to himself. They must alter this state of things, and must organise, not trust, but some system of universal co-operation, so that they could appear abroad as a coherent unit, not as at present a negligible quantity. Lord Amthill would lead the way to success in this.

The Chairman briefly responded to the toast, expressing his appreciation of Mr. Hirst's remarks. The health of Mr. Bruce Anderson was also honoured, though, as he pointed out in reply, his name had already been coupled with a toast.

During the evening a short but excellent programme was performed by Miss Carrie Tubb, Mr. Herbert Heyner and Mr. Ernest Hastings.

We have received the following summary of the report of the Council (Session 1912), which was submitted at the annual meeting held in the afternoon of the same day:—

The Council, in their confidential report issued to members (which covered the first year of working under the reconstituted Association), recalled the main object for which the Association was originally established—namely, the fostering and protection of the industry by means of co-operative action.

It had appeared to them at the outset that a subject which most urgently called for co-operative action was that of getting agreement between members as to the adoption of a set of equitable conditions to govern, as far as possible, the relations between vendors and purchasers of large plant. That work, therefore, became the first line of action, and was energetically put in hand last January.

A moment's consideration of the mere scope of the various interests represented in the Association made plain the extreme difficulty and complexity of that work. All large contracts contained about 40 important clauses, each dealing with a different subject-matter and bristling with contentious points. Fortunately, a text on which to work was at the disposal of the Association, viz., the "Model General Conditions of Contract," published by the Institution of Electrical Engineers. This text, originally drafted, as it is stated, by a firm of consulting engineers, had undergone amendment from time to time as circumstances seemed to its producers to require, and the industry at large owed those gentlemen a debt of gratitude for something in the absence of which the Association would have been confronted at the outset by a serious difficulty.

Even the briefest *résumé* of the work done upon this text by the Revising Committee of the Association would have to deal with an immense mass of matter thrown off first as between the Revising Committee and the members of the Association, and, secondly, as between that Committee and the other two representative bodies chiefly concerned, viz., the Institution of Electrical Engineers and the Incorporated Municipal Electrical Association.

The Council were able to announce, as a result, that at the end of the year just closed, the text of the general conditions of contract most commonly in use by engineering purchasers throughout the country had been very thoroughly amended in line with the requirements of the manufacturers; and they hoped that agreement on that text was within a short distance of being reached as between the Association and the kindred bodies.

That this result had been attained in so short a time was due partly to the unflagging energy of the Revising Committee, partly to the courtesy and assistance extended to the Association at all times by the cognate institutions concerned; and, to some extent, it should be said, to the clear earnest of its intentions which the Association afforded all and sundry by printing and forthwith putting into use, amongst such members as cared to adopt it, a text, limited to certain vital clauses common to all large contracts, as soon as the Revising Committee had settled the same. Printed copies of that short text, of which about 4,000 had been distributed, might be had by any member on application to the secretary; and copies of the complete text would similarly be available at a later date. Neither was to be regarded as final.

Members of the Association manufacturing prime movers and generating plant had long laboured under the cumbersome and wasteful procedure known as cross-tendering, whereby sub-contractors always tendered to a main contractor, and he again to the purchaser. A remedy for that had been devised and was embodied in the agreements between members known as cross-tendering agreements, under which their signatories, whether main or sub-contractors, now made separate tenders direct to the purchaser without cognisance of each other's prices, thus, in a very simple and certain way, not only avoiding temptations to cut prices, but obviating fruitless expenditure of much time and trouble.

A Committee dealing with the revision of standards for electrical machinery commenced work last February. Its terms of reference were to consider what extensions and modifications were necessary

to the Engineering Standards Committee's Report No. 36 on British Standards for Electrical Machinery, so as to make this a recognised text-book for British engineers and manufacturers corresponding to the standardisation rules respectively issued by the American Institution of Electrical Engineers and the Verband Deutscher Elektrotechniker.

As a result, the following sections of the proposed rules, viz.:—II, Standard Pressures and Frequencies; III, High-Potential Tests; IV, Classification of Machines; V, Rating; VI, Overloads; and VII, Heating, were now completed, and would shortly be presented to the Engineering Standards Committee.

The Association was represented on the various Sub-Committees of the Engineering Standards Committee and on the International Electrotechnical Commission, three of the Special Committees of which had met recently in Zürich on the subjects, respectively, of "Symbols," "Rating of Electrical Machinery," and "Prime Movers."

Another Committee of the Association which had made satisfactory progress, was that dealing with electrical accessories. Acting upon the recommendation of the Panel of the Engineering Standards Committee dealing with electrical accessories, a joint conference had been held under the chairmanship of Mr. C. H. Wordingham, consisting of members of the Panel and members of the Association. The outcome was that recommendations had been made which would, in due course, be presented to the Electrical Accessories Section of the Engineering Standards Committee.

The recent important activities of the Houses of Parliament as they affected the Association were well known. The National Insurance Act of 1911, particularly Part 2 relating to unemployment insurance, threw a considerable amount of work upon the Association, and the secretary attended on several occasions before, and otherwise communicated with, the Empire, and argued cases on behalf of members, securing in several instances the exclusion of certain branches of the industry.

A new Railway Bill was proposed by the Government during the year, but was dropped in favour of a short one-clause Bill which was now receiving attention.

A Bill to obtain further powers, and to extend the present powers of municipalities under the Electric Lighting Acts was promoted by the Incorporated Municipal Electrical Association, which, it was hoped, might be passed in a form agreeable to the conflicting interests.

During the past 12 months the Association's patronage and assistance had been invoked in respect of many exhibitions promoted either by local authorities or private enterprise. As members were aware, a standing rule of the Association was that members could not exhibit except on conditions very advantageous to themselves, and this rule was enforced in regard to all such exhibitions, with the exception of the forthcoming Ideal Home Exhibition and those held at Islington, Earl's Court (Shakespeare Exhibition), Glasgow and Newcastle, limited, however, to members who supplied heating, cooking and lighting apparatus, for the purpose of displays of smoke-abatement electrical appliances.

Arrangements were on foot for the formation of a Joint Exhibition Committee composed of representatives of the Association, of the Incorporated Municipal Electrical Association, and of the supply companies. The terms of reference to that Committee would be to consider whether, and, if so, by what means, agreement could be reached as to the Association's attitude towards proposals for holding exhibitions, and the nature of such exhibitions, having regard in particular to the question of avoiding overlapping throughout the country.

The railway companies had made, during the year, certain alterations in their rates, and prescriptions as to method of packing goods, which affected a large number of members. Switchgear and electric-heating stoves had both come in for punishment last year. A deputation of the Association, in respect of the carriage of switchgear, would shortly visit the Railway Clearing House, the carriage of electric heating-stoves having already been the subject of a visit of a deputation. It was expected that the points of difficulty in both cases would shortly be satisfactorily settled.

As members were aware, the Electrical Contractors' Association was one which took care of the interests of that increasing body of trading contractors who acted as intermediaries between members of the Association, the manufacturers of apparatus and appliances, and private customers. Many such contractors were in a large way of business, and several of them even manufactured lines of their own, while, on the other hand, several members of the Association confined themselves solely to selling. Distinct lines of cleavage were not, therefore, easily drawn, and this might account, to some extent, for the difficulty which had apparently been experienced in the past in arriving at a complete understanding between the two Associations, the respective members of which were so necessary to each other. A Joint Committee composed of members of the Association and the Contractors' Association was now, however, discussing a set of rules to govern the relations to one another of the respective members of the two Associations.

During the year the Publicity Committee held frequent conferences with the Electricity Supply Companies' Publicity Committee with a view to devising a scheme, and a scheme was finally devised and put before the Council, for an extensive campaign of Press and other advertising. That scheme, while it had many merits, appeared of somewhat too ambitious a character for the Council's sanction, and was, therefore, rejected.

Towards the close of the year, unfortunately too near the close for effective action, the Publicity Committee had under consideration questions raised as to the usefulness of the existing trade directories covering the branches of the industry represented in the Association. Recommendations made were a little confusing to the proprietors of these works, and action was left to members'

discretion. The subject would be dealt with sufficiently early this year to admit of promise of agreement between the Association and those gentlemen.

The Electrical Trades' Benevolent Institution, a body worthy of support, had benefited by a contribution from the Association of the sum of £250.

The number of sectional meetings held during the year was 135.

The number of members on the register of the Association at the close of the year was 109, being an increase of 14 on the number on the register at the close of 1911.

Under Article 17 of the Articles of Association five members of the Council retired as from the date of the annual general meeting, and, being eligible, offered themselves for re-election.

Under Article 25 the members of the General Committee retired, and, being eligible, offered themselves for re-election.

Mr. T. Trimmell, of 123, Cannon Street, London, had been invited to become industrial solicitor to the Association (in addition to the Parliamentary solicitors, Messrs Bircham & Co.), and, having accepted the invitation, his appointment was confirmed.

Messrs. Price, Waterhouse & Co., the auditors of the Association, retired under Article 53, and, being eligible, offered themselves for re-election.

## LEGAL.

### MARCONI CO.'S RUSSIAN EXTENSIONS.

MR. JUSTICE SCRUTTON, sitting as Commercial Judge in the King's Bench Division on Friday last, delivered his reserved judgment in an action brought by the Marconi Wireless Telegraph Co., Ltd., against Goukassoff and another for breach of contract, arising out of negotiations between the English Marconi Co. and a Russian company, which, for the purposes of the action, was referred to as the Russian Telegraph and Telephone Co.

Mr. Shearman, K.C., with Mr. Stuart Bevan, were for the plaintiffs, and Mr. Cavell Salter, K.C., M.P., with Mr. W. S. Hogg, represented the defendants.

MR. SHEARMAN, in opening the case, said that the point in dispute turned mainly upon the construction of a document relating to the contract between the parties. The plaintiff company desiring to extend their operations to foreign countries, including Russia, and thinking that combination was better than opposition, approached the Russian Telegraph and Telephone Co., which was working wireless patents invented by Eisenstein. Negotiations were begun in 1910 for working with the company or buying it out entirely, and a scheme was suggested by which the plaintiff company was to purchase sufficient shares to secure a controlling interest in the Russian company. Capt. Adrian Simpson, acting under the instructions of Mr. Godfrey Isaacs, the managing director of the Marconi Co., went over to St. Petersburg and commenced negotiations with Mr. Tischenko, under whose control were the majority of the Russian company's shares. Mr. Tischenko, on October 16th, came over to England and completed the transaction. All the documents were handed over as against cash. The document which was the cause of the dispute, was signed by Tischenko, and said:—"P. O. Goukassoff & Co., represented by myself, hereby bind themselves by every means to promote the success of the Russian company, and not to take part, directly or indirectly, in any other similar companies in Russia. At the same time, they hereby bind themselves, in the event of their wishing to sell the shares of the Russian company belonging to them of the nominal value of 340,000 roubles, to give to the English company a preferential right to purchase all those shares on the same conditions, and at the same rate, as may be offered for those shares by other persons or institutions." The whole object of the plaintiff company was to obtain complete control over the Russian company, and they did not want those shares to get into the hands of other people, who, as in this matter, were holding them for the purpose of trying to persuade and squeeze the plaintiff company to buy them at a prodigious price. In order that they might not be put at the mercy of Stock Exchange manipulation by outside purchasers, they stipulated that if Tischenko got an offer for the shares from anyone else, before selling them he was to give the plaintiffs an option of taking them. What happened was that Tischenko negotiated for the sale of the shares. He said he wanted capital for other purposes. They were offered to the plaintiffs on the Stock Exchange at a low rate, and Mr. Godfrey Isaacs made a low bid for them of 220,000 roubles. He was, however, not successful. He (counsel) thought the facts would turn out as follows: Somebody desirous of speculating in the shares approached the owners and made a substantial bid for them. Tischenko offered the shares to Capt. Simpson late one night in St. Petersburg at what was called 10 per cent. under par, and gave him only 36 hours in which to decide. The moment that was refused, Tischenko conceived himself at liberty to sell the shares to someone else, although the offer he made to the plaintiffs did not represent any valid offer that had been made to him. He sold them to other persons, who were now demanding a large premium if plaintiffs wanted to buy them. The plaintiffs submitted that Tischenko had bound himself down by the document. They did not know who had bought the shares, but they were held by a broker named Barnet, against whom there was a second action. All plaintiffs knew was that a two-man company had been registered to deal with the shares, and they were now being offered to the plaintiffs at 800 roubles for every 100-rouble share. They

had obviously been bought for the specific purpose of putting pressure on plaintiffs to buy them, which was one of the things they were seeking to prevent. He submitted that what had taken place amounted to a breach of contract. He did not, however, suggest that Tischenko was not a perfectly honourable man. Plaintiffs did not want to spend any more money at the present, but they desired to prevent the shares getting into the hands of a hostile group. In Russia, a great many things could only be done by a company if there was a 75 per cent. majority, and plaintiffs only held 60 per cent. of the shares. Plaintiffs claimed damages for breach of contract, said counsel, and the usual measure of damages would be what the plaintiffs would have to pay in the market for the shares, but there were hardly any shares to be had.

MR. GODFREY CHARLES ISAACS, the managing director of the Marconi Co., said that negotiations in 1910 came to nothing, but in September, 1911, Mr. Tischenko saw him in London, when further negotiations took place. He, Mr. Tischenko, suggested writing the letter of October 16th, giving plaintiffs' company a preferential right to purchase the 3,400 shares. The first offer submitted to him in respect of these shares was from Solomon and Co., stockbrokers, on September 27th, 1912. They first telephoned to him saying they had a large block of Russian shares to offer, and a correspondence took place on the subject. At the beginning of April, 1912, he purchased 700 shares at 100 roubles each, and others were offered afterwards. If he had been able to secure defendants' shares it would have given his company just over 75 per cent. of the shares of the Russian company, sufficient for the control of it.

In cross-examination, he said that as early as October 13th Tischenko had agreed to give the plaintiffs a preferential right to purchase the shares, although his letter of the 14th made no reference to the option. He was given to understand that Tischenko was doing things separately. He did not remember having had shares offered to him before February 20th, but he wrote to Capt. Simpson on that date stating that he had been approached by a firm of stockbrokers with an offer of 3,200 shares then held by Tischenko, and he, witness, had offered 220,000 roubles for them which had not been accepted. They were offered by the stockbrokers at par, which was 320,000 roubles. The shares were offered about March 4th for 280,000 roubles, but he declined them. The Russian company owed the plaintiffs a good deal. The business of the Russian company was so large that the plaintiff company had to advance considerable sums of money to finance it. Its business was entirely with the Russian Government, and with every order they had to pay 25 per cent. deposit for the fulfilment of the order. The payments from the Russian Government were often very long delayed. Plaintiff company were creditors of the Russian company for £20,000, and £40,000 in Russian bonds had been lent to them.

CAPTAIN ADRIAN FRANCIS HUGH SIMPSON, managing director of the Russian Wireless Co., said that he was previously engaged by the English Marconi Co. in Russia, and that while there he had negotiated with Tischenko. He and Mr. Isaacs afterwards saw Tischenko in London, when further negotiations took place with regard to the option, but eventually he heard from others that Tischenko would not give him the option. His company had been purchasing all the shares they could at reasonable prices.

In cross-examination, the witness said that he held a power of Attorney in Russia from the Marconi Co. When he, on March 5th, saw Mr. Tischenko, he reminded him of the engagement as to the option. Mr. Tischenko made a verbal offer and asked witness to telegraph to London, saying that he would be prepared to sell his shares at par, less 10 per cent. Later in the day he repeated the offer in writing. Witness agreed that on March 14th, Mr. Tischenko was informed by him that his company would be willing to take the shares at 90 per cent., but on the following day he heard that the shares had been sold.

MR. SALTER said that the offer was made too late.

MR. GEORGE TISCHENKO, called for the defence, stated that he was managing partner in the firm of Goukassoff & Co., and was chairman of the Russian company. The option was not mentioned until nearly everything in connection with the arrangement had been settled, but when Mr. Isaacs asked him to give the option he said he would do so with pleasure. When Capt. Simpson reminded him while at St. Petersburg of the document, he had forgotten it, although he had often spoken of selling his shares at the board meetings. Capt. Simpson knew of the offers he had received for the shares. Capt. Simpson afterwards bargained on behalf of the Marconi Co. for the shares, but nothing was agreed, and he was compelled to sell to the broker, Baruch, for 288,000 roubles. He did not know who the buyers were, and he wanted the money immediately for business purposes.

In cross-examination by MR. SHEARMAN, Witness stated that he did not know who had got the shares or whether Mr. Baruch was the holder of them himself.

COUNSEL having addressed the Court on the evidence,

HIS LORDSHIP said that his difficulty was that he did not know who had got the shares now. In reserving judgment his Lordship added that it was obvious that there would be judgment against the defendants for damages, but if before Friday morning, when he proposed to give judgment, sufficient shares could be got under the control of the plaintiff company it might make a difference.

There was a second action by the Marconi Co. against Mr. Baruch, against whom damages were claimed on the ground that he had induced Goukassoff to break the contract with the plaintiffs, the question being whether at the time he completed the sale, he knew of the option given by Goukassoff & Co. to the plaintiffs.

The Defendant having given evidence to the effect that he knew nothing of the option before the completion of the sale,

MR. SHEARMAN said he could carry the case no further.

HIS LORDSHIP accordingly gave judgment for the defendant.

HIS LORDSHIP in giving judgment in the case against Messrs. Goukassoff & Tischenko, said that, in the first place, the defendants pleaded that there had been no consideration for the agreement under which they undertook to make an offer of the shares to the plaintiffs before selling them to anyone else, at the price which the other buyer offered; but he had come to the conclusion upon the whole of the documents that there was consideration. The defendants, in the second place, contested the meaning of the agreement, and said that it was merely an offer to the Marconi Co. of the shares before selling them to another person, but he did not so read the document. The object of the agreement was that they should give the Marconi Co. the option of taking the shares at the same rate as others offered for them. In his view, the defendants were entitled to sell, but they must have a *bona-fide* offer from a buyer, and before selling must offer the shares to the Marconi Co. as offered by the other person, and must allow a reasonable time for acceptance. The Marconi Co. were not bound to buy unless they were informed of an outside offer, and they were therefore entitled to damages, and having regard to the position of the Russian company he assessed the damages at £6,000, for which sum he gave judgment, with costs.

#### THE GRAETZIN LAMP AGENCY.—JUDGMENT.

MR JUSTICE SCRUTTON, sitting as Commercial Judge in the King's Bench Division on January 24th, gave judgment in the action of Braunstein v. Graetz, in which the plaintiff, Mr. Bernard Braunstein, a manufacturer's agent, of Carthusian Street, London, claimed damages from Mr. Max Graetz, the patentee of the Graetzin lamps, trading in Berlin as Ehric & Graetz, for breach of agreement of agency for the sale of electric and gas lamps and fittings.

HIS LORDSHIP, in giving judgment, said that the plaintiff had for some years carried on business in London as agent for the sale of electric and gas lamps and fittings, and had for some time been acting as agent for the defendant in this country under an agreement which stipulated that he was to have the sole agency for a period of years. In December, 1908, the defendant arranged with the plaintiff to take up the sole agency for his lamps and fittings upon an agreement which provided that if he was able to sell £5,000 worth of the Graetzin lamps within a year, the agency would be extended for another year, and if in the second year he was able to sell £10,000 worth, he was to have the exclusive right for a further period of five years. The business was very successful, and the plaintiff became entitled to the longer period of agency. In the first year of the contract, a large order was given by the Welsbach Co., in which they offered to sell 500,000 lamps on condition that no other firm in the United Kingdom should be supplied with the lamps at less than 5 per cent. above the price at which they were supplied to the Welsbach Co. The Welsbach Co. exceeded their amount in the first year of the agreement, and in the second year they agreed to purchase 500,000 lamps to be marked with the Welsbach name. The plaintiff agreed to this, and the turnover again exceeded the order. For various reasons the Welsbach orders were discontinued, and subsequently, with the plaintiff's consent, an agreement was entered into with Krupka & Jacoby, under which they were to take a fixed amount of the goods. The plaintiff's agreement was affected by the arrangement, but it was compensated for by an arrangement with regard to the sale to other persons. It appeared that early in 1912, Krupka and Jacoby's sales hardly reached the minimum for the first year, and without the knowledge or consent of the plaintiff, an agreement was entered into by the defendant with Krupka & Jacoby for the whole of the electric lamp business, leaving the plaintiff with only the gas business, the agency for which terminated in January of this year. By the agreement with Krupka & Jacoby, a company was to be formed, and it was contemplated that that company should deal with both branches of the defendant's business. Krupka & Jacoby were to be the managing directors of the company for a period of five years. The plaintiff was not told of that agreement, although letters were passing between him and the defendant relative to the business. He did not know what was being done until June, 1912, when the defendant wrote to Krupka & Jacoby, stating that defendant was cancelling the agreement with them as from July, 1912. He (Mr. Justice Scrutton) had considerable doubts as to the *bona fides* of the letter, which was not shown to the plaintiff until some time afterwards. The plaintiff had, in the meantime, been asking for new price lists, and he did not receive, until August 26th, the information that the defendant had arranged with Krupka and Jacoby to give them the exclusive sale of the goods, and asking him not to obtain further orders. His Lordship then, at considerable length, dealt with the bearing of the German and English law upon the question of agency, it having been pleaded by the defendant that under the German law the plaintiff could not recover, as there was in German law no such thing as sole agency. He said that upon the authorities, and the evidence, he came to the conclusion that as the contract was made in Berlin, and the goods were supplied from Berlin, although the agency was carried out in England it came within the German law. The interpretation of the contract was governed by the German law, and the idea of an agency for the exclusive sale of goods was almost unknown in German law. Another point of importance was that when agents and principals disagreed as to the interpretation of a contract, the agent could not, under the German law, bring an action without having first obtained a declaration, and the agent, according to the expert evidence, could not complain of trading by other agents within his area. He found that the second agreement was a breach of the plaintiff's rights so far as it

excluded plaintiff's action as agent in his district. He (the Judge) would have held, under the English law, that the defendant had no right to cancel the contract, and that Krupka & Jacoby had no right to make the contract without plaintiff's consent, and he would have given judgment for the plaintiff on the claim, and assessed the damages at £2,300. He held, however, that, by German law, the plaintiff was not entitled to damages, but he was entitled to a declaration that the contract was a subsisting contract. The plaintiff was not entitled, under the German law, to an exclusive right of sale in Great Britain and Ireland, but he was entitled to a commission of 5 per cent. on all goods sold in his district. The defendant was not entitled to exclude plaintiff from carrying on business in his district or to prevent him from taking orders. With regard to costs, his Lordship said that, although plaintiff had failed as to damages, he was entitled to a declaration, and he would have half the taxed costs.

The form in which the judgment should be entered was left for future discussion.

#### EDINBURGH TRAMWAY GUARD CASE.

THE First Division of the Court of Session has refused a Bill of Exceptions, applied the verdict, and found defenders entitled to expenses in the case in which a lady sued the Edinburgh and District Tramways Co. for damages for personal injuries. When Lord Hunter and a jury tried the case in June last, the jury returned a verdict for defenders. The pursuer's case was that she took up a position in order to get clear of a cable car, but that when the car was halfway past her the lower part of her skirt was caught by the vertical stay on the car. As a result of her injuries, her left leg had to be amputated. She maintained that if there had been side guards on the car the accident would have been avoided. Defenders denied that the side guards were necessary, and stated that the pursuer in a preoccupied manner walked against the side of the car, with the result that she was thrown down. Lord Hunter charged the jury to the effect that if they came to be of opinion that the pursuer's carelessness contributed to the accident, they must return a verdict for defenders, and that the question as to their opinion with reference to the propriety of having side-guards or not was immaterial. His Lordship refused the request of pursuer's counsel to give the direction that even if there was carelessness the company could be held liable if the jury were of opinion that reasonable care on their part would have prevented the accident, and it was to decide this point that the case came before the First Division. The Lord President said that he was of opinion that Lord Hunter had rightly refused the direction, as he thought it would have been either a wrong direction, or, at least, a misleading one. Supposing the case was that the pursuer was standing, not in the tramway line, but in the vicinity of it, and that she had by no fault of her own been violently thrown on the tramway lines through the fault of somebody else coming up behind her, or through the pressure of the crowd or something of that sort, and she had been run over, that would have raised the question whether the tramway company should have had a side guard. The other Judges concurred.

#### ELLIS v. OSRAM LAMP WORKS, LTD.

WITH reference to the report of this case in our last issue, Mr. F. Samuelson, of 71A, Queen Victoria Street, E.C., writes as follows:—

"As solicitor to the defendants in the above action, I beg to point out an inaccuracy which occurs in the report published in your last issue. In such report it is stated that the counterclaim (which was in respect of dilapidations to the premises) was dismissed without costs. As a matter of fact this counterclaim was not dismissed, the sum of £7 was awarded to the defendants in respect thereof, but no costs were allowed in respect of the counterclaim. May I ask you to be good enough to insert this correction in your next issue?"

