**"Plexsim."**—MESSRS. SIMPLEX CONDUITS, LTD., have registered the above word for use in connection with their electric heating and cooking system, the increasing importance of this department of their business rendering it advisable to give these manufactures a descriptive mark differentiating them from "Simplex" lines such as conduits and fittings. In future, therefore, all their heating and cooking appliances will be labelled "Plexsim."

**Reversible Oil Engine.**—MESSRS. BOVING & CO., LTD., of 94, Union Court, Old Broad Street, E.C., inform us that they are now running a 16-H.P. marine "Avance" crude oil engine, with special reversible propeller equipment, on load at Southampton. Similar exhibitions will be held at various leading seaports in this country.

**Cable Works in Austria.**—The Hungarian Felten and Guilleaume Co., of Buda-Pesth, records net profits of £32,500 for 1912, as contrasted with £29,600 in the preceding year, and the dividend is at the rate of 17½ per cent., as against 16½ per cent. in 1911. A considerable number of orders was incompletable at the end of 1912, and notwithstanding the unfavourable circumstances affecting the political horizon and the money market, the company's degree of employment is said to be very satisfactory at the present time.

The report of Felten & Guilleaume, of Vienna, states that the company was abundantly employed during 1912. It was not easy to predict the prospects for the new year, owing to the uncertain political situation and the monetary stringency, which caused customers to exercise reserve in the allocation of orders. Nevertheless, a considerable stock of orders had been brought over into 1913, and the degree of activity was good. The net profits earned in 1912, after placing £18,000 to depreciation as compared with £17,000 in 1911, amount to £117,000, inclusive of the balance forward, as contrasted with £102,000 in the previous year. It is proposed to pay a dividend of 17½ per cent., as against 16½ per cent. in 1911.

**Book Notices.**—*The Aviation Pocket-Book for 1913.* By R. Borlase Matthews. London: Crosby Lockwood & Son. Price 3s. 6d. net.—This volume is a sign of the times; aviation (why not "flying"?) is now becoming a common-place, the science an industry, and the industry is being equipped with pocket-books, journals, directories, manuals, catalogues and all the other accessories which mark the firm establishment of a new branch of engineering, including an Act of Parliament. The next phase will doubtless be litigation. At any rate, here is the first pocket-book—the work of a well-known electrical engineer, who has now turned his attention to shipping. There is very little in the book, as in the art of direct electrical interest; the ignition of the engines and the use of the magnetic compass at present cover this part of the subject, but wireless telegraphy is practically the only possible means of communication with aeroplanes, and will become of increasing importance in this connection. The contents of the book cover, broadly, the whole field of theory and practice, and will undoubtedly prove very useful to the flying man. A list of "Aero Clubs and Societies" reveals the surprising fact that there are more than 100 of these in existence in this country and the overseas Dominions.

*The Wireless World* for April—the first issue of the new magazine which has replaced the *Marconigraph*—comes out with a striking multi-colour cover showing "wireless" spanning the globe in a series of zig-zag flashes, which might with advantage have

been arranged to form a Morse message instead of what appear to be a random succession of o's and s's. An introductory article explains that the magazine is to be "popular," and that the information given in its pages, while worthy of the attention of the scientist, will not be beyond the scope of the general public. A special feature is to be the subject of wireless telegraph as a factor in national defence: with this in view, a special course of lectures for "wireless amateurs" will appear in each issue. A biographical notice of Commendatore G. Marconi, whose birthday is April 25th, together with a portrait, appropriately forms the opening article. Other interesting items are articles on the Aden-Berbera wireless stations; the new Atlantic sentinel, the *Scotia*, which is to give warning by wireless of the presence of ice; the qualifications and prospects of the wireless engineer; a short story; the scheme for free instruction in wireless telegraphy for Territorials, &c., already outlined in our article on the Marconi School; and numerous other features, the whole forming an issue which reflects great credit on all concerned in its production.

**Bankruptcy Proceedings.**—ROBERT EDWARD JOY (Bristol Electrical Co.), electrical engineer, 143, Cheltenham Road, Bristol.—Application for discharge of debtor to be heard at Bristol on May 23rd.

WILLIAM LONGDEN and VERNON GEORGE COBB (trading as Longden & Cobb), electrical engineers, 101A, Derby Road, Nottingham.—The adjourned public examination of the above-named debtors was held last week at the County Court House, St. Peter's Gate, Nottingham, when the case was formally closed.

JAMES WILLIAM LEWISLEY, electrician, 65, Brierley Street, late 103, Mansfield Road, Nottingham.—The adjourned public examination of this debtor was fixed to take place last week at the County Court House, St. Peter's Gate, Nottingham, before Mr. Registrar Beaumont. It was stated that criminal proceedings had been taken against the debtor in respect of certain matters connected with his failure. The Official Receiver said that in these circumstances it would be best to adjourn the examination, and the Registrar having given his consent, the case was formally adjourned.

J. G. S. CUNNINGTON and H. P. ALLISON (Laing, Wharton and Cunningham), electrical engineers and contractors, Great Newport Street, London.—Last day for receipt of proofs for dividend, April 22nd. Trustee, Mr. A. Page, 25, King Street, E.C.

**Electrical Exports from France.**—There was a large falling off last year in the value of the exports of dynamo-electric machinery from France, the returns lately issued showing a total of only £119,520, as compared with £180,700 in 1911. On the other hand, the exports of electrical apparatus increased in value from £371,810 to £423,000.

**Dissolutions and Liquidations.**—The partnership existing between DRENNAN, GLOVER & COOPER, electrical engineers, 427-431, Corn Exchange Buildings, Manchester, and Milburn House, Newcastle-on-Tyne, has been dissolved by mutual consent. Mr. Drennan and Mr. Cooper will continue to trade under the style of Drennan & Cooper, at the same address at Manchester, and Mr.

Glover, in partnership with Mr. Bernard Gaffney, will continue under the style of Glover & Gaffney at 12, Eldon Square, Newcastle-on-Tyne. All accounts of the late firm will be attended to by Messrs. Drennan & Cooper at the old address.

MESSRS. E. READER & SONS, LTD., Nottingham.—This company is winding up voluntarily, with Mr. W. R. Hamilton, Victoria Street, Nottingham, as liquidator. A meeting of creditors is called for April 22nd.

WEZDON LAMP CO., electric lamp agents, 22 and 23, Verulam Street, London, E.C.—Messrs. Douglas Robinson and Johan Agernup have dissolved partnership. Mr. Agernup will attend to debts.

ADAMS MANUFACTURING CO., LTD.—We are informed that an order was made on Saturday last by Mr. Justice Swinfen Eady appointing Mr. Lewis Hardy receiver and manager on behalf of the debenture-holders of this company. It is stated that no interruption will be caused in carrying on the business, as the Receiver, under leave of the judge is to continue its business. Arrangements for the re-construction of the company are in process of being made.

JOHNSON-LUNDELL ELECTRIC TRACTION CO., LTD.—Creditors should send particulars of their debts, &c., to Mr. A. E. Messer, 14, Old Jewry Chambers, E.C., the liquidator, by May 31st.

**Spain.**—A new company has lately been formed in Madrid with the title La Sociedad Espanola de Construcciones Electricas, to carry on an electrical engineering business.

**Manufacture of Instruments and Meters.**—The United States Department of Commerce and Labour has issued a special report dealing with the manufacture of electrical instruments and meters in the United Kingdom, France, Germany and Italy. The works of 31 leading firms are described, attention being paid to equipment, number of employés, and especially to the nature of the products manufactured. The report may be seen by electrical instrument makers in the United Kingdom at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

**Exhibition in Australia.**—Steps are now being taken by the Victorian Chamber of Manufactures for carrying out the design of the Associated Chambers for holding an "All-Australian" Exhibition in Melbourne, opening in September and closing in November. The scheme of the Associated Chambers of Manufactures of Australia is to hold such an exhibition in the various States of the Commonwealth in rotation, the commencement being made in Melbourne this year. The special feature of this exhibition is to be trade processes in operation, and working exhibits.—*Australian Mining Standard.*

**Water Softener Contracts.**—MESSRS. LASSEN AND HJORT have received orders from the undernoted during the last few weeks for the installation of their automatic water softeners of an aggregate capacity of 1,030,000 gallons per day.

Gas Light and Coke Co., Ltd., 150,000; Imperial Paper Mills, Gravesend, 360,000; Monmouth Mill Co., Eccles, 72,000; Portland Cement Co., Aberthaw, 48,000; Distillers' Co., Dundalk, 96,000; Chiswick Electricity Works, 24,000; Maxted & Knott, Storey Bros., Lancaster, Premier Portland Cement Co., Wellingborough, Brighton Schools, Brighton, 250,000 gallons per day.

The firm's water softener has been exclusively adopted by Messrs. Babcock & Wilcox, Ltd.

**Catalogues and Lists.**—MESSRS. T. & E. WANNBACHER, 5, Appold Street, London, E.C.—Leaflet No. 85, giving illustrated particulars and prices of small centrifugal pumps.

THE INTERNATIONAL ELECTRIC CO., LTD., 111-115, Salisbury Road, Kilburn, N.W.—Leaflet giving illustrations and prices of their domestic "Talkyphone," 1913 model.

MR. HAYDN HARRISON, 11, Victoria Street, London, S.W.—Third edition (nearly 60 pages) of his street lighting pamphlet. This contains excellent art paper illustrations of a variety of designs of bracket arm fittings, tramway and wood-pole brackets and fittings, square type lanterns, &c., also scale drawings of lantern fittings as used at Marylebone, in the City of London, and at Harrogate, as well as similar drawings of time and half-night switches, and patent switch fuses. Other contents include patent anti-vibration lampholders, posts for high C.P. lighting and side street service, the Universal photometer, and the Harrison lightmeter for testing illumination and C.P. Several pages are occupied with tables and useful data respecting electric street lighting. A list of places using Harrison street fittings is given.

MESSRS. SIEMENS BROS. & CO., LTD., Woolwich, Kent.—Reprint No. 508C, fully describing and illustrating their testing instruments for magnetic measurements in iron and steel works.

MESSRS. REINFORCED METAL, LTD., 175, West George Street, Glasgow.—20-page pamphlet explaining their method of steel and concrete construction, known as reinforced metal, and containing a report by Prof. Andrew Gray, of Glasgow. A collection of reinforced concrete steel columns is being shown at the Building Trades Exhibition, now open at Olympia.

MESSRS. HARPER & BROS., 45, Albemarle Street, W.—List of books, including technical publications.

MESSRS. VERITYS, LTD., London and Birmingham.—Publication No. 741 gives illustrated information respecting "Aston" portable electric lamps—pocket, hand, cycle, motor-car inspection and other types, also "Aston" electric cooking apparatus (the "Utility" cooking set, electric oven, irons, kettles, &c.). Prices are stated.

THE GENERAL ELECTRIC CO., LTD., 67, Queen Victoria Street, London, E.C.—Fully illustrated catalogue (No. 5) of 44 pages relating to their manufactures for stage and theatre lighting. Among other appliances described in this publication are stage arc lamps and accessories; liquid and metallic dimmers and other resistances; Osram drawn wire lamps and Robertson lamps; cine-

matograph are lamps and projectors; small motors for cinematograph machine work; various types of batten, electric fixtures, motor-generators, &c. Particulars are given of the "Applebee" patent-worren or "Spotlight" shutter, which can be fitted to any stage arc lamp. It is attached to the inside of the lamp and operates from the back. By its use, strong shadows can be avoided, and a gradually diminishing light obtained. A clear mica-slide which is provided, prevents the projection of prismatic colouring upon the focussed object. Other features include the "Hawkins" and "Morehen" plugs. The feature of the former is that by means of detachable pins, male or female contact can be made. The latter is intended to be fixed under the stage level and provides an easy and safe method of taking temporary leads to portable stage properties. Everything mentioned in the list has been designed to meet the L.C.C. regulations. The company maintains a special dispatch department to facilitate the prompt delivery of all theatrical material. Copies of the list will be sent upon application.

MESSRS. FYFE, WILSON & CO, 155A, St. Vincent Street, Glasgow.—Catalogue No. 113 (40 pages) containing description of their Kelvin electric generating sets, specially designed for cinematograph theatres. Portable and stationary petrol or paraffin electric equipments are illustrated, and engine connection and wiring diagrams are included. Illustrations and tabulated prices and code-words appear of rotary transformers for cinematographs, motor-generators, model cinematographs and special arc lamps for same, and resistances, "Sunrae" flame arc lamps, cables and wires, and lamps and other lines are particularised.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—New price lists as follows:—No. 5,531 (8 pages), fully describing and showing their automatic time switches; No. 4,155 (8 pages), similarly dealing with their type O, form E, oil-break switches.

**Electricity at the Clothing and Outfitting Exhibition.**—One does not expect to find a very large array of electrical exhibits at an Exhibition devoted to the clothing trade. As a matter of fact, the only display at the Clothing and Outfitting Exhibition, which opened at the Agricultural Hall, London, on Monday last, which calls for notice, is that of Messrs. Eastman and Warne, of 241, Acton Vale, W., who are showing a range of "Hot Point" electric hand irons, which are, we understand, now being used all over the kingdom in laundries, clothiers', dressmakers', hatters', and similar workrooms. The feature of the "Hot Point" electric hand irons lies in the fact that they offer an exact substitute for the usual stove or gas-heated iron, without the use of the long cord usually employed for conveying the current to the iron, and which often prevents them being as handy as the old-fashioned stove-heated irons. In other words, in place of being continuously heated, they are given a heating as desired by being placed on a shelf covered with fireproof material, and provided with guides to take the irons; short pillars on the latter making contact with springs in contact boxes at the back of the shelves. When contact with the source of current is made, the irons are heated up by converters, consisting of long windings of fine wire round asbestos strips, embedded in the box of the iron, provision being made to cut down the current gradually as the temperature rises, thus securing economy and preventing any risk of burning out. The system was developed in the works of Messrs. Eastman & Sons (Dyers and Cleaners), Ltd., who have used electric irons in their finishing department for the last 12 years, and who are working with Messrs. Eastman & Warne. The electric irons can be heated just as quickly as a stove-heated one, and retain their heat equally as long; when an iron has become cool the operator has merely to push it into position on the heating shelf and pull out a fully-heated one. We are informed that a careful comparative test of the "Hot Point" irons with those heated by gas resulted in the former showing an economy of about 40 per cent. Messrs. Eastman & Warne have also on view an electric branding machine for branding names on anything from furniture to pigs (!) and also an "Eadisk," which is the electric equivalent of a gas boiling or heating ring.

**Trade Announcements.**—MESSRS. BERRY, SKINNER AND CO. announce that they have granted to the Safetee Controlling Appliances Co., Ltd., of Luton, Beds., a limited licence under Berry's patents Nos. 28,546/04 and 13,443/09 to manufacture and vend in the British Isles, under royalty, their apparatus advertised as the "Safetee" switch-fuse.

THE PREMIER ELECTRIC CONTROL, LTD., have removed to Kenmont Works, Harrow Road, Willesden Junction, N.W.

**For Sale.**—The Birmingham Tramways Committee has for disposal the whole of the machinery and plant installed at the Yardley generating station. Messrs. Wheatley Kirk, Price & Co. will, on May 7th and 8th, sell by auction the freehold works premises, the entire plant, stock and goodwill of the business of the Sunbeam Lamp Co., Ltd., (in liquidation).

MESSRS. J. & W. Heathcote will, on May 2nd, sell by auction the factory premises of Metalite, Ltd., Derby. See our advertisement pages in this issue.

## LIGHTING AND POWER NOTES.

**Aberdeen.**—An installation of electric light is now being made at Crathie Church, on the Lister-Bruston system; improvements in the lighting of Balmoral Castle are also said to be in contemplation, and here also electricity will play an important part.

**Basingstoke.**—At a meeting of the T.C., the draft provisional order for electric supply in the town and neighbouring parishes was received. The order approves of the local proposals with a few additions to the details.

**Bedford.**—The adjourned L.C.B. inquiry into the application of the T.C. for borrowing powers for the purchase of Diesel engine plant was held on the 16th inst., when the allegations of the Hick-Diesel Co. in regard to the manner in which the contract was placed with Messrs. Allen were fully gone into. The Town Clerk pointed out that Messrs. Allen's tender (for a 400-kw. set) including spares, and allowing for the cost of altering the roof incidental to acceptance of the Hick-Diesel tender (for a 500-kw. set) was less costly, also that the Hicks engine not being enclosed did not comply with the specification. It was stated that Messrs. Allen had not made a Diesel engine, and that their London representative had tried to induce the Hick-Diesel firm to facilitate Messrs. Allen's tender going through. The inquiry was concluded.

**Birmingham.**—The Electric Supply Committee of the City Council has decided to recommend that a sum of £250,000 be spent on a new power station at Nechells to supplement the existing one at Summer Lane. This, however, is only an instalment of a scheme which will ultimately cost nearly £1,000,000.

**Burnham (Somerset).**—With reference to the electricity scheme submitted by Dr. Purves, of Exeter, which was referred to in a recent issue of the ELECTRICAL REVIEW, the U.D.C. has decided to grant Dr. Purves an extension of time until May 8th, to register his electric light company under the Council's Parliamentary Order. It is anticipated that this extension will enable the scheme to be carried out without further delay.

**Canada.**—SUPPLY TO FARMERS.—The *Electrical News*, in a recent issue, referred to the development of the Electric Power Co.'s system, from which several pulp and paper mills are supplied. Our contemporary says the peak load on this system has grown very rapidly, and in December, 1912, just three years after the Stephens Dam power house commenced operation with a load of 300 H.P., the peak had grown to 15,000 H.P., with a daily load factor usually exceeding 80 per cent. Although the company has such excellent consumers as pulp mills, yet it apparently does not neglect the smaller classes of supply.

In order to satisfy the growing demand for electric light and power in rural districts the company is now actively engaged in building a number of rural distribution lines. One of these, viz., a 2,200-volt, single-phase line, about 10 miles in length, from Nanpess through Newburg to Camden East, has now been in operation for some time. It is fed from the company's sub-station at Nanpess. Distributed over the 10 miles of line are now about 60 customers.

Another of these lines, extending about 12 miles in a south-easterly direction from Campbellford, will be in operation before the end of the present month, with between 20 and 25 customers. Most of whom have contracted for from 1 to 3 H.P. There is also one customer on this line who has contracted for 25 H.P. The line will be fed from the Stephens Dam power house at Campbellford at 6,600 volts, single phase. Pole type transformers are used, having a ratio of from 6,600 to 120/240 volts. As a rule a separate transformer is installed for each customer.

Other lines are in prospect, and will be constructed in the near future, extending over 29 miles. The farmers along the routes of these lines are having their houses and barns wired for lighting and are installing motors for pumping water, sawing wood, chopping feed and various other purposes.

**Carlisle.**—The T.C. on the 8th inst., authorised the Electricity Committee to apply for sanction to borrow £7,500 for additional plant which is needed for the supply of two large business premises.

**Cheltenham.**—At the last meeting of the T.C., the electrical engineer was instructed to obtain tenders for additional condensing plant at the works. The loan of £1,500 sanctioned in May, 1900, for mains extensions being nearly exhausted, it was resolved to apply for sanction to a further loan of £1,500. It was stated that in the last four months the consumers added had been 103, compared with 35 in the corresponding period last year.

**Colwyn Bay.**—At a meeting of the U.D.C. a communication was submitted from the North Wales Power Co., which owns the power station in Nant Gwynant, stating that it intended to extend its mains to Penmaenmawr, and that it observed the U.D.C. was about to spend £5,000 for additional generating plant. The company suggested that this expense might be saved, and the cost of electricity supply in the town reduced if the company's mains were continued to Colwyn Bay and current were supplied to the Council in bulk. It was decided to refer the letter to the Electricity Committee.

**Continental Notes.**—HUNGARY.—Plant is about to be put down at Zwir to utilise the water-power of the River Reesina in the generation of electrical energy for lighting and power purposes in the town of Fiume. The water will be diverted from the river at Cankovo and conveyed along a canal, about 18 miles long to Zwir, where the existing steam-operated generating plant will be kept as a reserve, when the new installation is completed.

FRANCE.—Owing to the increasing demand for current, La Société Est-Eclairie is extending its central station at Mohon by putting down a new 12,000-H.P. steam turbine and generator. When the new plant is installed, the station will have a total capacity of 24,000 H.P.

**Coventry.**—Mr. HOOPER AND RATE-AID CONTRIBUTIONS.—A L.G.B. inquiry has been held into an application by the Corporation for sanction for a loan of £20,000 for electricity department extensions. The loan was intended to cover an overdraft of £16,357, and to provide for further capital expenditure, principally upon mains. The Inspector (Mr. R. H. Hooper) observed that last year the undertaking made a profit of £16,000, of which £1,000 was paid to the relief of the rates. He pointed out that the outstanding capital was increasing each year, whereas in a good many municipal undertakings the outstanding capital was dropping; and when it began to drop, then they began to get a far more valuable asset for the town. He did not question at all that the undertaking did very well in making a profit of £16,000, but he pointed out that they were placing money to the relief of the rates, and then having to borrow really in order to do so. There were no two ways out of it; it must cost the ratepayers more in the long run, because they would have to pay the interest and charges upon the borrowed money. He also pointed out that the poorer class of people paid their rents and rates in one lump sum, and that money devoted to the relief of rates in an undertaking of that character was of no benefit to that class of people; in fact, it was no relief whatever to the poorer working classes. There were just over 2,000 consumers of electrical energy out of a population of 115,000, so that practically one-fiftieth of the population were making a contribution to the relief of the rates for the benefit of the others, who did not happen to be users of electrical energy. He hoped the City Council would very seriously consider the question of these large contributions to the relief of the rates; it was very much sounder, financially, for the whole of the undertaking and for the city that the whole of the profits should be conserved. Alderman West inquired as to the opinion of the Inspector with regard to other municipal undertakings. The Inspector replied that the principle applied equally to them all, and said he had noticed that in towns where there were no contributions to the relief of the rates from municipal undertakings, the rates were extraordinarily low. The inquiry closed, and the Inspector notified that he would report in due course.

**Cromer.**—Notice of the intention of the Council to transfer its prov. order to Edmundson's Corporation, with the consent of the B. of T., appears in the *London Gazette* for April 11th.

**Dundalk.**—On the 28th inst. a L.G.B. inquiry will be held into the application of the Urban Council for sanction to obtain a loan of £5,000 to extend the electric lighting system of the town.

**Epsom.**—The U.D.C. has decided to offer existing consumers of electricity for outside shop lighting a supply of current at the rate of £3 10s. per lamp per annum, or an alternative charge of 2d. per unit.

**Falkirk.**—The T.C. is considering whether electricity or gas should be adopted for street lighting. An early meeting will deal with the reports of the electrical and gas engineers, and decide as to the best and most economical method.

**Fleetwood.**—The L.G.B. has sanctioned the following loans in connection with the electricity undertaking: £5,240 for 17 years, £1,410 for 15 years, and £500 for 30 years.

**Haiti.**—Electric lighting already exists at Port-au-Prince, Cape Haytien and Gonaives, and every year it is employed more in the streets and to light private houses. One company supplies the current to the first two towns mentioned above. Its station is at Port-au-Prince; the station at Cape Haytien is much less important. Electric lighting at Gonaives is in the hands of the Haiti Lighting Co., which has a capital of £20,000. The station of this company has two engines each of 66 H.P., and 40-kw. dynamos. A German firm intends to develop and improve the electric installation at Port-au-Prince. Power is to be supplied and the tramways electrified in that town, a contract having already been entered into with the Government. Over and above the three towns mentioned above, electric lighting could, says a correspondent, be installed with success at St. Mark, Mole St. Nicholas, Mixagoane, Petit-Gaove and Aquin; also at Jacmel, where there used to be an electric lighting company. At Petit-Gaove there are large works for the treatment of coffee. These are now worked by steam, but there should certainly be an opening for the use of electricity in them. A large number of small works in Haiti could be operated by electricity without much expense, as there are plenty of waterfalls which could be utilised to supply the power.

**India.**—According to the *Calcutta Englishman*, Howrah (Bengal) will be electrically lighted throughout by August next. At present 800 street lamps are in use; these will be superseded by 1,500 50-c.p. lamps lighting all the streets and roads in the town. The supply is obtained from the Calcutta Electric Supply Corporation, which has laid 6,000-volt cables through the Hooghly.

The *Pioneer* gave some details of the Simla hydro-electric scheme in a recent issue, from which it appears that the power house contains three 250-kw. Pelton wheel units operating under a head of 540 ft., and delivering energy at 2,200 volts, subsequently stepped up to 15,000-volts pressure for transmission to Simla direct, 9 miles, and to a pumping station at Chair, 12 miles; the pumping station is also connected to Simla by a 7½-mile transmission. At Simla the pressure is reduced to 2,300 volts, and subsequently reduced again in small sub-stations to 220 volts for street and house lighting. The additional water required at Simla led to the carrying out of the project; the pumping station is equipped with two induction motors driving slow-speed plunger

pumps, and the older pumping station for the Simla water supply is also to be electrified. The cost of the hydro-electric scheme is put at Rs. 1,320,000.

Arrangements have at last matured for the introduction of electric lighting and power in the three cities of Lucknow, Allahabad, and Bareilly. Tenders for the work will be invited forthwith.

**Kearsley (Lanes.).**—At a meeting of the D.C., held on April 10th, the surveyor reported on the lighting of Kearsley Hall Road and Slackey Brow by electricity, and it was resolved not to go to the expense involved.

**King's Lynn.**—At a recent meeting, the T.C. adopted a report of the Electricity Committee which stated that the electrical engineer had reported that, on account of continued abnormal increase in the demand for current, it was impossible to consider the gas engines, even if improved in accordance with previous suggestions, as an effective stand-by. He therefore asked the Committee to arrange for the installation of an additional 400-kw. steam set, with necessary pipes and apparatus, at an estimated cost of £3,000. The Committee recommended that one gas engine and dynamo be advertised for immediate sale, that the other gas engines and dynamos be sold as occasion arises, and that the necessary tenders be invited for the installation of a 400-kw. steam set.

**Lerwick.**—The T.C. is about to consider the question of lighting the town by electricity.

**Llandudno.**—The U.D.C. has decided to have mains laid in Augusta Street, Madoc Street and Chapel Street, in order that those thoroughfares can be lighted by electricity. The capital cost will be £270, and the annual cost of 400-c.p. lamps, £3 15s. each.

**London.**—POPULAR.—Tenders are invited from recognised makers of converting plant for the provision at the Farmgate sub-station at Millwall of one 1,000-kw. converter with the necessary switchgear and connections. The E.H.T. mains are to be extended by the laying of 5,000 yards of 15 sq. in. 6,000-volt cable from the main generating station to the Millwall sub-station at an approximate cost of £3,533. This work was first recommended by the engineer in March, 1912, but owing at the time to the rapid rise in the price of copper and lead, the proposal was deferred.

STOKE NEWINGTON.—Application is to be made to the L.C.C. for sanction to borrow £5,000 for mains, and £1,000 for meters.

STEPNEY.—The Electricity Committee reports having had under consideration a communication from the Comptroller of the L.C.C., notifying the following alterations in the maximum periods which will in future be sanctioned by that authority for the repayment of loans for electric lighting purposes:—Freehold land (a) new period 60 years, (b) old period 60 years; buildings (a) 30 years, (b) 50; mains (a) 25 years, (b) 30; plant and machinery (a) 15 years, (b) 20; house connections (a) 12 years, (b) 12; meters (a) 10 years, (b) 10. According to a report, the Committee states, which has been prepared by the borough treasurer and the borough electrical engineer and manager, it appears that the proposed reductions in the periods in question are not justified; and, moreover, are calculated to injuriously affect municipal electricity undertakings in the metropolis. The attention of the Standing Conference of the five East End Boroughs of Poplar, Stepney, Hackney, Shoreditch and Bethnal Green was then drawn to the matter, with the object of a conference of the whole of the local authorities in the metropolis owning electricity undertakings being convened, in order that concerted action might be taken in the matter, with the result that the Conference decided to adopt the course suggested.

HAMMERSMITH.—The Electricity Committee reports having considered the general working of the scheme approved by the Council in December, 1911, for hiring and maintaining arc lamps on consumers' premises. This scheme, the Committee states, at present allows only for a maximum guaranteed consumption during 800 hours per annum, but in actual practice, it is found that a number of consumers exceed this to a considerable extent. The Committee is, therefore, extending the scale of charges so that the guaranteed hours' use per annum can be extended to 900 and 1,000 hours, the rental being increased *pro rata*. The Committee is also proposing to give lower rates in consideration of the consumer entering into a contract at the expiration of the first 12 months, to continue the use of the lamps for a further period of four years.

HACKNEY.—In view of the large expenditure which has taken place in the capital expenditure of the electricity undertaking, the B.C. is pressing forward the sales and publicity sections so as to make the business take a corresponding step forward, and in view of this have decided to have full-page advertisements in certain papers once a month, the centre of the page to be devoted to an appropriate general popular article, and the margin to be let for traders' announcements.

**Luton.**—The assessment of the Corporation Electricity Works has been reduced from £3,000 to £1,500, without resorting to an appeal.

**Lye and Wollescote.**—The U.D.C. has appointed a Committee to consider the advisability of having the town lit by electricity in place of gas. As an experiment, it is proposed to have one street electrically illuminated.

**Lytham.**—The B. of T. has given its decision as to who shall have power to supply electricity to the district, the application of the local Council having been acceded to. The application of the St. Anne's U.D.C. has been refused.

**Merton.**—The Wimbledon T.C. has offered to provide, erect, and maintain public electric lamp standards at Merton, fitted with 500-550 watt lamps, at £27 10s. per lamp per annum, for a term of not less than 10 years. This offer is being considered by the Merton U.D.C.

**Portrush.**—Mr. G. B. Deane held a L.G.B. inquiry last week in connection with application of the Urban Council for sanction to raise a loan of £6,000 for the purpose of carrying out the long projected electrical lighting scheme.

**Plymouth.**—The secretary of the B.E.A.M.A. has written the Corporation, enclosing the copy of a printed form entitled "Municipal Tenders, Request as to Publication," pointing out that it had been agreed between the Association and the I.M.E.A. that the publication in the Press, local or general, of prices quoted on financial tenders and reports of electricity committees on municipal tenders was undesirable, both in the interests of municipalities and manufacturers. The Corporation was requested to take steps with a view to avoiding such publication. The Electricity Committee referred the matter to the Town Clerk for report.

**Richmond.**—At the last meeting of the T.C. a letter was read from the Richmond (Surrey) Electric Light and Power Co., Ltd., intimating that the company is advised that it is necessary to have the agreement which was made between the Corporation and the company in January last confirmed by an Act of Parliament, and that the Lord Chairman having allowed the company to proceed by a late Bill, the company is taking the necessary steps to deal with the matter this session. In this connection, the General Purposes Committee reported that the agreement referred to provided for its confirmation by Parliament if the company should consider this to be necessary, but the Parliamentary Notice foreshadowed provisions which did not appear to be in accordance with that agreement. Mr. Renwick, the company's general manager, suggested that certain provisions relating to the price of current contained in the original agreement scheduled to the Companies' Act of 1907 are cancelled by the provisions of the recent agreement, and he has submitted a draft supplemental agreement to provide for the repeal of so much of those provisions of the original agreement as relate to the revision of the price of current. The Committee advised the Council to oppose the Bill if necessary, and this was agreed to.

**St. Andrews.**—The Electric Supply Corporation is anxious to obtain a contract for lighting the streets of the city with incandescent electric lamps, and is fitting up lights in Greyfriars Gardens as an experiment.

**Stoke-on-Trent.**—The B. of T. has granted the T.C. a prov. order empowering the Corporation to supply current for public and private purposes at Wolstanton.

**Southborough.**—The B. of T. has granted the U.D.C. a prov. order for electric lighting.

**Swanage.**—The Electricity Supply Co. has applied to the Board of Trade for permission to erect a generating station at Court Hill, under the Electric Lighting Order, 1906.

**U.S.A.**—The Commissioner of Public Works of Boston, Mass., in his annual report, urges the installation of electric lamps in place of the 11,000 gas lamps now in use for city lighting. He says that 60-c.p. tungsten lamps, giving one-third more light than the present gas lamps, cost \$21.14 per lamp per year and their use would save the city \$21,716 a year over the present contract price paid for gas lamps.

**Wellesbury.**—The T.C. has decided to increase the charges for electricity for light and power, by 5 per cent., from April 1st.

**West Bromwich.**—A recent issue of the *Midland Chronicle* illustrates the improved lighting in Birmingham Road, where the Cable Accessories Co.'s "Seaco" sheet steel tungsten lamp fittings have been adopted. The fittings in question apparently contain five 100-c.p. lamps, and are hung direct from the tramway span wires. It may be mentioned that the lamp-holders are mounted on a spring-supported insulating base which gets over vibration difficulties.

The T.C. has received from the L.G.B. sanction to a loan of £6,500 for mains extensions. The Electricity Committee has been authorised to negotiate with the South Staffs. Tramways (Lessee) Co., Ltd., for a further supply of energy.

**Whitehaven.**—The T.C. has received from the L.G.B. sanction to loans of £665 in respect of excess expenditure on plant, £300 for mains extensions, and £600 for house services.

**Whitstable.**—The U.D.C. has decided, by 7 votes to 5, to agree to the installation of the electric lighting in the town on terms to be arranged with a proposed company, and that the latter be given half of the public lighting, subject to a proper agreement being entered into.

**Wolverhampton.**—In consequence of the continued rapid growth of the demand for electrical energy—particularly in the centre of the town and in the Dudley Road area—it is found necessary to again make extensions to the Corporation electrical plants and mains. Just before severing his connection with the undertaking Mr. C. E. C. Shawfield, the electrical engineer, prepared a report setting forth the requirements to meet next winter's load. He recommends the laying of a H.T. ring main from Commercial

Road to the School Street Stores, from the Stores to the Sunbeam Works, returning to Commercial Road. That a sub-station be built at the Stores, with three 250-kw. rotary converters with the necessary switchgear; and to install in a sub-station at the Moorfield Works of the Sunbeam Motor Car Co. one 250-kw. converter. Mr. Shawfield also states that extensions will be required to the E.H.T. switchboard to deal with the proposed ring main. There is no room for further extensions to the existing E.H.T. switchboard without going to very considerable expense. In view of this fact he recommends that a new switchboard be installed. The generating and converting plant will be controlled by this switchboard, the present board being used as an auxiliary switchboard to control feeders only. A further advantage of this scheme is that the switchgear for all the running plant, both A.C. and D.C., will be collected at one point, and will be under the control of one man, an arrangement desirable on the grounds of economy and efficiency. The expenditure required to meet the cost of the scheme is estimated as follows—E.H.T. ring main, £3,300; feeder cables to various points on the network, £550; alterations to existing network, £400; four 250-kw. converters, £3,000; E.H.T. switchgear for three sub-stations, £900; L.T. switchgear for three sub-stations and cable connections, £600; buildings and foundations, £570; cranes for two sub-stations, £150; new E.H.T. switchgear for Commercial Road generating station, £2,000; new cables for connecting existing machines, £150; or a total of £11,620.

Mr. Shawfield concludes his report with the following practical recommendation: "That an application be made to the L.G.B. to borrow a further sum of £15,000 for mains extensions, and £5,000 for sub-station equipment. Also that application be made to them to borrow £2,000 for E.H.T. switchgear and connections at the generating station, Commercial Road."

At the Council meeting following, Mr. Shawfield's report was unanimously adopted, and tenders are to be invited for the necessary work.

**Woodford (Essex).**—The U.D.C., after considering a scheme of obtaining a supply of current from Walthamstow Council, has deferred its decision until the ratepayers have had an opportunity of discussing the matter.

**Worthing.**—In introducing the half-yearly estimates to the T.C. Alderman White referred with pleasure to the fact that the accounts of the electricity undertaking were at last showing an appreciable profit. After placing £500 to reserve, the outcome of the past year's trading had been a realised profit of £748. Electric heating and power were appealing to the townspeople, with the result that it was expected that during the coming year something like 160,000 units would be sold for these purposes, representing an income of something like £1,000. It was proposed that in future this sum should be deducted from the cost of producing the electricity before calculating the charge for public lighting, and this would mean that whereas during the past year the charge for public lighting had approximated 5d. per unit, it would in future be about 4½d. The Committee estimated that 12 months hence there would be a balance of profit of something like £1,500, and he hoped that then not only the public lighting, but also the private consumers would benefit by a reduction.

**York.**—The T.C. has received from the L.G.B. sanction to a loan of £500 for wiring Corporation premises for the electric lighting.

The Electric Light Committee is to prepare a scheme for laying cables in the streets of the city, generally for public and domestic lighting, and other domestic purposes. The capital cost of such a scheme is estimated at £71,000, and it is anticipated that the public lighting could be undertaken at £3,075 a year, including interest on the loan, against £4,600 paid for gas.

## TRAMWAY and RAILWAY NOTES.

**Barking.**—It has been decided to agree in principle to the proposed traction supply from East Ham upon certain terms which were not made public, and the matter was left to the clerk and engineer to arrange the necessary details.

**Bournemouth.**—The financial year of the Corporation tramways undertaking shows that all previous records have been broken. The number of passengers carried was over 15,750,000, showing an increase of about 640,000. The receipts were nearly £95,700, an advance of about £4,340. There has also been a substantial saving in expenditure, and there is, it is stated, a balance of over £10,000 on the net revenue account.

