**Radiator Lampholders.**—In the course of a very long letter, received too late for use last week, Mr. G. St. John Day, of Oldham, says:—"Experience has proved that a screw lampholder is far from satisfying the requirements of the application. The troubles are not confined to the lampholders, but relate also to the lamps and the design of the radiator. Each individual part has its failings, and when fitted together the whole appliance has faults, and these individual and collective faults vary in degree with makers, contractors and users."

The foregoing remarks are equally applicable to other types of lampholders such as B.C., two-pin and central contact lampholders. The cleaner, larger, and firmer are contacts, joints, &c., the better; the best conditions then prevail and yield the best results. There is a vast field of opportunity for a better state of electrical accessories in many ways. Does the design of electrical accessories compare favourably with the design of steam, water and gas accessories?

Some of the correspondents have mentioned the Mumps lampholder as a solution of the matter. As the designer and patentee of the Mumps lampholder I simply state a few facts:—

A. A current of 10 amperes at 440 volts has been passed through a Mumps holder and plug in connection for 18 hours continuously without heating or breaking down of insulation.

B. The insulation of the Mumps holder is unique and extra strong.

C. The adjustable range of contact is not only new, but most desirable and effective.

D. Life of lamps increased.

E. More light for same watts.

F. Maintenance costs reduced.

G. Hard and spring contact at one and the same time.

H. Complete security and rigidity of both mechanical and electrical joints unaffected by vibration.

**An Everlasting "Auriga" Lamp.**—In a letter recently received by the BRITISH WESTINGHOUSE ELECTRIC AND MANUFACTURING Co., LTD., the writer says: "You will be interested to know that one of the "Auriga" metal-filament lamps, 50 c.p., 220 volts, which we bought from you in February, 1910, is still burning, and has been in use continually since that date, averaging at least 18 hours per day for the three years, thus burning practically 20,000 hours. The filament is quite intact—not having been 'joined across.'"

This is the highest record that has yet come to our notice.

## THE PERSONAL FACTOR IN ENGINEERING.

MODERN engineering, and particularly electrical engineering, has reached such a stage of definite mathematical precision that it is becoming harder and harder to adjust the mind to allow for variations. In the older days, when estimating was being conducted, it was a very common practice to put in a very substantial proportion of the total lump sum for contingencies, but except in the most speculative quotations, based on insufficient data, it is nowadays the exception rather than the rule to find any considerable sums allocated to this heading. The tendency is more and more to render everything included in the price clear and definite, the margins being cut away. This is, of course, the inevitable result of the keen-edged competition to which engineering and electrical industries have been subjected in recent years, as well as of the clearer definition of thought due to the scientific training which nearly everyone in the profession now receives.

Let us examine a little more closely what this really means. The price of a piece of engineering work depends to a certain extent, of course, on that of raw material, and here a certain amount of give and take must be allowed if the prices under which the supply is regulated are not sufficiently stable. The fluctuations in the price of copper are an example of this point. When once, however, the material is delivered into the factory it is then subjected stage by stage to processes, each of which can be accurately costed, and in many cases the cost can be predetermined to a decimal, until finally we obtain the finished article. Added to the works production cost must be the proper allowance for depreciation of plant, selling costs and the margin of profit, often very small, which is allowed, together with establishment charges, and we get the final price delivered from the works. All these charges can be, and in most cases are, very definitely ascertained, and it is manifestly impossible for the variations between price and price of a similar article made by different firms to be unreasonable. What then constitutes the determining factor or factors which sway the balance between one firm and another, and make the one a struggling concern for which orders are hard to get, while the other becomes a prosperous and increasingly important undertaking?

It is sometimes stated that a good deal of this difference is due to special features in a machine protected by patents; but while undoubtedly the foundation of many firms' prosperity lies in their pioneering work, it can hardly be argued that any firm can exist for very long periods, either wholly or in the main part, on patents. For one thing either a patent, as soon as it becomes valuable, becomes hotly contested as to validity, or the ingenuity of competitors rapidly devises something which is sufficiently close to the patent to render the balance of advantage very small. It

has generally been found that a firm which makes its name on patented articles utilises the name and does a larger proportion of its business on the general run of engineering work in which there is open competition. A good deal of success, of course, depends on engineering the organisation with a view to economy. This is largely a matter of personality, and with this we wish to deal further in another paragraph. Obsolete and obsolescent plant does much to handicap a firm in the production of work, but over and above these causes we would like to make the assertion that in a great many instances the determining factor in the success or failure of a firm is simply sheer personality, and cannot be expressed in any mathematical equation or determined in £ s. d.

It is this personal factor which we are to-day very largely in danger of forgetting, but it is worth while remembering what this means. Let us, for example, take a supposititious case. Suppose there are two firms, each of which manufactures, or is capable of manufacturing, the same article at the same price to the same specification. Let us further suppose that the specification is rigid enough to indicate clearly in the ordinary way of commerce exactly what is required. Let us, however, suppose that the first firm has a reputation for straightforward dealing and a clean record so far as any attempted evasion of its responsibilities is concerned, while the second firm somehow or other has obtained a reputation not for any overt act placing it outside the line of honourable firms, but for a general meanness and pettifogging spirit which quibbles at every point possible in order to make an insignificant addition to its profit. The two articles as produced might or might not be identical, but there is the danger in the second place that the specification might have left some matter vague, and that this would be seized upon by the second firm, while if the work were given to the first firm it would be understood that on a reasonable explanation being given the firm would not quibble, but would do its best for its own name's sake to give the fullest possible satisfaction to the buyer. Is there any doubt as to the direction in which the order would be placed? The difference in the firms is palpable. It cannot be expressed in any accurate terms, but the value of the personality of the firm here means all the difference between losing and getting the order.

Take another case. Two firms may both be absolutely reliable so far as the product is concerned. They may have a reputation for straightforward dealing, and both may be looked upon as competent manufacturers. Suppose, however, that one has, either through taking on more work than the works could turn out conveniently, or from any other cause caused disappointment to its customers in time of delivery while the other has not so disappointed people. The first firm will then have an uncertain character as regards delay, and in many cases even where time is not the essence of a contract, the order, other things being equal, will in all probability go to the firm which has kept up to the mark. Here, again, a very small difference in personal character will make all the difference between success and failure.

Putting it in another way, there is surrounding every firm a more or less nebulous character which everybody in the running knows and which nobody is able to define. It is stated that the limited liability company has neither a soul to be saved nor a body to be kicked, but from a busi-

ness point of view it has a definite personality which determines business. It may seem that we have rather laboured the point, but for the honour of the profession we are anxious that it should be remembered that everyone from the manager to the head of the smallest department is invested with a responsibility as regards the building-up of a corporate individuality for the firm with which he is connected. This individuality is a matter of slow growth and often slow decay. The individual atoms composing the substance of a firm may from time to time change, and with them, to some extent, the personality of the firm, but, as a rule, corporate personality is longer lived than individual personality, and hence its effect on the status of the profession as a whole is the more persistent and marked. We have, from time to time, had occasion to remark on the tendency towards the lowering of the status of the profession induced by the keenness of competition. Rules and regulations have been made and broken, but in the long run it comes back to a point of moral standing. The personality of a firm, which means ultimately its standing in the profession, depends on the cumulative personalities of the individuals composing it, and the standing of the profession in turn ultimately depends upon the personalities of the firms composing it. From this point of view, therefore, we claim that the moral virtues inculcated by the great philosophers of all time are obligatory from a commercial standpoint, and we also claim that they exercise a direct and not very far removed effect on the fortunes of individual firms and of the profession as a whole. These moral qualities cannot be expressed by mathematics. They are apt to be overlooked, but nevertheless they are so important that we cannot refrain from emphasising them.

---

### THE "COMPETENT PERSON."

---

SOME astonishing evidence was given at an inquest in Mansfield on Friday last. A boy of 14, employed underground, was killed by an electric shock obtained by touching the metal guard of a lamp, which had become charged due to a sharp corner of the fitting cutting through the insulation and making metallic contact with the live conductor. The circuit was apparently one of 440 volts A.C., feeding four 110-volt lamps in series. A number of these series were used about the workings. The unfortunate boy, quite casually, while in conversation with two chums, and with no mischievous intent, touched the fitting, which was not earthed; he fell down, exclaimed "Ah!" or "Aye!" when asked if he had got a shock, breathed a few times and lost consciousness; although artificial respiration was persevered with for a long period, he did not revive. The colliery manager, in giving evidence, stated that the electrician was under the impression that the circuit was a 110-volt one. The "electrician" was called, and stated that he had had 10 years' experience, but possessed no certificates. He said that the question whether the circuit was above or below the standard of low pressure laid down by the Home Office rules was a disputed one. The colliery manager stated that they employed the best people they could get.

Pertinent questions were put, and observations made, by the Coroner and the Home Office Inspector on these facts. The jury brought in a verdict of "Accidental death," and added no rider.

It was, of course, obvious that the colliery company, like so many others, had taken no real pains to ensure that the "electrician" was competent. The fatality would certainly

not have occurred if the Home Office rule as to earthing had been complied with.

According to the report of the inquest in the *Nottingham Evening Post*, the manager of the colliery said that the electrician considered this circuit to be one of 110 volts, but he himself had tested the circuit since, and found the voltage to be 440. "*Found*" is good: we admire the artless simplicity which is almost surprised to "find" that four ones make four—while we deplore the fact that nothing short of the loss of human life sufficed to drive home this simple lesson. But a representative of the colliery company went further, and submitted that there was something to be said for the view which the electrician took, and the colliery manager said it was not a case of neglect on the part of the electrician. It was, in point of fact, pure ignorance, and the whole thing hinges, as usual, on the definition of a "competent person."

In that district, and no doubt others, there are scores of lads who have been taken on by wireman contractors, having picked up the "trade" of running lighting wires in tubes, and posing as "electricians," they get on for quite a long time without the slightest real understanding of the principles of electrical science. Such things always lead to trouble.

**Mañana?** THE statistics published on another page relating to electrical imports into Spain are worthy of study, as showing the rapid advance that is being made in German electrical exports to that country. If any of us were inclined to take Consular comfort from the statement recently issued from Barcelona concerning the poor quality of German electrical manufactures and the willingness of the Spaniard to welcome British goods instead if we would push them there, these figures must fill us with pangs of regret that we were not there first. Several years ago we referred to Spain as being practically virgin soil electrically, but there has been a marked British disinclination to embark upon enterprise on the other side of the Pyrenees. German firms, however, established a complete electrical organisation covering the most important points in the country, and the 1911 returns show with what excellent results their efforts have been attended: and though British quality may tell, in the long run, to some extent, it is no good trusting to that possibility alone in presence of very active competitors, who, as experience is showing, are aggressive and price-cutting in their efforts to discourage competition and secure an early and substantial footing in foreign markets. It is unlikely that British manufactures will to-day sell themselves anywhere on the mere basis of quality. The existence of a poor quality can only be recognised in comparison with the availability on the spot of something better. A Consul may know that British manufactures are superior, and so may we, but how can such knowledge assist us unless the Spanish buyer or user himself has it strongly and persistently impressed upon his mind? Either through indifference, disinclination, or else through being too much occupied with other markets, we appear to have let our rivals have things pretty much their own way.

The figures may be allowed to speak for themselves, but they show that in some classes we have actually lost ground while German totals have leaped forward, and the least that we can hope for as the result of their study and analysis is that they will awaken us to the necessity for ending our apathy and entering upon the aggressive way.

**Submarine Transmission.** THE particulars which we give this week regarding the projected transmission of energy from Sweden to Denmark are of special interest, as this is, we believe, the first instance in which it has been seriously proposed to transmit large quantities of energy at high pressure through long submarine cables. The total distance is over 200 miles, so that in this respect alone the scheme would be unique in Europe,

without its other exceptional features; the distance from shore to shore is about  $3\frac{1}{2}$  miles.

The respective merits of direct and alternating current were taken into consideration by the experts of the Swedish Government in preparing the estimates, and, not for the first time, high-pressure D.C. was found to offer marked advantages over three-phase transmission. The fact that submarine cable for 90,000 volts D.C. can be obtained is of especial interest, while the highest practicable three-phase pressure for this part of the line is 20,000 volts, so that the former has here a very great advantage; and, apart from this, a D.C. line, for equal maximum voltage, is necessarily far cheaper than any A.C. line can be. Further, experience appears to leave no room for doubt that a given line will in point of fact withstand a much greater dielectric stress when the pressure is continuous than when it is alternating, so that here again the D.C. system has the advantage. The only difficulty appears to reside in the generators and motors; we question whether there is real ground for objection to the system on this account, but it would seem that if a method could be found of generating, say, 20,000 volts in a single machine, a considerable impulse would be given to the system.

#### Lignite as Station Fuel.

THE use of lignite for the firing of boilers in generating stations is attracting increased attention in Germany, particularly in the left Rhenish district. It is claimed that the erection of stations adjoining the deposits of lignite, which is worked from the surface, dried, or partly dried, in apparatus and pressed into briquettes, permits of the production of electric power at an exceptionally low cost. It was for this reason that the Berggeist supply station was established several years ago near Bruhl, whence a supply of energy is furnished to a considerable distance. The station, which in the meantime has been taken over by the great Rhenish-Westphalian Electricity Works Co., of Essen, which also possesses pit-coal works on the colliery site, delivered 25,800,000 kw.-hours in 1912. Now the Rhenish-Westphalian Co. has started the building of another large station in the vicinity of the Ver. Ville lignite mine belonging to the Rodkergrube. Two steam turbines, each of 15,000 kw., will be installed at first including boilers, the cost is estimated at £175,000, and a lengthy contract has been concluded with the mine owners for the supply of fuel. The station will supply current to the network of cables which the Rhenish-Westphalian Co. possesses in the district of Cologne and beyond, and energy for electrolytic purposes is also to be furnished to a chemical works to be built on the Rhine. A third instance is that of the Rhenish Lignite District Electricity Works Co., which was constituted in 1910, and has contracts for the delivery of energy to Cologne, Mulheim, and other places. The first plant was of 8,000 kw.; a second generating set of 8,000 kw. is now being put into service, and a third will be ready on October 1st, making a total of 24,000 kw. It is expected that the output will amount to 25,000,000 kw.-hours this year, without taking into consideration the annual supply of 16,000,000 kw.-hours which has been contracted for, for a chemical works to be erected in the neighbourhood of the generating station on behalf of the Metal Bank and Metallurgical Co., of Frankfurt-on-Main. A fourth example relates to the decision to establish on the site of the Zukunft lignite mine, near Eschweiler, a station capable of dealing with 30,000,000 kw.-hours per annum, by way of a beginning, and of this quantity agreements have already been made for the disposal of two-thirds at appropriate prices. Apart, however, from these developments, it has to be remembered that the generating station which supplies power for the working of the Dessau-Bitterfeld railway utilises lignite as boiler fuel, and brown coal is also projected for the power stations in connection with the conversion of the Berlin railways to electric traction.

## THE INSTALLATION OF POWER-FACTOR INDICATORS.

By LEONARD MURPHY, M.I.E.E., A.M.I.Mech.E.

It has now become recognised that an instrument for showing the power-factor of any machine or circuit is quite a necessity on systems dealing with large amounts of power, and there is every probability that in the near future the use of power-factor indicators will extend to every circuit in which the power factor is capable of regulation. The advantages of being able to work machines or cables at unity power factor are now well understood, and engineers invest capital in regulating apparatus for the express purpose of obtaining this condition. At other times it may be desirable to obtain a leading current, but in every case the full advantage can only be obtained from the regulating gear when the resulting power factor can be read at a glance from one instrument.

The function of a power-factor indicator is fundamentally to show the angle between the pressure and current in the circuit, and this may be shown by a scale of electrical degrees if desired, but most engineers wish to know chiefly the relation between the actual current which is being employed and the minimum possible current for the corresponding power, *i.e.*, with unity power factor. For this reason the scales are usually marked directly in values of power factor or the cosine of the angle of phase difference, but in a well-designed instrument the angular deflection of the pointer should be approximately a direct measure of the phase angle. This design also leads to an open scale for power factor in the region of the unity point, which is certainly desirable. The type of scale referred to is illustrated by the instrument shown in fig. 1. The scale of electrical degrees is also shown on this instrument, and it will be observed that this is nearly uniformly divided.

FIG. 1.—THREE-PHASE UNBALANCED-LOAD POWER-FACTOR INDICATOR.

These instruments are obtainable for all single and poly-phase circuits, and in the latter case may either be suitable for measuring the phase relation between one of the line currents only and the corresponding pressure, or for obtaining the average power factor of the whole circuit, having due regard to the magnitude as well as the phase relation of the current in each line. When the load consists entirely of motors, the currents in all the lines will be equal, and a balanced-load type of instrument, which operates only on one line current, is sufficient; but in determining the power factor of a mixed load, one should either employ as many instruments as there are phases, or adopt the type which depends for its reading on all the line currents. Some engineers prefer the former method when dealing with unbalanced loads, as the indications of the instruments give information as to the manner in which the load should be distributed when making further connections to the mains; but the single instrument giving an average result will meet the requirements of the majority of cases.

Fig. 1 is actually an illustration of an instrument of the unbalanced-load type. In designing this particular type, the makers had in mind what may be termed the average effective power factor.

If one considers a three-phase star-connected load in which  $C_1, C_2, C_3$  are the currents and  $\phi_1, \phi_2, \phi_3$  are the angles of phase difference between each of the currents and their respective applied pressures (taken from line to neutral point), the average power factor is—

$$\frac{\cos \phi_1 + \cos \phi_2 + \cos \phi_3}{3}$$

But an indicator which gives the value of this expression is of little practical use, since the power factor is only of importance when considered in conjunction with the current to which it actually refers. The unbalanced-load instrument mentioned above gives a reading whose value is approximately—

$$\frac{C_1 \cos \phi_1 + C_2 \cos \phi_2 + C_3 \cos \phi_3}{C_1 + C_2 + C_3}$$

It will be noticed that the reading of this instrument is not unduly affected by the power factor of a very lightly loaded phase. When using three instruments of the

A and B, potential coils on rotor; R, resistance in series with coil A; L, inductance in series with coil B.

FIG. 2.—DIAGRAM OF SINGLE-PHASE POWER-FACTOR INDICATOR.

balanced type on a three-phase unbalanced load, the mind involuntarily averages out the readings without regard to the relative values of the phase currents, and this is apt to be misleading.

It may also be pointed out that the unbalanced type can readily be provided with a switching arrangement whereby any two phases can be made inoperative on the current side of the instrument. By this means it is possible to obtain readings of the power factor of each phase independently, as well as the average effective value of the whole system, with the advantage that the readings are all given on one instrument, and only one scale is used.

Power-factor indicators are also extremely useful in the test room and laboratory. By their aid, it is possible to test a machine or a meter under definite conditions of power factor, this being practically impossible by any other means. The results obtainable are quite as accurate as those given by the best class of deflectional wattmeters, and form a ready check on the combined readings of voltmeter, ammeter, and wattmeter, when these are also used.

*Action.*—The operation of a power-factor indicator is dependent on the interaction of two magnetic fields, one of which is generated by a set of fixed coils, and the other by a set of coils, which are either carried by the moving system, or are fixed in such a way that they produce the same result as though they were so carried. One of the fields rotates, as in an induction motor, while the other may either be rotating, or simply a fixed-position alternating field.

In single-phase instruments, the windings which carry the current are usually fixed and produce a simple alternating field, while a two-phase rotating field is produced by the moving coils. These are two fine-wire coils, and carry currents obtained by connecting a high resistance in series with one, and a choking coil in series with the other across the potential. A clear idea of the way in which this type of instrument operates may be obtained from fig. 2. It should be noted that the moving portion is entirely free from control by springs or weights, so that until current

and pressure are applied to the respective elements, the pointer takes up no definite position on the scale.

Suppose that, first of all, the connection through the choker to the coil *B* is left broken; the current passing through *A* will generate a magnetic field, and this will turn the movement into the position in which it is shown, since, in this position, its field is in line with that of the current coils. The force tending to hold it in this position will be a maximum when the current in coil *A* is in phase with that in the fixed coils, and the force will diminish to zero, when the current in the fixed coils is  $90^\circ$  out of phase with that in *A*. Similar results will be produced if the coil *B* is connected, and *A* disconnected, except that the movement must turn through  $90^\circ$  in order to bring the axis of the coil *B* into line with that of the fixed coils. Now, it will be evident that if both *A* and *B* are connected, the moving system must take up some intermediate position depending on the relative values of the components of the currents in *A* and *B*, which are in phase with the current in the fixed coils. But it will be noted that since the current in *A* is derived from the potential, through a circuit composed almost entirely of resistance, it may be regarded as being in phase with the potential, while, since the circuit which supplies *B* is very highly inductive, the current in *B* will lag approximately  $90$  electrical degrees behind the potential. Hence, the position of the pointer will depend on how nearly the current in the fixed coils is in phase with the current in *A* (and with the pressure), and out of phase with the current in *B*. When the power factor of the circuit is unity, the axis of *A* will be in line with the axis of the fixed coils, and the force on *B* will be nothing; when the power factor is zero, coil *B* will come into line, and the force on *A* will be zero.

Now it will be noted that the combined effect of the two coils forming the moving system is really to produce a rotating field, and to some minds it is easier to dispense with any consideration of the action of each coil and simply remember that the axis of the rotating field must coincide with the axis of the alternating field produced by the fixed coils at the instant that the latter is at its maximum. The angular position of the rotating field, with reference to the coils *A* and *B*, is definite in its relation to the instantaneous value of the applied pressure, while the

FIG. 3.—CONNECTIONS FOR THREE-PHASE UNBALANCED-LOAD POWER-FACTOR INDICATOR.

instant at which the current attains its maximum value in the fixed coils depends for its relation to the applied pressure on the power factor of the circuit. The acceptance of this form of explanation makes the consideration of polyphase instruments much easier, as in these instruments no phase splitting is used. The rotating field is obtained by connecting a high resistance to each line and to one end of each pressure coil and then forming a star point at the other ends of these coils. The geometric angle between the coils on the moving system is the same as the electrical angle between the phases, *i.e.*,  $90^\circ$  for a two-phase instrument and  $120^\circ$  for a three-phase.

It is not essential that the rotating field should be produced by the moving coils, it being quite common practice, for example, to use three fixed current coils for this purpose on three-phase circuits. When the instrument is intended to work on unbalanced loads, both the current and the pressure coils are arranged so as to produce rotating fields. The movement then takes up a position depending on their relative instantaneous positions.

*Connecting-up Power-Factor Indicators.*—Engineers who have installed these instruments on polyphase circuits have generally found that it is possible to connect up in many ways before hitting on the correct one, and as the process of trying different methods is apt to be a long and tedious one, it is hoped that the following notes may assist in getting the correct connections as quickly as possible. Fig. 3 shows a diagram of connections for a three-phase unbalanced-load power-factor indicator working off current and potential transformers. Two of each kind of transformer are shown in the diagram, as this is the minimum number from which one can obtain a true copy of all the line currents and potentials; but, of course, three of each may be installed if desired. From this diagram one may trace the following possible sources of wrong connections:—

(a) Transformers may be connected wrongly with regard to the instantaneous relative polarity of primary and secondary.

(b) The order in which the phases attain their maximum value may not be the same as that for which the instrument has been constructed. This may occur on either the current side or pressure side, or both.

(c) A terminal or pair of terminals on the instrument, which corresponds to a certain phase either on the pressure or current windings, may be connected to some other phase, although the order of the phases mentioned at (b) may be correct.

To this list one might add such slips as connecting current leads to the pressure terminals, omitting to insert an external resistance box when this forms part of the instrument, &c., but these are obvious mistakes, and would be apparent immediately the connections were checked before switching on the current.

With regard to (a), transformers are usually marked by the makers in such a way that the currents from the secondary are instantaneously the same in direction as would be obtained if no transformers were used and the instrument were directly connected up in place of the primaries. This means that if the primary and secondary windings are similar in geometric direction, the ends of the secondaries must be crossed over each other. The potential transformers may be tested in their relation to each other by checking the voltages on each secondary and across the two outer terminals—*i.e.*,  $SV_3 - SV_1$ ,  $SV_1 - SV_2$ , and  $SV_3 - SV_2$ . If these are all equal, the polarity is correct; if not, one of the transformers must be reversed either on the primary or secondary side. The checking of the current transformers may be carried out by inserting an ammeter in each of the leads connected to the terminals  $C_3$ ,  $C_1$ , and  $C_2$ . These readings should be equal (if the load is balanced), but if one transformer requires reversal, the reading in  $C_1$  will be approximately 75 per cent. greater than the readings in  $C_2$  and  $C_3$ .

On account of the probability that the load will not be balanced, the indications in this test are not so emphatic as those obtained when testing the potential transformers. When a current transformer can be disconnected, one may check the relative polarity by connecting a polarised linesman's detector to the secondary and obtaining deflections by

FIG. 4.—DIAGRAMMATIC INDUCTION MOTOR ILLUSTRATING PHASE ROTATION.

touching wires from a small battery, first to the terminals of the secondary, and then to those of the primary. If the deflection is in the same direction in each instance at the moment when the circuit is made, it follows that those terminals of the primary and secondary which have been connected to a certain battery wire should be similarly marked. As, however, one may generally rely on the marking of the relative polarity of the primary and secondary

given by the makers, there is only need to use these tests in cases where a mistake in the marking is suspected.\*

The most prolific source of mistakes when making connections is that mentioned under (b). This is probably because there are few other instruments in which the question of the direction of rotation of the phase is of any importance. As is well known, it is possible to reverse the direction of rotation of a three-phase induction motor by interchanging two of the supply leads on the stator terminals. As one may represent the elements of an induction motor winding by three coils spaced at equal intervals of 120° about a circle, the direction of phase rotation may be defined as the order in which the currents in the windings attain their respective maxima. If, for example, the motor, shown diagrammatically in fig. 4, is connected so that it rotates in a contra-clockwise direction, it may be assumed that the phases attain their maximum values in the order 1, 2, 3, but if it should rotate in a clockwise direction, the assumption is that the phases come up 3, 2, 1. The numbering of the phases need not be expressed in this particular way, as the conditions are continuous. Thus, for forward rotation, the method of connections might also be expressed as 3, 1, 2, or 2, 3, 1, and similar alternatives are available for reversed rotation.

This point is not easily checked by tracing out the connections from the supply, as it eventually depends on the way in which the generator connections are brought out. It is therefore advisable to connect a very small motor to the circuit in order to ascertain the way in which the phases follow each other on the transformer secondaries, and for this purpose one may obtain a very sensitive little induction motor running in jewelled bearings and marked with the direction of mechanical rotation corresponding to certain phase numbering. Such an instrument is known as a phase rotation indicator; fig. 5 is an illustration of one of these with its cover removed. It can be operated off a very wide range of voltages, and takes about the same current as a high-class voltmeter. This instrument may also be

FIG. 5. PHASE ROTATION INDICATOR.

obtained in a form suitable for connecting in series with the secondaries of the current transformers, but this is not usually required, as one can generally trace the connections sufficiently far to discern which current secondaries correspond with any particular potential connections.

In many power-factor indicators, however, it is possible to obtain information as to the phase rotation directly from indications given by the instrument itself. In the example under consideration, one has two rotating fields available, and if the potential winding be short-circuited on itself,

while the current winding is excited, the movement will act as the rotor of an induction motor, and will move round in a definite direction, indicating the phase order of the current coils. Similarly, if the current windings be disconnected and short-circuited, a rotational effect will again be produced, but this time in the opposite direction. If these directions are known for the particular instrument, there will be no difficulty in obtaining the correct connections with regard to phase rotation.

The source of error under (c) should not now give any trouble, as all that is necessary is to ensure that the potential terminals are connected (through the transformers) to the lines from which the current coils of similar marking obtain their excitation. If this should be difficult on account of the transformers themselves being ungetatable, and if the value of the power factor is known approximately, one may deduce the alterations required to the connections from the indications of the instrument.

1. If the pointer should set in a position approximately 120 from the assumed correct value, step all the potential connections on or back by one phase.

2. If the pointer should set in a position 60 from the correct value, reverse all the current coils and proceed as at (1).

In conclusion, the writer would like to add that, although the above information will not be new to most instrument experts, he believes that it may prove of use to many others. The power-factor indicator is one of the most valuable alternating-current instruments, when properly understood, and he trusts that its rapidly increasing popularity will not be checked by any lack of knowledge as to the correct method of using it.

He would also like to express his best thanks to Messrs. Everett, Edgecumbe & Co., Ltd., for the photographs with which this article is illustrated and for their kind permission to publish details given of the unbalanced-load type of instrument, of which they make a speciality.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

### Wireless Telegraph Patents.

I notice in your columns a quotation from the *Australian Mining Standard* giving an account of a patent granted to Mr. Balsillie on October 15th, 1912, with respect to his system of wireless telegraphy. The description speaks of it as an arrangement wherein an exciting circuit is "electrostatically coupled" to a radiating circuit.

On referring to the diagrams this appears not to be the case. The two circuits are coupled by direct metallic connection, with a part common to both, in fig. 1; while in fig. 2 the resonating circuit is connected in the same way to the aerial and through a transformer to the detecting circuit.

I presume, therefore, that the phrase "electrostatic coupling" is a misdescription, especially as I hold a patent for coupling, which is really of that kind, dated April 8th, 1911.

Oliver Lodge.

Edgbaston, March 8th, 1913.

### Supply to Premises outside the "Area of Supply."

With reference to the article in your issue of March 7th on "the operation of Clause 6 of the Act of 1909," the writer is under the impression that the charge made by the Board of Trade for referring draft orders to counsel has either been discontinued, or is about to be discontinued, and that such charges were only made at the commencement of the working of the Act owing to there being certain obscurities in the wording of it.

It is also of interest to bear in mind that orders made under this clause have, up to the present, contained provision

\* If it should be found necessary to obtain decisive information as to the polarity of any current transformer without removing it from the circuit, the best method is probably to provide oneself with a spare current transformer, whose polarity is known. This should be of the type in which the magnetic circuit can be opened or closed at will for the purpose of enabling any cable or bar to be used as a primary winding without opening the electrical circuit, of which it forms part. Slip this transformer over the conductor which supplies the primary of the transformer whose polarity is in question, and connect the secondary at both ends directly to the secondary of the other transformer, so that the two secondaries form a simple complete series circuit. Connect also a low-reading voltmeter or test lamp across the windings, and note the effect on the voltage obtained when one secondary is reversed with reference to the other. When the two secondaries are connected in that relation which produces the higher voltage, the incoming terminal of the testing transformer is connected to the incoming terminal of the unknown. The transformer used for testing need not, essentially, have any iron circuit. All that is necessary is a coil of wire which can be held near the primary conductor, and this arrangement has the advantage that the reversal can be made by merely turning the coil over. There is also less voltage generated, and this is under more control.

giving the Board power to revoke the order in the future, in the event of any supply authority into whose area the extension contemplated is taken becoming able to give a supply of electricity at the point in question, where, at the time the order was made, they were not in a position to give a supply. In the event of such revoking clause being put into operation, it would presumably be competent for the first supplier to make a bargain with the second supplier, with regard to the cost of mains or other capital works carried out in order to give the supply; but the existence of this clause in the order does, in the writer's opinion, make some difference in the outlook of the supply authority towards business of this class, because, whilst the terms of the order commit the supplier to all the usual responsibilities of an electric lighting provisional order, they do not give that security of tenure in the business which exists within the supplier's own area. Therefore, apparently, supplies of this class should be sufficiently remunerative to cover all special capital expenditure involved within the period during which the supplier may anticipate that he will be allowed to enjoy the business unmolested.

#### Morse Signalling on Submarine Cables.

My keen interest in Mr. P. O'Neil's opportune letter, and specimen of his, inverse-current Morse signals, in the *ELECTRICAL REVIEW* of March 7th, became all the keener when, for the first time, I looked up Mr. O'Neil's patent, No. 16,462, 1907. I then found that his automatic pole-changing switch, which gave him these inverse-current siphon-recorder Morse signals, is practically identical with one of my two devices referred to in the *ELECTRICAL REVIEW* article of February 28th. It would be interesting if Mr. O'Neil would add to his kindness by telling us whether he ever succeeded in converting his received inverse currents into actual Morse dots and dashes. Mr. P. B. Delany's patent, No. 21,629, of 1893, includes a very clever device for effecting this conversion.

In Mr. John Gott's system—as your contemporary, the *Electrician*, of February 21st, has informed us—this conversion of inverse currents received on a suspended coil or other such relay is brought about by the electrical connecting together of the two contact stops limiting the play of the relay tongue. For readers new to the subject, this point, perhaps, was not sufficiently emphasised in the writer's article of February 28th. These two electrically-connected contact stops, between which the relay tongue oscillates under the alternate + and — currents shown in B, fig. 1, in the *ELECTRICAL REVIEW* article of February 28th, are in circuit with a local battery and a common Morse or Morse repeater. Whichever way, then, the cable relay tongue happens to be deflected, the effect on the local Morse is the same.

Mr. Gott has successfully co-ordinated apparently known physical principles with his own original and effective transmission devices. Official statements testify to successful direct Morse working between London and New York; truly a *fait accompli* which, apart from other men's clever work in the past, may justifiably regard Mr. John Gott as its true originator.

**E. Raymond-Barker.**

Wimbledon, March 10th, 1913.

#### Weak Hearts and Electric Shocks.

In your article this week on "Electricity in Mines," in an instance of a fatal shock, that at Trimdon Grange Colliery, it is pointed out that the inspector thought the effect would not have been fatal, but for the fact of the victim having a weak heart. That set me thinking, how many other victims have had weak hearts? Also of an instance that came before me about a year ago, and as I think it points a moral, I give it as briefly as possible, just, for an obvious reason, giving fictions instead of real names.

Felix Senior, 53, and Ralph Young, 23, were standing on the lead covering of a projecting shop-window trying to

localise a rupture in a cable that had been run eight years before in screwed tubing from a 200-volt a.c. circuit to supply an illuminated sign, when suddenly a tube which both were holding made contact with the live cable, and both received a rather severe shock.

Senior just left go of the tube, but, looking at Young, he saw that his face was becoming red, and then turning to purple, his hands being completely paralysed on the tube. He forcibly opened Young's hands (getting the shock meanwhile), and pulled him off; after a few minutes' rest, both were able to proceed with their work.

Now, why the difference? Both had similar boots on, both were on the lead sheathing, which was wet all over. Young was, besides being younger, much the stronger man physically—that is as regards running, lifting, &c. He, however, was a heavy tobacco smoker; Senior, an abstainer from this habit for some years. Both were abstainers from alcohol.

The veriest tyro in medicine knows that tobacco indulgence almost always, more or less, weakens the heart, especially in excess. Without wishing to dogmatise, least of all to pose as goody, I think that whether my surmise is right might be worth consideration as a word in season to young members of our profession.

**A. W. Bennett.**

Leeds, March 4th, 1913.

[The hands of Senior, the older man, were probably more dry and horny than Young's.—Eds. E.R.]

#### Heavy Service Lampholders and Adapters.

With reference to a letter in a recent issue signed "Sales Superintendent" anent heavy-pattern lampholders to carry 5 amperes without the slightest heating, being myself engaged in issuing approximately 400 electric power, lighting and heating specifications annually, I thoroughly endorse what is said. If some manufacturer would bring out a suitable heavy-pattern lampholder to enable a radiator or other apparatus to be used, it would quickly repay him, as some 10,000 could be sold locally in a very short space of time: it would supply a long-felt want in the West of Scotland and other parts of the country.

**An Engineer.**

Glasgow, March 4th, 1913.

#### Electric Cooking.

One very satisfactory feature of last year's trading, so far as it relates to electrical industries, is the greatly increased sales of electric cookers. Manufacturers have realised the great scope underlying this branch of the business, as evidenced by the cooking demonstrations which some of them have given in various towns throughout the kingdom with, I believe, very satisfactory results.

It is, however, one thing to familiarise the public with an article, and quite another to persuade it to invest in that article, and when it is remembered that nearly every gas concern hire-purchases out gas cookers, it is in some cases an extremely difficult matter to persuade a prospective consumer, who, perhaps, has a very limited income, to write out a £14 cheque for an electric cooker, and that by so doing, he is transacting a business deal which is in every respect not only satisfactory but also convenient to himself.

I am convinced that, if manufacturers were to hire-purchase out electric cookers, I, for one, would be able, in a comparatively short period, to increase my day-load peak by at least 40 per cent.

Another factor which has a predominating influence on the subject is the high cost of a reliable and efficient cooker.

Compare a gas cooker costing about £4 with an electric cooker of the same capacity, priced at about £14. Does £10 represent the actual worth of the difference? It seems almost impossible. Until we have a reliable cooker on the market priced at about £7, with the option of hire-purchase, electricity as a medium for cooking will never be seriously regarded by the middle class.

## CO-OPERATIVE ELECTRICAL CAMPAIGN IN AMERICA.

A CONFERENCE of the Society for Electrical Development was held in the Engineering Societies' Building in West 39th Street, New York, on March 4th and 5th, which brought together, we are informed, "representatives of more than ten billion dollars in a campaign of education." Every branch of the electrical trade will be represented. Officers of such corporations as the General Electric Co., the Westinghouse Co., the Philadelphia Electric Co., the Union Electric Light and Power Co., of St. Louis, and the Buffalo and Niagara Falls Light and Power Co., to mention but a few, are members of the board of directors.

The Society was organised a few weeks ago for the purpose of educating the public up to a more general use of electricity in all its forms, and the conference was called to make definite plans for carrying on the work through the expenditure of a considerable sum in advertising and publicity work of all kinds. The president of the Society is Mr. Henry L. Doherty, a New York banker, who handles many electrical securities, and is well known in the electrical industry. The general manager of the Society is Mr. J. M. Wakeman, for many years president and general manager of the *Electrical World*, and the secretary-treasurer is Mr. Philip S. Dodd, formerly general manager of the *Electrical Review*, and later director of the Commercial Development Department of the National Electric Lamp Association.

The conference was opened by an address by the President of the Society, Mr. Doherty, and some observations by the general manager, Mr. Wakeman, on "The Aims of the Society." "Electricity has been decreasing in cost to the consumer, while the price of everything else has been advancing," says General Manager Wakeman, in discussing the plans for the Society for Electrical Development, "and it is our aim to show the general public that electricity is no longer a luxury for the few, but has become a necessity for all. It can be stated, as a fact, that 70 per cent. of the people in the United States use electricity in some form every day, if only by sending a telegram, using the telephone, riding on a street car, or ringing a door bell, and approximately 5 per cent. of the population is supported more or less directly by the electrical trade and its ramifications. And this enormous industry practically can be said to have developed itself, as it is only within the past half dozen years that a few of the larger manufacturers and central stations have made any real effort toward educating the public to the use of what is still to the average layman a stupendous mystery. No one manufacturer, central station, contractor, or dealer can carry out single-handed efficient educational work as well as it can be carried out by co-operative effort. The conference constitutes a starting point in electrical development, and it will produce a co-operative result eclipsing any heretofore known, with individual benefit to all engaged in the industry, and to the industry at large. While no active campaign has as yet been inaugurated to obtain additional members for the Society, its membership is open to any individual or person as a representative of any firm, corporation or association which is engaged in the manufacture, production, installation or sale of electrical or other apparatus or supplies necessary in the production, distribution or utilisation of electrical current, or is engaged in the manufacture or sale of electrical current. The funds necessary to carry out the purposes of the Society will be subscribed by the members or the firms, corporations or associations represented. The central stations and manufacturers represented by membership will subscribe to its funds at the rate of not less than  $\frac{1}{100}$ th of 1 per cent. of the gross amount of their respective annual sales, and the contracting, dealing and jobbing interests represented will subscribe on the basis of  $\frac{1}{100}$ th of 1 per cent. of the gross amount of their respective annual sales. The Society has already been financed to the extent of something over \$100,000, and it is intended to immediately inaugurate an active campaign to increase the membership of the Society and to bring the amount subscribed up to a minimum of at least \$200,000. The thought is that active work will not be commenced until the full \$200,000 has been subscribed, but, naturally, the campaign will be continued to a point where the entire electrical industry will be co-operating to win the desired results. An analysis of the by-laws will bring out the truly co-operative extent of the Society. The fact that its membership is open to all the electrical industry, and that control of the Society will for all time be vested in the four different branches of the industry, to wit, central stations, jobbers and dealers, contractors, and manufacturers, and the actions of the Society are to be always controlled by an even distribution of the various interests mentioned, on its board of directors, executive committee, and among its officers, is a guarantee of the truly co-operative nature of the Society."

The object of the meeting was to obtain from as many angles as possible the various ideas of the many branches of the industry on the tentative plans that would be proposed in a most comprehensive programme. Among the plans to be suggested was a broad educational general advertising campaign, together with plans for a comprehensive Press bureau for the dissemination of news matter pertaining to things electrical, and also a field department for co-operative and general educational work throughout the electrical and allied industries, architects, building trades, and various manufacturing fields.

In addition to the items in the Conference programme mentioned above, the following were subjects brought forward:—"Where the National Electric Light Association Comes In," by Mr. T. C. Martin; "The New Value of Electricity," by Mr. F. H. Gale;

"Electricity and the Architect," by Mr. F. E. Wallis; "The Dissemination of News," by Dr. Talcott Williams; "Co-operation in the Electrical Industry," by Mr. J. R. Crouse; "An Electrical Advertising Campaign," by Mr. W. D. McJunkin; "Selling a Commodity," by Mr. E. St. Elmo Lewis; "Merchandising Co-operation," by Mr. W. E. Robertson; "Efficiency in Local Advertising," by Mr. J. C. McQuiston; "Electrical Development and the Electrical Contractors," by Mr. E. Freeman.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### "Economic" Bench Grinders.

THE WILSON-WOLF ENGINEERING CO., LTD., of Thornton Road, Bradford, have just placed on the market a new type of electric bench grinder, which we illustrate in fig. 1. This machine has been designed for hard and constant work; the motor is shunt-wound, rated at 1 H.P., and runs at a speed of about 1,800 R.P.M. It is fitted with Hoffmann ball bearings, and is quite dust-proof. The box base, on which the motor is mounted, is of rigid design, and

FIG. 1.—ELECTRIC BENCH GRINDER.

carries the tool rests, which, besides being adjustable to the wear of the wheels, are capable of a vertical and angular adjustment to accommodate work of varying thickness and shape. A starter, with no-voltage release attachment, is fitted inside the box, and is actuated by the hand wheel seen in front.

The standard equipment supplied with the grinder consists of two 8 in. × 1 in. wheels, of any grade to suit the work. The machine can also be supplied as a special heavy duty grinder, equipped with one 10 in. × 1½ in. wheel.

### Electric Toaster.

A new electric toaster has just been placed on the market by MESSRS. F. A. WILKINSON & PARTNERS, LTD., of Hatfield, Herts., the features of which are simplicity of construction, efficiency and cheapness. The heating element comprises a strip of mica, upon

FIG. 2.—A NEW ELECTRIC TOASTER.

which are mounted vertical steel rods, their attachment to the mica being made by a special process. The top portion of the coil is held by means of the steel supports, while the bottom portion is secured to the base by means of detachable rivets. The element is enclosed in a bright metal network, and is readily removed when required. An insulating strip is fitted beneath the element.

### An Ironclad Switch-Fuse.

Fig. 3 shows a 1,000-ampere, 500-volt, double-pole combined switch and fuse, made by the SAFETEE CONTROLLING APPLIANCES CO., LTD., of Luton, Bedfordshire. An examination of the illustration will show the remarkable compactness and space-saving properties of this form of circuit control as compared with the older designs which were adopted in connection with high-power traction voltage supplies of this description, and this saving of space has been secured without any detriment to safety. The switch is made up of substantial contacts, so sub-divided that considerable contact surface is given; on each pole there are two sets of contacts, and between these are mounted two indicating cartridge fuses, which are secured to the contact blades by means of screws in such a way that a blown fuse can be replaced in under half a minute. The switches are provided with a positive pull out, and, in addition, the motion of the moving portion is controlled by steel springs giving an extremely long and rapid break. The alignment of the moving portions with the fixed contacts is secured by

FIG. 3.—1,000-AMP. SWITCH-FUSE.

a squared steel shaft on which the moving part slides, and the mechanism is automatically interlocked with the lid, making it impossible to open or close the case unless the switch is in its off position.

The contact blades and fuses are insulated from the carriers by means of moulded micanite, and mica and metal construction are the features of this gear. The slates are insulated from the case by means of a special insulating material  $1\frac{1}{2}$  mm. thick, the puncture voltage of which is 10,000 volts per mm. The holding-down screws are insulated from the slates and the interior of the case is coated with a special enamel. In a test made by the National Physical Laboratory at Teddington, on a 500-volt 30-amp. switch, measurements were made between all insulated parts of the case and between one insulated part and another, and the insulation resistance was in every case over 200 megohms. The glands are removable, and hence the wiring of the switch is accomplished with ease. These switch fuses are constructed either for double or triple-pole service, and have been combined with other apparatus in panel form in order to produce complete controlling units for all purposes.

### Slow-break Witton Switches.

For many purposes a quick break is not necessary, as in equaliser switches and switches for short-circuiting starters on motor-generators, &c.

THE GENERAL ELECTRIC CO., LTD., provide for such purposes the "Witton" slow-break switches, which are made in sizes from 100 amperes up to 3,000 amperes, and in the single, double and triple-pole patterns. Good grinding over the whole area of faces in contact, coupled with a current density at the contacts of 90 amps. per sq. in., is responsible for a very small power loss, and in the change-over type, off-stops are provided, which prevent the possibility of the switch falling back on the lower contacts, should it by any chance work loose.

### Electric Water Heater.

Some years ago we described a simple form of water heater, in which the resistance consisted of carbon spheres, actually immersed in the current of water to be heated. This device has been greatly improved and developed, and is now about to be put on the market by the BRITISH HEATER CO., LTD., of 105, West George Street, Glasgow. The accompanying illustration, fig. 4, shows the apparatus, which consists of a high-class porcelain tube containing the carbon balls, a switch and stop-valve. It will be noticed that the switch and valve are both controlled by the same handle, that switch cannot be closed without first turning on the water, but after closing the switch the rate of flow of water can be widely varied, thus controlling the temperature of the issuing

water. The electrical connections to the resistance are at some distance from the water connections, so that the circuit is not earthed—as measured on the Glasgow mains, we understand, the resistance between them is no less than two megohms, though the current-carrying balls are actually in the water—and the use of

FIG. 4.—WATER-HEATER WITH IMMERSED RESISTANCE.

the device is permissible on any circuit. To eliminate the risk of shock, the inlet and outlet water pipes are electrically bonded together, and are therefore earthed, if the water supply is from the mains.

The apparatus is made up in forms suitable for domestic use, hotels, &c.; fig. 5 shows a pattern for use on board ship, which is

FIG. 5.—SHIP PATTERN, COMBINED WITH WATER-HEATER AND BASIN.

already becoming popular. There is, perhaps, no place where electric geysers are more readily applicable and convenient than on passenger ships.

### The "Regina" Electric Cleaner.

MESSRS. MICHAEL K. COOPER & CO., of 27, Oswald Street, Glasgow, are introducing a new type of electric suction cleaner, which possesses some exceptionally good features. The motor, which is made by the G.E. Co., of Schenectady, is of excellent design and workmanship, and is fixed in a compartment which is shut off from the air passages, so that no dust has access to it. The dusty air is drawn in through a canvas bag, which catches all the dust before it reaches the fan, which is thus protected from injury; a metallic casing encloses the dust bag, which is easily withdrawn and emptied. The nozzle is fixed on the front end of the casing, as shown in fig. 7, and the weight of the machine (only 14 lb.) is carried on rubber-tired wheels at the other end. By means of other attachments, a hose can be coupled to the front end,

for cleansing the walls, &c., or to the exhaust of the fan, for blowing dust out of crevices, books, &c. We have tried one of these machines, and find that it does everything that is claimed for it; it is a very practical and well-made pattern of cleaner.

FIG. 6.—B.T.H. "REALITE" FITTING.

FIG. 7.—"REGINA" SUCTION CLEANER.

#### B.T.H. "Realite" Semi-Indirect Fitting.

The "Realite" fitting (fig. 6) is the latest development of semi-indirect lighting introduced by the BRITISH THOMSON-HOUSTON CO. LTD. The fitting consists of an inverted standard "Veluria" reflector suspended on a special semi-indirect attachment. The Mazda lamp hangs pendant in the reflector, and is completely hidden thereby.

The "Veluria" reflectors produce charming lighting effects, and when used for semi-indirect lighting, they have the advantage of thoroughly diffusing the light, and consequently reducing the apparent intrinsic brilliancy of the light source.

### LEGAL.

JOHNSON BILLINGTON ELECTRICITY METERS, LTD., v. A. M. BILLINGTON.

MR. JUSTICE COLEBRIDGE, with a special jury, in the King's Bench Division on March 6th and 7th, heard an action in which the plaintiffs sought to recover damages from Mr. Arthur Marston Billington, of Holland Park (formerly one of the directors of the company), for alleged breach of duty. In his defence, Mr. Billington denied the various acts of negligence alleged, and denied that there had been any breach of duty.

Mr. J. R. ATKIN, K.C., and Mr. Theobald Mathew were for the plaintiffs, and Mr. Ernest Pollock, K.C., M.P., with Mr. H. G. Robertson were for the defendant.

Mr. ATKIN, in opening, said that Mr. Billington was one of two directors of the plaintiff company, and in July and August, 1910, he was managing director of a company called the Beck Flame Lamp, Ltd., which was a company formed to manufacture and work certain patent electricity meters. A successful meter (said counsel) was a thing of considerable commercial importance, and the patentee of the particular meter in which the company was interested was a Mr. Johnson. The other director of the plaintiff company was Mr. Harvey Benjamin Spiller, a jobber and a member of the Stock Exchange. Mr. Billington, who had known Mr. Spiller for a considerable time, saw him with reference to the formation of the plaintiff company for the purpose of working the patent, and the company was, in fact, incorporated in July, 1910. The company had a nominal capital of 8,000 £1 shares, and the arrangement was that £1,000 in shares was to go to the vendors of the patents. A cash working capital amounting

altogether to £1,775, was subscribed by Mr. Spiller and his friends. Mr. Billington then suggested the desirability of the meters being manufactured by the Beck Flame Lamp, Ltd., and eventually an agreement was drawn up, the substance of which was that the Beck Co. were appointed the sole licensees and manufacturers of the meters. The plaintiff company were to provide £500 as part payment of the outlay necessary to provide the plant required, and a Mr. Harrison was appointed to have the sole selling rights of the meters. There was a provision enabling the Beck Co. to use the £500 for the ordinary purposes of their business, it being stipulated that if within two years they placed orders for 10,000 meters, the Beck Co. were to repay the money. Counsel proceeded to suggest that at that time the Beck Co. were insolvent, and he alleged that Mr. Billington must have known it. About August 8th, 1910, there was a board meeting of the plaintiff company, at which Mr. Billington and Mr. Spiller were present. As Mr. Spiller was going away for a holiday, a resolution was passed that cheques could be drawn by one director with the counter signature of the secretary. The secretary appointed was a clerk in the employ of the Beck Co. It was alleged (added counsel) that Mr. Billington caused the plaintiff company to pay various sums to the Beck Co. by way of loans. For the £500 paid over previously, the plaintiff company received nothing, and eventually it was found that Mr. Billington had been in the habit of getting money in and out of the plaintiff company's bank by a series of loans upon the security of certain debts which he proposed to pay off. Various advances were made on outstanding debts, and there were certain repayments. Subsequently Mr. Billington was deposed from his office as director of the plaintiff company, and the Beck Co. had gone into liquidation.

Mr. HARRY BENJAMIN SPILLER said that he knew Mr. Billington 20 years ago, but he had not seen him for five years when they met in 1910. In June of that year he knew that Mr. Billington was managing director of the Beck Co., but he did not think anything definite was said in regard to the finances of the company.

Mr. MATHEW: So far as you knew the company was in a sound financial position?—Yes, I knew that years before, I had found money to put it in a sound financial position.

In cross-examination by Mr. POLLOCK, K.C., Witness said that the statement of claim showed that it was sought to recover £500 lost under the agreement with the Beck Co. to manufacture the meters; £46 the difference on certain transactions on the sale and purchase of debts; and something like £40 or £50 expenses relating to a matter with the Dublin Corporation.

Mr. POLLOCK: Do you think Mr. Billington has swindled you?—I am not going to say that.

In further cross-examination, Mr. SPILLER said that he placed debentures for the Beck Co. in 1909. He knew that the Beck Co. wanted money, but inquiries as to the value of the patents were answered satisfactorily. He was satisfied that the Beck Co. had a prosperous future before it. Mr. Billington had, in fact, bought several debts of the Beck Co.

A CLERK formerly in the service of the Beck Flame Lamp Co., Ltd., at the time Mr. Billington was managing director, said that he was appointed secretary *pro tem.* of the plaintiff company by Mr. Billington, who was well acquainted with the financial condition of the Beck Co.

Mr. HAYDN HARRISON, electrical engineer, stated that he entered into an agreement for the sale of the meters, and could have sold them if they had been supplied to him.

His LORDSHIP suggested that the evidence was unnecessary, as they knew that no meters were sold. The witness was the sole agent, and therefore, if there had been anything to be sold, he would have sold it.

Mr. ATKIN: Was it, in your judgment, a sound commercial venture, and do you believe that you would have been able to sell the meters if they had been supplied?—I do believe that it was a sound commercial venture, and I have no doubt I should have been able to make good sales.

Mr. POLLOCK, in opening the case for the defence, said that there was not an atom of evidence, and not even a suggestion, that any of the money had passed into Mr. Billington's pocket, or that he had derived any advantage out of the transactions. The Beck Co. was a company likely to do well, as it had some very good patents; but it wanted capital. It had been suggested that Mr. Billington had been guilty of fraud, but in order to arrive at such a conclusion, they must look for motive. It could not be suggested that a man would descend to fraud without motive, but here there was not even a suggestion that the defendant had derived any advantage. The only advantage had been with the Beck Co., and yet reckless charges had been made against the defendant in order to create prejudice.

Mr. ARTHUR MARSTON BILLINGTON was then called, and said that he was a constructing electrical engineer, carrying on business at Suffolk House, Lawrence Pountney Hill, E.C. In the course of his business he had come across several patents from time to time, and had been interested in companies formed to exploit them. He was for many years engineer to the London Electric Supply Corporation, and he entered into the plaintiff company, and Mr. Spiller was the other director. He had known Mr. Spiller for some 15 years, and in 1908 he came into business contact with him in connection with the Beck Co., whose business related to a patent arc lamp for street lighting. They secured some important contracts with the London County Council for lighting the Strand and other places. Mr. Spiller was to find a certain amount of capital, and witness promised him 300 shares, but he ultimately got 500. When he came to witness's office he saw the meter on the table, and asked what it was. Witness explained it to him, and told him that he had a half share in it, and was arranging with the Beck Co. to manufacture it. He suggested that as witness had a great deal on hand, it would

facilitate matters if witness would allow him to form a company. At first he (witness) rejected the proposal, because he did not wish to make a company of it, as he wished to work it with Mr. Johnson. Ultimately, however, he agreed that the company should be formed. It was formed, and the arrangement was that the Beck Co. should manufacture the meters. It was also agreed that £500 should be paid to the Beck Co. to provide plant, an accumulator house, and put up a testing room. In fact, it was arranged that they should put themselves in a position to carry on the manufacture. The plant was exceptional, and had to be provided. It was not true that he made any representations about the Beck Co. at that time, but he believed it would have been in a position to carry out the manufacture of the meters, or he would have had nothing to do with it. He was supposed to have a salary as managing director of the Beck Co., but he did not always get it.

As a matter of fact, have you ever had any fees as a director of the plaintiff company?—No, not from either company.

Had you any desire to falsify the minutes at all?—No, certainly not.

Or any object in falsifying them as alleged?—None whatever.

Examination continued: The meter company had a certain amount of capital lying idle, and the Beck Co. had no money immediately available, and I suggested that it would be to our mutual advantage to assist the Beck Co. financially. At that time we could not have made use of the money for the sale of the meters, as the meter was not then in a sufficiently advanced form.

Have you in any way sought by these transactions which are questioned in this action to secure profit or advantage for yourself?—None whatever. I have suffered in pocket and in health.

Is it true that on any occasion you have made false assertions to Mr. Spiller?—No.

In cross-examination by MR. ATKIN, Witness said that in August, 1910, he thought the Beck Co. was in a satisfactory financial position, and Mr. Spiller knew the exact position of that company.

After some further evidence, the Jury found a verdict in favour of the plaintiff company, and awarded them £486 damages.

Judgment was accordingly entered for the plaintiffs with costs, but a stay was granted with a view to possible appeal.

#### OSRAM LAMP WORKS, LTD., v. FREEMAN.

In the Chancery Division on March 7th, Mr. Justice Sargant had before him this case, on a motion to restrain an alleged infringement of the plaintiffs' patent.

MR. J. HUNTER GRAY (for plaintiffs) explained that the patent had been certified as valid by Mr. Justice Warrington as the result of a trial before him last year, which lasted two or three weeks. Since then there had been a very large number of infringing lamps made abroad, imported into this country, and sold through retailers. The patent was for a metal-filament incandescent lamp, and there was no process except plaintiffs' by which this filament could be made.

SIR ALFRED CRIPPS, K.C. (for the defendant) said his client was not the manufacturer but merely the retailer. Immediately the motion was launched the defendant told plaintiffs this and offered to abide the result of an action which plaintiffs were bringing against the manufacturers—the Gabriel Co. In these circumstances, counsel urged that it was extremely oppressive for the plaintiffs to have continued the proceedings against the retailer, and asked that plaintiffs should be ordered to pay the costs of the motion.

HIS LORDSHIP: Is there a substantial defence on the part of the manufacturer?

SIR ALFRED CRIPPS: Certainly. It is not evidence now, but I may say that, according to an affidavit of Mr. Ballantyne, there is a very substantial defence. We are not using the process upheld before Mr. Justice Warrington, but something quite different. We are not going to tell them now what it is.

HIS LORDSHIP: It would be very oppressive on the manufacturer for the process to be disclosed by the retailer.

MR. GRAY: This sort of thing is very much more oppressive on the patentee.

HIS LORDSHIP (to Sir Alfred): Are you prepared to keep an account of the lamps sold?

SIR ALFRED CRIPPS: Certainly. We have offered that, and to abide by the case against the manufacturer. We say that from the moment that offer was made, no costs should have been incurred.

HIS LORDSHIP made no order on the motion, and reserved the costs.

#### MUNDAY v. SOUTH METROPOLITAN ELECTRIC LIGHT AND POWER CO., LTD., AND THE NEW GUTTA-PERCHA CO., LTD.

On March 6th Mr. Justice Swinfen Eady heard in the Chancery Division an application on behalf of the South Metropolitan Electric Light and Power Co., Ltd., who were defendants with the New Gutta-Percha Co., Ltd., to an action brought against them by Mr. Edgar Lake Munday. Plaintiff asked for an injunction to restrain an alleged nuisance. By this application the Electric Co. asked that the plaintiff should be required to elect against which defendant in the action he was going to proceed, and that so far as related to the defendants against whom he elected not to proceed, the action should be dismissed with costs.

Mr. Tomlin appeared for the applicants; Mr. Frank Russell, K.C., and Mr. J. Edwards for the plaintiff; and Mr. A. E. Hughes for the New Gutta-Percha Co.

MR. TOMLIN said the statement of claim in the action alleged that the defendants carried on, or permitted to carry on, their businesses upon their respective premises at Crooms Hill, Greenwich, and upon the roadway or passage leading thereto,

known as May's Building Mews, so as to cause a nuisance by noise to the plaintiff as the owner and occupier of the dwelling house and premises, 54, Crooms Hill. The noise complained of was caused by the traffic of lorries, trolleys, and other vehicles. A nuisance was also caused by numbers of the workmen of the defendant companies gathering in the roadway and in front of the plaintiff's house and shouting and making a noise there. He (counsel) contended that there had been an improper joinder of defendants.

In reply to his LORDSHIP, Counsel said that throughout the claim there was a separate tort against each defendant alleged, and no sort of connection was alleged between the defendants, who carried on separate businesses on separate premises at the end of a lane.

HIS LORDSHIP: Which of the two defendants knocked the plaintiff's wall down?

MR. TOMLIN said he did not know, but the plaintiff seemed to be in the position of the unfortunate man who was squeezed between two omnibuses, and sued the owners of both, because he did not know who was the squizzer. Plaintiff ought to be compelled to elect against which defendant he intended to proceed.

MR. HUGHES, for the New Gutta-Percha Co., supported Mr. Tomlin's argument.

MR. RUSSELL said it was not possible to say whose lorry was passing or whose goods were being carried past the plaintiff's house on any particular occasion. Plaintiff complained that defendants were obstructing his right of way and making life intolerable—at all events, unpleasant, by reason of the noise. He could not, however, tell which defendant's workmen made more noise than the other—it was, however, a combined noise of the workmen which constituted the nuisance.

HIS LORDSHIP said it was not disputed that the defendants respectively had a certain right of way, but the extent of it was disputed by the plaintiff. It appeared manifest that plaintiff alleged a wrong or tort committed by each of the defendants. In each case the defendants claimed a right of way, and in each case it was a question of what the defendants had separately done. He was of opinion that the plaintiff must be put to his election as to which of the defendants he desired to proceed against, and the action must be stayed against the other defendant.

#### OSRAM LAMP WORKS, LTD., v. LOUIS SCHLOSS & CO.

On Friday last Mr. Justice Swinfen Eady, in the Chancery Division, decided a motion by plaintiffs against defendants, of 3, Rangoon Street, Crutched Friars, for an interim injunction to restrain the infringement of the plaintiffs' patent No. 23,899, of 1904, relating to tungsten filaments for lamps.

MR. COLEFAX, K.C., (with him Mr. J. Hunter Gray), instructed by Messrs. Bristows, Cooke & Carmichael, appeared for the plaintiffs, and the defendants were represented by Mr. Frost.

MR. COLEFAX, in opening the plaintiffs' case, said they had purchased a number of "Edna" lamps from the defendants. They had been submitted to Dr. Oberlander, who had sworn an affidavit that they had been manufactured in infringement of one or other of the plaintiffs' patents. The defendants said they purchased the lamps from the Société Anonyme Métal et Lumière, of 63, Rue du Marché, Brussels, and the Belgian company stated that the lamps were made in Italy—by the Società Edison and Cruto Clerici & Cie, of Milan—whose works were at Turin. There was evidence on behalf of the Belgian company showing that a gentleman connected with them had seen the Italian company's works, but he did not give any detail of the manufacture, and, so far as detail was concerned, it was left to a Mr. Maurice Bayet to put it in evidence.

COUNSEL reminded his Lordship that the Osram patents had been upheld by Mr. Justice Warrington, in an action against the "Z" Lamp Manufacturing Co. On the present application, he had an affidavit by Mr. Wm. L. Pakenham, the superintendent of the "Z" Co., who had, in fact, seen the "Edna" lamps manufactured in Italy, and he said that the process was precisely that which was carried on by his own company in this country, and which had been found to be an infringement. After describing the plaintiffs' mode of manufacture, Mr. Colefax said that the patent of 1904 consisted in the use of steam and hydrogen, and the other patent, in the use of nitrogen and hydrogen. The defendants in the action against the "Z" Co., said they did not use steam, but only hydrogen, but it was found, as a fact, that there was still sufficient trace of moisture left.

The affidavit of Dr. Oberlander stated that he had examined the Edna lamps submitted to him, and he was satisfied that the process used in their manufacture was an infringement of the plaintiffs' patents.

MR. FROST read the affidavit of Louis Schloss, which stated that he was a dealer in lamps. The "Edna" lamps were not manufactured by him, but purchased from the Brussels company above referred to.

The affidavit of Michel Bieske, managing director of the Brussels company, stated that all the lamps sold by them to the defendants were manufactured by the Italian company at their works in Turin.

MR. FROST read the affidavit of Carlo Clerici, son of a director of the Italian company, showed that he had made a study of lamps, and he visited the works of the Italian company and knew that neither steam nor hydrogen was used to prevent oxidation of the filaments.

Commenting on the defendants' evidence, MR. COLEFAX said that Clerici was the responsible person, but he did not go into any details of the manufacture. When the filament had got to its last stage, in order to raise it to a sufficient temperature, the Italians said they passed a current of electricity through it. Precisely the same suggestion was made in the action against the "Z" Co.,

and on that issue being fought out, Mr. Justice Warrington found that, in effect, there was a minute quantity of moisture clinging to the bell-jar, which, in fact, effected the removal of the carbon. He suggested that the defendants were swearing by the card rather than stating what the process really was.

**HIS LORDSHIP:** In the process described by the defendants supposing there is an imperfect vacuum, what is there to prevent the oxidation of the tungsten?

**MR. COLEFAX:** Nothing, unless hydrogen is put in. Our patent gets out the carbon without oxidation.

**MR. FROST:** The carbon is removed in vacuum. The vacuum being sufficiently complete there is not a sufficient quantity of oxygen remaining to destroy the filament.

**MR. COLEFAX:** The only evidence given by the defendants does not put forward any such story, but, on the contrary, says an electrical current is used.

**HIS LORDSHIP:** Are the lamps manufactured by the Italian company sold in Italy as "Z" lamps?—**MR. COLEFAX:** Yes. I submit that in the absence of any affidavit from Clerici telling us exactly what the process is, we are entitled to an injunction. Mr. Justice Warrington has found that there is no direction in the specification to introduce steam.

**MR. FROST,** for the defendants, submitted that as Clerici's affidavit was not contradicted, the motion failed.

**HIS LORDSHIP:** Does he explain anywhere how it is that the tungsten does not get oxidised?—**MR. FROST:** No.

**HIS LORDSHIP:** That is rather important.

**MR. FROST:** These things are very extraordinary. In the previous case against the "Z" Co. it was argued that there was no steam left in the bell jar. That, of course, has now gone. We contended that the carbon was actually distilled off without chemical action.

**HIS LORDSHIP:** The affidavit of Bayet throws over Mr. Swinburne's theory of the physical volatilisation.

**MR. FROST:** That is his opinion. If there is no hydrogen introduced into this vacuum, there is an answer to this case.

**HIS LORDSHIP,** in giving judgment, said he need only deal with the first of the plaintiffs' patents—that of 1904. The plaintiffs had established the validity of that patent in the action before Mr. Justice Warrington, and also that the "Z" Manufacturing Co. had infringed it. It now appeared that the defendants, Louis Schloss and Co., imported lamps, which, according to the plaintiffs' allegations, were made in infringement of the patent, and in the same way as the lamps which were the subject of the former action. According to the evidence adduced on behalf of the defendants in the former action, it was said that no steam or hydrogen, or hydrogen with a small quantity of water, was used, and that, therefore, there was no infringement. The plaintiffs' process was to protect the filament, and the defendants said the process used in the manufacture of Edna lamps was to remove the carbonaceous material by electricity, and although that was done in a vacuum, the vacuum was imperfect, and there was a sufficient residuum of air left for the removal of the carbon. Mr. Biske said that he had visited the Italian company's works, but he did not in terms say that he had witnessed the manufacturing process. All he said was that the carbon was removed by placing the filament in a vacuum, and raising it by means of current to a high temperature. In other words, he attributed the oxidation of the carbon to the small quantities of air remaining in the vacuum. Mr. Clerici did not give any details in his affidavit of the way in which the filaments were manufactured. He denied that certain gases were introduced, but there was no denial of the introduction of hydrogen alone. On the other hand, it seemed clear from the affidavit of Dr. Oberlander that unless some means were adopted to protect the tungsten in the filament from oxidation, the introduction of a high electrical current would result in the destruction of the tungsten filament. "Having regard to that evidence," said his Lordship, "I am of opinion that for the purposes of the present motion it has been shown that these lamps are really manufactured in the same way as the lamps of the "Z" Co. in the previous action." Mr. Parkerham, the superintendent of the "Z" Co., had seen the Italian process, and said it was the same as that of the plaintiffs. There would, therefore, be an interlocutory injunction against the defendants on the plaintiffs' undertaking in damages, and the usual order as to costs.

### Electrical Trade in Switzerland.—The year 1912

was a record year for the Swiss machinery and electrical industry. Factories were so full of work that delivery to date, in many cases, was impossible. Orders were booked for large electrical units for the Augst-Wighlen station, and also for that at Laufenburg. The enlargement of power stations and the extension of distribution networks, both at home and abroad, created a lively demand for generators, transformers and motors. In view of the monopolisation of electric supply by the Cantons and Communes, private capital abstained from putting forth new schemes. The electrification of the Federal railway system, which is to be undertaken at no distant period, involves the establishment of new generating stations to supply the current which will be required. In contrast with the temporary lull in electric circles in Switzerland, orders for water turbines came from abroad, and especially from overseas countries, in ever-increasing numbers. Business in steam turbines was also extremely satisfactory.

## REVIEWS.

*Design of Electrical Machinery.* Vol. III. By W. T. RYAN. London: Chapman & Hall, Ltd. Price 6s. 6d. net.

This is the third volume of a series of books by the author on electrical design, and deals with alternators, synchronous motors, and rotary converters, the two preceding volumes having discussed direct-current machines and alternating-current transformers respectively.

Different types of alternating-current generators and their characteristics are described in the first chapter. A number of extracts from specifications and the A.I.E.E. standardisation rules, together with some miscellaneous information on windings, vector diagrams, &c., are given.

Chapter 2 deals with the design of alternators and synchronous motors, and the treatment is quite modern. A number of tables are given relating to output coefficients, specific loadings, air-gap densities, and so on—all of which are on the safe side. Field and voltage wave forms are treated fairly thoroughly, as is also armature inductance.

Following, we have 11 pages devoted to the design of rotary converters, and the author states that he has only considered the points wherein a rotary is different from either a synchronous motor or a direct-current generator. As a matter of fact, the information given is of the most elementary and discursive character. Some definite data should surely have been given as to the different proportioning of the various parts, conductor sections, number of conductors in series per pole, &c.

The concluding chapter gives a number of reproductions from working drawings of a 180-K.V.A. 2,200-volt alternator.

The book consists of 127 pages of matter, with a seven-page index. Distributed amongst this 127 pages are 55 photographic reproductions of machines and parts of machines, strongly suggestive of manufacturers' catalogues, and it may at once be stated that the great majority are useless from an educational standpoint. The price is altogether unreasonably expensive.—H. G. S.

*The Practical Telephone Handbook.* By J. POOLE, A.M.I.E.E. London: Whittaker & Co. Fifth edition. Price 6s. net.

Dr. Fleming recently remarked, in the course of a series of lectures which he was delivering on wireless telegraphy, that nowadays it was quite impossible for a man to be an all-round telegraph engineer—he must specialise in one of the branches into which the profession is divided, each of which in itself constitutes a life's study. In none of the subdivisions of telegraph engineering are these remarks more true than in connection with telephony. Only a few years ago, telephony formed a part, and only a small part, of the work of the inland telegraph engineer. At present, however, telephony has grown to such an extent as completely to overshadow the older art, and rapid developments and changes are still taking place. The difficulty of keeping abreast of modern practice in the telephone field is only too well known to the engineers and other officials connected with the telephone industry, and by them the appearance of an up-to-date edition of the work under review will be welcomed. The greater number of readers are, in all probability, familiar with this book in earlier editions, and to them we need only say that the old standard of excellence has been well maintained in the present one, which has been considerably revised and enlarged. For the benefit, however, of any readers who may not be acquainted with the work, we give a short sketch of the ground which it covers.

The first chapter gives a brief outline of the elementary electrical phenomena upon which the science of telephony is founded. Then follows a chapter on batteries, and one in which the history of the development of the telephone is rapidly sketched.

The various pieces of apparatus, the different exchange arrangements, including some special exchange systems, and automatic working, are described in considerable detail.

Chapters are given on the apparatus room; power plant; traffic statistics; construction—overhead, underground and submarine; loading, including a brief sketch of Dr. Kennelly's theory of artificial cables; the localisation of faults; electrical measurements; development studies; and wireless telephony. The book concludes with a chapter on the miscellaneous applications of telephony, such as the electrophone service; police and fire alarms; the telautograph; and several others. At the end of the book many useful notes and tables have been collected into an appendix.

The book is well printed, the diagrams are clear, and we can recommend it to all who wish to obtain an up-to-date book on telephony at a reasonable price.

We have only two adverse criticisms to offer.

In dealing with the Leclanché cell, on page 31, the author remarks that in setting up this cell care should be taken to exclude manganese dioxide dust. It has been shown by Mr. J. G. Lucas, in a paper read before the Institution of Post Office Electrical Engineers, that this is a fallacy, and that a Leclanché cell, in which powdered manganese dioxide is used, is much more efficient than one in which the granulated substance is employed.

We notice with regret, on pages 405 and 406, that in dealing with the theory of telephone transmission, the author has used the symbol  $\alpha$  to denote the wave-length constant, and  $\beta$  to denote the attenuation constant. The best English writers on this subject, among whom may be mentioned Dr. J. A. Fleming and Messrs. Cohen and Shepherd, use  $\alpha$  to denote the attenuation constant, and  $\beta$  to denote the wave-length constant. This manner of using the symbols is that which follows naturally, in the theoretical investigation of the subject, from the mathematical conventions ordinarily employed in algebra and geometry.

It seems very undesirable to use the same pair of symbols with reversed meanings, and we hope that in future editions of the work under review this matter will be put right.

*Wireless Telegraphy and Telephony.* By W. J. WHITE. London: Whittaker & Co. Price 2s. 6d. net.

The author's aim has been to provide the general reader with a sufficient acquaintance with the fundamental principles of electricity and magnetism, to enable him to follow intelligently the principles and practice of wireless telegraphy and telephony. The work is neither a scientific treatise nor a "popular" book in the ordinary sense of the word. To treat a highly technical subject in a manner which shall enable the layman to obtain a reasonable insight into its theory and practice, without consulting other works, necessarily involves the devotion of considerable space to introductory matter, and, in our opinion, what is needed (and what is, indeed, already available in various forms) is a popular handbook dealing with the elements of electricity and magnetism in such a manner as to absolve the author of a popular treatise on any electrical subject from descanting on introductory matter, which is, after all, practically the same in every case. As matters stand at present, almost every popular handbook on electrical subjects—and, for that matter, most of the higher-grade text-books as well—is encumbered by preliminary chapters dealing with amber, ἤλεκτρον, magnetic needles, Ampère's "swimming rule," and so forth. The space available for the branch of electrotechnics actually in hand is consequently curtailed. Surely it is not too much to hope that this profitless repetition—wearisome to the reader and involving loss of time and space to the author—will be eliminated from electrical and other technical and scientific handbooks at no distant date. As the result of the space devoted to introductory matter—which is, be it understood, excellent in itself—the subject of wire telegraphy is not reached before page 40 in the present volume, and the subject of wireless telegraphy is broached on page 64; some 20 pages are devoted to wireless telephony.

The introductory pages deal with frictional electricity, voltaic electricity, and the storage of electricity in secondary cells. The section on magnetism affords an excellent introduction to the principle of action of telegraphic instruments. The Morse key, code, sounder, recorder, and relay, &c., are

treated in Chapter III, while Chapter IV is devoted to wire telegraph circuits and working. The latter section is brief (8 pp.), and in itself excellent, but it might easily have been omitted from a treatise on wireless telegraphy and telephony.

Chapter V explains the principle and limitations of wireless telegraphy by induction, and by utilising two more or less remote waterpaths across a river—the latter system simply avoiding the necessity for carrying wires across or through the river, and being largely used at the present day across a number of Indian rivers. Proceeding, the author describes and discusses induction systems, and then turns to the generation and telegraphic application of high-frequency oscillations. The work of Hertz and the application of his results in tuned circuits are discussed briefly, but very clearly, and the present limitations of wireless telegraphy in respect of secrecy are pointed out. Chapter VII, describing the function and construction of spark gaps, Righi's and Chunder Bose's oscillators, and the coherer and tapper, leads the reader to a clear conception of the *modus operandi* of Marconi's system. Chapters IX-XII respectively deal with the Telefunken, Lodge-Muirhead, De Forrest, and Fessenden systems, and clearly explain their characteristic features and advantages.

Recent progress and improvements in apparatus are considered in Chapters XIV and XV; most general readers would appreciate a rather fuller description of results already obtained, distance of transmission, general location of the chief present and proposed stations (preferably illustrated by a map), and a more complete review of miscellaneous present and prospective applications of wireless signalling. The Fessenden high-frequency alternator is illustrated and briefly described, but the author certainly attaches too little importance to the possibilities of high-frequency electro-mechanical generators, and no mention is made of the Goldschmidt machine.

The general production and style of the book are excellent, but the unorthodox spelling "oscillagraph" is repeated a number of times. It is a pity that some of the space devoted to introductory matter could not have been allocated to some of the recent important developments, which receive no mention, but the volume suffers much less than would be expected from being a revised early edition. By an oversight the author has allowed 1905 (page 145) still to be referred to as "last year" in the 1912, as in the 1906 edition. The book is to be recommended as a clear exposition of wireless telegraphy and telephony, sufficiently complete for the needs of the general reader.

*Common-Battery Telephony Simplified.* By WALTER ATKINS (Engineering Department, G.P.O.). London: The Electrician Printing and Publishing Co., Ltd. Price 3s. net.

Probably in no branch of applied electricity are more involved and complex systems met with than in modern common-battery telephony.

The full diagrams of the connections of these systems are so intricate that the student experiences very great difficulty in tracing out the paths of the currents concerned in the various operations of calling, clearing, &c. It is almost absolutely necessary, in order to obtain a clear grasp of the actions which take place, to cut out from the complete diagram everything not concerned in the particular phase of the working being studied, and to draw a simple diagram which enables the attention to be concentrated on the circuits and pieces of apparatus actually involved.

The difficulty is, however, immediately met with that when the working of the circuits represented on the full diagram is not properly understood, it is by no means easy to draw these simple diagrams—the knowledge, which the student wishes to acquire, being necessary to enable him to unravel the complexities which he meets with. The author of the present volume has recognised this difficulty, and has produced a book which should smooth the path of the beginner, and also be acceptable to those who are actually engaged in the telephone field—for, owing to the rapid

developments of the subject, any means by which the work of keeping abreast of modern progress can be facilitated is welcome.

The writer has omitted all padding in the form of descriptions of obsolete methods, discussions on theoretical questions, and photographs of exchanges and apparatus. He has confined himself to describing the principles of the common-battery telephone system, as used to-day by the British Post Office.

The book is divided into sections dealing with the main frame and apparatus room, subscribers' switchboard arrangements, junctions, subscribers' apparatus, testing arrangements, and several miscellaneous circuits, such as supervisor's, observation and interception circuits, electrophone arrangements, and some special types of switchboard.

An appendix is added, in which the colour scheme used for switchboard cables is given, and also one dealing with the voltmeter method of measuring resistances.

The book is well printed on good paper, the diagrams are clear, and it can be recommended to all who are brought into touch in any way with common-battery exchanges; especially to those who are studying the subject without the aid of a teacher.

## BUSINESS NOTES.

**Consular Notes.—India.**—A recent report by the American Consul at Bombay stated that the substitution of electric traction for steam power on the suburban line section of Bombay, which had been under consideration by the Railway Administration for some years, had reached an important stage.

If electric power is substituted for steam traction on the Great Indian Peninsular and Bombay, Baroda and Central India Railways, it is expected that both lines will be disposed to adopt similar systems to facilitate interworking. It is understood, however, that the intention of the Bombay, Baroda and Central India administration is only to carry suburban passenger traffic by electricity, there being no idea at present of using electric traction for either freight work or on the main lines. A number of newspaper articles have discussed the system of electrification most suitable for the project, and it is stated that, if the port authorities acquiesce in the desirability of electrifying their local lines, this will practically eliminate the introduction in Bombay of any but the single-phase alternating-current system, and that everything points to the expert recommending the installation of this system. Local engineers are somewhat at variance with this view, and results obtained on railways in the United States are cited in support of their argument for direct-current operation.

A survey will shortly be carried out by the agency of the Bombay, Baroda and Central India Railway Co., for a line of railway on the 5 ft. 6 in. gauge, from Gangapur, on the Nagda-Muttra section of the Bombay, Baroda and Central India Railway, to Luni, on the Jodhpur, Bikaner Railway, a distance of about 260 miles.

**Russia.**—The American Consul at Moscow reports that negotiations have been going on for some time respecting the sale of the Rauchial waterfalls on the river Vuoxen, and an agreement has only recently been reached under which the proprietors cede all their rights to a Brussels banking house for a little over £200,000. The average power of the waterfall is 48,469 H.P. It is said that the purchasers contemplate delivering the current to be generated by the fall for power purposes in St. Petersburg. The capital of the proposed exploiting syndicate is \$4,000,000. The bank in question, it is stated, is also negotiating for the purchase of the Vallinkoski Falls, the second in importance on the Vuoxen River, which will yield 44,398 effective H.P. The municipal finance committee of Finland is said to be considering a project for a car line between Helsingfors, Haaga and Munkunas. The Moscow Electric Light Co. has given out a statement of its business in 1911, which shows a net profit of nearly 84 per cent. According to the conditions of the contract with the city the surplus above 8 per cent. must be distributed among the consumers of electricity in proportion to the amount consumed by them. The total sum subject to distribution amounts to £3,000, and each subscriber is entitled to receive 1s. 5½d. on every £10 worth of electricity consumed. The company has presented to the city board a report on its development during the past three years, from which it appears that the reduction of the local rate has promoted its general progress. The average cost of energy has been reduced from 7d. to 5½d., while the assets of the company have increased from £1,400,000 to £2,200,000. The number of electric meters installed in private dwellings has risen from 14,000 to 33,000. The length of cable has increased from 325 to 725 miles, and the income of the company from £300,000 to £450,000 per annum.

The American Consul at Moscow also reports that there was a considerable increase in the amount of electrical power used in Russia in 1911, and in connection with this, in the

production of electrical machinery principally for mining and metallurgical purposes. The greatest progress was noted in the production of Diesel engines, while there was also a larger output of cables, tramway and telephone equipment, and machinery used in the production of ozone. The forward movement of Russia's industries, together with the increased agricultural production, caused the continued importation of various systems of electric, gas and other tractors, as well as of separate equipments. For some time to come Russian manufacturers will not be able to satisfy the demand. A considerable amount of improved machinery for working metal was imported, indicating the growth of machinery building in the country.

**Siam.**—The American Consul at Bangkok reports that estimates for three wireless stations and installations were placed in the budget of Siam for the fiscal year 1912-13. An experimental station of the Telefunken system was erected on the island of Kohsichang some years ago, and this system will be used for the new installations. The sites for the land stations will be on the eminence at the exhibition ground at Pratoomawan, at Kohsichang, and the third on the top of the hill at Singora. Three vessels of the fleet are to be equipped. The station at Singora will be easily able to communicate with the Telefunken station at Sabang during the day and during the night will have a much further radius. The Post and Telegraph Department will connect the central station at Sapatum with the Ministry of Marine by ordinary telegraph, and will place a second line between Post Office No. 2 and Sapatum. Commercial messages will be dispatched by wireless, but it is not anticipated that the system will compete with the landlines.

**China.**—A recent report by a German commercial agent attached to the German Consulate at Shanghai refers to the possibilities for the expansion of trade with China in electrical and similar goods. Although it is hardly to be expected that the electrical trade of China will develop as soon, or grow as quickly, as that of Japan, there can be no doubt that considerable expansion will take place in the near future. Apart from English companies already working in the market, American and German companies are displaying considerable interest, and competition is bound to become keener than it has been up to the present. The larger towns, which are more and more beginning to undertake the installation of municipal stations, are probably the most important source of demand. The extension of electric tramways, too, will call for important supplies; projects for such tramways are already in hand for Peking, Hankow, Canton, and several other towns. Electrical firms should also consider the possible demand for their goods on the part of mining and metal works. Not only are new works of this description being undertaken, but existing works are carrying out extensive works for the modernisation of their plant. With such possibilities of extension there will be excellent opportunities for the extension of trade in electrical goods of various kinds, and chiefly in power plant, lighting plant, lamps, &c. Steam power is chiefly used in China for driving generators. There is an active demand for water-tube boilers, which can be easily transported; boilers made by Babcock & Wilcox are specially favoured. English steam engines find a good sale. Turbines are in demand for plants of over 500 H.P., but for smaller plants, petroleum motors are used, as petroleum can be readily obtained all over China.

The Austrian Consul at Tientsin reports that the imports of electrical materials into that port in 1911 were valued at 326,131 Haikwan taels, as against 130,061 Haikwan taels in 1910. The most important items are metal-filament lamps, insulated copper wire, electrical materials for household installations, copper wire for electric tramway work, motors, &c. The imports of telegraph and telephone material fell from 299,190 Haikwan taels in 1910, to 77,853 Haikwan taels in 1911.

The American Consul at Swatow reports that the project of establishing a telephone system in that port, which was much discussed in the spring and summer of 1912, was again actively engaging the attention of local capitalists towards the end of the year, and it was anticipated that in all probability the scheme this time would materialise. It should be remarked that practically the same men who financed the electric light system and the waterworks are backing the telephone venture. The leading man in this group is also the principal shareholder in the Swatow-Chaochowfu Railway, and has also been asked to serve as a director of the proposed Chaochow-Hinchow line. It is proposed to open with a small exchange of about 100 subscribers, and it is not expected that there will be over 250 subscribers altogether in Swatow later on. Proportionately a great deal of wiring will be necessary, owing to the distances between subscribers. The concession was granted last October, and certain English and German manufacturers sent agents to study local conditions and submit estimates. The contract was to have been let before the end of 1912. No specifications were issued, each firm tendering being expected to draw up its own. Tenders were desired for the complete installation, including exchange, instruments, poles, wiring, &c. Under these conditions it was obvious that a manufacturer wishing to bid would have to send an engineer to Swatow to ascertain the conditions, and it was not believed that any American firm manufacturing telephone supplies, that did not have a Far Eastern agency, would be in a position to send a representative there in time to submit estimates, and that, even if it were, the contract was not large enough to warrant the heavy expenses involved in doing so. The waterworks already own two private telephone installations, one from the intake station at Ampo to Swatow, and another from Swatow to Chenghai. These were put in by the China and Japan Telephone Co., of Hong-Kong, a British concern, which naturally secured advance information of the present project. As indicated above, an agent of this firm has already visited Swatow. The local German firm of Lauts & Haesloop was also very anxious to secure the con-

tract. The Consul concludes with the following remarks, which are extremely interesting:—"The Swatow Consulate is greatly handicapped in efforts toward securing such contracts for American firms by the absence of local American business houses and by the lack of information as to which American manufacturers have agencies in China. The first difficulty is unavoidable, but the second is due to the carelessness of the American manufacturers themselves, who should notify Consular officers when establishing agencies if they wish to secure the assistance of the Consular service."

**Spain.**—The American Consul at Almeria reports that the wireless telegraph station (situated on a high hill behind Almeria and half a mile from the sea), belonging to the Spanish Government, has recently been equipped with new apparatus. The new instruments, manufactured by the Telefunken Co., are of the latest type and of high power. The station is in constant communication with the central office at Madrid and with other Spanish ports.

**Catalogues and Lists.**—THE METALLIC SEAMLESS TUBE CO., LTD., Birmingham.—Postal card relating to their "Metallic" cables and cords.

MESSRS. R. H. PATTERSON & CO., LTD., Forth Street Works, Newcastle-on-Tyne.—March catalogue of new and second-hand electrical, steam and other machinery for sale or hire.

THE ELECTRICAL CO., LTD., 122-124, Charing Cross Road, London, W.C.—18-page pamphlet (No. 14) containing particulars, with illustrations, prices and sketches, of a large number of their standard types of electric measuring instruments.

MESSRS. C. MELIN & CO., 7, India Street, Crutched Friars, London, E.C.—20-page catalogue, fully illustrating and describing their Borkness burner and blowpipes, some of which are specially designed for use by electric lamp manufacturers, while others are for laboratory and workshop service.

MESSRS. MAGIC APPLIANCES, LTD., 6, Farringdon Avenue, London, E.C.—Illustrated leaflet giving brief particulars and prices of their "Oscillon" vibrator, and "Hotwynd" blower.

MESSRS. PASS & SEYMOUR (INC.), Solvay Station, Syracuse, New York, U.S.A.—Illustrated folder, showing their "P. and S." interchangeable electric lamp sockets "24 sockets made from 15 parts."

THE HOTPOINT ELECTRIC HEATING CO., Canada and U.S.A.—Several illustrated lists (with prices) of Hotpoint electric irons, also heating and cooking apparatus.

MESSRS. H. MILLER, LTD., Hazebrouck, France.—Leaflet showing a number of French electric measuring instruments.

THE STERLING TELEPHONE AND ELECTRIC CO., LTD., 200, Upper Thames Street, London, E.C.—Leaflet No. 207, giving an illustrated description and price particulars of their watertight magneto mining telephone.

**Fire.**—We learn that a somewhat serious fire occurred at the Sphere Engineering Works of ENGINEERING AND ARC LAMPS, LTD., St. Albans, on Saturday night. The fire was first noticed by one of the employes at the North Metropolitan Electric Supply station next door, who promptly gave the alarm, at nine o'clock. Nobody had been on the premises since half-past four. No reason has been discovered for the outbreak. The two fire brigades were promptly on the spot, and succeeded in arresting progress of the flames. Apparently the fire originated at the south-east corner of the building, and three gables were completely burnt out for two-thirds the length of the works, and the coiling winding department was also completely destroyed. The shafting was very much injured, but damage to the machinery is not extensive, the principal loss being suffered by finished stock and raw material. The damage to the stock, building and contents is about £4,000, which is fully covered by insurance. It is hoped to have all the machines, &c., working within five weeks; and although part manufacture has already been resumed, the indulgence of clients for any delays in delivery is requested.

**Dissolutions and Liquidations.**—ROSSENDALE BELTING CO., LTD.—A meeting of creditors is called for March 14th, at 7, Norfolk Street, Manchester.

EXPRESS CABLE INVENTIONS, LTD.—A meeting is called for April 11th, at 29A, Charing Cross Road, London, W.C., to hear an account of the winding up from the liquidator, Mr. R. H. Gillespie.

MELDRUM BROS., LTD., Timperley, Manchester.—March 25th is the last day for receipt of proofs for dividend by the liquidator, Mr. T. Gregory, 3, York Street, Manchester.

ROAD AND RAIL ENGINEERING CO., LTD., Derby.—First and final dividend of 20s. in the £, payable at Smith's Bank Chambers, Market Place, Derby.

PYBUS & CO., electrical engineers, 29, Brown Street, Manchester, and Chorlton-cum-Hardy. Messrs. J. H. Pybus and T. Pybus have dissolved partnership. Mr. J. H. Pybus attends to debts.

**Bankruptcy Proceedings.**—J. W. LEWISLEY, electrician, 65, Brierley Street, late 103, Mansfield Road, Nottingham.—The first meeting of creditors herein was held at Nottingham last week, when the liabilities were put at £156, and there was a deficiency of £143. It transpired that the debtor started trading in partnership with another in 1910, with a capital of £160, which was contributed equally by the partners. After six months' trading the partnership was terminated, and Lewisley continued to carry on the business on his own account until 1911, when he executed a deed of assignment. Only two creditors, however, appeared to have assented to the deed, and the present liabilities were due to the non-assenting creditors.

MESSRS. J. & F. MITCHELL (Fred. Mitchell & Co.), electrical engineers, 97, Stockport Road, Ardwick, Manchester.—Receiving order made March 6th, on debtor's petition.

BERNARD MURGRAVE, director of a limited company, Howick, near Preston, late of Astley Bridge near Bolton. First and final dividend of 32½d., payable March 15th, at 10, Acresfield, Bolton.

**Sold Out.**—The last issue of the ELECTRICAL REVIEW was sold out early on publishing morning and some of our regular readers were, therefore, unable to secure their usual copies. If any such readers who may still desire to complete their sets will apply to the publisher, he will endeavour to obtain sufficient copies of the last issue for the purpose.

**Trade Announcement.**—THE TORMO MANUFACTURING CO., of Bunhill Row, E.C., have opened a branch depot at 8, Peter Street, Manchester, where they will keep a representative stock of F. and S. ball bearings and Tormo steel balls.

**Book Notices.**—*Manual for the use of Fire Brigades.* Compiled and published by the National Fire Brigades' Union Inc., London. Price 2s. 6d. net.—This work has been issued to fill a want, owing to the great changes which have taken place in the methods of fire-fighting in recent years and the introduction of improved appliances; it is believed that it contains all the details necessary for the education of firemen, so far as this can be derived from a book, to enable them to attain to efficiency in the execution of their dangerous duties. Many well-known experts have contributed to its pages, and the contents may be relied upon in all respects. The Manual will be useful not only to works which maintain their own fire brigades, but also to private householders and all others who are interested in fire prevention. There is a chapter devoted to "Electricity in the Fire Service," in which the fireman is given some general ideas about wiring, the method of control, suitable means of extinguishing electrical fires, &c. This is good on the whole, though somewhat too optimistic regarding the dangers of shocks from 200-500-volt circuits; these are treated lightly, but firemen with wet clothes and boots, standing on wet floors, should be peculiarly susceptible to severe shocks, and the warning might well be more earnestly impressed upon them. No doubt, to save bulk and weight, the book is printed on thin paper, with the result that in many places the printing on both sides of the leaf can be seen, and reading is difficult.

"Journal of the Institution of Electrical Engineers." No. 217, Vol. 50. London: E. & F. N. Spon, Ltd. Price 5s.—The issue for February, 1913, contains the following papers:—Inaugural Address of the President, by W. Duddell; Chairman's Address, Newcastle Local Section, by W. C. Mountain; Manchester Local Section, by A. A. Day; Yorkshire Local Section, by S. D. Schofield; Scottish Local Section, by W. McWhirter; Birmingham Local Section, by A. M. Taylor; Western Local Section, by W. A. Chamen; The Magnetism of Permanent Magnets, by Prof. S. P. Thompson; Earthed & Unearthed Neutrals, by J. S. Peck; The Turbo-Converter, by F. Creedy; The Control of Meters, Public Lamps, and other Apparatus from the Central Station, by W. Duddell, A. H. Dykes and H. W. Handcock; The Testing of Ebonite for Electrical Purposes, by C. C. Paterson, E. H. Rayner and A. Kinnes.

"Psychology and Industrial Efficiency." By Hugo Münsterberg. London: Constable & Co., Ltd. 1913. Price 6s. net.

"Reports of the Committee on Electrical Standards Appointed by the British Association for the Advancement of Science." London: Cambridge University Press. 1913. Price 12s. 6d. net.

"Methods of Measuring Electrical Resistance." By Edwin F. Northrup. "Electrical Machine Design." By Alexander Gray. Price 17s. net each. London: Hill Publishing Co., Ltd.

"Proceedings of the Physical Society of London." Vol. XXV, Part 2, February 15th, 1913. London: Electrician Printing and Publishing Co., Ltd. Price 4s. net.

"Bulletin Scientifique de l'Association des Elèves des Ecoles Speciales." January, 1913. Liège: The Association. Price 75 cents.

"Atti della Associazione Elettrotecnica Italiana." Vol. XVII, No. 4, February, 1913. Milan: Stucchi, Ceretti & Co. Price L. 1.50.

"Boletín de la Sociedad de Fomento Fabril." Vol. XXX, No. 3, January 1st, 1913. Santiago, Chile: The Society.

**Meeting of Creditors.**—FOSTER ENGINEERING CO., LTD., Wimbledon.—A circular letter issued by Messrs. Nicholson and Becroft, 12, Wood Street, Chapside, E.C., under date March 8th, reads as follows:—

"A conference of the principal trade creditors, amounting to over £8,000 out of a total trade indebtedness of about £12,000, was called this week by the debenture-holders of the above company, amounting to £9,000, as to the best course to be adopted for the

preservation of this valuable business, which lately has had some special losses in connection with matters now disposed of and which are not likely to occur again. Mr. James Rook, of the Sloan Electrical Co., Ltd., was in the chair, and it was generally felt that every effort should be made to accomplish this object, and that the creditors should be asked to hold their claims in abeyance for the time being, in order to give the Committee, consisting of five of the principal trade creditors which was appointed, and the other parties interested in the company, the opportunity of arranging, if possible, some scheme for the payment of the creditors' claims and placing the business on such a footing as will enable it to regain its former successful position. In order to preserve the *statu quo* of the various parties, to protect the assets and to carry on the business (there being a large number of valuable orders on hand and coming in), Mr. Nicholson, of this firm, has been appointed Receiver, and he will be in constant communication with the Committee, who will from time to time take such measures for the protection of the general interests as they may deem advisable. It is, therefore, hoped that you will see your way clear to sign and return the resolution passed, copy of which we have pleasure in enclosing you herewith.

The resolution was as follows:—

"That this meeting do hereby appoint a Committee as at foot to represent the interests of the trade creditors with power to make such arrangements with the debenture-holders and/or the company as they deem desirable, and that in the meanwhile the creditors should hold their claims in abeyance. The meeting and the Committee appointed very strongly recommend this course to be agreed to by the other creditors.

"Committee:—Mr. Rook, Sloan Electrical Co., Ltd.; Mr. Billington, Beck Engineering Co., Ltd.; Mr. Willey, London Electric Wire Co. and Smiths, Ltd.; Mr. Jenkins, J. Sankey and Sons; Mr. McKechnie, McKechnie Bros.; or, failing him, Mr. Churchill, Chas. Churchill & Co., Ltd."

**Makers to His Majesty.**—The CARRON Co., of Carron, N.B., has been appointed grate makers to H.M. the King. The Carron works have been visited on many occasions by Crown heads of Europe, including Czar Nicholas I of Russia, Prince Leopold Maximilian of Austria, and by King Edward VII, when Prince of Wales.

**The Shops' Act.**—The Leeds Corporation announces that tradesmen who alter their half-day closing arrangements at Easter, must alter the notices in the shops. There was much offending in that respect at Christmas, and the Leeds Chamber of Trade warns tradesmen that similar offending at Easter may bring trouble.

The Nelson T.C. has decided to take steps to ascertain whether the electricians of the district are agreeable to a closing order under the Shops' Act, fixing Tuesday or Saturday, as the half-day holiday.

The Manchester Corporation is proposing to make an order fixing Wednesday as the day of the weekly half-holiday for dealers in electrical fittings, &c.

## LIGHTING and POWER NOTES.

**Aylesbury.**—The U.D.C. has taken a referendum on the electric light question, and the result was as follows: For the scheme, 1,452; against, 439—majority for, 1,013. The number of voting papers issued was 2,538, including 116 sent to out-voters, and 2,090 were returned. Of these, 53 were rejected and 146 were unmarked.

**Birmingham.**—At a meeting of the Council on March 14th, Councillor E. C. R. Marks, a member of the Electric Supply Committee, suggested the amalgamating of the Gas and Electricity Supply Committees. He based his arguments for the consideration of such an amalgamation upon the statement that the two Committees controlled undertakings for the supply of the same commodities, viz., light, heat, and motive power, that they both used coal as their raw material, and as they were to occupy adjacent land at Nechells, it was reasonable that they should be amalgamated. The proposal was supported by Councillor Heath, another member of the Electric Supply Committee. Councillor Ellaway, the Chairman of the Electric Supply Committee, opposing the motion, said, there could be no real amalgamation, as each undertaking must necessarily be controlled by separate Sub-Committees. He also pointed out that both departments were so big, and the work of the Committees engaged in controlling them occupied so much time, that it was doubtful if they could, with efficiency, undertake the very heavy extra work which would be entailed by the amalgamation. With regard to the argument that the future engine was a gas engine, he pointed out that the gas would not be the same gas as was being manufactured by the Gas Department. The Electric Supply Department sold about eighteen million units per annum to the Tramways Department, and there was no suggestion of amalgamation between them, although the likeness between the two was more pronounced. Sir Hallowell Rogers, the Chairman of the Gas Committee, and Sir James Smith, the Chairman of the Public Works Committee, both opposed the proposal, which was negatived by a considerable majority.

**Bognor.**—At a half-yearly meeting of the Gas Co., it was announced that the company hoped to have its electric supply available by July next. The laying of mains will be proceeded with forthwith.

**Bradford.**—The Corporation Gas Committee has decided to install an electric equipment in connection with the coal elevating and conveying machinery at Thornton Road Gasworks, at a cost of £48.

**Braunton.**—The first annual report, presented at a meeting of the Braunton Electric Light and Power Co., was of a satisfactory nature. The net revenue account showed a profit of £80, and the directors recommended payment of a dividend of 5 per cent. (less income-tax) on the cumulative preference shares from October 1st, 1911, which would amount to £29, to write £30 off the formation expenses, and to carry forward the balance of £21. The chairman (Mr. T. Yeo) explained that the capital authorised to be raised was 5,000 £1 shares, divided into 1,000 5 per cent. cumulative preference shares and 4,000 ordinary shares each of £1. The amount of capital issued totalled £3,250 of fully-paid shares. They had good reason to be gratified at the first year's result.

**Bristol.**—The Electrical Committee reports that the loan of £52,919, sanctioned by the L.G.B. in March, 1907, for mains, substations and services has been expended, and recommends that it be authorised to apply to the L.G.B. for sanction to borrow a further sum of £25,000 for similar purposes, to be spent as and when required. This sum is the estimated requirements for the ensuing three years.

**Burnley.**—The Electricity Committee's estimates recently contained a recommendation that if the profits anticipated to be realised during the year ending March 31st, 1914, are sufficient, the sum of £4,550 be paid into the Borough Fund, the question of the disposal of the balance of profits (if any) to be deferred. This was agreed to on March 6th.

**Burton-on-Trent.**—In connection with the scheme for electrifying the brewery of Messrs. Marston, Thompson & Evershed, it is intended that the work of replacing the present machinery with electric motors shall be commenced almost immediately after Easter, and to this end a consulting engineer will be engaged to supervise the extensive operations.

The B. of G. has decided not to take any action at present in the matter of installing the electric light at the Workhouse, but to leave the matter to the new Board to be elected. The scheme submitted will entail an expenditure of £850.

**Bury.**—The L.G.B. has refused to sanction the application for the borrowing of £1,025 for the carrying out of certain works including the provision of electric light and bells at the Aitken Sanatorium, which was made by the Bury and District Joint Hospital Board. The L.G.B. pointed out that, notwithstanding previous warnings, the Bury Joint Board had incurred a large part of the expenditure for which the loan was required, without any sufficient reason for having anticipated the sanction.

**Cheltenham.**—The T.C. has decided to convert 33 gas lamps in various streets into 34 electric lamps. The capital cost will be £338, and the annual cost per lamp will be £2 10s., including a return of 8 per cent. on the capital outlay, which will be met out of the renewals fund.

**China.**—We have received from Mr. Aldridge, electrical engineer to the Shanghai Municipal Council, a copy of a Chinese pamphlet on electric signs and decorations, published by his department. We understand that it is the custom of Chinese store-keepers to have elaborate decorations for the opening of a store or business, and an electrically-illuminated building illustrated in the pamphlet, took, we are informed, about 150 kw. for lighting alone. As it is not unusual to have several such installations on at the same time, the effect on the streets can be well imagined.

**Colchester.**—The T.C. has applied to the L.G.B. for a loan of £7,660 for electricity purposes.

**Conway.**—The Lighting Committee has had under consideration a scheme submitted by the borough engineer for the electric lighting of a part of the town. The Committee came to the conclusion that it would be inadvisable for the Council to entertain such an elaborate scheme at present, and the engineer was instructed to submit an alternative scheme for lighting the embankment.

**Dover.**—The Electricity Committee of the T.C. has decided to purchase, at a cost of £528, 325 time switches for automatically switching on and off the public electric lamps.

**Folkestone.**—Quotations are to be obtained from the Electricity Supply Co. and the Gas Co. for lighting portions of Cheriton Road and Sandgate Road with electric light and high-pressure gas, respectively.

**Grimsby.**—Application is to be made to the L.G.B. for sanction to the borrowing of £8,000, the estimated expenditure for the ensuing three years on mains and services.

**Heckmondwike.**—The U.D.C. has decided to give a supply of current to the works of Messrs. T. F. Firth & Sons, Ltd., and the engineer has been instructed to prepare a detailed estimate of the cost of converting street gas lamps to electric lighting.

**Hull.**—The T.C. has rejected a recommendation from the Education Committee that gas should be used for lighting the new Sauer Street Schools, and intends to have electric lighting installed.

**Japan.**—Large new works for the manufacture of soap have just been completed at Tori-Shinden, near Amagasaki, by Messrs. Lever Bros. (Japan), Ltd. The buildings are lighted throughout by electricity, the machinery being also all electrically operated. The generating plant comprise a horizontal cross-compound condensing engine coupled direct to a 300-kw. dynamo.

**Keighley.**—The Corporation last week referred back to the Electricity Committee the proposed scheme for supplying Bingley with electricity in bulk, the particulars regarding which were given in a recent issue.

**London.**—**SOUTHWARK.**—The Electric Light Committee recommends the adoption of a scheme by the electrical engineer, for extending the plant at the generating station at a cost of £29,464, made up as follows:—Buildings, £2,000; two boilers, including fan, economiser, flues and foundations, £8,220; two 1,500-kw. generators, and four converters, switchboard and foundations, £13,350; condenser, cooling tower and foundations, £5,175; contingencies, £719. Messrs. Preece, Cardew & Snell, to whom the scheme was referred, express the opinion that there can be no doubt that an extension of the station is the correct way to meet the further requirements of the borough. The Committee also recommends that it be empowered to invite tenders for carrying out the works.

**LEWISIAM.**—At a meeting of the Guardians on Monday, the Works Committee recommended that the Board engage the services of the engineer of the South Metropolitan Gas Co. to draw up specifications for the electric lighting of the infirmary and workhouse, at a fee of £10 10s., and to invite tenders for the supply of electricity from the electric light companies, and from the South Metropolitan Gas Co., the latter to supply electricity from its own generating plant. The Board agreed to the recommendations.

**MARYLEBONE.**—The B.C. has approved a scheme by Mr. Seabrook for the lighting of the new circus in Marylebone Road. The scheme provides for eight columns with one large, and four small, lamps on each be placed in the circus (one at each quadrant and one on each of the refuges to be placed in the roads leading into the circus). The columns will have five lamps on each, and the approximate candle-power will be 4,800. The total cost of lighting and maintenance of the columns is estimated to be £110 per annum.

**HACKNEY.**—Of the £9,176 surplus, estimated on the working of the undertaking for the year ended March 31st next, the Finance Committee has decided to transfer £3,000 to the reserve fund, and £2,000 in aid of the rates. The balance, when ascertained, is also to be given in aid of the rates. Consent has been given to the proposal of the L.C.C. to double the tramway track in part of Lea Bridge Road.

**Plymouth.**—The Electricity and Street Lighting Committee of the T.C. has presented estimates of income and expenditure for the ensuing financial year, and the same were approved as follows:—Electricity revenue account: Income, £29,417; expenditure, £28,480; electricity capital account expenditure, £5,500; electricity reserve account expenditure, £2,000; and street lighting revenue account expenditure, £7,120.

**Port-Glasgow.**—The Corporation has lodged answers in reply to the objections made by the School Board with the B. of T. against the provisions of the local Electric Lighting Draft Provisional Order. The School Board's demand that distributing mains should be laid within a reasonable distance of the schools is described by the Council as wholly unreasonable and inexpedient, and if given effect to will place an undue burden on the undertaking. The Board, in its reply, states that the position taken up by the undertakers is contrary to the intention of the Electric Lighting Acts. The scheme of distribution was devised solely with a view to the earning of profits by Greenock Corporation, and not at all with a view to the provision of electric light for domestic purposes in the residential parts of the burgh of Port-Glasgow. As the object of the order was to confer an exclusive monopoly within the whole burgh, it was improper for the undertakers to give facilities in only one portion, where a large and profitable demand for electricity may be expected, and to deprive the other portions of the town of the benefits of electric lighting, as was proposed.

**Rochdale.**—Speaking at a meeting of the T.C. on March 6th, Councillor Walker drew attention to the fact that a number of contracts in connection with the electricity works extensions had been placed, subject to the sanction of the L.G.B., and remarked that long before they were completed the Committee would have to consider further additions to the works. He had previously informed the Council that the estimated increase in the electrical supply for the present year would be about 500,000 units. That estimate would be exceeded, and the estimated increase at the end of March would probably be in the neighbourhood of 750,000 units. The Committee would have to consider whether any further extensions that were required should be made on the present site or elsewhere.

**St. Helens.**—The T.C. has applied to the L.G.B. for a loan of £2,040 for a 500-kw. rotary-converter with switchgear, and for £1,660 overspent on a loan of £10,800 sanctioned in August, 1911.

**Sheffield.**—It has been decided to make a charge of 1d. per unit net to the promoters of the Fuel, Light and Power Exhibition to be held next autumn under the auspices of the Sheffield Health Association and the Sheffield Smoke Abatement Society. It has also been decided by the L.L. Committee to erect a stall at such exhibition for a comprehensive display of electrical appliances. Tenders are to be obtained for a new condenser and steam pump, together with all the necessary piping.

**South Africa.**—**DURBAN.**—The annual report of the borough electrical engineer (Mr. J. Roberts) shows a very satisfactory year up to July 31st, 1912. Many extensions have been made to the plant and mains during the year, particularly on account of the Corporation taking over the supply of current to the Government railways and harbour, which supply was commenced on June 21st last. The principal additions to the plant have been the following:—Two 2,000-kw. three-phase 6,600-volt turbine units and auxiliaries; two Babcock boilers and auxiliaries; a three-phase H.T. switchboard, and one 750-H.P. rotary converter and track booster. In addition, 6,000-volt three-core cables have been laid to the old railway power station, and a three-phase overhead line constructed to Greenwood Park. In street lighting, a great improvement has been brought about by changing the old enclosed type of arc lamps for high C.P. metal lamps. The progress during the year is reflected in the following figures:—

	1912.	1911.
Private consumers of electric light ...	5,223	4,803
Private consumers of electric power ...	308	278
Number of street lamps ...	2,292	2,200
Units sold ...	9,023,699	7,396,621
Total revenue ...	£78,894	£73,283

#### UNITS SOLD.

Private lighting ...	1,725,944	1,468,692
Private motors ...	1,157,321	809,350
Corporation lighting ...	157,673	127,077
Corporation motors ...	1,005,697	1,013,872
Street lighting ...	733,836	728,010
Tramways ...	3,389,712	3,249,623
Government ...	553,513	—

The works costs were 44d. per unit generated, and the total cost, including capital charges, 14d. per unit generated. The net profit was £22,192, of which sum £12,608 goes to the borough fund, leaving a surplus of £9,584.

Mr. John Roberts, the borough electrical engineer, has been called in by the Harris Smith T.C., to report on the suggested hydro-electric scheme, which it is proposed to inaugurate from the water at Plattburg, overlooking the town.

**Stoke-on-Trent.**—The T.C. has decided to apply for a loan of £8,000 for carrying out a scheme of electric supply at Fenton under the Stoken-on-Trent E.L. Extension Order, 1907. A further loan of £6,000 for mains extensions has also been applied for.

**Stroud.**—The U.D.C. is supporting the proposal for an electric light installation for the town. Having obtained favourable terms with the option of purchase in 21 years from the company, it has adopted a resolution consenting to the grant of the prov. order.

**Swindon.**—At the meeting of the T.C., it was, stated that the electric lighting showed a profit of £1,681, but there had been a loss on the tramways of £1,728, to which must be added £700 for depreciation.

**Torquay.**—The electricity undertaking continues to make satisfactory progress. The engineer reported that through the installation of the turbine, a saving of 1,200 tons of coal had been effected during the year, which at the lowest figure of 13s. 10d. per ton, amounted to £830, and that a saving of £206 had been effected in oil, water, &c. making a total of £1,036.

The Royal Torbay Yacht Club wrote stating that consequent upon the nuisance and damage caused by smoke from the electric light works, the Committee was authorised to commence further legal proceedings against the Corporation. The Electric Light Committee, after consideration, recommended that the Town Clerk inquire if the club was prepared to adopt the suggestion made by the magistrate at the recent police court proceedings, to consent to the heightening of the chimney, and in the event of a negative reply, it be suggested to the club that arrangements be made by it and the Council to make tests extending over a period of six weeks or two months to ascertain the extent of the nuisance complained of under various conditions of wind and weather, in order to obviate any dispute as to the facts of the case. The T.C. has approved the recommendation.

**Truro.**—The R.D.C. has decided not to oppose in any way the applications of the T.C. and the Gas Co. for prov. orders for electric lighting. The B. of T. had been asked to dispense with the Council's consent.

**Turton (near Bolton).**—The U.D.C. has acceded to an application of the Lancashire Electric Power Co. for permission to supply Egerton Hall, Dewhurst House and Egerton House with electricity direct from the mains recently erected for the supply of the works of Messrs. Deakins, Ltd., at Egerton and Belmont, subject to the company's entering into an agreement providing for the free use for the purposes of the Council of the sub-stations at Egerton and Belmont.

The electrical engineer having suggested that, in his opinion, the

time has arrived when the price of electricity might very well be reduced, it has been decided that the price be reduced from 6d. to 4d. per unit, and that the question of price be reconsidered at the end of another year's working.

The electrical engineer has been instructed to prepare a report on the cost and advisability of lighting the Eagle, Egerton and Belmont areas.

**Wallasey.**—The Council has decided that an expert shall be engaged to advise it as to the best method to adopt to meet its electricity requirements for the next 20 years. Last year, ended February, the undertaking contributed £6,000 towards the relief of the rates, and borrowing powers are to be applied for, for £13,500 for the provision of electric mains and services laid last year and to cover the cost of similar work during the next four years.

**Walsall.**—Mr. Lacey has issued an interim report upon the position of the undertaking, and expresses the opinion (1) that the action taken by the Committee so far as regards the immediate reorganisation of the power station staff was fully justified by the condition of the plant, and he was fully convinced that results would prove this in the near future; (2) that notice should be given to all the lighting consumers, who are not also power users, that the charges for electricity will be advanced from 4d. to 5d. per unit from next quarter day, and that no rents for meters will be charged from that date; (3) that assuming only the normal increase in the demand for electricity as shown in the Council's books, the existing plant will be insufficient to carry the undertaking through the winter of 1913-14, and immediate steps should be taken to provide for additional boiler power, capable of raising not less than 20,000 lb. of steam per hour. The cost of this addition, together with various small matters of expenditure, will not exceed £4,810. Concluding, Mr. Lacey states that the order should be put in hand forthwith so as to obtain such deliveries as will ensure completion not later than the beginning of September next. The Committee has concurred with the views expressed, and has decided to apply to the L.G.B. for sanction to borrow the above amount.

**Whitby.**—A deputation from the Glasgow Corporation visited the town last week for the purpose of inspecting the electrical gear of the Corporation swing bridge at the harbour. The visitors were received by the members of the local Council, and, after the examination of the bridge, were entertained and shown the places of interest.

**Wigan.**—The minutes of the Electric Light Committee, submitted for the approval of the T.C. on March 6th, contained a reference to a proposal to apply for the sanction of the L.G.B. for the borrowing of £3,000 for extensions. Councillor McQuaid said that, up to the present time, the concern had been a losing business, there being a loss, he understood, of about £1,600 on the year's working. He thought there should be some authoritative statement that the expenditure of the sum mentioned would improve the position. Councillor Grimshaw said that, with reference to the loss of £1,600, they had to pay in three yearly instalments a sum equal to nearly £2,000 for what were superseded works at Pemberton. If it had not been for this contribution, which they had to make this year and during the next two years, they would have had a balance on the right side. Even allowing for that, they would have had a balance if it had not been for the fact that, about two years ago, the Committee made a great reduction in the price of electricity supplied to the Tramways Department. The minutes were approved, and subsequently a resolution was adopted authorising application to be made to the L.G.B. for sanction to borrow £3,000 for the purpose of providing cables, transformers, &c., for the Electricity Department.

**Wimbledon.**—The B.C. has decided that 25 4-lb. and 25 6-lb. irons be purchased from the General Electric Co. for distribution on loan amongst consumers. Letters of complaint have been received upon the terms arranged with the Fixed Price Light Co. for the supply of light to premises wired by the latter, and as to the refusal of the Council to lay service lines from the mains in certain streets to premises wired by the company, if such service lines exceed 60 ft. in length.

**Wolverhampton.**—The sum of £2,125 has been transferred from the profits of the Corporation's electricity undertaking for the year ending March 31st to the credit of the improvement fund for the financial year ending March, 1914.

## TRAMWAY and RAILWAY NOTES.

**Bradford.**—A sensational mishap occurred on the tramway system last week; a car on the Thornton route was jerked off the metals, and ran into a wall which bordered a field whose level was several feet below that of the road. Upon examination of the points at which the car had left the lines, the points were found to be jammed with stones, and the opinion of the tramway officers is that the stones had been mischievously or maliciously placed there. There were about 40 passengers on board the car, and considerable panic prevailed. The mystery of the presence of the stones is being inquired into.

Alterations and additions are to be carried out at the Thornbury car depot at an estimated cost of £8,502. The tramways general

manager has prepared a report on the terms suggested by the Postmaster-General as to the basis on which the question of guard wires or other means for the protection of Post Office telegraph and telephone wires generally should be dealt with, but the Committee, owing to the fact that the Municipal Tramways Association would probably give instructions at its next meeting for the opinion of counsel to be taken on the subject, has authorised him, in the event of such opinion being unfavourable to the Association, to agree to the suggested basis at the meeting of the Association.

**Burley-in-Wharfedale.**—In reference to the matter of the suggested running of railless trolley-cars in Wharfedale by the Leeds Corporation, it appears that notwithstanding the fact that the clauses in the recent Leeds Corporation Bill relating to this matter were withdrawn, the authorities at Leeds have not yet given up the idea. At the last meeting of the Burley-in-Wharfedale D.C., a communication was read which had been received from the manager of the Leeds tramways, stating that he understood that the Corporation intended in the next session of Parliament to renew its application for powers to run the railless cars in Wharfedale, in which case he hoped that the negotiations between the Burley authorities and himself would be able to be completed.

**Cardiff.**—The question of repaving the main streets of Cardiff and relaying the tramway track, where necessary, was advanced a stage at a meeting of the Tramways and Lighting Committee. It was decided to appoint a joint sub-committee of the Tramways and Public Works Committees to discuss the matter with a view to arriving at a definite understanding as to whether the work should be done by contract or the employment of direct labour, and when the work should be taken in hand. The feeling of the Committee was that the work should be done with the least possible delay.

Sir John Curtis informed the Committee that although there was still a month to run to complete their financial year, figures supplied by Mr. Ellis, the manager, showed that the Committee would have a surplus which would enable it to vote a sum equal to 1d. in the £ to the relief of the rates. That would absorb £1,000, and would probably avoid the necessity of calling for an increase in the rates for next year.

**Continental Notes.**—**RUSSIA.**—Application has been made to the Russian Government for a concession for two projected electric railways—one from St. Petersburg to Ioukki, a distance of about 11 miles, and one between St. Petersburg and Vosnessenski, 12 miles.

**Croydon.**—On Saturday, by resolution of the B.C., the running of trams on the Whitehorse Road route was discontinued. The grounds for this action were "regular and consistent loss." Councillor Chamberlain, who moved the resolution, pointed out that the route was opened in November, 1906, and that the first year's working showed a loss of £2,150. The loss continued, and the route was closed, and now, after a second trial, the Committee had presented figures showing a loss over a given period at the rate of £3,726 a year. Councillor Denning (chairman of the Tramways Committee) said eight different methods of working the route had been tried. The track ought never to have been laid. The resolution to close the route was carried by 31 votes to 11.

**Dewsbury.**—The Electricity and Tramways Committee has decided to inform the manager of the Bradford tramways that it has no objection to a proposal of the Yorkshire (W.D.) Tramways Co. that the Bradford Corporation should take into consideration the question of through running of cars over the lines to Dewsbury.

**Doncaster.**—The T.C. has confirmed a proposal of the Tramways Committee to double the track in the Market Place and Baxter Gate, for a distance of about 130 yds. and to lay double lines from the Alma Inn to Balby Bridge, on the Balby route.

The Electricity and Tramways Committee has recommended that application be made to the L.G.B., for permission to use the £3,000 originally authorised for the construction of tramways, but not expended, the same now being required in connection with the tramways undertaking.

**Dumbarton.**—A Committee of the County Council is considering a proposal for an extension of the tramways from Clydebank to Duntocher, and the road surveyor is to examine the road and report.

**Dundee.**—The income of the Corporation tramways from May 15th to January 31st was £45,697, being an increase of £1,533. There was an advance on all the routes. The income for the railless trolley section in Clepington Road, which was started in September, was over £240.

**Edinburgh.**—A sub-Committee of the Tramway Committee recently met a deputation from the Colinton Tramway Co. in regard to the question of having the tramway from Slateford continued into the centre of the city. No decision was come to. It is stated that the Colinton Co. may make application to Parliament for authority to construct a line into the centre of the city, and, on the other hand, the Corporation, in the event of its asking the necessary power, may be opposed by the Edinburgh Tramway Co. The matter will come before the Tramway Committee shortly. The question of the extension has been raised by the approaching completion of Redford Barracks.

**Hastings.**—There has been an important development in the Front Line Tramway controversy, and hope has been revived of the possibility of the question being settled by the Tramway Co. and the Corporation without resorting to the expensive proceeding

of a fight over the Parliamentary Bill promoted by the company for the substitution of overhead wires along the front esplanade in place of the present trolley system. The B. of T. has sent an intimation to the Corporation that the increase in the number of "live" studs on the front is such that it proposes to condemn the system six months hence. Interviews between the Law and Parliamentary Committee of the Corporation and the directors of the Tramways Co. are now taking place. The frontagers are practically unanimous in their opposition to overhead wires, and have raised a fund to assist the Corporation in opposing the Parliamentary Bill. These people would prefer a service of motor-buses to trams of any kind, and, incidentally, it may be mentioned that two London companies have arranged to give demonstrations with their latest type of vehicles.

**London.**—Another stoppage of the L.C.C. tramways system occurred on Monday afternoon for a period of about half an hour; all the cars were stopped and much inconvenience was caused. It was due to a short-circuit on the switchgear, which put one of the generators out of action, and the necessary repairs caused delay in restarting.

**Manchester.**—At a meeting of the Corporation Tramways Committee on Tuesday, £100,000 was fixed as the contribution of this Committee towards the relief of the rates for the year ending March 31st. The sum is a record for the United Kingdom; it is the highest amount ever paid in any one year to the relief of the rates by any tramway undertaking in Great Britain. In 10 years, the Committee has contributed no less than £700,000, last year's amount being £85,000.

**Morecambe.**—The suggestion that the horse-drawn tramway service should be brought up to date by means of electrical equipment, is still to the front. At the present time, those who favour the electrification of the tramway system are concerning themselves with the Edison-Beach accumulator, and, though there is opposition on the ground of unsightliness of the overhead system, and the large outlay necessary for any scheme of electric trams, it is felt that the time is now ripe for putting some definite scheme forward and bringing the matter to fruition.

**Rochdale.**—The question of the introduction of motor-buses in certain parts of Rochdale not served by tramways was mentioned at a meeting of the Tramways Committee last week, and a short discussion on the matter took place.

**Salford.**—A question was raised at the T.C. on March 6th, as to how much the cars which it was proposed to dismantle had cost, and how and when they were bought. Alderman Linsley said he could not answer the question without proper notice. The cars had been a source of great trouble. They had tried to sell them, but had been unable to do so. By dismantling the cars, and inviting tenders for the supply of car bodies and trucks to be fitted with the electrical equipment taken from them, they were adopting the best method of dealing with them.

**Silsden (near Keighley).**—The surveyor to the U.D.C. has been instructed to go into the question of laying a single track tramway from Bolton Road end to the station.

**South Africa.**—**DURBAN.**—The annual report of the Municipal Tramways manager (Mr. H. N. Thomas) for the year ending July 31st, 1912, shows very encouraging results, the revenue exceeding the estimate by £2,863, and being 74 per cent. over last year's receipts. The length of line is now 19'882 route miles, or 34'022 miles of track. The income was £122,056; operating expenses, £72,217; net income, £49,839, which, after paying capital charges and 4 per cent. to the borough fund, left £716 as net profit. The car-miles run were 1,672,220, and the passengers carried 15,655,737.

**South Shields.**—At a meeting of the T.C., on the 5th inst., the proposal of the Tramways Committee to make a general fare of 1d. was considered. Ald. Wylie, in moving the adoption of the Committee's report, said they wished to introduce a system of fares that would be common to all users of the trams, and dispense with any sectional privileges that had been in force of late. It frequently happened that a passenger, who was compelled to pay 1½d. fares through boarding a car outside a 1d. boundary had travelled into the 1d. section, but actually travelled a much less distance for his 1½d. than the distance that was given for 1d. They further proposed to abolish the privileged sections, which they instituted some time ago. On these privileged sections 1d. return fares were adopted with the object of inducing more persons to use the cars in the districts where they were poorly patronised. What had been the result? They had two of these sections, and the returns showed they had only contributed 12½ per cent. of the total revenue. The Mayor seconded the resolution. He said he had found that South Shields only carried its population 74 times over in 12 months, which was practically one and a half times per week. Sunderland carried its population 99 times over in 12 months; Hull, 148 times over; Newcastle, 157 times over; and when they got into the larger towns and cities, the results were even more astounding. He favoured the proposal, as he thought it generally would lead to an increase in their traffic. Amendments were proposed to raise the age limit for children to 14 years, to make the hour for the issue of the cheap tickets 9 a.m. instead of 8.45 a.m., and extend the hours for the issue of dinner-time return tickets, from 11 a.m. to 2.30 p.m., instead of from 11 a.m. to 2 p.m., but the propositions were all negatived, and the Committee's report adopted.

**Stockport.**—The new railless cars were inspected on March 7th by Colonel von Donop and Mr. A. P. Trotter of the B. of T., and the service was opened to the public on Monday. The Bremen system, which has been adopted, is new so far as this country is concerned, and differs from the Leeds and Bradford installations.

**Stretford.**—Negotiations are to be carried on with the Tramways Committee of the Manchester Corporation with a view to a clause being inserted in the draft lease that the U.D.C. shall be entitled to exercise its powers to use the whole of the tramways for township purposes subject to a reasonable clause securing the Manchester Corporation against loss.

**Walsall.**—The Corporation Tramways Committee has decided that the net profit for the year amounting to £3,392 shall be carried to the reserve fund after payment thereof of a further contribution of £1,500 to the borough fund, which with the £500 paid in April last, makes a total contribution of £2,600 in aid of the rates from the profits of the undertaking for 1912.

A sub-committee has been appointed to consider and report as to what extensions, if any, of the tramways should be made in the borough and in the adjoining districts, either by means of railless trolley vehicles, motor-buses, or otherwise.

**West Ham.**—The Tramways Committee has adopted the idea of fixing illuminated service numbers to the tramcars, and has authorised its manager to carry out the work.

**Wolverhampton.**—£3,777 has been transferred from the profits of the Corporation's Tramway undertaking to the credit of the Borough fund.

Three additional tram cars, with top covers and vestibule ends are to be purchased by the Tramway Committee at a cost not exceeding £2,700.

## TELEGRAPH AND TELEPHONE NOTES.

**Durban.**—The annual report of the Durban Municipal Telephones manager (Mr. W. Manson), for the year ending June 31st, 1912, shows a total of 2,259 subscribers, with a revenue of £21,385 and expenditure of £7,655, giving a net revenue of £13,730, which, after paying capital charges, &c., and a 4 per cent. contribution to the borough fund, leaves a balance of £2,038.

During the year an extension has been made to the switchboard, giving room for an extra 720 connections. The trunk traffic is developing rapidly, there being a total of 153,056 calls during the year.

**New Fessenden Radio Station in Brooklyn.**—The National Electric Signalling Co., operating Prof. R. Fessenden's patents, has erected a large laboratory and works in Brooklyn. The company has engaged a large staff of engineers and mechanics, and is building one of the largest and most powerful radio-telegraphic and telephonic stations on the Atlantic coast of America. At each end of the roof of the company's six-storey building, is being erected a steel pylon, specially designed to resist sudden and sustained wind load. Between 10 ft. steel cross arms at the tops of the pylons, is stretched a multiple Tee-antenna, the span of which is 400 ft., the height of the cross wires above earth being about 250 ft. The pylons are 150 ft. in height, and are insulated from the roof by large porcelain pedestal insulators 2 ft. in thickness. The aerial wires are of phosphor bronze, and the downtake wires from the centre of the span are carried back to enter the operating room, which is on the top floor of the building, and just outside the base of one of the pylons. The company is building the Fessenden high frequency alternator for 10 key, per second and higher frequencies. The radiations emitted by a station using this alternator are heard in the receiving telephone as a shrill piping which is easily discriminated from foreign signals or disturbances. Machines are in course of design and construction which will provide frequencies up to 200 key, per second when driven at speeds up to 30,000 R.P.M., by direct coupled Laval turbines.

**Wireless Antenna at Ground Level.**—M. E. Rothé has recently carried out experiments at St. Denis regarding the reception of wireless radiations by antennae carried along and only just clear of the ground. The results obtained are rather different from those obtained by Jégou, near St. Brieu (which is about the same distance from Paris, but in the opposite direction). The antenna used by Rothé was a single copper wire placed on short posts about 6 in. high. The insulation obtained was very poor, and the wire touched grass at several points. The "aerial" was not set towards Paris; its length was varied from 50 to 115 ft. Connection was made to a water-pipe, as earth, through a self-induction of 0.0045 henry and a detector, telephone and battery were connected in series between the water-pipe and the common terminal of the aerial and the self-induction. Under these conditions signals from the Eiffel tower were received perfectly, whether a 400-ohm telephone was used or a 150-ohm receiver shunted across a Jégou transformer. The garden in which these experiments were conducted is surrounded by a metal fencing about 3 ft. 6 in. in height.

Equally successful results are reported by M. Tavenaux (Sedan), and experiments are being conducted to determine the wave length and other characteristics of these aerials which, by their cheapness and simplicity, should find many useful applications.—*Académie des Sciences.*

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Atherton (near Manchester).**—The U.D.C. has decided, on the recommendation of the Electricity Committee, to obtain tenders for transformers, to meet the growing demand on the low-tension mains.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" to-day.

**Belgium.**—March 29th. Municipal authorities of Ixelles-Bruxelles. Armoured cables necessary for the low-tension distribution service.

**Blackpool.**—High and low-tension cables and transformer switch pillars. See "Official Notices" to-day.

**Bolton.**—March 27th. Materials and stores for the year. Mr. Samuel Parker, Town Clerk, Town Hall. See "Official Notices" to-day.

**Bosnia.**—March 20th. Municipal authorities of Livno. Tenders for the establishment of a central station for public and private electric lighting purposes in the town.

**Bridgend.**—March 21st. One 400-K.V.A. steam alternator and accessories, for the U.D.C. See "Official Notices" Feb. 28th.

**Cardiff.**—March 19th. Electric light sundries for a year, for the City Mental Hospital. Mr. T. D. Morgan, clerk and steward. Mental Hospital, Whitchurch, near Cardiff.

**Carlisle.**—March 25th. Lubricating oils, greases, &c., and cables, for a year, for the City Electricity Department. See "Official Notices" to-day.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" Feb. 21st.

**Dundalk.**—March 24th. Stores for a year, for the U.D.C. Electricity Department. See "Official Notices" March 7th.

**Eccles.**—March 17th. Lancashire boiler, for the Electricity Committee. Forms of tender, &c., obtainable from Borough Electrical Engineer, Cawdor Street, Patricroft. Deposit £1 ls., returnable.

**Germany.**—April 15th. The Königl. Maschinenbau Amt in Hanover. Tenders for four steam turbines, four three-phase generators, two transformers and a battery of accumulators.

**Gillingham (Kent).**—March 28th. Stores for a year. See "Official Notices" to-day.

**Halifax.**—March 18th. Electrical fittings for six months, for the B. of G. Mr. A. T. Longbotham, clerk, Carlton Street.

**Hornsey.**—March 31st. Natural draught cooling tower for the T.C. electricity works. See "Official Notices" to-day.

**Leeds.**—March 17th. (a) Overground transformer chamber; (b) underground transformer chambers, for the electric lighting department. Specifications, &c., from C. Nelson Hefford, engineer (*pro tem.*), 1, Whitehall Road, Leeds.

**London.**—L.C.C.—March 19th. Electrical installation at the Victory Place elementary school, Walworth, S.E. See "Official Notices" March 7th.

It is proposed that during the recess, the Highways Committee shall have authority to open any tenders that may be received for the construction of the authorised conduit tramways from Catford to Southend *via* Bromley Road, and the reconstruction of the existing horse tramways from Chapel Street to Nile Street, Woolwich. March 18th.—Two 2,000-kw. turbo-generators, with condensing plant, &c. (further extension of time). See "Official Notices" February 28th.

April 3rd.—Reconstruction and rewinding of seventeen 300-kw. synchronous motor-generators and three 500-kw. induction motor-generators. See "Official Notices" to-day.

**MILE END.**—March 20th. Re-wiring wards, &c., at the Infirmary for the Guardians. See "Official Notices" March 7th.

**BATTERSEA.**—April 1st. Coal for a year, for the B.C. Electricity Department. See "Official Notices" to-day.

**Morecambe.**—March 19th. Coal or slack (about 2,500 tons), for the Corporation electricity works. Mr. L. B. Hogarth, engineer and manager.

**Pontypridd.**—March 17th. Tramway-men's uniforms for the U.D.C. See "Official Notices" February 28th.

**Portsmouth.**—March 18th. Stores and materials for a year, for the Corporation Tramways Department. See "Official Notices" March 7th.

**Salford.**—March 31st. Stores, &c., for the Corporation Electricity Department. See "Official Notices" to-day.

**Shanghai.**—April 3rd. Extra-high-tension and low-tension switchgear for sub-stations. See "Official Notices" to-day.

**South Africa.**—PORT ELIZABETH.—Tenders will, it is expected, shortly be invited by the municipality for additions to the town's electrical plant, the new items including a 400-kw. generating set with boiler auxiliaries, and high-tension mains, to be laid from the power station to Homewood.—*British and South African Export Gazette.*

**Stalybridge.**—4,500 yards E.H.T. three-core lead-covered cable. See "Official Notices" to-day.

**Swindon.**—March 20th. The Standing Joint Committee of the Wilts County Council invites tenders for work in connection with the installation of electric light at the Old County Police Station, Swindon. Plans and specification and form of tender from County Surveyor's Office, Swindon.

**Tonbridge.**—March 15th. Cables and meters for a year, for the U.D.C. Mr. H. W. Peach, clerk, Tonbridge Castle.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Wallasey.**—March 15th. Fuel oil (400 tons) for a year, for the Corporation electricity department. Mr. J. A. Crowther, electrical engineer, Seaview Road, Liscard.

**Wigan.**—March 31st. Materials and stores for the Corporation Light and Tramways Departments. See "Official Notices" to-day.

### CLOSED.

**Bolton.**—The B.C. Electricity Committee has accepted the tender of Messrs. John Booth & Sons, Bolton, for steelwork for the proposed generating station at Back-o'-th'-Bank.

**Bradford.**—The T.C. has accepted the tender of Cox-Walkers, Ltd., at £343, for a "Taylor-Scotson" voltage regulator. The following tenders have been accepted for supplies of materials required for tramway construction work:—

Walter Scott, Ltd.—Steel rails, £7,750.  
British Mannesmann Tube Co., Ltd.—Steel poles, £5,222.  
Hadfield's Steel Foundry Co., Ltd.—Points and crossings, £2,712.  
Bayliss, Jones & Bayliss, Ltd.—Tie bars, £197.  
Jonas Wells, Ltd.—Malleable iron castings, £503.  
A. G. Barrett & Co.—Iron castings, £415.  
R. W. Blackwell & Co., Ltd.—Copper bonds, £326.  
Thermit, Ltd.—Welding portions, 19s. 6d. each.

**Bridlington.**—The T.C. on Monday accepted the tender of Messrs. Willans & Robinson, Ltd., for a 600-kw. steam generating set, disk-and-drum turbine, coupled to tandem D.C. generators, made by Brown, Boveri, at £2,867.

**Canada.**—Messrs. Escher, Wyss & Co.'s branch at Montreal has been accorded the contract for the installation of three water-wheels of 6,800 H.P. each, for the extension of the City of Winnipeg's power station at Point du Bois.

**Cheltenham.**—The T.C. has accepted the tender of the General Electric Co., of Cardiff, for electric light fittings for a year.

**Croydon.**—The T.C. has accepted the tender of Messrs. Le Grand & Sutcliffe, at £240, for sinking a bore-hole at the electricity works.

**Dewsbury.**—The Electricity and Tramways Committee has accepted the tender of Messrs. Ferranti, Ltd., for a new switch panel for the turbine generator.

**Grimsby.**—The T.C. has accepted the tender of the British Westinghouse Co., at £7,524, for a 1,000-kw. turbine generator and condensing plant.

**Heckmondwike.**—The U.D.C. has accepted the tender of the Tudor Accumulator Co., Ltd., for re-making the top battery floor.

**Lincoln.**—The B.C. has approved the acceptance of a tender by Messrs. Howden for a boiler, stoker, superheater, economiser, chimney, induced-draught flues, &c., for £3,086.

**London.**—BERMONDSEY.—The B.C. last week decided to accept the tender of Messrs. Johnson & Phillips, Ltd., for the supply of 170 arc lamps for street lighting, for £1,615. Councillor G. Barrett opposed the acceptance of the tender, favouring the acceptance of the offer of the General Electric Co., Ltd., whose price was £1,568. Councillor J. Delderfield opposed the suggestion of Councillor Barrett. The electrical engineer explained why the

lamp of Messrs. Johnson & Phillips was chosen by the Committee. He said that with regard to maintenance, there was very little difference between the lamps of Messrs. Johnson & Phillips and the General Electric Co., but the former firm had given a two years' guarantee with their lamps. As stated, the tender of Messrs. Johnson & Phillips was ultimately accepted.

The Metropolitan Water Board has accepted the following tenders for annual supplies to all stations:—

Edison & Swan United Electric Light Co., Ltd.—Metallic-filament lamps.  
Veritys, Ltd.—Wires, cables and tapes.  
General Electric Co., Ltd.—Electrical accessories.

**Manchester.**—The Street Mains and Lighting Subcommittee of the Corporation Electricity Committee has recently recommended the following tenders for acceptance:—

General Electric Co., Ltd.—An additional 800-kw. rotary converter and transformer.  
Ferranti, Ltd.—H.T. switchgear and E.H.T. panels.  
Bruce Peebles & Co., Ltd.—600-kw. motor converter.  
General Electric Co., Ltd.—Circuit breakers.  
British Electric Transformer Co., Ltd.—Auto-transformers.

**Nelson.**—The T.C., on March 6th, decided to accept the following tenders for the new plant required at the electricity works:—

Tudor Accumulator Co.—Traction battery.  
Newton Bros., Derby.—Generator and booster.

**Newport (Mon.).**—The B. of G. on Saturday accepted the tender of Messrs. R. Alger & Sons for electric light fittings for a year.

**Peterborough.**—The T.C. has accepted the tender of Callender's Cable and Construction Co., Ltd., for cables for the new bridge, at £187.

**Rochdale.**—In connection with the extensions at the electricity works, the Gas and Electricity Committee has accepted the following tenders:—

R. & T. Howarth.—Building work.  
W. H. Allen & Co.—Turbo-alternator.  
J. Howden & Co.—Steam turbo-alternator.  
General Electric Co.—Motor alternator.

**Sheffield.**—The following tenders have been accepted by the City Council:—

Ferranti, Ltd.—Two high-tension two-phase switchboards, £173.  
Steel, Peck & Tozer, Ltd.—1,000 tons of steel tram rails, £10 15s. per ton.  
British Thomson-Houston Co., Ltd.—50 B 13 controllers, complete, required for new cars, £47 19s. per pair, less 2½ per cent; two rotary converters, complete with transformers, meters, switchgear, &c., £9,296, subject to the period of delivery being satisfactorily arranged.  
British Mannesmann Tube Co., Ltd.—75 light tramway poles, complete with bases and joint covers, £5 14s. each; 25 medium tramway poles, complete with bases and joint covers, £7 5s. 5d. each.  
Naylor Bros., Ltd.—75 light span pole brackets, complete with crosses, clips and shackles, 28s. each; 25 medium span pole brackets, 24s. each.  
Electric Construction Co., Ltd.—Two 45-w. negative boosters, complete with all fittings, connections and switchboards, £205.  
T. Wilkinson & Sons, Ltd.—Reconstruction of Home Lane tramway depot, £9,950.

The following tenders have been accepted for biennial supplies:—

#### ELECTRICITY DEPARTMENT.

Copper wires.—Imeson, Finch & Co.; British Insulated and Helsby Cables. Iron tubing.—Albert Frost & Co.; D. Ashton & Co.; Credenda Conduits, Ltd.; Wilks Bros. & Co.  
Timber and wood blocks.—A. W. Cliff; H. Newsum, Sons & Co.; General Electric Co.  
Tapes.—Thos. Furniss, Ltd.  
India-rubber goods.—L. Andrew & Co.; G. Maclellan & Co.; I.R., G.P. and T. Works Co., Ltd.; Thos. Furniss, Ltd.; W. T. Glover & Co.  
Brushes.—Thos. Furniss, Ltd.; Wilks Bros. & Co.; R. J. Stokes & Co.

#### TRAMWAYS DEPARTMENT.

Armature washers.—Samuel Peace & Sons, Ltd.  
Controller fittings.—Dyer & Young.  
Weldless steel tubes.—British Mannesmann Tube Co., Ltd.  
Trolley wheel spindles.—Samuel Peace & Sons, Ltd.  
Car electrical supplies.—G. W. Allsop; J. Turner & Sons; Edison & Swan United Electric Light Co., Ltd.  
Electric bell spares.—The Hallamshire Electric Co.  
Electric light fittings.—J. Thompson; General Electric Co., Ltd.  
Cable, &c.—I.R., G.P. and T. Works Co., Ltd.  
Fibre trolley sleeves.—Tramway Supplies, Ltd.  
Rubber materials.—G. Maclellan & Co.; I.R., G.P. and T. Works Co., Ltd.  
Insulating cloths, tapes and linen.—L. Andrew & Co.; W. T. Henley's Telegraph Works Co.; Spicer Bros., Ltd.; T. A. Ashton, Ltd.; and E. Inman & Co.  
Car furniture.—M. Bonser & Co.; Gabriel & Co.; Player & Mitchell, Ltd.; R. & H. F. Phillips; G. W. Allsop; W. S. Laycock, Ltd.; Samuel Peace & Sons, Ltd.  
Springs.—Cocker Bros., Ltd.; Tempered Spring Co., Ltd.; J. P. Skinner and Co., Ltd.  
Slipper blocks.—George Miles.  
Brushes.—R. Richmond & Sons; C. Heyland & Son, Ltd.; G. B. Kent and Sons, Ltd.  
Glass.—Pilkington Bros., Ltd.; Alfred Webb; Hallamshire Electric Co.  
Overhead line material.—Brecknell, Munro & Rogers, Ltd.; M. Bonser and Co.; Tramway Supplies, Ltd.; S. Peace & Sons, Ltd.; Fleming, Birky & Gordall, Ltd.; Veritys, Ltd.  
H.C. copper and lead wire, to be made up into cables.—W. T. Glover and Co., Ltd.

**South Africa.**—Messrs. Siemens have obtained a contract for the supply of 31,800 "Wotan" lamps for use on the South African Railways.

**Stockport.**—The Corporation Parks, Museum and Library Committee has accepted the tender of Mr. Richard Bardsley for wiring and erection of electrical fittings at the new library.

**Stockton-on-Tees.**—The tender of the Reason Manufacturing Co., Ltd., for electrolytic meters, has been accepted by the Council.

**Stoke-on-Trent.**—The T.C. has accepted the tender of Callender's Cable and Construction Co., Ltd., for cables at £3 053.

**Tunbridge Wells.**—The T.C. has accepted the tender of the Cwmaman Coal Co. for 100 tons of Welsh steam coal for the electricity works, at £1 6s. 8½. per ton.

**Watford.**—The U.D.C. has renewed its cable contract with Messrs. Henley's Telegraph Works Co., Ltd., for a further period of 12 months, on the schedule of prices revised on the basis of the present price of copper, viz., £69 per ton.

**Wolverhampton.**—The Corporation Tramways Committee has accepted the tender of Messrs. Pearson, Huggins & Co. Ltd., for the supply of caps and clothing for the tramway inspectors, drivers and conductors.

## FORTHCOMING EVENTS.

**Physical Society.**—Friday, March 14th. At 5 p.m. At the University College, Tower Street, W.C. Paper on "Some Oscillograms of Condenser Discharges and a Simple Theory of Coupled Circuits," and "An Exhibition of Braun Cathode-Ray Tubes and an Electrostatic Machine for Working them, used as a High-Frequency Oscillograph," by Prof. J. A. Fleming; and other papers. Demonstration of Spark Photographs, by Mr. W. B. Haines, before the meeting.

**South-Western Polytechnic Institute.**—Friday, March 14th. At 8 p.m. Presentation of prizes and certificates by Sir C. Alfred Cripps. Conversation following.

**Junior Institution of Engineers.**—Friday, March 14th. At 39, Victoria Street. Continuation of discussion on paper on "Water-Heat-Steam."

**Royal Institution.**—Saturday, March 15th. At 8 p.m. Lecture on "The Properties and Constitution of the Atom," by Prof. Sir J. J. Thomson. (Lecture VI.)

**Borough Polytechnic Institute.**—Saturday, March 15th. At 8 to 5.50 p.m. Annual exhibition of students' work.

**North-East Coast Institution of Engineers and Shipbuilders.**—Saturday, March 15th. At 7.15 p.m. Paper on "Transmission of Power by Chain Drive," by Mr. M. Ba-Gyau.

**Institution of Electrical Engineers (Scottish Section).**—Tuesday, March 18th. At 8 p.m. At 407, Bath Street, Glasgow. Paper on "Recent Developments in the Street Lighting of Manchester," by Messrs. S. L. Pearce and H. A. Ratcliff.

Annual general meeting postponed from April 8th to April 16th.

**(Newcastle Section).**—Monday, March 17th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Regulation of Pressure and Continuity of Supply of Electricity under Various Aspects," by Mr. E. Wyatt.

**(Newcastle Students' Section).**—Monday, March 17th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Regulation of Pressure and Continuity of Supply of Electricity under various Aspects," by Mr. E. Wyatt.

**(Manchester Students' Section).**—Tuesday, March 17th. At 7.30 p.m. At the Municipal School of Technology, Manchester. Annual general meeting.

**Association of Electrical Station Engineers.**—Thursday, March 27th. At 7 p.m. Meeting to form Birmingham branch, at the Y.M.C.A., Dale End, Birmingham. Meetings to form branches will also be held at Mechanic's Institute, Bradford, on Wednesday, March 19th, at 8 p.m., and at "Amalgamated Society of Engineers," Mount Pleasant, Liverpool, on Thursday, March 20th, at 8 p.m.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, March 17th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, March 18th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, March 20th.—Easter Camp.—N.C.O.'s and men attending this camp will parade at headquarters at 12.45 p.m. for issue of arms.  
"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Friday, March 21st.—"D" Company. Company training, 7 to 10 p.m.

Saturday, March 22nd.—Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.  
For Officer commanding L.E.E.

**Educational Notes.**—CENTRAL TECHNICAL COLLEGE.—The Goldsmiths' Company of the City of London, which has consistently supported the Central Technical College since its inception, and in 1909 gave £50,000 towards the extension of the Engineering Department, has offered to bear the entire cost of the new building, the additional outlay being nearly £37,000. The only condition attached to the gift is that the money thus set free shall be added to the endowment fund, and the income therefrom shall be used for the purpose of higher educational and research work carried on in the "Goldsmiths' Company's Extension of the City and Guilds (Engineering) College," as it will be called. The offer has been gratefully accepted by Lord Crewe, the Chairman of the Governors of the Imperial College of Science and Technology.

## NOTES.

**The Easter Holidays.**—As next Friday is Good Friday the ELECTRICAL REVIEW for that day will be published two days earlier, appearing on the morning of Wednesday, March 19th. Correspondents are requested to forward news, letters, &c., at the earliest possible moment. Our advertisement department asks that new advertisement copy and alterations to existing advertisements for that issue should be received not later than to-morrow (Saturday) morning, March 15th. An announcement on the matter will be found in our advertisement pages to-day.

**Electrical Trades Benevolent Institution.**—The annual general meeting will be held on Monday, March 31st, at 3.30 p.m., at the Institution of Electrical Engineers, Mr. E. Garcke presiding. In accordance with the new rules the meeting will be composed only of "members" of the E.T.B.I., but it is hoped that there will be a good representative attendance.

**Electrical Imports and Exports in February.**—The following are the foreign trade figures for last month:—

<i>Imports</i> —			
(A) Electrical goods and apparatus, other than machinery and un-insulated wire ... ..	£120,957	dec. £14,038	
(B) Machinery ... ..	£520,223	inc. £10,654	

<i>Exports</i> —			
(A) As above ... ..	£355,965	inc. £102,976	
(B) As above ... ..	£2,712,029	inc. £365,973	

For the two months of 1913 the electrical goods imported show a decrease of £17,842, and the machinery imported an increase of £169,131; while the electrical goods exported advanced by £196,503, and the machinery by £811,805.

**Dublin Electrical Contractors' Association.**—The annual dinner of the members of this Association was held on Thursday, March 6th, at the Hibernian Hotel, Dawson Street, Dublin, Mr. F. Barrett, Chairman, presiding. There were about fifty members present. The toast of the King having been honoured, the Chairman proposed "The Institution of Electrical Engineers," and referred to the cordial relations existing between the Association and the Institution. Mr. S. T. Land, in replying, mentioned that the Institution had recently taken steps with a view to placing itself in its proper position at the head of the electrical industry. It was in a most flourishing condition, and was worthy of the support of everybody connected with the industry. He trusted that before long the term "electrical engineer" would only be used by those who had the necessary qualifications entitling them to use it. Mr. A. Porte also responded, and said that, as a consulting engineer in Dublin, he had a great deal to do with the Contractors' Association, and a more straightforward body of business men he could not possibly meet. The Chairman then proposed the Kindred Associations, including the Institution of Civil Engineers, the Royal Institute of Architects, the Architectural Association of Ireland, and the Engineering and Scientific Association. Mr. Kaye-Parry, in acknowledging the toast on behalf of the Institution of Civil Engineers, said that electrical engineering was the young man's science. In these days more was expected of engineers than could reasonably be expected from one man. They not only were supposed to understand something of the building trade, but also to be lawyers and business men, as well as to have a knowledge of geology, bacteriology, and chemistry. They were, moreover, expected to be hydraulic engineers, and now, in their old age, they were expected to be electrical engineers as well. It was impossible for them, in the discharge of their duties, to be acquainted with all these things that they were supposed to understand, but they absolutely trusted their electrical contractors. Mr. G. L. O'Connor, on behalf of the Royal Institute of Architects, said that electrical engineering was not only the science of the present, but also was going to be the science of the future. Mr. G. M. Ross, on behalf of the Architectural Association of Ireland, and Mr. George Idle, of the Engineering and Scientific Association, also responded. The toast of "The Guests" was next honoured. Captain Purcell, Dublin Fire Brigade, in replying, said that electrical engineers were dealing with a very potent energy, and it was very pliable in their hands, but it was not amenable in the hands of others. He was thoroughly convinced of the great necessity of doing the work, which the members of the Association were engaged in, in the best possible manner, and he knew that electrical contractors, when left to themselves, did their work in a splendid manner.

**The B.A. Meeting, Birmingham, 1913.**—It is announced that Sir Oliver Lodge has been nominated as president of the British Association for the Advancement of Science, in place of the late Sir William White. Section "A" (Mathematical and Physical Science) will be presided over by Dr. H. F. Baker, F.R.S.; and the Engineering Section ("G") will have as its chairman Mr. J. A. F. Aspinall.

**The Batti-Wallahs' Society.**—At the annual general meeting held on 3rd inst., at the Golden Cross Hotel, under the chairmanship of Mr. F. J. Collis, the secretary, Mr. Pooley, gave a report on the progress made during the past 12 months. The functions held included four smoking concerts, a dinner, seven informal meetings, a down-river trip, an up-river trip, at which ladies were present, and a barge trip. The membership had

increased to 220, and the attendances at the meetings showed a remarkable increase over previous years. Mr. J. Snow Huddleston was unanimously elected president for the ensuing year, and expressions of appreciation were accorded to Mr. Collis, the retiring president, Mr. A. W. Robinson, the entertainment secretary, and Mr. F. Pooley. The Press were also thanked for their generous assistance in publishing the notices of the Society. The vice-presidents are Messrs. J. F. Avila, Haydn T. Harrison, W. A. Jones, G. Newton Russell; Committee, Messrs. Campbell, Carter, Gardner, Greenly, Smith, and Warrilow.

**London Electrical Engineers, R.E. (T.).**—On Saturday last the Corps dinner took place, at the Café Monico; Lieut.-Col. H. M. Leaf presided, and there was a good attendance of members of the corps and their guests. After the loyal toasts, that of "The Corps of London Electrical Engineers" was proposed by Col. Hon. W. Lambton, C.M.G., who congratulated the corps on its being in a highly efficient state, and above its establishment as regarded both officers and men, an almost unique circumstance. They were all experts in their own lines, and their work in time of peace kept them fully trained to perform their duties in time of war; hence it was one of the most efficient corps in the Territorial Force. In responding, Col. Leaf remarked that last year they had acquired a new Crossley engine and other equipment, including a fine motor lorry capable of running at 8 miles an hour, which had afforded them some highly interesting experiences. Referring to the popular tendency to depreciate the Territorial Force, he urged the corps to pay no attention to what the papers said.

Col. R. E. B. Crompton, C.B., before presenting the challenge cups and prizes won during the year, said the Territorial Army had been abominably treated by the Press. The corps had always been efficient, and he regretted that the authorities failed to realise the extremely important part that electricity would play in the next war. Wireless telegraphy had completely revolutionised modern methods of warfare.

He then presented the long-service medal to Coy. Sergt.-Major F. A. Hill, the third member of the corps to obtain it through service in the corps alone. A medal was also presented to Corp. W. J. Allen.

The Hopkinson Cup (for technical work) was won by "D" company; the Officers' Cup (for drill) by "C" company; the Bam Cup (shooting on open range) and the Leaf Cup (shooting on miniature range) by "A" company; and the Le Rossignol Cup (for sports) by "D" company.

The Rich Challenge Cup, for shooting at 500 yards, was won by Corp. W. J. Bardwell, and the Miniature Cup, for the best score in the elementary course, by 2nd Corp. C. H. Masters. Spoons were awarded to Sergt. E. V. Bowmaker, Sap. H. C. Redgrave, and 2nd Corp. J. W. Rodger. A large number of prizes for sports were also awarded.

Capt. Kenelm Edgecumbe proposed "The Visitors," and, humorously ringing the changes on the motto of the corps, "Ars Martis Comes," which he thought might be freely translated, "Science linked with Valour," pointed out that they were all linked together, not only as soldiers, but also as electrical engineers, with the I.E.E. as their *alma mater*.

Mr. W. Duddell, president I.E.E., in reply, said he felt he was in the company of men who were prepared to do their duty in defending their country—a duty never more necessary than now. They were all skilled men, and, as in the event of war there would be a great demand for such, the electrical engineers would play a very big part in the next great conflict. The maintenance of communications would fall to their lot; all kinds of artifices were possible in effecting communication in the face of great difficulties, and they should know and practice these in time of peace, so as to be ready to cope with any emergency.

Captain E. N. Bennett also responded, and said he had never before met with a body of Territorials that was exempt from public criticism; for one thing, no one knew what they did, and for another, their work naturally ran on smooth lines. The loss of the battle of Lule Burgas was due to the lack of military science and the absence of means of communication along the battle-front; this was remedied at Chalatalja by the installation of telephones, etc.

An excellent entertainment was provided, under the direction of Lieut. F. H. Masters, who, as organising secretary, carried out all the arrangements for the dinner.

### R.A.C. Trial of an Electrical Motor Delivery Van.

—The Royal Automobile Club has now issued the certificate relative to the week's trial under its supervision of an electric motor delivery van fitted with a battery of Edison nickel-steel accumulators, entered by Mr. F. J. Monnot, of 41, Great Portland Street, W. The vehicle, which had a rated carrying capacity of 1,000 lb. (nominally 10 cwt.), weighed 29 cwt. approximately, including a 60-cell battery. The trial was held in London from the 6th to the 11th January, or six days, and the average speed-rate was 11'52 miles per hour. The roads were "fairly heavy and some rain fell." The total mileage run was 312'3 miles, which included the distance run between the lock-up and the charging station. A total of 191'81 units was used for charging the battery, the aggregate time taken for the charging being 24 hours 30 minutes. The level of the electrolyte in some of the cells was tested on two occasions and distilled water was added to all the cells three times.

On days Nos. 1, 2, 3 and 4 the maximum distance possible was run on the battery charge. The time occupied in charging the cells was 6 hours 39 minutes, first day; 5 hours 27 minutes, second day; 3 hours 40 minutes, third day; 3 hours 6 minutes, fourth day; 5 hours 36 minutes, fifth day, and 1 hour 2 minutes, sixth day. On the sixth, or last day, the charging was repeated in six "doses" of 10 to 12 minutes' duration each. During these

short-period charges the average amperes ranged from 133·6 at 119·8 volts to 150·8 amps, and 111·9 volts. The longest distance between charging, viz., 50·2 miles, was covered on the third day; the battery had been previously charged for one hour and at the close of the run was again charged for 2 hours 40 minutes.

**Fatality.**—An inquest was held on 7th inst. concerning the death from electric shock, on 5th inst., of Benjamin Bettridge, aged 14, a pony driver at the Langwith Colliery. Mr. Nelson, electrical expert to the Home Office, attended. According to the evidence, deceased was resting his hand on a prop, and just above his hand was an electric lamp, which it was quite possible he touched, as it was pulled down when he fell. The manager of the colliery said that the screw which held the lamp to the prop was not broken; it had been drawn out of the wood. He could only account for the deceased getting a shock if there was a leak in the insulated cable. The insulation had been tested and found good. The lamp was afterwards put in a position similar to that which it occupied before it was disturbed, and it was then found that there was a possibility of a leak from the cable to the casing of the lampholder, on which there was slight evidence of fusion. That being the case, there was a liability to shock to anybody who touched any part of the metal or wire. Anybody touching the lamp at such a time would probably grip it and get it out of place. Mr. W. E. Ross, the underground electrician, said that earthing was being generally applied to the whole system. He did not think that there would be anything above 110 volts from the lamps, but he was now satisfied that the voltage was greater than he believed. The manager said that the rules required that circuits of over 125 volts should be earthed. Some of the lamps had been unearthed, but these had now been earthed. A verdict of "Accidental death" was returned. We refer to this matter in our leading columns.

**Sentence.**—For receiving about 700 yards of stolen copper telephone wire, the property of the Postmaster-General, which had been removed from poles near Paddington, Henry Newman, a dealer, was sentenced to 12 months' hard labour at the Central Criminal Court on Saturday last.

**Association of Electrical Station Engineers.**—A meeting was held at the Exeter Café, Manchester, on Friday last, for the purpose of forming a branch of the above Association. Thirty gentlemen were present at 8 p.m., and Mr. J. W. Lanham was unanimously voted into the chair. The widespread interest in the Association was evidenced by the presence of representatives from neighbouring towns such as Blackburn, Wigan, Oldham, Rochdale, Ashton, Stalybridge, &c. The proceedings were opened by the reading of a letter from the Hon. Secretary (Mr. Ebben), in which he clearly described the history of the Association, its objects and aims. It was stated that the object of the meeting was, in the first place, to form a local branch and then to obtain suggestions as to the working of the same.

The first question arising was as to the area included in the Manchester district. After a little discussion it was decided that this could be settled later by the London Conference. Meanwhile Manchester was to be the centre of as large a district as possible, compatible with the claims of other branches. It was unanimously resolved "That a branch of the A.E.S.E. be formed in the Manchester district." Mr. J. W. Thomas, B.Sc. Tech., was then elected secretary for the district.

In view of the possibility of some members not being able to attend meetings on account of their shifts, it was resolved that a Committee of at least 12 should be elected, chosen from as many of the districts as were represented, and this was done. A discussion ensued as to the qualifications which should entitle an applicant to become a member of the A.E.S.E. The following suggestions were made for consideration in London:—Eligible candidates should be—

(1) Totally employed in electrical station work. This includes shift engineers, assistant shift engineers, switchboard attendants, sub-station attendants, mains assistants. Assistant sub-station attendants might also be eligible, provided that sufficient evidence was given as to training and ability, the Committee having the power of discrimination.

(2) Or, in entire and exclusive charge of private plant, and producing a guarantee of training and experience.

It was resolved that the Committee have power to admit candidates with the above considerations in view, emphasis being laid on the desirability of either technical training, works training, or long experience in charge of electrical plant.

With reference to the annual subscription, it was suggested that, though the one proposed was very reasonable, it might be desirable to adopt a graded subscription varying according to salary.

The question of grievances pertaining to particular districts was commented on, but the subject was postponed to some future date, as being too big. It was, however, pointed out that the organisation was something more than a trade union, its main object being to raise the status of the profession.

As to the accomplishment of the latter object, it was suggested that meetings of a social and educative character should be held, including meetings for discussion, papers, &c., on subjects calculated to interest the members. These meetings might be held in other towns in the district besides Manchester.

All the gentlemen present who were not already applicants for membership promised to become so, and the meeting unanimously volunteered to persuade others of their acquaintance to join and to make the Association as widely known as possible.

Votes of thanks were accorded to the chairman and secretary for their services, and to the hon. sec., Mr. Ebben, for his pioneer work in the inauguration of the Association, and the meeting closed.

**Annual Dinners and Socials.**—**CROYDON.**—The annual staff dinner of the Croydon Corporation Electricity Works was held on Saturday evening, the chief engineer (Mr. A. C. Cramb) in the chair. The company, which gathered at the "Greyhound" Hotel, included the Mayor (Councillor S. Rogers), Ald. T. Betteridge, Ald. T. Hillier, Councillors H. W. Umney, W. B. Roberts, F. Denning, W. Peet, J. A. Clarke and H. T. Muggeridge, and Mr. T. B. Goodyer (general manager of the tramways). There were special electrical decorations, and a good musical programme. Ald. D. B. Miller (chairman of the Electricity Committee), who is abroad, sent a cordial message of goodwill, and the members of the staff on duty forwarded congratulations to their more fortunate colleagues. The chairman, proposing "The Corporation of Croydon," said the aim of the department was to give the public the best article at the lowest price. The Mayor replying, complimented Mr. Cramb on his good management, and the excellent feeling prevailing among the staff, the men being comfortable in their employment and satisfied with their wages. Councillor Denning, submitting "The Chairman and Members of the Committee," remarked—as chairman of the Tramways Committee—that his only complaint was that they wanted so much profit out of the current sold for the tramway service. Councillor Umney replied. The chairman, also responding to the toast, reminded the chairman of the Tramways Committee that his department had not had the difficulty of getting over the tight situation caused by the coal strike; nor had he to face a 40 per cent. increase in the price of coal. Mr. Cramb added that after nine years' work every department was just as he could desire.

**PERTH.**—The employees of the Perth Corporation Tramway Department held their annual social and dance last Friday night, when Councillor Moncrieff, convener, who presided, addressed the men. Bonuses to conductors and drivers were presented.

**LONDON.**—The annual dinner of the staff of the Osram and Robertson Lamp Works will be held at the Clarendon Restaurant, "Coronation Hall," on Friday evening, March 28th.

**Appointments Vacant.**—Chief engineer and manager (£700), and consumers' engineer (£300), for the Hampstead Borough Council; electrical engineer, for Heywood Corporation (£200); traffic superintendent, for the Aberdeen U.D.C. Tramways (£175); installation engineer and canvasser, for the Tynemouth Corporation electricity works (£100 and commission); assistant electrical engineer, for the electric light department of Selangor, Malay States (£360). See our advertisement pages in this issue.

**Strike.**—According to the *Daily Telegraph*, the electrical trade workers of the district of Southampton have made common cause with the engineers and others who are on strike there.

**Life Targets.**—Last week, at the invitation of the directors of "Life Targets," we inspected the remarkable device which has been developed by the company for target practice with the rifle. A moving picture is thrown on a screen, showing suitable objects in motion, such as birds, animals, soldiers, &c.; on firing at the target, the bioscope is instantly stopped and the bullet-hole, shown by a bright spot of light, remains visible for a few seconds, after which the hole disappears and the motion of the picture is resumed. The electrical arrangements, which involve the use of the "K.K." detector, are most ingenious, and so are the other details of the system, which we will describe fully at an early date. The sport obtained with this target is exciting, and splendid practice for snap shooting.

**Institution and Lecture Notes.**—**PRODUCTION MANAGERS' ASSOCIATION.**—This new Association will hold its inaugural dinner (morning dress) at the Holborn Restaurant on April 8th, the subject being "Labour Problems," which will be dealt with by experts in various phases of the problem of labour. Tickets 4s. each. The secretary is Mr. Charles F. Warren, Guest House, Leys Avenue, Letchworth, from whom further particulars can be obtained.

**INSTITUTE OF MARINE ENGINEERS.**—At a meeting of the Institute, held on Monday, March 3rd, a paper on "Recent Experiences with Babcock & Wilcox Boilers for Marine Purposes" was read by Mr. J. H. Rosenthal (member).

**INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH LOCAL SECTION).**—The Committee's nominations for office-bearers for Session 1913-14 are as follows:—

Chairman—J. A. Robertson.  
Vice-Chairmen—James Lowson and T. Blackwood Murray.  
Committee—David A. Starr, J. K. Stothert, J. F. Neilson, Wilfred L. Spence, M. B. Field, J. H. Bunting, J. S. Nicholson, E. T. Goslin, George Stevenson.

Hon. Secretary and Treasurer—James E. Sayers.  
Assistant Hon. Secretary—Wm. F. Mitchell.

**MANCHESTER SECTION.**—A meeting of the Section was held on Tuesday evening, when a paper was read by Mr. A. E. Hadley on "Power Supply on the Rand." An interesting discussion followed, to which the author replied.

**YORKSHIRE SECTION.**—A paper was read at Leeds University on Wednesday by Mr. Thomas Roles on "Electric Cooking and Heating." A discussion followed.

**THE ASSOCIATION OF ENGINEERS-IN-CHARGE.**—At the invitation of the Social Committee of the Association of Engineers-in-Charge, over 200 members of the Association and their friends attended a dance held in the Holborn Hall, Gray's Inn Road. A programme of 15 dances was arranged, and, owing to the very excellent manner in which Messrs. W. H. Ball and M. C. White (M.C.'s) officiated, it was found possible to get through the whole of these, together with five extras. Dr. H. E. Hele-Shaw, F.R.S.,

president of the Association, was present, and was ably supported by Mr. H. E. Neale (chairman of the Association) and the members of the Committee. Mr. Hardy's Blyon Orchestra was in attendance.

**THE FARADAY SOCIETY.**—A joint meeting of the Faraday Society and the Local Section of the Society of Chemical Industry will be held at Manchester on Friday evening, April 12th. The proceedings will take the form of a general discussion on "The Corrosion of Iron and Steel."

### OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—The Watford U.D.C. has increased the salary of MR. A. W. BARRHAM, chief assistant, from £140 to £155 per annum, with annual increments of £15 up to a maximum of £200 per annum.

The salaries of MR. J. ALLWARD, station superintendent, and MR. T. A. J. MARGARY, mains superintendent, have been increased by the Islington B.C. from £200 to £225 each per annum. Increases have also been given to two shift engineers, two mains engineers, a repair engineer, three junior engineers and a draughtsman.

MR. A. E. TURPIN, senior charge engineer, Weymouth Corporation Electricity Works, has been appointed assistant foreman electrical engineer to the Indian Government at Cossipore, and sails on March 15th. Mr. Turpin has been at Weymouth for the past seven years.

MR. W. H. WOODS, of Durham, has been appointed shift engineer at the Stnart Street generating station, Manchester, at £175 per annum.

The salary of the Bermondsey B.C. electrical engineer, MR. W. E. J. HEENAN, has been increased from £525 to £625 a year, by two annual increments of £50 each, and that of MR. J. G. DORAN, chief assistant engineer, from £250 to £300 per annum, by two annual advances of £25 each.

MR. S. T. ALLEN, of Carlisle, has been appointed electrical engineer to the Wolverhampton Corporation, in succession to MR. C. E. C. SHAWFIELD, resigned. The salary commences at £600.

The Wolverhampton Corporation Electricity Committee has decided to increase the salaries of the members of the technical staff as from October 1st last, as follows:—MR. STUBBS, technical and general assistant, £160 to £200 per annum; MR. BELLHOUSE, boiler house superintendent, £125 to £150; MR. FORDER, engine-room superintendent, £120 to £150; and MR. PLATT, junior assistant, £85 to £104.

MR. A. PRENTICE, of the Central London Railway Power House, Shepherd's Bush, London, has been engaged by the Walsall Corporation Electricity Committee as station superintendent, in place of Mr. T. J. Archer, resigned, for a period of one calendar month (to be extended to two months should the Electricity Committee so desire), at a salary of £5 per week, together with railway fare to and from London; and subject to mutual satisfaction at the end of that period, and to his references being satisfactory, Mr. Prentice is to be then permanently engaged at a salary of £200 per annum, removal expenses not exceeding £10 being allowed.

The Hackney Electricity Committee recommends that owing to increased responsibilities, the designation of MR. T. DALBY, works superintendent, be altered to "works and sub-stations superintendent," and the salary advanced from £200 to £300 by annual increments of £12 10s. MR. E. MATTHEWS, testing engineer, is to advance from £130 to £180 by annual increments of £10. MR. E. WILKINSON, generating engineer, is also to be advanced.

We understand that MR. H. H. COZZENS has resigned his position as engineer and manager of the Hampstead Corporation electric supply department, in order to take up a good appointment abroad. His resignation was put before the Committee last Monday, and accepted.

**Tramway Officials.**—The Bury T.C. has decided to increase the salary of the tramways manager, MR. CLOUGH, by £50 per annum, with a further increase of £50 at the end of 12 months.

The Keighley Tramways Committee has appointed MR. HARRY WEBBER, borough electrical engineer, as tramways manager, as from October 15th last, at a salary of £100 per annum.

**General.**—The *Times* states that MR. HENRY WOLLEN has resigned his position as director and chairman of the Edison & Swan United Electric Light Co., and the vacancy has been filled by the election of MR. C. J. FORD, of Messrs. Ford, Rhodes & Ford, as a director and chairman.

MR. WALTER J. CRIDGE, who has represented Messrs. Ferranti, Limited, in the Birmingham District, has severed his connection with that firm in order to join the A.E.G. Electric Co., Ltd., as an engineer representative in the same district.

MR. E. C. TITTON has severed his connection with Messrs. J. J. Smith & Co., electrical fittings manufacturers, of 44, Kirby Street, Hatton Garden, E.C., having resigned the managership of the above works, which he has held since they were first started in 1910.

MR. F. CLOUGH, who, out of 300 applicants, has been appointed chief assistant electrical engineer to the Essex County Council, for its large new asylum at Colchester, served his apprenticeship in the

Bradford Corporation Electricity Department prior to taking up the post of electrical engineer to the Worcester County Council, at the Barnsley Hall Asylum, Bromsgrove.

**Obituary.**—We regret to learn of the death, which occurred on Monday, 10th inst., of MR. ANDREW LIVINGSTONE LIND, A.I.E.E., who was until recently managing director of Messrs. Lind & Co., Ltd., of Liverpool.

### CITY NOTES.

#### Windsor Electrical Installation Co., Ltd.

THE directors report that the capital expenditure during 1912 amounted to £2,448, making the total £92,798. The additional expenditure chiefly represents the installation of a second Diesel oil engine of 135 kw. capacity. The profit (including £593 brought forward) is £6,823. Debenture interest absorbs £809, dividend on 5 per cent. preference shares £1,108, depreciation, renewals and reserve fund £1,750, and directors' fees £350. The directors recommend that a dividend of 5 per cent., less income-tax, be paid on the ordinary shares, leaving £451 to be carried forward. During the year new lamps were connected equivalent to 1,021 of 8-c.p.; the total connected to December 31st, 1912, being 51,076 lamps. The annual meeting takes place on March 19th.

#### Newcastle-upon-Tyne Electric Supply Co., Ltd.

THE directors' report states that the connections to the company's system at the end of 1912 amounted to 174,327 H.P., an increase of 22,700 H.P. for the year. The profit is £120,989, as compared with £114,839, plus £4,608 brought forward, making £125,597 as compared with £116,889. Against this has been charged interest on debenture stock, loans, &c., £35,078, leaving £90,518, as compared with £84,921. The directors recommend a dividend of 5 per cent. for the year on the preference shares, absorbing £34,375, a dividend of 5 per cent. for the year on the ordinary shares (as against 4½ per cent. for 1911) (of this an interim dividend of 2 per cent. was paid in July last), £34,375, the transfer to depreciation account of £15,000, carrying forward £6,768. From the reserve account have been deducted the charges in completing the conversion of debentures into debenture stock and the issue of new debenture stock to replace debentures paid off £4,644, leaving it at £10,405. The depreciation account has been increased by the transfer of £15,000, making it £145,000. From this there has been transferred £26,100 which has been utilised in writing down certain items of plant and stores (in addition to the sums of £150,000 and £2,500 previously shown as having been written off) leaving the amount of the unappropriated depreciation account at £118,900. The expenditure on capital account for the year amounted to £167,082. This has been incurred mainly in extending the distribution system of the company in both the northern and southern areas. Agreements for the supply of electrical energy have been entered into during the year, with important customers, including several large colliery companies. The Bankfoot Power Co.'s new waste heat station at Bowden Close, and the extensions to that company's station at Bankfoot, have been completed and brought into operation. The disorganisation caused by the national coal strike in the early part of the year added largely to the working costs of the company. It is gratifying to state that throughout the period affected by the strike the company was able to fully satisfy the requirements of all its customers. A resolution will be submitted for the approval of the general meeting on March 19th asking the shareholders to increase the directors' remuneration to £1,500 a year.

#### W. T. Glover & Co., Ltd.

THE directors' report for the year 1912 shows that the result of the trading is a credit balance of £38,469, plus £4,767 brought forward. There has to be deducted directors' remuneration, voted March, 1912, £1,000; directors' expenses during 1912, £41; interest at 4½ per cent. on first mortgage debenture stock, £4,250; interest at 5 per cent. on second mortgage debenture stock, £3,800; written off investments, £1,500 = £10,591; leaving £32,645 less appropriation for payment to trustees of second mortgage debenture stock, £4,000. The balance of £28,645 is to be dealt with, thus:—Dividend on 5 per cent. cumulative preference shares (£100,000) to December 31st, 1912, less income-tax, £4,708; transfer to first mortgage debenture redemption fund, £2,500; dividend on ordinary shares (£114,850) at the rate of 5 per cent., less income-tax, £5,407; bonus on ordinary shares, at the rate of 2½ per cent., less income-tax, £2,704; transfer to reserve fund, £5,000; leaving to be carried forward £8,326. The directors recommend the payment of the dividend on the 5 per cent. cumulative preference shares for the year, and a dividend at the rate of 5 per cent., and a bonus at the rate of 2½ per cent. on the ordinary shares for the same period. After making the above appropriations, the redemption fund for the first mortgage debenture stock will stand at £33,000, the redemption fund for the second mortgage debenture stock at £24,000, and the reserve fund at £20,000. The loan to the Trafford Power and Light Supply (1902), Ltd., having reached £25,000, a second debenture for that amount has been accepted in discharge thereof, and this item is now merged into the item of investments—£97,521.

The meeting is called for March 17th.

### British Engine, Boiler and Electrical Insurance Co., Ltd.

WE are informed that at the annual meeting, held at the head office in Manchester, on March 7th, the chairman (Mr. R. C. Longridge) mentioned that in the course of the past year the Royal Insurance Co., Ltd., had acquired a controlling influence by the purchase of shares, and, in consequence of advancing years, his father, the first chairman of the company, had taken this opportunity for resigning his position on the board. Mr. Moss, also, who had been secretary almost from the commencement of the company, was retiring from that position, and his place would be taken by Mr. H. F. Taylor, who had for many years represented the company in Glasgow, but these changes involved no alterations in the operations of the company, and had in no way interfered with its progress, as might be seen from the figures in the balance-sheet. Claims showed a considerable increase as compared with 1911, and this was chiefly among steam engines, possibly because trade was so good that engines were overburdened, but that explanation would not account for the fact that, in spite of a great increase in the number of electrical machines insured, the claims in that department had not increased. He ventured to hope that this improvement was due to the educational advantages derived from the repeated visits of the company's inspectors, when they explained to attendants—many of whom knew little or nothing about electricity—what should be done to keep machines in good working order. While the amount to be paid for claims was about the same, the ratio of breakdowns also remained nearly constant, namely, one out of every nine machines insured. There had been a considerable diminution in claims for boilers, and the general results spoke well for the efficiency with which the work of inspection had been carried out. It was resolved to pay a dividend of 5s. per share, with a bonus of 3s., and after re-election of directors and auditors, the meeting ended.

### Direct Spanish Telegraph Co., Ltd.

THE directors report that for the year 1912, after providing for interest on and redemption of debentures, and for the dividend (10 per cent.) on the pref. shares, there is a balance of £14,134, out of which the directors recommend a final dividend on the ordinary shares of 2s. per share, free of income-tax, which, with the interim dividend paid on October 1st last, will make a total distribution of 4 per cent. for the year, and absorb a sum of £2,586. In consequence of the entire absence of breaks on the company's cables during the year 1912, it has been possible to strengthen the reserve fund out of revenue by £11,000, which is satisfactory in view of the exceptionally large expenditure of £33,000 on the Bilbao cable in 1911. After crediting the reserve fund with £11,000, the balance of £548 is carried forward. The traffic receipts show an increase of £2,985, and the working expenses an increase of £1,080. The company's cables and the landlines in connection with them have continued in good working order throughout the year.

The meeting is called for March 17th.

### Manila Electric Railroad and Lighting Corporation.

—The Municipal and General Securities Co., Ltd. (European agents), announce that a dividend of 1½ per cent. (\$1.75 per share) for the quarter ending March 31st, has been declared on the common capital stock of the above Corporation, payable in New York on April 1st.

**Continental.**—GREECE.—La Compagnie Hellenique d'Electricité Systeme Thomson-Houston, of Athens, is declaring a dividend of 5 per cent. for the last financial year, the same as for the preceding 12 months.

**Canada.**—The Halifax (N.S.) Tramway Co. in their annual report show a surplus of \$704,119, an increase of \$101,834 over 1911.

**Electrical Distribution of Yorkshire, Ltd.**—At the annual meeting at Leeds on 25th ult., the chairman, Mr. R. W. Wickham, congratulated the shareholders on the steady and satisfactory progress that was being made. During the year there had been a steady growth in the demand for electrical energy, and a large number of consumers had been added in the 10 districts in which the company was now giving a supply. The company was the holder of 14 electric lighting orders for districts in the West Riding. The profits had increased from £37 in 1908 to £2,166 last year. A dividend of 6 per cent. on ordinary shares was adopted. Subsequently, the chairman moved that the capital of the company be increased to £50,000 by the creation of 25,000 new shares of £1 each. This was carried.

**Manorhamilton and District Electric Light Co., Ltd.**—The annual meeting was held at Manorhamilton recently, Mr. A. A. Alges presiding. The annual report showed that the company was in good standing, and it was adopted.

**Stock Exchange Notice.**—Application has been made to the Committee to appoint a special settling day in Ceara Tramway, Light and Power Co., Ltd.—£5,007 ordinary shares of £1 each, fully paid (Nos. 200,001 to 285,007) and 125,000 5 per cent. first debenture stock.

### South London Electric Supply Corporation, Ltd.

THE directors' report for the year 1912 shows that the gross receipts were £48,123, while expenditure was £20,859, leaving a profit balance of £27,264, plus £908 brought forward. There is a total amount available of £28,172, and after providing for depreciation on plant and machinery (£6,000), debenture and other interest accrued, &c., £13,289, there remains £15,183. Out of this the board recommended the payment of a dividend at the rate of 5½ per cent. per annum on the ordinary shares, amounting to £14,300, carrying forward £883. At the end of 1912 there were connected to the company's mains the equivalent of 273,306 (35-watt) lamps, showing a net increase for the year of 22,585. At the present time there are 285,388 (35-watt) lamps (equivalent) connected, in addition to which applications are in hand for a further 13,830 lamps. The plant, machinery and mains have been maintained out of revenue in a high state of efficiency. The units sold amount to 5,000,111, an increase of 520,631 or 11½ per cent., the total cost per unit sold being 1'00d., as against 1'03d. in 1911. The ratio of total costs to revenue has been maintained at 13 per cent.

Units generated	6,317,975
Sold to consumers and used by public arc lamps	5,000,111
Used on works	376,015
Total	5,376,126
Expended in distribution	811,812
Total kilowatts connected	9,600

The annual meeting is called for March 18th.