**Breach of Electricity Regulations.**—At Leigh, on Monday, the Howbridge Spinning Co. pleaded guilty to a breach of Clause 13 of the electricity regulations of the Factory and Workshops Act of 1901. Mr. J. Owner, H.M. Inspector of Factories, said that a man named Heskeith was using a portable electric lamp when he received a shock. There was a danger when handling the apparatus, whilst standing on a wet floor, of electricity passing through the man's body and causing death. The apparatus in the case was liable to become charged with electricity at a pressure of 130 volts, which was sufficient to cause death. Defendants were fined £3 and costs.

**The Radium Institute.**—The first report of the work carried out at the Institute up to December 31st, 1912, deals with the results of 578 cases treated by radium or its emanation; 39 received prophylactic irradiation only; 53 were apparently cured; 28 were cured; 245 were improved; 70 were not improved; 88 abandoned treatment; and 55 are dead. The cases treated were in no instance selected. Many of the patients had exhausted all the known resources of medicine and surgery, their condition being almost hopeless.

## THE L.B. AND S.C. RAILWAY ELECTRIFICATION.

THE Board of Directors of the Brighton Railway stated in the half-yearly report that they had decided to proceed with the electrical equipment of the whole of their suburban system comprised within the area extending from London to Croydon, Purley, and Coulsdon, and from London and Sutton to Cheam, and that active steps were being taken towards the execution of the work.

The board arrived at this decision after careful investigation of the conditions governing the suburban traffic, in view, more especially of the excellent results obtained from the limited electric service now running, and of the steady growth of the competition for this traffic by other means of transport.

The present electric service has been operated electrically for over three years on the single-phase system with every satisfaction.

As is well known, the introduction of electric traction on the South London line resulted in the number of passengers not only being brought back to that originally carried by steam before the competition of electric tramways first started, but in an increase of about 2,000,000 passengers, making a total of about 10,000,000 per annum, with a corresponding increase in revenue.

PLAN SHOWING THE ROUTES WHICH IT IS PROPOSED TO ELECTRIFY.

Little or no alteration in the fares was made when electric traction was introduced, so that the increase in receipts was practically proportional to the increase in passengers carried.

On the Victoria-Croydon line competition had not been felt so severely, in consequence of the distances being longer and of the tramway and motor-omnibus services not having been so extensively run in this region as in the area served by the South London line. At the same time the increase in traffic during the first 18 months of service has been most remarkable, and there is no doubt that before deciding on the larger scheme the directors must have satisfied themselves as regards the increase in traffic brought about by electrification.

The sections to be electrified comprise four tracks between Balham and Croydon and Bricklayers' Arms (just north of New Cross) and Croydon; three tracks between London Bridge and Bricklayers' Arms; four tracks from Croydon to Purley, the remaining sections being two-track roads.

The electrification so far carried out, including all sidings, expressed in miles of single track, at the present moment amounts to 70 miles. The section now proposed to be electrified, reduced to single track and including sidings, amounts to nearly 150 miles, thus bringing up the total electrification to 220 miles which will constitute by far the largest electrification ever undertaken by a railway company in this country.

The present rolling stock, as far as the electrical equipment is concerned, consists of 50 motor coaches, and in round figures another 200 motor coaches will be required to operate the extensions.

It is interesting to note that the supply of electricity from the London Electric Supply Corporation has proved so satisfactory, that it is intended to purchase all the electricity required for operating the suburban system from this company, which will mean the installation of additional plant of something like 10,000 to 50,000 kW., thus making the company's plant at Deptford, including its present equipment, one of the largest in this country.

The principal reasons which influenced the Brighton Co. to adopt the single-phase system, were the necessity, in their opinion, of not having a third rail, and their opinion that in the near future it would be necessary to extend the electrification as far as Brighton and Eastbourne.

As regards the first reason, it is interesting to note that this seems to appeal to every railway, as well as that the overhead system is going to be adopted in connection with continuous-current traction. This is the more interesting, as it was the overhead construction which was attacked by the opponents of the single-phase system.

As regards the question of long-distance electrification, all authorities are practically agreed that in that case the single-phase system possesses the greatest advantages.

The decision of the Brighton Co. to extend this electrification and their satisfaction with the single-phase system only confirms the experience of the Prussian Government and of the New York, New Haven Railway in America.

The whole of this extensive work is expected to be completed within four years, the plans and details being complete, so that the actual work can be started at once.

It is greatly to the credit of the Brighton Co.'s directors that they have now decided to adopt the forward policy, and proceed with one of the largest schemes of electric traction at present proposed in this country.

## BUSINESS NOTES.

**Consular Notes.—Brazil.**—An American Consular report states that the Brazilian Government has decided to erect wireless telegraph stations in Rio Grande do Sul, Santa Catharina, Sao Thome, Cruzeiro do Sul, Senna Madoreira, Rio Branco, Sao Luiz de Caçeras and Porto Mustinho. Steps are being taken to organise a general scheme of radio-telegraphy, both on the coast and in the interior.

**Norway.**—The American Consul at Christiania reports that Det Norske Nitridaktieselskab, which was formed in Christiania recently with a capital of \$550,000 fully subscribed, to produce sulphate of ammonia from the atmosphere, will adopt the method of the Austrian engineer, Dr. Serpek. The invention has been developed by a French company, Société Generale des Nitrures, and the patent right for Norway has been acquired by the Norske Aktieselskab for Elektrokemisk Industri. The new company has been started jointly by French and Norwegian interests. Construction of the mill was to begin immediately after the formation of the company, and production was anticipated to start in the autumn of 1914. At first 10,000 H.P. will be used, to be increased later to 25,000 H.P. The power will be supplied by the Aktieselskab Arendals Fossekompani. The annual output is calculated to exceed 40,000 tons of sulphate of ammonia.

This Consul also reports that the new wireless telegraph station opened on September 1st at Rundemanden, near Bergen, is the third large Norwegian Government station; a fourth will probably be established at Tryvandsheiden, near Christiania. Norway has also a number of smaller establishments doing excellent work. The Government's first land wireless stations were the two built in Lofoten in 1905 and 1906, which since their establishment have been among the busiest in the world, successfully sending and receiving some 6,000 telegrams a month. In 1905 the navy, after equipping its ships with wireless apparatus, established two stations, the Tjomo and the Flekkero, and operated them until a couple of years ago, when they were transferred to the Telegraph Board. In the autumn of 1910 the Våro station at Lofoten was opened, and there are now five coast stations in operation besides the three large stations. The first steps towards building the Rundemanden station were made in 1909, when a joint commission of military and telegraph experts examined the districts around Bergen with the view of establishing a large station for the west coast. Rundemanden was selected chiefly for military reasons, being within the circle protected by the fortifications of Bergen. Some years ago the American company, which is mining coal at Spitzbergen, applied to the Norwegian Government for a concession to build a wireless telegraph station on the island and keep up connection with an establishment on the coast of Norway. It being against the principles of the general director of the telegraph of Norway, Mr. Heftey, to recommend this kind of concession, he proposed instead that the Norwegian Government should build a station at Spitzbergen and one at Ingo, in Finnmarken, and thus supply the necessary connection with the far Arctic Island. This proposition was acted upon by the Government, and £12,000 appropriated therefor. The purpose of the coast stations is partly to connect the ships within their district with the shore, and partly to keep a watch over these ships in case of any emergency, and see that help is brought. Life and property have already in innumerable cases been saved by these means. The Lofoten stations, besides these functions, also do the work of ordinary telegraph stations. The large stations would also be of great importance in case of war. The time of service at Våro, Rost and

Sorvaagen is all day at Tjomo, Flekkero, Ingo and Rundemanden day and night; at Spitzbergen day and night in summer all day in winter. The system used is the one of Gesellschaft für Drahtlose Telegraphie, Berlin, the Telefunken system, and the different stations are equipped with the types of this system that were the newest at the time the stations were established.

**Japan.**—The American Consul at Nagasaki reports that the electric light, power, and tramway undertakings, had an unprecedented boom in his district in 1911, some 41 different electric projects, including five tramways, having been inaugurated in Kyushu and Okinawa-ken, of which 25 have begun work.

Fukuoka Prefecture in the northern central part of Kyushu leads in electric companies with eight working, and five in course of construction; Oita Prefecture has five working, and three under construction; Nagasaki Prefecture three working, and two under construction; Kagoshima two working, and three under construction; Saga two working, and two under construction; Miyazaki three working, and one under construction; and Kumamoto and Okinawa each one working. The Island of Kyushu is well adapted to electric development, having many streams capable of being utilised for water power, and extensive coal-mining areas with cheap fuel for steam power. The Hakata Electric Light and Tramway Co., of Hakata, in Fukuoka Prefecture, has been in operation a little more than one year, and is quite successful, having declared a dividend of 12 per cent. for 1911. The Nagasaki Electric Lighting Co. has made some improvement in its plant and will enlarge it considerably to meet the increased demand for light and power which the old plant is too small to supply. A dividend of 8 per cent. was declared for 1911.

**Uruguay.**—The American Consul at Monte Video reports that although small electric street signs of American make have been used in Uruguay for several years, these were until recently confined to signs capable of one reading only. On January 20th, 1912, the first large electric changing display sign was opened for service with a capacity for 40 advertisements, each visible every seven minutes. It was manufactured in New Jersey at a cost, delivered in Monte Video, of £620, the cost of placing in position being additional. The annual operating expenses will aggregate £1,400. The sign is patronised by many of the leading local houses and newspapers and by a number from other countries. It is situated at the western side of the Plaza Independencia, through which thousands of people pass during the day and night, doubtless the best site in Monte Video. It is operated by Publicidad, a well-organised advertising concern here, which also places "ads" in the various newspapers, periodicals, street cars, and billboards throughout this Republic, also supplying, free of cost, information relative to where advertising should be placed to produce the best results. This sign is the property of a young Uruguayan, who spent two years in the United States making studies of the best American novelties to introduce into his native country. This venture has succeeded so well that he is now planning to erect similar signs, but of greater capacity, in the cities of Buenos Ayres and Rosario (Argentina), Rio de Janeiro and Sao Paulo (Brazil), and Santiago and Valparaiso (Chile).

**B.T.H. Movements.**—Some months ago, in order to cope with the rapid growth of their business in Mazda lamps, the BRITISH THOMSON-HOUSTON CO., LTD., acquired a plot of land at Willesden, and were erecting a large up-to-date lamp factory at this point. This building has now been completed, and we are advised by the British Thomson-Houston Co., that, in order to relieve the pressure on the Rugby labour market for male labour, it has been decided to remove the switchboard department from Rugby and install it at Willesden, and to furnish the additional facilities required for the manufacture of Mazda lamps, at Rugby, in the space which the removal of the switchboard department will now provide. The British Thomson-Houston Co. anticipate that this change in plan will effect economies in lamp manufacture, will provide largely increased lamp manufacturing capacity, by reason of the concentration at Rugby, and, in addition to providing employment for female labour in Rugby, will actually improve the situation as regards the supply of male labour in the other departments of the Rugby factories.

**Ten Months under Water.**—MESSRS. CROMPTON AND CO., LTD., send us the following translation of an extract from a letter received from one of their customers in Tangiers, which affords interesting evidence of the quality of their machines. The machine in question formed part of a consignment to their Bombay office on the ill-fated *Delhi* :—

"I have to-day bought an electric motor of your make, which was taken out of the steamer *Delhi*, which was lost on this coast about a year ago. The electric motor in question has been under water for about 10 months, and in spite of this, I have been able to have it cleaned and dried perfectly well in a stove, which has meant altogether about three hours' work, and immediately after this, I put it on load—it ran absolutely well, as if it had only just come out of the workshops."

**Book Notices.**—*Lockwood's Builder's and Contractor's Price Book*, 1913. Edited by F. T. W. Miller. London: Crosby Lockwood and Son. Price 4s.—The rise in wages and in cost of materials naturally has affected this useful annual, though it is stated that the cost of building is not materially greater, being kept down by improved methods of production and by competition. The electric lighting section has been revised and extended by Mr. A. P. Haslam, M.I.E.E., and may therefore be depended upon to be correct; it includes not only prices of materials and apparatus, but also a variety of estimates of cost of electric lighting installations and running costs, with other information useful to the builder.

The *Telefunken Zeitung* for December, 1912, contains articles relating to the International Radiotelegraphic Conference of last summer, and the International Time Conference which met in Paris in October. Other articles relate to Telefunken apparatus for land and sea stations, military wireless, and the development of the system in Russia, the United States, New Zealand, &c.

The Adams Manufacturing Co., Ltd., of Bedford, have just brought out a second edition of their book, entitled "Electric Control of Printing Machinery." It contains a great deal of useful matter acquired during some years of practical experience, and it is divided up into some seventeen chapters. Since the last edition the contents have not only been brought up-to-date, but a number of new chapters have been added, containing descriptions of apparatus subsequently introduced. General considerations, notes on the essential features of a good control gear, "inching" devices, speed regulation, motor-starting switches, regulators, stopping devices, overload preventers, press controllers, are among the subjects handled, and most of the apparatus mentioned is illustrated.

"Spon's Architects' and Builders' Pocket Price Book and Diary." 1913. London: E. & F. N. Spon, Ltd. Price 2s. 6d. net.

"Atti della Associazione Elettrotecnica Italiana." January 15th, 1913. Milan: Stucchi, Ceretti & Cie.

"Transactions of the Concrete Institute." Vol. IV, part III. December, 1912. London: The Institute.

The *Journal of the Tramways and Light Railways Association* for January contains a full list of members.

"Journal of the Franklin Institute." Vol. CLXXV, No. 1. January, 1913. Philadelphia, Pa.: The Institute. Price 50 cents.

"Proceedings of the Physical Society of London." Vol. XXIV, part VI, October 15th, 1912. London: Electrician Printing and Publishing Co., Ltd. Price 4s. net.

"Abstract Bulletin of the Physical Laboratory of the National Electric Lamp Association." Vol. I, No. 1. January, 1913. Cleveland, Ohio: The Association.

"Examinations in Science and Technology, 1912." London: Wyman & Sons, Ltd. Price 9d.

"Design of Polyphase Generators and Motors." By H. M. Hobart. 1913. London: Hill Publishing Co., Ltd. Price 12s. 6d. net.

"Aziende Municipalizzate: Tramvie Urbane; Distribuzione di Energia Elettrica." 1912. Modena: Blondi e Parmeggiani.

**Calendars and Diaries.**—THE WHITE ELECTRICAL INSTRUMENT CO., of 2 and 4, Gloucester Street, Clerkenwell, E.C., have issued a small and handy-sized celluloid pocket calendar for carrying in pocket books or purses. Already they have satisfied innumerable applications for them, and an additional supply is now available for all who write to the above address.

MESSRS. MCKLURE & WHITFIELD, of Mersey Dynamo Works, Adwood, Stockport, have issued their useful pocket note-book and diary for the current year as usual. Illustrated particulars and prices of their Mersey multipolar type generators and motors of 70 K.V. and upwards, and other plant, are given in the opening pages, and there is also an insurance coupon.

**Electrical Works' Sale.**—The recent sale of the works of MESSRS. ERNEST SCOTT & MOUNTAIN, together with portions of the plant, as reported in our columns, was carried out by Messrs. Wheatley Kirk, Price & Co., who also conducted a six days' auction of the other machinery and contents of the works.

**Catalogues and Lists.**—MESSRS. JAMES GORDON AND CO., 81-83, Knightbridge Street, London, E.C.—New catalogue of between 60 and 70 pages, containing excellent half-tone illustrations and line diagrams, together with descriptive particulars of complete plant for the development of water-power, including turbines (vertical and horizontal shaft and Francis types), Pelton wheels, governors, pipe lines, &c. The plants illustrated are those in Khabul (Afghanistan), Dryden (Ontario), Ocean Falls (B.C.), Cauvery Falls (India) and Glenanne (Armagh). A number of useful and detailed tables concerning power, efficiency tests, dimensions, &c., are given.

MESSRS. HIGGS BROS., Dynamo Works, Sherbourne Road, Balsall Heath, Birmingham.—Preliminary four-page list containing brief descriptive and tabulated particulars of their shunt and series motors—semi-enclosed and enclosed-ventilated—which they have recently put upon the market. Messrs. Higgs have been manufacturing for the last eight months, during which time they have supplied upwards of 200 machines, and the only ones that have been returned are two which were broken by a railway company.

MESSRS. POPE'S ELECTRIC LAMP CO., LTD., Hythe Road, Willesden, London, N.W.—Folder, giving prices of "Elasta" wire filament lamps, also a picture blotter-card. Copies will be sent on application.

MESSRS. GENT & CO., LTD., Faraday Works, Leicester.—New catalogue of 52 pages (Book 5) in which are given very full particulars, with illustrations, and, in some cases, prices, of their "Pulsynetic" system of electric impulse clocks. "Pulsynetic" is the new name now adopted and registered for the system, which hitherto has been known as the "B.P." Considerable improvements have lately been carried out in the system, notably the increase in the sensibility of the movement, so that only one cell is now required for every three clocks in the installation. Among the new features in the list is the C24 impulse "Underground" clock, a pattern introduced for workshop use—interior and exterior. The impulse movements are in air-tight cast-iron cases for wet positions and where destructive fumes are present. The faces are part of the casting and are painted white, with black raised chapters. This clock is fitted with a water-tight flexible connection for fitting to screwed tubing. Another feature in the list is the Universal programme ringer, which enables a set of bells to be rung at any time during

the day or night, and the programme can be altered simply and as often as required. It is simply connected in series with the clock circuit. The firm's astronomical observatory clock, which has already been fitted in six well-known observatories throughout the world, has recently been ordered by the Hong-Kong Observatory. Contractors are invited to write for copies of this catalogue.

THE SCHNEIWEINDT ELECTRIC CO., 40 and 41, Staniforth Street, Birmingham.—Illustrated list, giving prices and full particulars of "Stangerotherm" electric heat carpets and mats.

THE STERLING TELEPHONE AND ELECTRIC CO., LTD., 200, Upper Thames Street, London, E.C.—New 40-page pamphlet (No. 201) containing brief notes, together with illustrations and prices, relating to cheap domestic telephones ("Parlyphones" and "Twencen" instruments), battery ringing telephones, magneto ringing ditto, "Primax" automatic interphones, and various "Sterling" accessories.

**Sentence on Dealer.**—For reselling 90 lb. of copper wire belonging to the Scottish Electric Power Co., a general dealer has been sentenced to 14 days' imprisonment by Sheriff Mitchell at Stirling.

**Liquidation.**—HEAT ECONOMISERS, LTD.—This company is winding up voluntarily, with Mr. H. St. J. Hodges, 20, Copthall Avenue, E.C., as liquidator. A meeting of creditors is called for February 8th.

**Bankruptcy Proceedings.**—W. LONGDON & V. G. COBB (Longdon & Cobb) electrical engineers, Nottingham.—First meeting, February 6th; public examination, February 14th; both at Nottingham.

A. E. MARTIN, Birmingham.—First and final dividend 11½d. in the £, payable February 3rd, at 191, Corporation Street, Birmingham.

F. HASTINGS MEDHURST (deceased), engineer, 13, Victoria Street, S.W.—Last day for receipt of proofs for dividend, February 8th. Trustees: F. S. Salamon, 1-2, Bucklebury, E.C.; and F. W. Pixley, 58, Coleman Street, E.C.

**Patents Restored.**—Notices appear in the *London Gazette* ordering the restoration of the following letters patent:—

E. J. DOBBINS.—"Improvements in light distributors for windows and the like." No. 8,461 of 1907.

S. G. BROWN.—"Improvements in electric telegraphy." No. 7,471 of 1900.

**Screw Caps for Radiator Lamps.**—Referring to the remarks by Mr. Allen, engineer and manager to the electricity department of Loughborough, in our issue of January 17th, under the heading of "Screw Caps for Radiator Lamps," the WESTINGHOUSE Co. inform us that they recognised the troubles attending the use of bayonet caps on such lamps years ago, and in their own make of luminous radiators they use exclusively screw cap lamps with suitable holders. They have found this type of cap much superior to the ordinary bayonet cap.

**Trade Announcements.**—We are asked to state that some time ago Mr. Wm. Yorath Lewis was appointed managing director of the BRITISH "NICLAUSSE" BOILER CO., LTD., Tottil Street, Westminster, S.W. The company have recently installed a large boiler at Messrs. Siemens Bros.' works at Stafford, and are taking steps to construct their boilers and mechanical stokers (in accordance with the most modern designs and standards of Messrs. J. & A. Niclausse, of Paris) in this country.

MESSRS. ALBERT, GRENIER & CO., of 68A, Lincoln's Inn Fields, W.C., will in future carry on their English business under the title of "The General Cable Manufacturing Co." The address and telephone number remain the same, until larger and more convenient premises can be found.

Owing to the large increase in the sales of Osram lamps since their manufacture with drawn-wire filaments, the GENERAL ELECTRIC CO., LTD., have found it necessary to provide additional facilities for handling orders. A larger space at their head office, 67, Queen Victoria Street, E.C., is now devoted to the sale of Osrams; the counter room has been doubled, and the new counter, which is adjacent to the old one, has been specially reserved for supplying high C.P. and fancy Osrams, battery lamps, &c. At their Osram Stores in Union Street additional premises have been taken and set aside for stock accommodation. A stock of Osram lamps, twice as large as that carried heretofore, is now constantly on hand.

MESSRS. W. DICKINSON & CO., of The Broadway, Bexley Heath, have taken offices at 130, Queen Victoria Street, E.C., to facilitate the handling of their manufactures, comprising small motors, switchboards, &c. Mr. L. M. Lawlor, for some years on the staff of Messrs. Dick, Kerr & Co., Ltd., will be in charge of their London office.

THE SELSON ENGINEERING CO., LTD., 85, Queen Victoria Street, London, E.C., state that their name was wrongly omitted from the Telephone Directory, and they will be glad if readers will take note that their numbers are as before: "Bank, 341," and "Central, 11779."

MESSRS. IMESON, FINCH & CO. (1912), LTD., of Stockton-on-Tees, have taken over the manufacture of White's patent controller finger, and are at present supplying same to H.M. Dockyards and many of the large works and tramway systems in Great Britain and abroad.

MESSRS. SAVILLE & WALTON, electrical engineers and contractors, have opened a branch business at 37, St. Mary Street, Cardiff.

THE LANODON DAVIES MOTOR CO. have installed an additional telephone service ("City 3388") in their office in Cannon Street, E.C.

The sale of patent adaptable earthing clips will in future be continued under the style of HANN & INGLE at the same address, 13, Albert Place, Bridge Street, Manchester.

**For Sale.**—The Aberdeen Corporation electricity department has for disposal two 200-kw. Willans-Mavor & Coulson D.C. generating sets, with spare armature, one surface condenser, and one Edwards air pump; and the Salford Corporation one 800-kw. Browett, Lindley-Mather & Platt D.C. generating set. See our advertisement pages in this issue.

## LIGHTING and POWER NOTES.

**Aberdeen.**—The extension of the Corporation generating plant, at an estimated cost of £15,510, proposed in a report by the electrical engineer, has been agreed to by the T.C.

**Alnwick.**—At a meeting of the U.D.C. on January 24th, the engineers to the new water scheme reported that they had gone into the three schemes of pumping, the estimated costs respectively being: Pumping by town's gas, £472; by suction gas, £315; and by electricity, £337; and they recommended the adoption of the latter scheme. The report was approved subject to the necessary consents.

**Ayr.**—The T.C. has increased the charge for private lighting from 3½d. to 4d. per unit, and for public lighting from 2d. to 2½. The rate for heating and cooking is to be 1d. per unit, and meter rent, instead of 1½d. The sum at the credit of the reserve account at May 15th last was £4,000.

**Bedford.**—The T.C. has decided to apply to the L.G.B. for a loan of £1,800 for electric lighting services for the next three years. Public lighting extensions by electricity are to be carried out at an estimated cost of £259.

**Bexhill.**—The electrical engineer has been instructed to prepare specifications and obtain tenders for a new switchboard.

**Bexley.**—The U.D.C. has referred to its electrical engineer for consideration and report, an offer by Woolwich B.C., which is considering a scheme for the extension of its generating station, to supply electricity in bulk to the Council at the actual cost of generation, plus a small profit to be agreed upon. It was intimated by Woolwich that it estimated that energy so supplied could be retailed in the Council's district at about 7½d. per unit.

**Blackburn.**—As indicated in our last week's issue the Mayor (Alderman Crossley) set in motion at the electricity works on the 24th inst. the first of two turbo-alternators of 2,000 kw. capacity, which has been installed along with two 800-kw. rotary converters to meet the requirements of heavy power consumers. This is the last extension possible at the existing works. The supply to a few more electrically-driven mills in the town will render necessary a new generating station, estimated to cost £150,000. The new plant is described elsewhere in our pages.