**Canada.**—The *Electrical News* says that the train service operated by the Grand Trunk Railway system through the St. Clair tunnel which connects Sarnia and Port Huron under the St. Clair river is claimed to be the heaviest railway service handled by electricity in the world. This electrification operates within a zone of approximately four miles, the motive power being derived from 1,500-h.p. electric locomotives, each weighing 135 tons with a normal draw-bar pull of 50,000 lb. and a maximum speed of 35 miles per hour. The time taken to change engines is from two to five minutes, and the time of passing through the tunnel which, with its approaches is more than two miles in length, is 13 minutes. Up

to 45 cars per train are hauled through the tunnel, which represents a train more than one-half mile in length.

During the 12 months of 1912 the company's records show that 197,801 loaded freight cars and 88,692 empties passed through the tunnel, in addition to 35,096 passenger cars. Estimated on a basis of 17 tons per car, this gives a total tonnage passing through the tunnel of approximately 3,500,000. These figures do not include any company material such as coal, lumber, ties, &c., which would swell the total to much larger proportions.

**Cardiff.**—The tramway receipts show an increase of £3,263 over the previous financial year, due largely to the Royal visit in June last, and the fact that Easter came much earlier, but Mr. Arthur Ellis and his staff are to be congratulated on the financial result. The number of transfer tickets issued during the year was 3,037,720, which compared with the figures of the preceding year—2,900,700—gives an increase of 137,000. The figures are as follows:—1913, passengers, 28,365,037; receipts, £128,882; 1912, passengers, 27,561,632; receipts, £125,618. The question whether some of the Cardiff thoroughfares should be remade and a portion of the tramway line reconstructed by contract or direct labour was discussed by the Tramways Committee. The Lord Mayor, referring to the decision of the Joint Committee to employ direct labour, said he would like to know whether the statement made by the city engineer that £27,000 could have been saved if the track had been relaid by direct labour in 1902 was accurate. The following resolution was ultimately passed:—"It is the opinion of the Committee that (a) the whole of the works involving reconstruction of the tramway track and repairing of the carriage ways should be carried out by the same agency, and (b) that before deciding the question of contract as against direct labour, tenders be invited by advertisement, and that the city engineer be requested to submit his estimate to be opened at the same time as tenders received from contractors. The whole of the work to be done to a specification, and schedule of prices to be prepared by the city engineer.

**Doncaster.**—Now that the district is growing so quickly through colliery development, an effort is to be made to compel the Corporation to fall in with the desires of the people, and provide a means of transit on the Sabbath. Some years ago the question was submitted to the referendum, but the area of the plebiscite was restricted to the borough, and the majority of the few who voted at all, were against such a service. If a poll were taken now, including the outside districts, there would be an overwhelming majority in favour of Sunday running.

**Edinburgh.**—The convener of the Tramway Committee, along with the town clerk, has had an interview with the War Office authorities with reference to the Colinton Tramway and to the application of the company for running powers in the city. It is stated that negotiations have been proceeding for the acquisition of the tramway by the Corporation, and that £10,000 has been mentioned as the price at which the promoters are willing to sell. The tramway runs between Slateford Station and Redford Barracks. The purchase by the Corporation would solve two questions in which the War Office is interested—the supply of electric lighting to the barracks and the provision of tramway facilities for the soldiers. It has still to be decided whether the city or the War Office will lay the mains from the city boundaries to Redford.

**Hull.**—In connection with the agitation for a tramway service from the centre of Hull to Stoneferry, which is within the city boundary, a largely attended meeting has been held at Stoneferry, when a resolution was passed in favour of the extension of the tramways. A motor-bus service used to be run, but this was discontinued as it entailed a loss of £5,000 per annum. Alderman Hanger said that out of the tramway profits, £190,500 had been contributed to the relief of the rates. Four hundred yards of the double lines were already laid of the 1½ miles required, and he held that the profits should be used for the development of the system.

**Leicester.**—The T.C. has approved the report of the Tramways Committee recommending the provision of repairing shops for tramway cars in the Abbey Park Road, at an estimated cost of £23,000.

**London.**—On Monday last another stoppage of the L.C.C. tramway service, both north and south of the Thames, took place for two hours during the busiest part of the morning. Following on two similar breakdowns, it is not surprising that some discussion took place in the Council on the matter, which appears to have been somewhat unnecessarily hushed up.

A report presented by the Highways Committee on the two tramway breakdowns which occurred on March 10th and 12th respectively, stated that on the evening of March 10th a short-circuit occurred on the switchgear at the Greenwich generating station, causing considerable damage to the switchgear, burning out several coils on a generator, and involving a temporary failure of the whole supply. A partial supply was given within a few minutes, and the normal supply was resumed the same evening. On March 12th, a few coils of another generator failed. These had apparently been weakened previously. By working day and night, the first generator damaged was on load again on March 19th, and a large proportion of the cars which had been withdrawn were put back into service. The repair of the second generator was completed on March 29th, and the full service of cars was resumed on March 30th.

Sir Edward White, chairman, Highways Committee, said they had received tenders for the supply of improved turbine machinery, at a cost of something like £200,000. This would give them considerable reserve power; but they were not depending entirely on this. They had a contract with the Metropolitan Electric Tramway

Co. to supply them with a certain amount of power, and under that contract power was being supplied to them now. They had also a contract with one of the public authorities, and cables were being laid down in order to give them a third string to their bow. They were thus taking every means in their power to meet the difficulties.

Mr. G. H. Hume, vice-chairman, Highways Committee, said none of the three accidents had anything to do with an over-demand on the resources of the generating station. That on March 10th was due to a slight error of judgment. On Monday last a piston was blown out of one of the engines, owing to the breaking of a cotter-pin, and a piece struck a generator. That caused a short-circuit, which in turn caused a short-circuit on the high-tension board. A section of the switchboard caught fire, and the same generator which broke down in March gave way in another place. The whole service had to be stopped while the fire was being put out, and the extent of the damage was being ascertained. It was no use the Council blinking at the fact that they were working with a very small margin at their generating station. After further discussion the matter dropped.

The total traffic receipts of the L.C.C. tramways for the year. April 1st, 1912—March 31st, 1913, were £2,143,190 from electrical lines, and £37,545 from horse tramways. The comparable receipts for the previous year were £2,231,945 and £60,356, showing a decrease of over £111,000.

**STEPNEY.**—The L.C.C. is to be requested to include in one of its General Powers Bills a clause to empower a Council to recover the cost of damage done to street lamp columns from the owner or owners of the vehicle, instead of from the driver as at present.

**Manchester.**—At a meeting of the Tramways Committee recently, the estimates for the ensuing year were considered. By resolution of the City Council, and in accordance with the scheme of the Trading Profits Committee, the tramways undertaking is expected to contribute £100,000 to rate relief purposes, being 5 per cent. on a capital expenditure of, roughly, £2,000,000. The estimated receipts for the ensuing year are put at over £900,000. The capital expenditure account makes provision for £30,000 for buildings, £30,000 for permanent way (new lines), £25,000 for street improvements, and £30,000 for cars and equipment.

**Nelson.**—A record year is reported in connection with the tramways undertaking. The Committee estimated a profit of £450, but this has been exceeded by no less than £1,000. The light railways have carried 267,271 more passengers than in the previous year, notwithstanding the fact that last summer was an abnormally wet one. The most gratifying feature is the great improvement which has taken place in regard to the Scotland Road section, which has hitherto been a great drag on the undertaking.

## TELEGRAPH and TELEPHONE NOTES.

**Direct Cable to Canada.**—Direct telegraphic communication between the United Kingdom and Canada has been opened, on the Morse system of Mr. John Gott.

**Rural Telephones.**—In answer to a question, the Postmaster-General recently stated that the additional Treasury grant of £20,000 would probably admit of the provision of about 1,300 additional rural party-line telephones.

**United States.**—It has been announced that a contract for eight wireless telegraph stations, to be the most powerful in the world, has been awarded by the American Marconi Wireless Telegraph Co. to the J. G. White Engineering Corporation. The stations will be located in pairs, a receiving and a sending station being 30 miles apart to reduce interference, at Oahu, H.I.; Tamalee Bay and Bolinas, Cal.; near Belmar, N.J., and in Eastern Massachusetts. Later on a station will be established in Japan. The range of these stations is estimated at from 4,000 to 6,000 miles, and each will utilise a different wave-length. The antennas will be 400 ft. or more high. Each station is to consist of 12 towers arranged in a semicircle covering a square mile. The power available at each station will be 750 KW.—*Electrical Review and Western Electrician.*

**Wireless Map of the World.**—An admirable map of the world has been compiled by Marconi's Wireless Telegraph Co., Ltd., and is published by Messrs. George Philip & Son, Ltd., at 2s. 6d. net. It shows very clearly the position of all stations open for ship-and-shore communication, high-power public and private stations, the long-distance stations of the Imperial scheme, and other stations for trans-oceanic communication. Lighthouse, light-ship and Naval stations are not shown, and this, perhaps, accounts for the omission of the stations at the Eiffel Tower and Nanen, for example, though we were not aware that these were regarded as "Naval." The distribution of the stations over the world is very interesting; Canada is thickly dotted with them along the St. Lawrence and the great lakes, as well as on the West coast, British East Africa, the Gulf of Mexico, and the East coast of South America are also noticeably well equipped, but the greatest concentration is, of course, in the West and South of Europe. The map is very welcome, and certainly fills a distinct want.

(Continued on page 647.)

# THE ELECTRICITY WORKS OF TROLLHÄTTAN.

The first power station erected by the Swedish Government is the huge undertaking at Trollhättan, which was carried

out by the State Waterfalls Board, under the supervision of the manager of the Board, Col. F. V. Hansen, the chief

FIG. 1.—TROLLHATTAN POWER STATION AND SWITCH-HOUSE.

out by the State Waterfalls Board, under the supervision of the manager of the Board, Col. F. V. Hansen, the chief

is available at Trollhätte Falls. The minimum discharge is 320 m.<sup>3</sup> per second, and the present works are laid out for a flow of 250 m.<sup>3</sup> per second, giving 80,000 h.p.; but by regulating the level of the lake, a total output of 200,000 h.p. can be made available.

From the headworks, the water is carried in a canal, 1,300 m. in length, to the forebay, which we illustrate on page 644, whence it is led by eight steel pipes, 4.25 m. in diameter and 60 m. long, through tunnels blasted out of the solid rock, to the power house. Three smaller pipes in a common tunnel feed the exciter sets. Ice-screens and headgates are provided within the intake building, and the former can be heated with electricity to prevent the formation of frazil. The arrangement of the plant is shown in figs. 3 and 6.

The power station, a building designed in keeping with its rugged surroundings, contains six three-phase generators

FIG. 2.—INTERIOR OF TURBINE ROOM.

engineers, Mr. T. Holmgren and Capt. G. Malm, and Mr. Holmgren's assistant, Mr. W. Borgqvist. The contractors were the Allmänna Svenska Elektriska Aktiebolaget—the "General Electric Co. of Sweden"—a firm which, founded by Jonas Wenström in the early eighties, has continuously progressed, and has become one of the most capable and successful concerns in Europe. The company recently issued an admirable description of the undertaking, and has kindly provided us with the photographs which we reproduce herewith.

The generating station is situated, amidst wild and picturesque scenery, at the Trollhätte Falls on the Göta River, which carries the discharge from Lake Vänern, the largest lake in Sweden, having an area of 5,570 sq. km. The whole of the water-power of this river became the exclusive property of the State in 1908.

The river is 86.5 km. in length, and has a total fall of 44 m., of which 32 m.

of 11,000 K.V.A. at 10,000 volts, 25 cycles, directly coupled to horizontal turbines running at 187.5 R.P.M., which utilise

FIG. 3.—SECTION OF POWER STATION AND SLUICE GATES, TROLLHATTAN.

an effective head of 30 m. Each turbine consists of two wheels enclosed in a common steel casing, and is provided with automatic regulating apparatus. Eventually the station will contain eight generating sets, in addition to the three exciting sets, of 350 kw. each at 220 volts. A storage battery is used in conjunction with the exciters. The switchgear is housed in a separate building, connected with the works by a cable tunnel 200 m. in length, there being no room for the switch-house close to the power station. The tunnel is divided into four independent corridors, and carries, in addition to the main cables, the signalling and operating lines for the complex system of remote control rendered necessary by the long distance between the two buildings.

In the switch-house are cells for eight groups of transformers, of the oil-insulated water-cooled type, which step up the pressure of part of the supply to 50,000 volts, for transmission to the more remote centres of utilisation.

The alternators have an efficiency of 96 per cent. when giving 9,000 kw. with a power factor of 0.8, and 96.9 when giving 7,200 kw. at unity power factor. The rise of pressure when the full load is switched off is 21 per cent. The mode of excitation is unusual; the three exciters work at 220 volts, and each of the alternators has on the end of the shaft an exciting booster, which is connected in series with the field winding and the main exciter bus-bars, and gives a pressure varying from + 110 to - 220 volts. Thus the resultant pressure of the exciting current can be varied between 0 and 330 volts, by regulating the field of the separately excited boosters. One of the alternators is pro-

vided with damping coils on the poles, to enable it to run as a single-phase generator for traction, the future supply of

FIG. 4.—POWER CANAL AND FOREBAY, TROLLHATTAN.

FIG. 5.—INTERIOR OF SWITCH-ROOM.

FIG. 6.—PLAN OF POWER STATION AND FOREBAY, TROLLHATTAN.

the State railways being one of the purposes for which the works have been built. The stator can be moved axially sideways, to enable the coils to be easily got at for inspection or replacement, the winding being laid in open slots.

A noteworthy feature of the generators is the system of ventilation employed. As will be seen in the illustration, fig. 2, the rotors are enclosed, and are provided with ducts bringing

air from the outside of the power station, the rotors carrying fans to propel the air, which passes through the stator and is carried away to outlets in the walls of the building. The cooling air required amounts to about 20 m<sup>3</sup>. per second for each machine. In winter the heated air is useful for warming the buildings, and in summer the station is kept cool; an additional advantage is that the machines are absolutely noiseless. The generators can be run as open machines by taking off the central end shields. The stators are of considerable size, measuring 6.65 m. in height from the base, and 4.9 m. from the ground level; the rotor is 4.75 m. in diameter. Each generator weighs about 200 tons, the rotor alone weighing 67 tons. In these days of high-speed turbines, the majestic dimensions of the machines of ten years ago are seldom met with; fig. 2 will give a fair impression of the massive proportions of these fine alternators.

The storage battery has a capacity of 1,000 kw.-hours, or 4,800 amp.-hours at the three-hour rate of discharge.

In the switch-room there are two control-boards of the bench type, for the generators, and for the transformers and feeders respectively. These are shown in fig. 5, with the signal desk provided with telephones and engine-room telegraphs communicating with the power station.

(To be concluded.)

## SOME AMERICAN CEMENT MILL INSTALLATIONS.

As many of our readers are aware, the conditions of service under which electrical motors in cement works are called upon to work, are extremely severe; the atmosphere is heavily charged with dust, and the attention given to the electrical plant is often quite unskilled in character. Yet both in this country and abroad, the electrical drive is now regarded as an indispensable feature of the modern cement mill, and as cement machinery largely runs throughout the day and night, it obviously provides an excellent load factor for electrical generating plant. For work of this description, the A.C. squirrel-cage induction motor is generally considered the best for well-known reasons, and our views illustrate some typical applications of these machines in large American cement works.

Fig. 1 shows two 440-volt 40-H.P. squirrel-cage motors, speed 166 R.P.M., driving ball mills in a raw-material mill of the Universal Portland Cement Co.

The ball mill consists of a heavy cylindrical drum containing heavy steel balls, which grind the material fed in as the drum slowly rotates; the drum speed is only about 20 R.P.M., and two-gear reductions are often adopted, but where a 25-cycle supply is available, good results are obtainable by using a slow-speed induction motor, as shown, with only one gear reduction.

In the works referred to, there are nine of these mills so driven.

Figs. 2 and 7, show Fuller mills driven by vertical type squirrel-cage motors; in these

mills the centrifugal pressure of large steel balls against a heavy steel ring pulverises the material, which is driven out by a fan through a screen which surrounds the chamber immediately above the steel ring. The Fuller mill is sometimes driven by ordinary type motors by means of quarter turn belts, an arrangement which, on account of

FIG. 1.—TWO 40-H.P. SQUIRREL-CAGE MOTORS DRIVING BALL MILLS.

FIG. 2.—VERTICAL MOTORS DRIVING FULLER MILLS; UNIVERSAL PORTLAND CEMENT CO.

the belt wear, is not so good as that shown and almost always used. The first view shows four of eight 40-H.P., 500 R.P.M., 440-volt S.C. motors driving Fuller mills at the Universal Cement Co.'s works, and the second 10 550-volt, 25-cycle, 75-H.P. S.C. motors, speed 500 R.P.M., in similar use at the Tidewater Portland Cement Co.'s works.

Our illustrations, figs. 3 and 5, show squirrel-cage induction motors driving tube mills through gearing.

As will be seen in the first illustration, fig. 3, of 12 440-volt 100-H.P. machines, speed 166 R.P.M., driving raw material tube mills, through flexible couplings and countershafts on the mills, at the Universal Portland Cement Co.'s works, the motors are installed in a separate room ensuring much cleaner operating conditions than would otherwise be obtained. Fig. 5—a view in the Sandusky Cement Co.'s works, where six 85-H.P. 375 R.P.M. motors driving tube mills are in use—gives a better idea of the flexible coupling and ordinary operating conditions where tube mills are driven. The tube mill, it may be mentioned, is one of the most extensively employed in various industries where a fine product is required; it consists only of a horizontal rotating steel cylinder lined with hard cast-iron plates and about half filled with flint pebbles.

The modern rotary kiln, which will be familiar to our readers, is used for burning the raw material to clinker, the

FIG. 3.—TWELVE 100-H.P. MOTORS DRIVING TUBE MILLS.

flame travelling up the kiln in the opposite direction to the material. Such kilns are driven through both belt and gear

We are indebted to the British Thomson-Houston Co. for the illustrations here given; this company, through their associations and connections, have electrically equipped over 50 cement works throughout the world, including those referred to above.

FIG. 4.—75-H.P. MOTORS DRIVING ROTARY KILNS.

drives, although the former type of drive is preferable, as it is possible to place the motor at a greater distance from the hot kiln. In order to regulate the time during which the material is subjected to flame, the speed of rotation requires

FIG. 5.—TUBE MILL DRIVE, SANDUSKY WORKS, SHOWING FLEXIBLE COUPLING.

to be varied, and slip-ring motors are therefore employed. Fig. 4 gives a good idea of a kiln house at the Knickerbocker Cement Co.'s Works, three 75-h.p. 440-volt slip-ring induction motors, speed 720 R.P.M., being shown with belt-drives on to countershafts, and gear-drives from the latter to the kilns.

The kilns are fired by means of powdered coal, and motor-driven fans are employed for forcing the latter, with the necessary air, into the kilns, as also into the slag and limestone dryers.

Our illustration fig. 6 shows a 150-h.p. s.c. motor running at 750 R.P.M. and driving a gyratory rock crusher used in the preliminary rock crushing operations; it is usually belt-driven, as in the event of the crusher becoming clogged with rock, a gear drive would be subjected to severe strains. The view was taken in the Tidewater Cement Co.'s works.

The subject of electricity in Portland cement works was dealt with fully in our issues on January 20th and 27th, 1911, particularly as regards the probable power requirements.

regulated by the water. Electric light is used in the mill, barns, office, stables, dairy and residence—40 16-C.P. and some 25-C.P. tungsten lamps being employed, usually half at one time. In addition to the lighting, a motor is installed for driving the separator, pasteurizer, churn and milking machine; a motor-driven saw and

FIG. 6.—A 150-H.P. ROCK CRUSHER DRIVE.

emery wheel are employed in the joiners' shop and a motor-driven vacuum pump is installed both for cleaning purposes and for use in connection with the milking machine. Arrangements are being made to run a laundry electrically—the ironing, water heating, &c., being already accomplished by electrical methods.

FIG. 7.—GROUP OF TEN 75-H.P. VERTICAL MOTORS DRIVING FULLER MILLS

## TELEGRAPH and TELEPHONE NOTES.

(Continued from page 642.)

**Brazil.**—The Government has authorised the erection of two wireless telegraph stations, one being at Fortaleza, in the State of Ceara, and the other at Porto Murinho, in Matto Grosso. The cost is to be £26,800. Also a special telegraph line is to be erected between Rio de Janeiro and the State of St. Paul, the cost of construction being estimated at £28,000.

**Imperial Wireless System.**—At the resumption of the inquiry into the Marconi agreement by the Select Committee on Wednesday last week, Mr. W. G. Rico, the stockbroker who acted for Mr. Lloyd George, was examined, and said that on April 19th, 1912, he warned Mr. George that the American Marconi shares were not a desirable investment. On May 22nd he purchased 3,000 of the shares for Mr. George. Mr. Percy Heybourn, who dealt in American Marconis, also gave evidence with regard to 350,000 of the shares, which he had from Mr. Godfrey Isaacs. The witness declined to give particulars as to the number and price of shares that he sold before April 19th. On the following day Mr. Heybourn was further examined, but owing to a resolution of the majority of the Committee, a question as to the number of shares sold before April 19th was disallowed, and the minority protested. The witness's refusal to answer other questions was supported by the chairman.

The next witness was Mr. Godfrey Isaacs, who gave evidence regarding the arrangements made between the British and American companies. As the new capital required to purchase the United Wireless Co.'s assets, and to carry out new work, could not be raised in America, the British company agreed to take up 900,000 shares, on condition that Mr. Isaacs made himself responsible for a further 500,000, the total amount being £1,400,000. He gave particulars of the subsequent placing of the shares on the market, and stated that all the profit on the shares had gone to the British company, he himself having made no profit, though he was entitled to do so. He had heard in April that a strong attack was to be made on the Marconi contract with the Government, and that there was a syndicate which was promoting the Poulsen company, with the support of members of Parliament. A prospectus of the Poulsen system dated March 5th, 1912, which he received, bore only the names of Mr. A. A. Campbell Swinton, attached to a report on the system, and of the printer. Mr. Swinton was recommended by Sir Henry Norman as an expert qualified to advise the Committee as to the best system for the Government to adopt. He could not obtain any information as to the source of the prospectus. He heard in July that those connected with the syndicate were arranging an attack upon Ministers to prevent the ratification of the contract.

On Monday Mr. Isaacs was further examined with regard to his evidence-in-chief, and stated that he had been informed from many sources that Major Archer-Shee, M.P., and Mr. Norton-Griffiths, M.P., were concerned in the agitation. It being pointed out that the Committee knew that Mr. Swinton had reported on the Poulsen system, long before Sir Henry Norman mentioned his name, Mr. Isaacs stated that he was not aware of the fact. The net result of the arrangement with the American Co. was that the English Co. had rights to about 1,200,000 shares out of a total share capital of 2,000,000. He offered the American shares to his brothers because he thought the American Co. had the best prospect of all the wireless companies. In 1909 the English Co. was badly in want of capital; it had a substantial business and a large organisation, but no liquid capital. The number of American shares now held by the English Co. was 566,700.

After discussing the fluctuations in the price of the English Co.'s shares, Mr. Isaacs stated that not only the contract with the Norwegian Government, but practically every important undertaking in the world that he had been negotiating for the last two years was standing over, in consequence of the contract with the British Government. The English Co. had resold practically the whole of the assets of the United Wireless Co. to the American Co. The Committee sat again on Wednesday.

On Monday, Major Archer-Shee and Mr. Norton-Griffiths both published statements that they had no financial interest in the Poulsen Syndicate.

**Wireless Telephony.**—At Dinnington Main colliery, in the South Yorkshire coal area, interesting experiments are being conducted with wireless telephony. An installation is being fitted up in the pit and on the surface, and it is claimed that the system, invented by a German scientist, makes it possible to converse through 1,500 yards of solid rock.

## CONTRACTS OPEN and CLOSED.

## OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" April 11th.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

April 29th.—20,000 yd. of 3 in. fibre conduit, for the Melbourne City Council. See "Official Notices" April 11th.

**SYDNEY.**—May 12th. Fibre conduit for the City Council. May 26th.—Meters and glazed stoneware bridges. July 7th.—Arc lamp carbons. Specifications 10s. 6d. for each section, from City Electrical Engineer's Department. *Australian Mining Standard.*

**TASMANIA.**—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

**QUEENSLAND.**—May 21st. Copper wire and accessories for the P.M.G.'s Department. See "Official Notices" April 11th.

**Austria.**—VIENNA.—May 13th. Supply of 1,800 intercalary switches for the central-battery system. Particulars, Postökonomieverwaltung, Vienna.

**Bedford.**—April 23rd. Carbon and metallic-filament incandescent lamps, for a year, for the Corporation. See "Official Notices" April 11th.

**Belgium.**—May 3rd. The Belgian Government, Salle de la Madeleine, Brussels. Supply and erection at the Royal Palace at Laeken, of two rotary transformers.

**Canada.**—WINNIPEG.—May 15th. City Light and Power Department. Two three-phase generators of 5,000 kW. for direct connection to 6,800-H.P. water turbines; also spare parts. Chairman, Board of Control. Deposit, £205. Particulars, Board of Trade Com. Int. Department in London.

**Cheltenham.**—The T.C. has instructed the borough electrical engineer to obtain tenders for additional condensing plant.

**Dublin.**—April 24th. High-tension and low-tension switchgear, cables and accessories, for the Corporation. See "Official Notices" April 11th.

May 1st.—E.H.P. sub-station switchboard and accessories and alteration to existing E.H.P. switchboard, for the Corporation. See "Official Notices" to-day.

**Felixstowe and Walton.**—May 5th. One 150-KW. Diesel-driven D.C. generating set for the U.D.C. See "Official Notices" to-day.

**Germany.**—The Hamburg Finance Deputation is at present in the market for the supply of four electric cranes.

April 24th.—The Lighting Committee of the Municipal Council of Bremen is inviting tenders for the supply and erection of two transformers at the central electric lighting station.

**Hoylelake and West Kirby.**—May 5th. One 400-KW. alternator and triple-expansion Belliss engine, and evaporative condensing plant, for the U.D.C. See "Official Notices" to-day.

**Hull.**—April 23rd. Electric light at Stepney Lane and Cleveland Street workshops and stables, for the T.C. Mr. A. E. White, City Engineer, Guildhall.

April 24th.—Electric light installation and fittings, Saner Street School, for the T.C. Mr. J. H. Hirst, City Architect, Guildhall.

**King's Lynn.**—May 5th. One 4,000-KW. steam dynamo with condensing plant and pipework, for the Corporation. See "Official Notices" to-day.

**Liverpool.**—April 18th. Electric light and power installation at the Highfield Infirmary, Knotty Ash, for the Select Vestry. See "Official Notices" April 11th.

**London.**—L.C.C.—April 23rd. Electrical installation at Shadwell High Street Special School. See "Official Notices" April 4th.

FULHAM.—April 23rd. 6,000 tons of nutty slack coal, for the B.C. Electricity Works. See "Official Notices" April 4th.

**SOUTH-WARK.**—April 23rd. Two boilers, with fan, economiser and conveyors, two 1,500-KW. generators, four converters, switchboard, barometric condenser, cooling tower and steel structure, for the B.C. See "Official Notices" April 14th.

**METROPOLITAN ASYLUMS BOARD.**—April 23rd. Electric light installation in the Laundry Block and Block No. 12 at the Grove Fever Hospital, Tooting Graveney. See "Official Notices" April 11th.

**ROYAL MINT.**—April 25th. 120 tons of ingot copper. See "Official Notices" to-day.

**Manchester.**—April 23rd. E.H.T. switchgear, low-pressure steam and water pipes, hot-well, valves, &c., and two 50-H.P. three-phase motors for cooling towers, for the Corporation. See "Official Notices" April 11th.

**Newcastle-on-Tyne.**—April 23rd. E.H.T. three-phase lead-covered paper cable and single conductor L.T. lead-covered paper cable, for the Corporation Tramways Committee. See "Official Notices" April 11th.

**Newport.**—April 26th. One 2,000-2,500-KW. steam turbo-alternator, surface condensing plant, one 600-KW. D.C. generator, and E.H.T. and L.T. switchgear, for the Corporation. See "Official Notices" April 11th.

**Rochdale.**—April 24th. Tramways Committee. Stores and materials for a year. Mr. J. S. D. Moffet, Tramway Offices, Mellor Street.

W. T. Henley's Telegraph Works Co., Ltd., £2,850. The tender of Caird & Rayner has also been accepted, at £61, for the supply of a surface water-heater.

ST. PANCRAS.—The B.C. has received the following tenders for the supply of 215,000 pairs of open type arc lamp carbons:—

Geipel & Co.	£862
Sloan Electrical Co., Ltd.	674
London Electric Warehouse Co.	796
Crompton & Co., Ltd.	740
Ship Carbon Co., Ltd.	709
J. & H. Greverer	796
The Electrical Co., Ltd.	800
General Electric Co., Ltd.	831
Braunlik & Co.	807
Electrical Engineering Co., Ltd.	911
Siemens Bros. & Co., Ltd.	1,071

The tenders of the General Electric Co., Ltd., at £43, Geipel and Co., at £25, Sloan Electrical Co., Ltd., at £39, and the Union Electric Co., Ltd., at £105, have been accepted for a supply of flame arc lamp carbons; as has also the tender of the British Electric Transformer Co., Ltd., at £118, for a transformer for testing purposes.

**Manchester.**—The Electricity Committee has accepted the following tenders:—

Callender's Cable and Construction Co., Ltd.—For 12 months' requirements of low-tension distribution cables.  
Liverpool Electric Cable Co., Ltd.—For rubber-insulated cable.  
Electrical Engineering and Equipment Co., Ltd.—For paper-insulated cable.  
B.I. and Helsby Cables, Ltd.—For the purchase of scrap cable.

The Tramways Committee has accepted the tender of the Daimler Co., Ltd., for four motor-omnibuses, and that of Messrs. Bell Bros. for one motor-car.

**Morocco.**—With reference to the call for tenders for insulators and brackets for the Moroccan Post and Telegraph Service, it is notified by the Acting British Consul-General at Tangier, that the contract has been awarded, for the sum of 12,750 fr. (£510), to a French citizen in that city.—*Board of Trade Journal.*

**Neasden.**—Messrs. E. Bennis & Co., Ltd., have received a repeat order from the Metropolitan Railway Co., for their Neasden power station, to relink 36 gears with their Bennis-Miller-Bennett link, including change speed continuous driving gear. This contract follows an initial order for four sets, bringing the number supplied to this station to 40. The Bennis link which is being substituted for those of another make hitherto in use, is specially adapted for slack coils and can now be applied to any existing chain grate frames. The link is particularly valuable where it is essential to burn slack or rough small as well as better class coals, inasmuch as it is so constructed that it is not liable to burn off.

**New Zealand.**—The contract for switchboard for the Auckland Harbour Board, which was noted for some time in the REVIEW, has been let to Messrs. Turnbull & Jones.

**Plymouth.**—The contract with the British Electric Transformer Co. has been renewed for a year at the same price, plus 5 per cent. on account of increased cost of materials. The existing contract with the B.I. and Helsby Cables, Ltd., has also been extended to March, 1914.

**Southampton.**—The T.C. has accepted tenders for annual supplies of cable from the following:—

Vulcanised bitumen.—W. Rickard, Ltd.; Craigpark Electric Cable Co., Ltd.; and B.I. and Helsby Cables, Ltd.  
Paper lead concentric.—Union Cable Co., Ltd.

**Southend-on-Sea.**—A two years' contract for demand limiters has been placed with Venner Time Switches, Ltd.

**Swindon.**—The tender of the Electrical Apparatus Co., Ltd., for the supply of 3-amp. meters for 220 and 440 volts, has been accepted by the Council.

**Walsall.**—The T.C. has accepted the tender of Messrs. E. Green & Son, at £495, for thoroughly overhauling No. 1 economiser and carrying out certain renewals.

The following tenders have also been accepted:—

Babcock & Wilcox, Ltd.—Water-tube boiler, superheater, mechanical stoker, economiser, &c., for the generating station, £3,231.  
Pearson, Huggins & Co., Ltd.—Tunics, trousers, overcoats and caps for the tramway employees for the ensuing two years.  
L. Andrew & Co.—Oilskins and machines.

**West Hartlepool.**—The Corporation has accepted the tender of the Bastian Meter Co., Ltd., for the supply of 2½ and 5-amp. meters.

**Wolverhampton.**—A renewal order from the Wolverhampton Corporation Tramways, for traction type tantalum lamps for the ensuing 12 months, has been received by Messrs. Siemens Bros. Dynamo Works, Ltd.

**York.**—The T.C. on Monday accepted the following tenders:—

Babcock & Wilcox, Ltd.—Two water-tube boilers, with superheaters, chain grate stokers, pipework, &c., £4,213.  
Oerlikon & Co., Zurich.—Turbo-alternator, 8,000 r.p.m., condensing plant, &c., £3,967.  
Tudor Accumulator Co., Ltd.—Storage battery and reversible booster, &c., £3,899, and £188 per annum for 15 years for maintenance.

**Yorkshire.**—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained two further contracts for the supply of tantalum traction lamps for two of the largest Corporation tramways in Yorkshire. They have also received a contract for the supply of Wotan lamps for shed and general tramway lighting other than cars.

## FORTHCOMING EVENTS.

**Institution of Mechanical Engineers.**—Friday, April 18th. At 8 p.m. Address by the President.

**Royal Institution.**—Friday, April 18th. At 10 p.m. Discourse on "Applications of Polarized Light," by Dr. T. M. Lowry.

**Junior Institution of Engineers.**—Friday, April 18th. At 8 p.m. At 80, Victoria Street, S.W. Paper on "Crude Oil Engines," by Mr. W. A. Tookay.  
Friday, April 26th. At 8 p.m. At 80, Victoria Street. Paper on "Condensing Machinery," by Mr. J. Elliott.

**Institution of Post Office Electrical Engineers.**—Monday, April 21st. At 5 p.m. At the I.E.E. Annual general meeting.

**The 25 Club.**—Wednesday, April 23rd. At 7.15 for 7.30 p.m. At the Connaught Rooms, 61, Queen Street, W.C. Dinner.

**Association of Electrical Station Engineers (London Section).**—Thursday, April 24th. Meeting at 7 p.m. At Salisbury House, E.C.

**Institution of Electrical Engineers (London).**—Thursday, April 24th. At 8 p.m. Paper on "Phase Advancing," by Dr. G. Kapp.  
(Yorkshire Section).—Wednesday, April 23rd. Meeting at 7 p.m. At the University, Sheffield.

(Newcastle Section).—Monday, April 21st. Meeting at the Armstrong College, Newcastle.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer.—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, April 21st.—"A" Company. Recruit training, 7 to 8 p.m.; Hopkinson Cup competition, 7 to 10 p.m.

Tuesday, April 22nd.—"B" Company. Recruit training, 7 to 8 p.m.; Hopkinson Cup competition, 7 to 10 p.m.

Thursday, April 24th.—"C" Company. Recruit training, 7 to 8 p.m.; Hopkinson Cup competition, 7 to 10 p.m.

Friday, April 25th.—"D" Company. Recruit training, 7 to 8 p.m.; Hopkinson Cup competition, 7 to 10 p.m.

Saturday, April 26th.—Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj't.  
For Officer commanding L.E.E.

## NOTES.

**Educational Notes.**—GOLDSMITH'S COLLEGE, New Cross, S.E.—An announcement is made in our advertisement pages regarding special summer classes in May and June. Lectures in wireless telegraphy, with practical work, engineering costs and works management, drawing office and workshop practice, &c., are included in the courses.

CRYSTAL PALACE SCHOOL OF ENGINEERING.—The new course commences on Wednesday, April 30th. See our advertisement pages in this issue.

**Exhibition in Switzerland.**—A Domestic and Industrial Electrical Exhibition is to be held at Basle from August 9th to September 14th, on the occasion of the yearly meeting of the Verein Schweizerische Elektrotechniker and the Verband Schweizerische Elektrizitätswerke.

**The Carleón Train-Lighting Dynamo.**—On Tuesday last we were present at a demonstration of a new train-lighting dynamo invented and patented by Messrs. Gavan Inrig, Ltd., who. it will be remembered, recently brought out a new gas turbine. The dynamo was shown running in conjunction with a storage battery at the works of Messrs. Bryant, Symons & Co., Rawstoner Place, E.C.

The principle which is relied upon to maintain constant voltage over a wide range of speeds—in the ratio of 1 : 6—is one with which readers of the REVIEW are not unacquainted, namely, that of withdrawing the armature core from between the poles of the field magnet as the speed rises, so as to diminish the magnetic flux through the armature. The method by which this is accomplished in the "Carleón" machine is ingenious. An obvious difficulty, if the armature is moved as a whole, is the necessity of having a long commutator, or of moving the brushes with the commutator; Messrs. Inrig, however, provide the armature with two concentric cores, a shallow one carrying the winding and commutator, which is mounted on a spider fixed on the shaft at the commutator end, and an internal concentric core sliding on the shaft. The latter is controlled by a mechanical governor of the fly-ball type, acting against a spiral spring coiled round the shaft. Before moving the armature core, the governor compresses a lighter spring and actuates a cut-in and cut-out switch, which closes when the speed is sufficient to generate the necessary voltage, and opens when the speed falls below that point.

Reversal of motion of the train is provided for in the usual way by moving the brushes; these being carried on a frame with very little friction, the pressure of the brushes on the commutator serves to rotate the frame until its motion is arrested by fixed stops. The latter are provided with magnetising solenoids.

in series with the exciting current (which is derived from the battery), to hold the frame steadily against the stop.