### British Insulated and Helsby Cables, Ltd.

THE directors' report for the year 1912 shows a profit of £218,395, plus £63,651 brought forward, making £282,046; from this have to be deducted directors' and debenture trustees' fees and remuneration to Works Committee, £5,315; interest on first debenture stock, £22,500; interest on second debenture stock, £10,000; depreciation on buildings, plant, machinery, &c., £20,000; transfer to reserve account, £20,000; transfer to special reserve account, £8,500; transfer to first mortgage debenture stock redemption account, £5,000; written off patents and goodwill, £36,500; dividend on preference shares for the year, £30,000; interim dividend on ordinary shares to June 30th, 1912, £20,000—leaving available for dividend £104,231. The directors recommend a further dividend of 6s. per share on the ordinary shares, making, with the interim dividend already paid, a total of 10 per cent. for the year, £30,000, carrying forward £74,231. The directors are pleased to report that there has again been an increased turnover during the year, which has resulted in an additional profit being earned of £30,136 over the previous year. £8,500 has been transferred to special reserve account, a further £5,000 to first mortgage debenture stock redemption account, £20,000 to reserve account, and £20,000 applied to depreciation on buildings, plant and machinery. In addition, £36,500 has been written off patents and goodwill. This account, which originally stood at £251,672, has now been reduced to £35,000. After deducting the aforementioned sums, the balance to be carried forward is £74,231. The sale of the Liverpool works to the Automatic Telephone Manufacturing Co., Ltd., referred to in last year's report, has been completed.

The annual meeting is called for March 17th.

### Giant's Causeway, Portrush and Bush Valley

**Railway and Tramway Co.**—Dr. Anthony Traill, D.L., presided at the annual meeting held recently at Portrush. The directors reported that the financial position of the company had been well maintained during the past year. The receipts amounted to £3,908, which, considering the extremely wet summer of 1912, must be considered satisfactory. The number of passengers fell from 136,395 in 1911 to 135,612 in 1912, and the receipts from £4,107 in 1911 to £3,908 in 1912. The expenditure last year was somewhat higher than in the previous year, and consequently the net profits were £1,222 for 1912, as compared to £1,546 for 1911. These profits were sufficient to pay the debenture interest, £612: the interest on the mortgage for the construction of the extension to the Giant's Causeway, £400; interest on temporary loans and bank interest £69; leaving a credit balance of £308, which it was recommended to be carried forward. While the wet summer of 1912 gave sufficient water to drive the full complement of electric cars, the same cause reduced the number of tourists travelling, with a consequent reduction in the receipts. The engineer reported that the number of miles run by electricity was 34,932, an increase of 1,525 over that of 1911, worked at a cost of 3½d. per mile run. The number of miles run by steam power was 3,922 worked at a cost of 2s. per mile run.

**Mid-Sussex Electric Light and Power Co., Ltd.**—Mr. T. Caffyn presided last week at the first statutory general meeting of this company.

**Melton Mowbray Electric Light Co., Ltd.**—The annual meeting was held on 7th inst., Mr. W. J. New presiding. The directors reported that satisfactory progress had been made during the year, the total number of consumers being 613. The revenue for the year, including £242 brought forward, amounted to £2,761, and after providing £1,000 for debenture interest, there remained £1,761 for distribution. They recommended a dividend at the rate of 3 per cent. per annum, that £750 be placed to the reserve fund, and £411 carried forward.

### Hove Electric Lighting Co., Ltd.

THE directors, in their report for 1912, give the following progress table:—

Year.	Houses.	Equivalent in S.C.P. lamps.	Units sold.	Gross revenue.	Net revenue.
1908	1,076	114,185	1,134,994	£21,695	£19,463
1909	1,830	129,946	1,192,598	25,305	19,981
1910	1,919	129,217	1,178,165	25,991	15,400
1911	2,129	138,200	1,139,328	21,840	14,457
1912	2,276	141,919	1,167,008	25,220	14,630

With the addition of the balance £637 brought forward and bank interest, the amount to the credit of net revenue account is £15,283, from which must be deducted the dividend on the preference shares paid September 1st, 1912 (£588), the interim dividend on the ordinary shares at the rate of 8 per cent. per annum (£2,825), a provision for debenture interest accrued and income-tax, leaving £9,283 now available. The directors propose to place £1,500 to the renewals and depreciation account and £3,000 to the sinking fund, to set aside £588 for preference dividend accrued to December 31st last, and to declare a final dividend for the six months on the ordinary shares at the rate of 10 per cent. per annum, making 9 per cent. for the year. The amount carried forward, after providing for the directors' extra remuneration of £315, is £348. The renewals and depreciation account, with the above addition, will now stand at £27,104. The sinking fund account, with the above addition of £3,000, and £2,016 received by way of dividends on investments, will now amount to £48,530. The expenditure during the year on capital account has amounted to £1,301, and the machinery, buildings and mains of the company have been kept in good repair. The Hove Corporation having given notice of their intention to purchase the undertaking of the company by payment of the legitimate capital expenditure, are promoting a Bill in Parliament to authorise the borrowing of the necessary money. The company will continue to carry on the undertaking until the transfer to the Corporation. The payment of the purchase-money will become due on December 8th next.

The annual meeting is called for March 19th.

### Chelsea Electricity Supply Co., Ltd.

MR. W. R. DAVIES (chairman) presided on Wednesday at Winchester House, E.C., over the annual meeting of the company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 396), the CHAIRMAN first referred to the death of Sir Irving Courtney, the late chairman. He said the deceased was the only remaining member of the original board. He directed the fortunes of the company through evil report and good report, and he had the satisfaction before he passed away of seeing the finances of the undertaking in a prosperous condition and its position among London electric light undertakings well assured. They were very fortunate in having been able to obtain the services of Mr. Stanley Beeton to fill the vacant seat on the board. Mr. Beeton possessed considerable engineering knowledge and a rare commercial faculty, a combination not often met with. The net additions to capital amounted to £1,277 only. In the revenue account the sale of current had increased by £1,400, but, on the other side, the Miners' Eight-Hours Act and the Coal Strike, which had left in their train what he was afraid would prove permanently higher prices, were responsible for an increase of a similar amount in the coal bill, and the result of their trading was that they carried to net revenue £40 less than a year ago. They had, however, an increased income from dividends of £670, which gave them about £500 more than for the previous year to deal with. They proposed to put to renewals and depreciation account £13,626, which was £446 more than the amount for 1911; to transfer the usual amounts to the debenture stock premium redemption fund; and to further reduce the cost of extinguishing the founders' shares; they also proposed to write a further £1,000 off the Cadogan Electric Light purchase account; to write down their investments to the market prices on December 31st last, which would cost £1,352; and, after paying interest on debenture stock and the dividend on preference shares, to pay a final dividend at the rate of 6 per cent. on the ordinary shares, making, with the interim dividend of 4 per cent., 5 per cent. for the year, reducing the balance carried forward by about £400. That this was a conservative distribution was clear from the fact that out of a total available of £31,880, they paid only £14,159 in dividends, and appropriated £17,771 for various writings down. Their aim, as a board, was, before increasing the dividend, to see that every doubtful item in the accounts was finally extinguished, as they believed that their first business was to preserve the corpus of the undertaking in preparation for the inevitable day when their provisional order expired and their business would be taken over. Their investments as written down to market prices at December 31st stood at £54,567. The business continued to made steady progress. The S.C.P. lamp equivalents had increased by 11,597, which was distinctly better than the increase of the previous few years. The units sold had increased by between 4 and 5 per cent. This improvement in business was only arrived at by persistent canvassing, and it was both unlikely and undesirable that there would be any decrease in this work, and in the necessary cost thereof, as time went on. They had taken two important departures in the matter of the supply of current during the year. In the first place, acting under the London Electric Supply Act, 1908, they had entered into an agreement with the Central Electric Supply Co., which owned the great power station at St John's Wood, and which supplied the St.

James's and Pall Mall and Westminster Companies with a considerable portion of their current, for a supply in bulk to the northernmost of their sub-stations, and they would see an item in the accounts of £69 for current purchased. The supply was only commenced in the last month of the year, which would account for the item being so small. The arrangement was an excellent one for them, inasmuch as it provided a stand-by for an important part of their area, and it was supplied to them at a point which was the least economical for them to supply from their generating station near King's Road. The second new departure was that they had decided to order Diesel gas plant to generate a considerable portion of their current. This matter had been carefully considered for many months, and he did not think they would have any reason to regret their decision. They were in a difficult position at Chelsea as regarded generating in the most economical manner, because, being surrounded by flats and houses, they were obliged to use a high-class smokeless Welsh coal in order to avoid smoke troubles, which increased their coal costs. Further, they were unable, owing to want of condensing facilities, to install the most economical form of steam plant, viz. turbine plant. The existing reciprocating engines were of comparatively small dimensions and by no means economical, and it reflected great credit on the chief engineer and manager, Mr. Still, that with the machinery at his command he had been able to produce the comparatively economical results which had been obtained. They had every hope that when the whole of the Diesel plant, which they expected to order within the next year or two, was working regularly, the generation costs would show a great improvement. In the meantime, they had ordered a first instalment, and expected this would be in position ready for working by the end of the current year. They would naturally wish for some information as to the prospect for the present year. They saw no reason why the steady improvement of the lamps installed should not be maintained, and in the ordinary course of events, provided nothing abnormal happened, they ought to be able to increase the gross revenue. On the other hand, they had not yet come to the end of higher prices for coal, and it was probable from this cause that their costs would be increased by hundreds of pounds.

MR. H. R. BEETON seconded the motion, which was carried without discussion.

The retiring directors were re-elected on the motion of MAJOR W. F. WOODS.

**Prospectuses.**—*The New British Ever Ready Co., Ltd.*—The list is to close to-morrow. Saturday, in an issue of 85,000 7 per cent. cumulative preference shares of £1 each, participating up to 10 per cent. The company is to acquire as a going concern the business of the British Ever Ready Electrical Co. Ltd., of Holloway, on which the profits—after charging repairs and renewals of machinery and plant, and providing for depreciation, but before charging income-tax, interest and directors' remuneration—were £6,314, £8,259, £13,514, and £21,119 for the last four years. The turnover of the business for the first two months of 1913 shows an increase of more than 25 per cent. over the corresponding months of 1912. The purchase price is fixed at £206,137, out of which £10,308 is for plant, machinery, &c., £16,864 for stock-in-trade, £21,574 book debts, £10,000 for interest in subsidiary undertaking, and £144,535 for "goodwill, patents, trade marks, copyrights, &c." The vendor company is to be paid as to £115,000 (in respect of goodwill) in fully paid ordinary shares, as to £75,000 in cash and the remainder in cash or in discharge of vendors' liabilities. Mr. Samuel Stern, the managing director (who is vice-president of the American Ever Ready Co.) will act for three years, and Mr. Gustave Hitzelberger, the manager, for five years, "thus providing for continuity in the management of the business." The company employs approximately 360 persons. The business was founded in 1901, and consists in the manufacture of electrical specialities and motor-car accessories. The vendor company has acquired further patents for the manufacture of dry batteries for portable lamps, for which it claims almost "double the life of the ordinary dry battery."

So much importance appears to be attached in the prospectus to these further patents in connection with the manufacture of dry batteries, that one is entitled to ask for fuller information on this point. The patent numbers at least might have been given, or the nature of the invention, or inventions, disclosed. From the exclusion of the word "electrical" from the title, and from the statement that "an important feature of the vendor company's business is its increasing trade in accessories and fittings for motor-cars," we are led to wonder what proportion of the business is electrical. The uncertain and intangible character of the great bulk of the "assets," as indicated above, will not escape the would-be investor's notice. The amount set down for goodwill, patents, &c., we cannot help regarding as extravagant, notwithstanding that it is to be taken as to £115,000 in ordinary shares. The whole of the preference shares have been underwritten.

*The Melbourne Electric Supply Co., Ltd.*—The list is to close today in an issue of £100,000 5 per cent. consolidated debenture stock at 93½ per cent.

**Vickers Ltd.**—The directors report that for 1912 there is a net profit of £872,633, after the usual provision for depreciation. The directors are carrying £200,000 each to works extensions and reserve accounts, and recommend a final dividend of 5 per cent., making 10 per cent. for the year. The prospects of the current year are regarded with confidence. The directors have decided to take steps to increase the share capital by the issue of 740,000 ordinary shares at a premium of 10s. per £1 share.

### London United Tramways, Ltd.

THE directors report that the operation of the undertaking during the year ended December, 1912, resulted in gross receipts amounting to £332,016, and the working and general expenses, maintenance and repairs to £223,654, leaving, with the balance brought forward, a net revenue of £109,793. After payment of interest on debenture stock and loans for the year, and providing for income-tax, there remains a balance of £11,228, a decrease of £15,203 as compared with the preceding year. Of this amount the directors propose to place £15,000 to general reserve, £25,000 to reserve for renewals and contingencies, and to carry £1,228 forward. The gross receipts show a decrease of £11,971, and the working expenses an increase of £4,621, resulting in a decrease in net revenue of £16,592 as compared with the previous year. The number of passengers carried was 61,139,285, a decrease of 1,407,843.

The L.U. Tramways Act, 1912, received the Royal Assent on August 7th last. This Act authorised an agreement to be made with the Chiswick Urban District Council for the extension of the company's tenure of the tramways in that district until 1935. An agreement to that effect has since been entered into. This Act also relieves the company from the obligations to the Richmond Borough Council imposed by the previous Acts of the company relating to Richmond tramways. To assist the company's employees in deriving the maximum benefits under the National Insurance Act, 1911, the directors formulated a scheme for an approved society, available for all classes of employees, and their scheme duly received the approval of the Commissioners. The directors have also undertaken to add to the benefits provided by the Act.

During the past year the work of improving the permanent way on the Middlesex lines has been proceeded with. Over 3,250 rail joints have been cast welded, making a total of 14,511 joints so dealt with to date. The arbitrator's award in the matter of the purchase of the company's tramways in Hammersmith was issued in February of last year, and negotiations in regard thereto are proceeding with the L.C.C. Pending the final settlement of this question the County Council have agreed to make advances to the company for the reconstruction of portions of the Hammersmith tramways. The Uxbridge Road tramway within the borough has already been reconstructed and portions of the track in Goldhawk Road and King Street will shortly be relaid.

The scheme for the consolidation of the company's interests with those of the Metropolitan Electric Tramways, Ltd., and the Tramways (M.E.T.) Omnibus Co., Ltd., which was submitted to the shareholders in November last, was accepted by a very large majority, and consequently became binding. In accordance with the policy therein indicated, the three companies have been placed under one management. Mr. James Devonshire has been appointed managing director in place of Mr. Stanley, who, however, retains his seat on the board, and Mr. A. L. Barber has succeeded Mr. W. G. Verdon Smith as secretary.

Mr. C. J. Cater Scott resigned his directorship in April last, and the board have appointed Mr. W. M. Acworth in his place as chairman of the company. Mr. W. H. Brown has found it necessary for reasons of health to resign his seat on the board. Mr. F. V. Schuster has been appointed to fill the vacancy.

THE annual meeting was held on Wednesday at the Holborn Restaurant, W.C. Mr. W. M. Acworth presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 392), said that the shareholders must have been more or less prepared for the report by the statement contained in the circular which the directors sent out last November. They then said: "The net profits for the current year cannot, of course, be ascertained, but unfavourable weather conditions and increased omnibus competition during the last summer have adversely affected them." The accounts showed that the receipts were nearly £12,000 down and the expenses were £4,600 up; in other words, their net balance was £16,591 worse than it was that time last year. The loss in gross receipts was due mainly to bad weather and omnibus competition. On the expense side, coal and the purchase of energy had cost them nearly £3,000 more; wages and other benefits granted to the staff had cost them an additional expense of close on £4,000, the largest item of which was owing to the granting of holidays on full pay. He believed, however, that that was money very well spent. Pending the time when the benefits under the National Insurance Act came into operation, they increased their contributions to the provident fund. An approved society had now been formed for the employees of the company, and the directors had undertaken to supplement the benefits under the State scheme. They had lost Mr. Stanley as their managing director, but they retained the benefit of his wise counsel as a member of the board. Mr. Knapp, their general manager, in whom both the board and the staff had entire confidence, and Mr. Verdon Smith, the secretary, had also left them, and they were glad to know, not to their personal disadvantage. To fill the vacancies the board had appointed Mr. Devonshire as managing director, Mr. Barber as secretary, and Mr. Pott as engineer and general manager, all from the Metropolitan Electric Tramway Company. Those appointments secured considerable economy at once, and would he believed secure larger economies in the future. The upshot of the accounts was that after payment of the working expenses, income tax, and interest on debentures and bonds, they had a balance of only £11,228 as against £56,434 last year. They proposed to place £40,000 to reserves and to carry forward £1,228. They entered the current year with a better hope for the future because of the arrangements which had been made for the consolidation of that company with other kindred concerns, under which additional sources of revenue would ensure for the benefit of the vast majority of those who had hitherto been shareholders of the London United Co. He was glad to tell them that the holders of 93 per cent. of the preference stock and 97 per cent. of the ordinary stock had acted on the advice of the board, and had exchanged their holdings for stock in the London and Suburban

Traction Co. That company would have a preponderating voice in the affairs of the London United Co., and therefore their future meetings would be of a more or less formal character. By exchanging their holdings for stock of the London and Suburban Traction Co., those who had hitherto been shareholders of the London United would have the benefit of new sources of income, namely, from the Metropolitan Electric Tramways, the North Metropolitan Electric Power Supply Co., and last, but they hoped by no means least, from the Tramways M.E.T. Omnibus Co., which would before long be working a fleet of 350 omnibuses. Some 60 were at work at the present time, and their number was increasing steadily at the rate of about 10 per week, so that by the summer time there would be quite a considerable fleet in action. He would like to point out that the London United Tramways Co. must always work under a heavy handicap, by reason of their capital expenditure on street widenings. For every mile of tramway opened, their expenditure worked out at something like five times the amount which the L.C.C. debited to its tramway undertaking. The L.C.C. had the advantage of being able to charge such portion of the cost of street widenings as it might think fit to a street improvements fund, the interest on which was payable by the ratepayers of London, but unfortunately that course was not open to the company.

THE HON. SYDNEY HOLLAND seconded the motion, which was adopted after a short discussion.

### Slough and Datchet Electric Supply Co., Ltd.

THE directors' report for 1912 states that the sum expended on capital account amounted to £3,397, bringing the total up to £58,031. The expenditure chiefly represents the installation of a second Diesel engine and dynamo of a capacity of 135 kw. The following table shows the progress of the company, the equivalent of 1,809 additional lamps of 8 c.p. having been connected last year:—

Year.	Lamps and motors connected.	Units sold.	Profit.
1909	10,380	335,563	£3,288
1910	17,876	332,296	£3,165
1911	24,115	426,186	£3,421
1912	25,914	619,733	£4,835

A railway siding has been constructed into the company's works, on a satisfactory agreement with the Great Western Railway Co., which is a great convenience and should result in considerable saving. In order to cope with the extension of business it will be necessary to increase the capital of the company. The shareholders will be asked at the meeting on 19th inst. to sanction the increase in the capital from £50,000 to £75,000. An issue of 10,000 shares at par will shortly be made, and the shareholders will be given the opportunity of subscribing to the issue in proportion to their holding. The total net profit available for distribution is £7,112. Out of this the directors propose setting aside £1,250 to the depreciation fund, bringing it up to £6,000. The directors recommend a dividend of 6 per cent., less income-tax, and that £637 be carried forward.

### Companies Struck Off the Register.—The following have been struck off the Register and are accordingly dissolved:—

Aerne Conveyor and Machine Co.  
Dynamo Electric Car Transmission Syndicate.  
Electrical Fittings Co., Ltd.  
Electrocarb Development Co., Ltd.  
Foxcroft & Duncan Engineering Co.  
London Electrocarb Co.  
Nitrogen Power Syndicate.  
Norfolk Electrical Co.  
Orient Electric Power Syndicate.

**Municipal and General Securities Co., Ltd.**—The directors' report shows that for 1912 the amount at the credit of appropriation account is £18,852, made up as follows:—Balance of profit from 1911, £1,621; net profit for 1912, £17,231. The directors recommend a dividend at the rate of 10 per cent. per annum, less income-tax (£5,000), adding to reserve £10,000 (making it £30,000), carrying forward £3,852. The investments are shown in the balance sheet at £73,359. The present market price of these securities considerably exceeds this figure. The annual meeting was held on February 27th. Messrs. J. G. White and W. C. Burton were re-elected as directors.

**Alley & MacLellan, Ltd.**—The directors report that, although the company's operations have been hampered by the various strikes, which increased expenses and made the getting of material difficult, and also by the increased cost of supplies, labour and taxes, they are able to show a satisfactory profit, a substantial portion of which they have transferred to the reserve fund. The profit from trading for the year to December 31st, after meeting all necessary charges, is £18,263. The directors have applied £4,800 for depreciation of property, plant, machinery, &c., have transferred £4,000 to reserve, and recommend a dividend on the ordinary shares at the rate of 6 per cent. per annum, leaving £1,729 to carry forward.

**Commonwealth Edison Co.**—The report states (says the *Financier*) that the accounts for 1912 showed a total income of \$5,582,229, and after providing for bond interest and placing \$514,000 to depreciation reserve, there remained an available sum of \$3,438,229, from which dividends absorbed \$2,516,783, leaving a balance of \$921,445, increasing the surplus brought forward to \$5,252,146.

### Brompton and Kensington Electricity Supply Co., Ltd.

THE directors' report for the year ended December, 1912, shows a revenue account credit balance of £33,178, which, with the balance of £7,858 brought forward, and £1,000 balance of interest received and accrued, makes a total of £42,036. After deducting £1,573 for interim dividend on the 7 per cent. cumulative preference shares, and £7,002 interim dividend at the rate of 9 per cent. per annum for the half-year to June 30th on the ordinary shares, the directors recommend that the sum remaining, viz., £33,180, be dealt with as follows:—To credit of depreciation account (maintaining this fund at £80,000), £10,200; written off cost of investments, £244; dividend on the preference shares for December half-year, £1,520; dividend on the ordinary shares for half-year ended December at the rate of 11 per cent. per annum, making 10 per cent. for the year (free of income-tax), £8,606; income-tax on dividends, £910; credit of reserve fund account (raising it to £33,000), £3,000; reserve against investment in the Brompton and Kensington Accessories Co., Ltd., £1,000; directors' additional remuneration, £973, leaving to be carried forward £7,026. The following table shows the progress of the business:—

Year.	S.C.P. lamps con- nected.	Inc. in S.C.P. lamps, nec- ted.	Cus- tomers con- nected.	Gross rec'pts.	Expendi- ture.	Net rec'pts.	Av. price per unit.	Div. on ord. shares.
1909 ..	235,802	10,976	4,883	£50,791	£23,710	£27,081	4.18	10 %
1910 ..	246,974	11,172	5,163	60,696	23,917	25,680	4.26	10 %
1911 ..	259,551	12,689	5,453	64,739	24,038	30,692	4.39	10 %
1912 ..	272,701	13,147	6,798	56,318	23,170	33,178	4.18	10 %

The meeting was held yesterday.

### Gateshead and District Tramways Co.

THE directors' report for the year ended December 31st, 1912, shows a gross revenue of £56,964. After deducting all expenses chargeable to revenue, including repairs and maintenance, interest on mortgages, and a provision of £2,730 for renewals, there remains a balance on the year's working of £22,783, plus £1,878 brought forward, making a total of £24,661. Of this there has been placed £4,500 to reserve, and to the sinking fund for redemption of mortgages £2,126, leaving a balance of £18,035. The directors propose to pay the dividend on the 6 per cent. preference shares, requiring £757, and that on the 5 per cent. preference shares, absorbing £6,000, also a dividend on the ordinary shares at the rate of 6 per cent. per annum, in respect of which an interim dividend for the half-year ended June 30th, 1912, at the rate of 5 per cent. per annum has already been paid, requiring £8,100, and a bonus of 1 per cent. on the ordinary shares £1,350, leaving to be carried forward £1,829. Interest derived from investments has been added to the renewals fund and to reserve. Only £64 was added to tramway capital account. £1,474 was expended on account of the motor-omnibus undertaking. The general trade of the district was satisfactory during 1912, and notwithstanding the coal strike the traffic receipts show an increase of £527. Nine cars constructed on the "Pay-as-you-enter" system are now operating on the Bensham and Saltwell routes. In view of special influences affecting traffics on these routes, it has not been possible so far to ascertain accurately the financial effect of adopting the system. The directors, however, are satisfied that these cars have many advantages, and they have, therefore, decided to construct two new cars on the P.A.Y.E. principle, which will be placed in service on the Low Fell route, where further cars are needed.

In response to a request of the Chester-Le-Street Urban District Council, the directors have, after very careful investigation, arranged to operate a service of motor-omnibuses between the terminus of the tramway at Low Fell and Chester-Le-Street. A garage is in course of erection at Chester-Le-Street, and the omnibuses are now being delivered. It is intended to commence the Chester-Le-Street service early in April. The institution of experimental services on other routes is receiving the consideration of the directors.

The annual meeting was to be held yesterday.

### County of London Electric Supply Co., Ltd.

THE annual meeting was held on Monday at Winchester House, E.C., Mr. J. B. Braithwaite presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 392), first referred to the capital account. The Bournemouth company had paid an increased dividend of 4 per cent., and had increased its allocation to reserve. At Coatbridge and Airdrie there had been quite a satisfactory increase, the units sold during 1912 amounting to 4,445,035, as against 3,538,320, or an increase of nearly a million. Coming to the business of their London stations, at the last meeting he congratulated the shareholders on the fact that the company had had a record year in almost every respect. This year, he was glad to say, had surpassed that record in every item. They had had a record number of applications during the year, amounting to

slightly over 4,000 KW., and they had a record in the number of new customers. In 1911 the new customers were 1,676; last year they numbered 1,787, making the total number of customers in their London areas 20,226, and they sold an extra 2,000,000 units approximately. That result had been obtained in spite of the fact that in 1911 they were supplying a considerable amount of current during the construction of some sewers in the South of London, which were completed in that year. Coming to the revenue account, there was an increase in the gross revenue of about £19,000, which amounted to £231,100, against £212,039, and of that, after paying various increased charges, they carried £134,082 to the net revenue, as compared with £126,228 in 1911. In other words, they retained £7,854 of the increased revenue as net. That would have been very much larger had it not been for the expenses entailed by the coal strike and the transport workers' strike. The effect of those two labour disturbances was to cost them £7,189 additional expense. He was glad to say that they came out of those labour troubles without having to inconvenience any of their customers in the slightest degree. During the whole period they did not have to cut off a single consumer, but maintained a regular and good supply the whole time, and that fact, he thought, was one of the reasons why they had had so many additional applications for power during the past year. Owing to the strikes their coal had cost them more than before, and he was afraid they would never get back to the old prices. However, by the adoption of the very latest machinery and appliances they had neutralised very appreciably the higher cost of coal. Last year he told them that they had completed their interconnection between City Road and the Wandsworth power house, and that had been of considerable use in making for economical working. They were now laying another interconnection which would save them several miles of routes. Their district at Purley, which they used to serve from a supply which they took from the Croydon Corporation had now developed sufficiently to warrant them supplying it themselves, and they were laying mains which would enable them to give that district a supply from Wandsworth. Dealing with the disposal of the profits, the chairman said they had had to pay £6,740 in dividends on the new shares. They had increased the appropriation to depreciation by £2,500, and they had added £2,081 to the carry forward. As showing the steady increase in the amount they had put aside year by year for depreciation, he might mention that it had risen from £16,000 to £25,000 in 1911, and this year it was £27,500, and but for the coal strike they would undoubtedly have increased it to £30,000. On the other side, they had written off all their plant which was of an obsolete character and which had been removed from their power house. As to the future, so far as this year had gone the business was quite normal. The units sold showed an increase of 6 per cent. over the corresponding period last year, and if they were free from labour troubles, he hoped that next year they would have a very substantial addition to their net revenue to report.

MR. A. H. SANDERSON seconded the motion.

MR. T. LIGHTON, while congratulating the board upon the results of the year, remarked that he would like to see the item of preliminary expenses materially reduced.

MR. PARKER asked whether, in view of the decision in the case of the National Telephone Co., it would not be possible for the board to call a conference of the electric lighting companies to see whether it was not possible to adopt some uniform method of treating such items as preliminary expenses, the cost of obtaining provisional orders, and the depreciation and renewal account. At present those matters were treated differently by the different companies, whereas, if some common form could be agreed upon, it would probably be of considerable benefit to the shareholders when the time came for the Companies to be acquired.

MR. EVERSHED, while complimenting Mr. Sparks, the chief engineer, upon the technical success of the company, criticised the board for not putting aside a sufficiently large sum to reserve, according to his opinion.

THE CHAIRMAN, in reply, said that with regard to the depreciation fund, it must not be forgotten that four years ago when that fund stood at £60,000 they had in their City Road station a large amount of old-fashioned plant. Now, although that fund had only been increased by £3,000, the whole of that plant had disappeared from the station, having been scrapped. With regard to the preliminary expenses, the matter had already engaged the attention of the board, and steps were being taken to have a careful consideration of the whole question by as many of the electric supply companies as possible. Had the Telephone Co. instead of writing off their preliminary expenses retained them in their books, they would have recovered the money from the Government as money legitimately expended in raising the capital and building up the business. If they were advised that that was the proper policy to pursue, they would leave that item in the balance sheet, because naturally they wanted to get as much as they could for the shareholders when they were purchased by the County Council in 1931.

The report was adopted.

**Hadfield's Steel Foundry Co., Ltd.**—The directors, in their report for 1912, propose to add £20,000 to the reserve and renewal account and to carry forward £49,556. They recommend that in addition to the interim dividend of 1s. per share paid in August last on the ordinary shares, a further dividend be paid on the ordinary shares of 2s. per share, together with a bonus of 1s. per share, all free of income-tax.

The annual meeting is called for March 17th. At a special meeting which is to follow, it is intended to pass a resolution changing the name to "Hadfields, Ltd."

### County of Durham Electrical Power Distribution Co., Ltd.

THE directors report for 1912, that the total connections to the company's system at the end of the year (including the connections of its associated Parliamentary company, the County of Durham Electric Power Supply Co.) amounted to 51,525 n.r., an increase of 11,000 n.r. The profit for the year is £33,736, plus £162 brought forward, making £33,899, against which has been charged interest on loans and debenture stock, £13,335, leaving £20,563, out of which the directors recommend a dividend of 5 per cent. for the year on the preference shares, £12,500, transferring to depreciation account £6,000, carrying forward £1,863. The capital expenditure on mains and works during the year has been £47,648, of which £17,193 represents this company's outlay, and £30,455, the outlay by its associated company, the County of Durham Electric Power Supply Co. During the year, the latter company transferred by sale to the Newcastle-upon-Tyne Electric Supply Co., Ltd., certain mains, &c., to the value of £15,372, the net addition, therefore, to the capital expenditure of the two companies together amounting to £2,277. The national coal strike adversely affected the progress of the company, which accounts for the smallness in the increase of the profit.

The meeting is called for March 19th.

### Metropolitan Electric Supply Co., Ltd.

THE directors' report, for the year 1912, states that the capital expenditure has now reached a total of £2,103,996, an increase during the year of £51,298, together with £62,866, representing the Acton transfer. A further amount of £56,926 3½ per cent. mortgage debenture stock was subscribed for and allotted during the year. The gross revenue amounted to £202,183, as compared with £182,622 in 1911, an increase of £19,561. The working expenses amounted to £99,086, as compared with £88,005, an increase of £11,081. The balance at the credit of the revenue account, before providing for depreciation, is £103,097. The directors have set aside £20,000 as an addition to the depreciation and reserve fund, which now amounts to £297,355, carrying to the credit of the net revenue account £83,097. This sum, with the balance brought forward from last account, interest and dividends on investments, and other receipts, makes a total of £94,314. After deducting interest on debenture stocks and loans, dividend on preference shares and other charges, there remains a balance of £46,762. An interim dividend of 2s. per share on the ordinary share capital, amounting to £20,000, was paid on August 13th, and the directors recommend that a further dividend of 2s. 3d. per share (being at the rate of 4½ per cent. per annum) on such shares be now paid, making a total distribution for the year of 4s. 3d. per share, or 4½ per cent. This will absorb a further £22,500, and leave £4,262 to be carried forward. The stocks of coal held in reserve by the company enabled them satisfactorily to maintain the supply to their customers during the coal strike, but the increase in the price of coal due to the strike, and since maintained, has materially affected the cost of production. During the year new connections representing the equivalent of 71,267 8-c.p. (30-watt) lamps, equal to 2,138 kW., were added to the company's system, making a total connection at the end of the year of 1,028,304 lamps. The company's engineer reports that the stations, machinery, and plant, have been maintained in a satisfactory condition.

The meeting is called for March 18th.

### Harrow Electric Light and Power Co., Ltd.

IN their report for 1912, the directors state that during the past year 129 new consumers, representing 79 kW. of additional demand, have been connected to the mains. The number of consumers at the end of the year was 1,510, and their aggregate requirements amounted to 1,292 kW. The output for the year was 162,737 units. In order to foster the use of electricity for heating and cooking purposes, the directors have reduced the rate of charge for such purposes to 1½d. per unit during the winter and 1d. per unit during the summer. They have also introduced an alternative "assessment" tariff for private houses with a fixed charge of 8d. per £ per quarter on the rateable value, plus 1½d. per unit supplied during the winter, and 1d. per unit supplied during the summer; this scale covering the supply of electricity for all domestic purposes, including lighting, heating and cooking. The new rates came into force on January 1st, 1913. The remainder of the 4½ per cent. debentures, amounting to £1,400, have been issued during the year. The balance to the credit of the net revenue account, after deducting debenture interest and the interim dividend on the preference shares, is £2,221, which the directors recommend should be dealt with as under: Final dividend on the preference shares, £375; dividend on the ordinary shares at the rate of 5 per cent. per annum, £1,667; balance to be carried forward, £179. It is proposed to issue the dividend warrants on 28th inst. The new offices and showrooms in College Road are now nearing completion, and will be occupied by the company at the end of March next.

The annual meeting was held at Harrow on February 20th. MR. J. N. STUART, who presided, said that at first sight it might seem that the progress of the company had met with a slight check, inasmuch as the increase in the number of units of electri-

city last year was much smaller than the increase for the previous year, but the fact was that the introduction of metallic-flament lamps instead of carbon lamps was so economical for customers, that all who used them were enjoying a reduction in their bills. They could look on this fact with equanimity and even pleasure, for it meant that electric light was becoming cheaper and as this was better recognised more consumers would be added. This was really evident this year, for the number of consumers had increased by 129—a larger number than had joined in any year since the company was formed. Harrow was somewhat behind other towns in taking to metallic filament lamps, but the use of them was now growing very rapidly. The company having now secured as customers the occupiers of nearly all the large houses in the district, the board had been considering how better to attract those of the smaller houses, who, under the existing tariff, used their electric light very sparingly. They had, therefore, introduced from the commencement of this year, a tariff of a fixed charge based on the assessed value of the premises, with an extremely low rate per unit of electricity consumed, viz., 1d. to 1½d.; this would enable customers to use their light much more freely, without feeling that they were adding materially to their bills, and would also give them the advantage of heating and cooking at a low price. Harrow had not yet woken up to the advantage of cooking by electricity, though other towns had done so to a very great extent, but at their new show-rooms, which would be opened shortly in College Road, they would be able to demonstrate the great advantage and saving of electrical cooking, as well as the best methods of lighting and heating. The depreciation account now stood at the high figure of £25,000, or more than 25 per cent. on the capital expenditure, a position attained by very few electric light concerns in England. The company had continued to be ably served by the engineer and manager, Mr. Horsley; the secretary, Mr. Bishop; the works superintendent, Mr. Adams; and all the members of the staff.

MR. G. SPENCER HAWES, in seconding, said that among technical people it was thoroughly realised that all electrical undertakings, especially those mainly dependent on lighting business, had been passing through a critical period during the last few years, not because there had been any lack of new consumers, but because of the inventive genius of electrical scientists, which had resulted in the production of a lamp which had proved to be of enormous advantage to electrical users. To show the effect on the Harrow undertaking of the use of metal lamps, he had only to state that upon a reasonable computation based upon output records, users of electric light in Harrow had had their bills decreased to the extent of something like £2,250, as compared with the position which would have existed under the old carbon lamp condition of things. This was confirmed in another direction. Some years ago their average revenue per consumer was £7 16s.; last year the average was £6 5s. That showed a decline in the period of £1 10s. per consumer. On the basis of their 1,500 consumers, this showed a direct decline of revenue of £2,250. The whole of that advantage had been reaped by their consumers. So far the company had reaped very little, excepting this—they had benefited by the improved conditions with which consumers viewed electric light. That was certainly an advantage to the company, because it brought to them business which perhaps they never would have captured in the early days with the old style of lamps.

The report was adopted, and the dividends were declared.

### Scarborough Electric Supply Co., Ltd.

THE annual meeting was held on March 5th, Mr. J. G. Alderson-Smith presiding.

THE CHAIRMAN, in moving the adoption of the report, said that they were going ahead. There was an increase in the lamps of 4,000 odd, an increase in units supplied of over 9 per cent., and the number of customers had increased by 16 per cent. They had sold an increase of electrical energy to the amount of £773, and the credit side was £1,000 to the good compared with last year. On the other side coal cost £358 more. They were able to keep running throughout the coal strike. The other items on the debit account were small. The "B" account—distribution—was £102 more, but they had spent a larger amount in repairs.

MR. A. A. CAMPBELL SWINTON, in seconding, said that beyond putting £1,000 to depreciation, they kept all their plant up to date out of revenue. £1,000 increase in gross revenue was something like a 10 per cent. increase. If that rate could be maintained, they would soon revert to the position of comparative prosperity that they occupied a few years ago.

A resolution was adopted declaring a dividend of 3 per cent.

### British L.M. Eriksen Manufacturing Co., Ltd.—The

directors report that for the year ending December 31st, 1912, the net profit amounts to £18,563. They recommend that after payment of 6 per cent. to the preference shareholders, the balance of £13,941 be appropriated by paying a dividend of 8 per cent. (free of income-tax) to the ordinary shareholders, requiring £8,001, and by carrying forward £5,940.

The annual meeting is called for March 19th, in London.

### Western Telegraph Co., Ltd.—The

directors have declared the second quarterly interim dividend of 3s. per share, free of income-tax, for the year ending June 30th, 1913, being at the rate of 6 per cent. per annum. The transfer books are closed until the 19th inst.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, March 12th.

## STOCKS AND SHARES.

Tuesday Evening.

THE Stock Exchange is going through another very anxious time. The focus of the financial horizon has shifted from war to money. Although trade is so good, and there is probably more money in the country at the present time than there has ever been before, for Stock Exchange and banking purposes the amount of floating capital is comparatively small. Money rates rule high. There is a great demand for accommodation. New issues have absorbed

substantial amounts, and with the unrest which is visible on all sides, people are retaining their money in banks and similar stockpiles rather than entrusting it to the ordinary channels of investment.

Inasmuch as the capitalist, large or small, can obtain five to six per cent. by lending money in the Stock Exchange on quite good security, it is not surprising that he should prefer to do this rather than invest it in securities, the prices of which appear to trend in one direction only. So far as electrical issues are concerned, the main feature this week is a shrinkage in the Latin-Canadian group, the news from Mexico—taken in conjunction with the monetary stringency—not only causing a feeling of depression, but also leading to realisations of actual stock.

The Home Railway market failed to derive any benefit from the settlement of the dispute between the Midland and its men. It was thought at first that the bulls might seize the occasion to make a demonstration in force; but circumstances proved too strong for them, and prices moved in exactly contrary direction from that in which they were expected to advance. The electrical stocks have given way, like most of the rest. Central London Ordinary and Deferred fell a point each, notwithstanding the favour with which they are being viewed in certain quarters. Metropolitan and Districts both fell back, and there was a shake out in Underground Electric descriptions. The £10 shares receded 5s., the 1s. shares lost 3/2, and the Income bonds at 92½ shed a point that they gained the week before. East London Ordinary stock, which had been run up to 10½, reacted a little, and the company's Preference stocks also went back slightly. The Traction market as a whole is quiet. A fall of 1 is registered in London United Tramways 4 per cent. Debenture stock. British Electric Traction 6 per cent. Preference at 11 is ½ lower.

The English Electricity Supply group remains a little on the dull side, although the falls are insignificant. The largest are those of 5s., in City of London 6 per cent. Preference—which has brought the shares down to a 4½ per cent. level of return to a buyer—and in St. James's Ordinary. City Ordinary shares touched 18, but reacted to their last week's figure. County Ordinary, in spite of the excellent report—commented upon in our last number—went back ½; but the fraction was picked up by the company's Preference shares, which have risen to 12, while the Second Debenture stock is a point better. Chelsea's are ½ down. The market, as a whole, is extremely quiet.

Of the manufacturing varieties, the feature is the strength of British Thomson-Houston 4½ per cent. Debenture stock. The price has risen to 97 upon a small demand, showing a gain of 1½. Otherwise this section is mostly easier in those few places where changes have occurred. Dick, Kerrs, for example, are down ½, both Ordinary and Preference drooping. Falls of ½ are shown by India-Rubber Preference and Callender's Cable Ordinary; while Eastern-Kellners lost a small amount. The rises in Edison & Swan shares have been maintained; the fully-paid are ½ higher on the week.

The Latin-Canadian section, as already mentioned, shows pronounced dulness, this being more particularly noticeable in the stocks and shares of the Mexican Companies. Mexican Light and Power and Mexican Electric Light Bonds have fallen from 1 to 2 points. Mexican Trams are 2 down, and the company's bonds are lower in each class. Rios eased off a little, and Sao Paulo bonds are ½ down. Montreals and Shawinigan Water show falls of 2, and Cordoba Light Ordinary are somewhat easier.

British Columbia Electric Railway has made its new issue this week, and the Deferred and Preferred Ordinary stocks were quoted ex rights on Monday, the official valuations being 3s. 3d. and 1s. 3d. premium respectively. The issue prices were 21s. for the Preference, 22s. for the Preferred, and 21s. for the Deferred, these being the figures at which they are offered to the present stockholders. Brazilian Traction shares have been sold extensively by speculators, and the gain of 3 last week has been lost. The Argic-Argentine group did not escape the infection of depression, which spread further to such shares as Para Electric Ordinary and United Electric Trams of Monte-Video.

Interest is reviving to a languid extent in Marconi shares, to which the bears have been paying some little attention this week. The price went back to 4½, and notwithstanding the sales which had been made by the short brigade, the contango rate was the exceptionally heavy one of 9 per cent. The Preference show ½ fall, and the various subsidiaries' shares are rather lower. National Telephone Deferred stock keeps very steady about 94. Such, at least, is the price to-night, though when these notes appear the price will be more like 19, because 75 per cent. of the recent award money is to be distributed on the Thursday in this week. American Telephone Capital stock and Collateral Trust bonds are easier, but Commercial Cable Debenture rose ½. Indo-European continue to advance. In the Eastern group, "China" shares lost their small improvement of last week. West India and Panama Telegraphs shared the same fate, the price going back to 34.

New issues are very much out of favour just now, but those who are on the look out for cheap stock have probably noticed the attractions of the 5 per cent. Consolidated Debenture stock offered this week by the Melbourne Electric Supply Company, Limited, at 93½ per cent. The security is covered many times over, and so is the interest payment. At the price of issue, the return to the investor is about 5½ per cent. on the money.

The Rubber market shows a steadier tendency, the price of the raw commodity keeping very close to 4s. per lb. There is, however, very little doing in the share market.

## TRADE STATISTICS OF SPAIN.

THE figures given below show the imports of electrical and similar goods into Spain during the year 1911, according to the official statistics recently issued. It will be observed that there is a predominance of German trade in practically every branch. The figures for 1910 are given for purposes of comparison, and notes of increases and decreases have been added:—

NOTE.—25 pesetas = £1.

## THE PROPOSED TROLLHATTAN-COPENHAGEN TRANSMISSION.

IN connection with the above proposal, to which reference was made in our issue of December 20th last, some interesting data arising from the investigations carried out by Swedish Government experts were recently published in the *Electrical World*.

The city and suburbs of Copenhagen have a population of 581,000 and are at present served by three central steam stations, and a number of isolated plants. Extensions or improvements of these stations were not considered for the purpose of furnishing the whole supply, but in case energy should be purchased from Trollhättan, it is proposed to retain these stations with their storage-battery equipments in case of interruptions on the high-voltage system, and also for carrying the peak load. The Trollhättan plant is designed for 100,000 H.P., generated by ten 10,000-H.P. turbo-generators, of which eight are now installed. The remaining two units could be used for the generation of energy for sale to Copenhagen. During 1911, when the investigation was made, the demand in Copenhagen was about 24,000 kw., and the yearly energy consumption 65,000,000 kw.-hours. The load factor was about 31 per cent. The demand for 1913 is estimated to be about 35,000 kw., and the yearly energy consumption about 95,000,000 kw.-hours.

In planning a transmission system from Trollhättan to Copenhagen, a distance of 204 miles, a matter of primary importance was the amount of energy which could be transmitted with greatest advantage. On account of the length of the transmission line, and

the consequent large expenditure involved, a comparatively large load factor would be essential in order to make the project commercially successful. To supply the whole demand at a load-factor of, say, 30 per cent. would not be feasible, as the price in that case would be considerably higher than that of energy generated by a steam plant in Copenhagen. Further investigations proved that one-third of the maximum demand, or about 11,600 kW., would be required during 5,200 hours. As this corresponds to 20,000 H.P. at Trollhättan, which is equal to the output of the two available generating units, the calculations were made on that basis.

The route of the proposed transmission line is along the west coast of Sweden from Gothenburg to Helsingborg, where it crosses the Strait of Öresund to Helsingör, and thence along the coast of Denmark to Copenhagen. Both alternating-current and direct-current systems were considered for generation and transmission. At present 25-cycle alternating current is generated at Trollhättan and 50-cycle alternating current at Copenhagen.

Three-phase generating equipment and transmission lines involve the installation of turbines, three-phase generators, transformers, transmission line, submarine cables, and transformer stations in Helsingborg, Helsingör and Copenhagen, and frequency changers in Copenhagen. At Helsingborg it is proposed to step down the pressure to 20,000 volts, and to carry the energy by four three-phase submarine cables across the Strait of Öresund to Helsingör, a distance of 3.4 miles. From Helsingör to Copenhagen either 20,000 volts or 100,000 volts can be used, the latter being the more economical.

If the generators have an efficiency of 96 per cent., all the transformers 98.5 per cent. and the frequency changers at Copenhagen 90 per cent., there would be available for distribution at 10,000 volts 11,600 kW. at 25 cycles, or 10,440 kW. at a frequency of 50 cycles.

A plan for the generation of 25-cycle alternating current at Trollhättan and its conversion to direct current for transmission was studied. Either impregnated wooden poles or iron poles might be employed and an earth return. Estimates were made for this as well as for ordinary metallic-return systems. For the direct-current generators and motors a constant current of 150 amperes was proposed, which, with a total of 14,720 kW. at the turbines and a maximum E.M.F. of 91,250 volts, could be obtained with 20 4,560-volt generators. The generators would be arranged in four groups, each having five generators in series, and each group would be connected to a 5,000-H.P. turbine.

The efficiency of the direct-current generators and motors was assumed to be 93 per cent., that of alternating-current generators 96 per cent. and that of alternating-current motors 94 per cent. The advantages claimed for the direct-current system are:—Simplicity in operation of generating equipment and building of transmission lines, the pressure on the latter corresponding to only 64,000 volts alternating; elimination of trouble from voltage variations due to varying load (the current is automatically kept constant at the power stations); high-pressure underground and submarine cables can be used wherever necessary; simple protection against lightning and other disturbances; a certain amount of reserve in the earth-return system by using two wires, of which one will be able to carry the load temporarily in case of emergency. The only apparent disadvantage of the direct-current system, it was pointed out, is that relatively little is known about the operation of the system.

and more expensive sets with the direct-current scheme. Two three-phase sets were sufficient for the alternating-current plan, while the Thury system required 20 generators in four groups, each coupled to a 5,000-H.P. turbine. In the line structure the cables were completely turned, the cost of the direct-current line being only about half that of the alternating-current line, not even taking into account the difference in the cost of the cables and the presence of at least one extra transformer station in the alternating-current project. The cables for the three-phase transmission cost  $2\frac{1}{2}$  times as much as did the direct-current cables. The grand total for the alternating-current project reached \$1,593,000, as against \$1,202,000 for the direct-current project advised. When everything was footed up for the rival projects the estimated annual expense for the direct-current transmission was \$6.75 per kW., as against \$12.43 per kW. for the three-phase project, to say nothing of the fact that the multiple transformations necessary with the latter would cause it to operate at a lower efficiency, thus yielding a materially smaller amount of power for the final distribution. All this is striking evidence of the great usefulness of direct-current transmission under conditions which are favourable to its economical use.

## NEW WIRELESS DETECTORS.

THE application of the Fleming valve as a wireless detector is well known; electrons are readily emitted from the cathode, and convey the negative charge thence through the vacuum, but the high-frequency current in the detector circuit cannot flow appreciably in the opposite direction. In other words, the "valve" has unilateral conductivity, whence its name. Such detectors are very sensitive, but the vacuum limits the durability of the apparatus, and with a view to overcoming this objection, Leithäuser\* has recently applied the unilateral conductivity of flames to the design of a sensitive detector.

The experimental apparatus employed comprised a small induction coil connected to a 5-mm. gap between two 1.5-m. wires with end capacity-plates. At a distance of from 33 to 65 ft. a similar receiving circuit was connected to the electrodes of a flame detector. A Bec-Meker burner was used to provide a steady flame of great intensity, with a small bright blue inner cone. The electrodes used were a 1-mm. copper wire and a ring of sheet platinum covered with a potassium salt (the object of which was simply to increase the conductivity of the flame). These electrodes were connected through a high-resistance telephone to the terminals of a resistance of some few ohms, across which a suitable P.D. could be maintained and varied by a local battery in series with an adjustable resistance. Later, a high-sensitivity moving coil galvanometer was also connected in the detector circuit and, at times, the telephone was replaced by an Edelmann vibration galvanometer. Experiments showed that the efficacy of the detector depended largely on the dimensions and relative positions of the electrodes, and on the size of the flame and its temperature round

SUMMARY OF COST ESTIMATES FOR VARIOUS SYSTEMS OF TRANSMISSION FROM TROLLHATTAN TO COPENHAGEN.

In its comments on the project, our contemporary points out that to cross the Strait, 3.4 miles wide, with cables carrying alternating current at 100,000 volts, was adjudged an utterly impracticable proposition. It therefore became necessary to plan for a reducing station at Helsingborg, bringing the pressure down to 20,000 volts for transmission under the strait, beyond which it could either continue the relatively short distance to Copenhagen at 20,000 volts, or the electromotive force could be stepped up again if desirable. On the other hand, submarine cable can actually be obtained for 90,000 volts direct current, according to the report of the Swedish engineers, and consequently the energy could be carried through to Copenhagen without any reduction in voltage on account of the submarine work. This matter alone put the alternating-current project at a serious disadvantage, rendered even more formidable by the facility with which an earthed line can be used in operating at constant current.

In the generating station the three-phase equipment had the advantage in first cost, as might have been expected, to the extent of nearly 30 per cent., owing to the necessity of using more units

about the electrodes. A current-voltage curve was prepared when working under the most favourable adjustments, and the steep rise and sharp change of this current proved the rectifying action of the detector to be very pronounced. That phase, corresponding to which the platinum electrode was positive, was almost entirely suppressed, but the other phase was carried with high conductivity. The delicacy of the detector was at least equal to that of a sensitive electrolytic valve, and was usually greater.

The Telefunken Gesell. für Drahtlose Telegraphie now employs Schlämilch electrolytic detectors in a form which overcomes the chief objections hitherto urged against this type, viz.:—(1) The deterioration of the platinum electrodes after considerable use, which deterioration necessitates the replacement of the detector as a whole, and, generally, the return of the defective apparatus to the makers for repair; (2) leakage of acid through crevices when the detector is inverted, as often occurs in transit.

\* See also "Phys. Zeitschr.," No. 18, 1912, and "Zeitschr. für Schwachstromtechnik," No. 2, 1913.

The new detector illustrated in the accompanying sketches comprises three Schlömilch cells radiating from the cross tube, as shown. The whole glass system is hermetically sealed, and connections are made to the terminal end caps by fused-in platinum wires; sufficient acid is contained to fill one, and one only, of the cells. The latter are inclined at 120° to each other, so that when one is vertical (as in use), the other two are completely drained of

NEW SCHLÖMILCH ELECTROLYTIC DETECTOR.

acid. If one cell fails or becomes insensitive, it is only necessary to rotate the system through 120°, to substitute another cell in circuit without appreciable interruption of working. In order that the cells may be distinguished (for experimental and maintenance record purposes) Roman numerals I, II and III are marked on the end caps.

Two springy strips carry current to the end caps on the cross tube and also act as pedestals to the latter, the end caps being provided with suitable bearing bosses. The whole is mounted on a vulcanite block, which has the same shape and dimensions as the old type of Schlömilch detector, and which can therefore be fitted at once to receiving sets designed for the latter.

In no respect is the manipulation of the new detector more complicated than that of the earlier type. In both cases, it is, of course, imperative that the polarity of the connections be correct. The electrode fused in the glass must be connected to the positive and the free electrode to the negative terminal of the local battery. So far as the detector itself is concerned, correct connection is ensured by a different formation of the cap bosses, so that the tube cannot accidentally be mounted incorrectly in the pedestal prongs.

The battery circuit connections, the P.D. required by the cell, and the electrical characteristics of the latter, are identical with the attributes and conditions of use of the earlier type.

## PAYMENT FOR CONTRACT WORK.

[BY OUR LEGAL CONTRIBUTOR.]

THE question sometimes arises in relation to works—when is payment due? If there is nothing amounting to a contract to complete the works before remuneration shall be due—as in the case of a shipwright undertaking, in the way that shipwrights ordinarily do, to put a vessel in repair—the contractor may, after he has proceeded with a portion of the work, refuse to continue it, unless he is paid for the work he has performed; and may recover to that extent (*Roberts v. Havelock*, 1832 3 B and Ald. 404). In general, if the contract is not entire (*i.e.*, to do the whole work for a lump sum), and can be divided, the Court will give relief to the contractor who has done part of the works. In contracts for large works it would be difficult, if not impossible, for the contractor to carry through the work unaided from the start. Provision is, therefore, made for payment by instalments, either (i) at certain stages of the work; (ii) by payments of certain fixed sums as they become due; or (iii) by payment of a percentage at certain periods. Thus, to illustrate the latter case, it might be arranged that at the end of the first three months the contractor should be entitled to 75 per cent. of the value of work actually done.

While a contractor is bound to conform to the specification, he cannot rely on that document in order to excuse himself from doing something which is essential to the completed work. For instance, in *Williams v. Fitzmaurice*, 1858, 3 H. & N. 844, the plaintiff agreed to build a house for the defendant, who prepared a specification which contained

particulars of the different portions of the work. Under the head "Carpenter and Joiner," there was specified the scantling of the joists of the different floors, the rafters ridge, and wall pieces, but no mention was made of the flooring. The specification stated that "the whole of the materials mentioned or otherwise in the foregoing particulars, necessary for the completion of the work, must be provided by the contractor. The specification also contained a memorandum to the effect that "The house is to be completed and fit for the defendant's occupation by the 1st August, 1858." It was held that the plaintiff was liable to put in the flooring.

A contract for works may consist of an entire job for which the contractor is to be paid a lump sum. In that case he cannot sue or recover the lump sum until the work is completed. Where, however, the work is severable into parts which are to be paid for separately, completion of one part may enable the contractor to sue for the amount then due. Another form of contract provides for the execution of a piece of work, no mention of a price being made. It will be convenient to deal with and illustrate these three forms of contract separately.

Where a contract to build for a lump sum is abandoned after part execution, the builder cannot recover as upon a *quantum meruit* in respect of the part executed, as was held in a case where the employer himself completed the building (*Sumpter v. Hedges*, 1898, 1 Q.B. 673). So in the case of a contract to carry out an engineering work for a lump sum it would be no answer for the contractor, who has not completed, to allege that the work as done will be worth so much to the employer. He must carry out this contract to the letter. If he does not do so he stands to lose, not only the contract price, but the entire value of the materials used and the cost of work and labour expended.

A lump sum contract cannot be said to be completed when that which is really done is done in pursuance of a fresh contract. In *Humphreys v. Jones and Pickering* (1850, 5 Ex. 952), two persons entered into a joint agreement with a railway company to execute a contract called the Morley Contract, for the construction of a tunnel. After this agreement one of the parties (A) assigned all his right and interest to the other (B), and the latter agreed to pay A a given sum "on completion of the said contract." After this agreement had been entered into between A and B it became necessary to alter the levels of the line, and B, by agreement with the company, abandoned the contract, and another was entered into between the company and other persons under which the tunnel at the altered level was completed. It was held that completion of the second contract did not involve completion of the first.

In *Forman & Co. v. Liddlesdale* (1900, A.C. 190), the plaintiffs contracted with the agent of an absent shipowner to effect certain specified repairs to a ship (all confined to damage by stranding), and instead of doing the work as stipulated, alleged that they had on the agent's authority, done the equivalent thereto or better, and in the same contract stipulated that they should be paid for repairs due to deterioration at scheduled prices stated by them. It was held that as it appeared that the agent's authority to their knowledge was limited to the specified repairs, they could not recover on the contract, which was an entire one, and in its entirety had never been performed. It was further held that the mere fact of the shipowners having taken the ship as repaired did not thereby ratify the contract. In that case the original contract price was £5,995 10s., which the plaintiffs sought to increase to £15,567 8s. 7d. by a claim for work not included in the contract and for other repairs.

In *Appleby v. Myers*, 1866, 2 C. and P. 651 the plaintiff contracted with the defendants to erect upon premises in his possession a steam engine and machinery, the works being by the contract divided into 10 different parts, and separate prices fixed upon each part, no time being fixed for payment. All the parts were far advanced towards completion, and some of them were so nearly finished that the defendant had used them for the purposes of his business, but no one of them was absolutely complete, though a considerable portion of the necessary materials for that purpose were in the building. At this time the whole premises, with the machinery and materials, were destroyed by an accidental fire. The plaintiffs sued to recover either the whole price

or the proper value of the work which had been done. It was held that, by reason of the fire, both parties were excused from the further performance of the contract, but that the plaintiffs were not entitled to sue in respect of those portions of the work which had been completed, whether the materials used had become the property of the defendant or not. Lord Blackburn said: "The plaintiffs having contracted to do an entire work for a specific sum, can recover nothing unless the work be done, or it can be shown that it was the defendants' fault that the work was incomplete, or that there is something to justify the conclusion that the parties have entered into a fresh contract."

As has already been indicated, if a contract is severable, the contractor may sue in respect of the amount of work which he has done. For instance, in *Newfoundland Government v. Newfoundland Railway Co.*, 1888, 13 A.C., 200, by a contract in 1881 embodied in a statute, the plaintiff company covenanted to complete a railway in five years, and thereafter to maintain and continually operate it. In consideration of this, the Government covenanted to pay the company upon the construction an annual subsidy. It appeared that the company completed a portion of the line, and received from the Government on the completion of each five-mile section the proportionate part of the subsidy which was deemed by the parties to attach thereto. Thereafter, the contract was broken by the company, and the Government refused further payments. It was held that on the true construction of the contract: (a) Each claim to a grant of land was complete from the time when the section which earned it was completed: (b) on the completion of each section a proportionate part of the subsidy became payable for the specified term, but subject to the condition of continuous efficient operation.

### THE MEANS FOR SECURING RELIABILITY AND MAINTAINING THE CONTINUITY OF SUPPLY.

By R. D. SPURR.

AT last year's I.M.E.A. Convention a highly-interesting paper was read on this subject, which, with the discussion, only lightly touched the surface of this very important matter.

It is a subject worthy of far more consideration and deep thinking than has been applied hitherto, and a subject that is daily increasing in magnitude and importance.

The moral effect of a shut-down of the whole or part of a public electricity supply system has a far more serious result than the stoppage of a traction supply: the latter is forgotten in most cases in a day or two, but the former remains long in the memories of those consumers whose works are stopped or left in darkness, and brings grave doubts to the minds of possible consumers, inconvenience to the public, and worry to the engineer and his staff, who generally have to bear the blame whether deserving or not.

From a financial point of view the units lost during a shut-down are but a fraction of the total loss, which cannot be given a monetary value.

It is hardly possible to take a census of shut-downs that have occurred to public supply undertakings, but such a census with the cause of each mishap would no doubt form very interesting reading. The total number would probably be a very large figure; moreover, as supply engineers are naturally unwilling to make public the number and cause of such failures, very little ever appears in print upon the subject.

Some engineers look upon these failures as unavoidable, and treat them as part of the day's work; others, whilst admitting that they can be avoided, shirk taking the necessary steps to do so; others, again, are helpless, and cannot take precautions.

The primary cause of interruptions of the supply appears to have been forgotten. The reason is decidedly unpleasant to contemplate; it is, that in the effort to reduce the total cost per unit to a minimum figure, the continuity of the supply has been ruthlessly sacrificed, cheapness has been

the predominant factor, and has resulted in the acceptance of the lowest tender when installing plant, the purchase of dirty unsuitable coal, the use of hard muddy water and poor quality oils and grease, continuously overloading antiquated plant, neglected boiler cleaning, patching up in place of overhauling, continued use of prehistoric switchgear, underpaid, incompetent, short-handed staff, and not providing capital for the purchase of necessary tools, stores and spare parts.

The above points by no means exhaust the list, but are sufficient to show that a shut-down can be directly traced to one or more of them.

It is possible that there are undertakings where everything is as it should be, yet all, or nearly all, compete for the somewhat doubtful honour of showing the "lowest costs per unit" in the tables published from time to time in the technical press.

To attain these low figures it is common practice deliberately to work one boiler less than actually necessary, and to force the others over an unexpected peak, to load the generators to their utmost capacity, or overload them if possible, and in stations where supplies are given for traction, lighting and power, D.C. and three-phase A.C., it is the prevailing practice to link up all three systems by means of synchronous machines in such a manner that a heavy fault occurring on one system is likely to result in shutting down the whole works.

Undertakings giving these supplies, varying more or less in detail, are rapidly becoming numerous, and on the grounds of economy this linking-up is deemed necessary during periods of light or heavy load according to the capacity of the plant available.

It is this linking-up indiscriminately that is the source of danger when synchronous machines are used, as the D.C. side of these machines cannot at present be arranged to change instantaneously from motoring to generating, or *vice versa*, without going through several switching operations, and moving the brushes.

Relays could, of course, be fixed to operate in either direction and limit the reverse power to 5 per cent. of the capacity of the machine, or induction motor-generators could be used for supplying D.C. from A.C., but in any case complications will occur when an abnormal fault develops on either system. Induction motor-generators are, perhaps, the nearest approach to safety where the D.C. supply is partly steam driven, and partly supplied from the A.C. system.

A traction supply can be safely handled by an A.C. system, either alone or with the help of steam-driven D.C. generators, but very reliable switchgear must be installed to prevent undue disturbance of the A.C. system by traction faults, and if synchronous machines are used, the reverse current should be limited to the lowest possible figure.

One method of linking up which is not in general use, but appears to be free from the defects common to other systems, is to use a D.C. and an A.C. generator driven by the same engine or turbine; such a combination with suitably proportioned units could be loaded up economically on either or both systems.

Some American undertakings have installed very large batteries as a stand-by, but large batteries mean heavy capital expenditure and maintenance charges; also such batteries will introduce complications in working, and to prevent rapid deterioration of the cells, regular charging and discharging are necessary.

The abnormally heavy discharges from batteries when faults occur are apt to burn up the switchgear, ammeter shunts or boosters, unless these are constructed to carry ten or more times the current at the one-hour rate of discharge. Switchgear can, of course, be constructed to carry such currents, but boosters are practically impossible.

It would be interesting to know of a battery installation where the switchgear, cables, &c., were capable of carrying double the current at the one-hour rate for any length of time.

After linking-up troubles, the next cause of many failures of the supply is the total loss of power, light and exciting current throughout the generating station, and the importance of this point is often ignored—not wilfully, perhaps—but such an event is looked upon as an impossibility until it actually occurs.

In A.C. stations each alternator usually has its own exciter,

lighting is taken from the main bus-bars, and auxiliary plant of importance is more often steam driven; some again have a two-wire direct-current supply for the works only, with steam-driven generating sets assisted by a battery and induction motor-generators for all power, lighting and excitation.

In D.C. and mixed supply stations, current for power, lighting and excitation is, as a general rule, taken from the D.C. bus-bars, and as the number of such stations is increasing, the number of failures will increase unless special precautions are taken to keep the works supply entirely free from the effects of outside interruptions. Where the auxiliary plant lighting, exciting and control circuits are of such magnitude that one or more steam-driven sets could be loaded up economically for 12 or more hours per day, six days a week, it would undoubtedly be a sound proposition to put down such sets, if none were available, and run the works supply independently of the public supply, as is already the practice in some polyphase stations for railway work.

An entirely insulated works supply has many advantages that altogether outweigh objections on the score of the inefficiency of small units, high-pressure reciprocating sets, or turbines exhausting into the low-pressure stages of the main turbines or feed water heaters, or mixed-pressure turbines taking part of their steam from other reciprocating plant would meet the case in that respect; outside faults, earths, &c., would not then be able to operate remote control circuits at inopportune times, and the insulation generally of all the works plant would be subject to far less severe strain, and would naturally require less attention to keep in good order.

In three-wire D.C. stations the balancing of the two sides of the system is a weak point, especially where the balancer consists of two similar generators rigidly coupled together, either machine driving the other as may be required. Such combinations are in constant use in hundreds of stations, and few, if any, are automatic in regulation, although designed to be so. This type of machine is notoriously inefficient, and is generally far too small to deal with any abnormal out-of-balance; a heavy fault will trip one or both of the circuit breakers, and consumers are not pleased with the conditions that ensue until the balance is restored.

A three-wire balancer capable of generating 100 amperes on either side takes about 7 kW. to run light or 168 B. of T. units per day. At 5d. per unit this works out at £85 a year actual loss for which no return is given, the actual time employed in doing remunerative work being negligible.

The interest and depreciation on a 75-kW. steam-driven balancing set will be approximately £85, and running at 70 per cent. of its full load it would generate 1,260 remunerative B. of T. units per day; the voltage regulation would be considerably improved and the supply much more reliable.

Larger machines will, of course, prove even more economical, and those stations equipped with steam balancers (one engine driving two generators in tandem, each machine being connected between the middle wire and outer of the three-wire system) will be found to be practically free from balancing troubles.

Static balancing, by means of special connections on the main generators, does not seem to be altogether a success, due probably to the fact that, although the out-of-balance current can be handled quite easily, the voltage falls on the heavily loaded side, which is quite the reverse of what is wanted.

Earthing the middle wire of a three-wire system is more often a source of danger when earthed direct; in some cases a resistance is put in circuit when the leakage current exceeds a certain value, but a very heavy strain is put on the insulation of all apparatus when a fault occurs, until this resistance is in circuit, due to the heavy surges which take place.

It would be far safer to earth the middle wire through a large variable resistance, capable of safely carrying from one to three hundred amperes for a considerable length of time; such a resistance, constructed of substantial grids, could be safely worked when red hot, and faults could be regulated to a certain extent, and located more easily, or burned out when necessary.

In one station, the middle wire was earthed through a circuit breaker, set to open at 100 amperes and insert a resistance between the middle wire and earth; the negative side was accidentally earthed, with the result that, before

the circuit-breaker opened, several weak places on the positive side broke down, making a dead short across the others.

In another case, where the middle wire was earthed through a resistance of 2·3 ohms capable of carrying 100 amperes continuously, a positive terminal in a street box came in contact with the iron and was welded on by the current passing; the fault was located and cleared without any further ill effects.

In the first case, every trifling earth would open the circuit-breaker, with a corresponding flicker of the lights, while in the second case, earthing one side through a 50-ampere fuse caused no inconvenience, nor could any flicker of the lights be observed.

The water supply is a very important factor, many stations being dependent on the continuity of the town supply for boiler feed, and, in a few cases, for condensing purposes.

The latter could possibly continue running several hours in case of a total failure of the water supply, but with the others, a total shut-down would be inevitable unless a very large reserve supply was available.

The few stations having their own wells or boreholes are fortunate, but there are a great many others so situated that a private supply would mean a considerable reduction in works costs for water charges, as the capital expenditure and running costs, even in the case of a very small supply, would not reach 6d. per 1,000 gallons, including chemical treatment where necessary, and very few, if any, water authorities will supply at that figure.

Water pipes, generally speaking, are very seldom protected against frost; even when under cover, in a draughty position, they are very liable to freeze when the flow of water is little or nothing between midnight and 7 a.m., when the temperature of the atmosphere is about the minimum point. Fortunately, severe frosts are not of very long duration in these islands, or more precautions would be taken to prevent a shut-down from that cause.

In conclusion, the human element must not be forgotten, as errors of judgment will take place at critical times. Only those who have actually been through it can understand the mental strain involved in running plant that is not exactly as it should be for the work it is called upon to do.

The slackers and don't-worry men are the immediate cause of many shut-downs; how they escape the consequences of their rank carelessness no one knows, but their elimination along with the moneyed men who *work* because it is considered the thing to do (fortunately, the automobile industry is attracting these gentlemen now) is only a matter of time.

## PROCEEDINGS OF INSTITUTIONS.

### Internal Combustion Engines.

By K. COX.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Sheffield, January 29th, 1913.)

AS regards the capital cost of either steam, gas or Diesel engine stations, when all the necessary auxiliaries, buildings and foundations are taken into consideration, there is not very much difference between them.

Taking a station of 650 kW., which would be a typical installation for supplying power to a moderately large works or factory, the comparative capital costs would be as follows:—

Turbo-Generating Plant...	£8,850
Gas-Engine Installation...	£9,640
Diesel Engine Installation...	£11,080

The running costs per kW.-hour would be as follows (it is assumed that the station is working ordinary factory hours, or a total of 3,000 hours per year):—

Turbo-Generating Plant...	0·348d.
Gas-Engine Installation...	0·292d.
Diesel Engine Installation...	0·447d.

Owing to the low price of coal, the number of stations where Diesel engines show to the best advantage is not so great in this country as in many instances abroad.

Where gas exists as a by-product the gas engine has tremendous advantages; although in Great Britain there is an immense

quantity of blast-furnace and coke-oven gas available, and often going to waste, only a small percentage of it is economically used in internal-combustion engines. The old steam plant can only be gradually replaced by the more efficient internal-combustion engine. On the other hand, where new plant is being installed, the advantages of gas-driven electric plant are obvious, as the demand for power in the case of a modern colliery or coke-oven plant with by-product recovery plant is so great that the utilisation of gas engines to obtain the maximum output from the waste gas is almost a necessity, the reason being that a gas-fired boiler and steam plant will not in general give more than 35 per cent. of the power that can be obtained from a gas engine using the same volume of gas.

Except in the larger installations, there is much to be said in favour of smaller units. The following considerations are worthy of notice:—

(a) The thermal efficiency of a moderate-sized unit is not less than that of a large unit.

(b) The risk of failure of vital parts in large engines is certainly greater than in small ones.

(c) The capital cost and space occupied by a number of smaller units is very little more than that of a large unit.

(d) A number of units give a much more "elastic" station and a greater factor of reliability.

In a large double-acting gas engine one of the greatest difficulties is the cooling of the moving parts, which have to be water-cooled; and as it is customary to make the piston rod and exhaust valve stems of steel a considerable amount of pitting and wear takes place due to the condensation of the exhaust gases, which always have an acid tendency, on the cooled surfaces. One of the main disadvantages of large cylinders is the danger of cracking the cylinders and cylinder heads, due to the temperature variation. The design of the cylinder for these large-power horizontal engines must of necessity become very complicated, and the mechanism for operating the large valves is very involved, requiring the most careful adjustment and attention. The piston rods and glands also require most careful attention, as the action of the gas is extremely erosive in the case of a leaking gland, and if not immediately attended to it cuts a groove in the piston rod.

In order to get a fairly high-power engine, say up to 1,000 B.H.P., one has the alternative of having a small number of large diameter cylinders, or a large number of small diameter cylinders, and it is with a view of avoiding some of the above troubles, and, at the same time, obtaining a fairly high-power engine, that the multi-cylinder vertical engine has been developed. This type of engine has been developed on the lines of the modern high-speed steam engine, having forced lubrication to the bearings and an enclosed crank case. The stroke being fairly short, the number of revolutions is high, the whole engine being compact and taking up very little space. These engines operating on the Otto or four-cycle principle, each crank receives one impulse in two revolutions.

A still further advance on this type is the vertical tandem gas engine. This engine is of the vertical single-acting type, operating on the Otto cycle, and the cylinders are arranged two in tandem, so that the explosion stroke of one cylinder is the suction stroke of the other. By this arrangement a very even pressure is exerted on the crank pin, and an even turning moment equal to that of the highest class steam engine is produced. This type of engine, like the high-speed steam engine, is particularly adapted for electric driving, the cyclic irregularity being so small that no difficulty is experienced in paralleling alternators. In the case of engines having only one or two cylinders, it has been found necessary to drive the generator through a flexible coupling. Such couplings are frequently a source of trouble, and the elimination of such a feature is desirable. Again, with the higher speed of the vertical multi-cylinder engine, a smaller and cheaper dynamo may be used. Other advantages are that with this vertical machine the vibration is less, due to the inertia of the reciprocating parts being smaller. Consequently much lighter foundations may be used. Again, owing to the smaller volume of the cylinders the silencing of the exhaust is a much less difficult proposition. This is a most important point to be considered when installing an engine in a residential neighbourhood, as the noise of the exhaust from a large-cylindrical engine can be heard for a considerable distance, even though large silencers are provided.

Turning now to the Diesel engine, one of the principal advantages of this type is the fact that the direct economical use of heavy crude or residual oils is made possible, and this form of fuel is extremely easy to handle and store, and occupies a minimum of space. It also possesses the advantage of quick and easy starting, with no stand-by losses, and the whole installation requires very little floor space.

Until recently, nearly all Diesel engines that have been constructed have been of the vertical, open type, the cylinder liners being let into A frames, and ring lubrication fitted to the main bearings. The later developments, however, have been in the enclosed type of engine with forced lubrication to the bearings. This form of engine is now built by several well-known firms, and lends itself much more readily to electric driving, as the speed is higher, and the engine, being of the multi-cylinder type, gives a more even turning moment.

The Diesel engine has also been developed on horizontal lines, several of the Continental manufacturers building this type. These engines are of necessity slow running, and consequently their great weight and large amount of floor space somewhat handicap them. In addition to this, the large size of dynamo required for the output at this low speed is a further disadvantage.

On the open-type Diesel engine, the cam-shaft operating the valves is carried on brackets at the top of the engine. This shaft is driven through skew or bevel gears from the crankshaft, a vertical shaft connecting the two. This arrangement is still

adhered to by some makers for the enclosed engine. The latest practice adopted, however, both in this country and on the Continent, is to enclose the cam-shaft in the crank-case and to operate the valves through rods. This renders the engine much more accessible, and enables the whole of the shaft, with its bearings, to be under forced lubrication.

The compressor for supplying the air for starting purposes, and also for injecting the oil into the cylinder, is now almost universally direct driven from the end of the crankshaft. This is either a two or, preferably, a three-stage machine, and must be capable of compressing up to 1,000 lb. per sq. in. It is provided with inter-coolers between the stages, and the air is stored in wrought-steel tanks. Air is taken from one of these tanks for starting purposes, one or more of the engine cylinders being, for the time, used as an air motor. The engine is thus very quickly started, no preliminary warming up being necessary. A Diesel engine can, as a rule, be started up cold and put on load in less than a minute.

The present high price of residual oil is due to lack of transport facilities. There are approximately 100 tank steamers under construction, 60 of these being built in this country. When these vessels are put into commission no doubt this fuel will fall to a reasonable cost again; but it is unfortunate that at the present time there is not the plant in this country to put on the market sufficient distillates from coal tar to supplement the residual oil and to keep fuel oil at a reasonable figure.

The modern gas or Diesel engine is as reliable a piece of apparatus as a good steam engine. The amount required for upkeep is little, if any, more than for a steam engine, provided that reasonable and intelligent care is given to the running.

#### DISCUSSION.

MR. RAVENSHAW remarked that he had two or three Diesel engines running at different places. At first they were started on Monday morning and shut down at Saturday dinner time without a stop, but now they shut down at the dinner hour for half an hour, and the bearings and cylinders wore better when they did so. He did not think that fuel oil was going to come down to what it was 18 months ago. That did not matter much, because all other fuels had gone up. While with turbines they could get 25 or 30 per cent. overload, with gas engines they could not do this. Above full load they could get a good deal more indicated horse-power, but they failed to get any more brake horse-power. He had found that both in Diesel or semi-Diesel engines, and in a large number of gas engines, the pressure of gas behind the piston rings forced them out against the cylinder, and they got extreme friction. At the moment of compression and explosion the last ring was pressing with a pressure of 100 lb. to the sq. in. against the cylinder wall, and that meant an enormous amount of friction.

MR. SMITH agreed that the cost of oil was not likely to come down to anything approaching what it was 12 months ago. As Mr. Cox said, the present price was about 80s. to 85s. a ton, and that put Diesel engines out of the running in such districts as Sheffield, where they had coal at 10s. a ton for boiler or gas producer use. He was inclined to favour the producer gas engine, particularly for districts like that. If the colliery owners in that district would look more to the question of utilising their bituminous coal where they had not waste gases, they might find it very economical for producer gas plants of the bituminous type. Up to the present time producers had not been constructed successfully as suction plants for the use of bituminous fuel. Mr. Dowson himself had admitted a few days ago that he did not now recommend bituminous suction plants. He had in mind the shipbuilding works on the Cheshire side of the Mersey, and the Cammell, Laird works, where they had a very large bituminous producer plant supplying gas engines. He believed they ran 24 hours a day and they produced current at considerably less than 4d. per unit. He knew of an instance where a similar plant was installed for more favourable conditions, running 24 hours a day, seven days a week, with a chemical process, where the working cost, apart from interest and depreciation, was 1 of a penny per unit. The station was operated chiefly by Westinghouse engines. One Westinghouse machine, of 1,000 H.P., had operated for the greater portion of six months continuously, without any shutting down worth mentioning. As regarded reliability, he knew of many instances in this country where gas engines only were installed and entire reliance was placed on them for the operation of the works which they were driving. These machines he had known to give absolute reliability for the past five years or more.

MR. WARDLE said that the firm he served his time with built both steam and gas engines, and in the latter they used piston rings of the ordinary Ramsbottom type, let in so that they distinctly filled the groove. The rings in the steam engine were let in so that they could push them round with their fingers, but the gas engine rings had to nip, and they had a special grinder made for the purpose. An engineer who had been concerned with small towns, places with not more than 10,000 inhabitants, with electric generators run by gas plants, told him that he had found it fearful work to get people to put their money into such places, principally because of the failure of gas engines, and also because of the awful mess which a certain firm had made of the supply business in small towns. He had put in an 80-KW. dynamo with a double cylinder 135-B H.P. National gas engine, and never had any trouble; his costs were a little bit high, but not seriously so. Personally, he had lately been trying to influence capital on behalf of small concerns, and these past mistakes certainly did tell heavily against them. He supposed that they could not use the Yorkshire fuel very successfully for the bituminous producer plant. It was too bituminous. As to the matter of attention, he thought that if

they paid a man about 35s. to look after steam plant, they wanted a man who was worth 40s. for gas plant, and 50s. for Diesel plant. Personally, he looked to the horizontal medium-speed engines for long life and economy and general freedom from worry if the engines were big enough for their work.

MR. YENHURY said it seemed to him that there was no reason why gas in bulk should not be at a very much lower price than it was, especially in view of the fact that there was no difficulty whatever in getting rid of their valuable by-products. The insurance companies did not think that gas engines were as free from breakdown as good steam engines. On inspecting large gas engines in Germany and Belgium a few years ago, he found quite a different class of men looking after the gas engines there—a higher type of men, and a larger number of men than one would require for a steam engine.

MR. BOULDEN, referring to a remark which was made in the paper regarding vertical tandem engines, that an even turning moment equal to the highest class of steam engine was produced, said he, was inclined to question that statement with regard to the turning moment. He had seen an article in that morning's paper to the effect that the people engaged in the colliery world had been successful in producing an oil from the soft deposits of coal which in many cases were not even now being worked, and that a large syndicate had been formed. This oil, it was hoped, would render this country absolutely independent of the oil brought from foreign countries.

MR. MYLAN said he had recently met a gentleman from Sweden, who mentioned that there they were prepared, in a particular installation that he was interested in, to supply at £2 per B.H.P. per annum, i.e., '075d. per unit. That, of course, was a particular installation of water-power, and the total capital cost—installation, buildings, power plant, transmission and everything—worked out at only £8 per K.W., a figure that was certainly remarkable. It was certainly not a fact that the bituminous fuel in that district could not be used in producers. It was used in many producers in the Yorkshire district. The increase of oil fuel was not out of proportion to the corresponding increases that one had met with in coal.

MR. COX, in reply, said a great deal depended on whether the piston ring was a good fit in the groove, but the gas pressure was practically the same in the Diesel engine, whether it was on quarter load or overload. The piston clearance was very small, and when the overload came on, the heat had to be transmitted from the crown of the piston down to the sides, and, therefore, the clearance would decrease through the expansion of the piston, and, of course, the mechanical friction would increase. He thought 50s. was the price to which oil would probably fall. Regarding accidents to Diesel engines, recently there had been two accidents, both at Falmouth. In the last case, the piston seized and the engine still went on running. It tore the cylinder and standards clean away and wrecked the engine; that was due to the small clearance. If makers would give a larger clearance they would probably get over the trouble. Springs behind the piston rings would not do, because the temperature was so great. It would take the temper out of the rings, so that the Ramsbottom ring was almost the only thing that could be used. It was necessary to use cast iron. The failure of the Walthamstow engines was due to neglect; the same type of engines had been working perfectly satisfactorily at other places.

### Some Factors in Parallel Operation.

By A. R. EVEREST, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Birmingham, February 12th, and London, February 13th, 1913.)

IN connection with the parallel operation of alternators it is well known that serious trouble from "hunting" may occur unless the system has such characteristics as to prevent the natural oscillating frequency from approaching resonance with the frequency of engine impulse. Unfortunately, however, the results obtained in actual practice often differ seriously from those indicated by the published formulae. These notes aim to show clearly the nature and importance of the correction necessary, and a means of applying it.

The natural oscillating frequency of an alternator as one of a similar pair, or as a single machine connected to a system of indefinitely large capacity may be conveniently expressed in the form—

$$f_0 = 976 \sqrt{K_w} \times \text{cycles/foot-tons},$$

where—

$f_0$  = the frequency of oscillations per minute;

foot-tons = the stored energy of the revolving parts at normal speed;

$K_w$  = the kilowatts of synchronising power corresponding to one radian (electrical) of displacement from the mean position of uniform rotation.

Fig. 1 represents the E.M.F. triangle for two machines when dephased. It is readily seen that the cross-voltage or impedance E.M.F. consumed in one machine (C A) for a small angle of deviation from mean position is proportional to once the radius voltage for one radian of deviation. The value of  $K_w$  is therefore determined by the amount of current which flows as cross-current to consume in one machine a cross-voltage equal to the working voltage.

It is in the proper determination of the  $K_w$  value that errors arise. The usual methods indicate that this shall be determined from the current which will circulate in the machine on short-circuit with excitation corresponding to the air-gap excitation for no-load working voltage.

(Some writers employing the method just described insert the full ampere-turns of open-circuit excitation, instead of the ampere-turns required at the air-gap. This is obviously wrong. The magnetising force consumed in saturating the magnet poles should not enter into the short-circuit test where saturation is absent.)

But in the case of power exchange current between two machines, the amount of current flowing due to a given cross-voltage is much larger than when consuming the same voltage on short circuit, hence the synchronising power as determined from the short-circuit test is usually far too low.

On the short-circuit test the circulating current is dephased 90° from the machine voltage; it exerts a direct demagnetising effect upon the field poles, and produces no synchronising power. But when

FIG. 1.

FIG. 2.

the cross voltage is at right angles to machine voltage the resultant cross current is in phase with the machine voltage; therefore it is true power current, and as a non-inductive current exerts distorting effect upon the field flux, instead of direct demagnetisation.

The reluctance of the cross magnetisation path is usually quite different from that of direct demagnetisation, and the current flowing to wipe out a given amount of cross voltage will often be two or three times as much as when cancelling the same amount of voltage by direct demagnetisation on the main poles. In other words, the real synchronous impedance which is active when "hunting" may differ widely in value from that measured on

Ratio	pole-arc pole-pitch	Ratio	cross reactance opposing reactance	Reciprocal.
1.0	...	1.00	...	1.00
0.9	...	0.73	...	1.37
0.8	...	0.51	...	1.97
0.7	...	0.35	...	2.85

short-circuit tests; and the latter quantity cannot give the correct value for synchronising current. This effect was pointed out by Goldschmidt as far back as 1902. He gave the correction factors as shown in the table above.

In order to determine the proper value of synchronising power  $K_w$  to be inserted in the equation for oscillating frequency, we may therefore employ the value obtained from the short-circuit test multiplied by a factor depending principally on the shape of the poles.

In fig. 2 the angle AOC of mechanical displacement is divided into two parts;  $\phi$  is the amount by which the flux axis is displaced from the pole axis by distortion from the cross current flowing. The actual E.M.F. triangle is D O C (for one machine), and the real cross voltage D C is consumed as reactive drop in the machine winding.

The angle of mechanical displacement corresponding to any assumed value of cross current, for instance, normal full-load current, is readily found. The angle D O C is given at once by the reactive drop, and we find the angle of flux distortion for any type of pole by Table I.

Distortion angle =  $\frac{\text{armature ampere-turns per pole all phases}}{\text{field ampere-turns per pole at air-gap}} \times \kappa$ .

Ratio	pole-arc pole-pitch	$\kappa$ in degrees.
0.5	...	10.0
0.6	...	13.5
0.7	...	18.0
0.8	...	24.0

NOTE.—When the air-gap increases in depth from the centre towards the edges the effect is further to decrease the effective width of pole-arc. For such cases a correction of 10 per cent. is suggested.

These two angles together give the displacement angle for one machine at the chosen value of cross current, and hence the cross current and synchronising kilowatts proportional to one radian displacement are at once known.

In the case where the field magnet is a continuous cylinder with pole-arc equal to pole-pitch, it will be found that this method gives substantially the same result as the short-circuit method.

But for the form of pole generally employed on fly-wheel alternators, if the pole-arc is 60 per cent. of the pole-pitch, Table I shows that the distortion angle for the same current is only one-third that in the former case, so that the synchronising current flowing for a given angle of displacement would be very much larger than indicated by the short-circuit method.

The value of winding reactance employed in this method should, as suggested by Hobart, include only that part which lies within the armature surface, and must not include that part due to

reactance flux which crosses the air-gap and passes along the pole face; since this portion is taken into account in the flux distortion. In general, it is sufficiently accurate to take a value of winding reactance E.M.F. one-half that determined in the usual way.

Wherever armature ampere-turns are referred to in this paper, the "effective value," as corrected for coil-pitch and distribution factors, should be understood.

In the case of a 1,500-KW. machine, the oscillating frequency calculated by the short-circuit method was 40.5 per minute. The "distortion" method indicated a natural frequency of 68. The frequency by actual test was 68.

Another interesting case was that of two large low-speed sets designed for close regulation and operating at 94 R.P.M. The sets were intended to operate around 2,100 volts, but while fairly steady at 2,200 volts, could not (in their original condition), be operated together between 2,000 and 1,700 volts, due to the excessive hunting which occurred within this range, indicating resonance between natural frequency and engine speed at about 1,800 volts.

Calculated by the short-circuit method, the fly-wheel actually present should have given at 2,200 volts a natural frequency of 74, thus safely below the engine speed, and with increasing margin for lower voltages. By the "distortion" method, the natural frequency at 2,200 volts was 111 per minute, and approached still nearer to engine speed as voltage was reduced. Actually, the operation became worse with changes known to reduce natural frequency, such as reducing operating voltage, reducing the air-gap, or adding reactance, while the stability was increased by reducing the active turns of the stator winding so as to increase the frequency. All showed that the original natural frequency was above the engine speed, as the "distortion" method indicates.

If calculated by the short-circuit method, taking not only ampere-turns at the air-gap, but also those absorbed in saturating the pole, a near approach to observed results is obtained; this fact, no doubt, accounts for the inclusion of these ampere-turns lost in saturation by some who still advocate the short-circuit method.

So far the no-load conditions only have been considered. When operating under load, the natural frequency should be calculated, not on the terminal voltage, but on the higher voltage, which must be generated internally to overcome the impedance drop of the machine windings.

It often happens that a new machine is required to operate with one of older type.

The following method of treatment has been found useful:—

In the case of two machines A and B, writing  $K_a$ ,  $K_b$  for the  $K_r$  values of A and B, each calculated as one of a similar pair, the resultant value for machines A and B operating together is—

$$2 K_a K_b / (K_a + K_b),$$

which expression may be substituted for  $K_r$  in the numerator of the equation for natural frequency.

Similarly with two unequal fly-wheel effects, writing  $T_a$ ,  $T_b$  for the foot-tons of fly-wheel effect in machines A and B, the resultant effect is—

$$2 T_a T_b / (T_a + T_b).$$

For two machines with any values of electrical constants and fly-wheel effect, we then have the natural frequency—

$$= 9.76 \sqrt{\text{cycles} \times \frac{K_a K_b (T_a + T_b)}{T_a T_b (K_a + K_b)}}.$$

When specifying the fly-wheel to be supplied in connection with an engine-driven alternator it is usual to stipulate that the total amount of fly-wheel effect present must be such as to satisfy these two conditions.

(a) The angular deviation from uniform rotation due to cyclic irregularity of the engine must not exceed  $2\frac{1}{2}$  electrical degrees (shaft degrees multiplied by the number of pairs of poles). An expression in terms of cyclic speed irregularity is usually preferred by the engine makers. The following is a convenient expression:—

Permissible limit of cyclic speed irregularity =  $1/a$ , where—

$$1/a = k/6 \times (\text{number of poles});$$

$k$  is the number of engine impulses per revolution.

(b) To avoid trouble from resonant hunting, sufficient fly-wheel effect should be provided to ensure that the natural frequency of the machine shall be at least 20 per cent. different from the frequency of the predominating engine impulse. The predominating impulse in a 2- or 4-stroke cycle engine always occurs with the frequency of the cam-shaft, and is independent of the total number of cylinders contributing to the turning moment diagram. Thus in a 2-cycle engine running at 200 R.P.M. the fly-wheel would be designed to give a natural frequency below 160, but in a 4-cycle engine running at 200 R.P.M. the cam-shaft speed being 100 R.P.M. it would be necessary to design the fly-wheel to keep within a natural frequency of 80 per minute.

For operating alternating-current generators of ordinary regulation, the total amount of fly-wheel effect required for each kilowatt of rating may be indicated by the following formula:—

$$1.3 \times \text{poles} \times (\text{strokes per engine cycle})^{3/2} / \text{R.P.M.}$$

#### DISCUSSION.

PROF. R. THRELFALL said that owing to the concentrated style of the paper he had great difficulty in following it. He drew attention to the fact that one term in the formula for the "natural frequency" of an alternator appeared to depend on the other

machines with which the alternator in question might happen to be in parallel, and asked whether it would not be necessary to calculate a fresh natural frequency every time a new unit added to the station.

DR. KAPP said that it must not be thought that the paper referred only to the older type of steam alternators; it also concerned turbo-alternators. A discrepancy existed between Goldschmidt's formula and his figures, and the author in his reply should state whether he considered the formula or the figures correct. No reason was given why the flux to be taken into account in calculating the E.M.F. of self-induction should be just one-half of the total self-induced flux. From a careful investigation made by Schueler on machines installed in four central stations, it was shown that in all cases the time of swing was shorter than corresponded to Rosenberg's formula, so that he was inclined to consider Punga's method, adopted by the author, to be the more reliable method; but it should not be worsened, as the author had done, by the introduction of Hobart's very arbitrary correcting factor of one-half. This correction made a difference of 11 per cent. in the predetermined periodic time.

DR. SUMPNER drew attention to the simplification resulting from using a consistent system of units in all engineering formulae, and urged in particular that electrical engineers should try to express all quantities in electrical units as far as possible. Thus, instead of reckoning the fly-wheel energy in foot-tons per kilowatt (at normal speed and full-rated load) it was convenient to regard this energy as so many seconds of full load. The machine instanced in Case 1 had an output of 1,500 KW. and a fly-wheel effect of 9,600 foot-tons. A foot-ton was equivalent to a kilowatt output for 3 seconds, whence, in the case cited, the fly-wheel energy corresponded with the full load for 19.2 seconds. If this fly-wheel time in seconds were called  $t$ , and if  $p$  denoted the ratio of the short-circuit current to the full-load current of the machine, and if  $f$  were the frequency, the ordinary formula for the period of the "hunting" became  $2\sqrt{\pi/p} t/f$ , and the speaker had used this formula for many years. The only uncertain quantity in the formula was  $p$ . But if corrections were introduced in accordance with the author's views, the calculated time would become close to the value actually found.

DR. M. KAHN said Mr. Everest gave in very small space the necessary information to determine the size of the fly-wheel of a prime mover suitable for an alternator. Most of the previous treatises on the subject gave such a host of calculations and formulae that the average engineer would very seldom have time to read them. He agreed that the distortion method gave the most accurate results, but he differed from the author in one part. In calculating the synchronising power Mr. Everest only took one half of the reactance into account, saying that the total reactance flux contained a part which crossed the air-gap and passed along "the pole face." No deduction need be made from the reactance in calculating the synchronising power.

MR. J. MARTIN said that it was clear that in calculating the cross current at normal excitation only the air-gap ampere-turns could be assumed as being effective in producing it. With regard to the reactance voltage, a statement was made that only half the total value should be taken, the other half being already accounted for in the distorting effect on the field. This seemed to him at first to be allowing for too much leakage flux across the air-gap, but he had had some machines checked up of the ordinary salient-pole engine-driven type, and found that the leakage flux across the air-gap actually did account for about half the total leakage flux. Mr. Everest pointed out that for a 4-cycle engine, running at 200 R.P.M., the fly-wheel effect should be such as to give a natural frequency of 80 per minute. This meant a heavy and consequently expensive fly-wheel, but, in his opinion, it was better practice to do this than to attempt to get the natural frequency of the revolving parts to lie between a frequency corresponding to the predominate engine impulse and twice this frequency, that was, to lie between 100 and 200 per minute. One was always liable to get too near to either one or the other of the frequencies, between which only satisfactory running could be obtained. The most that could be said for the plants designed to work with the light fly-wheel was that at the best they were running moderately well.

DR. E. ROSENBERG (communicated): Mr. Everest was correct in pronouncing that the synchronising currents for running conditions were considerably higher than the figures from the short-circuit test, especially if, according to his theoretical considerations, only the air-gap ampere-turns were taken into account. Recently he had been able to make experiments with two sets of synchronous motor-generators; the measurements showed quite clearly that the synchronising power for a given angle of deviation was considerably greater than that which would be measured from the short-circuit test with no load excitation. But he had never considered it possible to figure the critical value of the fly-wheel effect to an accuracy of a very few per cent., and then to make the fly-wheel just 20 per cent. heavier than the critical value. If it was not possible to make the fly-wheel much heavier, he would certainly use dampers, and take care that the engine impulses of the critical duration were sufficiently equalised, so as not to be too high for the damper. He had found in practically all cases that the simple short-circuit calculation tallied sufficiently well with the actual results. Two inaccuracies were introduced, which, however, fortunately counteracted each other, and gave a reasonably accurate result. The distortion method advocated by Mr. Everest was considerably more complicated than the short-circuit method, and was based on a good number of calculated constants and coefficients. With regard to "fly-wheel requirements," he much preferred to have as one condition a certain minimum cyclic  $\phi$  irregularity specified than a permissible angular deviation of  $2\frac{1}{2}$  electrical degrees. For high-speed machines this "permissible" deviation gave quite

impossible results. In his second recommendation, Mr. Everest did not consider the necessity which very often arose in connection with multiple four-stroke cycle gas engines to work with a fly-wheel between the critical values for impulses of the duration of one revolution, and those of two revolutions. The expression "frequency of the predominating engine impulse" might give rise to a serious misunderstanding. Damper windings on the field poles were of the greatest importance in the case of low-speed two-cylinder double-acting four-cycle gas engines, and allowed them to save many tons of fly-wheel.

MR. BRADSHAW said that since the double-acting tandem gas engine of the Nurnberg type claimed so good a cyclic irregularity as a good parallel operation was largely dependent upon the design of the alternators. Alternators were best suited for parallel running if designed to have small internal resistance and low self-induction, or, in other words, if designed for good voltage regulation, because then the synchronising current for a given angle of displacement was the greatest. His experience, however, had been rather with gas-engine driven alternators similar to each other and designed for a special purpose to have a high armature reaction in order to get constant load independent of sudden changes in the resistances of the external circuits. If these machines were in parallel, then for all conditions of load the power was equally divided between them. If, however, the alternators were of different design, and one machine had a much lower self-induction than the other, the characteristic curves crossed, and only at the point of intersection was the load proportionately distributed between the machines. It followed that alternators having dissimilar characteristics and running in parallel required for every load condition a different value for excitation current. It, therefore, seemed that in designing an alternator for parallel running one ought to compromise, if necessary, between the best value for the natural frequency of the alternator and the correct self-induction to give a characteristic curve similar to that of the alternator with which it was intended to operate.

#### DISCUSSION IN LONDON.

PROF. MILES WALKER said the avoidance of resonance was of increasing importance now that the Diesel engine was bringing the fly-wheel type of machine to the front again. He welcomed a better formula than that previously available, although it had not proved so very inaccurate in use. When dealing with machines having considerable saturation on the pole face, such as turbine-driven machines, ampere-turns on the pole face were just as important as ampere-turns on the air-gap. In the past the bad reputation of high-frequency rotary converters was often due to resonance in conjunction with disturbances in the supply. This was to be expected with approximate methods of design, and the formula in the paper would be of assistance to designers. The old rules were not so very much at fault, as shown by some curves got out by Dr. Rosenberg, in which the calculated curve due to Mr. Everest fell just outside the curves obtained by the old rule, showing that the latter was on the safe side.

DR. S. P. SMITH said the author enabled one to calculate a little more exactly than previously. Resonance effect was a most complicated matter, and the difficulties to which it gave rise were shown by a case where three gas engines would not run in parallel, lightly loaded, when one was independently supplied with gas, and the other two were supplied from a common pipe. If the effect of the polar arc had to be taken into account, he thought the power factor should also be considered; the position of the flux was affected both by the load and by its phase with regard to the pole centre. One could get rid of the power factor effect by using the non-salient pole machine; it was a nearly ideal machine.

A lengthy communication having been read from DR. ROSENBERG, in which he expressed his agreement theoretically with the author, but considered the usual methods had always proved satisfactory, MR. EVEREST briefly replied to the discussion.

### PRACTICAL NOTES ON EARTHING FACTORY APPARATUS.

By E. P. AUSTIN, A.M.I.E.E.

THE necessity of "earthing" factory motors and accessories is patent to everyone who is connected with workshop electric driving, but the means sometimes employed leads to the conclusion that earthing is best left alone unless properly carried out, as a false sense of security amongst workmen may lead to fatal results.

The Home Office terms, "well and efficiently earthed," are vague, and leave much to the interpretation of individuals. As a result, there are no hard and fast methods applicable to all cases, but the principles underlying the practice are well defined, and can be applied in all circumstances.

Briefly, the points to consider are these: Good conductance of the earthing system; mechanical strength of the contacts and bond wires (where such are necessary); bond and earth wires to carry the maximum current that will operate the fuses, &c., on any circuit without danger of fusion; and

the earthing point or points should be connected to a town or other reliable water supply wherever possible.

The method of earthing will depend on the system of wiring employed about the factory. With metal-sheathed cables of various kinds it is a common, but sometimes bad, practice to bond motor cases, &c., on to the cable sheathing, bridge all junctions with a bond wire and clip, and rely entirely on the sheathing for "earth" circuit conductance.

Screwed conduit is generally considered an ideal protection for all earthing purposes, without the provision of additional earth wires or bonds to ensure good conductance. For normal situations and runs of moderate length this is no doubt, the case, and gives ample protection for conductors becoming "earthed" to the tubing itself, but for long runs and situations where the tube joints are treated with water-proofing material, auxiliary earthing conductors are necessary.

The armouring of steel tape or steel wire armoured cables provides efficient conduction, but there remains the difficulty of jointing the armouring at junctions. Probably the best method of bridging steel tape armour joints is to clamp the cable near the end of the armouring with a cast-iron clamp and drill a hole in the end of the steel tape to take a bolt for connecting the lug of the bridge wire, a spring washer being used for security under the nut. Wire armouring can best be connected by means of a cone clamp, having an attachment to take the earth wire connection.

Lead-covered cables of various kinds are often a source of trouble and uncertainty when apparatus is improperly earthed on to the lead. Wiremen frequently leave earth wires merely twisted tightly round the lead sheath, with the result that the first fault causes the lead to melt at the point of contact and leaves the faulty apparatus unearthed and dangerous.

Lead-covered cables are quite suitable for factory work when properly installed, but the earthing should be carried out by an auxiliary conductor, to which all apparatus and cables should be bonded. As a precaution, all adjacent cables should be bonded and all bond wires should be plumbed on.

A refinement in a complete earthing system is the use of insulated earthing cables, which are earthed at one point through indicating and recording devices. Its usefulness lies in the ready indication of faults developing from small leakages, and a serious breakdown of plant may be prevented by prompt attention. On the other hand, it is advisable to earth at more than one point, in which case the use of indicators adds complications to the system, which are undesirable.

The method of providing an efficient connection with the body of the earth, requires special attention. Earth plates buried in a shop floor are most unreliable, and lead to the development of dangerous conditions. As a case in point, the writer has known the whole ironwork of a shop bay to be alive, due to a faulty motor being supposedly earthed on to a plate buried in ashes 6 ft. in the ground, and 12 ft. from the nearest iron stanchion supporting the roof.

It must be borne in mind that a low-resistance connection between structural ironwork and live conductors is quite sufficient to maintain such ironwork at high potential without appreciable leakage current flowing. If we bear in mind the Board of Trade regulations for electric tramways which call for the standards carrying guard-wires to be earthed to the rail, because their connection with earth is variable and imperfect, it is reasonable to suppose that the practice of relying on earth plates is bad.

Assuming that the main earthing system is good, the point and method of connection to individual apparatus remains to be considered. In the case of a motor with its bedplate or rails, each should be earthed. Merely to earth the bed is unreliable, since the grease, &c., between it and the motor is sufficient to cause a high-resistance connection. Switch and starter gear mounted on an iron frame should be individually bonded on to the earth wire, together with the iron frame.

Earth wires should always be sweated into lugs for connecting purposes; merely fixing a wire under a bolt-head is mechanically and electrically unreliable.

It cannot be too strongly emphasised that earthing conductors require quite as much care in installation as service conductors. The failure of the latter is often serious in effect, but not necessarily dangerous, whereas the failure of earth wires is not, as a rule, known until an accident happens.

They are the bulwarks between insulation breakdown and danger to life, and consequently should be installed in a manner beyond reproach. Earth connections are exposed to all the stress of dirt, damp and other risks of mechanical damage, and call for extreme care in erection.

The type of clamp used should have large contact area, and generally should be soldered. Toothed clamps should not be used, as the contact area is small, and deteriorates with time. They are particularly harmful for lead-covered cables. as they sometimes puncture the lead.

A most important point in factory and workshop work is safeguarding portable apparatus of all kinds. The danger of shock from portable drills, hand lamps, &c., has considerably hindered the extended use of electric tools, to the loss of the manufacturer. A "live" portable device has more elements of danger than any other piece of apparatus, since it may be used in a damp situation, or the operator may be standing on a wet floor, and it must of necessity be firmly gripped.

Two systems of earthing are commonly used, namely, a flexible metal tube carrying the wires, or alternatively a wire-armoured flex, and a three-core flexible, one core being used for the earth wire. For damp situations, the three-core flexible cable, if suitably covered and compounded, is the better, as the metal coverings retain the wet, and frequently set up corrosive action on the insulation, with resultant breakdown.

Wall connectors and plugs need careful selection, and should be constructed of cast-iron, and so arranged that the removable portion (on the flexible cable) makes definite earth contact before any "live" contacts are encountered. A handle should be provided on the plug, and arranged so that the flexible is clear of it, to avoid risk of injury in case the cable fuses at the bushing. All the apparatus must be "foolproof," and withstand rough and careless usage from unskilled labour.

Hand lamps are best constructed of hard wood, with a locked wire guard on the lamp to prevent the possibility of a workman removing the lamp and getting a shock. There are several good makes on the market which conform strictly to Home Office rules, and do not require an earth conductor in the flexible.

The writer hopes that the above remarks will serve to impress the importance of earthing on the minds of wiremen, &c., who sometimes treat the matter as a fad to satisfy "somebody's rules."

## ELECTRICAL TRANSMISSION OF COLOUR PHOTOGRAPHS.

By S. M. POWELL.

It is well known that in the ordinary direct system of telephony, it is advantageous to employ a set of seven photo-electric cells in order to eliminate the inertia or hysteresis effect of the selenium. The cells are placed very close together, are shunted across the line, and each is sensitive to one of the seven fundamental components of white light (red, orange, yellow, green, blue, indigo and violet).

The use of colour-sensitive cells naturally suggests the possibility of transmitting colour photographs over an ordinary telegraph line. The solution of the problem, which is described below, is closely related to multiplex telephony, since at least three distinct high-frequency electrical oscillations are transmitted over the same line. Indeed, it appears that the fundamental parts of the apparatus required are equally applicable to multiplex telephony and to colour telephony.

Following suggestions made by Ruhmer, Algeri Marino\* has evolved an elegant system for the electrical transmission of colour photographs by the use of three oscillations of high but different frequencies, derived from Poulsen arcs. The intensity of the oscillations at the transmitting station is controlled by analysing light beams from the picture to be transmitted, and these oscillations are employed to control other arcs at the receiving station, connected in circuits tuned to the frequencies employed. Before considering the arrangement of the sending and receiving circuits, however,

attention may be called to an important method of decomposing the image to be transmitted.

In the Korn and Belin systems, which have given the best results to date, decomposition is effected by the helicoidal movement of a cylinder carrying the image to be transmitted. The reproduced photograph then consists of a system of narrow parallel bands, but, however close together the bands may be, the gap between them can never be completely eliminated, hence the reproduced image is necessarily imperfect.

An alternative system decomposes the image by the movement of two films, one of which is displaced vertically by small successive steps, the other horizontally at constant speed. For good results the vertical moving film must be displaced with extraordinary accuracy—a result which it is not easy to secure. The new system devised by Marino appears to be as perfect as it is simple.

Referring to fig. 1, an opaque diaphragm having perforations of equal diameter, and equally spaced transversely, moves uniformly in front of an aperture in the dark chamber and quite close to the plate carrying the image to be transmitted. The diameter of the perforations is from 0.7 to 1.2 mm., according to the fineness of working, and the holes are equidistant horizontally and are in successively lower bands. As the diaphragm moves uniformly, the first hole traverses the whole image opposite to the first band, and, as soon as this hole has passed from one side to the other of the image, the next hole traverses the immediately lower strip thereof, and so on. Since the diameter and position of the holes can be determined with high accuracy, very

FIG. 1.

FIG. 2.

FIG. 3.

perfect decomposition can be effected and no discontinuities are visible in the reproduced picture.

The horizontal distance between perforations may be equal to the breadth of the plate, but it is better to make it somewhat greater so that an interval elapses between the tracing of successive trips. During this interval (which may be regulated by the spacing of the holes), the seven selenium cells remain in darkness and are thus afforded an opportunity of losing residual conductivity.

Returning now to the sending and receiving circuits for colour telephony, fig. 2 shows the transmitting connections in which are applied the fundamental principles evolved by Ruhmer. The selenium cells are in three groups, of which the first and third contain two cells in parallel. Each group is shunted in a battery circuit closed by a self-induction coil *L* connected in the supply circuit of a Poulsen arc as shown. The circuit of the battery may be closed on the inductance coil in the oscillating circuit, as in the Campos system of wireless telephony. These are the two best arrangements for the electrical transmission of photographs, inductive coupling being impossible at this point.

\* See also a recent issue of *L'Elettrotecnista*.

The three Poulsen arcs emit continuous trains of waves of different frequencies and induce corresponding currents in the line coils and hence superimpose three distinct oscillations in the line. At the receiving station (fig. 3) three detectors are connected in three distinct resonant circuits tuned respectively to the frequencies of the arcs at the sending station. These circuits terminate across three Poulsen arcs placed close together as shown, and in front of the arcs are three coloured screens— $s_1$ —a mixture of red and orange;  $s_2$ —a mixture of yellow, green and blue;  $s_3$ —a mixture of indigo and violet. If of equal initial intensity, the beams transmitted through these screens form white light when combined by the lens  $l$ .

It should be noted that the detectors used in the receiving circuits must have unilateral conductivity; the Forest audion valve gives the best results, but crystal detectors can also be employed satisfactorily.

At the sending station, the beam of light which traverses the colour photograph (ordinary telephoty), or the objective of the photographic chamber in the case of direct telephoty, falls on the seven selenium cells, and actuates one or more of the groups according to the constituent colours in its composition. The waves emitted by the transmitting arcs, and hence the intensities of the three high-frequency line currents, are correspondingly modulated.

At the receiving station, the three components of the line current are tuned out and rectified, and then modulate the luminous intensity of the arcs behind the three coloured screens in sympathy with the variations in the line current components, and hence, ultimately, in sympathy with the depth and colour of the image transmitted. The resultant combined beam at the receiving station is identical in colour variations with the original, and may be used to take colour photographs in the ordinary manner. In order to obtain the best possible separation of the line current components at the receiving station, the coupling of the transformers  $T_1$ ,  $T_2$ ,  $T_3$  (fig. 3), should be weak. At the sending station, however, the line transformer coupling must be as strong as possible.

This ingenious system, of practical as well as theoretical interest, marks important progress in the electrical transmission of photographs and other images.

## NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

A CONTRACT for the construction of a 1,500-ft. dam and the installation of a complete hydro-electric system at Grand'mère, Quebec, to cost about £300,000, has recently been awarded. The Grand'mère Fall is on the St. Maurice River, a little north of Shawinigan Falls and about 30 miles from the mouth of the river, which flows into the St. Lawrence at Three Rivers. According to the Commission of Conservation, there is about 40,000 H.P. available under a 75-ft. head at this fall. At Sydney, Nova Scotia, the Dominion Coal Co. is installing a 20,000-kw. plant. In Ontario, a great deal of talk is going on respecting electric railways. Messrs. Mackenzie & Mann, who control so many railway and electrical interests here, are said to be planning a combination of all radial electric railway lines in the Province, while the Canadian Pacific Railway, it is stated, contemplate building lines which will compete with the Mackenzie & Mann scheme. Still another proposal has been made, viz., that the Hydro-Electric Power Commission should construct lines linking up towns wherever practicable: these last would, of course, be owned by the people.

The municipal authorities of Lethbridge, Alberta, are engaging the services of an engineer to report on the question of the development of water power on the Belly and St. Mary's Rivers, which run through the adjacent territory. For two summers past the Commission of Conservation has had gauge readings taken of two large rivers in the Canadian North-West, and possible water power sites examined. It is said that during the season of navigation (May to November) it would be possible to utilise, under a total head of 135 ft., 1,000,000 H.P. at various rapids on the Slave River, and that "the volume of water is

enormous, being the combined flow of the Peace and Athabasca Rivers and their tributaries, with one of the great northern lakes, Lake Athabasca, acting as a reservoir to regulate the flow. . . . Raw material for pulp and lumber industries is found all along the river, and at the rapids."

"The Peace River Canyon has long been renowned for the wild character of its water, and no white man or Indian, be he ever so experienced in river work, or egged on by foolhardiness, ever attempts to run its rapids. . . . It is little wonder that the velocity of its waters should be so great when one considers that, as has recently been ascertained, the descent from head to foot is some 225 ft. in a distance of less than 18 miles. . . . The total minimum water power available during the open-water season (May to November) is estimated at 400,000 H.P."

The *Electrical News*, published in Toronto, recently inserted in full Mr. Hamilton Wickes's report on the Underwriters' Laboratories, Chicago, with which readers of the *REVIEW* are familiar. In the last issue of the *Electrical News* appears a letter from an Englishman resident in Canada, who, while writing strongly in favour of the work done by the Underwriters' Laboratories, says that he believes that Canada should have a laboratory for testing purposes either under the Government or Underwriters' auspices, whose rulings would be accepted by the American Laboratory, the Canadian one in turn accepting theirs, so that a uniformity of ruling would exist. He also states that "with the institution of such an examining body, the British manufacturers would not be under any disadvantage in exporting goods to Canada."

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"LOCAL" writes: "In a certain town, in which the electricity supply undertaking is owned and worked by the local authority under a provisional order obtained in 1890, a horse was killed as the result of an electric shock obtained through the roadway being made 'alive' by a fault in one of the local authority's lighting cables. In the said provisional order the following clause appears:—'The undertakers shall be answerable for all accidents, damages, and injuries happening through the act or default of the undertakers or of any person in their employment, by reason or in consequence of the undertakers' works, and shall save harmless all authorities, bodies, or persons by whom any street is repairable, and all other authorities, companies, and bodies collectively and individually, and their officers and servants, from all damages and costs, in respect of such accidents, damages and injuries.'

"The owner of the horse is claiming compensation, but the local authority deny liability, on the ground that the claimant cannot prove negligence on the part of the local authority.

"Is the said local authority liable for damages?"

"The clause above referred to is similar in terms to Clause 77 of the Schedule to the Electric Lighting Clauses Act, 1899. It was held that the corresponding section of the Tramways Act, 1890, applied only to a wrongful act or default, and does not make the promoters or lessees of the tramways answerable for any accident caused without negligence. *Brocklehurst v. Manchester, &c., Tramways Co.* (1886), 17 Q.B. D. 118. In the latest edition of Will's "Electric Lighting," it is submitted (at p. 202) that the decision in *Brocklehurst's* case (*supra*) is applicable, and the undertakers are only answerable for such accidents, damages and injuries if occasioned by the wrongful act or negligence of themselves or their employees or by acts or omissions amounting to or causing a nuisance. This appears to have been the view of the Divisional Court in *Solomons v. Stepney Borough Council* (3 L.Q.R., 912).

In that case the plaintiff brought suit for damages for injuries received from fright or shock caused by an explosion in a street close to and in front of her. The explosion emanated from a man-hole, feeder-box or conduit under the control of the defendants, containing their electrical cables. An expert stated, in his evidence, that he had visited the scene of the explosion, and had heard the accounts of those who had witnessed it; that he should imagine the explosion was caused by a leakage of electricity causing sparks, and that there must have been some explosive mixture—gas in all probability—accumulated in the conduit. If the conduit and works had been properly ventilated the gas would not have accumulated, and the explosion would not have occurred. It was held that there was in the circumstances evidence of negligence to go to the jury, the Lord Chief Justice observing that in such a case the mere evidence of the explosion was sufficient to place the onus of proof on the respondents. It is believed there was a case some years ago in which damage to a horse, occasioned by the breaking of a wire, was recovered against the Dublin Corporation, but the reference to the case is not to hand.

"ANOTHER INQUIRER" writes: Your reply to "Inquirer" in your issue of February 21st exactly answers some questions I was

about to ask you. May I trouble you to add (a) what a "licence" is; (b) how one may find out how to apply for it; (c) cost of licence; (d) can one proceed to supply without either licence or provisional order; (e) I presume that overhead wires are subject to Board of Trade regulations whether one works under provisional order, licence, or without either (the latter if possible)?

As to (a), "Another Inquirer" will find the last word about licences in Sec. 3 of the Electric Lighting Act, 1882. In Will's Law of Electric Lighting (1912), p. 73, it is written: "No licence is now in force, and an application for a licence will not be entertained by the Board of Trade except in very special circumstances. The object of a licence was experimental, and electric lighting has long passed the experimental stage." A provisional order is, therefore, applied for when power is sought to supply electricity for lighting and other purposes.

As to (b) and (c), see Sec. 3 of the Act of 1882, *supra*.

As to (d), supply without licence or provisional order is legitimate: but if a supply is already being given under licence or provisional order by a company or local authority, no other person can supply, unless his business is not primarily that of supplying electricity (see Electric Lighting Act, 1909, 9 ed. 7c. 34, Sec. 23).

As to (e) the reply (to use a familiar Parliamentary expression) is in the affirmative.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & CO., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

THE interesting paper read by Messrs. Pearce and Ratcliff before the Institution of Electrical Engineers, at four centres, brings before us again the conflict between the gas and electricity departments of the Manchester Corporation, a Titanic struggle which has raged more or less fiercely for 20 years. Seeing that some corporations owning electricity supply undertakings, but not gas works, have been known to favour electricity for street lighting even when an unduly high price was charged for it, we are not disposed to reproach the Gas Committee for retaining the street lighting in its own hands as long as possible; but we have no doubt that the citizens of Manchester have paid, not only in money, but also in time, convenience and reputation, many times over for the questionable privilege of gas-lighted streets, and the fact that their great city is universally shunned by all who can contrive to do their business elsewhere is probably due in great part to the funereal gloom with which its streets have become firmly associated in the minds of its visitors. It should be borne in mind by those responsible for lighting parks, and other public decorations or ornaments, that a city develops a "character" just as truly and inevitably as an individual; it may be a good one or a bad one, cheerful or gloomy—but whatever it be, the mental impression is linked with the very sound of its name, and traffic is diverted towards or away from it according as the impression is attractive or the reverse. It is the duty of the public representatives to remember all these things, and to lose no opportunity of improving the character and raising the status of their community. Fortunately for Manchester, the Corporation has at last realised the futility of expecting impartiality and altruism from a Gas Committee, any more than from an Electricity Committee, and has appointed a new Street Lighting Committee to deal with the subject without bias towards either illuminant, seeking only the best results for the benefit of the public.

The authors in their paper (of which we commence an abstract in this issue) give data which amply justify the report of Mr. Haydn Harrison on the same subject, abstracted in our issue of November 1st, 1912. It will be remembered that Mr. J. Abady, who carried out tests at the same time, also agreed that the gas lamps were giving an illumination far below their rated candle-power, and that electric lighting came out the cheaper; he held that the efficiency of the gas lamps could be greatly increased, but if so, why was it not done? The Gas Department had as free a hand as the Electricity Department; "each was to do its best," say the authors, and the result is an emphatic and unanimous verdict for the flame arc.

While we hail this result with satisfaction—though it is no more than we expected—we may point out that by no means the last word has yet been said on the subject of the arc lamp for street lighting. In point of fact, by their

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION

Ready.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

careful tests the authors have revealed defects in the ordinary design of shades or reflectors and globes, and have shown that these may have a very marked effect upon the uniformity and efficiency of the illumination obtained. In passing, we are inclined to regret that they have imported into a subject already sufficiently complex and involved a new factor—a suggested standard height of 5 ft. for these measurements; the proposed international standard is one metre, which is in general a very convenient height and enables results to be compared with greater confidence than when they have to pass through a conversion process beforehand. Even yet, it appears, the authors have not completed their investigations, but it is clear that certain definite conclusions can be drawn from the work already done—the central suspension is to be preferred; partially frosted globes are practically as effective as dioptric globes; and flame arc lighting has nothing to fear from high-pressure gas lighting, either on the score of cost or on that of uniformity of illumination.

The authors have also demonstrated very plainly the primitive condition in which the design of arc lamp globes remains, and the remarkable improvements that can be effected by simple means; it is surprising that greater attention has not been devoted to this subject by the makers, for the requirements of lamps for street lighting have been understood for many years. No doubt, in view of the results set forth in this useful paper, suitable changes will be quickly effected, doing away with the drawbacks in question.

#### The German Electrical Industry in 1912.

ACCORDING to the report of the Association of Electrotechnical Special Works, which claims to represent practically the whole of the industry apart from the three or four huge undertakings, the year 1912 was favourable to the special works, which were again able to secure an increase in the turnover. This was accomplished without any corresponding addition to the number of workmen, as the improvements introduced in manufacturing enabled the firms to satisfy the greater requirements. The course of business was chiefly stimulated by the erection of overland stations, the large demand experienced from industrial establishments, and the rapid extension of electric lighting in private dwellings. Nevertheless, the financial results did not always keep pace with the volume of trade, this being due to the sharp advance in the prices of copper, brass, lead, porcelain, &c.; and the extra charges which some branches impose as a condition in connection with contingent rises in the cost of materials, were only able to offer partial compensation. Concerning the larger turnover in 1912, it is mentioned that this principally applied to the domestic market, the export trade participating to a lesser extent. The exports to Italy suffered from the effects of the war in Tripoli, and those to the Balkan States from the war in that region. It is considered in this connection that the German firms must make still greater efforts in order to be able to meet the native electrical works, rapidly developing under the protection of high import duties in Italy, Austria-Hungary, Russia, and in the Scandinavian countries in general, and Sweden in particular.

After these general observations the report proceeds to deal with the different branches of the industry. In the case of electrical machinery, the interested works all experienced good sales. Unfortunately, however, the extra charges made for rises in materials were only applicable to types of over 5 H.P., as the large firms excluded the smaller machines, which are of great importance to the special works, from any improvement in prices. The cable department was satisfactory, as the effects of the cable

syndicate guaranteed the obtaining of profitable prices, although the level of prices was depressed in many cases by the operation of foreign competition. With reference to the very unfavourable rates realised in 1911 for insulated wires, the report points out that an improvement in this direction was effected in the spring of 1912 by the formation of a price convention, whilst a price syndicate for insulating tubes, the manufacture of which had long been unremunerative, was also constituted towards the end of 1912. On the other hand, the department for meters continued to suffer from inadequate prices, especially owing to the endeavours of the large firms to obtain possession of the supply works of communal authorities.

A slight improvement took place in the arc lamp branch. It was found possible to relieve to some extent the pressure exerted through the operation of the tax on lighting appliances by the introduction of new types of arc lamps having a longer lighting duration, although the tax continued to render business in arc lamps difficult in the home market. The competition of high candle-power metallic-filament lamps, which had unfavourably influenced the arc lamp trade until a short time ago, seems to have reached a parting of the ways, as it is shown that arc lamps still offer undisputed advantages over wire lamps in many cases. The glow lamp department also continued to labour under the disadvantages of the lighting tax; not only on account of the difficulties which the tax causes to the works, particularly the small glow lamp factories, but also because of the exceptional injury which has recently been inflicted on the export trade. In explanation of this remark, it is stated that both the United States and Canada have now for some time past included the glow lamp-tax in the German market value, which is based upon *ad valorem* duty, so that the rates of duty on glow lamps of German origin have been increased and have a prohibitive effect. The manufacture of measuring apparatus suffers from the depression in prices caused by the erection of new works of small size, and the makers of apparatus for heavy currents and of installation materials also complain of unfavourable prices, especially for staple articles. In conclusion, the report refers to the continuance of the monopolistic efforts put forth by the large manufacturing establishments.

#### Steam Raising Extraordinary.

It has often come within our province to deplore the ignorance of the ordinary newspaper writer, as exhibited whenever he has had to describe any mechanical contrivance, or otherwise enter upon engineering ground. Of late years some of the daily papers have professed to run an engineering page or two every week. But some of the effusions which grace the engineering columns of the daily Press are painful to read. In the *Standard* of March 11th, for example, there is what purports to be a description of a new system of boiler feeding which preserves the water-level constant. We are not finding fault with the appliance, for, to begin with, the description of it is too meagre to enable either praise or blame to be awarded. But we do object to the verbose, bombastic language of the article. A steady feed is desirable, but its attainment is not a novelty. There are many ways by which it has been, and may be, attained. But reasonable and small variations of water level are not accompanied by those horrible symptoms of engineering indigestion which our daily contemporary works up into a veritable witches' cauldron of disease to be exorcised by the engineer, surgeon or physician. These appeals to human ills and the medical profession, as applied to engineering matters, are out of place.

Engineers who read these florid and overdrawn descriptions are prone to disregard even the good things to which such misplaced language may have been applied. The daily Press should surely be able to secure the services of writers who, with a knowledge of technics, combine the ability to employ plain and simple descriptive language when dealing with mechanical subjects. We have all long ago sickened of the "extraordinary," the "revolutionary" and the "unprecedented" by which some writers think to goad up public interest in even the most trivial of improvements or the worst forms of perpetual motion.

## NEW TYPE OF TRAMCAR.

The new type of tramcar, illustrated herewith and now in use in New York, offers several interesting features, among which attention may first be called to the very low platform level secured by the use of the special bogie-trucks shown in fig. 2. From the passenger's standpoint, this alone is a most important innovation, and one which is confidently expected to reduce considerably the present annual number of accidents occurring when mounting or descending from cars.

The longitudinal members of the car framework must generally be about 1 m. above street level, over the wheels, in order to clear the latter, but there is no reason why the chassis should not be sunk between the bogies, and this has now been done, as shown in fig. 1.

The new car is carried by a bogie (with one motor and one trailing axle) at each end, passenger doors being arranged at the centre of each side of the vehicle. The side frames of the bogies and the side members of the chassis are so arranged that the floor of the car is as low as possible

FIG. 1.—NEW TYPE OF TRAMCAR.

while permitting free rotation of the bogies on curves of 40 ft. radius. The driving cabs are elevated and partitioned off from the remainder of the car. The leading dimensions of the new cars, which seat 51 and provide standing room for 32-40, are as follows:—

Length over buffers	...	41 ft.
Length between end partitions	...	34 ft.
Overall width	...	8 ft. 3 in.
Overall height above rail	...	9 ft. 6 in.
Height of step (passengers')	...	10 in.
Height of floor in body of car	...	1 ft. 4 in.
Height of floor in driver's cab	...	2 ft. 8 in.
Internal height of car	...	8 ft.
Minimum height above rail	...	7 in.
Width of double side doors	...	3 ft. 10 in.
Distance between bogie centres	...	29 ft.
Distance between axles	...	5 ft.
Diameter of driving wheels	...	2 ft. 6 in.
Diameter of trailing wheels	...	1 ft. 7 in.
Net weight of chassis	...	6·25 tons.

The transom of each bogie is mounted on inverted springs hung from the side frames of the truck, and a Westinghouse motor is mounted on each driving axle.

FIG. 2.—BOGIE OF NEW CAR.

The floor of the car consists of an angle-iron framework held by transverse angle-irons, to which are riveted the 3-mm. side plates. The principal cross-beams are 152 × 89/17·5 mm. and the joints to the longitudinal members are stiffened by riveted plates. The cross-beams are bent to suit the depressed floor of the car, and are connected to the buffers by double Z-irons. The latter, which are also bent to pass over the motors, carry the bearings for the bogie pivots.

The side doors are moved in or out of the recesses shown by pneumatic gear controlled by the conductor, who is seated on an elevated bench at the rear of the car. Eight top ventilators each provide the air supply requisite for ten passengers. The opening of the ventilators is automatically controlled by the car springs, so that the air supply is always proportioned to the number of passengers on board. In summer, additional ventilation is provided by opening the lower part of the side windows. Electric heating is provided, when required, chiefly by the controller rheostats.

## REVIEWS.

*Poems.* By E. L. HILL, M.I.Mech.E., A.M.I.E.E. London: The Electrician Printing and Publishing Co. Price 2s. 6d. net.

That an engineer may be an artist we know; but it is rarely that he breaks out into poetry, and when he does, we usually wish he didn't. But there are exceptions, and we are glad to include amongst them the author of this little book. Although a mechanical and electrical engineer, Mr. Hill does not drag technicalities into his poems; these are simple, and often touching, and though they are not highly finished, they bear the stamp of true and earnest sympathy with life. Some slight deficiencies of composition and punctuation may well be excused in view of the admirable sentiments which the author has embodied in his verses.

*A Primer of the Internal-Combustion Engine.* By H. E. WIMPERIS, M.A. London: Constable & Co. 1913. Price 2s. 6d. net.

This little book is intended for the use of students in their first or second years of study. It is well arranged, and commences with a table of useful constants with their initial abbreviations. Both British and metrical equivalents are given, and we welcome the metrical equivalent of the United States gallon, for it is too little known that the United States gallon is only about four-fifths the capacity of our 10-lb. imperial gallon, ignorance of which fact has, to our knowledge, worked injury to British interests. Some Americans are cute enough to sell, say, a 1,000-gallon article and let their motto be *Caveat Emptor*—Mr. Emptor buying the large number of gallons in ignorance of their less cubic measure.

But we must quarrel with Mr. Wimperis over his use of the bastard C.H.U., which, being interpreted, is the number of heat units per pound per degree Centigrade. Useful it may be, for we have seen it used in a report in such a way as to deceive the unwary. It is a constant which ought not to be allowed, and if, as may happen, an engineer may need to use a Centigrade thermometer when working with pounds, he ought to translate his results into one or other system, and not use such a likely deception as the Centigrade pound heat unit. The calorie and the B.T.H.U. are sufficient.

The author gives a brief historical résumé of the gas engine, and gives credit to Beau de Rochas for the invention of the so-called Otto cycle. It still puzzles many people to know how Otto could uphold his patent in face of de Rochas' earlier patent. But de Rochas was not the only gas engine inventor who did not profit from his invention, for Clerk, who invented the two-stroke engine, has only had the satisfaction of seeing it adopted in some of the best modern engines. Daimler and Diesel complete the history to date. There is a very brief section on fuels, after which comes Chapter II, an excellent chapter, only marred by the C.H.U. Why not have introduced the F. Calorie while on the job of multiplying these units?

Chapter III is a good exposition of the laws and properties of gases, especially the note on volumetric heat, so useful in gas-engine work.

The author describes entropy as a quantity which cannot be directly measured or simply defined. As a definition of entropy useful to the engineer whose ideas are usually

tied up to the P.V. diagram, we would suggest that entropy be defined as length on a diagram of energy of which the ordinates are temperature: just as the ordinary indicator diagram is defined as an energy diagram of which ordinates are pressure and length (or abscissae) is volume. This definition is really that given in this book at p. 34.

Chapter IV and V deal respectively with the ideal and the real engine, with its various mechanical details, but as in so many books, when the exhaust valve opens the gases lose their interest just where, in practice, they begin to give trouble and make themselves heard. When will the author arise who will tell us something of silencing and show how to silence an engine without loss of work? The author treats of the horse-power rating of petrol engines, but does not indicate what is the mean pressure on which ratings are based. Nor is the rotative speed named.

Fuels are treated more fully in Chapter VI, as well as gas producers, engine details in Chapter VII, and testing in Chapter VIII.

As a student's book, this is very good and clear.

*Winding Engines and Winding Appliances.* By MESSRS. McCULLOCH and FUTERS. London: Edward Arnold. Price 21s. net.

As mines deepen, the problem of winding becomes more important. The output of a coal mine is measured by the quantity of coal that can be raised at the shaft rather than by the capacity of the miners to get the coal. As mines deepen, the amount that can be raised per day must be reduced unless there is a corresponding improvement in winding efficiency. Winding involves the starting of a heavy load from rest, and its acceleration to, say, 2,000 ft. per minute, with final reduction to rest, also without shock.

Fortunately, for deep mines, the maximum speed can safely be higher than for shallow depths. Thus, any lift may be divided into three parts—acceleration, steady running, deceleration. The two end periods may be alike for deep and for shallow pits, but the middle steady run will be longer for deep pits, though not proportionately longer. A pit of 400 yards is wound, let us say, in half a minute. If it were 1,400 yards deep, there would be an additional 1,000 yards' run at maximum velocity, and if a maximum velocity of 1,000 yards per minute were allowed, this extra depth would demand 1 minute nearly, or a total time of 3 to a depth ratio of  $\frac{3}{2}$ .

The authors introduce the reader to the few main systems, including the cylinder drum, the cone drum, the flat rope, the combination cone and cylinder, the tail rope, and the Koepe systems.

All mine winding is based on the same principles: but in colliery work there is the advantage of long periods of work from one depth, whereas in a gold mine there are frequent changes of depth.

In winding the first requisite is the rope, which we are told had better be worked to death, and often replaced, than made heavy and lasting, for the rope is easily the main load in a deep mine; and the less its weight the less must be all other costs. This applies more especially when depths exceed 1,000 yards. Usually a factor of safety of 7 to 10 is employed. Thus in a 1,000 yards' pit the rope and its load will weigh close upon 5 tons if 1-in. diameter, and it will break at  $45\frac{1}{2}$  tons if of plough steel of 110 tons tenacity. Here the actual factor of safety is about 9. With a factor of 7 the rope would be only 0.835 in. diameter, and its weight 3,620 instead of 5,300 lb. For the first case a torque of 15,338 lb. is required. The authors work out the moments and negative moments with reference to the danger of over-winding, and so arrive at the heavily stressed rope and conical drum for deep mines, and more especially at the tail rope, whereby moments are kept statically equal. But the tail rope is limited to about 2,600 ft., because of its liability to sway and whip.

In their consideration of these various types of winding systems, the authors show themselves to be unbiased, pointing out the defects of all alike as well as the advantages, and thus greatly helping a mining man to select the best for any particular case. On the subject of electric winding, the authors see little in it on the basis of economy, as compared with direct steam winding, partly owing to the amount of

machinery necessary. But they do realise that electric winding with its regular speed minimises the tendency to dancing the cage and thereby seriously reduces the rope stresses. Is not this factor alone one of major importance in a process which is limited really by rope stresses? In any case, they condemn the conversion of old winders to electrical driving, for this plant must be new throughout. But with transmitted power from a central station for all purposes, electrical winding must surely be adopted. Yet the authors are not even sure on this point. The drum of an electrical winder may be a cylinder, thus saving the cost of the cone drum, for the difference of moment matters less to an electric motor with a powerful source to feed it.

Then tail ropes may be used to a greater depth than in the case of steam winding, for the rope surges less. Also speeds may be higher, which is an important item in deep mines, and though in the multiplicity of gear there is risk, experience does not seem to show such risk to have been great.

If the book has a fault it is that the authors see so far round all sides of every system that the reader is faced about from page to page.

Various examples are given of winding gears, electric and otherwise, with very full particulars, and in arguing out systems actual figures are used and very little mathematics.

Old belting and sheet lead are advised as a better facing for a brake than wooden blocks, but the belts must be of rubber, not of balata. And post brakes are better than hand brakes. Pit sheaves, if lined with wood, should not be done at home and exported. They should be done locally from indigenous timber. This is a practical point doubtless picked up in dry Australia, where imported articles of timber so seriously shrink on exposure to the parched atmosphere. Safety gears against overwinding on the illness of the engineman are described, and a special chapter is given to ropes, and is very good. Then there is a chapter on cages and safety hooks, &c., and guides, and another on cages and decking in coal mines. The whole is a thoroughly sound and practical treatise on the subject of winding, a subject of increasing importance, as mines become deeper and low-grade propositions become more common, for these require such a heavy winding tonnage to bring up with the pay stuff so many tons of dirt.

*La Télégraphie sans fil, la Télé mécanique, &c.* By E. MONIER. Paris: H. Dunod et E. Pinat. Sixth edition, revised and enlarged. Price 2 fr. 50 c.

This edition has been supplemented to bring it in accordance with more modern practice. Among the additions are descriptions of the uses which may be made of radiophares or shore stations giving directive transmission to enable ships to obtain their bearings and distances; methods of transmission giving musical notes; wireless telephony, &c. A special chapter is devoted to a description of the important Eiffel Tower station. Branly's method of producing mechanical results at a distance by means of Hertzian waves still forms a main feature of the work, but no special advances in this direction are recorded. They appear to be still very much in the air. Numerous other possible applications of electric waves are suggested, the author being evidently of a very sanguine turn of mind.

*Wireless Telegraphy for Amateurs.* By R. P. HOWGRAVE-GRAHAM. London: Percival Marshall & Co. Revised edition. Price 2s.

This interesting and useful little work for amateurs has been somewhat extended and improved since its first appearance.

The first two chapters are devoted to the outlines of the history and theory of wireless telegraphy, while the remaining chapters mainly concern practical methods so far as they are desirable for the amateur. In regard to the former part, the author is inclined to lay too much stress on absence of tuning in the early forms of Marconi transmitters. The earliest Marconi aërials consisted of elevated capacity areas which undoubtedly gave efficient syntonie transmission, but the receiver was not adapted to make effective use of the

syntonic properties of the transmitter. Such aeriels will ordinarily emit trains of waves with quite small damping, though there may be a weakness in selective properties arising from their tendency to produce shock excitation.

A point of criticism in regard to the efficiency of quenched spark transmitters may also be usefully referred to. The overall efficiency is said to be about 75 per cent., as against 25 per cent. for the unquenched spark. Possibly this is a fair statement so far as the production of energy in the aerial is concerned, and it is one which is commonly made. It does not follow that the radiation efficiencies are in this proportion, since the dissipative factor is made up of a radiative and a non-radiative part. The ratio of these two parts may be quite different in the two cases. The point is one which demands considerably more investigation than has yet been given to it.

On the whole the book is well suited to young amateurs, to whom it should prove a helpful acquisition, both from its simplicity and from its interest.

*Magneto and Electric Ignition.* By W. HIBBERT, A.M.I.E.E. London: Whittaker & Co. Price 2s. net.

The author, who is the head of the Physics and Electrical Engineering Departments of the Regent Street Polytechnic, has already written a book entitled "Electric Ignition for Motor Vehicles," but, in view of the way the high-tension magneto has practically displaced all other forms of ignition on automobiles, he has deemed the time appropriate to produce an entirely new work on the subject, on which, on the whole, he is to be complimented. He has set out with the object of endeavouring to impart to the ordinary non-technical motorist some idea of what goes on in connection with the production of the spark, the vagaries of which, in the early days of the motor movement, were the cause of much worry and anxiety, but which, in the hands of experts, has in modern times been so tamed as to behave with wonderful regularity, and, given a modicum of attention, with a minimum of trouble.

The introduction, which extends to 30 pages, will repay careful study, as Mr. Hibbert, in the method adopted of explaining the fundamental principles, has been very happy, his definitions being clear and striking, notably those explaining the difference between "electricity" and "a current of electricity," and his comparison of the human heart and its influence on the circulation of the blood, with the production of a mechanically-generated current of electricity and its distribution, most apt. Following the introduction is a description of a number of the best-known magnetos at present on the market, such as the Bosch, Eisemann, Simms, C.A.V., Mea, and Fuller. This section is useful so far as it goes, but if a motor-cycle type of magneto had been included, the book would probably have appealed to a much wider circle of readers.

Another useful chapter is that devoted to "gearing"; this deals with the relative speeds of magnetos and engine crankshafts, the firing sequence for motors with from one to eight cylinders and cranks being given, accompanied by diagrams. Seeing that, so far as motor-cars are concerned, the type has long been obsolete, the firing sequence of three-cylinder engines might, perhaps, have been advantageously replaced by that for the V-type of twin-cylinder motor now being largely used on cycle-cars. There is a good deal of other information in the book, which, while instructive to an extent, will not prove of much value to modern motorists and motor-cyclists, as, for instance, the description of low-tension magnetos with make and break inside the engine cylinders, a method which is no longer used on automobiles. A similar remark applies to the 40 pages (out of a total of 152) devoted to "Ignition by Battery and Coil," and "Faults in Cells," although the latter may serve a useful purpose to those owners of cars that have electric lighting installations fitted. The last chapter deals with dual or combination-ignition systems, with a brief reference to the Delco electrical arrangement for engine starting, lighting and ignition, as employed on the Cadillac cars. The promising future for arrangements of this kind—several new ones have lately been introduced—renders it desirable to embody as early as possible as much information as can be given of the different systems, and of the points that need

care and attention, and this section will doubtless be extended in the next edition.

Apart from the few points we have criticised, Mr. Hibbert's book leaves a good impression, and can be well recommended to motorists, particularly to those who drive and look after their own cars.—C. J. W.

*Applied Electrochemistry.* By M. DE KAY THOMPSON, Ph.D. London: Macmillan & Co., Ltd. 1911. Price 9s. net.

This book, unlike existing text-books treating of special branches of the subject, covers the whole field of applied electrochemistry and electrometallurgy, and, on that account, should prove very useful to students unable to consult a whole range of books or the original sources. Its special feature is a theoretical discussion of the scientific principles of each process before giving the description of the process as realised in practice, so that the closest possible connection is maintained between theory and practice, to the obvious advantage of both. A sound knowledge of chemistry is rightly assumed; a person with only a smattering of chemistry is in a position neither to understand nor to work efficiently modern electrochemical processes.

As already stated, the book covers practically the whole field of the subject, but the treatment accorded to the various branches is very unequal. Thus, while the chapter on the electrolysis of alkali chlorides is admirably clear and well covers the ground both on the theoretical and the practical sides, that on electroplating is so thin and superficial as to serve hardly any useful purpose. To a less degree this applies to other chapters in the book.

In the chapter on electrometallurgy of iron and steel there is no reference to the important subject of ferro-alloys. We think, moreover, that more attention should have been paid to the pure metallurgy of the subject. It is very strange how little it is realised, even by many practical electro-metallurgists, that an electric furnace is primarily a metallurgical apparatus, and it is on its merits as such, rather than on its electrical efficiency, that it will succeed or fail. Neither here nor elsewhere is sufficient stress laid on the all-important question of costs, which, in our opinion, should be brought before the student at the earliest stage of his technical career. If the simple principle were borne in mind that a new process will succeed not on account of its beauty, but because it does something more cheaply or better than it has been done before, the world would be spared much wasted effort and ill-spent invention.

In spite of these undoubted limitations, which, as a matter of fact, are unfortunately the common faults of nearly all technical books, Dr. de Kay Thompson has given us a very well-written and a very comprehensive text-book on a subject that is most difficult to write about both clearly and soundly. He has avoided most, if not all, of the pitfalls that abound, and his book is a welcome addition to the still scanty English literature on a subject which is every day becoming more and more important.

**Electric Arcs to Ignite Tunnel Gases.**—Large quantities of gas were encountered during the cutting of the aqueduct tunnel through the Santa Ynez range (California) for the water supply of Santa Barbara, and in order to dispose of this inflow, electric arcs were used to ignite the gas after firing shots in the heading. Specially designed open lamps were placed about 200 ft. apart in high points along the tunnel up to 150 ft. from the heading. Half an hour after blasting the arcs were switched into circuit (an ammeter at the switch indicating whether the arcs lighted or not). After switching on the lamps controlled from the tunnel mouth, the foreman and a mate advanced to another arcing station 3,500 ft. from the portal, and again switched on current. If no gas explosion occurred, the tunnel ahead was explored with safety lamps, and if no "pockets" were discovered, the inspectors returned to the in-by station, switched the arcs into circuit, and, leaving them alight, proceeded to the heading and placed torches at intervals of 100 ft. through the gas section. These torches were kept burning during the next shift, and four hours were occupied in testing before a heading gang was allowed to go on shift after blasting had been performed; apart from these testing intervals, work was continuous. The completed tunnel is 19,560 ft. in length.—*Electrical World.*

## CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## The Electro-Harmonic Society.

I was very pleased to read your footnote to the letter which appeared in your issue of March 7th. In order to anticipate criticism of my remarks, I will state at the outset that I smoke, drink, go to Bohemian concerts and am a Democrat—all in reason. But (and this is important) just as the strength of a chain is that of its weakest link, so the tone of any assembly is determined by the laxity of its rules.

Now I do not wish to say too much about what is, obviously, a delicate matter; but one of the privileges of belonging to the E.H.S. which a social or financial junior enjoys, is that he mixes with the seniors of his profession or industry. Once introduce smoking, and drinking will surely follow. Even then no harm would be done if all the members were seniors—but it is not necessary to push my argument to its logical conclusion. Suffice it to say that the majority of members, who like the present high tone of the E.H.S., and who can be in a lady's presence without feeling the necessity to smoke—would either resign or cease to bring their womenfolk.

Whilst it is true that we must move with the times, music halls and cinemas have not superseded theatres and concert halls. Similarly, Bohemian concerts need not supersede our ladies' nights, and those who prefer the former exclusively will find plenty of opportunities to gratify their taste.

Member, E.H.S.

## Electric Branding.

I should be much obliged if you could assist me, through the medium of your paper, in finding some manufacturer who has had experience of electrical heating of large-size branding machines for marking wooden box sides; the maximum overall sizes of the branding would be 3 ft.  $\times$  2 ft.

Any assistance that you could give me in this matter would be very much appreciated.

H. A. Nevill,  
*City Electrical Engineer.*

Wakefield, March 13th, 1913.

## Morse Signalling on Submarine Cables.

As a sequel to Mr. E. Raymond-Barker's article on Mr. Gott's discovery, and the observations made thereon by Mr. P. O'Neil and Mr. Fraser, will you give me leave to recall to the mind of your readers a telegraphic system of old date, viz., "The American Rapid Telegraph," patented by Messrs. Foote, Anderton and Randall, and described in some technical papers about the years 1879 or 1880. I, at that time, experimented with this system and was very much impressed with a most ingenious mechanical apparatus, invented to prepare the perforated slip, by means of which the currents were sent and changed in direction at each consecutive signal. Nevertheless, however great may have been the ingenuity of this mechanism, I do prefer incontestably (at least on lines with a return current) the method devised by Mr. Gott for realising this part of his discovery. It is not only as simple as it is elegant, but, above all, more electrical, sure, and much less expensive.

If I were not afraid to abuse the hospitality of your columns, I would add another souvenir: 25 years ago, an Italian inventor, the late Marquis Tommasi, had contrived a secret arrangement which appeared to me to be founded upon the same principles. His apparatus were locked up in a closed box, because intended for military purposes by Marquis Tommasi, who was convinced of the impossibility for a spy to decipher the signals fraudulently obtained either by means of a derivation, or otherwise—therefore, he was extremely amazed when I presented to him a correct slip obtained in such a manner with the help of two parallel

polarised relays and a Morse inkwriter, and he left very politely, but without further explanation concerning his invention.

F. Godfroy, Manager,  
*Compagnie Française de Câbles Télégraphiques.*

Brest, March 10th, 1913.

## The "Load-Factor" Question.

In fixing yearly contracts for the supply of current to factories, &c., on a load factor basis, I shall be glad to have the opinion of some of your readers as to whether the time element should be for, say, a certain number of days, the number of days run  $\times$  24, or the actual hours run by the factory.

Consumer.

## LEGAL.

## TRAMWAY ACCIDENT CLAIMS.

A ROAD accident, in which the driver of a phaeton, named Frederick William Betts, was seriously injured, was the subject of an action in the King's Bench Division, on Wednesday, March 12th. The L.C.C. as owners of the electric tramways, and Mann, Crossman & Paulin, Ltd., the owners of a motor lorry, were the defendants. On August 12th last the plaintiff was driving his employer's phaeton in the High Road, Streatham, when the brewers' lorry, while passing the tramcar, was struck on the hub of his wheel. The blow caused the lorry to swerve and collide with the phaeton, throwing the plaintiff out and pinning him against the wall, causing injuries from which he still suffers. The injury was not disputed, and the only question for the jury who tried the case was whether the tramcar or the lorry was to blame. A large number of witnesses were called by both the L.C.C. and the brewers, each of whom tried to cast the blame on the other, and in the result the jury found for the plaintiff, as against the L.C.C., assessing the damages at £300, and for the defendant in the case against Mann, Crossman & Paulin.—Judgment was entered accordingly.

A Court of Session action has been settled in which a vanman claimed payment of £500 as damages for personal injuries from Glasgow Corporation. While driving a van he was run into by a tramway-car. A payment has been made by the Corporation, which the pursuer has accepted, of £65 and expenses.

Sheriff Umpherston heard proof in the Sheriff Court in three conjoint actions against the Dunfermline Tramway Co. for damages in respect of personal injuries. Pursuers were a miner and an engineman and his wife, who were passengers. They each claimed £100. It was their contention that a car was being driven at such an excessive and dangerous rate of speed that it failed to negotiate a loop, and, jumping the metals, ran into an embankment. Defendants, on the other hand, stated that the car left the rails through some obstruction on the line, and that it was almost immediately thereafter pulled up by the driver. The driver, they state, drove cautiously and carefully while approaching the crossing. The hearing was adjourned.

## THE NATIONAL TELEPHONE CO., LTD., v. H.M. POSTMASTER-GENERAL.

THE Court of Appeal on 14th inst. decided to hear the appeal and cross-appeal from the decision of the Railway and Canal Commissioners respecting the purchase, on April 15th.

## DISPUTE ABOUT AN ACCUMULATOR SHED.

THE question whether a shed erected by the Metropolitan Railway Co. in Euston Road to hold accumulators for electric signalling, comes within an exemption of the London Building Act of 1894, although it is erected beyond the building line, was decided on Friday, March 14th, by Justices Channell, Bray and Coleridge in the King's Bench Divisional Court.

MR. MACMORRAN, K.C., who appeared for the Metropolitan Railway Co., said his clients had been convicted by a metropolitan magistrate for an offence under the London Building Act. It appeared that they were given power in their Act to erect a ventilator in the forecourts of two houses in Euston Road. That was at the time the trains were run by steam. When the railway was electrified, a system of electric signalling was installed, and the ventilator was removed and an accumulator shed erected. The County Council then alleged that the company had no right to erect the shed beyond the building line without the sanction in writing of the Council, and that they had been guilty of an offence. For the company it was contended that they were exempted by a proviso in their Act of 1866, and a section of the London Building Act. The magistrate, however, decided in the Council's favour. Mr. Macmorran argued that the mere fact that the ventilator was succeeded by an accumulator shed did not

after the fact that what was erected on the spot was something for the purposes of the railway, and although that was beyond the building line, it was exempted.

After hearing Mr. DALBY for the London County Council, the Court allowed the appeal, with costs, holding that the shed, as it held accumulators for electric signalling, was necessary for the purposes of the railway and was, therefore, within the exemption in the Building Act of 1831.

#### THE OSRAM LAMP WORKS, LTD., v. THE YORKSHIRE INCANDESCENT ELECTRIC LAMP CO.

IN the Chancery Division, on Friday, March 14th, Mr. Justice Swinfen Eady had before him a motion in the above action.

MR. LUNGE, who appeared for the plaintiffs, said that the matter had stood over until that day for the purpose of plaintiffs receiving the defendants' evidence. No reply to his clients' affidavits, however, had yet been received, and he would ask that the matter should be allowed to stand over again for the purpose of complying with a somewhat singular request. Plaintiffs' evidence was exceedingly succinct, and to the point on the question of infringement, but it was suggested that the defendants desired to send to Germany, where the filaments of the lamps in question were made, for the purpose of ascertaining whether there was any infringement or not.

HIS LORDSHIP: Is it another Osram lamp petition?—MR. LUNGE: Yes.

MR. FROST, for the defendants, said the filaments of the lamps complained of were made in Berlin by a well-known firm there. The defendants desired to make their evidence stronger, and to get it as complete as possible.

HIS LORDSHIP: When did you have the plaintiffs' evidence?—MR. FROST: About a fortnight ago. We have been in consultation with German manufacturers through their agents, and yesterday we reached the stage that they will demonstrate to us the process by which the lamps were made and permit us to take an independent expert with us.

HIS LORDSHIP asked why the defendants could not file an affidavit stating exactly what the process was. They could surely have done that in a fortnight.

MR. FROST said they thought their case would be stronger if they got independent evidence by means of experiments.

HIS LORDSHIP: Never mind the experiments; why don't they show exactly the way they are made? That could easily be done if the gentleman who makes the lamps were to file an affidavit.

MR. FROST said his clients were very busy communicating with the manufacturers.

HIS LORDSHIP: Do you mean they are busy making the lamps or making affidavits?

MR. FROST said they were busy preparing the evidence. The plaintiffs should have the evidence directly defendants had got it themselves.

HIS LORDSHIP said defendants could easily file evidence showing how the lamps were made; it need not be long.

MR. FROST: It will not be long, but we wish to make it quite clear that there is none of the mysterious water vapour.

HIS LORDSHIP: Set out your process in plain English!

MR. FROST: That is what we are going to do.

HIS LORDSHIP said he would let the motion stand over until the first motion day of next sittings, but the defendants must be ready then or, in the ordinary course, judgment would go.

#### WATSON, LAIDLAW & CO. v. POTT, CASSELS & WILLIAMSON.— APPEAL.

THE Second Division of the Court of Session last Friday disposed of an appeal in the action by Watson, Laidlaw & Co., 93, Dundas Street, Kingston, Glasgow, against Pott, Cassels & Williamson, Motherwell, for interdict against the infringement of pursuers' patent for improvements in centrifugal machines, and for £5,000 damages. Pursuers, having obtained a judgment on the question of infringement, the case was remitted to Lord Dewar to dispose of the question of damages. Defendants lodged a tender of £1,500, and the Lord Ordinary decreed against them for that sum in full of the conclusions for damages, found defendants liable in expenses to the date of the tender, and found pursuers liable in expenses since that date. Pursuers appealed against the finding as to damages. Lord Dundas, in giving the decision on the appeal, held it was fairly established that the loss of profits which the pursuers might have realised, if they had effected all the infringing sales of machines, 252 in number, amounted to very nearly £5,000. Considerable deduction must, no doubt, be made, but his Lordship thought £1,500 quite inadequate, and that the Court would not be treating defendants with any severity, but with some leniency, if it fixed the damages at £3,000. The other judges concurred in this opinion.

**Meeting of Creditors.**—A meeting of the creditors of WM. HENRY MICKLETHWAITE, electrician, of Belmont Terrace, Forest Road, Knarborough, and 12, Coronation Grove, Harrogate, was held at York on March 13th. The accounts showed gross liabilities amounting to £214, assets valued at £113, and a deficiency of £101. The estate remains in the hands of the Official Receiver for realisation.

#### RADIOPHARES NEAR BREST.

WHEN, in time of fog, luminous signals from lighthouses or ships cannot be seen, the risk of disaster on dangerous coasts is enormously increased unless warning code signals are dispatched and received by "wireless" from a coastal station. By noting the intensity of the signals received, an approximate idea of the distance from the sending station can be formed by a skilled wireless operator—particularly if the signals be continuously compared with those from another station situated at a second point on the coast. The installation of a Blondel orientation frame or a Bellini or Arton radiogoniometer on board a vessel enables the bearing of the latter to be determined fairly accurately with regard to two coastal stations. Were every vessel equipped with wireless transmitting apparatus, a more convenient arrangement would be to provide directive aeriels at two land stations, thus enabling the latter to

FIG. 1.

determine the bearing of any ship issuing inquiries, and then to communicate the bearing to the vessel. Even the simplest form of radiophare, emitting a pre-arranged code signal but employing and requiring no directive aerial, enables rough bearings to be taken by the navigator of a vessel, and prevents those radical misapprehensions which are so frequently the cause of disaster; the assistance thus rendered, supplements such information as is obtainable by sounding, dead reckoning and by listening for submarine signal bells, and it is more than probable that such radiophares—emitting signals capable of reception by all ships equipped with receiving apparatus costing only a few pounds, and capable of manipulation by any member of the crew—will soon be installed in as great numbers as light ships and houses are at present.

The French Admin. des Phares has lately installed radiophares at the entrance to the Port of Brest (see fig. 1), the equipment in each station comprising an alternator driven by a petrol or electric motor, an automatic transmitter and a suitable aerial. Referring to fig. 2, showing the general lay-out of a radiophare equipment, a Bôthéud alternator A (125 volts, 1 kcy. per second), enables resonance to be established once for all between the primary and secondary circuits of the transformer T (secondary pressure 10 kv.). A board mounted above M carries the requisite switch-gear and measuring instruments. The whole of the high-tension equipment is mounted in a glazed case with an automatic isolating switch on the door, so that the attendant is exposed to no danger. Four 30-kv. Moscicki condensers are used, and the spark gap E is composed of a brass tube and copper plate; the former is ventilated by a small electric fan v above the transformer. A motor-driven

\* It is not, however, to be expected that visual or any other signals at present in use will be abolished, even when the provision of radio-receiving apparatus is compulsory on every vessel. Fast elements of uncertainty must always enter into the problem of securing the safety of ships at sea, and every possible means must be adopted to attain this end. Luminous signals depend on no delicate receiving apparatus, if they can be seen at all; but they may become useless, almost at a moment's notice, owing to the formation of fog. Again, wireless transmitting and receiving apparatus has now attained to a high degree of reliability, but it is difficult to see how a certain considerable risk of derangement can ever be completely avoided in sets designed for use by unskilled men on small vessels. Under such circumstances, the most trivial defect may completely prevent the reception of radiophare signals, just as an "accident" of nature may render ineffective the most powerful lighthouses. Every safety measure must, therefore, be simultaneously adopted.

Blondel automatic transmitter\* is employed to make and break the small field current of the Bèthénod alternator, and the whole equipment operates automatically without any attention for at least 30 hours.

The International Radio-Convention, held in London last year, determined 150 m. as the maximum wave length, which should be employed by radiophares,† and the Brest aerial has been designed to transmit radiations of from 80 to 150 m. wave length up to distances of 30 nauts. As shown in fig. 1, the guy-cables carrying the

FIG. 2.

four radiating aerial wires are anchored to the platform of the existing lighthouse; the aerial remains suspended, and working can be continued, even should one of the guy-cables break.

The whole radiophare equipment described costs hardly as much as a wireless equipment for ships, and can be attended and operated by the present lighthouse staff. The equipment needed on ships to enable them to take advantage of this service costs from £14 to £16, and can also be used to receive time signals and weather reports from the Eiffel Tower and other stations which have now established a regular service of this kind.—*Génie Civil*.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Mining Telephones.

THE WESTERN ELECTRIC CO., LTD., of North Woolwich, have introduced a new pattern of mining telephone to comply with the requirements of the Home Office in gassy mines. The set, which

FIGS. 1 AND 2.—W.E. MINING TELEPHONE SET, OPEN AND CLOSED.

is illustrated in figs. 1 and 2, is a local-battery magneto set, enclosed in a heavy cast-iron case, which is neither airtight, gas-tight nor watertight. Special provision is made for the drainage of any condensed moisture, and an explosion-proof flange joint

\* Two contact makers are connected in series. In the present case, one contact is closed by a cam for 10 secs. at intervals of 30 secs., and the second contact is opened and closed continuously, and repeatedly transmits the code call of the station during the period in which the first contact is closed. By varying the control cams, an indefinite number of code-signals can be arranged, and there is nothing (beyond general undesirability), to prevent three contacts being used in series to provide more complex signals.

† In order that the continuous working of these stations should not interfere with other wireless work. At Ouessant a radiophare, is only 1½ miles from a public service station, the operation of which is, however, in no way affected by the 195 m. waves used by the radiophare.

prevents the transmission of flame from the interior to the surrounding atmosphere—this being the chief feature of the set. The transmitter is fixed on the cover, with a steel guard, and the receivers are mounted on rotary arms with short hinged tubes and earpieces. All the apparatus is so arranged that it can be removed from the set while it is in position, and the internal dimensions have been made as small as possible, to reduce the risk of explosion. The magneto generator is permanently bridged across the circuit and the only chance for a spark to occur is when the contact of the switch-book is broken on the completion of a conversation. The set is fixed to the support by steel plates screwed to the case, so that there is no danger of damaging the castings when driving or drawing spikes. Every precaution is taken to render the apparatus reliable and foolproof, and to provide for the replacement of parts by an unskilled attendant.

### New Fuse Box.

THE METALLIC SEAMLESS TUBE CO., LTD., Wigan Street, Birmingham, are marketing a new pattern fuse box, which is supplied single and double-pole, and tapped to receive ½-in. or ¾-in. conduit. The boxes are fitted with either single or double

FIG. 3.—NEW PATTERN FUSE BOX.

pole fuses, which are mounted on a small slate base with a dividing fillet in the case of the double-pole box, and fitted with pillar-type terminals for front wiring, with a capacity of 5 to 30 amperes.

## BUSINESS NOTES.

**Consular Notes.—Argentina.**—The British Consul at Buenos Ayres reports that the output of the German trans-Atlantic Electrical Co. during 1911 was as follows:—Light, 46,909,800 kw.-hours; power, 18,200,500 kw.-hours; traction, 63,718,800 kw.-hours; total, 128,829,100 kw.-hours. The returns of the same company for 1910 show a total of 97,927,900 kw.-hours. A syndicate of British, French, Belgian and American bankers is reported in the newspaper Press to have formulated a scheme for the building of an electric power station at Buenos Ayres for the supply of electricity for motive power and lighting purposes at prices considerably below those at present prevailing. A concession was applied for, which would bring the German monopoly of the supply of electricity to an end. The proposed contract stipulated that the plant should become the property of the Government at the end of 1957. Italian financiers are also said to be endeavouring to obtain a similar concession, the new company to be known as the Italo-Argentine Compania de Electricidad. The German company having their mains extended to every part of the capital, are naturally firmly established in this city.

The British Vice-Consul at La Plata reports that the British Electric Light and Power Co. inaugurated their new station on March 10th, 1912, and it was understood to be their intention to double the capacity of the station. The La Plata Electric Tramways Co., Ltd., are now laying rails from La Plata to the Port, thus giving an electric tramway connection, in addition to the railway service. There are several new concessions applied for by the existing tramway companies for the extension of their lines, the principal one being that asked for by the La Plata Electric Tramways Co., Ltd., for the outskirts of the city, and to connect up with the new station of the provincial narrow-gauge railway. The telephone wires in the town are now being put underground, and the area lighted by gas or electricity is being extended.

The British Consul at Buenos Ayres, reporting on the tramways of that city, states that although the streets in the centre of the town are only 10 yards wide, the excellent service of the Anglo-Argentine Tramway Co. runs in almost every street. The cars

are worked on single tracks laid along the side of the street within 15 in. of the narrow foot pavement, and receive their power from overhead cables. The car routes intersect one another at the end of every block of buildings, that is, at intervals of about 450 yards, and are undoubtedly a great source of danger to pedestrians. Blocking of the traffic in the centre of the town is of frequent occurrence, notwithstanding that the cars, as well as all other vehicles, are allowed to run in one direction only in each street, i.e., up one street and down another. With the increase in the population the congestion of the street traffic is becoming a difficult problem to deal with, and it will sooner or later have to be met by the adoption of either underground electric railways, or by a system of overhead tramways. A scheme has, in fact, been put forward by the Argentine Tramway Co. for the construction in the congested area of underground lines to work in conjunction with the present lines. The total length of tramway track is about 450 miles. The traffic receipts of the various tramway companies in Buenos Ayres during the first seven months of 1912 amounted to £1,886,100, representing the fares of 217,292,200 passengers. In 1910 and 1911 the traffic was as follows:—

	Passengers.	£
1910 ... ..	323,782,700	2,658,600
1911 ... ..	355,682,900	2,930,000

**Honduras.**—The British Consul in Honduras reports that at present all contracts for public works, all concessions for railways, &c., are given to United States contractors. The Government does not make public such contracts, and, indeed, does not even initiate them, but generally waits until some enterprising contractor makes suggestions and submits prices. There is no reason why British firms should not receive a part of the business. They should make themselves known to the Honduran Government, and appoint an agent in the capital to keep them informed of any likely business. This the Consul cannot do for obvious reasons, and principally because these negotiations are usually kept quiet until the contracts are signed.

The ports on the north coast have sprung so rapidly into being with the construction of railways that no doubt their importance has not yet been realised by British merchants. They would be well advised to send out representatives to examine the trade possibilities, which, although at present comparatively small, are likely to grow rapidly and to be of great importance before British merchants are able to get into the market. Our United States competitors are not only supplying articles which British manufacturers could supply if they took an interest in the market, but they are gradually learning to manufacture goods after the British style, although not so good in quality or so advantageous in price. Nevertheless the orders being small and the delivery from the United States more rapid, together with the total absence of British commercial travellers to show their goods and arrange terms of credit, the merchants very naturally take little interest in British trade. There is no doubt that British firms could, if they made an effort, regain a large part of the trade that has been lost. This is the opinion of a great number of merchants. But an effort must be made. It is not sufficient just to send out catalogues in English. They must be printed in Spanish, otherwise they are of little value; and at the best catalogues, unless followed up by commercial travellers, are little more than an unattractive bait to merchants who have long been used to the misrepresentations in foreign catalogues. Terms of credit, too, must be made attractive and such as to suit the exigencies of the local money market, which is entirely dominated by the banana crop. For example, when drought sets in or heavy winds blow down the crops, money is scarce and merchants are unable to meet their obligations punctually. United States travellers watch and understand perfectly the embarrassments of their clients, and consequently arrange to meet them half-way. There is no apparent reason why British manufacturers should not imitate their competitors and seek to manufacture that which suits the market at attractive prices, even if the particular article must be inferior in quality. The trade of Germany with the Atlantic coast of Honduras is small at present, but is likely to expand now in view of the new steamship service opened up by the Hamburg-American Line between Hamburg and Puerto Cortez. In June last an experiment was made by the company to carry bananas from Cortez to Hamburg. The venture was, it is said, a great success, and since then two other voyages have been made. It will, therefore, readily be seen what an advantage this will be to German trade, and British firms would do well to follow the example of their competitors.

**Catalogues and Lists.**—**MESSRS. GENT & CO., LTD.**, Faraday Works, Leicester.—Catalogue No. 12 (44 pages) containing illustrations, brief particulars and prices, of a variety of electric bells and telephone instruments for domestic, office, mining and other service; also indicators, batteries, cables and wires, and accessories. A hanging wall show-card is to hand illustrating their "Electromatio" telephones (automatic C.B. interphones). Further, we have received a copy of a testimonial from the rector and churchwardens of Ruardean Parish Church concerning the satisfactory service that is being rendered by a Gent electric clock installed three years ago in the church tower.

**MESSRS. NEVILLE & CO.**, Midland Electrical Works, Braebridge Street, Birmingham.—40-page art paper catalogue, giving illustrations with prices of a representative selection of electric light fittings—brackets, ceiling fittings, pendants, electroliers, hall pendants, lanterns, floor and netel standards, luminous and Bastian type radiators and advertising signs.

**INDIA-RUBBER, GUTTA-PERCHA AND TELEGRAPH WORKS, CO., LTD.**, Silvertown, E.—44-page well-arranged and fully-illustrated

catalogue of "Silvertown Instruments," including Morse and Wheatstone apparatus, sounders, portable testing sets, vibrators, lightning protectors, reflecting and needle galvanometers, portable batteries for testing sets, resistance boxes, the Appleyard conductometer, testing keys, condensers, switches and commutators, patent terminals, water-level apparatus, and numerous other manufactures of the same character.

**MESSRS. SIMPLEX CONDUITS, LTD.**, Garrison Lane, Birmingham.—Eight-page list (No. 477, catalogue section "W") giving tabulated particulars and prices of wires and cables, including the usual grades of vulcanised cables for electric lighting, flexible cords, and bell wires.

**THE SUN ELECTRICAL CO., LTD.**, 118-120, Charing Cross Road, London, W.C.—Thirty-six page catalogue (Section "S"), in which they give full information, with numerous illustrations, also photometric tests, and prices, concerning their "Sunlite" and "Sunline" reflectors. The contents in the main include wireless china, lineal, curved picture lighting, box, and other reflectors, window reflector signs, window fitting lighting accessories, indirect lighting fittings, outside lanterns, and metal and carbon lamps for same. The picture lighting reflector described, concentrates the light upon the middle portion of the picture where it is most desired. It is fixed at the top close to the picture, and can be decorated to harmonise with the frame or surrounding decoration.

**BRITISH ARC WELDING CO., LTD.**, Suffolk House, Laurence Pountney Hill, E.C.—Pamphlet describing the system employed (using an iron welding pencil instead of a carbon rod, so as to avoid a hard weld) in repairing ships' boilers, furnaces, frames, gears, &c., in position, with the aid of portable generating plant. Numerous illustrated examples of work done are given.

**THE BRITISH THOMSON-HOUSTON CO., LTD.**, Mazda House, London, E.C.—New edition of their folder "The Necessity for Scientific Reflectors" (S. 2,317), dealing briefly and popularly with the functions and advantages of a scientific reflector. The contents include description and prices of Veluria, Holophone and Mazdalux reflectors, also galleries and Mazda lamps. Folder No. S2,319 describes and prices the various types of "Veluria" reflectors. These have not long been on the market, but they are already widely used.

**MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD.**, Tyssen Street, Dalston, N.E.—Price list No. D7 (12 pages) giving illustrations, prices and other particulars of close upon 20 different designs of their rise and fall pendants for dressing rooms, &c.

**Trade Announcements.**—**MR. G. ELLAM** (who for some years has acted as branch manager of the supply department of the British Westinghouse Electric Co. for the London district) has been appointed assistant manager of the supply department at the company's headquarters at Long Millgate, Manchester. Mr. F. Rook (late of Messrs. Baxter & Caunter, London) has been appointed to succeed Mr. Ellam as London branch manager of the supply department at 179, Wardour Street, W.

**MESSRS. G. HARLAND BOWDEN & CO.**, announce that for greater convenience in their business, they are moving their offices from the City to Westminster. Their address is now 1, Victoria Street, Westminster, S.W.; telegraphic address, "Harbowdeco, Vic., London"; telephone number, "Regent 1009."

**Book Notices.**—*The Chemical Trade Directory, 1913.*—London; *The Chemical Trade Journal.*—This is the fifth edition of a very serviceable work, in which there are arranged both alphabetically and in classified sections, the names of chemical manufacturers, merchants, brokers and agents, and makers of chemical plant in Great Britain and Ireland. The closing section of the book (some 20 pages) contains a copy of the Alkali, &c., Works Regulation Act of 1906, an abstract of the Alkali Report for 1911, a statement from the Census of Production relating to the chemical trades, price diagrams of metals, chemicals, acids, &c., also tabular statistics regarding three years' exports and imports of chemicals and allied products.

"Science Abstracts." Vol. XVI, Part 2. February 25th, 1913. Sections A and B. London: E. & F.N. Spon, Ltd. Price 1s. 6d. net each.

"Transactions of the N.E. Coast Institution of Engineers and Shipbuilders." Vol. XXIX, Part 4. March, 1913. Newcastle-on-Tyne: The Institution. Price 5s.

"Transactions of the Institution of Engineers and Shipbuilders in Scotland." Part 5. 1912-13. Glasgow: The Institution.

"Journal of the American Society of Mechanical Engineers." Vol. XXXV, No. 3. March, 1913. New York: The Society. Price 35 cents.

**Patent Application.**—Application has been made by HARVEY HUBBELL for the restoration of patent No. 15,801 of 1901 for "Improvements in Holders for Electric Incandescent Lamps," which expired on August 6th, owing to non-payment of renewal fee.

**Dissolutions.**—**DEWHURST, TAYLOR & CO.**, mechanical and electrical engineers, Soho Works, South Street, Heywood.—Messrs. A. S. Dewhurst and J. Taylor have dissolved partnership. Mr. Taylor will attend to debts, &c.

**FLAMWELL & SHOTTON**, mechanical, and electrical engineers, Church Walk Works, Workson.—Messrs. T. H. Flamwell and E. W. Shotton have dissolved partnership. Debts, &c., are being attended to by Mr. Shotton, who, since January 1st, has carried on the business under his own name at the same address, and will continue to do so.

**Bankruptcy Notices.**—SAMUEL SMITH (Smith & Sons), Victoria Square, Widnes, "*Music and Musical Instrument Dealer*," *Electrical Engineer and General Dealer*.—Receiving order made March 10th at Liverpool, on debtor's petition.

MITCHELL, J. & F. (Fred. Mitchell & Co.), electrical engineers, Ardwick, Manchester.—First meeting, March 27th; public examination, April 25th, both at Manchester.

WILLIAM LONGDON and VERNON GEORGE COBB (trading as Longdon & Cobb), electrical engineers, 101A, Derby Road, Nottingham.—The adjourned public examination of the above-named debtors was held at the County Court House, St. Peter's Gate, Nottingham, last week. In answer to the Official Receiver, the debtor, Longdon, said that it was in August of last year that he first found that the firm was financially involved, and the trading losses during the 10 months totalled £250. Asked why he had continued to pay a money-lender 10s. a week after he had met his creditors, debtor said that some of his creditors had expressed the desire that he should go on, and if he had not paid, the money-lender would have taken all his assets. The Official Receiver said he thought that the examination of Longdon should be adjourned. This the Registrar ordered, while the examination of Cobb was declared closed.

JAMES WILLIAM LEWSLEY, electrician, 65, Brierley Street, late 103, Mansfield Road, Nottingham.—The public examination of the above-named debtor was held at the County Court House, St. Peter's Gate, Nottingham, last week, when the case was ordered to stand adjourned in order that an amended statement of affairs might be furnished.

**For Sale.**—The Ayr Corporation has for disposal a number of open-type A.C. arc lamps and accessories. Messrs. Fuller, Horey, Sons & Cassell will, on March 27th, sell by auction the electrical rolling stock used on the "All Red-Route Railway" at the Crystal Palace. See our advertisement pages in this issue.

**Battery Manufacture in France.**—La Société de l'Accumulateur Robust is the name of a new concern which has just been formed at Glos-sur-Lisieux (Calvados), with a capital of £16,000, to manufacture a new accumulator.

## LIGHTING and POWER NOTES.

**Acton.**—The Metropolitan Electric Supply Co. has sent in a tender of £25 for the lighting of the Acton Cottage Hospital by electricity, which very many members of the governing body are in favour of, regarding it as a great improvement on the present methods.

**Altrincham.**—The U.D.C. has received from the Altrincham Electric Supply Co. a portion of the scheme for the suggested lighting by electricity of Railway Street, Stamford New Road, and George Street. This consists of 41 lamps of 100 c.p. each, extending from the foot of the Downs to the junction of Barrington Road and Stamford New Road, the cost of the installation being given as £383. The matter is to be further considered at a meeting of the Highways and Lighting Committee.

**Arbroath.**—A proposal to work the dockgrates by electric power has been under the consideration of the Harbour Trustees, and recently a deputation inspected the electric motor gear at Kirkcaldy Harbour. On the ground that it would take "thousands of pounds to equip the Arbroath dockgrates similarly to those at Kirkcaldy," the proposal has been dropped.

**Argentina.**—The Compagnia Italo-Argentina di Elettricità is the title of one of the two companies which have obtained concessions in Buenos Ayres in competition with the German Transmarine Electricity Co. the other being the Lacroze Co., as previously mentioned in this journal. Originally formed as far back as October, 1911, the Italian company received the grant of its concession in August, 1912, and the plans of the power-station and distributing network are to be completed by the end of April, so that two or three years will have elapsed before the works are completed. The share capital is £440,000, and the undertaking will, therefore, be a comparatively modest enterprise which is said to reckon chiefly upon the custom of the Italian colony in Buenos Ayres. Most of the capital has been subscribed by Italians, the remainder having been furnished by Argentine subjects. Among the former are the firms of Pirelli & Co., of Milan, Franco Tosi, of Legnano, and the Tecnomasio Brown-Boveri, of Milan, who are said to have been induced to participate because Italian firms have no longer been given orders, as in former years, by the German Transmarine Electricity Co. These firms, which respectively make cables, engines, and generating plant, have assured themselves, by co-operation in the provision of the capital, of contracts of the value of £400,000.

**Ashton-under-Lyne.**—A startling discovery was recently made at the Corporation refuse destructor, which adjoins the electricity works. An employé, in delivering refuse to the destructor, discovered among the rubbish a 12-pr. lyddite shell, which, on examination, proved to be a live one. Had the shell reached the destructor furnace, there is little doubt that the plant would have been wrecked.

During the past month, 29 street lamps have been converted from gas to electric light.

**Barnsley.**—The Electricity and Lighting Committee has had under consideration a report by the borough electrical engineer, on the condition of the old mechanical stokers at the electricity works, and has decided that four of the original mechanical stokers be replaced by four Bennis sprinkler stokers, at a cost of £525, to be defrayed from the reserve fund.

**Bradford.**—The city architect has been instructed to arrange for the construction of an electricity sub-station at Odsal at the same scheduled rates as those for Thornbury sub-station.

**Bridlington.**—Owing to delay on the part of the L.G.B. in holding an inquiry into the Corporation's application for sanction to borrow £4,100 for the installation of a steam generating set at the electricity works, it has been necessary to hold a special meeting of the T.C. to consider the matter. Alderman Collins said the development of the town and the demand for current made it absolutely essential that they should have new plant, and though he did not anticipate that the L.G.B. would place any impediment in the way of the extension, if the Corporation were to cope with the summer demand for current, the work would have to be proceeded with at once. The Council unanimously decided to authorise the Committee to accept a tender of £2,867 for the plant required, and to accept the tenders for the installation.

**Bristol.**—At the last meeting of the City Council, Ald. Lloyd, speaking on the report of the Finance Committee, called the attention of the Council to the fact that in the matter of street lighting it was proposed, with the help of the Electrical Committee, to reduce the cost of electric lighting in the streets by £1,000 in the coming half-year, and stated that, no doubt, there would be a similar reduction in the following half.

At a meeting of the Sanitary Committee held later in the week, it was reported that a letter had been received from the City electrical engineer (Mr. H. Faraday Proctor) setting forth suggested alterations, which amounted to a reduction of the cost of the arc lamps by £2,000 per annum; and the conversion of some 700 gas lamps to electric lamps, to which the current would be supplied free of cost.

**Continental Notes.**—SPAIN.—A comprehensive scheme of water-power utilisation is now being carried out under perpetual concessions by the Compagnie Barcelonaise de Traction, d'Éclairage et de Force. The water-powers are located on the Rio Noguera Pallaresa, the Rio Segre and the Ebre, and are capable of furnishing 300,000 H.P., of which 137,000 H.P. is to be first brought into use by two large and two auxiliary stations. The Seros station, on the Rio Segre, will comprise four generators of a total of 56,000 H.P. and is expected to be set in operation at the end of the present year. In the case of the Los Tarradets station on the Noguera Pallaresa, there will be five generators with a total output of 70,000 H.P., and the work is to be completed in October, 1914. The two auxiliary stations are situated at Talam and at Pola respectively, and will yield 11,000 H.P., the latter being now finished. The stations of Seros and Los Tarradets, which are both 86 miles distant from Barcelona, will be connected with the latter by means of two transmission lines carried on steel standards, the current being transmitted at 110,000 volts to sub-stations in the suburbs of Barcelona. These lines are already in course of erection, and with their branches will have a total length of 228 miles, whilst the length of the secondary distributing network will be 210 miles at 25,000 volts, and 85 miles at 6,000 volts. It is definitely believed that the company will be able to meet all the power requirements in Barcelona and district, apart from the working of the tramways, which are already in the company's possession. During the past 12 months the company has secured contracts to supply 80,000 H.P., and it is expected that these will have risen to 100,000 H.P. when the first stations are brought into operation this year.

It is stated that an end has now been put to the ruinous competition which has existed for a long time past between the electric supply companies in Madrid, and which has only been of advantage to the consuming public in consequence of the very low prices charged for supply. It has now been agreed that the companies shall form two groups—the Electra and Giamberi on the one hand, and the Union Eléctrica on the other—and the receipts are to be pooled and divided in equal shares. A joint committee of inspection consisting of eight members has been constituted, and the chairman of each group will occupy the presidency of the committee in alternate years. The tariff, which had fallen to 1.92d. per kw.-hour under the effects of the competition, has been raised to 5.76d. The agreement is for a term of 60 years, and it is expected to be extended shortly so as to include the Hidro-Eléctrica Española and the Hidráulica Santillana.

FRANCE.—A new company has lately been formed in Paris (159 Boulevard Pereire) with a capital of £20,000 and the title La Société Électrique de Saint Priest et Extensions.

RUSSIA.—It is reported that the Moscow Electric Co. has acquired a large deposit of peat in the Bogorodsk district, and proposes to establish a large generating station near the same, with the object of transmitting the current generated to the city of Moscow.

**Crumpsall.**—At a meeting of the Manchester B. of G. recently, the clerk reported that the L.G.B. had sanctioned an installation of the electric light at Crumpsall Workhouse at a cost of £4,755, and also the borrowing of £4,300 for carrying out the work, which has been let to a firm of Salford electrical engineers.