**Blackpool.**—At a meeting of the Corporation Tramways Committee on January 23rd, there was general agreement with the engineer's extensive scheme for autumn illuminations for the whole length of the Promenade and adjoining squares and open spaces, in connection with the season extension scheme. The cost will be shared between the Tramways, Electricity, Markets and Street Lighting Committees. The electricity department will supply the current free.

In order to deal more effectually with the large volumes of water in times of flood, the Highways Committee has decided to install two electrically-driven pumps at the sewage chambers in Manchester Square, as mentioned in our "Contracts" column.

**Burton-on-Trent.**—The B. of G. has referred to the Building Committee a proposal by the borough electrical engineer, that the electric light should be installed at the workhouse.

**Canada.**—An application has been made for a grant to develop a water-power site on the Cheakamus River, a few miles south of Green Lake, a short distance from the proposed route of the Pacific Great Eastern Railway line. It is proposed to divert the water through a tunnel about one mile in length, having a fall of 100 to 150 ft., with a flow of 10,000 cu. ft. of water per second. A power plant is to be erected in connection with the project, and the estimated cost of the works is about £400,000. An application has appeared in the "Provincial Gazette" requesting the right to construct a dam across the Fraser River, in British Columbia, at a point about 2½ miles above Yale, in a narrow canyon at that place. The storage area will be about 5,000 acres, and the H.P. derived, 100,000. The applicant, the International Railway and Development Co., it is stated, has at present about £1,000,000 available and can, if necessary, secure several times that amount for further development.

**Carlisle.**—The tramway company has accepted the offer of the T.C. to light the centre tramway poles by electricity, at a fixed annual charge of £80.

**Dungarvan.**—The Urban Council has decided to light the town with electricity, if it is able to procure the funds necessary for doing so. It has now decided to ask the L.G.B. for sanction to enable it to negotiate a loan of £2,000 for the purpose of carrying out the work.

**Edinburgh.**—The Corporation Electric Lighting Committee is to be asked to consider and report as to revising the minimum charges for current, for power and lighting.

The Council, after discussion, has agreed to strike out the clause in the provisional order dealing with the power sought by the Corporation to provide and repair electric motor fittings.

**Erith.**—The U.D.C. has been approached by the Woolwich T.C. with reference to the supply of current in bulk on terms similar to those mentioned in the case of Bexley. The Council has decided to reply that it is prepared to favourably consider a definite offer for a bulk supply at a firm rate per unit, and all other essential terms upon which the supply will be given. In the meantime, the Council has deferred consideration for the proposed extensions to the generating station at Erith.

The engineer has reported that as far as the present station is concerned, the only extension he can recommend is that a 750-kw. reciprocating set should be installed in place of three existing small sets, the boiler plant remaining as at present. He further advises that the time has arrived for considering a new riverside station.

**Godmanchester.**—The T.C. has decided not to entertain an offer from the Cambridge Electric Supply Co. to install the electric light in the borough in conjunction with a scheme for the neighbouring borough of Huntingdon. The proposal of the company was that the two Corporations should jointly obtain a prov. order to distribute current which could be obtained in bulk from the company.

**Goole (Yorks.).**—The town is shortly to have a supply of electricity, as the Electrical Distribution of Yorkshire, Ltd., proposes putting into force the powers which it obtained last year to supply current for power and lighting purposes. It proposes obtaining current from a plant installed at Thorne Colliery, and a preliminary canvass of residents at Goole who might be prospective customers has yielded a very satisfactory result.

**Halifax.**—The B. of G. has decided to engage an electrical engineer to report upon the cost of producing the electricity at the hospital.

**Haslingden.**—The T.C., on the recommendation of the Electricity Committee, has reduced meter rents by from 50 to 25 per cent. Works using electrical power throughout, are to be allowed to use 5 per cent. of their consumption for works lighting. For lighting consumers, the minimum payment of 5s. per quarter has been abolished, and there is to be a minimum now of £1 per year. It was reported to the T.C. that the Committee had reason to be satisfied with the progress the electricity undertaking had made.

**Hastings.**—At the weekly meeting of the Hastings Board of Guardians, the clerk brought up a report showing the relative cost of gas and electric light. The electric light was installed at the workhouse buildings in December, 1911. For the year 1911 the total cost for gas amounted to £285. In 1912, £168 was paid to the Corporation for electricity after allowing for renewals, &c., and gas for cooking purposes cost £24 10s., making a total of £193, thus showing a net saving of £92 since the adoption of the electric light.

**Hove.**—The T.C. has decided to drop those clauses of the Parliamentary Bill in reference to the purchase of the electric lighting undertaking, which refer to supply to outside areas. One reason suggested is the desirability of getting rid of the opposition of the Brighton Corporation.

**Hoylake.**—The electrical engineer, at the monthly meeting on January 22nd, was instructed to prepare the specification for a new switchboard at the generating station, for which tenders are to be invited. The cost of these improvements is to be charged to the revenue account of the electricity undertaking.

**Leeds.**—The electricity authorities have decided to supply current to the Low Moor Iron Co., for use at the Osmundthorpe Colliery, at a fixed charge of £850 per annum, plus 1½d. per unit. Mr. C. N. Heford has been temporarily appointed to fill the post of engineer to the Electricity Department, in place of Mr. Harold Dickinson.

**Liverpool.**—The Select Vestry has decided to install at the Highfield Infirmary an electric lighting and power system. Gas lighting at the institution costs £561 per annum, in addition to which the engine for laundry power costs £266, making a total of £830. It is estimated that electricity can be generated at 1d. per unit, and that the cost of the supply required for the institution and laundry would be about £342 per annum. For the necessary plant and appliances it is estimated that £2,194 will be required.

**London.**—**MARYLEBONE.**—With regard to the Council's decision to take a bulk supply from the Metropolitan Electric Supply Co., Ltd., the Electric Supply Committee has decided to pay the company £408 as out-of-pocket expenses in fixing converting plant, &c., also to enter into an agreement with the company accepting its offer to supply current in bulk upon the condition that the Council has the call of 500 kw., and to pay at the rate of £800 per annum and 3d. per unit therefor, such payment only to be made in the event of 12 hours' notice being given that a supply is required.

**Manchester.**—The City Council has now adopted the report of the Trading Profits Special Committee, which recommended that the Electricity Committee should contribute in aid of the city rate 1 per cent.; the Tramways Committee, 5 per cent.; the Gas Committee, 1½ per cent.; and the Markets Committee, 2 per cent.; the percentage contribution in all cases to be based upon the

capital expended. The Committee recommended the adoption of the scheme for a period of three years, but an amendment was carried by the Council limiting the time of operation of the scheme to 12 months.

**Manchuria.**—The electric light service of the South Manchuria Railway at the end of last June served 30,294 lamps. The lamps most in demand were those of 5, 10, 16 and 25 c.p., the 16-c.p. lamp being in most common use. The arc lamps for street lighting purposes now number 112.

**New Zealand.**—According to the *Mining and Engineering Review*, Mr. F. Black, of Wellington, submitted to the Christchurch Council his report on the proposed purchase of bulk electricity from the Lake Coleridge power scheme. The report is favourable to the acceptance of the New Zealand Government's terms, as, under existing circumstances, it would be impossible for the Council to generate the required quantity of energy at as low a figure as that offered. The capital cost of the transforming plant, mains, meters, &c., necessary to satisfy the requirements is estimated by Mr. Black at £123,888, to which he adds 12½ per cent. for engineering and contingencies, making a total of £139,373. The City Council Electricity Committee recommends that a loan of £120,000 be raised to provide for necessary plant required.

**Penistone (Yorks.).**—The District Education Committee has decided to approach the West Riding County Education Committee with a view to electricity being used as the illuminant in the new school at Silkstone.

**Peterborough.**—The L.G.B. has given consent to the borrowing by the T.C. of £1,000 for the extension of mains.

**Pocklington (Yorks.).**—A largely attended and enthusiastic meeting of ratepayers was held last week for the purpose of urging forward a proposal to provide the township with electricity for lighting and power. The keen desire in this direction shown by the ratepayers, has encouraged Messrs. Crompton & Co. to offer to carry out the work if a suitable agreement can be arrived at with the local authority. It was stated that the provision of electricity would improve the town's lighting, and save £70 a year in that direction alone. A resolution urging the Urban Council to move in the matter was passed unanimously.

**Plymouth.**—The Parks Committee of the T.C. has adopted a scheme by the electrical engineer for electrical illuminations at Hoe Park, at an estimated cost of £300.

**Rawtenstall.**—At the T.C. meeting last Thursday some discussion took place regarding the proposal of the Lighting Committee to apply for sanction to a loan of £800 for the work of electric lighting in Bank Street, Haslingden Road, and along Baeup Road to Thrutch. Councillor Schofield said he thought it was the intention at the outset to borrow £2,000 and complete the work in the Crawshawbooth and Lumb valleys as well. Ald. Crabtree thought the intention was to deal with that later. Eventually the proposal was approved.

**Salford.**—The annual report of the Lighting and Cleansing Committee states that 100 electric arc lamps, each of 1,000 nominal c.p., are used for lighting several important street junctions and thoroughfares. The Electricity Committee charges £14 10s. per lamp per year, which includes the supply, erection, cleaning, and maintenance of the lamps, and also carboning and current.

**Shaldon (Devon).**—At a ratepayers' meeting on January 24th, it was decided by a majority of votes to ask the Council to adopt electricity for public lighting, in preference to gas or oil.

**South Africa.**—The Cape Town Corporation, having taken over the electric lighting of Claremont, Rondebosch and Mowbray, announces a further reduction of charges, making the price of the current from New Year less than half that in force 12 months ago. This is regarded as an example of the benefits to be derived from the projected unification of the municipalities.

**Stafford.**—The T.C. has reduced the price of current for lighting the outside of premises from 5d. to 3d. per unit.

Premises in Greengate Street are to be leased for 21 years, at an annual rental of £150, for use as showrooms and offices.

**Stalybridge.**—The Joint Tramways Board has resolved that the engineer be instructed to get out plans, &c., for extensions, and obtain prices for rotary converters for Hyde sub-station and the generating station.

**Stroud (Glos.).**—The R.D.C. has agreed to waive any objection it might have to the proposed electric lighting scheme for the district on condition that the promoters consent to protective clauses.

**Swanage.**—Messrs. Purves, of Exeter, have informed the T.D.C. that the County of Dorset Electric Supply Co. will shortly commence the erection of electricity works in the town, and anticipated that current would be available for public and private lighting in May. The Council has decided to interview Mr. H. W. Purves on the question of public lighting.

**Westhoughton (near Bolton).**—In the new weaving shed being erected for Messrs. Taylor & Hartley, Ltd., mention of which was made in our issue of January 17th last, 400 "Schorch" mangle-loom motors are to be installed.

**Whitstable.**—The U.D.C. on January 21st further discussed the electric light scheme prepared by Mr. Campbell. Mr. W. Camburn moved that in accordance with a minute passed in September, 1898, the Council should themselves apply to the B. of T. for a prov. order. Mr. Harrison seconded, but the motion was lost by seven votes to four. Mr. A. A. Kemp gave notice that at the next meeting he should propose the rescinding of the minute of September, 1898, and move that the Council consider the establishment of an electric light system for the town, subject to the necessary arrangements, guarantees and agreements being entered into with the promoters of the scheme.

**Willesden.**—Before giving a definite recommendation with regard to improving the gas lighting of the district, the Lighting Committee has decided to obtain tenders from the electricity department (1) for the lighting of all side streets in the parish, and (2) for those streets in which mains are already laid. The Committee also proposes to submit both systems of lighting to photometric tests by an independent expert. The offer of the electricity department to substitute all-night lighting of the arc lamps, at present lighted for half the night, with incandescent lamps, for £110, has been accepted. The question of gradually superseding the existing arc lamps, and providing flame arc lamps in lieu thereof, is under consideration.

## TRAMWAY and RAILWAY NOTES.

**Bradford.**—The Tramways Committee has decided to have 100 electric trams fitted with a new device invented by two Leeds men for preventing loss of life by persons being run over by the cars. The new idea consists of a couple of bars at the side of the cars stretching from the front "gate" which will have the effect of preventing anyone who is struck by a car from slipping underneath. This new contrivance works in conjunction with the Tidswell guard, which was invented by a Bradford man.

**Brighton Railway Electrification.**—Elsewhere in this issue we refer to the latest decision of the directors of the Brighton Co. to proceed immediately with the electrification of most of the remaining suburban routes south of the Thames, and extending as far as Coulsdon, Cheam, &c.

**Chesterfield.**—A poll taken on Monday on the question of the Corporation Bill seeking powers to install a system of railless cars in the borough and district resulted in a majority of 522 in favour, the figures being:—For the Bill, 905; against, 383.

**Continental Notes.**—GERMANY.—The Government of Saxony has decided to establish without delay a number of electric motor-coach lines on the same system as adopted in Bavaria, without awaiting the sanction of funds in the next Budget estimates of the Diet. It is also proposed to consider the question of converting the State railways to electric traction, and a scheme for this purpose is to be submitted to the Diet.

TRUCKY.—According to the *Pall Mall Gazette*, the first act of the new Government in the industrial domain has been to grant a concession to a German group, for an underground railway in Constantinople from Bayazid, in Stamboul, to Chichli, the farthest outlying quarter of Pera. The line will run under the Golden Horn.

**East Ham.**—The Electric Lighting and Tramways Committee states that it has considered a report of the engineer and manager in connection with the suggested leasing of the Barking tramways situate between the boundaries of the districts of East Ham and Barking, and the supply of electricity to Barking Council in bulk. The Committee has decided that the leasing be agreed to on the following basis:—That the Corporation supplies the necessary cars and staff required for all through running and local services, and that for all service purposes the section shall be considered as part of the East Ham system, also that the whole of the revenue received, after deducting East Ham's working costs, be paid to Barking Council, and that should these arrangements be completed an offer be made to the Barking Council for the purchase of three cars only; the lease to be for a period of not less than three years, determinable thereafter on six months' notice by either side; that an offer be made to supply power to the Barking Council for traction purposes, metered at the boundary, at a charge of 125d. per unit net for all power supplied, sufficient to operate the section of track above referred to; the agreement to be for a period of 12 months and thereafter quarterly; not to entertain the question of giving a bulk supply.

**Folkestone.**—The General Purposes Committee of the T.C. has decided to oppose the Bill of the Tramway Co. for a railless traction system, and to hold the company to its original agreement.

**Halifax.**—Having made an agreement with Brighouse Corporation by which Bradford and Huddersfield were to be excluded from that borough with regard to tramways, unless with the permission of the Halifax Corporation, the latter submitted a Bill embodying this agreement and other matters to a poll of Halifax ratepayers on Saturday. Part of the bargain with Brighouse was that Halifax should extend its tramways from the centre of Brighouse to Rastrick and pay over £4,000 for necessary street improvements. The tramway borrowing powers asked for in the Bill

amounted to, roughly, £200,000, and £45,000 was included for an important street widening in Halifax. The result of the poll was that 6,031 persons voted against the Bill, and 1,921 in favour. The Bill will accordingly be withdrawn.

**Hythe (Kent).**—At a meeting of the T.C. General Purposes Committee on January 20th, it was decided to support the proposed system of railless traction, on condition that the promoters pay £100 towards the lighting of the route and £1,000 towards the cost of adapting the route to the system, and that they will undertake to carry out the scheme within two years of the passing of the Bill.

**Leeds.**—The people of the Wharfedale towns and villages have received with very mixed feelings the news that the Corporation has dropped from its Parliamentary Bill the proposals for running railless cars through the valley. At Otley the abandonment of the proposal is felt with keen regret, but at Burley, Ben Rhydding and Ilkley the decision has caused satisfaction.

**London.**—THE PICCADILLY TUBE COLLISION REPORT.—The B. of T. report dealing with the collision which occurred between an entering and a stationary train at the Caledonian Road Station of the Piccadilly Tube, in September last, has now been issued. The accident was difficult of explanation in view of the automatic signalling arrangements used on the tube railways. The first train was delayed by motor troubles for between two and three minutes, and the second train ran past the signals and collided with the standing train, while travelling at 18 or 20 miles an hour.

Sir H. A. Yorke, who conducted the inquiry, has come to the conclusion that the driver of the second train, in view of its coasting down the incline between Holloway Road and Caledonian Road Stations, sat down and moved the reversing handles to the neutral position so as to render it unnecessary for him to keep his hand on the controller (dead man's) handle, to enable him to take his ease at greater convenience.

The fact that the brake-handle was found in the release position appears to indicate that the driver never applied his brake at all, and was paying no attention to his duties until the collision occurred. The evidence as to the brakes being applied was conflicting, and it was agreed that the train was running at the speed usual for a non-stopping train. If the signals failed, the failure was of brief duration, judging by the evidence of the driver of the train, which followed the above one minute behind it.

There remains the question of the train stop, which ought, if the signals were at danger, to have automatically applied the brakes. On this point, Sir H. A. Yorke finds that the trip and isolating cocks on the train were in their correct positions, but that the train stop was defective, and this probably caused it to be sluggish in movement, and prevented it from assuming the upright position with sufficient rapidity to catch the trip cock under the train, and stop the latter. The railway authorities are now engaged in improving the position of the signal mechanism, but in any case Sir H. A. Yorke agrees that automatic signalling combined with train stops may be regarded as the safest system which can be adopted on such lines as the one concerned.

[We may add that the signalling system adopted on this and other tube lines was fully described in our pages several years ago.]

**L.C.C.**—Owing to a cable burn-out at the Greenwich tramways generating station on Monday evening, some 1,200 of the Council's cars were held up for half an hour. A somewhat similar occurrence stopped the tramway service at Ashton-under-Lyne on Thursday evening last week.

**Woolwich.**—The B.C. has decided to lodge a petition against the L.C.C. (Tramways, Trolley Vehicles and Improvements) Bill, as regards the paragraph giving power to the Council to run trolley vehicles between the tramway termini at Lee Green and High Street, Eltham.

**North Wales.**—It is reported that after hearing the views of a deputation from the promoters of the proposed new railway to Trefrew and Llanrwst, a Committee of the Carnarvonshire County Council has decided to recommend a contribution of £20,000 towards the project.

**Persia.**—According to the *Standard*, a London syndicate has recently been formed with a view to providing electric tramways and lighting in the city of Baghdad.

**Siberia.**—It is reported from Vladivostok that a scheme is at present under consideration for the construction of an electric tramway in the town of Blagowestchensk.

**Southampton.**—The tramways manager has submitted a report to his Committee in which he strongly advises it to provide meters on the cars for the purpose of checking waste of energy, and in connection therewith to inaugurate a bonus system.

**Stirling.**—As a result of a decision come to at last week's T.C. meeting, the Corporation Lighting Committee is to consider and report as to how an electric or other improved tramway service can be secured for the town and district, to be carried on either as a municipal undertaking or by a company. In the course of the discussion, it was stated that, at one time, a provisional arrangement had been come to between the National Electric Construction Co., the T.C., and the existing tramway company, but that they failed to come to terms with the County Council regarding the roads. The Merchants' Association is strongly supporting the movement for electrifying the tramways.

**Stockport.**—Delivery has now been made of the first railless car to be used on the Offerton route, and the second car was due to arrive this week. After the necessary trial runs and B. of T. inspection, the cars will be available for public use.

**Walthamstow.**—It has been decided to take no action upon the question of the advisability of hiring tramcars from the Leyton undertaking. An appeal is to be made to the West Ham Union Assessment Committee against the proposal to increase the assessment of the electric light and tramways undertakings.

**Wood Green.**—The assessment of the properties of the Metropolitan Electric Tramways in the district has been reduced from £9,300 gross and £3,800 rateable to £8,558 gross and £2,530 rateable. A petition is to be presented against the M.E.T. (Railless Traction) Bill which enables the company to run railless trolley vehicles within the district.

## TELEGRAPH AND TELEPHONE NOTES.

**Germany.**—A wireless station is in course of construction by the men of the Telegraph Battalion on the flying ground at Johannisthal, near Berlin, for the exchange of messages with the marine airship L.T. The range of the station is between 300 and 400 km.

**Imperial Wireless System.**—On Wednesday last week the Select Committee inquiring into the Marconi agreement had before it Mr. W. R. Lawson, a writer on financial and economic questions. The witness criticised adversely the agreement on the grounds that it would tie the hands of the Post Office, and would put a stop to British progress in long-distance communication, as all competitors would be driven out of the field. The Government, he said, had very indefinite ideas as to what they were really purchasing from the company, and the State had been indirectly associated with a huge Stock Exchange gamble. The 10 per cent. royalty alone condemned the agreement as a business transaction. In addition to the heavy royalty, the Government would have to take all the risks and bear the cost of military protection, as well as the charges for collection and distribution of telegrams, &c. It was doubtful whether the business would bear more than 2 or 3 per cent. in addition to the necessary expenditure, and the Marconi Co. might draw a large income while the Post Office made a heavy deficit; the company could buy up new inventions and thus maintain its grip on the system. He contrasted the favour shown to the Marconi Co. with the treatment accorded by the Post Office to the cable companies and the National Telephone Co. While the Post Office dictated terms to the Telephone Co., the Marconi Co. appeared to have dictated terms to the Post Office. The cost of the system and the royalties were trifles compared with the effect of the negotiations on the Stock Exchange. In July, 1908, with the number of Marconi shares at 394,190, the price on the Exchange was 6s. 9d.; in December, 1912, with 750,000 shares, the price was £4 10s., and in April, 1912, when there were 500,000 shares, the price was £9 15s.; the total market value of the preference and ordinary shares, together making £750,000, was £7,062,500. Whereas the Post Office representatives said the agreement was forced upon them, the Post Office was really the master of the situation, and the Imperial wireless system was a matter of life and death to the company.

On the following day Mr. Lawson again gave evidence. He alleged that the company was not in a position in 1910 to carry out the proposal which it then laid before the Government, to establish long-distance communication at its own cost, and said that commercial opinion in the country did not regard wireless telegraphy as urgent.

On Monday Mr. Marconi was invited to state his reasons for wishing to withdraw from the agreement. He said that the only efficient way of doing so, in his opinion, was by giving evidence in reply to all that had been said. It would not be right for him to split up what he had to say, and he preferred to reserve his statement until he had an opportunity of going into the whole case. Much had been said that could have been contradicted, and he thought the time had come when it was essential that he should make his statement. The chairman announced that Mr. Marconi would be heard in full, probably at the end of the journalistic evidence.

Sir Alex. King, recalled, said the Postmaster-General did not think it right to reply to the company's letter until the Committee had had an opportunity of expressing its views on the matter. The Postmaster-General asked him to point out that if it were found that the Marconi system was the only one that could safely be employed, and the Government were still unable to carry out the work, it would be difficult to resist a demand for higher terms if a fresh contract had to be negotiated with the company. He could not accept responsibility for the delay which had occurred since he laid the agreement before Parliament. In the opinion of the witness, the bargain was a very good one, and he could not help feeling that Mr. Marconi had not been well treated. He and his system had been attacked, and although he was the wireless expert of the age, he had not yet been given an opportunity of refuting the statements that had been made. The Government had everything to gain and nothing to lose by holding the company to the contract. He understood that in addition to the Norwegian contract, the company had entered into a contract with the Argentine Government for communication

with Africa. The Marconi Co. had informed the Postmaster-General that they were making arrangements which would necessitate alteration of the proposed sites and the wave lengths of the Imperial stations.

The Committee sat again on Wednesday, when Mr. Lawson was further cross-examined.

Answering questions in the House of Commons, Mr. Samuel stated that he could not pledge the Government not to reply to the letter of the Marconi Co. asking to be released from the agreement until the Select Committee communicated with him. Any observations that the Committee might make would be taken into consideration.

In accordance with the recommendation of the Select Committee of the House of Commons on the Marconi Contract, the Postmaster-General has appointed a Committee "to report on the merits of the existing systems of long-distance wireless telegraphy, and in particular as to their capacity for continuous communication over the distances required by the Imperial chain." The Committee will consist of:—

Mr. Justice Parker (chairman).

Mr. W. Duddell, F.R.S., President of the Institution of Electrical Engineers.

Mr. R. T. Glazebrook, C.B., F.R.S., Director of the National Physical Laboratory, Past President of the Institution of Electrical Engineers.

Sir Alexander Kennedy, F.R.S., Past President of the Institutions of Mechanical and of Civil Engineers.

Mr. James Swinburne, F.R.S., Past President of the Institution of Electrical Engineers.

They have been requested, as desired by the Select Committee, in view of the urgency of the question, to report as soon as possible, and in any case within three months from the present date.

**Norway.**—Experiments have lately been made to open up telephonic communication between the most northerly point of the kingdom, i.e., the Saltema district, and the most southerly part, the Egner-Holmström high-pressure telephone being made use of. The results have shown that, up to a distance of 1,500 km., the telephone messages are clearly audible.—*Zeitschrift für Schwachstromtechnik*.