In normal working, the makers propose to couple the battery in parallel with the lamps and to charge it from the dynamo without the use of any regulating device. Without wishing to discourage the inventor, or to disparage his work, we feel bound to say that, while concentrating his attention on the dynamo, he has omitted the most essential part of a train-lighting equipment designed for use, as this is, with a single battery. The dynamo part of the equipment presents no difficulty; the regulation of the voltage applied to the lamps—not within a few volts, but within a range of 5 per cent. at most, which is about 1 volt—is the crux of the problem.

**Smoke Abatement.**—At the annual meeting of the Coal Smoke Abatement Society, on April 10th. Sir Wm. Richmond (President), in his presidential address, said the outstanding feature of the year was the International Smoke Abatement Exhibition, when a comprehensive and valuable assortment of apparatus for dealing with factory smoke was on view. It was admitted on all hands that the exhibits of the London electricity companies, who combined to furnish the Electricity Hall with examples of labour-saving and heating appliances, opened the eyes of town dwellers to the fact that in electricity they possessed an invaluable servant for eliminating the smoke fiend. The fact that in a few years the total output of electricity in the metropolis had reached the total of 242,000,000 units was proof of the value of the services of this, their ally, in the work of cleansing the atmosphere. To the electricity supply companies they desired to tender their expression of grateful appreciation for what they did to help the Exhibition, and were doing to help the cause.

**Fatality.**—EASTWOOD.—On 9th inst. an inquest was held into the death of Alfred Naylor, who received a fatal electric shock at New London Colliery on 7th inst. Mr. Fraser, H.M. Inspector of Mines, was present, and Mr. Elliott Smith represented the colliery company and Mr. Whyte, the manager. According to a full report published in the *Nottingham Daily Express*, Mr. J. H. Fox, deputy, said that deceased was going to the switch box to switch off the current working the conveyer, when he stumbled over a rail and fell across the wire. Witness endeavoured to raise deceased by means of a wooden bar, but failed, and he then switched off the current by pulling out the two wires, and deceased fell on the ground. Witness tried artificial respiration for 1½ hours, without success. In reply to Mr. Fraser, he said he found, on severing the wires, that one was loose and came away easily, but the other was fast and pulled the switch box with it. The plant was inspected every other day. Mr. James E. Dawson, chief electrician at the colliery, said he examined the apparatus after the accident, and found a live wire had come out of the coal-cutter switch-box, but everything else was in order. He also found the earth wire disconnected, and thought deceased broke it in falling. The head of deceased took the full pressure, 450 volts. Witness admitted that after the accident he found three of the eight screws fastening the terminals missing, but could not account for their absence. His brother carried out the examination on Friday. He thought it possible for the screws to have come out between Friday and Monday. He admitted that the regulations affecting earth wires were not carried out, but the company were having the necessary appliances made. Had the earth wire not broken, there would have been no danger. Mr. G. E. Dawson, assistant electrician, also gave evidence.

Mr. Whyte, the manager, said it was the first electrical accident since his appointment. The company were at the present time carrying out alterations in conformity with the report of Mr. Fraser, but were having difficulty in getting the material delivered. They were doing their best to conform to the special rules. Witness said the present installation was strong, but admitted that the earth wire would not have broken (unless defective) with a man's weight leaning on it. Dr. Northwood said the deceased was burned on the face and chest from contact with a live wire, death being due to shock. The jury returned a verdict of "Accidentally killed," and added that the colliery company should take steps to cover or provide better protection for the wires.

**Alleged Stealing.**—Thos. Shuttleworth, metal broker, of 3, Carroll Street, was committed for trial by Preston magistrates, on April 11th, for stealing 78½ lb. of phosphor bronze, the property of Messrs. Dick, Kerr & Co., electrical engineers, valued at £2 16s. 7d. A detective-sergeant said whilst searching for certain property at prisoner's warehouse he found several ingots of phosphor bronze and "anti-friction" bronze under scrap brass in the coal hole. In the kitchen was about a ton of white metal.

The Bench considered there was a *prima facie* case to answer, but they allowed bail.

**International Building Trades Exhibition.**—This Exhibition, which is the fifth of the biennial series held at Olympia, was opened on Saturday, April 12th, and will close on April 26th.

Practically every inch of floor space is given over to firms immediately connected with the building trade, exhibits of electrical interest being comparatively few and far between. It is rather surprising to note the entire absence of the small internal-combustion engine-driven lighting set, particularly because there are several firms exhibiting petrol air-gas machines suitable for country house lighting.

Messrs. B. Waygood & Co., Ltd., have an electrical passenger-lift operating between the ground floor and the gallery, and models of Waygood's patent "Electrolift" and full automatic passenger-lifts. Messrs. Marryatt & Place show a standard pattern passenger lift with push-button control and two speeds. This lift operates in a

lofty steel tower and gives a view over the whole exhibition. Messrs. Medway's Safety Lift and Elevator Co. exhibit a passenger lift suitable for control either by a single switch in the cage or by push-buttons. Messrs. Scholey & Co. are exhibiting a large model of the "Graham" lift with push-button control, and a 6-cwt. passenger lift gear.

Messrs. Ozonair, Ltd., are showing their portable apparatus in a variety of types and sizes, and a show-case contains a model ventilation and air purification plant as installed on the C.L.R.

Messrs. F. & C. Osler, Ltd., show a very fine selection of their well-known metal and cut crystal electric light fittings. Other firms exhibiting electric fittings are Messrs. Tuke & Bell, Ltd., Dryad Works, and the Linolite Co., Ltd.; the last-mentioned firm are showing "Tubolite" fittings and "Woodhose" steel casing. Messrs. Holophane, Ltd., exhibit a selection of their pressed-glass prismatic reflectors. The Carron Co. show an electric kitchen range, and Messrs. Blackstone & Co., Ltd., various types of oil engines. Electrically-driven vacuum cleaners are shown by the British Vacuum Cleaner Co., Ltd. Water softeners are exhibited by Mr. W. Boby; and the Kennedy tube-bender, by Mr. W. Kennedy.

An interesting line of electrically-driven rotary floor-surfacing machines is shown by Messrs. H. R. Wilson. These machines are also adaptable for bench use.

Among other firms might be mentioned the Brilliant Sign Co. (illuminated signs), Messrs. W. H. Wilcox & Co., Ltd. (semi-rotary pumps, lubricating specialties, &c.), Messrs. J. H. Heathman & Co., and H. C. Slingby & Palmer's Travelling Cradle Co. (tower ladders, &c.), the India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd. (rubber tiling), Messrs. J. B. Stone & Co., Ltd. ("Alligator" and other belt fasteners), &c. Several manufacturers of woodworking, paint, and other milling machinery are fitting their machines with electric motors as standard practice.

**Institution and Lecture Notes.**—ASSOCIATION OF MINING ELECTRICAL ENGINEERS.—A special meeting of the Notts. and Derbyshire Branch of the Association was held at Chesterfield on Saturday evening. It was decided to hold one meeting a quarter at Chesterfield, one during the session at Mansfield, and the other monthly meetings at Nottingham. A discussion took place on a paper on "Cable Jointing and Junction Boxes," by Mr. Chris. Jones.

ASSOCIATION OF ENGINEERS-IN-CHARGE.—The eighteenth annual dinner of this well-known and useful Association was held on Saturday evening last at the Holborn Restaurant. About 300 persons were present, the President of the Association, Prof. H. S. Hele-Shaw, F.R.S., occupying the chair, and Mr. H. E. Neale the vice-chair. The guests included Mr. T. A. Coghlan, S.I.E., Agent-General for New South Wales, Sir Hay F. Donaldson, K.C.B., His Honour Judge Rentoul, Sir A. B. W. Kennedy, F.R.S., Mr. Henry Adams, Mr. Frank Bailey, Mr. H. P. Boulnois, Mr. Philip Dawson, Mr. Frank Broadbent, Capt. Sankey, and the Ven. W. M. Sinclair.

After the loyal toasts had been duly honoured, the toast of "The Engineering Profession" was proposed by Mr. T. A. Coghlan, who referred in the course of his remarks to the engineering needs of Australia, and to the fact that, as the representative of one of the Colonies, he felt that he came not as a stranger, but a friend. In responding to the toast, Sir Hay F. Donaldson emphasised the fact that the problem of Australia was the supply of water. How to irrigate the country was an engineering problem, and there were few countries where the engineer's opportunity was so marked, or the reward so valuable. The adaptability of the engineer made him a very valuable arrival, and he considered that amongst the members of that Association there were few who could not in almost any situation make good use of their engineering skill. They were all well equipped to take advantage of any opportunity which might present itself to them.

Mr. Alfred E. Penn, the honorary secretary of the Association, proposed the toast of "Kindred Institutions and Our Guests." He referred to the help which the Association received from other Institutions, and thanked all the distinguished men who had in many ways helped them, and had often honoured their annual dinner with their presence. The large and enthusiastic assembly was a proof of the vitality of the Association, which was able to act in many ways as a real help to its members. The toast was responded to by His Honour Judge Rentoul, who reminded the audience that he had been present at so many of these annual dinners, that he was beginning to look upon himself as quite an institution. He always enjoyed their company, and hinted that he hoped the time would never come when they would not enjoy being in his company. After referring to the importance of the work carried on by the members of the Association, the Judge said that without in any way touching on political matters, he would ask them a question which had somewhat puzzled him. It related to the time when the value of a Mexican dollar was 4s. in Mexico, and 3s. 10d. in the United States, and the American dollar was worth 4s. in the United States, and 3s. 10d. in Mexico. A Mexican with a dollar in his pocket went to a public-house on the Mexican side of the frontier and bought two-pennyworth of whisky. He received as change an American dollar worth 3s. 10d., and forthwith he crossed the frontier and bought another two pennyworth of whisky at the first public-house. Receiving as his 3s. 10d. change a Mexican dollar, he recrossed the frontier and repeated the process. At last he was found dead drunk with the Mexican dollar in his pocket. There was no doubt the man had bought, paid for and drunk the whisky. He had the same amount of money at the end of his venture as at the start! Query—who had paid for the whisky?

Mr. Sydney Brooks proposed the toast of "The Association," which was responded to by the President, Prof. H. S. Hele-Shaw, who pointed out the happy combination made by the Associa-

tion of the social and educative branches of its work. He thanked them for the honour they had done him by electing him as their president, and was convinced that the future of the Association would prove as successful as its past. He urged them to do all they could to increase their membership, and so strengthen the Association. A capital musical programme concluded a very successful evening.

Mr. G. O. Milnes, electrical engineer to the Lancaster Corporation, in conjunction with Mr. W. McBretnay, on April 10th gave a lecture and demonstration in "Wireless Telegraphy and Telephony" before a large audience of the Lancaster Astronomical and Scientific Association.

**ASSOCIATION OF TEACHERS IN TECHNICAL INSTITUTIONS.**—The annual conference of the Association will be held this year in Bradford at Whitsuntide. The Lord Mayor of Bradford will officially welcome the conference to Bradford on Whit Monday, and the President, Mr. P. Coleman, of the Northern Polytechnic Institute, will deliver an address. The meeting on Tuesday evening will be addressed by the Right Hon. J. A. Pease, President of the Board of Education, and in view of the introduction of the new Education Bill soon after Whitsuntide, this address will be looked forward to with exceptional interest. Papers will be read on "Corporate Life in a Technical Institution," by Mr. W. Hibbert, of the Polytechnic, Regent Street; "Vocational Education," by Mr. A. C. Coffin, Director of Education, Bradford; and "Co-ordination within a County Area," by Mr. F. N. Cook, Secretary for Higher Education in the West Riding of Yorkshire.

**INSTITUTION OF ELECTRICAL ENGINEERS.**—On Thursday last week, Dr. E. Rosenberg read his paper on "Self-Synchronising Machines," before the Institution in London, and a discussion followed.

(YORKSHIRE SECTION).—A lecture was given by Mr. F. Simpson on "Prices Charged for Electrical Power," at Leeds, on Wednesday last. A discussion followed, and was adjourned.

**ILLUMINATING ENGINEERING SOCIETY.**—On Tuesday a paper by Mr. A. P. Trotter on "Standard Clauses for Inclusion in a Specification of Street Lighting" was discussed. A report will appear in our next issue. The discussion was adjourned to April 29th.

**Electrical Trades Benevolent Institution.**—On Thursday evening the annual festival dinner was held; the President, Mr. George Sutton, occupied the chair, and made an excellent speech in recommendation of the objects of the Institution, which was supported by Mr. A. B. Anderson, vice-president. The President announced that during the evening the sum of £854 6s. had been subscribed—almost double the amount received at the festival dinner last year. Proposing the health of the chairman, Mr. E. Byng offered to give £100 to the funds, if nine other sums of £100 were obtained within three months; as Mr. H. Hirst and Mr. G. Sutton would contribute £100 each, only seven such donations were required to fulfil the conditions of the offer, which was cordially commended to the audience by the President. A full report will appear in our next issue.

**Inquiries.**—The makers of the "Dickinson" trolley harp are asked for.

**Appointments Vacant.**—Lecturer in mathematics (£400 and quarters or £100 allowance), and lecturer on strength of materials (£350 and quarters or £100 allowance), for the University of Hong Kong; junior assistant superintendent of telegraphs for the Telegraph Department of Ceylon (£300); manager and secretary for the Minehead Electric Supply Co., Ltd. (£180 and percentage of profits); assistant clerk and collector (30s.), and junior switchboard attendant (20s.), for the Borough Electricity Department, Torquay. See our advertisement pages in this issue.

**Electrical Trades Union.**—To-morrow night at the Fulham Town Hall there will be a smoking concert, at which the chairman will be Mr. James O'Grady, M.P., supported by Mr. J. Kinniburgh, organiser of the E.T.U.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—On Saturday last at All Saints' Church, Gosforth, Mr. H. S. ELLIS, borough electrical engineer, of South Shields, fourth son of Sir J. Baxter Ellis, of Newcastle-on-Tyne, was married to Ida Beatrice, elder daughter of Mr. and Mrs. Henry Moseley, of Gosforth. After the ceremony a reception was held at Tilley's Rooms, in Market Street. The gifts, which were very numerous, included a grandfather's clock presented by the staff and workpeople of the Corporation electricity works at South Shields.

Mr. G. S. McLAREN, of the British Westinghouse Co.'s meter testing department, has been appointed meter engineer at Taunton electricity works.

The staff and employees of the Birkenhead Corporation electricity works have presented a gold watch to Mr. W. H. FENNET, shift engineer, on his departure for Canada.

**General.**—Mr. G. WILSON, who has had charge of the electrical department of the North Staffs. Railway in the Uttoxeter district, has secured an important appointment under the Egyptian Government Railway.

Mr. O. GILKES, of Messrs. Gilkes & Co., turbine makers of Kendal, has been elected chairman of the Westmorland County Education Committee.

A complimentary dinner was given by various engineering friends to Mr. P. V. BROWNHILL at the *Progreder Restaurant* in Sao Paulo, on the 25th ult., on his leaving the South American staff of Messrs. J. Stone & Co., Ltd., of Deptford, London to take over the important position of electrical engineer to the Paulista Railway Co. The chair was taken by Mr. J. A. Hamp, M.I.E.E. of the Sao Paulo Railway Co., and amongst those present was Mr. M. B. Chater, late of the Buenos Ayres and Pacific Railway Co., who is succeeding Mr. Brownhill as Messrs. J. Stone & Co.'s representative in Brazil. After a very pleasant dinner and loyal toasts usually indulged in by Britishers abroad, the company adjourned to the Sao José Theatre, and witnessed the performance of the well-known musical opera "A Viuva Alegre" ("Merry Widow").

The marriage took place at Holy Trinity Church, Chesterfield, on April 9th, of Mr. A. B. IMPEY, assistant manager of telephones for the Chesterfield district, and Miss Margaret Mary Saunders, eldest daughter of Mr. C. J. Saunders, of Brockwell House, Chesterfield.

Mr. G. C. MILNES, borough electrical engineer, Lancaster, has been elected treasurer to the Lancaster Municipal Officers Association.

Mr. L. N. MILLS, recently with the British Thomson-Houston Co., Ltd., Rugby, has now joined the staff of the Electric and Ordnance Accessories Co., Ltd., and is engaged in the sales department at their Birmingham works.

**Tramway Officials.**—At a meeting of the Aberdare U.D.C., held on Monday evening, Mr. H. KING, traffic superintendent of the Merthyr Electric Traction Co., Ltd., was selected out of 120 applicants for the post of traffic superintendent to the Aberdare Council.

**Obituary.**—Mr. E. B. BRIGHT.—Telegraph engineering has lost another of its few remaining pioneers by the death, at the age of 82, of Mr. Edward Brailsford Bright, at Tottenham, on Monday morning. Edward Bright, elder brother to the late Sir Charles Tiltson Bright, of Atlantic Cable fame, was born in 1831, and was the second son of Brailsford Bright. Cooke and Wheatstone's electric telegraph had lately been instituted under the aegis of the Electric Telegraph Co., which the two brothers joined in 1847, when respectively 16 and 15 years old. This came about through answering a *Times* advertisement for gentlemen's sons with education. Within a year of entering upon their new field, both boys became inventors, working together in more or less double harness. In those days, patent fees of £150 had to be paid, so the brothers contented themselves, for the time being, with starting a joint invention book, into which they, from time to time, entered up drawings, descriptions and dates. These were afterwards, with several additions, embodied in the famous patent of October 21st, 1852. It suffices to say here, that many of the novelties included therein are now in common use after a lapse of half a century. Perhaps the most important of their early inventions was the system, devised in February, 1849, of testing insulated conductors to localise faults from a distant point, by means of a series of standard resistance coils of different values, brought into circuit successively by turning a connecting handle, which enables repairing vessels to at once go to the scene of damage, instead of having to pick up and cut the cable here, there and everywhere at haphazard. The year 1851 saw some important changes in the lives of both the brothers. Charles left the "Electric" Co., and shortly after became engineer to the lately formed British Telegraph Co., whilst Edward joined the Magnetic Telegraph Co. Thus, the two brothers became engaged in advancing the early stages of two competing concerns. On the success of the Magnetic Co. being demonstrated, capital was quickly forthcoming for the organisation of a powerful chartered company entitled the English and Irish Magnetic Telegraph Co. In 1852, when only 21 years old, Edward Bright became manager of the "Magneto" Co. It was in this year that the brothers took out their famous patent, to which allusion has already been made. It contained 24 distinct inventions connected with telegraphs, and it may be well here to enumerate some of the more important. First of all, there was the porcelain insulator for fixing aerial telegraph wires mounted on posts, and, in one form or another, it continues in use to the present day. There was also its adjunct, the shackle or terminal insulator. This is also made of porcelain, and is universally employed for terminations, and whenever the wire has to be taken at an angle—over houses, for instance, round a corner, or in any case where great strains are involved. Then followed the now universal system of aerial telegraph posts, with varying length of arms, to avoid the chance of one wire dropping on another. After this came the brass tape device for the protection of insulated conductors of subterranean, or submarine, cables. There was then a translator, or repeater, for retransmitting electric currents of either kind in both directions on a single wire, also a standard galvanometer (foreshadowing differential testing) and a new type-printing instrument, as well as what was then a novel method of laying underground wires in troughs. At the outset of the "Magnetic" Co.'s operations the brothers found it necessary to devise fresh apparatus to compensate for the inductive discharge resulting from the long underground circuits, by discharging to earth and thus neutralising the recoil currents. Some of the results of these researches were detailed and illustrated experimentally by Edward Bright, at a meeting of the British Association at Liverpool, in 1854, in an address on "The Retardation of Electricity through Long Subterranean Wires." During 1855, young Bright thought out another important invention with his brother. This consisted of a system of duplex telegraphy which was worked successfully between London

and Birmingham. Charles Bright remained engineer-in-chief to the "Magnetic" Co. until about 1860, from which time (owing to press of other work) he held a consulting position only. Thereupon Edward Bright assumed the engineership in addition to the general management. Subsequently Sir Charles Bright went into partnership with the late Mr. Latimer Clark, but the brothers were again associated with each other from the year 1869 up to the time of the former's death. On the transfer of the Inland Telegraphs to the State, Edward Bright in 1869 became an independent engineer. Like his brother, he was an important factor in many Government Bills and arbitrations, and one of his more important late inventions was the electric fire alarm, modifications of which may be seen on so large a scale in our streets, warehouses, &c. As in the case of Sir Charles, though a prolific inventor and able engineer, Edward Bright died a poor man, which, indeed, he had been since his retirement some years ago. He was a member of the Institution of Civil Engineers, and a Member of Council of the Institution of Electrical Engineers, and originally with the late Dr. Dionysius Lardner, he brought out a work entitled "The Electric Telegraph," which, in its revised form, had a considerable sale. It is with the quite early, even youthful, work of this distinguished engineer that we have chiefly dealt, because—as in the case of his eminent brother—this undoubtedly formed the most remarkable feature of a distinguished career. His nephew, Mr. Charles Bright, F.R.S.E., so well known to our readers, is now the only remaining representative of the family engaged in the development of telegraphy.

MR. E. M. UNDERDOWN.—We regret to record the death which occurred suddenly on the night of April 11th, while entering a lift at the Strand tube railway station, of Mr. Emanuel Maguire Underdown, K.C., chairman of the Direct United States Cables Co., Ltd., for many years. The deceased gentleman was called to the bar in 1861, had been on numerous missions to foreign countries, was a prominent Freemason, and was very much esteemed in submarine cable circles. His son, Mr. Harry C. B. Underdown, is a director of the Direct United States Cables Co. The funeral took place at Knightsbridge on Tuesday.

ALD. E. HASLAM.—The death occurred, on April 9th, of Ald. Edwin Haslam, who had for many years carried on an electrical engineering business at 233, St. Helen's Street, Derby. The deceased, who was 70 years of age, was a brother of Sir Alfred Haslam, and had served on the Derby Town Council for 24 years.

MR. W. LOXLEY.—The death is announced, at the age of 82 years, of Mr. Wm. Loxley, for many years manager for Messrs. E. Green & Son, Ltd., the well-known engineers of Wakefield. The deceased, who had spent over 50 years with the firm, superintended the erection of Messrs. Green's American works at Matteawan, New York.

## CITY NOTES.

### Nairobi Electric Power and Lighting Co., Ltd.

The directors report continued satisfactory progress during 1912. The figures are as follows:—

	1910.	1911.	1912.
Units generated .. .. .	416,621	681,418	604,894
Motors connected, a.m.p. .	147	173	248
Lights connected, 8-c.p. equivalents	5,932	8,169	10,658
Street lighting .. .. .	2,400	2,000	2,000
Net profit .. .. .	£403	£2,027	£2,642

There have been some exceptionally heavy expenses during the year 1912, in connection with leave pay and travelling expenses of the company's chief engineer and others, whose time for leave happened to fall within the year, and it is hoped that for 1913 the accounts will show a considerably increased income with smaller expenditure. It was reported last year that further power stations were to be installed on the Ruera River, but in consequence of negotiations with the Government, these new installations are delayed. Mr. Charles Udall, the chief engineer, has visited England for some months on holiday, and has resumed his post at Nairobi. The company has now reached a dividend-paying stage, and out of the balance shown in revenue account the directors have declared an interim dividend of 6 per cent. on the preference shares for the years 1906 and 1907, which was duly paid in January last. Although the remaining balance is sufficient to pay the same for another year, they recommend that, for the present, it be carried forward.

**Lancashire Power Construction Co., Ltd.**—The report states (says the *Financier*) that the accounts for the year 1912, after deducting the credit balance of £1,101 brought forward, show a debit balance of profit and loss account of £2,613. The annual meeting was held in London yesterday.

**Monte Video Telephone Co., Ltd.**—The directors have declared an interim dividend for the half-year ended January 31st at the rate of 5 per cent. per annum on the preference shares and 6 per cent. per annum on the ordinary shares.

**Anglo-American Telegraph Co., Ltd.**—The directors have resolved to declare an interim dividend for the quarter ending March 31st, 1913, of 15s. per cent. on the ordinary stock and 11s. 10s. per cent. on the preferred stock, less income-tax, payable May 1st.

### Babcock & Wilcox, Ltd.

THE directors' report for the year ended December 31st, 1912, shows a net profit of £126,147, plus £69,467 brought forward, making £195,614; deducting the interim dividends of 3 per cent. on the preference shares, and of 7 per cent. on the ordinary shares, amounting to £119,200, there is a balance of £376,414, from which the directors recommend the following dividends for the half-year ended December, viz., 3 per cent. on the preference (less income-tax), £3,000, 9 per cent. on the ordinary shares (free of income-tax), £149,400; placing to the reserve fund £150,000, and to the staff pension fund £10,000, leaving to be carried forward £64,014. The volume of business done during last year, and that carried forward into 1913, shows an increase over any previous period. The scope of the business, both in land and marine boilers and in other manufactures, is continually being extended. In common with other manufacturing concerns, work during the year was much hampered by the coal strike, and the cost of production is enhanced by the higher rates of wages and materials now ruling, the increased cost of coal, and the expense resulting from the Insurance Act. To counteract this, further extensions, both to the company's selling and manufacturing organisations, have been, and are still, being carried out. Having regard to this, it is considered desirable to further increase the company's cash resources, and the directors recommend the issue of £200,000 in 5 per cent. cumulative second preference shares at par. It is proposed to offer these shares to the holders of the present preference shares. It is recommended to make the same provision for the staff pension fund as was made last year.

### Midland Electric Corporation for Power Distribution, Ltd.

—The directors' report for the year ended December 31st (as abstracted in the *Birmingham Daily Post*) states that the increase in both revenue and profit has been much greater than in any previous year, and this result has been obtained partly because of the additional consumers secured, and partly through the exceptionally good trade in the area covered by the company's orders. The balance to the credit of the net revenue account is £12,843, which the board recommend be applied as follows:—Provision for debenture guarantee premium, £1,250; written off expenses of issue of debentures and ordinary shares, £2,444; transferred to depreciation account, £2,899; carried forward as a provision for the payment of the premium due on the redemption of the debenture bonds now outstanding, £6,250. These debentures, amounting to £250,000, will become due for redemption on June 30th next, and arrangements are being made to provide for this, and also for the additional sum necessary for the capital requirements of the company. During the year further capital amounting to £27,653 has been expended. The 3,000-kw. turbo referred to in the last report was not delivered in 1912, the delay being due partly to the coal strike in March, 1912. It has now been delivered and erected.

**Indo-European Telegraph Co., Ltd.**—The directors, subject to final audit, recommend the payment of a dividend for the six months ending December 31st, 1912, of 17s. 6d. per share (making with the interim dividend already paid, 6 per cent. for the year) and a bonus of 20s. per share, both free from income-tax. They also recommend a special distribution of 15s. per share, free of income-tax, out of interest accrued during the year upon certain investments and advance accounts. The dividend, bonus and special distribution as above will be payable on and after May 1st next. The transfer books will be closed from April 16th to 29th inclusive.

**Guildford Electricity Supply Co., Ltd.**—MR. H. P. SMALLPIECE presided at the recent annual meeting, and in moving the adoption of the report, he said that the gross revenue had increased by £1,390 to £10,069. The costs had gone up by £738. This was an eminently satisfactory state of affairs. The directors had considered it advisable to write off on the depreciation fund account £1,250, as against £1,000 written off annually during the past few years, putting £500 to reserve as against £400 in the preceding year. They had acquired a very valuable site of freehold land adjoining the original works, which would afford ample scope for the development of the business for many years. The report was adopted, and a 5 per cent. dividend approved.

**Telephone Company of Egypt, Ltd.**—The directors have declared a dividend of 6 per cent. (6s. per share), free of income-tax, on the preferred and deferred shares for the half-year ended December 31st, making 10 per cent. for the year; £2,000 is placed to staff pension fund, and £112,698 is carried forward.

**British Columbia Electric Railway Co., Ltd.**—The directors have declared an interim dividend at the rate of 8 per cent. per annum on the deferred ordinary stock for the half-year to December 31st.

**La Plata Electric Tramways Co., Ltd.**—The directors have declared a dividend of 6 per cent. per annum on the preference shares.

**Indian Electric Supply and Traction Co., Ltd.**—The directors report that during the year to December 31st the paid-up share capital has been reduced from £130,035 to £78,021. The surplus on the year's working in Cawnpore, including interest accrued, was £8,458, and, after providing for debenture interest, a dividend of 4 per cent. is recommended for the year, carrying forward £1,834.

## Anglo-Argentine Tramways Co., Ltd.

THE annual report for 1912, which is to be submitted to the annual meeting at Winchester House, E.C., on Monday next, states that the gross receipts amounted to £2,778,303, less working expenses (which include various items amounting in the aggregate to £135,000 carried to depreciation renewals funds, in addition to £301,181 expended on ordinary maintenance) £1,824,022, leaving £954,281 plus £10,917 brought forward, making £965,228, less interest and charges as per net revenue account £755,922, leaving £209,306, less interim dividend of 4 per cent. on ordinary shares for half-year ending June 30th, 1912, £100,000 = £109,306. Out of this balance, the directors recommend that a final dividend of 4½ per cent. be paid on the ordinary shares for the half-year ending December, 1912, making 8½ per cent. for the year, which, after deduction of income-tax £6,198 will absorb £100,052, leaving £9,254 to be carried forward. The construction and equipment of the first subway line from Plaza Mayo to Plaza Once, a distance of over two miles, is progressing satisfactorily, and it is expected that this section will be open for traffic in October next. In order to meet the disbursements in connection with the construction of the subways, the properties required in connection therewith, new extensions, additional rolling stock, and under the powers conferred by the resolution of the company of June 1st, 1910, a further issue of £1,500,000 5 per cent. debenture stock was made in October last at a price of 9½ per cent. The directors report the death of Mr. Hector Monnom, a director. Mr. Georges de Laveleye, president of the Bank of Brussels, has been elected to fill the vacancy. The board again place on record their appreciation of the services rendered during the year by the local committee, the general manager, and the staff of the tramway generally, both at home and abroad.

As usual, there is published, together with the directors' report, a report by the general manager, in which he states that while the Government during the year 1912 has continued its progressive policy, in the commercial world affairs have not been satisfactory on the whole. The depression which commenced in 1911 was further accentuated by the disappointing results of the wheat harvest (1911-12).

Building of big houses in the central districts has continued on a large scale, and great changes are noticeable in almost all streets, the old one-storeyed buildings being now practically a thing of the past in the centre. Building in the suburbs has, however, considerably diminished, and rents, which had risen enormously during the past years, are now stationary, and have even, in some instances, been reduced.

Immigration is greatly improved. The population of the city shows an increase of 51 per cent.

Although not up to the standard of previous years, the increase in the number of passengers carried by the company as compared with 1911 is still quite satisfactory, in spite of the poor commercial results of the year. In passengers carried the increase was 5.72 per cent., and in car km.-run 3.79 per cent. The increased rolling stock has permitted of more thorough and frequent overhaul of cars. The number of breakdowns and interruptions caused through deficient working of cars has remarkably decreased. The daily average number of cars that entered for repairs has gradually decreased from 2.8 per cent. in December, 1911, to 0.6 per cent. At December, 1911, there were 1,539 motor-cars, two parlour cars and 666 trailers, and at end of 1912, 1,758 motor-cars, two parlour cars and 807 trailers.

The more important works carried out in 1912 were:—Revised and partially reconstructed, 268 motors; repainted, 630 motors, 404 trailers; partially repainted and revarnished, 1,251 motors; seven trailers: new cars erected in 1912, 219 motors, 200 trailers. Much work has been done on maintaining the overhead installation in good state of repair, and the number of cases of breakages has consequently not been important. These accidents will be still further considerably reduced when the company has fully complied with the new municipal ordinance that disposes that telephone protection wire shall be suppressed altogether in the centre of the city, and in the outskirts only one protection wire is to be placed. Over 80,000 metres of wire of 80 mm.² have been employed for the renewal of trolley wire.

The underground feeder system has worked satisfactorily. Very considerable permanent-way work has been done. Paving works all over the city have been continued on a fairly large scale, and this has necessarily affected permanent way installations to a good extent. The weather in 1912 was, from a tramway point of view, on the whole even worse than in 1911. The passengers per car km. increased from 4.04 to 4.11.

Expenditure increased by £88,644 (5.62 per cent.), wages amount accounting for £55,360, stores £17,737, and taxes £20,792; current diminished by £6,702. Wages have a continuous tendency to increase and hours of labour to diminish. The pay of guards and motormen of the first and second grades was increased from November, 1911, from \$4.20 and \$4.00 per day to \$4.50 and \$4.25 per day. The increased expenditure for 1912, due to the higher rate of pay, amounts to £12,440. The taxes paid during 1912, exclusive of concession taxes and advertising taxes, amount to \$2,657,493 paper, or £230,000, equal to 8.32 per cent. of the gross receipts. Advertising taxes amounted to £10,000. Notwithstanding the high coal freights and the increased cost of current per kW.-hour, the increased car km. run (2,811,606), and the consequences of the miners' strike in England, electric current has cost £6,702 less than in 1911.

Fortunately a considerable economy has to be recorded in the average consumption per car km. which in 1911 reached 767 watt-hours, whereas in 1912 the average was reduced to 688 watt-hours, a decrease of 10.30 per cent.

The percentage of expenditure on receipts has varied slightly, being for 1912 60.52 per cent. in comparison with 60.41 in 1911, notwithstanding the unavoidable increases in payments for 12 per cent. Municipality tax and for extra cost of current. Amongst the staff, there has been entire freedom from agitation, and the men seem, in general, to be perfectly contented. This is due to the company's method of treating them well. Providing for the families of the employees in the shape of the Mutual Aid Society has undoubtedly been one of the most important factors, together with the security they have of some provision in the case of death. The manager enters in detail into the work of this mutual aid society.

The construction of the subway between Plaza Mayo and Once has proceeded rapidly during the year, and the actual excavation for the tunnel was approaching completion by the end of December. Much work was done in the completed tunnel in the shape of electrical installations, painting, staircases, preparing platforms at stations, &c. It is anticipated that the first section can be inaugurated in October, 1913. Preliminary works and surveys were also carried out for the extension of the first section to Caballito, as also for the line from Retiro to Constitucion. There has been a satisfactory year as regards dealings with the Municipality. In July the Municipal Council granted the company a concession for various new extensions, amounting to some 45 km. of new track, comprising a new line between Once and Chacarita, extension of the line in Entre Rios and Calle Velez Sarsfield as far as the Riachuelo, a new line *ad Calle Nequen* to Villa Santa Rita, and several other short extensions and connecting lines. These extensions come into the company's concession without any new onerous conditions.

COMPARATIVE TABLE.

Year.	Receipts.	Expenditure.	Passengers carried.	Miles run.	Receipts per mile run.	Ex. per mile run.	Cars in stock.
1910	\$2,419,186	\$1,664,093	276,496,624	42,861,896	13.54d.	8.11d.*	2,126

\* Does not include credits or debits to depreciation renewal funds.

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in and to grant a quotation to—

Canadian General Electric Co., Ltd.—Further issue of 1,900,000 dols. common stock, in shares of 100 dols. each.

And to allow the following securities to be quoted in the Official List:—

Calgary Power Co., Ltd.—Further issue of £48,900 5 per cent. 30-year first mortgage bonds of £100 each (Nos. A 4,112 to 4,600).

Companhia Ferro Carril do Jardim Botânico (Jardim Botânico Tramway Co.)—Further issue of £200,000 5 per cent. 40-year first mortgage bonds of £100 each.

Empire District Electric Railway.—2,921,000 dols. first mortgage 5 per cent. sinking fund gold bonds of 1,000 dols. each.

London Electric Railway Co.—932,794 ordinary shares of £10 each, fully paid (Nos. 1 to 932,794) (special application).

The Committee have appointed a special settling day, as under:—

Wednesday, April 30th.—Shawinigan Water and Power Co.—Further issue of \$1,000,000 capital stock, in shares of \$100 each.

And ordered the undermentioned to be quoted in the Official List:—

Adelaide Electric Supply Co., Ltd.—£75,000 additional 5 per cent. debenture stock.

Hell's United Asbestos Co., Ltd.—60,000 6 per cent. cumulative preference shares of £1 each, fully paid (Nos. 140,001 to 20,000).

Rio de Janeiro Tramway, Light and Power Co., Ltd.—Further issue of £33,000 5 per cent. 50-year mortgage bonds of £100 each (Nos. B29,631 to 30,160).

Shawinigan Water and Power Co.—Further issue of \$1,000,000 capital stock, in shares of \$100 each.

Vancouver Power Co., Ltd.—Further issue of £50,000 4½ per cent. perpetual guaranteed debenture stock.

**Holsworthy Electricity and Gas Co., Ltd.**—Presiding at the third annual meeting Mr. W. Kivell said he regretted that the growth of the electrical undertaking was slow. The units sold during the year were £9,868. In consequence of the great rise in the price of fuel the directors had deemed it prudent to increase the price of electric current for power from 2d. to 3d. per unit, the increase to take effect from April 1st. The net credit balance, after providing for debenture interest, was £366, as against £467 for 1911, and it was resolved to allocate the balance as follows: Dividend of 4 per cent. to be paid; £25 carried to depreciation account, electric undertaking; £44 to be written off preliminary expenses account, and £38 to be carried forward. Thanks were accorded the chairman, the secretary (Mr. J. Rowland), and the manager (Mr. Illingsworth).

**Bude Electric Supply Co., Ltd.**—The *Financial News* states that the total receipts on revenue account for the year 1912 amount to £2,010, and the working expenses to £684, leaving a gross profit of £1,325. After deducting interest on debentures and temporary loans there remains a net profit of £1,200, which, with the balance brought forward of £111, makes a total of £1,311 available. The directors recommend a 7 per cent dividend, and commission to secretary, absorbing £727; £440 to depreciation account, which is now increased to £1,300; and £144 is to be carried forward.