**Darlington.**—Unlike some municipal electricity undertakings, that at Darlington has always been able to show satisfactory results. Up to the end of 1911 the total capital expenditure on generating plant, mains, &c., was about £82,000. The total capacity of the plant, including the batteries and allowing one set for traction and one set as spare, is about 1,900 kW., and the maximum load during the present winter has exceeded 1,800 kW., which is 50 per cent. higher than the maximum load of the previous year. For the nine months ended December 31st last, the output was 60 per cent. higher than that of the previous corresponding period, and for the year ending March 31st next it is anticipated by the Darlington Corporation's electrical engineer, Mr. J. R. P. Lunn, that the output will amount to over four million units. The bulk of this increased output has been taken by power consumers, but there has also been a large increase in the private lighting units. It is estimated that for the current year the cost per unit, excluding only interest and depreciation, will be less than 1d., in spite of the increased cost of coal. This will be the lowest on record for any undertaking with an output of less than ten million units per annum, and there are only five larger undertakings with costs lower than 1d. per unit. There are now 392 motors, representing 4,351 H.P., connected to the Darlington mains, and 14 of the large works in the town are being supplied with electricity for power purposes from the municipal station. Recently a supply has been given to the works of the Cleveland Bridge and Engineering Co., and in this connection and also owing to the fact that it is anticipated that, during the next 12 months, the output will increase by about 300 kW., it has been decided to install a 1,000-kw. turbo-generator, with rotary converters and condensing plant, and the cost of these, together with the necessary pipework, foundations and switchgear, is estimated at £7,770. In order to cope with the increased output, it has been decided also to provide a new boiler, which, including fittings, superheater, mechanical stoker, pipework, foundations and setting, will cost about £1,460. There will also be provided an additional feed pump to the two boilers, which will supply the new turbo-generator, and the cost is estimated to be £130, and of two superheaters, including the pipework, £230. An additional coal storage, of 1,000 tons capacity, will be provided, at an expenditure of £470. Accordingly, contracts have just recently been entered into with Messrs. Richardson, Westgarth for one 1,000-kw. turbo-alternator; with the British Westinghouse Co. for one 750-kw. and one 250-kw. rotary converters; and with Messrs. Babcock & Wilcox, for one water-tube boiler. Application is being made to the L.G.B. for a loan of the afore-mentioned amounts, as also for £530, the cost of a new fuel economiser, recently installed; and for £8,000 for prospective expenditure on mains and services; and for £1,500 for static transformers for supplying alternating current at high pressure and thus reducing the cost of the large power mains.

The Council has decided to fit penny-in-the-slot meters in houses where required, the charge being at the rate of 4½d. per unit, including the supply of metal-filament lamps to consumers.

**Edinburgh.**—The Electric Lighting Committee has considered a communication from the Colinton Tramway Co. asking on what terms the T.C. would give it a supply of energy for resupply to Redford Barracks. The company's order entitles it to get a supply of electricity at the boundary for the tramway at the same price as charged ordinary consumers. It was understood from the application for a supply that the company desires afterwards to sell it at its own price. To that attitude objections were expressed by members of the Committee, and the town clerk is to write to the company and the military authorities pointing out the objections. It is stated that the view is that the Corporation should, if possible, supply the lighting direct to the barracks.

**Farnworth (near Bolton).**—The Electricity Committee has decided that the price of electricity for lighting purposes be reduced, from April 1st next, to 4½d. per unit, subject to a discount of ½d. per unit if accounts are paid within 21 days. It was also resolved that power consumers of 2,000 units and over per quarter be allowed 10 per cent. of the same for lighting and other purposes, current for lighting in excess of this quantity to be charged for at lighting rates.

**Hereford.**—An inquiry has been held by the L.G.B. relative to the application of the Corporation for sanction to borrow £1,600 for the installation of electric pumping machinery at the waterworks. It was stated that the adoption of the scheme would have the effect of converting the electricity undertaking into a profitable concern, owing to the increased supply of current when the load was lightest. Some opposition was raised, an expert being called, but the Corporation officials declared he was taking a fictitious basis of calculations, and one which was out of date. A petition containing 317 names was put in against the scheme, but several of the chief objectors merely desired the scheme postponing in order that the merits of another make of pump should be considered. The Inspector, however, refused to admit discussion of this pump. It is proposed to use the existing plant as a stand-by, and it was urged by the promoters that if the £1,000 on the cable were not sanctioned, an expenditure of £800 would have to be made to meet the increased demand for current and light.

**Holmfirth (Yorks.).**—The Electricity Committee, last week, reported to the District Council that the Yorkshire Electric Power Co. had declined to supply electricity in bulk, and has recommended that an engineer be instructed to prepare a scheme

for the generation of electricity for the town. The Council already has powers of distribution, and has decided to invite competitive schemes from engineering firms.

**Kirkcaldy.**—The Harbour Committee of the T.C. is considering the substitution of electric light for the gas lighting at the harbour. From figures submitted it appears that for three recent months gas cost £69, while mantles for the same period cost £35. In view of this, the borough electrical engineer is to submit estimates for electric lighting.

**Lowestoft.**—The T.C. has decided that from the current March quarter the charge for energy for power shall be 2d. per unit up to a consumption of 2,000 units per quarter, and 1½d. beyond. The charge for private lighting is to be increased to 5d. per unit, with 5 per cent. for prompt payment of accounts, and the charge for incandescent outside shop lighting is to be increased to 2s. per quarter per fitting.

**Lytham.**—The interesting contest for the right to supply electricity to Lytham between the Lytham D.C. and St. Anne's D.C. reached its final stage on March 13th, when a B. of T. inquiry into the applications was held. Years ago Lytham Council possessed powers to supply electricity, but transferred them to a private company, which did not proceed with the scheme. Within the last two years another effort was made by a local company to supply electricity, but owing to the poor public response the company dropped the scheme. Following this came an application to St. Anne's Council from residents in Ansdell to supply them with electric light. In view of this move both Councils almost simultaneously applied for the necessary powers.

Mr. W. Fielden, of Lytham, presented a petition, signed by 270 ratepayers, against the Lytham application.

Mr. Browne, in presenting Lytham's application, said anyone who had gone over the district would be convinced the area afforded an exceptional field for the supply of electricity. He read a letter from St. Anne's Council offering to supply electricity within the Lytham district at 1½d. per unit for 75,000 units, 4d. per unit for 100,000 units, and at the same proportionate rate down to the minimum of 3d. per unit. In addition, he proceeded, Lytham was to pay the cost of the order. Lytham Council thought the prices were too high, and in January, 1905, entered into an agreement with Messrs. Foote & Milne to carry out the supply of electricity within Lytham. Messrs. Foote & Milne got the necessary order, but they did not proceed, and the order lapsed. The order was revoked in April, 1912, and immediately afterwards the Council took the matter into its own hands. The Board, he claimed, should give preference to Lytham. He did not think the tramway company was in a position to put up a generating station for its own supply. The site of the proposed generating station was near the railway station, and the Council was bound by contract never to put up a chimney and not to use steam upon the site. The proposal was to use Diesel plant.

Mr. J. H. Tonge, engaged to prepare Lytham's scheme, said the first year he estimated the receipts at £2,500 and expenses at £3,000; in the second year, receipts £3,500 and expenses £3,400; and in the third year, receipts £4,300 and expenses £3,600. The profit in subsequent years would continue to increase.

The inquiry was continued on Friday. Mr. Browne called Mr. Robert Hammond to give evidence in support of Lytham's application.

Mr. J. Ainscough, chairman of the Lytham Council, said it would be most objectionable that the powers asked for by St. Anne's should be granted. He believed if the works were erected at Lytham they would get many customers.

After additional evidence on similar lines, the Lytham case was closed.

Mr. Askworth, for the tramway company, said it had been advised not to take current from Lytham under any circumstances. It had power to supply its own current, and would erect a station. If the order was granted to Lytham, the latter would never supply the company. St. Anne's came to the aid of the company with electricity when Lytham was unable to supply, and the company was compelled to go to the expense of putting mains down in Lytham.

The St. Anne's case was presented by Mr. Hutchinson.

**Newport (Mon.).**—In view of the extremely heavy capital charges of the undertaking, and of the proposals for extending the plant, the erection of offices and stores at the east power station has been postponed, and the application to the L.G.B. for sanction to borrow the estimated cost of such buildings withdrawn.

The lighting of Commercial Street is to be improved, and, as an experiment, central suspension lamps are to be used. A total of 56 lamps in various parts of the borough are to be converted from gas to electricity. The question of extending the plant at the electricity works, at an approximate cost of £12,974, is under consideration.

**North Yorkshire Water Power Schemes.**—*The Morning Post*, in a recent article, points out that many of the small villages in the North Riding are going straight from the use of candles and oil to electricity. This is due to the abundance of streams in the Yorkshire Dales, and an inquiry addressed to secretaries and others connected with these undertakings has elicited some interesting facts. A number of schemes are still in embryo, but of those in actual operation special mention is made of the installations at Grassington, Hawes, Askrigg, Kettlewell, and West Burton. All have been organised locally, and the proprietors are, in most cases, if not all, inhabitants of the places supplied. Reference is made to the scheme being adopted at Kettlewell, where, at a cost of £260, it is proposed to provide a supply for 77 buildings, and about 400 lamps.

**Rishton.**—The Council has considered a letter from the Accrington Corporation in regard to the supply of electricity to the Rishton Paper Works, and has decided that it cannot consent to the Corporation's supplying electricity within the Rishton district.

**Romford.**—The U.D.C. has declined an offer made by Mr. W. T. Pressland, to transfer, when obtained, his Electricity Provisional Order, on payment of a consideration, provided that the Council would consent to the order being granted.

With reference to the application of the County of London Electric Supply Co. for a prov. order for electric lighting in the rural areas, the R.D.C. has practically arranged terms, except on the question of maximum price and damage for severance on purchase. The company has expressed willingness to forgo damage on severance provided the Council is willing to take a supply in bulk for a period of 15 years, if it desired to purchase the undertaking after the expiration of the statutory period.

**Ruthin.**—The T.C. has appointed a Committee to go into the question of an electric lighting installation for the town.

**St. Anne's-on-Sea.**—At the March meeting of the U.D.C. the electrical engineer reported that for the year there was an increased sale of 58,000 units, and that the number of consumers was now 1,251, against 1,104.

**Sidmouth.**—The sum awarded in the arbitration for the purchase by the Council of the Sidmouth gas and electricity undertaking is £34,654; an additional £8,500 represents costs and other expenses incurred in the proceedings.

**Southampton.**—Arrangements have been made for the supply of energy to the proposed factory on the Western Shore, subject to the lessees taking all energy from the Corporation for 15 years, with a minimum consumption for the second year of 500,000 units, for the third year 600,000 units, and for the residue of the term 750,000 units per annum, at £25d. per unit from midnight to half an hour after sunset, and 15d. from half an hour after sunset to midnight.

**Stockton-on-Tees.**—The T.C. is considering a scheme, suggested by the electrical engineer (Mr. J. J. Smith) of municipal maintenance of consumers' lamps.

**Sunderland.**—At a meeting of the T.C. on the 12th inst. Alderman Bruce moved the adoption of the report of the Electricity and Lighting Committee. This recommended that the minute passed by the Council, adopting a scheme for paying off the balance of the outstanding loans on the disused steam-generating plant be rescinded; that the L.G.B. be informed that the Council, in accordance with the request in the Board's letter, has reconsidered the scheme for extinguishing the debt on the superseded plant, and has decided to sell such plant, and to undertake to pay off the outstanding debt thereon within a period of five years from April 1st, 1913, and, further, that the proceeds of the sale together with interest thereon be paid to a separate "Superseded Plant Account" until such time as the balance of the outstanding loans have been met, and that meanwhile the profits of the electricity undertaking be carried to a reserve and renewals fund. Mr. Bruce said, if they accepted the tenders they had received, and supplemented the amount received by an annual sum of £520 from the yearly profits, it would wipe out the whole of the outstanding debt in five years. Mr. R. J. Wilson, seconded the report. Mr. Lawson said it was an unpleasant surprise to hear that the electricity undertaking now recognised the advantage of a reserve and renewals fund. They had always been given to understand that this was met by the sinking fund. The report was adopted.

In connection with the sale of the plant, it is stated that offers have been received from eight firms for amounts totalling £7,250.

**Swinton.**—The Tramways and Electricity Committee have decided to offer current to the Highway and Street Lighting Committee for street lighting at 1½d. per unit, for all-night burning, provided that each lamp is of not less than 80 watts capacity. This offer has been accepted. Subject to certain conditions the Committee resolved that current be offered to shopkeepers and others for outside lighting on the following terms:—For consumers using current at the alternative rate, 1s. per quarter for 63-watt lamp, and 1½d. per unit; for consumers using current at the flat rate, 2½d. per unit plus meter rent.

Experiments are to be tried at various points with electric street lighting, preparatory to a considerable extension of the system along the local tram routes.

The L.G.B. has sanctioned the borrowing of £600, repayable in 15 years, for the supply of electricity in Broad Oak Park. The Electricity Committee has been empowered to accept suitable tenders for the extension and for the supply of materials.

**Taunton.**—The Council has decided, on the recommendation of the E.L. Co. to apply to the L.G.B. for sanction for a loan of £2,500 for new plant at the electricity works.

**Truro.**—At the B. of T. inquiry held respecting the application by the T.C. and the Gas Co. for prov. orders for electric lighting, it was stated that the Gas Co.'s scheme was estimated to cost £7,535, and the estimated profit after four years was £494. Mr. A. E. Brooks, manager of the Ascot Electricity Co., expressed the opinion that it was extremely doubtful whether anyone, apart from the Gas Co., could make electricity pay in Truro.

**Troon (Ayrshire).**—The T.C. has instructed the clerk to ascertain the probable cost of obtaining an Electric Lighting Order, with power to transfer the same to a company.

**Tynemouth.**—It has been decided to reduce the lighting tariff as follows:—Flat rate from 4½d. to 4d. per unit; demand system from 5d. and 2d. to 5d. and 1½d.; arc lamp rate from 3½d. for a 6-ampere arc to 3½d. per hour. The engineer estimates that this scheme will entail a reduction in profits of approximately £660, but, if not put in force until the second quarter of the ensuing financial year, this sum would be reduced to £600. It is estimated that the profit of the present year's working will amount to about £1,250, which will go towards the paying off of the deficit (£1,600) still remaining on the undertaking. The Tynemouth Traction Co. have decided to postpone taking action in the matter of severing the electrical connection between the Tyneside Co.'s rails and their own rails until the matter has been discussed between the Corporation and the company. The carrying out of this scheme will, it is stated, entail considerable readjustment of matters on the part of the electricity department of the Corporation.

**Uruguay.**—The directors of the State Electric Light Stations have presented their report to the Finance Minister on the working of the various stations during 1912. The increase of subscribers was 1,050, of incandescent lamps installed 69,818, and 1,411 new motors, equivalent to 8,113 H.P. The output for the stations in 1910-11 was 12,266,410 KW.-hours, and in 1911-12 15,281,410, and from July 1st to December 31st, 1912, 11,209,771 KW.-hours. The net profits for 1910-11 amounted to \$556,566.26, and for 1911-12 to \$725,350.60. A considerable decrease was made in the tariff during the past year for power purposes. Amongst the new works carried out in 1912 were 151,778 m. of subterranean cable for both high and low tension, 145,870 m. of aerial lines and 13 new substations.—*Review of the River Plate.*

**Wakefield.**—The City Council has entered into an agreement with the West Riding C.C. for the supply of electricity to the County Hall and the extensions thereto.

**Whitehaven.**—The T.C. has decided that in future in the case of wiring of consumers' premises for connecting heating and cooking apparatus to the mains, the length to be supplied free should be limited to 25 ft., and that the consumer pay cost price for the excess, provided that on the termination of the agreement the excess payment be returned, less 10 per cent. for each year's use.

**Whitworth.**—The U.D.C. has received from the B. of T. an intimation that the question of revoking the E.L. order, 1905, is deferred until April 17th next. The Council has appointed Mr. H. Wilkinson, electrical engineer to the Radcliffe U.D.C., as consulting electrical engineer in connection with a scheme for which a loan of £5,000 is being sought.

**Worcester.**—At a recent meeting of the Council, the Electricity Committee recommended the Council to enter into a contract with the British Insulated and Helsby Cables, Ltd., to purchase from it all cable the Council required for three years. The contract came before the Council for the second time. Several members had previously said that the Council would prejudice their interests by accepting the contract. Mr. W. Sharpe contended that the bargain was a bad one. He believed a ring had been formed among the makers of cable, and the Corporation should try to buy outside it. Members who had hitherto voted against the contract, now said they were satisfied that it was an advantageous one. The Committee's recommendation was adopted.

## TRAMWAY and RAILWAY NOTES.

**Bradford.**—The general manager of the City tramways (Mr. C. J. Spencer) has reported upon the working of the revised system of fares from the time of the change on May 1st last year to December 31st. The revision fixed fares on cars boarded before 9 o'clock in the morning at 1d. for every 1d. stage, instead of the previous arrangement of 1d. for any distance. This, of course, reduced the fares for short-distance passengers, but increased those of some of the longer distances. The report shows that, dealing with the hours before 9 a.m., the car-mileage has increased upon that of the corresponding period of the previous year by 92,738, the receipts have decreased £2,394 (2'09d. per car-mile), and the passengers have increased 2,439,095, or 2'44d. per car-mile, an increase of 49 per cent. Notwithstanding this the receipts, it is seen, have decreased 11 per cent. At 7'428d. per car-mile the operating cost of the additional 92,738 car-miles was £2,870, so that, in the eight months, the experiment has cost the department £5,264. The traffic after 9 a.m. has yielded an increased car-mileage of 113,687, an increase of passengers of 64,893, a decrease per car-mile of 0'32, an increase of receipts of £4,345, and a decrease in receipts per car-mile of 0'10d. The additional car-miles have cost £3,520, leaving a net profit on this traffic of £825, instead of £4,345, which would have accrued had not the car-mileage been "pushed up somewhat unnecessarily." Traffic for the whole day shows that an increased mileage of 206,425 has been run, the increase in receipts being £1,951. The Tramways Committee, after receiving the report, decided to continue the present arrangement to the end of the 12 months' trial.

**Chile.**—The Chilean House of Deputies has authorised a new call for tenders for the electrification of the first section of the State Railways. This section comprises the line from Valparaíso to Santiago, a distance of 117 miles, and the branch line from Las Vegas to Los Andes, a distance of about 28 miles. The waters of the River Aconcagua will be utilised to generate the power required.—*Board of Trade Journal.*

**Continental Notes.**—**ITALY.**—It is stated that the Società delle Forze della Maira has just concluded an agreement with the Italian State Railway authorities for the supply of power for the working of the Gliovi auxiliary line between Ronco and Sampierdarena (Genoa). This power supply company's hydro-electric works on the Maira, near Dronero, in Piedmont, will be completed in a few months, and have a capacity of 50,000 h.p., and power will also be furnished later on to the Mont Cenis line, as the power station of the city of Turin, near Chiomonte, which is provisionally giving a supply, will eventually be inadequate for the purpose. It is understood that the Minister for Railways has under consideration the extension of electrical working on the State lines. Among others, it is proposed to convert the Riviera railway, between Ventimiglia and Genoa, and the power would be delivered by the Società Negri, which has already undertaken to furnish the energy for the Savona-San Giuseppe railway. Various transformations are also projected in Central Italy, including the Bologna-Florence railway, which climbs to an altitude of 3,250 ft.

**RUSSIA.**—Application has been made to the Russian Government for a projected electric railway between St. Petersburg and the Finnish frontier. It is proposed to utilise the water power of the River Vonoksa in the generation of the necessary electrical energy. The cost of the proposed line is estimated at 2,950,000 roubles.

**Douglas.**—It was reported at the meeting of T.C. that, for the quarter ended December 31st last, there was a deficiency on the tramway receipts as compared with the expenditure, of £1,422. A motion to increase the fares on the cable tramway was negatived, as was also a proposal to purchase a motor-bus, at a cost of £1,000, to run the service to the Peel Road district.

**Dunfermline.**—Negotiations are at present proceeding between the T.C., the superiors of the new Rosyth area, and the tramways company regarding tramway extensions. At a meeting of the T.C. it was stated that there was every probability of the tramways being extended to Milesmark during the summer. The question of 4d. fares has been brought before the tramway authorities.

**Edinburgh.**—The Tramways Committee is to ask power from the T.C. to negotiate with the Colinton Tramway Co., and, if thought necessary, with the War Office. The Committee has had an offer of sale from the company of the whole of its undertaking. Formal intimation was made that the company had resolved to apply to Parliament for a prov. order for powers to make a line from Slacelford, via Fountainbridge to the centre of the city.

**Gower.**—At Swansea on March 13th the Light Railway Commissioners held an inquiry into an application for power to construct a light railway in the Gower Peninsular. There was no opposition, and all the public bodies interested supported the application, with the sole exception of the Glamorgan County Council. The Commissioners intimated that an exceedingly strong case had been made out, and subject to satisfactory financial arrangements, they would be prepared to grant the order.

**Hove.**—Considerable correspondence has been going on during the past month between the Hove and Brighton Councils in reference to a suggestion from the latter that a conference should be held to consider the system of overhead equipment to be adopted for the "through routes" in the two towns, which, under the Brighton Corporation Act, of 1912, and the Hove Corporation Act, of 1913, should be completed within two years from August 7th, 1912, together with other works necessary for running the vehicles. The Hove Corporation appointed a sub-committee to meet Brighton, and expressed the opinion that the conference was somewhat premature, on the ground that, unless the B. of T. sanctioned double-decked cars, it would not be of interest to either borough to carry out the trolley system, and also that, owing to recent developments, it should be open to the conference to discuss matters on a broader basis than those indicated. Except the conference was upon these lines, the sub-committee did not see its way to attend for any other purpose. To this Brighton replied that its representatives were appointed specifically to attempt to agree on the system to be adopted for the purpose of its Act and the Hove Act. It appeared, the letter continued, that Hove had appointed its representatives to deal with an altogether different matter, and, under the circumstances, in default of its carrying out of the provisions of Sec. 16, Brighton would submit a system for the approval of Hove. On this letter, the Traction Committee of Hove states that it is still quite prepared to confer with delegates from Brighton but it must be on a broader basis than that suggested, and under these circumstances, it has decided to make a full inquiry into the matter and let the question of a conference stand over for the present.

**Ilford.**—The tramways general manager has been authorised to purchase a quantity of tramway trolley wire, not exceeding two miles. The centre tramway poles in High Road, from Cleveland Road to Seven Kings Railway Station, are to be removed and re-erected on the footpath. The cost of this work is estimated at £450. The general manager expresses the opinion that, from the point of view of general traffic, he thinks that it

would be an advantage to have the poles removed, as there would be less obstruction to other vehicles in pulling out of the way of cars when necessary.

**London.**—The Metropolitan Boroughs' Standing Joint Committee has circularised all the London borough councils asking them to take action to prevent sanction being given to Clause 16 of the Metropolitan Electric Tramways (Railless Traction) Bill, 1913, which permits the use of trolley vehicles on routes not specified without the consent of the road authority being obtained.

**Morley.**—The B. of T. has extended, until December 31st next, the period for the completion of the whole of the lines authorised by the Morley and District Light Railways Order, 1901.

**Ramsbottom.**—There has been considerable delay in proceeding with the work of railless traction construction, but it was announced at the Council meeting last week that the firm who had been ordered to do the work had agreed to finish it by the end of July. The overhead equipment will then be completed, and, in the meantime, the furnishing of the cars and so forth is being gone into by the Council.

**Sheffield.**—A recommendation has been made that tramway facilities be provided for the residents of Uppertorpe, the intention being to lay rails from the Hillsborough section, up Albert Terrace Road and Oxford Street to Harcourt Road, where they will join the Walkley section.

**Southampton.**—It has been decided to equip the Corporation tramcars with meters for checking the waste of energy, and the offer of Ferranti, Ltd., has been accepted to supply sufficient meters to equip the whole of the cars on the understanding that at the end of six months they are to be purchased outright at £3 5s. each, or returned without expense.

## TELEGRAPH and TELEPHONE NOTES.

**Brazil.**—The Government has decided upon the erection of wireless telegraph stations at Fortaleza, capital of Ceará, and at Porto Murinho, State of Matto Grosso. The total amount provided is about £26,700. The construction of a special telegraph line between the Federal capital and the State of S. Paulo has also been authorised. The amount provided is about £26,700.—*Board of Trade Journal.*

**Canada.**—According to statistics published in the *Financier*, the telephone companies in Canada number 683, an increase of 146 during the year. In Manitoba and Alberta the systems are owned by the Provinces. The aggregate capital is \$16,276,851, an increase of \$6,232,869 over the previous year. The gross earnings of all companies in the year were \$12,273,620, operating expenses \$9,094,688, and net earnings \$3,178,987. The operating expenses were 74 per cent. of the gross. A total of 370,884 telephones are in use in Canada, equal to one for every eight of the population. Employees numbered 12,873, and salaries last year totalled \$2,659,641.

**Imperial Wireless System.**—The Advisory Committee appointed by the Postmaster-General has had before it representatives of Government departments and of those firms claiming to be able to carry out the work. It has also visited wireless telegraph stations under the control of the Government, and intends to visit other installations of importance in the United Kingdom and on the Continent.

**Italy.**—A second scheme has been submitted to the Government for the expenditure of a further sum of over £2,600,000 on the systematisation of the Italian telephone network, and for the construction of new international lines. Of the proposed new expenditure, £2,097,000 will be allotted to the underground cable network, and £537,000 to the installation of new overhead lines. The scheme is expected to be completed within a period of 10 years.—*Telegrafia e Telefonia.*

**Post Office Telegraphs and Telephones.**—According to accounts published last week (dated November last), the total expenditure on the telegraphs (including telephones) for the year ended March 31st, 1912, amounted to £6,906,898, while the receipts fell short of this by £796,457. The receipts included a sum of £201,964 in respect of royalties paid chiefly by the National Telephone Co., Ltd., which, of course, will not recur. Adding the annual charge on the purchase price of the telegraphs (£271,691), the total deficit was £1,068,148. The amount expended on the telephones amounted on March 31st, 1912, to £15,266,699. Besides £1,586,151 retained by the National Telephone Co. in part payment of the purchase price of their undertaking. The total deficiency since 1869 amounted to £20,889,529; if items of the nature of capital were excluded, this deficiency was reduced to £8,093,149.

**Sweden.**—The patent rights of the Nya A.B. Autotelefon Betulander Co. have been sold to the Marconi Co., except those for Sweden, for over 2,000,000 kronen. The sale includes the patents previously owned by the French exploiting company. Usufruct rights in Betulander's automatic telephone system are retained by the Swedish Telegraph Administration.—*Aftarskärden.*

**The Telephone Service.**—According to a recent announcement, the Postmaster-General will in future accept three months' notice of termination of contract for telephone service.

At a meeting of the Associated Chambers of Commerce last week, a resolution was passed expressing the view that the telephone service should be carried on as a commercial undertaking in the hands of a special authority, and asking the Government to appoint a Select Committee to consider the question.

**Trans-Atlantic Wireless Telegraphy.**—In reply to a question in Parliament, Captain Norton said that no licence had been given or promised to the Marconi Co. in respect of a further station for trans-Atlantic communication; but the company had been informed that the question of granting a licence for such a station would be considered when a final report had been received from the Select Committee on the contract for the Imperial wireless chain. It was understood that the company was proceeding with the erection of the buildings intended for such a station on a site in North Wales, but it had been warned that its action was entirely at its own risk. Subject to any considerations which might arise out of the recommendations of the Select Committee, and subject to reasonable conditions as regarded non-interference between the various stations, it would be the policy of the Post Office to grant a licence for this purpose to any British wireless telegraph company giving adequate proof of financial standing and technical competence.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" to-day.

**Belgium.**—March 29th. Municipal authorities of Ixelles-Bruxelles. Armoured cables necessary for the low-tension distribution service.

**Blackpool.**—High and low-tension cables and transformer switch pillars. See "Official Notices" March 14th.

**Bolton.**—March 27th. Materials and stores for the year. Mr. Samuel Parker, Town Clerk, Town Hall. See "Official Notices" March 14th.

**Bridgend.**—March 21st. One 400-K.V.A. steam alternator and accessories, for the U.D.C. See "Official Notices" Feb. 28th.

**Cairo.**—March 30th. Tenders are required for the machinery and accessories for the electric lighting of the town of Damietta. Provisional deposit, 2 per cent. of amount of tender: final deposit, 20 per cent. Particulars, Ministère de l'Intérieur, Cairo, Egypt.

**Carlisle.**—March 25th. Lubricating oils, greases, &c., and cables, for a year, for the City Electricity Department. See "Official Notices" March 14th.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" Feb. 21st.

**Dundalk.**—March 24th. Stores for a year, for the U.D.C. Electricity Department. See "Official Notices" March 7th.

**Germany.**—April 15th. The König. Maschinenbau Amt in Hanover. Tenders for four steam turbines, four three-phase generators, two transformers and a battery of accumulators.

**Gillingham (Kent).**—March 28th. Stores for a year. See "Official Notices" March 14th.

**Hornsey.**—March 31st. Natural draught cooling tower for the T.C. electricity works. See "Official Notices" March 14th.

**London.**—L.C.C.—April 3rd. Reconstruction and re-winding of seventeen 300-KW. synchronous motor-generators and three 500-KW. induction motor-generators. See "Official Notices" March 14th.

—April 2nd.—Electrical installation at the Avery Hill Hostels, Eltham, S.E. See "Official Notices" to-day.

**BATTERSEA.**—April 1st. Coal for a year, for the B.C. Electricity Department. See "Official Notices" March 14th.

**Peterborough.**—March 31st. 1,028 yards of cable, for the Corporation. See "Official Notices" to-day.

**Salford.**—March 31st. Stores, &c., for the Corporation Electricity Department. See "Official Notices" March 14th.

**Spain.**—The municipal authorities of Salvaleon (province of Badajoz) have just invited tenders for the concession for the electric lighting of the town during a period of ten years.

**Shanghai.**—April 3rd. Extra-high-tension and low-tension switchgear for sub-stations. See "Official Notices" March 14th.

**Stalybridge.**—4,500 yards E.H.T. three-core lead-covered cable. See "Official Notices" March 14th.

**Uruguay.**—March 29th. Five electric gantry cranes for Customs warehouses at Monte Video. B. of T. C.I. Department in London.

**Wigan.**—March 31st. Materials and stores for the Corporation Light and Tramways Departments. See "Official Notices" March 14th.

### CLOSED.

**Ashton.**—The T.C. has accepted the tender of Messrs. Switchgear & Cowans, Ltd., for high-tension switchgear.

**Australia.**—SYDNEY.—The *Australian Mining Standard* publishes the following list of tenders for electrical machinery and accessories that were before a February meeting of the Electric Light Committee:—

Storage batteries, motor generators, &c.—

N. Guthridge, Ltd.—Alternative tender, No. 1, Sec. B, £12,590; do., No. 2, Sec. B, £12,500.

Ferranti, Ltd.—Formal tender, Sec. C, £6,525.

Noyes Bros.—Formal tender, Sec. A, £39,311; do., Sec. B, £11,095; do., Sec. C, £2,122.

British General Electric Co.—Formal tender, Sec. B, £7,873.

Australian Metal Co.—Formal tender, Sec. A, £32,015; do., Sec. B, £6,247; do., Sec. C, £5,721; alternative tender, No. 1, Sec. A, £32,090; do., Sec. B, £6,343; alternative tender No. 2, Sec. A, £32,595.

Tudor Accumulator Co., Ltd.—Formal tender, Sec. A, £32,060; alternative tender No. 1, Sec. A, £32,770; do., No. 2, Sec. A, £29,030.

Siemens Bros., Ltd.—Formal tender, Sec. A, £32,350, Sec. B, £14,592, Sec. C, £6,342; alternative tender No. 1, Sec. A, £32,770; do., No. 1, Sec. B, £10,858; do., No. 2, Sec. B, £9,205.

Australian General Electric Co.—Formal tender, Sec. B, £11,847; do., Sec. C, £5,154; alternative tender No. 1, Sec. B, £10,247; do., Sec. C, £6,362.

Dick, Kerr & Co.—Formal tender, Sec. A, £32,090, Sec. B, £10,924, Sec. C, £6,825; alternative tender No. 1, Sec. A, £32,770, Sec. B, £10,924, Sec. C, £6,525.

Haas & Eggers.—Formal tender, Sec. A, £36,160.

D.P. Battery Co., Ltd.—Formal tender, Sec. A, £34,810.

Chloride Electrical Storage Co., Ltd.—Formal tender, Sec. A, £37,749; alternative tender No. 1, Sec. A, £34,593.

**Transformers.**—

British General Electric Co.—£1,020.

Siemens Bros., Ltd.—£1,160.

Australian General Electric Co.—£1,230.

Australian Metal Co.—£1,265 (informal).

**Maximum demand indicators.**—

Australian General Electric Co.—£165.

W. G. Watson & Co., Ltd.—£308.

**Arc lamp contact and suspension gear.**—

Lawrence & Hanson Electrical Co., Ltd.—£214.

W. G. Watson & Co., Ltd.—£215.

The same exchange states that the Prahran and Malvern Tramways Trust has accepted the tenders for trucks, wheels and axles, brakes and motor equipments for 16 new cars as follows:—

Trucks.—Noyes Bros. Pty., Ltd., at £67 5s. per truck.

Wheels and axles.—Noyes Bros. Pty., Ltd., at £24 17s. 6d. per set.

Magnetic brakes.—Australian Metal Co., at £40 per set.

Motor equipments.—Australian Metal Co., at £255 per set.

**MELBOURNE.**—P.M.G.:—

Seven rotary converters, £2,065.—Maritime Wireless Co. (Sbaw System), Ltd., Sydney.

**BRISBANE.**—P.M.G.:—

Glazed earthenware conduits, £1,894.—Brunswick Brick, Tile and Pottery Co.

1,416 tubular cross-arms, galvanised iron, £198.—E. Sachs & Co., Ltd.

15,000 wood cross-arms, 1s. 6d. each.—F. E. Barbat & Sons.

15,500 insulators, porcelain.—Theodore Zwicker & Co.

78 manhole covers and frames, £1 7s. 3d. each.—Balmer & Crowther.

**ADELAIDE.**—P.M.G.:—

0½ miles paper-insulated lead-covered cable, £1,070 per mile; 3½ miles, £882 per mile.—Siemens Bros. Pty., Ltd.

8 miles various ditto cable.—W. T. Henley's Telegraph Works Co.

**VICTORIAN RAILWAYS.**—

n.d. bare copper cable.—B.I. and Helsby Cables, Ltd.

Electric street railway and tramway crossing, £320.—Sewell & Gaskell.

**STATE RIVERS AND WATER SUPPLY COMMISSION.**—

One motor-driven centrifugal pump, &c., for Hopetoun, £184.—Robinson Bros. & Co. Pty., Ltd.

**Bridlington.**—The T.C., at a specially called meeting, unanimously approved the recommendation by the Electricity Committee that, subject to the approval of the L.G.B., in connection with necessary extensions at the electricity works, the tender of Messrs. Willans & Robinson, Ltd., for a disk and drum turbine, coupled to a tandem D.C. generator of Messrs. Brown, Boveri's manufacture, amounting to £2,867, be accepted.

**Bolton.**—The Bolton Electrical Co. has received the contract for installing electric light at premises at 121, Deansgate, Bolton.

**Burton-on-Trent.**—The tender of Messrs. Richards for installing electric light at Christ Church has been accepted.

**Heywood.**—The Electricity Committee has accepted the tender of Mr. J. Smith for repairs to the chimney at the electricity works.

**King's Lynn.**—The T.C., on March 12th, accepted the tender of Messrs. Holdsworth & Sons, Ltd., for a Lancashire boiler, economiser and steam and other piping for the electricity works, at £987.

**London.—KENSINGTON.**—The Guardians have accepted the tender of the Sun Electrical Co., Ltd., at £20 12s., for an annual supply of electric fittings. Five other tenders were received, at prices ranging from £21 18s. 2d. to £35 10s. 9d.

**STEPNEY.**—The B.C. Electricity Committee received the following tenders for a.i. chambers, pavement frames and covers for one year:—

J. Every	.. .. .	(recommended)	£69
E. & F. Wright	.. .. .		70
Carron Co.	.. .. .		88
W. Creighton	.. .. .		119

Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract for the supply of "Wotan" drawn-wire and carbon-flament lamps for the ensuing 12 months for the County of London Asylums.

**Sunderland.**—The T.C., on March 12th, accepted the following tenders on behalf of the Electricity and Lighting Committee:—

R.I. and Helsby Cables, Ltd.	—472 yd. low-tension cable.
W. G. Farrow & Co.	—Cast-iron troughs.
Brotherton & Co., Ltd.	—Pitch and thinning oil.
W. T. Henley's Telegraph Works Co., Ltd.	—Switch-pillar fuses, and 24 bifurcating boxes.
I. R., G. & P. and Telegraph Works Co., Ltd.	—440 yd. of 19.20 cable.

**West Bromwich.**—The T.C. has accepted the tender of Messrs. W. H. Bowter & Co., Ltd., for 10,000 tons of coal for the electricity works.

**Whitehaven.**—The T.C. has accepted the following tenders:—

Doulton & Co., Ltd.	—Earthenware troughs.
Dusse & Bitumen Co.	—Bitumen.
General Electric Co., Ltd.	—Electric lamps.
Verity, Ltd.	—Clear glass wall globes.
W. T. Henley's Telegraph Works Co., Ltd.	—Tapes.
R.I. and Helsby Cables, Ltd.	—Fuse boxes.
Ferranti, Ltd., the Bastian Meter Co., Ltd., and the British Thomson-Houston Co., Ltd.	—Electricity meters.

**Worcester.**—The City Council has accepted the following tenders in connection with the electricity undertaking:—

B.I. and Helsby Cables, Ltd.	—Cables required during the three years ending December 31st, 1915, at scheduled prices.
Heenan & Proude, Ltd.	—Extension of coal storage bunkers and existing elevator at Hylton Road electricity works, £380.
Stokes Bros.	—Builders' work in extension of boiler house at Hylton Road electricity works, £77.
E. Bennis & Co., Ltd.	—Bennis patent improved smokeless chain-grate stoker, £112.
Phoenix Dynamo Co.	—350-k.w. motor-generator, £690; the company to take out the 100-k.w. complete motor-generator set, which cost £475, and for which an allowance of £425 will be made. The balance of £265 will be provided by the sale of an old 120-h.p. engine and obsolete 75-k.w. alternator, and of part of the old copper now in stock.

## FORTHCOMING EVENTS.

**Association of Electrical Station Engineers.**—Thursday, March 27th. At 7 p.m. Meeting to form Birmingham branch, at the Y.M.C.A., Dale End, Birmingham. Meetings to form branches will also be held at Mechanic's Institute, Bradford, on Wednesday, March 19th, at 8 p.m., and at "Amalgamated Society of Engineers," Mount Pleasant, Liverpool, on Thursday, March 20th, at 8 p.m.

**Manchester Electro-Harmonic Society.**—Friday, March 28th. At the Albion Hotel, Manchester. Last concert of the season.

**Institution of Electrical Engineers (Scottish Section).**—Annual general meeting postponed from April 8th to April 15th.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

WITH regard to the Orders published in our last issue, those interested are requested to note that the arrangements announced for 21st inst. should have been omitted, that date being Good Friday.

## NOTES.

**The G.E.C. "At Home."**—Instead of their annual dinner, which has hitherto been one of the events of the electrical world, the directors this year decided to celebrate the twenty-fifth anniversary of the formation of the company by giving an "At home" to their numerous friends. The difficulty of accommodating so large a gathering was met by engaging the Royal Opera House, Covent Garden, for the evening, and on Saturday last the guests assembled there to the number of over 2,500. The proceedings took the form of an entertainment provided by a selected company of leading artistes and humorists of the day; the auditorium was furnished with small tables and was occupied by the male portion of the audience, while the rest of the house was devoted to lady visitors, of whom a large number were present. Members of the staff of the G.E.C. drawn from all parts of the country, and from various foreign and Colonial centres, acted as stewards, there being a steward to each of the 80 tables. Smoking was permitted in the auditorium, and abundant provision to this end was made, while an elaborate and appetising menu was served at the various buffets. The arrangements, which were in the able hands of Mr. H. Clifford Palmer as organising manager, were in every way all that could be desired, and nothing was left undone to ensure that every guest should, in the words of the wish expressed on the flyleaf of the programme, "Spend a very pleasant evening." The Chairman,

Mr. H. Hirst, with the Vice-chairman, Mr. E. G. Byng, the general manager, Mr. M. J. Ralling, and their co-directors, Dr. A. Ralling and Messrs. L. G. Byng and F. S. Sells, mingled with their guests, but there was no formal reception, and no speeches were made.

Amongst those present were most of the leading lights of the electrical world, including Mr. Duddell, President of the I.E.E., Dr. de Ferranti, Prof. Perry, Mr. Sumpner, Messrs. Sparks, Highfield, McMahon, Wright, Sheppard, Slingo, &c., as well as many distinguished representatives of the professions and Government departments, such as Sir George Moore, Sir John Taverner, Mr. A. Colefax, Mr. A. Walter.

The orchestra, under the direction of Mr. Herman Finck, needless to say, fulfilled its duties with the highest efficiency. The programme included items by Harry Dearth, the Sunshine Girls, Miss Wish Wynne, Mesdames Olga and Elgar Hudson and Eli Hudson, Miss Clarice Mayne and "That," Edmund Payne and Geo. Grosmith, Miss Ruth Vincent, Harry Tate, Miss Lydia Kysast and Theodore Kosloff and Barclay Gammon; all these, obviously, were sure of a cordial reception, and fully maintained their respective reputations; but without detracting from the merit of the other performers, we cannot refrain from expressing appreciation of the delightful feast of harmony, perfect in every detail, with which the audience were regaled by that charming trio, Mesdames Hudson and Mr. Hudson, which alone would have rendered the occasion a memorable one. Interspersed amongst the musical items were several series of bioscope pictures representing the various works of the company and the operations carried on therein, and we do not hesitate to say that these were amongst the most interesting features of the entertainment. The Witton staff at work and at play, the manufacture of the Osram lamp, the making of telephones, and a variety of other subjects, including the offices of the G.E.C. both at home and "all-round the world," were shown in quick succession, and the views bore telling witness to the wide scope of the company's operations and to the diversified activities of the multitude of workpeople to whom it gives employment. Altogether the entertainment was in the highest degree successful, without a single jarring note, and the company is to be congratulated upon the thorough and efficient manner in which it carried out this novel and original birthday party.

We are pleased also to offer our congratulations to the company on the completion of its first quarter century, a period which covers practically the whole history of electrical engineering apart from the telegraph branch. Starting on a modest scale, the company has continuously grown until it is now the largest electrical manufacturing company in the kingdom, with a capital of over 1 million sterling, and employing nearly 10,000 hands, while it has also established subsidiary companies in South Africa, Australia, New Zealand, India, South America, France, Belgium and Spain. It is capable of providing almost everything electrical, from the equipment of a generating station to an electric bell, and owns factories at Witton and Edgbaston (Birmingham), Salford, and London. A specially commendable feature of the company's policy is the care shown for the well-being of its employees, not only in the factories, but also outside them, provision being made for their entertainment and recreation, of which full use is made by the workpeople. Athletic grounds are provided for all the works and for the head office; at Witton, in addition to cricket and football, grounds are set apart for bowls, tennis and hockey, and a scheme is on foot for the erection of an institute or club house, affording accommodation for recreation and refreshment on a comprehensive scale. Social clubs have been organised at most of the works. The G.E.C. athletic clubs have attained distinction both in London and in the provinces, and the Lamp Works Fire Brigade has scored a long list of triumphs. The fortunes of the company are bound up with those of British industry, and we cordially wish that the completion of its second quarter century may find it in a position in every way as satisfactory, but many-times more prosperous even than the present.

**Electric Car-Lighting Competition.**—A cup value £50 for the best electric car-lighting installation in an R.A.C. certified trial has been offered to the Royal Automobile Club by *Country Life*, and accepted, a condition being that there shall be at least four entries for the competition. The judges will be the Technical Committee of the club. The following are the conditions of the competition:—

1. The whole equipment must be entered for trial and must be properly installed upon a car.
  2. The distance run upon the road shall not be less than 2,000 miles.
  3. All lamps (not less than two head-lamps, two side-lamps, and one tail-lamp) shall be alight at the same time and for at least six hours every day.
  4. The Technical Committee of the R.A.C. shall decide which of the performances as shown in the trials' certificates is the best.
- Entries will be received by the R.A.C. under the general regulations for certified trials, until September 15th next, any equipment entered before that date, and completing its trial before October 15th, 1913, being eligible for the prize.
- The following data (*inter alia*) will appear upon the certificates, and any equipment entered for a certified trial in order to compete for the prize will be subjected to such tests as may be necessary to obtain such data: (a) Full description of equipment entered, including battery and its fitting to car, together with weights of parts, and the wattage and candle-power of the lamps; (b) total distance run; (c) number of lamps expended; (d) wear of parts during trial and general condition after trial of the equipment, including accumulator; (e) the behaviour of the equipment at different car speeds on the various gears at Brooklands; (f) the convenience of the adjustments of the dynamo and control of the lamps.

**Ghent Exhibition.**—Preparations are advancing for this Exhibition which opens on April 26th. No less than 130 Congresses are to be held during the six months that it is open. Of these about one-half are to be international. Most of these 130 Congresses will last several days, and there will be occasions when as many as five will be sitting at the same time. But we are informed that there will be plenty of accommodation, for an indefinite number might find room in the great permanent building, the Palais de Fêtes et d'Horticulture, which is one of the most striking sights of the whole Exhibition. The span of its main hall is far greater than that of the Crystal Palace; the hall contains 3½ acres, and the second or small hall 2 acres.

Ghent is, as yet, not nearly so well known to the British public as it should be. To the business man it is the most thriving of Belgian commercial towns, the centre of Belgium's cotton and linen industries; to the general public, a city full of old monuments and relics of the day when, as capital of Flanders, the town was in the forefront of medieval commerce and warfare. But few business men even recognise the important part which Ghent plays to-day in Belgium's commercial prosperity. In addition to being a port, Ghent is a great and growing manufacturing town in the centre of Belgium. In the cotton factories there are twice as many spindles as in the whole of the rest of Belgium; Ghent linen factories employ yet more hands than the cotton; Ghent machinery is exported world wide. To build an hotel to hold 1,000 guests on purpose to prepare for the rush of visitors to the Exhibition, and then to pull half of it down again when the Exhibition closes, is one of the striking pieces of enterprise which the municipal authorities of the town have undertaken. The hotel is in no way a temporary structure, but brick-built throughout, and the remaining half will continue under the management of the town as a station hotel at the new railway station on the main line from Ostend to Brussels. This station, the Gare St. Pierre, may almost be described as an Exhibition enterprise too, for it is just on the edge of the grounds, and the work has been specially put forward so that it may be ready for the Exhibition traffic.

The special hotel is being built to provide rooms at a fixed and reasonable price for visitors. But apart from the erection of this hotel, a "bureau de logement" has been formed to inspect and classify all the private apartments available. The price of these, 3 fr., 5 fr., 6 fr., 10 fr., or 15 fr. for the night and breakfast, is also fixed by the bureau, so that the keepers of hotels and boarding houses will not be able to raise their charges to famine rates in the face of this competition. This bureau, which is not a business concern, and has no financial interest in the work, will have offices at both the railway stations and at the Exhibition, and on applying there, visitors will be given the addresses of vacant rooms at the price selected. As there will all have been inspected and priced by the Committee, there will be little trouble in finding suitable accommodation. In order to provide for the visit to the Exhibition of large parties from workmen's clubs and institutes, the Bureau has also hired a number of large halls, and is fitting them up, with the assistance of the military authorities, as dormitories where as many as 100 or 150 men can be lodged at a time. The charge for these dormitories will only be sufficient to cover the expenses, but arrangements will have to be made beforehand with the Bureau de Logement. Yet another fact which should prevent any great rise in prices in Ghent is the nearness of Brussels, Bruges and Ostend. Bruges can be reached from Ghent by train in 35 minutes; Brussels in 50 minutes; and Ostend in 60 minutes.

It is interesting to learn that a contract has just been signed by the Zeppelin firm and the directors of the Exhibition for a regular passenger service from Düsseldorf to the Exhibition grounds. The service will be maintained throughout the months of August, September and October, and the fare for the flight, which is about 130 miles, will be £14.

**Breach of Colliery Rules.**—At Heanor on 10th inst., George Maxwell, collier, of Dunstead Road, Langley Mill, was summoned by Henry R. Watson, manager of the Butterley Co.'s collieries, for a breach of the colliery rules on February 21st.

According to the report in the *Nottingham Daily Guardian*, defendant was employed at the Ormond Colliery, Looe. On the date named he opened an electrical switch and applied a piece of wire, which had the effect of making a short-circuit, which caused a flash. The colliery was one in which safety lamps had to be used and a great deal of danger might have been caused, not only to the defendant and his fellow-workmen, but to the mine. The wire was insulated at one end, and so caused no injury to the defendant, but it appeared to be a case of foolhardiness. Mr. Watson said the voltage was 650. If the wire had been wet or the insulation in any way defective, the defendant might have been instantly killed.

Mr. Robinson said the lights went out in the pit, and work was stopped for 10 minutes. Defendant, in pleading guilty, said he did not know what he was doing; he was "acting the fool." A fine of £1, with 16s. costs, was imposed, the alternative being 14 days' imprisonment.

**Parliamentary.**—PRIVATE BILLS.—It has been decided that the following, amongst other Bills, shall originate in the House of Lords: Bradford Corporation, Brighton Corporation, Central London Railway, City and South London Railway, Ely Valley Gas and Electricity, Hastings Tramways, Hove Corporation, Huddersfield Corporation, Leeds Corporation, Leicester Corporation, London Electric Railway, Metropolitan District Railway, Metropolitan Railway, Porthcawl and District Gas and Electricity, and Wimbledon and Sutton Railway.

Petitions have been deposited in the Private Bill Office against the following private Bills: Brighton Corporation, Central London Railway, City and South London Railway (numerous petitions in this case), Hastings Tramways, Hove Corporation, Leicester Corporation, London Electric Railway (11 petitions), Metropolitan District Railway, Metropolitan Railway (33 petitions), Wimbledon and Sutton Railway, Ely Valley Gas and Electricity, Porthcawl and District Gas and Electricity, London and South-Western Railway, Morley Corporation, Folkestone, Sandgate and Ilythe Railless Traction, Crowborough District Gas and Electricity, I.C.C. (Tramways, Trolley Vehicles and Improvements) (many petitions), Metropolitan Electric Tramways (Railless Traction), Mexborough and Swinton Tramways (Railless Traction), Western Valleys (Monmouthshire) Railless Electric Traction, Chesterfield Corporation Railless Traction, Rhondda Tramways (Railless Traction), Coventry Corporation, Southport Corporation, Tottenham and Edmonton Gas.

**Automatic Time Signals at Rugby School.**—An ingenious device, known as the "Universal" programme ringer, has been installed at Rugby School for the purpose of controlling the time-table of class periods, so that the sessions of the entire school are now directly regulated by the headmaster to the nearest half-minute of Greenwich time. The apparatus comprises a perforated band of thick paper, 10 in. wide, which passes horizontally over trains of brass drums, so that at the appropriate instant electrical contact is made through the holes in the paper between a spring pointer and the surface of the drum. Signals are by this means transmitted to ring electric bells in various parts of the building. There are two sets of eight electrically-insulated disks, each set mounted in fixed relationship on a spindle. One disk is reserved for operating a daily change of mechanism, and other disks are assigned to the separate days of the week, the correct wheel being brought into the proper circuit automatically by the above mechanism.

The whole mechanism moves, carrying the perforated paper roll forward, every 30 seconds, by means of an electro-magnetic impulse device controlled by a master clock, which at the same time operates secondary "Pulsynetic" electric impulse clocks in the classrooms and elsewhere. There are eight signal bells and nine "Pulsynetic" clocks in the school. A simple means of perforating the roll is provided, so that additions can be made to the time signals. Parts of the system can be temporarily cut out of service by means of local switches.

An entire change of programme, as, for instance, between summer and winter, is effected by changing the roll. Power to work the ringer is supplied by a battery of Leclanché cells, which need but little attention. The ringer has been working satisfactorily since October last, and was erected to the design of Mr. Hardy Parsons, managing director of Messrs. Gent & Co., Ltd., of Faraday Works, Leicester, whose firm carried out the work.

**Electricity in the Reclamation of Marshes.**—For peat getting by machine, a species of dredger is employed. In a special apparatus made by Messrs. Strenge (Oldenburg), the collecting tackle is driven through a worm and worm wheel from an electric motor, while a second motor drives the whole collector to and fro on a 13-ft. spindle. The wet peat collected is carried by a chain conveyor, from the trough into which it is first thrown, to an electrically-driven press. Thence the peat issues as a uniform pulp which flows along two troughs, and is distributed by electrically-driven "spreaders" over the surface of the drained land. The whole apparatus runs on broad heavy beams, and one of the motors it carries drives it forward in the direction of the channel to be dredged in the bog. The scattered peat-cake is (first by hand and then by an electrically-driven cutting machine), cut into sods which are superficially dried and collected in small heaps. When the peat is dried to about 30 per cent. moisture content, it is collected in trucks and hauled by a small petrol loco, to neighbouring works, where it is stored in bunkers, or immediately delivered to the stokers, according to the needs of the case.

Another method of peat getting is practised by Messrs. Dolberg. Labourers dig the peat from the bog and throw it into a conveyor trough, whence an elevator carries it to a machine in which two oppositely rotating worm shafts (driven by a 12½-h.p. electric motor) masticate the peat and deliver it through a mouth-piece, where it is cut into sods. The latter are then carried on timber frames to the drying fields. Such a machine will deliver up to 80,000 sods in 10 hours.

The Wiesmoore electricity works depends entirely on the combustion of peat for steam-raising purposes, and, incidentally, is rendering the community a valuable service by cultivating the bog land from which it collects its fuel. Main canals are cut, into which the bog water drains, and a system of tributary ditches and furrows is laid out, the drained areas being then sown with grass seed. The grass binds the soil together, and the smaller drainage furrows can soon be replaced by drainage pipes, which are then covered up. The reclaimed land is next ploughed electrically—a 50-h.p. motor, driving ploughing tackle, being supplied through high-pressure lines and a 60-k.v.a. transformer. After ploughing, the land is harrowed, rolled, manured and sown, electrical energy being used for power purposes throughout.

About 12½ acres can be ploughed, 25 acres harrowed and 37 acres rolled per diem. The cost of reclamation and cultivation averages £12 per acre. As far as possible, the reclaimed land will be leased in holdings of from 15 to 25 acres each, and the incoming population will be collected in villages, which will then form an admirable load for the electricity station. It is expected to realise 8½ per cent. profit from this overland scheme.—*E.L.Z. and F.W.M.*

**Lamp-making on the Cinematograph.**—On Monday afternoon at the studio of Messrs. Pathé Freres, Ltd., in Wardour Street, W., at the invitation of Messrs. Siemens Bros. Dynamo Works, Ltd., Dalston, we had the pleasure of attending a private exhibition of a film showing the processes of manufacture of "Wotan" and tantulum drawn-wire lamps.

We were privileged to make a tour through the different departments of the lamp works at Dalston without the usual discomforts attending works' visits. The various operations (hand and machine) connected with the preparation of the filaments, bulbs, and the fitting together of the complete lamps, also their subsequent testing, packing in cartons and dispatch, were shown with great effect. The strength of filament was demonstrated in several ways, including the suspension of weights therefrom, and the handling of cases packed for carrier, while from the illumination point of view a domestic scene illustrates the effects of such brilliant lighting upon an average household.

**Heavy-Service Lampholders and Adapters.**—Referring to the recent correspondence on this subject in our pages, Mr. L. Hamilton writes that he has just seen a new type of lampholder, which has been produced as a result of these letters. He says:—"As the invention is, I understand, now protected, I may say it is really an ordinary type of bayonet holder, but instead of the plungers being actuated by springs they are made solid with the terminals. The socket, which is screwed as usual on the outside, has straight slots instead of the bayonet type of slot, and the tops of the solid plungers are bushed with small balls of fine copper wire to form cushions, so as to make good electrical contact with the standard type of lamp-cap terminals. On the outside of the screwed socket there is a screw cap which consists of a screwed ring, very like the ordinary shade-carrier ring, and it has a plain tubular extension with an inwardly projecting flange at the end without slots, for gripping the pins of the lamp cap. In placing the lamp in position, the flange of the screw cap is first passed over the side pins in the lamp cap, the lamp is then placed in the socket, the side pins being in the slots in the socket, and the screw cap screwed home, when the lamp terminals are pressed hard on to the cushions on the solid plunger tops."

**Picture Palace Lighting.**—The Angel Picture Palace at Islington, which, we understand, is the largest and latest in London, is fitted throughout with Pope's "Elasta" wire lamps, ranging from 5 to 600 C.P.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS.—At the meeting on Thursday last, the president announced that in future, in order to make the proceedings more quickly available, especially to the provincial members, the *Journal* would be issued at fortnightly intervals (during the session only), in quarto size, without advertisements.

(BIRMINGHAM SECTION).—The sixth annual dinner was held on Friday evening last at the Grand Hotel, Birmingham. Mr. A. M. Taylor, chairman of the Section, presiding.

The toast of the King having been duly honoured, the chairman proposed the Institution of Electrical Engineers, pointing out that it had passed its 40th year, although he hoped it had not passed the prime of its life. It was thoroughly representative of the industry and very much alive. An active Council and President had combined to further its objects, and he took the opportunity of congratulating the President on having been nominated for a second year of office, which he was sure would be a successful one.

The President, in replying, referred to the steady growth of membership of the Institution, mentioning that the raising of the subscription had had the curious effect of increasing the number of applications for admission, as it had done once before, when there was no question of an examination in the future. He reassured those present as to the character of the proposed examinations, which would not be academic, but suited to practical requirements. The Institution had decided, probably at the end of the year, to issue the *Journal* fortnightly, and he hoped in this way they would keep more closely in touch with members scattered over the country.

To Major W. A. J. O'Meara fell the toast of "The Birmingham Local Section." He mentioned that a visit to Birmingham had been considered an essential part of his education as a Royal Engineer, and referred to various incidents in his active service on the Indian frontier, which showed the extent of Birmingham's trade connections, even in little known countries. The I.E.E. had followed the nation in the matter of colonising, and he thought there was something of military organisation in its arrangements. Mr. C. F. C. Shawfield briefly responded.

Prof. Gisbert Kapp proposed "Our Guests." He was very glad that Dr. Ferranti, who was one of themselves, was also a guest. Electricity was the handmaiden of every other industry, and it was well for them to welcome mechanical engineers, municipal representatives and others at their gatherings; he wished it were possible to offer the guests an electrical feast with speeches of telegraphic brevity. Dr. S. Z. de Ferranti said he was replying to the toast partly as a visitor, but more "because he always did it." As regarded their Local Section, he was reminded that Wolverhampton had had a good deal to do with his early career. In those days each arc lamp had its own dynamo, but a very big machine would run six arc lamps. He recalled having been sent out to light an exhibition at Wolverhampton in 1880, where a portable engine plant supplied four arc lamps and 40 incandescents, and where during the first week there was not a single evening without some kind of shut-down. He agreed that electricity was entering into every other industry, and thought that if the price of electricity

could only be reduced below a certain critical figure it was difficult to understand how the various industries could avoid the use of electricity. It would be greatly to their advantage in the future to turn all their coal into electricity.

After the toasts a short, but interesting, entertainment was provided, in which the efforts of Mr. J. Woodward at the piano, the recitations of Mr. W. E. Warrillow, and the conjuring of Mr. E. Hermann were greatly appreciated. Music was provided during the evening by the G.E.C. orchestral band, and the proceedings concluded with a vote of thanks to the Chairman, proposed by Mr. Maurice Solomon.

**INSTITUTION OF MECHANICAL ENGINEERS.**—The rules for graduation and associate membership examinations have now been issued. The first examinations will be held in October next, and afterwards twice annually. Intending candidates can obtain particulars from the Secretary, Storey's Gate, S.W.

**INSTITUTE OF MARINE ENGINEERS.**—The annual meeting of the Institute was held on March 7th. A net increase in the membership of 66 was recorded, bringing the total number on the roll up to 1,350. It was stated that the negotiations for the acquisition of a site on Tower Hill were now completed, the total amount subscribed to the special fund being £5,015; £197 was added to the revenue account during the year. Mr. Thomas L. Devitt was unanimously elected president for session 1913-14, Mr. Jas. Adamson hon. secretary, and Mr. Alex. H. Mather hon. treasurer.

**ILLUMINATING ENGINEERING SOCIETY.**—On Tuesday, April 15th, a paper on "Standard Clauses for a Specification of Street Lighting" will be presented by Mr. A. P. Trotter at a joint meeting of the Illuminating Engineering Society, the Institutions of Gas and Electrical Engineers and the Institution of County and Municipal Engineers. Advance proofs will shortly be available, and can be obtained by those wishing to join in the discussion on application to the hon. secretary of the Illuminating Engineering Society (Mr. L. Gaster, 32, Victoria Street, London, S.W.).

**Appointments Vacant.**—City electrical engineer, for the Carlisle Corporation (£500); electrical mechanic, for the Postal and Telegraph Department of the East Africa Protectorate (£200). See our advertisement pages in this issue.

**Inquiry.**—A correspondent wants condensers for voltages from 100 to 2,200, to improve the power factor on a 60-cycle single-phase system.

**Proposed Strike at Aberdeen.**—The local branch of the Electricians' Union has petitioned its National Executive for permission to strike if its demand for an increase of a 1d. per hour is not conceded.

**Legal.**—In the City of London Court, on Monday, before Judge Lumley Smith, K.C., and a jury, Messrs. Watson, Marsh & Co., electrical engineers, 347, High Road, Bromesbury, claimed £60 3s. 8d. against Messrs. Claytons, tailors and clothiers, 33, Fenchurch Street, Tooting, and elsewhere, for supplying four Sunshine arc lamps with outside cases stoved and highly enamelled in green shade and with special protective varnish. Defendants paid £46 17s. into Court, with a denial of liability, and said that in any event that was enough to satisfy the claim. Mr. Brandon appeared for the plaintiffs and Mr. Samuel for the defendants. Plaintiffs' case was that defendants wanted blaze lamps exactly the same as those outside the premises of Messrs. Lockwood & Bradley, Oxford Street. They quoted £65 for these, and defendants said that it was too much. Some alterations were made to reduce the price, and defendants had to wait three months for the lamps, as they came from "the only place where things come from nowadays—Germany." Defendants had asked them to quote for £100 more work, but that had been declined in the circumstances. Defendants' case was that the plaintiffs had never completed their work, and therefore were not entitled to more than the amount paid into Court. The hands of copper were not of the quality stipulated for. The jury stopped the case, and found for the plaintiffs for the full amount claimed.

**Industrial Projects in Russia.**—The industrial journal *Norden* states that a Belgian company has recently obtained about 20 concessions for electric tramways and lighting in various places in Siberia and Central Asia, while another group of Belgian financiers is contemplating the erection of large factories for the manufacture of woodwork at Novoborisov, the necessary sites having already been acquired. An English company which has obtained a concession for the harnessing of a large waterfall and the building of an electrical power station at the river of Terek in Caucasasia, is said to intend to utilise the electrical energy derived from same for the purpose of connecting the towns of Vladikavkas, Natchik and Kislovoyek by means of electrical tramways. The Imperial Railway Committee are now examining a project laid before them, in which it is proposed to supply the province of Ferghana, the leading cotton-producing district in Central Asia, with a complete system of railways. The total capital expenditure of this project is estimated at £1,283,333. The Russian State Bank has decided to distribute 71 new corn elevators in various places, which will be erected and installed in good time to deal with the crop in 1916. The elevators are to be capable of dealing with 772,800 tons of corn. It is proposed in connection with this project to organise a special department of elevators, to which will be attached a technical staff.

**Annual Socials, &c.**—The Devonport Dockyard Electrical Apprentices' and Ex-Apprentices' Association held their annual social and dance at the "Criterion" Restaurant, Keyham, on Saturday, March 1st. The evening was spent in a very pleasant manner, beginning with games interspersed with singing and music, and after refreshments, dancing was indulged in from 9.30 till midnight. Most of the officers of the department were present, and credit is due to the secretary and committee for carrying out the arrangements.

**Association of Electrical Station Engineers.**—A meeting was held last week at the Y.M.C.A., Bothwell Street, Glasgow, the object being the formation of a branch of the above Association for Glasgow and the West of Scotland. There was a representative attendance, and a resolution was unanimously passed that a branch be formed. Mr. A. W. Lamont was appointed hon. secretary, and after some discussion, it was decided not to appoint a permanent committee until the next meeting, but until that meeting a provisional committee will look after the interests of the Association. The next meeting was arranged for April 2nd, same place as above at 7.45 p.m.

**The Marconi Libel Litigation.**—Before Mr. Justice Darling, in the King's Bench Division on Monday afternoon, Sir Edward Carson, K.C., applied that the libel actions by Sir Herbert Samuel and Sir Rufus Isaacs against *Le Matin* might be in the list for hearing on Wednesday. The paper, he said, had already published an apology, so that the defendants did not intend to contest the case, but, having regard to plaintiffs' public capacity, it would be necessary to put both Sir Rufus Isaacs and Sir Herbert Samuel in the witness box.

His Lordship directed that the action should be in the list next Wednesday.

**Electric Car Construction in Great Britain.**—It is reported that the Arrol-Johnston Car Co., Ltd., of Paisley, makers of the Arrol-Johnston petrol cars, have secured the sole concession for this country from Mr. F. J. Monnot, of 41, Great Portland Street, London, W., for the construction of electric pleasure cars, fitted with the Edison battery. The new vehicles are expected to make their appearance early in the 1914 season.

## ELECTRICAL DEVELOPMENT IN PERU.

In considering the possibilities of expansion of trade abroad, one is always apt to confine attention to countries which, because of the development obvious in them, are "in the public eye," and to forget that in the less advanced countries the greater opportunities often exist. Only the favoured few realise the advantages of opening up relations with these countries, and although they probably risk much, they undoubtedly gain a very great deal in the long run. The countries which are just beginning to open out are eminently suitable for trade, particularly in engineering and electrical lines: they have little to pull down before they build up, they are not hampered with work carried out on obsolete lines, consequently they are easily able to adopt the newest and most up-to-date principles. In South America, Argentine and Brazil, for instance, form the centre of our operations, whereas, in the smaller countries such as Peru, Bolivia, Colombia, &c., where the same natural advantages obtain, and where competition is not nearly so keen, we attempt but little.

That the natural advantages of Peru, from an electrical point of view, are realised, and developments already being effected, is shown in a report from Peru recently made to the American Government. This report points out that about 26 rivers of more or less importance flow into the Pacific Ocean, descending from the Andes at an average altitude of 15,000 ft., and rarely exceeding 100 miles in length. These rivers are more or less torrential, and can, therefore, furnish abundant power, both in the coast region and at their sources in the heart of the mountain ranges. Many cities of Peru obtain their power for lighting purposes, &c., from hydro-electric plants, the largest being those near Chosica and Lima on the River Rimac, furnishing Lima, Callao and their suburbs with about 7,000 H.P., and that of Charcani, near Arequipa, furnishing 10,000 H.P. Water-power plants are also plentiful in all the mining districts, with capacities varying from a few horse-power to 1,000 H.P. Some of these transmit energy to points up to 12 miles distant. There is thus plenty of opportunity for the mines to adopt electricity for power purposes, and there should be a large field for expansion of trade on these lines. As a rule there is more fall than volume of water, and Pelton wheels are used. The rivers flowing into Lake Titicaca are confined in the high plateau between the two branches of the Cordillera. They are torrential only near their sources, becoming slow-flowing streams on the more level plateau, but with a large volume of water. On the Atlantic watershed where the immense basin of the Amazon is formed by numberless rivers, the amount of available water-power is so vast as to be inconceivable. These precipitous rivers fall from 3,000 to 15,000 ft. in from 30 to 50 miles. Concessions of water for generating power as well as for other purposes are mainly governed by the Mining Code, each application being considered on its merits by a delegation appointed for the purpose. There is no tax whatever on this kind of concession.

As regards electric railways and tramways, the most important tramway system in Peru is the Associated Railway, Light and Power Co., of Lima, commonly called the Electric Trust (*Empresas Electricas Asociadas*), which has the monopoly of the three industries for Lima, Callao and their suburban towns. Its water-power stations are located near Chosica and at Santa Rosa, on the Rimac River, with auxiliary steam plants for cases of emergency. The dividend of this company was raised to 1½ per cent. for 1910, as against nothing for 1909, and one-half of 1 per cent. for 1908. This increased prosperity was chiefly brought about by the purchase in 1909 of the old National Line to Chorillo, and the suppression of its disastrous competition. The use of the £30,000 received from the sale of the Encarnacion station property in Lima for the redemption of outstanding debentures brought about an annual saving in interest of £1,500. The Electric Trust has a paid-up capital of £1,500,000, and its profits for 1911 amounted to £100,000, as against £80,000 in 1910. On June 21st, 1911, was completed the organisation of the *Sociedad Electrica del Cuzco, Ltda.* (Electric Co. of Cuzco, Ltd.). The board of directors was elected from representative Arequipa business men, and the company was formed to supply electric light and power to the City of Cuzco, the ancient Inca capital and present terminus of the main division of the Southern Railway, on the route of the proposed Pan-American line. The plan is to take water from Lake Chincheros by canal, or more likely, to go east of Cuzco and use the waters of the Vilcanota River. Plans for the installation of electric light and power in Cuzco are said to have been approved by the President.

By a Federal decree of August 11th, 1911, a private joint-stock company, the *Compania de Tranvia Electrica de Arequipa*, was recognised as the concessionaire for the construction and operation of the electric street railway system of Arequipa, by virtue of the assignment to it by the *Credito Urbano de Arequipa*, then in liquidation, of the contract of May 13th, 1910, entered into for the purpose indicated. According to a local publication, the actual construction work and laying of the rails on the Arequipa tramway lines was to begin in February, 1912, 8½ miles of single track being comprised in the original installation. Sixty-pound T rails were to be used, with steel poles and brackets for the overhead construction. Power was to be taken from the Arequipa Electric Co., whose power station was then being enlarged to provide the extra capacity, the current being transmitted from Charcani.

The *Compania de Tranvia Electrica de Arequipa* was incorporated under the laws of Peru with a capital of £30,000 in fully-paid shares, absorbing the urban railway system which operated the horse tramways since 1890. A bond issue of £75,000 was said to have been taken up by a syndicate of bankers which included the Bank of Peru and London, the Italian Bank, and W. R. Grace & Co.

Increase of business led the Arequipa Electric Co. to erect an additional power plant at Charcani to include two new hydro-electric units of 330 kw each, the construction being well advanced both on the new canal and the building. The machinery will be installed by the end of this year. A new transmission line is being erected between Charcani and Arequipa, doubling the present capacity and assuring the continuance of service in case of breaks.

The gross income of the company for 1911 was £16,000, and the net income £11,000. A dividend of 10 per cent. was paid on a capital of £60,000. The capital has since been increased to £75,000. Favourable credit arrangements were made with the Banco Aleman Transatlantico, and the income is expected to be materially increased through the consumption of power by the new Arequipa Electric Tramways Co. mentioned above, for which purpose the additional plant was necessary.

There has also been considerable expansion in the adoption of wireless telegraphy. In March, 1912, the wireless telegraph offices of Callao and Lima, under the direction of the Department of Posts and Telegraphs, were thrown open for public use for communication to and from vessels at the following rates: Telegrams, in Spanish, in either direction between the stations in Lima and Callao and steamers, up to 10 words, 25 cents, each additional word, 2½ cents; telegrams in other languages or in code, double rates. Double rates are also charged between other Government telegraph offices and steamers in either direction, or over the wireless line to or from the eastern part of the country, adding the rate of that line to the Lima or Callao rate. These rates are in addition to the charges of the companies supplying the services aboard steamers, which are collected in advance with the rate for the Government service.

The direct wireless service now in operation between Iquitos and Lima is under the direction of the Department of Public Works and Development.

In the summer of 1912, the Government ordered four new wireless stations, to give communication between the Southern Railway's station of Tirapata and ports in the Madre de Dios region. It is also proposed to place several stations along the coast and at points in the interior difficult of access by wire lines. Since the beginning of this year, wireless equipment has been installed on the naval transport *Chalaco* and on the *Limari* and other steamers in the Chilean trade. At the General Post Office and Telegraph Office in Lima, there has been installed a radio-telegraphic station, the apparatus for which was all made in a small workshop belonging to that branch. It has a radius of 300 miles, which will be increased to 500 miles.

According to official information, there were in active operation in Peru in 1912 the following radio-telegraphic stations:—At Lima a 10-kw. Telefunken system and a 2-kw. Peruvian system; at Iquitos, a 10-kw. Telefunken system; at Callao, a 2-kw. Peruvian system; and at Puerto, Bermudez, Masisea, Orellana, and Requena 2-kw. Telefunken systems.

# MESSRS. PARMITER, HOPE & SUGDEN'S WORKS, MANCHESTER.

ABOUT ten years ago Messrs. Parmiter, Hope & Sugden moved into a small building in Ellesmere Street, almost opposite their present works.

In the interval the growth of the firm's switch and fuse business necessitated a removal into larger premises, which, it is satisfactory to know, are still being extended, and constitute the Hulme Electrical Works, as we know them to-day, a building with 100 yards of frontage and several floors in height.

The works are laid out for the production of standard lines of ironclad switchgear and distribution fuseboards for power and lighting, and the mention of the Hope "honey-comb" fuse and "bi-metal" fuse wire will be sufficient to remind our readers of the firm's activities particularly in fuse-gear. The business has, in fact, been built up on specialisation and standardisation, in conjunction with originality in design, and some idea of its scope can be gathered from the output of about 1,000 switches and fuses per week, a large percentage of which goes abroad, chiefly to Australia and South Africa.

The works comprise, on the lower floor, an erecting shop for power distribution boards, with examining, painting and packing departments, and general stores for parts and fittings adjoining. The stores receive their complement of machined parts for stock from the general machine shop on the next floor—this section of the works being fully equipped

with necessary tools for dealing with the class of work undertaken by the firm.

A further floor houses another section of the works devoted almost exclusively to small switch work of a cheaper

THE HULME ELECTRICAL WORKS OF MESSRS. PARMITER, HOPE & SUGDEN.

type—one outstanding feature of this department is the enormous output of the familiar small K type switches, a pattern of switch which, we understand, was originally designed by the firm, and has undoubtedly become very popular.

Another department is devoted to small fuse fitting, and here also the firm's well-known bi-metal fuse wire—an alloy fuse wire with a copper core—is dealt with.

A fully equipped test room is provided, and extensive general and drawing-office accommodation. In the course of our visit a considerable order for three-phase "unit" distribution boards for a Yorkshire mill was passing through the works. The Hope unit system consists of cast-iron fuse-boxes so constructed that either end can be removed and additional fuse-boxes added, the bus-bars being extended to suit. These and other types of fuseboards are built up of standard single fuses on black china bases, each one fixed to the case by a central screw, and therefore easily detachable and replaceable.

THE ERECTING SHOP FOR DISTRIBUTION BOARDS, &c.

SMALL FUSE DEPARTMENT.

THE GENERAL OFFICE.

This construction dispenses with the usual slate base. The firm, of course, builds motor-starting panels and pillars of the water-tight and gas-tight patterns, particularly for mining work.

In the smaller type of fuseboard for lighting work, the new "Home Office" pattern of fuse—in which the usual method of construction is reversed, the live parts being fixed at the back of the china bases instead of in front, so that the fuses make contact through slots in the china—is interesting.

In fuseboards of this kind the bases can be fixed on hinged battens, thus enabling wiring at the back to be got at easily without interfering with the board. We understand that several thousand fuseboards with "Home Office" fuses are on order from these works at the present time.

However, the speciality of the firm is probably the "honey-comb" fuse, which is constructed in stock sizes between 20 and 650 amperes capacity, and largely employed in the various fuseboards built in the works.

Many of our readers are, no doubt, familiar with its construction, which includes a peculiarly wired hollow cellular china body enclosed in a lined fibre carrier, and so arranged that when the fuse blows, the volatilised metal is deflected by end baffle plates into the interior of the china body and there condensed. Another feature is the wiring of

treatment in the endeavour to gain reliable information as to their probable behaviour.

Although we have not mentioned specifically the numerous patterns of Ajax ironclad switches and switch

THE FINISHED STORES.

fuses, these are standard lines with the firm with which our readers are well acquainted.

Standardisation and organisation have enabled the firm to successfully carry through some very large orders—exhaustive stocks of regular pattern switches and fuses being always available for despatch the same day as ordered.

In conclusion, we are indebted to Mr. Vernon Hope for an instructive visit and an interesting, if unintentional, demonstration of the success which attends originality of design and specialisation.

### CRANE PLANT OF AN ITALIAN STEEL WORKS.

BY DR. ALFRED GRADENWITZ.

RECENT extensions of the iron and steel works of Terni (Rome) entailed the installation of a number of cranes

THE GENERAL MACHINE SHOP.

the china interior by means of small through copper strands—which normally carry the bulk of the current—in conjunction with a central fusible tin band coupled by copper strands to the terminals; a double path is thus provided for the current so long as the full normal capacity of the fuse is not exceeded. Any increase of current beyond this raises the temperature of the fuse carrier and melts out the tin band; all the current then passes by way of the through strands which immediately blow.

Although such a fuse has a very heavy overload capacity for a short period, the fusible band controls the overload definitely and it is possible to supply the fuse under a guarantee as to performance.

Many tests have proved that this fuse will stand the heaviest short-circuit without damage to the terminals; indeed, the firm can point with pride to a collection of undamaged fuse sections which have withstood most unmerciful

MACHINE AND FITTING SHOP FOR SMALL IRONCLAD SWITCHWORK.

destined for the most diverse purposes. After a very lively competition, in which the foremost crane builders of the chief industrial countries took part, the Maschinenfabrik Oerlikon, of Oerlikon, near Zurich, was entrusted with the construction of the crane plant. As this is one of the most remarkable installations of its kind in existence, a short description of the more important cranes will be of interest.

All the motors used in connection with this plant are fed from the three-phase current system of the works, at 42 cycles, 310 volts, and are designed as enclosed slip-ring motors, only the servo-motors for operating the brakes being enclosed motors with squirrel-cage rotors.

1. *Travelling Foundry Crane of 120 + 25 Tons' Capacity.*—The extensive foundries of Terni, where the heaviest castings are made, necessitated the installation of a travelling crane of 120 tons capacity, which was tested with a load of 150 tons on delivery.

Fig. 2 shows the crane with its ladle (which with its contents is 120 tons in weight). The main crab is designed to lift 120 tons, while an auxiliary crab with two motors serves for the lifting of loads up to 25 tons in weight, and is mainly used for tipping the ladle suspended from the main crab. The span between centres of crane rails is 18.25 m., and the lift of main hoist about 12 m. The auxiliary hoist has a lift of 17 m.

The main hoist lifts 120 tons at a speed of 1 m. per

chords and substantial cross bracings. A gallery is arranged along one side, and the driver's cage is at one end of the bridge. The girders carry two rails for the main crab and

FIG. 4.—AUXILIARY TROLLEY OF FOUNDRY CRANE.

two for the auxiliary crab, and two balancers fitted into the cross girders receive the axles of the travelling wheels.

The crane travels longitudinally on eight cast-steel wheels with steel axles, four of which are fitted with toothed rims for the drive. The longitudinal shaft, which is driven in

FIG. 1.—REVERSING STARTER OF 120-TON CRANE.

FIG. 2.—FOUNDRY CRANE OF 120 TONS' + 25 TONS' CAPACITY.

minute, and 60 tons at 2 m. per minute; the travelling speed of the crane at full load is 20 m. per minute, and of the main trolley 12 m. per minute. The lifting speed of

the centre, carries two steel pinions, and is supported at several places by bearings. The main trolley carries two motors for lifting and traversing respectively. The lifting motor is direct-coupled by means of clutches with two worm gears running in oil in a casing, the axial thrust being taken by ball bearings. Pinions on the two worm-wheel shafts engage with the toothed rims of four cable drums, 680 mm. in diameter. The traversing motor of the trolley similarly communicates through a clutch with a worm-gear driving the shafts of the trolley rollers. The eight rollers, 500 mm. in diameter, are made of cast-steel and run on steel axles, four of them being fitted with toothed rims for the drive. Both motors can also be rotated by hand.

For holding the load there are provided two toggle-joint brakes automatically actuated by servo-motors, and there are also auxiliary safety brakes acting directly on the cable drums. This arrangement comprises four friction brakes

for the four drums, each provided with a pinion and designed to be actuated from the driver's cage in case of emergency, by a pawl and ratchet wheel. All toothed

FIG. 3.—TROLLEY OF 120-TON GANTRY CRANE (see next page).

the auxiliary trolley (fig. 4) at full load is 3 m. per minute, and at half load 6 m. per minute.

The crane consists of two stout box girders with parallel

wheels have been milled on special machines. An especially flexible high-grade plough-steel wire was used for the load cable, which is 20 mm. in diameter and about 340 m. in total length. This carries in a  $4 \times 6$ -fold suspension from

FIG. 5.—TWIN GANTRY CRANE OF 120 TONS' CAPACITY.

a pulley block comprising eight pulleys, a substantial iron beam fitted at the ends with two jointed hooks for receiving the ladle, and in the middle with a double hook resting on ball-bearings for a load of 120 tons.

FIG. 6.—TROLLEY OF 75-TON TRAVELLING CRANE.

The auxiliary crab travels on rails arranged inside the box girders, and carries on a wrought-iron frame, two motors for traversing and for the lifting of loads up to 25 tons respectively, which can also be operated through a hand-crank, the energy being likewise transmitted to two worm gears connected by clutches. A toggle-joint brake and servo-motor are provided for stopping the load. The shaft of the worm-wheel carries two pinions engaging with the cast-steel toothed rims of the two cast-iron cable drums. The steel cable is 14 mm. in diameter and 210 m. in length, and is guided by four pulleys: it carries a simple wrought-iron crane hook on ball-bearings.

The traversing motion of the auxiliary trolley on four rollers is effected from the motor through worm gearing and a pair of bevel wheels, two of the rollers being fitted with toothed rims for the drive.

Both trolleys derive their current from 10 trolley contacts fixed by insulators on brackets, from the conductors running alongside of the crane girder.

The lifting motor of the main trolley, which is designed for lifting loads of 120 tons at a speed of 1 m. and 60 tons at a speed of 2 m., is wound for two different numbers of poles, viz., 8 poles for 120 tons and 4 poles for 60 tons, its output being 45 H.P. The traversing motor has at full load,

with a speed of 12 m. per minute, at 1,200 R.P.M., an output of 18 H.P.

The lifting motor of the auxiliary hoist is designed for an output of 26 H.P. (for the lifting of loads of 25 or 12.5 tons at a speed of 3 or 6 m. respectively per minute) as a two-speed motor with the same numbers of poles and revs. per min. as the main motor, and the traversing motor has an output of 4 H.P. for a load of 25 tons at 20 m. per minute.

The motor effecting the longitudinal motion of the crane is—like all the rest—connected through a semi-elastic clutch with a worm gear transmitting the energy to the longitudinal shaft, and is fitted with a mechanical brake operated by a pedal from the driver's cage. Its output in transporting the crane at full load at a speed of 20 m. per minute is 40 H.P. This motor can also be driven by a hand crank.

All the motors are controlled from the driver's cage through a combined starter, comprising an electrically braked reversing starter for the main hoisting motor, a reversing starter with starting resistances and fuses for the motor effecting the longitudinal motion of the crane, and a similar one for the traversing motor. The auxiliary trolley is controlled through a reversing starter with starting resistance and fuses for the hoisting motor, and the same for the traversing motor of the winch.

2. *Gantry Cranes of 120 tons' Capacity with Turning Gears, for the Operation of an Hydraulic Press.*—In manufacturing heavy armour plates and guns for the Navy and for other purposes, the Terni Iron and Steel Works frequently use huge hydraulic presses, e.g., a press of 4,500 tons' pressure, allowing the heaviest castings to be forged.

FIG. 7.—TROLLEY OF 60-TON CRANE.

The pneumatic hammer formerly used for the same purpose was served by two hand-operated gantry cranes designed as a rotating twin gantry crane with common central pillar, which, on account of its wide range (about 22 m.), allowed

FIG. 8.—TRAVELLING CRANE OF 75 TONS' CAPACITY.

the ingots to be taken from the furnace directly to the press without unloading. These cranes have now been reinforced, raising their capacity to 120 tons and converting from hand to electrical operation. The main data of this twin crane (fig. 5) are as follows:—Normal capacity (useful load)

120 tons; ganges of trolleys, 1'625 m. and 1'995 m.; radius of crane track, 21'6 m.; lifting speed with load of 120 tons, 3 m. per minute; traversing speed of trolley with 120 tons, 20 m. per minute; speed of rotation of gantry as measured on the crane track, 15 or 30 m. per minute (the lower speed being used during pressing); minimum distance between press and axis of load suspension, 1,400 mm.

The electrical arrangements of both cranes are identical. The design of the motors and gear generally corresponds with that of the foundry crane. Two of the four rollers of the trolley have toothed rims for the drive, and a Gall chain, the length of which has been so designed that the turning gear suspended by it may touch the ground in an erect position, serves to carry the load (fig. 5). This has been designed as a 2 x 4-fold chain. An alarm bell is sounded as soon as the terminal positions are reached.

The main current supply to each crane is in the pivot above the presses, and is designed with slip-ring contacts. Current supply to the trolleys and to the motor of the turning gear is effected by means of 16 insulated roller contacts fixed to a bracket. The output of the lifting motor is 135 H.P. at 1,220 R.P.M., and that of the traversing motor 25 H.P., at the same speed. The drive for the rotation of each crane comprises a two-speed motor of 65 H.P. at 810 R.P.M., or 35 H.P. at 410 R.P.M., with 6 or 12 poles respectively.

In order to allow heavy and clumsy castings to be dealt with as easily and simply as possible, turning gears suspended by the crane chain are used for turning the ingots round below the press. Each of these turning gears is an iron structure 2'3 m. in width, with lateral sheet metal walls and a bracket for receiving the motor and drive. It is suspended from the Gall chain by means of a beam with ball bearing and rollers, and is free to rotate round its vertical axis. The driving motor is designed to yield 35 H.P. during 4-5 hours' continuous operation.

The piece suspended by this turning gear is turned round at will below the press, in accordance with the requirements of the service. The motor is connected with a worm gear by a friction clutch ensuring a smooth operation. The turning gear is controlled from the driver's cage of the gantry crane, its speed of motion being regulated in three to four steps by inserting resistances. By regulating the speed of motor, ingots of different sizes can be turned round at practically the same peripheral speed.

The service of the turning gear requires considerable skill and foresight on the part of the crane driver, who with one hand controls the lifting and lowering, and with the other the turning-gear motor. In view of the rapid working of the press, a continuous regulation of the crane starters is required, the load being lifted quickly after each pressing operation and turned round by the turning gear. The resulting fluctuations in the load on the motors had to be allowed for in the design of them.

The several motors for lifting, traversing and turning respectively, can be controlled by means of two independent sets of starters. This double control allows the pressing process to be watched more easily by the driver.

3. *Travelling Crane of 75 tons' capacity for the Operation of the Armour-plate Rolling Mill and Hydraulic Moulding Presses.*—The main data of this crane are as follows:—

Span between centres of crane rails, 13'43 metres; height from floor to upper edge of crane rails, 7'9 metres; capacity, 75 tons, with lifting speed of 1'80 m. per minute; 37½ tons with lifting speed of 3'60 m. per minute; traversing speed, with full load, 12 m. per minute; travelling speed, with full load, 25 m. per minute.

The equipment of the crane corresponds to that of the foundry crane described above, apart from the auxiliary trolley used in connection with the latter. Three motors are provided for the various motions, the lifting motor of 40 H.P. being designed with eight and four poles in accordance with the two lifting speeds of 1'8 and 3'6 metres per minute, with loads of 75 and 37½ tons (at 600 and 1,200 R.P.M. respectively). A pole switch operated by remote control from the driver's cage is provided for changing from one speed to the other. The traversing motor has an output of 10 H.P. at 1,200 R.P.M., and the motor for the longitudinal motion of the crane (which is coupled by a semi-elastic clutch to toothed gearing), 25 H.P. at 1,200 R.P.M.

The brake of the lifting motor is controlled automatically by a servo-motor. The lifting hook is a wrought-steel double hook resting on ball bearings and suspended by 2 x 6 steel cables, each 23 mm. in diameter (figs. 6 and 8).

4. *Travelling Cranes of 60 and 20 tons' capacity respectively for the gun-hardening factory.*—Two special cranes built by the Oerlikon Machine Works are used to immerse gun barrels, vertically suspended from the hook, in oil tanks for hardening; they suffice for the longest tubes manufactured at Terni, and are especially remarkable for their considerable lowering speed, which is accurately adjusted.

In accordance with their special use, these cranes had to be mounted at a considerable height above the floor. The cranes are installed in two adjoining shops at different levels, the 60-ton crane being situated at 22 m. and the 20-ton crane at 11'4 m. from the upper edge of the crane rails to the ground. Both cranes are of the same design as those already described, their main data being as follows (fig. 7):—

	60-ton crane.	20-ton crane.
Lifting speed with full load ...	6 m. per min.	8 m. per min.
Lowering speed with full load ...	80 " "	80 " "
Traversing speed ...	20 " "	20 " "
Travelling speed ...	50-25 " "	60-30 " "

The lifting motors are fitted with a pneumatic brake on the Jordan system, which being operated from the driver's cage through electric remote control allows the lowering speed to be kept constant.

The brake is designed as a jaw brake, being put on by a weight and relieved by the piston of a brake cylinder fed with compressed air. A small air pump driven from the lifting motor produces compressed air, which is accumulated in a special tank, whence it is supplied in accordance with requirements to the brake cylinder. On a given air compression being reached, the air supply is cut off automatically by a pressure regulator, the compressor running at no load until the pressure falls again. A regulator permanently coupled to the lifting drum adjusts the air pressure in the brake cylinder, so that the lowering speed remains constant with any load (as well as at no load). During the lowering operation the lifting motor is uncoupled by a claw clutch actuated by compressed air, and the hook and load can then be lowered at 13 times the lifting speed (80 m.) without carrying the motor along. The control of the lowering motion is so arranged that lowering cannot be effected before uncoupling the motor. On account of the considerable power (about 1,000 H.P.) absorbed by the brake in lowering, the mechanism is designed most substantially. In order to eliminate any risk of failure of the brake during the hardening process, which would be liable to have the most disastrous consequences, four brake disks are provided on the 60-ton crane and two brake disks on the 20-ton crane, each of which alone is able to keep the load suspended.

Enormous difficulties, which could not be foreseen, were met with in designing this braking arrangement to comply with the special conditions to be met by the special cranes and to ensure a smooth operation: the braking effect is absolutely reliable and the lowering speed is kept constant, while all shocks and jerks are avoided and braking distances reduced to a minimum.

For traversing, there is provided a toggle-joint brake operated automatically by a servo-motor. The wrought-steel double hook is free to rotate on ball bearings round its vertical axis. It is suspended in the 60-ton crane by a 12-strand cable and in the 20-ton crane by an eight-strand cable.

The motor outputs are as follows:—

	60-ton crane.	20-ton crane.
Lifting motor with full load ...	110 H.P.	50 H.P.
Traversing motor with full load ...	15 H.P.	6 H.P.
Travelling motor with full load ...	36 H.P.	20 H.P.

All these motors run at a speed of 1,200 R.P.M.

The arrangement of the trolley contacts is the same as in connection with the other cranes, 13 bare copper conductors, 6 and 9 mm. in diameter respectively, with insulators and tightening screws, being used to convey the current to the trolley motors.

In addition to the cranes above described, a number of transporting cranes of the most diverse capacities and of the Maschinenfabrik Oerlikon's standard design have been supplied to the various workshops of the extensive Terni Iron and Steel Works.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—At the meeting on the 13th inst., of the Ealing B.C., the Mayor said he desired publicly to thank Mr. J. D. KNIGHT, borough electrical engineer, and Mr. A. E. PULLEN, for having very kindly acted as stokers at the electric light works on a recent evening when the employees were being entertained at the Town Hall. It only showed, said his Worship, how ready the head officials were to do anything to enable those under them to have an evening's enjoyment.

Mr. G. A. BRUCE, electrical engineer and tramways general manager to the Lowestoft T.C., has tendered his resignation.

With reference to the paragraph inserted in our issue of February 7th with regard to the decision of the Electricity Committee of Poplar to give prominence to the managerial side of the department, the Committee has now reconsidered its decision as regards the salaries of Mr. V. H. CRICKSHANK, station engineer, and Mr. E. R. INGRAM, mains engineer, and these gentlemen are now to receive salaries of £225 per annum, rising by annual increments of £12 10s. to £300 per annum.

The Installation Engineer of the Tynemouth undertaking has handed in his resignation, which has been accepted by the Electricity Committee, who invite applications for filling the vacancy on the same terms and remuneration as at present.

The salary of the electrical engineer at Rhyl was increased, at a meeting of the Rhyl District Council last week, from £170 to £200 per annum.

**Tramway Officials.**—The Bournemouth T.C. has, on the recommendation of the Tramways Committee, decided to increase the salary of Mr. VICKERS, chief assistant and electrical engineer, from £325 to £375 per annum, with annual increments of £25 to a maximum of £450; that of Mr. BALDWIN, tramway traffic superintendent, by £25 a year; and that of Mr. HARTLEY, works superintendent, by £25 per annum.

Out of some 300 applicants, Mr. G. M. BARRELL, chief cashier of the Leeds Tramway Department, has been appointed to a similar position under the Huddersfield Tramways.

**General.**—Mr. SIDNEY ANDREWS has severed his connection with Messrs. Verity, Ltd., for whom he acted as manager for Scotland for many years, and is now representative for Scotland and Ireland for Messrs. Royce, Ltd., of Manchester. His address is 133, Mount Annan Drive, Mount Florida, Glasgow, and all communications should be sent there.

Mr. HENRY C. CREWS, M.I.E.E., of Manchester, has been appointed by the governing body of Denstone College to act as consulting electrical engineer in charge of the electrical installation at the college.

On the occasion of their golden wedding, Mr. and Mrs. COX-WALKER have been presented by the present and past employers of Messrs. Cox-Walkers, Ltd., electrical engineers, of Darlington, of which Mr. Cox-Walker is a governing director, with a silver hot-water jug.

Mr. COLIN P. SUTHERY, of the staff of the British Thomson-Houston Co., Ltd., of Rugby, who is leaving to take charge of the electrical business of Messrs. Johnson & Fletcher, at Bulawayo, Rhodesia, has been presented by his colleagues with an attaché case.

We are informed that the old-established firm of Clark, Forde and Taylor (H. A. Taylor, A. L. Dearlove and R. M. Sayers), consulting engineers to the Pacific Cable Board and many of the large submarine cable companies, has been joined as partner by Dr. J. Erskine-Murray, D.Sc., F.R.S.E., the well-known expert in wireless telegraphy. The style of the firm after March 25th will be Clark, Forde, Taylor & Erskine-Murray, 4, Great Winchester Street, E.C. By this combination the firm will be in a position to advise upon, and act as consultants in, all branches of telegraphic engineering. The firm has been going for over 40 years, and at one time or another has acted as engineers for nearly all the large cable companies, supervising the making and laying of over 175,000 nautical miles of submarine cable. It must not be supposed that the firm fears the effect of wireless on cable work: it is associating the two systems in the belief that they will be helpful to each other, and that their interests do not really clash. Mr. Herbert Taylor will not now take such an active part in the firm as heretofore, but his valuable experience and advice will be available.

**Obituary.**—We regret to record that the death occurred suddenly at Aberdeen on 15th inst., of Mr. WILLIAM BULLOUGH, of Messrs. Howard & Bullough, Accrington, in his 50th year.

## NEW COMPANIES REGISTERED.

**Cunningham, Ltd.** (127,664).—This company was registered on March 10th, with a capital of £1,500 in 21 shares, to take over the business of an electrician and electrical engineer carried on by R. N. Cunningham, at Ware Road, and 3, Wellington Terrace, Haywards Road, W., as R. N. Cunningham & Co. The subscribers (with one share each) are: R. N. Cunningham, 171, Edgware Road, W., electrical engineer; L. Isaacs, 63, Abdon Road, Newington Green, N., traveller. Private company. The first directors are R. N. Cunningham (permanent governing director), R. L. Isaacs. Registered office, 171, Edgware Road, W.

**British Electric Heater Co., Ltd.** (8,571).—Registered March 7th, by Dalgleish, Debbie & Co., 26, Charlotte Square, Edinburgh. Capital £50,000 in 21 shares (30,000 participating pref.). Objects: To carry on business as electricians, mechanical, hydraulic and general engineers. The signatories (with one share each) are:—T. R. McLaren, 105, West George Street, Glasgow, clerk; M. Blair, jun., Garthland, Hamilton, clerk; K. Patrick, Trafford Bank, Bishopbriggs, clerk; J. E. Dunlop, 181, Do glas Street, Glasgow, clerk; J. McGavin, Cambusketh, Kilmarnock, clerk; H. J. Flevenson, 160, Onslow Drive, Dennistown, Glasgow; Miss I. W. Armstrong, 66, Ardwall Terrace, Rutherglen. The first directors (to number not less than four or more than nine) are A. W. Terrance, A. Green-Thompson, G. Ritchie, R. C. Hogarth, R. H. Urquhart, and G. R. Young; qualification, 100 shares; remuneration, £50 per annum (£50 extra for chairman). Registered office, 105, West George Street, Glasgow.

**C. A. Parsons & Co., Ltd.** (137,619).—Registered March 7th, by Crossman, Pritchard, Crossman & Block, 16, Theobald's Road, W.C. Capital, £150,000 in 1500 shares. Objects, to carry on the business of electrical, hydraulic, mechanical and general engineers, founders and workers in metal, boiler makers, machinists and implement manufacturers and designers, shipbuilders, &c., to acquire the businesses and undertakings of C. A. Parsons and Co., of the Heaton Works, Newcastle-on-Tyne, and elsewhere (including as part thereof the business carried on by Scott & Mountain, Ltd., at the Close Works, Gateshead), and to adopt an agreement with the Hon. Sir Charles A. Parsons. The signatories (with one share each) are:—Hon. Sir Charles A. Parsons, K.C.B., of Heaton Works, Newcastle-on-Tyne; A. G. Parsons, Heaton Works, Newcastle-on-Tyne, engineer; W. H. Johnston, Heaton Works, Newcastle-on-Tyne, engineer. Private company. The first directors (to be not less than three or more than seven, are Hon. Sir Charles A. Parsons, K.C.B., and not more than six others, to be nominated by him; qualification, £1,000; remuneration as fixed by the company. Solicitor, T. W. Thompson, Newcastle-on-Tyne. Registered office, Heaton Works, Heaton, Newcastle-on-Tyne.

**J. W. Courtenay, Ltd.** (187,549).—Registered March 4th, by G. D. Perks, 86, New Broad Street, E.C. Capital, £50,000 in 21 shares (10,000 6 per cent. cumulative preference, and 40,000 ordinary). Objects: To carry on the business of advertising agents and contractors, billposters, manufacturers of and directors in advertising specialties, electrical and mechanical signs and apparatus, printers, lithographers, designers, publishers, booksellers, &c., and to adopt an agreement with J. W. Courtenay & Co., 12, Northch Street, W.C. The signatories (with one share each) are:—J. T. Chapple, 79, Gresham Street, E.C., solicitor; W. W. Wright, 39-41, Broad Street Avenue, E.C., chartered accountant. Private company. The first directors are J. W. Courtenay, W. W. Wright and J. T. Chapple; remuneration (except managing director) £100 each per annum.

**Spiral Regulating Dynamo Co., Ltd.** (127,532).—This company was registered on March 3rd, with a capital of £5,000 in 21 shares, to acquire from A. A. Price patent rights relating to an electric dynamo. The subscribers (with one share each) are:—J. H. Turner, The Films, Willesden Green, N.W., contractor; F. T. W. Price, 122, Aldersgate Street, E.C., merchant; A. A. Price, 25, Charlotte Street, W., engineer. Private company. The number of directors is not to be less than three or more than five; the first are J. H. Turner, F. T. W. Price and A. A. Price; qualification, £100; remuneration according to profits. Registered office, 25, Charlotte Street, W.

**Rotary Units, Ltd.** (127,656).—This company was registered on March 8th, with a capital of £600 in 21 shares, to carry on the business of founders, engineers, makers of steam, gas and oil engines, petrol and other motors, motor-cars and buses, motor-boats, gas-producer plants, boilers, steam and water turbines and air compressors, electricians, manufacturers of electrical apparatus and electric motors. The subscribers (with one share each) are:—C. W. Jamieson, 2, Sunningdale Gardens, W., engineer; A. G. Orice, Drumceith, Dundee, engineer; J. T. Wood, Home Works, Datchet, engineer; C. M. Kellar, Home Works, Datchet, engineer. Private company. Table "A" mainly applies. Registered by Jordan & Buns, Ltd., 116-117, Chancery Lane, W.C.

**Rodonit Syndicate, Ltd.** (127,527).—This company was registered on March 3rd, with a capital of £5,000 in 21 shares, to take over the business of manufacturers of "Rodonit," carried on by W. Hermann and F. D. Bull, at Southbury Road, Enfield, as Hermann, Bull & Co. The subscribers (with one share each) are:—F. D. Bull, merchant, 149, Manor Road, Stoke Newington, N.; R. Atherton, 30, Springfield Avenue, Mansell Hill, N., electrical engineer. Private company. The first directors are W. Hermann, Herford House, Enfield, F. D. Bull, R. Atherton and C. W. Beckmann. Secretary, C. W. Beckmann. Registered office, 20, Victor Road, Finsbury Park, N.

**Anger Manufacturing and Supply Co., Ltd.** (127,703).—This company was registered on March 12th, with a capital of £2,000 in 21 shares, to acquire from J. E. Anger and G. H. Anger the invention of an automatic brake adjuster, and of improvements in apparatus for automatically adjusting or taking up the slack in brakes of trams and other vehicles, together with the business of engineers carried on by them. The subscribers (with one share each) are:—G. H. Anger, 186, Strand Road, Preston, engineer; A. Foster, 10, St. George's Square, St. Anne's-on-Sea, cotton spinner and manufacturer; J. Wilson, 53, Higher Back Road, Fulwood, Preston, rubber merchant. Private company. The number of directors is not to be less than three or more than five; the first are G. H. Anger (managing director), A. Foster and J. Wilson (all permanent, subject to holding 100 shares); qualification of ordinary directors one share; remuneration of managing director, £250 per annum. Solicitors, W. R. & W. Ascroft, Preston. Registered by Jordan & Buns, Ltd., 116-117, Chancery Lane, W.C.

**Parana Power Syndicate, Ltd.** (127,747).—This company was registered on March 19th, with a capital of £10,000 in 21 shares, to acquire shares, debentures and securities of tramway, light and power companies in Brazil or elsewhere, and to adopt an agent with A. J. Bynington. The subscribers (with one share each) are: W. J. Simpson, 85, Kings Road, Willesden Green, N.W., clerk; J. M. Tolley, 2, Rond Court, Walbrook, E.C., clerk. Private company. The number of directors is not to be less than two; the first are W. J. Simpson and J. M. Tolley. Registered office, 4, London Wall Buildings, E.C.

**New British Ever-Ready Co., Ltd.** (187,638).—Registered March 7th by Corbould, Ellis and Mitchell, 14, Clement's Lane, Lombard Street, E.C. Capital £300,000 in 21 shares (115,000 ordinary and 85,000 7 per cent. cum. participating preference). Objects: To carry on the business of electricians, electrical engineers, manufacturers of and dealers in electrical appliances, wires, accumulators, batteries, dynamos, lamps, switches, torches, novelties and specialities, mechanical engineers, producers and suppliers of electricity and power, and to take over the business of the British Ever-Ready Electrical Co., Ltd. Power is also taken to manufacture and deal in motor vehicles, flying machines and the like. The signatories (with one share each) are:—S. Stern, Ever-Ready Works, Hercules Place, Holloway, N., merchant; G. E. Ritzelberger, Hercules Place, Holloway, N., works manager; M. Goodfellow, Hercules Place, Holloway, N., company secretary; C. H. Dede, 1, Kingsway, W.C., manager of public company; B. R. H. Baker, Craighead, Blanchford Road, Stamford Brook, W., accountant; E. McNair, 3, East Ham Road, Littlehampton, secretary of public company; G. Bostock, 21, Ironmonger Lane, E.C., chartered accountant. Minimum cash subscription, 85,000 preference shares. The first directors (to be not less than three or more than five, are S. Stern, G. E. Ritzelberger, M. Goodfellow, C. R. C. Soller (7½, Colwyn Street, E.C.), and G. J. Dade (Electrical Federation Offices, 1, Kingsway, W.C.); qualification, £250 preference shares; remuneration not more than £100 each per annum (managing director, £750 per annum), with any extra sums voted by the company. Registered offices, Hercules Place, Holloway, N.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Sun Electrical Co., Ltd.** (63,261).—Capital, £45,400, in £1 shares (20,000 pref.). Return dated January 6th, 1918. 5,400 ord. and 19,704 pref. shares taken up. £19,161 paid. Mortgages and charges: £3,875.

**Melbourne Electric Supply Co., Ltd.**—A memorandum of satisfaction in full on March 5th, 1918, of mortgage dated August 8th, 1911, securing not more than £250,000, has been filed.

**Chippinham Electric Supply Co., Ltd.**—Particulars of £2,000 debentures created February 1st, 1911, and secured by trust deed of even date, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital and part of the old gasworks, Chippinham, with fixtures, plant and machinery, &c., thereon. Trustees: A. Cotes and A. A. Douglas.

**Tyer & Co., Ltd.**—Particulars of £7,000 debentures, created February 27th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Sun Electrical Co., Ltd.**—A memorandum of satisfaction to the extent of £275 on March 5th, 1918, of debenture stock dated March 31st, 1911, securing £7,000, has been filed.

**City of Ely Electric Light and Power Co., Ltd.** (79,285).—Capital, £5,000 in £1 shares. Return dated January 7th, 1918; 3,008 shares taken up; 2s. per share called up; £300 6s. paid. Mortgages and charges Nil.

**Electrical Industries Development Co., Ltd.** (89,461).—Capital, £25,000 in £1 shares (20,000 pref.); return dated January 13th, 1918; 9,007 pref. and 5,000 ord. shares taken up; £1 per share called up on 4,007 pref.; £4,007 paid; £10,000 considered as paid on 5,000 pref. and 5,000 ord. Mortgages and charges: Nil.

**India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.** (1,122 Cl.).—Capital, £812,000 in £10 shares (50,000 ord., 25,000 pref., and 6,200 unissued); return dated December 31st, 1912 (filed February 10th, 1913); 50,000 ord. and 25,000 pref. shares taken up; £750,000 paid. Mortgages and charges: £400,000.

**"Dac" Accumulator Syndicate, Ltd.** (40,763).—Capital, £25,000 in £1 shares. Return dated January 14th, 1918. 19,486 shares taken up; £1 per share called up on 4,486. £4,486 paid, leaving £25 in arrears. £15,000 considered as paid on the remainder. Mortgages and charges: Nil.

**Cutting Bros., Ltd.** (81,178).—Capital, £6,000 in £10 shares. Return dated January 4th, 1918. 600 shares taken up. £10 per share called up on 100 shares. £1,000 paid. £3,200 (3 per share) considered as paid on 400 shares. Mortgages and charges: £4,000.

**Supplies Construction Co., Ltd.** (66,081).—Return dated December 31st, 1912. Capital, £350,000 in £5 shares. All shares taken up. £350,000 paid. Mortgages and charges: Nil.

## CITY NOTES.

### Madras Electric Tramways (1904), Ltd.

THE directors' report for 1912 states that there was a gross profit of £20,032. After debiting interest and London office expenses, making provision for the debenture stock sinking fund, and transferring £5,000 to the depreciation and renewal fund, there remained a balance of £9,419, plus £1,104 brought forward, making £10,523. Out of this £3,450 was devoted to a dividend of 6 per cent. per annum on the old preference shares; £551 to a dividend of 6 per cent. per annum on the new preference shares; a dividend of 4 per cent. per annum on the ordinary shares is to be paid, absorbing £2,290; and there is devoted to writing off from the cost of issue of new preference shares £500, leaving to be carried forward £3,732. The traffic receipts show an increase of 11.98 per cent. upon the 1911 figures. The undertaking has been maintained, as heretofore, out of revenue, and special improvements and renewals have been debited to the depreciation and renewal fund, as formerly. The reserve arising from the debenture stock sinking fund now amounts to £4,608. During the year 5,860 6 per cent. cumulative preference shares were issued to repay the temporary loans obtained for the extensions to Washermanpet and Royapuram, which were opened in March and September respectively. Four new large double bogie cars have been supplied, and six trailers are being provided for the increased traffic. Further extensions of the tramway are also contemplated. The board record the death of their chairman, Mr. W. S. B. McLaren, M.P. They have elected Mr. Arthur Maxwell Quill as his successor.

The annual meeting was held on March 13th at the offices. Dashwood House, E.C. Mr. A. M. Quill presiding.

The CHAIRMAN, in proposing the adoption of the above report, said it was a great pleasure to him, on the first occasion of his chairmanship, to be able to present accounts which again showed a satisfactory improvement. The traffic receipts amounted to Rs. 598,092, being an increase of 11.98 per cent., and the number of passengers carried was 15,895,245—an increase of 8.45 per cent. Part of that increase was due to the opening of two short extensions in March and September respectively, but, obviously, some time must elapse before the full benefit of those extensions could be received. The greater part of the improvement, therefore, was obtained from the old lines, which was very gratifying, considering that the traffic had shown a steady upward tendency since the fares were reduced some years ago. Their fares were probably lower than on any other tramway in the world, but as they had to depend almost entirely upon the native population, they were compelled to

adopt low fares. The percentage of working expenses to receipts was less than on most tramways, proving that the undertaking was efficiently and economically managed. Under existing conditions, they could hardly look for any further marked development from the existing lines. The blot on the system was a mile of single track which passed through very narrow streets where a double track was impossible. That caused great congestion at times, but they could not increase the number of the cars on the system. He told them at the last meeting that negotiations were proceeding for a diversion of the lines, but he was sorry to say that little real progress could yet be reported in that direction. He had offered to contribute a substantial amount towards the cost of widening two bridges which the diversion would entail, and they were urging upon the authorities the necessity of the diversion, if they were to properly fulfil their obligations to the travelling public. Further extensions of the undertaking were contemplated, but they could not be proceeded with until the diversion had been authorised. He trusted that before this time next year a solution of the difficulty would have been arrived at. The amount expended on renewals £3,007 was less than they anticipated, but the two extensions absorbed the time of the staff to a great extent. The substitution of 90-lb. rails for 60-lb. would, he hoped, be practically completed before the end of 1914, and as the larger part of the replacement had been completed, they had fixed the contribution to the renewals fund for 1912 at £5,000. The balance at the credit of that fund at the end of the year was £7,645.

MR. JAMES GRAY seconded the motion, and the report was adopted.

MR. P. E. BEACHCROFT, in proposing a resolution fixing the remuneration of the directors at £200 a year each, as from January 1st, 1912, said that hitherto those gentlemen had not been at all adequately recompensed for the work they had done for the company. The board were to be congratulated upon the fact that the ordinary dividend this year was 4 per cent., as compared with 2 per cent. a year ago, and in view of the satisfactory progress the company had made, he thought it quite time that the directors were properly paid.

MR. W. BULLOCK seconded the resolution, which was carried unanimously.

The auditors and the retiring director having been re-elected, the proceedings terminated with a vote of thanks to the chairman.

**New York Telephone Co.**—The report states that the combined telephone earnings of the company and its associated companies for 1912 amounted to \$65,632,689, showing an increase of \$6,613,278 over 1911. The net telephone earnings, including \$1,510,072 other income, were \$18,681,070, an increase of \$2,164,775. Interest charges absorbed \$3,179,573 and dividends \$10,009,335, leaving a balance to surplus and reserves of \$5,492,162, an increase of \$1,572,126. On December 31st last there were 985,780 stations in the system directly operated by the company and its local connecting companies, an increase of 97,445. Including the associated and connecting companies, there were in service in the whole system 1,756,343 stations, an increase of 232,319 stations.

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in—

Sun Power Co. (Eastern Hemisphere), Ltd.—Further issue of 2,050 ordinary shares of £1 each fully paid, Nos. 168,505 to 170,557.

And to allow the following to be quoted in the Official List—

Vancouver Power Co., Ltd.—Further issue of £50,000 4½ per cent. perpetual guaranteed debenture stock.

**Llanelli and District Electric Lighting and Traction Co., Ltd.**—The directors' report states that the profit for 1912, including the balance brought forward, and after payment of loan and debenture interest charges, is £6,401. After paying the 6 per cent. preference interest there remains to be carried forward £2,801. The business, especially in the power and lighting departments, continues to expand, and the above results, which were obtained notwithstanding the coal strike and other abnormal causes seriously affecting the revenue, are regarded as entirely satisfactory.

**O. C. Hawkes, Ltd.**—The directors' report for 1912 shows a balance of £9,687, out of which 5 per cent. is paid on the preference shares, absorbing £4,250, and £4,000 is added to the reserve fund and £1,437 carried forward. The turnover has been progressive, and the profits would have paid a dividend, but it has been thought politic to place an increased amount to reserve bearing in mind that a further development of new branches is in view.

**Tynemouth and District Electric Traction Co., Ltd.**—The total revenue for the year 1912 was £13,661. After deducting all expenses chargeable to revenue, including a provision of £1,000 for renewals, and writing off a loss of £277 on sale of Consols, there remains a surplus of £4,377, plus £4,929 brought forward. The directors have placed £1,250 to reserve, and after paying a dividend of 5 per cent. on the cum. preference shares, a dividend of 4 per cent. is given to the ordinary shares, £297 being carried forward. Bad weather affected the receipts.

**Liverpool District Lighting Co., Ltd.**—The directors have declared a dividend at the rate of 4 per cent. per annum (less tax) for the last half of 1912.

**Winnipeg Electric Railway Co.**—The directors have declared a dividend at the rate of 3 per cent. for the quarter ending March 31st.

### Durham Collieries Electric Power Co., Ltd.

A MEETING of the debenture-holders was held on Monday, at Winchester House, E.C., Mr. A. W. Tait presiding.

The CHAIRMAN said that the meeting was held in accordance with an order made by the Registrar, for the purpose of considering a scheme of arrangement proposed to be made between the company and the debenture-holders. The agreement, which had been entered into with the Newcastle company for the purchase of the undertaking and property of the company contained the following eight undertakings:—

1. 10,000 fully paid ordinary shares of £5 each of the Newcastle company are to be issued to the company's debenture-holders in proportion to their holdings, subject to the proviso that fractions of shares may be sold by the Receiver for the benefit of those entitled to them.

2. The surrender by the Newcastle Co. of £12,860 debentures in the company for the benefit of the holders of the remaining debentures.

3. The discharge by the Newcastle Co., with interest, of a loan to the company of £3,500, made by third parties, and the procuring of the surrender to the company for cancellation of £8,000 prior lien bonds (ranking in priority to the debentures) deposited as security therefor.

4. The release of the principal and interest due in respect of a further £4,000 of such prior lien bonds held by the Newcastle Co.

5. The surrender by the company for cancellation of a further £12,900 of such prior lien bonds, deposited with the Newcastle Co. as security for a debt of £12,437 10s. owing by the company, and the release of the debt.

6. The release by the Newcastle Co. of their claims to have further prior lien bonds allotted in respect of a debt of £8,900 for work done, on the express agreement that the same should be secured by a further deposit of prior lien bonds.

7. The payment by the Newcastle Co. of all the costs and expenses of the debenture-holders' action and of carrying the agreement into effect.

8. The settlement of certain outstanding liabilities for trustees' fees, rent, office and other expenses.

Continuing, the CHAIRMAN said that if the agreement was passed by the meeting and sanctioned by the Court, the result to the debenture-holders would be that they would receive approximately £28 in fully-paid ordinary shares of the Newcastle company for every £100 debenture. That, of course, was a very disappointing outcome, and involved a very heavy loss to the debenture-holders, and the step had only been taken after the most careful consideration and the obtaining of expert advice. It was also put forward, with the concurrence and approval of the Committee of debenture-holders, which was appointed in 1908. They would probably remember that at that time owing to the poor results which had been shown and the financial difficulties of the company a rearrangement of its affairs was then carried out, which rearrangement was approved by the debenture-holders at a meeting held in December, 1908. Under the rearrangement the debenture-holders agreed to waive their foreclosure rights in respect of interest on their debentures for a period of five years to December 31st, 1913, on condition that any net profit earned by the company during that period, after meeting prior lien debenture interest, should be distributed among the debenture-holders. Only one distribution had been made, to the extent of 1½ per cent., on the debentures. An agreement was also entered into with the Newcastle-upon-Tyne Electric Supply Co., Ltd., and the County of Durham Electric Power Supply Co., under which the former company agreed to operate the company's generating station at Philadelphia, and to supply any current which might be required by its consumers at fixed prices, and also to manage the company's distribution system on a sliding scale according to the output; this arrangement to last for a period of 42 years from January 1st, 1909. At the time those arrangements were made the technical advisers of the company believed that with the growth of the company's business, profits would be earned which would gradually enable them in time to meet the debenture interest. As, however, those anticipations were not borne out in actual operation, the board decided to obtain independent expert advice on the position, and they accordingly requested Mr. W. A. Chamen to make a report. In this Mr. Chamen said that he had gone carefully through the consumers' agreements, and he regretted to say that he did not see any way in which the company could hope for any improvement in the price paid during the terms for which the agreements were to run, unless the consumers were willing to grant a revision of the price, which there did not seem to be much hope of their doing. Regarding the agreement with the Newcastle company as to operation, it was a somewhat complicated one. In it they protected themselves in the event of a rise in the price of coal, and the result had been that the company had suffered materially, and the recent trouble in the coal trade had not helped the situation. Under the terms of the agreement with the Newcastle company the prices could only be revised after 21 years by arbitration. There was no doubt that the estimates made by the technical experts at the time when the consumers' arrangements were made, and at the time the agreement of operation with the Newcastle company was entered into, had been seriously at fault. The only thing that could be said in this connection was that there was no experience available in this country at the time with regard to large loads for colliery requirements. The agreements with the consumers and with the Newcastle company were based on a probable load factor which had never been attained, and in fact they had fallen very far short of it. The present output of the company was at the rate of about 24,000,000 units per annum

with a load factor of approximately 40 per cent., and, in the opinion of the expert, it would require an improvement in the load factor up to 70 per cent., with an output of 35 millions per annum, to enable the company to pay debenture interest, assuming the price of coal did not exceed 6s. per ton, and that no further money was required for the purpose of extending the supply. In the opinion of the expert, none of those assumptions were warrantable, and he stated that, unless some alteration could be made in the controlling agreements, the company must get into a worse and worse position as time went on. After the expert's opinion had been carefully considered, and after the directors had endeavoured to obtain concessions from the consumers and from the Newcastle company, without success, they approached the committee of debenture-holders with regard to the position, and acting under their advice, negotiations were entered into with a view to the sale of the company's undertaking. They would appreciate that this was a very difficult matter. The company was not an authorised undertaker under the Electric Lighting Acts, and the whole of its distribution system, with the exception of a small part, was under wayleave and other agreements. As to the company's power station, a large amount of the plant required for the supply to the consumers did not belong to the company, but was the property of the Newcastle company, and there was, therefore, only one possible buyer of the assets. The negotiations for sale took a very considerable time, and it was only after great difficulty that the present offer was finally adjusted. He could only recommend under the circumstances that the offer should be accepted. There was practically no alternative, and if the assets were sold at a break-up he did not believe that the debenture-holders would get anything. He concluded by proposing a resolution authorising the board to carry the scheme into effect.

MR. W. S. POOLE, in seconding the resolution, said he did so as a member of the Debenture-holders' Committee. They realised that it was a very bad outcome of the business, but having carefully looked into the matter, they advised their fellow-holders to accept the scheme, lest something worse might befall them.

MR. MIDDLETON asked what was the value of the stock of the Newcastle company which they were asked to accept.

MR. T. A. HARDMAN remarked that, in his opinion, the company was in a rotten position in 1908, and the best thing would have been to have wound up then.

The CHAIRMAN, in reply, said that the position of the Newcastle company was quite sound, and was improving. They had just paid 5 per cent. dividend on their ordinary shares, and the market price to-day was about £4 for a £5 share. He did not think any of the directors could be blamed for the present position, because not only were the company's technical experts at fault with regard to the revenue which would be produced, but those estimates were practically confirmed by the engineers of the Newcastle company. The position was that a load of this kind was practically unknown in this country—they hoped for a 60 or 70 per cent. load, but they had never got more than 40 per cent.

The resolution was carried without a dissentient.

**Tramways, Light and Power Co., Ltd.**—The statutory report submitted at the meeting held in London last week states that the total number of shares allotted is 475,007 of £1 each (300,000 6 per cent. cum. preference shares, 90,007 ordinary shares and 85,000 deferred shares). 300,000 preference shares and seven ordinary shares have been allotted, payable wholly in cash. 45,000 ordinary shares and 85,000 deferred ordinary shares have been allotted, credited as fully paid-up, in part payment of the purchase consideration, and 45,000 ordinary shares have been allotted, credited as fully-paid up, in part payment of underwriting commission. The total cash received by the company to date in respect of the shares issued wholly for cash is £185,511.

**Huelva Gas and Electricity Co., Ltd.**—The report states (says the *Financier*) that the net profit for 1912, including the balance brought forward, amounts to £1,648. After providing for the dividend on the preference shares, £1,000 is to be written off for depreciation of gas and electric plant.

**Globe Telegraph and Trust Co., Ltd.**—The directors have declared an interim dividend of 2s. per share on the ordinary shares for the three months ended February.

**Canadian General Electric Co., Ltd.**—The directors have declared a quarterly dividend of 1½ per cent. for the three months to March 31st (at the rate of 7 per cent. per annum) on the common stock, and a half-yearly dividend of 3½ per cent. for the six months ended March 31st (at the rate of 7 per cent. per annum) on the preference stock.

**Ascot District Gas and Electricity Co.**—At the annual meeting recently held, it was stated by the chairman that the gas manager, Mr. A. E. Brooks, had made himself quite expert as an electrician. The speaker referred to the all-round economy and efficiency resulting from the manufacture of gas and electricity under one management in one undertaking, and said that gas companies were the right authorities to do electricity supply. The year showed an increase of 15·7 per cent. in electricity sold, and an increase of 6·07 per cent. in gas supplied.

**Farnham Gas and Electricity Co.**—The chairman at the recent annual meeting said that the electricity department started last May was increasing its income, especially from slot meters, and it would not be long before it was paying its way.

**Direct Spanish Telegraph Co., Ltd.**

SIR JOHN DENISON-PENDER, K.C.M.G. (chairman), presided on Monday at Electric House, E.C. over the meeting of this company. The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 111), said it was gratifying to the board to be able to report an increase in the traffic receipts of nearly £3,000 as compared with the year 1911, and also to report that the traffic from January 1st, up to the present date, also showed a slight increase over the figures of last year. The working expenses were £1,079 in excess of those of last year. Salaries in London had increased by £86, due to normal increase under the salary scheme and to the fact that extra assistance had been required owing to the continued increase in the company's business. Salaries at stations showed an increase of £678, which was partially due to normal increase and partly to the improvement in the salary scheme of the operating staff, which the directors found necessary in the interests of all concerned. No interruption of the company's cables had taken place during the year under review, and this had enabled the directors to place the sum of £11,000 to reserve, which they considered good policy, in view of the very heavy expenditure they were obliged to incur in 1911 in connection with the extensive renewal of the Bilbao cable. It must also be remembered that it would be necessary to realise some of the company's securities to enable them to redeem the necessary debentures in June, 1914. The securities now stood in the company's books at £83,956, which was the cost price, but the depreciation, which was something over 16 per cent. or £13,750, had to be deducted from the amount standing in the accounts.

MR. F. A. JOHNSTON seconded, and the report was adopted without discussion.

The retiring director, Mr. Johnson, having been re-elected,

MR. S. COLLETT proposed a vote of thanks to the board. He said the company had passed through difficult and troubled waters, but the directors had steered the ship very wisely, and to-day they had arrived at a very satisfactory state of things. He believed they had never before put by such a large sum as £11,000 to the reserve fund, and in view of the fact that the debentures would be paid off next year, their prospects certainly seemed brighter than for several years past.

The motion having been carried,

The CHAIRMAN replied on behalf of the board and the staff, and said that last Christmas he visited the Bilbao station and saw a great many of the staff there, and he complimented the company on the fact that the station was in perfect order, and everything bore a thoroughly business-like appearance.

**Bournemouth and Poole Electricity Supply Co., Ltd.**

MR. AYMER H. SAUNDERSON (chairman) presided, on March 13th at Moorgate Court, E.C., over the annual meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 391), the CHAIRMAN went through the various items in the balance-sheet, and pointed out that £1,761 had been added to the leasehold and special redemption accounts. The slot meter reserve, amounting to £2,671, had also this year been transferred to this account, which now stood at £19,096. The loan account stood at £30,500, as against £24,000 last year, the increase being due to a loan from the bankers for temporary purposes. On the asset side the amount expended on capital account stood at £469,577, of which £9,371 was spent during the year. The amount actually expended was £11,051, and the difference was accounted for by machinery written off during the year amounting to £1,680. As in previous years, the greater portion of the expenditure had been on mains extensions, and this was inevitable in an undertaking such as theirs, as they had such an extensive area to supply, and new residential districts were continually being opened up. This, of course, was a healthy feature, and one on which they congratulated themselves. As to the investment in the Richmond company, a loan of £2,200 had been advanced to that company during the year. The chairman next dealt in detail with the revenue account, and pointed out the various small increases and decreases. There was an increase of £2,358 in the item for coal, waste, &c., and there was an item of £174 for the insurance and superannuation fund, which, he thought, was an item which would commend itself to the shareholders. The company suffered considerable loss from the coal strike and the transport workers' strike, in common with all other electrical supply companies, and the local directors and Mr. Ingram, the chief engineer, had a very anxious time while the strikes lasted. Now the trouble was over they had the satisfaction of knowing that the steps they took to cope with the difficulties were the best they could have taken, and he was glad to report that the continuity of supply of current was not affected in the slightest degree. They estimated that the trouble cost them approximately £1,300, which they might otherwise have raked into their coffers, and could have used for paying an extra 1 per cent. to the ordinary shareholders, or else have utilised to strengthen their reserves. The repair of meters cost them £286 extra, due to their having overhauled all the meters both in stock and in their consumers' premises. Altogether, during the year they had written off £7,309 on various accounts, which was equal to 4.93 per cent. on the ordinary shares of the company. It appeared to him that their position might be summed up as follows: First, they showed an increase in the gross receipts from all sources of £5,604 over the previous year. Secondly, £7,399 had been added to depreciation reserve and redemption funds. Thirdly, the reserve for depreciation now stood at £34,703, as against £31,983,

showing an increase of £3,320. Fourthly, the dividend on the ordinary capital was at the rate of 5 per cent. per year, compared with 5½ per cent. for the three previous years. Fifthly, the carry forward amounted to £2,144 against £1,209 for 1911. The general progress of their business had been he was glad to say quite satisfactory during the year. The applications for the supply of current received during the year amounted to 613 k.w., as compared with 535 k.w. in 1911, thus showing an increase of 11 per cent. and the units sold were 3,338,125 as against 3,078,116 in 1911, being an increase of 8 per cent. During the past year the rates of supply to the Bournemouth Corporation for tramway traction had been revised in accordance with the provisions of the agreement, which contained powers to revise the rates every five years. The matter necessitated careful and lengthy negotiation, and ended in a friendly adjustment of the price, and hence the costly resort of arbitration was avoided. With regard to the Richmond Electric Light and Power Co., in which they held a large interest, it was a matter for congratulation that the company had been enabled to pay them in respect of last year a much larger contribution to their revenue than usual. It had maintained its position and given satisfaction to them in every way. They would remember that, at the last meeting, he told them he believed the time had passed when metallic-filament lamps could have anything but a most beneficial effect on their revenue, and he was glad to say that the results quite justified that view. The lamps rendered the current cheaper to the consumer and were making electric light far more popular than before. Practically all the chairmen at the meetings of the electric supply companies which had been held that year told them that last year had seen a great increase in the quantities of electricity supplied to their consumers compared with the previous year, not only for lighting, but for heating, cooking and power purposes. He was convinced that the electric supply industry generally speaking, had a very bright future before it. The Bournemouth Co. had certainly not lagged behind, and their prospects of increased business during the present year were distinctly encouraging, and he hoped next year to come before them with a statement showing improved results all round. In conclusion, the chairman referred to the appointment of Mr. H. B. Renwick, the former secretary, as managing director, the appointment of Mr. W. D. Brightman, previously local secretary, as secretary of the company, and the appointment of Mr. F. C. McQuinn as London secretary.

DR. J. ATKINSON HOSKER seconded the motion and the report was adopted without discussion.

In acknowledging a vote of thanks passed to the board and staff, the CHAIRMAN said he would convey the shareholders' appreciation to the staff at the staff dinner which it was proposed to hold shortly, when the food would be cooked by electricity.

**Prospectuses.—Clyde Valley Electrical Power Co.—**

The list of subscriptions was to close on Wednesday, 19th inst., in an issue of 30,000 6 per cent. cumulative preference shares of £10 each at par. The development of the business renders extensions to generating plant, cables and sub-stations necessary, and it is for providing capital for these purposes, for further extensions in the future, and for the repayment of temporary loans that the present issue has been made. The profits for 1910 were £29,316, for 1911 £45,782, and for 1912 they were £54,440, notwithstanding coal strike effects and consequent dislocation of business.

*The Cuban Telephone Co.*—The list was closed on 14th inst., earlier than was expected owing to its success—in an offer of \$1,500,000 6 per cent. cumulative convertible preferred stock in shares of \$100 each at \$19 per share, equivalent to, say, \$92½ per \$100 share. The company, which has already issued \$5,000,000 common and \$2,000,000 preferred stock, has acquired very large holdings in the Havana Telephone Co. and the Havana Subway Co. The proceeds of the present sale of preferred shares will be applied to further construction, extension and betterments rendered necessary by the growth of the company's operations. The Havana old telephone system was superseded at November, 1910, by the automatic, and the number of subscribers is now 11,494, and the ultimate capacity is 100,000. The business and the receipts are showing continuous increases. The concession confers the right, without limitation of time, to install and operate a general and long-distance telephone system extending over 1,000 miles, covering practically the entire island of Cuba.

**Rhondda Tramways Co., Ltd.**—The accounts for the

year 1912 show a balance to the credit of the revenue account of £18,680. After deducting rent to the Rhondda U.D.C., debenture interest, sinking fund for the redemption of debentures, interest on loan, &c., there remains £2,778, plus £1,193 brought forward. There is to be placed to reserve and renewal account £2,000, carrying forward £1,976. It is estimated that the profit for the year was adversely affected to the extent of at least £6,500 by the national coal strike and by the strike of the company's drivers and conductors in May. For the six months to June 30th, during which these labour troubles prevailed (according to the *Financial*) the traffic receipts were £19,700, but for the second six months they were £30,000. The company is promoting a Railless Traction Bill in Parliament to enable it to serve a large and increasing colliery district about six miles from Tonypandy.

**Dublin and Lucan Electric Railway Co.**—The gross

receipts for the half-year ended December 31st are £3,867, being 293 less than those of the corresponding period of 1911. The expenditure increased by £177. After providing for debenture interest and paying the usual half-yearly dividend on the 5 per cent. preference shares, £375 is to be carried forward.

### Gateshead and District Tramways Co., Ltd.

MR. C. R. GREENE presided on March 13th at the offices, Kingsway, W.C., over the annual meeting of this company, and in moving the adoption of the report (see ELECTRICAL REVIEW, page 444), he said that the excellent result of the past year's working had constituted a record. The profits on working showed an increase of £364 over 1911, and the directors were in a position to recommend the payment of a bonus of 1 per cent. on the ordinary shares in addition to the usual 6 per cent. dividend. Traffic receipts showed an increase of £572, and this was most satisfactory in view of the labour troubles during the year. The company benefited materially during the period of the coal strike from the reduced railway service in the districts served by the tramways, but when the strike was over the increase was soon lost, owing to the effect of the strike on general trade. Traffic, however, picked up rapidly again towards the latter part of the year, and they finished on December 31st with an increase of £572. The satisfactory expansion in the receipts had been continued in the current year, and the prospects so far for the current year were good. During the year the company took the whole of the advertising on the cars under its own control, and the change had been satisfactory. Turning to the other side of the revenue account, power and running expenses showed a decrease due to decreased current consumption, to which the fitting of meters on the cars had materially contributed. There were 6,572 more car-miles run during the year. Having regard to the size of the undertaking and the work carried out by the administrative and general expenses were on the low side. During the year the National Insurance Act came into operation, and in future years this would cost them considerably more. Repairs and maintenance had increased by £627, due to the heavy expenses on the bodies of the cars. Most of the cars were now 12 years old, and the wood-work needed extensive repairs. Nine cars were constructed during the year, and the whole cost had been charged against revenue. Repairs and renewals to the electric equipment and trucks of the cars had cost £252 less. Permanent way repairs were up £142, and in addition £485 had been spent on renewing portions of the track, and charged against renewals account. £1,473 had been expended on the motor-bus undertaking. Applications had been received from time to time from local authorities in districts adjoining Gateshead for the company to extend their tramways, but the board after careful consideration felt that this would not be profitable. Application had, however, recently been received from the Chester-le-Street Urban District Council for them to provide a regular service of motor-buses between the tramway terminus and Low Fell and Chester-le-Street. On careful consideration the directors decided to give the service, and nine buses of the latest type had been purchased, and a garage was in course of completion at Chester-le-Street, and it was hoped to commence the service within the next few weeks. There was every prospect of the service being a success, and there was always, in addition, the traffic brought by the omnibuses to the tramways. They had a further advantage in the form of the excellent tramway organisation, which would help to keep the expenses of the omnibus department at a minimum. There were other omnibus routes which the directors had under consideration, and one of the most promising was that between the tramway terminus at Felling and Usworth to Washington. The Chester-le-Street Rural District Council, in whose area these places were situated, had approached the board on the matter, and had provided them with useful information and assistance. As soon as the Chester-le-Street service was completed, it was proposed to operate an experimental service from Washington to Felling. The "pay-as-you-enter" cars had operated satisfactorily during the year, but owing to the exceptional influences affecting the traffic on the Bensham and Saltwell routes upon which these cars were running, it had not been possible to satisfactorily ascertain the effect on the traffic receipts. The directors, however, were satisfied that the results had been beneficial, and, as new cars were needed for the Lowfall route, the directors had authorised the construction at the depot of two new cars on the "P.A.Y.E." principle. The directors congratulated the shareholders on the results of the past year, and, in the absence of further strikes in the labour world, similar results might be anticipated for the current year. The general results of the undertaking had been materially assisted by the loyal way in which the whole of the staff in Gateshead and in London had worked.

MR. C. S. B. HILTON seconded the motion, and it was carried without discussion.

The retiring directors were re-elected, and a resolution was carried, on the motion of MR. BOWER, seconded by MR. BOWKER, fixing the remuneration of the board for the year at £450.

### Brompton and Kensington Electric Supply Co. Ltd.

MR. H. R. BEETON (chairman) presided on March 13th at Winchester House, E.C., over the annual meeting of this company.

The CHAIRMAN in moving the adoption of the report (see ELECTRICAL REVIEW, page 444), said that the accounts revealed the satisfactory progress of the company's business. During the past year they connected 345 additional customers, which was a larger number, with two exceptions, than in any previous year, and 13,147 35-watt lamps, which was the largest number since 1906. The sales of electricity had for the first time exceeded 3,000,000 units. The income therefrom was £56,348 being an increase of

£1,618, whilst the expenditure had amounted to £23,170, being a decrease of £868, thus showing an increased profit of £2,486 over the previous year. This result was largely due to the fact that, owing to the more economical plant they now had in operation, they had consumed 1,820 tons less coal, and had thus been able to save £478, notwithstanding that, owing to the strike, they had had to pay about 1s. per ton more. But for the introduction of the turbine plant their coal cost last year would probably have been £2,000 in excess of what it actually was. The growth of business had at length overtaken the reduction in demand which the metallic-filament lamp entailed upon them, to the advantage of their customers, and the gross and net receipts once more constituted a record in the company's history. In a purely residential district and at a pressure of 100 volts, as in their case, the metallic-filament lamp found its most profitable field, and he thought they might assume that the invention in its present stage of development had reached its full application in their area. In other words, they had not only been called upon to bear, but they had now faced, the full brunt of the metallic-filament lamp, and it would be interesting, therefore, to compare their position now with the position in 1907, before the advent of this current-saving device. Broadly stated, the position was that although they were now selling rather more current than in 1907, they were supplying about 30 per cent. more customers and lamps, and at the same time the maximum demand for current which they were called upon to supply at any time was actually less by more than 10 per cent. From this it followed that, inasmuch as their maximum demand determined the extent of the plant they required, they had now a larger reserve of plant to meet future expansion of business, and that the smaller extent of plant required was more fully, and, therefore, more profitably employed. In short, their "load factor," as it was technically called, which was the measure of the profitable character of their production, had risen from 16 per cent. to 18½ per cent. It was to the use of electrical accessories, which they had assiduously fostered of late years, that this improvement was due, and as such use extended, as it assuredly would, this favourable tendency would continue. Moreover, not only did they now require less plant to do the same business, but the plant installed was so much more economical than that which was installed five years ago, that they could now produce the same quantity of current at more than 10 per cent. less cost. This relief from additional capital expenditure, in conjunction with the accumulated profits in the interval, had enabled them to substitute up-to-date for obsolete plant to the extent of about £30,000 and at the same time to increase their reserve funds by another £30,000. On the basis of the appropriations which they now recommended, their reserves and undistributed balances would amount to upwards of £120,000, or 60 per cent. of their subscribed capital, and the radical demolitions of plant shown in the depreciation account of last year would permit of a reduced appropriation of this nature in the near future. "In order to maintain their prosperity in a progressive industry, such as that in which they were engaged, they were obliged to keep up with the latest developments, and since they last met them the board had continued to be actively engaged in the study of electric cooking through the agency of the Accessories Co. As he had occasion to tell them last year, they looked for considerable improvement in supply from this source, and at the same time they were confirmed in the expectation that they might be able to turn to profitable account the experience they had gained in the development of cooking appliances. To this end, and by way of demonstrating the advantages, and especially the reliability, of electric cooking, the Accessories Co. was opening the first all-electric restaurant in London, on premises adjoining their showrooms, at an early date. They did not conceal from themselves that there was a speculative element in this departure, but even so, it was one which their surplus resources justified them in entering upon. So far as they could judge of the prospects for the current year, they looked forward to at least as satisfactory results as those they had achieved in the year now under review.

MR. W. R. DAVIES seconded the motion.

DR. BERKWEILL asked how the cost of electric cooking compared with that of gas.

The CHAIRMAN said that it was difficult to give an answer to the question without causing some misapprehension. It depended largely on the cost of current; just as electric lighting progressively declined in cost, so could electric cooking. The fact was that experience showed that electric cooking was a vastly superior form of cooking, and had advantages associated with it which did not exist in the case of gas or coal. He believed it would grow to such an extent, that eventually they would derive a greater revenue from cooking than from lighting.

MR. FOX having congratulated the company on the enterprising manner in which it had encouraged the use of electricity for domestic purposes.

The report was adopted.

The retiring director, Mr. Davies, was re-elected, and the meeting closed with a vote of thanks to the board.

**Stewarts & Lloyds, Ltd.**—The directors, after setting aside £100,000 for depreciation, recommended, subject to audit (says the *Financial News*), the usual dividend of 10 per cent. on the preferred ordinary shares and a dividend of 1s. 6d. per share on the deferred shares, placing £50,000 to reserve, and carrying forward £90,000. Last year 1s. per share was paid on the deferred shares, £70,000 each applied to both depreciation and reserve, and £86,500 carried forward.

### City of London Electric Lighting Co., Ltd.

MR. J. B. BRAITHWAITE (chairman) presided on Wednesday last week, at Salisbury House, E.C., over the annual meeting of this company.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, p. 400), said that so far as their business was concerned the year had been a normal one. The capital expenditure, £45,508, was almost identical for the last two years, and the whole of this had, in accordance with the practice of some years past, been provided out of revenue: so that there had been no occasion to make any additional issue of capital. During the year the completion of further turbine generating plant had released the greater portion of the old alternating current plant, which, although seldom used, had been retained as a reserve. They had, therefore, disposed of it, and had entirely written it off. This accounted for the fact that £191,150 had been written off plant, as compared with £45,000 a year ago. The fact was that they had now written off and scrapped the second generation of their generating plant, if he might use such an expression: the first plant put in in 1891 had disappeared from their station for some years, and had been entirely written off, and now they had removed the last remains of the second generation of generating plant altogether, and there was nothing in their station now except comparatively modern plant, although, of course there was plant which in due time would ripen for removal, and then from year to year they would put in more and more modern plant. It was the adoption of this policy which had enabled them to pay increasing dividends. The result of the writing off that year would be that the total reserve funds would now show the figure of £240,000, as against £377,127 a year ago. This was after placing the increased amount of £50,000 to the depreciation reserve. As to the reserve they had experienced an advance almost identical with that of last year. Last year the revenue showed an increase of £9,455, and this year it showed a further increase of £9,035, so that during the last two years, their revenue had increased to the extent of £18,500. Last year out of the increase of £9,000, they were able to retain over £5,000 net. This year they would have done equally well had it not been for the coal strike and the transport strike, which materially interfered with their coal supplies, and also had the effect of raising the prices of coal; the rise was still continuing. On account of these strikes they had to pay £4,194 additional for coal. They had also this year felt the full effect of the quinquennial valuation, resulting in a further increase of the rates of £882. These, and other items had increased their expenses altogether by £7,220, so that of the £9,000 increased revenue, they had only been able to retain £1,850 as net. In the report they had set out how it was proposed to dispose of the balance available, and he would only call attention to one item, viz., contribution to employees' provident fund, and under the National Insurance Act, £1,804. In 1902 the shareholders gave them authority to become contributors to the British Electrical Superannuation Fund, but the constitution of that fund did not appeal to a large portion of the staff, and up to 1911 the company were never called on to contribute more than £400 a year, and owing to various circumstances the board had thought it well to withdraw from that fund, and had decided to establish a staff provident fund of their own, which was greatly appreciated by their staff, and there were now 140 members contributing to it. Their contributions for that fund this year would amount to £1,800, and he thought the shareholders would agree that no portion of their expenditure was more wise than that which went to make proper provision for the loyal and faithful members of their staff, who earned their dividends, when in due course their places would be taken by younger men. Therefore he anticipated that the resolution he was going to ask them to pass could be passed unanimously, giving approval to the scheme they had set on foot. They had made further progress in reducing the loan to their bankers and generally improved their financial position. Whereas, the bankers' loan stood last year at £85,000, it had now been reduced to £59,000. On the other hand, the amount due to their creditors was about £12,000 more, and investments were £4,000 less, so that the financial position showed a net improvement of £10,000 in the course of the year. With regard to public lighting there was nothing fresh to report beyond what was mentioned last year, that an agreement had been come to with the Corporation by which the public lighting in the City would be approximately divided between the Gas Co. and the Electric Lighting Co. In the report there were some particulars given with regard to the right of the Corporation to purchase their undertaking in 1914. So far as he was aware the Corporation had no intention of exercising that right. That was to say they had received no communication from them which would lead them to suppose they had, but, of course, their right did not arise until next year. He merely said that because there had been rumours in the papers that the Corporation were actually considering the question and that negotiations had been entered into. Nothing of the kind had taken place at all, and he had no reason to believe they had any intention of exercising their right of purchase. It was fair, however, that he should say that if the Corporation did not exercise their right next year the right would entirely lapse. Under the recently passed Electric Lighting Act the County Council became the ultimate purchasing authority of all the electric supply undertakings of London in 1911; and that being the case, unless the Corporation exercised their right next year, the view of the company was that their right lapsed entirely. The average price received for current was still slightly on the down grade, and they received an average of 2.37d. per unit, as against 2.39d., which, of course, was an answer to people who said they overcharged for current. The number of consumers being supplied showed an increase of 483 over 1911, and the number of K.W. connected showed an increase of 2,029, so that evidently

the City, as a field of electrical supply, was by no means exhausted. They got a considerable number of applications for connections, and one could only suppose that the use of electricity was extending in all directions. There was still, he thought, a considerable field for its use for heating in various directions, and he anticipated that they would see a considerable growth in that source of revenue in future years. Apparatus was now supplied at a very low rate, which enabled the occupier of any office in the City to have all the facilities of hot water and that sort of thing for a very small expenditure of money. They must look forward in the future to a gradual and steady growth of their load, and also, he hoped, in the results to the company. This year the board recommended a bonus of an extra 1 per cent. out of the dividend equalisation account they started some years ago to make provision for a possible drop in their revenue, due to the introduction of the metallic-filament lamp. So far as they could judge, that danger no longer existed, and therefore they felt justified in distributing half the fund by way of a bonus of 1 per cent., which would make the dividend for the year 9 per cent. On previous occasions they had never made an advance in their dividend unless they saw their way, humanly speaking, to maintain it, and he need not say that the same consideration had been present in their minds on this occasion.

MR. F. W. REYNOLDS seconded the motion.

MR. HEDGES asked if there were any particular terms on which the Corporation would acquire them if they exercised their rights, and whether the board considered it would be to the advantage or otherwise of the company to be bought out.

The CHAIRMAN said the Corporation would have to buy them as a going concern, with payments for goodwill and all the rest of it. He did not know that he ought to be asked to express an opinion as to whether it would be to the company's advantage to be bought out. That would depend on the arbitrator. They were quite content with their undertaking, but, of course, seeing that they were paying 9 per cent., the City would be able to raise money much cheaper and probably make something towards the rates.

The report was then adopted, and resolutions were also carried re-electing the retiring director and approving of the action of the directors in forming a Staff Benefit Fund.

### Cambridge Electric Supply Co., Ltd. — Mr. D.

Munsey presided at the annual meeting held in February, and in presenting the report (see ELECTRICAL REVIEW, page 314) he said that the year had been a very successful one. They had sold 110,000 more units than in 1911 (lighting increase, 83,000 units; power, 27,000 units). The extension of business had been going on in all directions, and their extra profit was £1,400, out of which an extra £750 would be put to depreciation account, and 1 per cent. more would be paid in dividend. Their depreciation addition for the year, £3,500, was not too much. They not only had coal enough to last through the whole of the strike, but could have lasted another four or five weeks. Mr. A. A. C. Swinton seconded, and the report was adopted, and the dividend of 5½ per cent. declared. There was a vote of thanks to the staff, the chairman specially mentioning Mr. R. C. Pierce (the engineer) and Mr. J. H. Taylor (the secretary).

**Australia.**—According to the *Australian Mining Standard* the Electric Light and Power Supply Corporation, Ltd., Balmain (N.S.W.), for the half-year ended December 31st, made a profit of £6,006, of which after deduction of interest on debentures, there remained £3,505. A dividend at the rate of 7 per cent. per annum absorbed £1,505, suspense and preliminary expenses account, £1,000, depreciation £865. The private consumers totalled 1,203, an increase of 563 for the year. Portions of the new 2,000-H.P. turbo-generator were delivered early in the year 1913, and it is expected that it will be in operation before the capacity of the present machinery is reached. Owing to the increase in population in Balmain, a larger quantity of garbage was collected, and it was found advisable to provide for the garbage being burnt in one shift per day by installing an additional cell: this is completed and working satisfactorily.

**Davis & Timmins, Ltd.**—At the annual meeting held at King's Cross last Friday, Sir Henry Mance, in moving the adoption of the report, referred to its satisfactory nature. Last year he informed them that the bonus, in addition to their 8 per cent., would be 5 per cent., and this year they were justified in recommending that it be 10 per cent. This was a record. In 12 or 13 years, though the capital was only £107,000, they had paid to shareholders in dividends £109,000. In 1912 business was remarkably good. Increased business had necessitated increased machinery, and no expense was spared to keep the latter up to date. Stock items were, of course, larger on account of the increased volume of business. In regard to prospects, judging from the two months' working so far, they had no reason to think that 1913 would be any worse than 1912. The works were full of work. The chairman thanked the energetic managing director, Mr. G. E. Davis, and the staff, for the excellent service rendered during the year. The report was adopted.

**Mirrlees Watson & Co., Ltd.**—The directors state that the balance at credit of profit and loss account for 1912, after providing for depreciation and directors' fees, amounts to £32,719, plus £2,478 brought forward. The directors recommend a dividend of 10 per cent. and a bonus of 5 per cent., less income-tax, and that £12,500 be transferred to the general reserve account, £5,042 being carried forward.

### Greenock and Port Glasgow Tramways Co., Ltd.

THE directors report that the total revenue for 1912 was £43,383. The traffic receipts, which amounted to £12,214, show an increase of £4,267. After providing for all expenses chargeable to revenue, including £2,137 for interest, payments to Corporations amounting to £1,418 and setting aside £4,000 to the renewal account there was a surplus on the year's working of £13,296, plus £1,072 brought forward. The directors propose to put to reserve sinking fund for loan redemption £1,773, to reserve £1,200, to pay 5 per cent. per annum on the preference shares £3,500, a dividend at the rate of 6 per cent. per annum on the ordinary shares £6,900, leaving £2,996 to be carried forward. The capital expenditure during the year amounted to £2,591, the greater portion of which was in connection with the purchase of motor-omnibuses. The directors believe that with the reliable vehicles now available there is scope for a profitable service of motor-omnibuses in the Greenock district, and a service will be commenced in the early spring of the present year, for which purpose six chassis of the latest type have been arranged for. The continued activity of the trade in the district is reflected in the satisfactory increase in the traffic receipts, and there are indications that equally good results will be experienced during the present year.

### Oxford Electric Co., Ltd.

SIR HENRY MANCE presided at the annual meeting on March 7th, and in moving the adoption of the report (see ELECTRICAL REVIEW, page 359), he referred, first of all, to the death of Sir J. Irving Courtenay, a director of the company since its inception. The chairman's observations respecting the accounts were then read by the secretary, after which Sir Henry, in referring to general matters, said that at the close of the coal strike they still had a month or six weeks' supply of fuel in hand. The result was, of course, unfavourable to their coal figures; but thanks to the partial assistance of the Diesel engine, which they had had running for some months, the figures were just as good as in the previous year. They had learned the wisdom of not being dependent upon a particular kind of coal or fuel, and they could get some by water and some by rail. The Shops Closing Act had had a noticeable effect on revenue derived from shopping districts; but, perhaps, the most important thing against them had been the metallic-flament lamp. They had, however, now touched bottom in this respect. They had added 146 new consumers, including some of the college buildings, &c. The equivalent of 10,000 lamps had been connected to the mains. They were hoping for a more rapid increase in the electric cooking business; appliances had been steadily improved, but the great difficulty was the objection of the cooks. They had been brought up to use coal, and did not like to try anything strange. In regard to the tramways, if the proposals now before the City Council did not succeed, he thought the alternative for tramways was self-contained traction cars, which had answered very well in other parts of the world. What, he thought, was wanted was a new battery—one durable, reliable and cheap—that would do for electric traction what the metallic-flament lamp had done for electric lighting.

The report was adopted, and Prof. T. L. Bullock was elected a director.

The meeting closed with thanks and best wishes to Sir Henry Mance, who has been associated with the company for 20 years.

### STOCKS AND SHARES.

Saturday Morning.

MARKETS round the Stock Exchange threw off some of their depression after the conclusion of the settlement. It happens generally that prices are advanced on the eve of a holiday, this being one way in which the incurable optimism of the Stock Exchange asserts itself year after year. Prices, moreover, had had a very considerable fall, and it was time that there should be some kind of upward reaction, for no small part of the decline was due to the simple process of marking down quotations, irrespective of any sales taking place.

The Home Railway market presented a firm front, on the assumption that prices here had reached levels which discounted a good deal of trouble. Taking the list through, a good selection of British railway stocks can be bought to yield from 5 to 5½ per cent. on the money, and such returns cannot be ignored, even in times like these. The Undergrounds are somewhat overlooked in the better feeling that prevails in the market as a whole, though Districts rallied to 5½, and Metropolitans to 5½. Business has

been done in Central London Ordinary up to 79½, and it would require very little demand to put the Central London trio substantially better. A fair amount of speculation in East London is a feature amongst the lower-priced issues, bullishness having been fanned by irresponsible whispers that the stock was being bought up by some of the powerful interests connected with what has been called the Traffic Trust.

English Electric Supply shares are now mostly *ex* their spring dividends, and on Thursday last, dividend deductions were made from County of London, City of London, Chelsea, Charing Cross, Oxford, Kensington, and London shares. Cities are *ex* 12s., this being the dividend and bonus. It will be seen from our lists overleaf that the return on the Ordinary shares of the principal electric lighting companies is now round about 5½ per cent. on the money; and if it were not for the uncertainty attaching to the prospect of what may happen to the companies in 1931, it is safe to assume that prices would stand considerably higher. As things are, however, brokers scarcely like to recommend the shares for investment, having regard to the obscurity of the prospect. Could this be lightened in any way, there is no doubt but that the electric lighting group would become a great deal more popular than it is at present.

In the Latin-Canadian department, it is increasingly evident that South American undertakings require ever more and more capital to meet their need of expansion. The railway companies are the principal claimants, but their appeals for money react upon the shares in the utility concerns as well as those which are more directly concerned with their own industry.

The position in Mexico is still far from settled, and although it is generally assumed that the worst has been seen in that country, there is still a possibility to be reckoned with of some fresh, unexpected outbreak. Mexican Light and Power Securities are easier, and there has been a little selling of Mexico Tramway bonds, but there is not much quotable change in the rest of the Mexican securities. Sao Paulo Trams went back a little, the loss being picked up, however, by Sao Paulo Electric Fives. Rio bonds are steady. Shawinigan are a point down, and Montreal Common shares at 227½ show a fall of 3.

We took the opportunity of having a long talk the other day with a gentleman, back a fortnight ago from the United States, who spent a day on the property of the Mississippi Light and Power Company, and he bore emphatic testimony to the wonderful piece of engineering work that has just been accomplished. We understand that the machinery is all but ready to commence work, and the result of the operations will be watched with intense interest. The Company's Common shares have recently fallen to the neighbourhood of 50; and while the Stock Exchange remains so non-commercial and unenterprising as at present, it is not likely that there will be much revival in the price. Quiet business, however, is being done in the 5 per cent. bonds at 90½.

Remembrance of the Georgia Light and Power episode is still with us, and those who bought the shares when they were run up to about 47 upon anticipation of a 4 per cent. dividend are not likely to pay much heed to the renewed talk of a distribution being made in the near future. Such rumours are afloat, however; and while we should hesitate to place much reliance upon them, they are certainly of interest. Of course, if the Company should pay a dividend this spring, it will certainly provide a very pleasant disappointment to many of the proprietors. The price of the shares keeps steady at about 39, while Alabamas at 44 are equally stagnant.

The Cuban Telephone issue of 6 per cent. Preferred stock, to whose advent we referred two or three weeks ago, has now been made, and the security looks good, while the price of 92½ cannot be called excessive. The Melbourne 5 per cent. Debenture stock, which came out last week at 93½, was, we believe, fully subscribed, but the lists have to be kept open a few days longer for the Australian subscriptions. There are buyers of the scrip in the market at 1 premium for cash.

National Telephone Deferred is quoted at 19½ *ex* the 75 per cent. return that was made to proprietors on Thursday last, but the reduction in the price of the stock has not stimulated speculation to any extent. On the other hand, Marconis have started into fresh life upon covering by the bears. Such, at least, is the Stock Exchange theory to explain the demand, though whether it is the correct reason for the improvement or not, it is difficult to say. In view of the very stiff contango rate charged on the shares last Tuesday. The price at 4½ shows a rise of ½, while the Preference shares are ½ higher. West India and Panama shares went back to 3.

The Anglo-American group is unchanged, but the market is watching somewhat narrowly for manifestations of the new President's probable policy in regard to trusts. To judge from his first efforts, Dr. Woodrow Wilson is likely to be at least as erratic as was his famous predecessor before last. Globe Telegraph Trust shares rose ½ over and above the dividend deduction at 2s. The Mackay issues are *ex* dividend, allowing for which there is little change in the quotations. United River Plate Telephone Preference have been in some demand, and Oriental Telephones hardened, while Telephone of Egypt 4 per cent. Debenture stock is a point up.

The Manufacturing division is quiet, though there is much talk of the strong accession of business which the companies are declared to have gained by reason of the trade boom. The market for raw rubber remains steady at about 3s. 11d. per lb. Many of those who have been watching it, express disappointment at the failure of the commodity to improve in price, but the steady way in which large supplies of rubber come forward every fortnight at the Mincing Lane auction sale is sufficient reason to account for the disinclination of consumers to buy more than they require for their immediate purposes.

## RELATIVE EFFICIENCY AND ADVANTAGES OF DIRECT, SEMI-DIRECT AND INDIRECT LIGHTING.

By L. CROUCH.

ILLUMINATION received from any lighting source can be regarded as due to direct and indirect components; "direct" lighting proceeds from the source to the illuminated plane, with or without diffusion by an opalescent screen, but without that complete screening of the source itself and reflection of light from a ceiling, wall, or special diffusing reflector, which characterises "indirect" lighting. In the majority of lighting schemes, the illumination provided has both direct and indirect components, and, as shown below, this condition is generally to be desired.

Some years ago, when illuminating engineering was no more than a name, the endeavour of most lighting "experts" was to increase the luminous efficiency of their lighting schemes by increasing the direct component of the total illumination. Owing to the considerable absorption of light by the diffuse reflecting surfaces, indirect lighting is naturally less efficient than direct lighting which, if secured by high-grade silvered reflectors, or, better still, prismatic reflectors, renders practically the whole of the luminous radiations from the source available in a more or less restricted field, whence a certain illumination of adjacent areas is effected (but in a manner which cannot be subjected to predetermination), by diffuse reflection. However, the low efficiency of indirect lighting is justified in many cases by the uniformity of illumination obtained. In a room lighted entirely by indirect illumination, there are practically no specular or regular reflection on working surfaces, no deep and sharply defined shadows, and no surfaces of sufficiently high intrinsic brilliancy to fatigue the eye. In such places as drawing offices, these characteristics are wholly advantageous, but in general offices, and, to a greater extent, in residences, &c., some shadow is very desirable to allow of a rational appreciation of relief and perspective. Once its novelty has worn off, purely indirect illumination becomes wearisome, depressing, and even fatiguing to the eye by its very uniformity. The tiresomeness of purely indirect illumination is particularly noticeable when the walls are of light-coloured material; much more pleasing effects are secured by the choice of a dark wall covering, and the luminous efficiency thereby sacrificed is, to some extent, compensated by keener visual acuity. The overall luminous efficiency of indirect lighting may be as low as 10 per cent. (particularly if the light fittings and ceiling, or other diffusing surface, be dirty or coloured); in very few cases can a higher luminous efficiency than 40 per cent. be secured.

There is now a general appreciation of the fact that interior illumination is usually best effected by semi-direct lighting; good diffusion and a reasonable minimum illumination should be provided by indirect light, but "life" should be given to the net illumination by a direct-lighting component arranged so as to secure faint shadows, but definite shading,\* while completely avoiding glare. So much biased matter has lately appeared concerning the relative advantages of various lighting systems, that it is refreshing to study the results of a series of tests† undertaken to determine the actual merits of direct and indirect illumination and the percentages of each which should be combined in a semi-direct illuminating scheme.

By proper design, including the judicious proportioning of direct and indirect illumination, the undoubted advantages of indirect lighting can be secured while correcting its disadvantages to a great extent, by direct lighting. The efficiency of

\* A striking example of the dangers of too uniform illumination is to be found on the library staircases in the Institution of Electrical Engineers' Building, Victoria Embankment, London. The ceilings are white, and the walls and stairs are surfaced with white marble; and as a result of the almost perfect diffusion of light, it is quite difficult at night to distinguish the edges of the steps when the latter are clean.

† Further particulars of these tests are to be found in the *Southern Electrician* for December, 1912, whence the subjoined data are drawn.

indirect lighting itself must always be low, but the overall efficiency of illumination may be increased by increasing the proportion of direct lighting, so long as the desirable features of the indirect lighting are not thereby sacrificed. The inefficiency of indirect lighting does not detract from its illuminating advantages; it merely increases the cost of securing the latter.

The problems to be solved are: (1) To what extent is diffusion of light desirable, as determined by the avoidance of specular reflection and by the depth and sharpness of shadows; (2) what is the maximum intrinsic brilliancy to which the eye should be exposed; (3) what percentage of direct illumination will compensate the "flatness" of indirect lighting without introducing undesirable features?

The diffusion of the net illumination provided should be such that no appreciable direct reflection or glare is noticeable from the highly glazed paper now so frequently employed—particularly for the printing of half-tone blocks. This consideration requires that direct illumination should be provided by opalescent bowls sufficiently large to avoid specular reflection and of no greater intrinsic brilliancy than the ceiling (or other diffuse reflector) area of maximum brilliancy. Great accuracy in determining these conditions and in estimating the percentage of direct illumination is not necessary—indeed, it is impracticable.

Tests undertaken by Sweet and Doane with semi-direct lighting units showed that, in a particular case, the proportions of illumination received directly and indirectly with

diffusion which can be secured by indirect, as compared with direct, lighting; in picture galleries and drawing offices, &c., this value is high, but in other instances it is negligible. In any case, a well-designed direct-lighting scheme is preferable to a semi-direct system, in which the direct component is sufficiently great to reduce seriously the illuminating advantages of the indirect component.

**Comparative Efficiencies.**—As the average result of a large number of tests, it may be taken that two lumens can be obtained per watt expended in an indirect lighting equipment under favourable conditions. In small rooms with light walls and ceilings, the efficiency may rise to 2.5 lumens per watt, falling to 1.5 lumens per watt, or less, in large rooms with high ceilings. Definite test data which, apart from their intrinsic interest, show the comparatively high efficiency which can be obtained in indirect and semi-direct lighting systems under favourable conditions, were recently presented by Henninger and are reproduced in abstract in Table I (see also *loc. cit.*).

In Case II, tests with the lighting unit at various distances below the ceiling gave the following results:—

Hanging height below ceiling.	1 ft.	1 ft. 6 in.	2 ft.	3 ft.
Extreme per cent. var. illum.				
Above mean ...	21.5	19.3	22.7	21.4
Below mean ...	22.0	21.1	20.2	17.6
Effective lumens per watt...	2.65	2.90	2.69	2.66

Tungsten lamps in prismatic glassware were used in Case IV; the direct illumination measurements were made

TABLE I.—TEST DATA COMPARING EFFICIENCY OF DIRECT, SEMI-DIRECT AND INDIRECT LIGHTING.

Case.	Size of room. Length x width x height.	Walls.	Ceilings.	Lamps (Tungsten) globes, &c.	Direct, semi-direct, or indirect.	Average foot candles.	Watts per sq. ft.	Effective lumens per watt.	Relative per cent. efficiency*
I.	19 ft. x 39 ft. 7 in. x 12 ft. 2 in	Light yellow	White	Eight 150-w. clear lamps bowl frosted	Direct, indirect	6.39 2.77	— —	4 1.73	100 43.3
II.	9 ft. 10 in. x 8 ft. x 8 ft. 3 in.	Black	White	Lamp 12 in. from ceiling.	Direct, indirect	5.63 2.40	— —	3.52 1.51	88 37.7
III.	36 ft. x 18 ft. x 12 ft. 6 in.	White wainscot and 4 ft. mirrors	Light Buff	Three 4 x 100-w. fittings.	Semi-direct	5.78	1.875	3.08	—

V.	38 ft. x 20 ft. x 10 ft.	Light yellow	Cream	Six 150-w. lamps in light opal bowls. Shade rims 15 in. below ceiling.	Semi-direct	4.14	1.16	3.56	—

\* Based on clear lamps and direct illumination.

white ceiling and white, medium and dark walls respectively, were:—11 per cent. and 89 per cent.; 13 per cent. and 87 per cent.; 14 per cent. and 86 per cent. If the direct component of the illumination does not exceed 12 per cent. of the total, no trouble should be experienced by specular reflection, and the amount of direct illumination should be kept as near as possible to the upper limit thus determined, in order that the overall efficiency of lighting may be a maximum.

It is desirable that no sharp shadows of greater density than 15 per cent. should be present on working surfaces; for drawing office work, 10 per cent. is a better limit, and in very few cases can a 30 per cent. shadow be tolerated. The lower limit of shadow desirable is determined by considerations of perspective and relief. As regards intrinsic brilliancy, the sources of direct illumination should be no more intense than the brightest patches on the ceiling, and even the latter are sometimes brighter than is desirable for eye-protection.

Summarising, we may say that the direct illumination should be: (1) About 12 per cent. of the total from the standpoints of specular reflection and intrinsic brilliancy; (2) from 10 per cent. to 15 per cent. of the total for best shadow results.

If the percentage of direct illumination falls below 10 per cent., there will be loss of perspective and lack of "life" in the illumination, while if it much exceeds 15 per cent. of the total, the advantages of the remaining indirect illumination will hardly justify the cost of its provision. In this connection, the illuminating problem reduces to a determination of the money value to be attached to the more perfect

with the fittings hung in their normal position, after which they were inverted, but kept at the same height as before. Finally, the inverted reflectors were surrounded by a cone of blackened Bristol board in order to isolate and determine the true indirect component of the total lighting. The maximum variation in the illumination was 55 per cent. in the direct lighting scheme, 44 per cent. in the semi-direct arrangement, and 78 per cent. under the total indirect illumination.

Efficiency considerations undoubtedly favour semi-direct as compared with indirect lighting and, if anything, a higher actual effective illumination is required in the latter case to produce the same impression of good lighting and the same ability to see well.

**Electrical Congress in Russia.**—A Russian General Electrotechnical Congress has just been held in Moscow, when among the papers read was one by M. Pilkevitch on "Central Generating Stations," in which he advocated the erection of the generating plants near the source of the fuel supply, and the transmission of the current to the point of distribution in preference to locating the station in the town to be supplied, and conveying the fuel thereto.

M. Koltvanoff, the director of the Moscow Urban Railway, submitted a scheme to the Congress for the construction of an underground electric railway in Moscow.

A resolution was adopted by the Congress in favour of a law with regard to electrical units in Russia, while it was decided to recommend the Government to enforce the adoption of officially-approved electricity meters.

## THE NATIONAL INSURANCE ACT, 1911.

## COURTS OF REFEREES.

By JOS. J. H. STANSFIELD, F.C.I.S.

THE National Insurance Act, 1911, came into force in July, 1912, but it was provided by Sec. 84 that unemployment benefit was not to be paid in respect of any period of unemployment occurring during the first six months. This period has now expired, and as claims for benefit are being made, it becomes advisable to consider the conditions under which benefits are payable, and in what way employers are affected or interested.

The statutory requirements and conditions under which benefits are payable are set out in full in Secs. 84 to 86, but it may be shortly stated that, subject to contributions having been paid by an employer on behalf of a workman and of himself, every workman of 17 and upwards, so long as the conditions are fulfilled and the workman is not disqualified, is entitled to benefits if he has been employed in an insured trade and is unemployed.

The workman must prove (1) that he has been employed in an insured trade in each of not less than 26 weeks during the preceding five years; (2) that he has applied in the prescribed manner; (3) that since the date of application he has been continuously unemployed; (4) that he is capable of work, but unable to obtain suitable employment; and (5) that he has not exhausted his right to benefit.

The disqualifications for benefit are by Sec. 87 (1) unemployment through trade disputes, so long as the dispute lasts, unless the workman has become employed elsewhere in an insured trade (2) for six weeks from the date of leaving if the unemployment is caused through misconduct, or voluntarily leaving without just cause; (3) being an inmate of any prison or workhouse, or other institution supported wholly, or partly, out of public funds; (4) residence temporarily or permanently outside the United Kingdom; and (5) in receipt of sickness or disablement benefit, or disablement allowance, under the Health provisions of the Act.

The unemployment provisions of the Act apply to persons of 16 years and over, but no benefit is payable for unemployment occurring before the age of 17, and only half benefits are allowed from 17 to 18, but after the age of 18 the benefit is 7s. per week for each five weeks' contributions.

A consideration of the qualifications and disqualifications for benefit will show that these are partly questions of fact and partly of opinion, and as it was anticipated that there might be disputes between a workman and the Insurance Officer as to the amount of benefit due, or whether benefit is payable or not, the Act provides (Sec. 88) for the setting up of Courts of Referees to which such disputes may be referred.

The United Kingdom has been divided provisionally into eight divisions, again sub-divided into 82 districts for each of which a panel of employers' and workmen's representatives have been constituted, the names of the divisions and the number of districts in each division being as follows:—London and South-Eastern (14), South-Western (7), West Midlands (6), Yorkshire and East Midlands (13), North-Western (14), Wales (5), Scotland and Northern (19), and Ireland (4). For these 3,158 representatives have been elected, one-half on behalf of employers and the other on behalf of workmen.

The members of employers' panels have been elected by the Board of Trade, and the members of the workmen's panels by ballot of workmen engaged in insured trades. If an Insurance officer refuses or stops benefit, or allows benefit of an amount not in accordance with the claim, the workman may require the case to be referred to a Court of Referees consisting of three persons—one drawn by rota from each of the two panels, with an impartial chairman appointed by the Board of Trade, the latter being neither an employer nor a workman in an insured trade.

Should the Court of Referees make a recommendation in agreement with the decision of the Insurance Officer, its recommendation is final, but if the Court disagrees the

officer must either accept the recommendation or, if desired by the Court, refer the matter to the umpire appointed by the Crown under the Act, his decision being final.

If an Insurance Officer thinks fit, he may refer a case direct to the Court, instead of deciding it himself when the decision of the Court is final.

Where a workman has required an Insurance Officer to refer his claim to a Court of Referees, the Chairman of the Court may at any time before the matter has been taken into consideration by the Court, refer it for report to two persons residing in the same neighbourhood as the workman, one of these persons being drawn from the employers' panel, and the other from that of the workmen.

Questions bearing upon the administration of Unemployment Insurance, may be referred by the Board of Trade for consideration and advice to the persons constituting the panels when special meetings will be held.

Courts of Referees usually meet weekly in some central town, but the number of representatives on the panels is sufficiently large as not usually to require an attendance of any individual member more than once a quarter.

It is as yet too early to say how Courts of Referees will succeed in settling disputes to the satisfaction of all concerned, but it is likely that some difficulty may be found in respect of the disqualification for six weeks of benefit where a workman leaves employment through misconduct or without sufficient cause. Indeed, Trade Unions already threaten agitation with regard to this, on the ground that workmen are being deprived of benefit where the misconduct has been due to a conflict between the rules of a Trade Union and the regulations of an employer.

Although employers are only indirectly concerned in the question whether a workman is entitled to benefit or not, it should not be overlooked that economical administration of unemployment benefit funds is of importance, and that, although the unemployment part of the Insurance Act at present only applies to a limited number of trades, that number may at any time be extended, within limits, by the Board of Trade, and if this part of the Act is considered to be a success, it is not unlikely that extensions may take place from time to time.

## PROCEEDINGS OF INSTITUTIONS.

## Electric Resistance Welding.

By P. BUCHER.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Manchester, December 17th, 1912.)

IF the correct interpretation of welding signifies the joining of two pieces together so as to form one while hot under pressure, then the only one of the new methods which can rightly be classified under this head is the electric resistance welding. In every one of the other methods the metals are actually heated to melting-point, and are in reality fused together.

The provision of the necessary current is one of the greatest difficulties with which the introduction of electric welding has to contend, where there are no public mains supplying single-phase alternating current. Where the public supply is direct current, it becomes necessary to install either a motor-generator or a rotary converter for generating single-phase alternating current.

In three-phase systems it is sometimes permissible to put a welder in one phase only, but in the case of larger welders the unbalancing effect would be too serious, and means must be provided to transform three-phase into single-phase current. This can be done by a three-phase motor driving a single-phase generator. A rotary transformer with two distinct stator windings, which gives a load on the three-phase primary balanced to within about 90 per cent., is considerably cheaper than the motor-generator.

The current is transformed down to about 2 volts in a special transformer, which in almost every case forms part of the welding machine itself. The secondary winding takes the form of a copper casting corresponding to a single turn, fitted with suitable means for transmitting the current to the pieces which are to be welded.

All the parts which are exposed carry only the low-voltage secondary current, so that the process is absolutely free from danger through shock. It is important that the secondary circuit be kept as short as possible.

The method of working is, in all cases, the same. The pieces to be joined are gripped in the clamps or placed between the electrodes and brought into contact. The primary circuit is closed either by an independent act of the attendant or automatically by the machine. The heavy current flowing through the joint heats it up at once, and welding temperature is reached very rapidly, in a

fraction of a second in light wire or the spot-welding of thin sheets, or in several minutes in the case of a heavy tire. The flow of current is interrupted as soon as the required heat is reached, and therein lies one of the advantages of resistance welding—it never consumes energy unless it produces work. Simultaneously with the interruption of current and the cessation of the heating comes the upsetting or shutting of the weld by continuing or increasing the mechanical pressure which was first used to bring the two parts into contact. The application of this pressure in butt welding raises at the joint a lump or burr, which generally must be got rid of.

Somewhat similar conditions to the raising of the burr in butt-welding prevail in spot-welding. When the current passes from electrode to electrode it brings a cylinder of metal to white heat, and thereby into the plastic state. This soft cylinder is surrounded by a shell of cold and hard metal. When end-pressure is applied to it for making the weld, its volume is reduced by the amount to which the electrodes enter into it. Some of the surplus metal escapes round the circumference along the sides of the cone of the electrodes, forming a low ridge, but some of it—and this is a drawback to spot-welding—is extruded between the two sheets to be joined, slightly driving them apart. This means that spot-welding cannot be relied upon to make a water or gas-tight joint between two sheets. If that type of joint is required, the cone-shaped electrode of the spot-welder must be replaced by the roller of the seam-welder. The principle of its working is simply a repetition of spot-welding, but its result is an uninterrupted seam or lap weld.

The use of very heavy currents makes the necessary machinery heavy, cumbersome, and expensive. The field is therefore not jobbing, where arc and hot-flame welding reign supreme, but repetition work, where it scores immensely by virtue of its simplicity, accuracy, reliability, speed, and economy.

Chain links are welded at an average rate of 10 to 15 per minute, or 30 to 40,000 per week. An average week's output of a heavy tire-welder was 625 tires, varying in width from 2 in. to 9 in. A bank of spot-welders worked by boys on miscellaneous hollowware dealt with 120 to 180 gross of articles per machine, corresponding to about 35,000 welds per machine per week.

The heat efficiency of a welder is about 75 per cent. The above-mentioned weekly output of chain, assuming about 3 a.w. gauge, would use from 100 to 130 units. The tire-welder already referred to used, according to the supply company's meter, 737 units, and a spot-welder on miscellaneous hollow-ware uses about 1 to 1½ units for 1,000 welds.

The most important question is: How strong is an electric weld? The reply to this is very favourable. Actual figures were quoted in "Experiments on the strength and fatigue properties of welded joints in iron and steel," a paper read before the Institution of Civil Engineers by Messrs. Stanton and Pannell. These experiments were made on sample welds prepared by 16 different engineering firms in the kingdom according to their usual practice. The condensed result for tensile strength is expressed in percentage of the tensile strength of the unwelded material:—

Hand-welded iron.	Hand-welded steel.	Electric-welded iron.	Electric-welded steel.
Mean of 24 tests	21 tests	7 tests	8 tests
89·3	81·6	89·2	93·4

In the same way for fatigue properties:—

Hand-welded iron.	Hand-welded steel.	Electric-welded iron.	Electric-welded steel.
Mean of 21 tests	28 tests	5 tests	12 tests
97·6	78·4	92·6	87·0

The authors state that with reference to the respective merits of hand and electrical welding, the tests show that more uniform results are obtained by the electrical welding method; and there appears to be no evidence that the want of uniformity in the material, which is usual in the region of a welded joint, is liable to cause failure of the joint under repeated applications of the load, provided the weld be originally sound.

Electric welders are in daily extended use in brass and copper wire mills for joining up rods and slottings, which afterwards pass through the drawing dies.

High-carbon steel can be welded up to about 0·8 per cent. carbon, but the results are not so satisfactory as in mild steel. When high-carbon wire is welded the heat of the weld is a very short one, and the bulk of the adjoining cold metal seems to have a quenching effect on the steel, so that the wire when taken from the machine is glass-hard at the joint and snaps on the slightest effort. To overcome this the wire must be locally annealed—for preference in the welder itself—and this heat treatment weakens the wire for the length to which it has been applied as compared with the rest of it.

Generally speaking, the strength of a welded high-carbon wire is about 60 to 70 per cent. of the unwelded wire.

Pure copper welds quite satisfactorily, and so do most of the brasses unless the percentage of zinc in them is too high, when the weld becomes brittle and will not draw. Nickel and most of its alloys also weld very well; so do aluminium, silver, gold, platinum and iridium.

Only iron and mild steel lend themselves to spot-welding in a satisfactory manner.

#### DISCUSSION.

PROF. E. W. MARCHANT said he had recently made experiments on the actual amount of energy used in making electric resistance welds between samples of iron wire. The energy consumption was remarkably small, as was seen from the fact that a weld between a

pair of  $\frac{1}{8}$ -in. rods took 20 watt-minutes, or, in other words, 1,000 welds of this kind could be made with only  $\frac{1}{2}$  B.T.U. of energy. Similarly, with  $\frac{3}{16}$ -in.-diameter rods, the energy consumption was 50 watt-minutes;  $\frac{1}{4}$ -in. rods, 110 watt-minutes;  $\frac{5}{16}$ -in. rods, 180 watt-minutes. As the diameter of the rod increased, the energy consumption per weld went up very rapidly; for example, comparing  $\frac{1}{8}$ -in. and  $\frac{5}{16}$ -in. rods, nine times as much energy per weld was required in the latter case. This increase was due partly to the increased contact area and also to the large amount of cooling due to the jaws holding the metal. The current used in the case of the  $\frac{5}{16}$ -in. rods was about 2,000 amperes. Using copper rods, a current of 6,000 amperes was required, against 2,000 amperes for iron of the same diameter. The use of chokers to increase and diminish the welding current would considerably increase the energy consumption in welding, but, in any case, the current rushes in welders would not seriously affect pressure regulation in the average supply station, even if no regulating device were employed.

MR. A. E. MCKENZIE said that, about 24 years ago, it was decided to increase the capacity of some superheaters, and the question of installing new superheater tubes was considered. The price of new tubes was so high that it was decided to lengthen the existing tubes by welding additional lengths. Twelve sample tubes (six scarf and six butt joints) were welded by the electrical resistance method, and on test the butt joints were found to be superior to the scarf joints, notwithstanding the greater surface of the latter. The result of the test justified the alteration of one boiler containing 40 tubes, which, after welding, were tested at 1,000 lb. per sq. in. Six months' satisfactory working of the experimental boiler warranted the change of three others, and, notwithstanding the strong criticism of the boiler makers and insurance companies, after two and a half years' work, not a single tube had given any trouble. Before making the welds, the tubes were slightly bevelled inside and outside at the butt; the burr was thrown up on the outside, although scarcely noticeable.

MR. W. CRAMP said the process of resistance welding appeared to be better than anything arc welding could produce. The portability of oxy-acetylene or oxy-hydrogen welding appliances was a great point, and, notwithstanding the author's suggestions, a direct-current machine should have a wide scope. Instead of a motor-transformer, a cheap form of homopolar machine run at a high speed might be successfully employed. If, using the same values of current and time, joints were made by (1) direct current, and (2) alternating current, would there be any difference in the results? The energy required for welding different sections of wire would depend very much upon the heat capacity of the section, and this effect would undoubtedly account for a portion of the increased energy consumption referred to by Dr. Marchant.

MR. K. M. FAYE-HANSEN said that in some cases the secondary of the transformer consisted of more than one turn, also some firms used copper laminations instead of a copper casting. Electrically, the casting was as good as the laminations, and it certainly provided a much better mechanical job.

MR. R. G. CUNLIFFE gave a description of a rail welding process for use on traction rails exceeding 10 sq. in. in cross-section. In this system, six special bridging plates were electrically welded so as to connect each fish-plate to the rails efficiently. The Chicago Railroad Co. employed the system with much success.

MR. J. FRITH wished to know whether in using the author's apparatus the back portion of the chain link did not short-circuit the portion to be welded. No mention had been made of the constant-current welding machine due to Dr. Rosenberg.

DR. E. ROSENBERG asked for further figures in connection with the tensile strength values. There was very little difference in the various methods according to the average value, but it was of considerable importance to know what the lowest value was.