**Russia.**—The Department of Posts and Telegraphs has decided to connect Moscow and Riga by a telephone system during the course of the present year. Branch lines will establish communication with Libau and Windau.—*Board of Trade Journal*.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdeen.**—February 10th. One 3,000-kw. turbo-alternator, with surface condenser and air pump, for the Corporation. See "Official Notices" January 24th.

**Ashton-under-Lyne.**—February 19th. U.T. switchgear, water softening plant, steam, exhaust and feed pipes, tanks, &c., for the Corporation. See "Official Notices" to-day.

**Australia.**—VICTORIA.—February 21st. Four 1,500-kw. rotary converters, for the Melbourne City Council. See "Official Notices" December 6th.

**WESTERN AUSTRALIA.**—February 19th. Armoured telegraph cable, for the P.M.G.'s department. See "Official Notices" January 10th.

February 27th.—Buildings and boiler-house equipment, turbo-alternators and rotary converters, for a Government power station at Perth. See "Official Notices" January 24th.

**SYDNEY.**—March 17th. Motors for the City Corporation.

**SOUTH AUSTRALIA.**—March 5th. One section of a common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

**Beckenham.**—February 10th. Arc lamp carbons (flame) and electrical house cut-outs and service boxes, for the U.D.C. The Offices, Beckenham.

**Belfast.**—February 5th. Electric lamps, carbons, wire, batteries, &c., for a year, for the Midland Railway Co. Northern Counties Committee (form No. 27). Mr. Ellis, Stores Superintendent, York Road Station, Belfast.

February 24th.—Stores and materials for one or three years, for the City Electricity department. See "Official Notices" to-day.

**Birkenhead.**—February 11th. Continuous-current electricity meters and house service fuse boxes, for the Corporation. See "Official Notices" January 24th.

**Blackburn.**—February 15th. Materials for a year, for the Corporation Electricity Department. See "Official Notices" to-day.

**Bolton.**—February 13th. Turbo-alternators with condensing plant, water-tube boilers, economisers, switchgear and steam feed pumps, for the Corporation. See "Official Notices" January 24th.

**Bootle.**—February 12th. Steam coal and slack for three or six months, for the Corporation electric light station.—Borough Electrical Engineer, Pine Grove.

**Bridlington.**—February 8th. One 600-kw. turbo-generator, with switchboard and pipework extensions, for the Corporation. See "Official Notices" January 24th.

**Bristol.**—February 14th. Arc lamp carbons, joint, junction and fuse boxes, A.C. wattmeters, and D.C. mercury type ampere-hour meters, for the City Electricity Department. See "Official Notices" to-day.

**Canada.**—MOOSE JAW.—February 10th. One 1,500-kw. steam turbine and generator, for the City of Moose Jaw, Sask. See "Official Notices" January 10th.

**REGINA.**—February 24th. Supply of materials for a street railway at Regina, Sask., including 2,140 tons of steel rails, with bolts and nuts, angle bars, &c.; 9,690 copper rail bonds; 21 miles of hard drawn trolley wire, 16 miles of stranded copper wire, and 10 miles of soft drawn iron wire: insulators, hangers, brackets, &c.; 20,000 barrels of Portland cement. Copies of the specifications, &c., from H. Doughty, Superintendent, Regina Municipal Railway, Regina. It is expected that copies will shortly be received at the Commercial Intelligence Branch of the Board of Trade, where they will be available for inspection by manufacturers in the United Kingdom.—*Board of Trade Journal*.

**Cardiff.**—February 14th. One steel chimney, with mechanical draught plant, for the Corporation. See "Official Notices" to-day.

**China.**—February 10th. Six 625-k.v.a. three-phase oil-cooled transformers, for the Shanghai Municipal Council. See "Official Notices" January 24th.

**Colchester.**—February 10th. Duplicate motor-driven air-compressor plant, with pipework, cables, switchgear, &c., for the Committee of Visitors, Essex and Colchester Asylums. See "Official Notices" January 24th.

February 15th.—Rubber and fibre insulating materials, cables, electrical fittings (lighting), electrical equipment (cars), overhead equipment, car fittings, &c., for the Corporation tramways department. Mr. R. C. Bullough, General Manager and Engineer, Magdalen Street.

**Constantine.**—January 1st, 1914. The contract with the local gas company expiring in 1920, the Mayor is prepared to receive offers from individuals or companies prepared to provide a public and private lighting service either by gas or electricity, together or separately, in separate tenders or jointly. For further particulars see this column last week.

**Croydon.**—February 4th. General stores and goods for a year, for the Corporation tramways department. Tramways Manager, Thornton Heath.

**Darlington.**—February 17th. One 1,000-kw. steam turbo-alternator, one 750-kw. and one 250-kw. rotary converter, and one water-tube boiler, for the Corporation. See "Official Notices" to-day.

**Dublin.**—February 13th. Water-tube boilers, economisers, pumps, conveying plant, pipework, &c., also boiler seatings and flue work, for the Corporation Electricity Supply Committee. See "Official Notices" January 24th.

**Egypt.**—March 31st. Section des Municipalités invites tenders for electric light installation at Damietta. For further particulars see this column last week.

**Fleetwood.**—February 14th. One 500-kw. mixed-pressure turbine and continuous-current dynamo, with condensing plant, and one water-tube boiler, superheater and brickwork, for the U.D.C. See "Official Notices" January 24th.

**France.**—PARIS.—March 5th. The Administration of the Chemins de Fer de l'Etat is prepared to receive tenders for the supply of five travelling cranes with electric equipment for the railway erection shops at Batignolles. Particulars from the Bureaux du Service Electrique (1st division), 43, Rue de Rome, Paris.

**Germany.**—DORTMUND.—The T.C. having decided to expend £119,000 on the improvement and extensions of its electric power station and tramway system, orders for electric rolling stock and equipment may be shortly expected.

**Grimshy.**—February 11th. One 1,000-kw. mixed-pressure turbine and continuous-current dynamo, with condensing plant, for the Corporation. See "Official Notices" January 24th.

**Halifax.**—February 17th. Stores and materials for a year, for the Corporation electricity department. See "Official Notices" to-day.

**Hoylake and West Kirby.**—January 31st. High-tension single-phase switchgear (eight panels) and one 50-k.v.a. single-phase transformer, for the U.D.C. See "Official Notices" January 17th.

**Hyde.**—February 5th. The Corporation is inviting tenders for the electric lighting of the Public Baths extension. Specifications and forms from the architect, Mr. J. H. Fletcher, 46, Oldham Place, Hyde.

**India.**—February 18th. High and low-tension switchboards, for the Bombay, Baroda and Central India Railway. See "Official Notices" to-day.

**Keighley.**—February 8th. Electrician's work for a year, for the Keighley and Bingley Joint Hospital Board. Mr. J. N. Clarkson, Clerk, North Street, Keighley.

**Leeds.**—February 19th. Coal and general stores for a year, for the Corporation electric lighting department. See "Official Notices" January 21th.

February 17th.—The City Tramways Committee invites tenders for electrical sundries and engineers' furnishings and other goods for the tramways during the 12 months ended March 31st, 1911, and also for the reconstruction of certain portions of tramway track, in respect of which tenders may be for six, nine or 12 months. General Manager, Tramway Offices, City Square, Leeds.

**London.**—February 4th. The Metropolitan Water Board is inviting tenders for Sec. 25, electric lamps and accessories, for one year. Specifications and forms of tender from the Clerk of the Board, Savoy Court, Strand, W.C.

**Hammersmith.**—February 5th. General stores for a year, for the B.C. electricity department. See "Official Notices" Jan. 24th.

**H.M. Office of Works.**—February 5th. Main switches, main fuses, switch fuse and fuse boards, for three years. See "Official Notices" January 21th.

**Bermundsey.**—February 17th. Stores for a year, for the B.C. Electricity Department. See "Official Notices" January 21th.

**L.C.C.**—February 11th. The tramways department is inviting tenders for 584 tons of special section mild steel bars for magnetic brake shoes. Specifications and form from Mr. A. L. C. Fell, Chief Officer of Tramways, 62, Finsbury Pavement, E.C.

The Highways Committee is to invite tenders from selected firms for additional water-condensing pipes, &c., required in connection with the alteration of the plant at the Greenwich generating station. Tenders are to be invited from selected firms for metallic filament lamps for electric cars.

February 25th.—Electric wiring of the Camberwell and Cressy Road car-sheds. See "Official Notices" to-day.

**Manchester.**—February 18th. General stores for a year, for the Corporation tramways department. See "Official Notices" to-day.

**Nelson.**—February 3rd. One traction battery, one automatic reversible booster and switchgear, one D.C. motor-generator and switchgear, for the Electricity and Tramways Committee. See "Official Notices" January 10th.

**Prague.**—February 28th. Tenders are invited for the supply of machine tools, with electric equipment, to the Bohemian Northern Railway. Particulars (enclosing 2d.) from the Direktion der Böhmische Nordbahn, Abteilung IV, Prag.

**Salford.**—February 3rd. Rotary converters for the Corporation. See "Official Notices" January 21th.

**Sheffield.**—February 5th. General stores for two years, for the City Electricity Supply Department. See "Official Notices" January 17th.

February 8th.—The Corporation Tramways Committee is inviting tenders for 1,000 tons of steel tramway rails. Specifications, &c., £2 2s. (returnable), from Mr. W. J. Hadfield, Surveyor of Highways, Town Hall.

**South Shields.**—February 17th. Uniforms, for the Corporation tramways department. See "Official Notices" to-day.

**Spain.**—Tenders have just been invited by the municipal authorities of Ledesma (province of Salamanca) for the concession for the electric lighting of the town during a period of 10 years.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Warrington.**—February 3rd. We are asked to state that a misprint occurred in the notice of last week. Specifications for the electric light installation at Public Baths are to be applied for at the office of the Borough Surveyor (Mr. A. M. Ker), Town Hall, Warrington. Drawings can be inspected, and further particulars obtained, at the office of Mr. F. V. L. Mathias, the borough electrical and tramways engineer, Electricity Works, Warrington.

## CLOSED.

**Bristol.**—The Docks Committee has accepted the tender of Messrs. Siemens Bros. & Co., Ltd., for the supply of flexible crane cable.

**Belgium.**—La Société de Ateliers de Constructions Electriques de Charleroi has submitted the lowest tender to the Belgian Post and Telegraph authorities for the supply and erection of two new telephone cables between Brussels and Antwerp, and a new line between Suhrbeek and Dieghem.

**Bexhill.**—The tender of Messrs. Myers, Rose & Co. for the supply of 1,000 tons of coal for the electricity works, at 29s. per ton (Shipley or Tibshelf peas), has been accepted by the Council.

**Blackpool.**—The Highways Committee has accepted the tender of Messrs. Mather & Platt, Ltd., for the supply of two electrically-driven pumps.

The T.C. has placed an order with Messrs. Halley's Industrial Motors, Ltd., of Yoker, for the supply of a petrol motor tower wagon for service in connection with the maintenance of the electric tramway overhead conductors.

**Bury.**—The Tramways Committee has placed a contract with the United Electric Car Co. for the supply of four new car bodies, and a contract with Messrs. Dick, Kerr & Co., Ltd., for a pair of 40-H.P. motors.

**Great Yarmouth.**—The B. of G. has accepted the tender of Mr. J. Lamb, of Bridge Foot, Southtown, for electric light at the new receiving home, at £29 19s. 9d. There were six tenders, the highest being £18.

**Keighley.**—Messrs. Clough, Smith & Co., Ltd., have secured from the Trackless Trolley, Ltd., the contract for the overhead equipment on the over-running system for the Ingrow to Haworth section of the Keighley Corporation's trackless system.

**London.**—PADDINGTON.—The Guardians have accepted the quotation of Messrs. Drake & Gorham, for a supply of 0-rim electric lamps.

**WOOD GREEN.**—The tender of the Private Telephone Co. has been accepted by the U.D.C. for installing 21 Sterling inter-communicating telephones at the Town Hall, at £63 4s. plus £6 5s. for lead-covered cable and a maintenance charge of £5 per annum.

**WOLWICH.**—The T.C. has accepted the tender of Messrs. Kirk and Randall for steel work for the electricity engine house at £1,486.

**Preston.**—The Tramways Committee has recommended the acceptance of the tender of Messrs. Dick, Kerr & Co., Ltd., for 50 to 60 tons of rails for relaying a portion of Church Street track, at the rate of £7 17s. 9d. per ton, exclusive of royalties.

**Pekin.**—Messrs. Pritchett & Gold, Ltd., have received an order for a battery of 120 cells, 600 ampere-hour capacity, for the Pekin Legation.

**West Ham.**—The British Westinghouse Co.'s contract with the T.C. for supplies of transformers is to be extended for a further period of 12 months. In regard to this matter the Council's electrical engineer states that the prices of transformers of the sizes used have increased from 3 per cent. to 5 per cent., and by the end of March the increase would be much more than this, and it would be to the advantage of the Council to accept the offer made by the Westinghouse Co.

## FORTHCOMING EVENTS.

**The Electrical Engineers' Ball.**—Friday, January 31st. At 9 p.m. Hotel Cecil, London.

**North-East Coast Institution of Engineers and Shipbuilders (Graduate Section).**—Saturday, February 1st. At 7.15 p.m. at Bolbec Hall, Newcastle. Paper on "Pipe Design," by Mr. J. Dickinson.

**Society of Engineers.**—Monday, February 3rd. At 7.30 p.m. At the I.E.E. Paper on "The Bus or Tram Controversy, and other Aspects of the London Traffic Problem," by Mr. W. Yorath Lewis.

**Royal Society of Arts.**—Monday, February 3rd. At 8 p.m. Cantor lecture on "Liquid Fuel," by Prof. V. B. Lewes. (Lecture III.)

Wednesday, February 5th.—At 8 p.m. Paper on "The Economic and Hygienic Value of Good Illumination," by Mr. L. Gaster.

**Institution of Electrical Engineers (Newcastle Section).**—Monday, February 3rd. At 7.30 p.m. At the Armstrong College, Newcastle. Author's reply to discussion on "Electric Resistance Welding," and demonstration of butt welding.

(Glasgow Students' Section).—Tuesday, February 4th. At 8 p.m. At the Royal Technical College, Glasgow. Paper on "Electrical Estimates and Opportunities," by Mr. N. C. Woodin.

(Manchester Students' Section).—Tuesday, February 4th. At 7.30 p.m. At the Municipal School of Technology, Manchester. Paper on "Winding of Electrical Machinery," by Mr. A. T. Robertson.

(Students' Section).—Wednesday, February 5th. At 7.45 p.m. At the I.E.E. Paper on "Low and Mixed-Pressure Turbine Plant," by Mr. C. H. Goulden.

**Chemical Society.**—Thursday, February 6th. At 8.30 p.m. At Burlington House, W. Paper on "The Presence of Helium in a Gas from the Interior of an X-ray Bulb," by Sir Wm. Ramsay; "The Presence of Neon in Hydrogen after the Passage of the Electric Discharge through the latter at Low Pressures," by Messrs. J. N. Collie and H. Patterson; and other papers.

**Royal Institution.**—Thursday, February 6th. At 8 p.m. Lecture on "Recent Research on the Gas Engine," by Prof. B. Hopkinson. (Lecture II.) Saturday, February 8th.—At 3 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture I.)

**Association of Mining Electrical Engineers.**—Friday, February 7th. At 8 p.m. At the I.E.E., Embankment, W.C. Paper on "Cables for the Shafts of Mines," by Mr. J. K. Scott.

**Association of Engineers-in-Charge.**—Saturday, February 8th. At St. Bride's Institute, E.C. Social Dance.

**Dance.**—To-morrow, Saturday evening, the Osram and Robertson Social and Athletic Club will hold a plain, fancy and evening dress dance at the Brook Green Works, Hammersmith. Dancing from 7 o'clock to 12 o'clock.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, February 25d.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, February 26th.—"B" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Thursday, February 28th.—"C" Company. Company training, 7 to 10 p.m.

Friday, February 29th.—"D" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Saturday, February 29th.—"C" Company. Week-end run at Fort Coalhouse, East Tilbury. Parade at Fenchurch Street Station at 3 p.m., for train leaving at 3.25 p.m. for Low Street. Dress:—Service dress, putties and greatcoats. No arms will be taken.

Headquarters will be opened for regimental business only from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.,  
For Officer commanding L.E.E.

### NOTES.

**The "Point Fives."**—We are informed that a meeting of the 4d. a unit men has been held in London under the chairmanship of Mr. Cooke, of Linton, and that a set of rules has been adopted for an Association to be called the "Point Fives." No one interested in electricity supply work will disagree with the underlying objects of this new Association, and we cannot wish it greater success than that its ostensible purpose, *i.e.*, the development of the use of electricity for domestic purposes, shall be so fully attained in the near future as to render its individual existence no longer necessary. The Association is to meet four times a year, one occasion being at the I.M.E.A. Convention, and the next meeting is at Bradford.

Mr. Cooke stated that in order to promote the more rapid and extensive use of electrical energy for cooking purposes, the Society was very badly in need of a compact, reliable and low-priced complete cooking outfit which would meet the requirements of the average family of six to eight persons. Although there were several cooking outfits on the market, there did not appear to be any uniformity of opinion among the manufacturers as to what the public really required, nor did they appear to realise the large sale they could obtain if the price of this class of apparatus was such as would bring it within the reach of the middle-class consumer. He therefore believed that the suggestion made by Mr. Rowley Hill at the last meeting was the only solution of the present difficulty, *viz.*, to standardise this apparatus as soon as possible. He suggested that the Society should adopt a standard specification for a complete cooking outfit, and arrange with the manufacturers for the purchase of a certain quantity over a given period. After this complete outfit had been standardised, the Society could then turn its attention to the standardisation of other articles for cooking and heating. He submitted a draft specification as a nucleus around which the Society might, with the co-operation of the manufacturers, develop something practical.

**Annual Dinner.**—The employees of Blackpool electricity and tramways department had their second annual dinner at the Winter Gardens, on January 23rd. About 140 attended. Mr. C. Forness, electrical engineer and tramways manager, presided, and was supported by several members of the Corporation. The chairman submitted the toast of the "Mayor and Corporation," and said that the department had had a record year, which could not have been achieved without the co-operation of each of the employees, who were all links in the municipal chain. It was of no use for the Committee to pass resolutions for the general manager to carry out unless every man in the department believed they were right and proper and carried them out to the best of his ability. They all tried their best without any tyranny on the part of the general manager or the staff. Councillor W. G. Bean, in proposing the health of the employees, commented with pride on the fact that last year 13,000,000 passengers were carried on the Blackpool Corporation cars, and that there had only been one accident. He also alluded to the work of the electricity department. Mr. J. Appleton, of the electricity department, acknowledged the compliment.

**Parliamentary Notes.**—**TIDWORTH AND BULFORD CAMPS (ELECTRIC INSTALLATION).**—In the House of Commons on January 22nd, Mr. Touche asked the Secretary of State for War if the specifications for the electrical installation at Tidworth and Bulford camps were prepared by a private firm; and, if so, would he mention the name of the firm and say why they were not prepared by the War Office electrical department. Mr. H. Baker replied that the specifications in question were prepared by Messrs Kennedy & Jenkin in conjunction with the War Office electrical staff. This staff, which was mainly employed on electric lighting for defence purposes, was not large enough completely to supervise extensive new installations such as the Tidworth and Bulford scheme. Mr. Touche then asked at what place the Armorduct cable, selected for the army camps at Tidworth and Bulford, would be inspected by representatives of the War Office. Mr. Baker replied that Messrs. Kennedy & Jenkin would inspect the cable at the works

of Messrs. Lynen & Co., Eschweiler, near Aix-la-Chapelle. Mr. Touche further asked the Secretary of State for War if his attention had been called to an advertisement circulated by the Armorduct Manufacturing Co., setting forth that the Armorduct cable had been selected by the contractors to the War Office for the army camps at Tidworth and Bulford, requiring approximately 300 miles; was this cable manufactured by Lynen & Co., Eschweiler, Germany; would he say who were the contractors who were providing the cable; and were all the competing contractors given an opportunity of quoting for German cable, or were they, or any of them, asked to tender for best quality English cable. Mr. Baker said that nothing was known at the War Office of the advertisement mentioned. The cable was manufactured by the company referred to. The contractors were Messrs. G. E. Taylor & Co. All competing contractors were given the same opportunity to quote for any cable complying with the British Standards Committee Report No. 7, of 1910. Mr. Touche asked if attention had been drawn to an advertisement in the papers to this effect:—"Is Armorduct cable good enough for you? It is good enough for His Majesty's War Office." He asked if the hon. member considered it desirable that the War Office should thus be used for the purpose of advertising the goods of foreign competitors. Mr. Baker said he had heard nothing of the advertisement, but could assure Mr. Touche that the cable was fully up to their requirements.

**Aluminium in 1912.**—The report for 1912 of the Berlin metal firm of M. Levy & Co. recalls, among other matters, the fact that the Neuhausen Aluminium Co., the French aluminium companies which had previously combined among themselves, the two English companies and the Norwegian works formed an international syndicate, which will work hand in hand with the Canadian and United States companies. It is of some interest to learn that the large stocks which were held at the close of 1911 have been entirely consumed by the works which produce domestic and fancy articles, the electricity companies and the airship works and the motor-car industry. During the final quarter of 1912 the motor-car works in the United States in particular imported large quantities of aluminium from Europe, whereas up to a short time previously American metal was being delivered in Europe. The prices of aluminium rose in accordance with the development of the market from £50 per ton in the autumn of 1911 to £70 in June, 1912, and further advanced by the close of the year to £85 and up to £90. As the stocks are completely exhausted, the report states that prices favourable to makers can be reckoned on in the present year also.

**Callender's Hospital Fund.**—With the close of the year 1912 the Callender's Hospital and Distress Fund completed its first decade. At the general meeting, held on January 25th at the Belvedere Works, Mr. A. R. Kibblewhite presiding, the tenth annual report and accounts were presented and unanimously approved. The penny weekly subscriptions realised £276, which is better by £57 than in 1911, and there were donations of about £70, including £50 from the company, £5 5s. from Mr. T. O. Callender, and £2 2s. each from seven others. The report details the various ways in which the money was distributed, £231 going to hospitals and infirmaries; this is the highest sum on record to go in this direction, and is an increase of £33 on the 1911 figure. Some £52 was granted to 37 cases needing financial assistance, while spectacles and surgical appliances were provided to a large number of members, and numerous hospital, convalescent home and nursing home tickets were given out. It is interesting to record that during the 10 years the fund has distributed among hospitals and members money and assistance in the above forms to the excellent total of £2,886, and has issued 2,668 letters. Those responsible for the conduct of this admirable fund are to be congratulated upon such splendid achievements.

**Admiralty Electrical Engineers.**—The Admiralty has notified the authorities at Plymouth that in future electrical engineers and assistant electrical engineers are to be borne on the established list, pensionable scales of salary being substituted for the non-pensionable salaries at present payable. Electrical engineers, highest grade, are to receive salaries of £450, rising by annual increments of £20 to £650, with an official residence, or an allowance of £50 to £75 in lieu thereof. Electrical engineers, lower grades, are to receive salaries of £300, rising by £15 increments to £400, with an official residence, or an allowance of £50 in lieu. First assistant electrical engineers are to receive £250 to £350 a year, and second assistant electrical engineers £200 to £250 a year. The pensionable scales are to apply to all future entrants, but officials now serving are to be given the option of being placed on the pensionable scales. They will enter these scales from the date of obtaining the necessary Civil Service certificate at the salaries they would have been receiving if they had served in the pensionable capacity throughout on the above scales, plus the proportion of increment earned on these scales up to the dates of their certificates. They will not be allowed to count their previous service for pension. With reference to the petitions of electrical engineers asking for an increase of pay, the Admiralty states that it is not prepared to make any alterations in the scales other than those indicated above.

**More Wireless.**—A correspondent anticipates a slump in copper and a sharp rise in the timber and tin-can trade as a result of some "wonderfully clever work" by scientific members of the Hampshire House Club, Hammersmith—at least, if the *Daily Mirror* account in Friday's issue is correct. This informs us that "they have no expensive apparatus, but have made delicate instruments, like electric bells and galvanometers, out of old tin-boxes and tin-cans." Perhaps they mean something like

**Old Centralians.**—The fifteenth annual dinner of the above Association will be held on Saturday, February 15th, at the Trocadero Restaurant, Piccadilly Circus, W. The chair will be taken at 7.30 p.m. by Sir John Wolfe-Barry, K.C.B., F.R.S., the President of the Old Centralians. The annual general meeting is arranged to precede the dinner, and will commence at 6.45 p.m. Further information and tickets (price 6s. 6d.) can be obtained from Mr. G. W. Tripp, A.C.G.I., 4, Fairfield Road, Charlton, Kent. "Old Centralians" is the name of the Association formerly known as Central Technical College Old Students' Association, the change being made when the College became the City and Guilds (Engineering) College, and it is hoped that the new name will serve as an effective link with the past.