**Bank Rate.**—The bank rate was yesterday reduced from 5 per cent. to 4½ per cent.

### Automatic Telephone Co., Ltd.

MR. JAMES TAYLOR, J.P., presided over the first annual meeting of this company, held in Liverpool last week. In moving the adoption of the report (see ELECTRICAL REVIEW, page 572), he said that the profit, £13,493, was satisfactory for the first year's working of the company, formed for the purpose of introducing a new commodity. Dividend on the 6 per cent. preference shares had been paid, absorbing £11,815, and £1,313 had been written off preliminary expenses, leaving a balance to be carried forward of £370. The company started business on January 1st, 1912, and in the early part of the year automatic exchanges at Epsom and the General Post Office, London, were completed and handed over to the Post Office, and to the public making use of them. As a result of their satisfactory working, the Post Office had placed with the company an order for an automatic exchange at Leeds, to start with an equipment of 4,800 lines. The company were now negotiating, with good prospects of success, for further orders for different towns in this country. An order had been received for an automatic exchange in Cordoba, Argentina, and two representatives of the company were touring the Far East giving demonstrations in the various countries where the company held rights, and there was every prospect of satisfactory business resulting. There was no doubt that the telephone system in this country required improved plant and extension on a large scale, and it was to be hoped that no false notions of financial economy or demands for expenditure in other directions would be allowed to interfere with the provision of the telephone facilities which the public expected, and to which they were entitled, more especially as experts in the telephone business were unanimously of opinion that a handsome return could be earned on a large amount of further capital judiciously expended. The company had received continual and effective assistance from the Automatic Electric Co., of Chicago, but as progress was made at the Liverpool works in the manufacture of automatic equipment, the proportion purchased from Chicago was gradually decreasing.

MR. D. SINCLAIR seconded, and the report and balance-sheet were unanimously adopted.

None of the directors were yet due to retire.

### Imperial Tramways Co., Ltd.

IN the Chancery Division on Tuesday, April 8th, Mr. Justice Swinfen Eady sanctioned a scheme of arrangement on the petition of the company.

MR. CLAUSEN represented the company, and stated that the scheme was exceedingly simple. The shares of the company consisted of cumulative preference shares and ordinary shares. The preference dividend was three years in arrear. Certain funds were set aside some years ago, and earmarked for division among the ordinary shareholders. The ordinary shareholders claimed that that money belonged to them, and was not applicable to pay the preference dividends. Circumstances had arisen which made it very desirable to clear up all questions as to arrears of dividends. The scheme proposed, therefore, was that the preference shareholders should waive their rights to the three years' dividends for 1909-10-11, the preference dividend to be paid from January, 1912, onward. The ordinary shareholders would waive their claim to the special fund, and allow it to go to a general fund of profits, so as to pay the preference dividend at once. The rights of the preference shareholders were contained in the memorandum, and the effect of the scheme was that the preference shareholders waived the rights conferred upon them by the memorandum. The meeting in support of the scheme was very nearly unanimous; no one now opposed the petition.

His LORDSHIP sanctioned the scheme.

**Johnson & Phillips, Ltd.**—The directors' report for 1912 states that the profit on trading accounts, &c., after making provision for bad and doubtful debts, and after charging to revenue upwards of £6,000 for maintenance of buildings, plant, &c., amounts to £28,325, plus £1,033 brought forward, making £29,358. From this there are to be deducted:—Remuneration of directors, auditors and trustees' fees, £1,378; interest on debenture stock, £6,772; reserve re debenture sinking fund, £6,143; interest on second debentures, £2,250; depreciation on machinery and plant, &c., £5,640; interest on loan, £546; amount written off patents, licences, &c., £1,306; cost of issuing second debentures, £2,007, carrying forward £3,315. The directors have appointed Mr. G. E. Davis, Mr. H. J. Sheppard and Mr. E. M. Dence as additional members of the board. The meeting is called for April 24th.

### STOCKS AND SHARES.

Tuesday Evening.

MARKETS in most cases have assumed a stronger tone during the past few days. For this the reason is that the Balkans outlook is regarded as more settled, while the fact of money becoming cheaper is a powerful stimulant to an improvement in prices.

There is a little public buying going on in certain of the markets; and even in those which have not this lever to help them, the anticipation is that the demand will spread to them later, and so prices there, also, are disposed to harden.

The Home Railway market shows a good deal of strength. The eye which hitherto has been fixed, wide open, on possible labour troubles, is beginning to relax its strain, and the attractions of Home Railway stocks from the investment point of view are coming into stronger focus. To what extent this is a far-sighted view it is not for us, perhaps, to venture an opinion; but in matters of investment, as in other things, it is often as well to fix upon a line of policy and to stick to it. The capitalist, therefore, who has made up his mind to keep out of the Home Railway market for fear of labour disputes, may be well advised to resist the temptation to buy just because everybody else is doing the same thing.

This does not necessarily apply to electrical stocks, for they are governed by a set of conditions different from those which prevail elsewhere. Central London stocks are better this week, Districts and Metropolitan have both hardened, and Underground Electric Railway shares and income debentures are once more on the mend. London United Tramways Debenture rose 2, thus regaining half of its fall of last week. British Electric Traction issues remain weak. Three of the company's stocks have further receded.

It is a matter of incidental interest to observe that the Canadian Pacific has recently started to electrify short portions of its wonderful system, and an announcement this week speaks of a 5-mile tunnel in British Columbia which is to be thus treated. A further part of the same message adds that the first sea-going vessel electrically-propelled has been built for service in Canadian waters and will be used for the navigation of the Canadian canal system.

Electricity supply shares are amongst the few which have yet to benefit by the better tone prevailing in other departments. Possibly because the summer is coming on—as witness the snow-storm at the end of last week—the market for electric lighting shares is dull. City Preference were marked down  $\frac{1}{2}$  the other day, but it was a mistake, and the quotation was restored to 12 $\frac{1}{2}$ . County Ordinary, at 10 $\frac{1}{2}$ , are  $\frac{1}{2}$  lower. On the other hand, improvements of  $\frac{1}{2}$  have occurred in Charing Cross Ordinary, Edmundson's Preference and Westminster Preference, the last-named shares evidently attracting investment notice from the excellence of their security.

The Telegraph market is firm, with a steady inquiry for the principal issues. Anglo-American Preferred rose  $\frac{1}{2}$ . Commercial Cable Debenture is  $\frac{1}{2}$  higher. Indo-Europeans gained 30s. The Telephone section is equally steady. New York Telephone bonds continue to advance, and United River Plate Telephones are  $\frac{1}{8}$  higher, but Oriental Telephones, at  $\frac{1}{4}$ , show a fall of  $\frac{1}{8}$ . Monte Videos are unchanged at  $\frac{1}{2}$ , upon the declaration of the usual interim dividend at the rate of 6 per cent. on the Ordinary. Telephone Company of Egypt, in paying 6 per cent. final dividend, makes its distribution 10 per cent. for the year. Constantinople Telephone shares are a little better, at  $\frac{1}{4}$ , for the £5 fully-paid shares.

Interest in the Marconi case is possibly waning a little, on account of the protracted nature of the proceedings and the somewhat technical character of the more recent evidence. The latter, however, has given the public some little knowledge of the way in which it is occasionally possible to market shares in a new company or a fresh issue, and affords an insight into the different "floors" upon which various sets of buyers are let into the good thing when it comes along. It must be remembered, however, that when people make big profits in the Stock Exchange, they usually do so by the taking of big risks, a point which it is well to bear in mind when considering the Marconi inquiry. Marconi shares are a little lower on the week, although the Preference are unchanged.

Anglo-Argentine Tramway issues are good, upon the excellent character of the report, following the declaration of an increase in the dividend on the Ordinary shares from 7 $\frac{1}{2}$  to 8 $\frac{1}{2}$  per cent. This has had the effect of raising the Debenture stocks, while the Second Preference at 5 $\frac{1}{2}$  are  $\frac{1}{8}$  better. Brazil Traction recovered  $\frac{1}{4}$ . British Columbia Electric Deferred and Preferred are both higher, on the declaration of an interim dividend at the rate of 8 per cent. on the Deferred stock.

Mexico Trams, ex 1 $\frac{1}{2}$  dividend, are  $\frac{1}{2}$  up on balance. Mexican Light and Power Common shares at 7 $\frac{1}{2}$ , ex 1 dividend, remain unchanged. Most of the Latin-Canadian issues are steady, and there is a fair demand for best class bonds. Montreal shares put on 3 points, but lost them and 2 more in addition. Allowing for their dividend deduction, Shawinigan Water shares are practically unchanged. The La Plata Electric Tramways' directors recommend a dividend at the rate of 6 per cent. per annum on the Preference shares, covering the period from July 1st to October 31st, 1911. Men in the market studied the announcement with grim interest.

The Manufacturing group is very quiet. India-Rubbers are 5s. better and British Westinghouse Debenture has been picked up, the price rising 3 $\frac{1}{2}$  to 64. Babcocks eased off a little, and Armament shares are slightly on the dull side. Dick, Kerr fell  $\frac{1}{8}$ . Rubber shares, after a temporary spurt, gave way on a fresh decline in the price of the commodity. The market is depressed, and is likely to remain so until something comes to the aid of the raw product to make the price better.

The affairs of the Northern Light, Power and Coal Company were ventilated at a general meeting held last Monday, when it was stated that arrangements had been made whereby the Canadian Klondyke Company undertook to lease the property of the Northern Light concern, and to guarantee a substantial annual revenue. Meanwhile the Northern Light 5 per cent. bonds remain at the nominal quotation of 10—20.

## PRESERVATION AND PROTECTION OF STANDING TELEGRAPH AND TELEPHONE POLES.

[COMMUNICATED.]

UNDER the above heading a lengthy extract from the *Canadian Electrical News* appeared in the columns of the *ELECTRICAL REVIEW*, on January 3rd, 1913 (page 33).

In the opening paragraph it was asserted that "practically all poles fall at the ground line because of decay, and on account of this weakening at the base, have to be replaced or cut off and reset while the top portion is still sound."

It will be obvious to those engineers who are responsible for the renewal of pole lines in this country that such a statement must represent Canadian experience and not English practice. Scepticism as to its general application on this side of the Atlantic is still further increased by the following observation: "The average pole (cedar) has a life of about 10 years." Dealing briefly with the extracts referred to, it is scarcely correct to say that poles fall at the ground line because of decay; at any rate such occurrences are the exception and not the rule. The fact is that deterioration commences near the top of a pole and not at the ground line. A reason for this is not far to seek. Poles have to be notched for the reception of oak arms: these latter are usually secured in position by G.I. bolts which

FIG. 1.—MODE OF DECAY OF CREOSOTED POLES.

FIG. 2.—CREOSOTED POLE, DATED 1900, CARRYING 68 WIRES: PROBABLE LIFE, 20 YEARS LONGER.

involve as many auger holes through a pole as there are arms to equip. Moisture slowly percolates into each tiny aperture and eventually destroys the heart core of the timber; hence disintegration takes place from the apex downward.

In these circumstances a preservative coating, such as is recommended in the *Canadian Electrical News*, would neither prevent decomposition nor render innocuous the decay which may have already started. An interesting photograph (fig. 1) shows more clearly than words can describe the destructive forces that are at work. The pole from which these two pieces were sawn two years ago was branded "1882." Thus nearly 30 years' uninterrupted service has been registered; and when it is remembered that the pole in question was exposed to the fury of hail, rain, frost and snow during the whole of the time named, the record is not a bad one.

How does it happen that a pole of cedar wood in Canada can only be depended upon for a period of 10 years, whereas one of Norwegian spruce or of Baltic pine in England may be safely relied upon for 25 years? The answer is to be found in the utilisation of creosote oil. Nearly every pole in

this country is creosoted, which renders it practically immune to climatic conditions. "Burnettising" and "boncherising" have been tried, but experience has shown that "creosoting" is far and away the best.

The process of creosoting consists of injecting creosote oil into the fibres under pressure. Trolley loads of poles, chained together, are wheeled into a long cylindrical tank, and after the cylinder end has been closed, oil is forced in by pumps to ensure the maintenance of the requisite pressure inside the tank. Owing to the brittleness imparted to the poles by this treatment and consequent liability to fracture when unloading them, it is not desirable that the timber should be completely charged with preservative oil. The quantity of creosote forced into poles is usually 8 lb. to the cubic foot of timber; and where the wood is perfectly seasoned and well dried this quantity will form a complete protective shell impervious to moisture.

Engineers agree that a pole should be pierced as little as possible; hence the practice of using climbing irons for gang purposes has fallen into disuse. For the same reason, pole testing axes have been recalled. A wise plan to discover whether a pole is subject to internal decay is to tap it with an ordinary hand hammer, when a peculiar hollow sound may be heard—difficult perhaps to explain, but never to be forgotten when once heard by those interested in the subject at issue. On odd occasions a gang joiner will report a defective pole, the condition of the latter having been discovered whilst using an auger for the erection of additional arms.

With a view to maintaining intact the protective shell of a creosoted telegraph pole, the Post Office Engineer-in-Chief stipulates that poles shall not on any account be notched near or below the ground line. This is all right as far as it goes, but it does not solve the real problem under consideration. Numerous efforts have been made to modernise the method of arming telegraph and telephone poles, but so far without success. In this connection the following incident is not devoid of interest. The late Mr. Langdon, of the Midland Railway Co., read an excellent paper before the Institution of Electrical Engineers, in April, 1896. During the discussion that followed, a representative of one of the leading railway companies in the British Isles is reported to have said: "I admit we have been in the habit of using this method of arming poles; but the writer has for some time been employed on a plan by means of which the timber of the pole shall remain intact both for ties and arms. The ties have been tried and found efficient, but the arms have not yet been finally arranged for."

The significance of the above quotation lies in the fact that the original system of arming poles is being pursued by that railway company to-day as merrily as ever.

If a creosoted pole could be yoked into service without having recourse to sawing and boring the upper parts, it is difficult, if not impossible, to say how long it would last; for, even with the present method of "rigging," its life may be relied upon to cover the period beyond which additions or alterations would justify its replacement.

**High-Pressure Underground Cables.**—In the electrification of the Italian railways, extended use is being made of underground cables working at high pressures. A three-phase cable having a cross-section of  $3 \times 40 \text{ mm.}^2$  and working at 25,000 volts, is being laid in connection with the Milan-Lecco line, over a distance of 70 km., and a similar cable, with a cross-section of  $3 \times 50 \text{ mm.}^2$ , 50 km. in length, is on order for the Giovi Ronco-Sanpiero-Raderna Railway. The latter will be tested with 85,000 volts at the works of Messrs. Pirelli & Co., of Milan, who are the makers of both cables; and after laying, a test of 65,000 volts will be applied.

**Wages and Condition at Aberdeen.**—The *Scotsman* states that a mass meeting of electrical engineers was held in Aberdeen Trades Hall buildings recently to discuss grievances with regard to rates of pay, hours of labour, the question of overtime payment, &c. Complaint was made that no answer had been received to a thrice-repeated request to the masters for a conference, the first request having been made last October. It was eventually agreed to ask the masters for an increase of 1d. per hour in wages, raising them to 9d. and 10d. per hour, the latter for chargemen. The employers were requested to forward an answer by Wednesday, the 9th inst., and in the event of the demand not being conceded, and other matters considered, it was unanimously agreed that the employees strike.

\* Our readers will, no doubt, recall the article in question from the fact that the heading was similar to the present one, and also because of a brief letter on the subject from Mr Wade adversely criticising it.

## THE FIRST INTERNATIONAL CINEMATOGRAPH EXHIBITION.

(Concluded from page 622.)

THE B.T.H. exhibits included a variety of semi-indirect "eye-rest" fixtures, which are so well known that it is unnecessary to recapitulate their arrangement and advantages. A new type of

FIG. 4.—B.T.H. CONCENTRATING TROUGH REFLECTOR.

cornice troughing was exhibited for the first time. Parabolic reflectors of ribbed glass are mounted in swivel holders, from two to ten reflectors being carried in each frame, according to requirements. Along the focal axis of each reflector is mounted a 17-watt or 20-watt metal lamp, the maximum candle-power of the complete unit being 240 c.p. The inclination of the reflectors in the holding frames (which are screwed to the wall), is varied till even ceiling illumination is secured. The lamps are 1 ft. between centres, and a 6-in. hollow cornice conceals the whole fitting.

Among the other exhibits shown by this firm may be noted their 18-amp. lens and flood lamps for stage lighting. These are exceptionally light and convenient; the necessary ballast resistance is mounted in a ventilated case at the foot of the lamp standard, and connection with a strong and neat wall or floor pocket is effected by a flexible cable. Carbon feed is obtained by the rotation of a right- and left-threaded spindle, the screws on which are of equal pitch for A.C. and of 6:4 pitch for D.C. working. Only one size of carbon need be used whether working on D.C. or A.C. supply.

FIG. 5.—RACK FOR D.C. LENS LAMP.

For dimming purposes, an improved type of plate rheostat has been designed. This may be mounted flat on a wall, or any number of units may be built in a bank as shown in fig. 6. The plates illustrated have 50 steps (100-step plates are under construction), and the crank and rack control provided allows of very smooth regulation. A plunger in the handle of each plate lever enables the latter to be interlocked or disconnected from the horizontal shaft controlled by the master lever at the left of the bank. The rheostats will stand from 100° to 120° F. temperature rise indefinitely, and the plates are easily adaptable to two or three-wire circuits.

The "Indra" diffused lighting unit (exhibited by the E.E. and E. Co.), is now available in a variety of sizes and patterns. From the description of these fittings which has already appeared in these columns, readers will remember that the chief advantage secured is a single diffusion of all light emitted by the lamp, and hence higher efficiency than is possible in ordinary diffusing fittings where considerable multiple reflection and therefore absorption of light occurs.

Several firms exhibited electric programme number indicators, the chief recent improvements in which relate to the reduction of the number of wires required between the controller and the indicator. The crudest form of number indicator requires 42 interconnecting wires but, by suitable grouping of the lamps (as regards position and electrical connection), the Walturdaw Co. reduce the number of leads required to 25, while the Stage Equipment Co.'s indicator needs only 20 wires to show numbers 1 to 19 and "Extra" and "Deputy." In all modern indicators, a master switch is used for "1" in the double numerals. It is interesting to note that, on

the Stage Equipment Co.'s systems, numbers 0 to 999 can be shown in 6-ft. numerals on four sides of an indicator by the use of 42 lamps and 38 wires, the latter being accommodated in a 1½-in. conduit. The addition of one wire and two lamps enables 0-1,999 to be shown.

The S.E. Co.'s footlight float is exceptionally shallow, and, the reflector being a single piece of sheet metal, behind which is all the wiring, it is possible to wash the reflectors with a water squirt. A hinged lid affords easy access to the wiring and holder connections.

FIG. 7.—"HOOVER" SUCTION SWEEPER.

The float lamps (usually of 25-watt consumption) are mounted 6 in. apart, and, in order to insulate their holders from the reflector sheet, holes rather larger than the holder diameter are cut in the metal and fibre washers are fitted above and below the latter. The screw-rings on each holder are chamfered on their inner edges so that they are able to force together the projecting fibre washers and thus fill the annular clearance space between the holder and the sheet metal. The floats are carried on steel spring shock absorbers.

The same firm also exhibited a new type of batten carrying lamps on a Uralite strip and having a stout iron guard frame with a specially long "approach," the latter being designed to reduce the risk of abrupt collision in music-hall installations where drop scenery is crowded. The wiring of the battens is in a fire-proof chamber, instantly accessible through a removable metal cover.

The importance of electric chameleon and flashing signs to cinema halls was hardly adequately represented by the exhibits shown. Messrs. Whiteley showed good examples of Causton signs in the gallery, and the Walturdaw Co. exhibited their attractive "Aurora" sign consisting of an 18-in. diameter kaleidoscope group surrounded by "rays" of lamps, alternate ones of which are alternately extinguished so that the effect is produced of sinuous streams of light.

**Cinema Switchboards.**—A number of types of switchboards were exhibited suitable for use in cinema operating boxes. These boards varied considerably in the details of their arrangement, but generally comprised a main ammeter and voltmeter, a two-pole, double-throw switch (to change over from one projector to another while the first machine is being re-threaded), a voltmeter switch or taper-key and fuse-boxes for the projector, pilot light and projector motor circuits. A switchboard shown by the Stage Equipment Co. offered the advantage that it practically formed its own wiring diagram, all the back connections being made by clearly traceable copper strip. Various types of regulating resistance frames were shown; for heavy current work and where the operator's comfort is studied, the unit type of rheostat mounted outside the operating chamber and controlled by knife switches offers obvious advantages.

**Vacuum Cleaners.**—The electrically-driven vacuum cleaner provides a most convenient and efficient means of cleaning all places of public assembly, and large numbers of these machines are already at work in cinema halls.

At the Cinematograph Exhibition, MESSRS. FYFE, WILSON & CO. demonstrated the working of their "Hoover" suction sweeper, which combines the beating and sweeping action of a rotating broom (having spiral lines of brushes), with the suction effect of a centrifugal fan. As shown in fig. 7, a 4-H.P. vertical spindle motor, running at 3,800 R.P.M., is direct-coupled to a centrifugal fan, and drives the sweeping brush through a quarter-turn rubber belt. The latter and the motor brushes are easily accessible by removing a few screws. The usual cleaning tools can be attached by rigid or flexible piping to an adapter connected to the suction opening of the cleaner.

The "Imperial" vacuum cleaner, shown by the ELECTRIC APPLIANCES CO., LTD., weighs only 10 lb., and probably enjoys the distinction of being the lightest motor-driven machine on the market. A ½-H.P. motor running at 7,000 R.P.M. drives a centrifugal fan, the discharge passage from the casing of which is carried in a continuous spiral to the filter bag connector. All the parts requiring inspection can be laid bare by the removal of six screws. A wick oil-cartridge attached beneath each motor-bearing carries six months' supply of lubricant, and the spindle-bearings are self-aligning (having ⅜-in. play in their seatings). We understand that many of these cleaners are in regular use by the L.G.O. Co. and various railway and steamship companies and theatres. For so small a machine the suction exerted is remarkable.

THE BRITISH VACUUM CLEANER CO.'S exhibits included several of their well-known motor-driven rotary pump equipments with Booth filters and fan-suction cleaners for lighter duties. The 2-H.P. rotary pump equipment mounted complete with starting gear on a small truck is specially suitable for theatre cleaning, the powerful suction available (25 in. vacuum against a closed nozzle) making possible thorough cleaning of thick seating, &c. It is hardly necessary to remind readers that this firm was the first to place vacuum cleaners on the market. Their products now include a

long series of hand and motor-driven machines ranging in capacity from 500 to 40,000 cu. ft. of air per hour (free inlet), and in price from 22s. upwards.

The recording cinematograph target exhibited by LIFE TARGETS, LTD., constituted one of the greatest novelties of the Exhibition. The exhibit should have been arranged so that visitors could see exactly what the proposition was without paying 6d. entrance fee; the latter certainly included the right to six shots, but it ought to have been more easily evident what the target was. This was described in our issue of April 4th.

## PROCEEDINGS OF INSTITUTIONS.

### Colliery Cables.

By W. T. ANDERSON, M.I.E.E., M.INST.M.E.

(Abstract of paper read before the INSTITUTION OF MINING ENGINEERS, at Manchester, February 11th, 1913.)

(Concluded from page 621.)

On paper-lead-covered and armoured cables single suspenders of the clamp type have been successfully used, although the writer does not recommend them, unless very efficient protection is accorded to the lead. In the upcast shaft of the Pretoria Pit, Lancashire, such an arrangement withstood the explosion with practically no dislocation, although most of the boxing in was destroyed.

Fig. 8 is an illustration from a photograph taken by the writer, with the permission of the Hulton Colliery Co., Ltd.

Continuous vertical casing, since the issue of the new rules, need hardly be considered.

Methods of lowering shaft cables largely depend on the gear at hand and on shaft conditions. The safest way, from the cable point of view, is to fasten the cables by lashings or small specially-made clamps to a wire rope controlled by a haulage engine

FIG. 8.—SINGLE SUSPENDERS OF THE CLAMP TYPE, SUPPORTING PAPER-LEAD-COVERED AND WIRE-ARMOURD CABLES, AT THE PRETORIA PIT

of sufficient strength and braking power to hold the necessary weight. Such engines are generally available, and the necessary guide pulleys for the wire rope are easily fixed up. The cable itself should be mounted close to the pit top and fed on to, and fastened to, the descending wire rope.

The best material for lashings is ordinary spun yarn  $\frac{3}{8}$  in. or  $\frac{1}{2}$  in. in diameter. The yarn should be used double, and each tie should carry about 1 cwt. of the weight of the cable.

An interval of 12 hours or so should elapse after lowering before cleating is commenced. This is especially advisable in deep pits, where the temperature at the top and the bottom of the shaft may vary to a considerable extent. Cases have been known of cleats being actually raised from their bearers by contraction of the cables.

Lowering direct from the cage with the drum slung either inside or underneath, can only be effected when there are no buntions in

the shaft, or when cleats are attached to their outer sides. Means must be provided to check the revolving drum, in case the weight of the loop of slack cable should overbalance that of the drum.

Raising from the pit-bottom is only possible when the clearance in the shaft is sufficiently great to allow of a loaded drum being taken down. The method is rapid but objectionable, in that it amounts, for a period at least, to single suspension, with consequent strains.

Lowering direct from a capstan or a haulage-engine requires, perhaps, more care than any of the preceding, and should only be undertaken in the case of heavily armoured cables. Lowering should be continuous and without interruption, in order to avoid undue bearing strain against the jockey-pulley. When winding from the cable-drum to the engine-drum, the cable bend should form a C and never an S bend; and when the cable is used for any but the uppermost length in a shaft, great care should be exercised in winding it over the steel hawser and the couplings underneath it.

Lowering with a locomotive should only be adopted as a last expedient.

If the total underground load is shared between two or more feeders cases should be rare indeed in which both break down simultaneously. An even greater precaution is to install mains in different shafts, making their electrical connection below ground.

For roadway cables intake airways should be selected, and the position chosen for the run should be such as to afford the greatest security from mechanical damage. In main roadways where there are good walls and sound roofs, the cables may be fixed in a permanent manner by cleats. Where there is a liability of damage from falls, the cables should be suspended in such a manner and with so much slack that they will readily tear away without fracture. With this in view, many methods of slinging are adopted, the least reliable being, perhaps, the pig skin suspender, in which the eyelet is very prone to draw out, as the material deteriorates. Better far is the simple expedient of tarred marline fixed at regular intervals, not exceeding, say, 10 ft.

The writer noted a case recently where a paper cable was run on slings 800 yards in-by with so little slack as to become as taut as a fiddle-string through the movement of the road. The joints were made without any boxes, and the mechanical strain, coupled with moisture at the unsealed end of the run, caused a very serious fire at that spot. Roadway cables more than any others are liable to come under Sec. c of Rule 12, and it may be mentioned that single-armoured cables (under certain normal conditions enumerated) will require to have their sheathings bonded together every 100 ft.; also that if two singles are so used, the conductivity of the sheathings of either shall be at least equal to 25 per cent. of the conductivity of the conductor enclosed thereby.

For installation purposes, it is advisable to take the new roadway cable down the pit intact on its drum, jacking it up on an improvised trolley running on tub-wheels, and paying out as the trolley moves along. If there is not room for the drum to be taken down the road, it must be jacked up and the cable drawn off and run in-by on tubs, rollers, or pit-props, care being taken to avoid dragging it along the ground and so causing needless abraision to the outer servings of jute.

If it is found impossible to get the drum down the shaft, the cable can be taken off at bank and lowered—either lashed to a haulage-rope or fixed to a capel—and run in-by as it descends. In no circumstances should a twist or kink be allowed to occur.

The importance of the question of boxes cannot be over-estimated, not only as seals to prevent moisture from entering the dielectric, but as means for making-off the armour in an electrically and mechanically sound manner, and of thus effecting continuity of the sheathings.

None but trained joiners should be employed on this type of work, and only the very best materials should be put in. If for reasons of general safety the sweating of cores cannot be undertaken, mechanical connectors, having an electrical conductivity not less than that of a sweated joint, should be used, care being taken so to protect such fittings with tape that the hot compound cannot creep into their crevices, with the possibility of ultimate sparking.

The fundamental features to be looked for in joint-boxes are absolute water-tightness and mechanical strength; long bearing glands; adequate means of bonding through from sheathing to sheathing; and such design as will reduce to a minimum the risk of cavities or "blow-holes" forming in the compound.

All pedestals should rest on porcelain feet immersed in the compound.

It is most inadvisable to joint actually in the shafts, but when it is necessary a vertical box must be used. Such a box should never be installed unless all dropping water can be temporarily diverted. Much the best method of arranging shaft joints is to make a horizontal connection in a heading or inset, even at the inevitable expense involved in the construction of such an inset. The most suitable box for this work is, undoubtedly, that of the horizontal type, in which the incoming and outgoing cables enter at one end, as illustrated in figs. 9 and 10. When it is desired to feed various levels from the shaft cable, a similar type of horizontal box may be used with an additional gland at its inner, or roadway, end. Such a box should be provided with disconnecting links, in order to allow of ease in testing. Boxes on lead-covered paper cables should have their glands "wiped" on to the leaden sheathing—an impossible matter, of course, in places where a blow-lamp cannot be used.

Terminal boxes are usually of the bifurcating or trifurcating type, and the question of protection of leads is one of some difficulty. The leads must certainly be metal-cased; when they must

be under one cover, a wrought-iron case constructed on site is perhaps the most suitable method to adopt. Alternatively a box may be provided, specially designed for use in any position, fitted with stuffing glands, and screwed so that barrelling, large enough to enclose three vulcanised india-rubber singles, can be fixed to the box. At the terminal ends of the rubber leads, fibrous tapes should never be allowed to come into contact with the metal of

FIG. 9.—SINGLE-ENDED TYPE OF HORIZONTAL JOINT-BOX (FOR FIXING IN AN INSET) TO CONNECT UP SHAFT CABLES.

lugs or conductors. The obvious method is to seal with material which will form a homogeneous water-proof covering from the cable trim to the lug. Not only will this arrangement facilitate the periodical work of testing, but it will minimise the risk previously mentioned of vagabond currents getting on to the metallic sheaths of the cables.

When joints are completed, the box must be filled up with an insulating compound, in order to protect the conductors and insulation from moisture. It is essential that this compound should be of high insulation resistance, that its consistency at the temperature at which it is poured into the box allows it to run freely, and that it sets hard, with no tendency to drain away from the box at normal temperatures.

For mining work the writer has always made it a custom to use only compounds suitable for extra-high-tension work, preferably with a high melting point, having a pouring temperature

The compound should be poured rapidly and continuously into the box, preferably through a funnel, and every facility should be given for air and gases to escape. It is essential that the boxes should be so efficiently filled that no cavities are left. If, on inspection after cooling, the box is found to be not quite full, final toppings are absolutely necessary.

As regards bonding and earthing, the new rules really enforce what manufacturers have been making their standard practice and generally recommending for several years past.

Rule 8 (a) provides that all sheathings, &c., "shall be earthed by connection to an earthing system at the surface of the mine." In the memorandum, reference is made to the use of at least two earth plates, and the addition of a footnote, quoting the Board of Trade Tramway Regulations in this connection, suggests that compliance therewith would be in order. Those regulations provide for two plates not less than 20 yards apart, which "shall be constructed, laid, and maintained so as to secure electrical contact with the general mass of earth, so that, if possible, an electromotive force, not exceeding 4 volts, shall suffice to produce a current of at least 2 amperes from one earth-connection to the other."

This result is somewhat difficult to obtain with ordinary earth-plates; indeed, the writer has failed to accomplish it with copper plates, each of 2 sq. ft. area, laid in a bedding of coke, although the intermediate ground was well soaked with saline water. This, however, only demonstrates the wisdom and breadth of the rules, which, while indicating a high degree of efficiency, do not hamper its attainment by narrow or vexatious regulations that might easily be rendered abortive by local conditions.

Copper plates should be avoided on account of their rapid deterioration. Iron cylinders or pipes driven vertically into the ground and filled with breeze, into which engine cocks can drip, make perhaps the best job, provided that a sound and visible mechanical and electrical connection is made with them. As an alternative, a couple of old boiler plates thrown into a pond have often been known to give excellent results. It is always well, however, in addition to any earth-plates at the surface, to bond all metallic sheathings by means of three or four separate tinned-copper conductors made off with lugs to the flanges of pipes, known always to contain water, and forming a widely distributed contact with the main mass of earth.

In conclusion, the writer would put forward an earnest plea with respect to upkeep and maintenance. Nearly all the faults met with in his experience—barring those of a purely mechanical nature—have been due to carelessness, and could have been readily prevented. Rigid tests for insulation resistance, for continuity of sheathings, and for proving the efficiency of earth-connections, should be made in respect of all cables at least once a month, and their results recorded and compared. Deterioration, or even the result of unknown mechanical damage, may thus be traced before serious consequences ensue.

#### DISCUSSION

MR. H. V. HART-DAVIS pointed out that last year there were 12 fatal accidents in mines due to electricity, as against 21 in the previous year, and the Electrical Inspector said that proper connections to earth might have prevented six of them; this showed the importance of efficient earthing. Instead of a separate earthing cable where transformers were used, he suggested a copper sheath under the armouring of the high-tension cable. In his opinion sufficient attention had not been given to lighting circuits underground; armoured cables should be used right up to the lamps.

MR. E. LONG referred to the recent paper by Mr. E. K. Scott, and deprecated the use of aluminium cables and wood casing in shafts. He preferred cleating at intervals to single suspension.

MR. G. S. CORLETT advocated paper-insulated cables for pressures of 3,000-5,000 volts. For lighting he preferred twin armoured conductors with joint boxes. In the case of a step-down transformer system, he pointed out that the probability of a heavy rush of current on the armouring of the high-tension cable was too remote to call for any special precautions.

MR. W. B. SHAW said that the single-suspension clamps shown were of his design, and the method was particularly applicable to armoured lead-covered paper cables, but not very suitable for bitumen-insulated cables, except short ones.

MR. A. F. W. RICHARDS said that it was important that the actual requirements of the Home Office as regarded earthing in the case of a transformer installation should be ascertained.

MR. J. D. PATON spoke in favour of due consideration being given to the advantages of aluminium for conductors, pointing out that though armoured cables were now required by law, the economic features of the question must not be disregarded.

MR. S. H. LEE suggested that three locomotives and a number of wagons were not necessary to hold back a cable weighing 6 tons. He did not favour single suspension, as mines were now often 1,500 to 3,000 ft. deep. In sinking new shafts it would be advantageous to provide special space for the cables. For trailing cables, the cab-tire sheathed type had proved to be much superior to any other type. In the event of a dead short between the cores, the arc would not penetrate the sheathing. He referred to the advantages of putting the cables behind the timbers in a road, or burying them in iron pipes.

MR. G. G. L. PREECE said that bitumen-insulated cables could easily be made to withstand a pressure of 6,000 volts, but paper insulation underneath the bitumen was often used as an additional precaution. He did not recommend single suspension.

MR. R. NELSON (Electrical Inspector of Mines) said he was very gratified to note that regulations which were designed primarily to secure safety appeared to the author to be successful, also in

FIG. 10.—DETAILS OF SINGLE-ENDED HORIZONTAL BOX.

of, say, 300° to 330° F. While overheating is injurious to the compound, it should never be used too cold, as the efficacy of the seal is thereby endangered. Enough attention is usually not given to this most important point. Not only should the correct pouring temperatures of any compound be ascertained, but jointers should always be compelled to use thermometers in order to gain such temperatures. Where heating cannot be done locally, it is necessary to get the compound rapidly transmitted from bank to box in some non-conducting jacket arrangement; the writer has seldom found much difficulty in effecting this, generally by placing large buckets in tubs filled with sawdust or some similar material.

assisting the manufacturer by "the standardisation of conditions." With Mr. Anderson's views in general, he expressed close agreement. Mr. Anderson recommended rubber-covered cables as "undeniably the best, both from a physical and from electrical points of view." Later, however, he remarked that bitumen-covered cables were "by far the most suitable for average colliery work." He could not mean that rubber-covered cables were the best "for average colliery work." If he had in mind what were usually called "tails," Mr. Nelson suggested that "making off or tailing cables" were obsolete below ground in mines. The best sphere for rubber-covered cables, if they had one at all below ground in mines, was in connections between controllers and resistance grids. Mr. Anderson mentioned the matter of the proper section of high-tension armouring where the current was transformed down at the shaft bottom, or elsewhere, for use in-bye. It should be remembered that the difficulty did not occur when the neutral point in both systems was earthed. To meet an insulated neutral point there was an alternative to Mr. Anderson's suggestion—namely, to fix earth plates at the junction of the two systems, and connect them in parallel with the surface earth by means of the armouring of the high-pressure cable alone, or, if the circumstances were thought to require it, in parallel with some other effective conductor. He supported the recommendation to "share the total underground load between two or more feeders." He would not expect two old boiler plates "thrown into a pond" to form a good earth connection. Water had an appreciable resistance, and he would expect to find that two buried boiler plates would give a better result. Mr. Anderson's last paragraph was a complete guide to proper maintenance.