MR. W. POLLARD DIGBY (communicated) said there was too much of a tendency to regard the tensile test as everything in regard to welding. They ought to consider other properties. The change in the microstructure of the metal welded was all-important. The mechanical engineer had failed to have recourse to the metallurgist. Each weld showed under the microscope such characteristics that it was possible for the metallurgist to say from a sample of the steel what method of welding had been employed. One thing was essential to resistance welds, that the resistance weld should receive adequate working while the metal was still plastic. If this were not done, one found, on cutting up a large bar welded by the resistance method, two distinct classes of fractures. The outer metal, near the extruded portion, had a decidedly splintered fracture; the inner area had a decidedly crystalline fracture with relatively low elongation, and showed under the microscope a slight tendency to overheating. Another property common to all welds in a greater or less degree was that of oxidation. Resistance welds shared with acetylene welds the least susceptibility to this. All the arc welds, on the other hand, which had come through his hands, had shown a marked tendency to oxidation. Each welding process had its own field of application. Many welding processes, not least among them that described by the author, were of great commercial success and general utility. At the same time they must really cease to place this excessive emphasis on tensile strength, and consider instead the fact that while tensile strength might remain high, the other mechanical properties might be affected, and not least, corrosion might be facilitated.

MR. L. W. SCHUSTER (communicated) said that the most interesting feature of the subject dealt with in the paper was the effect on the metal due to the welding. In the case of the acetylene welding of cracks and grooving of boiler plates, local hardening of the metal appeared to take place; great difficulty was encountered in obtaining a satisfactory weld, and the cracks were always liable to extend. It would appear that this would equally be the case in the event of its being practicable to adapt electric welding for repair

work of this nature. The cutting of plates by the acetylene blow-pipe flame seemed to have the same hardening effect, although in the case of steel pipes being cut in this manner for receiving branches and the branches being afterwards welded by the acetylene process on to the pipes, the results appeared to be satisfactory, but it might perhaps be safer to anneal afterwards. In the case of the electrical welding of flanges to pipes, the results did not appear to have come up to expectation.

The AUTHOR, in reply, said that aluminium welds were extensively made in connection with rim work in the Birmingham district. Regarding the chain link question, a certain amount of current did go round the back of the link, but not enough to make it unbearably hot to the fingers; even in small links the economy of the process was so pronounced that this loss of energy was never considered of importance. Some firms used copper stampings for the secondary, but by far the majority used a copper casting.

### The Institute of Metals.

THE annual general meeting of the Institute of Metals was held in London on March 11th, when the new president delivered his inaugural address. On the following day a number of papers were read. One on "Metal-Filament Lamps," contributed by Mr. Alexander Siemens, summarises the history of the use of metal filaments in glow lamps, and states that the first lamp to have actually drawn-metal wire as its filament was the tantalum lamp, manufactured by Siemens & Halske, Berlin. They also succeeded in drawing an alloy of tungsten and nickel, but before that process was perfected, the General Electric Co., of Schenectady, patented a process to make pure tungsten ductile, which is described in the paper.

Mr. Arnold Philip (Admiralty Chemist) dealt with "The Corrosion of Distilling Condenser Tubes."

A paper by Dr. G. H. Bailey deals with the action of water and salt solutions on aluminium. From an examination of the experimental evidence, he draws the following conclusions:—That aluminium of high purity is less readily acted upon than that of lower purity, and that the presence of sodium and copper in the metal increases the rapidity of corrosion. Well-annealed metal is also more resistant to corrosion than unannealed metal. In general the corrosion of aluminium is a process of oxidation; metal exposed for several months to water or salt solutions from which the dissolved air had been expelled, underwent no corrosion whatever. The normal course of corrosion (excluding the action of acids and alkalis) is thus a transformation of aluminium into alumina, which separates out as a flocculent precipitate without any of the aluminium passing into solution.

Mr. O. F. Hudson discussed the microstructure of German silver, and Mr. G. H. Gulliver read a paper on "The Quantitative Effect of Rapid Cooling upon the Constitution of Binary Alloys." The importance of the subject is due to the fact that the constitution of a cast alloy cooled at ordinary rates lies between that of the very slowly-cooled and that of the very quickly-cooled mixture, so that its limits of variation with change in the rate of cooling can now be specified.

A paper was read by Messrs. H. S. Primrose and J. S. Glen Primrose, on "Practical Heat Treatment of Admiralty Gun-metal." They find that even in the absence of blow-holes, which constitute the commonest source of unsoundness, cast gun-metal behaves unsatisfactorily under hydraulic tests due to the presence of microscopical pores formed between two constituents of widely-different properties. The most marked improvement was found to be produced by annealing the bars for half-an-hour at a temperature of 700° C., as the physical tests showed lower results both above and below this critical point.

The report of Council showed that the membership amounted to 614, an increase of 28. The balance to the credit of the Institute at June 30th, 1912, was £548, in addition to the balance in the research fund and various minor assets.

### Recent Developments in the Street Lighting of Manchester.

By S. L. PEARCE, M.I.E.E., and H. A. RATCLIFF, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Manchester, February 25th, and London, March 6th, 1913.)

THIS paper is principally a record of the work undertaken, the results obtained, and the numerous tests and experiments upon which the satisfactory completion of the work depended.

The first installation of arc lighting in Manchester was carried out in the early part of 1897. A number of 500-watt "open-type" arc lamps of the short-hour double-carbon type, suspended about 22 ft. above the ground, were erected. On October 27th, 1897, the City Council approved a report of the Electricity Committee recommending that all tramway routes be lighted by arc lamps; and in the following year application was made to the Local Government Board, and sanction subsequently received, for the borrowing of £75,000 for street-lighting purposes. The work has not been carried out, though at one period it was the distinct desire of the Corporation that the main thoroughfares should be so illuminated.

In 1904, the original "open-type" arcs were superseded by 600-watt and 900-watt lamps of the single-enclosure type, suspended some 18 ft. 6 in. from the ground, and burning 100 hours without re-trimming.

At or about that time a limited number of intensified gas lamps had been placed on the streets of Manchester; comparative results

obtained showed that the cost of a minimum horizontal illumination of 0.28 foot-candle per lamp per hour was 0.37d. for the 600-watt arcs, and 1.21d. for the intensified gas. The running cost per 1,000 C.P.-hours was similarly 0.75d. for the arcs, and 1.98d. for the intensified gas.

The year 1906 marked the beginning of the supersession of the single-enclosure type of lamp by magazine flame arcs, which was completed by the end of 1911.

That the amount of electric street lighting is ridiculously small, is due to the fact that up to a very recent date the Gas Committee of the Corporation has been the street-lighting authority. On October 2nd, 1912, the City Council placed the control of the lighting of the streets under the authority of a Street Lighting Committee, and it is hoped that impartial consideration will be accorded in the future to the rival illuminants.

Arising out of a proposal to extend the high-pressure gas lighting system, the City Council, on February 1st, 1911, authorised a scheme of competition between the two rival illuminants. No restrictions were placed on either department; each was to do its best.

This paper is particularly concerned with the comparative results of Princess Street and Portland Street, which may be regarded as typical examples of modern street lighting by high-pressure gas lamps and high-candle-power flame arcs respectively.

Four Keith high-pressure lamps were suspended in Princess Street at the same height above the roadway as the arc lamps, namely 27 ft. 6 in. The distance between the lamps averaged 106 ft. 6 in. Each lamp contained three inverted burners, and clear globes were used. At normal pressure each burner was rated at 1,500 C.P., or a total of 4,500 C.P. for the complete lamp; but the maximum candle-power obtained was only about half this figure. As originally installed, the lamps were fitted with traversing and lowering gears; but these were apparently not successful, as the lamps were at a later date fixed permanently in position. The flexible gas supply tubing was also replaced by rigid galvanised gas barrel.

Princess Street is 60 ft. wide, and as the lamps were on an average only 106 ft. 6 in. apart, the resulting illumination was very good, and far superior to any previous example of high-pressure gas lighting in Manchester. Presumably in order to improve still further the maximum illuminating effect, but certainly not the uniform distribution of the light, the lamps have been lowered about a foot.

The central-suspension system was chosen for the lighting of Portland Street, and certain predetermined "units" of light were erected at such calculated distances apart as to give the maximum illumination for the least capital expenditure.

In addition to low initial costs, the central lighting system has the following advantages, which appear to outweigh certain known disadvantages:—

(a) The distributing mains can all be kept to one side of the street.

(b) No separate lighting standards are required on the street pavements, with consequent advantage to pedestrian traffic.

(c) A more even illumination is obtained; in other words, the ratio of maximum to minimum illumination is less than with side lighting for a given amount of electrical power employed.

The traffic in Portland Street is of a very dense character. It was therefore deemed advisable to aim for a high standard of minimum illumination, viz., something of the order of 0.5 foot-candle.

The length of Portland Street is 1,751 ft., and its width 66 ft. Sixteen 550-watt lamps, working four in series on the 200-volt mains, have been erected; the distance between lamps varies from 114 ft. to 124 ft.

Eight of the 16 lamps are run on an all-night circuit, and the remaining eight are switched off at 11 p.m. The switching "on" and "off" is automatically controlled by time switches.

With six exceptions the arc lamps were suspended 28 ft. above the level of the street by means of two wrought-iron straps, from two steel wires of  $\frac{1}{4}$  in. diameter, placed 14 in. apart, one above the other in a vertical plane (see fig. 1). Under these conditions the swinging of the span wires is largely counteracted.

The lamps are fixtures, and all trimming has to be done from a tower wagon.

From the street level to a height of some 8 ft., galvanised steel tubing is run up the building walls. The service branch cables drawn through the tubing then enter a connecting box, and from the latter a heavily sheathed 7/18 s.w.g. twin vulcanised india-rubber cable is fastened to the upper part of the walls with raw-hide cleats, and is then carried across the span wires to the lamps by means of pigskin suspenders. The lamps are of the magazine type, and the actual hours of burning average 70; but it is usual to allow only 65.

The first results obtained were not considered altogether satisfactory. Shadows and concentric rings were practically eliminated by the use of slightly opalescent outer globes, but the efficiency of the lamps was impaired to a very appreciable extent, and the distribution of light was rather worse than before.

It is apparent, from an inspection of the polar curves (fig. 2), that neither the clear nor the opalescent outer globes were suited to the conditions.

The height of the lamps was lowered from 28 ft. to 27 ft. 6 in., to mask certain shadows of the trolley-wires.

Whilst the lamps were undoubtedly giving their rated candle-power, yet, owing to the particular design of the outer opalescent globes and spinnings, practically all the rays from the horizontal to the 18° angle below the horizontal were entirely blotted out. It was decided to modify the construction of the spinnings, lowering the arc a distance of  $\frac{1}{4}$  in., and to use another type of outer globe in which there was less interference with the direct trans-

mission of the light rays in the neighbourhood of  $20^\circ$  below the horizontal (fig. 8). The alterations resulted in a substantial increase in the candle-power emitted between the angles of  $10^\circ$  and  $20^\circ$ , the maximum ray attaining 3,600 C.P. at  $23^\circ$ .

In the early part of 1912 the Manchester Corporation called in Mr. Jacques Abady and Mr. Haydn Harrison to report on the two systems of street illumination as carried out in Princess Street and Portland Street respectively. The reports of these gentlemen have already appeared in the technical Press.\*

In order that the comparison between the various schemes of lighting might be both definite and reliable, and also to enable the best results to be obtained from the arc lamps, a very considerable amount of photometric testing was necessary. This work was in progress for over twelve months, and many thousands of readings were taken during that period.

All the testing was done in the streets at night with the lamps burning under normal conditions.

The photometer used was a modification of an instrument constructed by Messrs. Alexander Wright & Co. The photometer head is of the Simmance and Abady flicker type. This photometer measures the actual light flux density of the incident ray, from which values for candle-power and the intensity of illumination on vertical or horizontal planes can readily be calculated. The complete apparatus

FIG. 1. a and b, with original globes and spinnings; a, outer globes clear; b, outer globes opalescent; c, with clear globes of the type now used.

FIG. 2.—POLAR CURVES FOR 550-WATT LAMPS.

FIG. 3.—INNER AND OUTER GLOBES NOW USED. ORIGINAL SHOWN DOTTED.

is mounted on a special cart, by means of which it can be wheeled about as required. Owing to numerous structural alterations, and for no other reasons, it was not conveniently possible to arrange the photometer for taking readings at a less distance than 5 ft. from the ground.

Many of the measurements have, for purposes of comparison, been reduced to their corresponding values on a horizontal plane 3 ft. 3 in. above the ground.

Two 6-volt Osram lamps were used alternatively in the photometer as sub-standards of luminous intensity, thus providing a check on the measurements. The lamps were supplied from a 20 ampere-hour accumulator, burning when the discharge curve of voltage was practically horizontal.

In addition to photometer measurements, a few observations were also taken with a luminometer.

The results of the numerous photometric tests are given graphically in the paper. The results of street photometric tests are very frequently questioned, and gas authorities invariably dispute their accuracy. A consistently maintained degree of accuracy within a limit of 5 per cent. is all that is necessary for ordinary street work, and is recognised as sufficiently close by most of the authorities on photometric work. As all the curves obtained were plotted from the "means" of numerous readings taken with every necessary precaution, it may be reasonably assumed that the limit of possible error did not exceed 5 per cent., and, in many cases, was probably less.

The gas lamps give a much steadier light than the arc lamps, but their candle-power varies very considerably from day to day. The candle-power of a particular lamp may fall at least 50 per cent. before the mantles are renewed, unless it is arranged to change only one mantle at a time, thus spreading the complete change over a fairly long period.

The candle-power of the arc lamps may vary quite appreciably within a few minutes, but provided that the same make of carbons is used the average candle-power at any particular angle will not change to any extent from day to day, if the line voltage is reasonably constant.

A very important feature directly affecting the comfort of the general public is the absence or otherwise of glare. In this respect, the 3-burner high-pressure gas lamps have an advantage over the flame arc lamps with clear inner and outer globes. The use of clear outer globes with flame arc lamps is in fact hardly advisable from the point of view of scientific lighting.

Two notable features in Princess Street are the comparative softness of the shadows of objects cast on the ground and the absence of a pronounced dark horizontal zone in line with the reflectors. The first result is undoubtedly due in a great measure to the fairly large triple light source, which has the effect of shading off the edges of shadows; and the absence of a dark zone in line with the reflectors is no doubt due partly to the fact that the source of light is well below the reflector, and partly to the reflection from the inner surface of the large globes.

The shadows cast by the flame arc lamps when burning with clear inner and outer globes are very intense, and there is no appreciable shading of the edges; consequently, it is possible to confuse shadows with actual objects. The smallness of the light source, or, in other words, the high intrinsic brilliance, and the fact that the arc is well up under the reflector is no doubt the cause of the objectionable horizontal dark zone noticeable in cases where reflectors are used.

(To be concluded.)

#### DISCUSSION IN LONDON.

MR. A. H. SEABROOK, in opening the discussion, said that if the London electrical engineers had had such records as those contained in the paper, 18 months ago, they would not have been troubled by competitors to the extent that they were. The figures given were conclusive. He quite agreed with the centrally-hung lamps, but did not understand the absence of lowering gear, which was a great convenience. In the case of the Oxford Street lamps, lowering gear had superseded the use of the tower wagon, and it had paid for itself in 18 months in labour saved. It was essential to use good carbons, arc lighting being the best possible advertisement for electric lighting; the authors' figure of carbon cost, 2d. per lamp per hour, was a good one, which he (the speaker) had not found it advisable to reduce. The fixed costs of £61 per kW. connected for lighting was a good covering figure; the estimated 70 per cent. use of lighting connection (allowed in calculating the fixed costs) seemed high. In fixing cost it should be remembered that the load was largely a non-peak one; he asked whether the figures of cost were price charged or actual cost.

MR. HAYDN HARRISON said a great deal of the work covered by the paper had been also carried out in London, but the results had not previously been published as in this case. High-pressure gas was shown to be out of court, but it was only fair to mention that the pressure was lower in Manchester than in London, and the results not so good. But a higher pressure was impossible in Manchester on account of leakage, and even with the increased pressure electricity was the better of the two. The success of the Manchester arc lighting was taken with the installation; indiscriminate arc lighting had done more harm than good. Dr. Bloch, who was an authority on the matter, gave 255 C.P. per cu. ft. of high-pressure gas as a practical figure, and reliable tests in this country gave 27 C.P.; the claim to 50 C.P. was excessive, but the lower figures might possibly be exceeded. The Manchester street illumination suffered from the black buildings, and at the time of the test a lamp opposite a new building appeared to be the best, and would have been judged the best by the average observer, which showed the necessity of photometry. He believed the intrinsic brilliancy of the H.P.-gas lamps in Regent Street was far higher than that of the arc lamps adopted in Manchester, and a great deal higher than for the arc with an obscuring globe.

PROF. SCHWARTZ said one of the great difficulties in street photometry was the large range of illumination which had to be measured: a photometer, such as that used by the authors, was liable to introduce errors due to its construction. The metre height above ground proposed for outdoor photometric measurements, was an inconvenient one, and he thought 1½ metres, or approximately the height of the eye, would be better. Tests taken by his assistants confirmed the results in the paper, and the great variation in illumination of high-pressure gas lamps. He congratulated the authors on the absence of glare; this was cheaply obtained at the cost of a little light.

MR. FRANK BAILEY thought it might be cheaper for the Manchester authorities to clean the buildings, and save energy now used in obtaining the minimum illumination. The City of London E.L. Co. had published all the principal results obtained from its experiments in street lighting, which covered much the same ground as the authors. Judging by his experience the authors had secured some curious results from dioptric globes; the latter were not easy to design, and in his own case, a special mould had to be provided before the glass-maker would make them. The treatment of the arc lamp globes at Manchester destroyed the skin of the glass, which it was difficult to preserve even in the normal state. He could not agree that arcs would not burn as steadily as gas lamps and strongly advocated further experiments with dioptric globes which would remedy such a defect.

MR. K. EDGECUMBE said the metre height for photometric measurements had been adopted as a standard by the Germans. He thought the authors might explain a little more definitely what they meant by horizontal illumination. Illumination had nothing to do with ground surface; the figures given were presumably calculated illumination of the area covered—not necessarily Portland Street. He, however, thought the illumination should take into account the conditions due to the buildings, such as reflection, &c.

PROF. J. T. MORRIS asked whether the effect of the fog on the gas mantles was due to carbon getting in with the air, depositing on the mantle and diminishing the C.P. It was regrettable that the gas lamps were not working at their highest efficiency, but high-pressure gas lamps did not give their supposed candle-power; a falling off of 25 per cent., and in some cases of 50 per cent., being

found. His own experiments confirmed the great reduction in C.P. shown by the authors. He asked whether the authors had measurements to prove the superior penetration of the arc lamps in fog, as he knew of cases where gas had been adopted owing to the statements as to the latter being superior. In looking into the question of costs, to find the direction of possible improvements, he found in the case of the arc lighting that energy cost 60-65 per cent., trimming and maintenance 7-8 per cent., and carbons 28-30 per cent., of the total, while in the case of the gas lamps, gas accounted for 80 per cent., trimming and maintenance 13 per cent., and mantles 7 per cent. of the total. It had to be remembered that the 7 per cent. was for mantles giving only half their candle-power, and if the latter were increased the life would be shortened.

Mr. Dow said the nearly horizontal rays caused the glare, but they were wanted to give even illumination; the authors' globe appeared, if anything, to intensify the glare. He questioned whether any form of diffusing globe would greatly affect the illumination curve. The ideal curve could be obtained with the metal lamp; with flame arcs the light fell straight down, and the problem was to take some of it and redirect it rather than to smother it. He did not consider the colour effect would be appreciable with the order of illumination used at Manchester.

MR. A. P. TROTTER, in a communication, said the two rivals seemed to have had in view copious illumination, uniformity of distribution, and economy; if these were their objects they had both succeeded admirably. The difference between the illumination of the two streets, and between the uniformity of distribution, was imperceptible without a photometer, and the price was in favour of electricity. Until this experiment was made Manchester was, and in most of its other streets still was, the worst lighted of our great cities. Other street lighting authorities who might examine the results described, should not assume that a capital expenditure of £1,500 per mile of street, or £250 per mile per annum, was necessary for streets having the traffic of Princess Street, or even of Portland Street, after 7 p.m. The grading of the lighting to suit the requirements of the traffic in different streets, and the hours during which that traffic existed, were necessary factors in economy, unless a spectacular display was desirable for the purpose of making a town look attractive and gay. The whole of the illumination measurements might have been made with one of four or five direct-reading instruments, either at 3 ft. 3 in., or actually on the ground, with no calculations whatever. In street lighting one need not worry about the Purkinje effect, it did not begin appreciably to alter the relative brightness of red and green until the illumination had been reduced to about 0.025 ft.-candle. The authors said that their tests demonstrated a rather objectionable feature of dioptric globes, namely, the strongly-defined optical centre. But a dioptric shade generally meant one which, by the use of calculated planes and curves, so distributed the rays of light that a certain predetermined effect was produced. It was necessary to assume an initial distribution within the shade, and this implied a focus or optical centre. Dioptric shades were offered for street lighting in which no intelligence seemed to have been used in the design, and well-designed shades were so unintelligently used as to defeat the intended effect altogether. With a fixed focus arc there should be no difficulty in setting the shade as the inventor or designer intended. In 1879 he thought that uniform illumination was desirable in street lighting, but now he considered a street was more usefully lighted when the ratio of maximum to minimum was 15, or even greater. When half the lights were switched off in Portland Street, after 11 p.m., the street was excellently lighted. The graded frosting of the outer globes in Portland Street, no doubt, contributed largely to the uniformity of the lighting which had been achieved, but it was like regulating the speed of a steam engine by a brake instead of by the steam admission. There were two good features in the gas lighted Princess Street, which were well known to electrical engineers, but which had not been adopted in Portland Street. The gas lamps were surrounded by large clear globes. The large size might be necessary on account of the intense heat, but they looked well. While the maximum candle-powers were about the same, the glare looking straight at the arcs was greater in his opinion than with the gas lamps. The lesser glare of the gas seemed to be due to the use of a white reflector. If large white reflectors were used with the arcs the glare would be reduced, although the reflectors would be of little use in the sense of reflectors.

MR. S. L. PEARCE, in replying, pointed out that there was no power to attach to buildings in Manchester, and although consent to the fixing of rosettes was obtained, the fixing of winches was objected to. The cost given in the appendix included nothing for profit, but it was ample, and some items, having nothing to do with street lighting, might be omitted. The business lighting load in Manchester was a high percentage of the total, and he did not think the 70 per cent. referred to by Mr. Seabrook was too high. The standard of illumination was high, but he considered that it could be fully maintained all night with advantage. He could not recall any very detailed information having been published in regard to the lighting in the City of London; Mr. Bailey had a preference for dioptric globes, while in Manchester they preferred graded globes, and did not find their life shortened by the treatment given. In regard to candle-power per sq. ft., he was under the impression that leading gas authorities did not claim more than 40 C.P. at the present time.

MR. RATCLIFF, who also briefly replied, said the horizontal illumination they had in mind was the impressed light, not reflected light. Careful observation had confirmed the superiority of the arc lamps in a fog.

#### DISCUSSION AT MANCHESTER.

DR. E. ROSENBERG said that, seeing Mosley Street and Portland Street, one had the clear impression that there was competition between the Gas and Electricity Committees. In both systems there was by no means an absence of glare, and one was quite as bad as the other. It was as if the illumination problem was in its infancy, and nothing was known about illuminating streets and houses. In Manchester one could see the lamps, but not the motor-cars. He considered the photometer was used too much, as it only showed what the eye saw.

MR. ALDERMAN WALKER said that the paper would have the effect of making electrical authorities assert themselves more in this matter. Regarding foggy weather, in Portland Street with its lamps spaced a greater distance apart than the gas lamps in Princess Street the lighting was infinitely better, under the actual conditions. He asked the authors if they had taken into account the quantity of low-pressure gas used as a by-pass for the high-pressure gas. In Westminster, he understood, it worked out at about 18 lb. per lamp per annum.

MR. H. R. BURNETT said the figures given for trimming and maintenance were remarkably low and required a little explanation. The cost per mile of street per annum was given as £251; it should be remembered that this figure did not include any capital charges, and was only for the lamps to 11 p.m. If the capital charges were added the cost of this lighting amounted to £500 per mile of street. He thought 5 ft.-candle was too high a minimum illumination. If the main streets were lighted to this standard, the illumination of the side streets running into them must be raised also. The figure of 8½ per cent. on capital charges appeared to be inadequate.

MR. A. ANGOLD said he did not think the raising of the fittings in, produced all the improvement, the change from one globe to another had a lot to do with it. He explained how the globe had the effect of diffusing a light and boosting the light up at the angles of 15° and 20°. The glass, although clear, had considerable reflecting power; the beam thrown by the inner globe was on the 20° line, and that from the outer globe along the 15° line. About the question of glare from the full line globes shown in fig. 3, this would not be very noticeable if looked at anywhere from 35° upwards to the horizontal, because of the fact that so much light was coming from the surface of the globe. The graded frosting was a very good idea, but he did not think it would be permanently satisfactory, because all frosted globes tended to take up dirt, and the frosting spoiled the effect of reflection along the 30° line.

DR. T. Z. ZETTEL said that it was only recently that the design of arc-lamp globes had been given serious attention, and an endeavour made to design them scientifically. He asked whether any special notice was taken of the state of the globes when the tests were made; experiments had shown that a great difference could be found in candle-power figures when taken with clean and dirty globes.

MR. E. H. HOLLINGSWORTH said he had had to abandon arc lamps in favour of metallic-filament lighting, principally for the reasons mentioned by Mr. Burnett. In the old days arc lamps had to be placed 80 yards apart, and the lighting was very unsatisfactory midway between the lamps; metal-filament lamps of 200 C.P. were now fixed on each tramway standard, and the lighting was very satisfactory.

MR. H. T. WILKINSON did not think that the system of overhead suspension was used in England as much as it should be. On the Continent it was used much more freely. He could not understand why anyone trying to do his best should choose such an unsuitable street as Portland Street.

MR. A. A. KOPPEL said the arc lamps in Portland Street were too brilliant; they might be useful for advertising purposes, but were unsuitable for street lighting. Yellow flame arc lamps should not be used for street lighting. For equal distribution of light and for reducing the dark shadows complained of by the authors, three 200-watt metal-filament lamps in a single fitting would be more suitable. It would be worth the experiment to have units of 3,000 to 4,000 C.P. at 100 ft. from the ground, with special reflectors, and suitably spaced.

MR. R. G. CUNLIFFE said that, walking fairly often amongst the streets mentioned, anyone watching the lighting effects had been able to notice very quick differences in the shades, and often at close intervals, places which had been in shade had later on been well illuminated. Looking towards the gas lamps, and then up Portland Street, there was very little difference to the eye, whatever the photometer might show. Dr. Rosenberg referred to the question of glare, but those who had to drive in these streets spoke very highly of the illumination as against the side lighting. In Piccadilly, on the island platforms the centre lights were gas lamps with single mantles, which were very brilliant, but the glare was very objectionable to the people on the top of the trams.

MR. A. WILKINSON was of the opinion that the new type of globe used had a fixed focal point, and in fitting these globes to the spinnings, care must be used; if in drawing up the net wires one side were pulled tighter than the opposite side, the globe would be canted out of the centre line. This would alter the angle at which the light rays struck the inner surface of the globe, the resulting effect being to deflect the rays on one side upwards, and on the opposite side downwards; and as the 10° to 80° rays were entirely reflected ones, it was important that they should not be distorted. If possible globes should be made with necks, having a more mechanical support than nets. With the type of lamp used in Portland Street, the carbons were fed alternately to the right and left of the vertical centre line of the lamp and its globe; thus the arc was burning out of centre some ½ in., the shadow of the lower final was projected on the ground in an eccentric manner relative to the centre line of the lamp and ground, and on the arc changing over to the incoming carbons, the shadow was projected on to the

other side of the centre line. As this change took place every five hours, it was a difficult matter to design a reflector which would blot it out entirely.

Mr. P. P. WHEELWRIGHT said that in these days when main streets were very much more like railway tracks than roads, the more spent to good advantage on the lighting of streets, the safer were the roads. The colour of the flame arc was attractive to the public, and in the streets of Lancashire towns lighting was a valuable asset. In Blackburn people came from all the villages around for shopping, and the more attractive the streets were made, the more they would come.

Mr. JACKSON, referring to the low-pressure gas used for the by-pass, said it was a curious fact that gas people always did neglect this point. In some cases it worked out to 10s. per lamp per annum. To compete with high-pressure gas lighting by metallic-filament lamps would result in failure, and the only way to attain complete success was by using flame arc lamps. The maintenance charge given in the paper, not only with regard to the electric lighting, but also the gas, "0.5d. per lamp, worked out at 150 lamps per man; no one man could look after 150 flame arc lamps. A figure of 27s. 2d. per lamp per annum was quoted for the maintenance charges for gas lamps—in the case of ordinary gas lamps he calculated 17s. per lamp, and in street gas lamps the gas people charged 30s. per lamp per annum, but he thought those charges should be increased by at least 50 per cent.

Mr. S. L. PEARCE, in reply, said with regard to Dr. Rosenberg's remarks, that there was not a very high value of illumination in Portland Street, and at present he did not consider that they had carried out their experiments to a final conclusion in regard to getting over the glare. They were not satisfied that the best results had yet been obtained. He thought there was nothing included for the gas used for the by-pass in the figures which were returned by the gas department. The maintenance cost was borne out in practice, probably because Portland Street was very near Dickinson Street station, and consequently very little time was lost in going to and fro. He did not agree with Mr. Burnett and other speakers that there was too high a standard of lighting in Portland Street, and that it was too expensive. Those who resided in Manchester knew how extremely difficult the traffic was, especially between 4.30 and 6.30 in the evening. A most valuable report which had recently been issued by the tramways department, referred to the loss of the tramways due to drawing up on account of the congestion of the streets in the central area. This was possibly due to the fact that the illumination in the important thoroughfares was very poor, and the tramway traffic was often held up for this cause also. It seemed to him that the tramway authorities would very much reduce the energy consumption per car-mile if the illumination in the streets of Manchester was improved. He was surprised to hear Mr. Burnett's remark that on lower standards of illumination metallic-filament lamps were cheaper than flame arcs. For street lighting the tendency all over the kingdom to-day was for higher candle-power, and therefore the tendency would be to go in for flame arc lamps instead of metallic-filament lamps. In reply to Mr. Jackson, there was no doubt that the gas figures had all been based on laboratory tests, and they would not deny that under certain perfect conditions it was possible to get 60 c.p. per cb. ft. of gas per hr., but the figure had been used in a somewhat unwarrantable fashion. Only lately Mr. Frank Goodenough had reduced this figure from 60 to 40. He thought it absurd, even assuming that a single mantle gave 1,500 c.p., to assert that 4,500 c.p. was obtained from three mantles in the same lamp, as there must be some masking effect.

Mr. RATCLIFF, in reply to Mr. Angold's remarks regarding the 20° ray of light, said the tests did show that they got something of that sort, and also they got a beam of light at a lower angle which was utilised in another direction by means of the globes. It was the beam of light at the lower angle which the eye saw, and they tried to remedy it by using a special globe and got two advantages—it cut off the light they did not want, and the deflection improved the distribution in the direction where it was required. The gas lamps were cleaned for all the tests, and the electric lamp globes on the average were fairly clean. There was not any apparent difference between the illumination in Portland Street and Mosley Street, as the order of illumination was only about 0.5 to 0.4. These results were actually confirmed by the independent experts.

## POWER SUPPLY ON THE RAND.

THE description given elsewhere in this issue of the huge undertaking which has been developed on the Rand will be read with interest by all who desire to make themselves acquainted with the methods adopted for the supply of electrical energy on the grand scale; it is by far the largest of its kind in the British Empire, and has few rivals in the world in point of magnitude and output, though the distance over which the energy is transmitted is not great. It is noteworthy that so high a pressure as 80,000 volts has been adopted for transmission over 35 miles, though the rule generally accepted as to the appropriate voltage—a rough rule, it is true, but fairly well conformed to—would have given only half this pressure. Probably the exceptionally favourable condition of a dry climate, and the known fact that lines insulated for pressures over 50,000 volts are less liable to trouble from lightning than lines at lower voltage, had a good deal to do with the choice, which has been completely justified by the result.

While we have in this country no undertaking comparable in magnitude with the Rand power supply, it does not follow that we have nothing to learn from the work that has been done by the company's engineers, who, although beset with exceptional difficulties of transport, labour, &c., have triumphed over all obstacles, and have adopted methods which in several respects deserve our careful study. The arrangement of the boiler house in bays at right angles to the engine room, brought about by the adoption of the turbine, and the employment of transformers coupled directly to the terminals of the generators, were prominent features of the practice introduced by Messrs. Merz and McLellan in connection with the Tyneside electricity supply, the only undertaking in this country which appears to resemble that of the Rand at all closely, and the high compliments paid to the Merz-Price system of protection of mains by the author of the paper further emphasise the association of ideas embodied in both schemes. The system of boiler draught employed, however, is an entirely new feature: the difference between this and the ordinary induced-draught system is not apparently very great, yet it suffices to effect a very marked improvement in the results obtained, and Mr. Hadley's claim that the chimneys are "absolutely smokeless" will be noted with interest by engineers who suffer under—or should we say violate?—the local by-laws in this respect. Further details regarding this part of the plant would be welcome.

Perhaps the most remarkable feature of the working of the plant is the enormous output, which will, at no distant date, be about 2,000,000 units a day, or nearly five times as much as our largest railway output. This, too, is given at the extraordinary load factor of 70 per cent. and upwards—a figure to make a central-station engineer's mouth water. Under these circumstances, the price of 525d. per unit, as Mr. Highfield pointed out, at first appears somewhat high; but when we make due allowance for the high capital and running costs on the Rand, and the fact that this is the maximum price, we may fairly assume that the actual price is equivalent to not more than 4d. in this country. In fact, it comes within measurable distance of the condition foretold by Dr. de Ferranti, when electricity for all purposes will cost only 4d. per unit, and we shall have generating stations here far larger than those on the Rand.

It is exceedingly significant that the owners even of large mines have found it expedient to scrap their own plant, and to take their supply of power from the company's mains.

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AOERKAY, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 10s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

The same process is in progress here, but far more slowly; the relative cost of electricity is still much greater here than on the Rand, and manufacturers have not at command that ready flow of capital which stimulates enterprise and enables great economies to be effected by drastic changes, where it is available.

The extended use of compressed air, supplied in bulk on an unprecedented scale, is another feature peculiar to this unique undertaking. Although a great part of the air supply is derived from electrically-driven compressors, the intervention of this non-electrical medium can hardly be pleasing to the electrical engineer who loves his calling; but obviously it must be accepted, at any rate until electrical rock drills and other mining machinery have reached a more advanced stage of evolution.

The one consideration which we cannot but regard with deep regret is the fact that so large a proportion of the plant employed was built by foreign hands. The circumstances which led to this unfortunate result are known to our readers, and we need not further comment on them, but seeing that the turbo-alternator and the turbo-compressor were developed almost wholly by Sir Charles Parsons and his staff, it seems a great pity that this work should have gone abroad. For this the engineers were not responsible; their part of the work reflects the greatest credit upon them, and we congratulate them, as well as the managing director, Mr. A. E. Hadley, upon the successful accomplishment of a gigantic task.

## THE STATE AND THE ENGINEER.

In these days, when the development of engineering—in all its branches—is progressing with ever-increasing rapidity from one vast scheme successfully carried out to another of even more ambitious character, to be equally successfully accomplished in its turn, it would be well if attention could be brought to bear on the whole broad question of this development.

The one object of engineering is the more efficient working of the world; and, of course, this is attained by perfecting, so far as is reasonably practicable (to quote the words of the Home Office), the efficient working of communities, towns, and countries, which are the world's component parts. This is true, to a certain extent, of all professions, but particularly so of engineering.

Is development taking place along right lines? Is there any continuity of policy or purpose in the carrying-out of the great enterprises of the present time? The question of development along this or that line is almost always a matter of circumstances and individual judgment. The result of this is that the second question must be answered in the negative.

That being so, we naturally ask ourselves what can be done to improve matters? The *Canadian Engineer*, in its issue of January 23rd, 1913, contains some interesting articles bearing on the subject. Mr. T. Chase Casgrain, chairman of the International Joint Commission, some time ago offered two prizes for the best essays on "The Formation of a National Engineering Service." The essays which obtained the first and second prizes are printed in the issue above-mentioned. The first, by "Evolu," is entitled "A National Board of Engineering Control"; and the second, by "Observer," is called "The Organisation of a Corps of Civil Engineers for Public Works Services in the Dominion of Canada."

The first essay concerns itself almost entirely with the development of the natural resources of Canada through the instrumentality of the Board of Control. Railways, harbours, docks, ports, canals, irrigation, water power, surveying, and architecture, are all brought within the scope of the suggested Board, and the fundamental idea and method of working of the Board are expounded in a lucid manner deserving of careful attention.

"Observer" makes a general survey of public engineering departments throughout the British Empire and the United States, after considering which, he outlines a scheme for the Canadian public works service. This is also a very thoughtful essay, in that it bears evidence of much investigation of detail.

In the first essay, "Evolu" suggests a Board of five directors, responsible to Parliament, and appointed for an unlimited period, with retiring pensions after a specified number of years. Each director on being appointed would hand a formal signed and undated resignation to the Governor-General in Council, so that only Parliament could remove any director from his position; the Governor-General would fill in the date of resignation when it was decided by Parliament. Vacancies would be filled by the Board itself, either by promotion or appointment. Under the Board would come, with their staffs, the auditing engineer, the chief engineer of railways (we are taking the order in which they appear in a table given in the essay), the chief engineer of marine service, the chief engineer of harbours, the chief architect, the chief engineer of surveys, the chief engineer of canals and water service, and the secretary.

The auditing engineer would be responsible for the important work of collecting and tabulating information. This would indeed be a boon, and would probably do more than any other single thing to secure constant progress and to avoid the recurrent commission of the same mistakes. Now that Mr. Edgecombe is again President of the Incorporated Municipal Electrical Association, we may hear more of the information bureau which he suggested in his former presidential address, delivered at Kingston-on-Thames in 1906. The notion was turned down by the Council because they thought it beyond the scope of the Association, but it is a work that someone ought to do, and "Evolu" suggests what he calls the auditing engineer, with a technical librarian to assist him.

Much time, energy, and money are wasted, when tenders are invited for various schemes, by letting each tendering firm prepare and submit its own design. Designing, under the scheme, would be carried out by the Board's engineers, thus avoiding the loss incidental to the preparation of half-a-dozen or more designs, only one of which can be accepted, while all have to be paid for, directly or indirectly, by the buyers as a whole. Power actually to carry out the work by direct labour is suggested, but we do not think this is advisable or necessary. The Board should be a Board of Control—a *Direktion*, to use the German word, for which we have no equivalent—and not a Board of Works.

If this idea were carried out, engineering would be co-ordinated as the law is co-ordinated now. There would be uniformity of direction and continuity of purpose, and an entire absence of that haphazard working and that lack of coherence which are too often observable under present conditions. Heaven forbid that engineering should become as inelastic and difficult to set in operation as the law, but the idea is right.

From the idea of a Board of Control, it does not seem to us a long distance to a greater organisation of engineering as a whole, but we must reserve the further development of this conception for another article.

Whether the scheme, as outlined, will ever receive the sanction of the Canadian Parliament, or whether it will ever be brought before them at all, are matters which lie on the knees of the gods. It is obvious, as the *Canadian Engineer* points out, that appointments would be more likely to be made upon a strict basis of experience and ability, unaffected by political considerations. If this were done in Governmental matters, we should have public work carried on with something approaching the economy and efficiency of a private business undertaking. With proper care, the performance of some private undertakings might even be surpassed.

The notion has much to recommend it, and we hope that it will receive due public attention on both sides of the Atlantic Ocean.

### Celluloid Regulations.

A LETTER which appears in our "Correspondence" pages to-day serves to emphasise the need that exists nowadays for manufacturers and traders to be on the alert to prevent regulations which are drafted for the public good operating with needless hardship upon the interests of industry and trade. Remembering the grave fire risks that may attend the uncontrolled storage of celluloid and celluloid goods, everybody will agree that the time is fully ripe for better pre-

cautions to be introduced; and better precautions can only be enforced generally by means of regulations which receive the sanction of the Legislature. But those who draft such regulations are in danger of being influenced more by humane desires than by knowledge of, or regard for, industries which may be quite unnecessarily, and may be inadvertently, placed at a serious disadvantage; if the regulations are of too sweeping a character they may militate against the public interests as well as against those of private parties. There may be room for a little more considerate drafting without the main intentions concerning the lessening of fire risks being in the least degree defeated. The L.C.C. General Powers Bill, if allowed to pass in its present form, will enable the Council to enforce regulations for all premises in the county in which celluloid and other inflammable substances are kept for sale in quantities exceeding 10 lb. in weight. There is also a clause in the City of London Bill defining as a "celluloid shop" any premises whereon the aggregate celluloid kept "handled or otherwise dealt with (otherwise than for the purpose of being manufactured or employed in or subjected to any process of manufacture)" at any one time exceeds 10 lb. in weight. A celluloid shop has to be licensed and inspected and otherwise subjected to specified conditions. It hardly needs pointing out that this will involve every retail or wholesale accumulator dealer, and numerous traders in hardware and other goods! Unfortunately, it is too late for the battery makers or any other section of the electrical industry to take direct collective action in opposition, but the way is open for strong action to be taken through the medium of those who have already lodged petitions, and are sure to be heard. We draw attention to this matter, hoping that those sections of our trade which are likely to be adversely affected without sufficient reason will co-operate with Mr. Brooke, the railway companies, Chambers of Commerce and others, in order to ensure that the final wording of the clauses shall be fully effective, without being a needless handicap to trade and industry. It is expected that the second reading of the Bills will take place on Monday, 31st inst., and they will then go to the Local Legislation Committee, where they will probably be discussed on or about April 15th, when opposing petitions and arguments by counsel will be heard. It will be understood, therefore, that those who mean to take action must do so at once.

#### The E.T.B.I.

ON Monday next the annual meeting of the Electrical Trades Benevolent Institution takes place at the Institution of Electrical Engineers, with Mr. E. Gareke in the chair. The annual report to December, 1912, which will then come up for adoption, after expressing regret at the loss of a colleague and liberal supporter in Sir J. Irving Courtenay, shows that the income for the year was less than in 1911, as that was an exceptional year, inasmuch as there was a legacy received, as well as the balance of the Olympia 1905 Exhibition proceeds. A donation of £250 from the B.E.A.M.A. is, however, among the receipts for 1912. The total income for the year was £954, as compared with £1,101 for 1911, but it is important, as evidence of the wider interest taken in the Institution, that there was a marked increase in the number of persons subscribing, as well as in the amount of subscriptions; the latter is now more than four times the total of the preceding year, while the ordinary donations are also considerably more. The result of the year's work is a net income of £754, £150 of which has been placed on deposit at the bank, and £569 invested in Canadian 3½ per cent. registered stock, bringing the total of the invested funds to £3,968.

The report contains a regret—not that so few electrical men have died during the year—but that so far only one legacy has fallen to the fund. By way of comparison with other institutions, it is mentioned that one such benefited in 1911 to the extent of over £18,000. Perhaps the youthfulness of our organisation is responsible for this difference, or it may be that those who have the wherewithal to bequeath good round sums and have the mind to do it too, do not die; or, again, that those who have the mind to do so, and have shown a real interest in

the progress of the movement, have not the wherewithal to do it if they do die. But whichever way it be, we are hopeful that the timely hint of the Committee will carry effective weight with those of maturer years who have been fortunate enough to accumulate enough and to spare, and will also be borne in mind by more youthful spirits who may draft their wills, if only in hope of future ability, in such a manner that the secretary 10, 20 or 30 years hence, will be able in his own advancing years to say nice things about them and the benefit that their generosity has brought to the Electrical Trades Benevolent Institution, enabling it to grant pensions to many who were little more than beginners in the industry when the fund was first launched. The rules introduced in 1912 and the creation of a class of "members" have produced satisfactory effects, and at the end of 1912 there were 30 life members and 78 ordinary members. Efforts are being made, as some of our readers in London know, to stimulate interest among employees by means of entertainments, and during the current year this movement may be carried forward in a number of other centres. We hope that it will meet with success. The appointment of collectors in individual firms to receive members' subscriptions by instalments, in addition to being a convenience, will also answer the same useful purpose of popularising the fund and its objects. The life assurance scheme already referred to in our pages is intended to appeal particularly to juniors. The grants made from the fund during the year numbered eight, aggregating £71, but these figures do not convey any idea of the amount of investigation of circumstances that fell to the lot of the committee, nor do they indicate the real value of the Institution. In addition to meeting such temporary needs, the great work of those responsible lies in building up resources in preparation for the happy day when it will be possible to grant pensions. The annual dinner takes place next month, and we hope that our readers will do their utmost on this occasion—under a magnificent lead from Mr. George Sutton, a present-day leader in the industry—and add to the fund such an amount as will worthily represent the prevailing very active state of the electrical trade. It might be interesting for the guidance of would-be donors and legators if the committee were to say approximately what figure it has in mind—if any—as being required before the pension day can dawn.

#### Striking Companies in Turkey.

ALTHOUGH the difficulties to be referred to may have been overcome by the present time, it is yet of some interest to learn how two foreign companies in Turkish towns, far from the seat of the war, have been treated by the municipal authorities and the native population. In the first place, according to the Beyrout correspondent of a German newspaper, the Belgian Société de Tramways et Eclairage Electrique suspended the lighting system in Damascus because the municipal authorities were in arrears to a large amount in the payments to the company, and put off the company from day to day with an allusion to the empty coffers. Thereupon a large crowd attacked the company's administrative premises for two days in succession, smashed the windows, and fired revolvers without, however, the authorities taking any serious action against the demonstrators. Several tramcars were also entirely destroyed, whilst the windows of others were broken. The second case refers to the Beyrout Gas Co., which, at the time of the correspondent's letter, had already suspended working for three weeks on the alleged ground of the scarcity of coal, the imports of which have been rendered difficult through the war. In reality, however, the Municipal Council owed the company a large sum for street lighting, which the latter was unable to collect. Not only so, but the native population has diverted large quantities of gas, and the authorities have done nothing to bring the thieves to book. The whole of the city, with the exception of a few streets where electric lighting has been temporarily introduced, has been in complete darkness at night, and the police authorities have issued an order advising the use of lanterns by persons who go out after 8 o'clock in the evening.

# COST AND EFFICIENCY OF DISPLAY LIGHTING.

By L. CROUCH.

IN connection with the articles on "Ornamental Street-Lighting Poles" (ELECTRICAL REVIEW, March 22nd and July 19th, 1912), particularly as applied to "display" lighting in main business streets, various critics have urged the high cost of installing and operating such systems. However, the best proof of the pudding is well known, and the fact remains that the type of display standards, and the system of street lighting described in these earlier articles, continue to find increasing application in American cities. Nor do we find any digestive difficulties after the pudding has been eaten! The systems continue—as they commenced—to give every satisfaction, and practically every city which has adopted display lighting continues rapidly to extend its installation. There are, at present, three or four hundred towns in the States and Canada employing rolled metal and concrete standards, carrying tungsten lamps in diffusing ball globes, for the lighting of their main thoroughfares.

The cost of display systems is, in America, generally divided between property owners and the city authorities in a varying proportion, but, in many cases, the supply station has borne a large fraction of the expenditure. Owing to the advantage of brilliant frontage illumination in shopping districts, there is rarely any difficulty in collecting the major part of its cost from business proprietors, and, in a few American cities, the total cost is commuted to a tax against the properties as a permanent improvement. In the case of promenades and parks, &c., the local authority must, of course, bear the whole cost of the scheme, this being then purely for the public benefit.

A certain amount of specific cost data (both as regards installation and maintenance) was presented in the July 19th, 1912, issue of this journal, and readers will doubtless be interested in the following supplementary figures referring to some more recent installations in various American cities.\* Only those cases are here considered for which fairly complete data are available as to the exact nature of the equipment.

It is obviously impossible to prepare cost data which shall be universally applicable, since local conditions and the design of standard adopted are, of course, very variable. The following costs, however, may be regarded as representative for one of a number of 5-light ornamental standards of the type illustrated in figs. 1-6, p. 479, 1912:—

Pole ... ..	£7 0 0
Lamps and sockets ... ..	1 2 6
Globes ... ..	0 16 0
Erecting and wiring post and concrete foundations ... ..	1 12 0
65-ft. supply cable (lead, jute and steel) ... ..	3 5 0
Laying cable ... ..	7 16 0
Total ... ..	£21 11 6

The labour costs assume that the cable has to be laid below an existing concrete sidewalk, and all the items should be somewhat lower in this country.

Turning to particular cases, the data summarised in Table I show the conditions and results in a number of recent American installations. A cheap but very effective system, which has been adopted in residential quarters in Toronto (Ont.), provides light wooden poles along the inner edge of sidewalks. Each pole (which carries supply wires on insulators near its top) is provided with a cast-iron lantern containing a 150-watt tungsten lamp, screened by an 8 in. x 8 in. Alba-glass cylinder. The illumination provided is economical, novel and sufficient for residential needs.

The data in Table II refer to illumination measurements made at 3 ft. above ground level in the line joining adjacent 5 x 100-watt tungsten standards in Indianapolis.

\* Actual day and night photographs and more complete particulars of these installations are to be found in the *Southern Electrician*, pp. 448 et seq., 1912.

Finally, the figures in Table III refer to the energy expenditure per linear foot and per square foot, and the average foot-candles horizontal illumination provided in

TABLE I.—AMERICAN "DISPLAY" LIGHTING INSTALLATIONS.

Town.	Seattle (University Campus).	Minneapolis.	Hamilton.	Pine Bluffs.	Atlanta (N.Y.).	Chicago.
Type of standard	Reinforced concrete cr. a-n-cored 78	Iron	Iron	8" m'c iron pipe.	Orna-mental iron	Reinforced concrete, bronze ornaments 691
No. of standards in use.	1	5	5	4	5	1
No. of lamps per standard.	—	100	ca. 60	—	65	—
Spacing of standards.	—	100	100	100	4 of 60 1 of 100	490*
Watts per lamp.	£7 14s.	£88	£16	£4 10s.	£22s	£16 8s.†
Capital cost per standard.	—	£12	£2 8s. per foot fr. ntage.	£7 4s.	—	—
Operating cost per standard per annum.‡	—	—	—	—	—	—

\* In this case, 74 ampere series Jandus lamps (490 watts, 1,000 h.r. c.p.) are used; tungsten lamps are employed in all other cases mentioned.  
† Including proportion of central station equipment, posts, lamps and globes complete, erecting, supervision and tools.  
‡ Bare pole, £2 18s.; foundations, &c., £1 4s.; ornament, lamps, globes, transformers, &c., £3 8s.; total labour (students), 7s.; castings made in College foundry.  
§ £18 for poles, £10 for distributing system.  
¶ Including attendance, maintenance and electricity supply.

typical "display" street-lighting systems in four prominent American cities. For comparison are included corresponding data derived from Bloch's measurements in Berlin streets lighted by A.C. and D.C. arcs.

TABLE II.—ILLUMINATION DATA.

Feet from post.	Foot-candles illumination (3-ft. level). Crystal roughed inside globes.	Alba glass ball globes.
0 ... ..	0'34	1'40
5 ... ..	0'28	1'05
10 ... ..	0'18	0'50
15 ... ..	0'10	0'21
20 ... ..	0'06	0'12
30 ... ..	0'03	0'06
40 ... ..	0'02	0'04

Obviously—as would be expected—the best modern systems of arc lighting are more efficient, from the illuminating standpoint, than the ornamental tungsten schemes considered above, but the American display standards (which are also applicable and have already been applied to magnetite and Jandus flame arcs), provide an effective display illumination which can be achieved by no other system. The point—which has been indubitably made in American installations—is that the end justifies the means.

So recently as two or three years ago, ornamental or display lighting was regarded in the States as an expensive luxury which would probably be adopted only by private individuals or for the external lighting of public buildings.

TABLE III.—ENERGY EXPENDITURE AND AVERAGE ILLUMINATION.

	Watts per linear foot.	Watts per square foot.	Average horizontal foot-candles.
Dayton (Ohio) ... ..	8'71	0'173	0'092
Indianapolis ... ..	12'8	0'211	0'179
Toronto (Ont.) ... ..	9'85	0'235	0'175
Buffalo (N.Y.) ... ..	5'68	0'095	0'093
Ordinary D.C. arcs (Friedrichstrasse) ... ..	8'4	0'116	0'57
D.C. Flame arcs (Potsdamer Platz) ... ..	7'5	0'111	1'57
Ditto (Alsenbrücke) ... ..	6'1	0'218	1'55
A.C. Flame arcs (Hardenbergstrasse) ... ..	6'96	0'055	0'32

It was certainly not expected that the system would be employed to light entire business sections of large cities. This is almost exactly the point of view at present adopted in this country. Pavement display lighting standards have been already installed by a number of progressive business firms and hotels and, to a limited extent, by public authorities for public buildings. Surely it is reasonable to anticipate that, at no distant date, the proprietors or tenants of whole shopping areas will co-operate to provide display lighting for the whole of their main frontages. Artificial light is cheap enough in these days, and the cost of its provision

would be more than covered by the increased popularity and prosperity of the business districts providing it in pleasing profusion. After the business areas would follow promenades and the better-class residential quarters, particularly in holiday resorts.

Undoubtedly the whole proposition offers important possibilities to business men generally (and hence to the whole community), to manufacturers and contractors, and to central-station engineers. There is involved no question as to the relative merits of gas and electric light. What is required is display illumination along certain lines, and, in providing this, the relative positions of gas and electricity remain as in ordinary domestic or street lighting. The most favourable field for the development of the new system in this country is in those provincial towns which are to-day behind the times. In large cities, which have already adopted other costly lighting schemes, no change can at present be hoped for, except as a result of purely private enterprise.

## CO-OPERATION BETWEEN PRIVATE AND PUBLIC SUPPLY SYSTEMS.

[COMMUNICATED.]

At the present day the keynote of industrial progress is the elimination of waste products and the development of such products as marketable commodities or by-products of the main operation.

It is only comparatively recently that emphasis has been laid upon this side of engineering activity, and it is therefore hardly to be wondered at that, so far, the full value of research in this direction has not been appreciated. There is always a tendency on the part of manufacturers, whether large or small, to look after the interests of the moment and to leave the larger affairs which may culminate many years hence to look after themselves. Hence, such subjects as the conservation of the world's supply of energy are often regarded as a matter of academical interest only. When, however, it can be shown that such conservation in reality means pounds, shillings and pence at the present day, the matter assumes a live interest.

It is from this point of view that we propose to treat the relative position of the large centralised power plant and the groups of independent systems which are to be found in the areas served by a centralised supply. It is immaterial at the present stage to discuss whether these independent plants consist of steam engines with mechanical power transmissions, gas engine plants, or miniature electric power transmissions. The point to note is that in a given area we have a large centralised power supply, of which full use is not made, as evidenced by the existence of private plants. Is the proper relative attitude of these two sections that of competition or of co-operation?

In the United States, especially in the large cities, geographical disposition has proceeded in the vertical rather than in the horizontal direction. In other words, as the city has grown, more storeys have been added instead of more streets built. Hence, in comparatively small areas, we have great density of industrial operations and a correspondingly sharp conflict between centralised systems of power supply and private plants operating building blocks. The outcome of this is that the question of co-operation or competition has reached a very acute stage in America, and our contemporary, the *Engineering Magazine*, publishes in its January issue an interesting article, by Mr. Percival R. Moses, on "Practical Co-operation between Central Station and Isolated Plant." We propose to deal with this article more as an indication of the line of thought which is being actively pursued in America than to rigorously examine the arguments in detail, inasmuch as in this country we are not confronted with the large office block problem so much as with that of the congested manufacturers' district, and hence the problem is somewhat different in detail.

Broadly speaking, however, the British problem follows somewhat similar lines. The British manufacturer is now

becoming alive to the importance of utilising his waste products, using the term in its broadest sense. In the blast furnace, for example, he is no longer content to allow the waste gases, in a highly-heated condition, to pass away to the atmosphere. He utilises both the heat and the chemical constituents in power and heating in conjunction with the rest of his plant. He eliminates frictional waste by scrapping complicated mechanical transmissions in favour of a private electrical plant, and in connection with this plant he does not seek to maintain an expensive independent staff, but endeavours, so far as possible, to utilise men who can also be employed on other duties. If the works process is one which can be kept going evenly and continuously for a long number of hours per day and throughout the year without fluctuations, the manufacturer has reached, so far as his power production problem is concerned, a point of efficiency which it will take the central station supply a very long time to beat.

It is, however, precisely at this point where the private plants in a good many cases fail, because, owing to the requirements of manufacturing processes, the constant and regular demand on the power plant cannot be maintained. In other words, the private plant is at one instant overloaded, while at another time it is working at considerable inefficiency, owing to little or no load being placed upon it. Here, then, is the opportunity for the equalising effect of the large diversity factor of the public supply system, and it is here where co-operation can, with the greatest advantage, take place between the small power station and the large system. If we regard the large power system as a means of transferring super-abundant power available at one point to another point where there is a super-abundant demand, and the generating station itself as a species of storage reservoir capable of giving the necessary balancing action, we have what may be claimed as a practically new ideal of the co-operation of public and private supply, and yet one which it is practically certain will become more and more realised as time goes on.

This idea is by no means chimerical, nor should it be dismissed without careful consideration. The time is even now ripe for, at any rate, the first steps to be taken in the direction of such co-operation, because the centralised power supply systems are finding that as they widen their area the cost of transmission from a central point is becoming a more and more serious item. Even at the present day, cases are not wanting where, in preference to extending the capacity of an existing generating station to meet increased needs, further generating stations are being built at various points on the supply system, these generating stations working together and transferring energy from one to the other point as required. A still further step has been taken in the erection of such supply stations actually adjacent to industrial works, and deriving from them the necessary power to drive the electrical plant. If this process is extended, the final step is easily reached of having an extensive, and yet cheap, because not too bulky, transmission system, when one or two large power stations act as centralised or buffer supplies of power and a large number of smaller plants belonging to private manufacturers take energy from, or feed into, the common system, according to their individual requirements at any time. The importance of this on the cost of transmission is very great, because under competition conditions, in which the central station is trying to oust all individual plants in its area, the mains must be of sufficient size and capacity to carry all the power necessary over all the area without undue loss in transmission from the central point, while if co-operation is adopted, a large number of widely scattered sources of energy feed into the distributing system at many points, and hence the sum distance of transmission from the point of generation to the point of application over the whole area and throughout the whole year is less than if all the power had to be developed at one point, and therefore the cost of the transmission system taken as a whole will be less.

There is yet another point which bears upon the matter. In the central station, as pointed out by Mr. Moses, the by-product of the condensed steam from the engine or turbine, that is to say, the heat abstracted from the steam by condensing, either passes away to a river in the circulating

water, or is dissipated into the air by means of cooling towers, whereas in a large number of industrial processes the exhaust steam from the engine can be utilised in auxiliary service, such as heating buildings, warming die vats, &c. Where the private plant is of a modern description and of decent size, the value of such auxiliary services goes a long way to compensate for the fractional increase in efficiency due to the larger sizes of units used in the central power house, more especially when losses in transmission are taken into account. Further, the central station staff is occupied solely in producing the one thing, electric power; in the private plant, the staff is often used more efficiently because its labour and salary are distributed not only over the electrical production, but also over other manufacturing processes as well. These points all tend towards the realisation of an increasing overall efficiency if co-operation can be substituted for competition, and there is no doubt that in the future much more will be made of this point than has apparently been the case in the past. It would be well, therefore, if means could be found for the discussion in an impartial and business-like manner between the owners of private plants and the engineers of large public companies for the purpose of instituting a real attempt to secure co-operation, more especially in the large industrial districts, with a view to joining forces as far as ever possible to minimise industrial waste.

## A METHOD OF TAKING LOAD TESTS ON MAINS.

By J. B. MORGAN, A.M.I.E.E.

WHEN a distribution network has been laid down a few years and begins to get fairly loaded up, it is, of course, desirable to know exactly how the load is distributed among the various cables radiating from a feeder or section pillar.

Various devices have been brought forward from time to time to enable such records to be taken, but to those mains engineers who make liberal use of section pillars as well as feeder pillars, if they will only go to a little trouble from the start, a handy means of carrying out such load tests is always available. The only trouble to be taken is that of standardising on a certain length or type of switch fuse.

In the particular town I am interested in, not only are we liberally supplied with feeder pillars, but at all important street junctions we are using section pillars in place of the usual three or four-way disconnecting box, and our switch fuses are all of one particular make. The method of procedure was as follows:—

A switch pillar was fitted up in the test room and known currents were passed through a fuse; the fall of potential in millivolts between top and bottom of the fuse at various loads was taken after giving sufficient time at each different

step to obtain normal temperature. A curve was then plotted from the readings thus obtained.

On a single copper wire fuse mounted under working conditions the millivolt drop was found to be as follows:—

No. 16 S.W.G.		No. 18 S.W.G.		No. 20 S.W.G.	
Load.	Drop.	Load.	Drop.	Load.	Drop.
2 amperes	3.3 MV.	2 amperes	5.5 MV.	2 amperes	10.2 MV.
4 "	6.5 "	4 "	11.6 "	4 "	20.0 "
6 "	9.7 "	6 "	18.0 "	6 "	30.2 "
8 "	13.0 "	8 "	24.0 "	8 "	40.4 "
10 "	16.4 "	10 "	30.2 "	10 "	50.4 "
20 "	32.6 "	20 "	61.0 "	12 "	61.5 "
30 "	49.2 "	30 "	101.0 "	14 "	72.4 "
40 "	68.0 "	40 "	160.0 "	16 "	83.1 "
50 "	91.9 "	—	—	18 "	93.3 "
60 "	121.8 "	—	—	20 "	106.0 "

It will be seen from these figures that even when the fuses are working with small loads a good deflection is obtained.

This was done for each size of fuse wire in use, and from the curves obtained it is now possible to go to any pillar, take the millivolt drop across the fuses, note the size of fuse wire, and a reference to the curve gives at once the current passing, and also, as we are D.C., the direction of the current, whether into or out from the bus-bar.

It has been found in practice that such a series of readings is wonderfully accurate. In recent tests the sum of the currents ascertained to be passing through the fuses along the various distributors agreed not only with the measured current passing through the feeder fuse, but also within 2 per cent. to 5 per cent. with the feeder ammeter readings on the station switchboard.

It will easily be seen that millivolt readings like these can be taken very quickly, as it is sufficient to press the contacts of the voltmeter leads on the binding screws of the fuse, making it possible to take a complete set of readings at one feeder pillar in a very few minutes, and without disturbing cables and fuses.

From these figures a diagrammatic map of the mains can be made which will not only show the total load on the cables, but also will enable one to see where out-of-balance occurs. It also shows which mains are feeding or are being fed at interconnecting points, and it enables the mains engineer to work out a scheme whereby, in the event of having to run with each feeder supplying an isolated network, he can see how the distributors require grouping, so that each feeder takes up its proper share of the station output.

In taking the test for curves, and also the first records at the pillars, it is advisable to start with new fuses, as it will readily be seen that a deteriorated fuse will give a greater millivolt drop for the same load.

This test is also helpful in detecting a loose fuse contact or a deteriorated fuse at any time after having obtained an average of readings for the different distributors and feeders on good fuses.

A diagram is appended showing how such results can be plotted out, and the arrows show whether the mains are receiving current from, or are feeding into, the bus-bar in the pillar.

**Insulated Aluminium Cables.**—The British Aluminium Co., Ltd., inform us that the Paris Omnibus Co. have just placed an important contract for armoured aluminium cables for tramway feeder networks. The cables will have cross-sections up to 1,000 mm.<sup>2</sup> (1.55 sq. in.), and are for a pressure of 500 volts. The order comprises some 300 tons of metal, and is expected to show an economy of 8 to 10 per cent. as compared with the cost of copper cables. Including cables already installed of a net weight in aluminium of about 300 tons, this company's system now has in service or on order insulated cables employing a total of 600 tons of aluminium.

## A MARCONI TRAINING SCHOOL.

As a natural result of the rapid extension of wireless telegraphy the demand for trained operators has outrun the supply, and Marconi's Wireless Telegraph Co., Ltd., has been hard put to it to secure a sufficient number of them to take charge of the numerous installations which it is fitting on board ship, and in foreign countries. When the company entered into possession of its palatial headquarters in the Strand, in May last year, it set apart

FIG. 1.—WIRELESS TELEGRAPH TRAINING SCHOOL AT MARCONI HOUSE.

space on the top floor of Marconi House for a school for the training of wireless operators, with accommodation for 60 students at day and evening classes, and already 130 of the students have passed the Postmaster-General's examination since the opening of the school, and have obtained employment in the company's service. The classes proved so popular that the space available was taxed to the utmost soon after the school was opened, and it became urgently necessary to provide increased accommodation; the school was, therefore, transferred to the basement, where room was found for 125 students, and when we paid it a visit last week the space was fully occupied. We give herewith a view of the room in which lectures are given in the theory of wireless telegraphy by experts; a number of the students are also engaged in transmitting and receiving messages in the Morse code. We illustrate also the instrument room, which is equipped with a 5-kw., a  $\frac{1}{2}$ -kw., and a  $\frac{1}{4}$ -kw. set of apparatus, of the standard types made by the company; here the students are taught to operate Marconi apparatus of the type installed on board ship, and to carry out repairs and adjustments.

Students attending the day classes have generally had some experience with land lines or cables, and are able to acquire a work-

until he obtains the Postmaster-General's certificate and joins the staff of the company, when the total amount of the fees paid by him is refunded.

The arrangements made for the instruction of the neophytes appear to be very effective, and being trained with apparatus identical with that which they will handle after leaving the school, they can confidently proceed to take up their appointments without fear of finding themselves at sea, in a double sense.

The company is anxious to extend the benefits of the training to the Territorial Force, Cadet Corps, the Church Lads' Brigade and the Boy Scouts, and therefore not only will the *Wireless World* contain a series of special articles on the subject for their benefit, starting with the April number of the new magazine (the successor of the *Marcomgraph*, as already mentioned in our pages), and running for 12 months, but examinations will be held at suitable centres and valuable prizes will be offered, as well as certificates of proficiency in connection with the portable field apparatus. The company or troop which furnishes the largest percentage of certificated members will receive a complete set of Marconi field telegraph apparatus. Further, free tuition in the working of the system will be given at the London School to the Boy Scouts on two evenings a week, which should enable the boys, after about three months, to pass the examination for proficiency which will be held.

The company is to be congratulated not only upon the manner in which it has provided for the supply of operators, but also upon this generous offer, which is certain to evoke a hearty response, and will result in disseminating a practical working knowledge of wireless telegraphy over a wide area—besides adding one more to the many "badges" which reward the industry of the Boy Scout who is no slacker.

## SOME DIFFICULTIES WITH TRAMCAR MOTORS.

THE majority of troubles which are found on traction motors can be traced to comparatively simple causes. In one case, for example, it was noticed that a motor was exceptionally hot when the car was run, and at first it was thought that there was some defect in the design or construction of the motor, to which the attention of the manufacturers would have to be drawn. Examination, however, showed that both of the bolts on one of the field magnets in the top half of the motor case had slackened off, with the result that the magnet had been dropped slightly in position, and its pole face was rubbing

The faces marked x should meet when bolted up at B.

FIG. 1.

FIG. 2.—INSTRUMENT ROOM AT MARCONI HOUSE.

ing knowledge of the Marconi system in a couple of months; whilst they are learners they receive pay at the rate of 17s. 6d. a week, and after obtaining the Postmaster-General's certificate of proficiency and passing the examination set by the company's instructor, they are drafted into the service of the company. The commencing salary of a wireless telegraphist is £1 a week and all found on board ship, with an annual increment of 2s. 6d. per week to a maximum of 30s. per week. On promotion to the rank of senior telegraphist, the commencing salary is 35s. a week and all found on board ship—f.o.b., so to speak—with an annual increment of 5s. per week to a maximum of 55s. Promotions are made to higher grades when vacancies occur, according to seniority. Candidates for admission as pupils in the evening classes have to be between 19 and 24 years of age, and must have had previous business experience; the classes are held on three evenings a week, from 7.30 to 10 p.m. Each pupil pays a fee of 2s. 6d. a week

the bolts had been turned round with the nuts, with the result that they were not tightened up properly. It was, of course, a mistake to use round-headed bolts of this description for such a purpose, as it is difficult to prevent the bolt itself from turning, and all that can be done with this class of field-magnet bolt is to exercise very great care to see that the bolt does not turn, and to use a good make of lock washer. Wherever possible, however, square-headed bolts should be used.

Another cause of failure was discovered some little time after a car motor had been overhauled and fitted with new bearing bushes. After a short run in service, it was found that a bearing cap was broken, and that the armature had

dropped on the field magnets, and the car was taken back to the depot for inspection. It was then seen that the new bearing bushes were slightly larger in diameter than was requisite, and consequently when the bearing cap was bolted up, the lug face did not bear against the motor face. The position will be understood by reference to the illustration in fig. 1. If the bearing bush had been of the right external diameter, the faces of the bearing-cap lugs would have met the corresponding surfaces provided on the motor case, but the result of a gap left in this way was that the lugs of the cap, which was a casting, were in tension, and when they were subjected to the strain of the motor and the vibration on the road, they sheared, as shown in the sketch. Thus a considerable amount of trouble was caused by what was apparently an altogether unimportant detail, but the attention of the turner was drawn to the defect in order to secure the system from further trouble due to this cause.

Another difficulty which may be mentioned was of such a nature that at first the superintendent was thrown upon the wrong scent altogether, and it was not until a considerable amount of investigation had taken place that the true cause of the trouble was identified. It was noted on inspecting a car after returning from service that the motor case on the car had been rubbing slightly on the stone setts between the track. Usually this occurs when there are some high setts somewhere along the track, or else when the wheel tires are being run at less than the minimum thickness. It was found that although the tires were worn, they were still larger than the minimum diameter. An investigation of the track throughout the whole route, where the car had been in service, showed that it was in quite good condition, without any stone setts projecting unduly from the surface of the permanent way. Investigation was, therefore, thrown back on the car itself, and after a considerable amount of search it was discovered that there were no rubber shock absorbers under the axle-box springs, and, partly due to this cause, the springs themselves had closed up for about  $\frac{1}{2}$  in. These shock absorbers consisted of rubber washers about 1 in. thick when they were not under compression, and the combined effect of their absence, together with the closing-up of the springs and the wear on the tires which had taken place, had reduced the motor clearance to such an extent that the motor casing had rubbed on the crown setts of the track. The fitting of shock absorbers under the axle-box springs, together with the introduction of new springs of standard length, gave sufficient room to the motors to enable the full mileage to be got out of the tires before they had to be renewed.

In another case a hot armature bearing occurred on a car motor which had just been overhauled, and when the bearing was taken down in order to discover the cause of the trouble, it was found that this bearing had not received any lubrication, and it therefore fired and seized. The bearing bush had been fitted with a slot through which a felt pad pressed on the journal, and supplied the lubricant, and on the bearing cap was provision for a dowel pin fitting into a hole in the bush in order to ensure that the lubricating slot was in the proper position. In this particular case, however, the dowel pin had come out during the overhaul of the motor, and, unfortunately, when the motor was put into position again, the absence of the dowel pin was not noticed. Hence when the car was running in service the bearing bush turned owing to the absence of the pin, and in turning displaced the pad, interrupting the supply of lubricant and causing the hot bearing.

These few instances are typical of a good many others which might be narrated, showing the importance of the proper upkeep and repair of a tramway system.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Notice of Opening of Roads.

I understand that under Clause 61 of the new Bill promoted by the Metropolitan Water Board, the promoters are seeking to obtain powers to force any local authority or gas, electric light or water company to give them three days' notice before opening up any roads in their area.

The Battersea Borough Council are endeavouring to get the reference to local authorities omitted, but I have yet to hear that anyone is moving on behalf of the companies.

The electric light companies are already sufficiently burdened in this respect, having to give notice to the local authority and the gas company. One would not mind so much if the local authorities and the gas companies were compelled to return the compliment, but they are not.

Is it not worth while even now for the companies to follow the example of the Battersea Borough Council and endeavour to get the reference to themselves omitted, or failing this, to get a corresponding obligation imposed upon the Water Board?

M. Farrer.

Twickenham Electricity Supply,  
March 18th, 1913.

### Regulations Regarding Celluloid.

There are points in the London County Council General Powers Bill and the City of London Celluloid Regulations Bill which should receive the attention of traders, on account of the probable effects of them if they are allowed to be passed. If these Bills which propose to deal with the London area are passed, no doubt similar legislation will be promoted all over the country, and it is therefore imperative that Members of Parliament should be approached by traders to call their attention to the effect such legislation would have in handicapping shopkeepers and warehousemen, who are already suffering from heavy taxation, and some of whom are hardly able to make a reasonable livelihood, and if they were to be subjected to further harassing regulations would have to close down.

Neither the London County Council nor the City of London Corporation have the slightest case for asking for regulations for the storage of celluloid. The fact is that the fire at Moor Lane, where they were manufacturing articles out of celluloid, has caused the County Council and the Corporation to promote hasty and immature Bills. The manipulation of celluloid is one thing, and the storage is another, and we must fight to the best of our ability to have the storage clauses cut out of the Bill altogether.

The Bills ask Parliament to grant practically unlimited powers to members of these two corporate bodies, most of whom have no knowledge of the trade, and who may, with the best intentions, so use their powers as to destroy the trade without any necessity at all.

The regulations are left entirely to the discretion of the County Council or the City Corporation, and on behalf of the trade I most strongly object to its being left to any such body to create restrictions which are wholly unnecessary, the nature of which is not foreshadowed in any way, and which, if unreasonably made, must seriously hamper a very important industry and business.

Traders are at present suffering from a sufficiency, to say the least, of inspection and inspectors, and from the dead charges created by recent legislation; now a new attempt at creating a fresh army of inspectors is found in these two Bills, and it is both desirable and necessary for the trade to oppose them.

I have been examining the reports for the last seven years of the Chief of the London Fire Brigade, and find that out of a total of 21,726 fires, only 10 were in any way affected by celluloid, and in almost every case it was in connection with celluloid film. Large quantities of celluloid have been sold and stored in shops and warehouses for the last 35 years, and the record is singularly clean. For every one death due to celluloid, according to the firemaster's

**Gateshead Tramways.**—The Gateshead and District Electric Tramways Co. is just starting a service of motor-buses as adjuncts to the tramways. The first section will be between Low Fell and Chester-le-Street, so that passengers will be able to travel from Gateshead by car to Low Fell, and thence by bus to Chester-le-Street, a distance of 8½ miles, for a 6d. fare. Another route will link up Heworth tramway terminus with the Usworth and Washington district. The chassis of the buses have been built by Messrs. Straker & Squire, and the bodies by the Immisch Co.

reports above referred to, there were 90 recorded due to children playing with matches, beside a host due to children playing with fire; yet our County Council and City Corporation do not take any notice of that, but from sentimental reasons they promote Bills of which the preamble, so far as it relates to the matters aforesaid, is unfounded and incorrect, and incapable of proof.

If any traders want any further particulars, I shall be only too happy to supply them.

**The British Nylonte Co., Ltd.**

THOS. R. BROOKE, *Commercial Manager.*

Hale End, London, *March 19th, 1913.*

[We refer to this matter in a leaderette.—EDS. ELEC. REV.]

#### Canvassing Councillors.

With reference to the recent meeting of the Bermondsey Borough Council, at which our tender for 170 Metrolam lamps was formally accepted, our attention has been drawn to a complaint made by one of the members relative to councillors being canvassed at their homes by the representatives of competing arc-lamp makers.

We wish to make it quite clear that the remarks in question have no reference to our firm, as we have never approached any of the members of the Council in connection with this contract, all our communications with the Council being made through the borough electrical engineer.

**Johnson & Phillips, Ltd.,**

Charlton, *March 18th, 1913.*

#### Morse Signalling on Submarine Cables.

Referring to my letter and cable slip of March 7th, 1913, may I beg sufficient space in your valuable paper to inform Mr. E. Raymond-Barker, and others interested, that I did most successfully, and without any difficulty whatsoever, convert these inverse currents into Morse dots and dashes in the manner suggested, and they might have been relayed with ease.

**P. O'Neil.**

London, E.C., *March 18th, 1913.*

#### The "Load-Factor" Question.

In reply to "Consumer," for the purposes of determining a charge for energy, the time element may be the total number of hours during which current is available, viz., 8,760 for an ordinary year for most public supplies.

Few figures can be so misleading as that of load-factor.

It is quite easy to show that a poor load-factor can be profitably supplied at a very low rate; it does not always follow that a high load-factor can be supplied at a low rate.

A domestic refrigerating plant will probably have a very low load-factor, but it can be quoted at a low price because it will only be used in the summer time, and only a very small percentage of the energy it uses will be delivered at times of any peak load.

The load-factor of a barber's brush is not high, but it is quite desirable business on account of its abnormal diversity. Again, cooking offers an "all-the-year-round" load with summer maximum, and can be quoted at lower rates than heating, if that is considered desirable. This is, perhaps, the best case for the load factor.

A case came under my notice a while ago, in which one customer was taking two classes of load of about equal demand, from 8 a.m. to midnight all the year round. The normal load factor was really over 30 per cent., but for a few weeks in the winter time the two loads overlap for an hour or a trifle more. Academically, this overlapping halves the load factor, because it doubles the maximum demand. It is one of those many cases in which a load factor is of small commercial significance in deciding the price to be quoted.

Probably no system of charging for all loads will ever be so sound and equitable as by two rates over stated periods—unless Dr. Ferranti's dream materialises, when, I suppose,

load curves will be like a saw edge, and units fetch about £1 per 1,000. The cost of the meters militates against the general adoption of this scheme, but having determined what must be the "guarded" or high-price period, it will not be difficult to determine approximately what percentage of the total units delivered to any customer will be generated within that "guarded period." For this percentage, the "average price obtained" should at least be charged, and for the remainder a small margin above "running costs" as separated from "standing charges."

The price charged inside the "guarded period" can gradually advance as the percentage increasingly preponderates up to a maximum price per unit. From these figures a flat rate can be quoted.

**Reginald W. Klitz,**

*Chief Assistant Electrical Engineer.*

Wimbledon Electricity Supply,

*March 20th, 1913.*

#### The Electro-Harmonic Society.

I think if the letter in your issue of the 21st were allowed to pass without comment, a very wrong impression would get abroad. I can personally assure you that a very large number indeed of the members of the Electro-Harmonic Society have a strong objection to the practice of not smoking on Ladies' Nights; this feeling is not confined to the members, but is shared by the ladies as well. I think that no one could have any objection to smoking being permitted, say, after the interval. Your correspondent's remarks about drinkers seem to be quite out of place.

Referring to your foot-note to the letter in your issue of the 7th inst., the fact that you have not heard any complaints from *Members* of the Society must be due to the fact that you are so busy attending to the artistes and the programme. The subject is often broached in the room, and I can give you a lengthy list of people who would like to see the present practice changed.

If the Committee do not wish to make the alteration, they might at least remove temptation from us in the shape of matches and fairy lamps, which are always placed on the tables!

**F. R. C. Rouse.**

London, N.W., *March 20th, 1913.*

[It is not for us to dictate to the Committee. The "Ladies' Nights" are not "Bohemian" Concerts, and if members and ladies find difficulty in refraining from indulgence in the fragrant weed, we can only suggest that the temptation be removed. We may add that our meeting with members is not confined to the King's Hall.—EDS. ELEC. REV.]

#### Small Electrical Undertakings.

In regard to your North Yorks. note on p. 171, the Dales are much further forward than even your notice would indicate. Some five years ago, the Askrigg works were started to supply Askrigg, a village of 400 inhabitants: the following year the Reeth and Hawes schemes were undertaken, with populations of 400 and 800 respectively. Grassington was finished just after Askrigg: two years ago, the Aysgarth scheme was undertaken, while Middleham was similarly provided for three years ago.

Bainbridge, a little village of less than 250 inhabitants, has its own plant supplying at 6d. per unit, and looks like paying. I may say the schemes vary from 500 volts A.C. to 50 volts D.C., and are worked from ancient water wheels, turbines and up-to-date producer gas plants.

**Ernest Burton.**

Askrigg, *March 20th, 1913.*

#### Heavy-Service Lampholders and Adapters.

Re "Sales Superintendent's" and "Engineer's" remarks about lampholders, this lampholder is badly required here, and, so far, the manufacturers have nothing that will stand 5 amperes for any length of time without

breaking down. The old form of lampholder with the springs sweated or brazed to the pins at the top, and the base of contact to the leads, would carry 5 amperes without injury. The lampholders of to-day are very inferior in this particular. I am sure that any suppliers of a suitable 5-ampere capacity B.C. lampholder would get a huge demand not only here, but all over the country, owing to the increasing system of charging by contract, &c., and registering the domestic light and power consumption through only one meter.

C. J. Stonier,  
Sales Superintendent.

Dundee Electricity Supply,  
March 30th, 1913.

## LEGAL.

COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD., v.  
J. SALOMON & CO

MR. JUSTICE BANKES on Tuesday, March 18th, in the King's Bench Division, had before him for further consideration the case in which the plaintiffs sued defendants, leather dealers, of Weston Street, Bermondsey, to recover £1,880 5s. 1d., for electricity supplied to the defendants' factory at Mina Road, Old Kent Road, S.E., from June, 1908, to November, 1911. The plaintiffs' case was that through the reading of the final figure of the total shown on the meter dial as a decimal instead of a unit, the defendants had, in error, only been charged one-tenth of the proper amount. The matter was reported in our issue of March 7th. The jury had found in answer to questions left to them, that the plaintiffs at the end of each quarter by the quarterly accounts rendered, represented to the defendants that the quantity of power consumed was materially less than the amount actually consumed, but that the plaintiffs did not intend that the defendants should act upon such representations, that the defendants acted upon such representations, that the meter supplied by the plaintiffs was a suitable one, that the plaintiffs' servants were negligent in reading the meter, that the plaintiffs kept the meter in proper order for correctly registering the value of the supply, and that the defendants by reasonable care could have ascertained that they were using much more power than they were being charged for.

MR. ATKIN, K.C., counsel for the plaintiffs, said that his Lordship would not be further troubled with the case. The plaintiffs abated £150 off the claim, and there would be judgment for the plaintiffs for £1,730 5s. 6d., with costs. Certain money in Court would be paid out in part satisfaction.

MR. JUSTICE BANKES, in assenting, said: I am very glad to hear that.

BRITISH ECONOMICAL LAMP CO., LTD., v. THE EMPIRE, MILE  
END, LTD., AND A. BERNSTEIN.

ON March 19th, the reserved judgment was delivered of the King's Bench Divisional Court, composed of Justices A. T. Lawrence and Lush, in this case, which had been argued before their Lordships on February 14th. The plaintiff company appealed against a decision by Sir Forrest Fulton, the Recorder, at the Mayor's Court last year. The plaintiff company had proceeded to recover certain lamps at the theatre, or their value, and damages for their alleged detention. They had been let to the theatre tenants, and the landlord had entered on account of the non-payment of the rent. The plaintiffs claimed the lamps, but the Recorder held that the bulbs were fixtures, and had entered judgment for the defendant, the lessor.

For the appellant company, Mr. Geo. Wallace, K.C., had argued that the glass bulbs were not part of the house, and Mr. Rankin had submitted an argument in support of the Recorder's decision.

The judgment of Mr. Justice Lawrence (read by Mr. Justice Lush) was to the effect that the appeal must be dismissed, with costs. The action was brought to recover the electric lamps, or their value, and damages for their detention. The owners of the theatre re-entered for non-payment of the rent, and had been in possession a month or more before the plaintiffs made their claim. The lamps were affixed to the brackets by the bayonet attachment in common use for the purpose. The plaintiff company let the lamps out on hire to the late tenants of the theatre, and at the Mayor's Court the Recorder had held that the lamps were trade fixtures, and had given judgment for the defendant. The plaintiffs' appeal was against this decision, and they had to consider if the plaintiffs had shown a cause of action. In his opinion they had not done so. They claimed the right to enter the theatre and remove the lamps. The plaintiffs had their remedy against the person to whom they let the lamps. He thought the case did not involve any examination of the various decisions as to fixtures. In his judgment the plaintiffs failed, because they had shown no cause of action. The lamps were affixed to the brackets, and he knew of no duty on the part of the defendant to disconnect them and return them to the plaintiff company. He thought, therefore, the appeal must be dismissed with costs.

MR. JUSTICE LUSH, in his judgment, pointed out that the defendant was the lessor of the theatre, and he had re-entered for non-payment of the rent. The Recorder had held that the lamps were trade fixtures, and had given judgment against the plaintiffs, but he (Mr. Justice Lush) did not agree with that view. He agreed, however, that the plaintiffs had shown no cause of action, and he agreed that the appeal must be dismissed with costs.

The appeal was accordingly dismissed with costs. Leave was granted appellants to appeal further.

MR. GEO. WALLACE, K.C., smilingly observed that "the decision they really wanted they had not got."

BATTERSEA BOROUGH COUNCIL v. THE COUNTY OF LONDON  
ELECTRIC SUPPLY CO., LTD.

IN the Chancery Division, on Tuesday, this case was mentioned on a motion by the plaintiffs for an interlocutory injunction restraining the defendant company from breaking up the Council's streets in order to lay their mains.

MR. HUGHES, K.C. (for the plaintiffs), explained that the action raised a very important question upon a point of law under the London Electric Supply Act of 1908, but it was quite impossible for him to proceed with his motion that day, as the defendant company had just filed an affidavit, which he had not had an opportunity of considering. Counsel asked his Lordship to fix a convenient day early next term, as the matter was very urgent.

SIR ALFRED CRIPPS, K.C., M.P. (for the defendant company), agreed that the question was one of law and that it was important, but said that his view was that it had already been decided in his favour in a case tried by Mr. Justice Parker (now Lord Parker). It was a case in which the defendant company had to give certain notices, which had been done. If those notices were objected to, they had, in the company's view, to go before the Board of Trade. The company were quite willing to go before the Board of Trade, admitting that they were unable to proceed without the consent of that body. They refused, however, to give any undertaking pending the hearing of this motion.

MR. HUGHES: They claim to break up our streets and lay their mains through our streets. Whether they are right or wrong, it is an important matter for the Council.

His Lordship fixed Monday, April 7th, for the hearing of the motion, subject to any case part-heard.

HALL, BATLISS & CO., LTD., v. BODDAM.

THIS action, heard at Clerkenwell County Court last week, was a claim by plaintiffs, a firm of manufacturers, against Col. Boddam, an electrical specialist, of Old Jewry, E.C., for £6 1s. 9d., as the half cost, as agreed, of making an electric water heater, carrying out tests, and advising. Defendant counterclaimed for £20. Plaintiffs, he set up, verbally agreed to make an electric water heater according to plans and specification to the value of £20, in return for 21 days' option to purchase the patent. Defendant complained that the heater was not of proper material or manufacture. Plaintiffs, he alleged, did not carry out their contract, and he claimed as damages the £20 agreed to be paid for the option.

At the close of the hearing, his HONOUR held that plaintiffs were entitled to recover on the claim for £5 16s. 6d. With regard to the counterclaim, that was a whole misconception. One man could not say that another one must exercise an option. That was not the meaning of giving an option. The person to whom it was given had the right to say, "I am not going to exercise it," and because of his refusal the other side could not come upon him for damage unless the man promised to pay damages in the event of failure to exercise the option. Therefore, the judgment must be for plaintiffs on the claim and counterclaim.

POSTMASTER-GENERAL v. DUBLIN CORPORATION.

IN the Chancery Division, on 17th inst., in the matter of the above action, it was stated that difficulties had arisen between the parties as to the carrying out of certain telephone works which were then in course of execution. After hearing the argument, the Master of the Rolls directed an injunction to issue until further order, restraining the Corporation from interfering with, or in any way obstructing, the plaintiff in the laying of an underground telephone line and the provision of manholes along Baggot Street, Merrion Street, and Nassau Street, as shown by the plan furnished to the defendants by the plaintiff, the plaintiff undertaking to abide by any order of the Court. The question of costs was reserved.

**Burnham (Somerset).**—With reference to the electric lighting scheme proposed by Dr. J. A. Purves, of Exeter, the U.D.C. has asked him, if he saw no real prospect of being able to form a company to carry out the scheme, whether he would agree to stand aside so that the Council could negotiate with others. Dr. Purves had previously written to the Council promising that Burnham should be attended to now that a company had been floated, but as the time in which the company had to be registered had really expired, he asked the Council to grant another four months in which to enable him to get the company registered. At the Council meeting it was explained that Dr. Purves had until August 8th to complete the matter.

## BUSINESS NOTES.

**Catalogues and Lists.**—THE BRITISH ALUMINIUM CO., 109, Queen Victoria Street, London, E.C.—Three new illustrated circulars, one relating to aluminium collector bows, a second concerning aluminium light railway feeders, and the third, sundry aluminium fittings.

MESSRS. DRENNAN, GLOVER & COOPER, Corn Exchange Buildings, Hanging Ditch, Manchester.—Catalogue "J," of 56 pages, containing a large amount of tabulated data and prices, relating to their resistance materials, including "Nichrome" resistance wire, which is widely used for domestic electric heating devices, and "Nichrome II," which is the successful outcome of several years' work to produce a wire which can be run permanently at 2,000° F. Owing to its slightly higher cost, the restriction of its use at present to more severe conditions, such as laboratory furnaces, soldering irons, grills, hot-plates, &c., is suggested. The other materials included in the list are Climax nickel, Advance, Therlo, Yankee silver, German silver, and ferro-nickel.

MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Blomfield Street, London Wall, London, E.C.—Circular No. 76 giving particulars and prices of a new patent plug for use with the Henley wiring system, for fixing their patent "Link" clips, saddles and protective covering to plaster, brick, marble, slate, stone, &c. It is believed that the plug will fill a long-felt want for many purposes.

HENLEY'S NEW PATENT PLUG.

The hole made for the plug is only a little larger in diameter than the screw that fits it. Satisfactory tests made at the works showing the strength of pull required to remove the plugs from plaster and brick respectively, are published in the list.

MESSRS. SIMPLEX CONDUITS, LTD., London and Birmingham.—1913 edition of their pocket catalogue (84 pp.) of conduits and conduit accessories, distribution boards and watertight fittings. Very compactly arranged, and with numerous illustrations and price information, the present edition contains practically the whole of the matter covered by sections "T," "D," "U" and "M" of their general catalogue in a condensed form, and bound in handy size for contractors' convenience on the job. One or two new designs of conduit fittings have been added. These include back outlet bends and tees, which are intended for screwed conduit installations, and have heavy cast covers, to serve as a drawing point where a branch is taken off at right angles to the main run of conduit.

SIMPLEX SHORT-ARM TEE.

intended for screwed conduit installations, and have heavy cast covers, to serve as a drawing point where a branch is taken off at right angles to the main run of conduit.

MESSRS. CAMMELL LAIRD & CO., LTD., Cyclops Steel and Iron Works, Sheffield.—"Catalogue of Tool Steel" (about 90 pages, bound). Particulars of their high-speed steels, mining tool steels, special steel for coal-cutting machines, shear steels, water-hardening steel, non-tempering steel, nickel and automobile steels, sections of tool and spring steel, and other productions, are included, and a number of pages give weights, equations, gauges, and so on, in tabular form.

THE CENTURY ELECTRIC CO., St. Louis, U.S.A.—16-page illustrated pamphlet respecting "Invincible" split phase motors.

THE BRUSH ELECTRICAL ENGINEERING CO., LTD., Loughborough.—40-page book of pictures showing their various types of electric cars for tramway and light railway service, their designs for colonial and foreign cities predominating. A number of pages are devoted to Peckham truck illustrations.

**Shopping Week.**—At the Ashton-under-Lyne shopping festival last week, MESSRS. EATON & CO., of Old Street, were awarded a 2nd prize for their show of electrical goods.

**Belgium.**—La Société des Ateliers Electrochimiques is the name of a new concern which has just been formed in Brussels with a capital of £3,000.

**Book Notices.**—"Journal of the Western Society of Engineers." Vol. XVIII, No. 1. January, 1913. Chicago: The Society. Price 50 cents.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXII, No. 3. March, 1913. New York: The Institute. Price \$1.00.

"Journal of the American Institute of Architects." Vol. I, No. 3. March, 1913. Washington: The Institute. Price 50 cents.

"La Fixation des Unités par Voie Legislative." By R. de Baillache. 1913. Paris: A. Colin.

**Tale of a Lamp.**—We have received a story regarding a 16-watt, 250-volt Garam drawn-wire lamp which inadvertently found its way to an ashbin, from which it was taken in the usual way to the refuse cart, and from the latter, also in the usual way, to the refuse heap at a destructor worked by an electric supply company, in the neighbourhood of Blackpool. But it survived, once more in the usual way, being rescued, clothed in its carton by a workman, in a nick of time almost like a "brand from the burning," though it hadn't really reached the fire. Of course, after all that has gone before, it is surprising that the said workman was surprised to find it intact—everybody ought to have known what would happen! However, the end of the story is that the rescued lamp is burning "happily for ever afterwards," shall we say, in the house of the charge engineer.

**Trade Announcements.**—It is announced that the business lately carried on by MESSRS. T. E. SMITH & CO. LTD., Keighley, is being continued by Mr. J. H. Smith, under the style of the Smith Electrical Co., Ltd., at 7, Cavendish Street, Keighley.

THE ELECTRICITY SUPPLY CO. FOR SPAIN, LTD., have removed to Dunster House, Mincing Lane and 12, Mark Lane, E.C.

**France.**—The *Financial News* publishes news from Brussels to the effect that a Franco-Belgian syndicate, composed of the Ateliers de Constructions Electriques du Nord et de l'Est, the Banque de Bruxelles and the Banque d'Empain, intend to establish new iron smelting works near Dunkirk.

**C.T.S. Rubber Gloves.**—Mr. R. Nelson, Electrical Inspector of Mines, was recently reported to have said at an inquest that he did not like to see insulating gloves in use, presumably because when these have become worn or damaged, they become more dangerous than no gloves at all. To meet this difficulty the ST. HELENS CABLE AND RUBBER CO., LTD., of Warrington, applied a thin sheathing of leather to the face of their rubber gloves, which protected the rubber, but was not wholly satisfactory, the company, therefore, have made a further improvement, by devising a method of covering the gloves on the palm and fingers with their patent cab-tire sheathing, already well known in connection with their C.T.S. cables. We understand that this combination, which has been provisionally protected, appears to fulfil all the requirements of high insulation, long wearing power, flexibility and convenience in use.

**Bankruptcy Proceedings.**—CHARLES SPENCER NORTHCOLE, electrical engineer, 67, Stanthorpe Road, Streatham, London.—The adjourned public examination of the above-named debtor was held at the Court House, Wandsworth, last week. The Official Receiver said he had no further questions to ask, and debtor, having read the shorthand notes of his previous examination, and answered the formal questions of the Registrar, was allowed to pass, the examination being concluded.

FRANCIS HASTINGS MEDHURST (deceased), engineer, Victoria Street, S.W.—First and final dividend of 2½d. in the £, payable April 8th, at the offices of Elles, Salaman & Co., 1 and 2, Bucklersbury, E.C.

**Liquidation.**—DOLTER ELECTRIC TRACTION, LTD.—A meeting is called for April 23rd at Austin Friars House, Austin Friars, E.C., to hear an account of the winding up from the liquidator, Mr. W. S. Ogle.

**Meter Approved.**—The Board of Trade has approved of the Ferranti A.C. meter type C (single-phase two wire) deposited by Messrs. Ferranti, Ltd., in November, 1911.

## LIGHTING and POWER NOTES.

**Algeria.**—A central electric lighting station is to be established in the little town of Gurgotville.

**Argentina.**—The Hydro-Electric Co., of Tucuman, has made an offer to the municipality of that city to undertake the street illumination at a figure showing a reduction of 12 per cent. on the actual amount now paid to the Cia. Electrica del Norte. If the proposal of the Hydro-Electric Co. is accepted it would mean a reduction in the public lighting bill of \$1,200 a month.

The province of Buenos Aires Electricity Co. is arranging to give a day service in Azul. This company is erecting a station at Ramos Mejia, the building is now nearly finished, and the machinery will shortly arrive. It is also extending to the suburb of Caseros, where a sub-station is to be erected, current being taken in bulk from the Compania Alemana: the land for this station has already been purchased and plans prepared. In Villa Ballester a new sub-station is being built which will be supplied from the San Martin station.—*Review of the River Plate.*

**Australia.**—According to the *Australian Mining Standard*, some little time ago Mr. Forbes Mackay, the Sydney city electrical engineer, brought forward a proposal to construct an underground storage battery, which, with auxiliary plant, cables, &c., was estimated to cost £52,500. This battery was to provide for the expected load of 1914. Eleven tenders were received for the work, none of which complied with the general conditions specified, and the lowest entailed an expenditure of £63,000. The increased cost was due to the general increase in prices since the proposal was first considered, and the engineer

recommended, and the Council agreed, to drop the proposal for the present. Additional power is required, however, and tenders are to be invited for a 5,000-kw. turbo-generator.

**Barnes.**—The electrical engineer has been instructed to report whether special arrangements could be made with shopkeepers who use arc lamps for outside shop window lighting; and also upon the question of reducing the charges to consumers and for public lighting. The £1,000 standing to the credit of the undertaking is to be put aside as reserve.

**Bromley (Kent).**—The Electricity Co. has submitted to the T.C. terms for public lighting, viz., 1,009 single 60-watt lights at £1 7s. 6d. each per annum, and 40 240-watt lamps at £6 each, a ten years' contract being asked for owing to the cost of converting the lamps.

**Bury.**—At a meeting of the Electricity Committee, the electrical engineer (Mr. S. J. Watson) reported that he had been approached by representatives of the Peel Spinning and Manufacturing Co., with regard to a supply of electricity, which the company would require for power purposes when it had carried out the contemplated extensions to its mill. The Committee confirmed the terms offered by the engineer.

**Canada.**—The Calgary Power Co., owing to the rapid extension of the city, has decided to develop another of its water powers at Kanamaskia Falls, 2 miles above the present Horse Shoe Falls plant, at a cost estimated to be \$1,000,000.

The Western Canada Power Co., of British Columbia, will shortly have 100,000 h.p. developed on the Stave River. The second installation of the company's plant is near completion, and a large contract for a minimum of 12,000, and a maximum of 40,000 h.p., has been entered into with the British Columbia Electric Railway Co. from this second installation.

It is stated that fresh proposals are being made for utilising the tidal movement in the Bay of Fundy, between New Brunswick and Nova Scotia, in the generation of electricity for supply in Eastern Canada. Our correspondent says a site has been chosen for the project, and a reservoir is to be constructed between an island and the mainland, where from 50 to 70 ft. tides are found.

The Hon. Adam Beck, of hydro-electric power fame, is said to be investigating the possibilities of the H.T. direct-current system for Canadian transmission work.

**Caton.**—The ratepayers have decided to form a company to install electric light. For many years the village, which is practically a suburb of Lancaster, has been supplied by gas from the works of Story Bros., Ltd., Queen's Mill. They have arranged to substitute electric power for gas, and left the villagers to their own resources. Most of the capital required has already been subscribed, a gratifying feature being the interest taken in the scheme by the inhabitants.

**Chester.**—The Electricity Committee has decided to recommend the T.C. to sanction an extension of the electricity works as suggested by the electrical engineer, at a cost of £11,550.

**Clacton-on-Sea.**—The U.D.C. has applied to the L.G.B. for a loan of £6,000 for extensions to plant and buildings at the electricity works.

**Doncaster.**—The Electricity and Tramways Committee has decided to recommend an extension of the electricity works, at an estimated cost of £12,500.

**Dover.**—The Electricity Committee has had under consideration a report from the electrical engineer on the relative costs of automatic and hand control of the street lamps. He estimates that when the present conversion is completed, the average cost for the next three years for controlling and maintaining the lamps, exclusive of renewals, will amount to £290 per annum, also that if time switches were fitted to all the posts excepting those on the route of the lamps controlled from the works, and were incandescent lamps substituted for the arcs, the cost would only amount to £77 per annum; and if £13 were allowed for expenditure on repairs to the clocks, there would be a clear saving of £200 per annum. The cost of 325 time switches (the actual number required to meet present requirements) would amount to £528, and it is suggested that the cost should be spread over three years by means of a suspense account, although if only two years were allowed, the ultimate saving would seem to justify the increased cost of £64 per annum for the next two years. The Committee has approved and adopted the report, and has decided to spread payment over a period of three years as suggested.

**Duffield (near Derby).**—At the annual meeting of the parishioners a resolution was passed approving of the proposals of the Corporation of Derby to extend its electric lighting and power system to Duffield, provided that the mains are laid underground where so required by the Parish Council.

**Dufftown (Banff).**—At a meeting of the T.C. it was reported that Mr. Barker, Nairn, had been engaged to give a report on a lighting scheme for the burgh with coal gas, and Mr. McLeod, Clyde Valley Electric Power Co., Glasgow, to give a report on an electric scheme, the fee of the former being 8 guineas inclusive, and that of the latter £20 and expenses.

**Dungarvan.**—The B. of T. has informed the Urban Council that if it wishes to obtain powers for the electric lighting of the town, it will have to consider applying for a provisional order, as the Board has no power to grant licences for this purpose,

**Ealing.**—The electrical engineer has been authorised to purchase 50 electric heating irons, which will be let out on hire to consumers at a charge of 1s. per quarter, additional to the charge for current consumed.

**Eton.**—A statement to the B. of G. regarding the adoption of electricity for lighting and cooking, instead of gas, at the workhouse, showed that for the previous year gas for lighting and cooking, with rent of stoves, repairs to mantles, burners, &c., and 20½ tons of coal, cost £228. During the past year the cost of electricity, rent of meters, lamp renewals, part cost of new range and of installation, and 10½ tons of coal, amounted to £78, a saving of £150. The master of the workhouse testified to the improved conditions of lighting, atmosphere, &c., since the introduction of electricity.

**Glasgow.**—The date has been fixed for the exhibition of appliances for power, heating, cooking and lighting under the auspices of the Glasgow Corporation, at from October 23rd to November 15th. It is expected that there will be a large entry by manufacturers and contractors.

**Gloucester.**—The Council has adopted a scheme recommended by the electrical engineer, under which private consumers will have the option of taking a supply of electricity at the ordinary rates, or for an annual payment equal to 12½ per cent. upon the rateable value of their premises, and 1d. per unit for all electricity consumed. The tender of Messrs. Ruscoe, of Hyde, amounting to £195, was accepted for supplying and fixing mechanical stokers for two of the boilers at the electricity works.

**Greenock.**—At the annual meeting of the T.C. on the 18th inst., Treasurer Williamson announced that the agreement with the Port Glasgow power users was now completed. Ship-builders and engineers had felt some difficulty with the 30 years' undertaking, but the speaker gave the assurance that no better terms could be given at a later stage by Greenock Corporation for power. It was reported that for the last four weeks the supply of electricity showed an increase of 116,968 units over the same period of 1912—an increase of nearly 11 per cent.

The B. of T. has sanctioned the borrowing of a further sum of £30,000 by the Corporation for the electricity department, to cover expenditure to be incurred in connection with the extension to Port Glasgow.

**Grimsby.**—In connection with the proposed purchase of turbine plant for the electricity department, it has been decided to revise the application to the L.G.B. from £8,650 to £9,300, in order to carry out certain additional work.

**Ham (Surrey).**—At a meeting of the U.D.C. on March 20th, the clerk reported that he had prepared an agreement with the Twickenham and Teddington Electricity Supply Co. for supplying electricity to the district, but owing to trouble with the B. of T. nothing definite had been decided.

**Harrogate.**—The C.C. has decided to have the electric light installed at the police court premises, and the T.C. has decided to contribute £20 towards the cost.

**Haydock.**—The B. of T. has revoked the 1905 electric light order.

**Hayward's Heath.**—The application of the Mid-Sussex Electric Light and Power Co. for a prov. order for electric supply, formed the subject of a B. of T. inquiry last week. It was stated that the company intended to supply Hayward's Heath, Lindfield and the urban part of Cuckfield, and the only opposition was as to the site of the generating station, which had been acquired from the U.D.C., and which was 200 yds. from the nearest house.

**Heysham.**—An application was made to the Morecambe T.C. last week to apply for powers to supply electricity in the Heysham Urban Council district, which immediately adjoins the west end of Morecambe. The leading property owners and occupiers signed the request, which was heartily received by the Morecambe Corporation.

**Hindley.**—The U.D.C. has approved a draft agreement with the Lancs. Electric Power Co., and has forwarded it to the B. of T. for its approval before completing it.

**Hornsey.**—The income of the electricity undertaking for the year ending March, 1914, is put at £23,350, as against an estimated expenditure of £22,629. In the discussion which occurred upon this estimate, Councillor Double urged that, as there was a balance of £6,000 on the undertaking, and a sum of £4,000 was sufficient for working capital, a reduction in the price of current supplied should be made to consumers. Application is to be made to the L.G.B. for sanction to borrow £3,000 for services.

**Hoylelake and West Kirby.**—At a meeting of the U.D.C., the chairman of the Finance Committee presented the annual financial statement, which showed that the electricity undertaking had done very well, the approximate profit for the year being about £450. It was stated that the Committee had under consideration a further extension of the machinery in order to cope with any further development the district might make.

**India.**—The Madras Corporation has proposed to raise a loan for various improvements, including electric lighting. The electric lighting will occasion expenditure of about 10 lakhs of rupees, but of this sum only 3 lakhs have been budgeted for the financial year of 1913-14. The Corporation is to be congratulated on having determined on the electric lighting of the city. Private

citizens of all classes have provided themselves with this form of illuminant; the most insignificant bazaars are now to be seen lit with electricity, and it is about time that the Madras streets followed the example. When the electric lighting is an accomplished fact, or even before that time, the levying of the maximum lighting tax will doubtless become a necessity and will not be grudged.

It is now confidently expected that the Simla hydro-electric scheme—the main details of which have been given in these notes, will be ready for opening early in May next.

**TATA SCHEME.**—Our contemporary, *Indian Industries and Power*, recently reviewed the position of the constructional work on the Tata hydro-electric scheme. The initial scheme provided for some 30,000 H.P., but the completion of the three reservoirs, Lonavla, Waiwata, and Sherwata will enable some 60,000 H.P. to be supplied. The Sherwata dam is an extension of the original scheme and has just been commenced. Work is being actively carried on in connection with the dams, power house, pipe line and transmissions; it is expected that the hydro-electric plant will be in operation in a year's time, as the superstructure and machinery foundations of both power house and receiving station are under construction.

At the Bombay end, preparations are being made by the mills to utilise the power, and nearly all the motors and transformers required are said to be on order, while half the underground supply cables on the island of Bombay have been laid. Contracts have been entered into to supply 30 cotton mills and three flour mills, the smallest installation being of 250 H.P.

**Inverness.**—The North of Scotland E.L. and P. Co. has secured its first municipal lighting contract; the Market Hall is to be electrically lighted, the cost being given as 7d. per hour as against 9d. per hour charged for gas at present.

**Keighley.**—The T.C. last week considered the proposed arrangement for supplying the Bingley Urban Council with electricity in bulk for a term of 10 years certain, and the arrangement to continue thereafter from year to year until determined by either party giving 12 months' written notice to the other. The terms in brief provide for a fixed annual payment to the Corporation of £400 to £600, according to the amount of energy supplied, and for a charge of 3d. per B. of T. unit. After a long discussion, the arrangement was confirmed. Mr. H. Webber, borough electrical engineer, was appointed permanently as tramways manager.

**London.**—**BERMONDSEY.**—Application is to be made to the L.C.C. for sanction to, and the advance of, loans of £500 for meters and £1,000 for services.

**HAMMERSMITH.**—In a report to the B.C., the Finance Committee chairman states that the net surplus in the accounts of the electricity undertaking for the current year is estimated at £7,578, and he is of opinion that a sum of £3,340, part thereof, being equivalent to the produce of a penny rate, should be allocated to the relief of the general rate for the ensuing year.

Messrs. Walter Scott & Middleton have applied for a supply of electricity for driving their machinery in connection with the widening of the L. & N.W. Railway at Willesden Junction; also for the use of a 150-H.P. motor, and offering to pay a minimum of £250 per annum for current used, £65 per annum for the hire of the motor and £50 towards the Council's cost of laying on the supply. The Council has agreed to the above offer, and a supply is to be given at the flat rate of 1d. per unit.

**FULHAM.**—An expenditure of £1,100 has been authorised for converting the remaining 121 rectified arc lamps in the borough to metallic-filament cluster lighting. This alteration, it is stated, may be expected to result in a further reduction in the number of units consumed and chargeable to public lighting of £8,483 per annum, which is equivalent to an annual saving of £345. An additional expenditure of £210 has also been authorised for converting 100 gas lamps, which are on the lines of mains already laid in the side streets of the borough, to incandescent electric lamps.

**ST. PANCRAS.**—An agreement is to be entered into with the London Housing Society for a supply of current to its residences in Judd Street for lighting, heating and cooking purposes, upon payment by it direct, of an annual charge in advance, of £11 per KW. and 3d. per unit for all current supplied by meter. This is upon the condition that no gas is used by the society in any of the buildings. In assessing the KW. upon which payment would be made, the engineer estimated that 70 per cent. of the lamps in lighting at one and the same time could be considered as the maximum. The Electricity Committee reports having had under consideration the question of an undercharge which occurred in the accounts rendered for electric current supplied to the Railway Clearing House. In the year 1907, the Committee states, the voltage of the supply was changed from 110 volts to 220 volts, and at the Railway Clearing House three of the four 110-volt meters were replaced by 220-volt meters. In regard to the fourth meter, which was allowed to remain at 110 volts, inasmuch as it was one of special size and cost, the meter reading book was marked to be subject to a multiplying constant of two in making out the account. The reading of this meter for the quarter following was duly multiplied, and the account properly rendered, but the constant was subsequently omitted from the book, and, as a result, the current at 220 volts passing through this 110-volt meter was since then only charged at half its value. The total undercharge until the error was discovered amounted to £747. This sum, after negotiation, was settled in full. Arrangements were then made, the Committee continued, for a thorough and complete investigation of the meters in use, and it had been ascertained that the only other case of an error having occurred was in respect of a 220-volt meter which was con-

needed to a 110-volt supply. This was responsible for an undercharge of £41, which had also been paid in full. The district auditor, in his remarks upon these errors, says that, in his opinion "there is no reason whatever for supposing that the consumer was aware of the mistake. The substitution of metallic-filament lamps and the conversion to 220-volt current might easily have been regarded as sufficient explanation of the variation in charge. There are at present a number of 220-volt meters in use for measuring 110-volt current. In regard to them an efficient system has been instituted to obviate any risk of overlooking the constant, multiplier-cards of distinctive colour being used."

**Luton.**—It is stated that in all probability the profits of the electricity department will be absorbed by the proposed expenditure on house services, purchase of meters, &c. The question of installing new plant during the year, at an approximate cost of £20,000, is under consideration. In connection with the lease of the Corporation tramways, which expired on February 21st last, Messrs. Balfour, Beattie & Co., Ltd., the lessees, have now asked for a considerable reduction in the price of energy. The company suggested that the price should be for the first 200,000 units per annum, 1½d. per unit; for any quantity exceeding 200,000 units per annum, 1d. per unit. If this alternative was accepted, the company stated that it would be prepared to give the Council an option to determine the lease at any time upon 12 months' notice. Being of the opinion that it would be an advantage to have the power of determining the lease during the next 10 years, the Committee decided to agree to the proposal, subject to a fuel clause.

**New Zealand.**—Until recently the water of the Waipori River, which supplied the hydro-electric plant at Dunedin, was conveyed in an ordinary open flume. The risk and expense attached to its use led the Corporation to tunnel through a hill, some 4,440 ft., and in January last the water was diverted to the new course. The immediate result was to give the city an additional 1,000 H.P., making 4,000; two more generators are being installed, which will bring this up to 6,000 H.P., and it will be possible to develop an additional 4,000 H.P. in the future. The tunnel has an advantage over the open flume in that it can be used as a pipe line, supplying direct to the Pelton wheels and avoiding waste of excess water as heretofore. The tunnel, a new weir, and conduit have cost £39,752.

**Oldham.**—The B. of G. has decided to have electric lighting and telephones installed at the Workhouse.

Some time ago the Electricity Committee decided to install plant for supplying H.T. energy, and at a recent meeting of the Committee it was reported that there was not space available at the Greenhill station for the erection of the necessary switch-board, the engineer suggesting an extension on the eastern side fronting Churchill Street. This was agreed to by the Committee.

**Peterborough.**—The T.C. has discussed the extensions of the electricity works, for which a loan has been agreed upon. The city electrical engineer is to prepare a specification for a 500-KW. turbo-generator and two Lancashire boilers. The engineer was also instructed to make inquiries as to the value of various mechanical stokers and to report.

**Rhosllanerchrugog.**—The local Traders' Association has taken up the question of a supply of electricity for the district. A supply could be obtained from Wrexham by means of the tramway wires, this being considered the cheaper method, but the Association has decided to make further inquiries as to the possibility of current being generated in the town.

**Southampton.**—A letter has been received from Itchen U.D.C. with reference to the Council's schemes for supplying current, to the effect that the District Council favoured the proposal for a bulk supply on a six-years' contract. It is estimated that there will be a gross profit on the electricity undertaking for the year ending March, 1914, of £21,057, which, after deducting interest on redemption charges and special expenditure, will leave £1,879 available for appropriation.

**Stirling.**—At a meeting of the Lighting Committee it was reported that the capital account of the electric light undertaking was overdrawn to the extent of £115. It was recommended that £1,000, the balance of a sum authorised, be borrowed, and the T.C. has agreed to this. Recently the Committee met at the works and inspected the plant.

**Swansea.**—The question of increasing the contribution of the electricity department to the rates, was recently discussed by the E.L. Committee, and it was agreed to give one-third of the net profit for this purpose. It was pointed out that increased financial charges would have to be met shortly; that the reserve fund had not reached the 10 per cent. limit; that it would probably be necessary to pay for meters and street lighting out of revenue, to which the borough treasurer demurred; also that the price of gas was being reduced, all excellent reasons for retaining any available surplus in the undertaking.

**Theale (Somerset).**—There is every prospect of this village being supplied with electricity from Wedmore, where a scheme has been carried out. Prominent residents have taken up the matter, and the proposal has been favourably received.

**Troon (Ayrshire).**—The T.C. has under consideration the question of an electric lighting scheme for the borough.

**Truro.**—At the recent inquiry into the schemes promoted by the Corporation and the Truro Gas Co. for the electric lighting of Truro, counsel for the Corporation said the company was asking the B. of T. to ignore the Corporation—an unprecedented step. The Mayor of Truro gave evidence, and said the citizens were also against power being given to the gas company. Dr. Purves, of Exeter, said Truro was an exceedingly good field for the establishment of an electricity works. The capital expenditure he placed at £8,000. This, at 4 per cent, together with sinking fund, could be paid off at the rate of £520 annually for 25 years. To show the extent to which it was expected electric light would be taken up, Dr. Purves stated that Luncannon, with a population of 4,500, had 3,700 lamps connected at the end of the first year, and Paignton, with a population of 10,000, had 6,000 lamps. Councillor Lodge stated that all the population of Truro wanted electric light, and 95 per cent, would prefer it in the hands of the Corporation.

**Tynemouth.**—At a meeting of the T.C. on the 19th inst., Alderman Irvin announced the Electricity Committee's intention to reduce the tariff for lighting. He said that the works had done so well during the last two or three years that they had practically wiped out their deficit. Mr. Gregg added that the feeling of the Committee was that even a further reduction in the price of energy for illumination purposes might be made next year.

## TRAMWAY and RAILWAY NOTES.

**Bingley.**—The U.D.C. has been recommended to make an offer to the Bradford Corporation to obtain a provisional order for a tramway from Ling Bob, Wilsden, to the Bradford city boundary, and to lease the tramway to the Corporation upon certain conditions; and also to accept the terms suggested by the Shipley Council as the consideration for its consent to the junction of the proposed Bingley tramway with the Shipley tramway at Nab Wood.

**Birmingham.**—The City Tramways Committee has decided to improve the service by the introduction of more vehicles. At present 511 cars are in use, but to meet the requirements of traffic by extension of lines and also during the busy hours of the early morning and evening, it has become necessary to provide additional rolling stock. As a first instalment 40 more cars are to be purchased, some of which will be used on the Hagley Road route when the line is opened. The others will be utilised to increase the existing services in the city. Land has been purchased for the widening of Warwick Road and Stratford Road, and the work of laying the track, &c., will be carried out in the course of the summer. This work comprises the extension of the Stratford Road tramways from College Road to Hall Green, and also the completion of the line along Warwick Road.

**Blackpool.**—A petition signed by 2,000 ratepayers has been presented to the Tramways Committee calling for penny fares on the Promenade during the summer. The Committee has deferred consideration of the matter until it goes into the estimates for the ensuing year.

**Bolton.**—Despite the unfavourable weather which prevailed during the greater part of the day, the Corporation tramcars were extensively patronised on Good Friday, the receipts being about £100 in excess of the previous year's.

**Bradford.**—The Lord Mayor, on Monday, opened the extension of the tramway between Wyke and Bailiff Bridge, which provides a through connection between Bradford and Brighouse, thus making the second two-town connection in which Bradford is concerned. The new line opens up possibilities of an eventual through connection between Bradford and Huddersfield. The length of the new line is 1 mile 338 yd.; it is partly within the Bradford city boundary, partly in the Rural District of Hipperholme, and partly in the Halifax Rural District, and has been constructed on the Dawson & Foster patent reinforced system, at a cost of £22,000, which includes the special treatment of the road. It brings the total length of track now operated by the Corporation to 103 miles 1,096 yd., the capital expenditure being approximately £995,000. The Lord Mayor, accompanied by members of the City Council, officials and public men, travelled to the site in a gaily decorated car. The Mayor of Brighouse and other officials of that town were also present, and attended the subsequent luncheon at the Bradford Town Hall.

**Bury.**—The Tramways Committee at a recent meeting decided to continue the experiment of running tramcars to and fro on the Heywood Street route for a further period of one month.

**Doncaster.**—The extension of tramway at Bentley, which has been carried out at a cost of £3,750 by Mr. J. W. Pearce, of Morecambe, was formally opened for traffic last week, after an inspection by the B. of T. Inspector.

**Edinburgh.**—At a meeting of the T.C. the Tramway Committee, on a proposal to take over the undertaking of the Colinton Tramway Co., asked power to negotiate with the company, the Edinburgh and District Tramway Co., the War Department and other parties interested. The convener of the Committee advised that the Council should wait till next meeting, when it would have before it the printed report from the town clerk on the whole matter. This was agreed to.

**Glasgow.**—As reported in the REVIEW recently, Glasgow Corporation gave limited powers to two committees to make general inquiries in connection with a proposal to erect a new bridge over the River Clyde in Glasgow, to relieve the congestion caused largely by the conveyance of tramway traffic in the centre of the city, and also to construct a dividing bridge lower down the river. A deputation has now been appointed to visit cities in which bridges suitable to Glasgow's requirements may be seen.

**Hull.**—The tramway employes are agitating for the reinstatement of a driver recently dismissed on account of a collision, and a general strike is threatened.

**Leeds.**—The people of the Farnley district, which is served by the railless traction system, are up in arms against the service, which they say is inefficient. They have ceased to grumble about the cars tearing up the roads, racking the passengers' nerves and splashing mud on people and buildings, have had a public meeting, which was addressed by the members for the district on the City Council, and have obtained 865 signatures to a petition asking for a better service. The proposals, which were put before the Tramways Committee by a deputation last week, include an increase in the number of cars, facilities for interchange of workmen's tickets both ways in case of breakdowns of the cars (which, it is alleged, are frequent), overlapping stages, a system of queues, and the provision of a waiting room at Moor Top.

**Leicester.**—The Corporation has initiated a service of pay-as-you-enter cars.

**Liverpool.**—A problem which is being considered by the Corporation Tramways Committee is to quicken the service of cars in the more congested parts of the city. At the present the Pierhead is the terminus for the majority of the cars, but the greater number of the passengers carried do not complete the journey to the landing stage, the cars both to and from the Pierhead and the business part of the city being comparatively empty, while considerable congestion exists in the city itself. A proposal has been brought forward to abolish in many cases the journey to the Pierhead, and return the cars more quickly through the town, which would have the effect of saving the present waste, and, at the same time, relieve the congestion by allowing a quicker service of cars on the various routes. Various proposals have also been suggested, with a view to avoiding duplication on the suburban routes, and it is also urged that the number of first-class cars is excessive, having regard to their returns.

**London.**—Last week trial runs were made over the recently electrified East London Railway, and the complete service is expected to be running on Monday next.

**New Zealand.**—The B.C. of New Plymouth has decided to take a poll of the ratepayers on a proposal to borrow £55,000 for the purpose of constructing electric tramways on the overhead system.

**South Africa.**—The Bloemfontein Corporation has now decided to proceed immediately with a railless traction system for the city at an approximate cost of £80,000.

**Wallasey.**—The Tramways Committee has recommended the Council to rescind the extension of the penny stages made 12 months ago, and to revert to the shorter stages.

**Wath (Yorks.).**—A ratepayers' meeting was held last week, which had been called by the chairman of the local Council with a view to obtaining the support of the ratepayers in the Council's opposition to the Mexborough and Swinton Tramways Co.'s Parliamentary Bill. The chairman explained that the opposition had arisen because the Mexborough and Swinton scheme did not embrace a wide enough area; the Wath Council desired the opinion of the ratepayers as to whether it would not be more to its advantage to attempt to run its own scheme of railless cars, instead of allowing the Mexborough and Swinton Co. to have a monopoly for 31 years, as was proposed in the Bill. The meeting decided to agree with the Council's opposition, and asked the Council to combine with neighbouring Councils for the establishment of a system of tramways under public control.

## TELEGRAPH and TELEPHONE NOTES.

**Australia.**—The application of the Marconi Co. for permission to inspect the wireless stations of the Commonwealth Government, in connection with the action for infringement of patents which is being brought against the Government by the company, was granted by the Federal High Court last week.

A full automatic service is to be established at Perth, W.A., and in Melbourne. The same course will be followed in other important centres when the present switchboards have to be replaced.

There are now eight wireless stations at work in Australia, of which six have been constructed by the Government staff under Mr. Baskill. Ten more should be completed by June 30th next.—*Australian Mining Standard*.

**Imperial Wireless System.**—Two actions against *Le Matin* by Mr. H. Samuel, the Postmaster-General, and Sir Rufus Isaacs, the Attorney-General, were before the Court of King's Bench, presided over by Mr. Justice Darling, on the 19th inst. The actions arose out of an article published in the *Matin* on February 14th, in which allegations were made as to the conduct of the plaintiffs in relation to the Marconi contract. The *Matin* having published a full apology, the two plaintiffs only desired the opportunity of making a public statement in the witness box as to their position.

Sir Edward Carson, K.C., M.P., who appeared for the plaintiffs, said that the statement complained of was this:—"Mr. Leo Maxse, the eminent editor of the 'National Review,' protested vehemently against the way in which this agreement had been concluded. He imputed that Mr. Herbert Samuel, the Postmaster-General, whose idea it was to enter into the negotiations with the company, had entered into an arrangement with Sir Rufus Isaacs, the Attorney-General, and brother of Mr. Godfrey Isaacs." It was an absolute falsehood, said Sir Edward, to say it was Mr. Herbert Samuel's idea to enter into negotiations with the Marconi Co. The Attorney-General had never had anything to do with it. It had been alleged that they had bought Marconi shares at an average price of about 50 fr., at which the shares were quoted before the opening of the negotiations with the Government, and had resold them at a profit rising to as much as 200 fr. a share, according as the negotiations enabled it to be foreseen that the contract would be concluded. Neither of them ever bought shares in the company either in their own name or any other name, nor did anyone buy shares for them, nor were they ever interested in any option or syndicate, or in any transaction whatever in relation to the shares of the company. There were other Marconi companies. The American company was an independent company, which could have no interest in the contract at all. That company erected stations in America, and had no interest in the English company, although the English company had shares in it. The American company, subsequently to the tender, proceeded to raise capital, having bought out certain interests in America and made other arrangements which rendered an extension of capital necessary. Even the suggestion of the issue of shares did not come until some weeks after the tender of the English company had been accepted, but the Attorney-General, having heard of the American company and these shares, bought 10,000 shares at the market price premium. At the time the Attorney-General bought the shares, the British company's shares were at the very highest figure they had reached, so that any suggestion that the purchase of the American shares had anything to do with the price of these shares was entirely out of the question. He sold some of them, and amongst others he sold 1,000 to Mr. Lloyd George and another 1,000 to the Master of Elibank, believing them to be a good investment. The Attorney-General had 6,400 shares, and at the present price was a loser upon the transaction by about £1,000 to £1,500.

Mr. Herbert Samuel, the Postmaster-General, then went into the witness box, and, in answer to Mr. F. E. Smith, K.C., he corroborated the statement of counsel; he said the course pursued was absolutely in accordance with all previous precedents relating to Post Office contracts.

Sir Rufus Isaacs also entered the witness box and stated that he never had anything to do with the negotiations for the contract and never knew of the negotiations until just a few days before the announcement was made on March 8th, 1912. He never bought a share in the Marconi Co., either before or after, or at any time. He had never held a share, or had any interest in a share, nor had he ever had an interest in an option or syndicate, either in his own name or anybody else's name. He never heard of the shares, or of the constitution of the company in America, until his brother returned about April 8th or 9th of last year. He then heard that the American company were issuing shares to raise new capital to carry out special arrangements that had been made for the purchase of the assets of a competing company—the United Wireless Co.—which had gone into liquidation in America, and also some important contracts which had been made with the Western Union Cable Co. He bought 10,000 of the shares at the market price, but previously he satisfied himself that they had no interest with the British Government. His purchase in the American company had nothing to do with raising the price of the shares. He sold 1,000 of his shares to Mr. Lloyd George and 1,000 to the Master of Elibank, who were great personal friends of his. He would not have gone into it unless he had been satisfied that it had nothing to do with the Marconi Co. He sold 3,570 shares, and that sale averaged a profit which eventually brought the whole transaction to his having 6,430 left out of the 10,000. The net result of the transaction was that he had made a loss of about £1,100 or £1,200 if he sold the shares at the present prices.

Mr. Campbell, K.C., appearing for the *Matin*, described the circumstances under which the article complained of was written, and said that the moment the attention of his clients was called to it, they met it with an immediate apology and explanation.

Judgment was accordingly entered for the plaintiffs with an indemnity for their costs.

The Select Committee on the Marconi contract met on Thursday last week, and selected Sir Albert Spicer as chairman. The Committee met again on Monday, in private, and on Tuesday Sir Rufus

Isaacs, the Attorney-General, was examined regarding his purchase of American Marconi shares. His evidence was given in minute detail, but in substance was the same as that given in the libel action against *Le Matin*. The examination was continued on Thursday.

In reply to questions in the House of Commons, Mr. H. Samuel stated that the American Marconi Co. had no interest at all in the British Marconi Co., but that the British Co. had a large interest in the American Co. He explained that there was no similarity between the case of Mr. J. E. Taylor and that of the Attorney-General and the Chancellor of the Exchequer, and that the reduction in rank of Mr. Taylor would not be reconsidered.

**India.**—The wireless telegraph station at Lahore has just been opened, and the new station at Bombay will be ready very shortly.—*Indian Engineering*.

**Telephone Employes.**—The eighth annual conference of the Amalgamated Society of Telephone Employes was held in Glasgow last week; 70 delegates were present, representing 10,000 employes. The outgoing president, Mr. O. Preston, stated that if a plebiscite of male members of the staff were taken, the vote would undoubtedly be in favour of a return to the old order of things.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" to-day.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" to-day.

April 15th.—1,020,000 arc lamp carbons, 26,900 carbon-filament incandescent lamps, and bare hard-drawn copper cables, for the Melbourne City Council. See "Official Notices" to-day.

**SYDNEY.**—May 12th. Fibre conduit for the City Council. May 26th.—Meters and glazed stoneware bridges. July 7th.—Arc lamp carbons. Specifications 108. 6d. for each section, from City Electrical Engineer's Department.—*Australian Mining Standard*.

**Ayr.**—Corporation tramways. Tenders for work in connection with Hawk Hill extension—permanent way construction, road widening, &c. Mr. J. Young, engineer, Town Buildings, Ayr.

**Belgium.**—March 29th. Municipal authorities of Ixelles-lez-Bruxelles. Armoured cables necessary for the low-tension distribution service.

**Blackpool.**—High and low-tension cables and transformer switch pillars. See "Official Notices" March 14th.

**Buenos Ayres.**—April 15th. Supply of motors, cables, dynamos and other accessories for motive power. Oficina de la Direccion General de Minas, Geologia e Hidrologia, Buenos Ayres.

**Chorley.**—Board of Guardians. Tenders for a complete telephone installation for the workhouse.

**Croydon.**—March 31st. Stores for a year, for the Corporation Electricity Department. See "Official Notices" Feb. 21st

**Douglas (Isle of Man).**—March 31st. About 190 tons of good steam coal for the Corporation tramways department. Mr. A. Robertson, Town Clerk.

**Dundee.**—April 4th. F.H.T. switchgear and transformers, for the Corporation. See "Official Notices" to-day.

The Corporation electricity department invites tenders for the supply of steel sashes and frames, and for the supply and erection of opening casements, for extensions at Carolina Port generating station. Mr. H. Richardson, general manager and engineer.

**Edinburgh.**—Electric lighting for the new Veterinary College buildings at Summerhall. Mr. D. M'Arthy, architect, 25, Frederick Street, Edinburgh. Deposit two guineas, returnable.

March 31st.—Coal for the Corporation electricity supply department for 3 or 12 months. Engineer's Office, Dewar Place.

**France.**—The electrical department of the French State Railways has just invited tenders for the supply of eight underground electric cables to transmit three-phase 15,000-volt current between the Nord power station in Paris and the sub-station at La Garenne.

April 5th.—The Bureaux du Service Electrique (Second Division of the French State Railways in Paris (43, Rue de Rome) are inviting tenders for the supply of the switchboards required on the alternating side at the transformer station at the Champs de Mars, Paris.

**Glasgow.**—The Tramways Sub-Committee on Works and Stores of the T.C. is inviting offers required under the annual contracts. Mr. James Dalrymple, general manager, Headquarters, Bath Street.

**Hornsey.**—March 31st. Natural draught cooling tower for the T.C. electricity works. See "Official Notices" March 14th.

**Italy.**—The Azienda Elettrica Municipale, of Rome, has just invited tenders for the supply of about 350 km. of copper conductors required in connection with the electric transmission installation between Castelmadrada and Rome.

**Keighley.**—(a) Foundation work for a 2,000-kw. turbo-alternator and condensing plant at the electricity works; (b) rolled steel joists in connection with the above. Drawings and specifications obtainable from Mr. H. Webber, Borough Electrical Engineer, Coney Lane, Keighley.

**Limerick.**—April 10th. Stores and materials for a year, for the Borough electricity department. See "Official Notices" to-day.

**Lisnaskea (Co. Fermanagh).**—April 14th. Gas engine and suction gas plant, dynamo and booster, battery, wood poles, overhead mains, &c., and switchboard, for the Lisnaskea Electric Light Co., Ltd. See "Official Notices" to-day.

**London.**—L.C.C.—April 3rd. Reconstruction and re-winding of seventeen 300-kw. synchronous motor-generators and three 500-kw. induction motor-generators. See "Official Notices" March 14th.

April 2nd.—Electrical installation at the Avery Hill Hostels, Eltham, S.E. See "Official Notices" March 21st.

**BATTERSEA.**—April 1st. Coal for a year, for the B.C. Electricity Department. See "Official Notices" March 14th.

**LEWISHAM.**—March 31st. Guardians. Wiring and fittings for 500 lights at the workhouse, and 500 lights at the infirmary, in High Street, Lewisham, S.E. Specifications at Union Offices, 394, High Street.

**Manchester.**—April 1st. Electric fittings and wires, &c., for a year, for the Lancs. and Yorks Railway Co. Mr. Waring, Stores Department, Osborne Street, Manchester.

April 15th.—Tramways Committee. Tenders for roofing over of avenues at the Hyde Road car works, Manchester. Mr. J. M. McElroy, General Manager.

**Maryborough.**—April 9th. 1,120-amp.-hour accumulator, for the District Asylum. See "Official Notices" to-day.

**Peterborough.**—March 31st. 1,023 yards of cable, for the Corporation. See "Official Notices" March 21st.

**Salford.**—March 31st. Stores, &c., for the Corporation Electricity Department. See "Official Notices" March 21st.

April 10th.—Extra-high-tension switchgear, for the Corporation. See "Official Notices" to-day.

**Shanghai.**—April 3rd. Extra-high-tension and low-tension switchgear for sub-stations. See "Official Notices" March 14th.

**Spain.**—The municipal authorities of Epila (province of Zaragoza) have just invited tenders for the concession for the electric lighting of the town during a period of 15 years.

**Stalybridge.**—4,500 yards E.H.T. three-core lead-covered cable. See "Official Notices" March 14th.

**West Ham.**—April 3rd. Electric light installation at the new workshops, Aldersbrook Road, Wanstead, for the Guardians. See "Official Notices" to-day.

**Wigan.**—March 31st. Materials and stores for the Corporation Light and Tramways Departments. See "Official Notices" March 14th.

**York.**—April 5th. The Board of Guardians is prepared to receive tenders for (1) a dug well round an existing bore hole, an additional cast-iron liner down the bore hole, a deep well pump for 5,000 gallons per hour, and two small centrifugal pumps and electric motors; and (2) water-softening plant (without heat) dealing with 5,000 gallons per hour. Tenders to the Clerk (Mr. George Sykes), Union Offices, Museum Street, York.

## CLOSED.

**Ashton-under-Lyne.**—The Electricity Committee has provisionally accepted the tender of Messrs. Switchgear & Cowans, Ltd., for high-tension switchgear to specification.

**Atherton.**—The U.D.C. has accepted the tender of Messrs. Manchell, Barratt & Co. for two transformers.

**Bristol.**—The Docks Committee has accepted the tender of Buchanan & Curwen for the electric light installation at Bathurst and Prince's sheds.

**Burnley.**—The Guardians, on March 20th, entered into their half-yearly contracts. These included one for electrical requirements with Messrs. Simpson Bros.

**Chesterfield.**—The T.C. has accepted the tender of the British Westinghouse Co., Ltd., for a 500-kw. rotary converter, speed 600 R.P.M., and a 500-K.V.A. transformer, at £1,461.

**Australia.**—According to the *Australian Mining Standard*, the following contracts have been placed:—

**HOBART.**—Postmaster-General's Department:—

46 chains cable, 260 pairs, £125.—B.I. and Helsby Cables, Ltd.

118 chains cable, 208 pairs, £385; 61 chains cable, 160 pairs, £311.—Australian Metal Co., Ltd.

**VICTORIAN RAILWAYS.** Electrical equipment of Melbourne suburban system. (This matter has already been mentioned in the ELECTRICAL REVIEW):—

Power station, buildings, boiler house equipment and other plant—deposit, £6,455 10s.—£258,230.—Babcock & Wilcox, Ltd.

Equipment of suburban stations—deposit, £1,200—at rates.—Siemens Bros. Dynamo Works, Ltd.

Turbo-alternators and transformers—deposit, £9,156—£122,235.—C. A. Parsons & Co.

Train equipments—deposit, £16,901—£676,183.—General Electric Co. (U.S.A.).

**NEW SOUTH WALES.**—Public Works Department. Building works:—

Construction of electric lifts, Registrar-General's new building, £2,035.—Standard Waygood, Ltd.

Railway and tramway construction works,—100 tons of fishbolts for 80-lb. rails, £15 per ton.—H. W. Cameron & Co., Sydney.

**SYDNEY.**—Municipal Council:—

Maximum demand indicators, £308.—W. G. Watson & Co.

Transformers, £1,239.—Australian General Electric Co.

**Clacton-on-Sea.**—The U.D.C. has accepted the tender of the Consolidated Diesel Co., Ltd., for an engine and accessories and switchboard, at £4,840, and a Crompton dynamo, at £710; and that of Messrs. Johnson & Phillips, Ltd., for cables for extensions, at £56.

**France.**—The adjudications on the tenders returnable on March 11th, for telephone cables (in three lots) for the Post and Telegraph Department, Paris, have resulted in the rejection of all the offers made, owing to them exceeding the price limit previously fixed. The lowest tender for lot 1 (10,000 metres of copper cable and 28-pairs of silk and cotton-bound conductors) was 1,900 fr. per kilometre, by M. Grammont. The lowest tender for lot 2 for similar requirements, was 1,885 fr. by Messrs. Geoffroy & Delore, the India-Rubber, Gutta-Percha and Telegraph Works Co.'s tender being 1,925 fr. per kilometre. For lot 3 (15,000 metres and 14 pairs), the lowest tender was that of the Tréfileries du Havre, 1,210 fr.

The tenders invited for the same date, for extensible commutator telephone tables, were also rejected for the same reasons. The lowest tender was that of the Société des Ouvriers en Instruments de Précision, 50,126 fr. for two lots, the Thomson-Houston quotation being 52,700 fr. for two lots.

**Germany.**—Messrs. Heh. Riecke & Co., of Kassel, have submitted the lowest tender to the Prussian State Railway authorities of Munster for the supply and erection of five 80-ton electrically-operated cranes.

**Glasgow.**—The T.C.'s Tramways Committee on Works and Stores has recommended acceptance of the following offers:—

Porcelain insulators.—Bullers, Ltd.

Copper bonds.—R. R. Todd.

Winding armature coils.—Manchester Armature Coil Co.

Winding commutators.—Mavor & Coulson.

**Government Contracts.**—The following tenders have been accepted during the past month by the Government departments named:—

### ADMIRALTY: CONTRACT BRANCH.

Bell, bell fittings, gongs, &c.—Hawkers, Ltd.; India-Rubber, Gutta-Percha, &c., Co., Ltd.; McGeech & Co., Ltd.; Mehan & Sons, Ltd.; Player and Mitchell, Reid Bros., Engineers, Ltd.; Spagnoletti, Ltd.

Brackets, pendants, &c.—Evered & Co., Ltd.; Edison & Swan, &c., Co., Ltd.; Gabriel & Co.; General Electric Co., Ltd.; Mehan & Sons, Ltd.; W. McGeech & Co., Ltd.; Player & Mitchell, Ltd.; David Shanks and Co., Ltd.; Spagnoletti, Ltd.

Lampholders and insulators for.—Edison & Swan, &c., Co., Ltd.; General Electric Co., Ltd.; W. McGeech & Co., Ltd.

Incandescent lamps.—British Union Lamp Works, Ltd.; British Thomson-Houston Co., Ltd.; Crystalco, Ltd.; Edison & Swan, &c., Co., Ltd.; General Electric Co., Ltd.; Rugby Lamp Co., Ltd.; Pope's Electric Lamp Co., Ltd.

### WAR OFFICE.

Electric dry cells.—Atlas Carbon and Battery Co., Ltd.; Siemens Bros. and Co., Ltd.

Installation of electric light, officers' houses, Tidworth.—Nalcolm and Allan, Ltd.

### INDIA OFFICE: STORE DEPARTMENT.

Pipettes, &c.—Chloride Electrical Storage Co.

### CROWN AGENTS FOR THE COLONIES.

Cable.—W. T. Henley's Telegraph Works Co., Ltd.  
Dynamo sets.—Britannia Engineering Co., Ltd.  
Switchboard meter equipments.—Western Electric Co.

### POST OFFICE.

Protective apparatus.—British L.M. Ericsson Manufacturing Co., Ltd.; International Electric Co.

Telegraphic apparatus.—B.I. and Helsby Cables, Ltd.

Telephonic apparatus.—Automatic Telephone Manufacturing Co., Ltd.; British Insulated and Helsby Cables, Ltd.; British L.M. Ericsson Manufacturing Co., Ltd.; Crystalco Manufacturing Co., Ltd.; Edison and Swan United E.L. Co., Ltd.; General Electric Co., Ltd.; International Electric Co.; London Electric Wire Co. and Smiths, Ltd.; Siemens Bros. & Co., Ltd.; Spagnoletti, Ltd.; Western Electric Co., Ltd.

Telephonic cable.—B.I. and Helsby Cables, Ltd.; Johnson & Phillips, Ltd. Stoneware ducts.—Albion Clay Co., Ltd.

New wireless station, Malin Head.—Robert Colhoun.

Power plant and wiring at Malin Head wireless telegraph station.—Westminster Engineering Co., Ltd.

Steel masts at Valencia wireless telegraph station.—Marconi's Wireless Telegraph Co., Ltd.

Telephone exchange equipment, Leth; alterations and additions, Mayfair Exchange, London; Information desks and alterations, City and Central Exchanges, London.—Western Electric Co., Ltd.

Telephone exchange equipment, Barnsley and Helensburgh.—Peel-Conner Telephone Works, Ltd.

**Herne Bay.**—The U.D.C. has accepted the tender of Messrs. Stuart & Moore, of Ealing, for an installation of electric fire alarms, at £27 a year, for five years.

**Hornsey.**—The tender of the Reason Manufacturing Co., Ltd., for electrolytic meters for the ensuing year, has been accepted by the Council.

Messrs. Chamberlain & Hookham, Ltd., have also obtained a contract for meters from the B.C.

**Huddersfield.**—The Electricity Committee has accepted the following tenders:—

Mark Brook.—New chimney at electricity works.  
H. Brook & Co.—Tanks.

**Iford.**—The U.D.C. has accepted the following tenders for coal for the electricity works:—

Bradbury, Son & Co., Ltd.—2,000 tons of Godding small peas, 14s. 6d. per ton.  
E. Foster & Co.—7,000 tons of 1st stock medium peas, 15s. 6d. per ton, and 1,000 tons of Tanworth double-sieved nuts, at 10s. 2d. per ton.

The Education Committee has accepted the tender of Messrs. Ellis & Ward, Ltd., for the electric light installation at South Park Schools, at £157.

**London.**—HAMMERSMITH.—As the result of tests made of prepayment meters recently tendered for, the tender of Messrs. Chamberlain & Hookham was recommended for acceptance.

The tenders received for arc lamp carbons were:—

Electrical Engineering and Equipment Co., Ltd.	(accepted) £137
Ship Carbons .. .. .	149
W. Geipel & Co. .. .. .	148
J. G. Wilson .. .. .	153
Siemens Bros. Dynamo Works, Ltd.	154
H. G. Mayer & Co. .. .. .	170
Flan Electrical Co. .. .. .	178
General Electric Co., Ltd. .. .. .	188
Crompton & Co., Ltd. .. .. .	207

Net; others less 2½ per cent.

**BATTERSEA.**—The B.C. has accepted the following tenders for annual supplies to the Electricity Department:—

Carbon lamps.—British Thomson-Houston Co., Ltd.  
Oils.—Price's Co., Ltd.  
Turbine oil.—A. Duckham & Co., Ltd.  
Bitumen.—Callender's Cable and Construction Co., Ltd.  
Compound.—Dussek Bitumen Co.  
Engine room stores and ironmongery, &c.—Pryke & Palmer.  
Packings.—R. Meldam.

**FULHAM.**—The B.C. has accepted the following tenders for annual supplies:—

Carbon brushes.—W. Geipel & Co.  
House out-lets and service boxes.—B.I. and Helsby Cables, Ltd.; Sykes and Sugden.  
Glass globes.—City Glass Co.  
Electrical goods.—British Thomson-Houston Co., Ltd.; Siemens Bros. Dynamo Works; W. T. Henley's Telegraph Works Co., Ltd.  
Carbons.—Sloan Electrical Co. (for about seven months only).  
Frames and covers.—W. T. Henley's Telegraph Works Co., Ltd.

**EALING.**—At an estimated cost of £130, with an additional £15 for foundation work and fitting, Messrs. Weir, Ltd., are to be requested to provide at the electricity works, a Weir boiler feed pump to take the place of the two small ones which have been working for nearly twenty years and are now almost unfit for further service.

**STOKE NEWINGTON.**—The tender of the London Electron Works Co., Ltd., has been accepted for the purchase and removal of old tinned material and galvanised iron, &c., from the Stoke Newington destructor for three years, at £1 10s. per ton for tinned material, and 12s. 6d. for the iron, &c.

**BERMONDSEY.**—The B.C. has accepted tenders by the following firms:—

Reason Manufacturing Co.—Time switches and demand indicators.  
E. H. Cripps.—Meter boards.  
Stern, Sonneborn Oil Co., and W. B. Dink & Co.—Engine oils.  
Thos. Wragg & Co., Ltd.—Conduits and troughing.  
Sykes & Sugden, Ltd.—Street frames and covers, &c.  
Chamberlain & Hookham, Ltd.—Meters, fuses and time switches.  
General Electric Co., Ltd.—Cut-outs, &c.  
Union Cable Co., Ltd.—Paper cable, lead-covered.  
Liverpool Electric Cable Co., Ltd.—Rubber cable.  
C. Macintosh & Co., Ltd.—Lead-covered rubber cable.  
Siemens Bros. & Co., Ltd.—Lead-covered cable.  
Craig, Sharp, Ltd.—Joining material.

**Manchester.**—The B. of G. has placed a contract with Messrs. Anderson, Ltd., Salford, for installing electric light at Crumpsall Workhouse.

**New Zealand.**—Messrs. Hick-Diesel Oil Engines, Ltd., have received the following Colonial orders for their oil engines:—

Te Aroha Borough Council, N.Z.—One of 240 h.p.  
Corporation of Thames, N.Z.—Two of 160 h.p.

**Norwich.**—The T.C. has accepted the tender of Messrs. Alexander Wilson, of Aberdeen, for a two-cylinder electric motor-driven air compressor for New Mills power station, at £421.

**Salford.**—The Education Committee has accepted the tender of Messrs. Willoughby & Wilcox for installing the electric light at the technical laboratories and workshops, at £40; and that of Messrs. Davenport, Sparrow & Co. for similar work at the juvenile employment bureau.

**York.**—The Cable Accessories Co., Ltd., have secured the contract for supplying brackets and fittings for lighting the streets of the city.

**Southend-on-Sea.**—The T.C. has accepted the following tenders:—

Edgar Allen & Co., Ltd.—20 manganese iron tongues for trackways, £50.  
Worthington & Co.—Poles, brackets, trolley wire, section pins and bands, £801.  
Mr. D. H. Rose—Gun-metal overhead line material, £41.  
Alton & Co.—Steam pipes, £95, and exhaust pipes, £76.  
Hopkinson & Co.—Steam valves, £76.  
Glentfield & Kennedy.—Exhaust valves, £23.

The British "Nielanuse" Boiler Co., Ltd., has secured from the Corporation a contract for two 25,000 lb. capacity boilers, complete with Nielanuse stokers, superheaters and forced draught fan equipment, also Green's economisers and other work.

## FORTHCOMING EVENTS.

**Manchester Electro-Harmonic Society.**—Friday, March 28th. At the Albion Hotel, Manchester. Last concert of the season.

**Association of Mining Electrical Engineers (South Wales Branch—Western Section).**—Saturday, March 29th. At 7.30 p.m. At the Grammar School, Swansea. Lecture on "Turbine Engines, their Construction, Installation and Maintenance," by Mr. A. L. Osleon.

(South Wales Branch—Eastern Section).—Saturday, March 29th. At 5 p.m. At the Carlton Café, Cardiff. Discussion on paper on "The Speed Control of Three-phase Motors," by Mr. S. Simons.

**Institution of Electrical Engineers (Scottish Section).**—Annual general meeting postponed from April 8th to April 15th.

(Newcastle Section).—Monday, March 31st. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Telephonic Development," by Mr. J. R. Andrews.

(Manchester Section).—Tuesday, April 1st. At 7.30 p.m. At the University, Manchester. Paper on "Self-synchronising Machines," by Dr. E. Rosenberg.

**Association of Electrical Station Engineers (Glasgow Branch).**—Wednesday, April 2nd. At 7.45 p.m. Meeting at the Y.M.C.A., Bothwell Street, Glasgow.

**Electro-Harmonic Society.**—Friday, April 4th. Kieg's Hall, Holborn Restaurant. Last smoker of the season.

**Salford Technical and Engineering Society.**—Saturday, April 5th. At 7 p.m. At the Royal Technical Institute, Salford. Paper on "Modern Gas Engines," by Mr. K. Cox.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued:—

Friday, March 28th.—"D" Company. Company training, 7 to 10 p.m.  
Saturday, March 29th.—Headquarters will be opened from 10 a.m. till 12 noon for regimental business only.  
Monday, March 31st.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.  
Tuesday, April 1st.—"B" Company. Company training, 7 to 10 p.m.  
Thursday, April 3rd.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.  
Friday, April 4th.—"D" Company. Company training, 7 to 10 p.m.  
Saturday, April 5th.—Headquarters will be opened for regimental business from 10 a.m. till noon.

(Signed) J. H. S. PHILLIPS, Major.

For Officer commanding L.E.E.

## NOTES.

**The L.C.C. Highways Committee.**—The members of the new Highways Committee (which, as our readers know, took after the electric tramway system) will be as under:—

Cotton, H. E. A.	Kennard, Cpt. A.C.H.	Scott, A. H.
Evans, B. B.	Lidiard, H.	Squires, W. J.
Goodrich, A. O.	Monk Bretton, Lord	Ward, Henry
Gordon, H. H.	Prestige, J. T.	White, Sir Edward
Hume, G. H.	Rawson, A. C.	Yeo, A. W.
Hunt, William		

**Electric Motor-Vehicle Construction in the United States.**—The Edison Electric Vehicle Co., of America, is the name of a new concern which has just been formed at Lawrence, Mass., to manufacture industrial motor-vehicles of the electric type. The vehicles will all be fitted with Edison batteries.

**Rugby Engineering Society Conversazione.**—The third Conversazione held under the auspices of the Rugby Engineering Society took place on the evening of the 14th inst. in the Co-operative Hall, Rugby. This function is held about every two years, and is one of the most successful and interesting displays of the results of engineering progress and scientific research in the Midlands. The large hall was used for the display of exhibits, and of the two smaller halls attached, one was reserved for a lecture and demonstration theatre—there being during the evening continuous demonstrations of the Pathscope, by the courtesy of the Pathscope Co., interspersed with two very interesting lectures: one by Mr. E. B. Wedmore, entitled "Infinity," which, in spite of the awe-inspiring title, thanks to the wit and humour of the lecturer, was much enjoyed by a numerous and appreciative audience. The second lecture was by Mr. F. A. Haigh, on "Coloured Photography," in which a demonstration was given with suitable examples of this interesting development of the art. The second small hall was reserved for refreshments, and a most instructive and enjoyable evening was spent by some 400 members and their friends, a continuous programme of music being provided in the main hall throughout the evening by Mr. Dudley's orchestra. The Marconi Co. sent down a complete wireless installation, with one of their engineers to demonstrate the working of the equipment. There was an excellent demonstration of the X-rays, with specimen photographs, &c. Messrs. Alfred Herbert, Ltd., of Coventry, gave a practical demonstration of the photostat, using mercury lamps. Mr. Robert W. Paul, of London, exhibited a comprehensive collection of electrical instruments, and the Cambridge Scientific Instrument Co. sent a very comprehensive exhibit of their specialities. One of the most popular demonstrations was that of the effect of rotary alternating magnetic fields, by means of apparatus kindly loaned by Dr. Sumpner, of Birmingham, and many other very interesting exhibits were shown. Great credit is due to the Committee responsible for the arrangements, and particularly to the joint hon. secretaries, Messrs. R. G. Hosking and J. M. Ferguson, for having so successfully organised a conversazione which, on its social, as well as its scientific side, it would be difficult to surpass.

**Strike at Barrow.**—There has recently been a strike of Corporation employes in progress at Barrow-in-Furness. Although most of the workmen in nearly all departments went out on strike, the whole of the men in the electricity department, with the exception of two or three casual labourers, who were interfered with while at work, remained loyal, in spite of desperate efforts on the part of the Labour Party and agitators to get them to go out on strike. As a result, there was no interference of any sort with the electricity supply, and a number of Mr. Burnett's staff assisted at the gasworks, which, for some days, were largely run by the officials from the various departments. The gas supply was maintained at a reduced pressure, but none of the gas street lamps were lit. Fortunately, however, most of the main thoroughfares are lighted by electricity, and the fact that the electricity supply was maintained, of course, made the inconvenience caused by the strike very much less than it would otherwise have been. Under ordinary circumstances there is a keen but friendly rivalry between the electricity and gas departments, but, in the present instance, the former co-operated with and assisted the gas department in every possible way in the fight against their "common enemy—the labour agitator."

Later information received just as we go to press states that the strike still continues. A few of the men have returned to work, and the places of some have been filled. The gas supply is being maintained at reduced pressure by volunteers, but none of the gas street lamps are yet lit.

**Copper.**—Messrs. H. R. Merton's mid-monthly statistical circular, which is now to hand, shows a drop, during the fortnight ending March 15th, of 1,034 tons in visible supplies. This includes 932 tons withdrawn from English ports. Dutch stocks (also included) are up 550 tons, and Hamburg stocks 125 tons. Deliveries, at 24,379 for the fortnight, will, if continued at the same rate, show a fairly brisk trade on the month. North America's contribution is high, Spain's very low, Chile shipments average, and Australian the same. The world's supply figures for the end of February again show an increase (1,172 tons), though not so large as the preceding one. At 99,273 tons they stand higher than they have done since 1911. Stock in American producers' hands on February 28th, however, was 100 tons less than on January 30th, the increase in world's supplies, therefore, depending on the increase in Dutch and German stocks. Without these the European supplies are 2,009 tons down for the half-month, and the combined visible supply lost 2,452 tons during February.

**Charge of Receiving.**—At the London Sessions on 17th inst. Abraham Viner, a rubber dealer of Walworth, was charged with receiving six magnetos belonging to the Bosch Magneto Co. According to the *Morning Advertiser's* report, complaints were made that the company's consignments of magnetos to Australia arrived short of the proper number, paving stones of about the same weight having been substituted. There was no direct evidence to show when the cases were tampered with, but investigations led to the discovery that the prisoner had disposed of six of the magnetos at much below cost price. The accused was found guilty of receiving one magneto, and he was remanded in custody until April 10th, when the judge will give his decision.

**The Batti-Wallahs.**—The eighth annual dinner of the Batti-Wallahs' Society was held on Saturday, March 15th. The toast of "The King" constituted the toast list, and Mr. Collis, the retiring President, who took the chair, pointed out that there was no necessity for him to make a speech, since all he could say about

the Society was to be found in the menu-programme and the Batti-Wallahs' *Journal*, the second number of which was published in time for distribution at the dinner. We understand that Mr. Robinson, the entertainment secretary, displayed originality in stage-managing the whole affair. The menu took the shape of a uniform cap and inside there were amusing illustrations depicting the seven ages in the life of an electrical engineer. Mrs. J. Cornille, Mr. Martin Muir, Miss Ada Fox, Mr. Olley Oakley, Mr. Ernest Pike and Mr. Louis Nikola entertained the guests. During the course of the evening Mr. J. Snow Huddleston, the President for the ensuing year, who had a previous appointment, called in, and, in response to a general request, gave a short speech. We are informed that "there was a record attendance, in spite of the unavoidable clashing of dates."

**A Glasgow Electrical Exhibition.**—The Glasgow Corporation Electricity Department is organising an Electrical Exhibition (incorporating engineering and machinery) to be held from Thursday, October 23rd, to Saturday, November 15th, inclusive. An official preliminary circular, issued by the general manager (Mr. James M. Freer, 38, Bath Street, Glasgow), states that the scope of the exhibition will embrace lighting, heating and power, and a special section will be devoted to appliances for domestic purposes. Careful attention will be given to a section illustrating electrical applications to light railways, mining, textile, and every branch of manufacture. "The exhibition will afford a unique opportunity to engineering and machinery manufacturers to exhibit their specialities in conjunction with electric power appliances. The management will make special endeavours to bring the exhibition to the notice of likely users of electrical equipment in all parts of Scotland and the North of Ireland." The complete prospectus will be circulated a few weeks hence.

**Association of Electrical Station Engineers.**—A meeting was held recently at the Mechanics' Institute, Bradford; 16 gentlemen were present, and these included representatives from Colne, Dewsbury and Keighley, as well as Bradford. It was unanimously agreed that a branch of the A.E.S.E. be formed for Bradford and district. An hon. secretary was appointed, and it was decided to form a committee of 12. A number was elected from those gentlemen present, and a few vacancies were left to be filled by representatives of other districts around Bradford, who, it is hoped, will attend at the next meeting.

It was proposed that when the A.E.S.E. gets into working order, a magazine be published and sent to members. It was also proposed that the A.E.S.E. become incorporated.

All the gentlemen present promised to make application for membership at once if they had not already done so, and to do their best to obtain members; those from outlying districts promised to canvass the particular districts from which they came.

The next meeting was provisionally arranged for April 16th, and it is hoped that there will be a larger attendance.

A meeting was held at the Amalgamated Society of Engineers' premises, Mount Pleasant, Liverpool, on Thursday last. There was a representative attendance, and it was unanimously resolved that a branch be formed for Liverpool district and the Cheshire side of the Mersey. Mr. A. Chas. Black was elected hon. secretary, with Mr. F. A. Taylor hon. assistant secretary, and a committee of seven was appointed for the time being. It was resolved that the next meeting be held in about two weeks' time.

**Alleged Fraud.**—On 19th inst., at Marlborough Street Police Court, Horace Gustave Ménage, 31, described as an electrical engineer, living in Junction Road, Upper Holloway, was charged with obtaining on divers dates between November, 1912, and January, 1913, with intent to defraud, a quantity of electrical accessories of the value of £21 8s. 11d. from Walter James Spencer and others of the Sun Electrical Co., 118, Charing Cross Road, W.C.

According to a report in the *Morning Advertiser*, Mr. R. T. Smith, who prosecuted, said that the prisoner in 1902 entered into an agreement with the Telephone Instalment System Co., Ltd., of High Holborn, and by the terms of it he was forbidden to order any goods for that firm unless their printed forms, duly signed by the manager, managing director, or the secretary, were used. It was alleged that the accused disregarded this arrangement, and ordered goods from the Sun Electrical Co., representing that they were required by the Telephone Instalment System Co. In this way he obtained goods of the value of £21 8s. 11d., which he appeared to have applied to his own use. Mr. Smith said he also proposed, in addition, to charge the prisoner with forgery, he having altered a genuine order and made an addition to it.

Mr. R. Bos, managing director of the Telephone Instalment System Co., said that by the agreement entered into with his company the prisoner was to manage the electrical department, and was to have a third of the profits of that department over and above the cost of the work. He was not allowed to order goods for them unless the printed forms of the company, signed by the manager, managing director, or secretary, were used. The goods referred to in the charge had not been ordered by them. The business of the company was to supply telephones on the instalment system, and also to carry out work in connection with telephones.

Mr. Denman, on the application of Mr. Lewis, remanded the prisoner, allowing bail in two sureties of £30 each, or in one in the sum of £60.

**Edison Battery Car for Glasgow E.L. Department.**—The electrically propelled motor-van which the Electricity Committee of the Corporation has purchased has a load capacity of 1 ton, and is equipped with an Edison storage battery. The energy cost for a run of 40 miles is said to be less than 1d. a mile.

(Continued on page 527.)

## POWER SUPPLY ON THE RAND.

On Thursday, March 13th, a paper was read before the Institution of Electrical Engineers on this subject, by Mr. A. E. Hadley, M.I.E.E., managing director of the Victoria Falls and Transvaal Power Co., Ltd., which was formed at the end of 1906, with the object of supplying power in South Africa and Rhodesia and of acquiring the concessional rights to develop the Victoria Falls. We give below an abstract of the paper, together with reproductions of the lantern slides, for the use of which we are indebted to the courtesy of the author.

FIG. 1.—EXTERIOR OF ROSHERVILLE GENERATING STATION.

Under the original proposal a supply to the Rand was to be given partly by transmitting power from the Victoria Falls, 700 miles distant, and partly by steam generating stations located on the reef. The author became associated with the company shortly after its formation, and after its

original proposal had been modified through giving up the plan to supply part of the requirements of the Rand with power from the Falls.

The great demand for power on the Witwatersrand has arisen through the extraordinarily successful development of the gold mines on the reef, which, although only discovered in 1886, now produce 33 per cent. of the world's output of gold. Further, it is estimated by the leaders of the gold-mining industry that the work of raising gold will still be in progress on the Rand 100 years hence.

Turning for a moment to the history of electric power on the Rand, a few details will be of interest. Siemens and Halske were the first to obtain a concession in 1894, and formed the Rand Central Electric Works, Ltd., in 1895, which had a plant aggregating 3,200 kw. capacity in 1906.

FIG. 2.—ENGINE ROOM AT ROSHERVILLE POWER STATION.

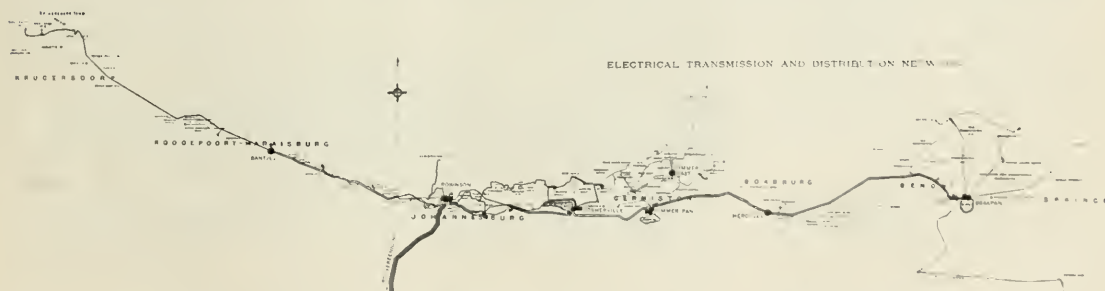

FIG. 3.—GENERAL PLAN OF NETWORK OF THE VICTORIA FALLS AND TRANSVAAL POWER CO.

Another concession was obtained by the Simmer & Jack mine in 1897, from which the General Electric Power Co. was established in 1903 with plant having a capacity of 2,500 kw. In 1905 Messrs. Lewis & Marks, having in view the possibility of supplying the Rand from their coal-fields at Vereeniging, 35 miles south, commenced obtaining wayleaves for a pole line, while certain European manufacturing companies sent out representatives to report on the prospects.

The Victoria Falls Co. ultimately took over the two existing supply companies in 1907, and purchased the Vereeniging wayleaves from Messrs. Lewis & Marks, at the same time entering into an agreement with them for the right to establish a power station at Vereeniging. In 1907, pending the installation of modern plant, a supply totalling 4,000 kw. was given from the existing steam stations which had been purchased.

As soon as it was appreciated that a cheap power supply was available the mining groups entered into contracts with

the company, and the demands for power have since increased so quickly that it has throughout been the greatest difficulty

FIG 4.—EXTERIOR OF GENERATING STATION AT SIMMER PAN.

for the company to raise capital and install plant rapidly enough to satisfy the demand.

In 1908 the largest group of mines, viz., that controlled by the Rand Mines, Ltd., and Messrs. Eckstein & Co., decided to change over their mines to electric driving. In addition to the supply of electricity to this group of mines, the conditions called for the supply of compressed air for working the rock drills.

The peak load of the combined undertaking has reached 88,000 kw., and the sales average 1,350,000 units per day.

These figures include the sales of compressed air to 10 mines. The air units represent practically the same amount of energy as if these 10 mines had converted their compressors to electric drive and purchased electricity. When the further

The supply is furnished to all mining consumers at 2,100 volts and 525 volts. The necessary step-down transformers

Name of station.	Total capacity of electric generating plant installed.	Steam driven air compressors installed.	Extensions in progress.
Brakpan ...	Two 3,000 kW. sets	—	—
Simmerpan ...	Six 3,000 - kW. sets	—	—
Rosherville ...	Five 10,000-kw. sets	Six 3,500-kw. machines	Three 7,000-kw. steam - driven air compressors
Vereeniging ...	Four 10,000-kw. sets	—	—
Extensions in 1913.	—	—	Two 10,000-kw. sets
	114,000 kW.	21,000 kW.	41,000 kW.

demands for power which have already been notified are met by the plant now on order, the sales will reach 2,000,000 units daily. The monthly load factor, based on the hour of maximum output, varies from 70 to 74 per cent.

FIG. 8.—AIR COMPRESSORS AT ROBINSON CENTRAL DEEP.

and switchgear are provided by the power company, while the consumer supplies the sub-station building and pays the

FIG. 9.—INTERIOR OF SIMMER PAN GENERATING STATION.

FIG. 10.—EXTERIOR OF GENERATING STATION AT VEREENIGING.

power company a sum equal to 2 per cent. of the power bill to cover the losses in the step-down transformers.

The standard price in mining contracts covering not less than 12 years is 0.525d. per unit, as long as the monthly load-factor is above 70 per cent., the load-factor being based on the hour of maximum consumption. This price is subject to periodical revision depending upon the cost of production, and further, a participation with the consumers in the profits of the business after a due return has been paid on capital is also provided for. In case of failure of supply the consumers are

entitled to a payment from the power company of 7s. per hour for each 100-kw. put out of commission.

The introduction of these prices on the Rand has reduced the cost of power to the mines by 40 per cent., and has reduced the cost of production of gold by an amount varying from 6d. to 1s. per ton of ore milled. It has further resulted in considerable saving of capital expenditure on

20,000-volt distribution line. Where the load is most dense the transmission system consists of two rows of towers, each arranged to carry two circuits (fig. 19, p. 521).

The 40,000-volt transmission system is fed at Brakpan, Simmer Pan, Rosherville, and at Robinson Central, where the supply from the Vereeniging station joins the reef. In addition to these distribution stations the transmission lines pass through two further distributing centres at Hercules to the east and Bantjes to the west. From these six points distribution networks, laid out as ring mains, supply the various sub-stations on the mines. The three eastern distribution stations supply the system through 10,000-volt overhead lines. The central portion of the area is served by an underground 20,000-volt cable system.

The Vereeniging station is connected to the Rand by an 80,000-volt line approximately 35 miles long, terminating at the Robinson Central distribution station, where the pressure is transformed to either 40,000 or 20,000 volts, these pressures being also coupled together through transformers aggregating 16,000 K.V.A.

All transmission and distribution circuits, with the exception of the long-distance 80,000-volt lines, are equipped with the Merz - Price balanced relay system for automatic switch control, without which a reliable supply on the ring-main system could not have been given, and the more expensive radial type of network would have been necessitated.

This balanced relay system is also employed for the protection of all transformers and for the large generators. The pilot wires for operating this system on the 40,000-volt transmission lines are combined with telephone circuits in a lead-covered cable suspended overhead, while on all distribution networks (both overhead and underground) combined pilot and telephone cables are laid underground.

A special feature of the lay-out of the telephone system is

plant, which in the case of a new mine may amount to £100,000.

The area over which a power supply has to be given lies within a strip about two miles broad and stretching 50 miles from east to west. The total power used by the mines at the present time is estimated at about 400,000 H.P.

Power plants aggregating nearly 180,000 kw. have been installed in, or are under construction for, the stations enumerated in the table on page 521. They are set out in the order in which they were built.

At Robinson Central air station there are also six electrically-driven air compressors, each of 3,500 - kw. capacity.

At all stations steam turbo-electric generating sets are employed, and produce three-phase energy at 50 cycles. Step-up transformers raise the generator pressure to 40,000, 20,000, or 10,000 volts, and their interposition gives additional security to the machines against pressure rises. This method, in which the generator voltage is optional, gives the further advantage of enabling the stators to be constructed with bar winding having one bar per slot.

The main system of transmission (shown in fig. 3) is effected by means of 40,000-volt overhead lines stretching practically the whole length of the reef. At the present time, however, the western extremity is working as a

the arrangement whereby the control of all switching and the control and regulation of load, voltage, power factor, and other operating conditions, are in the hands of the control department.

One control engineer or load dispatcher is responsible for all routine switching and linking carried out at any point

FIG. 11.—ENGINE ROOM AT VEREENIGING.

FIG. 12.—BARCOCK & WILCOX BOILERS (MARINE TYPE) AT VEREENIGING.

on the electrical system during his shift, and under the regulations no switching can be carried out without his consent. The load dispatcher, as soon as any switching has been carried out, adjusts a large diagram in the control room so that it shows every connection on the system (fig. 17, p. 524).

When the contract with the Rand Mines, Ltd., was concluded the site for the station was selected at the Rosherville Dam, which is the largest lake on the Rand. This station will shortly have a capacity of nearly 100,000 kw. of plant installed. After the new extensions are completed the turbine room will be 150 ft. long and 75 ft. wide, and there

FIG. 13.—CONTROL BOARD, VEREENIGING POWER STATION.

will be five right-angle boiler bays, each containing eight boilers. The general lay-out is shown in fig. 6, p. 520.

The coal-storage arrangements are very complete, the coal being discharged from a height of 14 ft. through the floors of 40-ton railway trucks into outside storage bunkers, under which coal conveyors are arranged. The whole structure is open, as roofing is unnecessary, owing to the favourable climatic conditions.

The conveyors, each capable of dealing with 40 tons of coal per hour, run in tunnels under the external coal store, and are fed with coal by gravity through shoots from the coal pile above. These conveyors are kept running practically continuously, allowing the internal coal bunkers in

FIG. 15.—BUS-BAR GALLERY.

the boiler house to be of small capacity. An automatic tip is fitted over the bunkers, which tips the conveyor buckets when the coal in any particular bunker has fallen below a certain level. Weighing machines are installed in the conveyor tunnels, and the coal is weighed as it passes in the conveyor buckets.

The ashes are discharged from the rear of the stokers into hand trucks in the basement, where natives push the loaded trucks out and attach them to a motor-operated rope haulage leading to the ash dump. The question of removing these ashes by suction is at present under consideration.

The class of coal burnt at this and other Rand stations is

mostly the small coal from the collieries in the Middelburg district 60 miles distant, mixed with a proportion of the duff produced by the coal-cutters. The coal has an average calorific value of about 11,000 B.T.U. per lb.

The large percentage of ash, viz., 18 to 25 per cent. of the coal, and the high load factor at which the plant is operated, necessitated a combination of boiler, superheater and economiser that would give the highest possible efficiency; the high cost of white labour, and the inefficiency of that of the native, also required that the plant should be mechanically operated.

FIG. 14.—CONTROL BOARD, SIMMER PAN POWER STATION.

In view of these considerations, and the great cost of constructional work in South Africa, the injector system of induced draught (fig. 7) originally devised by Mr. Prat has been adopted in all the power stations. The system has been found to give the utmost satisfaction.

In the lay-out employed, adjacent boiler units are connected to a common ejector chimney, the top of which is 90 ft. above the boiler-house floor. An electrically-driven rotary fan, capable of developing 75 h.p., blows cold air through the ejector situated in the chimney, thereby pro-

FIG. 16.—SWITCH GALLERY.

ducing the necessary suction in the flues, and a draught of about 1 in. is usually employed.

With this arrangement great flexibility in the boiler house is obtained, and by the use of a torpedo-shaped damper in the air pipe regulating the pressure of the air jet, the duty of the boiler unit can be easily regulated to suit fluctuations in the load. The plant is absolutely smokeless, and it is difficult by looking at the ejector chimneys from outside the station to tell which boilers are at work.

The boiler unit selected is the Babcock & Wilcox marine type, fitted with chain-grate stokers, each having an integral superheater and economiser. The boilers are arranged in

two rows in each boiler house, with a central and common firing floor (fig. 12, p. 522). Each boiler has a rated capacity of 32,000 lb. of steam per hour at a pressure of 220 lb.

FIG. 17.—LOAD DISPATCHER'S DIAGRAM.

with a temperature of feed water of 100° F., and is capable of producing 38,000 lb. of steam without undue forcing. The heating surface of the boiler is 5,520 sq. ft., of the superheater 1,720 sq. ft., and of the economiser 2,200 sq. ft. A six-hour test on one of the boiler units gave a combined efficiency of boiler, superheater, and economiser, of 80 per cent.

The turbine room (fig. 2) at present contains five turbo-generators each of 12,000 K.V.A. (fig. 5), and six steam compressors each having an input of 3,500 KW.; three more steam compressors each taking 7,030 KW. are also being installed. The turbines are of the A.E.G.-Curtis horizontal type, having one high-pressure wheel with three rims of blades. The admission pressure at the intake nozzles is brought down from 220 lb. at a temperature of 300°–350° C. to about 20 lb. with a superheat of about 20° C. In the low-pressure portion of the turbine, the steam is expanded through 12 stages. Both hand and motor regulation of the speed are arranged for. The total weight of a 12,000-K.V.A. turbine set, including condenser and pumps, is 370 tons.

The stators of each of the six-pole generators are bar wound, having one bar per slot. The machines running at 1,000 R.P.M. produce 50-cycle three-phase energy at 5,000 volts, which is stepped up to either 10,000, 20,000, or 40,000 volts, by transformers directly connected with the stator terminals.

The rotor coils are lined with metal casings before being attached to the rotor by dovetailed grooves and wedges. The rotor carries a ventilating fan at each end. The frequent dust storms in South Africa charge the air with heavy particles which might prove dangerous in the ventilation of the machines, consequently each machine is provided with an air filter having an effective surface of fireproof

cloth of 8,000 sq. ft. Each turbine set is provided with a direct-driven exciter, while a stand-by supply is also available from a motor-generator and battery.

The condensers have a cooling surface of 17,750 sq. ft.; each set has a centrifugal circulating pump of about 663,000 gallons per hour capacity, and a centrifugal air pump, both connected on one shaft and driven direct by a steam turbine. The exhaust from the auxiliary turbine is taken to the middle stage of the main turbine, where the remaining energy in the steam is utilised down to the vacuum of the condenser.

The water for the condensers and compressor jackets is taken from the lake through a channel excavated along the front of the station, and is discharged into a second canal placed alongside the intake; this canal delivers the warm water to the lake at a point as far from the intake as possible. Under normal conditions of water levels the intake water flows by gravity into the service canal, but in order to deal with periods when the water in the lake may be low, a pumping station has been erected half-way along the dam wall at the deepest part of the lake.

The boiler feed pumps are of the turbine-driven centrifugal type, and are installed in the turbine room. With the exception of certain electrically-driven bearing-cooling pumps, all auxiliaries are turbine-driven.

The generator transformers are connected by cables to their corresponding generators, and are each of 12,500-K.V.A.

capacity. Where larger transformers have been required, as for the last two sets at Vereeniging, two transformers for each machine have been installed. The transformers at Rosherville are of the shell type and water-cooled, the windings nearest the terminals being specially insulated to withstand between adjacent turns a pressure of 25,000 volts for 5 minutes. A test pressure of 160,000 volts was applied to the whole of the windings. The weight of each transformer complete, without oil, is 50 tons: the oil itself weighs 21 tons.

FIG. 18.—LIGHTNING ARRESTERS AT ROSHERVILLE.

FIG. 19.—DOUBLE TOWER LINE AT 80,000 VOLTS, AND CONSTRUCTION CAMP.

The steam turbo-compressors at Rosherville are similar to the motor-driven compressors at Robinson Central, and are each designed to deal with 22,000 cu. ft. of free air per minute with an outlet pressure of 9 atmospheres (absolute). The power required on the shaft is, roughly, 3,500 kw. In the case of electrically-driven sets at Robinson Central each unit is divided into two halves on separate shafts, each motor having a capacity of about 2,000 K.V.A., and being designed to operate at full load at a leading power factor of 85 per cent. The sets run at 3,000 r.p.m. The steam-driven compressors are arranged in two sections on the same shaft, with an intercooler between them. The cooling water required for the jackets of the compressor and intercooler amounts to about 40,000 gallons per hour. The air leaves the compressor at a temperature of about 70° C.

Between the compressor and the pipe line an automatic non-return valve is fitted, which allows a compressor to drop out to atmosphere when its pressure falls below that of the air system.

By the use of the rotary compressors the air entering the pipe system is kept entirely free from oil and other impurities liable to be introduced into the air system when piston compressors are employed. The speed regulation of the steam turbo-compressors is automatically controlled by the pressure in the air pipes. The regulation of the electrically-driven compressors at Robinson Central is effected by throttling the intake. The weight of a turbine-driven compressor, condenser, and pumps is 180 tons.

The switchgear is laid out in a building at the southern end of the station, and the step-up transformers are in cubicles arranged along the outer side of the switch-house. The last-mentioned is constructed with four floors: the upper floor contains the lightning-arrester gear, the third floor the bus-bars, the second floor the 40,000 and 20,000-volt oil switches, whilst the lower floor is occupied with cableways and pipe passages. Duplicate bus-bars are installed for both the 40,000 and 20,000-volt systems, the various oil switches being provided with knife selector switches to connect to either bus-bar. The 40,000 and 20,000-volt systems are connected together through coupling transformers. The switches consist of three single-phase coupled switches operated from a remote-control board (see figs. 13-16).

Since the Rosherville station came into commercial service, troubles have been experienced owing to failures of switches on short-circuit. When the Brakpan and Simmerpan stations were started to supply the 40,000-volt transmission and also the 10,000-volt local lines, their total capacity was 24,000 kw., and no trouble was experienced when a short-

Dynamos running at a high speed have a low internal reactance. The step-down transformers in the present case were designed with a low reactance to give good regulation, so that probably the total reactance in circuit on a short-circuit was about 7 or 8 per cent. The momentary rush of energy on short-circuit could therefore reach the tremendous proportions of 500,000—700,000 kw. No oil switch, as at present designed, could interrupt this rush of power unassisted. The intensely hot gases formed by the arc, after

FIG. 21.—OVERHEAD LINE AT 10,000 VOLTS.

rising through the oil, come into contact with the air and cause an explosion, which, more often than not, is productive of a switch failure.

About the time that this trouble became apparent on the Rand, exactly the same difficulty was being experienced on stations of similar large output in America, and the problem was vigorously tackled over there. Many methods have been tried at Niagara, Chicago, and other places, and it has become generally recognised that it is necessary to insert additional reactances in order to limit the rush of energy on short-circuit. In certain cases this precaution has proved entirely satisfactory. In others additional methods for assisting the oil switch have been necessary; such as (1) sectionalising the system on to separate bus-bars and limiting the amount of machinery that would be affected by one short-circuit; (2) the placing of two switches in series timed so that one opens first and inserts a non-inductive resistance, the circuit being actually broken by the second switch; (3) the use of a special type of switch having two moving systems, one of which first introduces reactances, and the other then breaks the circuit.

These methods have been tried on the Rand. The earthing of the neutral through a resistance has proved most valuable, as more than 90 per cent. of the faults start as faults to earth. At Rosherville and Vereeniging reactances having a value of about 6 per cent. have been installed between the dynamos and the step-up transformers. The latest practice is to design both generators and transformers required for power service with large internal reactances.

At Vereeniging and at the Rand end of the 80,000-volt line two systems of switching have been installed. On the first two Vereeniging machines two switches are employed in series, one introducing a non-inductive resistance; while on the last two machines, both of which have not yet been put into service, a two-movement reactance switch is being

FIG. 20.—LIGHTNING ARRESTERS, &C., AT END OF 80,000-VOLT LINE.

circuit occurred on the system. When, by the addition of Rosherville, the system grew to 60,000 and 70,000-kw. capacity, switch breakdowns occurred, conclusively proving that no apparatus was available which could be relied upon to interrupt the immense rush of current occurring on short-circuit.

Some serious line interruptions have in the past been caused by the wilful throwing of bare wires over the lines. When this form of short-circuit has occurred near a power station, apparatus has usually been lost.

installed. This switch is constructed on the lines of an oil-break switch, but is provided with a second pair of contacts

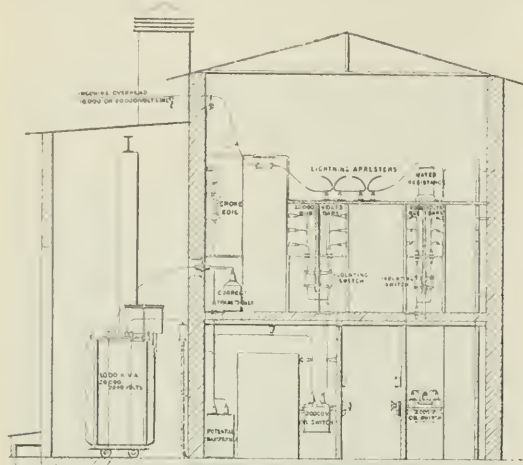

FIG. 22.—SECTION OF STANDARD TYPE OF CONSUMERS' SUB-STATION.

for the final break. The separation of the first pair of contacts introduces two reactances placed centrally one on each terminal bushing inside the oil tank, and the second pair of contacts finally breaks the circuit.

The standard sizes of consumers' transformers are 1,000, 500 and 250 K.V.A., designed with the primary windings arranged for either 20,000 or 10,000 volts. A temperature rise of 40° C. is allowed above an air temperature of 40° C. The windings near the outgoing terminals will stand a pressure of 15,000 volts between adjacent turns. The high-tension windings are tested to the secondary windings and core with a pressure of 40,000 volts, and the insulators with 60,000 volts. The transformers have been supplied by Messrs. Siemens, the Allgemeine Electricitäts Gesellschaft, and the Westinghouse Co.