**Electrical Trades Union.**—The Fulham Branch of this Union is holding the fourth of its winter lectures on Monday next, February 3rd, at 9.30 p.m., at the Red Lion Hotel, Waltham Green, when Mr. Andrew Clark, of the Anti-Socialist Union, will be the lecturer. A welcome note will be extended to anybody engaged in the trade.

**Electrical Fatality.**—At the Wandsworth Town Hall on Monday, Mr. S. Ingleby Oddie held an inquiry regarding the death of William Laming, aged 32, a labourer, who was killed by an electric shock. The deceased was in the employ of Messrs. Bentley & Lock, contractors, who are carrying out sewerage work in Mandrake Road, where the fatality occurred. Deceased left a widow and four little children.

The deceased and other men were working at excavations in Mandrake Road, and earth was hoisted up by an electric crane from the tunnelling. The deceased was found dead, after he had been heard to exclaim "Oh!" at the bottom of the shaft.

The driver of the crane, William James, said that he had no gauge to show him when there was a short circuit. He had never known the hook to become electrified. The strength of the electricity was 200 volts. The wire rope of the crane was not insulated, but witness knew of no defect in the machinery. The first witness knew about the deceased being found was when the banksmen told him to switch off the current. At the time witness suggested that the man had received an electric shock.

Dr. R. S. Trevor, pathologist at St. George's Hospital, who made a post-mortem examination, deposed that he found no marks of injury on any part of the body, but at the root of the neck on the left side he discovered a small oval pink mark on the skin. In the centre of this were numerous minute pin-point darker spots of hæmorrhage. Internally all the organs in the body were perfectly healthy—there were no signs of disease at all, and so far as the examination itself was concerned, it did not reveal the cause of death. There was no mark on the sole of the foot and no signs of burning on the feet and clothing. The only important sign was on the neck, and that was very superficial. He did not die from the effects of bad air, or through disease. He formed the opinion that he received a shock at the side of the neck where the pink mark was. It would correspond with the height of the hook of the crane, and as it was in the region of the great vessels of the neck, it would have been quite sufficient to produce immediate death. He concluded that death was due to an electric shock. There would be a sudden stoppage of the heart.

Heart failure following an electric shock?—Yes.

Would 200 volts be sufficient?—I think so, if received over the great vessels of the neck. The boots and clothing were damp. There is a case recorded of the death of a man who received 225 volts by touching an ordinary electric lamp. He, too, was wearing damp boots.

Damp boots would make the conduction more active?—Yes, more especially as the hands were wet, deceased having worked in a damp tunnel.

The mark you found on the neck was the result of the contact?—It is impossible to say, but it occurred to me it might be. It is quite common, in cases of electric shock, to find no marks. [The witness handed the Coroner the book in which the case he had cited was recorded.]

Evidence of a technical nature was then given by Mr. Chas. A. Baker, M.I.E.E., principal assistant in the L.C.C. engineers' department and electrical inspector under certain Acts and orders. He made an examination of the crane with the object of finding out whether it was well earthed, and with the instruments at his disposal he came to the conclusion that a man could not get a shock from the wire. Had it been sufficiently earthed it would have been impossible for any man standing on the earth to receive a shock.

Then if you electrified the rope it would not give a man a shock if it were properly earthed?—No, sir.

When witness subsequently made an examination with more sensitive instruments, he found there was a slight resistance, sufficient to make it possible for a man to get a shock, but he thought it was improbable. He could not make out where the wire got the electricity from, although it might have come from the motor if there was a leakage. The man in the cabin of the crane could not receive a shock, unless he touched the switchboard. If there were defective insulation, there would be a permanent escape the whole time the motor was working. Of course it would vary, and would mean a serious figure to the meters: it would tend to blow the fuses.

How do you think this wire became temporarily electrified? I should have thought that it would have gone on permanently?—It would be intermittent with the motion of the crane. A jerk might cause it, and another might remove it.

Witness thought that the real safeguard would be to have an

earth plate connected with the cabin and machinery by means of a copper wire.

That would make it absolutely safe?—I think so.

Is it the duty of any council or the Board of Trade to inspect these cranes?—Not to my knowledge, sir.

Can anyone put up a crane without inspection?—Yes, with this voltage, but the Board of Trade varies the figure—low pressure, high pressure, &c. This came under the head of low pressure, such as is admitted into houses for private consumers—the public generally. It is considered reasonably safe.

That is to say, that because there is only one recorded case of death with such pressure, it is regarded as safe?—Yes.

Continuing, witness said that when the voltage was double the strength the supply companies had to satisfy the Board of Trade that their requirements had been met. Subject to that, one could use the electricity as he pleased—there would be nothing said as to the working.

In summing up, the Coroner described the case as a difficult one, but said it was not so complicated as he at first thought it would be. It was evident that the deceased did not die through inhaling poisonous gas, or there being a deficiency of oxygen. Dr. Trevor's opinion was his (the Coroner's), and he thought the jury must irresistibly come to the conclusion that the deceased died as the result of receiving an electric shock. The jury could not very well blame anyone for the fatality, for those in charge of the crane could not have been aware that the man was going to be killed. Now that a life had been lost the authorities might think it desirable that cranes, such as the one in question, should be inspected before workmen arrived, in order that they might not be put in a position of risk. Now that they had had experience of a sad case, he thought that in future precautions should be adopted by people in charge of machinery such as this.

After a short consultation in private, the jury returned a verdict that the deceased was accidentally killed by an electric shock, and added that "further precautions should be taken in future."

### Municipal v. Private Ownership in Germany.—

In a recent issue of the Swedish *Teknisk Tidskrift*, an interesting paragraph appears regarding municipal electrical works in German cities, showing that municipal administration is not proving all that might be expected.

Electrical stations in the German cities are, as a rule, municipal property, and a great number of them have done very well in spite of the rather cumbrous administration which is associated with public or municipal working of an enterprise.

There are now, however, signs of a tendency to hand such works over to private enterprise, while retaining some sort of local control. The intention is to place the works under an administration which will manage their affairs in a more businesslike manner than municipal management will permit of. The electrical works at Brandenburg have recently been handed over to the A.E.G. for a period of 40 years, and it is thought that this arrangement, apart from the advantage which it has of removing some of the burdens from the municipal authorities, should also act as an incentive to the development of the town, as a private company would always be in a better position to meet the special requirements, and thus increase the use of electricity in general. Under the terms agreed, the A.E.G. will pay to the municipality a certain sum in cash at once, and afterwards a fixed sum per annum. The municipality will be entitled to a certain portion of the gross revenue and profits, while it further reserves the right to electrical energy for tramways and municipal buildings at reduced rates. The municipality also has the right of exercising a certain control over the working and the prices to be charged for energy. The electrical works at Brandenburg are valued at £60,000. A somewhat similar arrangement has been made between the town of Saarbrücken and the A.E.G. A new company has been formed in this case, and 70 per cent. of the shares are owned by the municipality, while the remaining 30 per cent. are in the hands of the A.E.G., which has undertaken the management on certain terms.

**The Austrian Bergmann Co.**—A scheme is being promoted with a view to the amalgamation of the copper and brass departments of the Austrian Bergmann Co. of Bodenbach, and the Vienna brass rolling firm of Chaudoir & Co., by the formation of a new company, with a spare capital of £416,000. It is said that during the first complete year's working of the Bodenbach copper and brass departments it was possible for the company to secure one-third of the Austrian demand for brass in competition with the Austrian Brass Syndicate. This circumstance has proved to be very inconvenient to the syndicate, which has consequently threatened to collapse, but the proposed fusion of Bergmann and Chaudoir would remove one of the difficulties in connection with the renewal of the syndicate. The purely electrical departments of the Bodenbach works are to be converted into a joint stock company with the co-operation of the Anglo-Austrian Bank, whilst the German Bergmann group will have an interest in the new amalgamated copper and brass rolling mills.

**Lamp-Making at the Cinematograph.**—We congratulate Messrs. Siemens Bros. Dynamo Works, Ltd., of Dalston, upon having made arrangements with one of the largest film manufacturing firms in the world to produce cinema films showing the processes of manufacture of "Tantalum" and "Wotan" drawn-wire lamps, together with several other interesting features in connection with the science of electrical illumination. Arrangements have also been made for the exhibition of these films at the majority of first-class cinema theatres, and it is hoped by this means to increase the interest of the general public in the use of electricity as a lighting agent.

**Willesden Polytechnic Electrical Engineering Society.**—The eleventh annual dinner will be held on Saturday evening next, February 1st, at 7 p.m., at Reggiori's Restaurant, Chapel Street, W., the President, Mr. Frederick H. Taylor, A.M.I.E.E., in the chair.

**I.M.E.A. New President.**—Mr. C. E. C. Shawfield having resigned his position as President of the I.M.E.A., consequent on his accepting another appointment necessitating his leaving municipal employ at an early date, the Council has filled the vacancy by electing as President of the Association for the remainder of the term, i.e., until the annual Convention in June next, Mr. J. E. Edgemoor, of Kingston-on-Thames, hon. treasurer and past president.

**The Corthesy Turbine.**—It is unwise to close one's eyes to new and apparently improbable inventions, because they are not based on familiar principles and proved mechanisms. For such is the Corthesy steam turbine, which is described somewhat vaguely in the *Standard*.

To begin with, the present types of turbine are not based on "shock tactics" as the *Standard* appears to think. The Corthesy turbine appears essentially to consist of a drum or series of drums rotating in a casing somewhat larger than itself. A narrow band of steam travels round this narrow space, and is supposed to cling round the rotor like a belt, and so drag it round. What really happens, if steam is regarded from the theory of molecular kinetics, is as shown in the figure annexed. Taking a single

molecule of steam projected into the narrow annular space between rotor and casing, it will follow a zigzag path and strike the rotor surface at an angle as shown, giving it a slight forward push at each impact.

Thus, just contrary to the *Standard's* dictum, this turbine *does* work by shock. And it does not work by the belt action fancifully supposed, for a belt does not slip, whereas the steam in this turbine acts wholly by slip velocity. It is, therefore, to be understood that the rotor will be turned by the impact of the steam molecules, and that if a sufficient circumferential area be thus lapped by a flat torrent of steam, the energy of the steam will be transferred more or less completely to the rotor. Presumably, the casing would be constructed so as to provide for expansion, and there would be many chambers in series. But the description is very vague indeed, and the mistake as to shock tactics throws doubts on it which are not laid to rest by the subsequent non-descriptive description so contradictory in what it appears to convey. There are no facts or figures given of value.

We would gladly welcome a bladeless turbine, and do not think the smooth rotor would refuse to rotate. What we fear is the very extended pulley surface to be exposed to the "clinging" belt of steam. As to efficiency, if it can be shown by tests that this turbine delivers its exhaust steam to the condenser at condenser pressure and condenser temperature, that is, not superheated, then it may be allowed that the turbine will be so far efficient, as the steam has lost heat by doing work.

**Municipal Electrical Trading at Edinburgh.**—Mr. Walter Finlay, secretary of the Electrical Contractors' Association of Scotland (Edinburgh Branch), writes as follows:—"I notice your paragraph referring to Edinburgh in your issue of 24th inst. Your paragraph correctly reports what took place at the special meeting of the Edinburgh Town Council called to consider the Bill, held on Tuesday, 14th inst., but I have to point out to you that the Bill is a very long one, embracing a great variety of subjects, and the electrical clause did not come on for consideration by the Council until a late hour, and there was a very small attendance.

"I understand that the clause at that meeting was amended to bring it in harmony with the model clause by a very small majority, and that the minority were in favour of deleting the clause entirely from the Bill. I have to point out, however, that at a meeting of the Town Council held on 21st inst., a motion was moved to disapprove of the minutes of the previous meeting so far as they approved of this clause in the draft provisional order, and that this motion in what was almost a full council was carried by a very large majority. The position of matters in Edinburgh, therefore, is that the Council have decided to have nothing whatever to do with municipal trading in electrical matters, and it is hoped by the trade that many other Corporations will follow the good example set by Edinburgh and leave well alone."

**Educational Note.**—The Engineering Department of the Manchester Municipal School of Technology is to be extended at a cost of £15,000, and re-equipped with modern machinery.

**Institution and Lecture Notes.**—ASSOCIATION OF MINING ELECTRICAL ENGINEERS (EAST OF SCOTLAND BRANCH).—At a meeting held at Dunfermline, on January 24th, Mr. David Beveridge, of Kelly, read a paper on "The Supervision of Electrical Cables Underground." The author said that there was difficulty in putting a cable in a deep shaft even where they had a clear space all the way down, but if they had to put the cable down the pumping space, where they would encounter wooden beams and steel girders lying across, it was

impossible to do the lowering there with guides. If, therefore, the cables were made and guaranteed to carry their own weight, without damaging them in any way, they would simply have to guide the end of the cable and brake it down. From practical experience he was of opinion that cables hung on trees, or near the ends of the crowns at the side of roadways, were in a much safer position than those suspended from the centre of the roadway. In such circumstances, when a fall took place, the crowns generally broke near the middle, and the half of the crown fell to the floor at one end, the other end commonly resting on the side of a roadway near the roof. The paper gave rise to an interesting discussion.

**ROYAL SOCIETY OF EDINBURGH.**—On Monday last week Dr. C. G. Knott read a paper on "Change of Electrical Resistance of Nickel subjected to Cross Magnetic Fields."

**SOCIETY OF ENGINEERS (INCORPORATED).**—The Council of the Society announces that arrangements are being made for holding the Fellowship Examination of the Society during the second week of June next. Intending candidates should apply to the Secretary of the Society, at 17, Victoria Street, Westminster, S.W., for full particulars. A paper is to be read before the Society on February 3rd by Mr. Yorath Lewis, at the Institution of Electrical Engineers, on "The Bus & Tram Controversy, and other Aspects of the London Traffic Problem."

**INSTITUTION OF ELECTRICAL ENGINEERS.**—The paper read before the I.E.E., in London on Thursday last week, on the "Use of a Large Battery in Central Station Supply," by Mr. F. H. Whyall, was read before the Manchester Section on Tuesday evening, the 28th inst. A long and varied discussion followed on each occasion, and the author replied. At the London meeting, the president, Mr. Duddell, announced that arrangements were in progress for the formation of a lending library, for the benefit of members who were unable to use the library at headquarters.

**INSTITUTION OF ELECTRICAL ENGINEERS (YORKSHIRE SECTION).**—A meeting was held at Sheffield, on Wednesday, when a lecture was given by Mr. Kenneth Cox on "Internal-Combustion Engines," and a discussion followed.

**THE CHADWICK TRUST.**—Three evening lectures on the "Hygiene of the Home" have been arranged under the Chadwick Trust. They will be given by Mr. H. Percy Boulois, M.Inst.C.E., in the library of the Royal Sanitary Institute, 90, Buckingham Palace Road, London, S.W., on Fridays, February 7th, 14th and 21st, at 8.15 p.m. The lectures will deal with the following phases of the subject:—(a) The Ideal Home; (b) Drainage and Sanitary Fittings; (c) Water, Ventilation, Heating, &c. The lectures are free, and any further information can be obtained from the secretary, Mrs. Aubrey Richardson, 8, Dartmouth Street, Westminster.

**MANCHESTER ASSOCIATION OF ENGINEERS.**—A paper on "Electric Lighting in Engineering Workshops" was read before the members on Saturday, by Mr. Haydn Harrison.

**NORTH-EAST COAST INSTITUTION OF ENGINEERS AND SHIPBUILDERS.**—A Scholarship will be offered for competition among Graduates of the Institution in September next, tenable for two years, and of the annual value of £50. It will be awarded on the results of an examination held in Newcastle during September. Candidates must apply to the Secretary of the Institution before August 1st. Conditions for membership of the Graduate Section of the Institution may also be had from the Secretary.

**How to Quote Judiciously.**—Our contemporary, the *Gas World*, pays a well-deserved tribute to Dr. Ferranti's James Watt lecture, which we abstracted in our last issue, and draws attention to his remarks on the suitability of the internal-combustion engine for small powers, which it suggests will be useful "in maintaining the cause of the small town gas engine." It was naturally inconvenient, or would, at any rate, have been injudicious, to give equal prominence to the latter part of the lecture, which states that the electric motor is displacing all forms of small engine, and that in the future probably all stationary motors will be electric, reciprocating forms of engines being only makeshifts.

**Appointments Vacant.**—General assistant to the secretary (£150-£200), and library assistant (£150), for the I.E.E.; assistant engineer (£80) and fitter-driver (25s.), for the Severalls Asylum, Colchester. See our advertisement pages in this issue.

**L.C.C. Tramway System.**—On Monday night the L.C.C. tramway system was brought to a standstill owing to the breakdown of a feeder at Greenwich power station.

**Correction.**—Two slight errors have crept into the report on the concert of the Manchester Electro-Harmonic Society, on page 204. For "Canzetta" read "Canzonetta," for "Kuti" read "Kati."

## NEW COMPANIES REGISTERED.

**Isaacson & Brown, Ltd.** (126,606).—This company was registered on January 20th, with a capital of £1,000, in £1 shares, to carry on the business of electrical and mechanical engineers, manufacturers and workers of electricity, motive power and light, &c., and to adopt an agreement with A. W. Isaacson. The members (with one share each) are:—A. W. Isaacson, 43 and 44, Farnival Street, E.C., electrician; C. W. M. Brown, 43 and 44, Farnival Street, E.C., electrician; J. C. Fisher, 24, Ribblesdale Road, Hornsey, N., clerk. Private company. The number of directors is not to be less than two or more than three; the first are A. W. Isaacson and C. W. M. Brown (both permanent managing directors), with power to appoint one other; qualification, 25s; remuneration as fixed by the company. Registered office, 43 and 44, Farnival Street, Holborn, E.C.

**Coniston Electrolytic Copper Works, Ltd.** (126,747).—This company was registered on January 25th with a capital of £1,000, in £1 shares, to carry on the business indicated by the title. The subscribers (with one share each) are:—J. F. Adkins, 240, Canbury Park Road, Kingston; F. F. Schellard, 28, Beckwith Street, W. & C. Private company. The first directors are not named. Registered office, 14, Cockspur Street, S.W.

**Ardwick Electric Regulator Co., Ltd.** (126,600).—This company was registered on January 20th, with a capital of £1,000 in £1 shares, to acquire certain inventions relating to electric controller regulators and controllers for electrical purposes, to carry on the business of engineers, manufacturers of electrical implements and other machinery, and to adopt an agreement with S. Smith, A. J. G. Fleming and T. Guerin. The subscribers (with one share each) are:—T. Guerin, 6, Mayfield Road, Whalley Range, Manchester; metal merchant; S. J. G. Fleming, 8, Redstone Avenue, Victoria Park, Manchester; salesman; S. Smith, 13, Mildred Street, Broughton, Manchester, engineer. Private company. The number of directors is not to be less than two or more than five; the first are T. Guerin (chairman), A. J. G. Fleming and S. Smith (all permanent); qualification, 100 shares. Registered office, 62, Queen Street, Ardwick, Manchester.

**North British Diesel Engine Works, Ltd.** (126,722).—Registered January 24th, by Ince Colk, Ince and Rowse, St. Benet Chambers, Finch Street, E.C. Capital, £1,000,000 in 500,000 preference, and 500,000 ordinary shares of £1 each. Objects: To carry on the business of mechanical engineers, manufacturers and repairers of internal combustion engines and electrical, steam or oil engines, foundries, smiths, machinists, boiler makers, central engineering contractors, builders, repairers, fitters and owners of steam and other ships and vessels, wet and dry dock and wharf owners, &c. The subscribers (with one share each) are:—T. H. Casebourne, St. Helens, Everley Park Road, Winchmore Hill, N.; cashier; W. Davies, 119, Thurlough Road, W. W. superintending; A. E. C. Greenwood, 53, Rectory Road, Walthamstow, accountant; L. Neville, 65, Windsor Road, Forest Gate, E.; clerk; F. B. Liley, 8, Holland Road, N. Brixton, S.W., shorthand writer; C. A. Targett, 32, Walwood Street, Burdett Road, E.; clerk; L. B. Colk, St. Benet Chambers, Finch Street, E.C., solicitor. Private company. The first directors (to number not less than five or more than nine) are to be appointed by the signatories; qualification, £1,000; remuneration as fixed by the company. No notice of situation of registered office was filed with the original papers.

**British Telegraph Instrument Co., Ltd.** (126,746).—Registered January 25th by J. H. Webb, Walter House, Strand, W.C. Capital, £5,000 in £1 shares. Objects, to carry on the business of manufacturers of instruments and appliances for use in connection with wireless and other telegraphy and telephony, cablegraphy, &c., to acquire the business carried on by A. W. Ward and W. W. Drury, at 93 and 93A, Stanley Road, Teddington, and elsewhere, as the "British Telegraph and Electrical Manufacturing Co." The subscribers (with one share each) are:—A. W. Ward, 179, Clapham Road, S.W.; J. H. Webb, Walter House, Strand, W.C., electrical engineer; C. B. Ward, 179, Clapham Road, S.W., engineer. Private company. The first directors (to number not less than three or more than five), are W. W. Drury, E. A. Poole, C. B. Ward and A. W. Ward. Registered office, 179, Clapham Road, S.W.

**Panama Electric Lighting, Power and Traction Co., Ltd.** (126,726).—This company was registered on January 21th, with a capital of £100 in £1 shares, to carry on the business indicated by the title. The subscribers (with one share each) are:—J. F. Crabb, 131, Stroud Green Road, N.; clerk; C. E. Ellis, 57, Rodenbury Road, Clapham Park, S.W., clerk. Private company. The number of directors is not to be less than two or more than seven; the first are H. W. Saunders (chairman and managing director), and F. G. Roper; qualification, £1; remuneration, £10 per annum (chairman, £15). Registered office, 30, Coleman Street, E.C.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Electrical Name and Numerical Sign Co., Ltd.**—Particulars of £3,000 debentures, created November 6th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £1,500. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Hampshire Light Railways (Electric) Co., Ltd.**—Capital £1,000 in £10 shares. Return dated November 29th, 1912. All shares taken up, £1,000 paid. Mortgages and charges: Nil.

**Hadley Trench and Wrockwardine Wood Lighting Co., Ltd.** (64,283).—Particulars of £3,000 debentures, created by resolutions of August 1st and 13th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

A memorandum of satisfaction in full on January 6th, 1913, of two mortgages or charges, dated June 20th, 1901, securing £1,250, has been filed.

**Musselburgh and District Electric Light and Traction Co., Ltd.**—A memorandum of satisfaction to the extent of £500 on December 31st, 1912, of charges dated November 13th, 1905, and May 11th, 1909, and September 12th, 1911 (unregistered), securing £30,000, has been filed.

**Keynham Electric Light and Power Co., Ltd.** (64,634).—Capital, £5,000 in £1 shares (5,000 pref.). Return dated December 31st, 1912; all shares taken up; £5,000 considered as paid. Mortgages and charges: £2,980 without interest.

**Derbyshire and Nottinghamshire Electric Power Syndicate, Ltd.** (in liquidation).—A memorandum of satisfaction in full on December 8th, 1912, of mortgage or charge, dated January 20th, 1904, securing £15,000 and interest, has been filed.

**Longstreth's, Ltd.** (64,823).—Capital £3,000 in £1 shares. Return dated December 2nd, 1912. 3,775 shares taken up. £1 per share called up on 2,275. £2,340 paid, including £65 on 225 forfeited shares. £500 considered as paid. Mortgages and charges: £1,700. Resolution passed December 16th, confirmed January 13th, to change name to "Lithanode, Ltd."

**Gosport and Alverstoke Electric Lighting Co., Ltd.** (82,693).—Capital £3,000 in £10 shares. Return dated November 29th, 1912; filed December 3rd, 1912. All shares taken up. £5,000 paid. Mortgages and charges: Nil.

**Indian Electric Supply and Traction Co., Ltd.**—Particulars of £75,000 debentures, created October 9th, 1912, and secured by trust deed dated January 1st, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £60,000. Property charged: The company's undertaking and property, present and future, including uncalled capital and leasehold and other property in India, of such nature as to be capable of being specifically mortgaged under the laws of India. Trustees: Beaver Trust, Ltd., 1, Queen Victoria Street, E.C.

**Cordoba Light, Power and Traction Co., Ltd.** (69,649).—Present capital £1,000,000 in £1 shares. Original capital £600,000 in £1 shares, increased to £800,000 in £1 shares on July 7th, 1910, and to present amount on July 14th, 1911. Return dated December 16th, 1912. 600,000 shares taken up. £1 per share called up on 170,000. £170,000 paid. £120,000 considered as paid. 5,320 shares have since been allotted, payable in cash. Mortgages and charges £905,000.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—Luton T.C. has increased the salary of the electrical engineer, Mr. COOKE, from £150 per annum to a maximum of £600, by £50 a year forthwith, and two annual increments of £50 each.