MR. W. T. ANDERSON, in reply to Mr. Hart-Davis, said that a reduction in the number of fatal accidents due to electrical causes of nearly 50 per cent. in the first year in which the electricity rules were in operation was their soundest justification. Mr. Hart-Davis's plea for a copper shield under the armour of high-tension shaft cables, in order to bring their lead-carrying capacity into line with the low-tension requirements below ground, was hardly feasible except in the case of lead-covered cables. In the event of pit water getting inside the armour, galvanic action would probably arise. The suggestion was otherwise distinctly sound, if only to avoid the danger set up by mechanical bonds between sheathing and an auxiliary earth wire, as it was most difficult to render these bonds efficacious. He agreed with Mr. Long's plea, that all colliery cables should be armoured (with the exception, of course, of trailers). This question of armouring had been disposed of by the new rules. Wooden casing had been mentioned by the writer, but dismissed by him as impracticable. His remarks applied equally to the split telegraph poles mentioned by Mr. Long. Rule 12 (D) happily put this suggested method entirely out of court. It was a method which was quite opposed to the spirit of the new rules. For normal conditions, in shafts, bitumen-covered cables without hygroscopic material of any kind in their internal construction were the best. He was inclined to agree with Mr. Corlett, that it was not electrically necessary to increase the high-tension armour as an earth connection to a low-tension system below ground; an earth on the low-tension might not affect the armouring of the high-tension system, but would probably be confined to the underground portion of the installation. Mr. W. Bolton Shaw, in referring to the single suspension at Hulton Colliery, had borne out the writer's remarks. The cables were light, and were of the one class which could be so treated without grave risk of injury. The writer could not, however, agree with Mr. Shaw that the clamp method of single suspension was good for paper-lead covered or for any other type of cable, and under no circumstances would he recommend its use. With regard to hydraulic pressure being set up at the bottom of paper-covered cables, this could not occur in cables the insulation of which was impregnated layer by layer and not in bulk. He had refrained purposely from any mention of aluminium for mining work, as he considered its use impracticable. The only form in which aluminium could be considered from motives of economy would be in the case of bare overhead lines. It was true that he had shown all his copper cores mechanically connected, for the reason that such connections catered for all eventualities. There could be no doubt, however, that sweated joints were to be preferred, and, broadly speaking, conditions allowed of their being so made in 50 per cent. of the mining boxes. For pit conditions of exposure to air and moisture the writer could not imagine a finer preservative for wood than creosote. Mr. S. H. Lee had suggested that three locomotives (two to lower and one as a stand-by) used to install a 6-ton cable were far from necessary. With this statement he could not agree. The stresses and safety factors to be provided for were impossible to gauge by ordinary calculation. Greasy rails, gradients, and local conditions might upset any ordinary precautions, and, as several recent accidents had shown (in one case where a couple of railway trucks accompanied the cable down the pit), it was much wiser to have a ton too much than an ounce too little, especially when the nose of the cable had to be followed down by men on the top of the cage. With regard to the capel, there was no question of lack of confidence in the more modern one made to the design of the cable makers. It was tested to 15 tons before being used for 6. Doubtless it was capable of taking something like 50 tons. The clamp was put on at the wish of the colliery authorities, and came in very handy as an anchor for the stand-by hawser. With regard to bare rubber-sheathed trailing cables, he was inclined to think that, although their initial cost was great, they had a great future before them. To thread considerable lengths of cable behind the timbering of roads was apt to do more harm in kinks and abrasions than would justify any increased protection, apart from the enhanced difficulty in slinging them satisfactorily in such a position. To bury roadway cables was undoubtedly bad practice, and one such successful

attempt could not justify its adoption. The writer particularly welcomed Mr. Nelson's contribution to the discussion. For all main feeders (both shaft and roadway) installed under average conditions, rubber-insulated metal-sheathed cables were unquestionably the best. Their cost, however, rendered them quite prohibitive for ordinary commercial purposes. Next in suitability and generally efficiency undoubtedly came bitumen, which possessed many of the properties which rendered the use of rubber no excellent. Regarding the unsuitability of rubber for "tailing" purposes, it was, of course, clear that the ultimate desire of the framers of the new rules was to persuade manufacturers of switch-gear to provide on their apparatus suitable sealing chambers for the cables, and so do away with tailing cables altogether, a consummation which would be most heartily welcomed by the cable manufacturer. Perhaps if Mr. Nelson were to substitute the word "obsolescent" for "obsolete," he would describe more accurately the present position. In present circumstances where terminal boxes were provided the cores of cables going through them should invariably be cut. To continue through such boxes with the unprotected paper or bitumen-insulated cores (bifurcated or trifurcated therein) would be impossible: there remained then only rubber-insulated leads or bare metal. Such rubber-insulated leads provided the necessary mechanical strength. Under the new rules they were themselves enclosed in a metal sheath or tube (to a point presumably as near their respective studs as the tubing could be brought). The safest method of making them off to the lug was to provide the non-fibrous seal mentioned in the paper. Mr. Nelson's remarks regarding earthing by plates in water were interesting. It should, of course, be borne in mind that plates thus treated were not exactly surrounded by water, but were probably more or less sunk in mud. The recent report on electrical accidents, where high resistance in the earth-circuit had led to trouble, abundantly justified Mr. Nelson in the stand taken to ensure efficient connections to earth; and the writer could only add that if colliery engineers would armour, bond, and earth soundly, fatal mishaps below ground due to electrical causes would practically become unknown.

### Electric Supply in London.

By FRANK BAILEY, M.Inst.C.E.

(Abstract of paper read before the SOCIETY OF ARTS, April 9th, 1913.)

THE use of electrical energy as the motive power of our tube and other railways, for the working of our factories, and for lighting, heating, cooking, &c., has become so general that few of those who now participate in its advantages realise the difficulties that were experienced in the early days of pioneering a new industry. In 1890 I placed before this Society a short account of the progress of electric lighting in London, and I will now endeavour to bring this information up to date.

The Electric Lighting Act of 1882 limited all provisional orders to a period of 21 years. This short period did not encourage enterprise, and strenuous efforts to secure a sounder basis for the building up of a great enterprise resulted in the passing of the Electric Lighting Act of 1888, which extended the period to 42 years. Useful pioneering work was, however, accomplished between 1882 and 1888.

Up to the year 1890 none of the London vestries—now merged into borough councils—had decided to embark on municipal trading, with the exception of the St. Pancras Vestry, and it was not until the commercial success of the various undertakings had been established that 13 of the remaining borough councils in London applied for and obtained provisional orders. We ought therefore to appreciate the enterprise of the 13 companies who had undertaken the responsibilities of carrying out the obligations imposed upon them by the terms of the provisional orders granted under the Act of 1888. These companies had to raise the capital they required without being able to quote actual experience of a profitable yield; and it is remarkable, considering the inexperience of the industry at that time, how few mistakes were made, and how well the capital was expended. Most of the early pioneering plants have now disappeared, the capital cost having been redeemed out of revenue.

The table on p. 662 gives, in a summarised form, the present position of the various supply authorities in London. It shows the output for the 14 local authorities who work their own provisional orders, as published for the municipal year ending March 31st, 1912, and as estimated for the year ending March 31st, 1913. The output given for the 13 companies is taken from the published accounts, supplemented in many cases by information kindly supplied.

The total output includes some supplies given for railway and tramway purposes, within the area of the County of London, which, according to the census returns of the year 1911, contains 74,816 acres and a population of 4,521,685 persons.

To complete the statement so as to include all electric supply, reference must be made to the various railways and tramways operated by electric traction.

The total amount of electrical energy utilised for all purposes may be estimated for the year 1912 as follows:—

	Units.
Railways ... ..	271,500,000
Tramways ... ..	130,000,000
General supply ... ..	277,500,000
<b>Total ... ..</b>	<b>679,000,000</b>

\*Estimated.

NOTE.—Local authorities' accounts made up to March 31st each year.  
Companies' accounts made up to December 31st each year.

The progress of the supply authorities is shown graphically by the curves indicating the maximum demand and output in units. The influence of the advent of the metal-filament lamp is shown by the lighting output, any temporary depressing effect being more

ELECTRIC LIGHTING AND POWER SUPPLY IN LONDON

than neutralised by the increase in the sale of units for power purposes. The future demand for increased illumination from existing wiring, and the necessity for providing all the buildings with the necessary means for utilising this most efficient and economical light shows signs of steadily increasing and exceeding all estimates based on the old carbon-filament lamp. Between the years 1889 and 1904 every unit sold at from 6d. to 8d. could be utilised to obtain light up to 250 C.P. for one hour by using carbon lamps, or, say, 36 C.P.-hours for 1d.; now by using the tungsten lamp at the present moderate charges for supply, 1 unit will provide 833 C.P. for one hour, or say, 208 C.P.-hours for 1d.; or, in other words,

the consumer obtains about six times the light for the same investment.

The Electric Lighting Act of 1888 did not contemplate the use of the electric motor, which was then made only in small sizes, and its great future was not realised by the public; but from 1890 to 1900 the utility of the electric motor was generally recognised, and pioneering efforts, involving much enterprise and patience, resulted in its gradual adoption and final universal use, with beneficial results to both supplier and consumer.

The electric supply authorities in 1906 combined to make an exhaustive canvass of all factory power users in London, and ascertained that the total amount of power required in all districts within the County of London was 208,806 H.P., or, say, 156,600 KW. The total connection for electrical power now amounts to about 135,000 KW., or 86 per cent. of all power required, and the increasing use of this power is shown on the curve.

From 1886 to 1900 the Willans engine was remarkable for the perfection of its design and the skill shown in its manufacture. The demand for generators of larger size placed the Willans engine at some disadvantage, and after the year 1900 the steam turbine took command of the field. The remarkable economy of the steam-turbine compelled many users to replace their Willans and other engines, securing not only more power for the same floor space, but also any amount of power from 500 KW. upwards.

The history of the steam turbine in this country is practically a biography of the life of the Hon. Sir Charles Parsons. In 1893 a Parsons turbo-alternator of 350 KW., then considered an enormous size, was constructed under exceptional circumstances, requiring quick manufacture and successful performance. A number of these machines were ordered to enable me to overcome complaints of vibration arising out of the working of reciprocating engines, and it became necessary to replace the latter by steam-turbines or to close the works. The result was successful; and while I must express the deepest gratitude to the inventor of the Parsons turbine, it is probable that the success of these machines encouraged the building of larger sizes and placed the turbine in the list of practical methods of electrical generation.

An interesting development is now being applied to the Parsons turbine in the form of speed-reducing gear, consisting of the employment of toothed gear wheels running in oil. It is better that the steam turbine should have a high speed and the generator a lower speed, and by means of this gearing the best conditions can be obtained without material loss or noise.

If we consider the wonderful progress of turbine design during the last 12 years, as proved by the fact that all reciprocating steam engines are now being superseded, we must recognise and appreciate

BIRD'S-EYE VIEW OF LONDON'S ELECTRICAL CENTRE OF GRAVITY.

the work of Sir Charles Parsons in startling the world with a revolution in mechanical science. There are many makers of turbines of various types, but, whether adopting the Parsons principle or some variation of it, their existence is due to the indefatigable pertinacity with which Sir Charles Parsons overcame all pioneering difficulties until he revealed the possibilities of a great commercial success.

Prior to 1888 the steam boilers used in this country were of the cylindrical type, and the water-tube boiler came to us from America, with the usual prejudice to overcome. In the capable hands of Messrs. Babcock & Wilcox, the water-tube boiler established itself as the safest and most economical means of obtaining a high steam pressure, with an integral superheater capable of raising the temperature of the steam to the highest limit permissible in the steam turbine.

The Babcock Co. have also done good service to the electrical industry of this country by perfecting an automatic stoker of the chain-grate type, which can be arranged to burn any kind of fuel—from Welsh small coal to the softest coal obtainable.

One effect of the great improvements in steam-generating plant is that the 257 million units sold in 1911, together with the units expended in distribution and for works purposes, were obtained by the consumption of about 570,000 tons of coal. If the present use of electrical energy were replaced by the old method of a separate

steam plant for each power user the amount of coal required would be at least 1,000,000 tons per annum more than at present, and the wasteful consumption of this increased quantity of coal would result in a repetition of the dense fogs which were so prevalent before the introduction of electrical supply. It must also be remembered that the distribution of power by means of underground mains has removed from the surface of the streets a

replacement. Each small gear wheel made about 120 million revolutions. On interurban and city railways the same wheel had to be changed after about 80 million revolutions, in other words, after about 24,000 or 36,000 car-miles, according to diameter of wheel, &c. The Prussian State railway management requires a guaranteed minimum of 24,000 miles for the small gear wheels and of 48,000 miles for the large gear wheels. As a matter of fact, distances of 120,000 miles have been accomplished without the large gear wheels needing replacement.

In like manner the wear of the bow of the current collectors varies considerably. Much depends on the material of the bow, on the amount of traffic, on the position of the rails, and on the construction of the overhead line. Aluminium bows, most commonly used, have, before needing to be changed, covered distances on interurban lines of from 2,000 to 3,600 miles, the overhead line being of simple construction. On main railway lines where trains are still hauled by steam locomotives, causing the wire to rust, the average life of the bows is about 1,000 to 5,000 miles, and on main lines with electric traction only it is about 9,000 to 12,000 miles.

Electrically or pneumatically-worked contactors have been very successful, the switch contacts having stood 6,000 short circuits before needing to be replaced.

In the case of the transformers on a city and suburban railway the internal insulation had to be changed after six years—i.e., after about 35,000 miles—because it began to crumble or break. The insulation of the coils themselves, however, was still good.

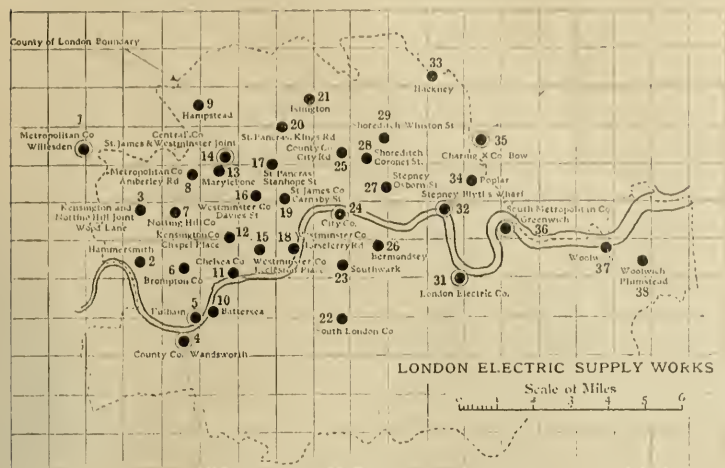

On the same railway the overhead wire was also changed after six years. The original copper cross-section of 90 sq. mm. had been worn about 40 per cent., so that there was still 60 per cent. of copper left. However, it was not deemed advisable to allow a greater wear in order to avoid increasing the drop. There was a daily traffic beneath the overhead line of about 220 trains, each with four bows, so that the wire was changed after about two million bows had passed along it.

The maintenance costs of the motor-cars (six-axle cars with two 200-H.P. motors) were, on the above-mentioned railway, about 2d. per car-mile, three-quarters of which is to the account of the electrical equipment. The average annual maintenance costs of four-axle motor-cars (four 70-H.P. motors) of an interurban railway are also given as about 2d. per car-mile. The working costs on other lines are still smaller, but then it must be borne in mind that electric traction has only been recently introduced there, so that the motors and equipment are still under guarantee and the makers bear a share of the working expenses.

## COPPER.

THE importance of copper to modern industries is shown clearly by the figures tabulated in Messrs. Merton's schedule of principal copper supplies, which gives the world's output, and the outputs of the principal copper-producing countries, for the last 20 years, including 1912. We see from this that, whereas the world's output in 1893 was a little over 300,000 tons, it had increased to over half a million tons in 1901, and was doubled in the subsequent decade, the total output for 1912 being 1,004,485 tons. Allowance must, of course, be made for the fact that, of late years, statistics on the subject have been more carefully compiled, and countries whose output, while small, was not included, have only come on the list with a fairly high figure, which may be responsible for some of the sudden leaps taken by the totals. For instance, while the average annual increase over the ten years 1893-1902 was 27,000 tons, the difference between the output for 1899 and that for 1900 was only 7,270 tons, while that between 1898 and 1899 was 42,618. This, however, may be traced to high prices in 1899 stimulating production, which, in the ensuing year, reached its limit for the time being. Between 1903 and 1904 there is the remarkable difference of 69,225 tons. The American mines, principally those of Montana, increased their output considerably in 1904, besides which Mexico was estimated to have advanced 5,000 tons, Namagua was 1,700 tons up, Australasia 5,000, and Japan 3,500. The high prices of 1907 further stimulated production, the effects showing themselves in 1909, which advanced 85,245 tons over the preceding year; 66,980 tons of this increase was put out by United States concerns. The following year the United States showed a decrease, and the increase for 1911 was only 7,615 tons. After this comes the largest increase of all, 132,565 tons for last year. The United States figures show an increase of 70,970 tons. Japan has 10,000 tons, Chile nearly 8,000, Canada 10,000, Australasia 6,000. Of the total, the favoured Continent yielded '66, South America '07, Europe '11; Japan with 65,500 tons, and Australasia with 47,000, were the only other contributors of much consequence.

Looking over the columns, Australia and Canada show good, steady increases, Australia having doubled in 12 years, and Canada

ELECTRICITY WORKS SUPPLYING LONDON.

large number of coal-carts which formerly supplied the needs of power users, and also the necessary dust-carts to remove the ashes.

It has been suggested that large electric power works in the coal-fields or down the river would, by superseding all the existing generating works, secure some economy in the costs of generation. Such economies can easily be shown on paper, and it can with equal ease be demonstrated that the additional cost of mains and losses in transmission more than counterbalance any hypothetical economy in generation.

London is at present supplied from 38 generating works, the positions of which are shown on the plan. Many of the works are equipped with plant of the latest design and best economy, and, having facilities for extension at low capital cost, it would appear to be wiser to convey coal to them rather than to provide expensive copper mains from distant works. Some of the existing works have sites of the utmost value to the future supply of London, and, so long as the centre of gravity of the whole demand falls at a hypothetical point not far from the south side of Blackfriars Bridge, it is clear there is greater economy in developing works on all sides of this point rather than the concentration of the load in a distant region.

(To be concluded.)

## MAINTENANCE COSTS OF ELECTRIC TRACTION.

OUR contemporary, the *Railway Gazette*, in a recent article by its Berlin Correspondent, gives the following interesting figures in connection with maintenance costs on German electric railways:—

The annual mileage figures depend essentially on the use that has been made of the traction equipment, and this, of course, differs on the several systems. Whilst on the City railways the average amounts to 56,000 motor car-miles, on the suburban lines, where, besides the ordinary local traffic, mixed trains are also hauled, the average amounts to 20,000 or 25,000 car-miles. The following are some fairly comparable results for the different railway systems regarding the wear of certain parts of the electrical equipment:—

The wear of the carbon brushes varies from 2 to 8 mm. per 1,000 car-miles, according to the type, number of revolutions of the motor, and amount of attention given. How far equalising connections in the commutator could diminish wear has not yet been definitely established.

The commutators must be ground or turned down on an average after about 20,000 to 30,000 miles; distances of 36,000 miles have been accomplished without undue wear of the collector. Too great a wear of the commutator would cause the insulating material to protrude between the commutator bars, and flat places to form themselves on the commutator, resulting in considerable wear of the carbon brushes. Commutators of the usual dimensions used in single-phase motors must be completely renewed after about six years. The armature bearings, if carefully attended to, are renewed after about 24,000 to 30,000 miles.

The data as to the wear of the gear wheels vary considerably. On one railway with infrequent stops the small gear wheels of the motor have lasted over 100,000 miles without requiring

in 10. Chile had its highest output last year, and Germany makes slow, but steady, increase. Japan has a most gratifying progress, very steady; Norway is now over 10,000 tons; there is a good show in Serbia's 7,240 tons, and Russia made a strong advance last year. Spain and Portugal also show a considerable increase after five years of much the same figures.

Messrs. Merton's table shows that the output of the following countries exceeds 10,000 tons:—Norway and the African mines; over 20,000, Germany and Peru; over 30,000 Canada, Chile and Russia; over 40,000 Australasia; over 50,000 Spain and Portugal (taken together); over 60,000 Japan; over 70,000 Mexico.

In connection with the above figures, the information to be found in the chairman's speech to the fourth ordinary general meeting of the Rio Tinto Co. is of considerable interest to consumers as well as producers. Mr. C. W. Fielding, who occupied this position, alluded to the high prices ruling in 1906 and 1907 as "unhealthy," as unduly stimulating production and bringing into the market excessive supplies, which kept the price down subsequently. In 1911, however, stocks began to come down, and in 1912 they were almost too low, and the price at one time rose temporarily to over £80. The price has been low this year owing to the unsettled state of European politics keeping the buyer from the market. Supplies would thus, after sound financial conditions in a country, appear to be, if not the determining factor in price, at any rate a good indicator of tendency.

Messrs. Merton's monthly circular is now to hand, and shows European supplies (excluding Rotterdam, Hamburg and Bremen) as 32,261 tons, a withdrawal of 3,885 tons during the month. Of this 1,410 tons are from English ports, the remainder of the reduction being on quantities afloat and at Havre. Including Dutch and German ports, the supplies are 45,074 tons, or an increase of 401 tons, and there are estimated to be 2,500 tons more at other European ports.

Arrivals from North America to Europe have been strong at 29,770 tons. Spain and Portugal contributed rather less than average to England and France, but more than usual to other countries. Chile shipments are just below average, and Australian lower than usual. Total deliveries, at 42,927 tons, are medium, the average for the past 12 months being 41,500.

American stocks at the end of February were 54,600 tons, or 400 less than at the end of January. Total visible supply for the end of February was 99,273 tons, 1,172 tons better than at the end of the preceding month.

## NEW PATENTS APPLIED FOR, 1913.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 286, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

1912.

- TIMING DEVICES FOR MAKING AND BREAKING ELECTRIC CIRCUITS AND FOR OTHER PURPOSES. H. S. Hatfield. 6,404. March 14th.
- VAPOUR ELECTRIC APPARATUS. M. A. E. Leblanc. 6,655. March 18th.
- DISTANCE-OPERATED MECHANISMS AND SIGNALS ON ELECTRIC SUPPLY SYSTEMS. H. W. Handcock, A. H. Dykes and W. Duddell. 6,716. March 19th.
- ELECTRIC TRANSMITTING MECHANISM FOR MARINE ENGINE GOVERNORS. S. Rumohr. 6,828. March 19th. (Addition to No. 29,764 of 1909.)
- AUTOMATIC ELECTRIC CIRCUIT-BREAKING ARRANGEMENTS. E. Müller. 6,990. March 21st.
- SIGNALING BY MEANS OF ELECTRO-MAGNETIC WAVES. F. J. Chambers. 7,242. March 25th.
- PROTECTIVE DEVICES FOR THE CONDUCTOR RAILS OF ELECTRIC RAILWAYS. C. H. Metz and S. G. Redman. 7,591. March 28th. (Addition to No. 11,947 of 1908.)
- SHIP-RISE COLLECTOR DEVICES FOR ELECTRICAL INSTRUMENTS AND MACHINES. A. Denny and F. T. Edgecombe. 8,640. April 12th.
- ELECTRIC COUPLING OR CONNECTION FIXTURES. S. Trood and J. H. Dale. 8,609. April 26th.
- ELECTRIC PHOTOGRAPHIC PRINTING OR COPYING FRAMES. J. B. Halden. 10,183. April 30th.
- VACUUM ELECTRIC WATER-HEATER. J. MARD. 12,367. May 24th.
- ELECTRIC APPARATUS FOR MEDICAL AND OTHER PURPOSES. C. H. Ivinson and G. Bryant. 12,757. May 30th.
- FRICITION CLUTCH GEAR FOR USE IN ELECTRIC BOAT-HOISTING APPARATUS. J. Fielding. 12,892. June 1st.
- MEANS FOR SELECTIVELY OPERATING ONE OR SEVERAL OF A SERIES OF ELECTRICAL DEVICES. A. Schmid. 14,121. June 17th.
- ELECTRIC INDUCTION HEATER OR FURNACE. A. Helfenstein. 14,164. June 17th. (June 16th, 1911.)
- PROTECTIVE DEVICES FOR ELECTRIC CIRCUITS. British Thomson-Houston Co. (General Electric Co.) 16,708. July 17th.
- ELECTRIC THERAPEUTIC APPLIANCES FOR THE SOLES OF BOOTS, SHOES AND THE LIKE. G. Wilson and C. J. Wilson. 16,768. July 18th.
- APPARATUS FOR REDUCING UNDESIRABLE ELECTRIC CURRENTS. J. Schiessler. 18,665. August 14th. (Convention date and Patent of Addition not granted. Divided application on No. 4,061 of 1912, February 17th.)
- CONTACT DEVICES FOR CONTROLLING POINTS OR SIGNALS ON ELECTRIC TRAMWAYS AND THE LIKE. J. J. H. V. Weeden, H. W. G. J. Stoffels and J. R. van der Sprekel. 19,100. August 21st.
- SPARK PLUGS. J. J. Thompson. 20,248. September 5th.
- AUTOMATIC ELECTRICALLY-OPERATED ELEVATORS. R. Liljeblad and Aktiebolaget Elevator. 23,918. October 19th.
- PRODUCTION OF HIGH-FREQUENCY CURRENTS ADAPTED FOR USE IN WIRELESS TELEGRAPHY AND TELEPHONE. W. P. THOMPSON. (Compagnie Universelle de Telegraphie et de Telephone Sans Fil.) 24,937. October 31st.
- MEANS FOR ELECTRICALLY TRANSMITTING AND INDICATING ORDERS, SIGNALS, INFORMATION OR THE LIKE. C. J. EVANS. 26,094. November 20th.

1913.

- MEANS FOR REGULATING THE OUTPUT OF DYNAMO-ELECTRIC MACHINES. T. W. Tattersall. 1,905. January 16th.
- ELECTRIC RESONANCE APPARATUS. H. W. Handcock, A. H. Dykes and W. Duddell. 6,807. March 3rd. (Divided application on No. 6,716 of 1912, March 19th.)
- DIFFERENTIALLY-WOUND COMPOUND DYNAMO-ELECTRIC GENERATORS. C. F. Kettering. 6,615. March 5th. (May 22nd, 1911. Divided application on No. 3,794, February 16th.)

## EXHIBITIONS AND TRADE EXPANSION.

WE have always maintained that large international exhibitions formed a most valuable medium for the extension of trade abroad by giving manufacturers an opportunity for introducing their goods to foreign buyers; but we have fully realised that the non-existence, until the last two or three years, of any organisation established specifically for the purpose of arranging British exhibits and for obtaining the best available spaces, often made it difficult for firms to take part in such exhibitions, and, in any case, detracted from their ultimate value.

It had previously been the custom, when any large exhibition was proposed abroad, for the Government to consider whether or not it would participate officially. If it were finally decided to participate, a Royal Commission was appointed to arrange the British section, but by the time the Commission had been actually appointed and had got to work, all the best spaces had usually been taken up by other countries. Moreover, the absence of any permanent policy with regard to exhibitions, and the lack of experience of previous exhibitions on the part of each new Commission, prevented the best possible results being secured to each individual exhibitor in the British section.

We consequently welcomed with considerable pleasure the appointment of a Royal Commission to inquire as to the nature and extent of the benefit accruing to British industries from the participation of this country in great international exhibitions. This Commission ultimately decided that it was essential that an efficient permanent organisation should be created to act on behalf of British exhibitors in all negotiations with foreign exhibition committees, Customs officials, &c., and to render them such assistance as would enable them to show their goods effectively at International Exhibitions without a prohibitive amount of trouble and expense. Such work could only be properly performed by a Government Department, and it is one more proof of the Board of Trade's recent practical interest in the extension of the trade of this country that it should so readily have formed a separate branch, under the direction of Mr. U. F. Wintour, to carry out the recommendations of the Commission. That this Department has fully justified its formation, even in so short a time, is proved by a report we have now before us which deals with the work of the Exhibitions Branch in connection with the Exhibitions at Brussels, Rome and Turin.

As a result of previous experience at exhibitions, British manufacturers had become rather apathetic regarding new departures of this kind, but there is undoubted evidence that this apathy is being gradually overcome. In the report which is before us the Exhibitions Branch endeavours to trace the commercial results which have accrued to British exhibitors from participation in the Brussels and Turin Exhibitions (the exhibition at Rome was an Art Exhibition and therefore is not of commercial interest). With the object of ascertaining these results, the following questions

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's.)

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

were submitted to all British exhibitors at Brussels and Turin :—

1. Have you had, up to the present time, any development in your business which you can directly or indirectly attribute to the Exhibition at Brussels (Turin)?

2. If so, can you give any information as to the extent or value of such development?

3. Have the sales effected, as a result of the exhibition of your goods at Brussels (Turin), repaid you for the cost of exhibiting?

4. Have you any observations to make with regard to any improvement which might be made in the organisation of British exhibits at future exhibitions?

The tracing of "results" of any scheme of advertising is by no means an easy matter, and participation in an International Exhibition, like other forms of advertising, may lead to results which it is very difficult, if not impossible, to trace. It should be borne in mind, however, that abstention from exhibiting when one's competitors are showing their goods may easily lead to a falling-off in sales, so that even if no new business accrues exhibiting will often have had results. Experience has shown that even in the cases of firms with an established reputation and world-wide connections attempts to discontinue advertising have usually been followed by a diminution in the sales effected, and it has been one of the chief causes of Government action as regards foreign exhibitions that the neglect of one of the important forms of national advertisement would be equally detrimental to our interests as a manufacturing country.

The individual answers received to the above questions were, for the most part, of a satisfactory character. In the case of the Brussels Exhibition, 32 per cent. of the exhibitors stated that their exhibits had produced good tangible results. A further 33 per cent. of the exhibitors indicate that they are satisfied with the result of their exhibits, making a total of 65 per cent. who feel that their expenditure in this form of advertising has not been misplaced. Of the remaining 35 per cent., the great majority simply answered the questions in the negative. Of all the answers received relating to the Brussels Exhibition only 11 expressed dissatisfaction, and four of these were from firms who had sustained heavy losses in the fire which destroyed the greater part of the British Section. As regards the Turin Exhibition, the results reported up to the present are not so good as in the case of Brussels, but the time which has elapsed since this Exhibition is hardly sufficient to allow of any accurate estimate of the commercial results which are likely to accrue. The Turin Exhibition, as a whole, also suffered from adverse circumstances, and it is consequently satisfactory to find that 24 per cent. of the exhibitors reported definite tangible results, while a further 30 per cent. reported themselves as satisfied, making 54 per cent. in all. Replies to Question 4 show a distinct desire on the part of exhibitors to co-operate with the Board of Trade in increasing the efficiency of our exhibition work, and the majority of the exhibitors from whom replies have been received have expressed appreciation of the manner in which the organisation of the British sections was carried out and of the services performed on their behalf.

Taking the statistical showing at its face value, results may therefore be taken to be eminently satisfactory, particularly so having in view the short time during which the Exhibitions Branch has been at work. Moreover, we are disposed to think that the Exhibitions Branch is too modest in the conclusions it draws from these statistics. Our experience goes to show that the British commercial community is not too prodigal of its praise, particularly where any Government institution is concerned, and is all too ready to complain on the slightest provocation. We therefore think that the work of the Board of Trade in connection with these Exhibitions is even more fruitful of results than the reports from exhibitors would lead one to believe. We trust that the wish is not father to the thought.

If we might offer criticism at such an early stage in the Board of Trade's active work in exhibitions, it would be that initiative might be displayed in organising independent exhibitions, as well as in participating in foreign exhibitions of the type of those at Turin and Brussels. Taking these two exhibitions as fairly representative, our criticism is that there are other countries than Italy and Belgium whose trade is much more important to us, and where an exhibition of

British goods would have much greater results in actual sales; there is a very urgent need for manufacturers to introduce their goods on these markets by ocular display, and permanent, or even temporary, exhibitions organised by the Board of Trade would, we think, meet with support that has not been forthcoming when such exhibitions have been privately arranged or mooted. In South and Central America, in Egypt, in Russia, in our own self-governing Dominions, to name only a few of the countries where our trade might be greatly increased, such exhibitions intelligently organised would, we are sure, have incalculable results. We offer the suggestion for what it is worth; if it has already been considered we commend it for further consideration, confident that if carried out its effect on our trade would be tremendous. Meantime we appreciate the work already being done, and urge manufacturers to co-operate. They may not find everything as they wish, we have heard that they have not, but obviously the Exhibitions Branch is prepared to consider their suggestions for improvement, and is certainly already supplying a want that has been badly felt for many years.

While dealing with this question of exhibitions and trade extension, we may refer to another scheme of exhibition work recently developed by the Board of Trade in collecting samples of foreign goods selling in markets abroad, and placing them before British manufacturers of similar lines of goods. This work, which has up to the present been done by the Commercial Intelligence Branch, is extremely valuable, and is capable of much greater development. Perhaps it is not too much to hope that before long we shall have under Government control a thoroughly organised and efficient scheme of sample bureaux, both abroad for the display of British goods, and at home for the display of the most successful foreign goods which compete with our own on markets abroad. One actual sample is worth reams of description, and it seems to us that along this line the Board of Trade may safely hope to give even more active support to British trade than is already forthcoming. We are, of course, aware that any comprehensive scheme of this kind must entail considerable cost, but we maintain that this increase in expenditure will be fully justified by a large increase of trade, and a consequent improvement in the general prosperity of the country as a whole.

---

## THE IMPORTUNITY OF LABOUR.

---

It has always been prophesied by those who have had experience of the methods of the Labour Party that they would never be satisfied with the recent Act passed to reverse the famous Osborne Judgment. They regard that as but a step in the great stairway of industrial reform which is to lead up to a kind of worker's paradise. The so-called representatives of the working man in the political world are now engaged in the task of "pressing for further legislation."

This is a policy which offers many attractions. It produces the maximum of advertisement with the minimum of result. The pressure exerted must, of course, be nicely adjusted. On the one hand, it must not be so great as to involve the leaders of labour in an open breach with the existing Administration, or the existing Administration in defeat. That would never do. It would be "killing the goose" in more senses than one. On the other hand, the pressure must be such, and must be so applied, as to secure as much notoriety as possible. The workers who read the halfpenny papers up and down the country must be told that their trusted representatives in politics are labouring in their interest. Resolutions must be passed at Congresses; these resolutions must be carried with all due pomp and circumstance (and expense) by influential deputations to Cabinet Ministers assembled at Whitehall. It is thus that the pro-

letariat are persuaded to believe that so much of the Trade Union funds as is subscribed for party purposes is being advantageously expended.

A favourable example of this up-to-date form of propaganda has recently been brought into prominence. It took the form of a deputation from the Parliamentary Committee of the Trade Union Congress to Mr. McKenna at the Home Office on April 8th. The object, apparently, was to draw the attention of the Home Secretary to certain resolutions passed at the recent Congress at Newport. The whole process rather reminds us of the archaic practice among European Monarchies, whereby, months after the demise of a Crowned Head, a state official is sent to "announce" the death. The deputation mentioned 25 resolutions, each one of which would require (according to the Home Secretary) to be dealt with by legislation. Let us mention a few of these at random:—Total provision for the blind; closing of factories and workshops over the week-end; prohibition of deductions from wages and the imposition of fines; provision of means whereby a magistrate can pay a cab-driver reasonable expenses incurred in discovering a delinquent fare; and amendment of the Workmen's Compensation Act so as to compel employers to insure.

According to the report in the *Times*, these are some of the topics dwelt upon by the deputation. The same journal reports the Home Secretary as having said:—

"He would only have been too glad to have introduced Bills on every one of the topics which had been raised, but there would not be the slightest chance of being able to get through more than a tithe of them."

We can well imagine Mr. McKenna, hand on heart, saying in a spirit of the utmost conciliation: "I and my colleagues have the inclination to confer these boons, but the exigencies of time prevent us." With similar candour did Mr. Spenlow declare, on his honour, that he would return willingly David Copperfield's premium, "but he had a partner—Mr. Jorkins."

We do not say for a moment that some of the suggestions put forward by this "deputation" did not fully deserve to be placed in the limbo of things for which there is no Parliamentary time. Take, for instance, the ridiculous proposal that factories and workshops should be closed over the week-end. How could the business of a great manufacturing community be conducted under such conditions?

In the brief abstract of the proceedings which we have been able to consult, it appears that Mr. McKenna was loud in his expression of sympathy, but very careful not to commit himself or the Cabinet to any active step. That, as it seems to us, is exactly what the Labour Party want—accept legislation whenever it pleases the Government of the day to pass it, but by no means use threats or become aggressive if you do not obtain it.

The reappearance in the House of Commons of the Old Dog in a new doublet—the Minimum Wage resolution—is another example of what we have ventured to call the importunity of labour. Notwithstanding the teachings of experience this same old ridiculous resolution makes its appearance year after year. It is rather surprising to find, too, that it is meeting with support in quarters where opinion ought to be better informed. Space does not admit of our dealing at length with this question; but there is one point we should like to make. It is that the minimum or living wage must necessarily be based on the cost of living for the time being. If that cost is increased, the so-called minimum must be increased. It follows that even if a minimum

wage of 30s. were guaranteed to every worker this year, a few years hence, when the price of the loaf had gone up, the cry would be heard for an amendment of the minimum wage.

#### Units and Abbns.

THE modern craze for abbreviation, and the insatiable passion for devising new units and systems of units, have lately given rise to a serious outbreak on the Continent, to say nothing of the isolated but equally sad case in the United States to which we recently drew attention. The disease appears to resemble influenza in that the germ or spore or whatever it be that disseminates the plague leaps over vast distances, leading to epidemics which appear to be quite independent, and that a single attack by no means safeguards the victim from a recurrence, but rather renders him more susceptible than ever to the complaint. From the boiled-down title of this essay on "New Units and Abbreviations" may be gathered some idea of the fearful prospect that would lie before us, should the virus attack the literature as well as the technical terminology of our time. What is the matter with the people who are constantly trying to foist upon a patient but sorely-tried world new and superfluous symbols and abbreviations? It cannot be want of time to use the longer but obvious and customary forms, for the time they expend on elaborating and learning the new hieroglyphs would far more than swallow up the time they might save by using these. One dare not suggest that it is nothing but laziness, whatever one may think; and therefore one is at a loss for a plausible explanation of this particular mental twist.