The transformers are exported filled with oil, thereby reducing the cost of transport and dispensing with the necessity of drying out after erection. In order to allow for the expansion and contraction of the oil each transformer tank is connected with a second smaller tank fixed on the wall of the sub-station. This expansion tank is fitted with a vertical vent-pipe, so that only a small surface of oil is in contact with the air, and by this means sludging is prevented. Each sub-station chamber has a short stack, which induces a natural draught and provides effectual ventilation. Double bus-bars are provided for each voltage. The high-tension and low-tension switchgear in each sub-station is arranged in different chambers with a central operating passage between containing no "live" material. The "live" chambers are locked, and stringent regulations as to the possession of the keys ensure that no unauthorised person can obtain access; in no case is one man allowed to enter alone. The total capacity of the transformers in operation, including generator transformers and coupling transformers, is unusually large, amounting at the present

time to 450,000 K.V.A.; but this will be increased to 508,600 K.V.A. when the transformers delivered and on order are brought into commission.

The company realise the importance of welfare work and its influence on the conditions of the life of the staff. They give a generous support to recreation and sport, and facilitate in every way the promotion of social intercourse among all classes of the employes.

Some 60 residences and quarters have been built by the company at the various power stations, and at each station a boarding house and recreation rooms are provided. Generally speaking, the conditions of life compare very favourably with those of an engineer on the mines. A fleet of 14 motor-cars is maintained in constant service for the use of those officers and engineers of the company whose duties necessitate visiting the different parts of the system. A special department handles the entire transport of materials, and employs constantly two motor-lorries and 50 mules and horses.

FIG. 23.—DISTRIBUTION STATION AT BANTJES FED FROM 40,000-VOLT OVERHEAD LINE.

At some early date the system will also be sectionalised in order to reduce the rush of power on short-circuit, and in doing so reactances of relatively large value can be inserted between sections in those cases where it is not economical to separate adjacent sections permanently.

This problem of switchgear for dealing with enormous rushes of power has proved one of the most difficult that has been encountered so far on the Rand and also in America. It has not yet been finally solved, nor have switches been standardised which are capable of dealing unassisted with these exceptionally severe service conditions. These remarks on switchgear apply not only to the central stations, but also to the distribution stations, and in a less degree to the consumers' sub-stations.

The electrical supply at 2,000 volts and 550 volts to the consumers' premises is effected from step-down transformer stations, which are built by the consumers, but are equipped with switchgear and transformers by the power company (fig. 22). There are 60 of these consumers' sub-stations connected to the system, and their individual capacity varies from 10,000 K.V.A. to 2,000 K.V.A., the normal size being 5,000 K.V.A.

FIG. 24.—SUB STATION FED WITH UNDERGROUND MAINS.

[Further extracts from the paper will be found under "Proceedings of Institutions," page 538.]

## NOTES.

(Continued from page 518.)

**Institution and Lecture Notes.**—**CONCRETE INSTITUTE.**—On Thursday, March 13th, a paper was read by Mr. H. C. Johnson, on "The Strength of Cement; Results of Tests on 15 different Brands used in Paste, Mortar and Concrete."

**INSTITUTION OF ELECTRICAL ENGINEERS (WESTERN SECTION).**—The annual meeting of the Section was held on March 10th, at the South Wales Engineers' Institute, Cardiff. Mr. W. A. Chamen presiding. The chairman reviewed at length the work carried out by the Section since its inauguration in March last year, and expressed gratification at the increase in the roll of membership. He congratulated the Section upon its new chairman (Mr. H. Faraday Proctor), and its vice-chairman (Mr. D. E. Roberts, Cardiff). The chairman announced that Mr. Arthur Ellis, Cardiff, had had to resign his seat. The following were elected on the Committee:—Messrs. H. D. Munro, A. J. Newman, E. G. Okell, A. B. Randall, Prof. D. Robertson, W. A. Scott, F. Tremain. After the general meeting, a discussion on Mr. Sydney F. Walker's paper on the use of "High-tension Continuous Current on the Thury System in Mines," was held. Owing to the absence of the author through ill-health, the secretary (Mr. Sidney H. Haslam) read an abstract on his behalf, and after further remarks from the chairman, the discussion was adjourned until a special meeting to be held on April 14th, in Cardiff.

(**YORKSHIRE SECTION.**)—On Wednesday, an informal paper by Mr. Thos. Roles on "Electric Heating and Cooking" was read at Sheffield. A discussion followed.

**ROYAL INSTITUTION.**—The following arrangements are announced:—

*Fridays.*—

April 4th, at 9 p.m.—"The Spectroscope in Organic Chemistry," by Dr. J. J. Dobbie, F.R.S.

April 18th, at 9 p.m.—"Applications of Polarised Light (with experiments)," by Dr. T. Martin Lowry, F.R.S.

May 23rd, at 9 p.m.—"The Secret of the Permanent Magnet," by Prof. S. P. Thompson, F.R.S.

June 6th, at 9 p.m.—"Reflection and Refraction of Light as Concealing and Revealing Factors in Sub-Aquatic Life," by Dr. Francis Ward.

*Thursday Afternoon Lectures.*

May 22nd and 29th and June 5th, at 3 o'clock.—Three lectures by Prof. W. J. Pope, F.R.S., on "Recent Chemical Advances: (1) Molecular Architecture; (2) Chemistry in Space; (3) The Structure of Crystals"—experimentally illustrated.

*Saturday Lectures.*

May 10th and 17th.—Two lectures by Mr. H. A. Humphrey on "Humphrey Internal-Combustion Pump."

May 24th, 31st, and June 7th.—Three "Tyndall" lectures by Prof. E. Rutherford on "Radioactivity": (1) The Alpha Rays and their Connection with the Transformations; (2) The Origin of the Beta and Gamma Rays and the Connection Between Them; (3) The Radio-Active State of the Earth and Atmosphere.

**Electric Stoves for Canada.**—H.M. Trade Commissioner for Canada reports that a firm in Winnipeg is desirous of getting into communication with United Kingdom manufacturers of electric stoves who may wish to do business in Winnipeg and the surrounding districts.—*Board of Trade Journal.*

**New Hydro-Electric Works in Italy.**—Several important schemes are proposed to be carried out in the near future. In the first place, a Government concession is shortly to be granted to the Società per le Forze Idrauliche della Sila, which is an investigation company formed by the Banca Commerciale, the Italian Southern Railway, the Società Meridionale di Elettricità, and the Société Franco-Suisse of Geneva. The concession relates to the construction of dams and hydro-electric works in the Sila mountain range, where there are heavy rainfalls, followed by periods of drought, so that the water falls very irregularly. It is proposed to construct four dams eventually, of which two are to be built at first, and the total power available is estimated at 150,000 H.P. As, however, no demand exists for such a large amount of power in this thinly populated district, which has few industries, the company intends first to proceed with plant of 50,000 H.P., and the energy will be used partly for the local production of carbide of calcium and partly for distribution over Calabria, Basilicata, and a portion of Apulia, by means of a network about 200 miles in length. The capital required for this provisional scheme ranges from £1,600,000 to £2,000,000, and it will be raised by the four promoting companies previously mentioned. A feature of the scheme is that by the adoption of a suitably arranged hydraulic system it will be possible to protect the districts at the foot of the mountain from drought on the one hand, and inundations on the other. A second project refers to Sardinia, where a hydro-electric proposal is also associated with an improvement in the agricultural land. It is intended to dam the River Tirso, and a yield of 15,000 H.P. is expected. The power is to be utilised in the local mines, and the water will be also used for the purposes of irrigation. The expenditure will be defrayed partly by the State and partly by other interests. A third scheme is that of the Società Ligure Toscana di Elettricità, of Leghorn, which is erecting a new power station of 15,000 H.P. on the Serchio River, in the Ligurian Apennines. The supply will be

extended to Pistola and Florence, and the cost of the new station is to be provided for by raising the company's capital from £450,000 to £640,000.

**The Siemens Smoker.**—The King's Hall at the Holborn Restaurant was well filled on Wednesday, March 19th, on the occasion of the Siemens smoking concert to which we made preliminary reference in our issue of February 28th. Mr. Alexander Siemens was in the chair and gave words of welcome to the very large number of friends of the Siemens companies who were privileged to enjoy the excellent entertainment and to partake of the hospitality which had been prepared. The artistes were as follows: Miss Annie Bartle, soprano; Miss Olive Fox, comedienne at the piano; Mr. Ivor Walters, tenor; Mr. Thomas Howell, baritone; Mr. Olly Oakley, banjoist; Mr. Bromley Carter, humorist; Mr. Will Edwards, humorist; Mr. Ernest Hastings, musical sketches; Mr. Jock Walker, Scotch humorist. Mr. Mansell Stevens was accompanist, and Mr. George Lakeman acted as musical director. Mr. Harry Gooding's Imperial Orchestra played a number of selections from 7.30 until 8 o'clock, and also during the interval. The event was declared by all to have been a huge success.

**Parliamentary.**—**ELECTRIC LIGHT PLANT CONTRACT.**—In the House of Commons, March 17th, Mr. Touche asked the representative of the First Commissioner of Works to state where the contract for the equipment of the British Legation in Peking with electric generating plant, ice-making plant and other things was placed, and if he would state the amount of the contract and whether it was given to a German firm. Mr. Benn replied that the contract in question was placed amongst British firms, with Messrs. Siemens Bros. & Co., Ltd., of Caxton House, Westminster. The amount of the contract was £11,572 10s.—Further questioned by Mr. Touche as to whether the hon. member was aware that Messrs. Siemens Bros. was a purely German firm, Mr. Benn said that on the contrary, the firm was a British one.

**SECOND READINGS.**—In the House of Commons on March 17th, the following were read a second time:—Chesterfield Corporation Railless Traction Bill, and Cleveland and Durham County Electric Power Bill.

**I.E.E. Students' Electric Dinner.**—The informal Electric Dinner held by the I.E.E. Students last Friday evening, in the West Room of Trinity House, was an unprecedented success. The attendance numbered nearly 60, the West Room being packed to its utmost capacity. Among the toasts may be mentioned those of "Electric Cooking" and "Point-Five Juice." The former was proposed in a very breezy speech by Mr. S. M. Hills (the author of a recent Students' Section paper on "Electrical Heating and Cooking Apparatus"), and Mr. C. H. Smith, of Marylebone, responded in a more technical vein. The latter was proposed by Mr. G. W. P. Page, and received a humorous response by Mr. J. Mould. Between the toasts Messrs. S. G. Killingback, R. E. Dickinson, W. V. Zolmer, and H. K. Whitehorn contributed items to the musical programme with much success. On the whole, the chairman, Mr. J. C. Rennie, is to be heartily congratulated upon the great success which attended the first All-Electric Dinner of the I.E.E. Students.

**South America.**—According to *La Electricidad*, of Buenos Ayres, activity in electric enterprise is very great in all that section of South America. The municipality of Anchorena, in the province of San Luis, has decided to establish an electric lighting service. The civic authorities of La Paz, in the province of Entre Rios, are similarly disposed, and the Comision de Fomento, of Carcarana, in the province of San Lorenzo, was considering tenders for the installation of an electric light and power service on March 8th, while in the province of Buenos Ayres the authorities of Pilar have begun the preliminaries for the introduction of the modern illuminant, and the installation at Trenque Lauquen is expected to be completed in the course of a month or two. A start has also been made with the installation at Pico. As will already have been seen from our "Contracts Open" column, in the Federal capital the Minas, Geologia and Hidrologia Department of the Ministry of Agriculture is inviting tenders for motors, cables, dynamos and accessories for a power installation. Furthermore, according to the same journal, Herr Mauro Herlitzka, of the firm of the same name, has returned to South America, having secured capital for new and important electrical schemes.

**Appointments Vacant.**—Meter tester-repairer (30s.), and switchboard attendant (25s.), for the Harrow Electric Light and Power Co., Ltd.; are lamp trimmer, jointer and meter fixer, for the Stoke-on-Trent Corporation; charge engineer for the Burgh Electricity Department, Paisley; mains superintendent for the Islington B.C. Electricity Department (£200). See our advertisement pages in this issue.

**Illuminating Engineering.**—An exhibition of the latest improvements in electric illumination and other devices was held in Newcastle-on-Tyne on 17th inst., having been organised by the BRITISH THOMSON-HOUSTON Co., of Rugby. The object of the show, as described by Mr. H. C. Wheat, the company's illuminating engineer, was to illustrate the fact that many existing installations are deficient and lacking in hygienic principles, and that a common failure to get better results is due to the fact that so few persons understand the proper method of utilising reflectors. Demonstrations were given to show the increased efficiency obtained by the proper use of reflectors. In the evening Mr. Wheat delivered a lecture on "Illuminating Engineering," which was illustrated by lantern slides.

**Inquiry.**—A correspondent inquires for the makers of a substitute for slate known as "Sindanyo Asbestos Wood."

**Annual Dinner.**—The fifth annual Staff Dinner of the South Metropolitan Electric Light and Power Co., Ltd., was held on 19th inst. at the Trafalgar Hotel, East Greenwich, the chair being taken by the managing director and engineer-in-chief, Mr. Henry W. Bowden. After the usual toasts of "The King" and "The Company" had been duly honoured, and the chairman had given a brief *resumé* of the year's work of the company, the evening was concluded with a social programme and whist drive.

**Fatality.**—A correspondent states that George Cochran, electrical engine-man, at Calderbank Colliery, Uddingston, who took great delight in having flowers and plants in his engine house, was setting a window box in position, when he fell over a stair-rail and was killed.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—There was quite a lengthy discussion at the Carlisle Town Council meeting, when the proposal to fix the salary of a successor to MR. S. T. ALLEN, the electrical engineer (who goes to Wolverhampton), at £500, he to be debarred from private practice and from taking pupils, was forward. There were two amendments moved by parties who thought the amount too large for a commencing salary, £350 and £400 being favoured. The original recommendation was a unanimous one on the part of the Electric Lighting Committee, but the Council meeting was markedly divided on the amendments, there being 10 in favour of £400 and 15 against. Eventually the recommendation was adopted. In the course of the discussion, high praise was given to Mr. Allen for the manner in which he had brought the undertaking from a non-paying to a paying condition by reason of his great business aptitude and engineering skill. The speaker said that had they been a private undertaking, they would not have let him go without offering him £1,000 per annum. His salary of £600 had only been a commencing one and he had been promised a long way beyond that figure. With the exception of the appointment of the Town Clerk, this was the most intricate appointment of the City.

The *Australian Mining Standard* says that MR. W. H. VINCENT, who has been electrical engineer in the works branch of the Home Affairs Department, Melbourne, at £350 a year, has been appointed chief electrical engineer to the Brisbane Electric Light Co., at £600 a year.

MR. E. G. BAKER, mains assistant at the Tynemouth undertaking, has been appointed to a similar position with the Motherwell Corporation.

The Stoke Newington B.C. has approved of the salary of MR. S. HANN, electrical engineer, being advanced by £20. Councillor Lavey said that the electricity department was increasing by leaps and bounds. Mr. Hann had saved the Council much money since it had dispensed with the services of the consulting engineer.

On the occasion of his departure to take up a position at Swansea, MR. J. A. SOMERVILLE, for five years on the staff of the Lewes and District Electric Supply Co., has been presented by his colleagues with a case of pipes.

A recommendation by the Electricity Committee of the Norwich T.C. to increase the salary of the city electrical engineer, MR. F. M. LONG, from £600 to £700 per annum, has been referred to the General Purposes Committee.

The Gloucester City Council has increased the salary of its electrical engineer, MR. F. H. CORSON, from £350 to £400 per annum, and granted him permission to take one pupil.

MR. J. A. MCKINNEY has left the Cleveland and Durham Electric Power, Ltd., to take up an appointment as relief shift engineer on the Kent Electric Power Co.

**Tramway Officials.**—MR. THOS. RIDYARD, for six years with the Manchester Corporation tramways department, has been appointed rolling stock superintendent to the Liverpool Corporation tramways at a commencing salary of £350 a year.

Amongst a large number of increases to Corporation officials at Manchester, sanctioned at a meeting of the City Council last week, were the following:—Tramways department.—MR. J. WOOD, financial superintendent, £475 to £500 (maximum); MR. J. T. OAKES, traffic superintendent, £450 to £475 (maximum £500); MR. F. A. MITCHESON, accountant, £375 to £400 (maximum); MR. G. R. BLACKBURN, rolling stock superintendent, £350 to £370 (maximum £400); MR. T. RIDYARD, car works manager, £250 to £270 (maximum £300); MR. R. BEATTIE, chief claims clerk, £325 to £350 (maximum); MR. T. G. KING, stores superintendent, £250 to £275 (maximum £300); MR. H. JACKSON, chief clerk, traffic department, £240 to £250 (maximum); MR. J. W. HEWITT, cashier, £225 to £245 (maximum £300); MR. W. GREY, chief clerk, general office, £220 to £235 (maximum £250); MR. C. H. PEPPER, assistant accountant, £205 to £220 (maximum £250). The following advances were made in the electricity department:—MR. L. H. MARLOW, installation inspector, £220 to £235; MR. F. R. RADCLIFFE, chief rental clerk, £215 to £225; MR. E. J. CONSTABLE, assistant resident engineer, city stations, £200 to £220; MR. L. R. LEE,

mains engineer, £450 to £475; MR. H. A. RATCLIFF, head of testing department, Polygon, £300 to £325; and MR. E. BOLTON, sub-stations engineer, £350 to £375.

The Keighley Town Council last week appointed MR. H. WEBBER, the borough electrical engineer, to be tramways manager, to date from October 15th last, at a salary of £100 a year. Great praise was expressed concerning Mr. Webber's work in the tramways department since his appointment as temporary manager last October. One member objected to the appointment on the ground that the result of Mr. Webber's occupying the dual position could not have a good result.

**General.**—The *American Electrical Review and Western Electrician* states that the Franklin Institute, Philadelphia, acting through its Committee on Science and the Arts, has recently awarded the Elliott Cresson gold medal, the highest honour in the gift of the Institute, to the following: C. P. STEINMETZ, Schenectady, in recognition of successful application of analytical method to the solution of numerous problems of first practical importance in the field of electrical engineering; EMILE BERLINER, Washington, in recognition of important contributions to telephony and to the science and art of sound-reproduction; ISHAM RANDOLPH, Chicago, in recognition of distinguished achievement in the field of civil engineering; JOHN WILLIAM STRUTT, Baron Rayleigh, in recognition of extended researches of signal importance in physical science; SIR WILLIAM RAMSAY, in recognition of numerous discoveries of far-reaching importance in the science of chemistry; EMIL FISCHER, Berlin, in recognition of numerous contributions of fundamental importance to the science of organic and biological chemistry.

The *Australian Mining Standard* for February 15th stated that MR. W. FITZPATRICK, chairman of the Victorian Railways Commissioners, was about to leave for Europe and America to study the newest electrical railway systems, giving special attention to points bearing on that part of the electrification of the Melbourne railways that has not yet been authorised by Parliament—the new electrical signalling apparatus for ensuring the proper control of the electric train service. Mr. Fitzpatrick will probably be away from the State for about five months. The Commissioners have also decided to send MR. E. BLAZEY, the superintendent of goods train service, and MR. F. C. CALCUTT, chief engineer of signals, on a tour of inspection relative to electrification of railways, the main point of their inquiries being the latest and most effective systems of signalling. "They will leave on March 11th, and will visit England, France and America, Mr. Fitzpatrick leaving on April 8th."

Our American namesake says it is announced that the Edison Electric Illuminating Co., of Boston, has arranged to retain the services of MR. ARTHUR WRIGHT, of London, in a general advisory capacity.

MR. ANTHONY G. LYSTER has been taken into partnership with Sir J. Wolfe Barry, Mr. G. E. Wilson Crotwell and Mr. K. A. Wolfe Barry as Sir John Wolfe Barry & Partners, 2, Queen Anne's Gate, S.W.

At Bradford Parish Church on Thursday, last week, MR. JOE DYSEN, principal of the firm of Messrs. J. Dyson & Co., electrical engineers, Bradford, was married to Miss Winifred Muff, youngest daughter of Mr. John Muff, the chairman of the Bradford Board of Guardians.

At the Star Hotel, Cudworth, Yorks., last week, a presentation of a marble clock and ornaments, appropriately inscribed, was made to MR. WM. WALKER, who is leaving the post of electrician at the Grimethorpe Colliery, Cudworth, to take up a position at Pendlebury Collieries, near Manchester. A presentation of a silver breakfast cruet was made to Mrs. Walker. A pleasant musical and social evening was spent.

MR. E. H. FIELD, of the staff of Messrs. Crompton & Co., Ltd., Arc Works, Chelmsford, has been presented, on his marriage, with a marble clock by the members of the staff at the works.

MESSRS. HEAP & DIGBY announce that they have removed from 28, Victoria Street, Westminster, S.W., to 48, Westminster Palace Gardens, Victoria Street, S.W.

## CITY NOTES.

### British Insulated and Helsby Cables, Ltd.

PRESIDING over the annual meeting of this company, which was held at Liverpool on March 17th, DR. E. K. MUSPRATT stated that the profit for the year amounted to £218,394, compared with £188,258 for the previous year, showing an increase of £30,136. The result was most satisfactory, particularly in view of the fact that during the year the company's operations were considerably hampered by the coal strike. During the previous year £44,416 was expended on increased plant and machinery, and the results had amply justified the course taken. The sale of the Liverpool works to the Automatic Telephone Co. had been completed, and the holding they now had in that company was likely to prove a valuable asset in the future. It was expected now that the Government had taken over the telephone system of the country, that a considerable demand would arise for the extension of telephone work generally, and they could with confidence look forward to getting a fair share of that work. With

regard to the profit and loss account, when they added the balance brought forward from 1911, they had available for all purposes £282,015, which had been dealt with as shown in the report. The balance available for distribution was £101,210. The directors recommended a further dividend of 6s. per share, making, with the interim dividend already paid, a total distribution for the year of 10 per cent., leaving a balance to carry forward of £71,230, which was an increase on last year's "carry forward" of £10,580. The sum of £5,000 had again been placed to the debenture stock redemption fund, and this could be looked upon as an addition to ordinary reserve. On referring to the balance-sheet it would be seen that after crediting the amount received from the sale of plant at the Liverpool works, and debiting the amounts expended during the year at their Prescott and Helsby factories, the amount now stood at £619,489, compared with £611,876 last year. In this connection the directors were following the policy of judiciously extending the company's manufacturing plant in accordance with the demand, and the directors thought that returned the best profit obtainable. In last year's balance-sheet the amount against the item of patents and goodwill stood at £71,500. The directors had decided to further reduce this amount by taking from profit and loss £36,500, leaving the amount standing in the balance-sheet under this heading at £35,000. At one time patents and goodwill stood at £251,672. If business continued good, it was the directors' wish to extinguish this item altogether. The value of stock and work in progress had increased by £65,838. This was partly due to the increased price of raw materials as well as to the increased volume of manufactures in progress. The sum under the head of sundry debtors had been increased by £106,148 for similar reasons. With regard to investments, this account, after writing off £8,500, now stood at £614,077, as against £552,193 last year. The position had, however, improved during the past year, owing to the fact that though they had obtained £120,000 ordinary £1 shares in the Automatic Telephone Co., their investment account had only increased during the past 12 months by £61,881. With regard to the Midland Electric Corporation for Power Distribution, Ltd., in which the company had a very substantial interest, a further marked improvement had taken place, the net revenue account for the past year, after paying debenture interest, having increased from £2,500 to £12,813. The present issue of Midland Electric Corporation debentures would fall due in June next, and it was proposed to re-issue these, together with a further amount, so as to provide a substantial sum for future extensions of that company's operations, necessitated by the growing demands for electric energy in that district. Their company (the British Insulated) originally guaranteed the present issue of the Midland Co.'s debentures as to capital and interest, and it was proposed by the directors, in order to facilitate the present issue and to obtain as low a rate of interest as possible, that the company continue the same guarantee with regard to the new issue. As, however, the Midland Co.'s profits had been continually improving, and were sufficient to cover the interest on the whole of the proposed increase of new debentures, it was not contemplated that this further guarantee would, in effect, cost the company anything. With regard to the Electric Supply Co., of Victoria, the other company in which they were particularly interested, he was pleased to report a further considerable improvement in the position. The British Insulated Co. had credits at various banks, principally abroad, of over £14,000, as against an overdraft on their own bankers at home of over £73,000.

The report and accounts were adopted, and a resolution authorising the payment of the dividend was passed.

Mr. J. Carlton Scott and Mr. J. S. Harwood Banner were re-elected to the board.

**Montana Power Co.**—Quarterly dividends of 1 per cent. on the common stock and of 1½ per cent. on the preferred stock have been declared.

**Consolidated Cities Light, Power and Traction Co.**—A first quarterly dividend of ½ per cent. on the common stock is announced.

**Tramways and Light Railways Estates Co., Ltd.**—The total revenue for 1912 was £735. A dividend of 2½ per cent. is paid, and £262 carried forward.

**Prospectus.**—*Mississippi River Power Co.*—The list is to close on March 27th in an offer of \$3,000,000 first mortgage 5 per cent. 40-year gold bonds at \$91 per bond of \$500.

**Shawinigan Water and Power Co.**—Dividend 1½ per cent. for the quarter ending March 31st on the Common stock.

**Great Northern Telegraph Co., Ltd., of Denmark.**—At the general meeting, which will be held at Copenhagen on April 26th, the board will propose to pay a total dividend and bonus of 20 per cent. for the year 1912, including the 5 per cent. already paid, and to transfer to the reserve and pension funds the usual amounts besides an extraordinary endowment once for all to the last-mentioned fund.

**Jarrow and District Electric Traction Co., Ltd.**—The report for 1912, as abstracted in a financial daily, states that the accounts show an available sum, after providing for debenture interest and placing £700 to renewals account, of £2,867. A dividend of 2 per cent. is to be paid, £1,025 put to depreciation and reserve account, and £843 carried forward.

**Mexico Tramways Co.**—The directors have declared a dividend of 1½ per cent.

### Salisbury Electric Light and Supply Co., Ltd.

The directors' report for 1912 which was adopted at the meeting held on March 11th, says that the generating plant has been sufficient to meet the output, and the whole of the plant is in thorough working order and capable of dealing with a considerably increased demand. The profit on the year's working, including £419 brought forward, amounts to £6,796, and after paying £1,290 interest on debentures and an interim dividend at the rate of 1 per cent. for the half-year, amounting to £709, there remains a balance of £4,804. The directors recommend that a further dividend at the rate of 8 per cent. for the half-year be paid, making, with the interim dividend, 6 per cent. for the year, and that £2,400 be carried to reserve, leaving £1,004 to be carried forward.

Mr. W. M. HAMMICK presided at the annual meeting, and in moving the adoption of the report, he said that not only were they paying the same dividend as last year, but they were carrying forward £1,004, instead of £449. The auditors drew attention to the insufficiency of the reserve fund, and they were catching up yearly to the point that the auditors thought should be attained in this respect. The coal contract was only 1s. 7d. a ton more than in the previous year, but the consumption had been reduced, the bill being only £65 more. The water supply had been better, but the floods had not assisted them at all, as when the river was in flood they did not get the value of their turbine, as they did when the water was moderately high. The sale of current was very good. The working expenses of 1911 and 1912 were practically the same.

Mr. GRIPPER seconded, and the report was adopted.

Thanks were voted to the staff, special mention being made to the services of Mr. A. R. Randall, the engineer and manager, Mr. Godwin, and Mr. Bamkin.

**Newmarket Electric Light Co., Ltd.**—The directors' report for 1912 states that the equivalent of 772 33-watt lamps have been connected to the mains, making the total 27,811 lamps. Applications for a further 430 lamps have been received this year. The whole of the works have been maintained in perfect working order. The profit, added to £10 brought forward, amounts to £2,569, which, after providing for debenture and other interest, £715, leaves a balance of £1,824. The directors recommend a dividend of 4 per cent.; that £700 be carried to reserve for renewal of plant, and that the balance be carried forward. The directors record the death last year of the chairman, Mr. J. Garrod. Mr. F. E. Gripper was elected chairman in his place for the remainder of the year, and Mr. F. W. Cobb, of Cheveley, was elected a director in place of the late Mr. Garrod. The meeting was held on March 17th.

**Clyde Valley Electrical Power Co.**—The half-yearly meeting was held in Glasgow, Dr. J. MacKenzie presiding. The chairman moved the adoption of the accounts, which (according to the *Scotsman*), showed a net profit of £24,718 for the six months ending December, 1912, together with £3,647 brought forward, making a disposable balance of £28,365. He stated that the board had decided to transfer the sum of £12,500 to contingency fund for depreciation, &c., bringing this fund up to the total of £56,600, and to carry forward £15,865. The company's business continued to show steady progress, and the number of new contracts recently closed and in course of negotiation justified the expectation that this progress will be maintained. Contracts for supply showed an increase of 5,000 h.p. during the half-year. The report and accounts were adopted. The meeting authorised the issue of the remaining £300,000 of capital in the form of 30,000 6 per cent. cumulative preference shares of £10 each.

**Stock Exchange Notices.**—The Committee have ordered the undermentioned to be quoted in the Official List:—

British Columbia Telephone Co., Ltd.—10,000 6 per cent. cumulative preference shares of \$100 each, fully paid (Nos. 1 to 10,000).

Compania Hidro-Electrica de Tucuman.—£300,000 5 per cent. first mortgage debentures of \$100 each (Nos. 1 to 3,000).

**Wemyss and District Tramways Co., Ltd.**—The board have under consideration doubling certain portions of the track with the view of expediting the service to Kirkcaldy. In their annual report the directors note that the profits for the year, together with the balance brought forward, after providing interest on debenture stock, and writing £1,000 off account for betterment of the undertaking, amounts to £3,643. The dividends are 6 per cent. on the preference and two dividends of 3 per cent. on the ordinary shares.

**Gandy Belt Manufacturing Co., Ltd.**—The profit for 1912 was £18,273, plus £1,542 brought forward. The dividend for the year is 10 per cent., and £1,584 is carried forward.

**Fairbairn, Lawson, Combe, Barbour, Ltd.**—The profit for 1912 was £33,269, as compared with £58,075 for 1911. The dividend for the year is 5 per cent., as compared with 7½ per cent. for 1911; £22,745 is carried forward, as compared with £47,136.

**Isle of Wight Electric Light and Power Co., Ltd.**—The net profits for 1912, including £2,115 brought forward, was £16,286. The *Financier* states that a dividend of 2 per cent. on the ordinary shares is proposed, adding £3,500 to renewals and £1,000 to the reserve, carrying forward £2,800.

**Mexican Light and Power Co., Ltd.**—Dividend 1 per cent. on the ordinary shares, and 3½ per cent. for the six months ended April 30th on the preference shares.

### Guildford Electricity Supply Co., Ltd.

THE directors' report for 1912 again records very satisfactory progress, the gross receipts being £10,069, as compared with £8,679 for 1911, showing an increased revenue of £1,389. There is a balance on the revenue account of £3,705 (after crediting depreciation fund account with £1,260), as compared with a balance of £3,303 (after crediting depreciation fund account with £1,000) on the revenue account for 1911. After making due provision for debenture interest, dividend on preference shares, &c., and the placing of £500 to the credit of reserve fund account, the net revenue account shows a balance of £1,075 for distribution. Out of this sum the directors recommend the payment of a dividend at the rate of 5 per cent., less tax, for the past year, on the ordinary share capital which will absorb £731, thereby leaving a balance of £344 to be carried forward. The following table shows the progress of the business:—

Year.	No. of connections.	Total revenue.	Total costs.	Gross profit.
1909	744	£7,490	£3,198	£4,292
1910	807	7,885	3,441	4,444
1911	874	8,679	4,876	4,303
1912	929	10,069	5,114	4,955

The above progress has made it necessary to enlarge the company's works, and for this purpose the freehold land and buildings situate between the company's works and the premises of Messrs. Dennis Bros., Ltd., have been purchased. A new engine room is now in course of erection, which will accommodate a further 1,100 H.P. of generating plant, of which 550 H.P. is now being installed.

	1912.	1911.
Units sold—Lighting	331,990	295,990
Power and heating	437,896	256,515
Total	769,886	552,445
H.P. of motors connected	753	553
Total number of connections	929	874

### County of Durham Electrical Power Distribution Co., Ltd.

THE annual general meeting was held in Newcastle-on-Tyne on 19th inst., Dr. J. T. Merz presiding.

The CHAIRMAN, in moving the adoption of the report (see ELEC. REV., p. 445), said the progress of the company had been very slow in the past year, very largely due to the interruptions of trade that took place. The increase of connections with the company's system had been 11,000 H.P., in respect to which the current year ought to reap the benefit. It was satisfactory to know that the increase had been more than in former years. The profit was only £7,000 more than in the preceding year, but they had written £813 off their manufacturing plant, and £850 off their connections for house services, and their lighting load had gone up considerably. The capital expenditure had been only trifling, £2,277; but this was due to the fact that the Durham Co. had sold to the Newcastle-on-Tyne Supply Co. £45,000 worth of mains. The company was not in a position to raise money easily, and therefore it depended largely upon the financing of its sister Supply Co., the company which took it over and promoted it seven or eight years ago; so the £45,000 raised in the way mentioned had been spent in the extension of the business in other directions. A Birmingham shareholder had written a letter expressing dissatisfaction with the progress of the company. The shareholder wrote, in effect, that it seemed clear either that the cost of the original installation was needlessly extravagant, or that the rates at which they supplied current were entirely unprofitable, or that their organisation for increasing the sale of current was defective; also that it was difficult to avoid the impression that all three were the cause, and he suggested that it was time either to reorganise the board of management, or the capital, or both. Well, he was glad to answer those questions. In regard to the prices charged by the company, they were slightly more than the prices charged by the Newcastle Supply Co. and the Newcastle Co. was supposed to be the most successful company of its kind in the kingdom, and he might perhaps, add that as a power company it was the only company that had met with some considerable success. Therefore it could not be a matter of prices. As to the management, the company was entirely in the hands of the staff and directors of the Newcastle Co., with one exception, and that was a gentleman who was capable of criticising and watching the affairs of the company, so there could be no complaint as to the management of the company. As to the company being overburdened with capital, he might give a little explanation of the real position. Their company was originally started 12 years ago, and it was carried on for some years before the Newcastle Supply took it over and bought the shares, or, rather, retained some and offered the others to the public, together with a larger amount of capital that was issued. At that time there was a great boom in electricity concerns, and many promoters and irresponsible persons rushed into the field and promised to get electric stations and electric supply organisations in order to supply customers very cheaply. The result was that the company started in that district without any statutory powers whatever, merely through private connections, and supplied current at unnecessarily low prices. These prices were certainly 25 per cent. lower than they should have been with the result that the company was prevented from entering into contracts for any large amount of electricity at any high figures. Had those prices been only 25 per cent. more for the

first five or six years their company would have made a considerable sum of money. In addition to this the company had been saddled with a considerable amount of unnecessary capital. That capital had been spent on plant that had become obsolete, and had to be renewed. Again, the company included in its area several communities such as Sunderland and South Shields, which, out of pure sentiment, had chosen to supply their own electricity at a much greater cost than they could have got it from the company. That, however, could not now be helped. What they were now aiming at was to try and increase the load, and that could only be done by progressing on the lines which they had followed so far. He thought they would see that all this criticism as to overloading of capital, or low prices, or failure of the management, could be discredited. The management was the same as that of the Newcastle company, a successful company, the capital could not be altered, and the prices could not be raised. The only way of getting out of the difficulty was to increase their load, and this they were trying to do.

SIR LINDSAY WOOD seconded the report, which was carried, and the retiring directors were re-elected.

### Newcastle-on-Tyne Electric Supply Co., Ltd.

THE annual meeting was held in Newcastle on 19th inst., Dr. J. T. Merz presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 440), said that the connections to the company's system at the end of the year amounted to 174,327 H.P., showing the large increase of 22,700 H.P. over the previous year. The capital expended in the 12 months had been £167,081. In former years he had stated that the amount of capital spent in proportion to horse-power connected would go down, but that statement was not quite correct so far as last year was concerned. If they took the capital expended, £167,000, they would find that it represented about 7 guineas per additional H.P. connected. In former years he had said the latter sum might come down to 5 guineas or £5. This required some explanation. The capital they were now spending, and had spent for some years, and notably last year, was not spent entirely in reaching consumers. The company had now a new department in its business, of which he had spoken on former occasions, but it had been very largely developed in the course of last year, and would be still more largely developed in the future. This was receiving supplies of electrical current from waste-heat stations situated near the coal mines themselves. This was a development of what had been called the waste-heat industry. Electrical current was now generated by the company in connection with coalowners at the mines, and especially where coke ovens existed. This waste heat and gas could not be used except on the spot, and, therefore, instead of bringing their fuel in that shape to their works, they went with their works to the fuel. They had now two classes of industrial concerns connected with them. First, there was the larger class of consumers who used electrical current for their own purposes, and, in the second place, they had those who produced waste heat and gas, which the company received on the spot and converted into electricity, usually in partnership with the coalowners. Therefore, the capital they now spent on mains was not only the capital spent on reaching consumers, but also capital spent upon mains by which they could conduct electricity made in various outlying places, where, to a large extent, it was of no use, into the centre of their distributing system. These mains belonged to the company, and were a valuable asset. They were a link for bringing electricity from outlying places, and for supplying consumers on the way. For these mains they had received a considerable sum—£22,500—which was really a repayment of profit. If they had not got that sum, they would have had to recoup themselves probably in the terms which they would have charged. This £22,500 was not brought into the profit and loss account, and did not ostensibly appear in the balance-sheet. Dr. Merz referred the shareholders to statement No. 8 in the accounts—investments—and said those investments in former years stood at a higher figure than at present—£73,000. If they compared this amount with that of last year, they would find that the figure was now £22,500 less, this sum having been taken off and utilised as an amount to discount the value of that asset, which had been written down by £22,500. If they took this figure from the amount spent in reaching new consumers, they would find that the capital spent per horse-power was £5 7s. 3d., which was coming near the figure he had mentioned in former years. The business of the company, continued Dr. Merz, had been materially interfered with and hampered by the coal strike. It was impossible to say how much the coal strike cost the company, partly in reduced output, in the cancellation of coal contracts, having to pay more for their coal, also in purchasing coal in the market at high prices in order to prevent any chance of stoppage, and lastly, in the deterioration of the large stock of coal which they held. The amount written off the coal stock was £1,419. That was in the shape of deterioration, but was not mentioned as deterioration in the report. The net profit of the company had increased by £2,600. They had now 22 motor-cars which stood on the books at £1,300, or less than £200 per car. They had spent £723 in replenishing these cars, and that sum had come out of revenue. The sum of £2,845 had been spent in making connections to dwelling houses, this being, of course, new business. Dr. Merz mentioned that, in regard to waste heat, the company benefited to the extent of an equivalent of about 70,000 tons of coal, which, he said, was a very large item. They might want to know how they got the £167,000 which they had spent out of capital. First of all, they took £28,400 out of the cash they had in hand, then they recalled loans which were standing out, and repaid those

owing to them, and the difference gave them £36,754. They afterwards borrowed from the bank £100,580, making up the total to £165,751. Of that sum, £3,500 had been spent on stations and the mains of the company, and £45,000 was paid over to the Durham company in purchase of mains in their district. These mains were laid down by the Durham company, and paid for by it, but the Durham company allowed the Newcastle company to use the mains, and they formed a large portion of the mains by which the latter company got the waste heat current. They could be used for supplying electricity and for bringing electricity from other places. These mains formed a link in the company's circle, and it was better that the Newcastle company should own the whole circle. The Durham company paid them rent, which gave the Newcastle company a return on the capital. The Durham company was the largest customer of the Newcastle company, which was anxious that the Durham company should increase its business as much as possible.

SIR LINDSAY WOOD, Bart., seconded the adoption of the report, which was carried.

Dividends at the rate of 5 per cent. on the preference shares and at the rate of 5 per cent. on the ordinary shares, were declared.

The CHAIRMAN then drew attention to the question of directors' fees. He said that the subject had not been dealt with for 11 years, when the dimensions of the company were less than one-fifth what they now were. Three years ago he had mentioned that the matter would be brought up at the next meeting, but when that meeting came the question was postponed for various reasons.

MR. N. H. MARTIN moved that the remuneration of the directors for the past year be £1,500, and that that sum be their annual remuneration until it is altered by a general meeting.

### South London Electric Supply Corporation, Ltd.

THE annual meeting was held on March 18th at the Cannon Street Hotel, E.C., Mr. J. Atherton presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 411), said he thought they would agree that the results of the year's working had been very satisfactory, the lamps added to the circuits during the year being the equivalent of 22,585 35-watt lamps; this was the largest increase they had had since the year 1908. The total lamp connections at the end of the year amounted to 273,306 (since increased to over 286,000), and he was glad to say that nearly 40 per cent. of this increase was due to new lighting connections. As he pointed out last year, they then hoped that the influence of the metal-filament lamp in depressing their lighting revenue had been overcome, and he was pleased to say that their expectation had been realised. The power side of the company's business had also made very satisfactory progress during the year, and nearly 650 H.P. of additional motors had been connected to the mains, bringing the total up to 4,600 H.P., and the units sold for power were again practically equal to the units sold for lighting. The result of these additional connections was an increase in the units sold of 520,631, and the total units sold for the year amounted to 5,000,118, as compared with 1,479,487 in the previous year, or an increase of 116 per cent., and the revenue obtained had been increased by nearly £4,000. In regard to the costs of production, these had increased by £1,587, and the gross profit had risen by £2,321, as against a rise in the previous year of £1,774. The largest increase in expenditure had been for coal, due to the abnormal price which this was now commanding, and which constituted a heavy tax upon all industry. Adding together all the items of expenditure under the revenue account, the sum total was £20,859, which worked out at the very satisfactory figure of 1d. per unit sold, as compared with 1'03d. in the previous year, this result being again one of the best obtained by any of the companies supplying electricity in the metropolis. Last year he told them that after very careful consideration they had decided to install a further 2,000-kw. turbine, and to change the system of generation from single-phase to two-phase, and they then hoped that this work would have been completed by the early part of last September. The coal strike and other labour troubles, however, completely upset their calculations, and they had to give their contractors an extension of time, and the plant was not completed until the latter part of November, so that although practically the whole of the capital expenditure for the new turbo-alternator, cables, switch-gear and other apparatus for the change over to the two-phase system was included in the capital account, it had not been productive of any revenue during the year. The capital expenditure during the year amounted to £17,312 principally incurred for the new turbine and the change over to the two-phase system. This change was made in the early part of the present year, and he was more than pleased to say that the resulting business was satisfactory. The new machinery was running well, and the change had been effected without the supply to any consumer being interrupted. Their sales department continued to grow apace, and as the accommodation in the offices at the works had become insufficient, they had decided to open central show-rooms in one of the main thoroughfares in their area of supply. The total amount available for distribution was £28,472, and out of this sum they had provided £6,000 for depreciation on plant and machinery. The item of £2,574 for renewals represented principally the value of the first generating set installed in the works, and this had been disposed of to make room for the new 2,000-kw. turbo-alternator. After providing for debenture interest and other interest accrued, &c., there remained to be carried to the general balance-sheet the sum of £15,183, out of which the board recommended a dividend on the ordinary shares at the rate of 5½ per cent. per annum, an increase of one-half per cent. over the preceding

year and in view of the enhanced price of coal and other difficulties with which they had to contend during the year, they thought the shareholders would agree that this was a very satisfactory result.

MR. R. A. HUSK, a shareholder, seconded the motion.

MR. HOOT congratulated the shareholders upon the satisfactory progress which the company had made since its inception. Now that the board had adopted the two-phase system, they could, he said, enter more widely into the field of competing for power on the very best terms, and he believed that the company was only in its infancy in that respect. There were a great many large factories in the area which hitherto they had not been able to tackle, and they might safely leave the development in the hands of the directors and the capable manager, Mr. Sprunt.

The CHAIRMAN, in reply to questions, said the debenture issue was made at 99 per cent. As to an interim dividend, the board thought such a policy inadvisable at the present time.

The report was adopted.

### Evered & Co., Ltd.

THE directors report that the trading for 1912 resulted, after the provision of £1,110 for debenture interest and £176 for income-tax, in a net profit of £13,256, plus £2,090 brought forward, making £15,346 to be dealt with. They recommend a dividend of 5 per cent., free of income-tax (£8,537), put to writing off plant, £2,500, and propose to carry forward £4,309.

The increase in the turnover reported during the previous year has been continued, and has reached a total which has not been approached for some years past, enabling the whole of the works to be kept fully going during the past financial year. Stocks of raw material at the works have been taken on the same fixed basis as in former years, and, therefore, very considerably below cost or market value. All part-manufactured and finished stock has been brought into account at the figures obtaining in the beginning of the year, since when large advances in cost of manufacture have occurred, and in the opinion of the managing directors the actual value of the stock at to-day's market prices is distinctly in excess of the amount at which it appears in the balance-sheet. But, in view of the uncertain position of the metal market, such action appears to the board to be wise. Machinery and plant, in addition to the writing off above proposed, have been maintained and renewed, and are in fully efficient condition. The depreciation of buildings has been provided for by the lease redemption policies mentioned in the last report.

The meeting will be held at Drury Lane offices on Monday.

**Kettlewell Electricity Supply Co., Ltd.**—A meeting of the shareholders of this company, which has recently been formed in connection with one of the West Yorkshire village schemes for generating energy by means of local water power, was held last week, when it was reported that the scheme was making satisfactory progress, and the directors hoped to be able to declare a dividend in due course. Messrs. O. Robinson (chairman), J. H. Coates (vice-chairman), L. Gaunt, Walsh, J. Raw, W. L. Carradice, and T. Inman were elected directors, and Mr. W. P. Inman, secretary.

**Liverpool District Lighting Co., Ltd.**—Mr. Charles McLaren presided over the annual meeting of this company, and in proposing the adoption of the accounts, he stated that during the year the company had increased their sales of electricity by over 50,000 units, and had added 3,515 lamps to the supply system. The extra profit, however, had been nearly all taken up in the increased cost of fuel and labour, and the extra expense incurred during the coal strike. The company were now making a business of hiring electric heating and cooking apparatus, and it was expected that the increased revenue from this source would make the figures for 1913 even better than for the preceding year. The increase in consumers necessitated increased capital expenditure for laying mains, and more plant would be required during the coming winter to meet the increased demand. Mr. Holbrook Gaskell, who seconded, pointed out that for the first 2½ months of 1913 the company was progressing more rapidly than in 1912. The report was adopted.

**Hadfield's Steel Foundry Co., Ltd.**—At the annual meeting on 17th inst., Sir R. Hadfield said that he hoped we should have nothing like conscription in this country to interfere with industry. It would be a great mistake to have men withdrawn from productive employment. The *Times* reports that in reply to a shareholder, Sir Robert said that while Hadfields were not likely to try anything venturesome, "they were going to launch out a bit."

**Winnipeg Electric Railway Co.**—The report for 1912 states (says the *Times*) that the gross earnings were \$3,765,384, as compared with \$3,829,749. The net earnings were \$1,761,236, as compared with \$1,928,782. After providing for the percentage on earnings accrued the city and interest on bonds, the directors declared four quarterly dividends, amounting to \$720,000, leaving a surplus of \$174,463, which has been transferred to the credit of profit and loss account, making a total credit to that account at December 31st of \$2,091,236.

**Calcutta Electric Supply Corporation, Ltd.**—The number of units delivered to consumers during the four weeks ended February 24th, 1913, amounted to 790,198, compared with 658,948 units in the corresponding four weeks of 1912.

### British L. M. Ericsson Manufacturing Co., Ltd.

THE directors' report for the year ended December 31st, 1912, states that the net profit amounts to £18,563. The directors recommend that after payment of 6 per cent. to the preference shareholders, the balance of £13,941 be appropriated as follows:—Dividend of 8 per cent. (free of income-tax) to the ordinary shareholders, requiring £8,001, carrying forward £5,940.

The annual meeting was held on March 19th, at the Memorial Hall, Farringdon Street, E.C., MR. W. M. CROWE, chairman and managing director, presided, and in proposing the adoption of the above report, he said that although that was the tenth annual meeting of the company, it was the first time that the directors had had the pleasure of meeting with the shareholders. Formerly the company was a private one, held practically by two shareholders—the National Telephone Co., and Messrs. Ericsson, of Stockholm. Therefore, the annual meeting was more of a form than a reality. He thought they would agree with the directors that the result of the year's working had been exceedingly good, and particularly so was that the case when they remembered that in common with other manufacturing concerns they had had a good deal to contend with. Early last year they had a series of strikes, including the coal strike, and the price of raw material went up considerably, and wages also rose. Coal was a commodity that they used a great deal of, and they had to pay some 65 per cent. more for it last year than in 1911. Then they had been burdened with extra taxation. The National Insurance Act cost them many hundreds a year. Then, again, their chief customer in this country—the Postmaster-General—had not put through so many orders in 1912 as he did in 1911. It would be remembered that in 1911, he had in prospect the taking over of the business of the National Telephone Co., and he, therefore, put in hand enormous supplies of material, and that company and other telephone manufacturers in the country put as much work through during that year as they could, and, consequently, they made big profits. He was glad to say that 1913 had started well, and should matters go on as they were at present, they hoped to meet the shareholders this time next year with as good, if not better, results than they showed that day. One thing was certain, and that was that there was any amount of work to be done in this country in telephones. When they compared this country with other go-ahead countries, they found that we were very far behind in telephones. If they took representative towns in the United States of America and some of the countries of Europe and compared them with towns in this country, it was found that we had a long way to go before we were equal with those other countries. London, for instance, had a telephone for every 35 inhabitants. New York had one for every 12; Chicago one for every 9; Washington one for every 6. If they went to Stockholm they found there that they had a telephone for every 5 inhabitants, and in Copenhagen there was one for every 12. Turning to our own country, as he had said, London had one for every 35 inhabitants; Birmingham had one for every 72; Liverpool one for every 40; Manchester one for every 47, and the other towns were in a like state. It would, therefore, be seen that before England was on equal terms with the countries he had mentioned, telephone manufacturers would have a great deal of work put through their hands. He was glad to say that the Postmaster-General and the officials under him realised this state of affairs, and they were tackling the matter in a businesslike way. They hope, therefore, that before many years were over they would be equal with the most advanced countries in respect to telephones. One thing he regretted, and particularly for the sake of their own company, and that was that the Postmaster-General had decided to continue the policy of the National Telephone Co. in withdrawing the hand micro-telephone from use in this country. That was a small instrument with the receiver and the transmitter combined. While we were removing this instrument, other countries were installing it. France, for instance, within the past six months had made the hand micro-telephone the standard for the country, and their friends in Stockholm had given large orders for the instrument. Turning to the accounts it would be seen that no amount was put aside for reserves, but during the year the amount written off for depreciation was within a few pounds of £10,000. The directors considered that that amount was ample and even generous under that head, and he believed that the shareholders would agree with them. It was especially ample when it was known that during the partnership of Messrs. Ericsson and the National Telephone Co. depreciation was written off at a very high rate indeed. An agreement existed between those two concerns which provided that after depreciation was written off every penny was profit which would be divided, therefore there was no reason for the heading "reserves"—the depreciation was at such a high rate that it served the purpose of depreciation and reserve. It would be remembered that before the issue of the prospectus last year, a valuation was made of the assets at the Beeston factory, and they were put down at £116,786, and that was after sufficient allowance had been made for depreciation. Those assets stood in the books at the company at £86,674, so that there was a reserve of £30,000, which did not appear in the account. It was the intention of the directors immediately they found it convenient to do so, to build up a reserve, in addition to continuing the present rates of depreciation. It must also be remembered that the fixed assets, the machinery, power plant, &c., had been kept up to the highest standard of efficiency out of revenue. Again, although the company had a valuable goodwill, and had valuable patents, having a right to all the patents taken out by Messrs. Ericsson, of Stockholm,

no amount stood in the books for them. It would, therefore, be seen that the company had not a penny of water in its capital. Turning to the balance-sheet, it would be seen that the cash in hand amounted to £68,000, which was £18,000 more than would be required to pay off the whole debenture issue, and to that had to be added the value of the stocks, which gave them a total of £111,300, or more than enough to cover the whole preference issue, and that was without touching the fixed assets, amounting to £96,600. The stocks in hand were practically all made under firm orders, and were, therefore, as good as liquid cash. The other liquid asset, sundry debtors £26,000, was £7,700 more than was necessary to pay off sundry creditors, and the amount of bad debts during last year was only £20. The fixed assets had increased considerably since 1911, the reason being that during last year an addition was made to the factory in the shape of warehouses, stores, and a testing department. The amount carried forward was practically sufficient to pay the preference dividend for 1913, therefore, taking everything into account, he thought it would be agreed that the security of the shareholders and the debenture-holders, and the position of the company generally, were about as good as could be wished for.

MR. HAROLD SANDS seconded the motion, and the report was adopted.

### Hove Electric Lighting Co., Ltd.

THE annual meeting was held on March 19th at Salisbury House, E.C., Mr. Carleton F. Tufnell presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 442), said that the capital expenditure during the year had amounted to £1,300, the principal item being £889 for extension of mains. The gross revenue had increased from £24,840 to £25,220, and the expenditure from £10,383 to £10,590, the profit carried to net revenue being £14,630, as compared with £14,457 in 1911. That was a small increase, but it was satisfactory in that last year they had to announce a reduction of profits to the extent of nearly £1,000 in comparison with the then previous year. The units sold in 1912 amounted to 1,169,003, as compared with 1,139,328 in 1911—a very satisfactory increase. Taking into the account the balance brought forward from 1911, and deducting the dividends paid on the preference and ordinary shares and also making provision for debenture interest accrued, there remained a surplus of £9,283, and as the outcome of the year's working, they again recommended the payment of a dividend at the rate of 10 per cent. per annum, making 9 per cent. for the year. They would, perhaps, expect him to say something with reference to the notice received from the Hove Corporation of their intention to exercise the option of purchasing the company's undertaking. The notice stated that the purchase was to be by way of repayment of the legitimate capital expenditure of the company, which was one of the two alternatives open for selection by the Corporation. Immediately on receiving the notice the directors thought it was only right to inform the shareholders, and this they did by a circular letter on December 3rd last. The Hove Corporation had lodged a Bill in Parliament for the purpose of enabling them to raise the necessary money for the purchase, and it was a condition of the Bill that until the transfer was actually effected by the payment of the purchase money the company would carry on the undertaking for the benefit of the shareholders. They must all regret the contemplated purchase, as the business had been a satisfactory one from the very start. He would again like to compliment the staff, both in London and Hove, upon the efficiency of their work, and to assure them how thoroughly the directors appreciated their efforts.

COL. H. WOOD seconded the motion.

MR. SCRASE asked whether the board had formed any view as to what the ordinary shareholders were likely to receive as a result of the purchase of the company?

THE CHAIRMAN said that according to the terms of the notice the Hove Corporation would pay them the actual capital expenditure, which, up to the present time, was £176,279. Of course they could not tell what further capital expenditure might be necessary during the present year, nor could they tell what the accrued profits might be which would come back to the shareholders.

MR. F. R. REEVES, the managing director, remarked that in addition to the capital expenditure there was the investment reserve fund, which also belonged to the ordinary shareholders, and if they put those two amounts together and deducted the debentures, the debenture stock, and preference shares, which did not share in the surplus assets, they would be able to see pretty clearly what the result was likely to be. A great deal depended upon the view the Hove Corporation might take of the capital expenditure account. If they accepted the audited figures then they would know where they were, but they might dispute some of the items, which of course would bring an uncertain element into the figures.

THE CHAIRMAN said he might say that they did not anticipate that there would be any dispute over the matter at all.

The report was adopted.

**Empresas Electricas Asociadas.**—The directors have declared a dividend of 1½ per cent. for the last quarter of 1912.

**Electrical Distribution of Yorkshire, Ltd.**—An extraordinary meeting was held at Leeds on 18th inst. Mr. R. W. Wickham presided. The resolution already passed increasing the capital, was approved.

### Metropolitan Electric Supply Co., Ltd.

MR. W. HARRISON CHIFFS presided at this company's annual meeting on March 18th, at Winchester House, E.C.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 445), he said that the capital expenditure was this year £2,013,999, an increase of £111,000. Of this, £51,000 was what he might describe as a direct increase, and £62,800 was an indirect increase. The gross revenue for the year was £202,000, an increase of £19,500. The working expenses were £99,086, an increase of £11,000. After deducting the working expenses there was left to the credit of revenue account, before depreciation, £103,096. They had thought right to put £20,000 to depreciation, and that left £83,096. As regards the increase in the capital account for the year, this figure was the large amount of £111,101, but the amount of cash actually spent was only £51,298. That was expended, to a large extent, for the extension and consolidation of their western area. The difference of the two amounts arose from the amount then standing in the books, which represented the purchase of the Acton undertaking. What they did was to take over that undertaking for a period of 42 years, including all buildings, mains, plant, &c.—in fact, the whole thing, lock, stock and barrel. In exchange for the undertaking, they took over the obligation of the debt and sinking fund for the amount spent by the District Council, less that which they had already repaid, which practically represented the depreciation on the property during the years they held it. Therefore they became liable to pay interest and sinking fund on the unredeemed part of their loan, this loan amounting to £62,863. That item, being a capital charge, had to be shown in the capital account in a separate column. Turning to the revenue account, they would see that they had earned, roughly, an extra £19,000 (the largest increase in one year since parting with Marylebone), at only a working cost of £11,000, leaving £8,000 as a net increase. He trusted they would consider this satisfactory, especially when they remembered that in 1911 the increase of receipts was practically swallowed up by corresponding increase in cost. They could rest assured that the board, ably assisted by their officers, went very carefully into every item of expenditure. There were some items, however, such as coal and rates, over which they had no control, and these two items had both shown a serious increase in their expenses last year. They regarded the future of the company very hopefully, for although, during the current year, there must be a considerable increase in the cost of coal, they also thought that there would be a substantial increase in the revenue. He would again call their attention to the satisfactory condition of the reserve and depreciation fund, to which they had added £20,000, compared with an addition of £15,000 two years ago, and £17,000 last year. It now stood at the substantial total of nearly £300,000. This had been built up for the most part out of revenue, and had been gradually accumulating since the early days of the business. They must remember in considering this fund that all their plant was kept up in the highest state of working efficiency out of revenue, and further, that in their own case they had less than an average depreciation to provide for, because a large amount of the old and depreciated plant was entirely renewed out of the funds obtained from the compensation money paid by the London County Council in taking over their old Sardinia Street works, and nothing was at that time withdrawn from the depreciation fund. In considering the amount of dividend, they thought that, after providing a considerable extra sum for reserve, the shareholders were fairly entitled to some small immediate benefit for the successful working of the year. They still looked cheerfully forward to the future prospects of the company. The business had been steadily expanding, and during the past year the increase in connections was equivalent to 71,267 S.C.P. (30-watt) lamps, and they now had the largest amount of connected lamps in the history of the company, the total exceeding 1 million. The progress had not only been marked in a large further demand for power, but also for light. They would remember that the effect of the introduction of the metal-filament lamp five years ago showed itself in a marked falling off in the sale of light units. This reached its climax in 1910. In 1911 there were symptoms of recovery, and for the first time there was a tendency again to rise slightly. They considered that a most satisfactory feature in this year's report was that this rise had not only been confirmed, but considerably increased, amounting during the year to nearly half-a-million of units, or over 5 per cent. Another source to which they looked for an increased revenue was the gradually extending use of current for cooking. Its use for this purpose had been slow at first—partly owing to the inefficiency of the early cooking ranges, but chiefly to its advantages not being generally known. The London County Council during the past year had had a committee sitting with reference to the future electrical supply of London, and had courteously sought an interview with the collective representatives of some of the companies. They did not know what might be the outcome of it, but he felt sure that any co-operation which would be of mutual benefit both to suppliers and consumers, would be carefully considered. He had often been struck with the fact that many Londoners thought there must be something wrong with the present system of supply, and that they paid too much for their current. With improvements in production there was a tendency for many articles to cheapen, and this would probably apply to current as in other matters. In the meanwhile it was only fair to the electrical undertakings, whether companies or Councils, to say that the public were obtaining their supply of current at a cheaper rate than in almost any capital in the world, a fact which they would discover by a few months' residence in Paris, Berlin, or in any of the big American cities.

SIR JOHN PENDER seconded the resolution.

MR. FISHER asked if in the conversation with the County Council any suggestion was made that the Acton undertaking should be excluded from any proposed taking over by the County Council.

MR. HARROP thought the working expenses had increased out of proportion to the income, and whilst he admitted that they were making progress, he did not consider they were making progress fast enough. They had about as many lights now as when they had the Marylebone undertaking but whereas they paid 10 per cent. in those days, now they were only paying a miserable 4 per cent.

MR. GURNEY asked if the capital value of the shares was increasing.

MR. MOORE remarked that they had heard from the chairman that their men had worked well and did not grumble. Having had to do with workmen all his life, which was between 80 and 90 years, he felt they must be paying the men well or they would grumble.

THE CHAIRMAN, in reply, said he was not present at the meeting with the County Council, but he understood that no details were discussed. As to Mr. Harrop, they could not talk of what one or another company was doing, unless they studied the history of the company. If they averaged what the shareholders had received over the life of the company, it would amount to considerably more than 1½ per cent. The company was getting as much of the business in Kingsway as others. The price of the company's shares was not in any way under the control of the board.

ON THE MOTION OF MR. F. LEVERTON HARRIS, seconded by the HON. G. BIRKBECK LUBBOCK, the retiring directors were re-elected.

MR. J. F. E. MULLET proposed a vote of thanks to the chairman, board and the staff. He was glad to hear that they had an admirable staff of canvassers, which was all-important in these days of keen competition.

MR. W. H. SKEEL seconded the motion, which was carried unanimously.

### British Aluminium Co., Ltd.

THE report of the directors, as abstracted in the *Financial*, states that the trading profit for 1912, together with interest and dividend on investments and deposits, and the revenue derived from Kinlochleven and Foyers estates, and transfer fees, is £194,823, plus £4,001 brought forward. Provision for income-tax, legal expenses, bad and doubtful debts, depreciation of investments and furniture, and proportion of profits payable to directors, has absorbed £17,420; prior lien debenture interest, £40,000; debenture stock service fund, £43,223; reserve for depreciation, £40,000; reserve account, £30,000, leaving £28,180. The directors recommend a dividend of 6 per cent. per annum, less income-tax, for the year on the preference share capital, requiring £17,974, leaving to be carried forward £10,206. The reserve account, including the sum of £30,000 added out of the profits of the year, amounts to £80,000. The investment of the balance of this fund will be made during the current year. The depreciation reserve account, including £40,000 set aside out of this year's profits, now stands at £100,000. The aluminium works at Vigeland, near Christiansand, Norway, previously controlled by the Anglo-Norwegian Aluminium Co., Ltd., have been purchased by this company. Part of the price has been paid, and the balance will be paid during the present year. These works, which will add considerably to the company's productive capacity, are now in full operation. The company has also acquired an interest in a works for the manufacture of alumina, to augment the supply from the works at Larné. The output and sales for the year were greater than in any previous year. The prices obtained were low, owing to the keen competition of the foreign producers, but prices for the present year show a material improvement. The demand for the metal continues to increase, and the sales made for the present year are encouraging.

### South Wales Electrical Power Distribution Co.—

THE directors report that, although the operations of the year 1912 were somewhat seriously affected by the national coal strike, which caused a lessened demand for current and a considerable increase in the price of coal, the units sold showed an increase of 3,319,081 over 1911, and reached a total of 19,689,656. After payment of all working expenses and interest on prior lien debenture stock, and making due provision for depreciation of new plant, there remains a fairly substantial surplus, which, according to agreement, will be utilised in discharging the indebtedness to certain consumers of the Treforest Co. The application last year for a prov. lighting order for the district of Llantwit Fardre was successful, and a supply is now being given in that district. The application for a prov. order for the district of Bedwas and Machen Upper is not at present being proceeded with. The supply of current in the Caerphilly area is developing satisfactorily, and the acquisition of the prov. order has been fully justified.

**Australia.**—An Australian exchange states that the Northern Sydney Electric Light and Power Supply Corporation, Ltd. has increased its capital to £250,000 by the creation of 230,000 shares of £1 each. This company has been negotiating with the North Sydney Council for the supply of electricity, and is also in communication with other Councils in the northern suburb for a like purpose.

### Aldays & Onions Pneumatic Engineering Co., Ltd.

—The directors announce a dividend at the rate of 5 per cent. per annum.

## MARKET QUOTATIONS.

## STOCKS AND SHARES.

Tuesday Evening.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, March 26th.

## Greenock and Port Glasgow Tramways Co., Ltd.—

The ordinary general meeting of the shareholders of the above company was held on March 18th, at Electrical Federation Offices, Kingway, W.C., Mr. W. L. Madgen presiding. The proceedings were quite formal, the report being adopted on the motion of the Chairman, seconded by Mr. A. C. Miles, without any remarks.

**Continental.**—SWITZERLAND.—La Société Suisse pour l'Industrie Electrique, of Basle, for the last financial year shows a profit of £69,350, as compared with only £50,865 in the preceding 12 months. A dividend of 7 per cent. is being declared.

ITALY.—La Società Italiana Thomson-Houston, of Milan, is declaring a dividend of 6 per cent. for the last financial year.

HOLIDAY influences are still noticeable factors in the stock markets, and there was no great rush of fresh business for the Stock Exchange to cope with after the Easter recess. The situation abroad was read as more encouraging, and this pointed to the possibility of money becoming cheaper, so that to this extent conditions were to the good of markets. The wild weather of the week-end led to considerable damage to telephone and telegraph wires, but much of this had been repaired before the Stock Exchange resumed work on Tuesday morning.

The Underground Railway Companies should have been benefited at the expense of the steam lines by the roughness of the elements during the holidays. Judging by the traffic returns, however, people moved about at Easter-time with much the same freedom as usual. The Undergrounds, therefore, could not expect to receive more than their customary share of holiday traffic, and prices are a little duller, there being falls in Metropolitan and Districts. The Income Bonds of the Underground Electric Railways eased off to 92. No changes have taken place in Central London stocks, nor in those of the City and South London Railway, with the exception of a point fall in the City 4 per cent. Debenture stock. Metropolitan Electric Tramways First Debenture lost 1 1/2. London United Tramways Debenture has not picked up its drop of last week.

The market for London Electricity Supply shares is well-nigh stagnant. Last week there was one change, and this week ties with its predecessor in the number of fluctuations, a fall of 1/2 in South Metropolitan Preference, reducing the price to 22s. 6d. Now that the dividends are declared and paid, and the reports issued, it is contended that there is nothing much else to go for at present; and, with the summer in front of us, the electric lighting companies of London will fall into their usual jogtrot, without exciting interest or attention from the investor. There is still a little speculation latent in the City of London Ordinary shares; and if the clique which has been operating in them were to choose to run up the price, the manoeuvre could be executed without difficulty. In the provincial list, Bournemouth and Poole Second Preferences have hardened to 10 1/2.

The Latin-Canadian group has somewhat weakened. Recent new issues from companies operating in South America have been left largely in the hands of underwriters, and this seems to have acted as a kind of caution signal in the way of checking purchases of American—North, Central, and South—stocks of the utility class. An important newcomer this week is the offer of three million dollars 5 per cent. Gold Bonds at 91 by the Mississippi River Power Company. The Common shares fell back to 48, but have recovered a point or so, while the existing 5 per cent. Bonds are quoted in the Stock Exchange Official List at 89 1/2 to 91 1/2.

Brazilian Traction dropped 1 1/2 to 96 1/2, and the British Columbia Electric stocks are lower. Havana Fives fell 2 points. Rio Trams 1st Bonds and Sao Paulo 1st Debentures are both a little lower. Of the Mexican descriptions, there are falls in Mexico tramway and Mexican Light and Power Shares and Bonds. The chief drop this week, however, is one of 5 points in Shawinigan water, where vague, unconfirmed rumours of an impending issue of new capital continue to play their part in depressing the price of the shares. Montreal gave way apparently in sympathy. Demand has arisen for Cape Electric Trams, the price putting on 1/2 at 15s. On the other hand, La Platas are 3/2 easier.

The Barcelona Tramway Company has recently made, we understand, an issue of 5 per cent. Bonds at 90, carrying a bonus of 33 per cent. in common shares. According to our information, it is intended to make a public issue of these Bonds later in the year, when the times are more propitious, the present emission being a kind of underwriting which enables the company to secure money and support at the time it wants them. The nominal price of Barcelona shares in the market is about 40. Columbia Gas and Electric shares have dropped back to 13, and the rest of the stocks and shares in this utility group are, on the whole, in a depressed state for the time being.

The Telegraph market is very quiet. Direct United States Cable shares dropped to 7, and Eastern Telegraph 4 per cent. Debenture at 96 is a point down. Other issues, however, retain the rises which they secured last week. New York Telephone Bonds are firmer, and National Telephone Deferred stock hardened to 20 1/2 on a little speculative inquiry by those who expect that the residue of the money to be awarded will work out at something better than this.

A good deal of activity in Marconi's has for its net result a fall of 1/2 in the price of the Ordinary, and of 1/2 in the Preference. Whatever may be the ethical attitude which ought to be taken in respect of Cabinet Ministers' investments, the plain man will probably deplore the fact that highly placed officials should allow the least handle to be given to the suspicion that they should be speculating. And that American Marconi shares savoured strongly of a speculation there will be found few Stock Exchange men ready to deny.

The British Aluminium Company's report makes a fine showing, net profits having risen to £194,800, no less than £42,000 better than those for the corresponding period. Some such result had been expected, and advances in the company's stocks have been noticed here from time to time. This week there are improvements in the Ordinary and Preference shares. Brush Second Debenture lost 5 points, bringing the price down to 25. Manufacturing descriptions as a whole are very steady. Rubber shares eased off, but braced up again; the stationary condition of the market in the raw material is fatal to activity in the shares; probably the users of rubber appreciate it more than the Stock Exchange does.

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING FEBRUARY, 1913.

THE February returns of electrical business show a falling off in both the export and import sections as compared with the previous month, which is to some extent accounted for by the shorter period covered by the returns.

The exports from this country reached a total of £517,375, as compared with £576,523 in the previous month, and included nearly £170,000 worth of machinery and cable valued at £106,711.

The telegraphic and telephonic exports, although, in figure with other things, showing some decrease on the January imports, reached very satisfactory totals.

Electrical imports were valued at £236,079, as against £252,167

in January; while the re-exports at £23,396, were about £5,000 down. The decrease in the imports total was mainly due to the falling off in cable, telegraphic and telephonic values, the other items of the imports showing but little variation in value as compared with the January returns.

Argentina was our best customer during the month, while India, New South Wales, Canada and Brazil were also prominent purchasers from this country.

As regards the imports, Germany, as usual, took the lion's share of the business, while the United States retained a large share of the remainder.

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports.	Electrical goods and appliances.	Wires and cables, rubber and other insulations.	Electric lighting fittings and accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable and apparatus and electric bells.	Telegraphic cable and apparatus.	Total.

TOTAL EXPORTS: £517,375.

TOTAL RE-EXPORTS: £23,396.

TOTAL IMPORTS: £236,079.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

## PROCEEDINGS OF INSTITUTIONS.

## Power Supply on the Rand.

By A. E. HADLEY, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Manchester, March 11th, and in London, March 13th, 1913. For the commencement of the paper see p. 519.)

The 80,000-volt pole line consists of two rows of lattice steel masts equipped with four circuits of stranded copper, each conductor having a section of 60 sq. mm., and carrying three earthed guard wires above the conductors. Every fourth mast (commonly called an "anchor mast," fig. 1) is of sufficient strength to take the full strain of the conductors in a lateral direction; and the three intermediate masts (fig. 2) are designed to take the strain due to wind

FIG. 1.

pressure in a direction transverse to the line. Extra anchor masts are also used whenever the line changes its direction, and at railway crossings. A special end tower (fig. 3) is used at the ends of the line.

The masts are normally spaced 500 ft. apart. The anchor masts have an overall height of 71 ft. 6 in., the lowest cross-arm being 34 ft. 6 in. from the ground. On these masts the conductors are placed

FIG. 2.

vertically above each other, separated by a distance of 9 ft. Each mast was required to deflect  $\frac{1}{4}$  in. at the top when subjected to a horizontal pull of  $4\frac{1}{2}$  tons applied  $4\frac{1}{2}$  ft. from the ground at an angle of  $30^\circ$  from the line direction.

The intermediate masts when carrying the weight of the insulators, conductors and guard wires, were required to give a temporary deflection at the top of  $\frac{1}{4}$  in. when subject to a horizontal pull of 35 cwt., applied 35 ft. from the ground and at right angles

to the line direction. The conductors on these masts are arranged three on each side, in the shape of an equilateral triangle having sides 8 ft. long. The lowest support for the conductors is 34 ft. 6 in. from the ground, and a 10-ft. sag is allowed, so that the lowest part of any conductor is never less than 24 ft. 6 in. from the ground. All masts are provided with a safety screen to prevent any possibility of men working on one circuit coming into contact with the circuit on the opposite side of the pole. This screen consists of a rectangular steel framework interlaced with galvanised steel wire netting.

The 80,000-volt insulators used are of the disk type, 10 in. in diameter, and connected six in series at each suspension and straining point. Before erection each insulator is subjected to a mechanical stress of  $1\frac{1}{2}$  tons, and while in this condition is tested to 60,000 volts for five minutes.

The latest type of 40,000-volt transmission line is of a similar design, but pin insulators are employed on the intermediate lattice masts, and four disks are used in each string of insulators on the main towers which take the lateral strain.

All the 20,000-volt cables have circular conductors of 100 sq. mm. section, and are paper-insulated, lead-covered and armoured. Each cable is capable of transmitting about 7,000 k.v.a. The cable was specified to stand a test pressure at the factory of 50,000 volts, and a test pressure of 40,000 volts for 10 minutes after laying.

The atmospheric conditions on the Rand are in many ways abnormal. During the winter violent wind and dust storms are encountered, while for six months during the summer (from September to April) the reef is the centre of frequent and violent lightning storms accompanied by heavy rain and sometimes phenomenal hail. The Rand, which is the watershed of that part of South Africa, is probably about the worst district in the world for lightning, the altitude of Johannesburg being 5,760 ft. At this altitude the range of temperature is very large, and rapid changes in temperature occur, disturbing the atmospheric conditions.

The total number of lightning storms passing over different sections of the system during the last season (which lasted for 182 days) amounted to 199. Most careful daily records and observations are taken of all atmospheric disturbances, and these records show that lightning is encountered on an average on one out of every three days.

Every storm exerts some influence of greater or lesser severity upon the overhead system, but year by year the number of troubles caused have been largely reduced, so that interruptions to supply are now infrequent, and the loss of apparatus seldom takes place.

As a general rule the effect of lightning is brought about through an induced effect on the overhead lines, setting up a high-frequency surge. Experience goes to prove that the intensity

FIG. 3.

of the induced effect is in the majority of cases localised to some part of the transmission line, and only in the minority of cases does it reach the end of the line with its full severity. Further, it is quite a rare though not unknown occurrence for the line to be actually struck by lightning; and it is possible, though not determined, that this immunity may be the result of the earthed guard wires.

The means whereby the effects of lightning have been prevented in the great majority of cases from disturbing the system are mainly; (a) the employment of earthed overhead guard wires; (b) earthing the neutral of each separate section of the system; and (c) by careful selection and adjustment of lightning arresters to deal with the different conditions arising.

Experience has shown that the guard wire constitutes one of the most efficient systems of line protection, and contributes largely to successful operation during storms.

During the earlier lightning seasons the neutral of the system was not earthed, and unquestionably many interruptions and much loss of apparatus resulted from not employing this system. One of the troubles caused by lightning is occasioned by the arcing-over of insulators, which with an insulated system having considerable capacity to earth generally results in an intermittent arc to earth, thereby setting up dangerous surges in the system. These surges lead to cumulative trouble and cause discharges on the arresters of the other two phases, increasing in severity until finally a second flash-over takes place (generally at the arrester gear itself) and short-circuits the phases. By earthing the neutral through a resistance, any arc to earth is immediately isolated by the operation of the Merz-Price balanced relay system, and the arresters are not called upon to continue operating. A star-delta transformer is employed for earthing to avoid disturbance to telephones. Since the neutral of the system was earthed, it has been

found that in the majority of cases where an arc has occurred over a line insulator, the fault has been isolated so rapidly as to prevent damage to the insulator, and the line has been immediately put back into service by closing the switches.

At the time of the initial installation the aluminium arrester was not on the market, and in consequence, a complete system of horn arresters was connected up. The most careful records have since been kept of the operation and discharges occurring on these arresters. The number of pressure rises on each of the phases with an earthed neutral has been found to be equal.

The best combination of the number of horns, the spacing of arc gaps, and the amount of resistance to earth, had to be determined by experience and experiment.

During last season some aluminium arresters were installed, but no conclusive observations of their operations were obtained. This system, however, has been adopted for the protection of the 80,000-volt lines, as the experience on many systems in America has been largely in favour of this form of protection.

In order to show the operating efficiency, technical figures such as are regularly used by this company, rather than financial figures, are put forward in this paper.

As they participate in the profits, the consumers supplied by the company have at definite periods the right of access to the books in order to determine the cost of a unit of power.

FIG. 4.—AIR METER.

The supervision of the power stations by the administration is based on weekly balance-sheets from each station, showing the efficiency of each process. The form in which these returns are made is based upon the underlying idea of energy, and all energy in whatever form it appears, whether as heat in the coal or in the steam, is expressed in the electrical engineer's unit, *i.e.*, the kilowatt-hour, which proves far more convenient than using foot-pounds or thermal units for expressing energy. The energy value of each lb. of coal, usually expressed in B.T.H.U., is converted to kilowatt-hours by multiplying by 0.000293; thus, a coal of 11,300 B.T.H.U. per lb. has a value of 3.3 kW.-hours per lb.

The product of the number of lbs. of coal burnt per kW.-hour, and the energy value per lb. gives the coal energy required for each unit of electrical energy sent out; and the reciprocal of this multiplied by 100 gives the overall efficiency of the station. Thus, taking an average figure for Rosherville of 2½ lb. of coal per unit sent out, and 3.3 kW.-hours (11,300 B.T.H.U.) for the heat value of the coal per lb., the overall efficiency is 12 per cent.

In a similar manner the energy in the steam is calculated in kilowatt-hours from Mollier's steam tables. The boiler efficiency is the ratio of the kilowatt-hours in the steam (less the energy supplied from the hot well) to the kilowatt-hours in the coal. The efficiency of the engine room plant is expressed as the ratio of 1 kW.-hour of electrical output to the kilowatt-hours of available energy in the steam, *i.e.*, to the total energy of the steam less the heat rejected to the condensers. The ratio of the available energy in the steam to the total energy in the steam gives a measure of the efficiency of the condensing process.

The balance-sheet and detailed report of the Rosherville station show how the returns of these efficiencies are regularly made. Similar returns are prepared for the other stations.

The compressed air required for the various mines had to be supplied at an average pressure of 100 lb. per sq. in. delivered on the property of each of the consumers. The initial demand involved a maximum load of about 30,000 kW.; but this has since been nearly doubled. All the advantages of centralisation of power production, such as the use of large units, saving in capital and operating diversity amongst the mines, spare plant, &c., apply to

this form of power supply. The system of centralising the compressor plant and transmitting by pipes was therefore adopted. The distance between the two extreme mines served by the air-pipe system is approximately 14 miles. The total length of pipe laid is 20 miles, varying in diameter from 24 in. to 9 in.

It was decided to install steam-driven rotary compressors at Rosherville Dam and to erect an electrically driven compressor station at Robinson Central Deep (fig. 5), a point six miles to the west, where a supply of water was available for cooling purposes, the two stations operating in parallel on a common trunk pipe system. The additional cost of two stations, as compared with one, was found to be more than offset by the saving in the cost of air

mains and by the beneficial influence on the power factor of the compressor motors at Robinson Central; these were designed to operate at a leading power factor of 85 per cent. at full load.

Six steam-driven rotary compressors have consequently been installed at Roshevville, and six similar compressors, electrically driven, at Robinson Central, each compressor being rated at about 3,500 kw. input. The orders for these machines were distributed among the three firms who tendered, namely, the Allgemeine Elektrizitäts Gesellschaft, Pokorney Wittekind, and Gutehoffnungshütte. These machines are the largest compressors yet constructed, 1,250-kw. capacity representing the construction limit previously reached. To meet the increase in the demand, three additional steam compressors, each rated at 7,000-kw., are under construction.

Before electrification, the mines obtained their compressed air supply by reciprocating steam-driven compressors at each mine. The agreement defined that the consumers should pay the same price for any given quantity of compressed air as they would have paid for the indicated steam energy necessary to enable their reciprocating compressors to produce this quantity of air, assuming that they bought this steam energy at the same rate per kilowatt-hour as they were paying for electrical energy for other purposes. This involved measuring the quantity of compressed air, which could be delivered for each 1'34 I.H.P.-hour (1 kw.-hour) developed in the cylinders of the consumers' reciprocating compressors.

The overall efficiency of the reciprocating mine compressors, on the average, was found to be 64½ per cent., so the commercial air unit was fixed at 0'641 of the quantity of air which would be compressed isothermally by the expenditure of 1 kw.-hour.

The tests of the compressors had to be conducted in South Africa, and as no meter existed then, and the usual methods of testing compressors were far from accurate, new methods had to be devised to determine a unit on which the purchase of power worth £250,000 a year for 20 years was to be based.

The measurement of the discharge from the compressors through orifices was decided upon. A master meter was designed by the Rand Mines, Ltd., and constructed by Messrs. Fraser & Chalmers, which was ultimately erected in an air-testing station. The orifices used in the compressor tests were compared with this master meter and their coefficients determined.

A general description of the principle of the Venturi meter adopted may be of interest. It has been agreed that the mean annual temperature on the Rand, 60° F., should be taken throughout, and similarly also the mean annual atmospheric pressure of 12'086 lb. per sq. in. was adopted.

Measurement of the weight of air by means of a Venturi tube is found by taking the drop in pressure across the throat, and the temperature and pressure at the point of supply, in accordance with the formula  $w = K(PH/T)^{1/2}$ ; where  $K$  is a constant,  $H$  is the pressure-drop across the throat, and  $P$  and  $T$  are the pressure and temperature respectively at the point of supply.

The recording mechanism has to multiply continuously two variables, one dependent upon the weight of air passing, and the other on a function of the pressure of supply. The weight of air is measured by the drop of pressure across a Venturi tube (fig. 4) fixed in the pipe line. In the meter adopted the Venturi head is measured by means of an inverted bell  $B$ , sealed by oil, the movement of which is controlled by a specially shaped float  $R$  that enters and leaves a mercury bath  $M$ . This float is so shaped that the displacement of the bell corresponding to any Venturi head is proportional to the logarithm of the number of pounds of air passing at a given pressure and temperature. The arrangement is sensitive to a Venturi head of less than one 10,000th of a pound per square inch, and it will measure a Venturi head up to 0'85 lb. per square inch.

The pressure of delivery is measured by steel diaphragms  $P$ , and a displacement proportional to the logarithm of the required pressure function is obtained from them by means of a cam  $P.C.$  These two displacements, each proportional to the logarithm of one of the variables to be measured, are added together by means of a differential gear,  $D.G.$  This combined displacement is finally converted by means of a logarithmic cam  $L.C.$  into a displacement proportional to the power (kilowatts) in the pounds of air being delivered.

The meter is provided with direct-reading recording dials which are capable of being connected with a clock-driven shaft running at one revolution every two minutes. To avoid winding, the clock is driven by a small constant-speed air turbine. The guaranteed accuracy which has been maintained in operation is as follows:—Full load, within 1'5; half load, 1'75; one-tenth load, 2'25 per cent.

The meters were constructed by Messrs. George Kent, Ltd.

The results of the operation of the air system have been observed over the 20 months since the supply was first put into commercial use, and have been very satisfactory.

It has been found that of the air units sent out 95 per cent. have been recorded at the consumers' meters, 3 per cent. have been lost in transmission, and 2 per cent. are unaccounted for. The monthly air load factor is at present 50 per cent.

The author wishes to express his thanks to Major the Hon. W. L. Bagot, D.S.O., the company's general manager in South Africa; Mr. Bernard Price, the chief engineer; Mr. G. M. Clark, the company's air engineer; Prof. Klingenberg, of Berlin; Mr. T. L. Hodgson, of Messrs. Kent, Ltd., and to the members of the staff who have kindly given their assistance in the preparation of this paper.

#### DISCUSSION IN LONDON.

MR. J. H. ROSENTHAL said that the arrangement of the boilers in bays at right angles to the engine room was first used at Carville, and had since been repeated in a large number of cases in all parts of the world. The allowance of 75 H.P. for the induced-draught fans was above the actual requirements for two boilers and looked

large, but it represented a very small percentage of the output. The barometric pressure on the Rand was low, and it would have been impossible to work this plant with chimneys in the ordinary way. Two boilers supplied 4,000 H.P., and the chimneys were of a peculiar shape. An advantage of the system was that the fan was not in the flue gases, and the special chimney gave a better efficiency than the ordinary type. The output of the plant was 1'19 kw. per sq. ft. of floor space—a record result; at Dunston the output was 1'12, and at Lot's Road 0'72 kw. In that climate the coal store need not be covered, as the coal did not suffer from exposure; the coal was handled entirely by mechanical means, white labour being costly and coloured labour unsuitable. The efficiency of 68 per cent., quoted in the paper, included all stand-by losses; the coal was of very inferior quality but very cheap.

MR. H. BRAZIL, referring to the guard wires, said he understood that in the original installations barbed wire was used; was it any better than plain wire? He asked what size were the star-delta transformers that were used to prevent disturbance to the telephones, what earthing resistance was used on the 10,000-volt system, and why the arresters were grouped as shown in the paper.

MR. A. P. TROTTER remarked that overhead construction was carried out in a different way in each country, local conditions being of the utmost importance. In this country stringent economy was necessary, as compared with the big job on the Rand. The spans were moderate compared with those used in America, and more in accordance with British practice. He was pleased to see the double line of poles and the ring main employed. He had always believed in the efficacy of the earth wire, especially when it was put above the line, and was glad to learn that it had proved successful. Barbed wire was not much better than plain. The clearance of 24½ ft. seemed to be large; in this country haycarts were the deciding factor—was there any need to go beyond 18 or 20 ft. on the Rand? The troubles due to surging which were cured by earthing the middle point only occurred on long lines.

MR. J. S. HIGHFIELD said it was important to realise what a very large expansion of electricity supply was in progress in all parts of the world. These big mines had found it best to drop their private installations, thus proving the case for long-distance transmissions. The views of twopence-halfpenny users of 50 H.P. on the subject of taking power from the mains here made him tired; the Rand would afford a useful argument to quote in such cases. The price of £25d. did not appear to be very low, in view of what was done here. He was interested in the co-operative scheme adopted on the Rand, under which the price was subject to variation; it was always difficult to fix the proper price in advance. It was essential to the consumer that the supplier should make a profit—otherwise the plant could not be kept up to date and extended, owing to the difficulty of raising capital. It was important that the earth wire should be above the line wires, and be of similar material, so as to last as long as the others, as it was a difficult wire to replace.

MR. A. JACOB disagreed with Mr. Trotter's remarks concerning the transmission lines, as he considered the American lines the more substantial. The sag of 10 ft. appeared to correspond with a factor of safety of 2 on the wire, whereas 5 was adopted in this country. The towers had extremely long arms, and if all the wires were cut on one side the arms would be subjected to an excessive stress. Comparing the cost of copper and aluminium for the 80,000-volt line, the ratio was 956 to 826, even when more rigid lines were used for aluminium, showing a marked saving in favour of the latter.

MR. DAVIS referred to the climatic difficulties and legislative restrictions met with in South Africa, and observed that the use of synchronous motors to drive the air-compressors would help the power factor. He dealt at some length with the control and operation of the air compressors, and the mode of transmitting the air.

MR. E. V. PANNELL remarked that, though there was no likelihood of such big schemes being carried out here, it should be remembered that such schemes were engineered from this country. He criticised the weakness of the towers in the event of a heavy side pull, and the small spread at the base, and asked whether concrete foundations were used; these sometimes cost 50 per cent. of the whole cost of the tower. The earth wire was useful in adding to the mechanical stability of the line.

MR. ARTHUR WRIGHT commented on the great success of the boiler house without tall chimneys, on the Prat system, and of the transmission of power by compressed air over long distances—two great experiments which had been completely successful. He believed that ultimately all the mains would be put underground, as that was the only way to overcome the trouble from lightning.

In reply, MR. HADLEY said that the figures for efficiency were not selected; they were ordinary working figures, obtained at a time when the cooling water was warm. The guard wires were always of galvanised steel without a hemp core; barbed wire had only been used to keep cattle off the masts. The clearance of 24½ ft. was provided to comply with the Government regulations, and was not really necessary except to prevent wires from being thrown over the line and to avoid the lashes of whips. The price of £25d. must be considered in connection with the purchasing power of money in South Africa, and was intended rather to fix a maximum than to represent the actual payment. The price was reviewed every year, and after a dividend of 6 per cent. had been paid, any surplus that remained was divided, ¼ to the supplier and ¾ to the consumer. The factor of safety of the line was calculated and tested to 5; each class of line was tested, and all the wires on one side were cut simultaneously, without twisting the towers. No trouble was met with from corona in dry weather. Legislation presented no difficulties; the Power Act was quite reasonable. If

saw no evidence of standardisation of towers in America. The guard wire had been given up in Central Colorado, owing to mechanical troubles. He saw no reason for putting the lines underground; the lightning grew less troublesome every year.

### Röntgen Society.

At the meeting of the Röntgen Society, on March 4th, Dr. F. HOWARD HUMPHRIS read a paper on "The Rationale of the Static Current," in which he advocated a wider acceptance of this electrical mode among British electrotherapeutists. He considered the current to be replaceable by no other form of electricity, and, in particular, to produce mechanical effects which were unobtainable by other means. These effects were due to the diffusion of the current caused by its high voltage—running from 600,000 up to a million volts. In the course of the discussion Mr. R. M. STANESBY said that there were certain points of difference between the static current and the ordinary coil current which ought to be investigated. After 10 years' experience of working solely with static currents for X-ray production, he had had no effect of dermatitis, although he had not protected himself in any way. In reply to a question as to climatic conditions and their influence upon the static machine, Dr. Humphris said that the supposed dampness of the climate was, he thought, an overrated bugbear. He had practised for 10 years in a damper climate than this, where the relative humidity was always over 90, and also in the Southern States of America, where it was over 95, and had been successful. But in the English climate, if proper attention were paid to the machine, and due cleanliness observed, there would be little or no difficulty. If a static machine was out of condition on 1 per cent. of the days on which it was in use, he thought its owner was unfortunate. With regard to the use of the static machine as a means of X-ray production, 10 years ago in the United States it was generally believed that dermatitis could not be produced under such circumstances, but subsequently he went over to Paris and was there undeceived. Burns, and very bad burns, could be produced.

At the same meeting, Dr. H. Lewis Jones brought forward an interesting communication, the purpose of which was to amplify a previous address by Prof. Silvanus Thompson on the physiological effects produced by an alternating magnetic field. With the head inserted between the poles of a magnet, Prof. Thompson had been able to observe a faint, flickering illumination over the whole field of vision. Previous workers, however, had had negative results with experiments along similar lines, and this contradictoniness Dr. Jones attributed to the differences in the duration of the induced currents which were set up. If the retina was to be stimulated, a current must have a much longer duration than was necessary for the motor and sensory nerves. He had ascertained from some experiments with the mechanical interrupter of Leduc, that the retina was unable to respond to electrical impulses of a briefer duration than  $\frac{1}{250}$ th of a second. In an apparatus in which everything was unchanged except the duration of the individual impulses, it was possible to regulate the retinal effect, and watch it come and go. The fluttering light—which, of course, was subjective—was observed at its maximum with waves of about one-fiftieth of a second, or longer; when much shorter than this, the retinal response died quite away, although the muscular twitching remained. The retina was very slow to respond to electrical stimulation, and would not respond at all to the short waves.

### Physical Society.

At the meeting held on February 28th, a paper on the "Interference of Röntgen Radiation," by PROF. C. G. BARCKLA and MR. G. H. MARTYN, was read by PROF. BARCKLA.

The authors have made a preliminary investigation of the Röntgen radiation proceeding from a crystal of rock salt (which is of the simple cubical form) when a pencil of Röntgen radiation is incident in a direction nearly grazing one of the three sets of mutually perpendicular cleavage planes. Using a very narrow pencil of radiation, it was seen that the principal secondary pencil was one obeying the laws of reflection from the cleavage planes.

A diverging pencil of radiation was directed on to a crystal so that various portions were incident on the cleavage planes at different angles. The intensity of the reflected pencil varied periodically with varying angle of incidence, the maximum being separated by intervals corresponding to approximately equal increments in the value of  $\cos \theta$ , where  $\theta$  was the angle of incidence on the reflecting planes. Such a series of maxima may be explained by interference of the pencils reflected from equal spaced parallel planes, the maxima being spectra of various orders. The wavelength, calculated on the assumption that these are planes passing through corresponding portions of molecules in the planes of cleavage, and that a molecule is simply NaCl, is found to be  $0.6 \times 10^{-9}$  cm. This value agrees remarkably well with the value (between  $1$  and  $2 \times 10^{-9}$  cm.) calculated from the velocity of ejection of electrons by this X-radiation, taking this to behave as ultra-violet light of short wave-length.

A paper on "Alternating-Current Magnets" was read by PROF. E. WILSON.

It follows from the well-known law of pull of an electromagnet that if the magnetic field alternates between positive and negative values the pull is unidirectional and intermittent. Unless means are provided to reduce the consequent chattering and vibration, the

magnet is rendered useless. In the present experiments a phase-splitting device has been adopted, and consists in surrounding a portion of the pole-piece of the magnet with a short-circuited coil. The portion of the pole-piece so surrounded is sometimes said to be "shaded," and the coil referred to as a "shading" coil. The effect of this coil is to alter, not only the relative amplitudes but the phase of the magnetic fields passing through the shaded and unshaded portions of the pole-face. The magnet used in the experiments varies the length of its gap when in action, and the influence of the gap length upon this phase-displacement has been studied. When the resistance of the shading coil is such that the magnetic induction over the whole face is substantially uniform and the gap closed, the phase-displacement is 72 electrical degrees ( $360^\circ = 1$  period). A gap length of 0.15 cm. reduces the phase-displacement to  $18^\circ$  and consequently the minimum or "hold-on" pull drops. This minimum or "hold-on" pull is, of course, smaller than the average, and has to be taken into consideration in the design of the magnet. The arrangement of the shading coil above described is very effective in preventing vibration and chattering when the magnet is closed, and renders the alternating-current magnet a practical success.

With constant alternating voltage impressed upon the magnetising coils of the magnet the net pull exerted diminishes rapidly at first as the gap length increases and tends to become more nearly constant. The R.M.S. amperes, on the other hand, steadily increase as the pull diminishes, owing to the increase in the gap length.

The observed net pull in the case of the magnet experimented upon is less than the calculated average pull, varying from 83 to 59 per cent, as the gap length varies from 0 to 1 cm. The frequency used was 50. The large displacement of phase only occurred when the air-gap was small, but it was only when the armature was actually in contact with the pole that it was required to abolish the chattering.

### PAINTING CARS WITH ENAMEL BAKED ELECTRICALLY.

By the use of a baking enamel (instead of linseed oil paint or air-drying enamel) the Hudson and Manhattan Railroad Co. are able to get cars through the painting shops in two days, as compared with from 6 to 14 days required by the usual process. Baking enamel has been used for years past on automobile bodies and for finishing such parts of railway coaches as can easily be stored, but we believe this is the first case in which entire cars have been painted with this material. The success of the new method and the advantages which it offers to traction companies are so considerable, that we have no hesitation in presenting the following notes, abstracted from a more detailed article in the *Electric Railway Journal*.

The enamel used in this case is the ordinary varnish-pigment baking mixture, the hardening of which requires the evaporation of turpentine and the oxidation of residual oils, the action being assisted by fossil gum. Baking enamels are essentially the same as air-drying enamels, but, being dried artificially, they may contain ingredients which give a hard tough surface, and, since they can be applied in a very free-running state, they are economical in use, and the dried surface has an admirable gloss. Experience in the automobile industry appears to show little difference in durability between air-dried and baked enamels, but the latter have a better appearance, and are more economical and expeditious in use.

In the present connection, it is essential that the baking enamel used should dry completely during a single, short-period heating, so that each layer assumes its permanent state before the next coating is applied. This condition is not realised in air-drying enamels, hence the network of cracks which soon appears on the surface of the latter in service.

There are three successful methods of baking enamel on railway cars:—(1) Stove the whole car in a kiln of suitable size, repeating the stoving for each coat; (2) bake the priming and first coat of enamel at a moderate temperature and air-dry the subsequent varnish coats; (3) seal all outlets and bake the interior of the car by electric heaters.

The latter method is the first to be adopted as standard on any railway, and is that used by the Hudson & Manhattan Co. This company's cars run chiefly in subways, hence the external appearance of the vehicles is not studied, but paint is, of course, applied to keep the steel from rusting. In ordinary cases, however, the outside of cars must also be enamelled, and, to apply the present process, it is only necessary to partition off a space large enough to hold the car and heat this enclosure by five or six sets of electric car-heaters.

After prolonged experiments, the Hudson & Manhattan Co. have adopted the following practice:—The bulk of the old enamel is removed by hand-scraping, and a varnish remover is then carefully applied and followed by a cleaning with gasoline on cotton waste. The car is then heated to  $200^\circ$  F. (this temperature not affecting the wiring in the car), by the suspension of three extra sets of electric car-heaters from the hand rods. About 50 kw. is required to maintain this temperature in a 41 ft.  $\times$  8 ft. 10 in. car with monitor-deck roof. Current is controlled from outside the car in accordance with the readings of thermometers visible through the windows. During baking, the car doors and windows are closed, and ventilator apertures, &c., are covered with layers of newspapers held down by tar. When the car has been heated to

200° F. for 1 hour, it is allowed to cool to about 115° F. and the priming is applied and baked at 200° F. for 3 hours. The second and third coats are applied with the air in the car cooled to 70°—80° F. and are baked at 140° F. for 3 hours each. The last coat is baked at 130° F. for 3 hours. If, for any reason, the priming cannot be baked at 200° F., the first coat should be baked for 4 hours at 165° F. It is especially important that the procedure recommended for the application and baking of the priming be followed as closely as possible. The final appearance is at least equal to that given by the best grades of air-drying coach colours and rubbing varnishes. At a conservative estimate, the new method occupies only from 20 per cent. to 25 per cent. of the time required by ordinary systems; the percentage of the car equipment held idle for painting is correspondingly reduced and, in many cases, the coat of varnish which is annually given to surface cars, could be applied between rush hours.

First-class materials and labour must be used where enamel baking is practised, but any additional outlay under this heading is compensated by the reduced charges on idle equipment. By the above process, the cost of application of baking enamel is roughly equal to that of high-grade painting. The cost of painting the interior of a car, 41 ft. between bulkheads by 8 ft. 10 in. over sills, is as follows (average H. and M. Railway data):—

	White ceiling (400 sq. ft.).	Green sides.
Removing old paint! ...	28s. 10d.	62s.
Quarts of paint in each coat ...	1'5, 1'5, 2, 2	2'5, 2, 4, 2'5
Total cost of paint ...	26s. 6d.	41s. 6d.
Labour cost of painting ...	21s. 6d.	30s.
Labour cost of sanding between coats ...	5s. 6d.	12s.
Total ...	82s. 4d.	146s.

To these amounts must be added 4s. for connecting extra heaters and 15s. for energy at 0'3d. per K.W.-hour, making a total cost of £12 7s. per car. The cost of materials is about half as great as where air-drying enamel is used, owing to the greater covering power of the baking enamel.

The wooden sashes on the H. and M. cars are treated as though they were of steel, except that the thoroughly hardened old paint is not removed before applying new enamel. When enamelling new or cleaned wood, an oil primer should be used; this need not be followed by more than two coats of baking enamel to secure excellent results.

Standard varnish removers can be used to remove baking enamel, but the special hardness of the latter makes the operation more difficult than usual.

## EXPORTS STATISTICS OF SWITZERLAND.

THE following figures showing the exports of electrical and similar machinery from Switzerland in 1911 are taken from the recently issued official trade statistics; the particulars for 1910 are added for purposes of comparison and notes of any increases or decreases are given:—

	1910.	1911.	Inc. or dec.
<i>Dynamo-electric machines and electric transformers of all kinds.—</i>	Francs.	Francs.	Francs.
To Germany ...	2,070,000	2,742,000	+ 672,000
" Austria ...	897,000	767,000	— 130,000
" France ...	3,108,000	4,675,000	+ 1,567,000
" Italy ...	2,874,000	1,298,000	— 1,576,000
" Belgium ...	342,000	1,036,000	+ 694,000
" Great Britain ...	573,000	1,374,000	+ 801,000
" Russia ...	997,000	1,306,000	+ 309,000
" Spain ...	1,340,000	1,319,000	— 21,000
" British India ...	78,000	253,000	+ 175,000
" Mexico ...	38,000	156,000	+ 118,000
" Brazil ...	179,000	627,000	+ 448,000
" Argentina ...	523,000	730,000	+ 207,000
" Other countries ...	2,647,000	1,765,000	— 882,000
Total ...	15,666,000	18,048,000	+ 2,382,000

NOTE.—25 francs = £1.

## HYDRO-ELECTRIC WORKS ON THE MISSISSIPPI.

WHAT is described as the world's largest hydro-electric development will ultimately utilise over 300,000 H.P. from the River Mississippi, at Keokuk, Iowa, and is now practically half completed. From the *Southern Electrician* we draw the following particulars:—The concrete dam across the river is 4,619 ft. long, 53 ft. high, and 42 ft. and 29 ft. in width at its base and top respectively; it comprises 119 similar spans, carries a causeway along its top, and provides deep water navigation 65 miles up the river. Between the power house and the Iowa shore, a large lock (110 ft. wide and 40 ft. lift) and dry dock have been built. The power house is of concrete construction, is 1,718 × 133 ft. in plan, and 70 ft. high to the generator floor; from this floor to the roof pinnacle is 107 ft. 6 in. The building is set almost parallel to the river, and will ultimately contain 30 9,000-K.V.A. umbrella-type alternators; half this equipment is nearly ready for service. The turbines are of the Francis type, 16 ft. 2 in. in diameter at the 20 buckets, and each is placed in a scroll case (39 ft. diameter × 22 ft. high) fed by four intakes which—initially parallel—sweep round to supply the whole turbine periphery uniformly. The total load on each main thrust bearing is 246 tons, and the shaft is 25 in. in diameter. Rated at 32 ft. head (the actual head varying from 29 to 43 ft.), the turbines are of 86 per cent. efficiency when running at 57.7 R.P.M.

The three-phase alternators are rated at 9,000 K.V.A., 11,000 volts, 25 cycles, and have a full-load efficiency of 96.3 per cent., and 13 per cent. regulation at unity p.f.; each machine weighs 27.5 tons, and is provided with a brake to hasten shutting down; the armatures are 30 ft. 9 in. in external diameter. Excitation is by an unusual system; turbine-driven alternators (ultimately four in number), rated at 2,000 K.V.A., 460 volts, 25 cycles, feed three-phase bus-bars running the whole length of the generator room. Thence 100-K.W. motor-generators, located in a gallery 8 ft. above the floor, excite each alternator at 250 volts. A reserve 440-volt bus-bar, excited through a 600-K.V.A. three-phase transformer from the main power circuit, is installed for each group of generators.

Duplicate bus-bars are installed on both high and low-tension systems, and all generators, transformers and lines have selector switches enabling connection to be made to either bus-bar. One L.T. bus-bar runs the whole length of the station, and will be used for

transfer and in emergency. The normal operating bus-bar has section switches and current limiting reactances. Each reactance is rated at 240 K.V.A., and comprises concrete cores wound with copper cable; total weight 12 tons. The generators and transformers feeding each outgoing line will be on a separate section of the bus-bar, but, ordinarily, the sections are paralleled through the reactances, and the emergency bus-bar unites the ends of the main bus-bar and forms a "ring." Except the L.T. bus-section switches, all switches are non-automatic and arranged so that trouble on one section opens its two section switches, reduces the generator voltage and leaves generators, transformers and lines connected together. One H.T. bus-bar is out into sections corresponding to the lines; the sections of the other can be paralleled if desired.

The three-phase transformers are rated at 9,000 K.V.A., 11,000/110,000 volts, and are connected delta low-tension and star high-tension, with neutral dead earthed; each occupies 8 x 16 ft. x 24 ft. total height, and containing 10,000 gallons of oil, weighs 103 tons complete. The H.T. bus-bars consist of 2 in. standard iron pipe, from which line connections are made with 1.25-in. copper pipe. The roof bushings give a safety factor, on line voltage, of 3 under rain and 4 under dry test. Rotary double-break air disconnecting switches are mounted 24 ft. between line phases and have 12-ft. arms.

The entire station is controlled from a switchboard room on the top floor, in the centre of the building, and complete telephonic communication is provided between every part of the building, the sub-stations and distributing points and the chief despatcher's desk and switchboard. An extensive oil-treating, storing and distributing system is installed, in addition to distinct water supplies for transformer cooling, fire protection and general station use.

Power is distributed locally at 11,000 volts, and through the populous country along the river at 110,000 volts. The 137-miles E.H.T. line to St. Louis comprises two 300,000-cm. copper circuits carried 10 ft. between phases in vertical planes on either side of 80-ft. steel towers placed 800 ft. apart. Anchor towers at 1-mile intervals will withstand breakage of all the line conductors and the 1-in. steel ground wire; other towers will withstand breakage of two wires. Steel conductors placed 24 ft. apart are used for the single spans over the Mississippi (twice) and Missouri (once). Seven-part suspension insulators are used (flash-over 440 KV. dry, 330 KV. wet).

## ELECTRIC CONTROL OF BOILER FEED.

The accompanying illustration shows the essential features of an ingenious and practical electric water-level regulator for steam boilers. The equipment comprises a float *S*, an electromagnet *M* (mounted adjustably on a standpipe *P* on the boiler), and an

electromagnetically controlled feed valve *V*. The float has a guide rod, penetrating the standpipe *P*, and carrying an iron block *B*. The relative position of *B* and *M* is so adjusted that, when the water level sinks in the boiler is normal, *B* lies above *M*, but as the water level sinks and the float descends, *B* practically closes the magnetic circuit of *M* and thus enables the latter to attract an

armature carrying a relay contact. An air brake on the valve magnet core provides for rapid opening and gradual closing of the feed valve, and an alarm signal is given in the event of current failure or of over-feeding.

As the stand-pipe is closed at the top, no stuffing-box is necessary, and the apparatus is, therefore, not liable to stick.

This apparatus is designed for operation on 110 or 220-volt circuits, and is made in sizes suitable for boilers having 3,000 or 5,500 sq. ft. heating surface. Where electric power is used for driving feed-pumps, chain grates, draught fans, &c., this regulator is very easily applied, and its use results in increased efficiency of steam raising and reduced liability to accident. The manufacturers are the Hannover-Maschinenbau A.G.—Elek. Abt. and E. u. M.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**NEW ZEALAND.**—The New Zealand Customs Authorities have issued the following decisions as to the duties to be levied on certain electrical and similar goods on importation; the duties in all cases are those levied on British goods under the Preferential Tariff:—

Nacho automatic signalling gear for electric tramway; telephone transmitters, mouthpieces, transmitter diaphragms and hand combinations; extension bells being telephone accessories; vulcanite nipples, claimed as electrical insulating material: 20 per cent. *ad val.*

**AUSTRALIA.**—The Australian Customs Authorities have decided that "telephone counters" are to be dutiable at the rate of 20 per cent. *ad val.* under the British preferential tariff.

**RUSSIA.**—The *Commercial Gazette* of St. Petersburg reports the introduction of a Bill authorising the Council of Ministers, on the suggestion of the Minister of Commerce in conjunction with the Minister of Finance, to permit the duty free importation of foreign products for their manufacture into finished articles or for final finishing, on condition that they are subsequently exported in the form of finished articles, within a time to be decided on by the Ministers under a separate application in each case, and provided that the products in no way circulate in the Russian market. The Minister of Finance will require the deposit of the amount of duty ordinarily payable, as guarantee for the manufacture and subsequent exportation of the finished articles.

**BRAZIL.**—The Brazilian Budget Law provides for the entry of certain goods at specially low rates of duty as follows:—Materials destined for the first public installation of light, power, and electric tramways, &c., when imported on the requisition of the Governments of the States or the municipalities (including the Federal District authorities) for works undertaken by them, are to pay 8 per cent. *ad val.* The reduced (*ad val.*) rates of duty resulting from the present law are to be calculated on the official values in cases where a fixed duty is assigned in the Customs tariff; as regards goods which are tariffed *ad val.*, the commercial value is to form the basis of assessment. In the case, however, of material for sanitary works, the duty is to be calculated on the commercial or invoice value of the goods.

**BELGIUM.**—The Customs authorities have issued a notice to the effect that time switches imported into Belgium are to be dutiable as apparatus which is classified in the tariff as follows:—

Of aluminium	...	...	...	40 fr. per 100 kg
" cast-iron	...	...	...	2 "
" wrought-iron or steel	...	...	...	4 "
" copper or any other material	...	...	...	12 "

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

It is a long while since any controversy has arisen in political and commercial circles arousing such intense interest as the incidents which during the last few days have involved the conjunction in the public Press of the words at the head of this article. Ministers are never without their enemies. The name of Marconi we use, of course, in an impersonal sense. It is representative of a great enterprise, and great enterprises must have their rivals, or would-be rivals. The evidence which was begun in the libel action against *Le Matin*, and continued before the Parliamentary Committee, may have afforded some satisfaction to enemies, but has also afforded considerable disappointment to the friends of both.

The contract for the links of the wireless chain was made by the Post Office after considerable discussion and negotiation. The officials of the Department have maintained, with a tenacity which is entitled to commendation, that the terms of the contract were advantageous to the State. Whether or not the terms were the best that could be obtained, or even if the best that could be obtained from that particular contractor should have been entered into, it is not now the time to consider.

The contract, in fact, contained some exceptional conditions, and we think it probable that these exceptional conditions mainly exercised the public mind in so far as the public mind is exercised about such undertakings. The contract having been provisionally agreed to by the Government, was subject to the ratification of Parliament. Such ratification was expected promptly, as the managing director of the company remarked in a letter upon which we commented in our issue of January 24th, 1913. By both parties to the contract it is to be feared that the confirmation of Parliament was regarded rather as a matter of form than otherwise. If that be so, it was an error of judgment which was to precede many others. Until ratified by Parliament, the contract was not complete, and when it came up for ratification, it became evident that it would be necessary to have it fully considered by a Select Committee. This resulted very largely from the criticisms in the Press, which seemed to emanate principally from political opponents of the Government. Much of the criticism, even in quarters which have been called influential, was based on compounds of inaccuracies and inferences. That an important organisation could acquire an influence of its own was not recognised, and the influence which the Marconi Co. unquestionably did exercise was attributed to the relationship existing between its managing director and one of the principal members of the Government. Continuing for some time it was clearly hinted in the Press, and more definitely stated in clubs and places where they talk, that some Ministers had made money out of Marconis. This general talk was formulated by the Attorney-General in the House of Commons in October, and specifically denied on

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

4, Ludgate Hill, London, E.C.

his own behalf and that of other Ministers according to formula. This was probably the crowning mistake of the series, because it is to be feared that friends and foes alike regarded the denial as general, and omitted to notice the specific nature of the formula. In consequence, there was surprise and disappointment at the evidence in the *Le Malin* case, which showed that whilst leaving British Marconis severely alone, the Attorney-General had dealt in American Marconis, and that he was joined in those dealings by the Chancellor of the Exchequer and the Chief Whip. The distinction between the two companies, the nature of an investment, and the limitations on Ministerial thrift, have formed the substance of much evidence before the Select Committee without, we think, very material benefit. Fine distinctions of this sort seldom reach the popular mind. To the man in the street, Marconis are Marconis, and the geographical prefix is comparatively unimportant.

The exact method of reaching a conclusion may not be scientifically or judicially correct, but the man in the street will unquestionably be right in his conclusion that such action on the part of the Attorney-General, the Chancellor of the Exchequer, and the Chief Whip was singularly ill-advised. The contract had to come before Parliament. The chief law officer might have to advise, the Controller of the Purse would certainly have to exercise some discretion in such a matter, and the Chief Whip would possibly be required to exercise his functions in obtaining the presence of the necessary majority of members. No reasonable individual would suggest that they would be in any way influenced by their personal interests in carrying out their respective duties, but the fact that their interests were possibly antagonistic to their duties would seriously impair their efficiency. Whatever the distinction between the particular companies concerned, no difference exists on the part of the individual managing their affairs. The investment was prompted by the Attorney-General's brother, who had "made himself responsible for" a large issue of shares of the American company, and it was the same brother and no other who was responsible for the negotiation of the contract with the British company. The practical objection is found in the fact that in consequence of the circumstances which had arisen, the Attorney-General, who is presumed to be the most able adviser at the disposal of the Government, was compelled to ask that he should be excused from advising as to the power of the company to withdraw from the contract.

The drawbacks attending the position of the Chancellor of the Exchequer are less direct, but to the public even more important. Amongst much inaccurate statement and unreasonable inference, the writer in the *National Review* made a perfectly reasonable reference to the South Sea Bubble in connection with the Marconi companies. In connection with company promotion, it is quite common to follow one success with another, making subsidiaries upon geographical or other lines, sometimes without much reason, except that the public are ready to absorb that particular brand of share. In the case of Marconis, the geographical company is quite a reasonable branch to pursue, but the flotation on the London market of the American company at the time, and under the circumstances concerned, must be regarded as being prompted by, and should be judged according to, the methods of the company promoter. It would be improper to describe the American company as a bubble company. We do not think it would be improper to describe its introduction on the London Exchange as an inflated flotation. The participation of the Chancellor of the Exchequer in such a deal is very much to be regretted, if only for its possible effect on the investor or dabbler who, hearing of the fact, might conclude that "if it is good enough for the Chancellor of the Exchequer, it is good enough for me." The lack of worldly wisdom evinced by both the Attorney-General and Mr. Lloyd George must be regarded as one of the most remarkable features disclosed by the recent controversy. The Attorney-General was so astonished as to answer: "Good heavens! No!" when asked if the surprise telegram from a celebrated man were not a familiar feature of company promotion. The Chancellor of the Exchequer persisted in the

description of his purchase of shares in a new company, with no dividend record, at an extravagant premium, as an "investment." We presume it is due to his more businesslike experience that we are able to congratulate Mr. Samuel, as we do, on having refrained from drawing fine distinctions, and on adopting the better policy of leaving the whole family severely alone.

## ELECTRIC HEATING AND COOKING.

IN view of the importance which already attaches to the subject named above, and which, we firmly believe, is but the merest shadow of that which it will eventually acquire, we make no apology for including in this issue an article on electric cooking apparatus, together with a report of the discussion on the subject by the Yorkshire Local Section of the Institution of Electrical Engineers. Mr. Roles, whose remarks in opening the discussion took the form rather of a paper than of a mere introduction, was clearly effervescing with information on electric cooking, derived from actual experience and observation, and could have said a great deal more if circumstances had permitted. We trust that he will find an opportunity to supplement his interesting comments on the construction of the apparatus employed for heating and cooking purposes, for it is precisely such information as this that is most urgently needed by the manufacturers, to enable them to eliminate defects and errors and to improve their products to the highest pitch of reliability and efficiency.

That many mistakes have been made in the design of the earlier forms of cooking stoves and utensils is common knowledge; but probably few were aware that the effectiveness of electric heating apparatus could be so materially influenced by small changes in construction as Mr. Roles stated. We speak of effectiveness rather than of efficiency in this connection, because of necessity, technically speaking, the efficiency of an electric heating device must be very nearly 100 per cent.; the whole of the electrical energy must be converted into heat energy in one form or another, with the possible exception of an inappreciable amount of electrical radiation. But it is evident that the mode by which that heat energy is communicated to the surroundings of the heating apparatus may have a very important effect upon the effectiveness of the apparatus as a means of imparting warmth to the person or of maintaining the temperature of a room. We are, therefore, led to make the suggestion that the whole question is one which ought to be subjected to exhaustive investigation with a view to ascertaining beyond doubt the best type of apparatus for the performance of given functions, such as heating a room, warming an air supply, and so on.

In the ordinary course, such questions as these are left to be settled by the slow and tedious process of evolution and survival of the fittest, at immense cost to the industry and the public; by the application of scientific method they could be solved in a few months, or even weeks, at a cost trifling in comparison with the resulting benefit. The same applies to cooking apparatus. Although so great progress has been made in the development of this branch of electrical service, the trade is in a chaotic condition with regard to the design of the cookers, and each maker is working along independent lines, so that a great deal of work and

trouble is being needlessly incurred, and the same ground is being trodden many times. Scientific research would soon point out the direction along which the most rapid progress would be made. One manufacturer imitates the ordinary gas cooker as closely as he can; another abandons all idea of imitation, and adopts a totally different system—can both be right? It may be observed that the gas engineers have developed a design for their cookers which is practically standardised, the differences between the various patterns being found only in minor details; their design is not necessarily the most efficient, nor yet the cheapest possible. It is, we presume, the most effective—the type which has been found by experience to be the best adapted for the public use. We want to arrive at an equivalent result by the quickest method available, and we have no doubt that an exhaustive investigation by competent researchers, carried out, of course, in conjunction with practical trials in domestic use, would take us a long way on the road to that stage of development.

The process is akin to that pursued by breeders of animals, and by horticultural experts—they do not wait for natural evolution to bring about the results they wish for; they accelerate them by judicious selection and elimination, so that it is possible, in the course of a few trials, to intensify and develop any quality that may be desired. In the same way, the Sheffield steel experts, setting themselves the task of improving tool steel, quickly evolved a steel that would stand up to heavy cuts at a red heat—a steel that is the admiration of the world. Why should we be content to leave so important a problem as the development of the ideal types of heaters and cookers to chance?

Whatever the merits of the Edison storage cell in comparison with those of the lead accumulator, it cannot be denied that the former is an engineering product deserving of the highest commendation; as a mechanical device, it is a beautiful piece of work. It did not become so by haphazard trial and error, but by scientific investigation of the highest order. Examples might be multiplied, but we must stay our hand. The point is, that the work should be done in this way; funds are needed to carry it out, but the reward would be great. The subject is one of the greatest moment to the electrical industry, both to manufacturers and to supply authorities. It is one that the new Research Committee of the Institution of Electrical Engineers might take in hand, with the certainty of valuable results in the minimum time, and we earnestly commend it to the notice of that Committee, in the hope that something may be done.

Even when the design of the actual apparatus has been settled, there is more to be considered. The whole question of heating rooms, for instance, is at present in the crudest state imaginable. We use coal fires, and stoke up until the small proportion of the energy of the coal that gets into the room has raised its temperature to an unduly high degree; the fire dies down until we notice that the room is cold, and the process is repeated. Similarly we allow the room to cool at night, and warm it up again next morning. If electric or gas radiators are used, we still follow much the same routine—we heat up and cool down irregularly. How much better it would be if, as we have previously suggested, the room were kept always at the same temperature—that which was found the most comfortable and conducive to the prosecution of our respective occupations! There is no system of heating that lends itself so admirably to the attainment of this end as the electrical system; automatic devices to regulate the consumption of power in accordance with the actual requirements are, in fact, already on the market. Where such a system is in use the supply authority has a steady load with a low maximum demand, and can afford to give the supply at the lowest possible price, while the user is relieved of all concern about the heating of his house. It would be worth while to ascertain with certainty whether electrical heating carried out in this ideal way was able to bear comparison in point of cost—including all items of expense incurred, directly and indirectly—with the cruder methods of its competitors, which, it will be noted, usually involve the provision of chimneys at considerable cost to the builder.

### British Trade in Argentina.

In a recent report on the trade of Argentina, the British Consul reports that the advantageous position of British trade in Argentina is founded on the widely different economic conditions of the two countries which places each in a position to supply what the other requires. British capital and brains have found full and profitable scope for the development of railways in Argentina; the building of ports, the organisation of tramway services, providing machinery for economising and accelerating the preparation, storage and transport of grain, developing the cold storage and packing industries, advancing irrigation, water power, and land reclamation schemes, &c.; while the British flag now covers no less than 61 per cent. of the River Plate shipping—a circumstance that should in itself substantially reflect the upward tendency of our trade with Argentina. But the magnitude of British trading interests in Argentina may, perhaps, be more fully gleaned from the fact that no less than £500,000,000 of British capital is reported to have found its way into the country. The Republic, on the other hand, has attained the position of a great exporter of agricultural produce and meat, of which the United Kingdom is the largest consumer offering a growing and profitable market.

Although a study of trade conditions happily reveals British supremacy in the more important enterprises in the country, it would be unwise to ignore the progress that is being made by other nations who are gradually introducing elements of complexity into the economic conditions of the country. An effort is being made to secure a larger share of Argentine trade by the United States, and according to the figures of the Washington Department of Commerce for the year 1911-12, the imports into Argentina from the United States were £10,631,600 and exports to the United States £5,919,400, showing an increase on the general turnover of 22 per cent. as compared with the previous year. An increasing volume of business is likewise passing into the hands of our German competitors whose activity has been marked in the sugar industry, the electrical plant business, and harbour works. The following table shows the imports from leading countries in 1909, 1910 and 1911:—

	1909.	1910.	1911.
From United Kingdom....	£19,839,700	£21,875,500	£21,727,560
" Germany ... ..	8,911,200	12,225,800	13,172,400
" United States ... ..	8,613,800	9,683,800	10,470,700
" France ... ..	6,160,200	6,730,100	7,605,300
" Italy ... ..	5,373,600	6,355,200	5,879,200
" Other countries ... ..	11,652,700	13,483,700	14,507,100
Total ... ..	£60,551,200	£70,354,100	£73,362,200

It will then be seen that although our trade with Argentina is still larger than that of any other competing country, our percentage of the total decreased from 32·8 per cent. in 1909 to 31·1 per cent. in 1910 and 29·6 per cent. in 1911. On the other hand, the German share increased from 14·7 per cent. in 1909 to 17·4 per cent. in 1910 and 18 per cent. in 1911; the United States' share remained much the same. Although it is only to be expected that as years go on the shares of the leading countries should show a narrower margin, there can be no doubt that part of the increased percentage of German trade in particular is due to the greater keenness shown by German capitalists and manufacturers during recent years. In view of the heavy harvests which have just been reaped, Argentina may be regarded as a profitable market at the moment, and we should lose no time in endeavouring to take advantage of the prosperous conditions. The following figures will be of interest to readers of the ELECTRICAL REVIEW, as showing the extent of the market for their goods:

Imports of	1909.	1910.	1911.
Iron and steel, and manufactures of ... ..	£7,315,000	£8,624,000	£8,617,000
Transport carriages, wagons, &c. ... ..	6,342,257	7,019,036	7,373,075
Building materials ... ..	5,673,178	5,847,467	6,757,888
Manufactures of metals other than iron and steel ... ..	2,042,164	2,574,091	3,095,987
Electrical apparatus ... ..	843,382	1,148,306	1,336,734

## A FRENCH INQUIRY INTO ELECTRICAL ACCIDENTS, AND SUGGESTIONS FOR PREVENTING THEM.

By W. STEUART, M.R.C.S., M.I.E.E., &c.

As the result of the very large number of electrical accidents that had occurred during the previous years, the French Minister of Public Works, at the end of 1909, appointed a Commission to make such inquiries and experiments as it thought advisable, and to draw up rules and regulations accordingly, with a view to reducing such accidents to a minimum.

The inquiry extended over a period of more than two years, and the results have recently been published by Dr. Weiss, one of the members of the Commission. The publication takes the form of a paper-covered book, entitled "Sur les effets Physiologiques des Courants Electriques," published by Gauthier Villars, Paris. The members of the Commission first directed their efforts to obtaining information regarding the causation of death by electricity, these observations being limited to the following groups of cases:—

1. Death from lightning.
2. Accidental shocks from industrial electrical apparatus.
3. Electrocutions in America.
4. Laboratory experiments on various animals.

As regards group 1 this was soon put on one side, as it was recognised, in the first place, that the conditions were completely different to those ruling in connection with industrial electricity, and further, through lack of competent observation, the data obtained were practically useless.

The same difficulty regarding competent observation again militated against reliable data being forthcoming in the second group, and the apparent idiosyncrasies of the current were extremely disconcerting.

Two cases were mentioned as instances in point:—In one the man received a fatal shock; the body showed no signs externally whatever, and the most careful post-mortem examination failed to disclose any cause of death.

In the other, the victim had been horribly burned, the forearms and legs being actually amputated, and yet the patient remained alive and the general health was not affected.

The electrocutions in America, although carried out by skilled observers, did not afford much help to the Commission. The object in these cases was to kill instantaneously, so that it was impossible to judge what organ gave way first, and in what manner. Apparently the only valuable result accruing from this source was to impress the Commission with the lack of success of this form of capital punishment.

The fourth group of cases, being the experiments on animals, permitted of a complete and methodical study of the effects of the electrical current. It had one objection, viz., that it was questionable whether the results obtained from animals, such as dogs, could be applied to man.

Inasmuch as some of the experiments on the dogs were similar in degree to accidents that had happened to human beings, it may be fairly deduced that the influence of the electrical current on animals should be an approximate guide to the effect produced on men.

In all, some 44 dogs were experimented on. In each case instruments were attached to the animal to register the blood pressure, the pulse, and the respirations. The varying values were recorded on paper driven by revolving drums, the length of paper used giving an accurate measure of the time of the operation.

The pressure was registered by a voltmeter connected across the electrodes applied to the animal.

The experiments were varied by changing the pressure, current, points of applications of the electrodes, and time of application. The tests were carried out with both alternating and continuous currents, and in the former case different frequencies were tried.

The results are carefully tabulated, and copies of all the curves are given at the end of the book. Specific details of the different experiments would render this article unduly long.

Briefly, it was found that with alternating currents the frequency (between industrial limits) had no apparent influence on the results.

If death is produced by an alternating current with a pressure of less than 120 volts, it is due to the arrest of the heart in fibrillary tremors. The failure of respiration follows as the result of the heart stopping.

If death occurs as the result of a current with a pressure of more than 1,200 volts, it is due to the inhibition of the nervous centres and consequent respiratory failure.

Between 120 and 1,200 volts, both phenomena occur simultaneously.

Within certain limits death occurs with a constant number of joules, i.e., the danger increases with the intensity of the current, and with the length of time the current is passing.

An alternating current is approximately four times as deadly as continuous current. Death was brought about by a minimum current of 80 milliamperes (.08 ampere) alternating and a minimum of 339 milliamperes continuous. Although alternating currents were found to be more dangerous as regards immediate effects, they have no delayed action, such as has been observed after the passage of continuous currents. There are several cases recorded in which men have been subjected to strong continuous currents, have recovered for a time, and have then become paralysed in the limbs through which the current had passed.

Currents that were selectively fatal to the action of the heart did not cause death if the heart were not included in the circuit; e.g., with the electrodes placed below the jaw and on top of the head the current did not destroy the dog, but brought about death when they were applied to the forepaws.

After the heart had entered into fibrillary tremors, no known treatment was of avail in bringing about recovery, but, in certain cases, where respiratory failure took place the respiration gradually recovered after a lapse of some 90 seconds.

From a consideration of various fatal accidents, it is probable that the reaction of human beings to the current is quite comparable to the reaction of dogs.

After due consideration of the materials obtained, the committee decided to have three sets of placards prepared. The first embodied instructions to experts, and these are to be displayed in the interior of all electrical works, substations, &c. The second set was for the general public who might not be able to differentiate between dangerous apparatus and, for instance, inoffensive telegraphic material. The third set was of an educational nature, and meant for distribution in schools.

The first set of placards commences with some general information and recommendations to be observed in all cases. The important item of advice under this heading is:—Release the victim from the influence of the current at the earliest possible moment, remembering especially that dampness and moisture render rescue work extremely dangerous.

The procedure differs according to the pressure of the current. If less than 100 volts alternating, or 600 volts continuous, no danger to the rescuer is to be feared, and the victim may be secured and pulled away, care being taken not to touch any conductor.

From 150 to 6,000 volts, it is necessary for the rescuer first to insulate himself thoroughly from the earth. This may be done by means of dry, clean bottles placed under a board, or better by some spare insulators supporting a board. If two hands are used they should both be placed on the same part of the injured man.

For pressures over 6,000 volts, rescue under any circumstances is extremely dangerous. It is necessary for the rescuer to insulate himself from earth with the greatest care, and on no account to touch the victim except through insulating material also.

The bill ends with instructions regarding first aid, &c.

The second set of placards is meant for distribution in districts supplied with electricity. The public are warned not to attempt rescue unless the accident occurs inside a house, where the pressure may be assumed to be comparatively low. Under these circumstances,

people are advised to use only one hand, to cover the hand with dry linen or dry paper, not to touch the conductors, and to stand on a chair, if possible, before attempting to pull the victim free.

Where, however, the accident occurs in connection with some form of distributing apparatus, nothing should be done beyond informing the authorities, with a view to cutting off the current and getting expert help.

It was suggested that an attempt might be made to short-circuit the victim, but it was decided that this procedure would be inadvisable; for although certain and practicable in the laboratory, the attempt would be fraught with great danger when rapidly improvised on the occasion of an accident.

In the general report the Commission lays stress on the necessity of educating the public, and especially all children at school, of the danger there is in touching electrical apparatus. It further advises that all future accidents, particularly those of a fatal nature, should be carefully studied by skilled observers, so that they may report on the conditions obtaining at the time.

One curious error has crept into the report which has escaped the notice of the electrical engineers of the Commission. Dr. Weiss deduces from an experiment that the intensity of the current is the important factor, and not the pressure. He shows that by keeping the current constant, adding external resistance, and increasing the pressure, the dog behaves in exactly the same way in each experiment, quite overlooking the fact that the potential difference across the dog remains the same.

This fallacy, however, does not affect the value of the experiments, as the intensity of the current through the body is directly proportional to the E.M.F. applied to it.

To combat the idea that an electrical shock can only take place when a person is in contact with two wires, M. Guery contributes a note showing the effects of capacity in this connection.

He first points out how on any circuit which may have developed an earth, shock is possible from a single contact, and then goes on to consider a single-phase alternating-current line with a high insulation, and shows that with a capacity of 5 microfarads the pressure to which a person touching one wire would be exposed would be  $E/2$ ,  $E$  being the transmission voltage. Similarly on a three-phase mesh system, with a pressure of  $E$  between wires, the shock pressure would be  $E/\sqrt{3}$ .

Another note included in the report deals with protective clothing invented by Mons. N. Artemieff, of Kief. A similar device, however, has been known in England for some time. Trials and experiments carried out by the inventor himself showed that the idea might be of great value in practice.

The clothing is composed of a very fine metallic tissue formed in a single piece, and enveloping the whole body, including the head, hands and feet. The metallic tissue is fixed to fine cloth, and the whole garment is arranged to put on over the ordinary clothes, and is so made that it can be put on and off without assistance. The necessary gaps do not affect its efficiency provided they are closed in the prescribed way.

The clothing does not impede the workman's movements in any way.

Its protective action is twofold:—

1. The body of the operator is short-circuited by a resistance of less than .01 ohm. The costume can take a current of 200 amperes indefinitely and 600 amperes for several seconds.

2. A man clothed with such a garment can touch any part of a high-pressure apparatus without danger, provided it is sufficiently well insulated.

Although the clothing protects against death, it cannot obviate the possibility of very serious injury.

In all probability the increased current would promptly blow the fuses or operate cut-outs, but should it not do so the operator would establish an arc on breaking the circuit, leading to the destruction of the metallic tissue and the production of very severe burns.

When testing the clothing, the inventor is said to have short-circuited a machine having an output of 200 amperes at 1,000 volts through his hands, and then to have quickly

broken the circuit. The tissue was burnt in several places by the resulting arc, but the hands were not hurt at all.

Another test was the short-circuiting of a 20-kw. transformer, wound to give a voltage of 150,000 volts, without causing damage to the clothing of the operator.

## NOTES FROM CANADA.

[FROM OUR OWN CORRESPONDENT.]

THE Hydro-Electric Power Commission of Ontario recently issued its third and fourth annual reports (for 1910 and 1911) under one cover.

The reports show what contracts were entered into for the supply of power to various municipalities, the growth of the load, the survey work carried out by the hydraulic department, and the work done by the municipal department in planning out distribution systems, advising and assisting local electrical superintendents in the execution of their duties, &c.

Some interesting particulars are given under the heading of "Operation of the Systems."

Before being put into operation the various items of equipment underwent severe tests, the high-tension windings of the 110,000-volt transformers and the transmission lines being subjected to a test pressure of 220,000 volts between each phase and earth.

The load factor of the system is said to be fairly high, and for 18 hours of the day the load is, roughly, 75 per cent. of the maximum.

At first, when the load was very light, the power factor at Niagara Falls was lower than 70 per cent. leading, but as the load increases it is expected that the power factor will in time be a lagging one. Some of the larger municipalities have provided synchronous motors to control the power factor of their loads.

The voltage regulation on the high-tension system is within 2 per cent.

In 1911 electrical storms were reported on 55 different days, 18 of them being severe. Six interruptions have been caused directly by lightning on the H.T. system, but contrasting it with other H.T. lines, either on the Canadian or the American side of the Niagara district, this is only about one quarter of the number of interruptions which occurred during the same season on these other lines.

An interesting fact is that out of the 120,000 high-voltage insulator sections on the line, not one has been broken due to electrical causes.

A good deal of trouble was experienced with the operation of the Commission's private telephone lines, but this has not been practically surmounted.

The foregoing particulars refer to no more recent date than the end of October, 1911; it is expected, however, that the report for 1912 will be published before long, thus bringing the information available down to a recent date.

The article headed "Electrical Apparatus and Standardisation," by Mr. W. A. Toppin, in the REVIEW of February 21st, leads one to suggest that a leaf might very well be taken out of the "National Electrical Code" of the "Board of Fire Underwriters," which has been to the fore lately in these columns.

It is well that certain things should be standardised, more particularly those articles which, owing to breakage or other cause, are in constant demand by the ordinary consumer. It should be as easy for anyone to buy a new fuse, for instance, as to go out and purchase a box of tacks. Fuses over here are standardised, but they have one great objection: all fuses for from 1 to 30 amperes are of one size and interchangeable: the step should be a much smaller one, say, 1 to 5 amperes, 5 to 10 and so on.

In this connection the German system, employing the Edison plug type of fuse, is well worth consideration,

as all the threads for a considerable range of size, are identical, and differentiation is obtained in a very simple manner by making the connection at the bottom of the socket thicker or thinner for the various sizes; thus, a 10-ampere plug will not be long enough to reach the contact at the bottom of a 5-ampere socket, and, therefore, is useless. Of course it is quite impossible to arrange any fusing device so that a person cannot *deliberately* make use of it for a greater current than is intended; the best that can be done is to make it difficult or inconvenient to do so, and to make it impossible for any to do it accidentally.

Mr. Toppin refers to the need for a means of identifying "Association" and "non-Association" cable; over here every cable maker is required by the Underwriters' Laboratories to put certain coloured threads into the insulating covering whereby each firm's cable may be known. A similar system could, no doubt, be utilised to advantage with regard to the two classes of British cable, provided that necessary safeguards were devised to prevent unscrupulous makers from putting "Association" threads into "non-Association" cables.

These notes have before this contained references to the rapid growth of some of the towns here, especially in the West.

Calgary, Alberta, started its municipal tramway system in 1909 with two cars: last year there were 48. The track mileage was 3, but this year it will be 71. The population has in this time grown from 35,000 to 75,000.

According to a recent Government report giving telegraph statistics, there were, in 1912, 168,000 wire miles of line in Canada and nearly 42,000-pole miles. Over 9½ million land messages and more than ¾ million cablegrams were sent during the year ending June 30th, 1912.

The Grand Trunk Railway Co. is evidently satisfied with the use of the telephone for the work of train dispatching, as it is steadily extending the system, and the operation of a good many miles of track is now taken care of by this means.

## LIFE TARGETS.

THE improvement of targets for rifle practice has received a powerful stimulus from the development of the "miniature," or, more correctly, "low-power" rifle clubs' movement during the past 10 years, and some very ingenious devices have been introduced with the object of lending realism to the pursuit of rifle practice and facilitating the recording of the shots; but nothing that we have hitherto met with can be compared in point of novelty and interest with the remarkable system which has been evolved by "Life Targets," of 12, Bow Street, E.C. We recently visited one of their rifle ranges where the working of the system is demonstrated, and can vouch for the excellence of the device as a means of enabling riflemen to practise under the most realistic conditions. To put the matter briefly, the marksman shoots at the images of moving objects—birds, animals, whatever one pleases—thrown on a screen by a bioscope; the report of the rifle instantaneously stops the mechanism, so that the picture remains stationary for a few seconds, while the bullet-hole, illuminated from behind, is seen as a bright spot of light on the screen, thus enabling the accuracy of the aim to be observed.

The motion of the picture is then resumed, and further practice can take place, the bullet hole disappearing from view. The means adopted to attain this end are most ingenious. The essence of the system is the use of the "KK" detector, which was described in our issue of October 11th, 1912, and was originally invented by Mr. von Kramer and Prof. Kapp for the purpose of the Rallophone, described in our issue of July 5th, 1912.

The detector as used in connection with the Rallophone is actuated by resonance when an alternating current of given frequency is induced in a coil carried on a railway vehicle, by a corresponding current sent through a wire laid alongside of the track. As employed in the target apparatus, however, the detector may be said to be actuated by resonance. A microphone is fixed in the roof of the rifle range, with a trumpet directed towards the firing point, and

is connected with a battery in series with the primary of a small induction coil, the secondary of which is connected to the KK detector. Ordinarily, therefore, the latter is inert; but on the occurrence of a loud noise such as the report of a rifle, the current in the microphone circuit is disturbed, and the KK detector is actuated, closing the circuit of a relay. Obviously, this having been accomplished, with the aid of electromagnetic devices and a local battery, the rest is easy; the motor driving the bioscope is stopped and a magnetic brake applied to the mechanism, instantly arresting the progress of the film; and a time-limit device is set in operation, which, after the lapse of any desired interval (3 seconds is sufficient), restores the circuits to the running condition. As the exposure of a stationary celluloid film to the rays of the projection arc lamp would cause its immediate ignition, a current of air is automatically directed upon it to keep it cool—without this or an equivalent device the system could not be operated. The air supply is derived from an electrically driven blower.

We have mentioned that the bullet holes in the screen disappear when the picture is set in motion again. The method by which this is accomplished is extremely clever. The picture screen consists of a wide sheet of stout paper wound on a roller below the target; the band of paper passes upwards, over a roller, and downwards to a third roller alongside of

x Indicates the position of the microphone.  
TERRITORIAL N.C.O.'S FIRING AT THE LIFE TARGET.

the first. Thus every bullet perforates the sheet twice. A white surface behind the target, brilliantly illuminated with flame arc lamps, forms the source of the light that shines through the bullet hole. The roller last mentioned is provided with a ratchet wheel, with which engages a pawl, actuated by a solenoid at the moment when the motion of the picture is resumed; by this means, the paper is wound up ½ in., and as the bullet hole is ½ in. in diameter, the relative motion of the front and back portions of the band of paper puts the two holes out of line, thus causing the disappearance of the spot of light. This occurs at each shot, or, rather, at each resumption of motion of the picture target, as several shots may be fired simultaneously. As a large roll of paper is employed, it is, of course, desirable that it should be used over again many times; but if the paper were merely wound back and forth, the holes already made would evidently reappear. To prevent this, a second band of paper is passed once horizontally between the folds of the first band from one vertical roller to another. This sheet is perforated with the other; but by moving it occasionally the holes in the middle sheet are moved sideways out of line with those in the other sheets, and thus it is rendered so improbable that holes in the three sheets will accidentally register accurately that the contingency may be dismissed as too remote to be worth consideration. Moreover, the appearance of such a hole would necessarily coincide with the resumption of motion of the picture target and the movement of the screen, before any one could have fired, and therefore it could not lead to any mistake. By this clever device it is made possible to use the same paper over and over again, until, in fact, it is riddled with bullet holes.

It will be seen that the whole system depends absolutely

upon the aid of electricity, and the mechanism, which, we understand, is the work of several inventors and the subject of a number of patents, is exceedingly ingenious. We must express our admiration especially for the stroke of genius which utilised the K K detector to enable a sound to give rise to the motion of a relay. The effect could certainly be produced by other means, but nothing more beautiful could well have been devised than the device adopted.

The intense interest evoked in the breasts of riflemen by the "life target" is better experienced than described; rifle practice becomes a fascinating occupation when performed under such realistic conditions, and we cannot doubt that there is a wide scope for the new target, even when viewed only from the sporting aspect. But it has its serious side also, and as a means of training riflemen for military purposes it would be difficult to conceive of a more admirable scheme. The system has, in fact, been demonstrated before the military authorities, who have expressed the warmest approval of it, and there is every probability that it will be adopted by the War Office.

## THE FIXATION OF ATMOSPHERIC NITROGEN.

By P. H. S. KEMPTON, A.R.C.S., B.Sc.

THE increasing use of chemical or artificial manures in agriculture, especially for corn-culture in the United States, has rendered the manufacture of nitrogen compounds suitable for soil enrichment a matter of considerable economic importance.

The chief natural source of nitrates is the celebrated Chile petre beds, and some idea of the vast increase in the demands made on these beds can be gained from the following figures:—Output in 1896, 1,060,000 tons; output in 1905, 1,567,000 tons; output in 1910, 2,700,000 tons, of which 600,000 tons were supplied to the U.S.A. for corn culture. Assuming a steady increase in the demand, M. Vergara calculates that the Chile beds will be exhausted in 1923. With these facts in mind, many experimenters have turned their attention to the fixation of atmospheric nitrogen, and processes on a commercial scale are now in successful operation at Notodden in Sweden, Odda in Norway, Vevey in Switzerland, Patsch, near Innsbruck, and at Niagara and other places in America, water power being invariably used to drive the electrical machinery.

The choice of a substance with which to combine the atmospheric nitrogen, and thus "fix" it, is subject to three important considerations:—

1. The cheapness of the combining substance.
2. The cost of the energy used in effecting the combination.
3. The availability of the nitrogen in the resulting product, and its consequent suitability for the purpose of soil enrichment.

Obviously the cheapest and most natural substance for combination is the atmospheric oxygen, and to the production of oxides and nitric acid most attention has been directed. Next to oxygen, hydrogen has been most in favour, and many experimenters have devoted their energies to perfecting methods for producing ammonia by acting electrically upon various mixtures of atmospheric nitrogen and producer gas, Dowson gas, &c. The combination with carbon to form cyanides, and with metals to form easily decomposable nitrides, has been referred to; while the most recent, and perhaps the most promising, direction of research is in the production of cyanamides.

*Fixation with Oxygen.*—As early as 1785, Cavendish combined nitrogen with oxygen by means of the spark discharge. In 1863 Meissner experimented on similar lines, and found that combination was effected more easily when the gases were moist. In 1892, Sir William Crookes suggested the use of the arc, and the same idea was also used by Rayleigh in 1897. In 1900, MacDougall and Howles, using a

high-tension alternating arc, concluded that the degree of fixation of the nitrogen was a function of the temperature. At about the same time Bradley and Lovejoy set up a plant at Niagara, in which 10,000-volt d.c. arcs were maintained between platinum electrodes. This undertaking ran for 15 months, and then failed, owing to technical difficulties arising with the apparatus and the smallness of the yield of saltpetre (430 kilos. per kilowatt-year). Soon afterwards, however, Birkeland and Eyde, at Notodden, perfected a process which is the basis of most modern methods of fixation. The essential difference between their method and the methods previously adopted is the drawing out of the arc into a disk by means of an electromagnet.

The arc is run at 5,000 volts a.c., and an electromagnet, placed equatorially, draws the arc out until it breaks: it then forms again, is again drawn out and breaks. This process, repeated very rapidly, provides what is, practically speaking, a "disk arc," and by suitably arranging the arc and providing a sufficiently powerful magnet (between 4,000 and 5,000 lines per sq. cm.), a disk as large as 3 ft. in radius can be maintained, and a field temperature of 3,000 °C. reached. Hollow U-shaped copper electrodes are used, 2.5 cm. in diameter, which are water-cooled. The air is passed through this arc at a gentle pressure, 25,000 litres per minute being the normal rate of flow, producing 2 per cent. of nitric oxide. This nitric oxide is cooled, oxidised to the peroxide and passed into towers, where it is first converted into nitric acid and, finally, into calcium nitrate, by passing into milk of lime.

In 1910 the plant at Notodden consisted of furnaces consuming 1,500 kw., and capable of "fixing" 150 kgm. of nitrogen per kw.-year. This has recently been augmented by furnaces using 800 kw. each, and whereas the production in 1910 was 20,000 tons of calcium nitrate, the new plant is now supplying nearly 40,000 tons per annum. Larger furnaces are now being tested, one of 3,000 kw. being in regular use. Results seem to point to increase of yield, with increase in furnace power. The product which is put on the market is 75 per cent. calcium nitrate (equivalent to 13 per cent. nitrogen), and the estimated cost of production is £4 per ton. Birkeland calculates that it can be sold at a profit at £8 a ton, thus competing with the natural fertilising products, which sell at from £6-£10 per ton.

At Vevey, Mosciaki and Kowalski have an arrangement in which the arc is maintained between two concentric copper poles and kept revolving by means of an electromagnet. In this way the arc is drawn out into an effective "ring arc," and the air passing through the annular space is "fixed," and the oxides produced are treated much as in the method described above. The arc is of exceedingly high frequency and voltage.

In the Badische Anilin und Soda Fabrik the arc through which the air is drawn is maintained in a tube 30-50 ft. in length, the upper end of which is water-cooled.

The arrangement of the furnace is such that the incoming air is heated to a temperature of about 500° C. by the outgoing gases.

The experimental furnaces working on this principle (the Schönheir arc) in Christiansand, work at 4,200 volts, and consume about 450 kw. In a new plant in course of erection, the arcs will be about 20 ft. long, the power consumed will be 600 kw., and the furnaces will require about 40,000 cb. ft. of air per hour.

It is claimed for this process that a 30 per cent. nitric acid is produced, and extensive experiments are being carried out at Notodden to determine the relative merits of the Birkeland and Schönheir systems with a view to installing the most successful method in the new works at Rjukan.

The furnaces used by the Salpetersäure Industrie Gesellschaft Gelsenkirchen, at Patsch, in the Tyrol, are of the Pauling type. The arc (of high frequency a.c.) is maintained between diverging electrodes and tends to spread to the widest space between them. The arc is also broadened by the stream of hot air passing over it.

The present plant consists of 24 furnaces taking 400 kw., each at 4,000 volts, and using 600 cubic metres of air per hour, but larger furnaces on this system are being installed in new works at Legnano, near Milan.

Haber and Koenig give the following comparison of the efficiencies of the flames:—

Paulig ...	60	grammes	HNO <sub>3</sub>	per	kilowatt-hour.
Birkeland ...	70	"	"	"	"
Schönherr ...	75	"	"	"	"

**Fixation with Hydrogen.**—In 1900, Hemptinne, experimented on mixtures of nitrogen and hydrogen with spark and silent discharges. He found that the best conditions for combination are low pressures and temperatures and narrow spark-gap. Three years later, Schlutins, experimenting with Dowson's gas, discovered that combination with atmospheric nitrogen proceeds fairly rapidly at temperatures below 80° C. in the presence of platinum under the influence of the silent discharge. The possibility of substituting Dowson's gas for purer forms of hydrogen has rendered the manufacture of ammonia by this method a commercial possibility, but as the supplies of gas-liquor ammonia are considerable, it is unlikely that this synthetic ammonia will enter into active competition with the nitrates which are produced more cheaply by the electrical methods previously described.

Other methods involving the use of catalytic agents other than platinum (*e.g.*, uranium) have been suggested, but have not achieved any commercial success.

**Fixation with Carbon.**—More recently attention has been turned to the possibilities of combining atmospheric nitrogen with another cheap material, namely, carbon. This has been accomplished indirectly by the following means: Calcium carbide or a mixture of carbide and chloride is heated in a specially constructed form of electrical furnace in the presence of nitrogen. The carbide takes up nitrogen, liberating carbon and forming calcium cyanamide (NCN<sub>2</sub>Ca), known commercially as kalkstickstoff. The nitrogen was originally obtained from the atmosphere by passing air over red-hot copper and then reducing the copper oxide by a stream of hydrogen or producer gas in order to recover the copper, but this method has now been superseded by the fractionation of liquid air to obtain the necessary nitrogen. Attempts have also been made to combine the production of the carbide and the cyanamide in one operation, but these have now been abandoned.

Theoretically, 1 kw. should suffice to "fix" 100 kg. of nitrogen per annum. In practice little over 40 kg. are obtained. The product—kalkstickstoff—contains 20 per cent. of nitrogen, and on treatment with water yields ammonia, and thus acts as an active fertiliser. Cyanamide factories are now in existence in Italy, the United States, Norway, Germany, Switzerland and France. The largest of these works is that at Odda, in Norway, which was originally built by the North-Western Cyanamide Co. to produce calcium carbide. The present output of cyanamide from this factory is 20,000 tons annually, the plant consisting of 196 furnaces, using a total of 20,000 h.p. derived from the River Tysse, four miles distant.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Business in Spain.

Your recent article on the backward state of British trade in electrical material in Spain is interesting, and may spur some manufacturers who do not already know the market to make efforts and spend money to obtain the trade which undoubtedly exists.

As a British manufacturer, with a good many years' experience of Continental trade, I might mention the following:—

For the last 11 years I have regularly worked Spain with travellers, from the rank of a director downwards, including some of my most competent engineers, of course speaking the language, but they have never yet secured sufficient business to pay more than their travelling expenses.

Thinking this system might be wrong, I appointed local agents, and endeavoured by moderate stocks to obtain the trade. This method also failed.

Then I tried employing a Spanish commercial traveller,

an engineer (certainly not a specialist in electrics), with a good working knowledge of Spanish requirements. The experiment was even worse than the others, and consequently I now feel the Spanish market is really no good to me. The trade is there, but the grade of material, whether accessories, fittings, motors or fans, is so low, that I find they will not even take the trouble to look at corresponding British articles, which as a rule are at least 25 per cent. more in first cost, and generally cost more to land through Customs duties, owing to their extra weight.

Further, the supply houses and jobbers of the principal cities are almost all tied houses, allied to the wealthy German, and occasionally French, manufacturers. These carry enormous stocks, and are willing to sell them at figures far below my works cost. Price, and price alone, seems the secret of the trade, and I think my experience will be found to be that of other manufacturers.

The only explanation I can offer is that so long as the German manufacturers are able to sell their machines at high prices at home (as I know from personal experience they do), they can continue with advantage to sell at dumped figures abroad. There may be some advantage to Spain as an importing country, but it effectually prevents her attempting the manufacture of this material, and as my experience shows, precludes any hope of success from England.

I should be interested to hear what other manufacturers' experience has been.

Manufacturer.

London, March 20th, 1913.

### Failure to Excite.

I should be pleased if any of the readers of the REVIEW could explain a curious difficulty which occurred to me the other day.

I wound a small shunt dynamo to generate 60 volts D.C. at 4,000 revolutions, to act as a speedometer for a variable-speed alternator, driven from the pulley of the same, and to record on a 0-60 voltmeter to be calibrated in "cycles per second" unit.

It ran at about 3,800 revolutions as a shunt motor on 60 volts, but when driven as a dynamo it refused to excite. Separately excited on 60 volts, however, we obtained about 55 volts from the armature, but even when we helped the excitation with a few turns carrying a heavy external current, when the shunt fields were connected across the two brushes, we only obtained 18 volts on the voltmeter, which slowly fell back to zero when this helping exciting current from the external source was switched off. The machine was a two-pole machine, the armature core and field stampings being of Sankey's "Lohys" iron (it being a core as usually used for small fan motors A.C. and D.C.); the field turns 1,500 per pole, carrying about 0.15 amp., and the armature resistance, brush to brush, being about 8".

Speedometer.

### Prospects in Electrical Engineering.

One of the most interesting sections in the ELECTRICAL REVIEW is the "Situations Vacant" columns, which I think are perused regularly by a large number of the profession, from chief engineers down to those young gentlemen who have studied Ohm's law for a few weeks and wish to become electrical engineers. These columns of your issue of March 28th are particularly interesting, and give one much food for thought. Take the case of a switchboard attendant wanted for an electricity works in Lancashire with three separate supplies—high tension, three-wire D.C. and traction—"should have technical school training," for the magnificent salary of 5s. per week of 56 hours (presumably seven shifts per week), which works out at 1d. per hour, with an odd 4d., with which the successful applicant can purchase the ELECTRICAL REVIEW to look for another job. This advertisement must be bad reading for some of the technical institutions.

Then, again, we notice that a chief electrical engineer is required at £500 per year clear of all expenses, and be it noted he must not exceed 40 years of age.

Now probably a young gentleman finishing a course at a

technical school notices these two advertisements, and immediately comes to the conclusion that he starts at the bottom at 5s. a week and rises to £500 a year before he is 40. Perhaps!!! He very likely consults the professor in charge of the institution at which he studies, and hears the old, old tale about starting at the bottom of the ladder, and goes straightway and takes the 5s. job, and in imagination we can hear the grunt of satisfaction of the electrical Mephistopheles, "Another one!"

The point I wish to impress is that the technical institutions do little or nothing to advise these young men. They are allowed to go to their dream without any warning, and they have not the least idea of the harm they do to the profession generally by accepting such low salaries for responsible positions.

I would suggest that the heads of all technical teaching institutions in the country should devote, say, one hour per session to a lecture on future prospects, with special reference to the danger of accepting small salaries for positions of responsibility, and perhaps reprints of articles on the subject from the technical Press could be distributed to all men finishing their course of study. Articles such as the one entitled "The Ends of the Rainbow," in the ELECTRICAL REVIEW of March 7th, 1913, would no doubt do much good. In this article is pointed out the folly of the rush to "the initial stages of a new branch of industry, or to the opposite pole when the industry becomes stereotyped." I had hoped to see some correspondence on the subject of this article, but electrical engineers seem at the present day very apathetic with regard to any subject which touches their status.

This brings me to another point—the apathy of a large number of electrical engineers with regard to the future prospects of the profession; this applies particularly to Birmingham and the Midlands.

When some members of the A.E.S.E. were visiting a number of electrical stations in the above districts, they found that a good number of the men engaged in them did not read the technical Press, and consequently knew nothing of what was going forward, other than in their own little sphere. A few back numbers of the ELECTRICAL REVIEW were distributed among them, and it is hoped that this will rouse these men to take more interest in their profession in the future. The majority are in receipt of very low salaries. Some have even dared to marry and have families. Perhaps they have heard tell of the reply which was given by a chief electrical engineer of a London supply authority when it was pointed out to him that he was paying his labourers as much as, and even more than, his engineers. He said the reason why the labourers were what he called "well paid," was because a labourer generally had a wife and about 10 children, giving the impression that if his engineers obtained a wife and a family each he would pay them a larger salary.

I must point out that any improvement must be initiated by the men themselves, in combination with their colleagues all over the country, and earnestly appeal to all electrical engineers who read this letter to come forward and help in the work that is going on to raise the status of the profession by means of the A.E.S.E.

W. J. Ebben,

Hon. Sec. Association of Electrical  
Station Engineers.

London, E., March 31st, 1913.

**An Electric Cloth-Cutting Machine.**—An ingenious electrically-operated machine for cutting super-imposed layers of cloth has lately been brought out by Messrs. G. Stibbe & Co., of Leicester. The machine, which is known as the "Ballard," is a compact and fairly light piece of mechanism, capable of being operated from an ordinary electric lampholder, and consuming, it is claimed, no more current than that required for a 32-c.p. lamp. Two types of the apparatus are being made, one with a vertically-moving knife, the other with a rotary disk cutter. In use the machine is held and guided by a small handle, the switch being so located on the machine that the latter can be stopped and started by a movement of the operator's thumb. The cutting blades are guarded to prevent accident or injury, and each machine is provided with a lamp for throwing a strong light on the cutting line. As the electric wire connections may be conveniently arranged for moving the machines through a considerable distance, great lengths of cloth may be operated upon. The cutters are built in three sizes, for cutting cloth layers up to 4, 5, or 6 in. in thickness.

## WIRELESS TELEPHONY IN MINES.

THE system of wireless telephony described in the following paragraphs has been in regular successful operation in the Carolinenglück mine for some time past, and provides efficient communication between the pit head and stations within a radius of more than one mile from the shaft bottom. We are indebted for the particulars and illustrations to *La Technique Moderne*.

The equipment required is very simple, and the necessary primary currents can be obtained from small batteries, so that the capital outlay and working expenses are low. High-pressure high-frequency secondary currents are supplied to ropes, pipes and rails in appropriate positions in the mine, and the electromagnetic radiations from these conductors are received in suitable local circuits.

Referring to fig. 1, wireless telephonic communication can be established between the engine house and the shaft cages by (1) connecting a loop conductor  $a$  in the shaft lining to batteries and a microphone  $t$  in the machine house; (2) connecting a telephone  $t$  and battery  $b$  between the extremities of the over and under-winding ropes at each cage. These ropes and the winding pulleys form a closed circuit in which the current can be varied (by speaking into the cage transmitters), and thus corresponding variations can be electromagnetically induced in the engine-house receiving circuit.

The various strata of the soil play an important part in wireless telephony in mines. Electrically, the surface of the soil acts as a vast condenser, capable of absorbing any quantity of electricity. The lower strata act as an insulator with regard to static charges. The rails and pipes form a conducting system, sufficiently insulated by the surrounding layers of soil to be used as such—even for weak static charges.

Referring to fig. 2, a 12-volt battery in the surface sending station passes about 0.5 ampere through a microphone and the primary of an induction coil, which raises the pressure of the

FIG. 1.

FIG. 3.

speech currents to several thousand volts. The secondary of the transmitting transformer is connected between earth and a pipe line  $r$ , traversing the mine shaft and galleries. The feeble high-pressure speech-currents flowing through the pipe line, or other conductors in the mine, emit electromagnetic waves, and the linear conductor may be interrupted at various points without disturbing the propagation of the waves. To collect some of these radiations and translate them into sound, one of three different arrangements may be employed. The simplest receiving circuit—see lowest gallery, fig. 2—comprises a high-pressure winding connected between  $r$  and the rails  $s$ , and a secondary low-pressure circuit containing a battery and telephone receiver  $t$ . In the middle gallery, the high-pressure winding of the receiving transformer is simply bridged across from 15 to 25 ft. of the pipe  $r$ , according to the distance from the sending station. A third arrangement—shown in the top gallery—requires no direct connection between the pipe line and the receiving circuit; the high pressure winding of the receiving transformer is connected to a loop of wire mounted parallel to the pipe line and constituting a receiving "antenna."

The chief difficulty encountered in perfecting wireless communication along these lines was to design a simple and reliable call device. After conducting a number of experiments, M. Reinecke has secured satisfactory results with the apparatus shown in fig. 3. A note of definite pitch is emitted by an "electrical trumpet" in the sending station, and the electromagnetic waves radiated from the pipe system in the mine impinge on a receiving antenna connected to an electromagnet mounted beneath a membrane  $m$  in the receiving station. This membrane is set in vibration by stimulating oscillations of predetermined frequency, and then makes and

breaks the contact between itself and the style  $s$  on the balanced arm  $k$ , the adjustment of which is independent of temperature. In the first form of the call device the current normally flowing *via*  $k$ ,  $s$ ,  $m$  energised a solenoid  $d$ , and thus held open the spring hammer contact  $r$ . Directly the contact  $s$   $m$  was opened by the vibration of  $m$ , the contact  $r$  in a local call-bell circuit was closed. It was found, however, that purely mechanical vibrations in the neighbourhood of the calling relay might set  $m$  in motion, and thus give a false alarm, to avoid which a time relay  $t$  was included in the bell circuit, so that the latter might not be closed unless  $m$  was in continued vibration induced by true call-waves. As thus perfected, the call device only operates when that button is pressed in the pit-head station, which controls the "electric trumpet" tuned to the natural frequency of  $m$ . By tuning the membranes  $m$  at various stations to different frequencies, and by providing a number of electric trumpets emitting corresponding notes at the pit-head station, it is possible to call selectively the stations in the mine.

In order to simplify the equipment, the primary transformer coil at the pit-head station may be used to actuate the electric trumpet, the secondary winding being automatically placed out of circuit by the action of pressing the call button. Sparking at the trumpet contacts is avoided by the use of a shunt condenser in the ordinary manner.

The weight of the complete equipment at each station, comprising a battery of cells, an induction coil, microphone and call apparatus (the whole enclosed in a suitable case), is about 24 lb. The British rights on the invention are secured by Patent 15,256, 1912, and for a more detailed description of the system and apparatus, readers should refer to *Glückauf*, October, 1912.

## ELECTRICAL TRADES BENEVOLENT INSTITUTION.

MR. E. GARCKE presided at the Institution of Electrical Engineers on Monday at the annual meeting of this Institution. Before moving the adoption of the report he mentioned that Mr. Justus Eck was not able to be present owing to his absence in Australia travelling. Mr. Garcke then proceeded to briefly summarise the financial position to which we referred in a leaderette in our last issue. The net surplus of the year, to carry to the accumulated funds, was £682. He said that the position as shown by the balance-sheet might lead to obvious comments to the effect that the grants and benefits bestowed were few in relation to the large number of men employed in the industry; that the expenses bore too large a proportion to the receipts; and that the subscriptions collected were small in the aggregate in relation to the size of the industry. Grants could only justifiably be made out of interest on capital; the latter was at present £4,000, yielding last year about £100, so that their benefits could not be conferred upon a large scale. But the benefits conferred were not expressed merely in figures; the money was given in such a form that the gift might lead to more permanent benefit, and the objective of the Committee always was to assist those in need that they might be able to obtain new appointments, or more permanent relief in other ways. The item of expenses (£200) might be taken as a minimum, and it would not necessarily follow that if the income were doubled the expenses would increase materially, so that the proportion might look better than now. Attention must be given to the best ways of increasing income, rather than to cavilling at expenses. By incurring greater expense they could show better results in regard to subscriptions and donations, but they must have regard to the proportion which the expenses bore to the collection, and it was not practicable for the Committee to do very much more in the way of making efforts to increase income without increasing expense. They only hoped that by constantly calling attention to the Institution and its beneficent work the various companies and firms successfully engaged in the industry might take note of the desire of the Committee to be put into a stronger position, by increase of its capital, to do the work for which the Institution was formed. The industry was capable of doing very much more in benevolence than it was at present doing. There were something like 6,000 companies and firms engaged in the electrical industry in this country, and the capital invested exceeded 500 millions sterling, and he was not expressing an unduly optimistic hope when he said that if attention was called to the needs of this Institution those engaged in the industry would respond liberally. If only a small proportion of the 6,000 firms would subscribe even the moderate amount of five guineas per annum the Institution would be placed in an exceedingly strong position. The work of the electrical industry was not very highly profitable, though exceedingly interesting, yet on that huge capital even a moderate return yielded something like 20 millions sterling per annum; therefore, it was not much to ask that a very small percentage—an infinitesimal proportion—of those profits should be put aside annually for the purposes of benefiting those who had struggled and failed. There were 450,000 people engaged in the industry, and out of that total a certain number must occasionally fail and be in need of assistance; and it was the duty of all those who made profits to put aside some of those profits for such men. There were also 130,000 investors in the electrical industry who were deriving moderate profit out of that industry, and they were dependent upon the strenuous efforts of those who were engaged from day to day in the industry. It would not be all impertinent to ask shareholders to contribute to the Institution. If only

1 per cent. of those 600,000 could be induced to become members, and pay a minimum subscription of 10s. per annum, there would be a handsome and increasing capital on which the Institution would be enabled to operate. Mr. Garcke then went on to refer to the question of legacies. It was only necessary to bring to the notice of gentlemen who were able to and did make wills that it was a very desirable form in which they could help this Institution. It would lessen the expense of collection and would not involve any immediate sacrifice on the part of those who so helped. The difficulty was to bring it to the notice of those in a position to make legacies of the kind. Most people were very busy, and it was only occasionally that they gave thought to the subject, and then, when they made their wills, the existence of the E.T.B.I. was not always in their minds. The Committee were strenuously considering the best means to adopt to constantly keep the matter before the minds of such people.

Mr. Bevis, in seconding the adoption of the report, mentioned that since making up the accounts, the Committee had invested another £300 in New Zealand stock, making a total of over £4,000 in investments.

The following members of the committee of management were re-elected: Messrs. Justus Eck, T. J. Grainger, E. F. Johnson, L. A. Lundberg, F. H. Nalder, H. Oppenheimer, W. R. Rawlings, L. G. Tate.

The names of Lord Yaux of Harrowden, director of an electrical manufacturing and other companies, Sir Ernest Spencer, a director of the Metropolitan Electric Tramways and other electrical companies, also Mr. Ernest Nash, of Faraday House, were added to the committee. Messrs. Price Waterhouse & Co. were re-appointed auditors, Mr. Garcke was thanked for presiding, and Mr. Wallis Jones suggested that legacy slips should be sent out annually.

## THE FIRST INTERNATIONAL CINEMATOGRAPH EXHIBITION.

DESPITE the inconvenience of its date (from the exhibitors' standpoint), and despite the serious trade opposition encountered during the early stages of its organisation, the First International Cinematograph Exhibition—held at Olympia from March 22nd to March 29th inclusive—proved an unqualified success. Some 20,000 visitors were admitted on Easter Monday, and an average of 10,000 was reached on the other days. We know of no other trade exhibition which has realised such instantaneous success. The effect desired and secured was to raise the cinematograph industry to that independent status which it justly merits. In the words of one of the exhibitors—"The cinema industry has hitherto been a sort of parasite to the stage, but now that is altered." No small share of the elevating effect of the Exhibition has been due to the excellent series of Conferences arranged, and to the Industrial Welfare Section of the Exhibition which demonstrated the value of the cinematograph in social and educational work.

Probably for the first time on record, no fewer than 15 distinct theatres holding separate licences and using, roughly, 250,000 ft. of film per diem, operated under one roof. Every theatre was required to comply completely with the L.C.C. Cinematograph Regulations (as regards wiring, fire prevention and building construction, &c.), and the manner in which their erection was carried out (under the control of Mr. J. W. Barber, consulting engineer to the Exhibition) was remarkable for speed and efficiency. Only those who have had close experience of exhibition work can realise the chaos which reigns on the eve of opening, when jobs which properly follow each other in ordered sequence have to be performed piecemeal and practically simultaneously. In the present case, the holiday season increased the difficulties to be overcome, and the arrangement, construction and proved efficiency and reliability of the miniature theatres formed by no means the least attractive and instructive feature of the Exhibition.

In every case the auditorium of the theatre measured 40 ft. x 20 ft., and the usual size of screen picture was 12 ft. x 9 ft. 6 in. Whatever the feature specially demonstrated—whether projector, film or screen—excellent results were secured, despite the fact that the special gangway regulations enforced involved serious ingress of daylight during the daytime.

The general arrangements made for electricity supply in Olympia, from the Hammersmith mains, have already been described in these columns. From the permanent 220-volt converter sets were supplied motor-generators or auto-converters forming part of the individual theatre equipments. These machines, which were normally required to supply from 30 to 35 amperes at 65 volts to each projector, were of various types, each of which had its own special advantages, and no one of which showed any serious defect. There were in use three Siemens, three Grever and two G.E.C. motor-generators, in addition to a C.M.B. and two Pathé auto-converters and one Cooper-Hewitt rectifier: three theatres took current direct from the Exhibition supply mains.

There is prevalent a decided opinion that it is a mistake to run cinematograph arcs with too little ballast resistance, and we learn from a representative of Messrs. Pathé Frères that this firm prefers to use 100-volt supply in the projector circuit. The ballast loss is, of course, increased as compared with circuits supplied at, say, 65 volts, but the arcs run much more steadily, fluctuations in resistance now exercising little effect on the total resistance of the projector circuit. It is false economy to sacrifice excellence of projection, in however small a degree, to reduced energy consumption. Whether

rectifiers, motor generators, or "constant-current" auto-converters are used, a considerably higher ballast loss than is at present generally allowed in such cases should be tolerated.

The Exhibition has proved remunerative to its organisers and to exhibitors, and has proved a great public attraction. It has given the cinematograph industry a distinct status, and has demonstrated its remarkable technical development, and wide technical and social scope. The next exhibition will probably be held about September, 1911 (this being the first vacant date at Olympia), and will last a fortnight. At this and subsequent exhibitions the great difficulty is likely to be the accommodation of exhibitors. The success of the present show has already led to the projection of similar exhibitions in America (for July next), and in Paris (for next autumn).

In the succeeding paragraphs attention is chiefly confined to electrical features, but passing reference may be made to the interesting historical exhibits showing the early development of the zoetrope and cinematograph, and to the innumerable pieces of modern apparatus, including film perforators, cinema cameras for standard or special work, printers, developing appliances, projectors, and the accessories of each.

**Petrol-Electric Sets.**—Where electrical energy is not available, or only at prohibitive rates, from public supply mains, petrol-electric generating sets are coming into extensive use. Indeed, so reliable and so economical in fuel consumption have these equipments proved in service that they are now used in many districts where public supply is available at from 1 to 2d. per unit. The generating costs claimed for petrol or paraffin driven sets, now on the market, vary from 1'0 to 1'5d. per unit and the capital, attendance and maintenance costs are extremely low. Cinema halls of such size and in such numbers are now in operation in every town of any importance, that their energy demand is well worth securing and retaining by central stations. Supply from the public mains relieves the cinema proprietor of the cost and responsibility of installing a private generating plant and, to a great extent, of the risk of failure of supply. Taking these facts into consideration, there should be no difficulty in arranging, in large and medium-sized supply undertakings, a tariff which will secure cinema loads to the central station. In smaller undertakings, however, the cinema load and the time of its demand are often unfavourable, so that either a comparatively high charge has to be made for current or the supply has to be taken through an auto-converter or motor-generator from the power mains or from across the outers of a three-wire lighting network. In either of these cases, the cinema proprietor will probably prefer to install his own generating plant.

Among the excellent generating sets exhibited at Olympia mention may first be made of the "Pelapone" sets shown by the E.E.E. Co. The engine used in these sets develops from three to 12 H.P. at 800 R.P.M., according as from one to four cylinders are used, and is certainly one of the most silent and smooth-running internal-combustion engines it has been our pleasure to inspect. The quantity and quality of the fuel mixture are regulated by a shaft governor, and forced lubrication is provided to every working part. The oil consumption is  $\frac{1}{2}$  pint or less per B.H.P.-hour.

Messrs. Pathé Frères exhibited several Pathé-Astor sets suitable for stationary or portable use, and providing electrical energy at 1'25d. or less per K.W.-hour. Owing to the small ballast resistance required where these sets are employed, it is estimated that their use is economical wherever public supply costs more than 0'75d. per unit. The "Ballot" petrol-electric set, which we understand is largely used in Pathé halls, is a particularly compact equipment providing 12 amperes at 75 volts, and weighing, complete with all tanking and piping, &c., 2 cwt.

Messrs. Fyfe, Wilson & Co. were exhibiting their well-known "Kelvin" sets, comprising a one, two or four-cylinder petrol or paraffin engine direct coupled to a compound generator, with or without interpoles. Standard sizes of this equipment provide 50, 70, 100, 135 or 270 amperes at 60 volts, and are sold complete with all tanks, piping and electrical control gear, either for stationary or portable use. Valuable features of the "Kelvin" engine are the partial intake of air from the enclosed crank case (thus preventing the accumulation of explosive vapour therein), and a quick starting device. The latter consists in the provision of about 18° play in the sprocket driving the L.T. ignition magneto. When starting up, the engine is brought into its firing position and a plunger is released which holds the magneto sprocket still, while the fly-wheel is rotated, till the limit of play of the former is reached. The spring plunger is then thrust upwards and the sprocket flies forward (under the action of two powerful springs), and thus provides a strong spark at the moment of firing, although the fly-wheel may have been moved quite slowly by the starting handle.

(To be continued.)

**Kent (Fortress) Royal Engineers.**—To-morrow the Gravesend Company of this branch of the Territorial Force will hold its annual dinner, and the prizes won during the year will be distributed by Colonel Seely. The Gravesend Company is one of the two Kent "Electric Light" Companies, and has a strength of 90 N.C.O.'s and men; it consists of three sections—engine drivers, electricians, and telephonists—and is well supported by the local employers, including Henley's, which contributes 21 men to the roll. Recently the Company, although it has not been two years in existence, won a valuable cup presented by Sir David Salomons, Hon. Colonel of the five Companies forming the Corps. The officer commanding the Company is Captain C. B. Grace, and the present headquarters is at the New Tavern Fort, Gravesend. A Cadet Company has also been formed in connection with the Company.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### G.E.C. Combined Switch Fuse and Plug.

THE GENERAL ELECTRIC CO., LTD., are making a new combined switch fuse with a plug attachment, fig. 1 for use in docks, non-flery mines and other work where a flexible connection to a motor is employed.

The switch cover cannot be opened, nor the plug withdrawn nor inserted, with the switch closed. The cover is interlocked in the orthodox fashion, and the switch spindle carries a cam, which, when the switch is closed, presses down the upper end of a hinged steel bar. The lower end of the bar is turned at right angles and forked. In addition to its two current-carrying pins, the plug is equipped with a long steel pin, which passes through a hole in the case into the interior of the switch-box, and is so notched that it can be gripped and held firmly by the fork on the hinged bar, so that when the plug is in position and the switch closed, the fork

FIG. 1.—G.E.C. COMBINED SWITCH FUSE AND PLUG.

engages with the steel pin and absolutely vetoes all attempts to withdraw the plug. Moreover, if one tries to insert the plug while the switch is closed, the end of the steel bar effectually blocks up the aperture through which the steel pin has to pass, so that access is completely denied, and the operator is compelled to switch off before he can insert the plug.

The earthing conductor from the motor terminates at a contact in the plug, and the first step in the process of inserting the plug is to complete this earth connection. Then, and not before, the brass pins enter their sockets. On withdrawing the plug the earth connection is the last to be broken. A device is included for preventing the insertion of the plug in the reverse way.

### New Type of Rheostat.

The accompanying illustrations from *L'Industrie Electrique* show a new type of automatic rheostat, which appears to offer some advantages in connection with motor starting. The principle of the apparatus is that of the hour-glass, supposed to have been rendered obsolete for chronometrical purposes in this country by Alfred the Great's calibrated candles, but still used in miniature as an accessory in the delicate operation of egg boiling.

The tube A, fig. 2, is divided into two roughly equal parts by throttle plates B, and one half is filled with sifted and dried finely pulverised carbon. The flow of the carbon particles is regulated by the cone valve C, attached to the rod D; C serves the further

purpose of distributing the carbon more or less evenly in the lower half of A. The electrodes of the rheostat are the tube A and the rod E, which is insulated from direct metallic contact with A. As carbon particles collect round E, the circuit F G is closed through a resistance which decreases (according to an exponential law) as the

FIG. 2.

FIG. 3.

HOUR-GLASS RHEOSTAT.

depth of granules in the lower chamber increases. The tube being closed, the carbon cannot burn, even when worked at high temperature; as in enclosed arc lamps, an atmosphere of carbon-monoxide and dioxide forms within the tube A. The apparatus is claimed to be equivalent to a liquid starter, while possessing none of the disadvantages of the latter.

Fig. 3 shows the rheostat applied to starting a shunt motor H. An automatic contactor J, actuated by a pressure solenoid, short circuits the terminals F G when starting is completed.

#### B.T.H. Starting Compensators.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby, have recently introduced a line of hand-operated starting compensators for two and three-phase squirrel-cage induction motors, on the auto-transformer principle, enabling these motors to be started without

FIG. 4.—B.T.H. STARTING COMPENSATOR.

FIG. 6.

drawing an excessive current from the line. In fig. 4 we illustrate the NR floor type compensator, which is one of a series suitable for starting motors up to 750 H.P., on voltages from 100 to 3,300 volts. The compensator consists of a strong iron box containing the transformer and an oil-immersed switch, the operating handle of which is on the right-hand side of the case; a no-voltage release is provided on the left-hand side, and overload relays can be fixed, as shown, above the case. The switch handle has three positions—off, starting and running—and is fitted with an automatic latch which prevents its being thrown from the off to the running position, while a strong spring prevents its being left in the starting position; the handle can only be thrown by a quick movement from the starting to the running position. When the no-voltage release operates, the handle automatically returns to the off position. The overload relays also actuate the no-voltage release coil with the same result. Fig. 5 shows the mechanism of the operating switch of one of the larger sizes of compensator, with the oil tank removed. In the case of the floor-type, illustrated in fig. 4, the switch is in the upper part of the case, and can be withdrawn together with the oil tank; the compensators are also made suitable for fixing to the wall, in which case the switch is in

the lower part of the case, and the oil tank can be lowered away from it without moving the compensator as a whole. The no-voltage release coil is protected with a cast-iron cover. The largest

FIG. 5.—SWITCH OF COMPENSATOR, WITHOUT THE OIL TANK.

compensators are not provided with self-contained switches, but are operated from a separate panel fitted with the necessary switchgear.

#### Electrical Shunt Calculator.

In our issue of January 24th, 1913, we described a device for calculating the combined resistance of two or more circuits in parallel, invented by Mr. H. W. BROWN, of 169, Cathall Road, Leytonstone, N.E. This device has been greatly improved by the inventor, and now consists of three scales (fig. 7), so set out and numbered that a straight line drawn from any one number on A

FIG. 7.—SHUNT CALCULATOR.

scale to any other number on B scale will cross C scale at a point which will indicate the value of the reciprocal of the sum of the reciprocals of the numbers to and from which the straight line is drawn. Of course, there is no need to draw a line at all; the edge of a ruler will answer the purpose. It will be obvious that by means of this calculator the joint resistance of two or more resistances in parallel can easily be determined.

The mathematical explanation of it is as follows:—

Referring to fig. 6, by similar triangles,

$$\frac{r_1}{r_2} = \frac{x}{r_2 - x}$$

Cross multiplying we get—

$$r_1(r_2 - x) = r_2 x$$

Therefore

$$x = \frac{r_1 r_2}{r_1 + r_2} \quad (1)$$

But

$$2x^2 = l^2$$

Therefore

$$x = l/\sqrt{2} \quad (2)$$

Hence, substituting the value of  $x$  given in equation (1), in equation (2) we get—

$$\left( \frac{r_1 r_2}{r_1 + r_2} \right) = \frac{l}{\sqrt{2}}$$

Hence if the diagonal scale is expanded to  $\sqrt{2}$  times the two scales at right angles to one another, the intersection point will give the value of the two resistances  $r_1$  and  $r_2$  connected in parallel. Similarly, the joint resistance of any number of resistances in parallel can be quickly determined, taking any two to begin with, and afterwards taking the result obtained in conjunction with another until all have been taken into account.

## BUSINESS NOTES.

**The "Mumps" Lampholder.**—Mr. G. St. John Day, of Mumps Electrical Works, Oldham, sends us a letter respecting the qualities of the Mumps lampholder adapters, and asks us to state that particulars will be forwarded to anyone interested therein.

**A Mazda House at Dublin.**—THE BRITISH THOMSON-HOUSTON CO., LTD., of Rugby and London, have recently opened offices and stores at Mazda House, 25, Suffolk Street, Dublin. The building is in a central position, about 50 yds. from Grafton Street. At the front is a display window, lighted by Mazda-lamp and Tungstolier fittings, equipped with Veluria reflectors and Mazda lamps. In the bottom of the window are arranged a number of samples of small wiring supplies, and in the centre is a pyramid of Mazda-lamp

VIEW OF SALES COUNTERS AND STORES.

cartons. On entering, the offices are on the right, and on the left are glass cases filled with examples of B.T.H. heating and cooking apparatus. At the back of the offices are the sales counters, which are sectionalised for different classes of material. The counter is 40 ft. long, and is lighted by a glass roof. Behind the counter are bins and racks containing varied stocks of lamps, reflectors and fittings. The whole of the wall on the other side of the room is occupied by show-cases. The premises are 120 ft. from back to front, and although narrow in front, they widen out considerably at the rear. The square space at the farther end of the sales counter is utilised as a fittings showroom, and a number of ready-wired fittings are hanging from the ceiling. These include samples of Eye-rest fittings, Mazdaliers and Tungstoliers, equipped with Holophane and Veluria reflectors, and semi-indirect fittings with Holophane and Alba bowls. There is an office railed off from the

FITTINGS STORES AND DEMONSTRATION ROOM.

showroom, where the clerical work of the stores is performed. On the right of the passage, coming in from the street, is the main office, which is tastefully decorated in green and white enamel. The whole of the basement is used as a stores, and it is thoroughly ventilated by a B.T.H. porthole fan. A portion of the stores is partitioned off to form a packing department, and this department opens directly into a yard leading into Wicklow Street. Large stores of electric lamps (Mazda, Gem, and B.T.H.-Edison), Veluria,

Holophane, Alma and Mazdalux reflectors, Eye-rest indirect lighting fittings, semi-indirect lighting fittings, Mazdalier and Tungstolier fittings, and wiring supplies of all kinds, are carried at the new stores.