Mr. J. M. DAWSON, charge engineer at the Hanley electricity works, who is leaving to become chief engineer to the Bethnal Green B.G., has been presented by his colleagues with a travelling bag, a case of pipes, and several technical books.

Out of over 100 applicants, Mr. FRED. RILEY, of Rawtenstall, was, at a special meeting of Todmorden Corporation, on January 23rd, appointed electrical engineer, at a salary of £150 per year.

Mr. WILLIAM INNES has resigned his position as assistant borough electrical engineer, Metropolitan Borough of Poplar, in order to take up a partnership with Messrs. W. T. Towler & Sons, engineers and boiler makers, Stratford, E., which firm will henceforth be known as Towler & Innes.

**General.**—MR. LEE MURRAY, M.C.E. (Melb.), M.I.C.E., M.I.E.E., M.I.M.E., who recently retired from the position of general manager of Messrs. Bruce Peebles & Co., Ltd., engineers, Edinburgh, has started business on his own account at 10, Norfolk Street, Strand, London, W.C., as engineering representative (buying, inspecting, &c.) for firms and corporations in the Colonies and abroad.

The Times states that Mr. G. T. MILNE, who was recently appointed H.M. Trade Commissioner for Australia, is to sail early in February.

Mr. E. F. COX has resigned his position as burgh electrical engineer at Wishaw as from February 15th, and any further communication after that date will reach him, care of Cox & Danks, buffer makers, Wishaw. Mr. Cox has formed the firm of Cox & Danks with a view of putting down a forge for making general forgings, but more especially buffers for railway wagons, with which class of work he has been very familiar during the last five or six years.

**Obituary.**—The death of MR. JAMES FERGUSON, electrical instrument maker and engineer. Pollokshaws, removes one who was associated with Lord Kelvin in the development of some of his chief discoveries. Mr. Ferguson, who was only 43 years of age, was first a pupil of and then assistant to the great scientist.

## CITY NOTES.

### Lisbon Electric Tramways, Ltd.

MR. L. BREITMEYER presided on Wednesday over an extraordinary general meeting of the above company, held at the offices, 1, London Wall Buildings, E.C.

The CHAIRMAN said that the object of the meeting was to obtain the approval of the shareholders to an alteration of the articles of association with regard to the remuneration paid to the directors. At present the articles provided for a sum of £500, but that amount had invariably been increased by the shareholders at the annual meeting. It was now proposed to alter Article 86, so as to provide that in future the directors' remuneration should be £2,500, and he felt sure the shareholders would have no hesitation in giving their sanction to a measure by which the directors would be paid adequately for their services. He concluded by moving the alteration of the article.

MR. P. TROQUET seconded the resolution, and it was unanimously agreed to.

**St. James' and Pall Mall Electric Light Co., Ltd.**—The directors recommend a balance dividend on the 7 per cent. preference shares, for the half-year ending December 31st, 1912, of 3s. 6d. per share, and 6s. per share on the ordinary shares, making, with the interim dividend paid thereon, a total distribution of 10 per cent.

**Prospectus.**—The Toronto Power Co., Ltd.—The list was to close on Wednesday in an issue of £616,438 4 per cent. consolidated guaranteed debenture stock of this company, at £97 per cent. The stock is guaranteed, both as to principal and interest by the Toronto Railway Co.

**Central London Railway Co.**—The directors have declared the following dividends:—3 per cent. on the ordinary stock for the half-year, 4 per cent. on the preferred ordinary stock for the half-year, 2 per cent. on the deferred ordinary stocks for the year, carrying forward £27,218.

### Metropolitan District Railway Co.

THE directors' report that the expenditure on capital account during the half-year ended December, 1912, has been £25,009. The gross receipts on revenue account amounted to £346,655, being an increase of £23,810, as compared with the corresponding half of last year. The working expenses have amounted to £149,109, which shows a decrease of £3,546, but it must be borne in mind that in the corresponding half-year the charge for electric current included interest on the cost of the power house, &c., whereas from January 1st, 1912, when the power-house undertaking was leased to this company and the London Electric Railway Co. jointly, the interest, by way of rent payable under the lease, appears in the net revenue account. After providing for interest and other charges and setting aside £10,000 as a reserve for renewals, the net revenue account shows a credit balance of £85,694, out of which the directors recommend that the following dividends for the half-year be declared and be payable on February 7th, viz.:—At the rate of £4 per cent. per annum on the £4 per cent. guaranteed stock; at the rate of £4 10s. per cent. per annum on the £½ per cent. first preference stock; at the rate of £2 per cent. per annum on the 5 per cent. second preference stock. The following table gives a summary of comparative figures for the second halves of the years 1912 and 1911:—

	Half-year Dec., 1912.	Half-year Dec., 1911.	Increase or decrease.	Or per cent.
Gross revenue .. ..	£346,655	£322,815	£23,840	7·9
Working expenditure ..	£149,109	£152,655	£3,546	—
Passengers, including workmen & season ticket holders' journeys ..	43,092,589	39,867,661	3,125,928	8·01
Passengers carried at workmen's fares ..	7,587,633	7,128,160	459,473	6·45
Passenger receipts ..	£327,236	£300,625	£26,611	8·85
Average receipt per pas- senger ..	1·82d.	1·81d.	0·01	0·55
Train mileage on District Railway ..	2,046,698	1,888,733	157,965	8·36
Car-mileage on District Railway ..	8,159,584	7,756,476	403,068	6·20

The traffic continues to show satisfactory increases, but owing to the higher price of fuel and increases in wages, the working expenses have increased. The company are constructing a fly-under junction at Earl's Court, which will, when completed, considerably improve the train working.

The following Bills will be submitted for the consideration of the proprietors at a special general meeting to follow the ordinary meeting, viz.:—

1. "A Bill to authorise the Metropolitan District Railway Co. to widen part of their Fulham extension railway, to confer further powers on the Wimbledon and Sutton Railway Co., and for other purposes."
  2. "A Bill to extend the periods limited by the Wimbledon and Sutton Railway Act, 1910, for the compulsory purchase of lands for, and for the construction and completion of, the railways and works by that Act authorised; to raise additional capital; and for other purposes."
3. In future accounts will be submitted yearly, and one ordinary general meeting will be held in January or February in each year. Interim dividends will be declared in July or August. The directors have appointed Mr. C. S. Louch, accountant of the company in the place of Mr. Wm. Whittle, who retired on December 31st last, after being 42 years in the service of the company.

Half-year ending December 31st, 1912.

	On District Railway.			Total miles run by Dis- trict trains, including corres- ponding joint and foreign lines, of 1911.	Total for half-year of 1911.
	District Company's trains.	Other companies' trains.	Total.		
Train-mileage ..	1,880,865	165,839	2,046,698	2,619,289	2,468,268
Electric car- mileage ..	7,677,407	582,127	8,159,534	10,995,866	10,530,824

	Passengers.			Receipts.		
	1st class.	2nd class.	Season tickets (estimated journeys).	1st class.	2nd class.	Season tickets.
Half-year ended—						
June, 1911 ..	1,250,241	34,459,790	5,793,600	11,503,831	17,990,250	45,558,312
Dec., 1911 ..	1,683,513	33,273,850	5,589,698	39,897,661	15,139,212	43,168,900
June, 1912 ..	1,238,897	35,047,963	6,623,760	42,910,560	17,582,216	45,722,325
Dec., 1912 ..	1,184,381	35,499,910	6,438,948	43,692,589	16,042,261	45,916,627

The meeting is to be held to-day, Friday, at Westminster Palace Hotel.

### London Electric Railway Co.

THE directors' report for the half-year ending December 31st, 1912, states that the capital expenditure which was mainly on the new extensions, amounted to £279,322. The gross receipts on revenue account amounted to £376,710, being an increase of £10,520 on the receipts for the corresponding half of last year. The working expenses have amounted to £162,703, being a decrease of £9,238, but it must be borne in mind that in the corresponding half-year the charge for electric current included interest on the cost of the power house, &c., whereas from January 1st, 1912, when the power house undertaking was leased to the company and the Metropolitan District Railway Co. jointly, the interest by way of rent payable under the lease appears in the net revenue account. After providing for interest and rents, and reserving £7,500 for contingencies and renewals, there remains a balance of £113,220

available for dividends, and the directors recommend that a dividend at the rate of 4 per cent. per annum be declared on the 4 per cent. preference stock, and that a dividend at the rate of 1 per cent. per annum be declared on the ordinary shares, leaving a balance of £3,107 to be carried forward. The directors recommend that these dividends be payable on February 7th, 1913. The following table gives a summary of comparative figures for the corresponding half-years of 1912 and 1911:—

	Half-year Dec., 1912.	Half-year Dec., 1911.	Increase or decrease.	Per cent.
Gross revenue .. ..	£376,710	£366,190	+ £10,520	+ 2·873
Working expenditure ..	£162,703	£171,941	— £9,238	— 5·328
Passenger receipts .. ..	£350,304	£342,451	+ £7,853	+ 2·293
Train-mileage .. ..	2,807,557	2,741,369	+ 66,188	+ 2·417
Car-mileage .. ..	9,472,887	9,121,677	+ 351,210	+ 3·847

The following table gives the number of passengers carried:—

	Half-year ending—	Number, including season- ticket holders.	Receipts.
June, 1911 .. ..	.. ..	62,548,384	£369,326
December, 1911 ..	.. ..	48,660,842	£42,451
June, 1912 .. ..	.. ..	51,691,661	£363,925
December, 1912 ..	.. ..	49,190,925	£350,304

Satisfactory progress is being made with the construction of the Charing Cross and Paddington extensions. Work has also commenced on the Queen's Park extension and on the installation of escalators (or moving stairways) at Oxford Circus Station, for which contracts have been let since the last report. The company has sold during the half-year under review £235,056 of debenture stock, the proceeds of which are being used towards paying for the Golder's Green, Paddington and Charing Cross extensions.

The following Bills will be submitted for the consideration of the proprietors at a special general meeting after the ordinary meeting, viz.: "A Bill to empower the London Electric Railway Co. to construct new railways and for other purposes." Powers are sought by this Bill to enable the company to construct junction railways at or near Euston Station to connect the company's Hampstead and Highgate lines with the City and South London Railway, and at Hammermith to connect the company's Great Northern, Piccadilly and Brompton Railway with the London and South-Western Railway Co.'s Kensington and Richmond line. Powers are also sought by the Bill to obtain running powers over the City and South London Railway. The additional capital sought by the Bill is £463,000 of preference stock and £463,000 borrowing powers. "A Bill for empowering the City and South London Railway Co. to enlarge their railway tunnels; to raise further money; and for other purposes." By this Bill power is sought by the City and South London Railway Co. for the enlargement of the tunnels of that company, and to wholly or partially stop or suspend the working of their railway during the construction of such enlargement. Power is also sought by the City and South London Railway Co. to enter into working or other agreements with this company. The London Electric Railway Act, 1912, which included amongst other things powers to consolidate the authorised Edgware and Hampstead Railway with that railway, received Royal Assent on August 7th, 1912. The Edgware and Hampstead Railway Co. has therefore become part of this undertaking. By the Railway Companies' (Accounts and Returns) Act, 1911, which came into operation on January 1st, 1913, the obligation upon the company to prepare half-yearly accounts and to hold an ordinary general meeting more than once a year is removed. The accounts, in future, will be made up yearly, and one ordinary general meeting only will be held in the month of January or February in each year. The directors, however, will declare interim dividends in the month of July or August.

	Half-year, Dec., 1911.	Half-year, Dec., 1912.
Train-mileage .. ..	2,741,369	2,807,557
Car-mileage .. ..	9,121,677	9,472,887

The meeting is to be held to-day (Friday) at Westminster Palace Hotel.

### Cape Electric Tramways, Ltd.

AN extraordinary general meeting of the shareholders of the above company was held on Wednesday, at the offices 1, London Wall Buildings, E.C., Mr. L. Breitmyer presiding.

The CHAIRMAN moved the following resolution:—

"That the company's articles of association be altered by deleting Article 81 and substituting therefor the following:—"81. The board shall be entitled as from July 1st, 1912, to receive by way of remuneration in each year at the rate of £200 for each director, with an additional sum of £100 for the chairman and such further sums as may be voted by the members in general meeting. The division of all such remuneration between the directors shall be determined by resolution of the board from time to time."

He said that the meeting had been called simply for the purpose of dealing with the remuneration of the directors. As they would remember, the articles provided no fees, and hitherto it had been the custom for shareholders to vote the directors a sum at the annual meeting. At the meeting last November a discussion arose regarding the remuneration, and they would readily understand that that discussion was distasteful to him and his colleagues, and he was confident of their approval of the steps which were now being taken to settle the question once for all. The remuneration which they asked—£200 for each director, with £100 additional for the chairman—was not excessive, and they considered that they were fully entitled to it for the onerous work they were doing for the company. He might mention that they had received proxies for about 300,000 shares in favour of the resolution.

Mrs. DAVIS seconded the motion, and it was carried unanimously.

**Provincial Cinematograph Theatres, Ltd.**—A third interim dividend of 5 per cent. was paid on January 22nd, making a total of 15 per cent. for the nine months of the year ending January 31st, 1913.

**Gwynnes, Ltd.**—A petition for confirming the reduction of capital from £135,000 to £82,500 is to be heard in the Chancery Division on February 10th.

### Metropolitan Railway Co.

For the half-year ended December, 1912, the directors report that the total receipts were £402,544, and the expenses £191,550, leaving a profit of £207,994. Compared with the corresponding half-year of 1911, the receipts show an increase of £5,561 and the expenses a decrease of £1,239. The net revenue account, after providing for the interest upon the debenture stocks and other fixed charges and placing £7,500 to the electrical renewal and depreciation fund, shows a balance of £171,778, which will permit of the payment of the dividends upon the preference stocks, and leave a balance of £66,037 available for dividend upon the ordinary stock. The directors recommend a dividend upon the ordinary stock for the past half-year at the rate of £1 15s. per cent. per annum, carrying forward £9,197.

The Surplus Lands Committee announce that the dividend on the surplus lands stock for the half-year will be at the rate of £2 15s. per cent. per annum.

The passenger traffic for short distances has again suffered severely from the competition of motor-omnibus services, but the longer distance traffic is steadily growing. The season-ticket business continues to show a satisfactory expansion, while the receipts from goods and mineral traffic exhibit appreciable progress. A resolution will be submitted at a special meeting immediately following the ordinary meeting with a view to the creation of the capital authorised by the Metropolitan Railway Act, 1912.

A Bill is being promoted in the ensuing session of Parliament for the transfer to and vesting in the company of the Great Northern and City Railway; for the construction of railways to connect the Great Northern and City Co.'s undertaking with the company's railway near Liverpool Street Station and with the Waterloo and City Railway at the Bank, and for other purposes.

A Bill has also been deposited by the Metropolitan District Railway Co., which includes, amongst other provisions, proposals for the acquisition of lands for the enlargement of Aldgate (East) Joint Station.

These Bills will be submitted for approval at a special (Wharnclyffe) meeting.

The work of replacing the electrical plant originally installed at Neasden by improved machines is now practically completed, and a substantial saving in the cost of the production of current is thereby being effected, notwithstanding the serious increase in the price of fuel. In order to provide for the increased service of through trains between the St. John's Wood line and the City, and the contemplated working of an electrical service over the East London line, it has been necessary to proceed with the laying of additional cables between Neasden and Moorgate Street and the installation of another rotary converter at Baker Street Sub-Station. The subways at Moorgate Street connecting this company's station with those of the City and South London and Great Northern and City Railways, were opened on September 2nd last, and have proved a great convenience to passengers. Facilities for the working of through trains between the St. John's Wood line and the City have been greatly increased by the opening of the double junction at Baker Street on November 4th last. The electrification of the East London Railway is rapidly approaching completion, and the through running of Metropolitan trains over that railway will be shortly resumed. Further contracts for the widening of the railway between Finchley Road and Wembley Park and for improvements at Finchley Road Station have been met, and substantial progress has been made with these works during the half-year. Contracts have been entered into for the construction of general offices at Baker Street, and also of a block of residential flats over the railway close to Regent's Park. In pursuance of an agreement with the Strand Hotel Co., Ltd., a contract will be entered into for the erection by this company of a large hotel on the building site which will be created over the new station at Baker Street, fronting Marylebone Road. Negotiations for the acquisition of the land for the railway to Watford, authorised by the company's Act of 1912, are proceeding.

The proprietors are aware that the position of the company in relation to proposals for a union of interests between the various transit companies in the metropolis has engaged the careful consideration of the directors for some time past. Having regard to all the circumstances, the directors have come to the conclusion that the interests of the company would best be served by maintaining a position of financial independence. An understanding has, however, been arrived at whereby this company and the Underground Electric Railways Co. will work in friendly co-operation in order to obviate unnecessary competition and to afford the fullest possible facilities to the public.

The National Insurance Act, 1911, came into operation on July 15th last, and imposes a substantial burden upon the revenues of the company. A certificate of exemption from the Act has, however, been granted by the Insurance Commissioners in favour of the members of the company's clerical staff who are contributing members of the Railway Clearing System Superannuation Fund; but in order that the full benefits of that fund, as set forth in the Railway Clearing System Superannuation Fund (Contributing Companies) Act, 1906, may be secured, a resolution will be submitted to the proprietors at a special meeting which will follow the Wharnclyffe meeting.

The directors regret to report the death on November 10th of their esteemed colleague and deputy-chairman, Lord Furness, and desire to place on record their appreciation of his valuable services to the company since his election to the board in 1901. Mr. Paul Speak has been appointed to the position of deputy-chairman in his place.

The agreement with the Great Northern and City Co. for the acquisition of that company's undertaking provided for the election to the board of this company of two of their present directors, viz., the chairman (the Earl of Lauderdale) and Sir Clarendon Hyde. The vacancy on the board caused by the death of Lord Furness has been filled by the election of Sir Clarendon Hyde, and the proprietors will be asked to agree to a resolution to increase the number of directors from eight to nine in order to permit of the election of the Earl of Lauderdale to the board in the event of that portion of the company's Bill relating to the Great Northern and City Railway becoming law, and to make provision for the consequent additional remuneration of the directors.

Year.	Passengers.	Gross receipts.
1909	99,981,997	£696,881
1910	102,549,458	718,089
1911	101,620,653	720,745
1912	100,146,324	712,239

The figures given in the report practically complete a period of 50 years of the company's operations, the first section of the Metro-

politan Railway having been opened for traffic on January 10th, 1863. "In congratulating the proprietors of the railway on the attainment of its Jubilee, it is highly gratifying to record that during the half-century under review more than 3,500,000,000 passengers have been conveyed over the line, and that only on one occasion has a fatal accident occurred for which the company could be held in any way responsible." In future, the accounts will be made up in annual periods, but the directors are empowered to declare and pay an interim dividend for the first half of any year.

	Miles	
	Dec., 1911.	Dec., 1912.
Steam passenger trains	200,511	211,868
Electric " " "	1,769,687	1,769,047
Steam goods and mineral trains	97,407	98,284
Electric " " "	1,815	4,205
Total	2,102,510	2,103,576

**Blackpool and Fleetwood Tramroad Co.**—For the half-year ended December the amount of profit available for distribution to the shareholders is £14,027. The directors propose to pay a dividend for the six months at the rate of 9 per cent. per annum, which will absorb £6,750; to place £3,500 to depreciation; to place £750 to the general reserve account, and carry the balance forward.

**Dundee, Broughty Ferry, and District Tramways Co.**—The directors announce an interim dividend on the preference shares at 6 per cent. per annum.

**Singapore Electric Tramways Co., Ltd.**—A petition to the Courts, for confirming the reduction of capital from £400,000 to £100,000, is to be heard on February 4th.

**Yorkshire (West Riding) Electric Tramways, Ltd.**—The directors, in their report for the year ended December, 1912, state that after providing for all expenses, including repairs, maintenance, and debenture interest, the operations resulted in a net income of £20,106, which has been appropriated as follows:—To dividend on 6 per cent. cumulative preference shares, at 3 per cent. per annum, less income-tax, £4,531; to depreciation, renewals, reserve fund in lieu of accident insurance, and general reserve fund accounts, £7,329. £6,243 is written off preliminary expenses account.

**Parsons Marine Steam Turbine Co., Ltd.**—The directors have declared an interim dividend of 5 per cent. for the half-year to December 31st.

**Smithfield Markets Electric Supply Co., Ltd.**—The directors have declared a dividend of 2 per cent. on the ordinary shares for the year to December 31st, carrying forward £954.

### STOCKS AND SHARES.

Tuesday Evening.

EVERY market in the Stock Exchange is under the influence of the foreign political situation, which has forced business to a standstill, and depressed prices from Consols downwards. The unrest abroad is supplemented by unsettlement at home, and, by a whimsical turn of the political wheel, the Suffragettes have been able to command more serious attention this week than they have done through the carrying out of all their freakish operations in times past.

Markets in electrical railway stocks are quiet to dull. The declaration of the usual dividends on the Central London Trio had no effect upon prices, because it was agreed that the announcement was of academic interest only, having regard to the fact that the proprietors of the company have agreed to throw in their lot with the Underground Electric group. Metropolitan's were the Stock Exchange tip just before the announcement of the dividend, and when the figures quoted here last week were announced, the price ran up to 54 bid, from which it has quietly dwindled since. On balance this week, the stock is 1½ down. Districts also have gone back after being a good market, and Underground Electric Railway shares, though they touched 5½ buyers the other day, eased off later to 4½. The "A" shares of the company at 15s. are ½ down, but the Income bonds, the dividend on which is expected to be declared this week, gained a point. Anticipation looks for the full 6 per cent. on the bonds.

Activity has been stimulated in the shares of the New Central Omnibus Company, a concern which has a close working agreement with the London General Omnibus Company, and from 35s. the price was run up to 45s.

The decision of the London and Brighton Railway to electrify nearly 200 miles more of their line has imparted quiet strength to the shares of the London Electric Supply Corporation. The prices of the Ordinary and Preference are firm at 1½ and 5½, respectively. According to a Stock Exchange statement, the Brighton Railway is thoroughly well satisfied with the source of its supply, and there seems to be little chance at present of the company branching out into an electric power business of its own, while it is further said that the London Electric is capable of supplying all the current which the Brighton Railway will need for the proposed extension.

Edmundsons and Urbans are a better market, and Edmundson's Preference have responded in price. The market in City of London shares has become very dry again, business being only fitful, and pointing in no particular direction for long at a time. For the best-class shares there is a fair demand.

Questions connected with Electricity Supply shares naturally arose out of the National Telephone award, and although the positions of the companies and the National Telephone are radically different, it is only natural that shareholders should be inquiring whether they are likely to be treated in the same way as those in the National Telephone undertaking. It may mean that the boards of some of the Electric Lighting concerns will consider the advisability of changing their policy, and either distributing profits well up to the hilt, or else seeing to it that their reserves are, as far as possible, in actual cash, which can be distributed to their proprietors at any time. Prices in the market, however, suffered in no way in consequence of the Telephone award.

Demand for shares in the electrical manufacturing companies is associated with the idea that the latter are doing extremely well just now. In this case, and in that, one hears of books being full of orders for another year or so, and evidently those who are in the know are also not averse to buying a few shares in the companies most interested. British Westinghouse shares retain their rise of last week. Electric Constructions are better, and other issues in this department are, as a whole, easier to sell than they are to buy just at present. Crompton Debentures gained  $\frac{1}{4}$ , Callender's are  $\frac{1}{4}$  higher, British Thomson-Houston Debenture is  $\frac{1}{4}$  up, British Aluminium Ordinary and Babcock Ordinary are both  $\frac{1}{4}$  to the good.

Report has it that Edison & Swan Company may shortly lay before its shareholders a scheme of reorganising its capital, and a great deal of interest attaches to the way in which this will be done. If the £2 per share uncalled liability on the "A" shares is called up, we should think that the first Debenture-holders would have something to say, since this liability forms part of their security. At the same time, it would be better for all concerned in the company to have its finances placed upon a thoroughly sound basis; but the difficulties that there must be in the way of effecting equitable arrangements to all classes of the company can be well imagined. The First Debenture stock has fallen  $\frac{1}{4}$  points this week.

One of the excitements of the past few days has been a sudden descent in the price of Georgia Electric Light and Power shares, which from 52 slumped to 42. The reason for the drop was an extraordinary one. The previous advance had been brought about largely by the circulation of figures from the Company's office in London, showing that the Georgia Company would be in a position to pay 4 or 5 per cent. on its common shares, in respect of the present financial year. Later, however, it was discovered that certain of the statistics were inaccurate. Upon this came the slump already mentioned, and the incident has hung an atmosphere of doubt over all the undertakings connected with the Latin-Canadian group. The mistake appears to have been a purely accidental one in the London office, and to have had no official recognition from New York; but the bad impression created will take some time to dissipate, and it is peculiarly unfortunate that it should have occurred at the time when several other utility company issues were in immediate prospect. After the fall a mild recovery ensued to 43.