Our comments are prompted by a recent report of certain very eminent German Societies advocating the use of a set of abbreviations which we give on another page—not because we approve of them in the least, but for the information of readers who may come across them in German writings and will naturally be at a loss to translate them without this little glossary. We had thought of criticising the separate items, but, indeed, as Beatrice said of Benedick's bad parts, they maintain "so politic a state of evil, that they will not admit any good part to intermingle with them." We therefore will merely invite our readers to—"Look at them!"

#### The Benevolent Institution.

OUR hearty congratulations are due to the Electrical Trades Benevolent Institution on the excellent result of the festival dinner, no less a sum than £854 having been added to the funds. It is worthy of note that more than half this amount was largely due to the personal efforts of the chairman, Mr. George Sutton, who has thrown himself into the work with an amount of zeal and energy worthy of the beneficent objects of the Institution, and has set a splendid example to future chairmen, not only in this respect, but also in his admirably conceived address in commending the Institution to the favourable regard of his audience at the dinner. His obviously sincere and heartfelt appeal should bear good fruit—and, indeed, it has already done so, as evidenced by the generous offer of Mr. E. Byng to contribute £100 to the funds if nine others would do likewise. Two such donors have already been found, in the persons of Mr. Sutton himself (whose large donation, as well as that of his firm, bears witness to the earnestness of his convictions) and of Mr. Hugo Hirst; and we trust that the remaining seven will come forward well within the specified limit of three months. As we go to press, we learn with pleasure that Mr. E. Garcke will make a fourth donor of £100. We hope to add the other six names in our next issue.

We should like to direct particular attention to the chairman's remarks on the subject of donations from limited companies. As he pointed out, the welfare of employes undoubtedly falls within the legitimate range of a public company, and at a time like the present, when trade is flourishing, there ought not to be the slightest hesitation on the part of boards of directors in performing their duty in this respect.

## THE MECHANICAL DESIGN OF SWITCHES.

By A. R. C. JENKS, A.C.G.I.

ELECTRIC driving of mechanical engineering works—generally by direct current—is now almost universal, and even a moderate-sized works may have in its equipment several hundred motors, supplying power for the large machines independently, the smaller ones in groups, and the various auxiliaries, such as cranes, air compressions, pumps, &c. Each of these motors is controlled by its own starting and operating switches, which are at the mercy of the men working the machines, who do not understand them and cannot be expected to appreciate their niceties. It is, therefore, surprising that the design of the majority of switches is still mechanically so imperfect, when the treatment they are likely to receive is considered. Improvements constantly tend in the direction of making them electrically rather than mechanically fool-proof; but this tendency is bound to lead to increased complications and therefore increased possibilities of mechanical breakdown.

In the most common type of starting switches—viz., the flat-segment type—the contacts and contact arm are mounted on a slate, marble, or composition base, and owing to the hard and non-resilient nature of these substances, it is difficult to prevent the small nuts and screws fixing the moving parts from becoming loose under the continuous rough usage to which the switch is subject; moreover, if it is of the open type most of the wear and tear is taken entirely by the base. In this respect the ironclad or protected type has the advantage, as the casing relieves the base of the mechanical strains; but this type is less accessible for repairs and is very heavy to take down and replace.

The chief fault of this simple starting switch is that it is easy to operate it too rapidly. This difficulty has been overcome in one design by moving the contact arm indirectly through a worm reducing gear by means of a second shaft to which the handle is connected. This is, on paper, an excellent idea, but practically the worm and worm wheel are not made nearly robust enough and consequently both are soon stripped. Another disadvantage is that the arrangements for holding the handle or worm in gear when starting, and releasing them when the arm is full over, are not satisfactory. In order to stop the motor and return the arm to the starting position, a neat little button is provided to short-circuit the no-volt coil; often, however, the arm sticks and will not release itself, and as it cannot be "assisted" from outside the casing, banging and jolting are resorted to, until it goes back.

When overload releases are fitted they are also a source of weakness. Their parts are generally small; and, as they ought to go for months without operating, they are liable to get stuck, owing to gummy oil and grit in the joints of their mechanism. When a short does occur, and it is essential that they should act, they cannot be depended upon to operate within 50 per cent., or even 100 per cent., of the current set for; and since they usually cut out by short-circuiting the no-volt coil, they are open to the same objection as the push-button for stopping.

The strongest and most reliable controller is the drum type universally used for service motors on traction work and cranes. The drum is well supported and protected from mechanical damage by the very rigid casing. Unless, however, the "notching" gear and spring are amply strong and well designed, it is possible to stop the drum between notches, causing much damage to the fingers through continual arcing. The advantages of this type as regards durability are becoming more widely appreciated, and a modified form—the pillar-type controller—is being increasingly used for machine-tool motors.

Another point which, though not strictly concerned with mechanical design, might be noted, is that it is absolutely essential that proper "inching gear" should be provided for obtaining the very small movements often required when setting machines or taking out work. It should be possible to obtain just as small a movement with the machine light as when it is fully loaded.

Main switches with intricate toggle joints are liable to give trouble when the joint-pins begin to wear; this occurs

fairly quickly, as they are generally too small and do not receive much attention in the way of lubrication. It is, however, scarcely possible to avoid these joints when heavy currents have to be broken by trip-gear incorporated with the switch.

Although, therefore, the "fool-proof" ideal appears attractive, advances in this direction can usually be obtained only at a sacrifice of mechanical simplicity, and this sacrifice is often too great. When the time lost during the course of a year through continual small delays caused by defects in switches is considered, it pays the user to insist on ample strength and simple design, thus ensuring that, instead of being generally defective, they will always be in good order. Reliance will have to be placed for protection from damage on fuses only, but these cannot easily go wrong, and wilful tampering can be avoided by enforcing severe penalties and by placing them under lock and key. It must be constantly borne in mind that the machinist regards his switches more or less in the same light as he regards his spanners, and treats them with about the same amount of consideration. Any extra expense to the user on heavier switches is likely to be amply repaid by reduction of lost time and of repair costs.

## NOTES FROM CANADA.

[FROM OUR SPECIAL CORRESPONDENT.]

THE Westminster B.C. Power Co. is preparing plans for a large hydro-electric plant on the Indian River. The idea is to utilise a number of small streams at high elevation, and run pipes down to the power house; the effective head of water will be about 1,800 ft.

The development of some 30,000 H.P. at the confluence of the Rivers Nicolum and Coquahalla, in British Columbia, is also contemplated by another concern.

The British Columbia Electric Railway Co. are building a large receiving station, which will contain four sets of transformers, each having a total capacity of 36,000 k.w., stepping down from 60,000 volts to 11,000 volts.

Two towns in Western Canada, Vernon in British Columbia, and Canora in Saskatchewan, have recently put into operation Diesel engines driving generators, and as this type of plant appears to be particularly suited to the needs of many of the small, but growing, towns of the West, the performance of the plants already started will, no doubt, be watched with interest and, if successful, other similar installations are certain to follow.

Strathmore, Alberta, will probably have an electric light plant soon, as a company proposes to install two 65-H.P. producer-gas engines to drive two 35-k.w. alternators, together with necessary transformers, lamps, meters, &c.

The Hydro-Electric Power Commission of Ontario intends to advertise almost immediately for tenders for the construction of a transmission line to Windsor from the main switching station at Dundas. The routes have not yet been decided upon, although four different ones are under consideration. The cost will amount to several million dollars, and all the towns along the route will be supplied with electricity. Tenders are also to be invited for material for the construction of transmission lines from Cannington to Beaverton, from Berlin to Elmira, from Clinton to Goderich, and from Brantford to Paris. The cost of material for these extensions will be about \$2,000,000.

The Manitoba Government is erecting an experimental station at Estevan with the object of demonstrating the commercial possibilities of lignite. It is said that the matter of installing a large power plant near Estevan is now being considered by New York financiers, who will furnish the necessary capital immediately the feasibility of the scheme has been proved by the tests.

**International Congress of Cold.**—Papers offered to be read at the Congress in the United States in September next should be sent as soon as possible to the Secretary, 431, South Dearborn Street, Chicago, U.S.A.

## CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

## Failure to Excite.

Without going more closely than necessary into considerations of shunt-dynamo "no-load characteristics," I think the following will suffice to explain the failure to excite of the small machine under mention.

The curves shown may be assumed, primarily, to indicate the behaviour of a separately excited dynamo under no-load conditions.

O S, which is a straight line, shows the variation of volts across the shunt coils, effected by varying the current round same, their resistance being assumed constant. Consistent with these field currents, and the speed at which the dynamo is running, the curve O C may be taken to represent, for illustrative purposes, the manner in which the E.M.F. of the armature under mention varies.

Now, a consideration of these two curves will show that for the machine to be self-exciting, it must be, so to speak, self-sustaining: in other words, the aforementioned curves must cut (or coincide) definitely, as shown, for instance, by O A at H.

A reference to O D will show the almost negligible drop due to the passage of the shunt current through the

armature. This small drop is allowed for on the curve O A, by plotting a portion of the terminal voltage curve, which cuts O S in E, just underneath.

Here we have an equilibrium of all conditions: the machine is able, when driven at the speed to which this E.M.F. curve corresponds, to generate from its self-produced field-flux an E.M.F. sufficient to overcome the small armature resistance, and urge the necessary current to maintain this flux round the field coils; this is the complete cycle.

It is possible under certain conditions—for instance, at too low a speed, other factors remaining constant—for the two curves practically to coincide for quite a considerable distance (see O to N on sketch). Where this is the case, the machine may assume any voltage along the line of approximate coincidence, since a momentary variation of any one of the prevailing equalising conditions may make the two curves exactly coincide somewhere along O N. I have noted practical instances where shunt generators have shown this erratic behaviour.

Without going further into detail, I suggest that either, or a combination, of the following more or less quickly attained methods will suffice to make the machine self-exciting:—

(a) Probably the most easily adopted is—Connect the field coils in parallel, and include an external resistance in circuit with these to cut down the current to its proper value.

(b) Increase the magnetic flux by lessening the air gaps, by careful packing at the backs of the pole pieces.

(c) Raise the speed.

Personally, I think a separately excited field, or some form of permanent excitation, would be the more suitable to employ, since the calibration of the scale would then be practically uniform over its whole range, and the disadvantage of what may be broadly termed a critical speed of excitation (other factors remaining constant) avoided.

In conclusion, it may be worth while noting that a bad connection in the shunt circuit, as suggested by Mr. C. V. Peake, would cause the curve O S to rise more abruptly than it should do; hence, no cutting of the curves would occur, and failure to excite would be the result.

W. T. Hilder, Grad.I.E.E.,  
Mains Superintendent.

Aberdare, Glam.,

April 12th, 1913.

I have been reading with interest the answers to "Speedometer's" letter in your issue of the 4th inst.

When in India I often had dynamos to deal with which failed to excite, evidently through being knocked about in transit. In most cases there was sufficient residual magnetism to attract a needle suspended by a fine thread, so that having found the polarity it was easy enough to pass a small current through from a battery or other source. Where there was no evidence of any magnetism at all, it was simply a case of magnetising to suit the direction of motion required, or of altering the leads if it did fail to excite.

There was, however, one motor which I could never get to work as a dynamo. I had every connection thoroughly cleaned, and ran the machine first in one direction and then in another, with no result whatever. It worked easily enough as a motor, and when run separately excited, behaved in much the same way as "Speedometer's"—that is, I could not get it to give the maximum voltage. In both these cases there was sparking at the brushes. This could not be remedied by altering the lead. The brushes were diametrically opposite (it was a bipolar machine).

The armature was drum wound with wire of rectangular section, and to avoid the sharp curve at the back, the coils were in two halves, and the wires soldered together with a copper clamp. There was evidently a weak joint here which I was unable to discover, small in itself, but of high enough resistance to impede the small currents at the start off. I should not be surprised if "Speedometer's" motor is one of a similar make, and should be glad to hear from him if this is so.

E. G. Lazarus.

New Moston, Manchester.

[Regarding the "magnetising to suit the direction of motion required," our correspondent presumably means the polarity required; the direction of magnetisation has nothing to do with the direction of motion of a self-excited dynamo.—EDS. ELEC. REV.]

With reference to "Speedometer's" letter on the above subject in your issue of April 4th, if he finds that all the suggestions given up to the present are of no avail, I think it is very probable that the trouble is caused by the mica insulation, between the commutator segments, being too high. If he gets a fine saw and takes a little off the insulation all round the commutator, I fancy he will find that the machine will then excite. I know of several cases, with low-voltage machines, where this has been the cause of the trouble.

H. Orford.

Kidderminster, April 21st, 1913.

I should like to say, in reply to "Speedometer" on the above subject, that I had a similar experience with a low-voltage self-exciting dynamo failing to excite. After testing all connections, I found the trouble was due to

hard mica having risen above the commutator segments, causing a bad contact; and after cutting down the mica and cleaning up the commutator, the dynamo ran quite satisfactorily. I may here mention that when the dynamo was separately excited and fully loaded, it sparked slightly, this being due to the bad contact between brushes and commutator before mentioned, and would not give its correct voltage.

E. Wells.

Cambuslang, April 21st, 1913.

### Prospects in Electrical Engineering.

I agree with Mr. Ebben's letter on the above subject. It is true that, generally speaking, one of the most interesting sections of the ELECTRICAL REVIEW is the "Situations Vacant" column, but it is, at the same time, the most lamentable.

In my opinion, central station engineers can be divided into three classes:—Those who eagerly look forward to the day when the ELECTRICAL REVIEW is obtainable, and who peruse it generally; those who can almost turn to the "Situations Vacant" columns blindfolded, and whose interest in the REVIEW begins and ends there; and those who never even look at it at all.

Almost invariably one can on taking up a copy of the ELECTRICAL REVIEW, which is undoubtedly the pioneer paper not only for reading matter, but for positions advertised, laugh at central station engineers.

Take, for instance, this week's issue (April 11th): An arc lamp trimmer is requested at a wage of 27s. per week, and the same firm requires a junior shift engineer at a salary of 28s. The fortunate engineer who gets the position will be presumably from 25 to 30 years of age, have served his apprenticeship, studied at a technical school, worked for years at a salary of a few shillings per week in order to gain experience. He will have to take on a position of responsibility, very probably work seven shifts, including night shift, which only tends to break up a man's constitution and shorten his days, also Sundays and Bank Holidays, &c., and will be subject to almost unbearable heat and din and risk of the engine room. And all this is for—what? A shilling more than the labourer who is required to trim arc lamps.

Concerning Mr. Ebben's suggestion that the heads of the various technical institutions should devote one hour per session to a lecture on "prospects on electrical engineering." This is a noble idea, and would certainly benefit members of the profession, but it would inevitably result in the "falling off" of students from the classes, if the plain truth were spoken. Obviously, it would not be in the principal's interest to give such a lecture. I remember some years ago, a distinguished engineer, Mr. Lloyd Barnes, giving a lecture on the matter at the opening of the session at the Liverpool Technical School, and stating that electrical engineering was the most difficult profession a young man could possibly follow. The effect of this and other remarks resulted in the decrease of over 50 per cent. in attendance at the next lecture, and at the finish of the session there remained only about a dozen students.

But leaving this point and in conclusion, to those of us who have already put "our hands to the plough," and spent some years in studying and acquiring experience, the only means of realising an improvement of our conditions, is, to use the words of Robert Burns: "When freedom, harmony and love unite us in the grand design."

A. C. Black.

Bootle, April 14th, 1913.

### Salaries and Wages.

Referring to your interesting article on "Salaries and Wages" in the current issue (April 11th), the enclosed details of classification of employment and maximum wages for each grade, which has recently been agreed by the St. Marylebone Borough Council, may be of interest.

The first thing that stands out is the adoption of a minimum rate for men of whatever class. Although there is a maximum fixed for each of the grades, the intention is that a thoroughly competent man who has reached the maximum of his grade shall be transferred to the grade

immediately above, if there is any possible vacancy. In some cases it can be done even if there be no vacancy. It is not intended that each man in each grade shall automatically reach the maximum, and there are no automatic annual increments provided for. An annual recommendation is made to the Electric Supply Committee each year as to the advance in wages which should be given, and each advance directly depends on each man's individual merit. An advantage of this grading is that it gives an intermediate course between an incompetent man and discharge; he can be severely punished by being placed in a lower grade, which punishment will frequently meet the case, whereas if no system of grading were in force, the man would probably be discharged.

This classification, of course, excludes myself and the four heads of departments: Secretary and accountant, generating engineer, mains engineer, and sales manager.

A. Hugh Seabrook,

General Manager.

St. Marylebone Electricity Supply,

April 15th, 1913.

ST. MARYLEBONE ELECTRIC SUPPLY.

Approved by Council April 3rd, 1913.

Salaries and Wages—Classification of Grades for Permanent Employment.

Maximum wages for unclassified juniors:—				Present No.	Estab-lishment.
Grade No.					
1	Up to 16 years of age ... ..	15s.		24	
	Maximum wages for unclassified lads and youths:—				
2	Above 16 and up to 24 ... ..	22s.		9	
	Minimum Wages for Men for whatever Class.				
	25 years of age ... ..	25s.			
	26 years of age ... ..	26s.			
	27 years of age ... ..	27s.			
3	28 years of age ... ..	28s.		6	
	29 years of age ... ..	29s.			
	30 years of age and upwards ...	30s.			
	Minimum Wages for General Employment.				
			Remarks.		
4	Chief assistants ... £6 0 0		Engineering	6	6
5	1st class assistants 5 0 0		or	8	8
6	2nd class assistants 4 0 0		otherwise.	12	12
7	1st class clerks ... 3 0 0		Applicable	14	14
8	2nd class clerks ... 2 0 0		to	33	33
9	3rd class clerks ... 1 0 0		men or women.	10	10
10	Representatives ... 2 10 0		Plus bonus	14	14
11	1st class foremen 4 0 0				
12	2nd class foremen 3 0 0			7	
13	Leading hands ... 0 1 0	hr. or pro rata wky.		4	
14	Draughtsmen ... 3 0 0			1	
15	Assist. draughtsmen 1 15 0			1	
16	Painters ... 0 0 9	hr.		1	
17	Bricklayers ... 0 0 11	"		—	
18	Carpenters & joiners 0 0 11½	"		2	
19	Wiremen ... 0 0 11	"		12	
20	Mates (all classes) 0 0 9	"		14	
21	Storekeepers, head 2 10 0	"		3	
22	Storekeepers, assist. 1 15 0	"		—	
23	Handy labourers ... 0 0 8	hr.		16	
24	General labourers ... 0 0 7	"		22	
25	Dynamo and Motor attendants ... 2 0 0			4	
26	Switchmen ... 2 10 0			2	
27	Battery attendants 1 15 0			2	
28	Sub-sta. attendts. 2 10 0			4	
29	Drivers ... 2 10 0			5	
30	Stokers ... 2 15 0			8	
31	Volt regulators ... 1 5 0			—	
32	Fitters ... 2 10 0			5	
33	Meter testers and repairs ... 2 5 0			3	
34	Meter readers ... 2 0 0			10	
35	Meter collectors ... 2 5 0			1	
36	Joiners ... 2 10 0			5	
37	Box inspectors ... 1 15 0			3	
38	Lamplighters ... 1 7 6	Part time only		25	
39	Arc lamp trimmers 1 15 0			2	
40	Inspectors ... 2 10 0			—	

With regard to Grade No. 2, this is designed to deal with employes who have not been specifically placed in one or other of Grades Nos. 4-40. Such cases will be few, and the grade is provided to give a small increase over Grade No. 1 until the employé is sufficiently skilled to pass into one of the other grades.

Grade No. 3 provides a minimum wage, and it provides for every man of 30 years of age in the department receiving a minimum weekly wage of 30s.

Grades Nos. 4-9 relate to sub-heads of departments and the clerical staff, and for these (and No. 10, the representatives) we have laid down a normal establishment, shown in the foregoing schedule, which corresponds with the existing employes who it is proposed should be allotted to these grades. This normal establishment should only be taken as the present figure, but no alteration therein will be made without the Council's knowledge.

For Grades Nos. 11-40 we do not think it convenient to lay down any fixed establishment in view of the fluctuating nature of some of the work, but the present numbers of each grade are shown on the schedule.

It will be noted that there are some grades (Nos. 11, 16, 22, 31 and 40) to which at present no employes are allotted, but we have thought it well to make provision for employes of these descriptions for the future.

Generally as to increments of wages, we do not, in any case, suggest a fixed increment, as we think the staff should be dealt with every year in the light of the year's working, and given such increments, within the maxima laid down, as may from time to time be thought desirable.

19-20, York Place April 10th, 1913.

#### Institution of Electrical Engineers. Election of Council.

Many members of the Institution will, I believe, be disappointed with the Council's nominations to fill the vacancies on the Council. This for two reasons: that the constitution of the Council seems tending to become official rather than commercial; that the Local Sections have insufficient representation.

The renewed interest in the affairs of the Institution which has shown itself since Dr. Ferranti's presidency has been due, I think, to the feeling that the programme of development which he outlined would be followed, and that the Institution would become of real practical assistance to the industry. To this end should we not have a greater proportion of business men on the Council?

On the present Council the Local Sections have, in addition to their special representatives, Messrs. Dickinson, Faraday Proctor, Pearce and R. K. Morcom. All these gentlemen retire, and the Council's nominees, worthy of the highest honour though they may be, do not represent the provinces in the same direct manner.

The Local Sections want binding closer to headquarters; I believe this can be attained by fuller representation.

W. B. Woodhouse.

Dewsbury, April 15th, 1913.

#### The Preservation of Telegraph Poles.

We see in your issue of the 18th an article on "Preservation of Telegraph Poles," and we note that the author now talks of the brittleness of poles which have been creosoted. We do not think that this is a fact, and believe that if anything poles and timber which have been creosoted are stronger than the same unpreserved. We think that any Post Office engineer would bear us out in this contention. Perhaps you have room in your valuable paper to insert this contradiction.

With regard to the decay caused by wet getting inside poles, we can only reiterate what we have previously said, and always recommend users of poles that it is much better for any cutting and boring to be done before the poles are creosoted.

For Richd. Wade, Sons & Co., Ltd.,  
CHRISTOPHER WADE, Managing Director.

Hull, April 21st, 1913.

#### Electric Laundry Irons.

With reference to the remarks by "Ironical" regarding the above, I think it only fair to manufacturers to mention that my firm have been using electric laundry irons for the past two years. These irons are in constant use, and up to the present have been in every way successful. The flexible wiring has not, even in one instance, been renewed. The writer will be pleased to furnish any further particulars to anyone interested.

J. Martin M. Carr,

Manager, JOHN BARKER & CO., LTD., Electrical Dept.

Kensington, W., April 22nd, 1913.

[Other communications on this subject will be found in our "Business Notes,"—EDN. ELEC. REV.]

#### L.G.B. Arithmetic.

On page 640 of your last issue (April 18th) Mr. R. H. Hooper is reported to have made the following comments at Coventry:—

"There were just over 2,000 consumers of electrical energy out of a population of 115,000, so that practically one-fiftieth of the population were making a contribution to the relief of rates for the benefit of the others who did not happen to be users . . ."

Those gallant 2,000! No wives, children, or householders consuming the flashing fluid in order that the remaining 113,000 may live in domestic comfort at the usual average rate of five per family.

The electricity consumers of Coventry are indeed an example to the rest of the country.

Benedict.

#### ELECTROSTATIC CAPACITY AND INSULATION RESISTANCE MEASURED BY DIRECT-READING METHODS.

By J. RYMER-JONES.

**Capacity test** (by charge or discharge).—Employing a scale of 1,000 equal divisions, adjust the slide reading ( $s r$ ) of the universal shunt so that the testing battery gives a throw of exactly 1,000 divisions for 1 microfarad. *E.g.*:—

If the shunt value  $s r$  gives 1,000 divisions for 1 mfd., then 754 divs. =  $754/1,000$ , or 0.754 mfd.

If the shunt value  $s r$  be reduced to  $s r/10$ , then 754 divs. =  $754/1,000 \times 10$ , or 7.54 mfd.

If the shunt value  $s r$  be reduced to  $s r/100$ , then 754 divs. =  $754/1,000 \times 100$ , or 75.4 mfd.

Using a Sullivan highly sensitive galvanometer (for use on shore), a shunt value  $s r$  of 2,928 gave exactly 1,000 divisions from a standard condenser of 1 mfd. (fig. 1).

Substituting a drum of core for the condenser, and retaining the same shunt value ( $s r$ ), a discharge of 611

FIG. 1.

FIG. 2.

divisions given by the cable core therefore represents 611/1,000, or 0.611 mfd.

If it be preferred to get larger throws when the discharge reading is undesirably near to the zero end of the scale, it is simply effected by doubling  $s r$  or  $s r/10$ , as the case may be, and dividing the throw by two.

**Insulation resistance** (by direct deflection method).—The diagram (fig. 3) represents a scale of 1,000 equal divisions, and also the same scale calibrated for resistance. If the galvanometer coil be so shunted that the testing battery, in circuit with one megohm, produces a deflection of 1,000 divisions, then the resistance represented by any other deflection ( $d$ ) will be  $1,000/d$  megohms; *e.g.*, a deflection ( $d$ ) of 500 =  $1,000/500$  = 2 megohms.

The resistances corresponding to certain other deflections are given in the diagram by way of a graphic illustration of how the resistance ( $R$ ) is in inverse ratio to the deflection, or  $R = 1,000/d$  megohms. That is to say,  $R$  is the reciprocal of the deflection multiplied by 1,000. Consequently, the resistance represented by any deflection is obtainable without calculation from Barlow's or other Tables of Reciprocals.

Having, therefore, adjusted the universal shunt reading ( $s r$ ) so that the testing battery gives exactly 1,000 divisions through one megohm, the reciprocal of the deflection from

the cable, when the latter is substituted for the megohm, gives the absolute dielectric resistance  $R$  at any moment after applying the testing battery.

As one division low down the scale represents a much greater difference in the resistance than one division near to the 1,000 end, it is not desirable to read below (say) 200 divisions, *i.e.*, equivalent to 5 megohms when using a shunt value  $s r$ .

The same scale serves for higher resistances by proportionately increasing the shunt values as given below:—

For resistances between megohms	Use shunt reading	Then $R =$
1—5	$s r$	Reciprocal of $d \times 1,000 \times 1$ .
2—10	$2 s r$	" $d \times 1,000 \times 2$ .
10—50	$10 s r$	" $d \times 1,000 \times 10$ .
20—100	$20 s r$	" $d \times 1,000 \times 20$ .
100—500	$100 s r$	" $d \times 1,000 \times 100$ .
200—1,000	$200 s r$	" $d \times 1,000 \times 200$ .
1,000—5,000	$1,000 s r$	" $d \times 1,000 \times 1,000$ .

÷ The equivalent for a deflection of 200 divisions.

It will be noticed that if the deflection  $d$  is near to the 200 divisions when using, say,  $10 s r$ , it will be much higher up the scale when using the next larger shunt value, *viz.*,  $20 s r$ , for testing the same insulation resistance.

Some years ago the writer employed such a scale as that shown in the diagram calibrated for resistance, from which to read directly the absolute  $R$  values of condensers during manufacture, using different scales and shunts to suit particular limits of resistance.

The avoidance of figuring out results when many condensers had to be tested saved much time, and is easily practicable, because the galvanometer deflection in the factory is quite steady.

The modified *equally divided scale* method explained above is, however, more applicable to *core* and to *cable* testing, especially when a test is affected by *earth currents*, or by

*Adjusting the shunt ( $s r$ ) to give 1,000 divisions through 1 megohm.*—If the galvanometer be very sensitive, necessitating a very low  $s r$  value, a difference of 1 may be excessive; this is easily remedied by using the higher value for  $s r$ , and reducing the resulting deflection to exactly 1,000 by adding resistance ( $r$ ) to the galvanometer coil circuit; *e.g.*, employing a highly sensitive Sullivan galvanometer, a testing battery of 600 volts gave a deflection of about 1,020 divisions when using a universal shunt value ( $s r$ ) of 6; and putting 1,228 ohms in series with the galvanometer coil brought the deflection to exactly 1,000. (Fig. 2.)

Substituting 1.6 N.M. of cable core for the standard megohm, and increasing  $s r$  from 6 to 6,000, *i.e.*, increasing the shunt value 1,000 times, the same testing battery gave—

1st minute ( $d$ ) ... 854 divs., the reciprocal of which is 0.001171, and the  $R$  ... = 1,171 megohms abs.  
Or  $\frac{1,000}{854} \times 1,000$  ... = 1,171 megohms abs.

When thoroughly discharged and tested by the ordinary method the calculated  $R$  was as nearly as possible the same.

Long single scale for factory or laboratory.—

Distance from galvanometer mirror to scale ... 12 ft. 6 in.  
Length of 1,000 divisions ... 4 ft. 6 in.

Short double scale for cables subject to earth current disturbances.—

Distance from galvanometer mirror to scale ... 3 ft. 6 in.  
Length of 500 graduations (each representing two divisions)\* ... 1 ft. 3 in.

\* The graduation is the same on both sides of zero.

## PARLIAMENTARY.

### City and South London Railway.

A SELECT COMMITTEE of the House of Lords, of which Lord Sanderson is chairman, commenced the consideration on April 17th of this Bill. The Hon. J. D. Fitzgerald, K.C., appeared for the promoters, and there was a large number of opponents, including the Bank of England and several insurance offices, who were represented by counsel.

THE HON. J. D. FITZGERALD explained that the railway was the pioneer in tube railway construction in this country. At the time it was built, it was thought that a tunnel of a width of 10 ft. 2 in. would be sufficient, but when other tubes came to be constructed the tunnels were made larger in diameter. The chief object of the present Bill was to enable the company to increase the size of the tunnels to that of other tube railways, so as to secure quicker running, a more frequent service, and improved rolling stock. During the morning and evening rush hours the company found great difficulty in accommodating the passengers who wished to travel, and it was that difficulty which had prevented the line being extended beyond its present termini at Clapham Common. The largest number of trains which could be run at present was 24 per hour, which, with five carriages per train, enabled 4,820 passengers to be carried. When, however, the tunnels were enlarged they would be able to put on 40 trains during the hour, each composed of seven carriages, with a seating capacity which would enable nearly three times the present number of passengers to be carried. Counsel went on to explain that under another Bill which would come before the Committee the Charing Cross, Euston and Hampstead Railway Co. were asking for powers to construct a line from their present Camden Town Station to Euston, where it was proposed to connect up with the City and South London line. If that scheme was sanctioned it would be possible to run through trains from Clapham Common in the south, to Highgate, Hampstead and Golder's Green in the north, which would be a very great convenience to the travelling public. Mr. Fitzgerald said he was unable to account for the opposition of the Bank of England and the other City firms, because this was not a proposal to construct a new line. It was a line which had been working for years without doing damage to anyone, and all that was now desired was to slightly enlarge the diameter of the tube. It was proposed to work the line in the same way as other tube railways were worked—by a system of supplying the motive power to the wheels of each carriage, thus getting rid of vibration and dispensing with the use of a locomotive.

Evidence in support of the Bill was given by Mr. ALBERT H. STANLEY, the managing director of the company, and Mr. C. B. STUART-WORTLEY, M.P., the chairman. Mr. Stanley stated that the accommodation which the company was able to offer was very inferior to that which was given by the later tube railways, and the result was that the traffic had shown a falling off of late years. Up to a point the company was fairly successful, and the traffic steadily increased; but some years ago it ceased to expand, and it had since gone back. If they could bring the tunnels up to the

FIG. 3.

induced and undulating currents, so disturbing to cable testing in the ship's tanks at sea, and which necessitate meaning several excursions.

Moreover, when testing a cable for  $R$  by the usual direct-deflection method, one very important criterion as to its electrical soundness is the regularly decreasing differences between *minute* readings, and also the strict comparison between the (say) "negative," "earth," and the subsequently observed "reversed current" readings, according to the usual routine.

It will therefore be obvious that a scale calibrated for resistances is not so suitable for cable testing as an equally divided scale; and as the reciprocal of the observed deflection is obtained from Barlow's Tables, and therefore the  $R$  value obtained by inspection, the method is practically *direct reading*, in so far as it obviates calculation.

same diameter as the other tube railways, and run similar coaches, he believed the traffic would again increase.

[3] After hearing further evidence in favour of the Bill, the Committee found the preamble proved, but held over the consideration of clauses until they had disposed of the next Bill on their list.

### Metropolitan Railway Bill.

(Concluded from page 636.)

MR. WILLIAM WILLOX, the engineer of the Metropolitan Railway Co., explained the engineering details of the two extensions. The first extension from Moorgate Street to Lothbury was, he said, about 502 yards long, and the two tunnels would be about 54 ft. 6 in. below the surface of the pavement. He had put in a proviso to the effect that they would not deviate upwards to such an extent as to bring the rails within 45 ft. of the surface of the road. It was proposed to construct the tunnels by means of shields with compressed air. They would be 16 ft. in diameter, which was rather larger than the ordinary electric railway tunnels. They did not encroach upon any private property. The length of the extension to link up the line with the Waterloo and City Railway was about 250 yards, and in that case the tunnel would be 12 ft. in diameter.

SIR DOUGLAS FOX also gave evidence in favour of the Bill. He said that he was engineer for the Bill of the Great Northern and City Co., in 1902, and on that occasion he satisfied Parliament that the extension to Lothbury could be safely carried out. Since that time, both engineers and contractors had had a good deal of experience as to the construction of tube railways, and by the use of compressed air he thought they had greatly minimised the possibility of injury along Moorgate Street. He regarded it of very great importance that the compressed-air method of construction should be employed in order to prevent the possibility of damage. In the estimates they had allowed £16,000 for compensation in respect to the Waterloo and City extension and £4,000 for the extension to Lothbury.

MR. C. L. MORGAN, chief engineer of the London, Brighton and South Coast Railway Co., giving evidence in support of the Bill, said that the extensions did not present any engineering difficulties.

Similar evidence was given by Mr. H. Dalrymple-Hay, C.E., Sir A. Stenning, and Mr. J. F. Middleton, a contractor.

MR. G. J. TALBOT, K.C., addressed the Committee on behalf of the petitioners against the Bill, and laid stress upon the fact that at one point the crown of the Central London tube would be only 1 ft. 6 in. below the new line. A very slight subsidence might cause serious consequences to wells, hydraulic lifts and the strong rooms of banks.

After hearing further evidence from a number of property owners who opposed the extensions on the ground that their property would be endangered, the Committee decided that the Bill might proceed so far as the proposal to extend the Great Northern and City line from Moorgate to Lothbury, subject to the conditions laid down in the Act of 1902. They rejected the proposal to give a connection with the City and Waterloo line.

### London Electric Railway Bill.

ON Monday the Committee proceeded to consider the Bill promoted by the London Electric Railway Co., which is opposed by the London County Council and the Hammersmith Corporation.

MR. BALFOUR BROWNE, K.C., in opening the case, said that the Bill sought powers to extend the Great Northern, Brompton and Piccadilly Railway at Hammersmith to a junction near Ravenscourt Park with the Kensington and Richmond branch of the London and South-Western Railway. It further proposed a junction between the Hampstead, Euston and Charing Cross Railway and the City and South London Railway on the widened tunnel. The London County Council wished the Committee to reject Clause 40 of the Bill, which gave the company power to carry out work beneath the public streets without compensation for the removal of the subsoil, the rights of which are vested in the Council. Mr. Balfour Browne said that the promoters were simply giving effect to the ordinary law in the clause which had laid it down that where a company used sub soil which was at such a depth below the surface of a public street that it was of no practical value to the public, they should not be obliged to pay compensation.

MR. FREEMAN, K.C., said that the position of the London County Council was that the railway would run down Northumberland Avenue and Southampton Row—thoroughfares which had been improved very largely at the public expense. In such a case, the Council thought it only right that a company wishing to go underneath such thoroughfares should be compelled to pay the Council something towards the cost of the improvement.

The Committee decided that they would allow the clause to stand, and the preamble of the Bill was declared proved.

**Central London Railway Bill.**—All opposition to the Central London Railway Bill has been withdrawn, and consequently it has been taken from the group down for consideration by Lord Sanderson's Select Committee.

**Richmond (Surrey) Electricity Supply Bill.**—The Standing Orders Committee of the House of Commons has decided that the Standing Orders in the case of the above Bill may be dispensed with, and that the Bill shall be allowed to proceed.

**Leeds Corporation Bill.**—The Standing Orders Committee have decided that the Leeds Corporation may proceed with their Bill, on condition that Tramway No. 6 is struck out.

**Herne Bay Gas and Electricity Bill.**—The Unopposed Bill Committee of the House of Commons has passed the preamble of the above Bill, which, amongst other things, gives power to the Herne Bay Gas and Coke Co. to supply electricity within the Urban District of Herne Bay.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Plexsim Sealing-Wax Heaters.

MESSRS. SIMPLEX CONDUITS, LTD., of 116, Charing Cross Road, W.C., have recently given attention to the development of electrical sealing-wax heaters, which, in view of the outbreaks of fire that have occurred with non-electric types, ought to be very favourably received in factories where much packing in sealed parcels is carried on. Two patterns have been designed, of which we give illustrations herewith.