**Electric Turret Clocks.**—MRS. GENT & CO., LTD., of Leicester, inform us that they have in hand at the moment the following large turret clocks all to work on their patented Waiting Train principle.

Holy Trinity Church, Southport, with four 5 ft. 6 in. dials and striking the hours on a 2-ton bell, and taking current from the Corporation mains.

Public clock at Fulval, Penzance, with four 5 ft. 6 in. dials and striking hours and half hours on a 12 cwt. bell, with current from Léalancha cells.

Public clock for Petone, New Zealand, with four 6 ft. dials with Westminster chimes, and driven by Léalancha cells.

Three public clocks for St. Johns, New Brunswick, each with four dials, the largest being 5 ft. in diameter.

Faire Bros. & Co.'s new works, Leicester, 5 ft. dials and striking the hours on 4-cwt. bell.

United Free Church, Newton Street, Glasgow, with three 4 ft. dials.

Torquay Town Hall, with four 5 ft. 6 in. dials.

Also a special observatory transmitter, for the Glasgow Observatory.

**Liquidations.**—FOSTER ENGINEERING CO., LTD.—On March 14th, a petition was presented by A. F. Burman, manufacturer, a creditor, for the winding up of this company, and it is to be heard on April 8th.

CANADIAN POWER TRAMWAYS CONSTRUCTION SYNDICATE, LTD.—This company is winding up voluntarily, with Mr. H. G. Clarke, 3, Princes Street, E.C., as liquidator. A meeting of creditors is to be held on April 11th.

**Patent Applications.**—Application for restoration of Patent No. 8,207 of 1908, for "Improvements in or relating to the sinking and lining of shafts or wells," has been made by JOSEF VINCENT BRECHA.

MR. CHARLES RUDOLPH has offered to surrender Patent No. 9,145 of 1911, for "Improvements in unions or couplings with bayonet joints for pipes and tubes."

**Trade Announcements.**—THE WALSALL ELECTRICAL CO., LTD., of 57, Bridge Street, Walsall, are now carrying out further extensions to their works owing to greatly increased business. It is only about 15 months since we mentioned their last extension. We understand that the firm have close on twenty times as many workmen as they had three years ago. As works alterations naturally interfere with deliveries to some extent, they ask indulgence from their clients in that respect. Within the last few weeks they have put down a large number of new tools, which will enable a resumption of prompt deliveries to be given shortly.

MR. G. T. BELLAMY, electrical engineer, of Croydon, has removed to more commodious premises at 33, Cherry Orchard Road.

MESSRS. HASELTINE, LAKE & CO., patent agents, have removed to 28, Southampton Buildings, Chancery Lane, W.C. Telephone No., "5,611 Holborn."

**For Sale.**—The Glasgow Corporation electricity department has for disposal a quantity of steam-driven generating plant. The Nuneaton Corporation has for sale a main switchboard. See our advertisement pages in this issue.

**Bankruptcy Proceedings.**—ANDREW GEORGE ADAMSON, electrical engineer, of Acton, lately in business at 22, Christopher Street, Finsbury Square, E.C.—April 12th is the last day for receipt of proofs for dividend by Mr. C. Mercer, the trustee, 14, Bedford Row, London, E.C.

JOHN MITCHELL and FREDERICK MITCHELL (trading as Fred. Mitchell & Co.), electrical engineers, 97, Stockport Road, Ardwick, Manchester, and 58, Ashton Old Road, Openshaw, Manchester.—The first meeting of creditors herein was fixed to be held last week at the Official Receiver's offices, Byron Street, Manchester, but there was not a quorum of creditors present, and no business was therefore done.

SAMUEL SMITH (trading as Smith & Sons), 22A, 24 and 26, Victoria Square, Widnes, Lancaster, electrical engineer, &c.—The first meeting of creditors herein was fixed to be held last week at the offices of the Official Receiver, 11, Dale Street, Liverpool. The Official Receiver stated that no statement of affairs had yet been lodged by the debtor, and only one proof of debt had been received. Matters were complicated by the fact that the debtor last August executed a deed of assignment for the benefit of his creditors to the trustee, who took over the assets and liabilities. Since then the business had been carried on by the debtor under the supervision of the trustee, and he incurred fresh liabilities which were now scheduled against the estate. In order to raise the money to file his petition the debtor had sold certain stock. There was not a quorum of creditors present, and no resolutions were therefore passed, the matter being left in the hands of the Official Receiver.

At the last sitting of the Bradford Bankruptcy Court, an electrical engineer's clerk, named Jonathan Edward Mitchell, of Bradford, appeared to undergo his public examination. He stated, in reply to questions addressed to him by the Official Receiver, that his deficiency was £98 14s. 6d., and his difficulties had arisen through personal extravagances and exorbitant interest charged by moneylenders in connection with loans which he had obtained. Between March 4th and November 28th, 1912, he had obtained seven loans amounting to £130, in connection with which he had to repay £192 10s., but had only repaid £87 8s. It was suggested by the Official Receiver that a portion of these loans had been obtained on the debtor's statement that he was entering for an examination of the Institution of Electrical Engineers, and that if he passed he had been promised a good position, and would get the whole of his fees back, and if he failed he would get half fees returned, but the debtor denied these statements. He said that he

had told the gentleman from whom he had borrowed the money, that he would require £30 for the examination, and £5 a week for expenses, though he denied stating that this sum was returnable if he passed, and he would hand it over immediately he obtained it. After asking some further questions, the Official Receiver informed the debtor that he had written to the secretary of the Institution of Electrical Engineers in regard to the examinations which the debtor suggested he had entered for, and had received a reply stating that such examinations had never been held. The debtor replied that there were tests of qualification for the degree of M.I.E.E. but the Official Receiver suggested that the statements which the debtor had made, that he required money for fees for the examinations, were fables and fictions of the imagination, and were fraudulently made in order to obtain money for his own personal extravagance. The debtor acknowledged that he had not paid the fees for the examination, but said that the statements which he had made as the reasons for wanting the money were not false, though later when the Official Receiver suggested that the statements that the debtor was expecting to receive a portion of his examination fees back were lies, he acknowledged that they appeared to be falsehoods. In closing the examination the Registrar (Mr. Registrar Lee) said he thought when the examination opened that the debtor, being a young man, might have been led into extravagances, but he did not think so after he had heard the replies of the debtor, because the statements that he had made were altogether disgraceful and incredible. He could not, unless he heard it from the debtor's own lips, believe that a young man, who might have been comfortably placed, could have been guilty of such recklessness and extravagant folly.

**Book Notices.**—The *British and Colonial Printer* for March 29th is a special export number (6d.), containing a great deal of additional editorial and advertising matter of particular interest to Colonial readers.

"Elements of Electrical Engineering." By J. L. La Cour and C. S. Bragstad. 1913. London: Longmans, Green & Co. Price 16s. net.

"Prospectus of the Working Men's College, 1913. Melbourne: The College.

"Transactions of the University of Toronto Engineering Society." Vol. VII, No. 4. February, 1913. Toronto: The University.

"Journal of the South African Institution of Engineers." Vol. XI, No. 8. March, 1913. Johannesburg: The Institution. Price 2s.

"Journal of the Franklin Institute." Vol. CLXXV, No. 3. March, 1913. Philadelphia, Pa.: The Institute. Price 50 cents.

"The Physical Review." Vol. 1, No. 3. March, 1913. Lancaster, Pa.: The American Physical Society.

"The School of Mines Quarterly." Vol. XXXIV, No. 2. January, 1913. New York: Columbia University. Price 50 cents.

"Annales des Postes, Télégraphes et Téléphones." with Supplement, "La Dynamique de l'Électron." By Henri Poincaré. March, 1913. Price 6 fr. Paris: A. Dumas.

"Transactions of the Illuminating Engineering Society." Vol. XIII, No. 1. January, 1913. New York: The Society. Price 75 cents.

**The Trade Paper.**—"The efficient trade journal proves its worth by enjoying the confidence and respect of the majority of its readers to a greater degree than any other non-human element with which these individuals come in contact. The information and knowledge which trade papers impart could not be supplied as effectively, as regularly, or as economically, to the reader by any other known method, and were these publications suddenly to disappear, great trades and industries would be left without their most effective and efficient method of intercommunication. The position of the advertiser in the efficient trade journal may be described thus:—Given a merchantable product, these journals can so efficiently place this product before the manufacturer, who is, in many cases, the consumer or converter of the product, or before the dealer, who resells, that no other method of advertising publicity can compare favourably in measured, definite value per dollar of expenditure."—C. G. Phillips in the *American Printer*.

**Catalogues and Lists.**—MESSRS. SIEMENS BROTHERS AND CO. LTD., Woolwich.—Supplement 2 to Catalogue 517, illustrating and describing the "Rawiplog" patent plugs for use in plaster, stone, &c. The plug consists of a tube of stiffened fibres, which expand when a screw is driven home, and grip the sides of the hole, as illustrated in our last issue. One of these plugs, for which Messrs. Siemens Brothers are the wholesale agents, will stand a direct pull of 670 lb. in slate, or 140 lb. in hard plaster, with a screw  $\frac{1}{8}$  in. long.

THE ELECTRICAL CO. LTD., Charing Cross Road, London, W.C.—Illustrated and priced leaflet briefly describing their electric number indicator for theatres, music halls, cinemas, &c. A simple switch operates a lever which changes the numbers, automatically locking at each point. The indicator consists of one or two 20-in. zinc figure fields, into which 2-c.p. metal-filament lamps are fitted. The connections between indicator and switch are made by means of 25-strand cables.

MESSRS. A. REYROLLE & CO., LTD., Hebburn-on-Tyne.—Pamphlet No. 20, illustrating and giving prices of the latest designs of their dust-proof and watertight cast-iron distribution boxes, fitted with their patent self-aligning fuse handles. A separate price list illustrates and prices these low-tension self-aligning fuses.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Two 8-page publications in their standard style, No. 4,101 containing an illustrated description and list of prices of overload relays for A.C. and C.C. circuits, No. 7,100 showing and particularising a number of types of B.T.H. fan motors and exhaust fans.

ARMORDUCT MANUFACTURING CO., LTD., Farringdon Avenue, London, E.C.—Publicity folder announcing that one of the largest English railway companies has placed a further order with them for about 100 miles of Armorduct 5,000-megohm grade vulcanised rubber cable.

MESSRS. BRUCE PEEBLES & CO., LTD., Edinburgh.—Pamphlet No. 16B (24 pages), containing very full descriptive information, with illustrations and a great deal of tabulated data as to dimensions, speeds, H.P., efficiencies, power factor, and so on, concerning the Peebles self-contained polyphase induction motors. Eight different types of standard machine covering all ordinary requirements, are dealt with. There is a very full specification of the motors, with illustrations of various parts, also outline illustrations and full lists of approximate weights and dimensions of every size manufactured by the firm, while full lists of technical data for 50 and 25-cycle motors are also given, machines being dealt with for three separate ranges of voltage from 110 up to 3,600 volts, at speeds of from 1,500 down to 150 r.p.m.

THE POWER PLANT CO., LTD., West Drayton.—Small folder, giving a specification of their self-contained mill gears.

THE CLEVELAND ELECTRIC STORAGE BATTERY CO., St. Louis.—Illustrated leaflets respecting their lamps, &c., for motor-car lighting, ignition batteries, &c.

MR. GEORGE ELLISON, Victoria Works, Warstone Lane, Birmingham.—Two illustrated leaflets have been issued. No. 50/1 gives particulars of the firm's patent adjustable time-lag device for overload circuit-breakers; No. 450/1 describes and gives dimensions of brake solenoids for C.C. up to 600 volts.

THE GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, London, E.C.—A number of illustrated and priced trade leaflets have been issued: No. E1,664, describing cylindrical dust bellows; No. 1,671, describing sliding resistances for fine regulation; No. C1,668, detailing the "Armearth" system of cable protection (a new leaflet cancelling a previous one); and card C1,672, describing "Geckduct" conduit-system porcelain block connectors and griptight continuity fittings.

MESSRS. VERITYS, LTD., 31, King Street, Covent Garden, W.C.—Illustrated and priced publication, No. 722, dealing with "Aston" indirect lighting fixtures fitted with metal reflector bowls, and semi-indirect fixtures with Holophane or alabaster bowls.

THE UNITED ELECTRICAL MANUFACTURERS CO., 89 and 90, Milton Street, London, E.C.—Advance illustrated price list of the 1912-13 season, of electric flashlights, batteries and measuring instruments.

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., 38 and 39, Upper Thames Street, London, E.C.—Leaflet respecting their new "type 462" S.P. ironclad service fusebox, also pamphlets dealing fully with house service safety fuses and "Melda" house water pumps.

MR. H. C. SLINGSBY, Old Street, London, E.C.—List No. 50 giving illustrations and prices of all-steel tubular wheel-barrows.

THE UNIVERSAL ELECTRICAL MANUFACTURING CO., 14, Station Parade, Peckham, S.E.—April folder, with calendar for three months, concerning their combined ironclad switches and fuses.

MESSRS. SCHOLEY & CO., LTD., 151, Queen Victoria Street, London, E.C.—Fourteen-page catalogue with information relating to "Indestructible" cable of various grades for outdoor and indoor service. Outdoor cables are protected against atmospheric and chemical effects by the use of a jute braiding, which is impregnated on a special system. For both high insulation (suitable for 2,000 volts) and atmospheric protection, the firm supplies a grade in which the conductor is insulated with a double layer of impregnated paper, a spiral layer of cotton, and the special braiding mentioned. A third grade is suitable for up to 10,000 volts. A braided and impregnated rubber cable is supplied for indoor service, carried on insulators, and is used by the G.P.O., railway companies, mines, &c., for lighting and power; after 10 years' service the insulation results are most satisfactory. The pamphlet gives tabulated sizes, weights, code-words, prices, &c.

**A Model Gas Engine.**—To explain the working of the "Duplex" valveless gas engine, which was fully described in our issue of October 11th, 1912, MESSRS. MATHER & PLATT, LTD., have issued a working model showing the action of the mechanism in the form of a book. One view shows the engine cylinders in plan; on lifting the cover plate, the cylinders, which in this engine are single-walled castings, are seen fixed in a tank which contains the cooling water. The other view is a side elevation; the raising of one flap removes the side of the cylinder tank, showing the cylinders and the method of supporting them. Removing a second flap, the interior of the cylinders and pumps is exposed, showing the pistons, and by turning a disk at the foot of the model, the several pistons are set in motion in correct relation with one another; the pistons and ports are lettered to correspond with a brief explanatory description facing the model. By this means the cycle of operations of this interesting engine is made perfectly clear and easy to follow. The air and gas pumps are provided with a sleeve valve, which also is set in motion in the model, showing that the scavenging air is blown through the cylinders before any gas is admitted, and that after the gas charge is delivered to

the cylinders a following charge of air drives any of the mixture that remains in the ports into the cylinders. The pistons receive an impulse at every stroke, like a double-acting steam engine. The sleeve valve is not exposed to hot gases, but only to the charge of air and gas; and there is no other valve, the admission and exhaust ports being uncovered and covered by the working pistons themselves. The model is certainly very novel and ingenious, and admirably illustrates the unique cycle of operations followed in this remarkable gas engine. The mechanism of the model is operated by means of fibre gear wheels, with links to drive the pistons, &c.

**Aluminium for Power Transmission.**—While the conditions governing the erection of overhead transmission lines in this country are by no means as favourable to aluminium as those under which long-distance power transmission schemes are installed in countries where water powers abound, if a comparison be made, it will be found that the cost of construction is well in favour of aluminium as compared with copper. As considerable doubt has been expressed upon this point, the BRITISH ALUMINIUM CO., LTD., have plotted a series of curves showing the relative permissible sags of copper and aluminium overhead conductors of varying span, cross-section, temperature and wind pressure, in accordance with the Board of Trade Regulations. These data are embodied in a neat little book, containing "in a nutshell" the information necessary to make a comparison between copper and aluminium, and demonstrating the truth of the foregoing statement.

## LIGHTING and POWER NOTES.

**Aldershot.**—The Gas, Water and District Lighting Co. has applied to the B. of T. for consent to construct a generating station at the gas works in Ash Road, in order to enable the company to supply electricity within the parishes of Ash, Normandy and Seale.

**Argentina.**—The lighting of Buenos Ayres is undergoing a steady transformation, and the kerosene lighting in the outlying districts is being replaced by gas and the electric light. At the present time public electric lighting consists of 2,531 arc lamps, with an equivalent of 3,531,000 C.P. In accordance with the recent arrangement between the municipality and the Compañía Alemana de Electricidad, the company has agreed to install, at its cost, 4,000 arc lamps at the rate of 1,333 per year, so that in 1915 the city will have 6,500 arc lamps in service with an equivalent of 6,500,000 C.P. The gas lighting of the city is in the hands of the Primitiva Gas Co., which has actually in service 18,037 lamps, and in four years' time this number will be increased to 20,000, as the company has made a contract with the authorities similar to that of the Compañía Alemana for a period of 15 years. There are also 2,181 alcohol lamps and 3,650 kerosene lamps.—*Review of the River Plate.*

**Bedford.**—A L.G.B. inquiry was opened on March 26th into the application of the T.C. for a loan of £11,590 for electricity purposes. Mr. R. W. L. Phillips, electrical engineer, stated that it was proposed to install a Diesel oil engine coupled direct to a 400-KW. Siemens alternator, and the tender of Messrs. W. H. Allen, Sons & Co. had been provisionally accepted. Questioned by the inspector, Mr. Phillips gave the list of tenders received, viz., Allen & Sons, £8,980; with own generator, £9,790; Hick Diesel Co., £7,160; with own generator, £9,335; Willans & Robinson, £9,429; with additions, £11,369. He added that the tenders of the Hick Diesel Co. and Willans & Robinson were not in accordance with specifications, as there was not sufficient protection of the working parts. The inquiry was, in the end, adjourned for inquiries to be made respecting statements made by the London manager of the Hick Diesel Oil Engine Co. respecting their tender.

**Blackpool.**—It has been decided to officially inaugurate the new plant at the electricity works on April 23rd, when members of the Council will be invited. The two new turbo-generators will be ready for starting, and in addition an installation for electrical cooking will be on view, and by way of refreshments members will be asked to test samples from the electrical stoves.

**Brighouse.**—A scheme is being put forward by the Corporation for electrically driving the machinery and plant at the sewage outfall works, and for this purpose a sum of £250 will be included in the estimate.

**Burnley.**—The increased demand for electricity for lighting, power, and traction, has led the Electricity Committee to take into serious consideration an extension of plant and service mains. The General Purposes Committee last week adopted a report suggesting the following:—(a) The installation of a 2,000-KW. turbo-alternator, with two 500-KW. rotary converters and transformers at the electricity station; and (b) the erection of a sub-station near the tramway depot in Colne Road, containing two 300-KW. rotary converters, one for lighting and one for traction, to supply certain districts. The proposed extensions will necessitate extensive alterations to the traction switchboard, and the Committee recommends that the traction and H.T. boards be mounted on a gallery, and that the cellular pattern of switchboard be dispensed with and replaced by a type similar to that supplied for the last turbine

installation. The cost of switchboard alterations will be heavy, but the Committee is advised that they should be carried out. Three small boilers in use since the commencement of the undertaking had been sold, and the Committee proposes to install two large boilers to replace them. It is also proposed to raise the pressure of three existing boilers from 130 to 160 lb. per sq. in., necessitating a new set of economisers; and to install a cooling tower with a capacity of 180,000 gallons per hour, or rather more than is required for a 2,000-KW. plant. The electrical engineer estimates the cost of the new works at £28,171, including one 2,000-KW. turbo-alternator, with condensing plant, £7,000; two 5,000 K.W. rotary converters and transformers, £2,500; new switchgear and alternators, £2,200; cable and connections, £450; two boilers and mountings, £1,300; superheaters, £250; economisers, £700; stokers, £110; boiler pump, £180; water softener and piping, £500; cooling tower and piping, £800; engine room crane, £600; a total of £17,660. The sub-station estimates are:—Buildings, &c., £1,300; rotaries and transformers, £2,000; switchgear, £800; sub-station cables and connections, £150; a total of £1,250. Two miles of '05 three-core cable in duplicate, £3,700. Allowing for contingencies, the grand total is £28,171.

The 1910 loan of £5,000 for mains and services will be exhausted during the summer, and the Committee recommend that the L.G.B. be asked to sanction a loan of £7,000.

The T.C. is now to be asked to authorise application to the L.G.B. for sanction to borrow £28,171 for additions &c., to the electricity undertaking, and £7,000 for electrical mains and services.

**Canterbury.**—The Windsor, Ont., municipality is to take 2,500 H.P. of hydro-electric power from the Commission, which will extend its 110,000-volt transmission from St. Thomas to Windsor 110 miles—for the purpose. The existing transmission from Niagara to St. Thomas is 135 miles long, so that the Niagara-Windsor transmission will cover 245 miles and be one of the longest in the world.

**Chester.**—At the meeting of the T.C. held on March 26th, it was agreed by 29 votes to 2:—(a) That the extension of the electricity works as suggested by the electrical engineer in his report dated March 7th be carried out at a cost of £11,550; (b) that application be made to the L.G.B. for sanction to borrow £7,550 in amounts to be repaid within the following periods:—£1,700 for buildings, 30 years' period; and £5,850 for battery, booster, switchgear, instruments and connections, seven years; (c) that the remaining £4,000 required be paid out of the reserve fund. It was also agreed that £500 of the net surplus revenue of the electricity undertaking for the current year be at the option of the Finance Committee, either carried to the credit of the local rate or applied to the improvement of the district under the provisions of the Chester Electric Lighting Order, 1890.

Mr. Britton's report, on which the Committee's recommendation to the Council was based, drew attention to the inadequacy of the plant last winter, when the maximum demand on the works reached 1,595 KW., being in excess of the normal capacity of the undertaking; he pointed out that this and the new consumers which will be added before next winter will appropriate the capacity of the hydro-electric extension for maximum load purposes. After considering the alternatives of steam and oil generating plant and storage batteries, he concluded that the most economical arrangement was to fully employ the hydro-electric plant by installing a storage battery at the New Crane Street works, to accommodate the electrical energy in excess of the demand during the night for use on the peak load of the following day; this surplus energy obtainable from the water-power plant at no additional cost will replace energy generated at the most costly period of the day. The battery recommended will have a net capacity of 550 KW. for three hours. Although the loan period for the battery is seven years, as compared with 15 years for generating plant, Mr. Britton estimated that the total annual expenditure would be from £620 to £1,530 per annum lower than if the latter plant were adopted. He further added that had steam plant been installed instead of the water-power plant, an extension either of generating or battery plant would now be required, and battery charging from steam plant would have been more costly than the proposed arrangement.

**Clacton-on-Sea.**—A L.G.B. inquiry has been held into the application of the U.D.C. for a loan of £6,000 for additional plant at the electricity works, viz., a Diesel generating set. There was no opposition.

**Continental Notes.**—BELGIUM.—An electrically-operated winding plant is to be installed at the Malassie pit of the Société des Charbonnages des Kessales, at Jemeppe-sur-Meuse.

A new generating station of a capacity of 4,000 KW. is approaching completion at Langerbrugge, near Ghent. It has been established by the Compagnie des Centrales Electriques des Flandres, and will supply current for lighting and power purposes to an area having a population of about 75,000.

The municipal authorities of Liège recently invited tenders for the concession for the establishment and working of a central electric lighting station in the town. Apparently the conditions were of too onerous a nature, as not a single offer was received.

FRANCE.—A new company has just been formed in Paris (41, Rue de Provence) with a capital of £80,000 and the title of La Société de Distribution de l'Electricité de l'Ouest.

The Société Hydro-electrique des Basses Pyrénées, whose several networks have hitherto been fed from the generating station at the Val Carlos fall, on the Spanish frontier, are now about to construct a second station on the Nive at Banca, where a fall equal to 450 H.P. is available. This station will be joined by two 30,000-volt lines to the steam generating station at Pont-de-Mongerrie near

Bayonne owned by this society. The distribution systems which supply Bayonne, Boucau, Osses and Cambo are also to be considerably enlarged. The programme in course of execution comprises for the 30,000-volt network, besides the two lines previously mentioned, a line serving the important industrial region of Boucau and a line to supply the Bayonne-Lycée-Biarritz tramway, hitherto worked by steam, the conversion of which is expected to be completed by September next. Further, a 5,000-volt network will supply, on one hand, the Basque coast as far as St. Jean de Luz and Aescan, and, on the other, the communes in the Landes region.—*La Lumière Electrique*.

GERMANY.—The Ruhrthalsperrenverein, of Essen, which is installing a large plant to utilise certain available water-power in the Ruhr valley, has placed a contract with Messrs. Bregleh, Hansen and Co., of Gotha, for the supply of four Francis double spiral turbines, each of 2,000 H.P., and four single spiral turbines, each of 1,000 H.P.

The Bavarian Minister of the Interior has addressed to local authorities the following official instruction with regard to the provision of electricity in this kingdom:—That (1) the supply of electricity is only possible by means of great bulk supply stations, serving large areas and pledged for long periods. (2) That the erection of such stations in each district must be relegated to separate companies, communal or other, or to large electric supply companies working in conjunction with banks. (3) That power must be generated to the utmost from the State-owned water resources. (4) That the bulk supply stations must be bound to serve every locality within their area at a unit price. (5) That the larger, and especially the municipal stations, must construct their own networks, taking energy from the bulk suppliers. (6) That rural authorities must leave the distribution of electricity to the bulk supply concerns, retaining merely the power of repurchase at some specified date. (7) That in areas where the supply will involve loss to the suppliers, special terms may be made, subject, however, to the State's approval. (8) That the price of current must be approved by the State and revised at stated periods. (9) That pre-emptive rights over the bulk supply stations must be retained by the State. (10) That bulk supply stations are to be built according to such plans, and in such sequences and at such periods as fixed by the State. (11) That the bulk supply concerns are to refrain from restricting free competition in such portions of installations not carried out at their own cost, especially in internal fittings; and, lastly, that the State will retain sensible touch with all the bulk supply stations with a view to conserving the interests of the general public. These conclusions are said to be the outcome of exhaustive investigations into local electrical circumstances, and of an inspection of the arrangements come to in other countries.—*Elektro, Nachrichten*.

The Rheinisch Westfälischen Electricitätswerke intends to construct a large new power station on the left bank of the Rhine near Zeche. The first equipment will include two 25,000-H.P. steam turbines.—*Zeit. f. d. g. Turbinenwesen*.

Negotiations are proceeding between the Rheinisch-Westfälischen Electricitätswerke and the five populous industrial Kreise of the Lower Rhine with respect to the completion of the distribution network and the construction of a special generating station. The five Kreise are prepared to place a loan of £525,000 at the disposal of the company, but the latter requires a larger advance (£750,000) in view of the fact that widely scattered and relatively unremunerative agricultural districts will have to be included in the completed network. A special opinion is to be taken on the merits of the divergent contentions, but it is considered in competent quarters that the company's standpoint will be eventually adopted.—*Elektro, Nachrichten*.

The Government of the Grand Duchy of Mecklenburg has just published its plans for providing electricity to the whole of the Grand Dukedom. It is intended to erect a large power station in Schwerin, at a cost of £100,000 for the supply of current to the whole of the south-western portion of the Grand Duchy. The remainder of the province will be served by another station; but, alternatively, a large transformer station may be substituted, in which event the current will be furnished by the Schwerin station. These plans obviate the resort to the private bulk supply station at Lübeck, in the neighbouring principality.—*Zeitschrift für Elektrotechnik und Maschinenbau*.

NORWAY.—According to official statistics, the number of electrical installations existing in Norway on July 1st last was 1,250, an increase for the 12 months of 100; the total generator capacity was 417,607 kW., an increase of 155,512; the number of accumulators in use remained at the same figure, 9,136; the utilised power for lighting in kilowatts is not on record, but in the foregoing period was 38,129; for motors it was 126,568, an augmentation of 28,856; the power used in the electrochemical industry totalled 211,131 kW., an increase of 114,345, and for other purposes 11,947, showing, however, a shrinkage of 4,418; the number of glow lamps in use was 980,317, representing an increment of 176,382, while arc lamps figured at 5,515, no record being made in the previous year. The number of motors in use was 12,825, an advance of 2,599. The Rjukan station, to serve the saltpetre industry, was opened during the official year.—*Elek. Zeitschrift*.

RUSSIA.—At the commencement of the present month the Société d'Electricité d'Odessa was supplying current to 3,588 consumers, with a total of 129,000 lamps and 116 electric motors, equal to a consumption of 4,510 kW.

Considerable additions are to be made this year to the iron works and collieries of the Union Minière et Metallurgique en Russie, the new plant including an electric power station comprising three gas engines and dynamos, each of 2,000 H.P.

A new company is being formed in Moscow with a capital of 6 million roubles, and the title La Société de Transmission Electrique.

SPAIN.—The special commission for the reform of the public lighting of Madrid has advised the municipality to declare the competition for the public lighting concession abandoned, and instead to raise a loan with the assistance of the Government, with a view to the establishment of a municipal installation, procuring current from the State-owned generating station on the Isabel II Canal.—*Electron*.

The municipal authorities of San Juan de Palamos (province of Gerona) have just invited tenders for the concession for the electric lighting of the town during a period of ten years.

SWITZERLAND.—A water-power plant is being installed at Martigny, utilising a head of 5,400 ft., through 3 miles of steel pipe. This will be the highest head of water so utilised in the world, the water pressure at the turbine being about 2,500 lb. per sq. in. Pelton wheels, with a total rating of 15,000 H.P., will be installed, and the *Electrical World* points out that only about 30 cu. ft. of water per sec. will be necessary to develop the full 15,000 H.P. output.

Darwen.—There is a movement on foot to extend the electrical undertaking to the village of Hoddleden. Messrs. Carus's new mill, and Messrs. Place's works, are already driven by electricity, and it is now proposed to ask for current for lighting purposes. Large firms and chief residents are willing to adopt electric lighting if the Corporation can see its way to supply it.

Doncaster.—Sitting in committee, the T.C. has decided to apply for sanction to borrow £12,500 for the extension of the plant, and also for structural alteration at the Corporation electricity works. It is proposed to put in a 1,000-kw. turbine set, bringing the total plant capacity up to 2,800 kW., and to adopt H.T. three-phase supply in order to reach the outside districts which are so rapidly developing owing to colliery enterprise. Alterations will be made at the electricity station, so that as the additions to the plant take place it will not be necessary to build a new station, the present one being sufficiently large for many years to come.

Dunfermline.—In view of impending developments in the district, the Fife Electric Power Co. has in contemplation a large extension at its works at Townhill. It is proposed to install a horizontal turbine set of 5,000 H.P., capable of developing 3,000 kW. With the necessary boiler power, the company will be able to supply double its present load.

Halifax.—The Electricity Committee has recommended that application be made to the L.G.B. for sanction to borrow £4,380 for the supply and fixing of two water-tube boilers and superheaters required at the electricity works.

Haslingden.—At a meeting of the T.C., held on Wednesday, last week, a letter was read from the L.G.B., sanctioning the borrowing of £3,750 and £1,500 for the electricity undertaking purposes.

Heston-Isleworth.—The Electricity Committee of the U.D.C. has decided to charge 4d. per unit for current supplied to the refuse destructor works for lighting purposes, and 1½d. per unit for power, instead of a uniform rate of 2d.

The seal of the Council has been affixed to an agreement with the Isleworth Brewery Co. for supplying its premises with current, and for laying down the necessary cables.

Leeds.—The Corporation Tramways and Electricity Committee has asked the Finance Committee to apply for borrowing powers to the extent of £168,500, which it is intended to apportion as to £38,500 for additions to the generating station, £100,000 for mains, and £30,000 for building sub-stations. The Committee also proposes to borrow £28,000 for building and equipment of a new depot in Sovereign Street.

The Corporation has a proposal in hand to reduce the price of energy for power purposes, and an additional discount is suggested for large consumers who take H.T. supplies and thus save the cost of transforming to low pressure.

Leyton.—Application is to be made to the L.G.B. for sanction to borrow £1,000 for services, and £5,370 for mains. An additional feeder is to be laid in Hainault Road at an estimated cost of £2,370. The estimated surplus on the working of the undertaking during the year ended March 31st is put at £951, of which £500 is to be set aside as a provision for the purchase of stores rechargeable to capital account as and when expended, and half of the balance, £225, is to be carried to reserve, while the remainder will be transferred to the credit of the district rate.

London.—LEWISHAM.—The B. of G. on Monday considered the question of installing the electric light at the infirmary and workhouse. A letter was read from the South Metropolitan Gas Co. stating that it would have been necessary for it to enlist the co-operation of a third party to undertake the responsibility of providing electrical plant and accessories, as distinct from gas engines, but the Guardians insisted that the installation should be the property of the gas company. The company had no doubt whatever as to its ability to generate electricity in the institutions with a gas-driven plant, and show a reasonable profit on the transaction. The Guardians decided to acknowledge the letter with thanks. A letter was also read from the South Metropolitan Electric Light and Power Co. offering to supply electricity for lighting at 2d. per B. of T. unit, and at 1½d. for heating, driving of electrical motors and ventilating, for 21 years, determinable at the end of the first 7 or 14 years by the Guardians only by giving 12 months' previous notice. The Board decided to accept these terms. The tenders received for the electric wiring of the two institutions are stated in our "Contracts Closed."

**Londonderry.**—The electrical engineer has submitted a report on probable cable extensions required during the next five years, and the E.L. Committee has approved it. The estimated cost of the extensions is £13,000.

**Manchester.**—The Electricity Committee proposes to apply for powers to borrow £75,000 for mains and services, and plant at consumers' sub-stations. The estimated increased revenue per annum is £12,000, against which working expenses, interest and sinking fund, amounting to £9,913, are to be set, leaving an annual surplus of £2,087, which represents a return of 2.78 per cent. upon the capital outlay involved. The Finance Committee raised no objection to the proposed application.

**Oulton Broad.**—The Board of Trade has revoked the 1908 Electric Light Order.

**Portishead.**—The Clevedon, Portishead and District Electric Supply Co. has applied to the B. of T. for permission to use overhead lines for the transmission of energy at a pressure of 100 volts for the purposes of supply under the order.

**Redditch.**—The U.D.C. has received a report from a special sub-committee on the working of the electricity undertaking. The undertaking has never been financially successful, due, it is said, to the installation of unsuitable plant, followed later by the introduction of metal lamps and recently by the numerous strikes. The capital cost of useless plant is stated to be £10,000 out of a total of £46,000. It is proposed to pay the works manager, Mr. Ferguson, £150 in respect of his special services as consulting engineer, and in order to give the committee freedom to make any necessary charges, he has decided to terminate his engagement as works manager. The sub-committee has made 22 recommendations to the Council, including one that a works manager be appointed at £250 per annum.

**Richmond.**—The Richmond (Surrey) Electric Light and Power Co., Ltd., is applying for further powers, including power to take a supply in bulk from the Metropolitan District Railway Co. the London Electric Railway Co., the County of London Electric Supply Co., Ltd., and any local authority, &c.

**Romford.**—The U.D.C. has provisionally agreed with the County of London Electric Supply Co.'s scheme for electric supply for the district, but the sealing of the agreement has been deferred until certain clauses are definitely decided upon.

**Siam.**—According to the *Indian Textile Journal*, La Compagnie Mutuelle de Tramways, of Brussels, is negotiating the formation of a large new company to undertake the establishment of an electricity station in Bangkok for the supply of current for lighting and power purposes, and for tramway operations in the Siamese capital.

**Stalybridge.**—The Joint Tramway and Electricity Board has approved a recommendation of the Generating Station Committee to amend an application to the L.G.B. for further borrowing powers from £20,000 to £22,551.

**Stoke-on-Trent.**—The B.C. has applied to the L.G.B. for a loan of £8,000 for extensions of the electric light mains to Fenton.

**Truro.**—The T.C. has received an intimation that the B. of T. proposes to grant the application of the Corporation for a prov. order for electric lighting.

**Walthamstow.**—Subject to the sanction of the B. of T. the Council has decided to undertake to supply Woodford with electricity in detail. When application is made for a prov. order, the Board is to be asked to provide in such order that the repayment of capital be deferred for a period of three years from date of borrowing, interest only being paid during such period.

**West Bromwich.**—The L.G.B. has sanctioned the borrowing of £6,500 for extensions of electric mains, repayment being spread over 20 years.

**Yarmouth.**—The electrical engineer is to make an experiment on certain tramway centre poles with 200-c.p. incandescent lamps placed at each end of the bracket arm, with the view of improving the lighting of the Marine Parade.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—Messrs. Otto Franke & Co., concessionaires for an electric railway between La Plata and the Federal capital advised the Department of Engineers of the Province of Buenos Ayres that they had commenced work, and, at the same time, they protested against that Department for the difficulties placed in their way. An investigation was ordered, and it is stated that the protest was only a pretext on the part of the concessionaires to endeavour to delay the concession being declared lapsed.—*Review of the River Plate*.

**Blackpool.**—The receipts from the Corporation tramways for the year which ended on Monday were £9,200 in advance of the previous year, and the statement made to this effect by Alderman Brodie at the meeting of the T.C. on Tuesday, was received with much satisfaction.

**Chile.**—Negotiations are being entered into to enable the Government to purchase the land on either side of the Rio Laja so as to make use of the water for a hydro-electric station to supply current for the third and fourth sections of the railway which are to be electrified, and also to supply electric light to several cities.—*Review of the River Plate*.

**Continental Notes.**—**BELGIUM.**—La Société des Tramways Liégeois has secured a concession for extensions of its electric tramway system, which will give connections between the southern portion of Liège and Chenée and Vaux-sous-Chevremont.

**GERMANY.**—The Local Government Board of Hirschberg has accorded permission for the construction of a new mountain railway in the Riesengebirge. The railway will be about 17 miles in length, and will run from Schmiedeberg through Steinsieffen Krummhübel, with a branch from there to Bruckenberg-Arnsdorf, Seidorf, Giersdorf, and Hermsdorf, so that a direct connection will be established between the eastern and western end of the mountains. The contract for the line has been secured by the Allgemeine Electricitäts Gesellschaft, of Berlin.

The system of working with single-phase current at 15,000 volts and 16½ cycles on the Dessau-Bitterfeld line is now adopted for the Magdeburg, Leipzig and Halle section. Three sub-stations are erected at Wahren, Marke and Gommern respectively each equipped with four 1,500-kw. transformers. The chief station at Muldenstein contains 16 boilers, and four 3,300-kw. turbo-dynamos. Four boilers, a turbo-dynamo, transformers, and switchboard form a complete power unit. The switchboard building is separate from the engine-room. For the working of the Prussian State railways, there have been ordered 72 new locomotives.—*Der Elektrotechniker*.

**ITALY.**—In consequence of the results obtained from the installation of electric traction on the old Giovi line, the Ministry of Public Works has proposed to the State Railways Administration the conversion of the branch lines from Giovi to Sampierdarena and Ronco. The plans have already been settled, and the cost is estimated at about £210,000. The current for working, unlike that for the old line, will be supplied by a private company, and a contract to this end has, in fact, been signed with the Società Forze Idrauliche della Maira. Construction and equipment will be carried out under the direct supervision of the Railway Department and the line is expected to be completed by March, 1914.—*Giornale dei Lavori Pubblici*.

A 60-years' concession for the construction and working of an electric tramway between Naples and Acerra, a distance of 8½ miles, has lately been granted.

**RUSSIA.**—The Ministerial Commission for the Study of New Railways is about to examine two schemes for electric lines starting from St. Petersburg. One scheme, the author of which is Mr. C. Hedding, proposes to construct a double-track normal-gauge electric railway as far as the Finnish frontier; it will have a 10-minute service, is for passengers and goods (principally wood), and will derive its energy from a fall on the River Vuoksä. Its cost is estimated at 2,969,000 roubles, and an 80-year concession is asked for. The second scheme, put forward by Messrs. Lipsky & Bieloff, proposes to construct a double-track normal-gauge railway, 17 km. long, as far as Ionkki, and a second line, 19 km., from Vosnessensky to St. Petersburg. The cost of the first line is estimated at 1,928,000 roubles and of the second at 2,007,000 roubles.—*La Lumière Electrique*.

**Dundee.**—The Tramways Committee of the T.C. has unanimously agreed to fix the ½d. stages on the Corporation's tramway system at a uniform length of 950 yards. A small Committee has been formed to decide upon the stages.

**East London Railway.**—On this line, now electrically worked, the electrical train service was started on Monday last. The service is maintained by Metropolitan trains, while the District Railway supplies the power required through its Whitechapel sub-station and a new sub-station at Surrey Docks, the latter equipped with three 300-kw. Westinghouse rotaries and transforming plant. The steam pumping stations at Rotherhithe and Surrey Docks have been converted for electrical pumping, and a special system of automatic signalling has been installed by the McKenzie, Holland, and Westinghouse Co., which utilises alternating-current track circuits. In the tunnel signals the red and green lamps are lighted by 5 and 50-volt lamps respectively, thus safeguarding the possibility of a "clear" signal being given in place of the "danger" signal.

**Halifax.**—A recommendation has been made that the Mount Tabor motor-bus service be extended to Wainstalls.

A request having been made that the tramway be extended from the terminus at Skircoat Green along the new road to Dudmell Lane, the Committee has passed a resolution regretting its inability to accede to the request, as it has no power to carry out the suggested extension.

**Liverpool.**—The report of the Corporation tramways for the year ended December, 1912, which has just been issued, shows that the total revenue for the year was £668,220. After apportioning the gross profit, the amount of net profit for the year is £133,857, an increase of £19,125 over 1911. The contribution in relief of the rates is £28,681 in excess of the amount handed over in 1911. There was an increase in the traffic receipts of £29,901. The City Council will consider a notice of motion, in the name of Councillor Holt, which reads:—"That it be an instruction to the Tramways and Electric Power and Lighting Committee to consider the practicability of utilising the tramway systems for the conveyance of goods to neighbouring towns."

At a meeting, which the public were invited to attend, held in the Picton Hall, Liverpool, last Friday evening, to protest against what was described as "a tramcar scandal," a resolution was

carried emphatically protesting against the prevention of a free discussion in the City Council, and calling for the publication of the reports of the tramways manager and the engineering experts on the condition of the cars. One speaker observed that Liverpool was one of the worst managed towns in the whole of Great Britain, and the majority of the members bolstered up their own interests and those of private enterprises to the detriment of the public interest. Another speaker declared that there was in the City Council a conspiracy of silence to prevent the public from knowing the condition of the cars.

**Middlesex C.C. and Its Passengers.**—The County Council has agreed, provided certain necessary approvals are obtained, that "while no dogs or other animal" shall be allowed inside a car, they can, at the conductor's discretion, travel on top, "but must be carried up the stairs." We quote the *Times*, which concludes its paragraph with the statement: "Dogs or other animals must be accompanied by a passenger." We trust that our canine and other friends will take note, and that the ladies will not claim a monopoly of the inside accommodation.

**Oldham.**—The past year has been a record one for receipts, number of passengers carried, and the diminution of working expenses, according to a statement made by Mr. Isherwood (chairman of the Oldham Tramways Committee) last week. The total receipts for the year ended March 24th were £107,083, as compared with £100,364 for the previous year, an increase of £6,719. The profit on the year's working was £4,500, and considering that the wages increase during the year added £1,400 to that item, the result, in Mr. Isherwood's view, was very good. The Committee would be able to wipe out the previous year's loss of £2,413, and have a balance of £2,087. He suggested that the balance should be placed to a reserve renewal account, and mentioned that during the next few years the track would require a good deal of repairing and renewal. During the year, 104,603 more miles had been ran than in the preceding year, but they had used 106,153 fewer units, and the resultant saving was £668. The saving was accounted for by the overhauling of cars and equipment.

**Plymouth.**—Up to March 15th the total income from the tramways for the current financial year amounted to £38,223, and the expenditure to £35,662, compared with £37,651 and £35,139 respectively.

**Stalybridge.**—The Joint Tramway and Electricity Board has decided that 14 additional cars be fitted with the Spencer mechanical slipper brake.

**U.S.A.**—According to the *Electrical World*, the electrified zone of the New York, New Haven and Hartford Railroad is expected to be in operation to New Haven some time in May. This will more than double the railroad's present electrified trackage, which extends from New York City to Stamford. The New Haven will then have about 35 miles under electrical operation, including, besides the single phase equipment, 12 miles of third-rail terminal tracks entering the Park Avenue tunnel and Grand Central Station. Several miles of overhead construction yet remain to be completed on the new Stamford-New Haven extension.

A run of 310 miles was made last month by a new Edison-Beach battery car, from New York to Boston. The car was 50 ft. long, and weighed 3½ tons; its equipment included four 20-H.P. 220-volt motors, and two batteries each of 230 cells. The car ran the first 114 miles (level) at an average speed of 35 miles an hour, and on an energy consumption of 37½ watt-hours per ton-mile. Subsequently a hilly route was followed; the batteries were recharged once, and subsequently received a short boost.

wished to deal solely with the rumour that he and other Ministers had made large profits out of the rise in Marconi shares before March, 1912, when the contract was accepted. He had informed the Prime Minister in August of his purchase. He would not agree that his sale of 8,000 shares could possibly have been the origin of the rumours which had been published.

The examination of Sir Rufus Isaacs was concluded on Friday. The Committee resolved not to permit him to answer the question whether he had made any communication to any member of the Committee of the fact that he had purchased shares in the American Marconi Co. He stated that in addition to the shares which Mr. Lloyd George obtained from him, part of which he had sold, Mr. George had bought on May 22nd a further batch of 3,000 American shares on his own account, and that of the Master of Elibank.

Mr. Lloyd George afterwards gave evidence. He said he took little part in the negotiations for the contract, having his hands full in other ways, but was prepared to defend the contract, for which he took full responsibility. He was on terms of intimate friendship with the Attorney-General and the Master of Elibank, and it was for that reason that he took part in the purchase of American Marconi shares, on the assurance of Sir Rufus Isaacs that the American company had no interest in any contracts between the British company and the British Government. He then confirmed the statements of the Attorney-General regarding the purchase of shares, and said that the net result was that he still held 1,643 shares, and had lost at present prices about £500. It was not true that he had made large sums by speculation. He purchased the Marconi shares on April 17th because he thought they were a good investment. On April 20th he sold 1,000 shares (for himself and the Master of Elibank). The shares were resold before they were delivered.

On Monday the examination of Mr. Lloyd George was concluded, dealing mainly with points of minute detail. He said that apart from the transactions described, he had had no dealings in Marconi shares. The Postmaster-General afterwards made a statement confirming his evidence in the case against *Le Matin*. The Committee sat again on Wednesday.

In the course of his statement on the Naval Estimates last week, Mr. Winston Churchill said that the development of wireless telegraphy in seagoing ships and in the shore stations of the Admiralty had during the year been very satisfactory. Good progress had been made, and the immense utility of wireless fully justified the considerable sum spent last year and the still more considerable sum included in the Estimates for this year. In one respect, however, Admiralty interests had suffered a grave and, to some extent, irreparable loss. The delay in ratifying the Marconi agreement, and the consequent prevention of all progress in the Imperial chain of wireless stations, had deprived us of the advantages in regard to wave length and priority which we had hoped to gain through being first in the field, and now that the company had refused to carry out the contract, and since it was manifestly impossible to compel them to do so, new arrangements of a different character would have to be devised, and it was possible that additional charges would be incurred by the public. No step, however, which would now be taken could put us back into the position which had been lost.

**Rural Telephones.**—In answer to a question, Captain Norton stated in the House of Commons that about 900 agreements for rural party lines had been accepted, and by the end of February about 450 subscribers were using the service. Proposals under consideration would provide for approximately 500 more subscribers. Some delay had arisen recently in dealing with applications for such lines owing to the necessity for applying to the Treasury for authority to exceed the experimental grant of £10,000.

**The Telephone Transfer.**—Replying to a question, the Postmaster-General stated that about 80 members of the electrical staff transferred from the National Telephone Co., out of a total of over 1,300, had resigned from the service since the transfer.

**Thefts from Call-Boxes.**—In consequence of thefts from cash boxes in public telephone call offices in Birmingham, the authorities invented an apparatus which caused a bell to ring when the lid of the cash box was opened. By this means a man named Charles Pollett was captured last week, and he was committed for trial.

**United States.**—The report of the New York Telephone Co., for the year 1912, on the combined operating results of the company and its associated companies, shows total telephone earnings \$65,632,688, telephone expenses \$18,461,690.75, net telephone earnings \$17,170,999.77; add other income \$1,610,072.57, making total net earnings \$18,681,170.34. After deducting interest charges and dividends declared a balance of \$5,492,161.77 is carried as surplus and reserves. Including the associated connecting companies, there were in service in the whole system at the end of the year 1,756,343 stations, an increase of 232,319 stations.

Arrangements are being made between the American and Russian Governments for the establishment of a regular wireless service across Behring Sea, which will ensure telegraphic communication between America and Asia at all times, even in the event of interruption of the cable service. The project, it is said, taken in connection with the existing trans-Atlantic radio service, completes the circuit of the globe by this means of communication.—*Journal of Electricity, Power and Gas.*

## TELEGRAPH and TELEPHONE NOTES.

**British Wireless Stations.**—It has been decided to construct small-power stations at Barbados, Mombasa, Penang, Singapore and Hong-Kong. It is understood that, subject to the necessary guarantees, the work will be given to the Anglo-French Wireless Co., the English branch of the Goldschmidt Co.

**France.**—For the first time wireless communication was established on March 28th between the Eiffel Tower and the station at Arlington, near Washington, U.S.A. The power of the Eiffel Tower station is to be increased from 35 to 140 kW.

**Imperial Wireless System.**—On Thursday last week the Select Committee of the House of Commons on the Marconi contract resumed the examination of the Attorney-General, who gave further evidence with regard to his purchase of shares in the American Marconi Co. He stated that his brother Harry convinced him that the shares were likely to prove a good investment, and said that he considered the American company's prospects to be unaffected by anything that might happen to the English company. He did not refer to his dealings in American shares in his statement to the House of Commons on October 11th, 1912, because he

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" to-day.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

**April 15th.**—1,020,000 arc lamp carbons, 26,900 carbon-filament incandescent lamps, and bare hard-drawn copper cables, for the Melbourne City Council. See "Official Notices" March 28th.

**SYDNEY.**—May 12th. Fibre conduit for the City Council. May 26th. Meters and glazed stoneware bridges. July 7th. Arc lamp carbons. Specifications 10s. 6d. for each section, from City Electrical Engineer's Department. —*Australian Mining Standard.*

**TASMANIA.**—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

**QUEENSLAND.**—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" to-day.

**Ayr.**—Corporation tramways. Tenders for work in connection with Hawk Hill extension—permanent way construction, road widening, &c. Mr. J. Young, engineer. Town Buildings, Ayr.

**Blackpool.**—High and low-tension cables and transformer switch pillars. See "Official Notices" March 14th.

**Bradford.**—April 17th. Three-phase and continuous current switchgear for two sub-stations, for the Corporation. See "Official Notices" to-day.

**Buenos Ayres.**—April 15th. Supply of motors, cables, dynamos and other accessories for motive power. Oficina de la Direccion General de Minas, Geologia e Hidrologia, Buenos Ayres.

**Chorley.**—Board of Guardians. Tenders for a complete telephone installation for the workhouse.

**Dundee.**—The Corporation electricity department invites tenders for the supply of steel sashes and frames, and for the supply and erection of opening casements, for extensions at Carolina Port generating station. Mr. H. Richardson, general manager and engineer.

**Edinburgh.**—Electric lighting for the new Veterinary College buildings at Summerhall. Mr. D. McArthy, architect, 25, Frederick Street, Edinburgh. Deposit two guineas, returnable.

**France.**—PARIS.—The Administration des Chemins de Fer de l'Etat invites tenders for the supply of three electrical traversers. Particulars, 43, Rue de Rome, Paris.

**Germany.**—HANOVER.—April 15th. Tenders are invited for the supply of the plant in eight lots for the hydroelectric station in the Eder Valley, comprising two 3,000-H.P. double-spiral Francis turbines and two 1,550-H.P. ditto, with governors, &c., turbine piping, four 6,000-volt three-phase generators, two rotary converters and a storage battery, three 6,000-KW. oil transformers for 6,000/55,000 volts, transmission lines, two 25-ton hand cranes of 25 metres radius, and a completely fitted switchboard. Particulars and drawings of all the items save the switchboard may be obtained on application enclosing 15 marks (for the switchboard 20 marks) to the Königlichen Maschinenbau Amt, Hannover, Brandstrasse, 1.

**Glamorgan.**—April 10th. Electric plant, wiring, &c., for the Training College now erecting at Barry for the Glamorgan County Council. Plans, &c., to be seen at office of the Clerk to the Council, at the Glamorgan County Hall, Cardiff.

**Glasgow.**—The Tramways Sub-Committee on Works and Stores of the T.C. is inviting offers required under the annual contracts. Mr. James Dalrymple, general manager, Headquarters, Bath Street.

**Keighley.**—(a) Foundation work for a 2,000-KW. turbo-alternator and condensing plant at the electricity works; (b) rolled steel joists in connection with the above. Drawings and specifications obtainable from Mr. H. Webber, Borough Electrical Engineer, Coney Lane, Keighley.

**Leyton.**—Tenders are to be invited for meters, and for one mile of 2 and ½ mile each of '025 and '025 cable, for the Council.

The Education Committee invites tenders for wiring the Church Road school extension.

**Limerick.**—April 10th. Stores and materials for a year, for the Borough electricity department. See "Official Notices" March 28th.

**Lisnaska (Co. Fermanagh).**—April 14th. Gas engine and suction gas plant, dynamo and booster, battery, wood poles, overhead mains, &c., and switchboard, for the Lisnaska Electric Light Co., Ltd. See "Official Notices" March 28th.

**London.**—L.C.C.—April 15th. Electrical installation at Jeffryes Almshouses, Shoreditch. See "Official Notices" to-day.

**April 23rd.**—Electrical installation at Shadwell High Street Special School. See "Official Notices" to-day.

**FULHAM.**—April 23rd. 6,000 tons of nutty slack coal, for the B.C. Electricity Works. See "Official Notices" to-day.

**Manchester.**—April 15th. Tramways Committee. Tenders for roofing over of avenues at the Hyde Road car works, Manchester. Mr. J. M. McElroy, General Manager.

**April 15th.**—(a) Tramway rail bonds. (b) Hard-drawn copper trolley wire; (c) Steel tramway poles. (d) Span drive brackets for tramway poles; (e) Granite setts. Mr. J. M. McElroy, General Manager. For (c) and (d) a deposit of £1 lb. is required.

**Norway.**—The Norwegian Telegraph authorities in Christiania have just invited tenders for the supply of 105 tons of iron wire and 57 kilometres of steel wire and lead-covered cables for the telegraph service.

**April 11th.**—76,300 kg. galvanised iron wire; 18,000 insulators and 7,000 metres of rubber-insulated copper wire, for Norwegian State Railways. Apply Telegrafinspektorens kontor, Stenersgaten, 8-1V, Christiania; also Board of Trade Com. Intel. Dept., London.

**Maryborough.**—April 9th. 1,120-amp.-hour accumulator, for the District Asylum. See "Official Notices" March 28th.

**Salford.**—April 10th. Extra-high-tension switchgear, for the Corporation. See "Official Notices" March 28th.

**Stalybridge.**—4,500 yards E.H.T. three-core lead-covered cable. See "Official Notices" March 14th.

**Stockton-on-Tees.**—April 10th. One 200-KW. rotary converter, transformer and starting apparatus, for the Corporation. See "Official Notices" to-day.

**York.**—April 5th. The Board of Guardians is prepared to receive tenders for (1) a dug well round an existing bore hole, an additional cast-iron liner down the bore hole, a deep-well pump for 5,000 gallons per hour, and two small centrifugal pumps and electric motors; and (2) water-softening plant (without heat) dealing with 5,000 gallons per hour. Tenders to the Clerk (Mr. George Sykes), Union Offices, Museum Street, York.

### CLOSED.

**Belgium.**—Five German and three Belgian concerns submitted tenders last week to the Belgian Post and Telegraph authorities in Brussels for the supply of a large quantity of telegraph cables. For one lot the lowest tender was that of the Société A.E.G. Union Electrique, and for the second lot the Siemens and Halske Co. quoted the lowest price.

**Bexhill-on-Sea.**—The T.C. has renewed for a period of ten years the agreement with Tudor Accumulator Co., Ltd., for the maintenance of batteries, at £70 a year.

**Bushey.**—The U.D.C. has accepted the tender of Messrs. Stuart & Moore, of Ealing, W., for the installation of electric fire alarms, at £63 10s. per annum, for seven years.

**France.**—The French State Railway authorities in Paris have just placed a contract with La Société Alsacienne de Constructions Mécaniques de Belfort, for the supply of 1,350 metres of electric cables.

**Gloucester.**—The T.C. has accepted the tender of Messrs. Ruscoe, of Hyde, for mechanical stokers at the electricity works, at £195.

**Haslingden.**—The T.C., on March 27th, approved of the following tenders for the erection of machinery, &c., at the sub-station:—

British Thomson-Houston Co., Ltd.—Rotary converter.  
Ferranti, Ltd.—Switchboard panel, recording voltmeter and charts.  
Chloride Electrical Co.—Extension of tramway switchboard.  
Siemens Bros.—Additional feeder cable.

**Heston and Isleworth, and Belfast.**—Messrs. Chamberlain & Hookham have received contracts for meters from the Councils of Heston and Isleworth and Belfast.

**Hornsey.**—The D.C. has decided to place a contract with Messrs. Isaris, Ltd., for electricity meters.

**Ilford.**—The U.D.C. has accepted the following tenders:—

Electromotors, Ltd.—Middle-wire reversible motor, £51.  
Wardle Engineering Co., Ltd.—Electric light fittings for centrally lighting High Road.

The following tenders have been accepted for annual supplies:—

Main cables.—Unic Cable Co.  
Arc lamp carbons.—J. & H. Grevenor, and Sloan Electrical Co., Ltd. ("Couraady" make).  
Incandescent lamps.—Siemens Bros. Dynamo Works, Ltd., and Cryselco, Ltd.  
Meters.—Ferranti, Ltd.; British Thomson-Houston Co., Ltd.; Siemens Bros. Dynamo Works, Ltd.; Isaris, Ltd.  
House service fuse boxes.—W. Lucy & Co., Ltd., and W. T. Henley's Telegraph Works Co., Ltd.  
Joint boxes.—W. Lucy & Co., Ltd.

The following tenders have been accepted for tramway supplies:—

General Electric Co., Ltd.—Lampholders, tatten holders and tages.  
R. W. Blackwell & Co.—P. and B. tapes.  
La Carbone.—Carbon brushes.  
British Westinghouse Co.—Armature coils.

**Kendal.**—The Westmorland County Council has accepted the tender of Messrs. R. Hadwin & Son, of Kendal, for the electrical installation at the Allen Technical Institute at Kendal.

**Leyton.**—The U.D.C. has accepted the tender of Messrs. Wm. Cory & Son, Ltd., for Shipley fine slack coal for the electricity works, at 13s. 10d. per ton, for a year.

**Liverpool.**—The tender of the Compania Fabril de Carbons Electros, per Mr. C. W. Webster, Bradford, has been accepted by the T.C. for an annual supply of flame arc lamp carbons.

**London.**—**LEWISHAM.**—The following tenders were before the Guardians at their meeting on Monday for electrical installation work at the Infirmary and the Workhouse:—

	Infirmary.	Workhouse.
Smeeton & Page .. .. .	£1,192	£1,003
Chapman & Co. .. .. .	1,800	1,800
Haycraft & Sons .. .. .	875	759
Ellis & Ward, Ltd. .. .. .	1,380	1,095
Alliance Electric Store, Ltd. .. .. .	998	970
V. G. Middleton .. .. .	1,050	1,200
A. J. Ewens .. .. .	740	675
Weston & Sons .. .. .	909	640
Tredegar & Co. .. .. .	866	668
Watson & Co. .. .. .	1,247	1,135
W. R. Reynolds, Ltd. .. .. . (accepted)	479	449
A. K. Klamet .. .. .	925	1,039
Stegmann & Co. .. .. .	1,127	897
Coxens, Ltd. .. .. .	1,249	1,010
Malcolm & Allan, Ltd. .. .. .	1,505	1,304
Saville & Walton .. .. .	940	797
L. Sunderland Co. .. .. .	1,400	1,050

The tender of Messrs. W. R. Reynolds, of East Ham, was accepted. In the event of the firm not agreeing to carry out the contract, the Board decided that the wiring of the Infirmary should be done by Mr. A. J. Ewens, and the Workhouse by Messrs. Weston & Sons.

**FULHAM.**—The Fulham Board of Guardians has accepted the tender of the Hart Accumulator Co., Ltd., for the supply of a storage battery of 102 cells required for the Fulham Workhouse.

**Luton.**—For Council. Brush Electrical Engineering Co., Ltd., two 1,000-KW. turbo-alternators and condensers, £9,200.

**Maidenhead.**—The T.C. has accepted the tender of the Crynant Colliery Co. for 1,000 tons of coal for the electricity works, at £1 1s. 10d. per ton.

**Plymouth.**—The Borough Surveyor reported to the Tramways Committee that he had communicated with four firms for the purpose of obtaining quotations for the supply of 100 tons of tramway rails. Two of the firms had declined to submit a price, being too busy, and the other two had submitted prices which were subject to acceptance within seven days. After communicating with the Chairman, and with his authority, he had accepted the tender of Messrs. Walter Scott, Ltd., at £8 10s. per ton. The surveyor's action was confirmed.

**Salford.**—The following tenders have been accepted by the T.C.:—

General Electric Co., Ltd.—Three rotary converters and static transformers, £6,200.  
Bertram Thomas.—Extension of lighting and power switchboard at electricity station, £438; supply of extra feeder panels, if required, £54 each.

**Southend-on-Sea.**—The contract for poles, brackets, &c., mentioned last week, was placed with Messrs. Watlington & Co not Worthington & Co. as stated in our last issue.

**Stalybridge.**—The Joint Tramway and Electricity Board has accepted the tender of Messrs. Wm. Storrs, Sons & Co., Ltd., for the erection of a chimney at the generating station.

**Traction Lamps.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract from Messrs. Balfour, Beatty & Co. for the supply of traction lamps (tantalum and Wotan) for the following tramways for 12 months:—Luton, Llanelli, Dartford, Carlisle, Leamington and Warwick, Notts and Derby.

**Walthamstow.**—The U.D.C. has accepted the tender of the Brush Electrical Engineering Co., Ltd., at £3,478, for the supply of four additional tramcars, and the tenders of Messrs. Chamberlain & Hookham and Messrs. Ferranti for meters for the ensuing year.

**Warrington.**—The British Westinghouse Co., Ltd., has received an order from the T.C., for a 25-H.P. motor. The following tenders have been accepted by the T.C.:—

Brush Electrical Engineering Co., Ltd.—Transformers,  
General Electric Co., Ltd.—Direct-current motors,  
British Thomson-Houston Co., Ltd.—Alternating-current motors.

**Worcester.**—The City Council has placed a contract with B.I. and Helsby Cables, Ltd., for cables for three years.

**Wrexham.**—The following tenders for the supply of materials to the electricity works have been accepted:—

Reason Manufacturing Co.—Miniature electrolytic meters,  
Edison & Swan United Electric Light Co.—Carbon-filament lamps,  
Jas. Light & Son, Ltd.—Crank chamber oil,  
Henry Wells Oil Co.—Cylinder oil,  
Wm. Hughes.—Boiler solution,  
Barton & Co.—Slack.

The Committee has also accepted the following tenders:—

British Westinghouse Co.—Condenser, £150.  
H. Davies.—Erection of sluice gates, £76.

**Yarmouth.**—The tender of Messrs. Walter Scott & Co., Ltd., has been accepted by the T.C. for 180 tons of steel tramway rails, at £8 2s. 6d., as has also the tender of Messrs. John Baker and Co. (Rotherham), Ltd., for 60 steel tires, at 3s. 6d. each.

## FORTHCOMING EVENTS.

**Electro-Harmonic Society.**—To-night. At 8 p.m. King's Hall, Holborn Restaurant. Last Smoker of the season.

**Salford Technical and Engineering Society.**—Saturday, April 6th. At 7 p.m. At the Royal Technical Institute, Salford. Paper on "Modern Gas Engines," by Mr. K. Cox.

**Association of Engineers-in-Charge.**—Saturday, April 6th. At 8 p.m. Visit to the works of the Westminster Electric Supply Corporation, Horsferry Road.

Wednesday, April 9th.—At 8 p.m. At St. Bride's Institute, E.C. Paper on "Notes on the Design and Economy of Diesel Oil Engines," by Capt. H. Riall Sankay.

Saturday, April 12th.—Annual Dinner.

**Institution of Electrical Engineers (Scottish Section).**—The annual general meeting is postponed from April 8th to April 15th.

(Newcastle Students' Section).—Monday, April 7th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Notes on the Operation of Three-Phase Transformers," by Mr. R. C. Phillips.

(Manchester Section).—Tuesday, April 8th. At 7.30 p.m. At the University, Manchester. Annual general meeting and lecture by Prof. E. Rutherford.

(Birmingham Section).—Wednesday, April 9th. Meeting at the University, Birmingham.

(Newcastle Section).—Wednesday, April 9th. At 7 p.m. At the Lit. and Phil. Middlesbrough. Paper on "Power Supply on the Rand," by Mr. A. E. Hadley. Afternoon visit to the works of the Skinningrove Iron Co.

(London).—Thursday, April 10th. At 8 p.m. "Self-Synchronising Machines," by Dr. E. Rosenberg.

(Dublin Section).—Thursday, April 10th. Meeting at 8 p.m. At the Royal College of Science, Dublin.

**Society of Engineers.**—Monday, April 7th. At 7.30 p.m. At the I.E.E. Paper on "The Status of Engineers and Engineering, with Special Reference to Consulting Engineers," by Mr. W. Ransom.

**Royal Society of Arts.**—Wednesday, April 9th. At 8 p.m. Paper on "Electricity Supply in London," by Mr. F. Bailey.

**Junior Institution of Engineers.**—Friday, April 11th. At 39, Victoria Street, S.W. Paper on "Methods of Regulating and controlling Working of Electric Accumulators," by Mr. G. C. Allingham.

**Physical Society.**—Friday, April 11th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "Some Errors in Magnetic Testing due to Elastic Strain," by Messrs. A. Campbell and H. C. Booth, and "Note on Cathodic Sputtering," by Dr. G. W. C. Kaye.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued:—

Monday, April 7th.—"A" Company. Recruit training, 7 to 10 p.m. company training, 7 to 10 p.m.

Tuesday, April 8th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, April 10th.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Friday, April 11th.—"D" Company. Company training, 7 to 10 p.m.

Saturday, April 12th.—Headquarters will be opened for regimental business from 10 a.m. till noon.

(Signed) J. H. S. PHILLIPS, Major.

For Officer commanding L.E.E.

## NOTES.

**The Electro-Harmonic Society.**—To-night the last Smoking Concert of the season will be held at the Holborn Restaurant (King's Hall), commencing at 8 o'clock. The artists are as follow: Vocalists—Mr. Henry Turpin (tenor). Mr. Peter Dawson (baritone); Humorists—Mr. Dutch Daly, Mr. Ben Osborne; Original Character Sketches—Mr. Stacy Aumonier; Entertainer at the Piano—Mr. Harrison Hill; Humorous Recitations—Mr. Walter Churcher; Banjo Solo—Mr. Olly Oakley; Entertainer—Mr. Hewson Brown; Piano Solo and Accompanist—Mr. Bernard Flanders, A.R.A.M.

**Copper.**—In the course of his speech on the difficulties of the year 1912, the chairman of the United Alkali Co., Ltd., mentioned that they had to pay about £70,000 more for coal and other articles than in the previous year, and prices had been permanently increased. The average price of copper, he said, had been about £18 per ton higher. The position for 1913 was difficult for the company as they could not raise their selling prices.

**Faraday House Old Students' Association.**—The Annual Dinner of this Association will be held at the Hotel Cecil (Victoria Hall), on Friday, April 11th, at 7 (for 7.30 p.m.), with the president, Mr. Haydn T. Harrison, M.I.E.E., in the chair. Any Faradians desirous of attending, who have not received a notice, are requested to communicate with the hon. secretary, F.H.O.S.A., Faraday House, Southampton Row, London, W.C.

**Will.**—According to the *Times*, the late Sir William H. White left estate of the gross value of £38,377, of which the net personality has been sworn at £34,599.

**I.M.E.A. Preliminary Programme.**—The eighteenth annual Convention of the Incorporated Municipal Electrical Association will be held in London in June, and the following programme has been arranged tentatively:—

*Tuesday, June 17th.*

10.0 a.m.—Opening of the Convention at the Institution of Electrical Engineers. (1) Address by Mr. C. E. C. Shawfield, ex-President, late chief electrical engineer, Wolverhampton; (2) Paper on "Prime Movers," by Dr. S. Z. de Ferranti, Past President I.E.E., to be followed by a discussion.

1.0 p.m.—Luncheon interval.

2.30 p.m.—Visits to the West Ham Electricity Works and works of the London Electric Supply Co., Ltd., at Deptford.

*Wednesday, June 18th.*

10.0 a.m.—Meeting at the Institution of Electrical Engineers. Discussion (members and delegates only). Subject to be announced.

1.0 p.m.—Luncheon interval.

2.30 p.m.—Visit to London Electric Railway Power Station, Lot's Road, Chelsea.

7.0 p.m.—Annual dinner, Hotel Cecil. Members, delegates, visitors and ladies.

*Thursday, June 19th.*

10.0 a.m.—Special train from Waterloo.

11.0 a.m.—Meeting at the Empire Theatre, Kingston-upon-Thames. (1) Paper on "Electric Vehicles," by Mr. A. H. Seabrook, member of Council, and Messrs. W. Watson, and R. J. Mitchell. (2) Paper on "Air Filtration," by Mr. J. Christie, Past President, chief electrical engineer, Brighton.

1.30 p.m.—Luncheon interval.

3.0 p.m.—River trip to Walton and Hampton Court, &c.

*Friday, June 20th.*

10.0 a.m.—Meeting at the Institution of Electrical Engineers. (1) Annual general meeting to receive the Council's annual report and the auditor's report and balance-sheet, elect the officers and Council, and transact other business. (2) Special general meeting to revise the articles of association.

*Saturday, June 21st.*

10.0 a.m.—It is hoped that it may be possible to arrange for a visit to the Metropolitan Water Board's new pumping plant at Chingford.

The headquarters of the Association will be the Hotel Cecil, and members are advised to book their rooms there or elsewhere at once, as it will be difficult to obtain accommodation later. The attendance of ladies accompanying members and delegates will be welcomed at the annual dinner and the visit to Kingston. An official programme will be issued in due course, and in the meantime all communications should be addressed to Mr. C. McArthur Butler, 28, Bedford Square, London, W.C.

**Manchester Electro-Harmonic Society.**—The closing concert of the first season of this Society was held last Friday evening. There was an attendance of something like 120, and the meeting was under the chairmanship of Mr. Sells. We hear that the musical items were exceptionally well received, notably the singing of "The Erl King," by Mr. Bridge Peters. Mr. F. S. Sells, in the course of a vote of thanks to the President, Mr. Pearce, remarked that the Society was exceptionally fortunate in having a gentleman of Mr. Pearce's standing as its president, who, notwithstanding that he was an exceptionally busy man, had taken great interest in the Society. Another notable point was that the Society, which only started in October last with a membership of 70, had now increased that membership to 170. Mr. Sells made an earnest appeal to each of the members to endeavour to get at least two new members, and it is hoped that the Society will commence next season with at least 300 members. A vote of thanks was proposed by Alderman Walker (vice-chairman of the Electricity Committee) and seconded by Mr. William Cramp, to the musical director, Mr. W. J. Smith, the secretary, and the treasurer. Each of these gentlemen responded, and a successful season was brought to a close with "Auld Lang Syne."

**Parliamentary.**—**SAFETY LAMPS.**—Sir Fred. Cawley asked the Home Secretary whether he had done anything to meet the complaints of safety-lamp manufacturers that they were charged a high fee for having lamps tested, whilst for testing lamps in Germany, France and Austria there was no charge, and that the testing station was not accessible and caused inconvenience; and whether he would say under what statute the Government had power to levy fees for testing safety lamps. Mr. McKenna said it had been found possible, in view of the large number of lamps which the makers proposed to submit, to make substantial reductions in the fees as originally fixed. The fees were so fixed as merely to cover the expenditure actually incurred in connection with the testing of a lamp, and no statutory authority was required for charging the fees. The testing station was established at Eskmeals because the Home Office already had an experimental station there, and the work could be carried out more economically for the makers as well as more conveniently for the Department than if the Home Office had had to acquire a special site and appoint a special staff. It might be possible later on to make arrangements for its transfer to a more central spot.

**Tramway Accident Claim.**—A settlement has been effected in the Court of Session action by a Renfrew teacher against the Paisley District Tramway Co., for £500 damages. Pursuer alleged that a tree which interfered with defenders' overhead wires was being cut down, and that she was struck on the head by a falling branch. Defenders denied fault. They made a payment of £50 and expenses, and the action has now been taken out of Court.

**Annual Dinners and Socials.**—**LONDON.**—One of those fixtures which we have always the greatest pleasure in attending is the annual staff dinner of the Garam and Robertson Lamp Works, which was again held in the Coronation Hall, Clarendon Restaurant, Hammersmith, on Friday, March 28th. In the unfortunate absence, through illness of Mr. Hirst, the chair was genially filled by Mr. C. Wilson, ably supported by Messrs. Sheppard and Driver, while Mr. Gosling looked after the general welfare of the visitors, among whom we noticed Mr. Jack Fletcher, manager of the lamp sales department of the G.E.C., Mr. Scolding, of Messrs. W. Cory & Sons; Councillor Johnson of the Hammersmith Electric Light Committee, Councillor Cook, and other well-known local gentlemen, the company mustering about 90 in all. After the usual loyal toasts given by the chairman, Mr. P. P. Driver proposed "The Allied Firms," to which Mr. Wilson responded, expressing his regret at the absence of Mr. Hirst, and referring to the steady progress of the firms, whose personnel had increased from a total of 90 to a present total of 1,700, which, when the extensions now in progress were completed would shortly be increased to 2,000. He was delighted to say that, throughout the works, there was a complete absence of friction and in every department a loyal striving for success. He also made the announcement that the directors had provided the necessary funds for the establishment of a club house, and he hoped, on the next occasion, to welcome their guests in their own house. The company then settled themselves to enjoy an excellent programme, provided, with one exception, by the members of the staff. Liszt's Rhapsodic Hongroise No. 2 was excellently played by Mr. E. C. Hosier, while Miss Dallender sang delightfully to her own accompaniment, besides taking part with Mr. J. Minson in a short farce. Mr. E. G. Sheppard proposed the health of "The Visitors and the Press," coupling it with the names of Mr. Scolding, Mr. Jack Fletcher and Mr. Sydney Rentell, who suitably responded. Mr. Fletcher, who was, according to Mr. Sheppard, suffering from "Osmatitis" (a strange disease whose symptoms are more noticeable among competitors than with the actual sufferer) pointed out that the year's sales had far exceeded any previous year, and that it was a subject of congratulation that this increase was not due to one or two exceptionally large contracts, but to a general expansion of the field of operations. The toast of "The Chairman," proposed by Mr. P. Pring, was received most heartily, and Mr. Wilson responded, calling the attention of those present to memories of the growth of the concern.

**BARNESLEY.**—The staff of the Corporation Electricity Works held their first annual dance in the Arcadian Restaurant, Barnsley, on Thursday evening last week, when nearly 200 people were present.

**Electricity Supply Rifle League.**—A representative match was shot on Saturday last between a team chosen from the above League and the London and South-Western Railway Rifle Club, on the latter's range at Clapham Junction. The scores were as follows:—

L.S.W.R.—H. Baker, 97; F. J. C. Mercer, 97; G. E. Barnes, 95; G. Coffin, 95; J. Cole, 95; W. Colley, 95; R. A. Hazeldine, 95; F. R. Wilson, 93; total, 762; E. Gray, 91; C. I. Barnes, 89.

E.S.R.L.—H. Murgford, 97; E. Neville, 97; J. K. Wells, 97; F. Winchcombe, 97; W. J. D. Partridge, 95; F. Barber, 93; A. W. Law, 93; E. G. Furneaux, 92; total, 761; H. P. Gaze, 91; H. A. Pearman, 91.

As the match was 10 to shoot and 8 to count, the result was a win for the railwaymen by the smallest possible margin, viz., one point, but on the total for all 10 men the electricians were one point to the good. After the match both teams were entertained to high tea by the general manager of the L.S.W.R. It is hoped to have a return match very soon.

**A Surveyor's "Loan."**—*Lloyd's Newspaper* reports a matter which was before the Sittingbourne County Court, on Saturday last, in which Mr. W. Richmond Warlow, surveyor to Milton Regis Urban Council, sued Mr. C. D. Richardson, an electrical engineer, and formerly member of the Whitstable Urban Council, for £20, money alleged to have been lent.

"In 1911 Mr. Warlow entered a competition for the best plan for sewage works at Whitstable. This scheme was accepted, and afterwards he became on friendly terms with Mr. Richardson. The latter, he said, asked him to lend him some money, and he sent Mr. Richardson two cheques for £10 each. Whitstable Council objected to the site of the proposed works, and ultimately Mr. Warlow's scheme was not taken up. When the plaintiff wrote for repayment of the loan defendant ignored his letters. Mr. Richardson said he did not ask for a loan. The money was a gift for services rendered in connection with the acceptance of the sewage scheme. Defendant's wife corroborated his account. Judge Shortt said he was convinced that the money was given by Mr. Warlow with the corrupt and illegal intention of influencing the conduct and vote of the defendant as a member of the Whitstable Urban Council in respect of Mr. Warlow's sewage scheme, and that it was accepted by Mr. Richardson with a knowledge of plaintiff's intention. The amount could not be recovered. Judgment was entered for the defendant."

**Imperial Services Exhibition.**—A preliminary prospectus has been issued regarding the above exhibition, which is to take place at Earl's Court from May onwards this year. The object of the Exhibition is to show the great advance that has taken place in late years in the scientific preparation for the defence of the Empire by land and by sea. The exhibits will include examples of transport, field cooking, signalling and wireless telegraph equipments. The Empress Hall will be converted into a lake, and electrically-driven models of Dreadnoughts, cruisers, and torpedo boats will manoeuvre thereon. Wireless telegraph and signal stations will be at work.

**Association of Electrical Station Engineers.**—A meeting was held at Birmingham, on Thursday last week, for the purpose of forming a branch of the A.E.S.E. for the Birmingham district. After some discussion, it was resolved not to appoint a Committee at that meeting, but that the secretary be asked to obtain by correspondence and reference to the register of the Association a representative Committee, and that another meeting be called to elect the Committee. All those present promised to make application for membership, and to endeavour to get others to make application. For the time being the affairs of the A.E.S.E. for Birmingham and district are in the charge of Mr. E. A. Gordon, 41, Spencer Avenue, Coventry.

A meeting was held at Grimsby on Friday last for the purpose of forming a branch of the Association. Fourteen gentlemen were present. The meeting was opened by the reading of a letter from the hon. secretary (Mr. Ebben), and, after the aims and objects of the A.E.S.E. had been freely discussed, it was unanimously resolved that a branch be formed for Grimsby and district. A Committee of six gentlemen was appointed, with Mr. W. M. Fowler as hon. secretary. It was decided to hold another general meeting to-day (Friday) to enable those who were on shift during the above meeting to attend.

**Accident.**—Mr. George Widdlake, chief electrical engineer at the Coxsides works of Plymouth and Stonehouse Gas Co. met with a nasty accident on Saturday. He was engaged in cleaning a revolver at a bench in the works, when by some means the weapon was discharged and the bullet struck him, grazing a lower rib. He was removed to the South Devon and East Cornwall Hospital, where he is doing well.

**Inquiries.**—A correspondent asks if there is any system of wiring for private houses, which is the permanent property of the tenant and does not become landlord's fixtures. Another correspondent asks for names of makers of small portable power-driven air pumps, capable of producing a vacuum down to about '001 mm. The present makers of the "Niblett" solid accumulator are asked for.

**Appointments Vacant.**—Correspondence clerk, for the Swindon Corporation Electricity and Tramways Departments (£70); installation inspector and tester, for the Birkenhead Corporation Electricity Department (£104); mechanic, for the Science Departments of the University College of North Wales, Bangor (30s.); assistant engineer, for the Burgh Electricity Works, Hamilton (£125). See our advertisement pages in this issue.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS.—The following are the nominations for election to the Council for 1913-14:—

The names in italics are those of the persons nominated by the Council for the vacancies which will occur on September 30th, 1913. Others remain in office.

President.—*W. Duddell, F.R.S.*  
Vice-Presidents (two vacancies).—*Hon. Sir C. A. Parsons, K.C.B., F.R.S., J. F. C. Snell, W. Judd, C. H. Merz.*  
Honorary Treasurer.—*R. Hammond.*

Ordinary Members of Council.—Members (one vacancy).—*A. L. C. Felt and G. Scott Ram, F. Gill, J. S. Highfield, H. Hirst, B. M. Jenkin, J. E. Kingsbury, Dr. A. Russell, W. Rutherford, A. H. Seabrook, Roger T. Smith, C. P. Sparks, H. E. Wimperis.*

Associate Members (three vacancies).—*F. E. Berry, Captain E. O. Henriot, R.E., W. Martin, S. W. Melsom.*

Associates (two vacancies).—*E. Russell Clarke, Francis Ince, A. M. J. Ogilvie, C.B., A. B. Anderson.*

(MANCHESTER SECTION).—A meeting of the Section was held on the 1st inst., when a paper was read by Dr. E. Rosenberg on "Self-Synchronising Machines." An interesting discussion followed, to which the author replied. The annual meeting of the Section will be held next Tuesday, when a lecture will be given by Dr. E. Rutherford on "The Electrical State of the Atmosphere."

**PHYSICAL SOCIETY.**—At the meeting held on March 14th, 1913, a paper on "Some Oscillograms of Condenser Discharges and a Simple Theory of Coupled Circuits," was read by Dr. J. A. Fleming, F.R.S. The author gave a very short method, involving only the simplest algebra, for arriving at a formula for the time of free electrical oscillation of a leaky condenser in series with an inductive resistance, the oscillations being damped. Oscillograms taken at low frequency with a Duddell oscillograph were shown, demonstrating the accordance of fact with deductions from the formula. In the same manner the case of coupled circuits was considered, and Dr. Fleming deduced an equation, which showed that there were, in general, oscillations of three frequencies in the circuits. This was confirmed by photographs of oscillograms and diagrams of resonance curves.

A second paper by Dr. Fleming described some Braun cathode ray tubes used as high-frequency oscillographs, and an electrostatic influence machine giving a steady current of 300 to 350 microamperes for working them.

**Prize Competition for a Miner's Electric Safety Lamp.**—The Verein für die bergbaulichen Interessen im Oberbergamtsbezirk Dortmund are offering an award of £1,250 for a miner's electric safety lamp possessing the following advantages:—Unprovocative of explosions, even after having received a blow or damage; useable for 12 hours uninterruptedly; easy to carry, not cumbersome, strong, simple to control, economical; furnished with a gas indicator, like the ordinary oil or benzine lamp; and of a lighting power of 1 hefner after 12 hours' burning. Lamps must be sent in, with explanations in German and drawings, before October 1st, 1913.

**Electricity Works in the Argentine Republic.**—In a leaderette in this issue we refer to the rapid development in Argentina. The following list of cities and towns in which electric light stations exist or for which concessions have been obtained or contracts are pending, has been compiled by the *Review of the River Plate*, and is of some interest in connection with the above:—La Plata, C. de Patagones, Chivilcoy, Dolores, Pergamino, Necochea, Carmen de Areco, Luján, Bahía Blanca, Punta Alta, San Fernando, General Alvear, Coronel Vidal, Campana, Navarro, 24 de Mayo, Saladillo, Chascomús, General Belgrano, Las Flores, Dolores, Azul, Olavarría, La Madrid, Coronel Suarez, Pigué, Concordia, Florencio Varela, Mercedes, Dorrego, Tres Arroyos, Mar del Plata, Balcarce, San Martín, Tandil, Ayacucho, Maipú, Pringles, Suipacha, Bragado, Avellaneda, Lomas, Trenque Lauquen, City of Buenos Ayres, Corrientes, Goya, Monte Caseros, Curuzú, Cuatía, Posadas, Paraná, Victoria, Concepción, Gualeguay, Gualeguaychí, Catamarca, Ríoja, San Juan, San Luis, Villa Mercedes, Mendoza, Salta, Santiago del Estero, La Banda, Jujuy, Tucumán, Córdoba, Villa María, San Francisco, Bell Ville, Suñio, Santa Fe, Rosario, Coronda, Galvez, Rafaela, Esperanza, Reconquista, San Carlos Centro, Caseros (Buenos Ayres), San Rafael, Pelotas, Colon, General Paz, Capilla del Monte, San Antonio Oeste, San Andres de Giles, 9 de Julio, Trelew (Chubut), Laboulaye (Cordoba), Nogoya, San Justo, Venado Tuerto, Vera (Santa Fe), San Lorenzo, General Villegas, Villa Nueva, San Cristobal, Junin, Merlo, Carcaraña (Santa Fe), General Pico, General Sarmiento, San Martin de los Andes, Alberdi, Cruz (Cordoba), Ramos Mejía, Villa Ballester.

**India.**—A demonstration of certain sources of weakness said to be common to nearly all forms of block instruments at present in use on Indian railways was recently given, at Delhi, by Mr. McCloskey, assistant electrical engineer, B. & C.I.R., before a Committee of senior Government Inspectors, representing the Railway Board. Experiments were shown illustrating irregularities in block working by which the Ghaziabad disaster, and many subsequent collisions and potential collisions, may have been caused. Arrangements have been made to give an extensive practical trial to the safeguards suggested.—*Indian Engineering.*

**First Aid in Case of Electrical Burns.**—A commission, representing the American Medical Association, the National Electric Light Association and the American Institute of Electrical Engineers, suggests the following rules as embodying the approved methods for first care of electrical burns:—

"A raw or blistered surface should be protected from the air. If clothing sticks, do not peel it off; cut around it. The adherent cloth, or a dressing of cotton or other soft material applied to the burned surface, should be saturated with picric acid (0.5 per cent.). If this is not at hand, use a solution of baking soda (one teaspoonful to a pint of water), or the wound may be coated with a paste of flour and water. Or it may be protected with a heavy oil such as machine oil, transformer oil, vaseline, linseed, caron or olive oil. Cover the dressing with cotton, gauze, lint, clean waste, clean handkerchiefs or other soft cloth, held lightly in place by a bandage.

"The same coverings should be lightly bandaged over a dry, charred burn, but without wetting the burned region or applying oil to it.

"Do not open blisters."—*Electrical World.*

**Electric Cooking: Australian Development.**—We have it on the authority of the *Australian Mining Standard* that remarkable demonstrations have lately taken place in Melbourne of a new system of electric heating and cooking which "allows such economy in current consumption and gives such rapid heating effects that the stove suitable for the average householder, fitted with the new unit heated to 600° within 7½ minutes, turned out a batch of perfectly cooked scones within 17 minutes of the current being applied." Our contemporary mentions the great simplicity of its construction, and says that "the cheapness of manufacture of the elements will enable the owners of the patents to manufacture at such low costs that a full-sized electrical stove can be sold to the householder at a price approximately that of the ordinary gas stove, and full electrical appliances at similarly low figures. The cost of cooking will be reduced by between 50 and 75 per cent. below any other apparatus at present on the market." We shall await fuller particulars with no little interest.

**Fatalities.**—Alex. Faulds, a Vale of Leven man, in the employment of the Dominion Power Transmission Co., Hamilton, Ontario, was recently killed instantly by receiving a 4,000-volt shock while working on a transformer.

A correspondent says that a young man named Herbert Allen, aged 19, an electrical fitter of Nottingham, was killed at the transforming station at Ushaw Moor Colliery, Durham, on Monday.

**Correction.**—On page 552, in the last paragraph of the article on the "Fixation of Atmospheric Nitrogen," it is stated that 1 kw. should suffice to "fix" 100 kg. of nitrogen per annum, but that in practice little over 400 kg. are obtained; these figures should be 1,000 and 4,000 respectively.

**Killed by Lightning.**—At an inquest held at Reigate on Mrs. Charlotte Oxley, according to a son's evidence, the deceased was preparing for church when there was a flash of lightning; witness heard a fall, and found his mother on the floor. Dr. Watson said there were no external marks, but an examination revealed several bruises on the skull bone, small hemorrhages on the surface of the brain, and a larger one at the base. The lightning must have caused death, the current passing through deceased without injuring the skin. A verdict in accordance with the medical testimony was returned.

**The Aberdeen Slander Action.**—A correspondent says that it is understood that the action raised by Mr. James Alexander Bell, electrical engineer of the City of Aberdeen, against Mr. Alfred Edward Milne, solicitor, Aberdeen, hon. secretary of the Aberdeen branch of the Electrical Contractors' Association of Scotland, for £1,000 damages for alleged slander, will come up for proof in the Court of Session on June 21th. Lord Hunter recently adjusted the issues for trial by jury.

**Alleged Fraud.**—The charge against H. G. Mönge, an electrical engineer, reported in our last issue, was before the Marlborough Street Police Court again the other day, when, according to the *Morning Advertiser*, it was urged by counsel in defence that there was no case against his client, as by the terms of the agreement the defendant was a partner in the firm. He contended it was not a *bona fide* prosecution. Mr. Denman thought it was a case for a jury to decide. He would express no opinion on its merits. Mr. Lewis said the defendant bore an irreproachable character, and he submitted that no jury would convict. Mr. Denman committed the prisoner for trial, allowing bail in the sum of £30.

## OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

**Central Station Officials.**—On Sunday, March 30th, the staff of the Wolverhampton Corporation electricity department met at the Commercial Road Works to wish farewell to the retiring chief, Mr. C. E. C. SHAWFIELD. After being photographed, the party moved to one of the offices, where Mr. Shawfield was presented with a solid silver salver, suitably inscribed, which had been bought by subscriptions from the whole of the staff. Speeches were made by several members of the staff, who wished Mr. Shawfield every success in his new undertaking, and expressed their great regret at losing him. More than one speaker said that the only fault he had to find with Mr. Shawfield as chief, was that he had been unable to use the profits of the undertaking to bring salaries and wages up to a reasonable level, rather than to hand them over for the relief of rates. In reply, Mr. Shawfield thanked those present for their kind appreciation, and said that he and Mrs. Shawfield, who had always taken the keenest interest in the work of the department and in the staff, would consider the salver one of their most treasured possessions, not only for its intrinsic value, but chiefly for the good feeling which prompted the gift. He referred to the development of the department since its commencement, and gave accounts of amusing incidents which occurred in its early days. He expressed the opinion that it was to be regretted that any money had been paid over to the relief of the rates, as he thought it was not in the best interests of the department; or the town as a whole, that the profits of a trading undertaking should be used for this purpose. He thought that the first call on the profits of the undertaking should be to improve the status of employment, as the success or otherwise of the department depended, to a very large extent, on the efforts of those employed therein; any surplus beyond this should go to reducing the price of current to the consumers. However, Mr. Shawfield said that the chief of a department had not a free hand in the matter of salaries and wages, but that he, in turn, had to carry out the instructions of his employers—the municipality. He also imparted the information that he would not be leaving the town—at any rate, for a few years—and thus hoped still to keep in touch with those with whom he had been associated for so long a period.

Out of 134 applicants, Mr. R. B. LEACH, electrical engineer to the Turton District Council, has been appointed electrical engineer and tramways manager to the Heywood Corporation, at £200 per annum.

We regret to learn that Mr. A. A. DAY, borough electrical engineer, Bolton, who has been staying at the Cleveley's Hydro, Blackpool, had another seizure last week end. His medical adviser was summoned, and Mr. Day's condition caused considerable anxiety. Mr. Day was seized with sudden illness whilst on the train at the beginning of last September, when he was commencing his holidays, and he has not been himself since.

Mr. J. E. STARKIE, Burnley's electrical engineer, is suffering from a nervous breakdown, and has been advised to spend some time at St. Anne's.

Through a mishap at the Accrington generating station on March 27th, Mr. ERNEST HALL, charge engineer, sustained serious injuries. The cause of the accident is not known, but Mr. Hall was found in a sluice in connection with the gas generating plant. He was taken to hospital, where it was discovered that he had badly injured his head and fractured an arm.

Mr. W. G. COATH, who has been on the staff of the Newton Abbot Electricity Works for the past 33 years, was on Friday last presented with a handsome case of instruments by members of the staff, on the occasion of his departure to Swindon. The presentation was made by the resident engineer, Mr. G. E. Smith.

Mr. THOMAS D'ARCY NASSAU, who is at present resident engineer to the Honiton and District Electric Supply Co., Ltd., has been appointed resident engineer and manager to the County of Dorset Electric Supply Co., Ltd.

At a special meeting of the Lowestoft Town Council on Tuesday, Mr. W. H. MAY, who has been assistant engineer at the Corporation Electricity Works for 10 years, was appointed borough electrical engineer (in the place of Mr. A. A. Bruce resigned), at a salary of £250 a year rising to £260 by annual increments of £10. Mr. H. H. SAUNDERS, chief accountant in the Borough Tramways Department, was appointed general manager of the electric light and tramways undertakings, at a salary of £250 a year, increasing to £255 by increments of £10 per annum.

Mr. R. H. LEE has resigned his position of junior engineer at the Fulham Electricity Works, in order to take up the post of junior shift engineer at the Borough of Islington Electricity Works.

**General.**—Mr. E. P. BENNETT has been transferred from the sales department of the London office of Simplex Conduits, Ltd., to take up the position of manager at their Liverpool branch.

Mr. EDWARD ALFRED GIMINGHAM, M.L.E.E. and Mr. CHARLES ERNEST HUNTER, the works managers of the lamp and engineering departments respectively of the Edison & Swan United Electric Light Co., Ltd., have been elected to seats on the board of the company.

Mr. J. P. MCKEILJOHN, who has been works manager with Messrs. Grindlay, Ross & Co., of Glasgow, has been appointed chief assistant engineer to the Penarth Electric Lighting Co., Ltd.

The marriage took place last week at Bargoed of Mr. T. S. THOMAS, electrical engineer, of Y-tradgynlais, and Miss Mabel Clement, daughter of Mr. H. Clement, of Bargoed.

Mr. G. GILKES, of Messrs. G. Gilkes & Son, turbine makers, of Kendal, has been re-elected an alderman of Westmorland County Council.

The marriage took place on March 27th at Wellingborough of Mr. THOMAS JAMES LARGE, electrical engineer, of the staff of Messrs. Belliss & Morcom, of Birmingham, and Miss Jessie Gadsby, youngest daughter of Mr. W. K. Gadsby, of Brigstock.

Mr. WATSON, of Messrs. W. G. Watson & Co., Ltd., Sydney, will be in England, Europe, and the United States, toward the middle of the year in connection with the opening up of a London office of the company.

Mr. A. B. SCORER has joined the board of Messrs. Meldrums, Ltd., who have moved their London office to 92, Grosvenor Road, Westminster, S.W.

Mr. HERBERT LAWS WEBB has removed from 35, Old Queen Street, S.W., to 104, Victoria Street, Westminster, S.W.

Congratulations and good wishes to Mr. and Mrs. LEONARD G. TATE. The marriage of the secretary of the Electrical Contractors Association was to take place at Richmond Parish Church yesterday. We regret having to mingle our congratulations with condolences, for we read in the *Electrical Contractor* that Mr. Tate's mother passed away a few days ago.

**Obituary.**—Mr. J. PARKER.—"The death occurred suddenly, at Blackpool, on Saturday, of Mr. John Parker, who had a long connection with the firm of E. Green & Co., Ltd., engineers, of Manchester and Wakefield. He was in his 76th year.

Mr. G. HUMPHREY.—The death is announced, at the age of 65 years, of Mr. Geo. Humphrey, head of the firm of Geo. Humphrey and Co., electrical and general engineers, of High Street, Sevenoaks.

## NEW COMPANIES REGISTERED.

**Rio Grandeuse Light and Power Syndicate, Ltd. (127,761).**—Registered March 14th, by S. Morse, 1, Kingsway, W.C. Capital £100,000 in £1 shares. Objects: To carry on the business of suppliers of electricity, gas for lighting, heating, motive or other power, &c., in Brazil and elsewhere, to adopt agreements (1) with Emilie Gullayn giving an option of purchase of the electric light undertaking in the town of Baga, State of Rio Grand de Sul, Brazil; (2) an agreement with Buxton, Cassini & Co. for sale and purchase of a concession for the exploitation of electric tramways, power and light service in the City of Pelotas, in the said State; (3) an agreement with the British Electric Traction Co., Ltd., appointing them the company's London agents; and (4) with Buxton, Cassini & Co., appointing them the company's local agents in Pelotas. The signatories (with one share each) are:—Emilie Gullayn, Salisbury House, E.C., banker; T. Bower, Electrical Federation Offices, 1, Kingsway W.C., secretary. Private company. The directors are to number not less than three or more than five. The Articles of Association specify that the first directors shall be Senior Emilie Gullayn and one to be nominated by the British Electric Traction Co., Ltd. A copy of register of directors filed at same time names Senior Gullayn and Charles H. Dade (of 1, Kingsway W.C.) as the directors. Registered office, Electrical Federation Offices, 1, Kingsway, W.C.

**Barton-on-Humber Electric Supply Co., Ltd. (127,760).**—This company was registered on March 14th, with a capital of £20,000, in £1 shares, to carry on the business indicated by the title, and to adopt an agreement with F. Hopper. The subscribers (with 100 shares each) are:—F. Hopper, Elm Tree House, Barton-on-Humber, cycle manufacturer; J. B. Tomblinson, Westfield, Barton-on-Humber, brick and tile manufacturer; H. Wilson, The Hall, Barton-on-Humber, solicitor; H. Pigott, Eagle House, Barton-on-Humber, managing director; J. Barraclough, Westfield Road, Barton-on-Humber, shipowner; W. H. Blyth, Highfield, Barton-on-Humber, brick and tile manufacturer; J. C. Lee, George Street, Barton-on-Humber, pharmacist. Minimum cash subscription, £3,000: the number of directors is not to be less than three or more than seven; the first are F. Hopper, J. B. Tomblinson, H. Wilson, H. Pigott, J. Barraclough and W. H. Blyth; qualification, £100; remuneration as fixed by the company. Solicitors, Nowell & Son, Barton-on-Humber. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

**Reform Lighting Co., Ltd. (127,911).**—This company was registered on March 20th, with a capital of £3,000 in £1 shares, to take over the business of electric lamp manufacturers carried on as the "Reform Lighting Co." The subscribers (with one share each) are:—G. W. Lomas, 26, Moore Street, W., clerk; P. Rowson, 14, Harcourt Street, Marylebone, W., clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Registered by Pakemah, Son & Read, 11, Ironmonger Lane, E.C.

THE annual meeting of this company was held at the offices, 3, Laurence Pountney Hill, E.C., on March 13th, Mr. L. B. Schlesinger presiding. Our reporter was informed that the meeting was private, but he was subsequently granted permission to see the chairman's speech. This showed that after providing for interest on debentures and loan, redemption of debentures, rent of the Rhondra U.D.C., and depreciation, there was a balance of £2,778 on the year's working, plus £1,198 brought forward. Out of this, £2,000 had been added to the reserve and renewals account, bringing it up to £10,000, and leaving £1,976 to be carried forward. During the coal strike their receipts dropped from between £900 and £1,000 per week to as low as £594, and the weekly receipts following the termination of the strike were £736, £832, £974, £947 and £1,064, but, unfortunately, just before Whiteside their own employes were smitten with the strike fever, and put forward extraordinary demands in the form of an ultimatum, which demands, however, after careful consideration by the directors, it was decided could not, in the interests of the shareholders and the future welfare of the company, be entertained. The undertaking was closed down for about a month, but no damage was done to the company's property, and as events turned out, the directors' action was fully justified. At the request of the chairman of the Rural Council, who had been approached by the men, Mr. Cowrie was asked to meet the men's committee at Perth, and this he did, with the result that on the following day the strike was at an end, the men returning to work on the old terms. As 25 new hands had in the meantime been taken on, 25 of the old hands had to stand down.

although within a short time the manager was able to offer them employment. Unfortunately, however, as the strike occurred just before Whitsuntide, one of their biggest weeks, the company was hit pretty heavily; for instance, during Whitsuntide week they certainly looked to take receipts up to about £2,000, but they only ran one day, and their receipts were £108. Although the undertaking was closed down, a considerable portion of their expenditure still ran on, and he thought the directors were on the safe side in stating in the report that the profits suffered to the extent of £6,500 owing to the coal strike and the strike of their employees. It was mentioned in the report that the receipts for the six months to December 31st last amounted to £30,000, as compared with £19,700 for the previous six months. The extensions which were opened helped the receipts, and judging from the results already obtained, the original traffic estimates from the extensions would be thoroughly justified, and he would not be surprised if this year their traffic revenue exceeded £60,000, provided no further about troubles were experienced. He thought, however, that both masters and men had had enough of these disputes, and that every effort would be made to keep the peace. The directors, however, did not represent philanthropists, but investors, who naturally looked for a fair return upon their capital. Although further debentures to the amount of £10,000 were only issued in November, 1912, and interest on them paid from that date, he could point out that until then they financed the construction of the extensions by loan from the bank, on which interest had to be paid. The report referred to a Bill which was being promoted to construct a railless traction system to serve a very important colliery district within a few miles of their terminus at Williamstown. Here were some 16 pits being sunk, and it was estimated that within the course of a few years the population to be served would have increased from approximately 14,000 to over 50,000. They were asked by the manager of the collieries in question to provide travelling facilities for the miners, and, after studying the scheme, they came to the conclusion that if powers could be obtained on reasonable terms, the scheme would be a profitable one for the company, and would bring considerable extra traffic over the tramways. The capital account now stood at £364,200, an increase of £35,581. The discount on debentures issued to cover the cost of the extensions had been added to the account, and after deducting the debentures redeemed, the amount was £21,400, compared with £19,800 for last year. To-day they had at the bank and on loan £15,000, so that as regarded finance the company was in a strong position. Turning to the revenue account proper, comparison with the revenue account for 1911 was impossible, having regard to the troubles already referred to. The speaker referred to a number of items. Traffic expenses amounted to £9,953, as compared with £10,315, the decrease being due to the strike. General expenses amounted to £7,336, compared with £6,786, a small increase. Repairs and maintenance amounted to £4,859, as compared with £4,226, the increase being largely due to repairs on cars, which were overhauled and repainted. Traffic revenue was £49,778, an increase of £1,561, which was very gratifying under the circumstances. While the results must be unsatisfactory to the shareholders, they were satisfactory to the directors, considering the troublesome experiences of the year, which no foresight on their part, or on the part of the management, could have prevented. A word of praise was due to the manager, Mr. Nesbitt, for the manner in which he had handled the business throughout the year, and particularly during the strike. The thanks of the shareholders were due to Mr. Barnett for his numerous visits to Rhondda on behalf of the board. It was, of course, a great regret to the directors that they were unable to recommend a dividend, but a careful study of the results, together with the opinions that he had been able to give them, could only lead to one conclusion, viz., that they had in the Rhondda Tramways a valuable undertaking with great potentialities, and all that was wanted to obtain a satisfactory return upon their capital, was peace in the labour world. Their traffic receipts from January 1st to March 12th were £11,004, as compared with £9,163, or an increase of £1,841.

Mr. J. T. JERVIS seconded the motion, which was adopted.

**Browett, Lindley & Co., Ltd.**—According to the *Financial News*, the gross profit for 1912 was £5,253. After deducting £2,191 for bank and debenture interest, and £5,019 for depreciation, there remains a loss on the year's working of £1,965, making, with the former adverse balance, a present debit to profit of £17,562. The adverse trading is attributed to low prices for contracts, the continuous rise in the cost of materials, increased wages, and the coal strike. The directors state that the orders now on the books are at better prices. The preference dividend remains paid since December, 1901.

**Oriental Telephone and Electric Co., Ltd.**—At the annual meeting on 30th inst. (subject to final audit) the directors recommended the following dividends:—At the rate of 6 per cent. per annum on the preference shares for the half year ended December, less income-tax; a final dividend of 7 per cent. on the ordinary shares issued, free of income-tax, making a total of 10 per cent. for the year. The share transfer books will be closed from April 17th to 30th, inclusive.

**Continental Note.**—SWITZERLAND. — La Société Electrique d'Altoth, of Basle, which has a working arrangement with Messrs. Brown, Boveri & Co., of Baden, is declaring a dividend of 4½ per cent. for the last financial year, the same as for the preceding 12 months.

### Arbroath Electric Light and Power Co., Ltd.

At the fifth annual meeting, held on Friday, Mr. George Balfour presided. The report showed that the profit for the year amounted to £1,410, plus £854 brought forward, while £170 had to be deducted for interest leaving a balance of £2,126. The directors proposed to apply to reserve and renewal funds £500, for dividend at 3 per cent. on preference shares, £18 in payment of dividend of 3 per cent. on ordinary shares, £689, and to carry forward £222, subject to deduction of directors' and auditors' fees. The general business of the company was steadily extending and there had lately been a large and increasing demand for power. In view of this, the directors had resolved to enlarge the plant at the electric station, and the additions would be carried out during the course of the present year.

Mr. BALFOUR referred to the increase in capital from £200,000 to £10,000, which had been divided into 10,000 preference shares and 25,000 ordinary shares. He pointed out that with the issue of preference shares there was no likelihood of it ever being necessary to issue debentures, as the preference shares would provide, approximately, the amount required for repaying existing loans, and providing for increasing the plant capacity at the power station by approximately 130 per cent. of the existing plant. The directors had resolved during the coming summer to install additional generating plant. Power-users in this country had only recently wakened up to the great advantage of electricity for power purposes, and this was particularly noticeable in Arbroath, as the company had secured the leading engineering and manufacturing firms as consumers for driving the whole of their works. The prospects of the company were exceedingly bright, and but for the increased price of coal, which materially affected costs during 1912, the results shown, excellent as they were, would have been still better.

The motion adopting the report and accounts, and declaring a dividend of 3 per cent. on the ordinary shares was unanimously carried.

### Provincial Cinematograph Theatres, Ltd.

This company held its annual meeting on Tuesday at the Holborn Restaurant. The report showed receipts from theatres for the year amounting to £198,702, and the trading profit £80,355, an increase of £33,250 over 1911. After providing for debenture interest and redemption, preferred dividend, depreciation, writing off preliminary expenses, and issue of preference shares, and carrying £5,000 to reserve, the ordinary dividend is 20 per cent., and there is a bonus of 4 per cent. upon debentures. The company is going to issue 200,000 7½ per cent. cumulative "B" preference shares of £1 each for redeeming the debentures and extending the business, including the erection of new theatres in Edinburgh, Portsmouth, Newcastle and elsewhere, and the enlargement of existing ones.

### Braunton Electric Light and Power Co., Ltd.

The first annual report of the directors congratulated the shareholders upon the success attained. The net revenue account showed a profit of £81, and the directors recommended payment of a dividend of 5 per cent. (less income-tax) on the cumulative preference shares from October 1st, 1911, which would amount to £29, writing £30 off the formation expenses, and carrying forward £21. Mr. T. Yeo, C.C. (chairman of directors), who presided, said the capital authorised to be raised was 5,000 £1 shares, divided into 1,000 5 per cent. cumulative preference shares, and 4,000 ordinary shares, each of £1, and the amount of capital issued totalled £3,250 of fully paid shares. That, he said, was found not quite sufficient for the whole matter, but the directors did not feel there was any necessity for the calling up of extra capital, thinking it better to raise a certain amount out of revenue account. So far as they could see, their present machinery, equipment and capital in hand, would be sufficient. He moved the adoption of the accounts, and observed they had good reason to be gratified at the first year's results. The report was adopted.

### Wemyss and District Tramways Co.—Mr. Geo.

Balfour, of Balfour, Beattie & Co., moved the adoption of the report at the annual general meeting on Saturday. He intimated that it was the intention of the directors to double the line by degrees until the whole service was lined up. Councillor Barrow, Leven, who seconded, drew attention to the congestion which existed in the service, and also asked when the electric cable would be laid through Leven. Mr. Balfour said he was afraid they could do nothing with the congestion until the whole line was doubled and double-decked cars were run. The report was adopted.

### Newmarket Electric Light Co., Ltd.—Mr. F. E.

Gripper presided at the annual meeting of this company, and said that the revenue had increased during the year by £300, and the expenses by £158. The coal bill had advanced by £95. The report was adopted.

### Kalgoorlie Electric Power and Lighting Corporation,

Ltd.—The directors have declared a dividend on the preference shares at the rate of 6 per cent. per annum for the six months ending March 31st, 1913, payable April 28th.

### Lancashire Dynamo and Motor Co., Ltd.—The

*Financier* states that the directors have declared a dividend at the rate of 10 per cent. on the ordinary shares, making 7½ per cent. for the year, placing £6,000 to reserve fund, and carrying forward £1,634.

### Folkestone Electricity Supply Co., Ltd.

The annual meeting was held on Thursday last week. ALDERMAN SPURGEN, J.P., who presided, in moving the adoption of the report, said they had had a very fair year's work. There had been an increase in the receipts of £1,117, and if that had stood alone they would have had a good year. It was, however, neutralised by the fact of the increased cost of £1,873, which put them £456 on the debit side. The increased cost of coal owing to the strike had been £1,128. As he told them last year, the mine-owners, owing to the unrest of the miners, were cautious about entering into contracts, and, unfortunately, they were caught just at a bad time, and their coal worked out at 3s. 4½d. per ton more than in the previous year; but they had made a saving in the amount of coal per unit. They were looking forward to the time when the Kent coalfields were developed and when they would be able to get a supply in their own neighbourhood. Personally, he was very hopeful that, in another 18 months, they would get their supply from the Kent coalfields. Rates and taxes had also increased considerably, and the national taxes, with the National Insurance Act, represented an increase of £216. They had, however, written off £6,073 on depreciation account, and that fund now stood at £28,573, and in addition to that they had carried £1,100 to reserve fund. Shareholders might say that £2,000 depreciation fund was very large. All their plant in active use was in excellent order, but new machinery was constantly being brought out, and they might find it imperative some day to get rid of some of the present machines and introduce others of a newer type. They had had a good year so far as new lamps were concerned. They had put in 7,104, as against 6,100 last year, and they had 189 more consumers. There were no bank charges, as they had a deposit of over £10,000, and altogether things looked very hopeful. He moved the adoption of the report and that a dividend of 6 per cent. be paid for the half-year, making 6 per cent. for the whole year, less income-tax.

ALDERMAN PENFOLD seconded, and it was carried.

### Tynemouth and District Electric Traction Co., Ltd.

MR. H. S. DAY presided on 26th ult. at the Electrical Federation Offices, Kingsway, W.C., over the annual meeting of this company.

The CHAIRMAN, in moving the adoption of the report, said that the total revenue for the year amounted to £13,661, a decrease of £508 compared with 1911, and after deducting all expenses chargeable to revenue, including £1,000 for renewals, and writing off a loss of £278 on the sale of consols, there remained a surplus on the year's working of £4,377, which, with £551 brought forward from last account, made an available balance of £4,929. The directors had placed £1,250 to reserve, and recommended a dividend of 5 per cent. on the cumulative preference shares and 4 per cent. on the ordinary shares, and that £297 be carried forward. With the sum recommended this year the renewals and reserve funds of the company would amount to £19,502. Trade during the year at Tynemouth was very unsettled, owing to the coal strike in the first portion of the period, and the strike of railway men on the North-Eastern Railway later, but a better condition of affairs now existed, and he thought the present year would show an expansion of the improvement. He was pleased to say that so far their net position this year compared most favourably with the same period of 1912. They had carried 1,992,000 passengers during the year, as compared with 2,093,000 in 1911, a decrease of 101,000. This decrease was entirely due to the bad weather experienced during the summer. The average traffic receipts per passenger, 1'33d., remained the same, chiefly due to the increased fares put in force during the year, whilst the average expenditure per passenger, '87d., also remained the same. The proportion of expenses to receipts, 56 per cent., remained the same, whilst the number of car-miles run had decreased by 3,379. The negotiations with the Tyneside Corporation for an extension of the line to Preston Village was still proceeding, and it was hoped that satisfactory terms would be arranged for carrying out the work of construction. The junction formed with the Tyneside Tramways and Tramroads Co. with the tramways of the Tynemouth Co. in North Shields for the purpose of improving the interchange of traffic between the two companies had proved satisfactory.

MR. S. J. SOMERVILLE seconded the motion, and the report was adopted without discussion.

**American Telephone and Telegraph Co.**—The directors' report for 1912, which has appeared in the financial papers in abstract during the past week, shows that the net earnings were \$37,907,644 an increase of \$4,066,398 over 1911. The interest charges were \$5,844,059, and the dividends, at the regular rate of 8 per cent. per annum, were \$26,015,588. Of the balance, \$6,047,357, there was carried to reserve \$2,800,000, and to surplus \$3,247,357. During the year \$13,652,000 of new stock was issued under the offer of June 20th, 1911. In addition, \$2,726,200 of stock was issued upon conversion of bonds, making the total increase of capital stock during 1912 \$16,378,200. At the close of business December 31st, 1912, \$132,908,000 of the \$150,000,000 of convertible bonds of 1906 had been handed in for conversion, leaving outstanding at the end of the year \$17,002,000, a reduction in 1912 of \$3,457,000. The number of shareholders, 50,297, on December 31st, 1912, shows an increase of 2,956 during the year. As to the future of the company, the board state it was never brighter.

### Berlin Elevated and Underground Railway.

The report of the Gesellschaft für Elektrische Hoch und Untergrundbahnen, of Berlin, for 1912, states that the extensions in progress, according to the programme, were so far advanced in the year that the prospective opening to traffic of the northern section from the Spittelmarkt, *via* the Alexander Platz to the Schönhauser Allee, will take place in May, and the south-western sections from Wittenberg Platz to the Nürnberger Platz, and to the Kurfürstendamm, in September of the present year. By means of these prolongations the length of the railway will be increased from 11 miles to 15.8 miles, and that of all the lines operated by the company from 12.7 miles to 22 miles, including the level railway and the communal lines to be connected with the Nürnberger Platz station. The complementary line from the "triangle" station to the Wittenberg Platz will re-establish direct connection between the Eastern line and the West, and the triangle station will then become a junction for two large through lines, sanction having already been given to the section between the triangle and the Potsdamer Strasse. The accounts show the following results for the two years:—

	1912.	1911.
Share capital .. .. .	£2,500,000	£2,500,000
Working receipts .. .. .	415,000	414,000
Working expenses .. .. .	206,000	199,000
Working surplus .. .. .	209,000	215,000
Various receipts .. .. .	79,000	60,000
Brought forward .. .. .	31,000	21,000
Gross profits .. .. .	319,000	305,000
Interest on loans .. .. .	81,000	80,000
Renewal fund .. .. .	36,000	36,000
Local taxes .. .. .	8,900	9,000
Depreciation .. .. .	3,600	3,600
Net profits and balance forward ..	176,000	162,000
Dividend .. .. .	127,000	122,000
Dividend, per cent. .. .. .	6	5½

The dividend is on paid-up capital of £2,125,000, and the interest is on loans totalling £3,192,500. During the year the number of passengers carried was 62,731,827, as compared with 62,585,512 in the preceding year, and the average receipts per passenger were 1'62d., or a fraction less than in 1911. The train-miles run amounted to 2,347,275, the trains being composed of from two to four coaches, and the rolling stock at the end of 1912 comprised 143 motor coaches and 116 trallers. It is now proposed to increase the share capital by £500,000, and the loan capital also by £500,000, in order to provide for the extensions in progress or in contemplation.

**Prospectus.**—*Minas Geraes Electric Light and Tramways Co.*—The list was to close on Wednesday in an offer of £120,000 5 per cent. first mortgage bonds at 90½ per cent., the principal and interest being unconditionally guaranteed by the Government of the State of Minas Geraes, Brazil. A letter from the chairman of the company issued with the prospectus states as follows:—"The properties comprised in the lease include four electric generating plants, of which three are water-powers and one is steam. The first hydro-electric plant, situated on the River das Pedras, about 25 miles from the City of Bello Horizonte, has a capacity of about 1,600 H.P., and is now being equipped with a new unit of about 800 H.P. The company is now building a new transmission line with 300 steel towers. The second hydro-electric plant, situated on the River Santa Barbara, about 45 miles from the city, has a capacity of about 665 H.P., and is now ready for the installation of a new water turbine of about 330 H.P. A further 10,000 H.P. can be developed at this point when required. The third hydro-electric plant, situated on the River Arrudas, about three miles from the city, has a capacity of about 330 H.P., and is already fully equipped for the generation of electric power. The fourth is a steam plant, situated near the distributing station in the city, and is used as an auxiliary plant, its capacity being about 1,400 H.P. The company has the exclusive right, subject to the terms of the lease, for the period mentioned, to supply electric light and power and to operate the tramways and telephone system of the City of Bello Horizonte. The total length of the tramway system is 19 miles. The municipality has entered into a contract with the company for the public lighting of the city until 1965. In respect of the period from April 1st, 1912, to January 31st, 1913, the net earnings of the company, after allowing for the rental to be paid to the State, amounted to £12,327, being at the rate of £14,784 per annum, or sufficient to pay the interest and sinking fund of those bonds more than twice over. The company is paying dividends on its share capital at the rate of 7 per cent. per annum."

*African Mica Mines, Ltd.*—A prospectus is in circulation offering an issue of 60,000 shares of 5s. each in this company, which has been formed to acquire mining rights and work mica deposit in Transvaal Colony. Estimates given in the prospectus show on a sale of 50 tons of trimmed electrical mica, realising £500 per ton, a profit on the first year's working of £20,500. The nominal capital is £40,000 in 5s. shares.

**South Metropolitan Electric Light and Power Co., Ltd.**—The warrants for interest on the 4½ per cent. first mortgage debenture stock, payable on the 1st inst., for the six months ended that date, have been posted.

**Rees Roturbo Manufacturing Co., Ltd.**—According to a financial daily, after providing for administration expenses and interest on loans, the accounts for 1912 show a net profit of £2,031, thus converting the debit balance of £1,544 brought forward into a credit of £487, which the directors propose to carry forward.

**British Aluminium Co., Ltd.**

MR. A. W. TAIT (chairman) presided on Friday at Winchester House, E.C., over the meeting of this company.

The CHAIRMAN, in moving the adopting of the report (see ELECTRICAL REVIEW, p. 533), said that the trading profit for the year, together with interest and dividend on investments and the revenue derived from the Kinlochleven and Foyers Estates and transfer fees, was £194,824, as compared with £152,902 for the previous year, or an increase of £41,922. The results for the year were satisfactory considering the prices which had ruled during the period, which were exceptionally low owing to the keen competition of foreign producers. The average price obtained for the metal was even lower than during the previous year, when prices were also at an unsatisfactory level. These results had only been achieved by a substantial increase in output and some decrease in cost of production. The increase in profits was almost entirely accounted for by the increase in the trading profit, which had risen from £140,378 in 1911, to £181,529 for the year 1912. There were slight variations in the amount of dividends on investments and interest on deposits, but the increase in the former was almost negated by the decrease in the latter. There was also a slight decrease in the revenue from the Kinlochleven and Foyers Estates, and a small increase in the amount of transfer fees. The output and sales for the year were greater than in any previous year since the company's business was founded. The continued expansion in the demand for metal was an encouraging feature of the business, and if this continued the surplus of the productive capacity of all existing works over the world's consumption would be rapidly taken up. The contracts which had so far been made for delivery over the current year were satisfactory, and the prices, of course, showed a material improvement over those of last year, so that there was every reason to believe that when they came to present accounts to the shareholders next year, the position should show some further material improvement. The company had purchased the reduction and carbon works at Vigeland, near Christiansand, Norway, which were controlled by the Anglo-Norwegian Aluminium Co. This purchase was concluded by the board after the works had been visited by their experts, and their reports duly considered, and in the opinion of the board, it was an advantageous purchase for the company. These works were well and substantially built, and were able to give a considerable production of aluminium all the year round. They were also capable of important development without very large capital expenditure. Part of the purchase price had been paid, and the balance of the purchase price would be paid within the next few months, and as this was being done entirely out of the internal resources of the company without the necessity of raising any additional capital, the shareholders would appreciate the considerable improvement in their position, owing to the fact that the company now controlled a substantially larger output than previously. These works were in full operation, and the company would obtain the benefit of it in the current year's accounts. The increase in the production of aluminium necessitated the increase in the company's capacity of production of alumina. In order to supplement the supply of the works at Larne, which were sufficient for the requirements of the three works at Kinlochleven, Foyers, and Stangford, the purchase had been made of one-half interest in the works of the Bauxite Refining Co., at Hebburn-on-Tyne, which gave the company the right to one-half the output of these works. Certain additions were at present being made to increase the capacity of these works, and it was expected that these extensions would be completed in the course of the next three months. At the last two meetings he had mentioned that extension had been carried out at the rolling mills at Milton, Staffordshire, which had now been brought up to their full capacity under existing conditions. In order to cope with the increased demand for the company's manufactures, arrangements had been completed for the acquisition of land and buildings at Warrington, Lancashire, and the site provided for considerable future expansion if necessary. These had been obtained on favourable terms, and contracts had been made for the supply of rolling plant, and it was expected that these works would be in operation at the end of this year, or the beginning of next. As the demand increased, further plant would be put in, so that the shareholders would observe that this was a growing and important part of the company's business. The directors were of opinion that it was a wise policy to extend this part of the business, because it enabled the company to be more independent of fluctuations which might take place in the demand for ingot metal, while the business was in itself a profitable one, which contributed a substantial amount to the general trading profits of the company. The demand for sheets and circles, tubes, and other forms, continued to grow in a satisfactory manner, and the increase in the demand from the electrical industry for the use of the metal in transmission lines, insulated cables, and switchboard work, showed encouraging expansion. All the works of the company had been operated satisfactorily during the year, and the whole of the plants had been maintained in a thoroughly efficient manner out of revenue. The plant installations referred to in the last report had all been completed, and were working satisfactorily. The reduction works at Kinlochleven, Foyers and Stangford, had been practically fully employed, and he was pleased to say that the reservoir capacity at Kinlochleven had been sufficient for all their requirements during the year, and at the end of the year the reservoir was overflowing. Trade in general for the year 1912 was considerably interrupted, and the company's business in particular was directly affected by the coal and dock strikes. The shareholders were probably aware that they were very large consumers of coal at their Alumina Works and at their rolling mills, but they were able, by making proper provision beforehand, to keep these works in full operation during the whole period of the coal

strike. This, however, was only done at considerable cost, owing to the increased price of coal, and he was afraid that, as the result of that strike, coal prices were likely to be on a higher level for some time to come. There had also been a considerable rise in freight rates during the year, due to general commercial activity. They were, however, always endeavouring to improve their methods of production, and economies were being made from time to time, all of which had a cumulative and growing effect, and although last year suffered because of these abnormal expenses, he did not think that their costs of production should show any increase in the near future. In order to improve the labour conditions at Kinlochleven, some further expenditure had been incurred during the year, and the board had authorised the erection of further workmen's cottages for the accommodation of their workmen and their families. This expenditure was having a good effect in the gradual improvement in the standard of labour. In last year's report it was mentioned that the company had authorised its subsidiary company, the Union des Bauxites, to complete the purchase of certain bauxite mines. This was done, and in order to ensure a large reserve supply, a considerable tonnage had been purchased by this company from the Union des Bauxites, which would be at aside for future requirements. This purchase would also enable the Union des Bauxites to increase considerably the development of its mines, so that a further large stock of the raw material might be built up. It was absolutely essential for this company that the reserves of raw material should be in hand for a long time ahead, and the arrangements which had now been made would ensure this. With regard to the Oriskany power scheme, there was nothing new to report. The necessary development work mentioned at the meeting last year had now been carried out, so that the works could be maintained at the minimum cost. The company's rights were being properly protected, but it was not intended meantime to proceed further with the development of the scheme. The railway was being operated and maintained in an efficient manner, and the gross earnings were more than sufficient to meet the operating expenses. The chairman proceeded to deal with the salient features in the accounts and pointed out that the investments had increased from £571,255 to £749,217, due to the purchase of the Vigeland works and the interest in the Bauxite Refining Co. With regard to the liabilities, from now onwards the prior lien debentures would be gradually reduced by the application of the cumulative sinking fund of 1 per cent. per annum, whilst already £28,685 of debenture stock had been redeemed. After providing £17,420 for legal expenses, depreciation, &c., and proportion of profits payable to directors; £40,000 for prior lien debenture interest; £43,223 for debenture stock service fund; £40,000 for depreciation; and £30,000 to reserve account, the board recommended the payment of the 6 per cent. preference dividend, which left £10,206 to be carried forward. In conclusion, he congratulated the shareholders on the successful manner in which the company was emerging from its difficulties.

MR. S. H. POLLEN seconded the motion.

MR. KENNEDY asked what remuneration the directors received, and

The CHAIRMAN said they were entitled, under the articles of association, to 5 per cent. of the profits after payment of the prior lien interest of £40,000.

MR. KENNEDY: How much is that?

The CHAIRMAN: That is a matter of calculation; I am sure you can do it for yourself.

The motion was then carried.

**Bromley (Kent) Electric Light and Power Co., Ltd.**—The directors report that during 1912 the lamp connections increased from 101,276 to 107,649. The sale of current increased from £16,418 to £16,651. The works have been maintained in good order and repair. The result of the year's trading, including £703 brought forward from last year, shows a profit of £13,262, and after payment of debenture interest and trustees' fees, &c., amounting to £3,059, and writing off the balance of the cost of motor-car, and the cost of fitting up a new showroom, there is a balance of £10,044. An interim dividend at the rate of 4 per cent. per annum was paid for the half-year in October, and the directors recommend the payment of a further dividend for the second half-year at the rate of 8 per cent. per annum, making a total dividend of 6 per cent. for the year, and that £1,000 be placed to general reserve account, leaving £1,544 to be carried forward. To fill the vacancy caused by the death of Mr. R. Taylor, the directors propose the election of Mr. E. G. Peill, of Bromley. The meeting is to be held at Bromley on April 7th.

**Vickers, Ltd.**—Mr. Albert Vickers presided, on March 28th, at the annual meeting, and said that there was no reason to think that 1913 would be less favourable than 1912. Their subsidiary companies had brought much profitable business, especially foreign business. The report was adopted, and a dividend of 10 per cent. on the ordinary shares was approved. A resolution was passed to issue 740,000 new ordinary shares of £1 each at 30s, one new share to be allotted to holders for every five now held.

**Dublin and Lucan Electric Railway Co.**—Mr. J. W. Hill presided at the half-yearly meeting on March 28th, and moved the adoption of the report, which showed gross receipts £93 less than in the corresponding half of last year. The expenditure increased by £178. After paying 5 per cent. preference dividend, £378 is carried forward. The mechanical stokers had enabled them to save on the coal bill, notwithstanding the higher price. The report was adopted.

## Automatic Telephone Manufacturing Co., Ltd.

THE directors' report for 1912 states that the profit for the year amounts to £13,499. After payment of dividend on 6 per cent. preference shares to December 31st, 1912, £11,816, and deducting amount written off preliminary expenses, &c., £1,313, there remains a balance of £270 to be carried forward. The directors report that the transfer of the Liverpool works and business of British Insulated and Helsby Cables, Ltd., and the assignment of the patents of the Automatic Electric Co. were satisfactorily carried through, and the company commenced business on January 1st, 1912. In the early part of the year two automatic exchanges, each of about 500 lines, were completed for the British Post Office, and these exchanges have worked remarkably well throughout and continue to give good and efficient service. Other automatic equipment orders to the extent of about 8,500 lines have since been received, and the company is at present negotiating and tendering for a number of other automatic exchanges in this country and abroad. The works of the company at Liverpool have been considerably extended during the year, and good progress has been made in the manufacture of automatic equipment there. The manufacturing business taken over from British Insulated and Helsby Cables, Ltd., shows a satisfactory increase. During the year several manual exchange equipments were supplied or completed, and orders for manual exchanges to the extent of about 12,000 lines are now in hand. The telegraph business of the company also shows a material increase. This being the first year of the company's trading, nothing has been written off for depreciation.

The annual meeting will be held at Liverpool on April 7th.

## STOCKS AND SHARES.

Tuesday Evening.

THE greatest apologist for Stock Exchange markets must be fain to admit that the position of affairs generally speaking—politically, domestically and financially—is not all that it might be, and that the shyness which business shows in coming forward has, at all events, a good deal to excuse it. War news from day to day swings see-saw fashion, and although by the end of this week the termination of the struggle may be within actual sight, in these earlier days there is obviously plenty to do before peace can be confidently counted upon. With peace will, or should, come cheaper money, and it is to this last that the Stock Exchange is looking for relaxation of tension and anxiety.

The Home Railway market has had a bout of strength. Speculation ran strongly upon some of the lower-priced stocks, and Metropolitan Consolidated formed a conspicuous feature. The price was run up to 54, reverting later to 53½, at which a rise of 2½ is left on the week. Districts rose 1½, and the Underground Electric group improved at the same time. The rise in "Mets." was accompanied by a general tip to buy the stock; and since it is one of those which moves quickest in the Home Railway market, some of the bullish operators were content to take a hand. Talk has it that the price is to be put still higher, but it is not an investment for the nervous individual.

Another strong feature this week was London and South-Western Railway Deferred stock, where the price shot up suddenly, and this had the indirect effect of dragging down London United Tramways 4 per cent. Debenture stock, causing it to lose four points. It is argued that if the South-Western Railway is at last going to wake up and galvanise its suburban traffic on electric lines under the energetic new management, this may be had for the London United Tramways Company. The East London electrification was started in working order on Monday last, and the price of the Ordinary stock hardened to 10½, to revert later to 10½. Central London Ordinary rose 1, in connection with the jump in South-Westerns.

British Electric Traction issues are still somewhat dull, the 7 per cent. Preferred stock being ½ lower. City and South London 4 per cent. Debenture at 96 shed a point; and, considering the nature of the security, the yield of 4½ 2s. 6d., which this stock now affords, must be regarded as good.

The market for English Electricity Supply shares remains well-nigh comatose. County of London Ordinary shares went back to 11, but most of the other alterations are caused by the ex-dividend markings of last Friday. Brompton Ordinary recovered its dividend deduction, and Westminster's gained ½; otherwise the net movements are almost nil. Business, what there is of it, comes in fitful flickers. Even in City of London Ordinary there is hardly anything doing.

At the end of last week started a boomlet in most of the Mexican issues, prices of the railway and utility companies being run up substantially. A good part of the improvement is retained. Mexican Light and Power Common is up 3, and the Preferred 2½. Mexico Trams show a gain of 3½, while the Company's bonds of both classes are materially higher. Monterey Fives are a point to the good, and similar improvements were secured by other stocks in this group. At the same time, most of the Latin Canadians assumed better complexion. Brazil Tractions spurted 4½, to the accompaniment of vague rumours about a further and a larger rise yet to come. Montreals are 3 up, Shawinigans gained 7 and improvements were secured by Alabamas, Georgias, Columbia Electric, and similar shares. Mississippi rallied on

the understanding that the disastrous floods have come nowhere near the company's area. Columbia Gas and Electric shares dropped to 12½ when it was announced that the town of Dayton was in the middle of the afflicted country, but this, it seems, is not the Dayton which is served by the Columbia Gas and Electric undertaking, the shares in which promptly rallied to 15½. Canadian General Electric's partially recovered the deducted dividends, and Rio Tramway bonds have hardened.

In connection with the Latin-Canadian group, mention must be made of a most serviceable volume which has just been published for its third year, dealing with the utility concerns of the Americas. The book, "Atkin's Manual," contains illuminating details of all the principal concerns, but what renders it of particular value is the fact that in many cases maps are provided by which the scope of the undertakings can be grasped with a readiness that would be impossible without this aid. The book is prepared by a firm in the Stock Exchange; and while one hesitates to use so hackneyed a word, the term "indispensable" is in this case no exaggerated compliment to pay it.

In the Telegraph market, Anglo-American Telegraphs are better. Eastern Ordinary is ½ up, Great Northerns have advanced, while West India and Panama, after showing the big jump of ½s. 3d. per share, lost part of the rise. The latter are being bought again by the same speculative division which on previous occasions has taken the market in hand, and the price is largely at the mercy of extrinsic considerations—such as political news, and so on. Telegraphs are not by any means active, but the tone of the market is good, and dealers declare that there is not much stock about. An increase of 4s. in the dividend on the Great Northerns caused the price to rise 50s. to 32½.

New York Telephone Bonds continue to creep up, being now quoted at 99½. National Telephone Deferred is neglected, but keeps about 20½. Marconi rose to 4½, from which they have reacted a little; but the Preference at 3½ has recovered their loss of last week. The Automatic Telephone Company, the British Insulated "baby," announces a net profit for its first year's working of £13,500; and while no dividend is to be paid on the ordinary shares for the period, the future prospect is distinctly satisfactory.

There is little of interest to record in connection with the Manufacturing market. A recovery of 2 points, after its drop of 5 points, has resulted in Brush Second Debenture being raised to 27. Dick, Kerrs are quoted at 10s. middle, showing a loss of 2s. 6d. British Aluminiums retain their rise, and the 5 per cent. Prior Lien is up a point, in consequence, of course, of the excellent report, to which attention was drawn here. British Westinghouse 6 per cent. prior lien is better. Castner-Kellners at 3½ have rallied, and in the armament market Armstrongs are the principal feature of strength, with a big rise on the proposal of the board to distribute as a bonus one new share for every four old now held. The rubber share market has been acutely weak, for which the incessant sagging of the price of the raw material is responsible. If the American buyers of the product do not come forward as they are expected to do, it seems likely enough that the price of rubber will go still lower, in which case, of course, it is only to be supposed that quotations for the shares will follow suit.

## ELECTRIC COOKING APPARATUS.

BY "ELEMENT."

ELECTRIC cooking may now be considered as well beyond the early experimental stage, but its development and general adoption must, of necessity, be extremely gradual, even after the ideal apparatus has been put on the market. It is not intended, in this paper, to dwell on the many advantages of this system of cooking, but rather to plunge at once into the matter of the construction and working of the apparatus. It is sufficient to state that the merits of the system are so great that the few shortcomings, which at present tend to hinder its general use, are almost negligible when compared with the many disadvantages of other methods of cooking. Granted that we have reasonable prices for energy, and that the more costly apparatus may be obtained on hire from the local supply authority at a nominal rental, then it may safely be said that the most convenient and economical method of cooking is within the reach of anyone who has the electric supply cables laid into his or her house. With electricity, there are no noxious fumes to cause a smell in the kitchen; no dust or dirt is caused by the use of electricity; and an improvement in the appearance of the food will be noted by those who generally have their food cooked by coal or gas. The shrinkage in the food cooked in an electric oven is found to approximate one-tenth, as compared with one-fourth when the article has been cooked in a gas oven.

These considerations are weighty in themselves, but they are not sufficient to warrant the householder in discarding, say, a gas cooker. They must be backed up by strong and reliable apparatus, or electric cooking will undoubtedly fall into disfavour. It must be remembered that the appliances will be in the hands of the good lady of the house, or the domestic servant, whose business is to cook, and not to look after complicated electrical machinery. The appliances must, therefore, be "fool-proof," so that mistakes will not have very dangerous consequences. Most of the serious defects in the early cooking outfits have now been remedied, and the only stumbling block to makers of this class of goods seems to be the manufacture of a heating element which will give a high efficiency with *absolute reliability*. Some of us are familiar with the cry: "The electric apparatus has broken down." A trivial oversight has resulted in a stoppage of the electricity flowing through a heating element, or a drop of water has, perhaps, been spilled on a portion of an exposed wire. But the breakdown is enough to make a topic of conversation for a few hours afterwards, and the result is a set-back in the development of electricity for domestic purposes. The same outcry might also be brought about by an appliance with defective insulation. Someone receives a slight electric shock from the surface of a kettle, and the electric method is thereupon condemned as "highly dangerous."

The apparatus, then, must also be electrically perfect, in having reliable heating elements, well insulated from the other parts, and in having all exposed metal efficiently connected to earth. Makers are now turning out cookers with a guarantee against breakdown within five years, and it would seem that we have now almost reached the stage when little trouble should be experienced under this head. It would be impossible, within a short article, to detail all the different types of electric cookers, but a brief description will be given of a few which have come under the notice of the writer. We are all familiar with electric kettles, electric stewpans and frypans, milk boilers, &c., with their self-contained elements. The latest forms of these are most efficient utensils, some of them attaining an efficiency of over 90 per cent. For fast cooking by electricity, they are, without doubt, the proper appliances. It is possible, by the use of an electric kettle, to boil 1 pint of water in less than four minutes, which is quick enough to satisfy the most impatient housewife, and this is obtained with an expense of  $\frac{1}{10}$ th of a unit, which, at  $\frac{3}{4}$ d. per unit, works out at  $\frac{3}{40}$ th of a penny, so that with this utensil the operation of boiling one pint of water 20 times entails a cost of only 1d., where energy is sold at  $\frac{3}{4}$ d. per unit for heating purposes.

The great drawback to the use of self-contained appliances,

however, is, of course, the confusion of flexible leads, where many cooking operations are in progress at one time, and this has led some makers to confine most of their experiments to the design of separate heating appliances on which ordinary utensils may be used. And in this pursuit, the principal difficulty has been to design an element which will immediately impart its heat to the vessel placed over it, without great loss of heat in the material supporting the element. This necessary loss of heat must appreciably lower the efficiency of the method. With the use of hot-plates the efficiency is between 60 and 70 per cent., showing that the best arrangement of apparatus, taking account of the before-mentioned objection to self-contained appliances, will be that in which roasting, grilling, frying, &c., are carried out on the separate heater system, and a self-contained, heavily-loaded kettle or pan is provided for the quick boiling of water. The utility and economy of a combination such as this would, it is believed, outweigh its possible disadvantages in one or two isolated cases.

In considering the many types of heating units, let us refresh our memory regarding the elementary principles underlying the transmission of heat from one body to another. As is well known, heat is transferred by radiation, convection, and conduction, and it will be seen that all three modes of transference have been tried by electrical manufacturers in their endeavours to further the cooking business. The sun's heat is radiated to the earth during the day; heat currents are conveyed through liquids and gases without luminosity; and conduction takes place when substances at different temperatures are in actual contact with one another. Let us see in what manner these fundamental principles have been applied in the various types of cookers to be considered.

The element in one firm's goods consists of lamp-heaters fixed in a cast-iron case forming an oven, grill and hot-plate. The heat is radiated from the lamps to the food or the vessel containing the food. This form of cooker never was successful, as the lamps were too easily destroyed by drops of water or grease breaking the glass bulbs. Another maker uses spiral resistance wires placed in a quartz tube. The objection to the lamp heater applies to the quartz system also, although the cost of renewal of the quartz tubes is not so great as that of the replacement of an entire lamp in the first-mentioned type. The purpose of the quartz tube is to increase the incandescence of the element so that more radiated heat is emitted, but it also serves to hinder the process of oxidation of the wire when at a red heat. Notwithstanding this precaution the quartz type of element "burns out" very readily, and on this account no great reliance can be placed on it. A small hot-plate with a quartz element has lately been put on sale, consuming about 200-300 watts, but it cannot do the electric cooking business much good, as its construction and wattage only render it of value where the maintenance, and not the raising, of temperature is required. Instructions issued by the manufacturers of this small article contain a list of its accomplishments, which include "the heating of dinner plates, the maintenance of boiling temperature in a kettle, the roasting of chestnuts, and the boiling of an egg," but a footnote carefully informs the reader that one must first of all procure the hot water in which the egg is to be boiled. This hot-plate, no doubt, fulfils the purpose for which it is intended, but it seems that to expend energy at the rate of 300 watts "to roast chestnuts" is a wicked waste of electrical energy, and an uninitiated person might be pardoned for thinking from the appearance of the hot-plate that it should do the ordinary work of a gas-ring.

Several manufacturers have convectors, &c., made up with elements of metal deposited on mica sheets, and these have also been fitted to ovens, grills and kettles. The heater usually consists of a deposit laid between two short strips of mica in such a way that air is prevented from reaching the metal; consequently little oxidation takes place at high temperatures. The elements are placed in parallel, so that should one burn out the others will not be affected. Another advantage is that, as there is not much material surrounding the element, the heat passes off as soon as it is generated. It is evident, too, that with an oven having heaters of this type renewals can be fitted expeditiously.

Then we have the composition known as "silundum," which may be heated to a very high temperature—about

3,000° F.—without oxidising. This material has been used in the construction of electrical cookers, and the results have been fairly satisfactory, but the efficiency does not seem to be very remarkable.

A few years ago electric ovens having cartridge elements were turned out by a well-known electrical firm. Each cartridge was formed of a spiral of resistance wire, wound on an asbestos cylinder, and inserted and sealed in a metal tube. Three elements were placed in the oven—two in the bottom and one at the top. Owing to the large amount of material forming the element, the efficiency was not good, and, therefore, little has been done in the improvement of the cartridge heater. Other forms have spiral wires, in some cases supported on, and in others embedded in, enamel or porcelain, and this brings us to the question whether the heating wires should be exposed to the atmosphere, or enclosed in mica or other insulating material, unaffected by reasonable temperatures. Exposing the element to the oxygen of the air limits the temperature to which the wire may be raised, while deterioration of mica occurs in the enclosed element when subjected to the higher temperatures; so that at the present time, elements must be designed which have a large dissipating surface per unit of power consumed, otherwise the apparatus will be liable to breakdown through overheating. In the cast-iron hotplate, lately brought out, one might suppose we had the ideal electric cooker, and it certainly is an improvement on former attempts, but considerable energy has to be expended in heating the cast-iron slowly, to prevent the deterioration already alluded to. If a substitute for mica were discovered which did not perish with great heat, cookers could be designed with a high initial wattage, giving a quick rise of temperature on the element, after which the power could be automatically reduced to a value sufficient to maintain the high temperature. This would, it is believed, be the cooker *par excellence* if the elements were constructed in a solid and reliable manner. Putting aside the objection of the slow initial rise of temperature in the existing hotplate system, the arrangement has much to be commended. The heating resistance is a flat spiral strip laid between two sheets of mica, which are inserted in an imperishable cast-iron disk. Expansion and contraction of the iron are allowed for, and the whole is fixed on the top of an iron support with the disk projecting above the level of the supporting frame. Ordinary utensils may be heated on the disk, but greater efficiency is, of course, obtained by the use of special vessels having flat ground bottoms to ensure good conduction between the disk and the utensil, and having bright, polished surfaces to prevent the escape, by radiation, of the heat. It is well known that a black surface will radiate heat quicker than a brightly polished surface, so that, to obtain the best results, it is necessary to have the sides of the utensils polished, while the surface of the hot-plate and the bottom of the vessel should be a dull black. It must be remembered, however, that the contact areas should be quite clean and free from soot and other non-conducting material. The hot-plate should also be fixed to its support in such a way as to prevent, as far as possible, the transmission of heat to the other metal parts of the cooker. This will ensure that almost all the heat generated is brought to the exact position where it is required for cooking purposes. The tinware vessels, supplied by the makers of the cooker, have special flat and very thin copper bottoms, which not only fit well on the top of the plate, but also overhang round the edge of the plate. It has been found in practice that the overhung rim of the utensil becomes too hot on account of the heat transmitted to this portion not passing off quickly, and thus the rims of utensils very soon get burned and cause leakages from the vessels. The best utensils are, therefore, those of cast metal having a dull bottom and highly polished on their other surfaces. An oven is provided to fit over the hot plate, and, to give additional heat, a second hot plate is inverted and placed in an opening in the top of the oven. The oven, as in the case of the other utensils, has polished surfaces, and a further precaution against loss of heat is given by the provision of an air space between the outer and inner walls of the oven. The whole apparatus can be used in a great variety of ways, and advantage may be taken of all the heat generated in the plates. A complete set consists of a

public cooker, having two hot-plates on one frame, an extension plate for the top of the oven, and an assortment of utensils for use with the apparatus. To the back of the frame is connected a flexible armoured cable which carries the current required for the three hot-plates.

A Scotch firm of manufacturers has recently put forward an electric cooker, which, with the possibility of improvement, bids fair to become the ideal cooker we have looked for. The makers have copied, to a certain extent, the design of a gas cooker, in having a cast-iron oven for roasting and baking, two hot-plates on top for boiling, stewing, &c., a public grill and toaster, and a hot cupboard for keeping food warm, warming plates, or for slow cooking. The oven is lined with white porcelain enamelled steel sheets, and fitted with an inner glass door, so that food can be examined while cooking without loss of heat. It also has a thermometer added to show what temperature of oven is required for the various cooking operations. The grill is fitted with white enamelled sides and back, and both oven and grill are thoroughly lagged with asbestos. The elements are of thick high-resistance spirals mounted on fire-brick, and so arranged in sections that it is a matter of minutes to replace a section should it burn out. It will be interesting to see how the claims for reliability of the new cooker are borne out in practice. From its similarity to the gas cooker at least has the advantage that no special instructions in its use need be given to anyone familiar with the working of a gas cooker.

The control of electric cookers has always been a difficult problem for manufacturers. Good appliances have been completely spoiled for lack of perfect switching arrangements. In the case of the disk stoves, two switches are provided—one to give full heat and the other to give about one-third of full heat. To obtain even distribution over the plate at both degrees of heat, the element must be divided into two parts, and the switches arranged so that on top of the two portions are in parallel, while on "low" the current passes through them in series. To allow of this, one maker has double-pole tumbler switches, which have been designed with too great heed to proper insulation between plates, and practice has shown that, after being in use for some time, the insulation breaks down, and arcing across the full pressure takes place on switching off. In another type, three two-way switches have had to be linked together to give the desired change from series to parallel in the two parts of the element. A firm of accessory manufacturers has, however, come forward with special, well-designed switches of ample capacity, and having the necessary insulation resistance, and little trouble should be experienced from this source in future where the new pattern of switch is adopted.

It is desirable to fix the control switches on a separate board close to the cooker, unless a position on the cooker can be selected where they will not be damaged by water or fat. Connecting wires should, however, be as short as possible, as a great many breakdowns to ovens and hot-plates occur in the leading-in wires. They should also be of much heavier wire than the heating element. One switch only, having several positions, should be fixed to control the complete heating element, and as the top heat is always required in commencing operations, the positions should be arranged so that the handle of the switch can be moved directly from "off" position to the point connecting with full heat, and from "full" to the lower values before switching off. This arrangement, it will be observed, also tends to minimise the arcing at the switch contacts on inductive circuits. A single-pole enclosed clip fuse (a "Zed" type is almost ideal) should be inserted in the circuit with the element.

It is of great importance that the cook should know, not only that the switch is "on," but also that current is actually flowing through the element, and where the latter is not exposed to view, some method must be devised to show that current is passing.

A small pilot lamp at a convenient point has been tried, and in some instances, switches have been used which are provided with small glow lamps behind the index, which indicate not only that current is flowing, but also the relative strength of the current. These special devices naturally increase the cost of an electric cooker to a figure

which may seem ridiculous when compared with the cost of a gas cooker, but it is quite decided that apparatus for use with electricity must necessarily be very much more expensive than gas appliances, and it will be a great mistake if the development of electricity for cooking is hampered by leaving out devices which tend to greater reliability. Certainly the public will require to be educated in the new way of cooking, no matter how simple the apparatus may be, just as it had to be familiarised with gas cookers when these first came into vogue. With handy controlling gear on an electric cooker it will be evident that once a cooking operation has been carried out satisfactorily, the same satisfaction should be obtained again for the same operation, with the switches arranged and time allowed, as in the first case.

Cheap sets of breakfast outfits are to be had, consisting of a hot-plate, frypan, stewpan, and an electric kettle, and the results attained with these compare very well with those of the ordinary gas-ring, if we neglect the delay occasioned through the initial raising of the temperature of the hot-plate. It is easily possible to cook a breakfast by electricity for three persons within half an hour with an expenditure of less than half a unit, taking full advantage of the heat stored in the hot-plate after the current is switched "off." When account is taken of the enormous waste in the ordinary kitchen fire—about 90 per cent.—and the losses which occur with a gas-ring through radiation of heat from dirty utensils, and on account of soot on the bottom of kettles, &c., it will be seen that the electrical method is, after all, a very efficient system.

The loading of the elements of cookers has already been briefly referred to. The wattage for hot-plates should not exceed 23 watts per sq. in. of boiling-plate surface where mica enters into the construction, and should not be less than 20 watts per sq. in. A higher loading than 25 watts per sq. in. will disintegrate the mica and destroy its insulating properties.

In the foregoing notes an endeavour has been made to emphasise the fact that to popularise electric cooking, the apparatus must be *absolutely reliable* on all occasions. Elements will, naturally, burn out through time, but they must be so constructed that only that portion which gives way will be affected, and a complete stoppage of the cooking made an impossibility. The heaters must be cheap, and so simple that any housewife may be able to replace them in a few minutes. So far as present knowledge goes, we have not quite got the ideal apparatus, and it is to be earnestly hoped that, as the price per unit is still further reduced by supply authorities, manufacturers will on their part leave nothing undone in their attempts towards the perfecting of their electric cooking apparatus.

---

## DUMPING: A NOTE ON A PARTICULAR CASE OF DISCRIMINATIVE CHARGES.

---

By JOSEPH GOODMAN, A.M.I.Mech.E., A.M.I.E.E.

---

IN the following note it is not intended to treat the above question fully or in any way dogmatically, but it is written with the hope that any person who will bear with the arguments to the end, will be sufficiently interested to think for himself on the matter, and not content himself with the popular view, which usually only leads to a deeper misconception of the principles involved.

When considering the question of dumping, it is well to define at the outset the particular meaning attached to the word in the particular instance under notice, or, in other words, to distinguish between the various kinds of dumping.

The dumping of surpluses may first be considered. The manufacturer of a certain article can seldom, if ever, predict the exact demand that there will be in any certain period of time for that article, but he will, at any rate, see that he is not short of the amount that will bring him a maximum of profit; hence it frequently occurs that his supply is excessive, and a surplus arises.

Now, as a matter of business, the manufacturer will

probably prefer to keep a fairly high price level in his home market; this means that he will restrict his supply to the home market, and will dispose of the surplus, which consequently arises, in the foreign market.

This surplus will, as a matter of fact, sell at the price which then obtains in the foreign market for that particular article, which price, however, may actually be lower than the figure which would leave any profit for the manufacturer, were his whole output to be sold at that particular price.

It is at once seen from the above that in this case a surplus may be considered as a quantity of output which would not have been manufactured if the price for which it was to be sold had been foreseen.

A second kind of dumping is that which consists in deliberately manufacturing an excess so that increased quantities of the manufacture can be sold abroad (at a loss) in order to advertise the goods or to drive competitors from the market. It is, however, very doubtful if any manufacturer would adopt this plan in view of the excessive cost (except possibly in the case of some unique article, where it might be done to create a market, the price being afterwards raised when the public taste had been whetted).

With regard to competitors the above course would be feasible if actually the competitors could be driven from the field with small chance of recovery within a reasonable time. It will be seen that this should not be the case in ordinary commercial life.

Take the case of the old-established industries; these would work and sell for many years below their full cost of production (*i.e.*, including standing charges) rather than shut down, since shutting down would mean the destruction of their plant. They would manufacture so long as the selling price was well above the works cost of production, *i.e.*, exclusive of standing charges, which would not be saved by a shut down.

Again, taking the case of other industries so controlled that, directly prices become in the least unremunerative, their output immediately contracts; it is equally fair to assume that immediately upon a recovery in price, which would again render manufacture profitable, the output can be as easily increased.

Briefly, it seems probable that competitors who are easily driven from the market when prices are unfavourable, are easily rallied on an improvement in the market; whilst those competitors who are not easily routed, can only be finally driven out of the market after a long and expensive campaign. Also in either case an eventual rise in price occurs which involves the danger of losing the custom which was obtained at the lower price; in short, the commodity must be somewhat unique or indispensable for such a course to be taken.

Finally, one may consider dumping in which there is to be no ultimate raising in price, *i.e.*, the commodity is sold at first, and for all time (in the foreign market), at a price which is below the cost of production. This is a very different case, and is a much more feasible and business-like proceeding. Such a supply has to be manufactured that after the home demand has been satisfied at a high or moderately high price, a quantity is still left which has to be sold in outside markets at a price below the cost of production.

An ordinary method of argument, attempting to show that the policy pays, is to say that the manufacturer can afford to sell at a loss in the foreign market, because he obtains more than a normal profit from his home sales. This necessitates explaining why, when he is making easy money at home, the manufacturer deliberately determines to carry on a losing trade with foreign customers.

It can, however, be shown that under favourable conditions, it is possible for a manufacturer to sell continuously abroad at a price below the cost of production, cost of production being understood to mean the average cost (cost per unit) over the whole of the output manufactured. Then sales in a foreign market at a price beneath the cost of production will be profitable, provided that the foreign price is greater than the additional cost made to the total costs of the industry by the production of the additional exported quantity of output, when this additional

cost is estimated per unit of the exported output. Hence we see that the industry must be subject to increasing returns.

The fact that the foreign market (*i.e.*, increased output) is deliberately catered for in manufacturing, involves the expansion of the industry, and the enlarged industry properly organised means a lower cost of production per unit of the article or commodity manufactured. In addition to this must be reckoned the reduction in the cost of articles still sold on favourable terms in the home market.

N.B.—When the expansion of a business is accompanied by a fall in the marginal cost, it is usual to say that the business is subject to increasing returns; if the expansion is accompanied by a rise in the marginal cost, it is usual to say that the business is subject to decreasing returns.

The above involves the term "marginal cost":—Suppose a firm manufacture in any period one thousand boots, then the additional cost of production incurred by manufacturing the last boot over and above the previous nine hundred and ninety-nine boots may be taken as giving the "marginal cost"—a crude explanation of an important term, but sufficient for the present purpose.

## PROCEEDINGS OF INSTITUTIONS.

### Electric Heating and Cooking.

THE YORKSHIRE LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS discussed this subject on March 12th, 1913. In opening the discussion, MR. THOMAS ROLES said the subject was one which, in his opinion, was of the greatest moment to the electrical industry. As far as he had been able to ascertain, the United Kingdom was well ahead of all other countries as regards both the manufacture and use of electric heating and cooking apparatus. This progress has been principally due to three causes, *viz.*:—(1) The reductions which had been made in the prices at which the apparatus was sold; (2) The reduction in the prices charged for electricity used for such purposes; and (3) the more active steps which had been taken to make public the advantages of the use of electricity and to push its sale.

The remarkable developments in the application of electricity for power purposes had overshadowed to a large extent the question of the use of electricity for heating and cooking purposes, as supply engineers and contractors had had their hands full in dealing with work in connection with power supply.

In areas where few manufacturing industries were in existence, the local electrical engineers had had to turn to business and domestic premises as the only outlets for increased output, and in a number of instances the heating and cooking problem had received the special attention at their hands which, in most manufacturing centres, had been given to the question of power supply. In one of these areas—*viz.*, the Metropolitan Borough of St. Marylebone—an average of over 150 kw. of electric heating and cooking apparatus was being installed per month, and nearly 200 complete electric cooking outfits were on hire by consumers from the supply undertaking. This had been accomplished in the face of very keen competition on the part of the large company supplying gas in the borough. He could unhesitatingly state, from actual experience, that there was a demand for electric heating and cooking in manufacturing districts, and it was his belief that this demand would grow rapidly, with the result that in a few years' time electric heating and cooking would to a greater or lesser extent become an everyday practice in the majority of houses having electric lighting installations, and that eventually electricity would be far more popular than gas for these purposes.

The invariable experience of those engineers who had energetically tackled the heating and cooking problem was that they had not been troubled by excessive peak loads, but had benefited by a general increase in output and load factor.

Up to December 31st last, the total capacity of the heating and cooking apparatus which was known to have been connected to the Bradford Corporation mains, exceeded 1,000 kw. Included in this figure were the following appliances which had been connected by consumers who had adopted the special domestic rate:—251 radiators, 138 irons, 27 kettles, 25 cooking ovens, 12 hot plates, and other small utensils, such as shaving-pots, milk and egg-boilers, toasters, &c. A very considerable number of the connections, however, were only represented in the department's books as plugs, and when apparatus was purchased for attachment to these, in the majority of cases no formal notification was made. There were undoubtedly very considerable numbers of radiators, irons, &c., connected to the Bradford mains which were not included in the above figures.

The number of cooking outfits connected might have been very considerably increased had the electricity department instituted a scheme for hiring out such apparatus at reasonable rates. The design of cookers of several makes had, however, now become so far standardised that in all probability a hiring scheme would soon be inaugurated, and a considerable number of consumers had expressed

a desire to give electric cooking a trial immediately such a scheme was put into operation.

The increase in the heating and cooking output had been almost solely the result of the special charge of 15 per cent. per annum on the net rateable value of the premises, plus  $\frac{1}{4}$ d. per unit for all current consumed, as registered by meter (which was provided free of rental charge), and of recommendations made by consumers to their friends after personal experience of the use of electric heating and cooking apparatus.

In his opinion no great headway would be made by any supply undertaking working in an area where gas was supplied at 3s. per thousand cubic feet or under, unless electrical energy for such purposes was supplied at a price not exceeding  $\frac{1}{4}$ d. per unit. The author was of opinion that such a tariff was remunerative, provided that a reasonable fixed charge was also made.

The lower the price charged for current the higher will be the load-factor of the supply. This had been proved to be the case in connection with lighting and power supplies. The question of load-factor was not of such great importance when dealing with cooking loads as when applied to heating loads. Leaving out exceptional cases, cooking loads must be intermittent, and a low tariff could only be justified by reason of their great diversity factor. Radiators and convectors would only be used for occasional purposes where a high tariff was imposed, but with the reduction of the tariff they would become more and more popular for all-day heating. (See table.)

*Statement showing Total Number of Units Sold to Consumers who have adopted the Special Domestic Rate each year since its institution.*

Year ended.	Units.
December 31st, 1910 (six months only) ...	53,733
December 31st, 1911 ... ..	263,618
December 31st, 1912 ... ..	435,765

When considering the best method of applying electricity for heating purposes, the actual requirements of the case should be taken carefully into consideration. Should the heater only be required for intermittent use, or to provide warmth immediately, a radiator should be installed. If, however, it was desired to warm the whole of an apartment in the shortest possible time, and to maintain the warmth afterwards, a convector would be found most suitable.

It has been found by the author that to obtain satisfactory heating the consumption of the heater should not be less than 1 watt per cu. ft. of the apartment to be heated. In apartments where there are a number of doors or windows, or the door is being continually left open, the consumption should be greater. Now that current is obtainable at  $\frac{1}{4}$ d. per unit, and cheaper designs of radiators and convectors have been evolved, it is quite common for two and three-unit heaters to be installed, with the result that satisfactory heating effects are obtained.

The luminous radiator of Mr. H. J. Dowling is as efficient as any on the market, and it is advisable that this form or some modification thereof should always be used when luminous radiators are adopted.

In some designs of lamp radiators which have come under the author's notice, the lamps are more or less hidden at the top, bottom, or sides of the radiator by some portion of the body. This tends to cause overheating of the lamps, and to shorten their life. Overheating of the lamp holders also results, with consequent trouble with their contacts, and further reduction in the efficiency of the heater as a whole. Designers of radiators should always bear in mind that the object for which a heater is required is to give off as much heat as possible, and not to retain the heat in its body. This object can only be achieved by allowing the air to have as free access as possible to the heater, in order to reduce the temperature of its parts, and, in the case of radiators, to design the body so that there is as little obstruction as possible to the rays of heat given out by the elements. There are many luminous radiators on the market which do not comply with the above conditions.

Bastian and other types of open glowers should be guarded to prevent fire occurring through inflammable materials touching the elements, and should not be mounted too close to the floor unless the latter is well heat insulated, as it is found that these types of heaters throw a considerable amount of heat downwards. The connections to the heating elements should be of good mechanical construction, simple clips, such as are often used, being a source of great trouble, especially if the glowers are of high capacity, as in course of time, through the continual expansion and contraction which takes place, the clip becomes loose.

The type of radiator known as the Ferranti fire is very efficient. The usual form in which this is made is that of a metal bowl some 18 in. in diameter, in the centre of which is fitted a hot plate covered with a quartz disk. After current has been switched on for some little time both the face of the hot plate and the disk become red hot, giving the heater a cheerful appearance, and the formation of the metal bowl causes the radiant heat to be well thrown out into the room. In using this type of heater, care must be taken to prevent inflammable materials from touching the quartz disk.

Many convectors are made with insufficient air inlets, and the outlets are often considerably baffled. This causes over-heating of the elements and contacts, and tends to reduce the efficiency of the heater. In a recent case which came under the author's notice, a convector was returned by a consumer on the ground that the heat given off was insufficient, and with the request that additional heating elements should be inserted. The capacity of the convector was increased by adding further elements, which were of

wire wound on mica strips, the air openings in the lower part of the body were increased by 100 per cent, and the baffle plate, which had been fixed above the original elements, was removed. On the heater being returned to the consumer it gave every satisfaction, so much so that the additional heating units were not required, the temperature of the room being maintained with less consumption than was the case when the convector was used in its original condition.

A simple and effective form of convector is that known as the G.E.C. tube heater, in which radiator lamps are fitted inside metal tubes of about twice the lamp's diameter. In this case the radiant heat of the lamps is not utilised directly for warming the room, but to heat up the enclosing metal tubes, which in turn heat the air which passes rapidly through them.

Radio-convectors have during the past few years become very popular. These usually consist of a four-light luminous radiator at the back of which are arranged a number of coils forming a convector. By combining the two forms of heaters a very satisfactory result is obtained.

Generally speaking the electric heater can only compete with other forms of heaters by reason of its adaptability, and the fact that the whole of the heat units given off by it can be efficiently utilised. In preparing schemes for electric heating, therefore, it is most desirable that the whole of the conditions should be thoroughly studied and the heat applied in the most suitable manner and positions.

One of the first firms to make a serious attempt to put a practical cooking outfit on the market at a reasonable price was the Perry Construction Co., Ltd., whose "Tricity" cooker has had a very considerable sale, and is well known throughout the country. Very satisfactory results have been obtained from the use of this outfit, but it has been found by experience to have a number of disadvantages. Amongst these may be mentioned the following:—

The flexible connections to the hot-plate on the top of the oven and the extension cooker are often found to be in the way, and, as is the case with all flexibles, faults develop where the wire is attached to the plug or to the plate. The plugs also after a time make bad contact owing to the pins losing their spring through constant use. When this happens, either the plug heats up the fuses, or, as had been the case on a number of occasions, the contact is so bad as to prevent current passing to the hot-plate, with consequent loss of heat in the oven and spoiling of the food being cooked. Another great disadvantage which is found in connection with this outfit is its novelty of construction, which causes it to fail to appeal to the average cook, who is usually of a conservative disposition. Having been used to coal fires and gas ranges, the cook naturally prefers that an electric cooker should be constructed somewhat on the same lines, and for this reason electric ovens designed on somewhat similar lines to gas stoves are now becoming the standard article provided for electric cooking purposes.

The majority of manufacturers, however, cannot be said to have yet settled down to what may be regarded as standard lines, as they do not seem to have sufficiently studied the requirements of the various classes of people for which they have to cater.

The varying requirements of different parts of the country have also not been realised. Most electric stoves appear to have been designed to suit London conditions, and the ovens made sufficiently large to cook a small joint and pastry. On introducing these ovens in Bradford, it was soon ascertained that they would not meet the local conditions, as one of the first requirements for an oven in the West Riding seems to be that it should be capable of baking bread, whereas in London and in most towns in the south it is unusual for bread baking to be carried out at home. The internal dimensions of the cookers originally supplied were too small to accommodate the usual baking of half a stone of bread. In addition to this, the elements in some types of ovens were arranged round the sides, and, as, in connection with the baking of bread, it is generally conceded that a bottom heat gives the best results, and as the majority of coal ovens in Bradford are so arranged that the most intense heat is at the bottom, the consumers who tried the electric ovens could not obtain satisfactory results from them. In London and the south, cooks have become quite used to side heat by reason of the general use of gas stoves; and in the case of coal-fired ovens for domestic use, the most intense heat is applied at their tops.

The ovens should be provided with at least three separate sets of heating elements, so controlled that not less than three regulations are provided. It is advisable that the capacity of the heating elements should be such that two sets are capable of maintaining sufficient heat for all ordinary baking operations. The advantage of this arrangement is that the oven can be quickly brought up to full heat by the use of all three elements, and that in the event of the failure of one of them, the remaining two would provide sufficient heat to complete the operations in hand without spoiling the food.

It would appear an advantage if ovens were constructed so that a glowing type of unit could be used for the cooking of meat, and controlled by a series-parallel arrangement, so that the heat in each individual element could be reduced when bread or pastry was being baked.

A thermometer of the mercurial type, protected from injury, should be provided on the door or other convenient portion of the oven, and a table of temperatures and instructions as to the heats required for the cooking of various dishes should be sent out with each cooker.

Glass panels are provided by some makers in the door of the oven, and these are of unquestionable use if the heating elements used glow sufficiently to provide enough light to enable one to see the food being cooked.

It is generally found that two hot plates and one grill mounted above the oven are sufficient for all ordinary purposes. The hot plates should be so arranged that either the plate as a whole, or the heating element, can be easily removed for the purpose of repair, otherwise repairs prove costly and of great inconvenience to the persons in whose houses the cookers are installed.

A flat plate of not smaller dimensions than 36 in.  $\times$  18 in. should be fitted at the top of the oven, level with the base of the hot plates, so that cooking utensils, dishes, plates, &c., may be stood thereon. This plate should be left bright and kept clean.

The space between the underside of the hot plate and the oven should be utilised partly as a hot cupboard for warming dishes, plates, &c., and partly as a grill, the grill elements being fixed to the underside of the plate. The grill should be of not less dimensions than 12 in.  $\times$  8 in., and should be arranged with two heats, so that one half of the heating elements can be used if found desirable. Arrangements should be made so that the grid on which the article to be grilled is placed can be supported at varying distances from the elements.

The whole of the heating units should be separately switched and fused. Each hot plate should be provided with at least two, and preferably three, regulations of heat in the proportions of quarter, half and full, the regulation being provided by a Diamond "H" switch having one "off" and three "on" contacts. The switches and fuses should preferably be mounted on a board. On the same board should be mounted a main double-pole switch, so connected that it can be used to cut off entirely the supply of the cooker, sub-switches and fuses. A pilot lamp should also be mounted on this board, unless one is fitted on the stove itself. The pilot lamp should be separately fused.

The wires between the cooker and the switchboard should be enclosed in flexible metallic tubing, and the whole of the metal portion of the apparatus, apart from the electrical circuits, efficiently earthed.

Where a cooker is supplied from a circuit of which one pole is maintained at earth potential, if plug connections are used for all or any of the various circuits, the pins of the plugs should be of different diameters or some other device used to prevent change of polarity, otherwise single-pole sub-fuses will afford no protection.

With a hot plate the heat is transmitted to the containing vessel entirely by reason of the conductivity of the materials employed. Unless, therefore, the bottom of the utensil bears evenly throughout the whole of its area on the surface of the hot plate, points of excessive local heating occur at the places where the vessel touches the plate. If water is being heated, a rapid convective action takes place at these points, and the heat units are thereby distributed throughout the whole of the liquid. In the case of milk, gravies and similar thick liquids, however, the convective action is so slow that the heat cannot be transmitted from the bottom of the vessel sufficiently rapidly to prevent an excessive rise in temperature, with the result that burning takes place. These facts should be borne in mind when choosing utensils for use on hot plates.

The best results are obtainable with stiffly constructed vessels, such as those made of cast-iron or castaluminium, having machine-ground or turned bottom surfaces of fair thickness. Excellent contact is made by such vessels with the turned surface of the hot-plate, which contact, owing to the vessels' rigid construction, is not broken by buckling. In addition to this, due to the thickness of the metal in the base of the utensil, the heat, even if absorbed unequally over its under-surface, is equalised by the rapid conduction which takes place in the metal itself before reaching the surface exposed to the liquid. Not only does the use of such utensils tend to prevent the burning of food, but the heating is more rapid, and, therefore, more efficient.

Enamelled iron utensils have been found very unsuitable for use with hot-plates.

MR. T. HARDING CHURTON said he thought that if Mr. Roles had been in America recently, he would have felt that the United Kingdom was a long way behind. As to the use of radiators at 1d. per unit, he had come to the conclusion that to heat a room of any considerable dimensions was rather an expensive matter. In small rooms, such as dressing rooms and the like, a radiator was very nice indeed. He found the cost of a coal fire was 4d. an hour, whilst that of the radiator was 1d. per hour, and the coal fire did very much better service. It would require half a dozen radiators to make much difference to the temperature of an ordinary living room. However, they were handy for supplying warmth to the individual, as they could be moved about the room for that purpose.

MR. W. B. WOODHOUSE said he thought the great advantage of electric cooking was the convenience of it. From Mr. Roles's paper he worked it out that to treat a house rated at £50 would involve a heating bill of something like £80. He considered that Mr. Roles made out a very strong case against the Marylebone or Telephone Tariff, because where there was a plug by which the customer could connect anything he liked, it would be extremely difficult to apply accurately such a tariff. He thought Mr. Roles was claiming too much in saying that he was supplying current for domestic cooking and heating at a 4d. per unit. There was the rateable value charge to take into account. Cooking would give them a Sunday load, and that might become a very important thing. He thought the tendency to copy the form of the gas stoves was wrong. Far better would it be for the makers to develop a stove which was absolutely right in type for electrical use, and then to persuade the public that, though different from the gas stove, it was better than it.

MR. A. B. MOUNTAIN said many years ago he persuaded the Huddersfield Corporation to spend a good many hundreds of pounds in establishing a showroom and buying fittings for hiring, and so far as cooking was concerned it was a great failure. The great

difficulty was the lady problem. The wealthy ladies left the matter to the servants; what he might call the economical genteel class could not afford the appliances, and the working class at once raised the question of how to boil water. His experience of radiators agreed with Mr. Churton's.

MR. H. VESGER said he did not think any reasonable man would suggest heating a house with radiators under present conditions of price of energy, though the radiators might be a most excellent thing for old people and babies going to bed and getting up in the morning. There was no comparison between heating an ordinary sized room with radiators and with anthracite coal. As to cooking, he thought there was distinctly a field for it. The enormous advantage of cleanliness was most obvious. A single unit "Tricity" cooker was most useful and economical for cooking odd things in case of sickness and so forth.

DR. R. POHL said he had seen German figures which led him to the conclusion that 4d. per unit for electric current and 2s. 5d. per 1,000 cb. ft. for gas amounted to exactly equal cost for cooking. These figures, however, related to individually heated vessels, and he believed that the efficiency of these was 80 or 90 per cent., whereas the efficiency of the stoves which were so largely used now would not be more than 60 per cent., and, therefore, would be about 40 per cent. more expensive in working than the individually heated vessels. In regard to the load factor point of view, he thought that Mr. Roles had rather under-estimated the importance of the fact that cooking went on in summer as well as winter, whereas heating was in winter only.

MR. W. LANG thought that Mr. Roles might well have dealt with the claims which were made as to the saving in weight of food by the electric cooking, and also the better flavour, the absence of loss of juices, and the increased pleasure of eating the food. A difficulty which operated against the manufacture of ovens was that the disks for heating the vessels had to be made of very light castings, and in use they were liable to buckle, and so the uniformity of surface for the vessels to rest upon was spoiled, and when the pots and pans were resting upon two or three points only, the advantage of the heat was largely lost. As to heating, he thought that by a very simple arrangement the fresh air admitted into a room by a wall ventilator could be heated by means of a small electric heater fitted into the wall.

MR. ALBERT INNES, speaking upon the subject from the contractor's point of view, referred particularly to difficulties in educating the customers. There was great difficulty in persuading ladies that convectors were better than radiators for heating rooms.

MR. E. C. WALLIS testified to the great usefulness of radiators in case of illness.

MR. HAME, of York, said he had been very gratified at the fewness of the cases in which electric cookers had been returned. He thought the public liked the cookers very much indeed, and at York the authorities were only waiting to see whether the popular favour was permanent before going into the provision of more cookers. There were difficulties sometimes—as, for instance, when, as he remembered in one case, cooking was attempted on a small "Tricity" cooker for a family of 12, who had hot lunch every day, and hot dinners most evenings—in hitting upon the right size and style of apparatus. Obviously the possibilities of electrical heating were limited, but he knew of a case in which a church at York was heated solely by electricity, and though it was a very old and damp church the results were satisfactory. It was done by double tiers of tubes about four inches in diameter, and six tubes high running right round the building. He believed the cost was about 6s. or 7s. per Sunday, and the people concerned seemed to think that it was worth the money. Though he had started with the greatest doubt about electric cooking, he now thought it had come to stay.

MR. CAMPION, of Dewsbury, said it was a very good thing that the makers were now prepared to enter into contracts for the maintenance of the elements of the ovens.

MR. ROLES, in his reply, said that, notwithstanding Mr. Churton's observations, all the information that he had been able to gather suggested that the Americans were not up to the standard of this country in regard to cooking and ovens. He had not advised anyone to attempt to heat a house all through by electricity. If people began to do that, he would have to start another works. One advantage of the electric cooker was that it was safer than the gas cookers, with which many accidents happened. In Bradford the people who were chiefly taking an interest in electric cooking, were people living in houses rated at from £20 to £35 a year, who had little domestic help and wanted apparatus that they could use with safety and cleanliness themselves, the lady doing the cooking whilst the one servant did the rougher work, and for these people the electric cooker was very much better than the gas stove. With regard to saving in weight of meat, results obtained by himself showed very material advantages in favour of electric cooking.

The subject was further discussed at Sheffield, on March 26th.

MR. KING said that he desired to consider the matter of electrical heating and cooking from the point of view of the man in residence, for with such an individual practically the only question was that of cost. For the purposes of comparison he took a nine-roomed house, containing an average family of five grown-up people in Sheffield. Such a family would spend about £13 per annum on electricity for lighting, gas for boiling water and cooking purposes at only 1s. 3d. per thousand, and £8 2s. for coal for heating for the year. In the case of greater use of electricity for a house and family of the same size, he estimated that for lighting, heating and cooking purposes they would require 5,271 units per annum in total, and, working this out on Mr. Roles's basis of 15 per cent. on the rateable value and 4d. per unit, the cost would come to £17 16s. 6d. There was thus a difference of between £4 and £5,

and in order to make it worth a person's while to go in for electric cooking and heating they would have to save the amount of the difference. Some saving would be made in dispensing with a certain amount of labour in house cleaning and so on. In regard to the matter of diversity factor they would all probably have noticed for themselves that persons went to work at different times in the morning, and therefore they also had their breakfasts at different hours. It was absolutely necessary to have red heat for grilling and to have black heat for baking.

MR. E. J. MARSH said that electrical cooking and heating offered a great field for electrical engineers. In the past the trouble had been that lightly built materials had been used, and the designs soon became obsolete.

THE CHAIRMAN (Mr. Wilson Hartnell) said that years ago he had made experiments with a gas oven in order to find how little gas was being used, but in actual use the consumption of gas was doubled and even trebled. The same thing applied to electric installations. In both cases it was due to carelessness in use.

MR. BURNAND said that it was pretty well recognised that they had to have a fixed charge and a charge according to the amount of current used, and the only point at which that system failed was when the diversity factor was altered. The ideal tariff was one where there was a fixed charge and a charge per unit at a low rate, and also an increased rate at a time of maximum load at the station, and it was possible with this system to make one charge for current for heating and lighting or anything else, and yet get a fair revenue.

MR. ROLES, in reply to the discussion, agreed with the estimates which had been made by Mr. King. He always found that, after persons had commenced using an electrical installation for heating and cooking, they continued with it, and in cases of illness in the house, the occupiers when they had once tried an electric radiator, would, under no consideration, use a gas stove and run the risk of leaving the gas turned on and getting asphyxiated. At the present time he thought the manufacturers were getting down to a standard type of oven, and this, together with the experience of users, showed that the new ovens would not become obsolete in the course of a year or two, as they had done previously. The prices for ovens were dropping, and a satisfactory one could now be obtained for £10 or £11; there did not seem to be any reason for doubting that the prices would drop still further. At the present time he was very anxious to get a two-rate system for shops and smaller consumers. He was not altogether satisfied with the rateable-value system for shops, and yet, at the same time, he could not at present find another system that would suit his purpose.

Recent Developments in the Street Lighting of Manchester.

By S. L. PEARCE, M.I.E.E., and H. A. RATCLIFF, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, February 25th, and London, Birmingham and Glasgow.)

(Continued from page 498.)

THE Portland Street light has a much warmer and more cheerful effect than the comparatively cold light in Princess Street.

The curves (figs. 4 and 5) show the horizontal and vertical components of the illumination on planes 3 ft. 3 in. above the ground, and on the ground level. Table III gives a summary of the actual results obtained. The figures in Table II were obtained with a luminometer, and clearly show that, as regards the intensity of the illumination at a considerable distance from the lamps, the flame arcs give better results than the gas lamps.

FIG. 4.—Curves showing the results of the photometric tests on the Princess Street three burner high-pressure gas lamps. Full-line curves represent illumination on a horizontal plane 3 ft. 3 in. above the ground level; dotted curves, the illumination on a vertical plane; chain curves, the illumination on the ground.

Purely from the point of view of illuminating effect, there is much to be said in favour of both systems; but the electric lighting system possesses all the practical advantages, a few of the more important of which are:—

- (a) Lower cost

- (b) Simplicity of switching operations, and possibility of dispensing with lamplighters.
- (c) Flexibility and ease of erection.
- (d) Lamps not affected by vibration when suspended from traction poles.
- (e) Possibility of reliable check on running costs (i.e. current consumption and carbons).
- (f) Negligible leakage.
- (g) Absence of globe breakages due to heating, &c.

All the above advantages are absent in the case of the high-pressure gas system, and in contrast may be mentioned the disadvantages incidental to its use:—

- (a) Extensive and highly dangerous leakage of high-pressure gas.
- (b) The detrimental effect of a foggy or heavily smoke-laden atmosphere on the mantles, resulting in a serious diminution of candle-power just at a time when it is most required.
- (c) Partial and occasionally complete failure in frosty weather.

Portland Street is a most unsatisfactory street to illuminate, owing to the nature of the buildings and the absence of any appreciable amount of reflection; nevertheless, the present lighting is

FIG. 5.—Curves showing the results of the photometric tests on the Portland Street 550-watt lamps, fitted with the latest type of outer globe having a graded frosting. Full-line curves represent illumination on a horizontal plane 3 ft. 3 in. above the ground level; dotted curves, the illumination on a vertical plane; chain curves, the illumination on the ground. The elimination of the shadows under the lamps should be noted.

probably as good an example as will be found elsewhere of uniform street lighting with a high average intensity of illumination on the horizontal plane, and a reasonable absence of glare.

The minimum intensity of the illumination on a horizontal plane 3 ft. 3 in. above the ground is, with unimportant exceptions, 0.5 ft.-candle, and the ratio of maximum to minimum illumination in the centre of the road is 3.75. The ratio of the maximum to the minimum illumination on the horizontal plane may conveniently be referred to as the "variation factor."

When carefully analysed it will be noticed that the experts' reports very closely confirm the values of candle-power and illumination claimed by the Corporation Electricity Department as a result of the tests made by their own staff.

Mr. Abady refers to the meaning of "illumination" and the difficulties incidental to its measurement. Throughout this paper, illumination has been regarded as the equivalent of impressed light flux density multiplied by the cosine of the angle of incidence.

Apart from actual values, the proportionality of Mr. Abady's figures for the illumination of Portland Street and Princess Street is in fairly complete agreement both with the electricity department's and Mr. Harrison's results; and his values for the candle-powers of the Princess Street lamps provide important confirmation not only of the electricity department's tests, but also of the fact that the lamps were not giving anything like the candle-power claimed by the manufacturers.

This result is both interesting and important, for it has always been the experience of the authors that gas lamps give substantially lower candle-powers than the values claimed by the manufacturers. This is evident from the figures given in Table I.

TABLE I.

Description of lamp.	Year of test.	Rated candle-power.	Actual maximum c.p. (Average results.)
Keith 3-burner high-pressure gas ... ..	1912	4,500	2,300
Keith 2-burner high-pressure gas ... ..	1912	3,000	1,630
Keith, single-burner high-pressure gas ... ..	1912	1,500	725
Welsbach-Kern, twin-burner	1907	1,200	655
Suggs "Belgravia" ... ..	1907	1,800	1,025
Lucas "Thermopile" ... ..	1907	1,250	765
Intensified gas, Sackville Street ... ..	1904	1,000	525

In Appendix A is set forth the method of arriving at the cost of the current under the conditions that obtain in Portland Street.