The Latin-Canadian group, as a whole, is somewhat upset by the Georgia incident, in addition to which there has been flatness in Mexican issues generally. Shawinigan fell 2, though the bonds are  $\frac{1}{4}$  up. Mexican Light and Power remain very steady, nor have Mexico Tramways moved. Montereys lost a point. On the other hand, Montreal Light, Heat and Power Common gained 6, and Royal Electric of Montreal  $\frac{1}{4}$  per cent. Debenture put on 2 bonds. Electric Development of Ontario bonds are  $\frac{1}{4}$  higher, in connection with the issue this week of \$3,000,000  $\frac{1}{4}$  per cent. guaranteed Debenture stock at 97 by the Toronto Power Company and the Toronto Railway Company. The prospectus of this newcomer appeared at a moment none too opportune for fresh appeals to the investor, but the stock can be regarded as a good investment of its kind, though it is offered at a price very little less than the quotation for the existing Debenture stock, which is 98. The Company's  $\frac{1}{4}$  per cent. Debenture stock (1918) stands at 99 $\frac{1}{2}$ . The rest of the electric tramways, railways and power group is steady. Anglo-Argentine Debentures show an improving tendency, and West Kootenay gold bonds are a little better. Victoria Falls Power Preference lost  $\frac{1}{4}$ .

National Telephone Deferred stock continues to provide plenty of scope for speculation. On balance, the movement is decidedly retrograde, the stock having lost another 5 points this week. The market revises its estimates almost from day to day; and as the stock goes lower, so are the calculations modified. Marconis, on the other hand, have been on the up grade, regaining most of the fall of last week. Opinion in the House still adheres to the idea that, in proposing the nullification of the agreement with the Government, the Marconi Company has made an excellent move. Certainly one of the unexpected developments has been increased speculation in the shares. Canadian, American and Spanish Marconis are moving in sympathy with the fluctuations in the parent shares, and, of the trio, the Canadians are the most animated.

The Telegraph market is very quiet. West India and Panama and Anglo-American Deferred both went back a little. Except for these movements, there are no changes worth mentioning. Reuters rose to 11 $\frac{1}{2}$ , the high yield again attracting purchasers. There are no movements to be recorded in any of the Eastern stocks and shares.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

## NEW TYPE OF SINGLE-PHASE LOCOMOTIVE.

THE 1,500-H.P. single-phase locomotive recently constructed for the Chemin de Fer du Sud by the Ateliers de Construction Electric du Nord et de l'Est, possesses a number of interesting features, chief among which are: Axle drive without connecting rods; simplified voltage regulation; improved commutation; and automatic current regeneration.

The locomotive is of the 1-C-1 type, weighing 86 tons (18 tons on each driving axle, and 16 tons on each trailing axle). Two air-cooled transformers, each of 750 kW. capacity, are mounted near the ends of the locomotive and are connected in parallel to the collector bows. An induction regulator is mounted on the upper yoke of each transformer, so that the total iron weight, losses and space occupied are hardly greater than those of a simple

FIG. 1.

step-transformer for the same output; the copper weight is 18 per cent. greater, but chokers and other auxiliaries are eliminated. The transformer secondaries are in series with each other and their induction regulators, which provide continuous voltage regulation between 200 and 760 volts.

Three 500-H.P. motors are mounted perpendicularly over the respective driving axles, to which they are connected by gear wheels, and the elastic universal coupling described below. The motors are of the compensated series type, connected in series across the transformer secondaries. On starting they can be connected as repulsion motors without field weakening. Speed control is by voltage variation from the induction regulator, and regenerative action on down grades is obtained by separately exciting the main motors from the compressor motors.

Fig. 1 shows the ingenious coupling employed between the motor and driving wheel. The motors are fixed to the loco. frame, and their centre of gravity lies 1.8 m. above the rail level. No connecting rods or cranks are employed; each motor drives a hollow shaft through a 1:2.72 gearing. The hollow shaft is concentric with the driving axle, and is connected to it by a flexible coupling.

The circular coupling piece *c* is provided with four extensions, of which two *t*<sub>1</sub>, *t*<sub>2</sub> are free to turn and slide in the bronze shells *c*<sub>1</sub>, *c*<sub>2</sub> mounted in the arms *B* of the hollow shaft, and two *t*<sub>3</sub>, *t*<sub>4</sub> in the shells *c*<sub>3</sub>, *c*<sub>4</sub> held with some play in the track wheel flange. This arrangement permits a certain rotation of the hollow shaft round the driving axle and a certain inclination to its axis. The shells *c*<sub>3</sub>, *c*<sub>4</sub> can slide parallel to the axle in their bearings *p*<sub>3</sub>, *p*<sub>4</sub>, so that the coupling allows for side play. Finally, the bearings *p*<sub>3</sub>, *p*<sub>4</sub> are held between springs *R* in the wheel flange; these springs prevent shocks on starting the locomotive and damp oscillations in the driving torque. It is found that the lubrication of the coupling offers no special difficulties, and the mechanism operates satisfactorily at train speeds up to 80 km. per hour, and under most severe braking conditions.

The windings of the induction regulator and the compensation are so arranged that leakage is practically confined to coil end, slot, and zigzag leakage, and is very low. High power factor is thus secured.

The motor output is 500 H.P. at 450 R.P.M. under a terminal voltage of 230 volts. The efficiency, including gearing, is then 87 per cent., and the P.F. 93 per cent. At 400 H.P. output per motor, the efficiency is 88 per cent. and the power factor 95 per cent.

Complete compensation and good commutation are secured by two windings, 1, 2 (fig. 2a), of different sections and number of turns, connected in parallel and lying in the same slots. In this winding there flows a compensating current, displaced 90° from the working current, proportional to the latter and independent of

speed. At constant load (and hence excitation) the voltage between commutator bars induced by the alternating field is constant and represented by the line *A A* (fig. 2b). The pressure dynamically induced by the compensating current is proportional to the speed and is represented by *O N*. The difference between *A A* and *O N* gives a good commutation characteristic. The characteristic of an equivalent simple repulsion motor is given by the difference between *A A* and the parabola *O C*, and is much less satisfactory. On full starting current, *O A* = 3.5 volts, and it becomes zero at a train speed of about 50 km. per hour. At low speeds, the repulsion connection yields best commutation. The windings 2 (fig. 2a), are now disconnected from 1 and placed in parallel, motor to motor, this arrangement constrains the motors to run at equal speed, and is an admirable substitute for coupling rods.

Current regeneration is rendered more difficult by the requirement that it shall be effected over a relatively wide current range. The single-phase Latour shunt motors driving the compressors are provided with auxiliary stator windings. The main winding is supplied at a pressure *E*<sub>1</sub> (in phase with the supply pressure), from transformers. The auxiliary winding, in quadrature with the main winding, induces an alternating field in the main motors and a total E.M.F. *E*<sub>2</sub> almost in phase with *E*<sub>1</sub>. By a suitable setting of the induction regulator, the total secondary voltage *E*<sub>3</sub> can be made equal to *E*<sub>2</sub> so that the circuit can be closed.

Directly it is attempted to return current to the network by lowering *E*<sub>3</sub>, there arises serious phase displacement between current and pressure; referring to fig. 2b, the phase displacement is given by:  $\tan \phi = \omega L / w$ . To increase the power factor, *E*<sub>3</sub> is displaced with regard to *E*<sub>2</sub>, as shown to the right of fig. 2c, this being automatically effected by a transformer, the primary of which carries *J* and the secondary of which is connected to the compressor motor terminals. To compensate for the phase displacement produced by the watt-current required to drive the compressors and fans and to cover losses, a compensating transformer is provided and, finally, transformers and ohmic resistance serve to compound the compressor motors so that the latter operate at unity power factor at all times. The connections of these small transformers appear complicated, but their practical operation is very satisfactory. Regenerative braking is practised at speeds between 22 and 55 km. per hour; it occurs quite automatically from the driver simply controlling the degree of braking by a lever — E.T.Z.

## AUSTRALIAN TRAMWAY COMPANIES AND THEIR EMPLOYÉS.—IX.

(Continued from Vol. 71, page 568.)

THE settlement of the Melbourne rates, which was given in our last article, seemed to pave the way to further arrangements, and the Court adjourned in the hope that other settlements by consent would be made. In several cases, however, agreements could not be arrived at, and, on September 23rd, the Court resumed its sittings, continuing them until October 15th, when a further adjournment took place till November 26th. The case commenced on March 4th, and has occupied the attention of the Court for nearly 90 days. The Judge has now stated that his decision, when arrived at, will be retrospective as from November 1st last. When the Court resumed on September 23rd, it was stated that complete settlements had been come to in the cases of Melbourne and Perth,

FIG. 2a.

FIG. 2b.

FIG. 2c.

and that agreements were practically complete with Ballarat, Bendigo, Hobart, Fremantle and Northcote.

At North Melbourne there was still trouble, the men not seeing their way to make the few concessions from the Melbourne terms rendered necessary by the company's financial position.

The case of Adelaide was then taken. The situation here is somewhat peculiar; in 1906 the South Australian Government bought up the interests of the horse car systems in Adelaide for £280,000. Next year a Trust was formed to carry on the working and to unify and electrify the systems. The Trust has in all incurred liabilities amounting to £1,500,000 to the Government, and is bound to repay this sum in 30 years. The Trust had to pay all its receipts to the treasurer, and after payment of all expenses and the provision of a 24 per cent. renewal fund, the balance went to the repayment of the loan. If this was not sufficient, the benefitting localities had to make up the difference from rates. It was shown that on the past year's working there was a deficiency of £15,000, due entirely

to sinking fund repayments. The position was that the fares in Adelaide were very high, and any addition to the pay-roll would practically have to be paid by the ratepayers. The Trust had already improved the conditions of its workers, but to a large extent its hands were tied. The Judge suggested wages on the Melbourne scale, but the Trust could not then see its way to grant them, or the men to accept them, as they considered that a motorman's work was more important than a gripman's. The question of the 1 minute wait at terminals was discussed, and it was stated that to increase it to 3 minutes would mean 23 additional cars in service, and an extra annual cost of £26,624. Mr. Goodman, the manager of the company, pointed out the difficulty of keeping working times within 8 hours per day, and stated that he thought that overtime rates should be reckoned after 9 hours' working.

Although the Trust could not see its way to definitely offer the Melbourne rates, a ballot of the men refused to accept them on the ground of the higher cost of living at Adelaide.

It was stated that the extra cost to the Trust of an agreement on these terms would be about £11,000 per year which would mean additional rates in the various townships of from 2d. to 4d. in the pound. It appeared that the sinking fund was about £41,000 per year, and that after paying all expenses and a small interest on the capital, there was a balance of £26,000 to go towards the sinking fund, leaving a deficiency of £15,000, as already stated. The Judge asked whether, under these circumstances, the Trust ought to want to pay low wages to its employes simply because it was under a liability to pay off a sinking fund. Had not the worker a prior claim on the net profit of working the system? Some interesting evidence on the cost of living and house rents was then given by Mr. Lightfoot, an officer of the Statistical Department, on the basis of last year's costs. Amongst other figures, he gave the following comparison of the relative cost of food, groceries and four-roomed houses in various parts of the Commonwealth:—Calling Melbourne 1,000, Sydney would be represented by 1,119, Newcastle 913, Broken Hill 1,108, Ballarat 841, Bendigo 833, Geelong 913, Brisbane 919, Rockhampton 930, Adelaide 1,117, Perth 1,177, Kalgoorlie 1,447, Hobart 1001, and Launceston 951. Rents would compare as follows:—Melbourne 1,000, Sydney 1,236, Geelong 863, Brisbane 802, and Hobart 818.

This concluded the evidence on behalf of the Adelaide Trust, and the case of Brisbane was next gone into. Mr. Frew, on behalf of the Brisbane Tramway Co., contended that there was no industrial dispute. The men's Union had lodged claims, but that did not constitute a dispute. The company thought that the troubles they had had with their workpeople had been due to the interested efforts of Mr. Prendergast and other officials of the Union, who had done their best to sow discontent against employers. The Judge pointed out the lack of any sympathetic tone in these remarks, and showed how, in his opinion, the company had taken up a too autocratic attitude, which had been the real cause of the trouble with the men.

The Judge then asked whether the company would undertake that in future there would be no preference shown to non-unionists over unionists. This was referred to the company at Brisbane, who replied by a counter inquiry as to whether an answer from them would mean that they accepted the jurisdiction of the Court. As the Judge would not accept this as an answer, a further request for a direct reply was forwarded to the company at Brisbane.

A number of complaints were then made by Mr. Frew as to the manner in which the men's Union conducted their business, and the way in which they secured adhesions to their policy, but the Judge remarked that this argument cut both ways, in view of the manner in which the company asked their employes to go to their solicitor's office to sign their own petitions. Mr. Frew then argued that the lower costs of living in Brisbane justified lower wages than in Melbourne, and took up the position that a motorman's duties were less arduous than a gripman's. The Judge pointed out this was exactly opposite to the opinion held in Adelaide.

Before the conclusion of Mr. Frew's address, the Court adjourned. It was intimated that several of the other tramway authorities were ready with their employes to ask the Judge to meet them and arrange a settlement. Mr. Justice Higgins intimated that he would appoint a time at the next sitting of the Court.

## HONG KONG UNIVERSITY.

PROF. C. A. M. SMITH has sent us a list of apparatus offered—the replies sent within a fortnight of his appeal to our readers. This we give below. He says that he is certain that this is merely a preliminary list, and he wants British manufacturers to support him thoroughly. He is almost pathetic concerning the recent telephone contract for the city of Canton (over £100,000). Canton is within 80 miles of Hong Kong,—yet a Continental firm got the order for the telephones. He begs Britishers not to let the Canton electric tramway scheme be captured by their trade rivals.

As for the University—there are visitors every day. There are 37 engineering students this year, and already there are indications of a further increase in numbers next year. We are glad to learn that the Councils of the British

Engineers' Association, and the Institutions of Electrical and Mechanical Engineers have been asked to nominate members for the London Committee of the University of Hong Kong.

We understand that oil and gas engines up to 20 H.P., driving 110-volt D.C. dynamos, are wanted, and also electric motors and switchgear for use with machine tools. Later on we hope to publish a more complete list of apparatus presented. Meantime, Prof. Smith wishes to sincerely thank ourselves and another journal, also the British Engineering Association, which, he says, has more than justified its existence by its splendid co-operation with him.

## PRELIMINARY LIST OF APPARATUS PRESENTED BY BRITISH ENGINEERS.

1. Storage battery, 60 cells, 480 ampere-hours. (The Chlor Electrical Storage Co., Ltd., Manchester.)
2. Experimental steam engine, complete, with condensing plant. (Messrs. Marshalls, Ltd., Gainsborough.)
3. Ten H.P. vertical oil engine, coupled direct to D.C. 110-v. dynamo, mounted on base complete. (Messrs. L. Gardner & Sons, Ltd., Patricroft, Manchester.)
4. Semi-Diesel oil engine. (Mr. Locke.)
5. Water-tube boiler, oil-fired heater, filters, burners, &c., complete. (Messrs. J. Samuel White & Co., Ltd., Cowes, I. of W.)
6. Water-tube boiler complete. (Messrs. Babcock & Wilcox.)
7. Hot air engine, with pump attached, water meters, &c. (Messrs. Hayward, Tyler & Co., Ltd.)
8. Marine motor engine. (Messrs. John I. Thornycroft & Co., Ltd., Chiswick.)
9. Wood-working lathe and circular saw. (Messrs. A. Ransome & Co., Ltd.)
10. Motor starters, circuit breakers, &c. (Messrs. Ferranti, Ltd., Hollinwood.)
11. Various meters, electrical instruments, &c. (The Wale Electrical Co., Ltd.)
12. Assortment of electrical switches and gear. (The Venetian Switch Co., Ltd.)
13. High-speed twist drills, turning and planing tools. (Messrs. Turton Bros. & Matthews, Ltd.)
14. Water meters and fittings. (Messrs. Glenfield & Kennerly, Ltd.)
15. One 14-in. reversible level. (Messrs. T. Cooke & Sons, Ltd.)
16. Various tools as desired. (The Hardy Patent Pick Co., Ltd.)
17. Electrical machinery, telephone gear, &c. (The General Electric Co. of China, Ltd.)
18. Fery spiral radiation pyrometer. (The Cambridge Scientific Instrument Co., Ltd., Cambridge.)
19. Photo arc lamp. (The Westminster Engineering Co., Ltd., London.)
20. Case of steel fractures. (The Eagle & Globe Steel Co., Ltd., Shanghai.)

## TRAMCAR GEARS.

WE understand that the Birmingham tramways are to adopt the system of driving from both ends of the motor spindle, employing two sets of wheel and pinion gear, and thus equalising the distance between the road wheel and the gear wheel on the two sides of the motor. Incidentally, and this is perhaps not the least important benefit which will accrue from the change, the wear on the motor bearings will be equalised between the two ends, and there will be no further need for two patterns of white metal or the casings therefor. The parallelism of the motor spindle and the driven axle should no longer be a matter of few seconds' duration, but should be permanent, and the bearing pressure between the gear teeth should be distributed and should remain distributed across the faces of the wheels, so that the wear of the teeth to a sharp edge at one end, while the other remains nearly of its full section, will be avoided. As it is obvious that two wheels of half breadth will be stronger than the present double-breadth single wheel, it will be seen that this is a move that ought to have been made years ago for the faults of the existing system are all too visible, and they have often been pointed out.

The use of the parallel axle should also receive consideration. In railway work the parallel axle condemned itself years ago by its frequent breakages, and amendment was only secured when the axles were forged or rolled down thinner in the middle, in order to give them elasticity. This was done in the days of wrought-iron axles, and wrought-iron was much less liable to fail than is steel.

This liability to failure of steel is still more marked here wheels with sharp-edged bored centres are fitted lightly on a plain straight axle. After such axles have run a time, they break off at the edge of the wheel bore. The best way to overcome the trouble is to turn the wheel-bore slightly larger in diameter than the rest of the axle, and to make this swelled portion shorter than the length through the boss. Thus the boss overhangs the swell, as in fig. 1, and failure is not caused, for there is no keen pressure on the axle by the sharp edge of the wheel bore at *a*. If the swell is not made upon the axle, then the boss of the wheel could not be bored of equal size right through. Half an inch from each end the bore should begin very gently to

FIG. 1.

FIG. 2.

increase in diameter, as shown much exaggerated in fig. 2. The diameter between *d* and *c* is to be increased, so that a fairly stout "feeler" can be entered, and then beyond the corner may be rounded to  $\frac{1}{8}$  radius.

There must not be an angular change at *d*, but the curve *d* should be hyperbolic, so that where it departs from *d* the change of diameter shall be insensible. By this means any sudden nip in the metal of the axle is avoided. Even in fig. 1 the same bell-out of the bore may be carried out with advantage.

Where keyways are sunk in a shaft or axle the end should not be sudden, but the bottom of the keyway should curve gradually up to the surface, so as to avoid the risk of that sudden change of section, so fatal to steel.

Experience may show that the system of equalised double driving will not only diminish the breakages of axles, but may do something towards diminishing the evil of rail corrugation as well, which some engineers believe to be caused or intensified by the greater length of axle exposed to torsion on one side than on the other side of a car. If the two wheels differ in circumference, the long end of the axle is wound up by torsion like a spring. When the torsion stress exceeds the frictional grip on the rail, one wheel releases itself hold on the rail, and produces an abrasion. Such release will be determined for a given wheel by a variety of circumstances such as the relative quality of the two tires concerned, and the class or quality of the rails on which the wheels happen to be running at the time.

Axle torsion can, of course, occur in any case of unequal wheels, but in the case of driven wheels there is the additional fixed point of the gear wheel. With two points of gearing the torsion angle will be small, for there will be so short a length of axle to twist, and the intermittent slip which causes corrugation will be so frequent as to become equivalent to a steady grinding. In aid of the solution of corrugation some assistance might, perhaps, be obtained from tests on the angular torsion of axles under stress, with a view to finding how far two wheels can be put out of phase with each other before they slip on a restraining braking surface.

## ELECTRICAL DANGERS.

By S. LEES.

THE intelligent observant mind cannot fail to have noted with something akin to alarm the rather disturbing frequency of fatal electrical accidents, particularly amongst skilled workers, during the past 12 months or so. At the subsequent inquiries into several cases of fairly recent date, it transpired that the victim had either omitted precautions altogether, or taken quite inadequate ones against risk of shock whilst working in a dangerous situation. In some other cases, although the medical testimony was clear enough regarding the cause, no evidence was forthcoming as to how the deceased had received the shock.

It would seem, at first thought, inexplicable that skilled workers, extraordinarily conscious of the grave possibilities attendant on such lapses from what really is, or, at any rate, ought to be, part of their routine, should ever, even for a moment, allow vigilance to relax, or permit their mind to wander from the thought of the dreaded danger, as so often happens, within easy reach of it. One reads too often of the sad results following neglect to use the much-maligned rubber gloves. But those having actual experience of the average example of rubber glove, especially in confined places—and it is under such conditions that the employment of these accessories mainly applies—will readily concede that some extenuation may not unreasonably be allowed where a skilled worker disdains to wear the protective rubber sheath. Armed with the average glove, the manipulation of anything smaller than, say, a  $\frac{1}{2}$ -in. size spanner, will almost invariably require the dexterity of a Maskelyne. The operator knows full well that he needs must keep a watchful eye on small details, such as nuts, screws, and what not, these often of Lilliputian proportions, as the inadvertent loss of one or other amongst a mass of closely adjacent "live" metal may easily complicate matters regarding not only the quality of his work, but what is most important of all, his personal safety, by introducing an element of added danger in the process of recovery thereof.

With men accustomed to handling "live" work, involuntary twitching of the nerves is a fairly common complaint, and often an attack which may be only of momentary duration is mistaken for the sensation of electric shock. The effect is certainly very similar. The sensation consequent on a blow struck on the ulnar nerve, or, as it is more popularly known, the "funny bone," is remarkably like the sensation of electric shock, and, curiously, this part of the human anatomy seems peculiarly liable to injury. Now, such a circumstance occurring under the usual conditions surrounding live working is easily conceivable, and it will be obvious that the almost inevitable, although, maybe, only very temporary confusion following, may be easily attended with serious results to the unfortunate worker. Again, a simple fit of sneezing, which under more congenial surroundings might prove beneficial, would, perhaps, possess grave potentialities of harm to the one so affected. The writer has often watched men working in risky places and become interested as to the cause of the profuse perspiration which attacks them, even during the coldest weather. An explanation would seem to point to some form or other of slight paralysis, or intense numbness, which temporarily affects the respiratory organs. Cramp of the fingers is common to men who are used to working on live metal in confined places, and it is quite the usual course for such workers to take a temporary rest to enable them to massage their hands.

Following the adoption of the Home Office new rules and regulations, manufacturers and others closely interested have hastened to remedy or otherwise bring into conformity with the changed order of things, apparatus, notably switchgear, of ante 1910 design. While undoubtedly some considerable measure of success has attended these laudable efforts, there still exist on the market numerous examples of switchgear of various types, which, owing principally to price considerations, find a ready sale, in spite of the fact that under the new regulations the employment thereof is prohibited. One well remembers the almost feverish cry so familiar some two years ago for all-metal enclosed switchgear. The result was the production on an unparalleled scale of a type of the now common ironclad gear, which was to prove the panacea for all the troubles hitherto experienced, which switchgear was often supposed to be heir to. But too often one is forced regretfully to admit that the substantial-looking mechanical iron case covers up a multitude of electrical sins inside.

The design of switch-handling media, too, still seems to receive but scant consideration from manufacturers generally, notwithstanding that in the new Regulations it is provided that:—(Clause 3) Every switch, switch fuse, circuit-breaker and isolating link shall be (a) so constructed, placed, or protected as to prevent danger; (b) so constructed and adjusted as accurately to make and maintain good contact; (c) provided with an efficient handle or other means of working insulated from the system, and so arranged that

the hand cannot inadvertently touch live metal; so constructed or arranged that it cannot accidentally fall or move into contact when left out of contact.

Speaking from extensive actual experience under everyday working conditions, the writer is reluctantly forced to the conclusion that even in these enlightened days, sub-Clause (c) in the extract quoted above is more often honoured in the breach than in the observance thereof. These details were better understood a quarter of a century ago. The writer remembers some examples of low-pressure switchgear by Siemens during the early nineties, which afford an interesting comparison at the present time. The gear referred to formed part of a large three-wire central supply station switchboard. All the generator switches thereon were fitted with interlocking devices to prevent mishap due to inadvertent operating, and, in addition, hand-insulating shields of circular form over 6 in. in diameter were provided for the safety of the operator.