In the case of the "Plexsim Industrial Pattern," shown in fig. 1, the sealing-wax is placed in the inner receptacle, and is allowed to run over the two slopes at either end, which are also heated to prevent the wax from cooling down: it can be picked up by the

FIG. 1.—PLEXSIM SEALING-WAX HEATER, INDUSTRIAL TYPE.

flaps of the parcels to be sealed. Where it is required to make use of an ordinary seal impress, the wax can be allowed to run down the slopes, which are specially shaped at the bottom to allow it to drop off. The amount flowing out of the central chamber can be accurately regulated by opening or closing the apertures with the small shutters provided. Any excess wax is caught in the

FIG. 2.—PLEXSIM WALL-PATTERN SEALING-WAX HEATER.

tray upon which the heater stands and used again, thereby guarding against waste. The appliance is substantially constructed in black enamelled iron, and being double-ended, allows two persons to work with it at the same time.

The wall pattern, shown in fig. 2, is intended for the use of chemists, and in other trades where a large quantity of small packages require sealing. It is especially suitable for use where the ordinary hand seal impress is used, or where the packages are small and require sealing in a number of different positions. The heater is made suitable for fixing to the wall, and for use with the ordinary sealing-wax supplied in sticks. The latter is pressed on to the heated cast-iron point, which is so shaped as to allow the melted wax to fall off the point in the form of small drops suitable for receiving the impress.

The appliance is solidly constructed, and the heated portions are insulated and ventilated from the base upon which it is mounted, which always remains cool. The heater is ready for use in three or four minutes from switching on. The energy consumption is so low, however, that it may be kept continually in circuit without undue expense, and may be connected to any convenient lampholder.

#### Gate-end Box for Docks and Mines.

The gate-end box which is shown in the accompanying view, fig. 3, and for which the GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, E.C., are responsible, consists of a standard ironclad switch and fuses, with the usual device for preventing the switch cover being opened with the switch at the "on" position. This switch is interlocked with the plug, to which is connected the flexible cable running to the motor. This interlock refuses admission to the plug with the switch closed, and prevents the plug from being withdrawn with the switch closed. The earthing conductor is brought back from the motor to the plug, and here it is connected to special terminals, which make contact with others in the plug socket. These contacts are so arranged that the first thing done on the insertion of the plug is the completion of the

FIG. 3.—G.E.C. GATE-END BOX FOR DOCKS AND MINES.

FIG. 4.—STONEWARE BOILING JUG.

earth circuit, and the last thing on its withdrawal is the breaking of the earth circuit. The result is that the motor can never be under pressure with the earth connection unmade. It will be observed from the illustration that the lower part of the interlocking bar is protected from any blows that might do damage by an iron tube. The interiors of the switch and fuse cases are well protected against arcs, and adequate clearances are given between the fuses and case and between the switch blades and case. It will be remembered that the Home Office has recently called attention to the fact that many switches are defective in this respect.

#### Stoneware Electric Utensils.

A neat novelty has been introduced by MESSRS. BAXTER AND CAUNTER, LTD., of 219, Tottenham Court Road, W., under Hosgood's patents, in the form of a series of stoneware utensils provided with electric heaters, as illustrated in fig. 4, which shows a one-pint boiling jug. The heating element is placed round the lower part of the vessel, and is protected with an insulated metal cover; being in actual contact with the stoneware, it communicates heat to the latter very quickly, and on trial with a two-pint jug we find that less than 10 min. suffices to boil a pint of cold water. The jugs can be used for heating water, milk, beef-tea, &c., or cooking eggs, and a shaving pot is made on similar lines. The socket is adapted for direct connection to an ordinary lampholder. Other patterns are in course of preparation. These utensils are much cheaper than metal ones.

## LEGAL.

SCHLOSS & Co. v. DODD.

IN the City of London Court, on April 17th, before his Honour Judge Rentoul, K.C., an action was brought by Messrs. Louis Schloss & Co., electric lamp manufacturers, 3, Rangoon Street, Crutched Friars, E.C., against Mr. Edward H. Dodd, electric lamp dealer, 11, Old Bond Street, Bath, to recover the sum of £2 4s. for electric lamps supplied. There was no dispute about the order or delivery of the lamps, but the defendant said that they were defective. Judge Rentoul observed that the burden of proving that was on the defendant. When a man received electric lamps and he raised as a defence that they were not fit for the purpose for which they were supplied, he had to prove it.

Defendant said that he tested the lamps when they arrived, and then he wrote to the plaintiffs and told them that they were defective. He first tested three lamps. The filaments went, and the plaintiffs sent him three more which were no better than the others. Then he went through all the lamps and returned the lot to the plaintiffs.

JUDGE RENTOUL pointed out that substituting three others might be an admission that the original ones were wrong, or it might be an endeavour to avoid litigation.

MR. MORLEY, plaintiffs' solicitor, said that the lamps were supplied in November and defendant gave a post-dated cheque to February 10th, which was returned twice marked "Not provided for." No lamps had been exchanged as alleged; others were sent as ordered.

DEFENDANT said he told plaintiffs that he would not meet the cheque as the lamps were defective.

MR. MORLEY said that the lamps had not been returned to the plaintiffs. They were sent back, probably, but were delivered to someone else on the premises. There was no complaint about the lamps being defective until the cheque was stopped.

JUDGE RENTOUL said it would not do for the defendant to keep electric lamps for several months, and then say they were defective. If he had written at once and said that the lamps were wrong, it would be another question. It was not fair to keep lamps, send a cheque, and then say that they were bad.

Defendant said he gave the cheque in February, not in November, as the plaintiffs said.

JUDGE RENTOUL said that the defendant had put himself in the wrong by keeping the lamps as long as he did. There was no complaint for several months.

JUDGE RENTOUL gave judgment for the plaintiffs for the amount claimed, with costs.

#### QUINN v. SUNDERLAND CORPORATION.

AT Sunderland County Court on April 17th, before Judge Bonsey, Mrs. Margaret Quinn brought an action against the Sunderland Corporation to recover damages in respect of injuries received while a passenger on one of its tramcars.

MR. MUNDHAL, for the plaintiff, said Mrs. Quinn was 70 years of age. She and her son proceeded to get on to a car, and as she was making an attempt to reach a vacant seat, the vehicle started with a jerk. As a result, Mrs. Quinn was thrown. Her nose and her wrist were broken. The plaintiff claimed £5 for the doctor's bill, £2 9s. for special nourishment and £3 for loss of employment. She also claimed that she was entitled to additional damages for pain and suffering.

JUDGE BONSEY: Your view is that a conductor should not start a car until all the passengers are seated. That is not the general practice.

MR. MUNDHAL: That is so, but a conductor starts a car at his own risk, and he should take special care in the case of elderly and infirm persons.

JUDGE BONSEY said he could not find that the conductor of a tramcar was bound to delay starting his car until all the passengers had seated themselves at their own pleasure. The only obligation on him was to give reasonable time for them to be seated and if they were not seated then it was at their own risk. He was convinced that in this case the conductor had led the lady to a seat, and had given her reasonable time to sit down, but she did not take advantage of the time given her. He, therefore, gave judgment for the defendants.

A formal order for costs was made, but it was understood that it would not be enforced.

#### ACTION AGAINST DUNDEE CORPORATION.

THE record has been closed in the Sheriff Court in an action at the instance of a motor lorry company against the Corporation. It is alleged by pursuers that a lorry belonging to them fell through an improvised roadway, which had been opened up by the Town Council, for the purpose of laying an electric cable. They claim £50 as damages.

#### SENTENCE FOR STEALING.

AN extraordinary series of thefts from the Glasgow Corporation's tramcar building and repairing works at Coplawhill, extending over a period of six years, was disclosed in the Sheriff Court on Thursday, last week, when a foreman electrician, James Pollock, was charged. Accused pleaded guilty to having, between January 1st, 1907, and February 25th, 1913, stolen 2 tons of armature coil

copper wire, 6 cwt. of copper commutator bars, 9 cwt. of block tin, and 25 miles of insulated copper wire, valued at about £800. Pollock had been in the service of the Corporation for 15 years, and had a wage of £3 per week. Unfortunately he had fallen into bad company, and, to increase his means, had sold these articles belonging to the department.

SHERIFF BOYD, in passing sentence of six months' imprisonment with hard labour, said that while this might be the first charge brought against the accused, it was a very serious one.

#### NATIONAL TELEPHONE ARBITRATION: QUESTION OF COSTS.

BEFORE the Railway and Canal Commission (Mr. Justice A. T. Lawrence, the Hon. A. E. Gathorne-Hardy and Sir James Woodhouse) was mentioned on Monday last the case of the National Telephone Co., Ltd., *v.* His Majesty's Postmaster-General.

SIR ALFRED CRIPPS, K.C., on behalf of the company, asked that the taxation of costs might be on the higher scale. His Lordship, he said, had not expressly mentioned that it should be, but it was usual to allow higher scale costs in exceptional cases, and he thought he might say this was an exceptional case. He did not know what attitude the Attorney-General would take, but all parties were desirous that the taxation should go on.

The ATTORNEY-GENERAL (Sir Rufus Isaacs, K.C.) said he did not desire to question the costs being given on the higher scale. It was a question entirely for his Lordship and he, therefore, did not desire to put forward any argument. His Lordship knew all about the case, and anything that was reasonable and right they were prepared to do. They did not want to pay more, and at the same time they did not want to pay less than his Lordship should think was reasonable and right.

His LORDSHIP, after consultation with the other commissioners, said that they thought the taxation ought to be on the higher scale.

SIR ALFRED said he was obliged to his Lordship, and under these circumstances the matter could go forward.

#### SOLOMON F. WELLS, RAYNER & CO., LTD.

ON Saturday last, in the King's Bench Division, before Mr. Justice Rowlatt, an action was brought against defendants, electrical engineers, of Paddington Street, W., by Mr. David Carvalho Solomon, who was formerly in their employ.

MR. R. P. G. JOHNSON, on behalf of plaintiff, stated that his client sought to recover £126 8s. 6d., for commission due and payable under an agreement dated March 25th, 1912, by which defendants agreed to pay Mr. Solomon a commission of 2½ per cent. on defendants' turnover in their electrical business above £4,000, for a period from January 1st, 1912, to December 31st, 1912, including net cost of work in hand at December 31st, 1912, such commission to be payable before January 31st, 1913. Defendants had paid into Court and admitted liability of £99 1s. 10d. out of the £126 8s. 6d. The position was, explained counsel, that the defendant company, which he understood was a private company, carried on business as dealers in electrical supplies. In May, 1911, plaintiff entered their employment when something was said about giving plaintiff an interest in the business, and it was agreed that he should receive besides his salary, a commission on the turnover above £4,000. It was explained to Mr. Solomon that the business was carried on in such a way that until they had a turnover of £4,000, there would be no profit accruing. Mr. McClelland, the chief shareholder and managing director of the business, told plaintiff what the amount of business was for the current year up to that time, but explained that they expected to double it during 1912, and said that the £4,000 had already been reached during the first three months of that year. There was also some mention of a large country job in particular, the order for which had been given in 1911, and upon those representations, Mr. Solomon himself drew up a form of agreement, but although Mr. McClelland objected, he signed it substantially in the form in which plaintiff had drawn it up, by which plaintiff was to receive £2 a week and 2½ per cent. on the turnover over £4,000, including net cost of work in hand at December 31st, 1912. Nothing further came of the matter until a day or two before the agreement ran out, when Mr. McClelland asked plaintiff whether he felt he was entitled to commission on 1911 orders.

His LORDSHIP: The whole question is the application of the word "turnover."

MR. JOHNSON agreed, and said the trouble was as to the work remaining unfinished at the end of 1911.

MR. CUMBER, on behalf of the defendant company, said that the plaintiff knew when he entered into the agreement, exactly what was intended by the word "turnover," and he was now trying to introduce into the agreement something which it was never agreed between the parties should be in it. The balance-sheet was produced to plaintiff at the time, and the method that was adopted for arriving at the turnover on which the commission should be based was quite usual.

After hearing evidence on both sides and considerable legal argument, his LORDSHIP said he saw so many reasons for deciding in favour of both sides, that he would consider his judgment.

On Monday MR. JUSTICE ROWLATT delivered judgment. He said that the point in dispute merely involved the construction of a document, but the evidence and arguments made it necessary that he should carefully consider the decision to which he had come. The plaintiff made an agreement with the defendants, a firm of electrical engineers, to serve them for a year, and they agreed to pay him a commission of 2½ per cent.

The defendants had put forward accounts for the purpose of calculating the commission showing the full amount of the invoices rendered during the year, and added to that was the net cost of the work in hand. There was no dispute as to those figures, but they had deducted the net cost of work in hand at the beginning of the year, which it was said they had no right to do. The plaintiff contended that the turnover of the company meant the amount of the invoices rendered during the year. He said that if the turnover was to be taken as involving the exclusion of work unfinished at the beginning of the year then the clause which said "including work in hand in December, 1912," was of no effect at all. He said that in order to give meaning to those words, they must adopt his construction that the word "including" meant in addition to. Of course the more accurate turnover was the actual work done in the year, which involved the exclusion of the beginning part. On the other hand, the defendants said that the plaintiff was paid by salary up to December 31st, 1911, and was not paid by commission at all, and that he, therefore, had no interest in work being done up to that time. When they came to the following year the contract was that he was to be paid by commission on the business of the company for the period during which he engaged himself to serve under the agreement. He (the judge) had come to the conclusion that the defendants were right. He thought that the governing consideration actually was that the plaintiff was going to serve for a year, and that he was to be paid by commission on the volume of business done during that period only, and not something more. He had had his salary up to the end of the preceding year. The best construction his Lordship could put upon the agreement was that it was to be assumed that he was not to be paid commission during the period he was being paid by salary. He, therefore, gave judgment for the defendants, with costs.

Judgment was entered accordingly.

#### IMPORTANT APPEAL CASE *re* FACTORY ACTS.

AT the Middlesex Sessions, held at Caxton House, Westminster, on Monday, before Mr. Montagu Sharp and a bench of magistrates, the appeal of the North Metropolitan Electric Power Co., Ltd., was heard against two convictions on June 26th, 1912, by the Highgate Magistrates for committing breaches of Rules 18 (d) and 28 of the Home Office Regulations regarding the generation, transformation and use of electricity in factories and workshops.

Mr. Bodkin appeared for the appellants, and Mr. J. Hunter Gray and Mr. Boyd for the respondents.

MR. GRAY said the appeal was with respect to two convictions, but it would be convenient to take them together. The convictions were for failing to comply with certain regulations which were issued under the Factory Acts of 1901 and 1907 to govern the proper protection of electric supply companies' works. The drawing he had put before the Court was the Finchley sub-station, which was supplied with electrical energy from the main station at a very high voltage. Energy was supplied by this sub-station to the Metropolitan Tramways Co. for the purpose of driving their tramways and lighting them, and for some other subsidiary work. In the room of which he produced the drawing the voltage was 10,000 volts. It was not necessary that each conductor should be of 10,000 volts, and they were agreed that the voltage which was exposed in the case they were considering was something like 6,000, and strict precautions had to be taken to prevent anyone coming in contact with a conductor carrying such high voltage, especially as, unlike other sources of danger, one could not see that the danger was there. The result of the alleged failure on the part of the appellants was that a man was killed. Counsel proceeded to direct the attention of the Bench to the drawing of the room, and pointed out the cable coming in from the main station bringing in electrical energy at 10,000 volts. There was also an X on the drawing, which showed a porcelain tube. It was at this point that a part of the conductor was bare, and it was at this point that the young man who was killed came in contact with the conductor. The workman who was killed, whose name was Arthur Shapcot, had the duty of cleaning certain parts of the machinery, and on March 25th, 1912, during the night he was cleaning the part just above the bus-bars. There were three inverted troughs, and above that there were the pressure limit resistances. A great deal of dust got on to these, and therefore it was necessary for them to be kept constantly clean. The young man was told to clean these pressure limit resistances, and in order to do that he had to get up from the floor, because the height of the pressure limit was about 10 ft. from the ground. He appeared to have got on to the right-hand oil switch cell, and from that position to have dusted part of these resistances. Then by some means or other, he appeared to have gone over to the left-hand oil switch cell, so as to finish the cleaning of the resistances from that side. Unfortunately, while he was there his left wrist appeared to have come into contact with the bare conductor at the part marked X on the drawing, and he received the whole 6,000 volts and was killed. He submitted that the purpose of the rules of the Home Office was clearly to provide against accidents of this kind, and what the legislature had done, and what had been found in practice to be the necessary thing, was that persons who had to do with such apparatus, should make the whole of the room dead. In this case the particular part of the room where the young man was working was dead, but unless the adjoining parts of the apparatus were also dead there was still danger and liability to accident. Therefore there was an alternative provision made in the regulations that if they only cut off sections of the room they had to properly screen off the adjoining parts so that accidents might be avoided. The contention of the prosecution was that the part marked X should

have been properly screened off so that the young man in going on to the left-hand oil switch for the purpose of cleaning could not, under any circumstances, have come into contact with the bare metal. Substantially that was the whole case. Rule 28 read: "(28) No person except an authorised person or a competent person acting under his immediate supervision, shall undertake any work where technical knowledge or experience is required in order adequately to avoid danger; and no person shall work alone in any case in which the Secretary of State directs that he shall not. No person except an authorised person or a competent person over 21 years of age acting under his immediate supervision, shall undertake any repair, alteration, extension, cleaning or such work where technical knowledge or experience is required, in order to avoid danger, and no one shall do such work unaccompanied." On the night in question, the young man was accompanied by his superior, Thomas Styles, and the contention of the prosecution was that he was neither an authorised person nor a competent person over 21 years of age. To see what an authorised person was they had to look at the definition, and it was there laid down:—"Authorised person" means (a) the occupier, or (b) a contractor for the time being under contract with the employer, or (c) a person employed, appointed, or selected by the occupier, or by a contractor as aforesaid, to carry out certain duties incidental to the generation, transformation, distribution, or use of electrical energy, such occupier, contractor or person being a person who is competent for the purposes of the regulation in which the term is used." Whether this young man was competent as defined by the regulations was of course a matter of opinion, but, *prima facie*, he would say that the very fact of his being killed was to some extent evidence that he was not competent.

THOMAS GEO. STYLES said he was 26 years of age, and was at the Finchley sub-station. He remembered the accident to Shapcot, who was his assistant. Witness was in charge of the room in which the accident took place. Shapcot was on duty on the night in question, and was instructed to clean the pressure limits. Witness was standing on the platform higher up than the deceased. At the time of the accident the bus-bars on the left-hand were completely dead. He saw a great flare where Shapcot was standing, and went to him, and found that something was wrong and called assistance, and it was found he was dead. The only mark he saw was on the deceased's wrist. The deceased had a piece of white rag in his hand, and was dusting the resistances. He did not know how the deceased got where he was. The union just inside the insulator was bare.

In cross-examination, witness said he gave evidence at the inquest on Shapcot, and the jury exonerated him from all blame. He had been over six years in the employ of the company. He started at the Finchley sub-station, and was under Mr. Hunt, the sub-station engineer in charge. He was promoted to be charge attendant. Before being promoted, Mr. Hunt observed his work, and questioned him from time to time. The cleaning was carried out once a week by different shifts. The work was done at night, and it came to the return of each shift once in the week. Shapcot had worked five or six times with him, and had done the very work they were doing when the accident happened. Shapcot was an active man, and was very keen on his work. He understood deceased had had three terms technical instruction at the Tottenham Institute. He found the deceased very competent. He knew under the regulations that he would not be allowed to work if incompetent, and there had been nothing to make him regard Shapcot as anything but a perfectly efficient assistant. On the night in question he told the deceased to do his work. Deceased used the same ladder as he did to get to do the right-hand oil cells, and when he got there he was in his accustomed place for doing the work where he had been on previous occasions. The oil or brick cells were about 6 ft. high. From the position in which the deceased usually stood he could by stretching have done all the work required. He would of course have either to straddle over or crawl under certain cables.

Counsel, by means of the model, took the witness over the position occupied by the deceased on the night in question, and witness pointed out the cables which were dead. There were various positions in which the deceased could have done the work, and witness would have had no hesitation in climbing anywhere about on the right-hand side. The bus-bars on the No. 1 side that night were disconnected. From the time he saw the deceased doing his work to the time he saw the arc, and knew there was trouble, was hardly any time. He dropped his screwdriver, and, after stooping to pick it up, he saw the deceased on the other side of the passage, and saw the arc. Counsel took witness through a list of a number of other duties carried out by deceased, with the object of proving that he was possessed of very considerable technical knowledge and skill. Had he questioned the deceased on whether the different apparatus in the room were live or dead he could have told him. From his knowledge of the place, the deceased ought not to have been on the left-hand side at all, and there was no necessity for him to be there for the purpose of doing the work he had to do. His belief was that the deceased did not touch the bare spot at all, but a part of the insulation just as it emerged from the porcelain cover.

THE CHAIRMAN: Which means that the insulation was defective?—Witness said he thought the deceased caught hold of it to steady himself, and the insulation was not strong enough.

In re-examination, Witness said the deceased would not often go into the high-tension room. He would go into it every shift, and if anything were wrong would call witness. The room where the accident took place was the most dangerous in the station. It was not possible, standing on the oil switch on the right, to clean the whole of the bus-bars. Witness would not have stood on the left-hand oil switch. He believed that deceased fully understood the danger

of 10,000 volts. He saw the deceased get on to the left side in the previous week, but on that occasion that side was dead.

MR. G. SCOTT RAM, H.M. Inspector for the Home Office, said he had to visit electrical stations to see that the regulations were complied with, and he went to the Finchley sub-station after the accident.

MR. GRAY was proceeding to put it to witness to say what provision might have been made in the station to prevent the action, when MR. BODKIN objected, and pointed out that the question was whether the particular regulations had been contravened or not. These regulations had the force of an Act of Parliament, and it was no part of the duty of a gentleman, however expert, to put his interpretation upon any section.

MR. GRAY: If the isolating switch had been open could this accident have occurred at the place where it did occur?—It could not.

If the isolation switch had been closed and a screen had been placed round the current transformer, could that accident have happened?—No.

Speaking as a practical man, is there any practical difficulty in any of these methods of avoiding accidents?—None whatever.

MR. GRAY: Supposing the isolating switch were on, and there were no screens, is there any other way of rendering the whole of that room dead?—The cable might have been made dead from the far end.

THE CHAIRMAN: Then that is a third alternative?—Yes. It would be some miles away at the next sub-station.

THE CHAIRMAN: But that would be impracticable?—It is very often done by telephoning to the other station.

MR. GRAY: That would not have stopped the working?—No; the other feeder could have gone on.

Answering further questions put by MR. GRAY, witness said that, in his opinion, the easiest way to have cleaned the pressure-limit resistance would be first to clean one side, standing on top of the right-hand cell, as Shapcot did, and then it would be the easiest thing to clean from the other side. He did not consider there was any difficulty of a person getting across from one side of the passage to the other. If a person went to the top of the bus-bars to clean, there was nothing to prevent him from coming down on the other side on to the left-hand cell.

Cross-examined by MR. BODKIN, witness said it was easy to get across from the right-hand series of cells to the left-hand. He admitted it was a distance of at least 2 ft. 6 in., and that a man would have to bend down to make himself 3 ft. 2 in.

MR. BODKIN: Active official as you are, could you reduce your height to 3 ft. 2 in. and then step across 2 ft. 6 in.?—Witness said that the same questions were put to him at the Police Court, and he gave the opinion that a man could get across. He had been to the station since then, and saw an engineer do it.

Replying to the CHAIRMAN, witness said he had not been to this particular station before the accident, but he had been to other stations of the same company. The station was visited by other inspectors. The station had been going on for many years, and he believed it had been inspected.

If this is so, how is it that the Home Office has not pointed out this defect?—It is not the duty of the Home Office to point out all defects. The duty of complying with the regulations is upon the occupier.

How can they say whether the regulations are complied with if they are not aware of the defect?—It is their duty to be aware.

Then why is not this pointed out? I want to be perfectly fair. Here is a Government department supposed to overlook buildings. This has gone on for some years, and then there is an accident, and the Home Office say: "Why is not this done?" If the Home Office officials did their work properly they would have detected this dangerous spot?—It is a regulation dealing with special work and repairs, and extensions. The Home Office official might go to that building once a week and never catch them at this particular cleaning work. This regulation requires that certain things are to be done when you do certain work, but you might go a hundred times and not see that work done.

But the inspector would know when it was cleaned; certain men would have to be in certain positions?—He would know certain things ought to be done when it was cleaned, but it is no matter to the inspector what they do if they make it safe in accordance with the regulations. If the switch had been off everything would have been safe and the regulations would have been complied with, but they did not do that. They chose to have another method, and in choosing that they did not make the proper provision.

How is it that the Home Office, with all this inspection, did not foresee these things, and point out to the officials the chance of a possible accident? You are the expert?—We told them in the regulations that when anything has to be done on the switchboard they shall do either of two things, and they have done neither. It is impossible for the Home Office to send inspectors out to see to these, as they do not know when the work is to be done.

This closed the case for the respondents.

(To be continued.)

We shall complete our report of the hearing in our next issue, but the result may now be given.

THE CHAIRMAN said the Bench were unanimous in their decision. As regarded the conviction under Regulation 18, they were of opinion that the appellants should have opened the switch, which would reduce that point of danger. Therefore, in that case, they thought the appeal must be dismissed, but that the penalty should be reduced to £10 10s. With regard to the conviction under Regulation 28, they were of opinion that within the technical meaning of the regulation Shapcot was an authorised person, and in that case the appeal was allowed. They made no order as to costs.

## BUSINESS NOTES.

**Electric Clocks at the Ghent Exhibition.**—We are informed that among the many interesting things shown at I.L.M. Post Office exhibit at Ghent Exhibition, which is to be opened this week, is an installation of electric clocks made by the SILENT ELECTRIC CLOCK CO., LTD., of London. In the centre of the Stand is a hanging clock with four faces, while other smaller clocks are placed elsewhere—the whole installation being controlled from one master clock. These clocks are of the standard pattern as supplied to I.L.M. Post Office, for which department the Silent Co. have carried out, and are now carrying out, many important electric clock installations. The main feature of this company's system lies in the "rotary armature" dial mechanism invented by Mr. G. B. Bowell.

**Electric Laundry Irons.**—Referring to the letter of "Ironical," in our issue of the 11th inst., Mr. G. Maurice, manager of the fixture and heating departments of the G.E.C., agrees that the writer's remarks would have been fully justified up to quite recently. The GENERAL ELECTRIC CO., however, has recently placed upon the market a "Magnet" electric laundry iron, which will do away with most of the objections raised by our correspondent to this class of electric-heating apparatus, and to demonstrate the progress made in this class of goods, the company would have much pleasure in submitting to "Ironical" a sample of these "Magnet" laundry irons to test.

Referring to the same correspondence, MESSRS. SIMPLEX CONDUIITS, LTD., inform us that they have supplied a large number of their "Service" type iron. This iron was described in our issue of April 5th, 1912, and is provided with special means of protecting the connector and with a revolving connection box, which takes up any twisting of the connecting wires when the iron is in use, preventing the frequent failures attributable to this cause. They send us an interesting report from the chief engineer of Dundee regarding a number of these irons in use at the laundry attached to the King's Cross Hospital at Dundee, which is worth reproduction, as showing the economy of electric irons:—

Weight of irons in use: Two 8½-lb., one 12-lb.

Date.	Material Ironed.	No. of workers.
Monday, Feb. 17th, 1913...	21 pieces of flannel; 27 unstarched dresses.	1
Tuesday ... ..	40 pieces body linen ...	
Wednesday ... ..	150 aprons ... ..	2
Thursday ... ..	Collars, cuffs, belts, ties, caps, small pieces of finery and 130 bibs of aprons.	2
Friday ... ..	16 starched dresses and petticoats	

Units used for week, 42; at 1d. = 3s. 6d.

Coal previously used, 3s. 6d. Net saving for week, 2s.

Date.	Material Ironed.	No. of workers.
Monday, Feb. 24th, 1913...	24 unstarched dresses ...	1
Tuesday ... ..	27 pairs of flannel 38 underclothing	1
Wednesday... ..	147 aprons ... ..	
Thursday ... ..	432 articles ... ..	2
Friday ... ..	14 starched dresses and small finery	1

Units used for week, 58; at 1d. = 4s. 10d.

Coal previously used, value 6s. 6d. Net saving per week, 1s. 8d.

The workers state that the irons are eminently satisfactory, as, owing to the fact that the irons are always ready, the time taken to do the work in hand is very much lessened; also the comfort, compared with the awful heat experienced before, is unique. The management have since gone in for a glossing iron for the collars and cuffs, which now does away with the old coal stove entirely.

**Siemens on Parade.**—MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., of Dalston, obtained both a first and second prize at the London Van Horse Parade in Regent's Park. As many of our readers are aware, the firm's delivery vans are used for displaying their well-known posters.

**New Zealand's Electrical Manufactures.**—From the report of the industrial census of New Zealand taken in 1911, which has lately been issued, it appears that the value of the productions of the electrical engineering concerns in the Dominion in that year amounted to £69,673.

**Book Notices.**—*Chronique Illustrée du Concours International de Télégraphie Pratique*. Turin. 1911. Milan: from the Author. Price 20 fr.—This really magnificent souvenir of the 1911 competitions at Turin, prepared by Sig. F. Geronimi, constitutes a complete record of the organisation, execution, and consummation of the noteworthy event, which took place during the run of the Exhibition at Turin. Most ample information is given regarding the arrangements that were made, and the volume is replete with photographic illustrations, many of which are very beautiful. A full account is also given of the proceedings at Como in honour of Volta, and of the celebrations at Milan, followed by a chronicle of the closing visit to Rome, and much other matter. Unfortunately, there was only one British competitor on this occasion, so that the results of the trials are of little interest to this country; but the

work as a whole will be invaluable when the organisation of a similar international competition is under consideration, and we must express our admiration of the manner in which this volume has been written, illustrated, printed and bound.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXII, No. 4. April, 1913. New York: The Institute. Price \$1.00.

"Transactions of the Institution of Engineers and Shipbuilders in Scotland." Part VI. 1912-13. Glasgow: The Institution.

"Descrizione una Macchinetta Elettro-Magnetica." By Dr. Antonio Pacinotti. Milan: Associazione Elettrotecnica Italiana.

"Transactions of the North-East Coast Institution of Engineers and Shipbuilders." Vol. XXIX Part 5. April, 1913. Newcastle-on-Tyne: The Institution. Price 5s.

"Journal of the Franklin Institute." Vol. CLXXV, No. 4. April, 1913. Philadelphia, Pa.: The Institute. Price 50 cents.

"Journal of the Roatgen Society." Vol. IX, No. 45. April 1913. London: Smith & Ebbes, Ltd. Price 4s. net.

**French Electrical Imports.**—The value of the dynamo-electric machinery imported into France last year amounted to only £371,920, as compared with £378,640 in 1911. On the other hand, the imports of electrical and electrotechnical apparatus increased in value from £571,200 to £671,600.

**Bankruptcy Proceedings.**—SAMUEL SMITH (trading as Smith & Sons), 22A, 24 and 26, Victoria Square, Widnes, Lancaster, electrical engineer, &c.—The adjourned public examination of the above-named debtor was held at the Court House, Government Buildings, Victoria Street, Liverpool, last Monday. It was reported that there had been disputes between the debtor and his sons as to the conduct of the business, and a deed of assignment was executed, but later, finding himself in difficulties, the debtor filed his petition. There had, in the meantime, been a proposal to convert the business into a company, but the matter had fallen through. The Official Receiver stated that the deed of assignment was executed about seven months before the date of the petition, and that the deed became operative. He (the debtor) filed a statement showing an estimated surplus of £750. In regard to the assets the debtor stated that £750 was the surplus if the estate had been realised promptly and properly, but he did not think there would be that amount of surplus now. Under those circumstances, the accounts would have to be amended. Subject to the accounts being amended, the examination was closed.

**Liquidations.**—THE GILBERT ARC LAMP CO., LTD.—Creditors must send particulars of their debts, &c., to Mr. W. A. Henderson, 3, Fenchurch Street, E.C., the liquidator, by May 15th.

BERRY CONSTRUCTION CO., LTD.—A meeting is called for May 22nd at 29A, Charing Cross Road, W.C., to hear an account of the winding-up from the liquidator, Mr. J. C. Wrist.

ACOUSTIC PATENTS, LTD., 353, Oxford Street, London, W.—Date of release of liquidator, April 10th.

**Patent Application.**—Application has been made for the restoration of Patent No. 22,819 of 1908, granted to Thomas John Murday for "Improvements in Primary Electric Clocks."

**Safety Lamp Approved.**—The *London Gazette* contains notice of approval by the Home Office, of the Gray-Sussmann electric safety lamps, Nos. 3 and 4, for use in all mines covered by the Coal Mines Act, 1911.

**For Sale.**—Messrs. P. Huddleston & Co. will, on May 1st, sell by auction, at Dalling Road, Hammersmith, a large quantity of electrical apparatus. See our advertisement pages in this issue.

**Trade Announcements.**—Arrangements have been completed for the continuance of the old-established business of John Musgrave & Sons, Ltd., by a new company with a cash capital of £80,000, which was duly registered on March 12th. Such new company, in addition to acquiring the assets of the old company, has purchased the goodwill and patterns of the business of Messrs. J. & E. Wood, engineers, of Bolton, and Mr. Henry Wood will act as a director. The name of the new firm is JOHN MUSGRAVE & SONS (1913), LTD., and its address Globe Ironworks, Bolton. It is stated that the new capital introduced into the concern is ample for its requirements.

MESSRS. J. PRICE & SON, electricians, &c., have opened new premises at 113, Bedford Road, Rock Ferry, near Birkenhead.

MESSRS. MARSH, SON & CO., dealers in electrical fittings, are relinquishing their depot at 11, Upper Priory, Birmingham.

MESSRS. H. W. BUTLER & CO., of Craven House, Kingsway, W.C., have been appointed agents for London and district for Messrs. James MacIntyre & Co., Ltd., of Burslem, makers of electrical porcelain.

**Catalogues and Lists.**—MESSRS. C. E. LUGARD & CO., Chester.—Illustrated pamphlet of 28 pages, fully detailing and showing by means of half-tones and line diagrams, the Vulkan drive applied to several makes of planing machines—the Vulkan reversing electro-magnetic clutch and the automatic reversing switch.

MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD., Tyssen Street, Dalston, N.E.—Eight-page booklet, giving full particulars of their series system of h.c.p. illumination, as at present applied to street lighting by the Brighton Corporation. It is claimed for the Brighton system that low-voltage h.c.p. "Wotan" lamps can be used for replacing series arc lamps, with a considerable reduction in working and maintenance costs. The existing wiring can be employed and the same substitutional resistances.

THE ELECTRICAL CO., LTD., Charing Cross Road, W.C.—April stock list of A.C. and C.C. motors, kinematograph sets, &c.

**MESSRS. PETTERS, LTD.**, 63, Queen Victoria Street, London, E.C.—New 16-page catalogue, with excellent art coloured pictures, giving description, specification, results of tests, &c., of the Petter patent semi-Diesel crude oil engines.

**THE GENERAL ELECTRIC CO., LTD.**, 67, Queen Victoria Street, London, E.C.—Publication No. 1,662 (eight pages), containing fully-illustrated particulars and prices of the "Magio" suction cleaner, the "Little Briton," "Rapid," "Express," and "Turbine" vacuum cleaners, and attachments for use with them.

**MESSRS. VERITY, LTD.**, King Street, Covent Garden, London, W.C.—New publication No. 751, contains some illustrated information concerning the "Aston" totally-enclosed and ventilated type motors, ranging from  $\frac{1}{2}$  to 80 H.P. Tabular particulars are given for such motors for voltages ranging from 110 to 500 volts.

**MESSRS. SCHOLEY & CO., LTD.**, 151, Queen Victoria Street, London, E.C.—Small pocket pamphlet, entitled "The 'Leakage' at your Lift—have you Noticed It?" in which the waste occurring in hydraulic installations is alluded to and the merits of the Graham electric lift are summarised.

## LIGHTING and POWER NOTES.

**Acton.**—The U.D.C. has requested the Metropolitan Electric Supply Co., Ltd., to submit an estimate for the lighting of the public baths, library, and Council offices, and also for supplying electricity for power for the artesian well and other purposes at the public baths.

**Argentina.**—The Compania Alemana Transatlantica de Electricidad is making active propaganda in connection with the use of articles of domestic use, such as kettles, irons, toasters, heaters, &c., which have not yet to any great extent been adopted in Buenos Ayres.

So as to meet the increased service in Concepcion del Uruguay, the Anglo-Argentine Electricity Co. will shortly commence the construction of a new power house, plans of which have already been approved.—*Review of the River Plate.*

**Ayrshire.**—Two new pits which have been put down near Dreghorn by Messrs. Wm. Baird & Co., are to be equipped with modern electric plant, including electric motors for winding.

**Bingley (near Keighley).**—The U.D.C. proposes to erect an electricity sub-station upon a portion of the market site.

**Birkenhead.**—At a meeting of the T.C., Alderman T. S. Deakin, in presenting the estimates for the year, said the Electricity Committee had come forward with a contribution of £2,000, which was £500 above that included in the estimates for the year 1912-13. In addition to this, the Committee believed that it would be able to increase the renewals fund by over £2,000, which would raise that fund to somewhere about 8 per cent. of the total capital outlay. The Tramways Committee's traffic receipts showed a considerable increase, the figures for 1912-13 being practically £2,000 above those for 1911-12, and some £1,700 in excess of the estimated income. It expected to do even better in this respect during the present year, and to be able at its close to swell the renewals fund by £2,100. This was essential owing to the necessity of providing funds for the renewal of the tracks, which work would probably have to be faced in the near future. At March 31st the fund amounted to not more than £14,000, which was rather less than 4 per cent. of the amount expended on capital account—none too big a reserve when bearing in mind that the undertaking would not be freed from debt for a further 16 years. In the discussion which followed, Mr. D. J. Clarke said that the total capital expenditure of the Electricity Committee was £176,797, and the outstanding debt £131,017; therefore, the Committee had paid back £45,000, and it had a reserve fund of £10,063.