The totals for "fixed" and "running" costs respectively are arrived at in the manner shown.

The resultant figures are £6133 per kilowatt of demand plus 0.292d. per unit metered. Applying these values as shown in Appendix B, the costs of the current for the 11 o'clock and for the all-night lamps respectively come to 0.97d. and 0.6d. per unit.

Appendix C contains a statement of all costs involved in lighting Portland Street.

Appendix D is a statement showing the cost per lamp per annum of lighting Princess Street, as given by Mr. Abady in his report.

The following particulars of the lighting in Princess Street and Portland Street are extracted from Mr. Hadyn Harrison's report. In order to make the figures strictly comparable, the Portland Street lamps are assumed to be all switched out at 11 p.m.

	Princess Street high-pressure gas.	Portland Street arcs.
Candle-power of lamps ...	1,750	2,970
Number of lamps to the mile ...	49.34	43.6
Running costs per lamp per hour ...	1.5d.	0.7d.
Capital cost per mile of street ...	£2,537	£1,569
Running cost per 1,000 C.P.-hours ...	0.857d.	0.236d.
Cost per annum per mile, equal illumination ...	£675	£254
Minimum illumination, basis of comparison ...	0.39 ft.-candle	0.5 ft.-candle
Cost per mile of street per annum (up to 11 o'clock) at above illumination ...	£617	£254

The high-pressure gas lighting in Mosley Street is a very poor display compared with the arc lighting. It is also a very poor display of high-pressure gas lighting. An illumination on the horizontal plane 5 ft. above the ground level equal to 0.5 ft.-candle is only obtained up to a distance of 22 ft. from the bases of the lamp-posts, and the minimum midway between the posts is only 0.07 ft.-candle, the "variation factor" being as high as 43.

St. Peter's Square is distinctly a better example of high-pressure gas lighting, and compares favourably with the flame arc lighting in Albert Square. The illumination on a horizontal plane 5 ft. above ground level is maintained at a sufficiently high value, and is equal to 0.5 ft.-candle in all parts where there is any great amount of traffic.

The 500-watt lamps in Albert Square are fitted with slightly opalescent globes, and are mounted on poles at a height of 22 ft. 8 in. above the ground. The illumination is fairly uniform.

The average horizontal illumination in Piccadilly is well over 1 ft.-candle, and in no part where there is any appreciable amount of traffic is it less than 0.5 ft.-candle. The roadway is lighted by means of 12 500 and four 550-watt lamps fitted with clear inner and outer globes, and fixed on the tramway standards at a height of about 27 ft. 6 in. above the ground. In addition, there are also 10 450-watt lamps on the esplanade. These lamps have opalescent bowl-shaped globes. They are suspended from swan-necked pole-brackets at a height of 18 ft. 6 in.

The reading tests and observations in Table II refer to clear weather; there is no question as to the superior penetrating power of the rays from the arc lamps in foggy weather.

TABLE II.

Sizes of type.	Maximum distance at which distinctly readable. High-pressure gas.	Flame arcs.
Large (Pica Doric) ...	339.0 ft.	371.5 ft.
Medium (Small Pica) ...	265.0 ft.	313.0 ft.
Small (Brevier) ...	212.5 ft.	242.0 ft.

All figures are the average of not less than six sets of observations taken on different nights.

A very considerable amount of testing and experimental work has been undertaken in order to discover, if possible, the most satisfactory type of outer and inner globe for use under the conditions obtaining in Portland Street, and to comply with the following requirements:—

Reasonably uniform illumination; absence of glare; moderate cost of globes; light distribution not affected by slight alteration

in the position of the arc; maximum candle-power approximately between the 20° and 25° rays below the horizontal.

The light distribution with the original globes was anything but satisfactory, and the glare was very objectionable.

The first attempt to overcome these defects was by the use of opalescent outer globes of the same shape as the clear globes. The result was a distinct diminution of the shadows under the lamps, and the complete disappearance of the concentric rings; but unfortunately the light distribution was very considerably reduced, and the dark gaps midway between the lamps were very noticeable.

Various types of dioptric and inner diffusing globes were then tried, but without appreciable success. This lack of success was no doubt due in a great measure to the position of the arc and the shape of the original outer globes. It was not until the type of outer globe now in use had been adopted that any headway was made with the various attempts to improve the light distribution (see fig. 3).

Fig. 6 shows the polar curve for the 11-ampere lamp fitted with the clear inner and outer globes. This curve possesses many excellent features, but can be modified with considerable advantage. For street-lighting work, the upper portion of the curve between 15° and 25° from the horizontal is of most importance,

FIG. 6.—Polar curve for 550-watt flame arc lamp as used in Portland Street. The dotted portion shows the effect of the original experimental obscuration. Tested with "old type" carbons.

but the portion between the 40° and 65° rays could be reduced with advantage. The absence of appreciable candle-power between 80° and 90° is a result of the rather pronounced shadows cast by the ash-trays.

The first attempt to reduce the distribution of light between the 40° and 65° rays, and at the same time to improve the distribution in the neighbourhood of 20° below the horizontal, was by the use of dioptric globes. The results were not entirely successful.

These tests seem to demonstrate very clearly a rather objectionable feature of dioptric globes, namely, the strongly defined optical centre, in consequence of which the light distribution is very considerably distorted if there is any appreciable change in the arc position.

It is very probable that the open lower end of the dioptric globe is largely responsible for the very marked dip in the polar curve.

Attempts were made to modify the shape of the polar curve by suitable obscuration of the outer globes, and it was owing to the success of the early attempts that further investigations were conducted upon these lines. The necessary obscuration was

TABLE III.

Description of lamp.	Where situated.	Height above ground level.	Maximum candle-power. Average results.	Illuminations on horizontal plane in foot-candles			Variation factor.	
				Maximum at centre of road.	Minimum at Centre of road.	Building-line.	Height of measuring place.	Centre of road. Maximum.
550-watt flame arcs, original globes. Outer globe opalescent	Portland Street	27 ft. 6 in.	2,250	3.14	0.370	0.280	5 ft.	8.50 11.20
550-watt flame arcs. New type inner and outer globes. Final graded frosting	Portland Street	27 ft. 6 in.	3,560	{ 2.50 2.00	{ 0.670 0.670	{ 0.500 0.500	3 ft. 3 in. Grnd level	3.75 5.00 3.00 4.00
550-watt flame arcs. Clear inner and outer globes	Piccadilly	25 ft. 6 in.	3,580	5.95	0.760	0.500	5 ft.	7.85 11.90
Keith 3-burner high-pressure gas	Princess Street	26 ft. 6 in.	2,300	2.23	0.575	0.400	3 ft. 3 in.	3.88 5.58
Keith single-burner, high-pressure gas	St. Peter's Square	17 ft.	725	* 2.45	0.180	0.120	5 ft.	13.6 20.4

\* These values are the maxima obtained approximately 5 ft. from the posts and not at centre of road.

at first obtained by the application of whitening on the inside of the lower portion of the outer globe.

Globes obscured in this manner have actually been in use in Portland Street for over six months, and no doubt the slight difference between the test results obtained by the Corporation's own staff and the independent experts are traceable to the variable nature of this obscuration, and also to changes in the type of carbons used.

FIG. 7.—Polar curve for 550-watt lamp with dioptric inner globe and clear outer globe with dense frosting up to 48° above horizontal.

FIG. 8.—Polar curve for 550-watt lamp with dioptric inner globe and clear outer globe with graded frosting tapering off to 40° above horizontal.

FIG. 9.—Polar curve for 550-watt lamp, fitted with clear inner and outer globes, as shown in fig. 3 (full lines), and having a graded frosting on the lower portion of the outer globe. The frosting is densest at the bottom of the globe, and disappears at an angle of about 40° below the horizontal.

FIG. 10.—Polar curves for Keith high-pressure gas lamps. (a) Single-burner; (b) twin-burner; (c) three-burner.

Attempts were then made to obtain from the globe makers suitable obscured globes, but the greatest difficulty was experienced in obtaining exactly what was required. No manufacturer would undertake to give a graded effect, at any rate on a diffracting globe, although a flashed opalescent globe with a graded effect on the lower portion was eventually obtained.

The experimental etching of globes was therefore undertaken. The globes were clamped on to a special lead stand and filled to the desired height with the etching acid. The grading effect was then obtained by allowing the acid to run out of the globe through an adjustable orifice in the lead stand, and any desired degree of frosting could be obtained by regulating the rate of flow.

Figs. 7 and 8 show polar curves obtained with different combinations of globes, and it is obvious that they are very suitable for giving a fairly uniform illumination on a horizontal plane.

(To be concluded.)

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**NORTHERN RHODESIA.**—The Board of Trade has issued a copy of a new Customs tariff of Northern Rhodesia. The new tariff divides the country into two zones: the Zambesi basin and the Congo basin, and deals with these zones separately. The "general" rates of duty in the Zambesi are practically identical with those in the South African Customs Union, but the preferential rates of duty leviable on British goods are in some cases lower. In the case of the Congo basin no provision is made for the preferential treatment of British goods. In any case electrical plant and machinery, and tramway material, are duty free.

The certificates of origin necessary in order to obtain entrance for British goods under the lower preferential rates are the same as those already in force for the South African Customs Union.

The new tariff has effect from February 1st last.

**SIAM.**—The Board of Trade Journal reports that the Director-General of Customs and Excise at Bangkok has issued a notice laying down regulations with regard to the entry of goods for importation and exportation; the regulations were to come into force on Tuesday last, and are as follows:—

1. The entries must be made in the form prescribed by the Department.

2. The goods must be denominated in strict accordance with the classification shown in the official Import and Export List.

3. Particulars of quantity and value must be furnished for each separate kind or class of goods, and quantities must be given in the terms of the Import and Export List.

4. The country from which the goods are consigned, in the case of imports, and the country to which they are consigned, in the case of exports, must be declared for each separate kind or class.

The Department, it is stated, will not accept entries which are not in accordance with these regulations, which have been framed with a view to providing more complete and accurate statistical information; and it is the intention of the Siamese Government to enforce them at all the ports of Siam.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

6,513. "Electrical device to enable several spindles to be driven synchronously as required in cinema and gramophone shows, and in like cases." W. J. SWAIN. March 17th.

6,544. "Apparatus for regulating the ignition of internal-combustion engines." SIR A. W. RUTSENBAERS. (Convention date, March 18th, 1912, Germany.) March 17th. (Complete.)

6,551. "Sockets and terminals for electric leads." A. G. BLOXAM (firm of) R. Bosch, Germany. March 17th. (Complete.)

6,581. "Electric incandescent lampholders." S. W. MARTIN. March 17th.

6,602. "Electric lamps." W. E. BLADON. March 17th.

6,603. "Device for the improved stopping of pulley automatic electric lifts." J. W. SODEN. March 17th.

6,647. "Manufacture of insulated windings or coils for electrical purposes." SIEMENS BROS. DYNAMO WORKS, LTD. (Siemens Schuckertwerke G.m.b.H., Germany.) March 18th. (Complete.)

6,648. "Commutators for dynamo-electric machinery." SIEMENS BROS. DYNAMO WORKS, LTD. (Siemens Schuckertwerke G.m.b.H., Germany.) March 18th. (Complete.)

6,664. "Circuit arrangement for semi-automatic telephone systems." SIEMENS & HALSKE AKT.-GES. (Convention date, March 19th, 1912, Germany.) March 18th. (Complete.)

6,668. "Process and apparatus for the electrical treatment of cellulose and other substances of which it forms the essential part." A. L. C. NODON. (Convention date, March 26th, 1912, France.) March 18th. (Complete.)

6,675. "Portable electric battery lamps." A. MENZEL and B. POEDERS, trading as United Electrical Manufacturers Co. March 18th. (Complete.)

6,700. "Electric safety lamps." P. WOLF. March 18th. (Complete.)

6,730. "Switches and other electrical apparatus where circuit is made and broken." F. DURET. March 19th.

6,738. "Electric lamps." F. WESTWOOD. March 19th.

6,739. "Safety-wired conduit for electrical installation in mines and all electrical purposes." L. J. RODRICK. March 19th.

6,757. "Combined wall plugs and switches." B. P. K. WALSH. March 19th.

6,764. "Electric lamps." H. ROKKAER. March 19th.

6,767. "Transmitting apparatus for electric switches." WESTERN ELECTRIC CO. LTD. (Western Electric Co., United States.) (Divided application on 25,382 of 1912, November 5th, 1912.) March 19th. (Complete.)

6,768. "Paper-lift mechanism." WESTERN ELECTRIC CO. LTD. (Western Electric Co., United States.) (Divided application on 25,382 of 1912, November 5th, 1912.) March 19th. (Complete.)

6,772. "Distance-operated mechanisms and signals on electric supply systems." H. W. HANDCOCK, A. H. DIXON and W. DUBBELL. (Addition to 6,716 of 1912.) March 19th. (Complete.)

6,775. "Electric incandescent lampholders." S. W. MARTIN. March 19th.

6,799. "Electric transformer arrangements." BRITISH ELECTRIC TRANSFORMER CO., LTD., and R. CROSSIE-HILL. March 19th.

6,800. "Electric clocks." COVENTRY ELECTRIC CLOCK CO., LTD., and T. RUSHTON. (Addition to 14,616 of 1911.) March 19th.

6,806. "Electrical regenerative motor control systems." CROMPTON & CO., LTD., and H. BURROK. March 19th. (Complete.)

6,807. "Electrical distribution systems." BRITISH THOMSON-HOUSTON CO., LTD., and E. B. WEDMORE. (Divided application on 25,382 of 1912, November 5th, 1912.) March 19th. (Complete.)

6,817. "Electric cables." A. T. MIRZA. March 19th.

- 6,834. "Reversible double electric fuse." W. PATTERSON. March 20th.  
 6,873. "Electrical switches." BRITISH L.M. ERICSON MANUFACTURING CO., LTD., and A. G. ROGERS. March 30th. (Complete.)  
 6,875. "Incandescent electric lamps." G. E. GODIN and A. A. GODIN. March 30th.  
 6,880. "Fuses for electric circuits." SIEMENS-SCHUCKERTWERKE G.m.b.H. (Convention date, March 21st, 1912, Germany.) March 20th. (Complete.)  
 6,891. "Synchronous dynamo-electric machines." E. ROSENBERG. March 30th.  
 6,897. "Process and apparatus for the production of copper by electrolysis." M. P. LLOYD. (Convention date, March 22nd, 1912, France.) March 20th. (Complete.)  
 6,900. "Means for protecting direct-current working electrical instruments from being operated by extraneous or unauthorised currents which may reach the line to the instruments by accident or design and a relay for the same and like purposes." R. DORMER. March 20th.  
 6,901. "Electric candle fittings." F. HODGSON. March 20th.  
 6,902. "Microphones especially applicable to wireless telephony." G. E. HEYL, E. SANKER-SHEPHERD and T. T. BAKER. March 20th.  
 6,911. "Process for manufacturing articles or objects of tungsten." O. VOIGTLANDER. (Convention date, March 23rd, 1912, Germany.) March 20th. (Complete.)  
 6,933. "Dynamo-electric machines." BRITISH THOMSON-HOUSTON CO., LTD., F. R. CLOVER and L. DUNKER. March 20th.  
 6,934. "Electric clock control." ALLGEMEINE-ELECTRICITÄTS-GES. (Convention date, March 22nd, 1912, Germany.) March 20th. (Complete.)  
 6,936. "Circuit arrangements for registering subscribers' calls in semi-automatic telephone installations." SIEMENS & HALSKE A.E.T.-GES. (Convention date, March 21st, 1912, Germany.) March 20th. (Complete.)  
 6,950. "Electric dry batteries." S. STERN. (C. Hubert, United States.) March 20th.  
 6,952. "Electric furnaces for treating metallic filaments." G. LUDRICKS and BRIDGMAN LAMP WORKS, LTD. March 20th. (Complete.)  
 6,964. "Electric arc lighting." S. L. PEARCE and A. WILKINSON. March 22nd.  
 6,965. "Arc lamp globes." S. L. PEARCE and A. WILKINSON. March 22nd.  
 6,968. "Sealing means for boxes containing electric point controllers, switches, and the like." S. T. QUILLIAM. March 22nd.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of MESSRS. W. P. THOMPSON & CO., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

### 1911.

STARTING AND SPEED CONTROL GEAR FOR USE WITH ELECTRIC MOTORS. G. W. MARCOLD. 26,964. November 30th.

### 1912.

- ELECTRICALLY-OPERATED TRIPHEBS AND TRACKS THEREFOR. Strachan and Strachan & Henshaw, Ltd. 150. January 2nd. (Cognate application, No. 15,831 of 1912.)  
 AUTOMATIC AND SEMI-AUTOMATIC TELEPHONE CIRCUITS. Siemens Bros. & Co. (Siemens & Halske Akt.-Ges.) 2,320. January 29th.  
 ELECTRICAL CONDENSERS. British Insulated and Helsby Cables, Ltd., and E. A. Bayles. 2,701. February 2nd.  
 PORTABLE ELECTRIC BATTERY LAMPS. H. F. JOEL. 5,170. March 1st.  
 THERMOSTATS. H. H. GRUNDY. 5,311. March 2nd.  
 METAL VAPOUR ALTERNATING-CURRENT RECTIFIERS AND SIMILAR APPARATUS. HARTMANN & BRAUN Akt.-Ges. 5,345. March 2nd. (March 2nd, 1911.)  
 METAL VAPOUR ALTERNATING-CURRENT RECTIFIERS AND SIMILAR APPARATUS. HARTMANN & BRAUN Akt.-Ges. 5,415. March 4th. (March 2nd, 1911.)  
 SUPPORTS FOR LAMPS. E. I. PARKES. 5,587. March 5th.  
 ELECTRICAL SIGNALLING APPARATUS. L. M. POTTS. 6,050. March 11th. (November 18th, 1911.)  
 HOLDERS FOR ELECTRIC LAMPS, ELECTRIC SWITCHES, CEILING ROSES, PLUGS AND THE LIKE. A. R. MULLER. 6,395. March 14th.  
 ELECTROSTATIC SEPARATING DEVICES FOR SORTING HETEROGENEOUS MATERIALS, MORE ESPECIALLY MINERALS, METALLIC AND OTHERS, SULPHUR, PHOSPHATES OF LIME AND LIKE MATERIALS. A. M. F. BLANCHARD. 6,772. March 19th.  
 PROCESS FOR THE MANUFACTURE OF INCANDESCENT ELECTRIC LAMP FILAMENTS. R. JAHODA and Elektrische Glühlampen-Fabrik "Watt" Schaid Loti and Latzko. 7,977. April 2nd. (September 30th, 1911.)  
 TELEPHONES. C. F. KILLAR and J. C. GROVE. 9,714. April 21st.  
 OSCILLATION-GAPS OR DISCHARGES FOR USE IN RADIO-TELEGRAPHY RADIO-TELEPHONE AND LIKE PURPOSES. W. TORIKATA, E. YOKOYAMA and M. KITAMURA. 10,823. May 7th.  
 TELEGRAPH SYSTEMS. E. POPE. 11,604. May 15th.  
 APPARATUS FOR THE ELECTROLYSIS OF ALKALI CHLORIDES. J. V. JOHNSON. (Badische Anilin und Soda Fabrik.) 16,773. July 18th.  
 INSTRUMENTS FOR MEASURING OR CONTROLLING THE FREQUENCY OR WAVE LENGTH OF ALTERNATING CURRENTS, OR FOR INDICATING SPEED. G. SEIBT. 16,874. July 19th.  
 ELECTRICAL GENERATING SET. J. A. REY. 19,025. August 3rd.  
 METAL VAPOUR ALTERNATING-CURRENT RECTIFIERS AND SIMILAR APPARATUS. HARTMANN & BRAUN Akt.-Ges. 18,693. August 19th. (June 5th, 1911. Divided application No. 6,414 of 1912, March 4th.)  
 TELEPHONE SYSTEM. J. BAUMANN. 18,677. August 14th. (August 14th, 1911.)  
 CHEMICAL GENERATORS OF ELECTRICITY. O. SOZZI. 20,101. September 3rd.  
 TELEPHONIC TRANSMITTING APPLIANCE. J. K. RHODES. 20,196. September 4th. (April 6th, 1912.)  
 BRUSH-HOLDERS FOR DYNAMO-ELECTRIC MACHINES. A. E. BERDON. 20,224. September 25th.  
 METHOD OF MANUFACTURING ELECTRIC INCANDESCENT LAMP FILAMENTS. E. M. BAILEY and H. F. McDOWELL. 20,621. September 10th.  
 MOVABLE SLEEVE DEVICES TO FACILITATE THE INSPECTION OF WIRES IN ELECTRIC CABLES. J. A. WILLIAMS. 21,215. (8 pendency 18th.)

- ELECTRICAL INDICATING OR ALARM APPARATUS. E. E. WEIKEL and D. WEIKEL. 21,989. September 26th.  
 ELECTRIC COOKING APPARATUS. Downe and Brompton and Kensington Accessories Co. 25,185.  
 SUPPORTS FOR METALLIC FILAMENTS OF ELECTRIC INCANDESCENT LAMPS. H. A. GILL. (Volframlampen Akt.-Ges.) 26,249. November 15th.  
 ELECTRICAL SWITCHES. A. WYNN. 26,517. November 19th. (Divided application No. 13,145 of 1912, June 5th.)  
 TELEGRAPHERS' KEY CUSHION. H. A. KELLY. 27,079. November 26th.

### 1913.

- TRIMMING INDICATOR FOR ARC LAMPS. Korting & Mathieson Akt.-Ges. 253. January 4th. (July 29th, 1912.)  
 RECEIVER FOR SUBMARINE SIGNALLING. Signal Ges. 2,155. January 27th. (December 18th, 1912.)

**The Progress of the Allmänna Elektriska A.B., Sweden.**—The report of this company for 1912 contains, according to the *Allfärskriften*, the following interesting statements about the larger orders which have been executed during the year. The sixth generator for the Trollhättan power station has been delivered, and Nos. 7 and 8 have been taken in hand. With the installation of these machines the first part of the scheme will be completed. For the Bullerforsen power station, three generators of 4,100 kW. each are under construction, and two of 2,600 kW. each for the Uddeholms power station. The company has also had large orders from abroad, and has now completed the construction of the Electrical Works of Copenhagen, for which have been further delivered three cascade transformers of 1,000 kW. each. For the transformer station of the Union Electrica Madrilenä, at Madrid, have been delivered generators with an aggregate capacity of 20,000 kW., and electrical plant to the power stations at Linares and La Cruz, in Spain, besides a generator of 4,000 kW. to Nokia, in Finland, while some larger installation orders have been executed in various places in Russia. From Norway the company has received several good orders, among which may be mentioned a generator of 20,000 kW., ordered by the Arendals Fossekompani, for their new electrical iron and steel works. Canada has also been a good customer of the company for larger machines, orders having been received for five electric motors of 2,000 H.P. each, from the Ontario Paper Co.; from Eddy & Co., for three generators of 3,750 kW. each; and from the Calgary Power Co., for two generators of 4,250 kW. each. The company has, during the year, completed the construction of the electrical plant at Ljungfors, consisting of an electrical power station and a smelting furnace transformer plant. These works have been done for the Stockholm Superphosphate Manufactory, and both plants have been designed for about 17,000 kW. each.

Another large order for transformers with a total capacity of 30,000 kW. has been placed by the Alby United Carbide Factories, at Odda, in Norway, and from Arendal the company has got an order for a smelting works plant of 3,000 kW. The company has previously delivered the electrical machinery for the nitrate manufactory at Svågfors, in Norway, and has in 1912 supplied generator No. 5 of 10,000 H.P. for their power station. The work in connection with the electrification of the railway from Kiruna, in the north of Sweden, to the Norwegian frontier, has made good progress, and the time for its completion is approaching. The same may be said about the electrification of the railway, Stockholm-Saltsjöbaden, which soon is going to be opened for general traffic. The company has during the year made experiments with Diesel-electric carriages, which have given very satisfactory results and are very promising for the future.

A number of 40 tramway carriages have been delivered to the towns of Helsingfors, in Finland, Viborg and Gothenburg. Fifteen electrical winches for the Diesel engine ship *Selandia*, which was built in the shipbuilding yard of Barmeister and Wain, of Copenhagen, were supplied by the Allmänna A.B. The results of the working of same during the first voyage of the ship, and afterwards, have been so satisfactory that the company has now received orders for nearly 100 winches more. Among other things delivered from the company's workshops may be mentioned a large number of hoisting apparatus, chiefly for Russia. The manufacture of electric heating apparatus has increased to such a degree that it has become necessary to establish a separate department for this class of goods.

**The Frankfort Dynamo Works.**—When the Frankfort Dynamo Works were acquired from the Lahmeyer Co. two years ago apprehensions were entertained by a portion of the staff that the A.E.G. would close the works and transfer manufacturing to Berlin. Although these fears proved to be unfounded a similar idea has now been revived at the works, where several thousands of workers are employed. The A.E.G., however, states that the intention to shut down the works does not exist, although a small portion of the business—the construction of large machines—is to be removed to Berlin. The building of large machines has only been continued at Frankfort until the extension of the Berlin machine works, commenced four years ago, was completed, which is now the case. For the rest all the other departments at Frankfort are being constantly extended, and the development would proceed more rapidly if a larger number of skilled workmen was locally available.

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

TRADE activity invariably brings in its train discontent in labour circles. No sooner does a manufacturing concern show a large credit balance than its employes are up in arms for better pecuniary recognition of their individual services. In illustration of this, take the recent strikes of coal miners, railwaymen, dockers, carters, restaurant waiters, and the less important strikes of electric wiremen in Bradford, Glasgow, &c. With the price of raw materials increased by 20 to 30 per cent., and manufacturers' costs proportionately augmented, freights have become high, giving a corresponding rise to the price of foodstuffs. Rents and taxes, also, have gone up considerably all over the country. It is, therefore, not surprising that skilled artisans, and, for that matter, foremen and superintendents, should expect their wages to be increased in such proportion as will allow them to live at least as comfortably as they have hitherto been able to do.

In another column of this issue we print an article dealing with the standard of salaries and wages paid to officials in municipal undertakings in this country, illustrated with curves indicating how their emoluments vary with the responsibilities appertaining to their positions. From a consideration of the data given in the article, it would appear that the average municipal electrical engineer's responsibilities are not adequately recognised. Too often is a cheese-paring policy adopted by Electricity Committees in fixing the salaries of the electrical staff, on the ground that they are thereby tending to reduce the assessments levied on the ratepayers of the Borough. In many municipalities, the Committee appoints an engineer to control the whole undertaking, with full powers to deal with all the members of the staff; in others, all the primary assistants hold their appointments directly from the Committee. With the former arrangement, each employe's hopes for future advancement in this world are centred in one individual—his chief. Under the latter arrangement a competent assistant, who has inadvertently given his chief cause for annoyance, may have some consolation in knowing that, although he must submit to the ruling of his chief in matters affecting his work, he is not entirely at the mercy of his superior in office. Much can be said for both methods of management.

The Stoke-on-Trent Council evidently holds the belief that it, as a body, is best able to decide what increase of wages, if any, should be granted the employes of its electrical undertaking. In the minutes of a Council meeting held on March 28th, when consideration was given to salaries and appointments in a number of the Council's departments, it is reported that "the new general policy of the Corporation is to arrange, or re-arrange, appointments and salaries within a fixed maximum, with a view to combined efficiency and economy."

Reading further, we find that the Electricity Committee, in adopting the sub-Committee's recommendations with regard to applications for increase in wages, has perfunctorily shelved the question for another 12 months, in so far as it concerns resident engineers, charge engineers, and switchboard attendants. The inconsistency of this decision, having in view the general policy of the Corporation, certainly savours of economy, but as regards efficiency, we hold a different opinion. Greater consideration, however, has been meted out to the mains superintendents in the three districts under the Council's jurisdiction. The salaries of these gentlemen, which at present range from £130 to £145, have to be increased by £5 per annum in each case. Advances of 1s. to 2s. per week have also been granted to the three shift engineers in the Burslem works, thus raising, in that station, the average wage of this class of employe from 35s. to 36s. 6d. per week.

The case of Stoke-on-Trent is by no means an isolated one. As a matter of fact, the same conditions will be found to exist in almost every city and town in the kingdom, and it is no wonder that great numbers of our young electrical engineers, on the completion of their apprenticeship or pupilage, and after spending a year or two as shift engineers or attendants in a power station, accept minor but more lucrative situations abroad, and leave the power stations of the home country in the hands of juniors and marine engineers grown tired of sea-going. Many instances could be cited where the chief engineer has pleaded with his committee to raise the standard of wages in his department, but without success. On the other hand, we understand that there are municipal chiefs who not only make no attempt to raise the standing of their subordinates, but even frustrate any efforts put forward with this intention by the assistants.

The tabulation of central station costs has become quite a fine art with municipal engineers, some of whom would almost risk their professional reputation to reduce their working charges by one-tenth of a penny per unit sold. After much scrutiny of the manner of burning coal at the station, and the possibility of cutting down the coal bill, and an inquiry into the superintendent's methods of tackling repairs, the chief finally arrives at the conclusion that something will have to be lopped off the wages item. We have a case in mind where an engineer, on taking over the management of a municipal undertaking in the North, had the existing members of the staff replaced by others at approximately two-thirds the salaries previously in vogue in the town. His brother engineers waited with considerable interest for the result of his first year's working with the new staff, which showed that although the wages costs per unit had dropped by 30 per cent., the increased costs per unit on coal and repairs items caused the total working charges per unit to jump up to an alarming figure. The reason for this was undoubtedly bad staffing, as the prices of coal and metals had not altered to any appreciable extent during the two years when the comparison was made.

A chief's time is taken up principally with the commercial side of the undertaking, while he exercises supervision over his departmental superintendents. He is therefore in large measure dependent on the ability of his engineers for the smooth and economical running of the plant, and a discontented shift engineer or superintendent can be the cause of greater losses to the undertaking than one might at first sight imagine.

We are in perfect agreement with the statements made by Mr. C. E. C. Shawfield at the farewell meeting with his staff at Wolverhampton on the 30th ult. In reply to several remarks regarding the application of profits towards the improvement of salaries and wages, he said that it was to be regretted that any money had been paid over to the relief of

the rates, as he thought it was not in the best interest of department, or the town as a whole, that the profits of a trading undertaking should be used for this purpose. The first call on the profits should be to improve the status of employment, as the success or otherwise of the undertaking depended to a very large extent on the efforts of those employed therein. The chief, however—added Mr. Shawfield—had not a free hand in the matter of salaries and wages, but had to carry out the instructions of his employers—the municipality.

Fortunately the impropriety of robbing the electricity undertaking for the sake of relieving rates, upon which we have so often and so long insisted, is becoming more and more widely recognised, and amendment in this respect will, we hope, be accompanied by justice to the *personnel*.

#### An Agreement between Electrical Undertakers.

WE publish elsewhere in this issue a report of the case of the London Electric Supply Corporation *v.* Westminster Electric Supply Corporation, which was decided last week by the House of Lords. For

the convenience of those who have not time or inclination to study the whole case, we propose to give a summary of the decision, which appears to establish a very important principle in relation to that particular kind of transaction. We trust that no apology is necessary for repeating in a shortened form that which has been enunciated at greater length in the stately language of the House of Lords. To extract the kernel from a legal nut is not always easy. An old lawyer once told us that even with his experience he never understood a case until he had read it through three times. Let the following be regarded as the product of a frequent perusal of this important decision: The London Electric Supply Corporation and the Westminster Electric Supply Corporation, Ltd., are each authorised to supply electricity in parts of the Borough of Westminster, the "London" supplying alternating, and the "Westminster" continuous current. The Westminster Borough Council is entitled at a certain time to exercise the right to purchase the undertakings of both companies—the right in regard to the London falling to be exercised in 1931. In 1910, the London transferred to the Westminster the right to exercise their powers subject to the annual payment of £22,000, and to the right of the London to retain the purchase money at the date of compulsory sale, the Westminster agreeing to make up that sum to £100,000, if less were awarded.

It will be seen that, having regard to this agreement, the continued supply of alternating current was of importance to the London Co. In these circumstances they found it necessary, in 1911, to seek an injunction to restrain the Westminster Co. from soliciting customers who took alternating current to take continuous current. They also sought a declaration that, having regard to the agreement, the defendant company were bound to supply alternating current to any person in Westminster who might apply to the plaintiff company for such a supply. To put the matter in a nutshell, it appears that the Westminster Co. claimed, in effect, the right to act as if they were purchasers of the London Co.'s undertaking. In other words, they claimed the right, if so minded, to supply continuous current to all consumers, and to do that which would ultimately have destroyed the goodwill of the London Co. in the area. The judge of first instance and the Court of Appeal both refused to grant an injunction or to make any declaration; but the House of Lords has reversed this decision. The Lord Chancellor, in giving judgment, pointed out that the sale of an electrical undertaking was prohibited; that he could not treat the agreement as an arrangement under which the respondents had purchased for fixed sums the appellants' undertaking in the area, with freedom to do what they pleased with it. Finally, he declared that the Westminster Co. were bound, without prejudice to their right to carry on and develop their own undertaking in a fashion consistent

with their obligations under the agreement, to do nothing while the agreement lasted which would destroy the appellant's undertaking within the area. In the event, the House of Lords made a declaration to the above effect, holding that it was unnecessary to grant an injunction, as it was certain that the Westminster Co. would loyally act in accordance with the law as thus declared.

The principle to be drawn from the case may be thus briefly stated: Where undertakers, having power to supply electricity in a district, transfer their rights to rival undertakers supplying electricity, on the terms of a money payment, and on the terms that when compulsory purchase takes place, the purchase price shall be paid to the first company, the second company must not attempt to do anything which will destroy the goodwill of the first company.

We have been at pains to expound this decision as clearly as possible, inasmuch as the arrangement come to between these two companies is one which may at some future period be considered desirable in other districts.

Two important exhibitions are being organised for the autumn of 1913.

#### Exhibitions at Glasgow and Sheffield.

One will be exclusively electrical—at Glasgow, and the other largely so—at

Sheffield. They will run concurrently, though the former will open a day earlier than the latter, that is, on Thursday, October 23rd, and both will close after three weeks' duration, on Saturday, November 15th.

The literature that has just been officially issued regarding both undertakings suggests that they will be business-like displays calculated to popularise the lighting and industrial applications of electricity if appropriate action be taken.

Glasgow has already had a couple of Smoke Abatement Exhibitions, but these are admitted to have applied to only one or two sides of the electrical industry, and the Corporation now feels that the time is ripe for holding in the Zoo Buildings a purely electrical exhibition (incorporating engineering and machinery), at which it is intended to include examples of all branches of electrical engineering, making a show which will "be at once worthy of the Second City of the Empire and of one of the youngest and greatest industries." It will be under the auspices of the Lord Provost and the Electricity Committee, with Mr. W. W. Laekie, of course, as electrical engineer. A feature of convenience from an exhibitor's point of view is the decision to have stands of uniform design erected by the Corporation, the cost being included with the charge for floor space; current will be provided free. It is intended to take advantage of the educational value of the cinematograph by displaying films of the latest uses of electricity, which manufacturers are invited to provide, in a hall which will be specially built for the purpose. There will also be lectures as well as special daily demonstrations of electric cooking, baking, bread-making, sick-room cooking, fancy bread making, and sweet making. It is considered by the authorities that the time is opportune for making, before the people of Glasgow and district, a powerful demonstration of the progress that has been made in telephony, lighting, power, heating and cooking, and as we have always thoroughly believed in properly organised exhibitions as a means of stimulating electrical interest, and have urged electricity supply authorities to adopt up-to-date business-getting methods, we wish every success to the Glasgow Corporation venture, and refer our readers to Mr. J. M. Freer, of 38, Bath Street, Glasgow, who has been appointed general manager.

In regard to the Sheffield undertaking, this is a Fuel, Light and Power Exhibition, which will be held in the City Exhibition Hall, under the auspices of local Health and Smoke Abatement Societies, and with the patronage of the Lord Mayor, the Master Cutler, and the president of the Sheffield Chamber of Commerce. The Advisory Committee includes Mr. S. E. Fedden, the manager of the Corporation electricity department; Mr. T. Scott Anderson, and Prof. W. Ripper, of the University. From the electrical point of view, the event may not at first appear to be so important as the Glasgow display, and electrical ardour may be

damped somewhat by reading in the preliminary prospectus, that the Hall "is well lit with high-pressure gas," but while at Glasgow electricity will have no would-be rival in the Zoo buildings, at Sheffield it may be put upon its mettle. For instance, in the "Fuel" Section, "Electricity for Cooking" follows "Gas Stoves and Ranges for Cooking," and in the "Light" Section, "Electricity for Lighting and Heating" is sandwiched between certain gas and acetylene lines. By way of compensation, in the Power Section, electric motors and electric generating plants are allowed to lead, gas, oil and steam engines following. To some of our readers it may appear that this mixing up of different classes of lighting and power agents in one exhibition render it all the more important that electricity should make a strong showing.

Of course, the Sheffield management's idea is to lessen the smoke nuisance of that great industrial centre, and there is room for means many and varied, electrical and non-electrical, to obtain that very desirable result. No doubt the Sheffield Corporation Electricity Department will make an effective display of its own, and we trust that the exhibition will bring on many new consumers of all classes. Electrical firms who are interested should communicate with the hon. secretary, Mr. Wm. Bashford, at the Exhibition offices, 45, Bank Street, Sheffield.

#### Electrical Benevolence.

WE make no apology for again reminding our readers that the annual Festival Dinner of the Electrical Trades Benevolent Institution will be held on Wednesday next, and urging them to lose no time in conferring effective support upon a movement which, above all others, merits their approval. The spirit of co-operation is in the air; it makes its influence felt throughout the world, from the highest to the lowest. European Powers, Oversea Dominions, Cabinet Ministers, British manufacturers, suffragettes, central station assistants—all feel the need of combining for mutual assistance and support in furthering their various aims, and the electrical industries ought to regard it as a sacred duty to their weaker members to co-operate in making provision for the relief of their necessities. As Mr. Garcke pointed out last week, the industry is not doing anything like as much as it ought to do towards this end: whereas there is a capital of 500 millions sterling invested in electrical concerns, employing nearly half a million souls, there is no more than a beggarly £4,000 in the coffers of the Benevolent Institution, the interest on which is quite inadequate to cope even with emergency grants, let alone the granting of pensions. If only the 6,000 firms engaged in the business would contribute on the average the trifling sum of one guinea each per annum, the Benevolent Institution would at once be put into a position of prosperity: surely it is not much to ask?

We do not, and cannot, believe that the will is wanting; the fact is, we think, that the interest of the vast majority of these firms has never been effectively aroused, although every effort has been made by the organisers and the Press to direct their attention to the Institution and to the benefits which it desires to confer upon the victims of unforeseen calamity and misfortune—benefits which cannot be secured in any other way. If the employes themselves would contribute the sum of one penny each per annum, the Institution would double its present capital every two years. How insignificant a contribution—and yet what magnificent results it would ensure! If only one good voluntary organiser could be obtained in every important centre to arrange for the collection of this trifle, a new era would dawn for the Benevolent Institution.

But this by the way. The immediate question is—the dinner. The chairman, Mr. George Sutton, has done splendid work for the cause—let it not be said that he lacked the support of his friends, each and everyone of whom, whether he realises it or not, is saddled with a real and personal responsibility in this matter towards his less fortunate neighbour.

## SALARIES IN MUNICIPAL UNDERTAKINGS.

[COMMUNICATED.]

IN the ELECTRICAL REVIEW of February 28th, 1913, a comparison was given of the wages paid to shift engineers and switchboard attendants in numerous central stations throughout the country.

A study of the salaries paid to chief electrical engineers and their principal assistants, and the relationships which exist between their total emoluments and the capacity, output and value of the undertaking, will elicit many facts and figures of personal interest, not only to those who at

the application sometimes depends, in a greater or less degree, on the relationship, harmonious or discordant, which exists between the engineer and his committee or its chairman.

Many chiefs of departments are allowed to practise at private consulting work, while others are granted the privilege of engaging premium pupils and retaining the premiums for themselves. There are managers, too, who, even in the face of greatly increased responsibility through the growth in the size of the undertaking, steadily oppose, as unnecessary and superfluous, all suggestions of the appointment of a chief assistant, so that thereby their own positions may be strengthened. It should be recognised that where the capital value of an undertaking exceeds £100,000, an assistant manager and engineer should be appointed, to take entire charge and have absolute responsibility for the working of the plant in the absence of the chief.

With the object of tracing the connection between the capacity, &c., of a municipal station and the salaries paid to officials in charge, the accompanying information relating to 39 undertakings has been extracted from the latest returns in the ELECTRICAL REVIEW Tables, and the "Personal" and "Situations Vacant" columns of the same journal during the last few months.

Table I contains particulars regarding chief engineers' salaries in the 39 towns, expressed in pounds per annum for each 100-kw. capacity, mains connections and maximum demand respectively, and also per £1,000 of capital, £1,000 of revenue and 1,000 of population in the area of supply.

TABLE I.—SALARY OF CHIEF ENGINEER.

Municipal undertakings. Plant capacity. No.	Per 100 kw. of plant.	Per 100 kw. connected to mains.	Per 100 kw. of max. load.	Per 100,000 units sold per annum.	Per £1,000 of capital.	Per £1,000 of revenue.	Per 1,000 of population.

present hold those appointments, but also to the charge engineers, switchboard attendants and other employees who hope to fill the higher positions on the staff in years to come.

On what bases are the salaries of chiefs and assistants fixed? Very often the settlement of the chief's salary is limited to a consideration of purely local conditions, and no external influence is allowed to enter the question. In many cases, however, when an increase of salary has been requested, the chief himself inaugurates a crusade for the purpose of ascertaining the salaries paid to his *confrères* in other towns of approximately similar size, or having an output comparable with that of the undertaking which he controls. Having obtained the desired particulars, he carefully weeds out information that should be withheld from his committee, and the remaining data are embodied in a report showing how small his salary looks in comparison with the salaries of chief engineers in other undertakings, and how important his department is when compared to the electrical departments in other towns with approximately the same population. The matter will then be decided by a committee of gentlemen who probably have no electrical knowledge, and who are not aware of the responsibilities which rest upon their electrical engineer. The ultimate fate of

	(28) —	1'2	2'6	2'5
5,000—10,000 KW.	(29) '26	0'8	3'8	2'2
	(30) —	1'9	4'5	2'7
	(31) '44	—	3'8	2'4
	(32) —	1'5	3'5	2'1
	(33) '52	1'4	2'6	1'9
	(34) '50	0'9	2'4	2'7
	(35) —	1'0	2'6	—
10,000—40,000 KW.	(36) '47	0'9	1'1	1'7
	(37) '28	0'7	1'5	1'7
	(38) —	—	—	—
	(39) '60	0'6	1'4	0'8

The minimum, average and maximum values of the above figures are as follows :—

Salary of chief engineer :—	Minimum.	Average.	Maximum.
Per 100 kw. of plant ...	£2'5	£13'1	£31
Per 100 kw. of connections ...	1'6	7'2	21
Per 100 kw. of maximum load ...	4'0	21'5	57
Per 100,000 units sold ...	2'3	13'6	58
Per £1,000 of capital ...	0'4	2'2	7
Per £1,000 of revenue ...	3'7	16'1	40
Per 1,000 population ...	1'2	4'9	12

In figs. 3 and 4 the curves show the average total salaries of chief engineers in comparison with the power plant in the

tricity Committee, but the assistants have not the same opportunity of improving their positions on the staff as they would have if they were responsible to the Committee instead of to their chief.

It is quite common to hear of a chief engineer absolutely forbidding his assistants to engage in private consulting work in their leisure hours, while he himself openly accepts fees for specifications which may not improbably have been drawn up by one of his assistants.

As the chief assistant is of next importance to the chief, he should have a salary worthy of the responsibility he has accepted. In the third column of Table II the ratio of the chief assistant's to the chief's salary is given for as many of the 39 undertakings as have a chief assistant. A glance at the tabulated figures will show that out of the 39 stations, 13 have no assistant, while in six of them, the chief assistant also acts as mains engineer. In some of the columns blanks have been left where the information is not available. It will be observed that a common rule evidently adopted in fixing the assistant engineer's salary is to make it one-half of the chief's salary. Out of the chosen 39 towns, in as many as seven, the chief has a salary exactly double the amount of his under-study's.

The topmost curve in fig. 5 delineates the diversity of the ratios between the assistant's salaries and the chief's, while the other three lines represent the variations for the various undertakings of salary of mains engineer per 100 kw. of mains connections, salary of chief clerk per £1,000 of revenue, and salary of station superintendent per 100 kw. of plant installed.

The minimum, average and maximum values for these items are :—

	Minimum.	Average.	Maximum.
Ratio of chief assistant's to chief engineer's salary ...	26	44	60
Mains engineer's salary per 100 kw. connected ...	£0'6	£2'7	£11'1
Chief clerk's salary per £1,000 of revenue ...	£1'1	£4'7	£10'6
Station engineer's salary per 100 kw. of plant ...	£0'8	£4'3	£11'1

The chief clerk's sphere is the supervision, under the chief engineer, of all office work—such as the issuing of energy and other accounts, the checking of invoices for goods purchased, and the general book-keeping of the department. Correspondence on non-technical matters may also be included in his tasks, as well as the filing of all records relating to the undertaking. Generally he acts as secretary to the chief engineer, and, in certain instances, he is also the collector of all moneys due to the department. His salary will naturally be in proportion to the duties appertaining to his office. It is assumed in this comparison that he controls the cash transactions, being, of course, dependent in this connection only on the City or Borough Treasurer. Comparing his salary with the income from all sources, the fluctuations in pounds per £1,000 of revenue are clearly shown in the curve.

The most satisfactory basis on which to compare the salaries paid to station superintendents is the total generating capacity of the plant for which they are responsible. In some cases the superintendent has charge only of the running of the plant, the repairs being placed in the hands of an independent engineer. In other power stations dual responsibility exists for the running and maintenance, the dividing line being drawn

FIG. 1.

FIG. 2.

station, the capital cost of the undertaking, and the units sold per annum. A striking similarity will be seen to exist between the "plant" curve and the "units sold" curve, which would seem to show that the load factors of these stations do not vary to any great extent.

Assistants in electrical departments have, as a rule, many grievances, real and imaginary. These most often arise from discontent over the magnitude of their work, and the meagreness of their remuneration. As the undertaking expands in size and importance, and the chief's salary is augmented in like proportion, the assistants, who possibly do

FIG. 3.

FIG. 4.

the bulk of even the administrative work of the department, may be entirely overlooked. Where the chief is the autocratic controller of the whole staff, including the chief assistant, the standard of discipline has certainly proved to be better than if several of the assistants are directly under the Elec-

between the electrical and the mechanical portions of the plant. The best results are obtained, however, where a good all-round mechanical and electrical engineer is

## THE COST OF HOUSE SERVICES.

By "IMPROVER."

FIG. 5.

placed in absolute charge of the running of, and repairs to, all the appliances and machinery at the generating station.

As opportunity seldom arises for assistants in electricity undertakings to compare their wages with those of a number

FIG. 6.

of other towns, in the same manner as chief engineers are privileged to do, the curves in fig. 5 may be of some interest to them. With a view to arriving at average values for different sizes of stations, the average results obtained from

Capacity in kw.	Chief engineer.	Chief assistant.	Mains engineer.	Chief clerk.	Station engineer.
1,500	£320	£150	£150	£150	£150
2,500	450	200	180	160	170
5,000	620	260	230	190	200
10,000	800	350	270	240	260
15,000	880	400	310	290	320
20,000	950	460	330	320	380
30,000	1,000	520	360	380	430
40,000	1,100	580	390	440	480

fig. 5 have been plotted in fig. 6. Reading from the latter curves, the accompanying table of average salaries for different sizes of stations has been compiled.

VERY little has been written in connection with the all-important item of house connections and their cost. The amount of money spent annually on this class of work must have a considerable bearing on the efficient running of mains departments, whether company or Borough Council; and yet very little attention is paid to this important spending department.

As is usual with the ordinary operation of a service-laying gang, the foreman of the department pays a visit to the premises about to have a service laid on, and measures up the amount of cable required for the job, and the usual requisition goes into the stores. Care has to be exercised in choosing the run, and accurate measurements are necessary, as the writer has frequently seen cases where the amount of cable brought on the job has been considerably in excess of all ordinary requirements, and anything from two to three yards has been returned as scrap ends.

Twelve years ago, the whole of the service work of a certain undertaking was carried out by one of the cable companies, and, in spite of the special supervision which was supposed to exist, the cost of services was quite out of all proportion to the length of any particular service, some of the reasons being:—(1) The price charged for service boxes; (2) cut-outs; and (3) waste labour.

The service boxes were of a type that had fuses controlling the installation, and were fitted with glands for plumbing to the outer sheathing of the lead-covered cables. The boxes were supposed to be the best of their kind at the time, but they have since been proved to be a nuisance through the fuses giving trouble. Many cases occurred where the fuses were found to be eaten through, and thus, together with other complaints, caused them to be discarded. The cost of these boxes was £1 8s. each.

The use of such a box on a conduit system of distribution meant the building of a brick pit with a frame and cover for easy access, the cost being £1 9s. in each case.

The type of cut-out used, regardless of make, was a somewhat costly piece of apparatus, but in most cases the workmanship was good and the whole thing was reliable.

The labour was a very variable amount, and little judgment was exercised in setting out a day's work. In consequence there was a great deal of what the writer regards as waste labour, by which he does not necessarily mean loafing. This, together with hasty measurements of cable and consequent waste, completed what was a very costly job.

In more recent years the prices of joint boxes and cut-outs have decreased considerably, and at the present time a good joint box can be obtained at a few pence over 5s. Cut-outs, too, have decreased in price to the same low level, the workmanship being quite good and the cut-outs quite substantial in every way. The abolition of boxes that contained fuses having done away with the necessity of frames and covers, led to an improvement in cost of about £2 3s. per service.

In dealing with waste of time, the writer has in use a system of service connections which reduces this waste to a minimum, by the use of a cast lead shell for service boxes. At the same time use is made of all scrap lead stripped from the ends of cable returned to stores from the various works. This shell, in addition to providing the usual protection and receptacle for the compound, forms a continuous lead sheathing, and its value as such must be obvious to all.

It frequently happens that the service gang cannot begin operations until about 7 a.m. in the case of private houses, and, perhaps, 9 a.m. in the case of shops. The joiner and mate are, consequently, compelled to wait about until one end of the cable is fixed in the basement of the premises (unless some "hospital" job can be found for them). This gives a considerable amount of time that can be profitably utilised, and is so utilised where the system of casting lead carcasses is in vogue. The preparation of metal and moulds is quite a speedy process, and sufficient carcasses can be turned out during the waiting period of the ordinary joiner's day. After a careful study over several months, it appears that the cost of turning out these carcasses amounts to:—Labour, 9d. per set; lead (if at scrap value), 1s. 6d.

**Meter Approved.**—The Board of Trade has approved of the Chamberlain & Hookham polyphase watt-hour meter, type A.I.T., deposited by the makers in February, 1912.

per set, and if new lead 1s. 10d. per set, or not more than 2s. 7d. per set of two halves. Together with fitting, this completes a very cheap service box.

The cost of connecting or fixing is no more than that of the ordinary cast-iron shell, and a jointer and mate can, during the early morning, cast three sets of six halves and fix and complete three service boxes and cut-outs during one working day of 9½ hours where the mains are clear.

The only process is that of laying a strip of prepared tape along the joints of the two halves of the boxes and applying a powerful blow-lamp for 15 minutes. This also serves the very useful purpose of warming up the joint-box and keeping the compound in a very fluid state for a considerable time, and allows any air to escape. The sealing and completing of the box is done by laying a small sheet of metal over the opening in the top half.

As a means of checking the scrap cable sent in, a book is kept in the stores, and the jointers' mates return daily all ends from the completed jobs, which materially assists the stores clerk in keeping an accurate record; this used to be a very troublesome task and meant much "cooking" of cable measurements.

Below is given a record of the cost of service laying complete with reinstating charges, at various periods from 1901 to the present year, the service laying being done by a contractor from 1900 to 1902, and by the Council's employes from 1903 to date. In the case of all services laid prior to 1907, both by the contractor and Corporation, wrought-iron pipes were used to draw the cable through from the Council's mains to the consumers' basements. From 1907, the cable used has been strip armoured, and here there is a slight saving of about 3d. per foot run. In the case of armoured cable services, the mains are laid at an increased depth to avoid damage to the mains by other mains layers, who are many and have not always the respect for electric cables that they might have.

In 1901 a service was laid by the contractor (and is representative of those of its class). The length of cable was 45 ft., and the cost was as under:—

45 ft. '05 L.T.C. and W.I. pipe ... ..	£3 10 0
Box and cut-out, stores, jointing, materials, &c. ...	3 3 0
Brick pit, frame and cover ... ..	1 9 0
Paving ... ..	1 0 0
<b>Total ... ..</b>	<b>£9 2 0</b>

In 1903 a service was laid by the Council's men, the joint box and cut-out being identical, and the method of laying the cable the same as in the previous case. The cost worked out as follows:—

45 ft. '05 cable in 1½ in. W.I. pipe ... ..	£3 8 4
Box and cut-out, stores, jointing, materials, &c. ...	2 12 4
Brick pit, frame and cover ... ..	1 6 0
Paving ... ..	0 19 6
Extra for meter-board fixed by Council ... ..	0 4 0
<b>Total ... ..</b>	<b>£8 10 2</b>

In 1907, using armoured cable, a non-fused type of joint box, and a much cheaper, though equally good cut-out, a service was laid costing:—

45 ft. '05 armoured cable ... ..	£2 17 0
Box and cut-out, jointing, materials, stores, and "blind" brick-box ... ..	2 0 0
Paving ... ..	0 19 9
<b>Total ... ..</b>	<b>5 16 9</b>

Here a brick pit was built, but a frame and cover were not needed. A slab of York stone was placed over the box just under the paving, and a mark peculiar to the department was cut into the wall of the premises to indicate the point of entry.

From this date the services cost less, mainly owing to the reduction in the price of service boxes and cut-outs, the cheapening of compound, the better manipulation of the various gangs, and the sandwiching-in of other useful work, until in 1909 we had services of 40-ft. run costing:—

40 ft. 7/18 cable ... ..	£1 1 3
Joint-box ... ..	0 4 9
Cut-outs... ..	0 4 9
Meter-board ... ..	0 1 8½
Stores, compound, &c ... ..	0 2 4½
Labour ... ..	1 7 6
Paving ... ..	0 12 8
<b>Total ... ..</b>	<b>£3 15 0</b>

A service laid the same year, but having a larger size cable, cost:—

45 ft. '05 cable... ..	£1 17 11
Joint-box ... ..	0 4 7
Cut-out ... ..	0 4 9
Meter board ... ..	0 1 9
Stores ... ..	0 2 6
Labour ... ..	1 3 7
Paving ... ..	0 19 7
<b>Total ... ..</b>	<b>£1 11 8</b>

Since 1911, the new method of joint boxes has been in vogue, and the cost of services has worked out at an average of:—

35 ft. 7/18 cable ... ..	£1 0 5
Box fitting ... ..	0 1 7
Box carcass ... ..	0 2 6
Cut-out and meter-board ... ..	0 6 2½
Labour ... ..	0 10 6
<b>Total ... ..</b>	<b>£2 1 8½</b>

Thus it will be seen that marked improvements have been made in cheapening the cost of services, this being primarily due to the better setting out of work and the consequent reduction in the cost of labour, and the cheapening of service boxes and cut-outs.

In the case of the first service mentioned we had a cost of £3 8s. 4d. for cable and laying, exclusive of paving, or 5s. 4d. per yard run. Of this amount, 3s. 7½d. per yard was for cable and wrought-iron pipe, laid and jointed. The balance of 1s. 8½d. per yard was for laying service line only. This should have shown a very fine return, as some hundreds of connections were made in the year, and the fact has also to be taken into consideration that only 24 ft. of ground had to be opened, the balance of cable being simply cleated to the wall of the consumer's basement. The cost of the service box and cut-out was £2 12s. 4d., including fixing. Of this sum, 10s. 8d. was for fixing only, leaving a figure quite in keeping with the charges for electrical apparatus in those days.

As a fair comparison, I place alongside the above a service laid by the Council's men in 1909, the size and length of the cable being the same, with the exception that armoured cable was used. The cost of this service was £1 17s. 11d., or 3s. 11d. per yard. Here the service box cost 9s. 4d., exclusive of fixing, which was an immense saving on the old charge, while the quality was good. Of the labour charge of £1 3s. 7d., the sum of 6s. 3d. was for the time of the jointer and mate fixing service box, meter board and cut-out. The balance of 17s. 4d. was for excavating, laying cable and building "blind box" (the system is a draw-in one). This represents an all-in price of 1s. 3½d. per yard, which must be regarded as a great improvement.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Maintenance of Tramway Rolling Stock.

Referring to the interesting article on "Some Difficulties with Tramcar Motors," in the issue of the ELECTRICAL REVIEW for the 28th ult., I beg to suggest that it contains some food for reflection for those tramway managers who are anxious to maintain reliability of service and efficient running of the rolling stock.

Undoubtedly the receipts per car-mile and the ratio of receipts to expenses, &c., are important items in tramway management; but it is to be feared that in some undertakings the commercial aspects overshadow, to a large extent, the technical or engineering considerations, with the unfortunate result that the rolling stock is apt to receive less skilled engineering supervision than is desirable to secure the most efficient results.

It is not uncommon either to find that the car-shed staff consists principally of "fitters" whose training and wages are inadequate for the work that generally devolves upon them, for it is often supposed that rolling stock repairs can

be efficiently carried out by skilled labourers or fitters, with little or no training in shop methods or the use of tools, &c.

Indeed, in more than one instance, the writer has known the depot staff to be under the control of men whose previous experience was acquired in a winding shop or in jointing on a lighting network: and although such men may eventually become efficient "fitters," it is more often than not at the expense of both the equipment and the time-keeping on service. It may be argued that "it would not pay to employ skilled fitters at, say, 8s. 6d. per hour," but when one has had actual experience with "fitters" and fitters on rolling stock repairs, I venture to think that an analysis of the various items which compose the working expenditure will, in the majority of cases, amply prove that it pays to employ efficient men.

The best of traction equipments have a fairly low overall conversion efficiency under service conditions, and in these days of the extensive use of meters and methods of diagnosing inefficiencies, it is all the more surprising to find that in many cases so little interest is evinced in the condition of the mechanical details of the rolling stock from an engineering point of view.

L. Marshall Jockels.

York, April 5th, 1913.

#### Electric Laundry Irons.

I should be glad to hear, through your valued columns, from any of your readers who have discovered a practical electric iron for laundry or factory use. I have tried all the well-known makes, but cannot find one that will stand up without attention for more than three months. The chief difficulty is the disintegration of the copper of the flexible close to the connector terminals, due to the heat rising from the iron, which also destroys the rubber on the flexible, and causes short circuits.

Has anyone experimented in this connection with the brass flexible that was on the market some 10 years ago, and, if so, with what results?

Another fault with most irons is the way the connection is made between the heating element and the brass terminal pins. This is, as a rule, very crude, and has not the attention given to it which it deserves, the result being arcing, and eventually an open circuit.

These faults are, of course, not nearly so frequent in household electric irons, partly due to the lower temperatures at which they are run, and their intermittent use.

Ironical.

#### Electrical Shunt Calculator.

Referring to the description of an electrical shunt calculator on page 556 of your last issue, I would say that this is quite an old device for summing reciprocals. Its use for combining resistances was described some years ago in the American journal *Power*, and is also to be found in Peidie's "Construction of Graphical Charts." It is, of course, a particular example of the monographic diagram which M. Ocagne brought into prominence many years ago, and of which a large number has appeared in American journals from time to time.

It may be noted that the solution of this problem is quite readily effected by the slide rule, only one movement of the slide being necessary.

I trust this information may save Mr. Brown expending further time and trouble in this connection.

C. N. Pickworth.

Withington, Manchester, April 4th, 1913.

#### Prospects in Electrical Engineering.

I read with interest Mr. W. J. Ebben's letter in the current issue of your paper, and as a former teacher, with many years' experience, perhaps you will allow me to make a few remarks.

In London at present the "system" pursued by the London County Council in its numerous technical institutions is that associated with the name of Lancaster, and is

as follows:—Number of students  $\times$  hours = work done per annum. Anything tending to reduce this product is absolutely "taboo" at present. As for the merits of this system, they have already been dealt with, but it is extraordinary to find a system exploded many years ago still rampant in London.

Consequently the duty of the teacher is clearly to impress on all the students that the special system of teaching inaugurated by the L.C.C. is for the express purpose of increasing his "money-earning capacity"—a matter, no doubt, of great importance to people who know nothing of education.

W. H. F. Murdoch, B.Sc., M.I.E.E.

Millhill, Middlesex, April 5th, 1913.

#### Failure to Excite.

I should like to suggest, in reply to "Speedometer," whose letter appears in the "Correspondence" columns of your current issue, that the fact that his generator refuses to excite itself when run up to speed in the ordinary way may be due to the fact that one of the field connections is not making perfect contact, with the result that the initial low voltage induced by what is at first only remanent magnetism is not high enough to drive any more current through the shunt coils than is already passing, and that, therefore, the field cannot "build up."

This suggestion is supported by the fact that the machine runs O.K. as a motor.

I may say that I have had the same experience on more than one occasion, and, by tightening up the field connections after scraping them, have found the generator quickly build up its field.

When the machine was run as a generator with series turns on the fields, these were quite possibly opposing and overcoming the small effect of the shunt winding.

C. V. Peake.

Birmingham, April 7th, 1913.

#### Electric Heating and Cooking Apparatus.

The writer of the article under the above title in your current issue states that my "Pygmy" heater consumes about 200 to 300 watts, and I trust you will allow me to correct this statement, the actual consumption being from 125 to 140 watts.

Considerably over 10,000 of these little hot plates have now been sold, and whatever the technical man may think of them, it is an undoubted fact that they are well appreciated by the public. They serve as a useful object lesson in electric heating and cooking, and in exciting the interest of the public they may be looked upon as a very useful canvasser for business of a more ambitious nature.

The same writer states that the quartz type of element burns out very readily, and I think that his experience cannot have been obtained from apparatus made during the last two years. My quartz glowers do not burn out very readily unless they are greatly over-run, and the only trouble that has been experienced during the last two years has been with heaters used on alternating-current circuits, such trouble not being due to the burning out of the elements, but to failure at the terminals. This latter defect has now been entirely eliminated, and if the writer of the article will be so good as to test some of our recently-constructed apparatus, I am quite confident that he will be forced to adopt an entirely favourable view as to its reliability.

I have read with interest your editorial remarks on the subject of the electric heating of rooms, and it seems to me that the only golden rule that one can follow in connection with the design of apparatus for that purpose, is to imitate as nearly as possible the appearance and temperature of the glowing coal fire, the comfort of which, so far as physiological effect is concerned, is very generally admitted.

In the course of the recent discussion at the Yorkshire Local Section of the Institution of Electrical Engineers, on the subject of electric heating and cooking, Mr. H. Veger said that he did not think any reasonable man would suggest

heating a house with radiators under present conditions of price of energy, but I am prepared to demonstrate to Mr. Vesger that heating by electricity at one penny per unit compares very favourably indeed with heating by gas at 2s. per 1,000 cb. ft. provided adequate ventilation is arranged in each case. The open coal fire is admittedly cheaper than electricity for heating continuously an ordinary living room, but it is absolutely useless for temporary heating, for which electricity can practically defy competition.

Surely the facts cannot be as Mr. Vesger would like us to believe! The tens of thousands of electric heaters that are sold every year are evidence that the public entertain a contrary opinion.

C. Orme Bastian.

London, E.C., April 7th, 1913.

#### Remote Control by Vibrations.

Among other interesting matter, your issue of April 11th contains descriptions of inventions relating to "Life Targets" and "Wireless Telephony in Mines," both of which include apparatus for governing a local circuit by means of vibrations, air being the medium in the first case, and ether in the second.

I had the pleasure in December, 1907, of showing you my method of effecting control of operations at a distance without solid connections, a sound being received on that occasion by a microphone transmitter in series with a battery and the primary of a small induction coil, the secondary of which was connected to the magnet illustrated on page 963 of the ELECTRICAL REVIEW of December 13th, 1907. A time relay was combined with a step-by-step motion by means of which a variety of actions were governed in a model torpedo. Without the time relay, the apparatus responds to sudden loud noises such as gunshots. The corresponding devices described in your last issue under the head of "Life Targets," bear some resemblance to those previously invented by me, as may be seen from a reference to your article of December, 1907, and to my Patent Specification No. 11,021 of 1906.

Your Mr. Gatehouse may recollect that a curious discovery was made at the time of his inspection of my instruments. A common deal box in which the microphone transmitter was enclosed, was found to have a pronounced natural period of its own—about 275 v./s. The instruments could sometimes be caused to respond to the pitch of the box when Mr. Gatehouse sang the appropriate note.

It soon became obvious to me that my membrane might be set in vibration by ether waves if its natural period were brought into correspondence with the train or group frequency of such waves. In this case the alternations passing through the magnet under the membrane were derived from a receiving aerial, instead of a microphone transmitter. The arrangement is the subject of my Patent 12,183 of 1906, and there appears to be little difference between it and the call device described in your last issue under the head of "Wireless Telephony in Mines."

J. Gardner.

Fleetwood, April 5th, 1913.

[In our article we pointed out that "the effect could certainly be produced by other means," having in mind such devices as those of Mr. Gardner's invention.—EDS. ELEC. REV.]

#### Replacement of Plant.

I should be glad to hear if any readers of the ELECTRICAL REVIEW have replaced old plant, the capital of which has not been fully paid off, out of their invested reserve fund, and if they have found any difficulties, legal or otherwise.

R. N. Torpy,

Borough Electrical Engineer.

Electricity Works,

Tunbridge Wells,

April 1st, 1913.

## PARLIAMENTARY.

### Coventry Corporation Bill.

A SELECT Committee of the House of Commons, presided over by Mr. H. Law, considered this Bill on April 2nd and 3rd. The chief object sought by the Bill had relation to the water supply, but there were also clauses to empower the Corporation to run motor-buses, and to extend the area for the supply of electricity so as to include the parishes of Allesley, Binley, Coundon, Keresley, Stoneleigh, Walegrave, Willenhall and Wyken. The estimated expenditure on motor-buses was £11,200, and there was a further estimate of £3,800 for the erection of a garage. Mr. Hutchinson, K.C., and Mr. Jeeves appeared for the promoters, and Mr. Talbot, K.C., and Mr. Field for the Warwickshire County Council, and Mr. Maconachie for the Leicestershire and Warwickshire Electric Power Co.

The Warwickshire County Council opposed the running of motor-buses over the main county roads outside the city, and after a consultation it was decided to withdraw all such routes.

The County Council also opposed the extension of the area for the supply of electric light, on the ground that there was no real necessity for such extension, which, if granted, might ultimately be used as an argument for the extension of the city boundaries.

MR. HUTCHINSON announced that all the electricity extensions would be withdrawn, except in regard to a part of Stoneleigh parish lying contiguous to the existing municipal boundary.

MR. MACONACHIE opposed the extension of the electricity supply powers to Stoneleigh, and called

MR. GEO. BALFOUR, of Balfour, Beatty & Co., Ltd., who stated that the Leicestershire & Warwickshire Electric Power Co. had completed a trunk line, which was to go *via* the outskirts of Coventry to Warwick; and he was also making a contract with the Leamington & Warwick Electric Co. to supply them with power from Hinckley. The company intended to apply for a provisional order for lighting, and would be prepared to supply Stoneleigh.

The Committee decided to allow the Corporation's proposal for extending their electric lighting area to the part of Stoneleigh parish defined.

On the consideration of the clauses, MR. MACONACHIE, on behalf of the Leicestershire & Warwickshire Electric Power Co., asked the Committee to insert a clause defining the position of the Corporation in regard to the supply of electricity in Stoneleigh. He pointed out that under the company's Act of 1902 the company was debarred from supplying electrical energy in the Coventry district without the consent in writing of the Coventry Corporation, and the object of the clause was to make it perfectly clear that the company would not need such consent when they exercised their powers to supply in the Stoneleigh district.

MR. PRITCHARD (Parliamentary agent for the Corporation) said no such protective clause was necessary, as the Bill took no power to extend the boundaries of the city.

The CHAIRMAN said the Committee would allow the clause of the company, although they thought it was somewhat superfluous. As some apprehension appeared to exist in the minds of the company, they would grant the clause, as it was not the intention of the Committee to place the company in any worse position with regard to the area in question.

The Bill was ordered to be reported for third reading.

**Dundee Corporation Bill.**—This Bill, which presumably has for its object the widening of streets, &c., came before the House of Commons Committee on Unopposed Bills on 4th inst., and was ordered to be reported for third reading. The Bill contains estimates for tramways to the amount of £13,000. To meet the wishes of the Scottish Office, the Corporation inserted a clause in the Bill providing that not more than £1,000 in any one year should be paid from the tramway receipts to the relief of rates.

## LEGAL.

BUCKLEY & BEACH v. NATIONAL ELECTRIC THEATRES, LTD.

IN the Court of Appeal on Wednesday, April 2nd, Lords Justices Vaughan Williams and Hamilton heard an interlocutory appeal in an action brought by plaintiffs, electrical engineers, against the defendants, to recover moneys alleged to be due in respect of work done and materials supplied at three electric theatres, namely, at York, Hull, and Chatham.

MR. TINDAL ATKINSON, for the plaintiffs, said that his clients appealed from an order of Mr. Justice Bucknill in chambers reversing an order of Master Bonner. In October, 1910, the plaintiff and the defendants entered into a contract under which the former were to install electric light in defendants' theatre at York, the contract price being between £400 and £500. The work was completed in July, 1911, but the architect's final certificate was not given, and payment was not made until October, 1911. Rather more than 12 months after completion of the work at York, defendants suggested that there were defects, and the dispute between the parties was whether the defects were due to the faulty work of the plaintiffs originally, or whether they were due, as the

plaintiffs alleged, to negligent treatment of the installation by the defendants' servants. Plaintiffs, in consequence of the complaint, did certain work at the York theatre. About the same time they also did some work at the defendants' theatres at Hull and Chatham. Plaintiffs instituted proceedings, claiming against the defendants £33 11s. 10d., as to which £18 3s. related to work at the York Theatre, and £15 8s. 10d. to work at the other two theatres. A letter was received from the defendants, complaining of the work at Hull, and saying that they would probably counterclaim in respect of it. Eventually two summons came before Master Bonner, one by the plaintiffs asking for summary judgment under Order 14, and the other by the defendants asking that the proceedings should be stayed by reason of an arbitration clause in the York contract. The plaintiffs' contention was that the work having been completed under that contract the arbitration clause had ceased to be effective. In the circumstances, Master Bonner remitted the whole action to the West London County Court. That, said Counsel, worked no injustice upon the defendants, because they could counterclaim as well in the County Court as in the High Court. Twelve days afterwards, after the plaintiffs had entered the case for trial in the County Court, the defendants appealed to Mr. Justice Bucknill. The appeal was out of time, but the learned Judge extended the time for appealing and then dealt with the matter on its merits. In the result his Lordship reversed the Master's order, stayed the whole action and referred the dispute to arbitration. Counsel submitted that the judge was wrong in making such an order. In the first place, he contended that the arbitration clause had ceased to be effective, and that in any event it did not cover the claim for the work at Hull and Chatham, and in the second place, the case having been set down in the County Court the judge had no jurisdiction to hear the appeal at all.

Mr. POLLOCK, K.C., who appeared with Mr. Newbolt for the respondents, supported the judge's order.

LORD JUSTICE VAUGHAN WILLIAMS giving judgment allowing the appeal, said that when Mr. Justice Bucknill made the order he had no jurisdiction because the cause of action had been lodged in the County Court before the defendants issued their summons asking for an extension of time to appeal.

LORD JUSTICE HAMILTON concurred. He thought the appeal succeeded on both points.

The appeal was accordingly allowed with costs, and the order of the Master restored.

#### TRADE MARKS.

In the Chancery Division on Friday, April 4th, before Mr. Justice Swinfen Eady, Mr. Kerly said he had a motion on behalf of the Western Electric Co., Ltd., by way of an appeal from the decision of the Comptroller of Trade Marks. The parties, however, said counsel, had made arrangements of which the Comptroller approved, and he proposed in these special circumstances to withdraw his decision. That being so, he (counsel) asked to be allowed to withdraw his appeal.

His LORDSHIP granted the application.

#### ELECTRICITY SUPPLY IN WESTMINSTER.

In the House of Lords on Friday last, before the Lord Chancellor and Lords Atkinson, Shaw and Moulton, judgment was given in an appeal by the London Electric Supply Corporation, Ltd., to which the Westminster Electric Supply Corporation, Ltd., were respondents. The facts and arguments were fully reported in the ELECTRICAL REVIEW of March 7th, ante pp. 377-378.

Mr. Danckwerts, K.C., Mr. Buckmaster, K.C., and Mr. Austen Cartmel appeared in support of the appeal. Sir Robert Finlay, K.C., Mr. Younger, K.C., and Mr. W. S. Kennedy for the respondents.

The LORD CHANCELLOR, in the course of his judgment, said that the case appeared to him to be not unattended with difficulty, but he had come to the conclusion that the judgment appealed against could not stand. The question was whether the agreement of 1910 was, as held by the Courts below, one under which the respondents were at liberty to manage the undertaking of the appellants within the Westminster area with the same freedom as they could have done had they been out and out purchasers for their own benefit. Put less abstractly, were the respondents left free to reduce the working of that undertaking by soliciting persons, who were entitled to apply, and did apply, to the appellants to supply them with electricity, to take their supply from the respondents instead? Were they further at liberty as between themselves and the appellants, to say to those who, under the terms of the appellants' Provisional Order of 1889, were entitled to claim a supply from the appellants, and subsequently to the agreement did so claim, that they, the respondents, had acquired the right to manage the appellants' undertaking as well as their own, had an option to tell these persons which supply they should have? In order to understand the meaning of the agreement, it was necessary to remember the state of legislation affecting these companies when the agreement was made. Sec. 11 of the Electric Lighting Act, 1882, had prohibited such companies from divesting themselves of their legal powers and liabilities as imposed by that Act, without the consent of the Board of Trade. The object was to maintain competition and avoid monopoly. The provisional orders of the appellants and the respondents, which were made in 1889, and were confirmed by Parliament, accordingly prohibited them from purchasing or acquiring the undertakings of, or from associating themselves with, any other company or person supplying electricity under any

licence, provisional order, or special Act within London, unless authorised by Parliament. In 1908 by the London Electric Supply Act of that year they were authorised to enter into and carry into effect, with the approval of the Board of Trade, any agreement for mutual assistance or for association with each other in regard to, among other things, the giving and taking of a supply of electricity, and the distribution and supply of electricity so taken, and for the management and working of any part of their undertakings. It was to be observed that this permission did not in terms authorise purchase or transfer. Sec. 11 of the Act of 1882, and the orders of 1889, remained standing except so far as the words of the Act of 1908 relaxed their stringency. Sec. 11 was, indeed, afterwards repealed by Sec. 14 of the Electric Lighting Act, 1909, but its substance was re-enacted by the same section in rather more stringent terms. Under these circumstances, the two companies negotiated, and the Board of Trade approved, the agreement in question. It was dated May 4th, 1910, and consisted of 21 articles. His Lordship then referred to Article 2, which provided that the appellants were to place their undertaking in the hands of the respondents during the continuance of the agreement: to Articles 3 and 4 which referred to the upkeep of existing mains and the cost of extensions; to Article 9, reading of meters and collecting accounts, and Article 11, by which the respondents were, in a proper and efficient manner, to fulfil and comply with all the conditions and requirements in respect of supply to which the appellants were or might be subject within the area, and were to indemnify the appellants against claims for default of supply. Turning to Article 13, he said the appellants were to supply to the respondents such amount of alternating current as might be required for enabling the respondents to supply all the requirements of the appellants' consumers for alternating current within the area, and of all such other consumers within the area, as might be required for enabling the respondents to supply their own customers with current within the area. By Article 15, the respondents were to pay to the appellants in each year until 1931 the fixed annual sum therein mentioned, and, if the statutory purchasing authority did not purchase the undertaking in that year, a reduced annual payment thereafter until such purchase. By Article 16, the price to be paid to the appellants by the purchasing authority was to go exclusively to them and the respondents were to make up the amount payable for the portion of the undertaking within the area to £100,000 should it fall short of that sum. By Article 17, the respondents were, in addition to the annual payments already mentioned, to pay the appellants for electricity supplied under the agreement £2,000 a year to meet certain standing charges and 85d. for each Board of Trade unit of electricity supplied. He also read Articles 19 and 20. The Lord Chancellor, continuing, said he agreed that the agreement must be read as a whole and its real substance sought for. It seemed to him that the construction sought to be placed upon the powers conferred by the agreement upon the respondents could not be upheld. He did not, however, think it necessary to grant an injunction at present. It would be sufficient, looking to the circumstances, to give liberty to apply in the action if such an injunction or other relief should prove necessary. He had had the advantage of considering the declarations suggested in the judgment about to be delivered by Lord Moulton, and he thought that the wording he proposed, with the addition of liberty to apply, was the proper form for such declarations to take. Accordingly, he moved that the appeal should be allowed, and as the respondents had been substantially wrong, they must pay the costs there and below.

LORD ATKINSON concurred.

LORD SHAW read a judgment to the like effect.

LORD MOULTON then read an exhaustive judgment dealing with the course of legislation, the agreement, and the grounds for the conclusion at which he had arrived. He said that the appeal raised points of general importance, as well as issues affecting only the parties to the suit. For the sake of clearness, it would be well to deal with matters in chronological order. His Lordship referred to the Act of 1882, the Act which still formed the basis of the legislation applicable to the subject, and said that no practical action took place under that statute, because of the shortness of the term which Parliament then was willing to give undertakers of electric lighting enterprises. By the Act of 1888, things were made more favourable, and many applications for provisional orders covering various areas of London were made in 1889, and among them those of the plaintiffs and the defendants. The plaintiffs' area was a very large one, and extended on both sides of the Thames. It included the district of Westminster. The system of supply was an alternating current generated at a station outside the area, the energy being transmitted at very high pressure to the districts of supply, and there transformed down to a low pressure. In 1908 it was felt that difficulties of establishing generating stations in populous districts, and the advantages of producing on a large scale, and with large units of machinery, rendered it advisable to make some concessions in the provisions aimed against monopoly in the statute of 1882 and 1889, and accordingly the Act of 1908 was passed to allow authorised undertakers of electric lighting to enter into arrangements as to certain matters with other electric supply companies. It was under the powers of that Act that on May 4th, 1910, the parties to this suit entered into the agreement out of which this action arose. The differences relative to the meaning and effect of that agreement might be summed up in two plain issues. First, the Westminster Co. claimed the right to use all means in its power, whether in the form of persuasion or by the exercise of powers possessed by it under and by virtue of the agreement, or the statutes regulating the undertakings, to detach customers from the London Co. and transfer them to the Westminster Co.; and, secondly, the Westminster Co. claimed the right to refuse to give alternating current

from the London Co.'s mains to members of the public having a right to be supplied by that company, and to compel them to take the Westminster Co.'s continuous current if they wished to receive a supply of electric energy at all. The first question, therefore, was, What were the powers and duties of the Westminster Co. with regard to that part of the London Co.'s undertaking which was situated in the Westminster area? Those powers and duties could only have been acquired by the Westminster Co. in virtue of the existence of corresponding provisions in the agreement. Those provisions must be within the powers given in the London Electric Supply Act, 1908, for, apart from that Act, no such powers or duties could have been acquired by the one company with regard to the undertaking of the other, either by agreement or otherwise. His Lordship said that this was evident by the chain of statutory enactments, which he proceeded to consider at some length, beginning with Sec. 11 of the Act of 1882, and tracing the changes, as referred to by the Lord Chancellor, brought about by the subsequent statutes. He referred to Sec. 4 in each of the Provisional Orders under which the companies respectively worked their undertakings, which provided that "the undertakers shall not purchase or acquire the undertaking of, or associate themselves with, any other company or person supplying energy under any licence, provisional order, or special Act within the Administrative County of London, unless the undertakers are authorised by Parliament to do so." Before examining the agreement of May 4th, 1910, in detail, it was necessary to state shortly the position of the two companies with respect to the nature of the supply that they were respectively authorised and compelled to give to the public. The Westminster had from the first sought, and obtained, powers to supply to the public low-tension continuous current only. From the first the London had adopted the alternate current as its form of supply, and down to the year 1905 it was not authorised to give any other form. In June of that year it obtained powers for an additional system—namely, an extra-high-pressure alternating-current supply to motor-generators placed in substations erected above the ground, and from those motor-generators a continuous-current low-pressure supply to the public by means of conductors on the three-wire system. But although they had acquired such powers, they availed themselves of them only in districts south of the Thames. In Westminster, for instance, they neither installed the requisite motor-generators nor laid down any mains for such supply, which required separate mains of a different construction to the company's mains in that area. It followed, therefore, that in the Westminster area they remained as they had been from the commencement—a company supplying to the public alternating current only. His Lordship then referred to the recitals in the agreement, and said that the main provisions which dealt with the "giving and taking of currents" were to be found in Clauses 13 and 14. The monetary terms of the agreement were as follows:—The Westminster Co. was to take the whole of the customers' payments, *i.e.*, the entire revenue produced by the London Co. in the Westminster area. In return it made a fixed annual payment of an amount to be ascertained once for all in a manner specified in the agreement. It was argued by the parties that this had been done, and that the sum so ascertained amounted to £21,735 per annum. It also paid for all the alternating current supplied by the London Co. under the agreement at the rate of '85d. per unit. And, finally, it paid £2,000 to the London Co. to meet the standing charges of the London Co. for the maintenance, renewal and upkeep of the works handed over to the Westminster Co. under the agreement. It then came to be considered the hearing of the various recitals he had referred to on the points at issue between the parties. With reference to the first question—What was the effect of the Westminster Co. taking over the "management and working" of the London Co.'s undertaking in Westminster?—in his opinion, the words must be taken to mean just what they did in the Act of 1908, under which the agreement was made, and which it purported to put into practice. The company, like an individual, were bound to manage and work the business with reasonable care and skill and with an honest regard to the interest of the parties entrusting them with it. He had no doubt that it was in this sense that the words were used in the permissive section of the Act of 1908, and this must prevail in agreements made to carry into effect the powers so granted. The power to allow another company to manage and work an undertaking which was rendering services to the public did not mean that it might be put into hostile hands to be strangled. If, therefore, the language of other parts of the agreement were such as to compel their Lordships to give to these words the meaning contended for by the respondents, a serious question would arise as to whether the agreement was not self-contradictory or in the alternative was not *ultra vires*. But he could see nothing in the language of the agreement which gave rise to difficulties of that sort. His Lordship then examined the arguments of the defendants on this head. They claimed, *inter alia*, that the London Co. had no further interest in the undertaking—its sole asset was the annual payment of £21,735 and the guarantee as to the purchase price, and that, therefore, it was the intention of the parties that the defendants should do what they liked with the undertaking, avoiding, of course, violation of the statutes. But it could not be assumed that if fairly worked and managed by the defendants, the plaintiffs' undertaking might not fetch a higher sum than £100,000, and he did not think that the defendants' contention was sound, that the arrangement meant that, on their undertaking to pay £21,735 per annum and to guarantee a purchase price of £100,000, they obtained the privilege of getting rid of a competitor so far and so soon as they could do so without violating statutory obligations. That was not, in his opinion, a fair exercise of the permission to allow companies to associate or give mutual assistance

in the management and working of their undertakings, or a fair interpretation of the language of the agreement itself.

The second question was whether the Westminster Co., as managing and working the London Co.'s undertaking, was entitled to refuse to give a supply of alternating current to owners and occupiers applying to that company for it, and entitled to a supply of electric energy from that company. He thought the one simple and decisive answer to that question was this. The London Co. was bound to give to such owner or occupier a supply of alternating current, because it could give no other. It had never taken the necessary steps to qualify itself in the Westminster area for distributing continuous current, either by laying the requisite mains or erecting the stipulated generating, or, rather, transforming plant, *i.e.*, the motor-generators. It was abundantly clear that an electric lighting corporation could only give its statutory supply from its own mains. The order was full of provisions as to the responsibility of the company for the conditions of its mains, the preparation of maps of those mains, which were to be open to the public for inspection, and so forth. All these precautions were for the benefit of owners and occupiers who were entitled to a supply from the company. The whole of these provisions would be evaded if the company could refuse to connect a would-be consumer with its own mains and force him to take his supply from some other source. It followed, therefore, that the London Co. had no power to give a statutory supply of continuous current in the Westminster area, because it had laid no mains for the purpose, and, indeed, had done nothing to enable it to make use of the additional system of supply which it used in some parts of its area south of the Thames. His Lordship, having referred to what he characterised as the "curious process of reasoning" by which the defendants seemed to have arrived at the conclusion that the London Co. might distribute continuous current to the public in Westminster—namely, that, as managers of the London Co.'s undertaking, they were entitled, as against the public, to call the mains of the Westminster Co. London Co.'s mains, which he considered wholly unsupported by anything in the agreement, said:—

It follows, therefore, that in both of these, their main contentions, the Westminster Co. have been in the wrong. It remains to consider what should be the relief given by this House in the circumstances of this case. It is not necessary to grant any injunction, as there is no reason to think that the defendants will fail to act in accordance with their obligations when these have been duly declared. I should suggest the following declarations:—

1. That it may be declared that the defendants in managing and working the plaintiffs' undertaking in the Westminster area are bound to do the same with reasonable care and skill, and with due regard to the interests of the London Co. therein.

2. That it may be declared that according to the true construction of the said agreement of May 4th, 1910, the defendants are as between themselves and the plaintiffs bound, if required so to do by the plaintiffs, to supply electric energy by means of the plaintiffs' alternating current to any consumer, or proposing consumer, in the Westminster area who applies to the plaintiffs for a supply of electric energy, and is entitled to receive from them a supply of the same, and whose application is duly forwarded by the plaintiffs to the defendants for execution, and to do, and permit to be done, all acts and things necessary for furnishing such customer with the plaintiffs' alternating current.

The defendants should pay the costs of the actions and the appeals.

HARRIS v. HULTON

In the City of London Court, on Tuesday, before His Honour Judge Lumley Smith, K.C., a claim was made by Mr. Corbin Harris, the liquidator of the Oro Light and General Supply Co., Ltd., 36, Cock Lane, Snow Hill, E.C., to recover £2 17s. 4d. against Messrs. R. P. Hulton & Co., electrical engineers, 109, Great Eastern Street, E.C., for electric lamps supplied last year. The claim was admitted, but the defendants raised a set off for £3 18s. 6d., alleging that the lamps were useless.

Defendants' solicitor stated that the defendants required 72 105-volt electric lamps for use at the Picture Palace, Windsor. The defendants had to return them, because the caps were loose, and defendants had to get others at a cost of the sum now counter-claimed for.

Defendants' manager said the plaster that held the cap became loose, and they were useless.

MR. HARRIS, the plaintiff, said he was formerly the chairman of the Oro Light Co. He received the order in question. Every lamp was tested before it was sent out and found to be quite satisfactory. That was the only complaint which they had had. If the lamps were put in the damp, such as outside a picture palace, they would be injured, because the cap was fixed on with plaster of paris. If the lamps were to be put outside they ought to be put in a proper casing. That was usual; otherwise they had to be fixed on with gutta-percha. That was the only way of resisting the wet. The lamps in question went wrong because they were put outside the picture palace. They might have been spoilt by too strong a voltage being used.

JUDGE LUMLEY SMITH: My voltage is 200. I expect the lamps to stand that.

WITNESS: If you put a 150-volt lamp on to your 200 voltage it will soon smash the lamp.

JUDGE LUMLEY SMITH thought the plaintiffs' lamps ought to have lasted some time without going to pieces as they had done. Plaintiff said it must be due to exposure. He would have thought that electric lamps ought to go outside as well as inside. He did not see why they should not if properly made. He was disposed to think the defendants had made out their case. They could not

recover anything in that case, but the plaintiffs could not recover any of their claim. Defendants would set off the amount of the plaintiffs' claim, and defendants could claim the rest in the plaintiff company's liquidation. It was not a case for costs.

#### POST OFFICE TELEPHONE GRIEVANCES.

THE Postmaster-General, Mr. Herbert Samuel, sued Mr. W. J. Macmanus, 26, Agate Road, Hammersmith, on Tuesday, in the City of London Court, for £2 6s., the return of telephone apparatus and telephone calls due.

MR. ALLSOPP, plaintiff's solicitor, said that the defendant entered into an agreement to have the telephone service in September, 1910. The period expired and he would not return the apparatus without the Court's order.

DEFENDANT said he had the telephone on January 18th, 1912, and from the moment of the installation there had been nothing but trouble. No proper instrument and no proper service had ever been given him. The workmen were never out of the house. There had been one incessant series of complaints. The telephone was absolutely necessary to his business, and, bad as it was, he had to put up with it, as it was no earthly use to argue with the Post Office Department. Then he was sent a fresh agreement for the old apparatus, and he objected. He had always been prepared to pay his rent. The agreement was most inequitable.

JUDGE LUMLEY SMITH said he had been expecting it to be taken to the Court of Appeal, but no one had done it yet.

Defendant added that the service made his place more like a comic scene in a pantomime than a business house. On the last day of the service it took him 32 minutes to get through to the exchange.

JUDGE LUMLEY SMITH said the defendant only owed 2s. 8d. for fees. He would have to pay that, and £1 16s. 5d. in respect of the apparatus. The latter money would not be payable if he gave up the apparatus. Judgment accordingly.

#### COMPENSATION CASE.

AT the Rochdale County Court, on Friday, Mr. R. D. Mattley, representing Mrs. Eliza Brierley, 103, Peel Street, Rochdale, applied to Deputy Judge Leresche, for an order directing Messrs. R. & T. Howarth, contractors, of Royds Street, to pay £275—an agreed sum—as compensation on account of the death of her husband. Mr. Mattley said the husband was employed by Mr. Geo. F. Endersby, a contractor, to whom Messrs. R. & T. Howarth had sublet certain work in connection with an extension at the Rochdale Corporation Electricity Works. Whilst working there on January 3rd, Brierley, who was a journeyman joiner, fell from scaffolding and died the same day from the effects of the injuries he received. The respondents had served notices for the purpose of being indemnified by Mr. Endersby. Mrs. Brierley, however, was entitled to an award.

THE JUDGE awarded Mrs. Brierley £275, and, on the application of Mr. Mattley, he granted her an immediate payment of £25, and made an order for her to receive the remainder at the rate of £3 a month.

Messrs. R. & T. Howarth then claimed to be indemnified by Mr. Endersby for the amount they have to pay Mrs. Brierley. Dr. Atkinson (instructed by Mr. C. B. Hudson) represented Messrs. R. & T. Howarth, and Mr. Acton (instructed by Mr. J. Bright Clegg) appeared for Mr. Endersby.

AT the invitation of the JUDGE, counsel went into his private room. On returning into court, his Honour said the case could not be finished that day, and he did not think it should be commenced and left for another judge—who might be sitting at the next court—to finish. The adjourning of the case might also enable the parties to come to some arrangement.

All engaged in the case agreed to it being adjourned to May 23rd. It was accordingly adjourned to that date.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Automatic Earthing Device.

A new pattern of disk type earthing device, made by MESSRS. A. REYROLLE & CO. LTD., is illustrated herewith. It consists of an isolating switch combined with a paper disk earthing device. The latter part is of special interest at the moment, particularly in view of the discussion which followed the paper recently read before the Institution of Electrical Engineers by Mr. J. S. Peck.

It consists of a paper-insulating disk A, fig. 1, which can be made of any thickness or material according to the voltage at which it is required to spark over. The terminals T are enclosed in an insulated box B, and dropped into a carrier C. The carrier is in the form of a change-over switch, so arranged that when the disk is temporarily removed a direct earth connection takes its place. It is, therefore, possible to have three positions:—

1. Isolating switch open, in which position the neutral point is insulated.

2. The isolating switch closed, insulating disk in place (fig. 2). In this position the neutral point is again insulated, but in the event of

a disturbance on the system occurring, which would cause potential difference between the neutral point and earth, the disk would be pierced, and the neutral point thereby automatically earthed.

3. In the third position, the neutral point is earthed direct, and in this position the disk box can be conveniently removed for inspection or replacement (fig. 1).

The principal demand for this arrangement is from those systems where the neutral point is earthed at the power station and, in accordance with the Board of Trade regulations, it must *not* be permanently earthed at any other part of the system.

It may so happen that main switches are open, and certain parts of the system become isolated from the section where the neutral point is earthed. At the same time, the sections whose neutrals are thereby insulated remain in commission, possibly on account of

FIG. 1.

FIG. 2.

REYROLLE AUTOMATIC EARTHING DEVICE.

step-up transformers, or because they are connected to another power station. When such a contingency occurs, the use of the above earthing device at the neutral point of the static transformers provides for automatic earthing, and, in the event of an accident, for instance, an earth on one phase occurring, the device would ensure the proper operation of the main switches, and so avoid the risks which might be attendant upon a line conductor being accidentally earthed on what would be, but for the use of the earthing device, an insulated system.

As a safety device, the arrangement has a further use in a modified form on the secondary of step-down static transformers, in those cases where it is necessary to provide some means for isolating the static transformer in the event of a failure of the transformer occurring, which would tend to raise the potential of the secondary, for instance, a contact between primary and secondary winding.

### Focusing Reflector Lamp.

The object of the BRITISH THOMSON-HOUSTON CO.'s new concentrated-filament "Mazda" lamp is to get a filament approximating as closely as possible to the theoretical point source of light. The

FIG. 3.—B.T.H. "MAZDA" LAMP WITH CONCENTRATED FILAMENT

lamp is made in three sizes—50 watts, 100 watts and 200 watts—and in voltages ranging from 12 to 200. The filament is made of drawn tungsten wire wound in a very narrow spiral, which is formed into a series of loops bunched closely together. By this means it is possible to get a very high candle-power filament in a small compass. For example, the 100-volt 100-watt lamp (giving approximately 100 c.p.) has a filament which could be contained in a cubical space measuring  $\frac{1}{2}$  in.  $\times$   $\frac{1}{2}$  in.  $\times$   $\frac{1}{2}$  in. (see fig. 3). This new "Mazda" lamp has been designed for use with parabolic reflectors in motor headlights and searchlights, and in optical lanterns, photographic enlarging lanterns and small cinematograph projectors. For these purposes this lamp has all the advantages of the ordinary incandescent electric lamp in regard to cleanliness and safety, and in addition gives the concentrated light source necessary for accurate reflection with parabolic reflectors, or projection by means of lenses and condensers.

#### The Aston Ball Body.

We illustrate in fig. 4 the "Aston" three-light adjustable ball body, which is supplied by MESSRS. VERITYS, LTD., London, for use with  $\frac{3}{4}$ -in. lip Holophane reflector bowls and open glassware. It is claimed that this device enables the glass reflector to be taken off for cleaning without unwiring and removing the body; and that

FIG. 4.—ASTON BALL FITTING.

it allows the lamps to be placed in their correct position inside the bowl by means of the set screws (on collar), which hold the adjusting tube as required. The body is supplied wired for two circuits, one and two lights, ready for fixing, and it can be equally well used for large Holophane bowls or open shades having a  $\frac{3}{4}$ -in. lip.

#### Recording Blast-Furnace Charges.

Ironworks managers will not need to be told that the sooner the operation of charging blast furnaces is over, the better. Obviously the longer the furnace bell is lowered, the longer does gas escape which can be utilised advantageously, and

FIG. 5.—FURNACE-CHARGING CHART.

hence it becomes of importance to have some check on the periods of charging, not only as regards the time when the charge took place, but also the actual time consumed in completing the charge. In order to meet these requirements, a very ingenious and yet simple device has been developed by MESSRS. WORKS CONTROL, LTD., of St. Margarets-on-Thames. This consists of a recording drum, on which is placed a time chart such as is shown in fig. 5. On this time chart the pen moves uniformly upwards at a fairly rapid rate so long as the electrically-controlled mechanism of the recorder allows it to do so. When current is shut off from the recording

mechanism, the pen drops out of contact with the chart, and falls back again to its lowermost or zero position. On examining the chart which is shown, it will be seen that the pen marks intersecting horizontal lines are not strictly vertical. This is caused by the fact that while during a certain interval the pen is moving upward at a fairly rapid rate, the time chart is also being moved forward at a slow rate, so that the lines become diagonal. Now, supposing that the vertical distances are ruled to a very open spacing, so that the total height of the paper corresponds to, say, a two-minute vertical travel of the pen, while the horizontal travel of the drum chart is made a 21-hour circuit, it will be seen that on the same chart can be recorded the times at which the bell was lowered by examining the horizontal distances, while by examining the vertical distances one can obtain the interval in fractions of a minute that the bell was kept lowered.

The electrical mechanism in the recorder is operated by the closing of a circuit having switch contacts, which are closed when the furnace bell is lowered. The current necessary for operating the instrument may be supplied by a small battery or the supply used for lighting the plant. The actual size of the chart which is shown in the illustration is  $5\frac{1}{2}$  in. high and  $7\frac{1}{2}$  in. long, so that accurate measurements can be obtained.

## BUSINESS NOTES.

**Condensing Plant Contracts.**—The following is a list of some recent orders received by the MIRLIEES-WATSON CO., LTD., of Glasgow:—

Surface condensing plant with Mirrieles-Leblanc rotary air pumps.—Two sets for the County of London Electric Supply Co., per the British Thomson-Houston Co., Ltd. Two sets for auxiliary machinery for H.M.S. *Queen Elizabeth*, per Peter Brotherhood, Ltd. One set for Aberdeen Corporation, per Mr. G. Wuthrich. One set for Sheepbridge Coal and Iron Co., per the British Thomson-Houston Co., Ltd. One set for Fleetwood U.D.C., per Messrs. Jas. Howden & Co., Ltd.

Surface Condensing plant with Mirrieles-Edwards air pumps.—One set for the Lancashire Electric Power Co., and one set for New Zealand, per Messrs. Hendry Bros.

Mirrieles multi-jet condensing plant.—Two sets for the Summerlee Iron Co., and one set for the Cambrian Collieries, per the A.E.G. Electric Co. One set for Flemington Coal Co., and one set for Tinsley Park Colliery, per Messrs. Greenwood & Batley, Ltd. One set for Moorbrook Mills, per the British Thomson-Houston Co., Ltd. One set for Bargood Colliery, and one set for Glasgow Iron and Steel Co., per Messrs. Fraser & Chalmers, Ltd. One set for the Weardale Steel, Coal and Coke Co. (repeat order). Two sets for the Londonderry Collieries, Ltd., per Mr. Wm. C. Mountain. One set for the Powell-Duffryn Steam Coal Co., Ltd. One set for J. Whiteley & Sons, Ltd., per Messrs. Daniel Adamson & Co. One set for the Glegarnook Iron and Steel Co., per Messrs. Jas. Howden & Co.

Barometric Condensing Plant with Mirrieles-Leblanc Rotary Air Pumps.—One set for Birtley Colliery, per Messrs. C. A. Parsons & Co. One set for the Powell-Duffryn Steam Coal Co.

Mirrieles-Leblanc Simple Jet.—One set for the Denton Colliery Co., Ltd. Low Level Jet Plant.—Two sets for the Sheepbridge Coal and Iron Co. and one set for Dinnington Main Colliery, per the British Thomson-Houston Co., Ltd.

Barometric Plants with Reciprocating Dry Air Pumps.—Four sets for Peru and one set for the Argentine.

The above represents a total steam duty of over 1,000,000 lb. per hour.

**Hydro-Electric Contracts.**—MESSRS. BOYING & CO.'s recent contracts include 17 km. of welded-steel pipe for the 1912 extensions of the Victoria Falls and Transvaal Power Co. The line consists of pipes of 27 $\frac{1}{2}$ , 22 and 16 in. diameter, the pressure being 100 lb. per sq. in., while the temperature of the compressed air is as high as 80° C. They are also supplying a further 11,000 ft. of 15-in. pipe for the Rand Water Board. Other orders include two water turbines of 225 H.P. for the Kawasugawa Hydro-Electric Co. of Japan, and one of 70 H.P. for the Wheel Jewell & Marytavey Mines (Cornwall). Orders for pumps include one 3,000-gallons Victoria pump for Messrs. Hulett, Durban; two 8,950-G.P.M. pumps for Messrs. Willans & Robinson, for Sydney; one 100-G.P.M. pump for the Soudanese Irrigation Department; eight Victoria pumps of various capacities for the Papeteries de Rethel, Ardennes, France, to which company the firm are also supplying a complete 110-in. paper-making plant.

**Catalogues and Lists.**—THE EASTERN ELECTRIC CO., LTD., 11, Queen Victoria Street, London, E.C.—Catalogue, consisting of a number of lists containing illustrations and prices of a variety of electrical accessories. These include switches, lampholders, ceiling roses, cut-outs, fuseboards, wall plugs, opal shades, wood blocks and casings, wires and cables, bells and bell accessories, and ironclad switches.

THE ELECTRICAL CO., LTD., London, W.C.—Stock list of A.C. and C.C. motors, and other machines.

**Bankruptcy Proceedings.**—SAMUEL SMITH (trading as Smith & Sons), 22A, 24 and 26, Victoria Square, Widnes, Lancs., electrical engineer, &c.—The public examination of the above-named debtor was held at the Court House, Government Buildings, Victoria Street, Liverpool, last Monday, when the liabilities were put at £270, and there was an estimated surplus of £648. It appeared that the debtor started trading at Widnes about 23 years ago, and until recently the business had proved very successful. Two of his sons had been in the business, but he had declined to make them partners while they were under 21 years of age. Last August debtor consulted a solicitor who advised him to execute a deed of assignment for the benefit of his creditors. He agreed to this course, and ultimately two trustees were appointed

under the deed, the business in the meantime, pending sale as a going concern, being carried on by him at a weekly salary of £2. His liabilities at that time were about £401, and he estimated that his assets were worth £1,550. Creditors to the extent of £114 odd did not assent to the deed within the time specified, and were now scheduled as unsecured creditors for that amount. Since the deed liabilities had been incurred amounting to £156 odd. Debtor was questioned by the Official Receiver as to his estimate of the value of his assets, and was reminded that the trustees had been put to considerable expense in resisting a claim made in the Chancery Court by his sons, who asserted that they were partners in the business. The Official Receiver further stated that he understood that the debts were understated at the time of the assignment. Debtor maintained that if the estate were properly dealt with there should be a large surplus for him. After further questions had been asked the examination was ordered to stand adjourned.

E. J. CROSIER (Crosier, Stephens & Co.), engineer and merchant, Newcastle-on-Tyne.—April 26th is the last day for the receipt of proofs for dividend. Trustee: Mr. J. A. Gardner, 145, Pilgrim Street, Newcastle-on-Tyne.

**Electric Clocks.**—We are informed that the great house of Whiteley's, Westbourne Grove, is to be equipped throughout with a service of uniform and accurate time by the SYNCHRONOME CO., LTD., of 32 and 34, Clerkenwell Road, E.C. The installation will comprise a very large number of their "one-wheel" electrical impulse dials, and will include handsome turret clocks on the galleries under the domes. The same company have also in hand their fourth extension of the time circuit in Waterloo Station. Railway companies have a reputation for caution and conservatism, but from a list before us of "Synchronome" installations in railway stations in all parts of the world, it appears that this system of time-keeping is appreciated by them. The Buenos Ayres and Great Southern Railway is among the latest to go in for this system.

**Willans & Robinson, Ltd.**—The scheme of capital rearrangement recently proposed to and accepted by the shareholders of this company, was duly confirmed by the High Court last week. The company has always been so closely identified with the electrical industry, and has carried out so much excellent work, that we feel our readers will join with us in the hope that its trading may continue for the benefit of the industry at large, and that the company itself may now enter upon a renewed stage of prosperity. It is interesting to learn that the business now in hand, especially in steam turbines and Diesel engines, shows a larger volume than for some time past.

**Dissolutions and Liquidations.**—MELDRUM BROS., LTD., Timperley.—A second dividend of 3s. in the £ is payable April 7th at the office of Mr. Theodore Gregory, 3, York Street, Manchester.

S. T. ROBBINS & CO., automobile, electrical and general engineers, 19, Port Street, Evesham.—Messrs. Stanley T. Robbins and H. S. Hunt have dissolved partnership. Mr. Hunt will attend to debts.

MESSRS. SIMPSON, SCOTT & CO., electrical contractors, Cape Town, have dissolved partnership. Mr. Simpson is carrying on business as district agent for Messrs. Orenstein and Arthur Koppel, Ltd, and Mr. Scott is joining the local agency of the A.E.G. Co. as technical adviser.

**For Sale.**—The Darlington Corporation has for disposal a 35-KW. steam dynamo. See our advertisement pages in this issue.

Messrs. Wheatley Kirk, Price & Co. will offer for sale by auction on April 30th the plant, machinery, stock, &c., at Falcon Works, Bedford Street, Greengate, Salford, under instructions from Mr. T. R. H. Tetley, who is discontinuing manufacturing. See our advertisement pages to-day.

**Trade Announcements.**—THE ELECTRIC BATTERY Co. has removed to more extensive premises at 62, Eagle Street, High Holborn, W.C. (Telephone No. "Holborn 1080,"), where they have a floor area of over 6,000 sq. ft., which will be equipped with modern plant for the manufacture of E.B.C. (patent) dynamos for car lighting, accumulators, &c.

MESSRS. POWLEY BROS., electric lighting engineers, &c., of 32, Park Road, Kingston-on-Thames, have opened additional premises at 1, Ditton Road, Surbiton.

Mr. Donald Smeaton Munro, M.I.E.E., acquired, in March, 1912, that section of the electrical business of Anderson & Munro, which was formerly worked from Edinburgh. To avoid confusion, this Edinburgh section is now carried on by, and under the name of, DONALD SMEATON MUNRO, 11, Randolph Place, Edinburgh, and all communications should be so addressed.

## LIGHTING and POWER NOTES.

**Accrington.**—The refusal of the Rishton District Council to allow the Accrington Corporation to supply electrical energy to Messrs. Peebles & Sons' Works, Rishton, has led the Accrington Electricity Committee to the decision to apply to the B. of T. for an Order permitting it to give the supply desired. It has also been decided to apply to the L.G.B. for sanction to borrow £2,000, the estimated cost of laying and supplying the necessary mains and transforming plant in connection with the supply.

It is proposed to give domestic consumers the option of an assessment tariff—viz., a fixed rental of 12½ per cent. per annum on

the net rateable value, to be apportioned over the various quarters of the year as follows:—First quarter, two-sixths; second, one-sixth; third, one-sixth; fourth, two-sixths, together with a charge of 3d. per unit, with a discount of 5 per cent. from all accounts paid on or before a specified date. It has been decided to adopt a charge for all purposes other than for power from April 1st of 4d. per unit, subject to discounts on accounts paid before a specified date varying from 10 to 25 per cent., according to consumption.

**Atherton.**—The U.D.C. has confirmed a proposal of the Electricity Committee to apply to the L.G.B. for sanction to borrow £5,500 to meet the cost of a new transformer station, feeder cable, &c.

**Australia.**—The report of the Electric Supply Committee of the Melbourne City Council for the year 1912, according to the *Australian Mining Standard*, shows that in spite of (perhaps because of) reductions in the price at which current is supplied to consumers, and in spite of large new expenditure on plant, there is still a credit to profit and loss account, though of about a third less than for 1911. The gross revenue for 1912 was £130,276, and the working expenses amounted to £65,130; the gross profit, therefore, was £65,146. Charged against this was interest on capital, commission and exchange, £19,357; sinking fund, £5,615; depreciation and renewals, £23,458; on account of loans, £844, making a total of £49,274, and leaving a net profit for the year of £15,871. The revenue from the sale of current for private lighting purposes increased from £59,679 to £68,936, and the revenue from heating and power by nearly £8,000. In allocating the amount to be set to the various accounts, a sum of £8,750 was contributed to the town fund, and £5,615 to the sinking fund, making that fund now £99,184. The depreciation and renewals account amounts now to £163,514; during the current year this fund will be drawn upon extensively for the cost of plant which is being scrapped to make way for new plant of a larger capacity and greater efficiency. The net profit in 1911 was £22,000.

It is stated that the Commonwealth Government has decided to equip the Federal Woollen Mills at Geelong, Vic., with a complete electric power plant.

**Banbridge (Co. Down).**—Mr. G. B. Deane, B. of T., has held an inquiry into the application of the Urban Council for a prov. order. Mr. Gordon explained the scheme, which would cost about £3,300. The borrowing powers of the Council ran up to nearly £30,000, and the gross valuation of the town was £14,456. Mr. Pleasance, of the firm of Messrs. Woodside & Co., Belfast, having given evidence of the projected scheme, the inquiry was adjourned.

**Bath.**—The L.G.B. has sanctioned the borrowing of £1,789 for district mains, services and transformer pillars in the Weston area; £2,250 for prospective expenditure on mains; £2,250 for prospective expenditure on services; and £5,000 for prospective expenditure on transformers—each for a period of 15 years, and has authorised the allocation of the sum of £1,210 out of the Diesel engine loan, which is not required for the purpose, to make up the balance required for the mains, &c., in the Weston area.

**Bootle.**—The T.C., on the 2nd inst., approved of the scheme recommended by the Electric Power and Lighting Committee, for extending the electricity mains, at an estimated cost of £4,375. It was decided to apply to the L.G.B. for sanction to borrow a sum of £3,750 for defraying the cost of a portion of the scheme, and the remainder will be defrayed out of loans already sanctioned.

**Bradford.**—The Chamber of Trade is in negotiation with the Corporation Electricity Department, with a view to the possibility of reductions in electricity charges, and the payment of discount by taking an amount off accounts instead of the Corporation giving free lamps. The provision of these free lamps, in lieu of discount, is stated to be an injustice to the local electrical contractors. It is also stated that last year the Corporation placed an order for a quarter of a million such lamps.

**Braintree.**—The U.D.C. has decided to obtain expert advice on the question of lighting the town by electricity.

**Brighton.**—A fairly large electrical cooking installation has now been running for a few weeks at Messrs. Staffords, in Western Road. This is used for preparing meals for a staff of some 70 hands, and consists of a Jackson range, with eight heating plates and two large ovens, in which several big joints can be cooked at the same time. The control board is mounted behind, and fitted with indicating lamps showing exactly what heater is in use. We gather that experience with the range has been highly satisfactory, its cleanliness, efficiency, and the improved cooking being much appreciated.

**Canada.**—The municipal electrical department of Ottawa last year made a profit of \$35,000, as shown by the statement presented by the Electric Commission. Since the plant was taken over in 1907, the profits have totalled \$132,652.28—this after reducing the price of electric current in the city to one-half of the former rates.

**Colwyn Bay.**—An inquiry has been held by the L.G.B. relative to the application of the U.D.C. for sanction to borrow, among other sums, £5,300 for additional generating plant at the electricity works, to meet the growing supply. It was pointed out that the load on the works last season came up to the maximum capacity of the machinery installed, so that the increase was essential for the safety of the supply. No opposition was raised to the proposals.

**Dartford.**—The U.D.C. has instructed the electrical engineer to proceed with the preparation of plans and specifications for a U.T. generating set, as the demand is likely to soon necessitate the generation of U.T. current direct. The Council has declined to entertain a suggestion from consumers at Crayford that the supply to that district should be treated as a whole, and that the charges for power should be based on the united demands of all the works connected to the new main.

**Doncaster.**—The T.C. has adopted a new scale of charges for electricity for power and domestic purposes, by which 1½d. per unit will be charged for the first 500 units per annum, 1½d. per unit for the second 500, 1½d. per unit for the third 500, and 1d. per unit for the fourth 500.

It was reported that the Electricity Committee had finished the past financial year with a surplus of £1,055, although some of the charges had been considerably lowered. For the extension of electricity mains and plant an expenditure of £13,206 is estimated to be necessary in the coming year.

**Dewsbury.**—At the T.C. meeting, last week, a long discussion ensued upon the subject of the Corporation's municipal trading undertakings, the rates, and the financial position generally. Sir Mark Oldroyd said that the development of the tramways, if carried out, might cost another 10d. rate. He complained of the extensive appropriation trading profits for relief of rates, maintaining that the purpose of these undertakings was the convenience of the public. Mr. T. Myers criticised the action of the Council in taking £500 from the electricity department for relief of rates when it had just borrowed £8,000 for works extensions.

**Dover.**—The T.C. has received from the L.G.B. sanction to a loan of £300 on account of transformers.

**Dromore (Co. Down).**—A B. of T. inquiry was held on the 5th inst. into an application on behalf of the Urban Council and a number of ratepayers to provide electricity for lighting and power purposes in that town. The application was opposed by some ratepayers and the local gas company. Evidence was given of the finances of the town, by which it appeared that it had borrowing powers up to £10,000, and its debts and liabilities were under £2,000. Nine of the 10 members of the Council were in favour of the scheme. Two schemes had been submitted, one costing £3,998 and the other £3,400. Mr. H. V. Pegg, consulting engineer, of Belfast, gave the details of the schemes, after which the inquiry adjourned.

**East Ham.**—At the last meeting of the T.C., a letter was read from Woolwich B.C., stating that the limited consent given to it for supplying current to the L.C.C. pumping station at North Woolwich only, would be quite useless, as it would be unable to incur the expense unless allowed to supply properties on the route of the main, and stating that it would be prepared to pay a percentage upon the total revenue received from the supply if allowed to do this. The T.C. is agreeing to the suggestions put forward, subject to the payment of 5 per cent. upon the total revenue received from the supply.

**Gillingham (Kent).**—With reference to the Corporation's contract with the Augsburg-Nurnberg Co. for the installation of a new Diesel engine at the electricity works, the T.C. has entered into a supplemental agreement with the company to enable the British Westinghouse Co. to at once proceed with the construction of the alternator, the cost of which will be £1,019.

**Grasmere.**—The question of electric lighting in the Council's area has been introduced by a company. The Council is giving preliminary support to the scheme, which it is proposed shall include street lighting.

**Halifax.**—A L.G.B. inquiry into an application by the Corporation to borrow £18,180 for the purchase of plant at the electricity works, and for extensions of the electric mains, has been held. Mr. Halsey, chairman of the local Ratepayers' Association, opposed the application.

**Leeds.**—At a recent meeting of the T.C., on the presentation of the Electricity Committee's minutes, Mr. D. B. Foster moved an amendment to refer back a recommendation to defer further consideration of the question of instituting a scheme of motor hiring in order to give time for trial of a scheme submitted by Mr. H. S. Ingleby. He urged that it would be more to the interests of the manufacturers of the city if steps were taken to get into touch with other motor manufacturers, than to consider the scheme of Mr. Ingleby, who had written stating the terms upon which nine Leeds firms were prepared to supply motors on hire or hire-purchase. Mr. Hugh Lupton pointed out that by the terms of the Committee's recommendation the Council would not be in any way pledged to the firms mentioned. Mr. R. Armitage said the letter contained a suggestion that officials of the Corporation canvassed the city solely, or to a large extent, with a view to pushing the sale of certain makes of motors to the prejudice of other makes equally good. He thought in the interest of the officials these charges ought to be investigated. Alderman Tetley intimated his willingness, on behalf of the Committee, to insist on the withdrawal of these passages in the letter. Mr. Hugh Lupton said the sub-Committee concerned would undertake to investigate the matter raised with regard to the officials. The amendment was carried.

The proposed reduction in charges, more particularly to large power consumers, referred to last week, was also agreed to; it is estimated that power users will benefit to the extent of £4,000 per annum under the new rates.

**Leyton.**—The U.D.C. has applied to the L.G.B. for a loan of £6,456 for mains, feeders, &c.

**Liverpool.**—In his annual report which has just been issued, the city lighting engineer states that a great improvement has been effected during the year in the centre of the city by the fixing of 70 flame arc lamps in lieu of open type and metallic-filament cluster lamps, the light being increased thereby at least fourfold. An extension of electric lighting by metallic filament lamps has also been carried out during the year on the Edge Lane tramway route with 50 and 100-c.p. lamps. At the end of the year there were in use 921 electric lamps, 192 arc, and 729 incandescent metallic-filament lamps.

**London.**—**BATTERSEA.**—With reference to the motion for an injunction taken by the Council to restrain the County of London Electric Supply Co. from laying mains in the borough, the Council has received a letter from the solicitor of the company forwarding copy of notice of appeal and copy of a letter which had been addressed to the B. of T. on the company's proposal. The Council decided to ask the Board to postpone taking action in the matter until the application of the Council to the High Court had been dealt with.

**WOOLWICH.**—In order to be able to give a supply of current to the new hostels in course of erection at Eltham for the L.C.C., the Borough Council has decided to borrow £1,448, the estimated cost of providing transformers and switchgear at the High Street substation; also for the provision of a duplicate main to New Eltham, which will provide for a general supply also being given, if required.

**ST. MARYLEBONE.** The Electric Supply Committee has considered a letter inviting the Council to join in a general conference to consider the decision of the L.C.C. to again revise the maximum periods which it will sanction for the repayment of electricity loans in respect of buildings, mains and machinery, and with the object of representing to the L.C.C. the advisability of reconsidering and amending such decision. The Committee did not think that any useful purpose would be served by the Council joining the proposed conference, and recommended accordingly.

**Lossiemouth.**—The B. of T. has approved of the order for the electric lighting of the town.

**Macclesfield.**—The New Electricity Co. of Macclesfield, Ltd., has informed the T.C. that the response to the invitation to various persons to take shares in the concern, has not been such as to justify the company making a start on the proposed electricity works. The company was formed about two years ago, and obtained a prov. order for electric supply, and this expires by effluxion of time on August 11th next. A new syndicate has come forward and taken over the company's powers and responsibilities, and has taken a disused dyeworks in George Street as a site for a generating station.

**Manchester.**—Mr. S. L. Pearce, the chief engineer of the electricity department, and Mr. J. G. Newbidding, engineer of the gas department, were recently instructed to consider the question of street lighting, and they have prepared a report which has been approved by the Lighting Committee of the Corporation—a Committee which consists of members of the Gas, Electricity and Finance Committees. The report states that the two engineers are agreed on certain recommendations. One is that a further extension on a moderately large scale of the lighting of the principal thoroughfares in the city be made with high-pressure gas, and electric arc or metal-filament lamps. The total length of the streets to be lighted by the first-named system is 13,500 yards, and that of the streets to be lighted by electricity is 11,835 yards. In arriving at the allocation of streets, the engineers have had regard to the thoroughfares in which special arc lighting cables are already laid, and the suitability or unsuitability of the streets scheduled for centre suspended lighting or side lighting, it being their opinion that, broadly speaking, one set of streets are best dealt with by means of electricity, whilst others are more suitable for the high-pressure gas system. They have not attempted to deal with secondary thoroughfares or with the lighting of courts and passages, and they recommend that this be deferred pending the result of the present proposal.

**Mexborough.**—A L.G.B. inquiry has been held in connection with the application to borrow £11,500 for extensions of the electricity undertaking. Mr. J. Senior (electrical engineer) stated that the amount was made up as follows:—Turbo-generator, £4,200; buildings, £3,200; boiler foundation, £800; water cooling tower, £800; pipe work, £400; balancer-booster, £330; three years' prospective services, £300; three years' public lighting, £300; contingencies, £170; builder's tender in excess of estimate, £750; and travelling crane, £250. There was no opposition to the application, and the inquiry was closed.

**Newport (Mon.).**—We understand that the recommendations of Mr. A. Nichols Moore, the borough electrical engineer, for extending the electricity plant, have been unanimously adopted. It is intended to install a 2,500-kw. turbo-alternator, with condensing plant, and a 600-kw. D.C. generator, with switchgear.

The engineer's proposals for lowering the single-phase frequency were also approved, but will not be carried out for another year.

**New Zealand.**—On February 20th, a poll of the Christchurch ratepayers resulted in a vote of 2,874 for, and 492 against, the proposal of the City Council, to raise a loan of £120,000 for equipment in connection with the utilisation of electric power to be supplied in bulk from the hydro-electric installation now being erected at Lake Coleridge. The amount is to be expended

in:—Sub-stations and plant; transforming plant and buildings; mains and services; meters; poles, lamps, &c., for street lighting. The Mayor congratulated the ratepayers on the magnificent support given to the proposal. The Wanganni-borough is about to extend the tramways, the amount involved being about £9,000.

At Wellington, the engineer has been requested to report on the advisability of combining the lighting and tramways stations. The lighting supply is rapidly increasing, and it is anticipated that additional generating plant must be purchased at no distant date; the supply is single-phase at 80 periods transformed from 2,000 to 100 volts.

**Newcastle-under-Lyme.**—The T.C. has decided to apply to the L.G.B. for sanction to borrow £20,000, being the estimated cost of certain electricity extensions.

**Nuneaton.**—The T.C. has resolved to replace 25 gas lamps in the town by electric lamps.

**Newton-in-Makerfield (Lancs.).**—The U.D.C. has had under consideration a communication from Messrs. McCorquodale and Co., asking whether there was any immediate likelihood of the Council's obtaining powers for the supply of electricity, and further stating that if there was no prospect of the order being granted, it was the company's intention to proceed with the scheme it had had before it for some considerable time, for the generation of its own electric power for driving and lighting purposes. It was resolved that the question be considered with the estimates.

**Orsett (Essex).**—The B. of G. has decided not to let the proposed electric lighting scheme for the workhouse drop. The L.G.B. recently intimated that the premises were too small for an installation, but the Guardians have ascertained that at Buckingham the Board of Guardians has installed a small electric plant at a cost of £187, with satisfactory results. This has been inspected by two of the Guardians from Orsett, with the result that the firm who carried out the installation—Messrs. Johnson and Phillips—have been communicated with. Consequently further steps are to be taken in the matter.

**Royton.**—The Oldham Corporation has applied to the District Council for power to supply the Industry Mill with electricity for power purposes. There is a strong feeling in the Royton district that the Oldham Corporation should get the necessary provisional order to supply the whole of the district.

**St. Helens.**—The T.C. has adopted an assessment tariff for private houses, viz., a fixed quarterly charge based on the net rateable value of the house, and 4d. per unit for all current used for lighting, heating, cooking, and other domestic purposes.

**Salford.**—The T.C. has adopted a recommendation to approve the settlement of the Corporation's claim against the insurance companies for damage caused by the recent fire at the electricity station for £11,383, which covers the whole of the damage.

**Scarborough.**—The Corporation has under consideration the question of the purchase of the local electric supply undertaking. A special sub-committee has been appointed to carry on the negotiations. The borough engineer has been instructed to obtain the consent of the Electric Supply Co. to the examination of its plant by Mr. Wyld, of Birkenhead. The borough accountant has reported as to the financial position of the Electric Supply Co., and the further consideration of the matter has been deferred.

**Sevenoaks (Kent).**—The U.D.C. was recently informed by Mr. Frank Reeves, acting secretary of the Sevenoaks and District Electricity Co., Ltd., that all objections to the company's application for a prov. order for electric lighting had been removed, and it was advised that no doubt the order would be granted. He added that orders for oil engines had been provisionally placed, and arrangements were being made with Messrs. Crompton & Co. to supply the electrical equipment of the generating station. It was hoped that the cables would be laid almost immediately, and that by means of a temporary plant a supply of current might be made available without waiting for the completion of the permanent generating station, which would be erected at Sundridge. The company's operations will include not only the urban district, but practically half of the rural district, and Limpsfield, Oxted, and other parishes in Surrey.

**Sheffield.**—The Corporation is proposing to offer domestic electricity consumers the alternative of an assessment tariff, based on a fixed charge of 10 per cent. of the annual rateable value of the premises, payable quarterly, plus 4d. per unit used, with no meter rent. Consumers in premises other than private houses using electricity throughout for lighting purposes, and who sign a minimum payment form, are to be charged 4d. per unit for heating and cooking purposes. Under the latter scheme, between 700 and 800 consumers will benefit immediately.

With a view to improving the lighting of Norfolk Street and Barkers Pool, at present lighted by gas, a trial is to be made with electricity, subject to the cost of supplying and fixing the lamps being borne in equal proportions by the electricity supply department and the Watch Committee, and to the cost of maintenance and energy not exceeding the cost for gas.

**Stockport.**—A carters' strike has been in progress at Stockport for several days, and there were fears at one time that the electricity supply would be seriously diminished, owing to the uncertainty of securing supplies of coal. Last Saturday, however, a fresh supply of coal was obtained, wagon loads being escorted by police from the sidings to the works.

**Stockton-on-Tees.**—The T.C. has arranged with the Cleveland and Durham Electric Power Co. for a supply of current between 10 p.m. and 6 a.m., or, if necessary, between 6 p.m. and 6 a.m. This will obviate the expense of installing additional plant.

**Tonbridge.**—The Kent County Education Committee has decided to have the electric light installed at Sussex Road Schools, Tonbridge, at a cost of £56.

**Torquay.**—The question of electrically illuminating the gardens immediately adjoining the new pavilion is under consideration. The engineer has been directed to report as to the general use of electric cookers; also to obtain four sample street lighting lamps from certain firms, and to fix them for experimental purposes. The results will be compared with the 1,000-c.p. Osram lamps now in use. Current is to be supplied to flame arc lamps outside shop premises on the following scale, subject to the type of lamp and the conditions of supply being approved of by the engineer in each instance:—1,600-c.p. lamps, 1d. per lamp per hour; 2,400 c.p., 14d.; 3,300 c.p., 14d.

**Tunbridge Wells.**—The E.L. Committee proposes to convert a further 50 gas lamps into electric lamps in those streets in the town in which electric cables are laid.

**Watford.**—The Northwood Electric Light and Power Co. having applied to the B. of T. to dispense with the consent of the R.D.C. to its extension order, the B. of T. deemed it advisable for the promoters of the Order and the objectors to attend a conference in London. This took place on April 1st.

The T.C. has decided to alter the assessment tariff from the present rate of 12½ per cent. plus 1d. per unit, to 12½ per cent. plus 1d. per unit.

**Wimbledon.**—The Sub-Committee appointed to consider and deal with any questions arising in connection with the supply of electrical energy by the Council to the Fixed Price Light Co., Ltd., reports that it has instructed the borough electrical engineer to prepare and submit a report upon the fixed-price light system of supply, and the actual and probable results of the working of such system in Wimbledon and Merton, including the question of transformer losses.

**York.**—The electricity department has decided to reduce the price of electricity to consumers who are charged on the flat rate system, and from April 1st the charge is to be 3½d. per unit for all consumptions not exceeding 4,000 units per quarter, instead of a sliding scale of 4½d. per unit to 3½d. per unit, according to consumption. The reduction has been brought about by the increasing demand for current, and the more economical means of generation in vogue at the electricity works.

## TRAMWAY and RAILWAY NOTES.

**Australia.**—According to the *Board of Trade Journal*, the Victorian Government has authorised the chief railway commissioner to make a five months' tour of Europe and America in order to study the working of electric railways. He was to leave Australia for England at the beginning of this month.

We are informed by Mr. W. G. T. Goodman, general manager of the Adelaide Municipal Tramways Trust, that the gross revenue for the half-year ended January 31st last amounted to £154,013, or £10,655 more than in the preceding half-year. The capital cost of the revenue earning portion of the undertaking was £1,279,710, and the surplus revenue over operating expenses, £52,610, or 5.33 per cent. per annum on the capital. We gather that the revenue was sufficient to meet the normal expenditure on the completed electric traction system as well as all statutory charges, including also interest on purchase money.

**Bexley.**—A reorganisation of the tramway service, suggested by the manager, has been agreed to by the Council.

**Bingley.**—The Shipley U.D.C. has given consent to an extension of the Bradford Tramway system from Nab Wood to Bingley, on condition that the Bingley U.D.C. pays it £150 per annum for the privilege. The Bingley Council has communicated this fact to the Bradford Corporation, which has approved the terms of the Shipley Council, and has agreed to pay the £150 annually to the Bingley Council during the term of the lease of the Bingley tramway to the Bradford Corporation.

**Birmingham.**—The year's working of the Corporation tramways resulted in traffic receipts amounting to £573,000, or £150,000 above those of the previous year. As concessions in fares amounting to over £70,000 were given during the year, it is not anticipated that the amount given to the rates will exceed that in the previous year, viz., £46,000.

**Bournemouth.**—A scheme for running railless trolley vehicles from the Square to Bournemouth Pier, and along the Undercliff Drive to Boscombe, has been before the T.C. The estimated cost is £13,600, and a net profit of £1,500 per annum is anticipated. The scheme was opposed, and has been referred to a Committee for consideration.

**Bradford.**—The general manager of the Corporation Tramways Department has had an interview with an inspector of the B. of T. in reference to the overturning of a tramcar at Allerton during a gale, and as a result the Tramways Committee has decided to provide wind gauges to indicate the prevailing wind pressure at various parts of the tramway system.

The Tramways Committee has also decided to accede to the suggestion of the Watch Committee that constables in uniform should be allowed to ride on the Corporation tramcars without payment of fares.

The preliminary statement of the working of the Corporation tramways for the year ending March 31st, show that the total receipts amounted to £289,616, an increase on the previous year's figures of £7,239. The number of passengers carried has been 62,000,000, an increase on the previous year of 6 millions. The increase is largely attributed to the establishment of the 4d. fares on cars boarded before 9 o'clock in the morning.

**Burnley.**—The tramway receipts for the year ending March 31st, 1913, are £7,190 more than last year, representing an increase of 1,481,000 passengers.

**Bury.**—Alderman Collinge announced at the T.C. meeting last Thursday that the tramway profits, Bury and Ratcliffe combined, for the year just ended, would reach £10,800. Of this, £9,500 was from the Bury system, and £1,300 from the Radcliffe system. Last year there was a combined profit of £8,550. Traffic receipts showed an increase of £1,250, and the working expenses a decrease of £1,000.

**Canada.**—Among Canadian railroads none are making more progress in the electrification of their lines than the Canadian Northern. This road is now making application for permission to take water from the Nicolou River, British Columbia, which joins the Coquahalla, about 11 miles from Hope, for the purpose of developing hydro-electric power. If sufficient power can be generated to operate the Rocky Mountain division by electricity, it is stated that the company will prepare plans for the construction of a power plant at Yale. It is also the intention of the company to tap Jones Lake in the mountains, to the south of the main line below Yale. From this they will be able to generate 50,000 H.P.

**Continental Notes.**—**ITALY.**—La Società Elettrica Transviaria Litorena Viareggio-Versilia has secured a concession in respect of a projected electric tramway between Viareggio and Forte-del-Marmi, with a branch to Pietrasaito, a total distance of about 1½ miles.

**GERMANY.**—The Mersburg Ueberlandbahnen Gesellschaft is the name of a new company, with a capital of £65,000, which has been formed to work the new light electric railway, which is being built between Merseburg and Mueheln, Saxony, by the A.E.G. The line will be about 1½ miles long.

**Dewsbury.**—A communication has been received from the Batley Corporation to the effect that it cannot undertake the construction of a tramway line from the borough boundary.

The decision of the Corporation with regard to a physical junction between Shaw-Cross and Westborough tramways is to be forwarded to the Batley Corporation, and the latter is to be asked whether it is prepared to submit an amended proposition.

**Doncaster.**—It was reported to the Council last week that Lieut.-Col. Drnutt, of the B. of T., had inspected the new tramway extension to Bentley, and expressed satisfaction with it, and that the latter had been opened for service at a fare of 1½d. for the whole distance, the route being divided into two penny overlapping stages. In his Budget statement, Alderman Bentley, chairman of the Finance Committee, pointed out that the tramways had done well last year, coming out with a surplus of £471, after providing out of revenue £657 for a motor tower wagon. The Royal Show was a great help to the tramways. The estimated capital expenditure for the coming year included £43,186 for the extension of the tramways.

**Halifax.**—The receipts of the Corporation Tramway Department during the year ended March 31st, show a decrease in the profits of £3,839, as compared with 1911 (£14,182, as against £18,021). The total receipts were £105,970, as compared with £101,893 in 1911, while the expenditure had increased from £83,873 to £91,788. The number of passengers carried was 19,456,928, as compared with 18,749,456; the miles run were 2,152,391, as against 2,102,757. Amongst the expenses was included an item of £861 in connection with the abandonment of the Parliamentary Bill.

**Hastings.**—There seems no prospect of any agreement being arrived at between the Corporation and the tramways company in connection with the latter's Bill before Parliament for the adoption of overhead traction along the front line of the town in lieu of the Dolter system, which the B. of T. will only allow for a few months longer. The Bill is expected to be reached in the course of a few weeks, and present appearances point to a keen fight. The frontagers are backing up the Corporation in its opposition to overhead wires. In some quarters self-propelled tramcars are being advocated, and in others the preference is given to motor-buses. There is general agreement on one point—that the existing system, with its noise and "flashing," is most undesirable.

**Leeds.**—The returns for the year ending March 31st, according to a comparative statement just issued, show that the Corporation tramways have had another prosperous year. Following an increase in receipts last year of £24,900 (as a result of certain extensions), the increase upon the 1912 total has in the

year just ended (when there have been no extensions) been £16,212. The receipts were £111,533. The number of miles run has been 8,795,466, an increase of 267,608. The number of passengers carried has increased by 3,646,242, having been 89,668,185, as against 86,021,943. The amount paid in fares per head of population had increased from 15s. 4d. to 16s. 3d.

The opening of the Lawnswood extension of the Corporation tramways has been delayed owing to the necessity of carrying out the recommendation of the B. of T. Inspector as to widening a portion of Otley Road to 60 ft.

**L. and Y. Railway Electrification.**—The Lancashire and Yorkshire Railway Co. has inaugurated new electric train services to Ormskirk, thus completing a through electrified system from Liverpool to Ormskirk. With the completion of the erection of the new battery station at the latter town a full service of express and stopping trains will shortly be substituted for the present limited number of trains.

**London.**—**CAMBERWELL.**—The Borough Council has received a reply from the L.C.C. to its letter drawing attention to the dangerous condition of the tram tracks in the borough, more especially between Camberwell Green and Rye Lane, to the effect that it is proposed to relay the lines in Peckham Road within the next six months, but that in the meantime steps would be taken to maintain the existing lines safe for vehicular traffic. This reply is not considered satisfactory.

**HACKNEY.**—The L.C.C. has advised the B.C. that it proposes at an early date to commence the reconstruction, for electrical traction, of the existing horse tramways in a portion of Ball's Pond Road.

**Manchester.**—The question of traffic congestion in Manchester has engaged a great deal of attention recently, and a report by the Lord Mayor at the Council meeting last week contained a recommendation that the Chairmen of the Improvement and Buildings Committee, the Watch Committee, and the Tramways Committee, together with the Surveyor, the Chief Constable, and the Tramways Manager (assisted by the tramways permanent way engineer) be instructed to visit, at an early date, either collectively or separately, and make full inquiries in other large cities in this country and abroad, and report the result for the benefit of the committees concerned, who could then prepare a joint report and recommendations to the City Council. The question was discussed for an hour, and several members strongly protested against the proposal to send deputations abroad. Ald. Bowes (Chairman of the Tramways Committee) said it might be that they would have to have 100 more cars, and they would have to consider the type of car best suited for the city. It would be reckless to build 100 double-deck cars, for it might be that in a few years they would have to scrap them for a small single-deck car. A resolution confirming the visits to cities in this country was adopted, but eventually it was decided to refer the whole report back for further consideration.

**Merthyr.**—The tramways aggregate receipts during the past quarter show an increase of £378.

**Nelson.**—A record in revenue in connection with the Corporation tramway undertaking is reported. The Committee estimated a profit of £450, but this has been exceeded by £1,000. During the 12 months 267,271 more passengers were carried than in 1911, in spite of the abnormally low summer.

**Newport (Mon.).**—Mr. F. J. Young, manager of the Corporation tramways, has drafted a report in which, amongst other recommendations for increasing the revenue of the service, he suggests an increase of ½d. in the fares on each of the stages of the various routes. It is also suggested that there should be an alteration in the charges for supply of electric power.

**South Shields.**—At a meeting of the T.C. on the 2nd inst., Alderman Wylie, in bringing up the report of the Tramways Committee, mentioned that quite recently they had completed seven years' working of the tramways. The last year, ended on March 31st, had been a record year, the revenue, which was over £30,000, was £1,500 more than it had ever been before. During the past seven years they had carried more than 50,000,000 passengers. During the past 12 months the traffic receipts amounted to £33,516, an increase of £1,472. The passengers carried numbered 8,456,688, an increase of 124,200, and the receipts per car-mile were 9'8d., an increase of ½d.

**Swansea.**—The aggregate tramway receipts total £14,546 for the past quarter, showing an increase of £1,089.

**Wallasey.**—The T.C. is to receive a recommendation of the Parliamentary Committee that a scheme should be prepared for promoting a Bill in Parliament with the object of effecting a number of improvements. It is proposed, among other things, to extend the promenade to Harrison Drive, and to link up New Brighton and Wallasey Village by means of a tramway along the sea front. Powers will also be sought to run motor-omnibuses.

**Wath.**—The inhabitants of Wath appear to be very keen upon a system of railless traction being taken up by the Councils of Wath and the surrounding districts—Wombwell, Darfield, Bolton and Thurnscoe. The Council has agreed to a suggestion that the scheme should be under the control of the municipalities, and is agreeable to the expenses being equally divided between the five Urban Councils.

**Wigan.**—At a meeting of the B.C. on April 2nd, Ald. Ashton reported that, for the year, the total receipts from tramway fares had been £71,290, as against £66,328 for 1912, or

an increase of £4,961. The total receipts were £73,004, as compared with £67,664, an increase of £5,339. The total payments were estimated to be £72,452, and the estimated profit £551. That position was very satisfactory to the Committee and to the management. Councillor Bradshaw said he hoped the present position would be the beginning of better days for the tramways. Last year they lost over £4,000, and to have turned that into a profit of £500 was a splendid achievement.

## TELEGRAPH and TELEPHONE NOTES.

**Aids for Deafness.**—It is said that deaf persons can hear better in one definite pitch than in others, and an instrument has recently been devised for the purpose of finding the exact pitch at which a partially deaf person's hearing becomes sensitive. It consists of a series of microphones, each having carbon balls of different size and quality, and a different internal resonance, in conjunction with a number of ear-pieces.

**Australia.**—The Commonwealth Court of Conciliation and Arbitration has resumed the hearing of the claims made by the Postal Electricians of the Federal Public Service, which was commenced as far back as August, 1912. The wages and conditions asked for are:—Mechanician, £450 per year; exchange foreman, maximum £400, minimum £250; foreman mechanic, maximum £400, minimum £250; inspector, maximum £400, minimum £250; senior mechanic, £222; mechanic, £192; junior and cadet mechanic, from £48 at 14 years of age, to £180 at 23 years of age. For battery-men, the wages claimed are:—Foreman battery-men, £222; battery-men, £172. Amongst the conditions asked for are that, where continuous day work is in existence, 44 hours shall constitute a week's work. Where time is worked over the stipulated hours it shall be paid for at the rate of time and a half for the first five hours, and after the first five hours double time. Where an officer is obliged, through no fault of his own, to remain in a grade for a period longer than five years, he shall be entitled to long-service increments of £10 for each five years he may remain in that grade. Entrance to the staff shall be by examination.—*Australian Mining Standard*.

**Imperial Wireless System.**—Mr. Harold Smith, Mr. Terrell and Mr. Harvey having resigned from the Select Committee on the Marconi Agreement, Sir F. Banbury, Mr. Butcher and Sir W. Essex have been appointed in their stead.

The scientific committee appointed to report on the merits of the existing systems of long-distance wireless telegraphy was at Copenhagen on Friday last, and visited the Poulsen station at Lyngby.

On Wednesday last week the Select Committee on the Marconi contract again examined Mr. Herbert Samuel, mainly with regard to the dealings in American Marconi Co. shares. He stated that the Treasury objected to the payment of a fixed royalty to the Marconi Co., regardless of the number of the company's patents in use, but the company would not agree to any reduction. Throughout the period between the acceptance of the tender on March 7th and the signing of the contract in July, communications were passing between the Government Departments and between them and the company with regard to the precise form of words to be adopted in the contract; that was the sole reason why the contract was not signed earlier than July 19th. Mr. Samuel stated that he had not personally met Mr. Godfrey Isaacs until December 11th, 1912, and that every interview between them had been muted and sent to the Committee. He had no reason to suppose that his subordinates had been "got at" or approached by interested parties in any way. He could not account for the origin of the rumours that had been circulated alleging corruption on the part of his department and other Ministers. The British Marconi Co. had a licence for transatlantic communication, and recently a licence for an experimental station in Ireland had been granted to the Poulsen Co. Licences were granted for one year only, but there was a reasonable expectation of their renewal. He first heard of the purchase of American shares about the end of July; he never attached any importance to it, regarding the companies as quite distinct.

On Thursday the Committee sat again, and took the evidence of brokers with regard to the America purchases, and on Monday further evidence of this nature was given.

Mr. Samuel made a statement regarding his previous evidence, explaining that a discrepancy as to the date when he first met Mr. Godfrey Isaacs was due to an oversight, whereby the report of an interview in August had not been included in the Blue-book which was presented to the Committee. It was an error on the part of a clerk. The Committee sat again on Wednesday.

**Telephone Transfer.**—The Court of Appeal has fixed April 15th for the hearing of cross-appeals arising out of the arbitration between the National Telephone Co. and the Postmaster-General, relating to the transfer of the telephone system to the Government.

**Wireless Alarm.**—Mr. Raymond Phillips, the inventor of a system of steering airships by wireless telegraphy, last week gave a demonstration of an instrument which distributes a danger signal capable of cutting out all wireless messages passing over a circle of 20 or 30 miles radius. Should there be no one on duty in the operating room, a siren is made to operate, arousing the officers and wireless experts to the fact that a neighbouring ship is in need of assistance.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" to-day.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

April 15th.—1,020,000 arc lamp carbons, 26,900 carbon-filament incandescent lamps, and bare hard-drawn copper cables, for the Melbourne City Council. See "Official Notices" March 28th.

April 29th.—20,000 yd. of 3-in. fibre conduit, for the Melbourne City Council. See "Official Notices" to-day.

**SYDNEY.**—May 12th. Fibre conduit for the City Council. May 26th.—Meters and glazed stoneware bridges. July 7th.—Arc lamp carbons. Specifications 10s. 6d. for each section, from City Electrical Engineer's Department. —*Australian Mining Standard*.

**TASMANIA.**—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

**QUEENSLAND.**—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" to-day.

**Barley.**—April 16th. The Electricity Committee invites tenders for general stores for the electricity works for 12 months. Mr. S. Derwen Jones, engineer.

**Belford.**—April 23rd. Carbon and metallic-filament incandescent lamps, for a year, for the Corporation. See "Official Notices" to-day.

**Belgium.**—April 26th. The Belgian Post and Telegraph authorities (Salle de la Madeleine), Brussels, are inviting tenders for the supply of 1,200 m. of subfluvial and 240 m. of submarine electric cables.

April 29th.—The municipal authorities of Schaerbeek, near Brussels, are inviting tenders for the supply of a large quantity of armoured high-tension cable, and for the establishment and equipment of 11 static transformer boxes. Particulars may be obtained from the Service de l'Ingenieur, 30, Rue de la Ruche, Schaerbeek.

**Bradford.**—April 17th. Three-phase and continuous current switchgear for two sub-stations, for the Corporation. See "Official Notices" April 4th.

**Bristol.**—April 16th. Arc lamp carbons and incandescent electric lamps for a year, for the Bristol Docks Committee. Mr. W. W. Squire, engineer, Cumberland Basin.

**Canada.**—WINNIPEG.—May 15th. City Light and Power Department. Two three-phase generators of 5,000 kw. for direct connection to 6,800-H.P. water turbines; also spare parts. Chairman, Board of Control. Deposit, £205. Particulars, Board of Trade Com. Intel. Department in London.

**Dover.**—The T.C. has decided to invite tenders for coal for the electricity works until April, 1914.

**Dublin.**—April 24th. High-tension and low-tension switchgear, cables and accessories, for the Corporation. See "Official Notices" to-day.

**France.**—SAINT JEURY, TARN DEPARTMENT.—April 27th. The Municipality requests tenders for the supply of two groups of electric lifts (elevateurs electriques) and accessory piping (conduite d'aspiration). Particulars at the Mairie.

**RENNES.**—April 18th. Supply and erection at the port of St. Malo-St. Servan of two centrifugal pumps, two electric motors and accessory lines; also for electric plant for opening and closing sluice gates and sewer outlets, and for working a footbridge over the same. Particulars from the Ingenieur-en-chef des Ponts et Chaussées, 3, Rue de Fougères, Rennes, France.

**Lisnaskea (Co. Fermanagh).**—April 14th. Gas engine and suction gas plant, dynamo and booster, battery, wood poles, overhead mains, &c., and switchboard, for the Lisnaskea Electric Light Co., Ltd. See "Official Notices" March 28th.

**Liverpool.**—April 18th. Electric light and power installation at the Highfield Infirmary, Knotty Ash, for the Select Vestry. See "Official Notices" to-day.

**London.**—L.C.C.—April 15th. Electrical installation at Jeffryes' Almshouses, Shoreditch. See "Official Notices" April 4th.

April 23rd.—Electrical installation at Shadwell High Street Special School. See "Official Notices" April 4th.

**FULHAM.**—April 23rd. 6,000 tons of nutty slack coal, for the B.C. Electricity Works. See "Official Notices" April 4th.

**SOUTHWARK.**—April 23rd. Two boilers, with fan, economiser and conveyors, two 1,500-kw. generators, four converters, switchboard, barometric condenser, cooling tower and steel structure, for the B.C. See "Official Notices" to-day.

**METROPOLITAN ASYLUMS BOARD.**—April 23rd. Electric light installation in the Laundry Block and Block No. 12 at the Grove Fever Hospital, Tooting Graveney. See "Official Notices" to-day.

**Manchester.**—April 15th. (a) Tramway rail bonds; (b) Hard-drawn copper trolley wire; (c) Steel tramway poles; (d) Span drive brackets for tramway poles; (e) Granite setts. Mr. J. M. McElroy, General Manager. For (c) and (d) a deposit of £1 ls. is required.

April 23rd.—E.H.T. switchgear, low-pressure steam and water pipes, hot-well, valves, &c., and two 50-H.P. three-phase motors for cooling towers, for the Corporation. See "Official Notices" to-day.

(Continued on page 607.)

## ELECTRICITY SUPPLY IN THE POTTERIES.

As many of our readers are, no doubt, aware, the modern Stoke-on-Trent came into being officially just three years ago, when the several contiguous towns, commonly known as the Potteries, and extending for a distance of about 10 miles along the Trent valley, were, by Act of Parliament federated into one county borough.

From the point of view of electricity supply, the amalgamation of the local government of these several adjoining towns, which comprise Burslem, Fenton, Hanley, Longton, Stoke and Tunstall, introduced a rather involved problem, not only because four of the towns had electricity undertakings in existence, three giving direct-current supplies in each case at a different pressure—(viz., Burslem, 220 and 440 volts; Longton, 230 and 460 volts; and Stoke, 240 and 480 volts)—

provisions of the Federation Act and the local conditions existing in the area.

As regards the Federation Act, a clause was inserted which compels the Gas and Electricity Committees in that area to so conduct the various works that no profit shall be made which can be handed over in reduction of the rates, and, in point of fact, each of the undertakings is conducted as a distinct business financially, not only the technical features but the charges for electricity varying in each concern, although, of course, the management of all is centralised under Mr. C. H. Yeaman, who took charge when the federation became an accomplished fact.

The Burslem works are about 3 miles north of the Hanley works, and the latter are 13 1/4 miles north of those at Stoke, and 3 miles north-west of those at Longton.

From Burslem the district of Wolstanton, outside the federated area, is supplied, and Tunstall, while Fenton, lying between Stoke and Longton, is supplied from both these places, pending the completion of a scheme for H.T. supply which has been agreed on.

FIG. 1.—THREE-PHASE E.H.T. SWITCHBOARD, NEW POWER STATION, STOKE-ON-TRENT.

FIG. 2.—INTERIOR OF THE NEW POWER STATION, STOKE-ON-TRENT, SHOWING THE TURBINE PLANT, MOTOR-GENERATORS AND SWITCHBOARD.

and one an alternating-current supply (Hanley, single-phase, 100, 200 and 400 volts), but also by reason of the

The population of the combined area is 235,000, but despite this it has a comparatively low rateable value, and

FIG. 3.—THREE-PHASE TO SINGLE-PHASE MOTOR-GENERATORS FOR SUPPLEMENTING THE HANLEY SUPPLY.

does not offer either in its inhabitants, who are mostly employed in the local pottery works, or in its industries, which employ a comparatively small amount of power, the scope for extensive electricity supply, which is found in some industrial boroughs having smaller populations. But once the federation scheme came into effect, it became necessary to settle on some definite future policy in regard to electricity supply in the area, in view of the future

FIG. 4.—CONDENSING PLANT, NEW POWER STATION, STOKE-ON-TRENT.

FIG. 5.—SKELETON PLAN OF THE FEDERATED AREA, SHOWING EXISTING GENERATING STATIONS.

growth of the demand, and this by no means easy task fell to Mr. Yeaman, who, after considering various schemes, eventually recommended the provision of a central power station to supplement by means of bulk supplies delivered to the existing stations, the generating capacity of the latter. This arrangement enables the most economical adjustment of load as between the bulk supply and local stations to be made, each local station being debited with the actual cost of the supply given to it.

The bulk supply scheme which has been carried out on these lines at a cost of £60,000 approximately, was officially inaugurated yesterday; it includes a central power house, which has been built on land adjoining the original Hanley generating station, and contains turbo-generating plant supplying three-phase current at 50 cycles and 6,000—6,600 volts; three-phase transmissions to the original stations at Stoke, Burslem and Longton, where H.T. transforming and converting plant has been installed; also the provision of three-phase to single-phase converting plant in the power station itself for feeding the Hanley network through the adjacent station.

The plant installed at the new power station consists of three standard pattern five-drum Stirling boilers, each of 18,900 lb. evaporative capacity and designed for a working pres-

FIG. 6.—VIEW OF THE STIRLING BOILERS, COAL BUNKERS, &c., AT THE NEW POWER STATION.

situated in the basement below, where also are electrically-driven Mirrlees-Edwards twin air pumps and Rees Roturbo centrifugal circulating pumps. The former are combined

station and local stations is of Westinghouse standard pattern, with remote-controlled solenoid-operated oil switches installed in masonry cubicles of the type shown in fig. 11.

It has been designed and is guaranteed to break on a dead short with 9,000 kW. (*i.e.*, the ultimate capacity of the station) behind it.

The board consists of 15 panels, including two alternator panels equipped with the necessary switchgear, induction-type ammeters, polyphase indicating wattmeters, power-factor indicators, and integrating watt-hour meters. Two E.H.T. summation panels are fitted with Bristol recording voltmeters, frequency indicators, wattmeters, watt-hour meters and recording ammeters. An E.H.T. bus-bar coupler panel is fitted with a synchroscope and the necessary gear for paralleling the alternators.

A Brown-Boveri automatic pressure regulator is provided and arranged to control one, two or three turbo-alternators; it is provided with three double-pole change-over switches suitable for use in the exciter field circuits; one pressure and one current transformer.

There are four outgoing feeder panels, each fitted with polyphase overload and inverse time-limit relays; four further panels are provided for controlling the H.T. and L.T. sides of the two 600-kw. motor-generator sets installed in connection with the Hanley supply.

Fivesets of Merz-Price protective gear are provided for future use in connection with the E.H.T. transmissions to the other stations.

An auxiliary board controls the station battery, the secondary station transformers and distribution.

FIG. 10.—WESTINGHOUSE ROTARIES AND TRANSFORMERS, LONGTON STATION.

with double-acting hot-well pumps, and are gear driven from 9-H.P. three-phase motors, while the latter are coupled to 48-H.P. three-phase motors, each delivering 132,000 gallons per hour over the cooling tower mentioned below. The condenser system is worked in conjunction with a Davenport cooling tower, one of three which can be accommodated between the existing buildings and the Caudon branch of the Trent and Mersey Canal, which is situated about 150 ft. behind the station.

A special suction dock, fitted with an electrically-driven "Brackett" screen, has also been constructed on the canal side, so that circulating water can be drawn from the canal or cooling tower pond as required; a separate motor-driven pump is installed for supplying make-up water to the cooling pond and hot-well.

As previously mentioned, the new station also contains what is in effect sub-station plant for supplying the Hanley single-phase network. This consists of two 600-kw. Siemens induction type motor-generators; the motors run on the 6,600-volt 50-cycle three-phase supply, and drive single-phase machines with exciters, generating current at 100 cycles and 2,200 volts for supplementing the plant in the adjoining Hanley station.

The whole of the three-phase switchgear installed both in the new power

FIG. 11.—E.H.T. SWITCH CUBICLES AT THE OLD STOKE GENERATING STATION.

FIG. 12.—LA-COUR MOTOR-CONVERTERS, E.H.T. SWITCH CUBICLES AND CONTROL PANELS, AT THE OLD STOKE STATION.

The switch and bus-bar cubicles at the power house occupy two parallel basement chambers beneath the operating switch-board, as shown in fig. 7; the auxiliary current for excitation and operating the remote control is supplied by a battery of 60 D.C. cells, and 300 ampere-hours capacity, in connection with which a 50-kw. Peebles motor-generator is installed for charging purposes. Our view (fig. 2) gives a good idea of the interior of the engine room, a feature of which is the arrangement of the switch panels flush with the wall, and on a platform raised only slightly above the general floor level; as will be seen, the engine room is excellently lighted, while the arrangement adopted also enables ample light to be obtained in the boiler house, and particularly on the firing floor, which is lighted by large side windows, and leaves nothing to be desired in this respect.

The whole of the three-phase E.H.T. mains running to the old stations were supplied and laid by Messrs. Callender's Cable Co.; they are of the paper-insulated, lead-sheathed, wire-armoured type, laid on the solid system in stoneware troughing.

Outside the generating station, the cables were drawn into 3-in. pipes, and a number of spare pipes are provided for future requirements.

The ends of the feeders in each station are finished off in cast-iron dividing boxes, the connections to the bus-bars being made by single-conductor rubber-insulated lead-sheathed cables. Some 23,000 yd. of E.H.T. main have been laid, as well as a considerable number of L.T. distributor cables for 230-460-volt service.

As regards the original stations, the Burslem works were opened in 1905, and supply at 440 volts for power and 220 volts for lighting on the three-wire continuous-current system. The plant, in combination with a Heenan & Froude three-cell destructor, comprises four water-tube Babcock boilers, three Howden-Dick, Kerr generating sets respectively of 100, 200 and 350-kw. capacity and an exhaust and live steam Belliss-Siemens turbo-dynamo of 600 kw., with one Storey condenser.

The Hanley works were opened in 1894, and supply on the alternating-current system at 2,000 volts, 100 cycles, single-phase, and distribute from some 60 sub-stations at 400 volts for power and 100 or 200 volts for lighting. The plant consists of two Ferranti alternators with rotating armatures, respectively of 300 and 600-kw. capacity, and two Howden-Westinghouse 500-K.V.A. sets with rotating fields, each fitted with a condenser. Steam is raised in nine Lancashire boilers, three fitted with Bolton superheaters and three with Bennis mechanical stokers. Some of the plant in regular use has been at work nearly 19 years.

The Longton works are in the local gasworks yard and commenced supply in 1901. Supply is given at 460 volts for power and 230 volts for lighting. The system is a direct current one with three-wire distribution. The plant comprises three steam generators, two two-pole machines of 150 kw. each, and one multipolar machine of 300 kw., all of E.C.C. make and driven by Belliss engines; three Babcock boilers fitted with chain-grate stokers. The station is run non-condensing. A Chloride battery takes the light loads.

The Stoke works were started in 1904, and supply power at 480 volts and lighting at 240 volts on a direct-current three-wire system. The plant consists of four Willans-Dick, Kerr generators, two of 150 kw. and two of 250 kw., with two condensing sets and a Tudor battery. Steam is supplied from one Lancashire boiler heated by the gases from three cells of a Meldrum destructor and two Babcock coal-fired boilers.

As regards the latter station, the engine room has been extended, and two 500-kw. La Cour motor-converters have been installed, together with three-phase and direct-current switchgear. Our views, figs. 11 and 12, show the general layout of this plant, fig. 11, in particular, giving a good idea of the cubicle work which is similar to that in the other stations.

The direct-current panels for the converters have been added to the original switchboard, situated on a gallery at the other end of the building. At Longton, two 300-kw. Westinghouse rotary converters with three-phase oil-cooled transformers have been installed, as shown in

fig. 10; the necessary switch panels have been added to the original switchboard shown in fig. 9, the three-phase panels, as in the other cases, being of the remote-control pattern, with the oil switches in cubicles in this case in an annexe to the station.

The Burslem plant extensions consist of two 600-kw. Westinghouse rotary converters with starting motors, boosters, and exciters, and the necessary transforming apparatus, three-phase and direct-current switchgear; this plant is arranged to run inverted in regular service, while the converting plant at Stoke could in emergency be similarly used.

Under Mr. Yeaman's management the commercial and technical control of the various undertakings has been centralised at St. Peter's Chambers, adjoining the Stoke-on-Trent Town Hall, where a complete suite of offices has been provided; it is almost unnecessary for us to add that so far as detail organisation can be provided to ensure the efficient control of the various undertakings which, as previously mentioned, are financially independent, this has been provided by Mr. Yeaman.

The scheme which has been successfully carried to completion aroused very great interest locally. The Electricity Committee, of which Alderman Lecce has been an indefatigable chairman, and Mr. Yeaman, its engineer, visited some of the best known electricity works in the country before submitting their proposals to the Council, and at a later date these were endorsed by Mr. J. F. C. Snell and thoroughly investigated by Mr. H. Ross Hooper at a Local Government Board inquiry, which resulted in the scheme being sanctioned.

It offers a satisfactory solution to a problem fraught with many difficulties, and undoubtedly places the federated towns in the best possible position, under existing circumstances, to develop their electricity supply undertaking on rational lines.

Our congratulations are due to Mr. C. H. Yeaman, the chief engineer, to whom we are indebted for facilities for preparing this short description.

## CONTRACTS OPEN.

(Continued from page 602.)

**Newcastle-on-Tyne.**—April 23rd. E.H.T. three-phase lead-covered paper cable and single conductor L.T. lead-covered paper cable, for the Corporation Tramways Committee. See "Official Notices" to-day.

**Newport.**—April 26th. One 2,000-2,500-kw. steam turbo-alternator, surface condensing plant, one 600-kw. D.C. generator, and E.H.T. and L.T. switchgear, for the Corporation. See "Official Notices" to-day.

**Salford.**—May 19th. Tenders invited for 10 car bodies and 10 Brill trucks. General Manager, 32, Blackfriars Street, Salford.

**Servia.**—April 26th. The Servian telegraph authorities in Belgrade are inviting tenders for the supply of 125 km. (about 78 miles) of insulated copper wire.

**South Africa.**—DURBAN.—May 28th. Electric meter-testing equipment for the Council. Copy of specification, &c., may be seen at Board of Trade Com. Intel. Dept. in London.

## CLOSED.

**Argentine.**—The Argentine Government has accepted the tender of the Augsburg Maschinenfabrik Gesellschaft, of Augsburg, for the supply of no less than 75 electric cranes for the port of Buenos Ayres, with six sets of spares, at a total cost of £18,500.

**Belgium.**—Eight German firms and only one Belgian submitted tenders last week to the municipal authorities of Ixelles for the supply of a large quantity of low-tension armoured cable, the lowest offer being that of Messrs. Felten & Guilleaume, of Mulheim-am-Rhine.

**Bury.**—The T.C. has accepted the following tenders:—  
W. T. Glover & Co., Ltd. Cable.  
British Westinghouse Co., Ltd.—Equipment for four cars.

**Canterbury.**—The T.C. has decided to purchase 13 of the General Electric Co.'s "Angold" electric arc lamps for main street lighting.

**Barrow.**—The T.C., on April 7th, approved of the acceptance of the tender of the B.I. and Helsby Cables, Ltd., for cable, at £1,324; also the offer of the British Westinghouse E. & M. Co., Ltd., for an additional 150-KW. rotary converter, together with the necessary rheostats, at £658; and for additional switchboards, at £183.

The Electricity Committee has accepted the following tenders:—

Engine and cylinder oils.—Jas. Light & Son, Ltd.  
Crank chamber oil.—Stern-Sonneborn Oil Co., Ltd.  
Metal polish.—Glaro Metal Polish Co., Ltd.  
Shellac varnish, &c.—W. Geipel & Co.  
Prepared tape.—A. Artaise.  
Insulating compound, &c.—Dusseck Bitumen Co.  
Switches, &c.—H. C. Barlow & Co.  
Tin lead fuse wire, &c.—Baxendale Bros.  
Carbons.—Ship Carbons, Ltd.  
Arc lamp globes, &c.—Falk, Stadelmann & Co., Ltd.  
Junction boxes, &c.—Sykes & Sugden, Ltd.  
Switch cut-outs.—B.I. and Helsby Cables, Ltd.  
Electric meters.—Chamberlain & Hookham, Ltd.  
Electrolytic mild meters, &c.—Reason Manufacturing Co., Ltd.  
Tantalum, &c., lamps.—Drake & Gorham, Ltd.  
Carbon filament lamps.—Radium Electric Co.  
Earthenware pipes, &c.—Doulton & Co., Ltd.  
Linen tape and rubber gloves.—L. Andrew & Co.  
Brass saddles and pins.—Veritys, Ltd.

**Cape Town.**—The following tenders were received for wiring the new factory of Lever Bros. (South Africa), Ltd., at Salt River:—

	Screwed conduit.	Close joint conduit.
R. M. Ross & Co. . . . . (accepted)	£225	—
Woods, Westerton & Co. . . . .	283	£251
Edward A. Shaw & Co. . . . .	322	201
Cunningham & Gearing . . . . .	394	350
Clyde Engineering Works . . . . .	398	350
R. G. Jack . . . . .	459	451

The tenders of Messrs. E. A. Shaw & Co. have been accepted for wiring the new factory and offices of the Premier Gate Fence and Wire Co., Ltd., also for wiring the Council Chamber and the new offices of the Cape Rural Council.

**Colchester.**—The T.C. has accepted the following tenders:—

H. G. Merry & Co.,—200 tons of Shirebrook nutty slack, at 15s. per ton, and 200 tons of Digby fidling nutty slack, 14s. 4d. per ton, for the electricity works.  
Joslings, Ltd.—Electric lighting fittings, &c.  
Williams & Co.—Rubber, fibre, &c.  
Stanford & Co., Dick, Kerr & Co., Ltd., and Malleable Steel Castings Co.—Tramcar fittings.

The T.C. has accepted Messrs. Chamberlain & Hookham's tender for ordinary and P.P. meters.

**Doncaster.**—The Tramways Committee has accepted the tender of the United Electric Car Co., Ltd., for supply of four covers to existing cars, at £143 each.

**East Ham.**—The T.C. has accepted the tender of the Engineering and Equipment Co. for the supply of about 6 miles of figure-8 trolley wire, at 8½d. per lb.

**Glasgow.**—The Tramways Committee recommends acceptance of the following:—

Copper trolley wire.—E. Le Bas & Co.  
Copper strip.—Leslie & Hall.  
D.U.C. wire.—London Electric Wire Co. and Smiths, Ltd.

**Godalming.**—Messrs. Rawlings & Co., of Lee, S.E., have secured the contract for installing plant and 400 to 500 lights and laundry motor and electric pump at Peper Harrow, Godalming, the residence of the Right Hon. Viscount Midleton.

**Heckmondwike.**—The U.D.C. has accepted the tender of the White Lea Colliery Co., Ltd., for 2,000 tons of coal for the electricity works, at 8s. 9d. per ton.

**Leeds.**—The offer of Messrs. Willans & Robinson, Ltd., for a turbo-alternator, condensing plant, pipes, &c., for £20,399, has been accepted by the Corporation.

**London.**—MARLEYBONE.—The tenders of the following have been accepted by the B.C.:—

Babcock & Wilcox.—Superheater, £500.  
British Insulated & Helsby Cables, Ltd.—High-tension cable, £107 per 220 yds.  
Union Cable Co., Ltd.—Ordinary underground cable.

The following tenders have been accepted for annual supplies to the Electricity Supply Committee:—

The London Electric Wire Co.—Fuse wires.  
Sloan Electrical Co.—Arc lamp carbons.  
Union Cable Co., Ltd.—Cables and pilot wires.  
Dusseck Bitumen Co.—Compounds.  
Siemens Bros. & Co., Ltd.—Tapes, &c.  
W. Lucey & Co., Ltd.—House service and main joint boxes, &c.  
Sykes & Sugden, Ltd.—House fuse boxes.  
Callender's Cable & Construction Co., Ltd.—Frames and covers.  
British Electric Transformer Co., Ltd.—Transformers.  
Ferranti, Ltd.—Meters and prepayment meters.  
British Insulated & Helsby Cables, Ltd.—V.I.R. cables.  
Edison & Swan Co., Ltd.—Accumulators.  
Geipel & Co., Ltd.—Arc lamp carbons.

**BATTERSEA.**—The B.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., at £1,920, for a water-tube boiler, fitted with superheater, chain-grate stoker and pipework, at the electricity station. The tender of Callender's Cable Co., Ltd., has been accepted for an annual supply of troughing and bends for cables, &c.

The contract for an automatic electric passenger lift in Admiralty House, Whitehall, the official residence of the First Lord of the Admiralty, has been secured by Messrs. A. W. Penrose and Co., Ltd.

**Luton.**—The T.C. has accepted the tender of the Brush Electrical Engineering Co., Ltd., for two 1,000-kw. turbo-alternators, complete with condensers, &c., at £4,600 each.

**Manchester.**—The Corporation Rivers Committee has accepted the quotation of Electromotors, Ltd., for a 6-B.H.P. motor for the Withington works.

The Tramways Committee has accepted the tender of Messrs. Walter Scott, Ltd., of Leeds, for 2,500 tons of steel girder tramway rails.

The tender of Messrs. Thomas Anderson, Ltd., for the electric lighting of the George Leigh Street Municipal School, has been accepted.

Amongst a very large number of tenders for general stores and services, as required during the ensuing year, which have been accepted by the Tramways Committee, are the following:—

Dyer & Young.—Assembled commutator segments.  
British Thomson-Houston Co., Ltd.—Motor and controller spare parts, motor cases.  
L. Andrew & Co.—Fibre barriers and circuit-breaker handles, &c.  
Dick, Kerr & Co., Ltd.—Motor and controller spare parts, &c.  
British Westinghouse Electric and Manufacturing Co., Ltd.—Motor and controller spare parts, &c.  
Estler Bros.—Controller fingers, &c.  
Kay & Co., Ltd.—Motor brush holders.  
Manchester Armature Repair Co.—Armature and field coils.  
P. R. Jackson & Co., Ltd.—Armature and field coils.  
Electro-Mechanical Brake Co., Ltd.—Grid resistances.  
H. Wallwork & Co., Ltd.—Grids for resistances.  
Brecknell, Munro & Rodgers, Ltd.—Trolley poles, &c.  
General Electric Co., Ltd.—Incandescent lamps, bells, lighting material, telephones, testing instruments, &c.  
Commercial Electric Co., Ltd.—Incandescent lamps, traction type.  
B. Gratrix, Jun., & Bro., Ltd.—Bell presses, arc lamp globes, sundry glass, &c.  
C. Macintosh & Co., Ltd.—Cells, insulation tape, goloshes, rubber gloves and gauntlets, &c.  
Eckstein, Heap & Co., Ltd.—Spare parts for Gilbert arc lamps.  
Meisrowsky & Co.—Amber mica segments for commutator bars, &c.  
Saulcliffe (Crumpton), Ltd.—Fibre sheets and stick fibre.  
Spicer Bros., Ltd.—Red fibre paper, leatheroid strips, insulation paper and cloth.  
British Nylonite Co., Ltd.—Celluloid.  
Connolly Bros., Ltd.—P. and B. tape, power and lighting cables.  
J.R., G.P. and T.W. Co., Ltd.—Linen tape.  
Inghin, Johnson & Co., Ltd.—Insulation varnish.  
R. W. Blackwell & Co., Ltd.—Insulating compound.  
Morgan Crucible Co., Ltd.—Carbon brushes, &c.  
Baxendale & Co., Ltd.—Arc lamp carbons, turpentine, &c.  
Alfred Wiseman, Ltd.—Overhead equipment insulating material, pole switches.  
General Patents Co.—Trolley heads.  
Fleming, Birby & Goodall, Ltd.—Trolley wheel bushes and spindles.  
Souper & Callaghan.—Automatic sanding devices.  
John Taylor.—Tubular sand controllers.  
Hudson & Bowring, Ltd.—Automatic life-guards.  
Philips & Co.—Folding side-guards.  
T. Bolton & Son, Ltd.—Copper wire, copper strip and sheet copper.  
C. Clifford & Son, Ltd.—Brass wire.  
F. Smith & Co., Ltd.—Steel wire.  
Richard Johnson & Nephew, Ltd.—Galvanised steel wire cable and rope.  
I. Bentley & Co., Ltd.—Lubricating oils, &c.  
J. Stoddart & Son.—Paraffin oil.  
British Petroleum Co., Ltd.—Motor spirit.  
Hardman & Holden, Ltd.—Resorcinol oil.  
Newton, Chambers & Co., Ltd.—Disinfecting fluid and powder.  
Reliance Manufacturing Co.—Liquid metal polish.  
Till & Whitehead, Ltd.—Sundry workshop tools, plant and appliances, &c.  
Carborundum Co., Ltd.—Special blocks for grinding steel rails, &c.  
Lundoe Emery Works Co., Ltd.—Special wheels for grinding steel rails, &c.  
West Bromwich Spring Co., Ltd.—Truck springs, &c.  
J. Billingham.—Brake chains.  
Brampton Bros., Ltd.—Gear chains for brakes.  
Miles, Voss & Co., Ltd.—Car fenders.  
Cammell, Laird & Co., Ltd.—Tramcar axles.  
J. Brown & Co., Ltd.—Tramcar wheel tires.  
F. W. Rowlands & Co.—Gear and pinion wheels.  
National Rail and Tramway Appliances Co., Ltd.—Iron castings, brake block castings.  
Interchangeable Brake Block Co., Ltd.—Chilled iron brake block castings.  
Moston Malleable Castings Co.—Malleable iron castings.  
Leys Malleable Castings Co., Ltd.—Gear-case castings.  
S. Peace & Sons, Ltd.—Steel castings.  
Armstrong Oiler Co., Ltd.—Lubricant pads for axle boxes.  
J. Carr & Sons, Ltd.—Trolley cord.  
Chamberlain & Hookham, Ltd.—Ampere-hour tramcar meters.  
British Oxygen Co., Ltd.—Oxygen gas and acetylene gas.  
Thermit, Ltd.—Thermit welding material.

**Warrington.**—The B. of G. has accepted the tender of Mr. H. Bibby for electrical fittings and sundries for six months.

**Nelson.**—The T.C. has accepted the tender of Messrs. Briggs, Jones & Gibson, of Manchester, for uniforms and caps for the Light Railway men.

**Newport (Mon).**—A contract for carbon-filament lamps and radiator lamps for the Corporation Electric and Tramways Department for the ensuing 12 months, has been placed with Messrs. Siemens Bros. Dynamo Works, Ltd.

**Plymouth.**—The Electricity and Street Lighting Committee has accepted the following tenders received for the supply of stores and materials during the ensuing financial year:—

Carbons.—Crompton & Co.  
Engine waste.—Northern Waste Co.  
House meters.—Ferranti, Ltd.  
Oil, &c.—A. Hoppes & Sons, Ltd.; Stern-Sonneborn Oil Co.; and M. Wells and Co.

The chairman and the electrical engineer were authorised to purchase one ton of electrolytic copper and half a ton of sheet copper.

**Russia.**—ST. PETERSBURG.—It is stated that the municipal council of St. Petersburg has placed an order with the Russian A.E.G. for the supply of tramcars of the value of 905,000 roubles (£90,500). Orders have also been allocated to the firm of Filzner and Gambert, which is closely associated with the German Borsig Works, of Tegel, for the sum of 371,930 roubles (£37,193), and with the Russian Westinghouse Co. for the amount of 315,427 roubles (£31,542).

**Sheffield.**—The City Council has accepted the tender of Messrs. R. White & Sons, at £587, for the construction of an aerial ropeway at the Neepsend power station.

Quotations have been received from the Post Office, amounting to £965 15s. per annum, for installing 50 fire alarms with boxes, and to £999 15s. per annum for 50 fire alarms with pedestals, on a ten years' agreement. The consideration of the quotations has been deferred pending the result of further inquiries about the "Ganewell" system.

**Southend-on-Sea.**—Mr. G. Branlik has received a contract for his current limiters for the Corporation for the next two years. He has been supplying these limiters to the Corporation for several months past.

**Stretford.**—The U.D.C. has accepted the tenders of the Union Cable Co., amounting to £706 and £67, for supplies of cable.

**Watford.**—The U.D.C. has accepted the tender of the Union Electric Co. for a motor-generator, at £190, and that of the Electric Construction Co., for new machine panels and reconstructing existing panels.

**Woolwich.**—The B.C. has accepted the tender of Messrs. Babcock & Wilcox, Ltd., at £7,865, for two boiler units, with chain-grate stokers, for the electricity department. With reference to the supply of current to the L.C.C. hotels at Eltham, referred to elsewhere, the tender of the British Electric Transformer Co. has been accepted, at £114, for four air-cooled transformers.

## FORTHCOMING EVENTS.

**Junior Institution of Engineers.**—Friday, April 11th. At 39, Victoria Street, S.W. Paper on "Methods of Regulating and controlling Working of Electric Accumulators," by Mr. G. C. Allingham.

Saturday, April 19th.—At Caxton Hall, Westminster. Bohemian smoking concert.

**Physical Society.**—Friday, April 11th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "Some Errors in Magnetic Testing due to Elastic Strain," by Messrs. A. Campbell and H. C. Booth, and "Note on Cathodic Sputtering," by Dr. G. W. C. Kaye.

**Institution of Electrical Engineers (Scottish Section).**—Tuesday, April 15th. Annual general meeting.

(Newcastle Section).—Monday, April 14th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "The Formation of Deposits in Oil-Cooled Transformers," by Dr. Michie.

(Students' Section, London).—Wednesday, April 16th. At 7.45 p.m. At the Institution, Embankment, W.C. Paper on "Alternating-Current Railway Signalling," by Mr. T. J. Hornblower.

**Illuminating Engineering Society.**—Tuesday, April 15th. At 8 p.m. At the Royal Society of Arts. Paper on "Standard Clauses for Inclusion in a Specification of Street Lighting," by Mr. A. P. Trotter. Discussion open to members of the I.E.E., I.G.E. and I.M. and C.E.

**Electrical Trades Benevolent Institution.**—Wednesday, April 16th. At 7 p.m. At the Trocadero Restaurant. Festival dinner. Tickets from the Secretary, 18, Park Mansions, Vauxhall Park, S.W.

**Institution of Mechanical Engineers.**—Friday, April 18th. At 8 p.m. Address by the President.

**Royal Institution.**—Friday, April 18th. At 9 p.m. Discourse on "Applications of Polarised Light," by Dr. T. M. Lowry.

**Association of Engineers-in-Charge.**—Saturday, April 12th. At 6.15 p.m. At the Holborn Restaurant. Annual dinner.

Saturday, April 19th. Social. Bohemian concert.

**Association of Electrical Station Engineers (Bradford Section).**—Tuesday, April 15th (Wednesday, April 14th). At 7 p.m. Meeting at the Mechanics' Institute, Bradford.

(Manchester Section).—Thursday, April 17th. At 7.30 p.m. Meeting at the Exeter Café, Deansgate, Manchester.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer.—LIEUT.-COL. H. M. LEAF.

The following orders have been issued:—

Monday, April 14th.—"A" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Tuesday, April 15th.—"B" Company. Company training, 7 to 10 p.m.

Thursday, April 17th.—"C" Company. Recruit training, 7 to 10 p.m.; company training, 7 to 10 p.m.

Friday, April 18th.—"D" Company. Company training, 7 to 10 p.m.

Saturday, April 19th.—Headquarters will be opened for regimental business from 10 a.m. till noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj. For Officer commanding L.E.E.

**Radium Treatment.**—Dr. Saubermann, of Berlin, lecturing before the members of the Röntgen Society, recently stated that water containing radium emanation had great possibilities. The water was artificially charged with radium emanation to a much higher degree than the water found in any natural spring. On the Continent remarkable results had been attained by this treatment in the whole range of diseases of metabolism, including gout, rheumatoid arthritis, nephritis, and arteriosclerosis.

## NOTES.

**Reduction in German Wire Lamp Prices.**—After the lapse of a year and a half since the last reduction in the prices of metallic-filament lamps was made by the principal makers in Germany, further concessions have now been granted in that country. As on previous occasions, the initiative in the matter has again been taken by the A.E.G., which states that the new prices are 1s. 1d. for lamps of 5 to 10 c.p., as compared with 1s. 6d. hitherto, 1s. 9d. for lamps of from 10 to 50 c.p., as against 2s. 6d., and 2s. 6d. for lamps of 100 c.p., as contrasted with 3s. 6d. The company explains that the very considerable increase in the sales both at home and abroad, as well as the introduction of the drawn metallic wire, has brought about a cheapening of the cost of production, which permits of sale prices being reduced. Merchants require reliable gross prices and a rebate, which as far as practicable is to represent their profits. The company wishes to place a limit on the present uncertainty of the market by regulating the rebates in connection with the reduction in the gross sale prices. It will perhaps be remembered that the previous price concessions were made in October, 1911, when the right of use of the wire lamp patents of the United States General Electric Co. was secured by the A.E.G., the Siemens & Halske Co., and the German Incandescent Gas Light (Auer) Co., and this privilege was subsequently extended to the Bergmann Co. The action of the A.E.G. on the present occasion has been speedily followed by the Siemens & Halske Co., which also announces a reduction of 25 per cent. in the prices of Wotan and tantalum lamps, whilst a lowering of the net prices charged by the Incandescent Gas Co. has likewise been made, although not to the same extent.

The price reduction on the Continent will not be followed by a price reduction in England, as the patent situation here is entirely different.

**Inquiries.**—A correspondent asks where "mann marble" can be obtained. Another correspondent asks for addresses where model electric laundries may be seen.

**Electric Lighting Installation.**—In reference to the case of Watson v. Claytons, reported in these columns on March 21st, the plaintiffs, Messrs. Watson, Marsh & Co., 347, High Road, Brondesbury, write to say that the claim of £60 was for a complete inside installation of incandescent lighting, together with four outside arc lamps with special covers. Messrs. Claytons claimed that the contract had not been carried out, inasmuch as the special arc lamp covers were not as per Messrs. Lockwood and Bradley's pattern, whereas Messrs. Watson, Marsh & Co.'s case was that Messrs. Lockwood & Bradley's covers were not specified by them, and that in any event those covers, being an extra charge over and above those ordered by them, had nothing to do with the amount claimed by them.

**Foreign Trade in March.**—Last month's trade returns show an increase of £180,531 in imports, and one of £975,976 (2'3 per cent.) in exports, but it is not possible to make a fair comparison with 1912, for last year the coal strike was in progress. We may, however, select the electrical and machinery figures from the published reports, as below. From these it appears that although there are two working days less in the 1913 reckoning, the export figures are very substantially higher:—

Imports.				
Electrical goods and apparatus, excl. machinery & un-insulated wire	Month of March.	Inc. or dec.	Three months, 1913.	Inc. or dec.
...	£117,190	— £19,080	£374,339	— £36,922
Machinery...	639,942	+ 31,975	1,833,892	+ 201,409

Exports.				
Electrical goods and apparatus, excl. machinery & un-insulated wire	Month of March.	Inc. or dec.	Three months, 1913.	Inc. or dec.
...	£815,675	+ £153,015	£1,510,256	+ £349,518
Machinery...	2,764,960	— 34,212	8,590,063	+ 777,593

**The Batti-Wallahs.**—At the informal meeting of the Batti-Wallahs' Society, on Wednesday last week, during the evening, between the other turns, stanzas caricaturing certain members were read, much to the amusement of the company. The next function—a smoking concert—will be held at the Holborn Restaurant, on Friday, April 18th, and not April 28th, as stated in the official programme. This is the last smoking concert of the season.