It has now become the common practice to provide the popular knife switch, or its many modifications, with some form or other of sparking device to prevent injury caused to the main contact member by arc burning. The form usually adopted is a light construction of one or more auxiliary contact pieces hinged to the main member. It is no exaggeration to state that with the majority of such switches the disposition of the handle or grip is such that the operator runs not a little risk of injuring his hand owing to the too close proximity of the surrounding metal, which often presents sharp projections. One well-known make of switch of the type referred to has several wicked-looking spear-like mountings placed so close to the handle that it is physically impossible to close the blade without lacerating some part or other of the operator's hand. The *modus operandi* usually observed in working such switches is first to half-close by hand, and then to drive home by means of a stout piece of wood. To open under load the only way consistent with a reasonable margin of safety is to use the aforesaid stick with the addition of a hook-like projection. Further, the practice of mounting handles and grips directly on top of vertically-disposed switches, especially of the conventional knife type, is distinctly bad, and should be rigorously condemned. When coupled together such handles are almost invariably secured to an indifferently designed insulating cross-bar, which usually, owing to manufacturing considerations, literally bristles with "live" metal, and against which no protection, or worse than no protection—an apology in the shape of a ridiculous flange turned on the handle itself, which gives the operator a false sense of security—is provided for the hand.

Metal-clad switchgear, especially for situations where it is liable to be subjected to careless handling by the non-technical worker, whilst being a step in the right direction, is rather apt to be over-estimated in order of importance. It is obvious that switchgear of robust mechanical design is worthless unless embodying equally sound electrical construction. It is of no use to employ massive metal moving parts, including handles or grips, with contingent heavy cast-iron covers, water-tight, dust-excluding, fool-proof, and what not, whilst the safe working of such devices depends wholly upon the integrity of a diminutive vulcanite or fibre washer, or ferrule. Yet it is a matter of common knowledge that numerous examples of such gear are made and marketed and assured of ready sale at this day.

We know the laboratory teaches us that substances such as vulcanite, mica, &c., all possess really wonderful insulating properties, even when only of microscopic thickness, but experience should surely have taught us also by this time the absurd fallacy of carrying laboratory conditions into switchgear practice, particularly for work on heavy power service. Further, one might, not unreasonably either, go a step further and include some of the smaller types of illumination switch apparatus. Many examples of small-current hand switches are veritable sinners in this respect, the insulation (save the mark) usually being of ridiculous proportions, and not a few accidents to operators have been traced to failure of the insulation in ordinary tumbler switches, key-lampholders, adapter devices, &c. The last-mentioned are used largely on inductive circuits with fan-motors, vacuum cleaners, &c.; the inadvertent opening of such a circuit at

the adapter connection would, in all probability, be attended by serious injury to the operator's hand.

Most, if not all, makers now provide some arrangement or other, usually a bonding screw, for earthing purposes, in compliance with the revised Regulations. Given good earth, and good earth is not by any means a definitely certain quantity, it might not unreasonably be urged that no untoward consequences need be apprehended in the event of a defect developing on the circuit apparatus or gear. But a condition is easily conceivable where, say, a metal switch-handle may be very much "alive," whilst the metal protecting cover of the switch proper remains insulated therefrom, and at earth potential.

The continuity question is still awaiting satisfactory solution, and regarding this subject it appears to the writer at least that the efforts of some would-be solvers, although otherwise laudable enough, seem at times rather inconsistent. On the one hand we have manufacturers who pride themselves, naturally enough, on the excellence of the enamel protection used on their products, especially conduit tubing. On the other hand, we find the same maker, or, it may be, some trade rival, evolving some contraption or other which only requires springing or clipping on such tubing to ensure perfect metallic continuity, or for earthing. The excellent quality of the aforesaid enamel, which is declared to be absolutely impervious to all sorts of severe tests, is, as it were, rendered instantly impotent by the adoption of *So and So's* patent continuity device.

Quite recently the writer in the course of his vocation had to do with a number of D.C. motors of a certain well-known make and of up-to-date design. Excellent machines otherwise, they had one potentially weak point. The brush gear was fitted with a tension device, adjustment of which was provided for by means of a small insulating knob, about  $\frac{1}{4}$  in. in diameter, and flush with the metal spindle to which it was attached. It was practically impossible to grip the said knob without some part or other of the hand coming into contact with "live" metal. Another case of, one might well say, unpardonable inconsistency, was a batch of automatic circuit-breakers, splendid switches as regards duty, by the way. The trip coils had been most carefully insulated on the exterior with sheet fibre, the whole finally being securely bound together with several turns of No. 16 bare copper wire, the ends of which were firmly anchored to one of the breaker's live terminal binding posts.

## EFFICIENCY IN THE ESTIMATING DEPARTMENT.

[COMMUNICATED.]

In the hurry and rush of modern business, and particularly during "boom" periods, such as that which we are at present experiencing, it is impossible to give too much attention to those internal methods, which, when carefully arranged, make for smooth working. The writer hopes, therefore, without giving an exhaustive description of estimating department practice, the following remarks may prove of interest and value:—

Considering, in the first place, the personnel of the department, there can be little doubt that, in most cases, the average engineer, by his very training, becomes unfitted to take control of office routine work, but, perhaps, in the future, the further development of the so-called "commercial" engineer will tend to improve matters in this respect. However, when the most desirable state of affairs is not possible, it should not be detrimental to the work of the department if the head be a non-technical man, provided he has that keen commercial spirit, tact, and general capability which are essential, and can be assured of an adequate staff of assistants. These assistants may be partly recruited from pupils who have finished their shop experience, and have also been through the drawing and design offices, &c., but a proportion of them should be on the permanent staff, so far as is possible.

Taking here as an example one of the "universal provider" class of manufacturers, the sectional work should be subdivided within reasonable limits, and with careful consideration of its nature. To quote an instance, the machine section should obviously deal with all the concomitant apparatus, such as starting, regulating and switchgear, &c. This sub-division, however, must not be carried to extreme, and it is a mistake to go so far as to create several estimating departments where one should suffice, thereby involving a certain amount of overlapping, duplication of work, and lack of cohesion, besides increasing the establishment charges, which disadvantages greatly outweigh the few minor advantages obtained with the separate departmental system.

With regard to clerical routine, the following procedure is one which the writer has found by experience to be most advantageous.

Enter every inquiry immediately on receipt under the following headings:—Date received: reference number of inquiry; name; description (class of apparatus stated briefly): date quotation due out.

These headings could, of course, be extended to suit various requirements. It may, for instance, be useful to add a column for the name or initials of the estimating man who will prepare the tender, or for that of the salesman who will follow it up. The reference number should be quoted in all correspondence, and when, as is often the case, a later revised inquiry is received, it is not advisable to assign a new reference number, but the original number should be retained, with the suffix "a," &c. If this method is not observed, considerable difficulty in keeping the correspondence files straight may be experienced.

Such an elementary matter as indexing need not be here mentioned in detail, but although it forms part of the deadly dull routine work usually relegated to the office boy, its prompt and accurate execution is essential to the well-being of the department.

There is one point of great importance (though nevertheless often neglected), viz., that all inquiries should be immediately acknowledged where it is not possible to quote by return post. Frequent negligence in this matter is discourteous and inexcusable, and, being so, naturally causes offence, and in these days of keen competition no one can afford to offend a possible customer. This leads up to an equally important requirement, namely, the necessity of preparing and dispatching quotations and tenders with the utmost expedition. It is, unfortunately, too often the case that there is a prolonged delay in sending out estimates, with exasperating results all round. Imagine the consternation and distress of mind of an unfortunate salesman, following up a tender, after perhaps several hours' travelling under the worst conditions, upon being told on arrival that the order was placed some days "before your people quoted, as I thought they were too busy!"

When it is necessary to refer to one or more of the design departments, to the drawing office, or any other part of the organisation, or to outside manufacturers, steps should be taken to ensure that each portion of the specification is put in hand concurrently, and not consecutively. This may be done by copying out essential extracts, but such typing should be carried out judiciously, for to retype the whole of a long specification is, in most instances, sheer waste of time. (In the case of publicly advertised contracts, most municipal bodies will willingly furnish a duplicate copy of the specification.) It is impossible to emphasise this question of promptitude too much, as it constitutes one of the principal factors tending towards good business relationships between the manufacturer and his customer.

In the case of an important inquiry, where ample time is allowed for preparation of the tender (and *à propos*, some kind friends err very much the other way: may they read these notes!) it will be found very advantageous to go through the specification immediately on receipt and to make memoranda of the more important features before referring it to the designing engineers. Later, when finally making up the tender, reference to these notes is an extremely useful check. Such memoranda should preferably be made by the head of the department, before turning the inquiry over to the assistant.

Prices should always be "made up" on an estimate sheet,

this being so arranged as to set forth clearly the cost of each item, freight and packing, special development charges which may be incurred, per cent. profit, total cost, total selling price, &c.; this sheet should be checked by another member of the staff.

All estimating men should cultivate the art of quick and accurate dictation and composition, observing the necessity of stating with brevity and lucidity the vital points of the tender and the more important features of the apparatus; particular emphasis should be laid upon any advantages over competitors' apparatus, which can be demonstrated, and mention made of any installations which may have been carried out. Do not hesitate to submit an alternative proposition, if the circumstances warrant it. Tact in plenty is a very necessary qualification, and is never more required than when corresponding with clients having idiosyncrasies (they do exist!). Avoid ambiguity of expression, repetitions, and side issues. Even if not asked for, it is advisable to state a time for delivery, and to forward descriptive literature, illustrations, and dimensioned prints, as attentions of this nature at the outset are not only appreciated by the prospective customer, but are helpful to the salesman, and often save future correspondence.

Three copies of the quotation may be made, these being disposed of as under:—

1. Filed numerically with complete correspondence in suitable folder.
2. Filed alphabetically in customer's docket.
3. Handed to the salesman.

Further copies may, of course, be distributed to meet any requirements that may arise.

As indicated at the outset, these notes are by no means intended to be exhaustive, but the writer ventures to hope that they will be of some use to others who may be considering the subject as it affects their own particular sphere, though the application of the suggestions herein expressed will not, of course, produce any good results unless tempered with that grain of common sense, without which no system, no matter how perfect theoretically, can flourish.

**The International Ampere.**—A detailed account is given in No. 2, Vol. 8, of the "Bulletin of the Bureau of Standards," of the work done by Messrs. E. B. Rosa, N. E. Dorsey and J. M. Miller in a redetermination of the international ampere in absolute measure. The mean of the five most accurate previous determinations gave for the E.M.F. of the Weston normal standard cell at 20° C. the value 1.01824 "semiabsolute volts." The authors adopted the Rayleigh balance, with a single moving coil suspended coaxially between a pair of fixed coils, the planes of the coils being horizontal. Water-jackets were employed to maintain the fixed coils at a definite temperature, and to ensure perfect constancy in the unavoidable convection currents due to the heating of the moving coil, the effect of which was eliminated by successive weighings with the current in the fixed coils reversed. The construction of the balance and of the coils, &c., is minutely described in the article, as well as the methods of making the observations, which extended over four years. The final conclusion is that the E.M.F. of the Weston cell at 20° C., as realised by the Bureau of Standards, is 1.01822 "semiabsolute volts," with a possible uncertainty of 2 parts in 100,000. The result differs from that obtained in 1907 at the National Physical Laboratory (1.01818 volts) by 4 parts in 100,000. Part of this may be due to a real difference in the E.M.F. of the standard cells. The International Committee has defined the E.M.F. of the Weston normal cell as 1.0183 international volts.

From the results obtained is deduced the value of the electrochemical equivalent of silver, 1.11804 mg. per coulomb. The value adopted by the London Conference was 1.11800.

The article describing the investigation occupies 124 pages of the Bulletin.

**Electrical Industries in the U.S.A.**—The following table gives the approximate results of the past year's electrical work in the United States, as estimated by the *Electrical World*:—

	1911.	1912.
Electrical apparatus made ...	\$325,000,000	\$350,000,000
Electric railway earnings ...	575,000,000	625,000,000
Central station earnings ...	375,000,000	450,000,000
Telephone earnings ...	310,000,000	350,000,000
Telegraph earnings ...	75,000,000	85,000,000
Isolated plant service ...	125,000,000	125,000,000
Miscellaneous electric service ...	100,000,000	125,000,000
	\$1,885,000,000	\$2,110,000,000

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING DECEMBER, 1912.

THE December returns of electrical business, which we publish herewith, complete the series for the year 1912.

The exports for the month amounted in value to £510,700, inclusive of telegraphic material, and to £466,874, exclusive of the latter, and represent rather above the average value for a month.

The totals for the preceding month, comparing with the above, were £468,465 and £430,000 approximately.

The imports for the month reached £231,554, a decrease on the previous month's total of £252,672; the latter figure, however, is considerably above the average of the year.

The re-exports, at £24,867, were over £5,000 less in value than in November.

As the export figures indicate, December was a good month for

the home electrical manufacturer, whose staple exports, machinery and cables, were represented to the extent of some £198,000 and £102,000 respectively.

In other lines, telephonic exports were valued at £50,000 roughly, but some falling off occurred in the battery, lamp and instrument sections.

In the case of the imports, the value of machinery, telegraphic and telephonic material, and electric lamps, entering this country fell considerably as compared with November, but the cable imports more than doubled those of the latter month.

Our best customer during December was India, with Canada, New South Wales, and Brazil following; Germany sent us some £150,000 worth of material during the same period.

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports.	Electrical goods and appliances.	Wires and cables, rubber and other insulations.	Electric lighting fittings and accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters and instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable, and apparatus and electric bells.	Telegraphic cable and apparatus.	Total.

Additional imports: Spain, carbons, £210; Japan, glow lamps, £15; Victoria, telegraphic goods, £209; and Canada, carbons, £375.

## Registered Re-Exports of Foreign and Colonial Electrical Goods from the United Kingdom.

Various countries, mainly as above ...	13,636	1,425	...	2,802	519	...	5,257	...	163	1,061	4	24,867
--	--------	-------	-----	-------	-----	-----	-------	-----	-----	-------	---	--------

TOTAL EXPORTS: £510,700.

TOTAL RE-EXPORTS: £24,867.

TOTAL IMPORTS: £231,554.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

ELECTRICAL EXPORTS AND IMPORTS DURING 1912 AND PREVIOUS YEARS.

As in previous years, we publish simultaneously with the December returns of electrical exports and imports, a series of curves illustrating as concisely as possible the trend of electrical business during 1912 and preceding years.

Thus fig. 1 shows graphically the monthly totals of the exports, imports and re-exports for the years 1905-1912 inclusive. The heavy curve shows the continued upward tendency of the exports, which have been fairly steadily mounting upwards for the past half-dozen years, while, on the other hand, the home manufacturer will note with satisfaction that the imports curve, on the whole, shows no particular upward tendency during the past two years.

The actual gross value of the exports (dot-and-dash curve) during the 12 months was approximately £6,300,000, as compared with some £4,600,000 in 1911, and £5,700,000 in 1910, the last year having been a more than usually

In 1910, and £234,000 in 1909, the larger proportion of which, of course, represents machinery and cable.

The character of the imports curve has been noted above; actually the average monthly value of approximately £217,000 was somewhat higher than that obtaining in 1911 while the same also applies to the re-exports, which were slightly on the up-grade.

The upper export curve is inclusive of telegraphic exports from November, 1908.  
FIG. 1.—CHART SHOWING MONTHLY ELECTRICAL EXPORTS AND IMPORTS DURING THE PAST EIGHT YEARS.

FIG. 2.—MONTHLY EXPORTS OF ELECTRICAL MACHINERY AND ELECTRIC CABLE, OTHER THAN TELEGRAPHIC OR TELEPHONIC CABLE, DURING 1908-12 INCLUSIVE.

FIG. 3.—MONTHLY IMPORTS OF ELECTRICAL MACHINERY, TELEGRAPHIC AND TELEPHONIC MATERIAL AND CABLE, AND ELECTRIC LAMPS AND PARTS, DURING 1908-12 INCLUSIVE.

busy one for the telegraphic manufacturers, judging by the high total recorded.

Excluding telegraphic exports, the fluctuating character of which has been noted by us on several occasions, there remained an average monthly electrical export of nearly £400,000 during 1912, as compared with £338,000 in the preceding 12 months, £285,000

One or two suspicious kinks will be noted in the export and other curves during the past two years; such are particularly noticeable during 1912, where they roughly coincide with the labour troubles in connection with shipping and transport.

Turning to fig. 2, the progressive character of our export business in machinery and cables is clearly shown; the cable section in 1910

FIG. 4.—ELECTRICAL EXPORTS TO CANADA, ARGENTINA AND BRAZIL, 1909-12.

cates a particularly gratifying improvement after what has been a steady climb for some years.

It is interesting to compare with the above the year's progress of the three principal electrical imports into this country, shown in fig. 3, from which it will be observed that, although the value of machinery entering this country compared well with the preceding year, a decided decrease occurred in telegraphic and telephonic imports, while the lamp business was apparently a repetition of that for 1911.

#### Purchasing Countries and Importers into the United Kingdom.

The remaining curves, in figs. 4, 5, 6 and 7, are an extension of those appearing a year ago, and bring up to date the various export and import features dealt with therein. Fig. 4 is of particular interest, as it emphasizes the rapid development of the Canadian market, which bids fair to easily outdistance the other American markets shown in the same chart, viz, Argentina and Brazil. In point of fact, our Brazilian electrical business declined heavily as compared with the previous two years, while our exports to the Argentine Republic show a comparatively small expansion as compared with the preceding year, and in view of the great electrical progress being made out there.

The two curves shown in fig. 5 are also of great interest as they indicate the expansion of our Australasian export business, beside which the lower curve of dwindling South African business is a disappointing contrast. Since June, 1910, our collective electrical exports to South Africa have steadily fallen off, due, no doubt, to the strong position of the German electrical interests on the Rand where the bulk of the engineering development has taken place.

The sixth set of curves shows the trend of our Indian and Far Eastern business; Japan, it will be seen, has been a particularly good customer during the past year, and, although to a less extent, India also increased her electrical trade with us. China, on the other hand, still remains "the coming market" so far as the British electrical manufacturer is concerned, judging by the almost featureless record of Chinese electrical business with this country during the past two years.

The last diagram, fig. 7, illustrates the progress made by our most prominent foreign

FIG. 5.—ELECTRICAL EXPORTS TO AUSTRALASIA,\* AND SOUTH AFRICA,† 1909-12.

\* Includes New Zealand, Australian States and Tasmania.

† Includes Cape Colony, Natal, Transvaal, Orange River Colony and Rhodesia.

FIG. 6.—ELECTRICAL EXPORTS TO JAPAN, INDIA AND CHINA, 1909-12.

competitors in the English market during the past four years. It will be noted that only a slight extension of business, in any case, is indicated by any of the curves, unless it be with the U.S.A.

German electrical imports into this country, still far ahead of those of any other country, were probably a little in excess of those during the preceding year, and amounted roughly to an average of £140,000 per month.

It should be understood that this represents electrical goods which were absorbed almost entirely by the people of this country (not being re-exported to any appreciable extent). As the figure

FIG. 7.—ELECTRICAL IMPORTS FROM GERMANY, U.S.A., BELGIUM AND FRANCE, 1909-12.

mentioned amounts to about 26½ per cent. of our own average electrical exports to the whole of the world's markets, and the latter, we believe, form no inconsiderable proportion of the internal electrical trade of this country, it is evident that the German electrical industry still retains a very large proportion of the latter despite the efforts of the home manufacturer.

To some extent, no doubt, Germany retains her pre-eminent position by her adaptability to trade conditions, as, for instance, when a year or two since the metal lamps she imported into this country suddenly increased to a value in excess of machinery imports. Again, during the past year it is noticeable that German magneto imports have been increasing to large proportions, some £25,000 worth figuring in the December returns; this business, in common with a good deal of other small motor-car electrical supplies, represents work which might well be retained by the British manufacturer.

General.

In conclusion, it is evident that the year, in comparison with previous ones, has been a prosperous one for the exporter, despite the interference of labour troubles at home. Probably the most interesting feature was the rapid growth of the Canadian export business, which, in view of the great attention which has been drawn to its possibilities in our pages, is particularly gratifying to ourselves. Australia, India, Japan and, to a less extent, Argentina, were also improving markets, but, unfortunately, the best that can be said of our business with Brazil, our South African colonies and China is that it does not, so far as we can see, expand.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

"Meta" Heaters.

THE METALLIC SEAMLESS TUBE CO., LTD., of 153, Corporation Street, Birmingham, are supplying a number of pleasing designs of electric heating apparatus, as the accompanying illustrations will

FIG. 1.—ELECTRICAL WARMING PLATE.

FIG. 2.—"META" FRYING PAN.

FIG. 3.—"META" HEATER.

show. These are some of their popular domestic lines of "Meta" apparatus, of which prices are given in a new folder just issued for the use of the trade. Fig. 1 is a specimen of a warming plate, intended for table or sideboard use, for keeping dishes or food warm. It is constructed of brass, electro-plated, with aluminium top, either 7½ or 9 in. diameter. Fig. 2 is a "Meta" frying pan, 11 in. diameter, in polished aluminium; it has four-heat regulation by using triple cable. In fig. 3 will be found a "Meta" heater with two-heat regulation by two switches. This heater, which measures 16 in. × 16 in. × 8½ in., has a sheet-metal body mounted upon a cast-iron frame, and is finished black and relieved. Copies of the folder mentioned can be obtained free of charge, overprinted with name and address, on application to the company.

Device for Making Earth Connection.

The accompanying illustration (fig. 4, p. 202) shows an earth connection which is now being manufactured by the L.S. BRACH SUPPLY CO., of New York City. It is claimed that this device will produce a low-resistance contact between the earth wire and the earth itself which it is impossible to secure through the earth wire or plate in common use. To accomplish this, the earth connection has been designed to retain the moisture in the vicinity of the contact, to present a sufficiently large area of metal surface to the earth, and to ensure firm contact between the earth and the metal plates. To secure moist earth, three bowls or cups are fastened to a centre rod, providing a means for rain water as it soaks through the earth to be caught and retained within the earthing device itself. This water will remain in the bowls as long as the surrounding earth is moist.

When, by reason of the hot sun, evaporation takes place and the earth becomes dry, there still remains a local moist area due to the water that will be given off from the bowls. To aid in attracting and holding water, small pieces of charcoal are placed within the bowls and covered by a perforated metal screen. The perforated screen itself is intended to protect the space in the bowls from being filled up by the surrounding earth, so that ample water space may be retained. The three bowls, being sweated to the centre rod, offer more than three times the exposed surface which the common

FIG. 4.—DEVICE FOR MAKING EARTH CONNECTION.

ground plate can offer for a hole of given size. The third essential, that of securing firm contact with the earth, is provided for by reinforcing the bowls and the metal screw so that the earth may be packed tightly around the earth connection.

At the top of the centre rod a slot milled in a threaded portion affords a convenient means of joining the earth wire to the earth connection. These "hydro-grounds," as they are called, are now being manufactured in three standard sizes, each size carrying three bowls of varying diameters.—*Electrical World*.

#### A New Electric Sign.

THE FRANCO-BRITISH ELECTRICAL CO., LTD., of 50, Oxford Street, London, W., have just completed the erection of an animated sign, of which we give a reproduction from a photograph taken

FIG. 5.—'FRANCO' ANIMATED ELECTRIC SIGN.

while it was alight. The sign is made up on their well-known "Franco" principle, and is fitted with their patent porcelain holders and nearly 200 1-C.P. carbon lamps. The whole of the sign is supplied from a transformer, the secondary of which works at

14 volts and about 250 amperes, the corresponding primary taking 17 amperes at 200 volts. The sign works in connection with a "Franco" flasher which controls the whole of the 250 amperes. The working of the sign is as follows:—First of all, "The Angel" and "Kingston Bros." light up, then the barrel and the outline of table and glass; next a hand appears at the tap of the barrel and amber lamps representing a stream of beer become illuminated and have the appearance of continually flowing down into the glass, the latter gradually filling up with amber lamps until the top is reached. The froth now commences to rise and eventually to flow down the side of the glass and spread out over the table. After it reaches the edge of the table, the hand on the barrel disappears and the flow of beer stops. The froth on the glass then gradually subsides and the part which is at the side of the glass also goes out, leaving that which is on the table; this then commences to effervesce, and while so doing the words "Bass Best Beer Drawn from the Wood" come in, one word at a time. After being alight in this way for some two or three seconds, the whole goes out and recommences. There are 75 switch wires controlling the sign. Although the surface of the sign is quite flat, the painting has been carefully done in order to give the necessary appearance. The sign is erected in Stratford Broadway and was supplied and fixed for Messrs. Stuart A. Curzon, of Westminster.