**Fatality.**—USHAW MOOR.—An inquiry was held at Ushaw Moor, Co. Durham, on the 3rd inst., by Mr. R. A. Shepherd, Deputy Coroner, into the circumstances of the death of Clarence Herbert Allen, 18, an electrical improver, who was killed at Ushaw Moor sub-station on the Monday preceding. Norman Vincent Raven, of Eldon Place, Newcastle-on-Tyne, supervising electrical engineer for the Newcastle Electric Supply Co., said he was in charge of a contract which Messrs. Ryrolle & Co., of Hebburn-on-Tyne, were carrying out for his company at Ushaw Moor, and he gave instructions for the carrying-out of the work. There were three chambers, and the 20,000-volt chamber was reached from the transformer chamber by a wooden staircase. He had told the joiner that he must not go into the 20,000-volt chamber, and gave instructions that the pilot cable was not to be drawn into that chamber unless the inspector was present. Alphonsus Lawton, joiner, of Sunderland, said that on Monday he was told by the foreman to proceed with work on a 3,000-volt cable, and that if

necessary he was to get assistance. Finding he could not get assistance, he proceeded with the drawing of the pilot cable into the 20,000-volt chamber. He knew that certain parts of the switchgear were "alive." Allen had to pull the pilot cable through a hole, and witness told him not to go near where the live contacts were, and not to go higher than the switch, but just to stand on the floor of the chamber. After Allen had pulled the cable partly through, he asked, "Have I got enough?" Witness replied that he would be there in a minute, and went upstairs, when he heard a hissing noise. On getting into the 20,000-volt chamber, he was surprised to see the youth on top of the switch, in a kneeling position, with his head about 5 in. from the "live" contact. He gave Allen a slight pull by the coat, and saw the sparks pass from the contact to his head. There was no need for Allen to get on the top of the switch. What he should have done was to have knelt underneath the switch, and pulled the pilot cable through. Allen was badly burned, and although artificial respiration was applied, it was unsuccessful. Witness had a danger pass with him, but it was not signed, as there was no one there to sign it. Mr. Robinson (representing Messrs. Reyrolle) complimented witness for his brave act in attempting to pull Allen away from contact with the electric current. The Coroner said it would appear to have been easier to pull the cable above the switch rather than underneath. Apparently the deceased had got on top of the switch, and in pulling the cable through probably he had tilted his head, and caught one of the contacts. He expressed the opinion that they could not attach blame to anyone, as it seemed to have been a pure accident. The jury returned a verdict of "Death from accidental electrocution," and recommended that there should be more safeguards at the sub-station, and that the rules should be more stringently enforced. Although Allen was employed by Messrs. Reyrolle, he was not at the time of the accident working upon switchgear of their make.

**SHEFFIELD.**—According to the *Sheffield Daily Independent* an explosion occurred at the Devonshire Works at Staveley on Wednesday last week. From facts elicited at the inquest it appears that when the accident occurred several men were engaged in turning steam from an engine into an exhaust turbine. In order to do this they had to close one valve and open another. The men stood on the top of an oil separator, about 12 ft. from the ground. Martin Stops, 20, a fitter, happened to step back, and got pinned between two parts of the valves. Mr. Ronald Fowler, the engineer-in-charge, said that when the deceased was pinned, he called out to another man to tell the engineman to stop the engine. Whilst witness's back was turned a man named Wilson closed another valve, with the result that there was no outlet for the steam. They had no time to jump from the separator before an explosion occurred, and they were all thrown to the ground. Being pinned, Stops received the full force of the explosion, and he died soon afterwards. The Coroner said that Wilson seemed to have lost his head in closing the valve on his own authority. The jury returned a verdict of "Accidental death."

**Annual Dinners and Socials.**—**LONDON.**—At the Pier Hotel, Cheyne Walk, Chelsea, on March 15th, the third annual dinner and concert of the Underground Electric Railwaymen's Sick Benefit Club was held. Mr. J. W. Towle, chief engineer, presided, and he was supported by Mr. P. R. Wray, sub-station engineer, Mr. T. O'Reilly (club secretary), Mr. A. McCutcheon (treasurer) and others, the company numbering nearly 100. The toast "The Power Station" was proposed by Mr. S. L. Phillips (shift engineer) and responded to by Mr. Wray. "The Club" was proposed by Mr. McCutcheon, and the club secretary replied, thanking all who had contributed to the success of the annual dinner and referring to the continuous increase in membership since the club was started in 1906. The number of members for 1912 was 168; the sick pay was £43 19s. 6d. and funeral allowance £15 8s., leaving a surplus returned to each member at the end of the year of £1 8s. 4d. After the toast of "The Chairman" had been disposed of the gathering enjoyed a programme arranged by Messrs. Cooper and Nash.

The fourth annual Bohemian Concert in connection with the Electrical Installations, Ltd., Athletic Club, was held on April 7th, at the Oval Hall, Kennington. Before an audience of some 300 to 400 people, consisting of the staff and their friends, an able body of entertainers carried through a most excellent variety programme. At the opening of the proceedings Mr. Stanley C. Russ, president of the Club, alluded in a few suitable words to the successful development of the club, and informed the members that he had been successful in his negotiations with the City of London Cricket Club, in renting a portion of their exceptionally fine ground at Acton on behalf of the staff, and also that the E.J., Ltd., Cricket Club had entered for the Western League.

**Institution and Lecture Notes.**—**ASSOCIATION OF CONSULTING ENGINEERS.**—The report of the Committee for the year 1912, which has just been issued, recapitulates the circumstances under which the Association came into existence, and gives the qualifications and duties of members, as well as the definition of a "consulting engineer." An International Congress of consulting engineers and engineering experts is to be held at Ghent during the running of the Exhibition there this year, and the creation of an International Federation of Associations of Consulting Engineers is contemplated. The Association numbered 80 members at the close of the year, and is the largest society of its kind in existence. The Committee was unable to accept the Standard Conditions of Contract prepared by the B.E.A.M.A., holding that it is not possible to frame one set of conditions applicable to all contracts. The Committee was requested to draw up a scale of professional fees for the use of members, but decided that

it would not be advisable to attempt to stereotype rates of remuneration. Referring to a recent incident in Parliament, relating to the employment of Government officers to give advice as consulting engineers in their private capacity, the Committee comments on the disadvantages of the practice, which in future is not to be followed without the consent of the head of the Department concerned. The fact that the obligation to pay an engineer's fees is outside the jurisdiction of taxing masters is pointed out by the Committee. It is proposed to issue reports to the members from time to time, dealing with subjects of interest to them. The accounts for 1912 show income £130, expenditure (covering also 1908-11, £38) £113, balance £17. A full list of members is appended to the report, together with the code of ethics of the American Institute of Consulting Engineers and their schedule of fees. A little booklet containing the rules and practice of members of the Association has been issued, to enable them to put these before their clients and others.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS (EAST OF SCOTLAND BRANCH).**—At the last monthly meeting, at Dunfermline, a paper by Mr. H. G. Humphry (H.M. Junior Inspector of Mines) on the "Supervision of Electrical Plant," was discussed. In reply to criticisms, Mr. Humphry said that sets of printed instructions similar to those suggested in his paper would tend to lighten rather than increase the responsibilities of managers. In reply to a remark that persons authorised to work switchgear under Rule 11 should not be allowed behind a switchboard for the purpose of cleaning, the Inspector thought that this was a question that must be decided by each manager for himself.

**SOCIETY OF ENGINEERS (INC.).**—An essay on "How to Improve the Status of Engineers and Engineering, with Special Reference to Consulting Engineers," was read by Mr. W. Ransom on Monday, April 7th. This was awarded the second prize in the Status Prize Competition last year, no first prize having been awarded.

**GREENOCK ELECTRICAL SOCIETY.**—This Society held its business and social meeting on March 28th, with Mr. J. A. Robertson, the honorary president, in the chair. After tea the chairman congratulated the company upon the success of the Society since it was formed last year. He knew of no business or profession in which it was more necessary that there should be a free interchange of opinion among the members than electrical engineering, for it had more problems requiring discussion than any other branch of engineering. The Society was primarily intended for the benefit of the younger members of the profession, who would obtain knowledge from the experiences of older members. The syllabus showed that subjects dealing with nearly every branch of applied electricity, from wireless telegraphy and electric cooking down to the more prosaic worries of a shift engineer, were dealt with. The chairman concluded with a reference to the services of the president (Mr. J. H. Parker) and the secretary (Mr. W. B. Smith). The secretary's report showed that there were 17 hon. members and 77 ordinary members. Twelve meetings were held, with an average attendance of 37. Six visits were paid to works. Mr. W. A. Toppin has been appointed this year's president, and Mr. A. Hurry secretary, Mr. Robertson continuing as hon. president.

**INSTITUTION OF MECHANICAL ENGINEERS.**—The summer meeting of this Institution will be held in Cambridge from Monday, July 28th, to August 1st. A provisional programme has been issued regarding receptions, a garden party, excursions to Ipswich and Bedford, and visits to works, laboratories, &c., in Cambridge.

**IRON AND STEEL INSTITUTE.**—The programme of the annual meeting of this Institute shows that the proceedings will open on Thursday morning, May 1st, at the Institution of Mechanical Engineers, Storey's Gate, S.W. The daytime will be occupied with papers and discussions, and at night the annual dinner will take place at the Hotel Cecil. Mr. Arthur Cooper, the president, presiding. The meeting will continue on May 2nd. Among the papers that are down for reading is one by Mr. Andrew Lamberton, on "A New Form of Electrically-driven, Two-high, Continuous-running, Reversing Mill"; also one by Dr. J. Puppé entitled "Rolling-Mill Practice in the United States, Part II." The autumn meeting of the Institute takes place at Brussels, from September 1st to 5th.

**INSTITUTION OF ELECTRICAL ENGINEERS (MANCHESTER SECTION).**—The annual meeting of the above Section was held on Tuesday last, when voting took place for the chairman, vice-chairman and Committee for the next session, which resulted as follows:—

Chairman.—Dr. E. W. Marchant.

Vice-chairmen.—Dr. E. Rosenberg, Mr. P. P. Wheelwright.

Committee.—Messrs. C. C. Aitchison, C. J. Beaver, K. Faye-Hansen, H. J. Hawkins, E. L. Hill, G. Layton, A. E. Mackenzie, E. M. Hollingsworth, B. Thomas, B. Welbourn, F. H. Whysall, Prof. Miles Walker.

Votes of thanks were accorded to the Vice-chairmen, Secretary, and Committee for their work during the session, also to the Council of the University for kindly granting the use of the Physical Laboratory for holding the meetings of the Section.

After the formal business of the meeting was concluded, Prof. E. Rutherford, of the Manchester University, gave a lecture on "The Electrical State of the Atmosphere." The lecture was illustrated by lantern slides and was listened to with great interest.

Prof. Marchant, in proposing a vote of thanks to the Chairman, stated that Mr. Day had suffered a relapse, and that it seemed certain he would not be able to resume his active duties for some time.

The report of the Committee states that the Section comprises 813 members, an increase of 23.

At a meeting of the HUDDERSFIELD ENGINEERING SOCIETY on Thursday last week, Mr. J. E. Schofield (Bradford) read a paper on "Electricity in Textile Mills."

**INSTITUTION OF ELECTRICAL ENGINEERS.—EXAMINATIONS.**—Regulations for the examination of candidates for Associate Membership have now been issued. Examination will be required on and after June 1st, 1913. In lieu of examination, candidates will be allowed to present a thesis, paper, or other contribution to electrical knowledge, but they will be liable to be examined orally thereon. The examinations will be held in London twice annually on two days (Friday and Saturday) about the end of April and end of October. Examinations may also be held at other centres, if the number of local entries warrants such arrangements.

Applications to enter for the examination must be made not later than March 1st for the April examination, and not later than September 1st for the October examination. The examination fee will be two guineas for the first entry, and one guinea for any subsequent entry. Fees will not be returned.

The subjects of examination will be as follows:—Part I: An English essay; or translation into English of passages in one of the following languages, to be selected by the candidate: French, German, Italian or Spanish. Applied mechanics; and either general elementary physics or chemistry. Part II: Two papers on one of the following subjects, to be selected by the candidate:—Electricity supply; electric lighting and power; electric traction; telegraphy; telephony; application of electricity to mines; electro-chemistry and electro-metallurgy; manufacture of electric machinery (including works management); design of electric machinery and apparatus. No detailed syllabus of the subjects of examination will be published.

Exemption from the whole of the examination is secured by any Engineering Degree of any University in the United Kingdom or in the British Dominions over seas; by Whitworth Scholarships, and by the Diplomas or Certificates in electrical engineering granted by the following bodies:—The City and Guilds Engineering College; City and Guilds of London Institute (Honours Grade); Faraday House; Finsbury Technical College (day course); King's College, London; University College, London; Heriot-Watt College, Edinburgh; Royal Technical College, Glasgow; Municipal School of Technology, Manchester; Armstrong College, Newcastle-upon-Tyne.

Candidates who have obtained a Science Degree from any University in the United Kingdom or the British Dominions will be exempted from Part I of the examination.

**I.E.E. PARIS VISIT.**—Particulars have now been issued regarding the Paris meeting, to be held on May 21st to 24th next, in conjunction with the Société Internationale des Electriciens. Members will leave London at 11 a.m. on Tuesday, May 20th, arriving in Paris at 6.45 p.m. On Wednesday morning the inaugural meeting will be held at the Conservatoire des Arts et Métiers, when there will be a discussion on the electrification of railways, or, alternatively, an inspection of the exhibits at the Conservatoire. In the afternoon there will be alternative visits to the generating stations of the Electricité de St. Denis and of the Triphasé at Asnières, and to the Sèvres porcelain factory. In the evening the Société Internationale will give a reception and banquet at the Palais d'Orsay.

On Thursday morning there will be a discussion on Long-distance Transmission of Electrical Energy by (a) Continuous Current, Thury System (paper by Mr. J. S. Highfield); (b) Three-phase Current (paper by M. Maurice Leblanc), and a number of alternative visits to places of interest. In the afternoon, M. Eiffel will hold a reception at the Eiffel Tower, and there will be an inspection of the wireless installation. An alternative visit has been arranged to the electrical installations of the Métropolitain, the Nord-Sud and the Compagnie des Omnibus.

On Friday morning, the discussion at the Conservatoire will be continued, and alternative visits will be arranged. In the afternoon there will be an excursion to Chantilly.

On Saturday morning, M. Claude will read a paper on "Lighting by Means of Vapour-Tube Lamps" (illustrated by experiments), and there will be a lecture by Commandant Ferric on "Wireless Telegraphy." The rest of the day will be spent in visits to Versailles, the Aerodrome at Buc, and the Ouest-Etat Railway, returning to Paris by special electric train.

The cost, exclusive of hotel expenses, will be five guineas each. **ROYAL SOCIETY OF ARTS.**—On Wednesday evening, a paper on "Electric Supply in London" was read by Mr. Frank Bailey, M.Inst.C.E., M.I.E.E., joint managing director, City of London Electric Lighting Co., Ltd. The chair was taken by Mr. A. A. Campbell Swinton.

**INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS.**—A paper on "Telegraphic History," read before the above Institution last year by Mr. H. R. Kempe, has just been printed. It covers the period since the year 1837, in which Sir Charles Wheatstone, the pioneer of modern practical telegraphy, took out his first patent. As a former pupil of Wheatstone's, and the oldest representative of the Postal Telegraph Engineering Branch, the author was able to relate a series of extremely interesting reminiscences, and to illustrate his subject with numerous examples of apparatus and systems, tracing the development of the science through its earlier stages.

**THE PRODUCTION MANAGERS' ASSOCIATION.**—The inaugural dinner of this Association was held on Tuesday night at the Holborn Restaurant. The subject of the evening was "Labour Problems," introduced by Mr. W. Gamble, managing director of Messrs. A. W. Penrose & Co., Ltd., who was in the chair.

**Electricity Supply Rifle League.**—A post match between teams representing Hackney Electric Rifle Club (Hackney Borough Council) and the Brompton and Kensington Rifle Club in the above League resulted in a win for the latter by 41 points. The scores were:—Hackney 520 (best score, Hilling 94); Brompton and Kensington 561 (Beale 97).

**Appointments Vacant.**—Meter superintendent (£104), meter tester and erector (30s.), jointer-wireman (32s.), arc lamp trimmer (27s.) and junior shift engineer (28s.), for the Guildford Electricity Supply Co. Ltd.; charge engineer, for the Ilford U.D.C. Electricity Works (£78); sub-station shift engineer, for the Bristol Corporation (30s.); switchboard attendant for the Portsmouth Corporation (25s.); station assistant and mains engineer for the City Electricity Works, Londonderry (£2); junior assistant electrical engineer for the Oldham Corporation (£80); tramways manager, for the Southport Corporation (£240). See our advertisement pages in this issue.

**Football.**—During the football season down to date, the Beeston Erission Club have played 26 matches, winning 19, while five were drawn and two lost. They scored 100 goals to 33. This is for all matches, League, Cup and friendly. The club won the Notts. Intermediate Cup, scoring 11 goals to 1, and they are runners-up in the Notts. Combination League. The League record is—Played 17, won 11, drawn 1, and lost 2, scoring 58 goals against 19.

**Association of Electrical Station Engineers.**—A meeting was held on Friday last at Grimsby. Mr. A. Nottall was in the chair, and the questions of increased salaries, six day week and certificates for qualified electrical engineers were discussed, after the reading of a letter from the hon. sec., replying to some queries on these points. The replies of the hon. secretary being considered satisfactory, the meeting passed a few resolutions with regard to future policy to be considered by the London Committee. It was suggested that the views of chief electrical engineers be ascertained with regard to the A.E.S.E. Mr. W. M. Fowler was elected delegate to attend the London conference, and it was decided to hold another meeting before the conference to instruct the delegate on matters which the Grimsby district wishes to lay before the conference.

**Late Legal.**—**BATTERSEA BOROUGH COUNCIL v. COUNTY OF LONDON ELECTRIC SUPPLY CO.**—In the Chancery Division on Wednesday, April 9th, Mr. Justice Joyce heard a motion in this action for the purpose of obtaining a decision as to whether the defendants were entitled to lay electric mains through the streets of the plaintiff Council.

Mr. Hughes, K.C., and Mr. Meyer appeared for the plaintiffs, and Sir Alfred Cripps, K.C., and Mr. Tyldesley Jones for the defendants.

Mr. Hughes said that the real question was whether these defendants had the right to break up streets within the plaintiffs' area, and by the notice of motion the plaintiffs asked for an injunction to restrain the defendants from laying their mains in the Wandsworth Road, Nine Elms Road, Battersea Park Road, York Road or any other street or place within the Metropolitan Borough of Battersea. What the defendants wanted to do was to lay their mains along the main roads right through Battersea. They had already got provisional orders in respect of some districts.

Sir Alfred Cripps said they had yet to get the consent of the Board of Trade, but the question was whether the defendants had the right to lay the mains at all. Mr. Hughes said that if the defendants had the right, then in respect of any difference as to route or the way the mains should be laid, it was to be settled by the Board of Trade, but the only question was whether the defendants had any right to do it at all. If they had the right, then the further question would arise as to how the right should be exercised. That was to be settled by agreement with the local authority, and failing an agreement by an arbitrator appointed by the Board of Trade. The defendants had no power to do what was complained of under their provisional orders or the Confirmation Act, and the question was whether they had under a subsequent Act which related to various other metropolitan companies as well. The defendants had certain defined areas of supply.

Mr. Justice Joyce asked whether they claimed a monopoly in these areas.

Mr. Hughes thought not, but that did not matter for the purposes of the Act.

Sir Alfred said that in some districts there were one or two companies supplying.

Mr. Hughes said the defendants had a large area of supply on the south of the Thames, which included Wandsworth, Camberwell and north of that to the Southwark boundary. Wandsworth was detached from the other two by a short intervening space of about a quarter of a mile. They had an area on the north side of the Thames with a generating station at Clerkenwell. They had also a generating station at Wandsworth, just where the Wandale flowed into the Thames. They had no right of supply in Battersea, but what they were proposing to do was to lay a main along the high road through the Borough of Battersea, and the plaintiffs, as the highway authority, objected to their breaking up the streets. It was not necessary for him to point out that the importance of the question was very great. This main street was honeycombed with pipes, and if additional powers were given to any power company to break up the street it would be a very serious matter indeed. There were already there electric light companies' wires, telegraph and telephone wires, sewers, water pipes and what not. If the defendants, therefore, had not the right they claimed, it was very important for the Council to prevent them from doing what they were proposing to do. The point in the case was that the Wandsworth area was already connected with Camberwell area at a point close to West Norwood and that they desired further to connect those two areas was the key to the whole matter. Recently, under powers given by the County of London Electric Supply Act, of 1908, the defendants had connected up their south

areas with the generating station at Clerkenwell by cables carried over London Bridge. The whole of their areas were, therefore, now connected together, and each area was connected with both of their generating stations. What they now wanted to do was to have this further connection, which they did not allege was necessary, but only alleged that it was convenient. It was most important to bear in mind that all their areas were already connected, and that both generating stations were connected with all the areas, as his case would be that they were only entitled to necessary connections. The Act of 1908 for the first time enabled the suppliers of electrical energy in the Metropolitan area to enter into agreements with one another, and in order to enable such agreements to be carried out, power was given to connect one area with another, and also to connect generating stations with outlying areas. In their own areas the method of carrying it out was to be governed by each company's own Acts, coupled with the general sections of the Electric Lighting Act of 1882, and special sections of the Act of 1899, and where the mains were laid outside the area the right was to be subject to the provisions of those Acts and agreement with the local authority interested. Failing agreement with the local authority, the matter was to be submitted to an arbitrator appointed by the Board of Trade. The route which defendants were proposing to follow was the most inconvenient possible, because it went along the main street of Battersea from one end to the other. That would, of course, be a matter for the Board of Trade, but what the defendants wanted was a second or alternative connection between their Wandsworth and Southwark areas, and that the plaintiffs contended they were not entitled to. If they were entitled to more than one, then counsel supposed they might have three, four, five, or, in fact, any number they chose.

His Lordship asked when the existing connection was made. Sir Alfred said about 16 years ago by agreement with the local authority, but it was outside Battersea.

Mr. Hughes submitted that the Act did not give them any power except to make a connection where they had not got it already.

Mr. Justice Joyce: You admit that but for this existing connection the company would be entitled to do what was proposed.

Mr. Hughes thought that probably they would. If they were not connected, he said, they would probably be entitled to make a connection. The section, however, seemed to be carefully limited. The words were "to make a connection," and he contended that that meant to make one and one only. If the plaintiffs' contention was right they might make any number of connections they liked. They said this proposed connection was convenient, but they did not say it was a necessity.

His Lordship: What order do the plaintiffs ask for?

Mr. Hughes said that they wanted a declaration that under the section the defendants were not entitled to make the proposed connection.

His Lordship said he could not do that on an interlocutory motion. He might grant an injunction restraining the defendants from making any connection, but could not grant an injunction to restrain the breaking up of the roads.

Mr. Hughes said an injunction to restrain the making of the connection would satisfy them, and, of course, so far as they were concerned, it would be confined to Battersea.

Sir Alfred said that, assuming the Court was against him, which he did not anticipate, he would offer every assistance for getting the declaration or injunction in the proper form.

Mr. Hughes said that if the plaintiffs were right, they could break up every street in Battersea.

Mr. Justice Joyce said no doubt the Board of Trade would have something to say to that. Without calling upon counsel for the defendants, his Lordship dismissed the motion. He was not impressed, he said, with the arguments of the plaintiff Council, and he did not see why the company should not be entitled to connect now two or more of their areas merely because they had some 16 years ago managed to get a connection which was more or less convenient. It might, or might not, be sufficient, and it might be either in good or bad repair. There were no words in the section which said the company was not to make a connection in places where they had one before the passing of the Act, and he could not grant an interim injunction. The motion must, therefore, be refused, and the costs of the motion would be costs in the action.

Sir Alfred hoped that, if the Council had any idea of proceeding to appeal, they would press it on.

Mr. Hughes thought his clients would probably do so.

His Lordship said the sooner the question was settled the better.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—The staff of the Dundee Corporation electricity department gave a dinner at the Queen's Hotel to Mr. H. RICHARDSON, in honour of his tenth anniversary as engineer and manager. Bailie J. M. Nairn, the present chairman, and Bailie W. Don, ex-chairman of the Electricity Committee,

were present as guests, and both the bailies congratulated Mr. Richardson on his able management, also upon the remarkable success of the department within the last decade, and commented on the close friendship that existed between the manager and the staff. In reply, Mr. Richardson spoke of the encouragement he had received from both gentlemen, and also thanked the staff for their loyalty to the department, especially the older members who were with him in the early days. After dinner a most enjoyable programme was sustained.

The Accrington Electricity Committee has advanced the salary of Mr. H. PILLING, tramways manager, from £200 to £225 per annum, with a further increase of £25 next year; and that of Mr. A. W. CLEGG, electrical engineer's assistant, from £200 to £225 per annum, with a further increase of £25 next year. Mr. H. GRAY, electrical engineer, is to be paid £50 for overtime and extra services in connection with the recent extensions at the electricity works.

Mr. C. S. TAYLOR has resigned the post of deputy engineer and manager to the Hankow Light and Power Co., and has accepted an appointment as a sub-station and power engineer to the Shanghai Municipal Council's electricity department.

Mr. H. W. REEKS (formerly of London) has resigned his position as switchboard attendant to the Mersey Power Co., Ltd., at Runcorn, having been appointed to a similar position under the London County Council.

The Committee of the Worthing T.C. has increased the salary of Mr. C. BROADHURST, assistant electrical engineer, from £160 to £170 per annum.

The Carlisle Electricity Committee on the 4th inst. selected Mr. FREDERICK WALTER PURSE, of Watford, for appointment as electrical engineer, at Carlisle, at a salary of £500 per annum. There were 148 applicants.

**Tramway Officials.**—The Birkenhead T.C., on April 2nd, confirmed the recommendation of the Tramways Committee, to increase the salary of Mr. WYLD, manager and electrical engineer, from £600 to £650 per annum. An amendment that the increase be not granted was rejected by 21 votes to 9.

**General.**—Mr. THOS. B. L. NEWSTEAD has joined the engineering staff of Messrs. Marconi's Wireless Telegraph Co., Ltd. as assistant in the estimating department at Marconi House, Strand, W.C. He was previously for over three years with the Westinghouse Cooper-Hewitt Co., Ltd., as engineer-in-charge of their factory at 151-152, Great Saffron Hill, E.C., and upon leaving them recently was presented with a silver tea-kettle and opt-glass claret jug from the office staff and employees, together with an expression of cordial wishes for his future success.

Mr. WM. BAXTER has resigned his appointment with Messrs. A. Reyrolle & Co., Ltd., Hebburn-on-Tyne, and opened an office at 90, Pilgrim Street, Newcastle-on-Tyne, as an agent. He will represent Messrs. Daniel Adamson & Co., Dukinfield, for turbines, boilers, pumps, &c.; Messrs. Eckstein, Heap & Co., Ltd., Manchester, for switchgear; Messrs. Newton Bros., Derby, for motors, dynamos, gas engines, &c.; also the St. Helens Cable and Rubber Co., Warrington, for cab-tire sheathed and other cables. Before leaving Messrs. A. Reyrolle & Co.'s works he was presented by Mr. Reyrolle with a handsome filing cabinet, which was subscribed for by the members of the office and works staff.

The marriage took place at the Church of St. Peter-Advincula, Coggeshall, Essex, on April 3rd, of Mr. C. SANDYS BALL, A.M.I.E.E., only son of the late Mr. Chas. Ball, of St. Leonards-on-Sea, Hastings, and who is a director of Messrs. Brown & Green, Ltd., electrical and general engineers, of Windsor Street, Luton, and Miss Mary Bright, second daughter of the late Mr. Wm. Bright and of Mrs. Bright, of Cromwell House, Coggeshall.

The telephone staff at Chesterfield have presented a tea service to Mr. A. B. IMPEY, assistant manager for the district, on his marriage.

Mr. PHILIPP LAUBACH has resigned his position as manager of the switchgear department of the Electrical Engineering and Equipment Co., Ltd., in order to join the firm of Mr. J. A. Law, chartered patent agent, 331, Birkbeck Bank Chambers, Holborn, W.C.

Mr. WM. BENJAMIN PINCHING, electrical engineer, was on Monday elected on to the Southgate U.D.C. for the Winchmore Hill Ward.

**Obituary.**—Mr. JAMES TANGYE.—We regret to record the death of Mr. James Tangye, one of the founders of the well-known firm of Tangyes, Ltd. He was born in 1825, and was the eldest of the Tangye family of nine. He died on 4th inst., at Illogan, near Redruth, Cornwall.

PROF. ADOLF SLABY.—The Times publishes from its Berlin correspondent, a report stating that Prof. Adolf Slaby, of the Slaby-Arco wireless telegraph system, died at Charlottenburg on Sunday last at the age of 63. He received a second paralytic stroke a fortnight previously, and never recovered consciousness. Our contemporary states that from 1884 to 1902 the deceased professor was director of the electrical laboratory at the Technische Hochschule, and there began the experiments which led to the perfection of the "Telefunken" system. He attended Mr. Marconi's experiments in England in the year 1897. The Emperor William gave him frequent encouragement and support. In the Royal gardens, on the banks of the Havel, he worked the whole of the summer of 1897, sometimes 10 hours a day attempting to establish wireless communication between the Pfauen 1-land, in Wannsee and the Pfingstberg. In October of that year he established wireless connection between two captive balloons at a distance of 21 km.

## CITY NOTES.

**Brentford Electric Supply Co., Ltd.**

THE annual meeting of this company was held at the office of the company, 16, Stratford Place, W., on Tuesday last, Mr. F. Leverton Harris presiding. The following report of the proceedings has been received:—

The Secretary, Mr. E. Cunliffe Owen, having read the notice convening the meeting, the Chairman stated that of the authorised capital of £10,000, 3,757 shares had been issued. During the year £3,656 had been expended on capital account in laying a system of distributing mains throughout the area of supply and in providing house services and meters. With regard to the revenue account £507 had been paid to the Metropolitan Electric Supply Co., Ltd., under the bulk supply agreement for purchase of current; repairs had cost £19, and management expenses and general establishment and other charges £181. The sale of current had brought in £768 and other receipts £51, the financial result being a balance carried to net revenue account of £112, which the directors recommend should be carried forward. He thought the shareholders would consider this a satisfactory result for the first year's working. On December 31st last the number of consumers was 57, their requirements amounting to 168·5 kW., 96·2 kW. being for power. The maximum demand during the first half of the year was 51 kW., and during the second half this had risen to 85 kW. He referred to the prospects of the present year as being very satisfactory, the number of new consumers showing a steady increase. The accounts were adopted.

**Lancashire Dynamo and Motor Co., Ltd.**

THE directors in their report for the year ended December 31st, 1912, state that, after providing for debenture and bank interest and charging full depreciation, the accounts show a profit for the year of £15,150. Adding the sum of £1,990 carried from the previous year, there is a disposable balance of £17,140, which it is proposed to appropriate as follows:—Dividend on preference shares for the year at the rate of 5½ per cent. per annum, less tax, £2,434; interim dividend on the ordinary shares at the rate of 5 per cent. per annum, free of tax, paid October 1st, 1912, £2,125; final dividend on the ordinary shares at the rate of 10 per cent. per annum, making 7½ per cent. for the year, free of tax, £4,250; directors' fees, £700; to reserve account, £6,000; carry forward, £1,631. In view of the coal strike and disturbed labour conditions, which have restricted the output of the year, the results are considered satisfactory. The orders on hand are at better prices than last year, and if there are no labour disturbances the result for 1913 should be quite equal to, if not better than, the past year.

The Manchester *Daily Dispatch* publishes the following figures showing three years' comparisons as follow, after deduction of debenture and loan interest and depreciation:—

	1910.	1911.	1912.
Profits .. .. .	£5,268	£10,009	£15,150
Preference dividend .. .. .	2,434	2,434	2,434
Directors' fees .. .. .	700	700	700
Opening foreign agencies .. .. .	2,074	6,875	12,016
Ordinary dividend .. .. .	1,971	—	—
Reserve .. .. .	103	6,875	12,016
Brought forward .. .. .	103	5,100	6,875
Carried forward .. .. .	103	1,775	5,641
	103	—	6,000
	103	1,775	—
	112	215	869
	215	1,990	1,960
			1,631

Owing to exceptional circumstances, including the development of new types and opening of foreign agencies, the company for the year 1910 paid no dividend on its ordinary shares, for the first time since its formation, 14 years ago.

It is stated that the company is issuing the balance of the unissued ordinary capital, amounting to £15,000, which will bring the total ordinary capital up to £100,000.

We congratulate the company upon the excellent improvement shown in the above figures for 1912.

**Stock Exchange Notices.**—The Committee have ordered the undermentioned securities to be quoted in the Official List:—

Birmingham District Power and Traction Co., Ltd.—£51,463 additional 4½ per cent. first debenture stock.

Consolidated Cities Light, Power and Traction Co.—\$4,000,000 first lien 5 per cent. gold bonds of \$500 each (Nos. 1 to 8,000, in lieu of the script).

Consolidated Diesel Engine Manufacturers, Ltd.—67,470 shares of £1 each, fully paid (Nos. 527,777 to 594,546).

Pacific Power and Light Co.—\$5,904,000 5 per cent. first and refunding mortgage 20-year gold bonds, international series (Nos. 1 to 5,904), for £1,000 each.

**Canadian General Electric Co.**—The report states that the year to December 31st was one of marked expansion. The accounts, according to the *Financialist*, show a profit of \$2,011,700, from which have been written off for depreciation \$456,400, and for interest on borrowed capital \$158,900, leaving \$1,396,500. Out of this the usual 7 per cent. dividend has been paid on the preferred capital, and 7 per cent. on the common shares, together with a bonus of 1 per cent., while \$700,000 has been added to the reserve fund, giving a total of \$2,360,500 at credit of this account.

**North of Scotland Electric Light and Power Co., Ltd.**

THE directors' report for 1912 states that satisfactory progress has been made during the year. The gross profit, including £1,653 brought forward, is £8,018, and after meeting interest paid on debentures and loans, amounting to £2,799, and writing off £28, part cost of street lighting alterations, and 10s. loss on meters transferred, there remains a net profit of £5,221. The directors recommend a dividend at the rate of 2 per cent. for the year, which will absorb £1,000, that £2,000 be placed to renewal reserve account, and that the balance, £2,221, be carried forward.

**Prospectus.—International Light and Power Co., Ltd.**

—This week there has been offered for sale \$1,000,000 6 per cent. cumulative preference stock, in shares of \$100 (£20 10s. 8d.), with a bonus of \$60 in common stock, at £18 per share. The list was to close yesterday. The company has acquired the stock and debentures of companies owning electric light and gas plants and distribution systems in Caracas, Venezuela, and Parana, in the Province of Entre Rios, Argentina, together with £30,000 for working capital. The Venezuela Electric Light Co. is registered in Canada, and its \$900,000 ordinary capital and \$900,000 in 5 per cent. debentures are all held by the International Co. It serves Caracas, which has a population of 80,000, with electric supply, and purchases power from a hydraulic company, so that further generating stations beyond those now possessed are not at present needed. The Parana Co.'s \$500,000 shares and \$295,000 debentures are held by the International Co. Parana has a population of 42,000, and the company has a 640-kw. generating station operated by producer gas, also a gas supply plant. The receipts and expenses of both undertakings are quoted in the prospectus, and a report is also given therein by Messrs. J. G. White & Co. Ltd., who will act as managers of the properties. Mr. W. C. Burton and Mr. A. N. Connett, directors of that company, are on the board of the International. The International Co. is negotiating for further similar properties, and has entered into a conditional contract for the purchase of the shares and debentures of one other electric lighting undertaking. The London offices are at 9, Cloak Lane, E.C.

**Milford-on-Sea Electric Light Co., Ltd.**—Dr. V. D. Harris (chairman) presided on March 29th over the annual meeting of this company. The directors reported that the progress during the year had been satisfactory, and the amount of revenue showed an increase from £808 to £906. After charging all working expenses, writing £25 off preliminary expenses, and placing £149 aside for depreciation of plant, there remained a net profit of £353, which had been carried to net revenue account. This had been charged with the interest on debentures and depreciation on investment, and with the balance brought forward from last year, there remained £290, out of which the directors recommended a dividend of 5 per cent. for the year on the ordinary shares, the balance being carried forward. The report was adopted.

**Reading Electric Supply Co., Ltd.**—The directors report a net revenue for 1912, after setting aside £3,500 for depreciation, and including £420 brought forward, of £7,363. They recommend a dividend of 3½ per cent. £517 is to be carried forward.

**Sao Paulo Tramway, Light and Power Co.**—The directors have declared a dividend of 2½ per cent.

**Rio de Janeiro Tramway, Light and Power Co., Ltd.**—The directors have declared a dividend of 1½ per cent.

**United River Plate Telephone Co., Ltd.**—The directors have declared a dividend on the ordinary share capital for the nine months ended December 31st at the rate of 8 per cent. per annum, free of income-tax; £5,804 is carried forward.

**Anglo-Argentine Tramways Co., Ltd.**—The directors have declared a final dividend of 4½ per cent. on the £2,500,000 ordinary share capital for the half-year to December 31st, less income-tax, making 8½ per cent. for the year. £135,000 is placed to depreciation, renewals funds, &c., and £9,253 is carried forward. The dividend for 1911 was only 7½ per cent.

**Electrolytic Alkali Co., Ltd.**—According to yesterday's papers, a notice was issued by the Electrolytic Alkali Co., Middlewich, summoning an extraordinary general meeting to pass a resolution voluntarily winding up the company's business. The year's accounts, which accompany the notice, show a debit balance of £11,894. The directors state that the negotiations for power schemes, which would have placed the company in a sound position, have failed, and they feel that until modern power plant has been installed they can hold out no prospect of the company earning a profit. The company's issued capital is £301,869.

**Direct United States Cables Co., Ltd.**—Final dividend, 2s. per share, less income-tax, payable 30th inst., making with the three interim dividends already paid a total distribution of 4 per cent. for the year ended March, 1913. The transfer books will be closed from April 15th to 29th.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

## STOCKS AND SHARES.

Tuesday Evening,

THE Balkans business seems to get more oppressive instead of less. We seem to have been standing on the eve of peace over and over again, but something has intervened at the last minute to intercept the conclusion of the war, and markets are in a sensitive and nervous condition, not knowing from day to day what will be the next turns of events. On Monday, matters seemed to be drifting once more in the direction of a general European *impasse*, but on Tuesday a partial recovery followed rumours of the Servians having abandoned their intention of taking Scutari.

Every now and then comes one of these little flashes of bright-

ness, to be dimmed, as a rule, within all too short a time. Fresh borrowing is no more than checked, for new issues of substantial amount appear with unpleasant frequency. Fortunately, the acute stringency in the money market stands somewhat relaxed, but the expectations that the Bank of England would this week reduce its rate are at the moment considered nebulous, in view of the unsettlement of the outlook abroad.

Prices had to give way everywhere in the Stock Exchange where a bull account of any sort existed, and the Home Railway market has already suffered severely. The Undergrounds proved incapable of resisting the tendency, and Metropolitan shed 1½ after their substantial rise of last week, while the Surplus Lands stock fell 1, and the two Preference issues both lost a point. Districts went back 1½. Underground Electric shares fell ½ and the Income Bonds ½. City and South London 1-91 Preference went back to 99½. The spurt in East Londons, which carried up the price of the stock to 10½, became exhausted under the pressure of the bulls to realise their profits, and the price has fallen back to 9½, notwithstanding the electrification. North Londons at 93½ are 2 down. Traction issues remain fairly steady, but British Electric 7 per cent. Preferred is again ½ lower. Yorkshire 6 per cent. Preference shares at 3½ show ½ rise.

In English Electricity Supply shares, the only rises are one of ½ in Edmundsons' 6 per cent. Non-Cumulative Preference, and another of ½ in Bournemouth and Poole Second Preference. London Preference are the turn easier, but Westminsters and Bromptons have retained their advances. The prior charge issues are firm, a point rise in Midland Electric 4½ per cent. Debenture stock being the only quotable change.

After the rise in Marconis last week there has been some reaction, both Ordinary and Preference going back. Canadians eased off to 16s., Americans to 1½, and Spanish to 18s. 9d. The dealings of the three Cabinet Ministers remain the subject of the liveliest interest in the Stock Exchange, where members, while disclaiming political bias, have only one opinion as to the discretion shown by responsible members of the Government in investing their money at 100 per cent. premium in shares of a company like the American Marconi.

National Telephone Deferred has fallen to 18½, some of the previous holders evidently getting timid with regard to the probable payment that will be made in respect of this stock. Great Northern Telegraphs have again mounted, putting on another 10s. on top of the rise of 50s. which took place in them last week—due, of course, to the increase in the dividend. The hardening process in Eastern Telegraph Ordinary is once more noticeable, and Globes have risen ½. New York Telephone bonds continue to be bought by the investor, and the quotations have again reached par. Improvements have been scored by Monte Video Telephones and Oriental Telephones. Mackay Common and Preference picked up in response to New York advices, the American Railroad market being so firm as to lead Industrials in its train. American Telephone stock and bonds are both better.

The Latin-Canadian market is comparatively hard, considering the dullness ruling elsewhere. Mexico Trams and Mexican Light and Power Common shares have gone back, which is not very surprising, seeing that they both had big improvements a week ago. The bonds of both companies, however, continue to advance, and those of the Mexico Tramways Company are in demand from the Provinces as well as London. British Columbia Electric Deferred stock rose 2 on the day that the lists closed for sending in applications for the new shares offered by the Company. These latter had been quoted at 1s. 6d.-2s. 6d. premium for cash, and an incessant stream of selling took place during the past fortnight by holders who elected to accept their profit rather than to take up the shares and wait for something more substantial. That the new shares will improve seems virtually assured, unless anything very unexpected should happen. British Columbia is going ahead rapidly, but, as is the case with many other parts of Canada, the stringency of the money markets of the world has made itself felt even as far West as this.

Shawinigan Water lost a point, though the 4½ per cent. Debenture stock is ½ higher. Brazil Tractions, after touching 102, went back to 100, the price being swayed considerably by the tenour of the foreign political news. Canadian General Electric Common strengthened to 117. Outside this group the market is quietly dull. Buenos Ayres Trams lost ½, and Bombay Electric Preference went back to 11½, a fall of ½. No changes have occurred in the Anglo-Argentine quintet.

British Westinghouse Preference shares and Debenture stock are both better, and British Aluminium 5 per cent. Prior Lien Debentures put on another point, attention being directed to them by reason of the soundness of the security offered by the stock. Henleys are a little lower. Armaments shares, after being strong, went back again. Armstrongs rose smartly upon the decision of the board to give proprietors one new share for every four old at present held, but part of the rise was lost later, when it was announced that the board intended to apply for powers to issue a couple of million pounds new capital in 5 per cent. Preference shares. Vickers, too, have been a little erratic leaning somewhat to the dull side. Babcocks at 3½ have failed to recover from their small shrinkage of a week ago. The rubber share market enjoyed a brief spell of strength upon the conclusion of the fortnightly auctions, but this evaporated, and prices have once more fallen back into weakness, with buyers of the shares distinctly scarce. There is now a fairly big bear account in many of the leading rubber issues, so that if the price of the commodity were to take an upward turn, there is a ready-made element of strength. Still, at the moment, there does not seem much chance of a sustained revival occurring in raw rubber.

## PROCEEDINGS OF INSTITUTIONS.

## Recent Developments in the Street Lighting of Manchester.

By S. L. PEARCE, M.I.E.E., and H. A. RATCLIFF, M.I.E.E.

*(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS at Manchester, February 25th, and London, Birmingham and Glasgow.)**(Concluded from page 583.)*

Experiments were also made in equipping the lamps with enamelled iron reflectors of various shapes, but it can hardly be said that the results were very successful, at any rate from the point of view of the distribution of the light. Reflectors were really tried in order to remove the shadows under the lamps cast by the ash-trays; but for this purpose they were only partially successful, and the resulting distortion of the polar curve was very unsatisfactory. One objection to the use of reflectors is the dark shadows cast above an angle of about 80° to the vertical, as a result of which the blackness of the buildings and the darkness above the lamps are very much intensified. This is particularly noticeable in foggy weather. There is no doubt that it is a distinct advantage to illuminate as large an area of buildings as possible, provided always that it can be done without a reduction of the light flux in a more useful direction. If the elimination of shadows can therefore be effected by more legitimate means, there is no advantage to be gained by the use of reflectors. It is very evident, from the results, that the most satisfactory curves of light distribution are obtained either with suitably frosted outer globes or with dioptric inner globes used in conjunction with partially opalescent outer globes. There is very little to choose between the two methods on the score of light distribution. The dioptric globes undoubtedly have a slight advantage in this respect, but when it comes to the consideration of general advantages and disadvantages, there is much to be said in favour of the partially-frosted outer globes.

The advantages are:—

(a) Comparatively inexpensive to produce.  
(b) The degree of frosting may be easily varied or graded as required.

(c) They have no optical centre, and consequently slight relative displacement of globe and arc is of no serious consequence. (This must not be confused with relative displacement of arc and economiser.)

(d) Intrinsic brilliancy of the light source is considerably reduced with a corresponding reduction of the glare effect, provided that the lamps are fixed sufficiently high.

(e) Shadows under the lamps are entirely eliminated, and the sharpness of the shadows cast by objects is toned down very considerably.

Compared with these advantages dioptric globes have the following disadvantages:—

(f) They are rather expensive.  
(g) They have a very definite optical centre, and slight alteration in the relative position of arc and globe produces large changes in the light distribution.

(h) A completely uniform distribution of light does not appear to be obtainable without the use of special outer globes.

The numerous tests referred to in this paper have at least vindicated the lighting of city streets by means of flame arc lamps, not only on the dual basis of equal cost and illumination, but also on the ground of light distribution.

As there is a substantial difference between the cost of the flame arcs and the high-pressure gas lamps for the same minimum illumination, it would be possible to improve the arc lighting, if considered desirable, by reducing the distances between lamps in the case of future extensions. If fixed at the present height, and 100 ft. apart, the minimum illumination would be not less than 0.75 foot-candle. No attempt has been made to obtain perfectly uniform illumination, since it is very doubtful whether such a scheme would be desirable, even if possible. A variation factor of 3.75 is not excessive, if the change is fairly gradual; and in this respect the partially frosted globes give results quite as favourable as the dioptric ones.

## APPENDIX A.—MANCHESTER CORPORATION ELECTRICITY DEPARTMENT.

*Statement of Cost of Supplies during the Year ended March 31st, 1912.*

	Total.	Running costs.	Division. Fixed costs.
Generation costs, distribution costs, rents, rates, and taxes, management expenses, interest charges, depreciation account, reserve funds, rate aid ... ..	£447,498	£87,431	£360,067
<i>Deduct:</i> Cost of traction supplies taken in accordance with the Model Form drawn up by the I.M.E.A. and M.T.A. ... ..	109,389	25,078	84,311
	£338,109	£62,353	£275,756

(a) Running costs: £62,353 ÷ number of units sold (other than traction), 64,166,221 = 0.232d. per unit.

(b) Fixed costs: £275,756, divided on following assumptions:—

(i) That the costs are due to the maximum demands of consumers.

(ii) That these (known only in total of 31,175 kw. from station records) are estimated to be made up thus:—

70 per cent. of lighting connections,	
24,031 kw. ... ..	16,821 kw. £147,371
The balance as power ... ..	14,664 kw. 12,385
	31,175 kw. £275,756

(c) Lighting "fixed costs" spread over total kilowatts connected:—

$$£147,371 \div 24,031 \text{ kw.} = £6.133 \text{ per kw. connected.}$$

## APPENDIX B.—STATEMENT SHOWING COST OF CURRENT PER UNIT.

Cost of current = £6.133 per kw. connected, plus 0.232d. per unit metered.

(a) The all-night lamps run on a 45 per cent. load-factor, or 4,015 actual burning hours per annum. Cost of current per unit = 0.6d.

(b) The 11 o'clock lamps run on a 23 per cent. load-factor, or 2,017 actual burning hours per annum. Cost of current per unit = 0.97d.

## APPENDIX C.—STATEMENT SHOWING COST PER ANNUM OF LIGHTING PORTLAND STREET.

Lamp watts = 550.

Carbon costs = 0.2d. per lamp per hour.

Trimming and maintenance charges = 0.05d. per lamp per hour.

Current consumption per annum (all-night lamps = 4,000 × 55/100 = 2,200 units + 11 o'clock lamps = 2,000 × 55/100 = 1,100 units) = 3,300 units.

	Cost per lamp per annum.
<i>All-Night Lamps.</i>	
Current, 2,200 × 0.6d. ... ..	£5 10 0
Carbons, 4,000 × 0.2d. ... ..	3 6 8
Trimming and maintenance, 1,000 × 0.05d. ... ..	0 16 8
	£9 13 4

<i>11 o'clock Lamps.</i>	
Current, 1,100 × 0.97d. ... ..	£4 9 0
Carbons, 2,000 × 0.2d. ... ..	1 13 4
Trimming and maintenance, 2,000 × 0.05d. ... ..	0 8 4
	£6 10 8

*Summary.*

Cost of 8 "all-night" lamps ... ..	£77 6 8
" 8 "11 o'clock" lamps ... ..	52 5 4
	£129 12 0

Capital expenditure on installation, £564.

Capital charges per annum (8½ per cent. on £564) 48 0 0

Annual acknowledgments for building attachments 1 4 0

Annual cost of painting poles ... .. 3 6 6

Total ... .. £182 2 6

Averaged over 16 lamps, the cost per lamp per annum equals £11 7s. 8d.

*Capital spent on installation of the 16 arc lamps in Portland Street.*

Wages of men ... ..	£88 18 5
Material, viz.—	
Arc lamps, poles, wire, carbons, hangers, &c. ... ..	342 0 4
Meters ... ..	4 17 6
Paid to Tramways Committee for erecting side poles, wall rosettes, and span wires ... ..	128 6 7
	£564 2 10

or, say, £564.

## APPENDIX D.—STATEMENT PREPARED BY MR. ABADY, SHOWING THE COST PER GAS LAMP (11 O'CLOCK) PER ANNUM.

Cost of gas, uncompressed ... ..	12.69d. per 1,000 cb. ft.
Cost of compression ... ..	1.2d. " "
Cost of gas, compressed ... ..	13.89d. " "
Mantles ... ..	1s. 1½d. each.

Wages—Proportionate part of time of one man (whole time at 28s., and one man for six hours a week at 25s.): £1 7s. 2d.

Each lamp consumes 80 cb. ft. of gas per hour for 2,000 hours per annum.

One mantle lasts about 100 hours, therefore each three-burner lamp takes 15 mantles per annum.

Lamps attended to and maintained at a wages cost stated above.

	Cost per lamp per annum.
80 cb. ft. by 2,000 hours = 160,000 cb. ft. at 13.89d. per 1,000 ... ..	£9 5 2
Lighting, extinguishing, cleaning and maintenance ... ..	1 7 2
15 mantles at 1s. 1½d. each ... ..	0 16 10½
	£11 9 2½

Equivalent to 1.37d. per hour lighted.

Nothing is included in the above for interest and depreciation on capital spent on installation, or for globes.

*Capital spent on Installation of the Four Gas Lamps in  
Princess Street.*

Wages ... ..	£12 6 6
Lamps ... ..	49 17 6
Poles ... ..	33 0 0
Suspension gear and rosettes ... ..	26 16 10
Barrel and fittings... ..	2 1 2
Tramway account for work done ... ..	70 9 4
	£194 11 4

Nothing is included in the above for high-pressure mains or compressor plant.

DISCUSSION AT BIRMINGHAM.

MR. R. A. CHATTOCK said the comparative figures of the cost of electric arc lighting and of high-pressure gas lighting were very valuable, especially as they were obtained by experts appointed by the Manchester Corporation to report on both classes of lighting. They demonstrated that high-pressure gas lighting was considerably more costly than electric arc lighting. The cost of the high-pressure gas lighting amounted to £11 9s. 2½d. per lamp per annum without including anything for interest and depreciation on capital spent on the installation, and without globe renewals, while the cost of the electric arc lighting amounted to £11 7s. 8d. per lamp per annum, including all capital and other charges. In Birmingham practically the whole of the street lighting was carried out by low-pressure incandescent gas mantles, and this was now under the control of a special Lighting Committee. In the Handsworth and Aston areas, which were recently incorporated in Greater Birmingham, there was a small amount of electric arc lighting, which had recently been considerably cheapened in cost. Taking the Handsworth district as an example, there were originally 120 open-type 11-ampere arc lamps which required recarboning every 18 hours. These were replaced by 50 magazine flame-arc lamps taking 8 amperes each, and requiring rettrimming every 70 hours, and 70 twin-carbon flame-arc lamps taking 7 amperes each, and requiring rettrimming every 50 hours. In the table below are given particulars of the consumption of energy, cost of energy, carbons and trimming, and illumination in candle-feet, the lamps being spaced approximately 400 ft. apart. The 8-ampere magazine flame-arc lamps showed a saving of 25 per cent. in running costs, and gave approximately four times the light given by the old open-type lamps, each lamp costing £5 2s. per annum for energy, at 1d. per unit, carbons and trimming, from dusk

which they had had on trial at Handsworth, he had been able to obtain a balance almost, if not quite, as readily as with gas lamps. Lamps with direct electrically-driven feeds gave the steadiest burning. By this he meant lamps in which the feeding was effected by an auxiliary shunt coil, which came into action when the volts across the arc were above the normal, so regulating the feed that the drop across the arc was not more than 1 volt, and thus maintaining steady burning. With a feed which depended upon the slip of a chain or band brake, or piece of metal on a wheel controlled by a lever operated by a main and shunt coil, one could not depend upon a 1-volt feed. Generally, the variation was 2 or 3 volts or more, and this affected other lamps in series, especially if these were themselves on the point of feeding. His experience with flame-arc lamps was that they required cleaning, and the deposit from the carbons brushing out, after 60 to 70 hours' burning at least; and if the lamp had to be lowered for this purpose, it might just as well be carboned at the same time. Another important point with regard to the choice of magazine lamps for street lighting was that there should be no extinction of light when a new pair of carbons came into operation.

MR. M. SOLOMON said that although the data contained in the figures were very valuable, their value was diminished by the fact that some of the figures were not referred to at all in the text, and the shading was different in the two sets of contour figures, so that the actual impression created was a wrong one. The comparative table showed the arc lamps to be, roughly speaking, twice as good as the gas lamps, but it was admitted that the gas-lamp figures were not really representative of the best that could be done with high-pressure gas lighting. He did not think that it was of any benefit to create the impression that arc lighting had a walk-over as against high-pressure gas, when, as a matter of fact, it was a very close race between the two rival illuminants. Improvement in the distribution curves (apart from that due to the graded frosting) was attributed to the alteration of the spinnings and of the shape of the outer globe; the shape of the inner globe was also altered, and a very considerable amount of the improvement in the 20° rays was due to this alteration, as the new inner globe was designed so that the light reflected from its inner surface should be reflected at an angle of 20° with the horizontal. He had been struck by the very close correspondence between the light distribution curve obtained by the authors and his own curve, obtained under laboratory conditions, while theirs was made under practical working conditions in the street; this not only confirmed the accuracy of both sets of readings, but also showed that flame lamps and carbons were now so standardised that the results obtained might be relied on with considerable certainty.

MR. A. M. TAYLOR thought the most important thing in the

HANDSWORTH STREET LIGHTING.

	Consumption in units per annum.	Cost of energy at 1d. per unit.	Cost of carbons.	Cost of labour.	Total cost.	Illumination in candle-feet, measured on road surface.		
						Max.	Min.	Average.
<i>Main Road—</i>								
Original installation—50 open-type arcs, 11-ampere, 18 hours.	44,750	£186 10 0	£17 10 0	£116 0 0	£350 0 0	0'51	0'02	'14
Present installation—50 magazine flame arcs, 8-ampere, 70 hours.	33,000	£137 15 0	£50 0 0	£72 15 0	£260 10 0	2'35	0'05	'66
<i>Side Roads—</i>								
Original installation—70 open-type arcs, 11-ampere, 18 hours.	65,000	£271 10 0	£25 0 0	£204 0 0	£500 10 0	0'51	0'02	'14
Present installation—70 twin-carbon flame arcs, 7-ampere, 50 hours.	40,000	£166 10 0	£79 10 0	£100 10 0	£346 10 0	1'0	0'04	'327

to 11.15 per p.m. The 7-ampere twin-carbon flame-arc lamps showed a saving of 30 per cent. in running costs over the 11-ampere open-type lamps, and gave over twice the light, each lamp costing £5 per annum for energy, at 1d. per unit, carbons and trimming, from dusk up to 11.15 p.m. The shadows caused by the ash-trays in the lamps fitted with converging carbons are not found in the case of the twin-carbon lamps fitted with vertical carbons.

MR. E. CROCKER said the great problem in connection with street lighting appeared to be to make the variation factor as small as possible, and the change from maximum to minimum illumination as gradual as possible, and to do this not regardless of cost. In this connection the design of the globes played a most important part, and the information given in Mr. Pearce's paper was exceedingly valuable. He had experimented on much the same lines, with very similar results. He had not, however, tried frosted globes, and it was with these that the authors had obtained their best results. Their variation factor of 3'75 with frosted globes was an enormous improvement. The variation factor of the gas lighting in Bristol Road was as high as 18 over a distance of only 20 ft. from the lamp post. He agreed with the authors' remarks re the use of outside reflectors, and the importance of illuminating the buildings on the sides of the road. Steadiness was a most important thing to be aimed at in street lighting, and this was the most striking feature of high-pressure gas lighting, although, as the author remarked, the candle-power varied considerably from day to day. When testing some of the arc lamps

paper was the table which comprised a *résumé* of the principal features of the two systems, gas and electricity. He suggested that the variation factor for the two systems might be added, and an additional basis for comparison, which would be known as the "Maximum variation of the candle-feet per foot run." The gas people could not and should not take any exception to the division of the total costs into "Running Costs" and "Fixed Costs" nor to the deductions on account of the cost of traction supplies. Mr. Pearce had, however, carried the distribution of costs further, and allocated a certain proportion to lighting and to power respectively. He had worked out what the fixed charge would be if the whole had been simply divided up by the total number of kilowatts; it came to £8'76 per kw. connected, per annum. This added an amount of approximately 25 per cent. to the charge for energy for the "All-night lamps," and approximately 33 per cent. to that for the "11 o'clock lamps." This was obviously an extreme view to make, and it might be taken as certain that Mr. Pearce's figure of £6'133 per kilowatt was substantially correct. The cost per mile per annum (for presumably equal minimum illumination) was given as £675 for the gas and £254 for the arcs. Gas according to this statement was 2'65 times as dear as the electric light for equal illumination, so that it would be obvious that any trifling divergencies from Mr. Pearce's figures for the cost of energy which might be suggested by the gas people, could not to any material degree affect the great superiority of the figures for the electric supply on the basis of cost.

## Colliery Cables.

By W. T. ANDERSON, M.I.E.E., M.INST.M.E.

*(Abstract of paper read before the INSTITUTION OF MINING ENGINEERS, at Manchester, February 11th, 1913.)*

THE first question that confronts the mining man who proposes to install electric light or power below ground is the choice of cables. Under normal conditions rubber is undeniably the best both from physical and from electrical points of view. On account of cost, its use is almost prohibitive for large cables. In small lengths, however, rubber cable (generally treated with fire-resisting braids and compounds) is nearly always used for making off, or tailing, cables of other description. Nothing but the very best material should ever be used below ground, say, 2,500-megohm grade for low-tension, and nothing inferior to that specified by the Engineering Standards Committee for high-tension work.

There are also exceptional uses to which rubber cable can be put—principally in connection with breakdown work. An example is given in the accompanying illustration (fig. 1). The cables shown were hurriedly rigged up to follow down a sinking pump in a flooded shaft. Working at a current density of about 3,000 amperes to the square inch, they were slung in the manner depicted to prevent them from becoming unduly hot.

While paper-lead covered cable has advantages as regards withstanding heat from without, and ready dissipation of heat from within, consequent upon overload, paper has the disadvantage common to all fibrous materials of being more or less hygroscopic.

For mining work where temperatures are often high, and more especially for shaft work, the physical consistency of the impregnating compound under working conditions should be such that it has no tendency to flow or creep away from the paper.

Although the results of injury to paper cables are usually serious, it is remarkable how much mechanical stress they will withstand. The writer believes that at Hulton Colliery, not a single cable was

FIG. 1.—RUBBER CABLE SLUNG READY TO FOLLOW DOWN A SINKING PUMP IN A FLOODED SHAFT.

brought to bank after the recent disaster, and that all are now in use. The cables lay under falls, the weights of which have probably never been exceeded, many being crushed into abnormal shapes.

Paper leadless cables are insulated with paper and sheathed with a non-metallic material, which is almost invariably vulcanised bitumen. They have certain advantages in the way of dissipation of heat due to overload, and also as regards internal solidity, because of the comparative incompressibility of the paper insulation. In the event of damage, however, they have the same disadvantages as paper-lead covered cables, and for shaft work are unsuitable.

Bitumen cables are, in the writer's opinion, by far the most suitable for average colliery work—certainly for shaft work. Until quite recently great difficulty was experienced in getting the bitumen insulation to such a consistency that in moderately high temperatures it would not decentralise, while in low temperatures it would not become brittle. As the result of research and of manufacturing improvements, it is now possible to avoid these troubles over a range of temperature which covers all ordinary working conditions, say, 28° to 120° F. Further, whereas it was necessary formerly to introduce in the construction of the cable mechanical reinforcements, such as tapes, braids, &c., the improvements in physical properties of the bitumen and methods of manufacture now enable cables to be made without these hygroscopic,

and therefore electrically undesirable components. For instance, the "solid" three-core bitumen cable, which is familiar to most colliery engineers, is so constructed as to contain no hygroscopic material whatever inside its sheath, so that in effect the conductors are embedded in a solid cylinder of vulcanised bitumen.

A more recent form of construction, called "Cracore" (fig. 2) consists in the laying up of the separately insulated cores on a central cradle of vulcanised bitumen, shaped to receive them. The whole is then sheathed overall with a tube of vulcanised

FIG. 2.—"CRACORE" FORM OF CONSTRUCTION IN A BITUMEN CABLE.

bitumen, which is cylindrical on the exterior, but shaped internally so as to fit the interstices of the laid-up cores. This construction, by distributing the mechanical pressure between the cores over a large area, enables even twin bitumen cables to be made without the inclusion of hygroscopic substances anywhere within the boundary of the vulcanised-bitumen sheath.

In these types of cable the conductors should always have the strand interstices filled with compound, in order to prevent water entering at a damaged part of the cable from passing to another part, where it might settle and cause trouble. It is, of course, very desirable that the compound should be of such a character that it will not melt, or become displaced under the influence of heating effects set up by excessive currents in the conductors. In cable manufactured on these lines, the important advantage is secured that any mechanical damage which may happen to it is quite local in its effects, and in many cases it may be repaired *in situ*, and be little the worse for its misadventure. An instance recently came under the writer's notice where failure to take this simple precaution of strand-filling resulted in water travelling down a bitumen cable throughout its entire length. Unlike paper, however, it was possible to keep the cable in use, it being little the worse, so far as its dielectric was concerned, for the mishap. Bitumen cables should not be installed immediately after direct exposure to frost or very keen winds.

In all of the above-mentioned types, if used for pressures exceeding "low pressure," it is now necessary that the conductivity of the metallic coverings must be at least equal to 50 per cent. of that of the largest conductor which they enclose, and in no case of less cross-sectional area than that equivalent to 0.022 sq. in. of copper. This last-named point would appear to apply to even the smallest size of trailing cables.

Fig. 3, for which the writer is indebted to Mr. C. J. Beaver, shows the approximate relation between the conductivity of the "largest conductor" and metallic sheaths (made according to the Engineering Standards Committee's tables) in several types of cable. From this it will be seen how very slightly it has been necessary for manufacturers to reinforce the sheathings of any but large-sized cables under the new rules. As in most great reforms, however, the new rules are likely to lead to some remarkable situations—none more so than in this very question of armour conductivity.

Taking a high-tension system, with transformers at the shaft-bottom, the high-tension shaft feeder taking, say, a tenth of the current of the low-tension roadway cable or cables, what must the section of the high-tension armouring be? Logically five times the conductivity of the high-tension conductors, if there be only one low-tension distributor, or half the conductivity of the largest low-tension cable if there be more than one distributor. It appears that the spirit of the rules could only be met in this case by running separate and additional conductors at earth potential down the shaft, in parallel with the sheathing of the high-tension feeder.

The importance of efficiently protecting the armouring from corrosion can hardly be exaggerated. Both inner and outer servings of jute, as well as the steel-wire armour, should be heavily and separately compounded with water-resisting mediums. Where particularly bad water is suspected, or known to exist, samples should be submitted to the manufacturer, so that he may design his protective arrangements in accordance with the result of analysis.

FIG. 3.—DIAGRAM SHOWING THE RELATIONSHIP BETWEEN THE CONDUCTIVITY OF STANDARD WIRE ARMOUR AND THAT OF THE CABLE CONDUCTORS IN BITUMEN THREE-CORE LOW-TENSION CABLES.

A factor which is often overlooked as a cause of corrosion is leakage-current; mines are nearly always wet enough and the water impure enough to provide a sufficiently good electrolyte for leakage currents to effect an almost unlimited amount of damage. This being so, the obvious course is to provide their paths (generally the cable sheathings) with such sound mechanical and electrical connections to earth that corrosion cannot take place.

The chief essentials in the construction of trailing cables are those relating to flexibility and resistance to external abrasion and ill-usage. The former is attained chiefly by making the conductors of a large number of fine wires, and the latter by special coverings, usually of a non-metallic character, such as rope-lappings, leather or whipcord braidings, rubber sheathings left bare, &c. Metallic armourings are now considered undesirable for portable flexible cables (see memorandum on Rule 13, Sec. a).

FIG. 4.—CABLE SUPPORTED BY SLINGS FROM A CATENARY WIRE.

The latest construction consists of rubber-insulated conductors laid up with an earth-conductor having a conductivity of not less than 50 per cent. of that of the largest main conductor, with a minimum conductivity equivalent to 0.022 sq. in. of copper. These cores are usually sheathed after laying up with a vulcanised-bitumen or rubber sheath. While it possesses the obvious advantage of excluding moisture from the cores, the mechanical support afforded by the sheath also tends to prevent kinking of the cable. The various forms of mechanical protection mentioned above are then applied as desired.

The space between the generating station and the headgear is, perhaps, the most prolific field of any for cable breakdowns, and too much attention cannot be given to the handling of cable in this area.

A large colliery was completely stopped through two three-phase bitumen shaft-cables breaking down simultaneously at bank, owing to a 1-in. steam pipe being laid across them.

The best means of grappling with this difficulty are either to build a well-ventilated surface culvert (open or covered with chequer-plate), in which the cables can be carried on brackets, or to sling them overhead from a catenary wire (fig. 4). Old haulage-ropes can generally be used for this purpose, made taut with capels and tightening screws. A good type of sling much used by the

writer for this purpose is made on the wedge principle, with a former of sheet lead, braided with compounded yarn. The combination of lead and braid offers prolonged resistance to fumes or atmospheric influence, while the exceptional width provided at the

FIG. 5.—SITTING TYPE OF WOODEN CLEAT FOR SHAFT SUSPENSION, RESTING ON EXISTING BUNTONS.

bearing point protects the dielectric from risk of damage. The hooks slide very readily along the span wire, while the slings cannot slip along the cable.

If the shaft is some distance from the power house, the use of paper lead-covered cable laid solid is worth considering. In such a case, a disconnecting box should be inserted at the pit top. For greater distances, especially on extra-high-tension lines, bare overhead conductors are frequently used.

For the permanent installation of vertical cables, the most desirable arrangement is a cleat of the sitting type resting on the inner or wall sides either of existing buntons (fig. 5), or on segmental H-girders erected for the purpose (fig. 6). The cleat should be of

FIG. 6.—SITTING TYPE OF WOODEN CLEAT FOR SHAFT SUSPENSION, RESTING ON H-GIRDERS.

FIG. 7.—FITTING FOR "SINGLE-SUSPENSION" METHOD IN SHAFTS.

some hard wood, creosoted. An average cleat should not be less than 2½ to 3 ft. in length; and should be provided with at least three sets of ½-in. bolts and iron straps ½ in. thick, back and front. The bores that take the cable should be cut to the exact diameter of such cable. The ½ or ¾ in. taken out by the saw when cutting them into halves will allow ample margin for tightening. The grip depends on friction, and direct pressure is only a component thereof. All wooden cleats should be fitted with wrought-iron roofs, so as to throw off water and falling bodies. The distance between the cleats will depend on the weight of the cable. Such a one as

mentioned above should not be loaded with more than 7 to 8 cwt. which, in an average cable, would allow of spacings of about 25 yards.

Many colliery engineers insist on having an absolutely clear shaft, and in shallow pits it is possible to install the cables with a single suspender, built on the capel or wedge principle, with the outermost armour of the cable taking the weight. This certainly has the advantage of offering no obstacle to break the fall of dropping material, but the use of such a fitting (except perhaps for short lengths of paper-lead covered cable) is to be deprecated, as the stresses set up in the cable have sometimes led to breakdown immediately under the suspender, where, of course, the stresses are most concentrated.

In the suspender illustrated in fig. 7, it will be noticed that the cable forms an easy fit through the bore of the cone, over the outer sides of which one layer of armour is bent, and gripped between the cone and the seating as the weight comes on. The top of the fitting is hollowed so as to allow of bitumen being poured in to prevent corrosion of the wires. In this suspender three-quarters of the breaking stress of the armour may be reckoned on, so that if the armour be designed with a breaking stress of eight to ten times the weight of the cable, the safety factor of the installed cable is from 6 to 7.5.

(To be concluded.)

## THE FIRST INTERNATIONAL CINEMATOGRAPH EXHIBITION.

(Continued from page 554.)

**Motor-generators, Converters, &c.**—These machines are of the utmost importance in reducing the energy bill in cinema installations taking current from public supply networks. If supply is available at 100-110 volts, it is hardly worth while installing motor-generators or converters, but generally current has to be taken at 200-250 volts, and where very large projectors are used, at 400-450 volts (from power mains), so that there is no longer any question as to the advisability of employing pressure reducing machinery in place of the equivalent ballast resistance. Where A.C. supply is available, the use of running machinery for pressure reduction may be avoided by employing transformers (of which, and their use, we noticed no example at Olympia\*), or by employing mercury rectifiers. The latter enable the high efficiency of D.C. arcs to be realised simultaneously with the simplicity of static pressure reduction, but the high cost and fragility of glass rectifier bulbs are undeniable disadvantages in cinematograph work.

The various types of motor-generators and converters used by the miniature theatres during the recent Exhibition have already been noted: all these machines ran perfectly during the seven days they were in service, despite the fact that they were set to work after exposure to wet weather, without preliminary drying or testing. Broadly speaking, the advantage of motor-generators lies in the flexibility of their control and the steadiness of their output. Auto-converters are lighter, cheaper and more efficient machines, but they are less flexible while being liable to produce a "sensitive" arc unless considerable ballast resistance is used in the projector circuit (see previous remarks *re* advantage of high voltage supply in the arc circuit).

**Electric Motor Applications.**—Electric motors, of from  $\frac{1}{2}$  to  $\frac{1}{4}$  H.P. output, find many applications in the operations connected with the manufacture and exhibition of cinema films. For instance, in slow speed cinematography—which now plays so important a part in recording the germination and growth of plants, &c.—an electric motor is used to drive, through variable-ratio reducing gearing, the film and shutter of a cinema camera. The Debrie apparatus, arranged on this principle and shown at Olympia, enables from one picture per second to one picture per hour to be taken and provides 120 intermediate speeds.

The Pathé film perforator (punching 500 pairs of holes per minute), and the Pathé printing machine (printing from 200 to 250 ft. of positive film per minute) are each driven by  $\frac{1}{4}$  H.P. motors. An all-important part is played by a special form of electric motor in the stencil-cutting machine used by Pathé Frères in the manufacture of their colour films and, since neither this machine nor the Pathé colour process are at all generally known, both may be described in some detail.

The film to be coloured is placed in a projection chamber below the stencil-cutter's operating table, and on to a ground glass screen let into the latter, an image of a single film picture (enlarged about two-fold), is projected by aid of a Nernst lamp and a simple optical system. A pantograph linkwork enables the outline of any part of this image to be reproduced on a blank stencil film. The operator selects certain areas of the picture which have to be coloured—say, blue—and traces round the boundaries of these areas with one style of the pantograph. The reduction ratio of the copying linkwork being identical with the multiplication ratio

of the system used to project the image of the film on the tracing table, it follows that the second style of the pantograph cuts out areas of such size and relative position as to enable the film operated upon to be used as a stencil when applying blue colouring matter to the picture film.

It is in the mechanism used to cut the stencil that the chief interest of the machine lies, from the present standpoint. A pair of vertical electromagnets are used to rotate a horizontal winged plate (pivoted on a vertical spindle), against the control of a spring. Directly the plate has turned through a small angle, it breaks a contact in the magnet field circuit, and therefore returns to its original position; the plate is thus maintained in very rapid oscillation so long as a master contact is closed by depressing the tracing style on to the film image. The oscillation of the winged plate is converted to a vertical reciprocation of a fine stencil-cutting needle by a short connecting rod mounted in spherical seatings in a lug on the winged plate and the outer end of a forked lever engaging with a collar on the needle stem. Normally, the connecting rod is in an oblique position, but, as the winged plate rotates, the connecting rod is raised to a nearly vertical position, and thus thrusts the needle down (through the stencil film into a fibre backing block), against the control of a spiral spring. This action is repeated with extreme rapidity during the whole time the tracing style is moved over the film image and the required stencil is, therefore, demarcated by a series of perforations so closely contiguous that the central portions of each closed area can be easily picked out, leaving the clean cut edges shown in fig. 1, which reproduces an example of the work done by this machine.

FIG. 1.—PATHE STENCILS FOR COLOURED FILM.

A stencil is cut for every picture in the film, and for every colour to be applied to the latter. Less than three colours are never employed in composing the final coloration, and, in the best films, as many as seven distinct colours are applied, so that from 48 to 112 stencils have to be cut for every foot length of the film dealt with. About 100 colour films can be made from each set of stencils, so that, assuming 1,000 ft. of film to provide 20-minutes' entertainment from 2,400 to 5,600 stencils have to be cut to provide each minute's Pathé-colour entertainment in 100 halls simultaneously.

The actual colouring of Pathé films is a purely mechanical process. The film to be dyed is passed through an electrically-driven machine which applies that aniline colour for which the stencil film was cut, through the latter on to the picture film. As many films as possible are thus treated till the stencils begin to show signs of wear. The dye in the machine is then changed to suit the next stencil, and the films are over printed with the second colour, and so on till all the selected component tints have been applied.

The electric driving of projectors is very desirable, since it ensures uniform speed, and leaves the operator free to attend to other matters while relieving him of a duty which, especially in long-hour continuous-performance halls, is very monotonous. In most of the motor-driven projectors now on the market, the regulating rheostat is mounted near the motor on the projector stand. This arrangement is being condemned by the L.C.C. on the ground that it considerably increases the risk of firing broken films.

In cinema halls themselves, the applications of small electric motors, include the driving of "Kinesounders" and similar machines, sign flashers, fans and vacuum cleaners, concerning which more is said in later paragraphs.

**Electric Lamps and Lighting.**—Electric lamps are used almost exclusively in cinema halls and projectors, indeed, electrical energy and apparatus is so intimately associated with every branch of modern cinematography that it may be questioned whether the

\* A.C. arcs are, of course, much less satisfactory than D.C. arcs for cinema work, but a considerable number are used in this connection. It is claimed that, owing to the higher efficiency of the D.C. arc, an A.C.-D.C. auto-generator set enables better results to be obtained than auto-transformers while effecting anything up to 20 per cent. economy as compared with the latter.

electrical aspects of the Exhibition were made sufficiently prominent.

The Elektrophotograph. Ges., of Frankfort-on-Main, exhibited several types of "Jupiter" lamps for ordinary or cine-studio illumination. Each lamp comprises two horizontal arcs arranged along the axis of a semi-circular diffusing reflector which, for cinematograph work, is provided with a swinging-front diffusing screen.

The Westminster Engineering Co. exhibited a new type of studio lamp embodying their standard 15-ampere enclosed arc with a diffusing parabolic back reflector and an extended top deflector plate.

For printing films and for projecting purposes in their stencil-cutting machine, Pathé Frères use Nernst lamps.

Space limitations prevent detailed description of the many types of projector arcs exhibited. The design and manufacture of these lamps has reached a high degree of perfection, and no radical alterations have been introduced in the leading makes during the past year or two. The chief developments have been the provision of additional adjustments and increased mechanical strength to ensure rigidity and to suit the heavy currents now employed in large halls. The German exhibits included some exceptionally heavy designs, but we consider the British products shown to be neither electrically nor mechanically inferior to the Continental lamps. Standard

FIG. 2.—TRINITY ARC, SET AT USUAL ANGLE FOR A.C.

first-class projector arcs, as now supplied for cinema work, have usually seven adjustments, viz. carbon feed, top-carbon traverse (back and front or right and left), and tilting, raising and traversing (to and fro or right and left) of the whole lamp. Among the mechanical improvements adopted to prevent back-lash (initial or due to wear) and consequent unsteadiness of adjustment, may be noted square guides for the main carbon feed bars, parallel guides for the adjustable carbon holder, specially wide rack threads and guide pins preventing side play round racks. There is also a notable improvement in the insulation of terminals and leads on all projector arcs.

The "Trinity" projector arc, exhibited by the Cinema-Halles Trading Co., is worth special notice not only on account of its substantial mechanical construction but also by reason of the swinging jaws provided. The lamp has seven adjustments, and the swinging jaws enable the carbons to be set to give best results with either D.C. or A.C. supply (fig. 2). If desired, the carbons can be set at right angles, and in any case the jaws can be brought within 1 in. of each other, thus reducing carbon wastage to a minimum. This lamp is built in various sizes from 10 to 120 amperes.

The Kamm "Universal" projector arc has no fewer than nine distinct adjustments, and "remote control" clamping devices are

FIG. 3.—WESTMINSTER MINIATURE ENCLOSED ARC.

provided, so that there is no difficulty in re-carboning while the lamp is hot; the expansion of the clamps merely grips the carbons more tightly.

The Westminster Engineering Co.'s miniature enclosed arcs, using carbons at right angles for projection purposes, have been

previously noted in these columns; a 35-ampere model, embodying several new features, has just been placed on the market, and is illustrated in fig. 3. Both carbons are simultaneously fed by a single hand-wheel, feeding being necessary about once in 10 mins. on 200-volt supply. The P.D. required across the arc is 55-65 volts and a maximum of 8,000 C.P. is available in the direction of projection. The lamp is built to enter any standard projector lantern, and the deposition of soot on the front of the enclosing cylinder is prevented by the provision of a top condensing chamber into which gases pass, on rising from the arc, returning behind a vertical dividing plate in the glass cylinder and through passages in the base-plate. As in the smaller sizes of this lamp, the partial enclosure of the arc secures quiet, steady burning and reduced carbon consumption.

For home or school use the "Pathéscope"—employing a hand or pedal-driven magneto-generator—has gained rapid popularity, but if it is preferred to take current from ordinary supply mains, a miniature arc lamp, or a metal-filament lamp, may be used. The 15-20-ampere "Jupiter" lamp, burning 5-mm. carbons, enables 5 ft. x 6 ft. pictures to be shown, while the "Ideal" projector, shown by the same firm and using a 16-volt metal lamp, makes possible satisfactory projection up to 3 ft. x 4 ft. on the screen.

A number of firms now specialise in the supply of high-grade carbons of suitable quality and size for cinema work, and many of their products were exhibited at Olympia. The E.E. & E. Co. exhibited positive carbons, the tips of which were ground at an angle; this slight departure from usual practice enables a steady arc of the desired form to be obtained immediately on starting up.

(To be concluded.)

### Electricity at the Laundry Exhibition.—Although

electricity did not play a very important part in the display of machinery connected with laundries at the International Laundry Exhibition, which was held at the Agricultural Hall, London, last week, there were several items of considerable interest on view. Perhaps one reason why electricity is not more fully utilised as a medium for power transmission and heating is that a plentiful supply of steam is a first essential in large laundries, which necessitates the installation of a steam-raising plant, the consequence being that the majority of laundry owners find it at present more economical to put in a steam engine for shaft-driving purposes. At the same time there were indications that electricity is beginning to play a more important rôle in laundry work, for, as one walked around the Exhibition, one came across a number of machines that were driven by directly coupled electric motors. Thus, MESSRS. JAMES ARMSTRONG & CO., of Queen Victoria Street, E.C., displayed, in addition to an electric bleach-making machine, a huge "Trojan" flatwork ironer, with 120 in. x 48 in. cylinder, which was shown in operation driven by an attached electric motor. MESSRS. T. BRADFORD & CO., of the Crescent Ironworks, Salford, Manchester, exhibited an electrically-driven rotary washing machine of 20-shirt capacity, in which the usual steam for boiling purposes was replaced by a gas heater. MESSRS. T. BROADBENT & SONS, LTD., Huddersfield, displayed a couple of electrically-driven hydro-extractors, one of which—a 26-in. machine—was belt-driven off the motor mounted on the same bed-plate. The second machine, which was of 48-in. diameter, was of the suspended type, in which the armature or rotor of the electric motor is mounted on a sleeve which is independent of, and can revolve round, the centre spindle of the machine. To the upper part of the sleeve are attached friction shoes, which are thrown out by centrifugal force when the armature commences to rotate, and engage with the inner rim of a clutch secured to the centre of the spindle. The weight of the shoes is regulated so that, when the motor attains its normal speed, the friction developed is equal to the torque of the motor, and slipping ceases. By this arrangement the armature is able to develop practically full power and speed immediately the current is switched on, the rotating cage of the machine being quickly brought up to full speed by the action of the clutch. MESSRS. R. G. WHITAKER, LTD., of 22, Southwark Bridge Road, S.E., had on view a new 26-in. hydro-extractor with direct-attached 3-H.P. Crompton motor and an electrically-driven proffering machine. A range of electrically-heated hand-irons was exhibited by MESSRS. ISAACS BRAITHWAITE & SON, of Kendal, and one was shown in operation at the stand of the POLYSULPHIN CO., LTD., of Bristol.

### Sterilisation with the Mercury Vapour Lamp.—

The use of the mercury-vapour lamp to sterilise water is well known. A further use has been made of it by Herr Otto Hlasek to sterilise underclothing. The process favours the polymerisation of the oxygen with the formation of ozone, resulting in rendering the garments thoroughly aseptic and destroying all pathogenic germs, without affecting the texture or suppleness of the stuffs. Experiments showed that 13 of the most virulent bacilli succumbed at various periods from 5 to 60 seconds.—*Revue Pratique de l'Electricité*.

**Electrical Trades Union.**—At the North-Western branch of this Union, Princess of Wales Hotel, corner of Belsize Road and Abbey Road, N.W., on Tuesday, April 15th, at 9 p.m., Mr. Harry Springfield will deliver an address entitled "An Evening with Olive Schreiner."

## RECONSTRUCTION AT BANKSIDE.

We recently paid a visit to the works of the City of London Electric Lighting Co., at Bankside, where the process of removing the old generating plant and the concrete foundations is in full swing, to make room for the new plant which is on order. Three turbo-alternators of 2,500 kw. each have been running for a considerable time, and a new set consisting of a turbine driving two 1,250-kw. direct-current generators in tandem—the largest D.C. set so far constructed—is in position; another D.C. set of the same size, and a 4,000-kw. D.C. set, in which gear-driving will be adopted, are to be laid down in time for the winter load, and as the existing foundations (which carried Willans-B.T.H. A.C. sets) are altogether unsuitable for the new plant, it has been found necessary to clear them out entirely. As the foundations are of solid concrete of excellent quality, which has set very hard, the work of removal is an undertaking of considerable difficulty, more especially as the proximity of boilers and generating plant in operation precludes the use of explosives.

Under these circumstances, it has been necessary to have recourse to more scientific and effectual methods than that of manual labour, in order to break up the huge masses of artificial stone, which appear to have been designed on the lines of bomb-proof fortifications; and bear eloquent testimony to the thoroughness with which the engineers of 20 years ago carried out their duties.

Having regard to the smooth running of the Willans engine, it would seem that lighter foundations would have sufficed to ensure their stability and freedom from oscillation. Perhaps the intention was to prevent the transmission of vibration to neighbouring buildings, for in those days the phenomena of vibration in connection with reciprocating engines were not fully understood, and even now they sometimes give rise to puzzling effects.

The method devised by Mr. Frank Bailey, joint managing director and engineer to the company, to cope with the difficulty is interesting, more especially as the construction of the apparatus was carried out entirely in the company's well-equipped workshops.

An old armature shaft, weighing several tons, is employed as a battering ram, being provided with a lifting eye screwed into one end, and with rings sliding on a pair of iron guides. One of the two travelling cranes with which the long bay is served has been furnished with a trigger hook, by means of which the ram can be lifted a few feet; on pulling a rope attached to the end of the trigger the ram is released and strikes a powerful blow after the fashion of a pile-driver. A hole about a foot deep and a few inches square is drilled in the top of the concrete block by hand, taking a couple of men about two hours to do it; heavy wedges are then knocked into the hole, and the ram is allowed to fall upon them, striking a blow of about 100 inch-tons. A few taps of this kind suffice to crack the concrete in all directions, enabling workmen with crowbars to break it up without difficulty. The tap is then used to pound the blocks into smaller lumps, which are carried on a temporary railway to a stone-crusher and reduced to a size suitable for use in making new concrete.

As the device employed is interesting, and may be of use to other engineers in these days when the work of demolition and reconstruction is going on in so many places, we reproduce photographs of the battering-ram, for which we are indebted to Mr. Bailey.

## OUR LEGAL QUERY COLUMN.

[Questions addressed to this column should be written on one side of the paper only.]

"W. S. D." writes:—"A supply of electricity has been given to a consumer having premises on a lease. The lease having expired, the premises are now vacant. Are the undertakers, upon demand by the owner, bound to take out the service from the building back to the footpath? The owner complained that the cut-outs would be in the way, so the cables were sealed and buried under the floor. He now insists on their coming out altogether."

"\*." This query raises a point of some interest which it is difficult to answer with certainty, having regard to the somewhat meagre statement of facts. Thus it is not quite clear what is meant by "the service from the building back to the footpath." Is this within the outillage served by the supply, or is it outside? The obligation cast upon the local authority or company supplying electricity is to give, and continue to give, a supply to owners and occupiers of premises within the area of supply situate within 50 yards from any distributing main in which they are required to maintain, or are maintaining, a supply of electricity for the purpose of general supply to private consumers. The consumer must, if

CONCRETE-BREAKER AT WORK AT BANKSIDE.

required, bear the cost of so much of any electric main for the supply to him as is laid on his premises, and of so much of such electric main as it may be necessary to lay for a greater distance than 60 ft. from any distributing main of the undertakers, although not on his premises. If it should turn out on inquiry that in the case under notice the owner in question, or his lessee, paid for the service, it would seem that the cables ceased to be, or never were, the property of the undertakers, who cannot now be compelled to remove them.

**The Imperial Motor Transport Conference.**—The Rt. Hon. Lewis Harcourt, Secretary of State for the Colonies, has consented to become Vice-President of the Imperial Motor Transport Conference, sharing this position with the High Commissioners for the self-governing Dominions. Recent additions to the executive committee of the Conference include Col. the Hon. Sir N. J. Moore, K.C.M.G., Agent-General for Western Australia, the Hon. J. H. Turner, Agent-General for British Columbia, and John Howard, Esq., Agent-General for Nova Scotia. The Army Council has nominated, to serve on the Executive Committee, General F. W. B. Landon, C.B., Director of Transport at the War Office, and the chairman and secretary of the Mechanical Transport Technical Committee. It has now been definitely decided that the exhibition of Industrial Motor Vehicles at Olympia shall open on Friday, July 18th, and the visit of the Conference delegates to the Exhibition is timed for the morning of Saturday, July 19th.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 3d. (in stamps).

## 1911.

ELECTRICALLY-ACTUATED TAXIMETERS FOR CABS AND LIKE VEHICLES. C. Robinson. 27,556. December 8th.

## 1912.

MEANS FOR TRANSFORMING ELECTRICAL ENERGY INTO HEAT ENERGY, PARTICULARLY APPLICABLE TO HAIR-DRYING APPARATUS. London Electrical Trading Co. and C. O. Bastian. 5,723. March 7th.

SWITCH ARRANGEMENT FOR ELECTRIC INCANDESCENT LAMPS. J. F. Smith. 5,814. March 8th.

APPARATUS FOR THE ELECTROLYTIC REFINING OF IRON. G. Tischenko. 5,855. March 8th.

VARIABLE-SPEED DYNAMOS FOR USE IN STARTING INTERNAL-COMBUSTION ENGINES AND THE LIKE. H. LEIDER. 6,189. March 12th.

SYSTEMS OF ELECTRICAL DISTRIBUTION. British Thomson-Houston Co. (General Electric Co.) 6,212. March 12th.

ELECTRICALLY-CONTROLLED LIFTS OR ELEVATORS. A. RIZIET. 6,304. March 13th.

INSULATING SCREWS FOR THE CONDUCTOR RAILS OF ELECTRIC RAILWAYS. E. T. Brook. 6,473. March 16th.

DEVICE FOR SUPPORTING CONDUITS, PIPES OR THE LIKE FOR ELECTRIC CONDUCTORS AND OTHER USES. J. B. Blake and W. Kilburn. 6,562. March 16th.

AUTOMATIC APPARATUS FOR OPERATING ELECTRIC STARTING SWITCHES AND THE LIKE. W. A. CLARWORTHY. 6,599. March 16th.

ELECTRIC MEDICAL APPLIANCE. E. T. BRASRUPE. 6,645. March 18th.

ELECTRIC INDICATING APPARATUS SPECIALLY, THOUGH NOT EXCLUSIVELY, APPLICABLE FOR USE ON BOARD SHIP. W. D. KILROY and EVERSHED and VIGNOLES, LTD. 6,792. March 19th.

ELECTRIC LIGHTING SYSTEMS FOR AUTOMOBILES. J. BIJUR. 6,803. March 19th.

METHOD OF SETTING OR ADJUSTING FROM A DISTANCE THROUGH THE MEDIUM OF PERIODIC OSCILLATIONS OF DIFFERENT FREQUENCY. ERICH F. HUTH GES. and H. BEHRE. 9,181. April 18th. (April 18th, 1911.)

ELECTRIC RESISTANCE FURNACE. L. UBBELOHDE. 9,303. April 18th.

CONSTRUCTION OF ELECTRIC BELL PUSH. A. BONDELLA. 10,360. May 1st.

ALTERNATING-CURRENT GENERATORS. C. R. SHAW, J. G. SHAW and H. G. SHAW. 10,427. May 2nd.

FORM OF ELECTRIC FIRE-ALARM APPARATUS. H. NEAL and E. E. MOORE. 10,927. May 8th.

MEANS FOR STARTING INTERNAL-COMBUSTION ENGINES. B. BROOKS and W. HOLT. 10,996. May 8th.

MACHINES FOR MAKING ELECTRIC INCANDESCENT LAMP BASES. British Thomson-Houston Co. (Allgemeine Electricität Ges.) 13,788. June 12th.

TERMINAL MOUNTING AND CORD-GRIPPING MEANS FOR ELECTRIC LAMP HOLDERS, ADAPTORS OF THE LIKE. G. ST. J. DAY. 14,306. June 19th.

PROCESS AND DEVICE FOR INCREASING THE LIFE, UNIFORMITY AND ECONOMY OF ELECTRIC DISCHARGE TUBES HAVING AN INCANDESCENT CATHODE. R. VON LIEBEN, E. REIZZ and S. STRAUSS. 15,975. July 8th. (July 7th, 1911.)

APPARATUS FOR UNIFORM ELECTROLYTIC TREATMENT OF METAL STRIPS, WIRE AND THE LIKE UNDER CONTINUOUS ACTION. F. WERTH. 16,535. July 15th.

DEVICES FOR ADJUSTING THE TIME OF IGNITION IN INTERNAL-COMBUSTION ENGINES PROVIDED WITH MAGNETO-ELECTRIC IGNITION MACHINES. A. G. BLOXAM. (Robert Bosch, Firm of.) 17,489. July 27th.

HIGH TENSION INSULATORS FOR OVERHEAD LINES. W. FELLNBERG. 17,761. July 31st. (July 31st, 1911.)

ELECTRODES FOR ELECTROLYTIC MEASURING INSTRUMENTS. H. S. HATFIELD and Chamberlain & Hookham, Ltd. 18,341. August 9th.

ELECTRICALLY-HEATED THERAPEUTIC APPLIANCES. J. de Bernard and J. Ebb Smith. 19,267. August 22nd.

ROTARY ENGINE WITH ELECTRICAL POWER TRANSMISSION GEAR. A. BALDWIN. 19,787. August 25th. (September 23rd, 1911.)

ELECTRIC POCKET LAMPS. W. KNOPF. 23,093. September 28th.

TWO-RATE ELECTRICITY METERS. LANDIS & GYR. 24,503. October 26th. (October 27th, 1911.)

THERMO-ELECTRIC BATTERIES. H. O. GROSS. 25,372. November 6th. (November 8th, 1911.)

CONTROLLERS FOR ELECTRIC MOTORS. L. G. RILEY. 25,591. November 7th. (November 8th, 1911.)

SPREADERS FOR TELEPHONE RECEIVER CASINGS. P. M. COX. 26,474. November 18th.

DRY ELECTRIC BATTERIES. J. BOHLE and "Volta" Commanditgesellschaft für Elektrische Kleinbeleuchtung. 26,699. November 20th.

ELECTRIC HEATING APPARATUS. E. G. BYDG and J. H. COLLIGRS. 28,542. December 11th. (Divided application on No. 6,763 of 1912, March 19th.)

**Book Notices.**—*The A B C Guide to Patents for Inventions.* By R. E. PHILLIPS and A. M. FLACK. London: Butterworth and Co. Price 2s. 6d. net.—There are few subjects on which so many guide-books are written as that with which this work deals, and necessarily the differences between the treatises are found mainly in the method of treatment. In the book before us, the matter is thrown into paragraphs, arranged under alphabetical headings, with a view to enabling the user to find the point he wants with the minimum of trouble. So far as we have tested it, we have found the arrangement satisfactory.

*A First Book of Electricity and Magnetism.* By W. PERREN MAYCOCK, M.I.E.E. London: Whittaker & Co. Price 2s. 6d. net.—This is the fourth edition of a work which is intended to provide a really easy introduction to the subject; it is written in very simple language, and illustrated with very clear drawings and diagrams, some of which are admirably devised to convey correct ideas, as, for instance, the horseshoe magnet on page 17, in which each of the external lines of force shown is continued throughout the body of the magnet. Starting with the magnet, the author passes on to voltaic cells and electric currents, electromagnetism and electrolysis, and the induction of currents, up to the principles of dynamos and motors; he then commences electrostatics, and eventually shows the connection between this subject and electrodynamics by explaining the action of the condenser. A number of questions is given at the end of each section, and a list of experiments bearing upon the subjects dealt with is appended, together with a priced list of all the apparatus required for carrying out these experiments and many others. The book is exceptionally well printed on good paper.

"Science Abstracts." Vol. 16, part 3, March 31st, 1913. Sections A and B. London: E. & F. N. Spon, Ltd. Price 1s. 6d. net each.

"Proceedings of the American Society of Civil Engineers." Vol. 39, No. 3, March, 1913. New York: The Society.

"On the Temperature Rise and the Deterioration of the Covering Material of Wire by the Carrying Current." By T. HIROBE. August, 1912. Tokio, Japan: The Electro-Technical Laboratory.

"Atti della Associazione Eletrotecnica Italiana." Vol. 17, No. 6, March 31st, 1913. Milan: Stucchi, Coretti & Co. Price L. 1.50.

"Bulletin Mensuel Société Belge d'Electriciens." Vol. 30, January, 1913. Brussels: E. Bruylant. Price 1 fr. 75.

**Russian Platinum Tax.**—A Reuter dispatch from St. Petersburg states that the Council of the Empire has adopted a resolution of the Duma regulating the conditions of export in the platinum industry. It decided, however, instead of prohibiting the export of raw platinum, as proposed by the Duma, that raw platinum should be liable on exportation abroad or to Finland to a tax of 30 per cent. *ad valorem*.

(J. A. Berly's).

1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

THE paper read before the Society of Arts last week by Mr. Frank Bailey was of exceptional interest, as a review of the progress made in London during the 20 odd years which had elapsed since he read his previous paper before the Society—a period which covers practically the whole history of electricity supply on the commercial scale. It is almost exactly a quarter of a century since the passing of the second Electric Lighting Act removed the prohibitive restrictions which had been placed upon the embryo industry, and enabled capital to be adventured in this new field with a reasonable prospect of securing an adequate return. If we transport ourselves back in imagination to the date of the first paper—1890—what a striking contrast is presented between then and now!

At that time we were emerging from what Mr. Swinburne aptly described as the "postage-stamp paper and sealing-wax" stage of electrical engineering, when a 300-kw. dynamo was a monster, the Willans engine was asserting its supremacy, and various "battles of systems" were raging—between direct coupling and belt-driving, high speed and low speed, two-pole and multipole types of dynamo, A.C. and D.C.; high voltage was then 2,000 volts, and transformers were commonly installed on consumers' premises, while alternators were run on separate feeders, as parallel operation was considered, if practicable at all, too risky. The supply of electricity for motive power was practically non-existent, and there were no trolley tramways in the country—though there were electric railways!

To-day, on the other hand, we hear of the construction of a 25,000-kw. Parsons turbo-alternator without raising an eye-brow, and the cutting-off of the electricity supply of London for a single hour would be a disaster of national importance.

No better exponent of the past 20 years' progress in London's electricity supply could be found than Mr. Bailey, who, as engineer to both the City of London Co. and (formerly) the Metropolitan Electric Supply Co., has a unique acquaintance with the history, published and unpublished, of the subject, and himself was responsible for a very large share in the development of the industry in London. It is interesting to note that, by introducing the Parsons turbine into central-station practice in London, in order to overcome the vibration nuisance arising from the use of reciprocating engines in a residential quarter, Mr. Bailey gave a great impetus to the development of the turbine at a time when it was viewed with suspicion and incredulity by many of his *confrères*, and thus rendered timely service of the utmost value to Sir Charles Parsons—besides solving his own difficulties. That his confidence in the ability and genius of

that great inventor is unabated is well illustrated by the fact that he has ordered for the Bankside works a geared turbo-generator of the largest output yet constructed for direct-current supply.

The importance of the industry to London may be gauged from the tabular statement of the capital expended upon it and of the annual output which is given in our abstract of the paper on another page. That this huge business, engaging a capital of 21 millions sterling, should be split up between no fewer than 14 local authorities and 13 companies is, to our mind, a misfortune, attributable partly to the fact that the industry is of so recent origin that it has not yet grown out of the chaos of systems and supplies that reigned at the commencement, partly to the craze for municipalisation which overwhelmed the country towards the end of last century, and partly to the allied jealousy of private enterprise which gave rise to the ill-omened Act of 1882, and to the establishment of competition by the Government throughout the Metropolitan area in 1889. In the latter portion of his paper, Mr. Bailey contrasts the London conditions with those obtaining in Berlin, Paris and Buenos Ayres, to which might be added many other great cities, such as Chicago, Montreal, &c.

The advantages of centralisation of management and uniformity of system in the hands of a single authority, under statutory control, are hardly if at all less patent in the case of electricity supply than in that of the telephone system; and while we do not advocate the municipal management of any great commercial undertaking such as these, we believe that unification of the supply of electricity in London would tend to lower the price to the consumer, while ensuring an adequate return to the investor and guaranteeing a continuity of supply unattainable under existing conditions. But it will be the work of many years, and we hardly anticipate that it will be complete even when Mr. Bailey reads his third paper before the Society of Arts in 1933—as we sincerely hope he will do. May we be there to hear him!

#### Smoke Abatement.

THE annual meeting of the Coal Smoke Abatement Society was held on April 10th at the Royal United Service Institution.

There was a time when this Society displayed something other than affection for electric generating stations, and we were inclined to feel that in pursuing its policy of relentless persecution of electrical undertakers, it was blind to the support that electricity supply was lending to its movement by providing power which would render multitudinous furnaces and factory chimneys unnecessary. To-day, however, the Society appears to be full of appreciation of the work of the London electricity suppliers. Indeed, reference to a note elsewhere in this issue will show that "the value of this, their ally, in the work of cleansing the atmosphere" is now gratefully acknowledged. In regard to the general course of smoke abatement, it cannot be said that the progress towards better ideas on matters of combustion is very rapid, yet in some way or other black fogs certainly seem to be less frequent than they were 20 years ago. It is a matter for regret that the income of the society should be less than £300 per year, for the society deserves encouragement from us all. What is needed by way of better methods for burning coal is not the use of anthracite, which some seem to think is the one and only way, but the use of methods for burning all fuels in a cleanly manner. It is to be hoped, however,

that the semi-coke made from bituminous coal may, before long, be a regular article of sale. Coalite seems to have gone altogether. But what of that system by which ordinary gas coke was annealed in some way when freshly drawn from the retorts? To our knowledge that coke was an excellent fuel; it ignited as easily as coal, made a nice clean fire, produced no smoke, and yet gave a fire more like coal than coke. It was also economical. Of course, coal should never be burned until it has been at least partially coked and the by-products saved. But that is a large question. The domestic chimney should be less an offender to-day in consequence of the developments of gas and electric heating and cooking, and hopeful electrical men look in this direction, perhaps, more than in any other, for the clean and sweet, because smokeless, city of the future.

AN American contemporary recently gave some interesting particulars of the electric heating load connected to the mains of the New York Edison Co. In 1900, this load amounted to 200 kw.; by 1907 it had increased to 800 kw., and, at the present day, it amounts to some 3,000 kw.—a figure which has, however, been exceeded in the Marylebone (London) area. Naturally, it is the electric iron which has come into favour most readily, and such is its popularity that the average energy consumption per iron used in tailoring establishments in 1912 reached the remarkable figure of 350 kw.-hours—an amount greater than the total annual consumption of many, if not most, middle-class lighting consumers in this country.

Our Chicago namesake states that nearly 700 additional electric irons were placed in New York factories last year by the Edison Co. alone, and it is known that 98 per cent. of these are in regular use. An installation of six irons is reckoned to be a small one, yet it secures a very acceptable annual revenue, and there are many larger installations bringing in from £100 to £300 per annum. With such figures before us, there can be no doubt that electric irons are as valuable to users as their demand is to the central station.

Prominent among the other industrial heating loads supplied by the Edison Co. are several large japanning ovens, the efficiency of which has been greatly increased by the adoption of electric heating. During January, 1912, the ovens in one establishment consumed 882 kw.-hours. Recently electric heating has been adopted in connection with celluloid button dies, and in the better millinery and dry goods establishments there are a number of electrically-heated boilers used for steaming velvet and feathers.

Similar installations have recently been put in by large theatrical companies using a multitude of costumes. Electric sealing-wax heaters are working six days a week in many large offices, electric branding irons have gained greatly in popularity within the past year, and soldering irons and pitch kettles make a steady, if not startling, progress. Cinema film companies are now using electric heaters for their developing baths.

In domestic service in New York the electric iron averages 14 hours' use per month; the 6-lb. iron usual in resident flats averages 84 kw.-hours per annum. Special provision is made for the use of electric irons in the newer apartment houses; in one case, 35 tenants are each provided with two irons and an ironing board in an elaborate basement laundry, and complications are avoided by placing each iron on its own meter and locking the outlets. Among all kinds of domestic heating appliances, that for which the greatest increase in demand developed in New York during 1912 was the "combination grill," comprising a series of cooking utensils capable of being used with a single heating unit,

The Washington Water Power Co. (Spokane) has an industrial heating and power load of 77 per cent. daily load factor, to which, as we gather from the *American Electrical Review*, there has recently been added an electric heating installation in the banana ripening rooms of the Chas. Uhden Co. Each of two rooms, 16 x 18 x 7 ft., accommodates 200 bunches of fruit, and is heated by four 500-watt heaters mounted in an asbestos-lined wall box. In addition, a 500-watt heater is placed in a bucket of water to provide the requisite atmospheric moisture. A circulating fan is placed in each wall box at the outlet of an air duct, which has its inlet at the floor line on the opposite side of the room. Cool air is thus drawn in and blown through the heaters on to a distributing board. Experience shows that this system of heating enables a uniform temperature to be maintained in every part of the room without the aid of a thermostat. At night, the fan and half the heaters are shut down, an even temperature within 0.5° F. being then maintained during the night. In summer, the heat generated by the ripening fruit is greater than is required for best results, hence ventilating ducts are opened, and (the heaters being idle) the fan is used to circulate cool air through the ripening rooms. By working the rooms alternately, a high load factor is obtained, and 200 bunches of fruit are available for market every two days. The nature of the load, from the central station standpoint, will be seen from the following data:—

1912.	Max. demand. kw.	kw.-hours.	Load factor.
March ... ..	1.7	1,100	87 %
April ... ..	1.2	800	92.5 %
May ... ..	1.2	840	94 %
June ... ..	1.2	90	10.2 %
July ... ..	1.2	60	6.7 %
August ... ..	1.2	75	8.4 %
September ... ..	1.5	240	22.2 %
October ... ..	1.4	450	43.3 %
November ... ..	1.9	900	65.8 %
December ... ..	2.3	1,150	67.2 %

In the case of *Crosfield v. Techno-Chemical Laboratories, Ltd.*, which was really a contest between the two great firms of Mond and Lever, Mr. Justice Neville had something important to say about the functions of the expert witness. One has only to peruse the headnote or summary of the case which appears in the *Times* "Law Reports," published last week, to see that it was a dispute in which the services of experts were urgently needed. That summary is as follows: "The plaintiffs, as legal owners of letters patent granted to one N. for 'a process for converting unsaturated fatty acids, or their glycerides, into saturated compounds,' alleged that the defendants were infringing their letters patents, and they claimed an injunction and the usual ancillary relief. The defendants denied the validity of the letters patent, on the ground that N.'s specification did not sufficiently describe the manner in which the process was to be carried out. It was held that the specification was insufficient in this respect, and that the action failed." It is obvious that a dispute about such a patent must have involved the employment of experts—if only to explain to the Court the meaning of the technical words used; but it is evident that in the view of the learned Judge the experts engaged exceeded their functions. In the course of his judgment he said:—

"It is not competent in any action" for witnesses to express their opinion upon any of the issues, whether of law or fact, which the Court or a jury has to determine. The assistance of expert evidence in patent actions is generally essential. It is required for the purpose of explaining words, or terms of science or art, appearing in the documents, or to inform the Court in case the import of a word or phrase differs from its popular meaning. Further than this, in some cases it is impossible for the Court to understand a document without in-traction with regard to the laws of the science with which the patent may be concerned, without expert assistance. Moreover, the Court cannot inform itself as to the state of public knowledge with regard to the matters in question at the date of the patent. The above category may not, indeed, be exhaustive; but in no case, in my judgment, is it per-

missible to seek the opinion of a witness upon any of the issues in the action, or the construction of any document relied on. Yet I believe if the records of patent actions during the last 20 years were examined, it would be found that a very large proportion of their contents, I should say at least nine-tenths, is devoted to questions which, either openly or under more or less skilful disguise, are directed to eliciting the opinion of the witnesses upon one or other of the issues in the case, or the construction of documents relied upon.

Anyone who has been concerned in a patent case will readily admit the force and truth of these observations. The expert witness necessarily becomes imbued with the merits of the case he is asked to support, and finds it difficult to avoid the expression of an opinion as to whether a particular invention has or has not been infringed or anticipated. But while it is easy to point out the symptoms of a disease, it is not always easy to prescribe a remedy. Under our present system of judicature by which technical cases of the highest order must be tried before a tribunal which may, scientifically speaking, be wholly ignorant, the assistance of expert witnesses is essential. For some reason which is difficult to explain, the judges almost invariably refuse to summon a scientific assessor whose opinions on technical matters would be of the utmost value. True, the parties to a patent action can retain the services of counsel who have much scientific knowledge; but the opinion of the counsel is only argument when heard in court. Some of us, perhaps, may live to see the day when there will be a special tribunal for the determination of patent cases before which the services of expert witnesses may be entirely dispensed with.

#### Invention in 1912.

THE annual report of the Comptroller-General of Patents shows that among the predominant lines in which there was evidence of inventive activity during 1912 were the following:—Internal combustion engines and other motor-car matters, including the construction of small dynamos for motor-car lighting; life-saving appliances for use at sea, inventive ingenuity apparently being markedly encouraged by the *Titanic* disaster (means for preventing collisions and detecting the presence of ice, also arrangements for enabling wireless signals to be received when the operator is off duty are mentioned in this class); and automatic telephone exchanges—especially the difficult problems of junction and trunk line working, and semi-automatic and other methods for facilitating the gradual introduction of automatic systems. Legislation which gave rise to a great public controversy also led inventors to find new appliances for obviating the necessity for wholesale stamp-licking being carried out on the orthodox lines; while the public appreciation of the cinematograph made this comparatively new department a popular one among patentees. In regard to the general figures of the year, the number of applications was 30,089, as compared with 29,353 in the previous year; provisional specifications were 19,825, and complete 18,853, while 15,814 were sealed, these figures in 1911 being 19,524, 18,662 and 17,164 respectively. The receipts from patents fees were £293,529, showing an increase of £10,325 for the year. In designs and trade-mark fees there were increases of £441 and £3,369 respectively. There was a decrease of £379 in the sale of Patent Office publications. The total expenditure on behalf of the Office showed a decrease of £3,140, and the net financial result of its entire operations is a surplus of receipts over expenditure amounting to £131,627; this is an increase of £16,896, as compared with the 1911 surplus. It appears that there is an increase in the number of applications received from the United Kingdom and from Canada, India and the West Indies, but those received from the Australian Commonwealth, New Zealand and the South African Union, showed a considerable decrease. In respect of ten foreign countries (included here is the United States), there were increases, but six Continental countries—Belgium, France, Germany, Hungary, Russia and Sweden—sent fewer applications than in 1911.

## ELECTRODES FOR ELECTRIC FURNACES.

By G. BASIL BARHAM, A.M.I.E.E.

For some reason in electric furnace work, not only the actual electrodes themselves, but also the end connections which are used to connect the cables from the supply to the heating resistance are frequently termed electrodes, although this term could only be applied in the correct sense to these terminals when the resistance was of an electrolytic nature. Generally speaking, the name is given to the carbon or metal bodies which, together with the charge, form the primary essentials for almost every form of electric furnace yet devised.

The best material for electrodes from the point of view of conductivity is graphite. Usually ordinary carbon is employed, as all forms of carbon decrease in resistance as the temperature to which they are heated increases, being in this respect the exact opposite of most of the so-called rare metals—such as those used for lamp filaments. Carbon, further, can be raised to a higher temperature than can any other substance suitable for use as electrodes. Unfortunately at high temperatures it will readily enter into combination with certain metals—tungsten and molybdenum in particular—forming carbides. Carbon electrodes at high temperatures also act as reducing agents unless they are properly cooled, and it may be said that the problem of effectively cooling electrodes without allowing heat to flow from the hot end of the electrode to the exterior of the furnace is not an easy one to solve. If metal electrodes are employed in order to avoid the troubles which may result from the use of carbon, they also must be effectively cooled or they will dissolve or volatilise. When metal electrodes are used it is customary to form them of similar metal to that about to be treated, so that should any part of them be dissolved, the melted metal would still be in its original form and not in that of an alloy. It will be remembered that Ferranti, Héroult and Kjellin devised means whereby the work of smelting could be carried out without electrodes or without such electrodes as were used coming into actual contact with the metal which was being dealt with.

It has been mentioned that one method of preventing the escape of heat to the outside of the furnace is by cooling, but it will be evident that much depends on the proper proportioning of the electrodes themselves to the current which will be passed through them, and by which the interior portion is raised to the required temperature. This question was thoroughly gone into a short time ago, and it was found by experiment that many of the rules formerly used for designing electrodes were quite incorrect. It was proved that current density was not a determining factor in the design of these parts, and that the resistance was determined by the conditions and not to be considered as merely a matter of choice. The conditions determine either the length or the section of the electrode, and it is only the ratio of the section to the length which is the determined factor. Neither the thermal conductivity nor the electrical resistivity is a governing factor, but it is their product and quotient which are the true measures of the qualities of electrodes. The quotient of the thermal over the electrical conductivity is proved to determine the loss, while the product of the two resistivities determines the proportions, hence it is not necessary to know either one or the other of these properties, but only their quotient and product. It was furthermore shown that these are more easily determined than the others. These two quantities lead to some new quantities not hitherto used, but by means of which the calculations of electrodes become simple in the extreme. These two quantities are termed the loss and the size factors.

Hering has tabulated these for each of various temperature ranges. The loss factor, called "watts per ampere," when multiplied by the current, will give the loss in watts directly, whilst the size factor, called "section per ampere per sq. in." when multiplied by the current and by the length, gives the cross-section in sq. inches.

A problem, which has been the subject of considerable attention, has been in regard to the terminal connections to the electrodes. It appears useless to clamp the electrodes

into metal holders, or to use clamping bands, plates, couplings or caps. The metal expands much more than does the carbon as the temperature rises, with the result that the metal attachment works loose, and local heating, which may have disastrous results, sets up. A metal rod, carrying a terminal attachment, can be used for the purpose, one end being morticed or sunk into the carbon electrode. It is important, however, that this should not be too tight a fit, as otherwise, when the metal expands, it will burst the end of the carbon rod or block. In one form of terminal a metal rod, which is enlarged at its bottom end, is passed into a hole in the carbon which has been undercut so that whilst it is large inside, the mouth of the hole will only just permit the thickened end of the rod to pass. When the thick end of the rod is pushed to the bottom of the hole, thin metal plates are slipped down beside it, with the result that when an attempt is made to withdraw the rod, the plates jam it in place. This makes a sufficiently good electrical connection, and one further which allows of expansion, the metal rod sliding slightly down the inclined plane made by the metal strips, as it expands under the heat conducted through the electrode.

Common coke, as obtainable at any gas works, is quite suitable for electrodes in the majority of circumstances, and has the advantage of costing but little. In the production of calcium carbide, aluminium, or carborundum, such electrodes answer the purpose admirably in every way, especially if the coke is first picked over, and the light and more porous portions removed. A good carbon for low-tension work is made of a mixture of 25 per cent. of gas coke, and 75 per cent. of petroleum coke. This latter is a by-product of the oil distilleries, and at one time was the only kind that was largely used in the manufacture of carbons for electrical purposes. The only other constituent for the best quality of electrodes is pitch, obtained from the distillation of tar. A common pitch obtained from blast furnaces, but which is far from pure, being contaminated with iron compounds, can be used, but it is not nearly so suitable. At the same time it is not easy to get the desired quality of pitch from the distilleries. The quality depends on the freedom of the pitch from anthracene oils, as when it contains these it is what is technically termed "wet," an expression the meaning of which is self-evident. To get it properly dry all the oils must be driven out, and few still owners care to expose their plant to the high temperatures, which have to be kept up for a long period, in order to drive off the whole of these oils.

In the manufacture of electrodes the coke is first crushed to the size of coarse gravel, after which it is heated to incandescence in a sealed retort, which is provided with a few vents to permit occluded gases to be driven off. After withdrawal from the retorts the coke is ground to fine powder and conveyed into storage bins. The pitch is first broken by hand and then passed through machines which break it up into fine granules. The coke and pitch are then accurately mixed, and it is on this mixing that the quality of the resultant electrode depends. It is carried out in a cast-iron cylinder containing an independent shaft, which is fitted with arms which drag the material from the sides of the drum as fast as it is thrown there by centrifugal action, and bring it back to the centre. After undergoing this treatment for some time, the mixture is spread out and allowed to solidify, after which it is again broken up and pulverised in a mill. It is then finally pressed into moulds, which are the shape of the required electrodes, and baked to render the pitch-coated particles of coke thoroughly adhesive. As soon as the required degree is reached the mould is placed in a hydraulic press, and a pressure of several hundred tons brought to bear upon it.

---

**Electric Laundry Irons.**—In view of recent correspondence on the subject of laundry irons, the BRITISH PROMETHEUS CO., LTD., of Birmingham, inform us that they are now making a speciality of a new type of laundry iron, which has been expressly designed to obviate the defects mentioned. They are so confident of the utility and long life of this iron that they are willing to submit samples for approval to laundry engineers, some of whom have already tested them with complete satisfaction. The guaranteed life of the new Prometheus laundry iron is three years.

## THE LIGHTING OF SMALL COUNTRY HOUSES.

BY J. CALDWELL.

It is now generally recognised that electric lighting cannot be surpassed for use in large country houses, and in the technical Press many interesting descriptions of extensive installations for electric lighting and power duty appear from time to time.

The expense of carrying out such comprehensive schemes is, however, considerable, and often exceeds average requirements in the country where castles and large mansions—many of which are already provided with electric light—form a very small proportion of the residences where the installation of private lighting plants is now being considered.

It is in these small or moderate-sized country houses that one sees the keen rivalry between petrol air gas and electricity for supremacy. The exponents of each system endeavour to convince the prospective customer as to the advantages of their system, and also to give all information of disadvantages and dangers, whether real or non-existent, that are reported regarding the rival system. Figures are given to prove the superiority and wonderful economy of either illuminant, and as these particulars are often misleading with reference to the standards of comparison they prove damaging to both systems, as the customer ultimately finds out the true facts for himself, and although the results of work may be entirely satisfactory, they prove disappointing in view of previous assurances.

Both illuminants are particularly satisfactory and efficient, and can claim to be convenient, cheap and simple to operate when compared with oil lamps, coal or acetylene gas. Electrical plants have already proved durable and reliable in the performance of their duty, and although petrol air gas plants have not yet ceased to get out of gear periodically, it may be expected that this trouble will soon be eliminated when manufacturers realise the advisability of increasing the strength and improving the design of the machine parts with a view to providing efficient service rather than cheap equipments.

Hereunder we give comparative particulars of two existing typical installations of petrol gas and electric light. These were erected two and four years ago respectively, and are chosen from amongst installations representing the nearest similar capacity and duty in which the writer is interested. The gas plant has practically no storage accommodation, but operates automatically to supply the lighting demand, whereas the electric plant has a storage battery which is charged for a few hours each day, and a longer period on Saturdays in winter, but less frequently in summer months. The maximum capacity of the gas plant is 100 burners, whilst the electric plant when working under the same conditions with combined supply from dynamo and battery could be connected to 82 lamps for 10 hours and a maximum of 112 lamps for one hour without recharging the battery.

These conditions, however, do not occur in usual practice, and the average number of lamps in use at any one time in the two small installations under consideration does not exceed from 30 to 50 lights.

**Petrol Air Gas.**—The necessary quantity of petrol is introduced into a tank in the generator containing water, which is aerated by a revolving stirrer during admission of the spirit; petrol air gas is emitted and distributed to burners throughout the house by pressure obtained from a weighted gas-holder fitted to the machine. The correct proportion of petrol admitted to the tank is measured in a small bucket placed inside the generator, which admits the desired quantity into the water, depending on the rate of gas consumption.\* The distributing pipes are made of iron or block tin, sufficiently large to pass the requisite amount of

gas to the burners without loss of pressure, and taps are connected to the bottom of vertical pipes as found advisable to drain away any condensed water that accumulates. The initial cost of this installation was as follows:—

Generating plant with accessories ... ..	£102	10	0
Piping, &c., in house ... ..	63	0	0
Fittings ... ..	0	0	0
	£165	10	0

**Electric Lighting.**—The generating and storage plant is accommodated in an outhouse, and consists of a petrol-paraffin engine direct coupled to a shunt-wound dynamo with switchboard and a storage battery.

The "Rational" engine, manufactured by the Heatley Gresham Engineering Co., Ltd., develops 1·6 B.H.P. at constant working load, with fuel consumption of ·8 pint per B.H.P.-hour, on paraffin fuel having a specific gravity of ·825 at 62° F.

The engine is fitted with magneto ignition, and when started cold, is run on petrol until the vaporiser is sufficiently heated—in about five minutes—to allow of paraffin being used.

The interconnecting pipes between the engine, oil and water tanks and exhaust silencer are laid in trenches in the floor neatly covered with checker plating fitted with iron frames.

The dynamo gives 40 amperes, 25-40 volts at 800 R.P.M., and is mounted with the engine on a combined bed-plate.

The switchboard is recessed into the partition wall between the engine and battery rooms, thus providing easy connection to the cells, whilst the back of the switchboard is enclosed as a protection against acid fumes.

The battery, made by the Chloride Electric Storage Co., consists of 14 cells capable of supplying 32 16-C.P. metal-filament lamps continuously for 10 hours.

**Wiring, &c.**—Bitumen cables, contained in wood troughing filled in with pitch and covered with tiles, are laid underground from switchboard to house and two avenue lights.

The branch wiring throughout the house is of V.I.R. 2,500-megohm grade conductors contained in solid-drawn steel tubes sunk behind walls and ceilings.

The work was carried out by Messrs. Steel & Wilson, Glasgow, to the specification of James E. Sayers & Caldwell, Glasgow, and the total cost is summarised below:—

Generating and storage plant ... ..	£90	12	9
Switchboard and connections ... ..	17	0	0
Underground cables ... ..	11	11	0
Wiring for 68 lamps and 62 switches ... ..	57	16	0
74 metal-filament lamps ... ..	9	5	0
Alterations and extras ... ..	11	10	5
Fittings ... ..	10	0	0
	£207	15	2

The fittings for gas and electric light are not included in the above comparative costs, as the amount spent on these depends on the design and class of fittings selected, which varied in both these installations.

The gas consumption for each burner is 9 cb. ft. per hour. Petrol of ·68 specific gravity at 62° F. as recommended by the makers of the gas plant is at present 2s. 1d. per gallon, and as this quantity generates 1,300 cb. ft. of gas, the cost of petrol per 1,000 cb. ft. will be 1s. 8d.

To start the engine, petrol of ·825 specific gravity is used which can now be obtained at 1s. 4d. per gallon, and paraffin for 7d. per gallon, equivalent to an average fuel cost of 8d. per gallon. As ·2 gallon of fuel is required per B.H.P.-hour, which is equivalent to about ·3 gallon per unit, the oil required per 16-C.P. lamp will be ·006 gallon per hour.

It is difficult to obtain reliable information for intelligent comparison of the upkeep of these respective plants on the same basis, but if we assume that 30 lamps are in use for 1,500 hours per annum, the annual charges will be:—

Petrol Air Gas.— $30 \times 1,500 \times 9 = 405,000$ cb. ft. gas at 1s. 8d. = £33 14s. 8d.
Electric Lighting.— $30 \times 1,500 \times \cdot006 = 270$ gallons fuel at 8d. = £9.

The proprietors of both plants have indicated that the accounts for petrol and oil during the last six months (September to March, 1913), which include the darkest days of the year, were £24 for the petrol-gas plant and £6 for the electric plant, so that it may be assumed that the above figures are substantially correct.

\* In other air gas machines the petrol is contained in a small closed storage tank, from which it is automatically passed into a carburetter, when it is brought into intimate contact with air which has been dried by means of calcium chloride and is drawn through the carburetter by a small pump. The carburetter consists of a series of pipes arranged in zigzag form, and the petrol when admitted is passed through wire gauze, where it is broken up into fine particles and mixed with the dried air.

## FILING ARTICLES FROM TECHNICAL JOURNALS.

By "WHISTLEFIELD."

ANYONE who has made a practice of keeping his technical journals for future reference soon finds that the pile begins to assume unwieldy proportions, and when any article is wanted, it is a very difficult and often times dusty business to lay hands on it.

There is so much that is of purely momentary interest in most papers, that it is not worth the expense of binding them even if the amount of room required for storing the volumes was not a consideration. To make a neat job of a scrap book requires two copies of each paper to be bought, otherwise pages which are gummed down one side, or along the top to allow the letterpress on both sides of the page to be visible, will become torn in handling. In addition to the trouble of cutting out and mounting, is the further one of indexing, and unless the reader is of more than ordinary methodical habits, and has more time than he knows what to do with, the scrap book is sure to get behind and degenerate into a folder full of torn-out pages without method or index.

Another way is to take out the pages containing the letterpress that is wanted, score out with blue or red pencil the columns not required and bind the whole pages in some form of clip file or spring-back folder, numbering each page with blue pencil for the purpose of indexing.

This method is an improvement on the scrap-book from the time-saving point of view, but does not get over the difficulty of indexing, and unless the indexing is thorough and well done, the usefulness of the file is greatly reduced.

The following method for dealing with articles and other interesting matter published in the *ELECTRICAL REVIEW* is one which works well and requires so little time to keep up to date that perhaps it may prove of interest to those who have not yet got a working system.

A Stolzenberg or other similar file, foolscap size, with a loose flap, so that the first paper filed always remains on top, is procured, and each week every page of the *REVIEW* which has anything of permanent value is torn out and inserted in the file, care being taken that the numbers of the pages run consecutively—that is, if pages 300, 304 and 310 are kept one week, they are filed in the order given.

In the first or second week of January and July there is a very complete index of the contents of the paper for the previous six months, published as a supplement to that week's issue; this is removed intact, and placed in front of the file containing all the pages referred to in that index.

All the articles retained and filed are now underlined in ink in the index, and, of course, the page number given in the index corresponds with the number on the page filed, and these numbers run in consecutive order in the file. A careful examination of the index will also show if any papers of value have been overlooked, and these can now be added to the file, and the remains of the issues destroyed.

It does not take more than half an hour every six months by this method to get a completely indexed useful file of technical data; and as the *REVIEW* index is grouped under sub-headings also, the system is as thorough as one could wish for.

The same method, of course, could be adopted with regard to the articles of any periodical which issues an index to each volume.

**Anglo-German Exhibition in London.**—From May to October, 1913, there will be an Anglo-German Exhibition in progress at the Crystal Palace. We have received a copy of a pamphlet prepared for the instruction of prospective exhibitors, and full particulars can be obtained from the administrators of the Exhibition, Empire House, 175 and 176, Piccadilly, London, W. The list of exhibits includes machinery and tools; lighting, electricity, gas, &c.; mining; transport, railways, tramways, &c. Money prizes, aggregating £2,500, are to be awarded for the best decorated stands. There will be an Anglo-German club in the grounds, and various sports and other amusements will be arranged for. One of the great objects of the promoters will be to cultivate a more friendly feeling between the two nations.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### Failure to Excite.

In reply to "Speedometer's" letter on the above subject in your issue of April 4th, I would suggest that the trouble is due to the shunt winding being reversed.

It is a well-known fact that a shunt wound generator will only excite, if the field winding is so connected that current generated in the armature assists the residual magnetism, and builds up the field.

To find if this is the cause of the trouble, the generator should be run in the reverse direction. Should the machine still fail to excite it will be due to the field being totally demagnetised, or slightly magnetised in the wrong polarity.

The machine should be run for a short period as a shunt motor, after which if it is run in the opposite direction as a generator, it cannot fail to excite.

H. P. Bramwell.

Glasgow, April 12th, 1913.

[We must point out that a shunt machine runs in the same direction whether as motor or as generator. Still, Mr. Bramwell may have put his finger on the trouble; possibly "Speedometer" drove the machine in the wrong direction.—Eds. E.R.]

### Long-Scale Instruments.

My attention has been drawn by several friends to advertisements and descriptions in various electrical journals of the long-range ammeters and voltmeters of Messrs. Record & Co., and I would ask your kind permission to express my view with regard to long-range instruments generally.

In this expression I do not desire to reflect in any sense on the design of the instruments of Messrs. Record. Writing purely from a personal point of view, I wish the firm success in their endeavour. There is, however, another aspect of this matter that must be taken into consideration, and it is this: that others also are manufacturing long-range instruments.

I think engineers will realise that the instruments now manufactured by Messrs. Record & Co. are essentially of the same type as those made as long ago as 1895 by Messrs. Muirhead & Co., and more recently by Messrs. Gambrell and Co.

It is not pleasing to me to have to write in this strain, but in justice to others now making these meters, it is well that your readers should know how the matter stands. I will be brief.

For the long-range type of meter, letters patent were granted to me in 1893. This type was subsequently described in a paper before the Physical Society of London, February 10th, 1899. Descriptions appeared also in the *Philosophical Magazine* for August, 1899, and in text-books and electrical journals. The instruments appeared in various forms, but all had scales varying in length from 220° to 295° of arc.

A long-range instrument was patented also by Mr. W. P. Thompson in 1897 (No. 22,851) having a range of 270° of arc. There is, therefore, nothing novel in long ranges. Letters patents were granted to Mr. Record in 1912, Nos. 3,454, 26,241 and 26,242.

The range of one of the 1893 meters is shown in fig. 1. It is in degrees, being an instrument designed for laboratory purposes. The length is 240° of arc. The figure is taken from Messrs. Muirhead's catalogue.

Moreover, the 1893 instrument was by no means the first meter possessing a long range. Prior to this there existed a French instrument of a similar type designed, I believe, by M. Carpentier. I was not aware of this till 1899, when Prof. Ayrton sent me a sketch of it drawn to scale. I cannot now put my hand on this, but my recollection is that the scale length was 250° of arc at least.

Mr. Record makes a claim in one of his specifications for the "ring-shaped" pole-piece. The "ring," however, is an

essential feature of all the 1893 instruments, as well as the Thompson instrument of 1897. Figs. 2, 3 and 4 show the pole-pieces of the three meters. Fig. 2 is taken from Mr. Aspinall Parr's book; fig. 3 is from the Thompson patent specification, and fig. 4 is from the Record patent specification No. 26,242 of 1912. All these possess the "ring-shaped" pole-piece, and all have long ranges.

Mr. Record, in one of your contemporaries (*Electricity*, January 10th, 1913), quite rightly lays stress on the plan of making two sides of his moving coil active, and then makes a comparison with the 1893 instrument, in which only

one side was active. He will find, however, on referring to the *Philosophical Magazine* for August, 1899, that I had arranged for the active use of even three sides of the coil. Fig. 5 is a reproduction of a cut published in that journal.

Again, in Mr. Record's patent specification the formation of a gap in one of the pole pieces, with the object of avoiding waste of magnetic flux at a certain area not swept through by the moving coil, is raised to the dignity of a claim. This gap, as every engineer would see at once, is purely a constructional necessity. In one of the forms of the 1893 meters, owing to its particular construction, that same gap was used, and is shown in the *Philosophical Magazine* for August, 1899, page 205. The gap is such an obvious necessity that one is somewhat astonished that it could ever have been thought of as a sufficient basis for a claim in a patent specification.

Benjamin Davies.

Enfield, April 11th, 1913.

### Electric Laundry Irons.

It was with great interest that we read the remarks contained in your columns last week by "Ironical."

We have had considerable experience in electric, domestic and laundry irons, and we have tried all the well-known makes, but cannot find one that will give satisfaction for any length of time.

The troubles we experience are either the copper contact loosening inside the iron from the element, which seems to lose its nature by the close proximity of the heat, or the pins connecting the cable connector lose their tension and continually have to be renewed.

The flexible wire immediately on leaving the connector in a very short time frays and the rubber perishes and short circuits occurs if these are not attended to periodically.

We have tried all kinds of flex with the exception of brass flexible mentioned by your correspondent, and we certainly think there is a vast amount of room for some heating firm to devote their greatest attention to put on the market an electric iron that will get over this difficulty.

We shall be pleased to hear from any makers that they are in a position to supply us with these goods when the troubles complained of have been overcome.

J. E. Lester & Folwell.

Leicester.

## THE PREVENTION OF ACCIDENTS IN ELECTRIC LIFTS.

[COMMUNICATED.]

A CONSIDERABLE number of cases which have recently occurred where passengers in electric lifts have been killed or injured has led to a stirring of interest in the question of the safety or otherwise of the electric lift, and it may, therefore, be worth while reviewing very briefly the conditions of the problem and the means which are adopted in order to secure as far as possible the safety of those using the lifts.

Considering, first of all, the method of control, the electric lift is operated either by hand rope, a switch in the cage or push buttons, and in each case there is the liability to trouble unless suitable means of securing safety are provided. Further, in any type of lift, especially where high speeds are adopted, there are dangers which can only be overcome by most accurate controls, preferably of an automatic nature. For example, it is very difficult to bring a high-speed lift accurately to rest in its proper position in line with the landing, and it is easy to see that a difference of an inch or two might, under certain circumstances, make the owner of the lift liable for any accident caused to passengers or intending passengers. Again, on a high-speed lift, unless automatic means for slowing down and stopping the lift at the top and bottom of its travel are installed, there is the danger that it might slightly overrun its path and cause damage either to the cage, the supports or the passengers. Due provision must also be made against the breakage of the rope, the failure of the motor or the brakes and any mechanical or electrical breakdown which would interfere with the safety and convenience of working.

A most important and serious class of accident arises in connection with the gates. If adequate precaution is not taken to have these properly closed when the cage is not in position on the landing, there is the danger of a passenger falling down the shaft or meeting the top of the gateway while the cage is rising, and thereby suffering severe injury. To ensure safety, automatic means must be devised for the closing of gates before the cage begins to move away from the landing, and it is towards this point that a great degree of attention has been directed.

Considering, for the moment, the problem raised in the former series of possibilities, it may be pointed out that strain on the ropes, over-running and similar troubles can be overcome by means of a suitable method of electrical control. The method of starting and stopping the lift by hand rope is, of course, the simplest and least costly, and can be applied either by hand ropes passing through the cage and controlled by an attendant, or by one rope passing through the cage and one rope placed outside the lift shaft altogether, and controlled by anyone desiring to use the lift. Safety is assured with this latter system, provided that the cage is fitted with barrier gates which either lock the starting-rope mechanically or are electrically interlocked to prevent the cage from being started when loading or unloading is taking place. Where the lift is controlled by means of a reversing switch in the cage, terminal blocks are usually fixed one in the cage and the other half way up the shaft, to which is attached a multiple wire cable connecting the switch to the controlling apparatus, which operates electromagnetically, and is designed to effect a smooth starting and stopping of the cage at landings with the ordinary movement of the handle by the attendant, while, at the same time, the motor and apparatus are protected against breakdowns, even on heavy or frequent service, by good and substantial design and construction. At the top and bottom landings automatic stopping is provided.

In the case of push-button control it is customary either to use a panel of buttons at each floor, enabling the cage to be dispatched from any one floor to any other floor from either inside or outside the cage; or alternatively, there is only a single button at each floor, enabling the cage to be brought to that floor by touching the button and dispatched to any other floor from the inside of the cage only. In addition to the push-button panel in the cage containing the corresponding push buttons of the floors, there is also a lighting switch and emergency stop, while the control apparatus for starting, reversing and stopping the motor is

**Magnetic Survey.**—The Terrestrial Magnetism Department of the Carnegie Institute is beginning a magnetic survey of New South Wales, which will be linked up with Dr. Mawson's work in Adeline Land.

fixed near the machine itself. The emergency switches are actuated automatically if for any reason the cage overruns the top or bottom levels. Reference was made above to the possibility of the main ropes failing, and this is overcome by using duplicate adjustable slack additional wire rope to arrest the cage and the balance in the event of the main right ropes failing; while in some cases safety apparatus is adopted, which arrests and grips the cage tightly in the event of failure or undue stretching of any of the hoisting ropes.

The most likely form of trouble is in connection with the gates, and various designs of collapsible and swinging gates have been produced, in order to avoid accident. Interlocking between the cage and the gate is essential, and may be accomplished either mechanically or electrically. A construction very frequently adopted depends on the grip which is obtained on the hand starting rope. This is adaptable to all hand rope-operated lifts; and as one hand rope can be fixed outside the gate and one in the cage, it is not necessary to reach through the gate to start the lift. The gate is automatically locked across the opening when the cage is away, and it can only be opened by hand to admit of entrance to the cage when the cage is stopped approximately level with the floor. When the cage is stopped on any floor the handle of the rope grip is moved to a horizontal position in front of the collapsed gate, and, at the same time, it grips the starting rope on the inside, preventing the lift from being started from either the inside or outside. When the rope grip is released the gate automatically closes across the opening, and automatically locks. Another useful locking device in connection with rope control may be mentioned. Occasionally a lift is overloaded and refuses to rise when power is applied. Someone steps out to lighten the load, but, before he can get entirely clear, the relieved cage starts away, and a serious accident results. Moreover, the cage may have been properly stopped, but it is operated by the hand-rope method of control; and if any part of the hand rope is accessible from another floor, a person other than the attendant could incautiously start the cage while a passenger was entering or leaving. In order to overcome this trouble, a hinged barrier bar can be coupled to a rope gripper. When the cage is in motion the bar lies across the doorway of the cage and the gripper is free. On stopping the lift, however, no person can enter or leave the cage until the bar is raised out of the way, and this opening of the bar simultaneously closes the grip on the hand rope and locks it in the closed or standing position. It therefore follows that as long as the bar is open the lift cannot be started, and passage into and out of the cage is automatically rendered safe. Moreover, as the bar must be closed to release the hand rope, no person can pass while the power is on, even though it is standing owing to overloading. If the bar is improperly raised while the lift is travelling either up or down the power is automatically cut off and the lift is brought to rest.

An alternative form of interlocking is an electrical one, which is suitable for electric lifts operated either on the push-button control, switch-in-cage control, or hand-rope control. This type of gate is hand-opened and closed, and only with the lifts having the switch-in-cage control is an attendant necessary. Each gate is provided with an electric switch, and all these switches are connected to the controlling apparatus, so that the lift cannot be started until every gate in the lift shaft is closed across the opening when the cage is away, and no gate can be opened until the lift is stopped at a floor. In the locking of automatic lifts, it should be noted that three things have to be done. First of all, the door or gate has to be shut; it should then be latched, and then current has to be given to the machine. In some such locking systems, trouble arose owing to an attempt to make these three things occur simultaneously. If the closing of the gate happened to be completed first the gate was not latched, nor was current given to the machine. That fault was then corrected by allowing the latch to act and the switch to be closed before the gate was completely closed. This is obviously a dangerous procedure, for the gate may be pulled back and an arc drawn out without stopping the machine. If the switch happens to be closed first the machine can start with an unsecured gate, a contingency which has given rise to the largest number of accidents. A lock has, however, been designed

for the purpose of performing the three requisite functions in a definite sequence. First, the gate or door must be completely closed; until this is done nothing further can be effected; then follows the latching of the door, and until that is securely done it is impossible to give current to the machine. Finally, the circuit is closed and current is applied. On opening the door the reverse order is equally definite: first, the current is cut off; and then only can the gate be unlatched, and finally opened. In some safety locks a counter-locking action is operated by springs as the cage moves away from the door. Breakage of springs has sometimes rendered the counter-locking inoperative. In recent designs of safety locks this difficulty has also been removed.

Reference may be made to a type of automatic gate lock which has been largely applied to lift purposes. The automatic cage lock consists of a vertical spring plunger fixed in the floor immediately under the doors or gates giving access to the lift. This plunger is withdrawn by a cam fixed on the lift cage operating the lever by a small roller. When the cage leaves the floor level the plunger is forced into the bottom of the doors, and this action securely locks them. Inasmuch as the operating levers are inaccessible from the outside, it is impossible to open the doors unless the cage is at the floor level.

It will probably be objected that, however carefully the means of automatic control and safety provision is designed, there are always to be found persons of sufficient ingenuity to render all provisions for their safety of no use. This is undoubtedly the case, and he would be a bold designer of lift machinery and accessories who would be prepared to say that under all conditions and circumstances his apparatus was absolutely foolproof. At the same time, a great deal has been done to mitigate the possibility of accident due to ordinary carelessness, and in the above description it has been attempted to show as briefly as possible the main features of design, as shown in the work of such firms as Messrs. Rawlinsons, Ltd., of Leeds; Messrs. J. C. Etchells & Co., Ltd., of Manchester; Messrs. Smith, Major and Stevens, Ltd., of Northampton; Messrs. Holt and Willetts, &c. Inasmuch as the reliability of the electric lift is, apart from its undoubted economy of operation, a most potent factor in securing its adoption for commercial purposes, it is considered advisable to point out the means and methods which have been adopted to secure the safety of the public.

## CHICAGO LABORATORIES AND CANADIAN TRADE.

MR. F. A. CAMBRIDGE, city electrician of Winnipeg, recently wrote the following interesting letter to the *Canadian Electrical News*, respecting the report of Mr. Hamilton Wickes on the Chicago Underwriters' Laboratories and Canadian Electrical Trade, which was printed in our issue of January 3rd, 1913. He refers to an editorial comment made by our contemporary.

"While you are in the main correct as to the high standard of British manufactured articles, there are still a number of appliances and articles of manufacture of British make that are not in many respects up to the standard of American or Canadian goods intended for similar purposes. I know of what I speak as I have been in this work for the last 18 years and have repeatedly had to refuse to accept British made appliances and material, although this city does not, in spite of the statement of Mr. Wickes, insist upon the Laboratories' label. It seems to me that in this question two points have to be considered, namely; first, the standard of quality and the fitness for the duty and, second, the standardisation of dimensions of certain appliances, such, for instance, as cut-outs or fuses. You will remember the years of effort that were necessary before a simple matter like the standardisation of enclosed fuses was reached and similar action in regard to lamp sockets and lamp bases.

"Mr. Wickes seems to be afraid that under the present arrangements the Laboratories impose no restrictions as to the 'danger to life' factor. It is true that the Underwriters are largely represented on the National Code Committee, but all the other interests are also represented, and during the last few years the question of 'danger to life' has been increasingly emphasised in the Committee's rulings, and there are numerous rulings in the code that not only protect against fire, but also enforce the necessary safeguards for the protection of life, as, for instance, the grounding of the neutrals of the low-tension system. It is rather remarkable that Mr. Wickes should lay stress on this point, as in his own

country the requirements have been extremely lax on this point up to a very recent date, in fact, until recently apparatus and appliances have been sold and used in Great Britain that would not be allowed in this country where a properly organised Inspection Department existed; for instance, a long-skirted Edison base lamp having a live projection of 1½ in. below the socket. Such crude and unsafe methods were eliminated years ago on this side of the water, and inspection departments of this country find this form of lamp to-day (constantly imported from European points) to be one of the most serious menaces they have to deal with.

"While the British manufacturers are, no doubt, handicapped by the present conditions, and while as an Englishman myself I am doing everything I can to facilitate the placing of their goods on this market, the whole trouble is due to the fact, to use the words of your editorial, 'The Englishman does not feel the need of the same progressive step until he comes into direct contact with the United States' product in this continent,' and, judging by the increasing number of fatalities in the British Isles, due to electrical causes, it will not be long before public opinion will force the authorities to take a progressive step and call for the standardisation of electrical fittings generally.

"I believe that we should in Canada have a laboratory for testing purposes either under the Government or Underwriters' auspices, whose rulings would be accepted by the American laboratory, we in turn accepting theirs, so that a uniformity of ruling would exist. I understand that there have already been some proposals along this line, and with the institution of such an examining body the British manufacturers would not be under any disadvantage in exporting goods to Canada. I have at times come in contact with some of the leading members of British firms, who have been over here looking up trade possibilities, and in most cases they have expressed their readiness to adapt their goods to Canadian practice; on the other hand, there are Britishers of the well-known stubborn variety who will think that 'what is good enough for John Bull is good enough for Johnny Canuck,' but the latter has a habit of suiting himself. I imagine that a form of British standard that would be recognised the world over, will hardly come about.

"I cannot refrain from expressing my indebtedness to the American laboratories for the excellent work they are doing. It is of the very greatest value to the department over which I preside, in fact I do not know how we could get along without the valuable assistance they render from time to time. We are especially pleased with the way they are handling the rubber-covered wire situation to-day. Canadian manufacturers have found no difficulty in complying with the Laboratories' tests. Canadian manufacturers are to-day turning out wire with the Laboratories' labels, and I was only the other day requested to collect samples of wire found in the field and forward same to Chicago, when they would be tested and reported upon free of charge. The value of this service is, as I have said, very great, and I do not think it is sufficiently appreciated."

## LEGAL.

### JOHNSON F. JOHNSON-BILLINGTON ELECTRICITY METERS, LTD.

MR. WILLIAM HARRY JOHNSON, of Teddington, an engineer, and the inventor of the Johnson-Billington electricity meter, brought an action in the King's Bench Division on April 9th before Mr. Justice Horridge and a common jury, to recover a sum of money, amounting to about £140, which he alleged was due to him as salary by Johnson-Billington Electricity Meters, Ltd.

Mr. Patrick Hastings said the plaintiff was the inventor of the electricity meter which the defendant company was formed to acquire and exploit. The company was formed in 1910, and in August of that year the agreement was entered into under which the present action was brought. The agreement was for a period of five years, and apparently the company could get rid of the plaintiff, but he could not get rid of the company. His salary was £200 for the first year, and £250 a year afterwards. Plaintiff was the largest shareholder in the company, and he worked for them from August to the time this action started. His salary was paid for a certain period, and then stopped.

The other directors of the company were Mr. Billington and Mr. Spiller, and there appeared to have been some difference between them. The company had set up a number of defences. One was that the company, being in want of funds, they suggested that plaintiff should waive his rights until he was successful in raising fresh capital, when the arrears of his salary would be paid. Another defence was that the company had said they would not pay, and that that put an end to the agreement, and that he accepted and adopted this because he did not issue a writ at once. A third defence was that the plaintiff voted against an increase of capital, and thereby prevented the arrears being paid, and a fourth defence was that the plaintiff was not entitled to arrears because he had been negligent in not telling the company that the Beck Flame Lamp Co., which company was under contract to make all the mechanical parts of the Johnson meter, was insolvent, and that by not informing defendants of that fact they lost possession of moneys in the possession of the Beck Flame Co., which were the property of the defendant company. Counsel said, as a matter of fact, the plaintiff had nothing to do with the financial aspect of his com-

pany's dealings with the Beck Flame Co. and that further, the directors of the defendant company and the Beck Co. being the same, the defendants knew as much about the affairs of the Beck Co. as plaintiff did.

Plaintiff in the witness box bore out the opening statement of counsel.

On April 10th, Mr. SAUNDERSON, opening the case for the defence, said Mr. Johnson had nothing to complain of, as he had 2,000 shares in the company, while Mr. Spiller and his friends had to find the capital. It was the plaintiff himself who had brought disaster on the company by refusing to agree to the raising of further capital.

MR. SPILLER, a director of the defendant company, and one of the original promoters, said he told Mr. Johnson he must not rely on his agreement, but he (witness) would do all he could for him, and that, if they could find more capital, he would do all he could to pay him. Witness said that his grievance was that the plaintiff did not tell the Meter Co. about the insolvent condition of the Beck Co. At the time of the liquidation of that company, witness wanted to buy it, but it was acquired by a Mr. Davis. Witness went to Davis, and asked him to continue to make the meters for the Meter Co. and to give Johnson employment.

After further evidence, and the counsel and Judge had summed up, the jury, without retiring, returned a verdict for the plaintiff for the agreed sum—£131, plus £12 10s.

His LORDSHIP entered judgment for the plaintiff for this amount, with costs.

### RELIGHTING OF ELECTRIC LAMPS IN MINES.

AT Chester-le-Street (Co. Durham) Police Court, on the 9th inst., Robert Smith, 16 years old, a driver, was summoned for an offence against the Electric Lighting Regulations for Coal Mines at Haddon Hold "Busty" Pit, on March 7th. The accused pleaded guilty. Mr. J. Turnbull, who prosecuted, said that statutory regulations had been made for controlling the relighting of electric lamps in mines, and the apparatus for relighting them was kept in a locked box down the mine, and only officials were supplied with keys, or were entitled to open the box or relight the lamps. The defendant was found in possession of a contrivance by which he was able to open the box. It was an exceedingly simple thing, and the owners had been shocked to find that the apparatus was so easily opened, and they had made an arrangement with the manufacturers to have a patent lock put on.

THOMAS WHITAKER, a driver, said he saw the defendant open the relighting apparatus with a nail. He put in an electric lamp to have it relighted, but the under manager arrived, and the operation was not completed.

A fine of 10s. and costs was imposed.

### BIRKENHEAD TRAMCAR CONTRACTS: SLANDER ACTION.

AT the Liverpool Assizes, Mr. Justice Bankes heard an action to recover damages for alleged slander, in which the plaintiffs were Messrs. G. C. Milnes, Voss & Co., Ltd., railway carriage and tramcar builders, of Birkenhead, and Thomas Voss, and the defendant Councillor E. T. Coston, J.P., chairman of the Tramways Committee of the Birkenhead Corporation.

Mr. Rigby Swift, K.C., M.P., and Mr. William Proctor appeared for the plaintiffs, and Mr. F. A. Greer, K.C., and Mr. A. Kennedy represented the defendant.

MR. RIGBY SWIFT, in opening the case, said the action had been brought against Mr. Towler Coston in respect of a series of defamatory attacks he had made upon the plaintiff company and upon Mr. Voss at a meeting of the Birkenhead Town Council on July 10th last in regard to certain tenders for new tramcars making allegations of a most serious character against the plaintiffs. He had alleged that they were incompetent in their work; suggested that their financial position was not sound; that they were not able to carry a sufficient amount of stock for their business, and that they were living from hand to mouth. He said that they (plaintiffs) had improperly obtained knowledge of rival contractors' tenders, and he charged them with using underhand and discreditable means in order to get their own tenders accepted. Defendant, counsel added, did not now suggest that any of these allegations were true. What he said was that he had not used the words complained of, that his statement could not be said to have the meaning now put upon it, also that he made the remarks upon a privileged occasion, and was making comments upon a matter which was of important public interest. Counsel added that public men should not be allowed to take advantage of their position and a privileged occasion to say things about other persons for which there was no foundation. The speech was not fair comment, but rather a malicious statement of facts. Mr. Coston, in his desire to get Messrs. Hurst Nelson's tender accepted for the supply of new tram cars, had made charges suggesting that the plaintiffs, or one of them, had been guilty of conducting their business by improper and dishonourable methods; that they had attempted to persuade, and did persuade, a member of the Committee to use his position for his own personal gain; that, as manufacturers, they were incompetent and unable to execute any large orders; that the plaintiff company were a firm of a precarious financial stability, and consequently unable to keep a sufficient supply of timber in stock. The plaintiffs had brought this action in order to show that Mr. Coston's charges were unfounded.

THOMAS VOSS, in giving evidence, said he had never at any time received a complaint about the cars he had converted for the Co-

poration that he not remedied. Dealing with the complaint about leaky roofs, he stated that the cars were made to carry 64 passengers each, and he now knew that as many as 130 had been carried. He could quite understand why trusses and bolsters were required, in view of the overcrowding. He was asked in January, 1910, to send in new tenders, and later heard that those of another firm had been accepted. Whilst being invited to tender, there was never any suggestion that the work he did in 1909 was bad work. In regard to his transactions in connection with the tenders, he did nothing that was either unbusinesslike or disgraceful tactics. There was no foundation for the suggestion that Mr. Dickie, timber merchant, advocated plaintiff's contract in order that he might get something out of it himself.

By MR. GREER: Plaintiff said he had between January, 1909, and July, 1912, distributed orders in Birkenhead amounting in value to over £5,262. He had never discussed with Mr. Dickie the position of plaintiff's tenders and the efforts he (Mr. Dickie) might make to get local tenders accepted.

COUNCILLOR DICKIE, a member of the Birkenhead Tramway Committee, emphatically denied that he had given information to Mr. Voss of what was going on in the Committee. He had committed no breach of conduct as a councillor.

MR. GREER: Was it discreet in your opinion to take part in the discussions when you knew that if Mr. Voss's tender was accepted you would make money out of it through supplying that firm with timber?—It was not until I had consulted my solicitor in regard to the allegations that I knew that I could have supplied the timber.

MR. GREER: At the committee meeting on June 26th, Mr. Coston said "Mr. Dickie has conveyed to Voss the business that has been transacted in this Committee." How is it that you did not contradict him at that meeting?—I believe that I did.

COUNCILLOR W. M. FURNIVAL, another member of the Tramways Committee, said there was no ground for the suggestion that he had improperly supplied Mr. Voss with information as to what took place at the Committee meeting.

For the defence, MR. GREER said there could be no doubt that the question of these tenders for new tramcars was a matter of great importance and interest to the members of Birkenhead Town Council, and to the ratepayers generally. If Mr. Coston, believing what he did in reference to the work done by Messrs. Milnes, Voss and Co., had not drawn attention to the matter, he would have been failing to perform his duty as a councillor. The report of the tramways manager in respect to the tramcars which had been altered and refitted by Messrs. Milnes, Voss & Co., contained a series of complaints that could not have been made if the work had been adequately and properly done. Mr. Coston could not but believe the manager's report, and in doing so he could not come to any other conclusion than that this was a disgraceful piece of work. There was nothing in Mr. Coston's speech that could be construed as an attack on the financial stability of the plaintiffs' firm. Referring to the tenders, Mr. Greer said it had been shown that plaintiffs had reduced their estimate when none of the other contractors had been invited to do so, and the defendant thought that information was being passed to the firm from the Committee. Under those circumstances, he was of opinion that he would have been lacking in his public duties if he had not expressed his views.

MR. COSTON, in his evidence, said that when he heard the tramway manager's report read in the committee he was astounded. It was the first time that he had heard of any serious complaints in regard to these tramcars. Mr. Furnival at that meeting described the report as prejudiced and ridiculous, and that led him (witness) to visit the depot, and after seeing the superintendent's reports and books relating to the matter, he came to the conclusion that the report was accurate. Assuming the report true, it was his candid opinion that it was the most disgraceful piece of workmanship that could be turned out.

By MR. SWIFT: He knew that Voss's for 12 months had to keep these cars maintained, and that with the exception of the superintendent's report of July, 1910, and November, 1911, there was not a solitary complaint after the 12 months had expired. He knew that the cars had been subjected to a very great strain. He did not make any inquiry as to whether the charges against Messrs. Voss were true or not. He was convinced they were true. He did not want the Council to believe that the firm were incompetent, but that they had done bad work. Witness admitted that the plaintiffs had been invited to reduce their tender.

At the conclusion of defendant's evidence, MR. GREER informed the Court that the defendant was now satisfied, after the investigation that had taken place, that upon the real facts of the case there was nothing which entitled him to say that there was anything discreditable in relation to Messrs. Milnes, Voss & Co.'s business transactions, and he did not now allege that there was any disgraceful work done by them. Mr. Coston therefore withdrew the charges, expressed his regret, and agreed to pay costs as between solicitors and clients.

MR. RIGBY SWIFT said that there was never, from the very first, any desire on the part of the plaintiffs to make any money out of the allegations made against them. What they desired was that the charges should be withdrawn in the fullest and most public manner, and that it should be made plain to everybody that there was no foundation for them.

MR. JUSTICE BANKES thought that Mr. Coston had taken the right course. He felt considerable sympathy with Mr. Coston, because he believed that the report from the tramway authorities had been most misleading. While he (the Judge) was sitting there he would honestly maintain the right of a member of a properly constituted authority to speak boldly and fearlessly when he honestly believed that there was something going on which was

wrong. It was because of the false impression created by the report that Mr. Coston had been led to suggest things which he had no right to suggest. The investigation had made it quite plain that Mr. Coston had gone too far—further than the occasion really allowed—and it was now only right that Messrs. Milnes, Voss and Co. should be absolved from those charges.

#### OSRAM LAMP LITIGATION.

MR. JUSTICE SWINFEN EADY, on Friday, April 11th, in the Chancery Division, had again before him the motion of the Osram Lamp Works, Ltd., v. the Yorkshire Incandescent Electric Co., but, with his Lordship's consent, the matter stood over for another week, in order that the evidence might be completed.

In Mr. Justice Eady's court on the same day an application by the Osram Lamp Works, Ltd., that a motion against the Electrical Manufacturing Co. to restrain infringement should stand over for a week, was also granted.

#### HARRIS v. LONDON UNITED TRAMWAYS, LTD.

BEFORE MR. Justice Bailhache, sitting in the King's Bench Division, with a common jury, on April 9th, Mrs. Esther Harris, a widow, sued the London United Tramways, Ltd., under Lord Campbell's Act, for damages in respect of the death of her husband, who was thrown from his bicycle while riding in the Victoria Road, Surbiton, and killed by a passing motor-omnibus. The accident was caused through the wheel of the bicycle catching in one of the tramway grooves at switch points near Surbiton Station. It was alleged that the defendants were negligent in allowing their line to be in a state dangerous to general traffic. The negligence alleged was that the grooves of the line at the switch points, either from wear or other causes, were too wide, and that the bicycle dropped its front wheel dead into the groove in consequence. Evidence was called to show that the groove at the spot where the tragedy occurred was sufficiently wide to allow a bicycle wheel to drop in, and before the plaintiff's expert evidence on that point had closed, a brief consultation took place between counsel, resulting in the announcement that there would be judgment for the plaintiff by consent, on terms agreed, which it was not thought desirable to mention publicly. Mr. Geo. Elliott, K.C., appearing for the plaintiff, mentioned that the case was one of great interest quite apart from the individual circumstances, for which reason it had been taken up by the Cyclists' Tourist Club.

#### BRITISH WESTINGHOUSE ELECTRIC CO. v. THE ELECTRIC PALACES CO.

THIS action came before the Divisional Court of King's Bench, composed of Mr. Justice Channell and Mr. Justice Coleridge, on Monday, April 14th, on an appeal by the defendants from a judgment of the Judge of the Salford County Court.

The action was one which concerned the supply of an engine and dynamo, &c., by the British Westinghouse Co. for an electric theatre in Northumberland, and a counterclaim was set up by the defendants, based upon an allegation of delay in delivery.

MR. POWELL, K.C., who appeared in support of the appeal, stated that after negotiations with a Mr. Worley, the British Westinghouse gave an estimate for the supply of an engine and apparatus for working a picture exhibition, the price being £131 10s., which they said they could dispatch complete within a few days from the receipt of the order. They guaranteed the whole of the equipment for 12 months, and offered to accept deferred payments if 5 per cent. were added to the contract price. Mr. Worley, as agent of the Electric Palaces Co., said that the tender would be accepted, subject to the gas supply from the local gas company being sufficient to enable them to get the requisite power. A correspondence followed, and the letters which passed, together with certain verbal statements it was said constituted the contract. The County Court Judge at the hearing believed the witnesses called on behalf of the Westinghouse Co. in regard to the terms of delivery, which was that the delivery was contingent upon the engine being in stock. There seemed to have been delay in giving the final order, with the result that when it was given the gas engine which they had in stock had been sold. It was then arranged that the engine should be supplied according to the defendants, within six weeks, but, as a matter of fact, it was not delivered until eight weeks afterwards.

MR. JUSTICE CHANNELL: On what grounds do you appeal?

MR. POWELL, K.C., said that he appealed on the ground that there was no evidence to support the Judge's finding, that the contract was really made with the Palaces Co., and that the Westinghouse Co., or their representatives, had no knowledge of Mr. Worley's financial position. The terms of the contract were that the engine should be supplied within six weeks "or thereabouts," and "thereabouts" could not possibly mean eight weeks. The claim was only for £11 odd for one instalment. Having regard to all the circumstances of the case, he contended that the judgment of the County Court Judge was unsatisfactory, and submitted that there ought to be a new trial. The delivery in eight weeks instead of six weeks did not satisfy the terms of the contract.

MR. JUSTICE COLERIDGE said that the words were "six weeks or thereabouts," and the extra two weeks could not be said to be a matter of law. It was simply a matter of fact.

MR. ATKINSON, for the plaintiffs, said it was a question of what the words meant as applied to particular facts. He argued that

the six weeks did not begin to run until the plans and documents had been furnished by the defendants. The plans were not furnished until September 21st, although the order was given on 15th, and the engine was, in fact, delivered within six weeks and one day from the time the plans were received.

MR. JUSTICE CHANNELL, in giving judgment, said that, upon the assumption that the contract was between the Westinghouse Co. and the Electric Palaces Co., the question was, what were the real terms of the contract as to delivery? If the first tender had been accepted straight off, it would have been a question of the construction of that tender and a question of law. But that was not the case. There were interviews and alterations in the contract which gave the Westinghouse Co. reasonable time in case they had not the engine in stock. The County Court Judge thought that the evidence of those who spoke to the six weeks was so satisfactory that he could disregard what was in the correspondence, and that was entirely a question of fact. The delivery was only one day out, and therefore it was treated at the trial as being within the contract time. That being so, there was no ground upon which the Court could set aside the judgment, and the appeal must therefore be dismissed.

MR. JUSTICE COLERIDGE agreed, observing that the contract being partly verbal and partly in writing, it was for the judge to decide whether what was said in writing was only part of the contract. It was entirely a question of fact, and the Court could not interfere.

The appeal was accordingly dismissed with costs.

#### THE POULSEN PATENTS.

IN the Chancery Division on April 15th, Mr. Justice Warrington had before him a petition in the matter of Valdemar Poulsen, No. 8,961, of 1899, and in the matter of the Patents and Designs Act, 1907. The petition was put into the paper to be mentioned.

MR. BYRNE, for the petitioners, said that it was an application in a case in which a petition was being presented for the extension of the term of certain patents granted to Valdemar Poulsen. The rules under the Act gave the Court an absolute discretion to deal with the matter as should be thought fit. In the present case time for alleging notice of opposition had long since expired, and no notice of opposition had been given. The Board of Trade was the only party interested, and the petitioners had given them notice. Mr. Austen-Cartmell, who had appeared for the Board of Trade, had intimated to him (counsel) that the Board did not propose to offer any objection.

The facts were that Valdemar Poulsen was the inventor of the patent, and the present petitioners were an American company incorporated in Maine, U.S.A., who were the assignees of the rights. A large portion of the shares were held by a Danish company. The purpose of the amendments was to set forth in greater detail the whole history of the foreign dealings with certain patents. They had nothing to do with what had been done with the English patents. In the course of preparing the preliminary proceedings, certain further information had come to the petitioners' advisers in England, which they felt it was their duty to lay before the Court and the Board of Trade. They were now seeking to insert that information, and the reason that information was not obtained earlier was because all the matters had to be dealt with by correspondence with the United States and Denmark. Certain very complicated transactions were carried out in 1905 and 1906 between a certain Stilson Hutchins and one Lindaford, who represented the Danish interests. Mr. Hutchins became quite unable to transact business, and then died, and Mr. Lindaford died on his way to America. No proper record in writing had been kept of the greater part of those transactions and negotiations. When the advisers of the petitioners were preparing their accounts for lodging, a difficulty arose as to getting some of the books from abroad, but eventually it was arranged that a book-keeper should bring the books from America. Lord Parker (then Mr. Justice Parker) then gave an extension of time for lodging those accounts. In the course of going through the accounts the petitioners' advisers in this country first became aware of the extremely complicated nature of the transactions in connection with the foreign patents. The information asked for by the petitioners' advisers was only obtained in part from the United States on April 7th, and two days later a copy of the petition was informally submitted to the Board of Trade for their information, so that there had been no delay so far as anyone on this side was concerned.

The original petition stated that the company was formed in 1899, for the purpose of exploiting the patents, and gave the history of the subsequent dealings, so far as they were known to petitioners. It was believed that the transactions with the American and Canadian patents were of a very simple character, but, of course, that was now known not to be the case.

MR. JUSTICE WARRINGTON: It seems to be a statement of fact by the petitioners, which it may be material to consider.

MR. AUSTEN-CARTMELL: Yes. The view I take on behalf of the Board of Trade is that the general rule is that the Board of Trade would oppose. Here, there is no notice of opposition from any member of the public, and the only party appearing except the petitioners would be the Crown. There is also the point to be taken into consideration that the greatest possible difficulties had been experienced by the legal advisers of the petitioners in this country in obtaining information. We have been informed by the solicitors for the petitioners, in whom we have every confidence that every step has been taken to expedite matters. Under those circumstances, I am prepared to leave the matter in the hands of the Court, but it must not be taken as a precedent, but simply because of the special circumstances of the present case. If the Court allows the amendments, a day had better be fixed for

the petition to come into the list to fix a day for the hearing. I suggest the 24th inst., as the patent expires on the 29th inst.

HIS LORDSHIP: I think I ought to allow the amendment under the circumstances, and I appoint the 24th inst. as the appointed day. This is a very special amendment.

MR. BYRNE: It does not affect any party.

MR. AUSTEN-CARTMELL: It is true that no notice of objection has been given, but the Court has power to allow anyone to come in.

HIS LORDSHIP: I think the petitioner had better give notice in the *London Gazette* of the appointment of the 24th inst. as the appointed day on which the amended petition is to be in the list.

#### NATIONAL TELEPHONE ARBITRATION APPEAL.

THE cross appeals in the National Telephone Arbitration from the decision of the Railway and Canal Commissioners on the arbitration with regard to the taking over of the National Telephone Co.'s undertaking by the Post Office, came before the Master of the Rolls and Lords Justices Buckley and Kennedy on Tuesday, April 15th.

The notice of appeal given on behalf of the Postmaster-General asked that so much of the judgment of the Court of the Railway and Canal Commission as decided that, in determining the value as on December 31st, 1911, of the plant of the company purchased by the Postmaster-General, the Court might take into consideration—

(a) The cost of raising a sufficient amount of capital to pay for the construction of the company's plant.

(b) Any part of the cost of the company of inducing persons to agree with the company for the supply to them of a telephonic service and for installation upon their premises of telephonic plant for the purpose of supplying such service, might be reversed, and that it might be declared that neither of the said matters might be taken into consideration in determining the said value, and that the amount of £10,459,796, ascertained as the depreciated value of the said plant, might be reduced by the sums allowed by the Court being in respect of (a) the sum of £249,189 and in respect of (b) the sum of £150,000.

The cross notice of the Telephone Co. stated that, upon the hearing of the Postmaster-General's appeal from the order and determination of the Court of the Railway and Canal Commission, the company intended to contend (if and so far as an appeal was open to the respondents) that the order of the Court of the Railway and Canal Commission should be varied, and that the amount should be increased to such amount as the Court should seem fit, and that the order and determination might be remitted to the Court below (if need be), with proper directions for arriving at the amount of such increase and all other necessary or expedient directions. In particular, the respondents would contend that the said amount was insufficient on the following grounds:—

1. There was no evidence or legal ground to justify the Court in reducing or excluding from consideration the sums, or any of them, estimated by the respondents as items of cost over and above the "agreed fundamental cost," which would be incurred in constructing and establishing the plant.

2. The method of depreciation adopted by the Court was wrong in law, and/or there was no evidence on which to found its correctness, nor of disallowing the respondents' basis of arriving at this allowance.

3. That an allowance should have been made by the Court by way of an additional sum given in respondents' favour, in view of the fact that substantially the whole of the said plant was suitable for the purpose of the Postmaster-General's telephonic service, and/or was complete, and ready *in situ*, for working and use on December 31st, 1911.

4. That the Court were wrong in their disposal of, and method of dealing with, the respondents' respective claims under the headings of "head office engineering," "contractors' profits," "contingencies," and "separate establishment."

5. That the Court mistook in some of their calculations the meaning of "value."

On the appeals being opened by the Attorney-General for the Postmaster-General, Mr. Danckwerts, for the Telephone Co., took the preliminary objection that no appeal by the Postmaster-General would lie. On this point, after hearing the Attorney-General and the Solicitor-General, their Lordships reserved judgment until the following day.

The Master of the Rolls and Lord Justice Kennedy (Lord Justice Buckley dissenting) then held that the preliminary objection failed, and by agreement between counsel for the respective parties, and with the consent of their Lordships, it was arranged that, pending an appeal by the Telephone Co. to the House of Lords from the decision of their Lordships upon the preliminary objection, the hearing of the main appeals should stand over.

The Attorney-General stated that he would endeavour to get the House of Lords to hear the appeal in question as soon as possible.

#### PROSECUTION UNDER THE FACTORY ACTS.

"As a result of the electricity regulations not being complied with, Thomas James Brownell met his death through a connector socket not being protected," remarked Mr. H. H. C. THOMAS (H.M. Inspector of Factories) in prosecuting the Patent Shaft and Axletree Co., Ltd., Wednesbury, on Tuesday in last week, at the local Police Court. The prosecution was under the Factory and Workshop Act, 1901 and 1907, Sec. 136.

The Hon. R. W. Coventry defended, and Mr. F. A. Platt (Walsall) appeared for Henry Bates (25), who had been summoned under the same Act.

The connector socket, MR. THOMAS explained, was on a wooden horizontal bar near to a drilling machine where Brownell worked,

It was 3 ft. 6 in. from the ground, and 12 in. from the machine. At the time of the accident the socket was connected up and charged with current, which had a voltage of 205 alternating. Some time before the accident there had been a cover on the socket, but this had not been so for a fortnight previously. At the spot the ground was wet, with the result that practically the whole of the voltage would be applied to the man's body. Although a cover had been off the socket for a fortnight, no attempt had been made to replace it.

The evidence called for the defence was to the effect that it was an unwritten law that the men should report breakages. From 20 to 30 of them were reported every day. Men were continuously doing repairs about the works, but this particular plug might not have been seen.

The Stipendiary Magistrate decided that there had been no negligence by the firm, and dismissed the case.

The summons against Bates was withdrawn.

## PARLIAMENTARY.

### Southport Corporation Bill.

MR. MIDDLEBROOK'S Select Committee of the House of Commons commenced the consideration of this Bill on April 8th. The Bill is an Omnibus Bill dealing with a number of proposals affecting the government of the borough, but one of the principal objects is the obtaining of authority to run trolley vehicles and omnibuses. Mr. H. Lloyd, K.C., and Mr. Jeeves appeared for the promoters, and a large number of opponents were represented by counsel.

MR. LLOYD, K.C., in his opening address, said that under a series of orders and an Act of Parliament, a system of tramways had been constructed in the borough which was worked partly by the Corporation and partly by their lessees, the Southport District Tramways Co. In 1900 the Corporation obtained powers to construct a new line along the Promenade; but as they thought on further consideration that the traffic would not be remunerative the powers were allowed to lapse. It had always been considered desirable to give the public further facilities along the route, and it was felt that a system of trackless trolley-cars would give these facilities. The cost of the equipment of the scheme was estimated to be £3,500, with £2,250 for the vehicles. The chief opponents were the Victoria Pier and Promenade Hotel Co., who submitted that the trolley-cars would injure the hotel; the Lancashire and Yorkshire Railway Co., who contended, amongst other things, that the carriage of goods on the tramway would be injurious to the district; and the Cheshire Lines Committee, who opposed on the ground of competition. The Southport Tramways Co. and the Birkdale Electric Supply Co. had also presented petitions against the Bill.

MR. J. B. HAMILTON, general manager of the Leeds Corporation Tramways, gave evidence to the effect that he had carefully examined the proposed route, and considered it suitable for a trackless trolley system. He looked on the route as one upon which people would ride to and fro for a constitutional. He estimated a gross revenue of 10d. per mile, and that there would be a net surplus of £189 per annum.

In cross-examination by MR. RAM, K.C. (representing the Johnson Trustees), witness said the trolley-cars created much less dust than motor-cars. It had not been decided whether the cars would be single or double-decked.

In answer to MR. FORBES LANKESTER, witness said it was proposed to take powers for carrying goods and minerals on the trolley cars. It was true that in the cases of Bradford and Keighley there was a prohibition in this respect.

After some discussion, MR. JEEVES intimated that his clients would agree to a prohibition of the carriage of parcels beyond 56 lb. in weight.

Witness was cross-examined at length by MR. FORBES LANKESTER for the Victoria Pier and Hotel Co. on the point that in a seaside town of the character of Southport it was better to keep the Front free from tramway or trolley, and, in reply, he said that while this was a matter of high policy with which he could not deal, yet from his point of view he thought this was a road on which the poor man's car should be allowed as well as the rich man's.

ALDERMAN T. P. GRIFFITHS (chairman of the Parliamentary Committee of the Southport Corporation) gave evidence in support of the scheme, and said the trolley cars would add another to Southport's many attractions.

MR. R. P. HIRST, consulting engineer to the Corporation, considered there would be no fear of vibration from the running of the trolleys along the Promenade.

Other local evidence was called in support of the Bill.

MR. FORBES LANKESTER, on behalf of the Cheshire Lines Committee, said that having arrived at the limit of 56 lb. for parcels, he would not trouble the Committee further with regard to the trackless trolley proposals.

MR. VESLEY KNOX, K.C. (Lancashire and Yorkshire Railway Co.), said the particular route would not affect his clients' interests, but they wanted safeguards introduced having regard to Sec. 31 of the Bill, under which it was proposed to apply to the Board of Trade for prov. orders for new routes. He asked that notices of intention to apply for such prov. orders should be inserted in the *Gazette*, as well as in the local papers.

A large number of witnesses then gave evidence to the effect that the trolley cars would affect property detrimentally.

The Committee decided to approve the scheme, and inserted clauses for the protection of the property of the Cheshire Lines Committee.

On April 15th, having heard the opposition of licensed vehicle owners, the Committee rejected the motor-omnibus proposals.

### Metropolitan Railway Bill.

ON April 10th a Select Committee of the House of Lords, presided over by Lord Sanderson, commenced the consideration of this Bill for purchasing the Great Northern and City Railway, and for making two extensions of that line.

MR. LLOYD, K.C., in opening the case for the promoters, said the Bill was an omnibus one containing a number of provisions, many of which were not opposed. The main features of the Bill were, first, to sanction the vesting in the Metropolitan Railway Co. of the undertaking of the Great Northern and City Railway Co.; and secondly, to authorise the Metropolitan Railway Co. to construct certain new railways as an extension of the Great Northern and City line. The Bill also asked for powers to enable the Metropolitan Co. to enter into agreement with the London and South-Western Railway Co. for the construction and working of one of the extensions, and for the working of through traffic. The first part of the Bill, which was unopposed, was that which sought to vest in the Metropolitan Co. the existing undertaking of the Great Northern and City Co. That was an electrically-worked tube railway of about 3½ miles in length extending from Finsbury Park to Moorgate Street. It was recognised shortly after the line was opened that if it was to serve a really useful purpose, and was likely to be remunerative, it must be carried on beyond Moorgate Street, where it now stopped, and in 1902 the company obtained powers to extend the line from Moorgate Street to Lothbury. Unfortunately the company had never been able to find the money to construct the extension, and the powers had lapsed. The result had been very unfortunate to the Great Northern and City Co., for they had found themselves in a financial position which had prevented them doing that for the public which they desired to do. The line had no connection with any other railway, and the company had not been able to pay its fixed charges, and it could not go on in its present hands. That position had been fully realised by the directors and stock holders of the company, and they had been approached from time to time by many other companies who were interested in their traffic, and after considerable negotiations the Metropolitan Co. had succeeded in arranging terms by which the Great Northern and City Co. was to cease to exist as a separate entity, and was to become amalgamated with the Metropolitan. The result was the promotion of the present Bill. Originally there were four extensions proposed, but two had been struck out. The two proposals that remained in the Bill were first for extending the Great Northern and City line from Moorgate Street to Lothbury, which was practically a re-enactment of the line which was authorised in 1902, and the second proposal was to form a junction with the Waterloo and City Railway at the Bank Station. The result of the construction of these two extensions would be to enable the Great Northern and City line to be carried to the point where Parliament intended it should be carried so long ago as 1902, and it would also bring people from the North of London into direct communication with the London and South-Western Railway. The estimated cost of the first extension was £256,540, and of the second £53,749.

Having proceeded to detail to the Committee the manner in which it was proposed to construct the proposed extensions, counsel dealt with the opposition, which chiefly came from the City Corporation, the Bank of England, the Grocers' Company, the Gresham Assurance Co., and the Northern Assurance Co. He said that the objections of the City Corporation were against interference with streets in the heart of the City and depreciation of property which might result. Those objections could easily be met, and in view of the great public advantage of the scheme, he felt sure that the City authorities were not really antagonistic to the proposals. Dealing with the allegations of other petitioners that damage might be caused to their property from the excavation of the subsoil and the pumping out of water, Mr. Lloyd said they were the same objections as were brought forward in 1902, when Parliament approved the scheme.

MR. RAM, K.C., who appeared for the Bank of England, said that while the Governors and directors of that institution had no desire to oppose a scheme which might be for the public advantage, they felt that the Bank should be granted the fullest possible protection.

MR. R. H. SELBIE, general manager of the Metropolitan Railway, having given evidence in favour of the scheme, the Committee adjourned.

(To be continued.)

**London County Council Tramways.**—The House of Lords' Standing Orders Committee have decided that the Standing Orders not complied with in respect of the London County Council Tramways, Trolley Vehicles and Improvements Bill shall be dispensed with, subject to the omission therefrom of *clauses 2, 4, 4A, 5, 5A, 6, 8, 8A and 8B*, and to the consent of the Hampstead Borough Council in respect of tramway 3A being proved before the Committee on the Bill. The proposals which are, therefore, to be struck

out of the Bill are the following: A double line between the county boundary in Finchley Road and the existing tramways in Chalk Farm Road, *via* Finchley Road, Avenue Road, Adelaide Road and Chalk Farm Road; a single loop line from Fonthill Road, *via* Evershot Road, Hanley Road, Regina Road and Tollington Park into Fonthill Road again, and then a double line along Fonthill Road to the existing tramways in the Seven Sisters Road; a double line from the existing tramways in Gray's Inn Road to Farringdon Road, *via* Holborn and Charterhouse Street; a double line from Farringdon Road to Ludgate Circus; and the tramway in connection with the proposed new St. Paul's Bridge.

**Ely Valley Gas and Electricity Bill.**—The Standing Orders Committee of the House of Lords have decided that the Standing Orders not complied with in respect of the above Bill, ought not to be dispensed with, and accordingly the Bill will not proceed. The proposal was to incorporate a company with a capital of £45,000 to supply gas and electricity.

**Hove Corporation Bill.**—The Chairman of Committees reports that the opposition to the Hove Corporation Bill has been withdrawn. The Bill contains clauses for the purchase of the electric light undertaking.

**Leeds Corporation Bill.**—The Standing Orders Committee of the House of Lords considered this Bill on April 10th, when the Parliamentary Agent stated that the tramway in regard to which there had been a non-compliance with the Standing Orders, had been struck out. Under these circumstances, it was decided to allow the Bill to proceed.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### The Oldham "Emergency" Electric Lamp.

The Oldham "Emergency" electric lamp, which was recently approved by the Home Office for use in coal mines, is of the bull's-eye type, as shown in fig. 1.

The case is of cast aluminium, with a cover secured by a lead rivet lock. The electrical accumulator is so constructed as to prevent escape of the liquid, whatever the position of the lamp, whilst allowing the escape of gas generated by chemical action in the accumulator. A flame-tight screwed plug of vulcanite encloses the contact made between the insulated lead and the positive

FIG. 1.—THE OLDHAM "EMERGENCY" MINER'S LAMP.

terminal of the cell. The switch is contained in a flame-tight enclosure, the cover of which, with its washer, is secured by screws. The screw-heads are pierced so that a wire may be threaded through, and the ends sealed with lead seals. The lamp bulb and reflector are contained in a second enclosure, which communicates with the switch enclosure. It is made flame-tight by means of a screwed ring containing the lens, and a washer. The ring is prevented from unscrewing by means of a clip secured by screws, the heads of which are pierced as in the case of the switch cover screws. The total weight of the lamp is not more than 4 lb. 8 oz., and it is capable of maintaining a light of 1.5 c.p. throughout a period of not less than 10 hours. The lamp is only to be used for work of rescue or exploration in the case of an accident or other emergency, or by officials, and is made by MESSRS. OLDHAM AND SON, Denton, near Manchester.

### Cinema Theatre Dimmers.

THE ADAMS MANUFACTURING CO., LTD., of Balfour House, Finsbury Pavement, E.C., have brought out the "Adams Igranic" cinema theatre dimmers, to enable changes of illumination from dark to light to be gradual and painless; they can be so arranged that the same movement that gradually dims the white lights will also gradually brighten the reds, and so on, and can be mounted in the operator's room with practically no alteration of the

wiring. Each dimmer consists of a resistance plate having a large number of contacts and an operating handle, so that the resistance in the lighting circuit can be increased or reduced to lower or brighten the lights. The dimmer plates are standardised and so arranged that a number can be mounted together to deal with separate circuits. They are suitable for any lighting voltage A.C. or D.C. Each dimmer is specially arranged with an "off" position, so that the lights may be left fully on or fully off indefinitely.

### A New Lampholder.

MESSRS. JOHN DUGGILL & CO., of Fallowfield, are placing on the market a "high-duty lampholder," which has been provisionally protected, and in which "an arch or loop of springy metal" is used supplementarily to, or in substitution of, the ordinary spring plunger contact stud.

In one of the samples submitted, two strips of ribbon metal are looped round the two plungers, being fastened by the holding-in screws under the latter and bent round so as to pass over the tips of the plungers. The connection between the housing and the end of the stud is thus continuous metal, not through a sliding contact, when pressure is applied, as during insertion of the lamp. It is claimed that the springy loop flattens and accommodates itself to the surfaces of the segments, ensuring a broad contact area, instead of the comparatively small contact area of the present type of plunger.

Another sample sent has a conical spiral spring of ribbon metal looped round the plunger stud and rigidly connected at its base; the end turns make contact with the lamp cap, supplementing the ordinary plunger contacts and giving, it is claimed increased current-carrying capacity.

Messrs. Duggill claim that these lampholders are suitable connectors for radiators, small motors, &c.

## BUSINESS NOTES.