**Blackburn.**—At a meeting of the Corporation Electricity Committee, on Monday evening, Mr. P. P. Wheelwright, electrical engineer, submitted his scheme for erecting and equipping a new electrical station at Greenbank, at a cost of £75,800. This was adopted after discussion. The new premises are not intended to supersede the present establishment in Jubilee Street, where new machinery has just been installed, but rather to act as an adjunct to it. The demand for power is gradually increasing, owing to its more general adoption for houses and for mills and factories. Mr. Wheelwright says that what is required is an increase in productive power to enable the department to keep ahead of the demands, and not to have to refuse customers in the future. It is true that the present plant is not yet fully loaded up, but it must be borne in mind that a long period after the adoption of a scheme must elapse before the new station can be erected and completed ready to give a supply of energy. The new station is proposed to accommodate about 10,000 kW. of plant.

**Bridlington.**—A L.G.B. inquiry has been held into the application of the Council to borrow £5,000 for the purposes of the electrical undertaking. The electrical engineer (Mr. A. J. Beckett) stated that the demand for current was greater at the present time than it had ever been in the past, and it was likely that further application would have to be made for another loan for mains and services, amounting to £3,500. The profit made at the works since they were opened was about £2,784, and there was a small reserve

fund. The £5,000 included £2,905 for generator; £420 for pipes, &c.; £220 for switchboard; £100 for contingencies; £500 for new pipes and extensions; and £200 for air filter and foundations. The total amount borrowed for the electrical undertaking was £47,125, of which £46,746 had been expended up to March 31st.

**Bristol.**—To the annual report of the Bristol Chamber of Commerce about to be issued for consideration at the meeting of this organisation on May 22nd, an interesting report is contributed with regard to the Corporation electrical supply. An optimistic tone characterises the statement, in which the following occurs:—

"Progress by the Bristol Electricity Department has been most marked during the year. The net number of new consumers added to the books was 357, being the highest number recorded since the inception of the undertaking, and comparing most favourably with the increase of 62 new consumers in 1911, which year itself was a very good one. The additions to the system in the equivalent of lamps of 30 watts, equalled 51,576, as compared with 22,562 in 1911.

"The most recent and interesting development in connection with the department has been the introduction of electric cooking stoves. The Electricity Department has kept in touch with the modern demands, and is supplying electric stoves as rapidly as they can be obtained from the makers for cash, or on hire-purchase terms. A considerable number has been disposed of in this way, and by advertising, systematic interviewing and public exhibitions the uses of electricity for cooking, and for other domestic purposes, is being kept well before the Bristol consumers and prospective consumers, and the use of electricity for all purposes is steadily advancing in public favour. A special low rate is charged for cooking.

"Power matters have progressed most satisfactorily, and a great confidence in electricity as a source of power has been firmly established in Bristol. The total H.P. connected to the mains at the end of the year exceeded 13,000 H.P. The following are some of the trades using electricity for power:—Tobacco, cocoa, printing, leather, confectionery, cloth, joinery, galvanised iron, brewing, paper-making, engineering and cold storage, and during the year there has been added a very large flour mill.

"The results of the introduction of the hire-purchase of installations department have again been most gratifying, a considerable percentage of the increase of consumers being due to the facilities afforded for acquiring installations on deferred payment terms."

**Colwyn Bay.**—The abstract of accounts of the U.D.C., for the year ended March 31st, 1913, shows that the gross profit on the electricity undertaking was £3,482.

**Delabole.**—This village is to be lighted by electricity, the old Delabole Slate Co. having promised to supply energy at a cost of about £1 per lamp per annum. In order to carry out the scheme the ratepayers have adopted the Lighting Act.

**Doncaster.**—In connection with the R.D.C.'s scheme of sewerage works at Askern, the L.G.B. has sanctioned the borrowing of £3,165 and £500, the latter amount being for electric motors and pumps.

The B. of T. has granted the T.C. an order to enable electricity to be supplied by the Corporation within the areas of the Bentley-with-Arksey and Balby-with-Hexthorpe Urban Councils.

**Dublin.**—An examination of the details of the Public Lighting Committee's estimates discloses the fact that the income estimated for the current year at £95,075 is now expected to reach £95,233, while the Committee has set down as the probable income for the ensuing 12 months the sum of £108,096, which it is confident will be realised. The working expenses have, however, shown an increase from £37,857 to £41,413, practically all of which is accounted for by the increase in the cost of coal of £2,650, and of wages and materials of £840. After providing for interest and repayment of loans, the Committee estimated to have a surplus for the current year of £16,724, which is now expected to realise only £13,326. The surplus, of course, would have approximated more closely to that anticipated when presenting last year's estimate were it not for the increase above referred to. A sum of £3,331 is proposed to be allocated in relief of next year's rates out of this surplus, and, taking this with an amount which the Council resolved last year to transfer, the total sum brought to relief of rates for the current, and the coming, year amounts to £8,831. An alternator has been renewed at an expenditure of £1,500 out of the profits of the current year.

**Ealing.**—Having further considered the proposals of the Fixed Price Light Co. for the adoption of a scheme for the lighting of small houses, the Electricity Committee of the B.C. has ordered a reply to be sent to the company that, at the present time, it is not prepared to accept the offer.

**Edinburgh.**—It was reported to the Electric Lighting Committee that the estimate of expenditure in connection with the department for the year 1913-14 is £80,265, as against an estimated expenditure for 1912-13 of £73,470, and an actual expenditure in 1911-12 of £69,640. The estimated revenue is £142,660, as compared with an estimate of £135,410 in 1912-13, and an actual revenue of £131,678 in 1911-12. The sum estimated for cost of coal is £30,000, as against £24,000 last year.

The Electric Lighting Committee has agreed to extend the mains to Craigmoad, provided the consent of the B. of T., the County Council and the Lothians Power Co. is obtained. The extension will cost about £900. The Corporation mains at present extend to Craigmoad Castle, and it is expected that a number of residents

and proprietors in the Cramond district will take advantage of the further extension.

The Electric Lighting Committee has also approved of the proposal to supply electricity to Redford Barracks direct from the city mains. The cost of the supply will be 1d. per unit more than the rate within the city.

**Guthrie.**—A L.G.B. inquiry was held on April 16th, into the application of the T.C. for loans of £9,300 for new plant for the electric light works, and £8,000 for mains and services. The inspector, Mr. T. C. Ekin, suggested that a sum of £6,000 in the sinking fund, which accumulated during the first three years of the undertaking before a regular loan was taken up, should be utilised in respect of the present application. In consequence, the Council revised the application to £9,300, made up as under:—Turbine and condensing plant, £7,500; switchboard and cables, £300; pipework, £600; foundations, £250; additional feeder panel, £100; extension of cooling towers, £200; oil separator, £150; contingencies, £200.

**Harwich.**—Efforts are being made to form a local electric light and power company, for the purpose of supplying "cheap electricity" to the district.

**Hazel Grove.**—The B. of T. has issued a prov. order to the Hazel Grove and Bramhall U.D.C., authorising it to supply electrical energy for public and private purposes in the urban district.

**Higham Ferrers.**—Electrical mains are about to be laid in the town, the company holding the Order having informed the T.C. that it will forthwith commence the laying of mains in the High Street.

**Hoylake.**—The U.D.C. has had under consideration a report by the electrical engineer, recommending the following extensions as capital expenditure:—400-kw. set and condensing plant; engine, £1,750; alternator and exciter, £800; panel and rheostat, £110; piping and valves, £200; condenser, £1,830, and other items, totalling £5,500. The Council approved of the scheme, and decided, subject to the approval of the L.G.B., that the extensions be proceeded with. It was also decided to advertise for tenders for a triple-expansion Belliss engine coupled to a 400-kw. alternator, and a committee was appointed to consider the tenders and report thereon.

**Hyde.**—The Corporation has decided to ask the Joint Electricity Board to submit to the Street Lighting Committee a scheme for lighting Newton Street, Old Road and Bennett Street by electricity, together with an estimate of the cost.

**India.**—According to the *Indian Textile Journal*, arrangements are being made with a view of largely increasing the power available at the Cauvery Falls during the dry months of the year and rendering it secure from interruptions on account of shortage of water. The scheme also embraces extensive irrigation works.

**Japan.**—A correspondent says that the development of hydro-electric stations for supplying Tokio and district with power, has been making great headway. There are plants with a total capacity of about 225,000 kw. starting up, under construction, and projected for this purpose. The transmission pressure is generally 66,000 volts, the transmission lines being equipped with steel towers for distances of 60 or 70 miles. The Sagami Water Power Co. is just placing orders for 12,000 kw. of plant for two power houses, for the supply of power in Yokohama. The transmission will cover 45 miles, and be at 66,000 volts pressure.

At the annual meeting of the Yokohama Foreign Board of Trade just held in Yokohama, the chairman referred to the great development in hydro-electric companies in Japan, stating that the total subscribed capital of such companies exceeded £25,000,000. A large number of the concerns have not yet reached the dividend-paying stage, but there can be no doubt that the cheap power they will be able to offer to industrial concerns will in due course prove a great asset to the country and a stimulus to many industries struggling against the handicap of dear fuel. He added that although Japan may not have much coal there is an ample rainfall, and, fortunately, also suitable physical configuration, which will make it possible for consumers to be supplied with all the water and electrical power they require at a moderate cost.

Another correspondent says a period of severe competition for the electric lighting business in Tokio is about to be inaugurated, for as a result of the announcement that the Katsuragawa Electric Co. will be ready to supply current about the middle of May, the Nippon (Dento Karata) Electric Light Co. is making every effort to have its plant ready by the end of the present month. The last-named concern proposes to only supply the two districts of Shitaya and Asakusa at first, and with the view of securing clients has decided to install 30,000 10-c.p. lights free of charge for several months.

**Kilmarnock.**—The T.C. has approved of a scheme for providing electrical installations in dwelling houses up to a rent of 20s. free of cost, the charge for energy to be 6d. per unit, with a minimum of 1s. 5s. per annum. The approval of the scheme, however, has been given on the understanding that the scheme may be dropped, if, after experiment, it is found not to pay.

**Leatherhead.**—The Leatherhead and District Electricity Co., Ltd., has recently extended its sphere of operations in certain parishes under the parochial control of the Epsom Rural District

Council. We understand from Mr. Leslie Dixon, the manager, that the company has obtained powers to supply in the parishes of Bookham, Effingham, Cobham and Stoke D'Abernethy, and has laid seven miles of three-phase high-tension mains for supplying light and power in these parishes. A supply to the first two parishes mentioned will be given almost immediately as the new plant is practically ready. Cables are now being laid to Cobham, where a supply will be available, when the mains are completed, in the course of a few months.

**Lincoln.**—An inquiry has been held by the L.G.B. relative to the Council's application for sanction to borrow money for local purposes. It was stated that £12,500 was required for extensions at the electricity works, information as to the proposals being supplied by Mr. S. Clegg, the Corporation electrical engineer.

**London.**—**LEWISHAM.**—The chairman of the B. of G., discussing the question of electric lighting in the Infirmary, said, with regard to their engineer, he did not think anybody knew he was acting against any rules of any association. It was thought at one time that the prices for installing the electric light might be prohibitive, but now they found that the cost was not likely to be so great as they estimated. He added that he had received a letter from a churchwarden of a Lewisham church, in which it was stated that the cost of lighting the church with gas for the quarter ending Christmas, 1911, was £9 10s. 1d., and Lady Day, 1912, £9 19s. 1d. The cost of lighting the church by electricity for the Christmas quarter, 1912, was £4 12s. 9d. and for the Lady Day quarter, 1913, £2 14s. They were paying 4½d. per unit, whilst the Guardians would only pay 2d. per unit for lighting and 1½d. for power.

**MARYLEBONE.**—As from the June meter meetings, the non-contract tariff for heating is to be reduced to 1d. per unit flat-rate, and for cooking to 1d. per unit for the winter six months, and 1d. for the summer six months. The general manager is of opinion that this reduction will do away with the 2d. and 1d. maximum demand system. Mr. A. C. Roberts, district auditor, in his report upon the audit of the accounts of the Council for the year ended March 31st last, stated that exception had been taken to two classes of expenditure in connection with advertising the undertaking, viz., £81 for labour and materials upon private fitting work, where no charge was made to the customer, and which arose in cases where the work had been done on approval and the customer had elected not to purchase the fitting installed; and £101, the purchase of exhibition tickets for free distribution to persons who might possibly become purchasers of fittings or consumers of current; and the contribution to the expenses of one exhibition. Neither of these expenditures, the auditor concludes, appears to come within any powers which the Council possess, but both items on this occasion had been covered by special sanctions under the Local Authorities (Expenses) Act, 1887. An agreement has been entered into with Marshall & Snelgrove for a stand-by supply. This agreement provides for 60 kw. at £2 per annum per kw., and a further charge of 1d. per unit, except during peak hours (during peak hours 6d. per unit); the minimum amount to be received from 1d. units consumed per annum to be not less than £62 10s. (equivalent to 15,000 units); the firm to undertake not to renew any of its existing plant; and the emergency supply to be used only during peak hours in case of breakdown to its existing plant and while it is under repair.

**WESTMINSTER.**—The Westminster E.S. Corporation has agreed to a six months' extension of the period of negotiation with the City Council in regard to public lighting in St. George, Hanover Square.

**BATTERSEA.**—The B.C. is appealing against the decision of Judge Joyce not to grant the Council an interim injunction against the County of London Co., in respect of the laying of trunk mains through the borough.

The Special Committee on London Electricity Supply, appointed in February, 1912, by the L.C.C., states that it has concluded the preliminary steps of its investigation, which included numerous conferences with the various electricity suppliers in London, and has collected a large amount of information. It now proposes to hear expert evidence on the matter, and will be glad to have the views of authorities on either the technical or business side of the matter placed before it.

**Long Eaton.**—The U.D.C. has authorised the engineer to proceed with the extension of the electricity plant at an estimated cost of £10,000.

**Manchester.**—The Electricity Committee reports that, notwithstanding the increased cost of coal and materials during the past year, an even rate of progress was more than maintained. During the past 12 months 104,000,000 units were sold, as compared with 93,000,000 units for the previous year. In considering the estimates, the Committee allocated £28,500 to the relief of the rates.

**Mansfield.**—For the ensuing year the Electricity Committee will make a contribution of £400 from profits towards the general district rate.

The T.C. has accepted the tender of Messrs. J. Maude & Co. for the provision of electric standards for public lighting in the Mansfield Woodhouse district. The Mansfield Woodhouse U.D.C. has accepted the Mansfield T.C.'s terms for the lighting of the streets, and the L.G.B. has sanctioned the T.C.'s application for the borrowing of £230 for that purpose.

**Mexborough.**—The U.D.C. has resolved that application be made to the L.G.B. for sanction to borrow a further £1,000 in addition to the sum of £10,500 for extensions at the electricity works.

**Moffat.**—The T.C. has agreed to accept the offer of Mr. W. E. Townsend, of Edinburgh, to submit the necessary detailed plans and specifications, and give a complete estimate of the cost, free of charge, for a scheme of electric lighting, on the understanding that if the scheme goes on he is appointed engineer to carry it out. It is believed that in the Well Burn there will be ample water power to provide a sufficient supply of electricity for the burgh.

**Oldham.**—A statement has just been compiled by the engineer showing that the Corporation obtained Parliamentary powers in 1892 to supply electrical energy within the borough. The Greenhill station was opened in June, 1903, with plant of 6,000 H.P., which together with that transferred from the old station made the total capacity 6,720 H.P. In 1911-12, a further extension was found to be necessary, and a steam turbine of 2,000 H.P. was installed. During the last two years the demand had increased greatly for power purposes, and rose from 583,553 units in 1910-11 to 888,840 units in the year ended March 25th, 1912. The number of consumers now connected to the mains is upwards of 1,700. In 1911-12 the number of units sold was £5,992,476. The capital expended up to March, 1912, was £306,746, of which £100,000 had been repaid or was in hand.

**Philippines.**—A Manila paper says the favourable report of the expert who has just completed his investigations of a site for a hydro-electric plant near Pagsanjan is at hand, and as a result the Manila Electric Railroad and Light Co. will invest the sum of P. 3,000,000 approximately, for the purpose of securing cheaper electricity for Manila and the suburban lines. The proposed site on the Caliraya River is distant about 60 miles from Manila. The construction will consist of a dam and runway with an outlet turning the water back into the river again. The initial unit installed will provide at least 33 per cent. more power than is now necessary to supply light and power for Manila, or 10,000 H.P., with an efficiency in Manila of about 80 per cent.

**Rishton.**—In regard to the objection of the District Council to the application of the Accrington Corporation for permission to supply electricity to the paper mills of Messrs. A. M. Peebles & Son, Ltd., the Rishton Council appointed a deputation to confer with the town clerk of Accrington.

At a meeting of the Rishton Council on April 17th, it was decided to consent to the application by the Corporation to the B. of T. for an order authorising the Corporation to supply electricity to Messrs. Peebles' mills, subject to certain reservations and conditions.

**Rochdale.**—The profit on the electricity works for the year is £2,883. With the exception of 1911-12 this is the lowest since the department began to pay, and is attributed to increased cost of coal, and to additional interest and sinking fund charges on extensions, the full benefit of which cannot yet be felt. The gross profit on the year was £11,740, as against £10,664 a year ago. Of the net profit of £2,883, £2,000 is being allocated to the relief of the rates and the balance carried to reserve.

The Electricity Committee has agreed to supply current in bulk to Whitworth for five years on terms mutually arranged.

**Romford.**—The U.D.C. has sealed an agreement with the County of London Electric Supply Co., and given consent to the prov. order being granted to the company, subject to the insertion of a purchase clause.

**St. Thomas.**—The Westindische Compagnie, of Copenhagen, having bought the "French Wharf" in the Danish Island of St. Thomas, have decided to undertake works for the modernisation of the harbour, including the building of quays, the installation of electric cranes, the construction of a power house, &c. For particulars of the machinery requirements, application should be made to the company.

**Salford.**—The General Electric Co. have offered to supply the Electricity Committee with flame arc lamps on loan free of charge for experimental purposes. The offer has been accepted, and the lamps are to be tested in Chapel Street.

**Skelton and Brotton.**—The B. of T. has granted the application of the U.D.C. for a prov. order for electric lighting.

**South Africa.**—The ratepayers have approved of a scheme for the supply of electric power for lighting Umtata, estimated to cost £7,000. The Municipal Council will borrow the necessary funds from the money in hand for the water scheme. Power will be generated at Umtata Falls, one mile from the town.

**Stockport.**—On April 16th, Mr. R. H. Hooper, L.G.B. inspector, conducted an inquiry into the application of the Corporation for sanction to borrow £24,500, for the purposes of the electricity undertaking. There was no opposition.

**Swansea.**—The Housing Committee has asked the Tramways and Electricity Committee to submit an estimate of the cost per week to be charged upon the houses which are to be erected at Town Hill, for electric lighting, such costs to be added to, and included in, the rent of the houses. Application is to be made to the L.G.B. for sanction to borrow £40,000 to cover the cost of extending the generating plant and the construction of sub-stations, mains, cables, &c.

**Swinton (Lancs.).**—The Tramways and Electricity Committee has instructed the Clerk to point out to the L.G.B. that the expenditure on the supply of electricity to Broad Oak Park

would be greater than the amount sanctioned to be borrowed (£600), and to ask if the Board would allow the work to be proceeded with—application for sanction to borrow a further sum being made later.

At the D.C. meeting last week, Mr. Heywood, referring to the electricity undertaking, said there were now 167 consumers, and the units sold were 206,339 and the receipts £1,728, as against 159,182 units and £1,433 for the previous year. The total loans borrowed for the undertaking were £13,910, the repayments up to the present being £1,134. The capital expenditure had been £12,892, and the loans unspent £1,018. The Broad Oak Park extension was now taking practical shape, after several years of hesitation on the part of the Council. The deficit for the past year was £238, but the expenditure was coming down, and there were prospects of having a balance in hand before long.

**Yeovil.**—The T.C. is having a report prepared with regard to the relative cost of electricity and gas for driving the machinery of the sewage works.

**York.**—At the last meeting of the City Council, it was reported that the L.G.B. had given sanction to the borrowing of £500 for the wiring of premises for electric lighting as desired by the Council, the period of repayment being fixed at 10 years. The following tenders were recommended for acceptance:—Two water-tube boilers, with superheaters, chain-grate stokers, pipe work, &c., Messrs. Babcock & Wilcox, Ltd., London, £4,213; supply and erection of a turbo-alternator of a capacity of 3,500 kW, 3,000 H.P.M., condensing plant, &c., the Oerlikon Co., of Zurich, Switzerland, £9,967; storage battery and reversible booster, &c., and the maintenance thereof for a term of 15 years, the Tudor Accumulator Co., Ltd., £3,899, with a maintenance charge of £188 per annum. In answer to a question addressed to him, Alderman Meyer stated that the approximate cost of laying cables in the streets of the city generally for street lighting, domestic lighting and other domestic purposes would be £16,500 for 30 miles of streets. The cost of the feeders, distributors, &c., would be £119,000 if carried out on the underground system, but if powers could be obtained to carry it out in another manner the cost would be reduced to £71,108. So far as regarded street lighting, he would recommend the Council to consider some scheme for undertaking this. Alderman Wragge expressed the opinion that if it was only going to cost the city £16,500 to light the whole of the streets, it was time the work was undertaken. If that sum was spread over a period of 40 years at  $\frac{3}{4}$  per cent., the interest and sinking fund would be £825. The supply of electricity from the Council's own works would cost £2,250, the two sums together totalling £3,075, whereas the gas company was now receiving £1,500 for lighting the streets by gas. Besides that, they would be able to make a substantial profit, and the saving which would be made would amount to a 14d. rate. The recommendations of the Committee were adopted, including the proposal to light the streets by electricity, as outlined by Alderman Meyer and Alderman Wragge.

## TRAMWAY and RAILWAY NOTES.

**Birmingham.**—A special meeting of the City Tramways Committee was held on the 15th inst. for the purpose of hearing the views of a deputation from the Diocesan Conference, which had passed a resolution recommending that no cars should be run on Sundays, in order that all employees might have an opportunity of attending Divine worship. The Committee, after hearing the deputation, expressed sympathy with the object in view, but explained that the public convenience had to be considered, and many difficulties were likely to present themselves. It was agreed, however, to refer the whole matter to Mr. A. Baker, the general manager, who was instructed to consider the points raised and report to the next meeting whether anything could be done to meet the views expressed by the deputation.

**Blackburn.**—The general manager of the tramways (Mr. J. H. Cowell) states that the gross receipts for the past year were £66,683, against £63,129 in the previous year; working expenses £42,516, against £41,235; gross balance £24,166, against £21,894. The net profit was £3,870, comparing with £1,290 in the previous year. The traffic details show an increase of 17,150 miles, 556,452 passengers, and £3,171 in receipts. From parcel carrying the revenue was £2,191, against £1,995; 276,715 parcels were handled during the year.

**Bury.**—The profit on the tramway sections for the past year was £9,572, of which £5,000 is to go to rate relief purposes, £1,000 to insurance fund account, and the balance to reserve and depreciation fund account.

The experimental service *via* Heywood Street is to be continued for another month.

**Doncaster.**—At a meeting of the Finance Committee, the estimate of the Electricity and Tramways Committee for six new tramcars, with covered tops, at an estimated cost of £800 each, was approved of. The purchase of additional cars is necessitated by the growth of the tramway traffic generally.

**Huddersfield.**—The U.D.C. has decided to suggest to the Huddersfield Corporation the dropping of the proposed extension of

the tramways from Elland Town Hall to West Vale, owing to the decision of the Greatland D.C. not to consider the question further until the Huddersfield Parliamentary Bill has become law.

**Heywood.**—At a meeting of the Electricity and Tramways Committee on April 16th, it was reported that there was a loss of £11 on the tramways undertaking during the past year's work, and a loss of £4,118 on the electricity undertaking. These losses are equal to a rate of 10d. in the £. For the previous year the losses were £712 on the tramways, and £2,532 on the electricity undertaking.

**Huddersfield.**—The borough treasurer's financial statement respecting the tramways for the 12 months ended March 31st, 1913, showed a capital outlay to date of £117,408. The miles run were 2,383,858, compared with 2,215,427. The income amounted to £109,709, or 11'01d. per car-mile, against £101,602, or 11'18d. last year. The income was made up as follows:—Passengers, £106,286; postmen, £300; parcels, £1,238; advertising, £1,200; coal haulage, £676; and sundries, £9. The total working expenditure was £65,528, or 6'59d. per car-mile, compared with £57,239, or 6'12d. last year, leaving a gross surplus of £44,181, against £47,363. Interest on capital absorbed £13,318, and redemption of debt £10,904, and after provision had been made for depreciation at 3 per cent., there was a net surplus of £7,437, or 7'5d. per car-mile, against £11,766, or 1'52d. last year. The balance brought forward on the reserve or renewals account amounted to £13,253, the interest on investment was £350, and the transfer for the 12 months £12,522. The payments amounted to £7,841, leaving a fund of £18,284. The Committee has decided that £6,590 be transferred to the borough fund in relief of the borough rate, and that the balance of £847 be placed to the reserve or renewals fund, making the total amount in that fund £19,131.

The urban districts of Holmfirth, Kirkburton, Lepton and Mirfield are to be linked up with the Huddersfield tramways by means of motor-omnibus services.

**Japan.**—In connection with the electric railway between Yokohama and Tokio, the electrical track is now being laid alongside of the existing steam road; the 10,000-H.P. gas-engine station for supplying this line is also being equipped—the engines were illustrated recently in our pages.

**Leeds.**—The balance-sheet of the tramway undertaking issued on Monday shows that after providing for every form of expenditure there remains a sum of £61,374 to be used for the relief of the rates—an increase of £211 over the corresponding figure of last year. This is nearly equal to the produce of a 7d. rate. The total revenue of the undertaking amounted to £411,531 (or 11'23d. per car-mile), an increase of £16,210. The increased number of passengers carried was 3,646,242. Traffic receipts amounted to £405,551 (11'120d. per car-mile) against £391,142 (11'008d.). Advertisements on cars realised £3,661. Traffic expenses amounted to £109,413, wages of drivers and conductors being £77,442—an increase of £3,881. General expenses were £36,005, an increase of over £1,000. Regarding £19,809 set aside for rates and taxes, £5,300 of this is being held over pending the decision of the House of Lords on the tramway rating case. If the appeal is dismissed the profits will benefit to the extent of the sum now held over. The total working expenses were £213,817, leaving a balance of £197,713 to be carried to the net revenue account, which, with bank interest, &c., amounts to £205,224. Out of this has been paid £42,196 for interest on capital; £5,020 income-tax, and £3,216 as rent for the Morley lines, leaving £154,790 to go to the appropriation account. £19,922 had to go to the sinking fund, and £41,752 for renewing the permanent way—a record figure—£1,439 increase on the previous year. Other items brought the total expenditure of the account to £93,415, which, deducted from the available surplus of £154,790, left a net surplus of £61,371 odd. The estimate of the department in this respect was £60,000.

**London.**—The L.C.C. has circularised all the Metropolitan B.C.'s requiring them forthwith to send to the Assessment Committee a provisional valuation list containing the assessment of the County Council's tramways, on the ground that the hereditament has been reduced in value, in consequence of the falling off of the receipts from the tramway undertaking due (among other things) to competition from motor-omnibuses.

**Merthyr Tydfil.**—The T.C. has entered into an agreement with the Merthyr Electric Traction and Lighting Co., whereby the time of purchasing the undertaking by the Corporation is extended until 1934.

**Plymouth.**—A return submitted by the general manager of the tramways for the financial year ended March 31st shows that the cars travelled 820,406 miles, and carried 8,834,786 passengers. Including £1,985 received from the Plymouth, Stonehouse and Devonport Tramway Co., the total receipts amounted to £40,208, an increase of £263 compared with the previous year. All the sections showed an increase in receipts, the highest, however, being on the Peverell route. The total expenditure amounted to £37,370, an increase of £820. For the previous year the figures were:—Miles travelled, 809,036; passengers carried, 8,666,269; receipts, £39,079; and expenditure, £36,550.

**Preston.**—The Tramways Committee has decided that a new crossing be constructed between Derby Street and Pole Street; it is also proposed to purchase three additional top-deck covers, at an estimated cost of £360.

**Radcliffe.**—At a meeting of the U.D.C., it was reported that there was a net profit of £1,411 on the working of the tramways for the past year, which was double that of the previous year.

**Rochdale.**—The net profit on the tramway undertaking is £7123 as compared with £6180 last year. For the first time the undertaking contributes to rate relief. The Committee proposes to offer £2,327 for this purpose, and asks to be allowed to carry £5,096 to the renewals fund, which the members feel requires strengthening in view of the coming necessity for renewal of track.

**St. Mellon's.**—The U.D.C. on April 16th decided to oppose the Western Valleys Railless Electric Traction Bill.

**U.S.A.**—After three years of complex negotiations and heated controversy, the contracts for the operation of the dual rapid-transit system for New York city were signed on March 19th. These contracts relate to the operation of a system the total cost of which will be about \$400,000,000. Of this one-fourth covers the existing systems and \$300,000,000 the construction now under way or authorised for the new subway, elevated and surface lines. When the new system is placed in operation, which will probably be in 1917, there will be over 600 miles of single track in service, as compared with 271 at present. —*Electrical World.*

**York.**—The City Council has agreed to the suggestion of the Electricity and Tramways Committee that blind persons should be permitted to ride on the tramcars free of charge.

## TELEGRAPH and TELEPHONE NOTES.

**Brazil.**—Particulars have been published regarding the organisation of wireless telegraphy throughout Brazil. The scheme will embrace an international service of wireless telegraphy both terrestrial and trans-oceanic, a river service, a frontier service and an inter-State service. The international stations will include one at Belem, having a range of 4,000 miles, one at Cape Santa Martha having a similar range, and another at Rio de Janeiro have a range of 2,000 miles. The text of the decree may be seen at the Commercial Intelligence Branch of the Board of Trade.—*B. of T. Journal.*

**Chile.**—Official sanction has been accorded to the scheme for organising a wireless service in Chile, consisting of a long-distance chain from Africa to Punta Arenas and a low-power chain between Arenas and Talcahuano.

**Constantinople.**—The *Journal of the British Chamber of Commerce* of Turkey states that the progress of the telephone construction has been delayed by the impossibility of getting the necessary cables and ducts from Great Britain, these being contraband of war. Nevertheless over 26 km. of cable has been laid, and practically all the underground piping is in place. The work of erecting poles in the outlying districts is now in progress, and the three principal exchange buildings are well advanced. Over 3,000 subscribers have been enrolled.

**Imperial Wireless System.**—On Wednesday last week the Select Committee on the Marconi contract resumed the examination of Mr. Godfrey Isaacs regarding the transactions in shares of the American Marconi Co. The witness stated that the price paid by the English Co. for the shares of the United Wireless Co. was \$750,000; they were sold, with other property, to the American Marconi Co. for \$1,400,000. A letter was read from Sir Henry Norman stating that he had never in any way been connected with the Poulsen people.

On Thursday the examination of Mr. Godfrey Isaacs was concluded. He stated that he had personally made no profit in connection with the purchase and sale of American shares, and that the American Co. had no interest at all in the British Co. He believed the foreign Governments with which he had been in negotiation when the Committee was appointed were now awaiting the report of the Technical Committee. The delay had not affected the American Co. Mr. Harry Isaacs was then called, and explained the transactions with his brothers, Sir Rufus Isaacs and Mr. Godfrey Isaacs. Afterwards Mr. Ernest Hawkins was examined regarding the letter which he had written to Mr. Godfrey Isaacs, and the information he had received from Mr. Charles Kerr, who also gave evidence. Mr. Kerr stated that on May 9th, 1910, he formed the Poulsen Wireless Telegraphy Syndicate, Ltd., and held an option on the Poulsen patents, which expired in February, 1911. The option was not exercised, and the syndicate went into voluntary liquidation on June 28th, 1911. Mr. A. A. Campbell Swinton reported to him on the Poulsen system. Since the expiration of the option he had had no interest whatever in the Poulsen system, but he still thought it the better system.

On Monday Sir A. H. Brown gave evidence, and the examination of Mr. Kerr was concluded. Mr. Harcourt Rose, a member of the firm of solicitors that acted for the Poulsen Co., referred to the evidence of Mr. Godfrey Isaacs regarding the origin of the rumours, which he contradicted in detail, stating that the promoters of the Poulsen system were in no way associated with the allegations against Ministers. Evidence was given by stockbrokers regarding the market in American Marconi shares on

April 17th, 1912, the latter stating that the price on April 19th was artificial and absurd, and that the public rushed in recklessly. The Committee adjourned till Wednesday.

**Telephone Electrical Staff.**—In reply to a question regarding the case of the electrical staff transferred from the National Telephone Co., the Postmaster-General said he found that owing to the arrested development of the telephone system during the latter part of the company's existence, the average length of service of the electrical staff was very high. Under the arrangements sanctioned by the Treasury, it was only possible to place a certain proportion of this staff on the establishment: a number of men with long service had consequently to be assigned to an unestablished class, and complaints were made to him on their behalf. He had now secured the assent of the Treasury to the creation of a considerable number of additional established posts for the benefit of this staff, as a temporary measure; and also to the grant to those members of the electrical staff (other than faultmen) who did not secure establishment, of a special allowance of 1s. per week, to cease on establishment, by way of compensation for certain privileges which were granted by the company on a higher scale than that which prevailed in the Post Office.

**Wireless and the Aurora.**—It is stated that during the occurrence of strong aurora boreales it is almost impossible for the wireless station on Spitzbergen to communicate with the station at Ingo, near Hammerfest. This fact seems to confirm the theory that the aurora is an electrical phenomenon.—*E.T.Z.*

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" April 11th.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

April 29th.—20,000 yd. of 3-in. fibre conduit, for the Melbourne City Council. See "Official Notices" April 11th.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" to-day.

June 10th. Deputy-Postmaster-General, Melbourne. Incandescent electric lamps.—July 8th. Common-battery switchboard at Windsor.—*Australian Mining Standard.*

**NEW SOUTH WALES.**—May 12th. Fibre conduit for the Sydney City Council. May 26th. Meters and glazed stoneware bridges. July 7th.—Arc lamp carbons. Specifications 10s. 6d. for each section, from City Electrical Engineer's Department.—*Australian Mining Standard.*

**TASMANIA.**—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

**QUEENSLAND.**—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" April 11th.

August 27th.—Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

**W. AUSTRALIA (P.M.G.'s Department).**—July 9th and 16th. Wire.—July 30th. Switchboard cable.—July 30th. Steel towers, battery material, &c.—August 6th. Insulators telegraph and telephone material and poles.—*Australian Mining Standard.*

**Barnes.**—May 19th. Feeder and distributor cables, for the U.D.C. See "Official Notices" to-day.

**Barrow-in-Furness.**—May 7th. Electric light installation at the workhouse, for the B.G. See "Official Notices" to-day.

**Belfast.**—May 19th. Circulating-water pump, for the Corporation Tramways and Electricity Committee. See "Official Notices" to-day.

**Bolton.**—April 28th. Reservoir construction in connection with the new Back-o'-th'-Bank generating station. Mr. A. A. Day, Borough Electrical Engineer.

**Bootle.**—May 13th. Boiler and pipe coverings for Marsh Lane electricity works. Borough Electrical Engineer's Office, Pine Grove.

**Canada.**—WINNIPEG.—May 15th. City Light and Power Department. Two three-phase generators of 5,000 kW. for direct connection to 6,800-H.P. water turbines; also spare parts Chairman, Board of Control. Deposit, £205. Particulars, Board of Trade Com. Intel. Department in London.

**Chesterfield.**—The T.C. is to obtain tenders for an overhead electric light cable for Chatsworth Road, and for an installation of batteries and extension of the sub-station at Whittington Moor.

**Dublin.**—May 1st. E.H.F. sub-station switchboard and accessories and alteration to existing E.H.F. switchboard, for the Corporation. See "Official Notices" to-day.

**Felixstowe and Walton.**—May 5th. One 150-KW. Diesel-driven D.C. generating set for the U.D.C. See "Official Notices" April 18th.

**Glasgow.**—May 9th. Cables, meters and arc lamp carbons for a year, for the Corporation. See "Official Notices" to-day.

May 26th.—Two steam turbo-alternators, with condensing plant (5,000 kW. and 2,000 kW. respectively), for the Corporation Tramways Department. See "Official Notices" to-day.

**Hoylake and West Kirby.**—May 5th. One 400-KW. alternator and triple-expansion Belliss engine, and evaporative condensing plant, for the U.D.C. See "Official Notices" April 18th.

**Italy.**—MENAGNE.—Tenders are about to be invited for the establishment of an electric light installation. Particulars of the Giunta Provinciale Amministrativa.

**King's Lynn.**—May 5th. One 400-KW. steam dynamo with condensing plant and pipework, for the Corporation. See "Official Notices" April 18th.

**London.**—ROYAL MINT.—April 25th. 120 tons of ingot copper. See "Official Notices" to-day.

**L.C.C.**—May 6th. 3,200 tons B.S.S. steel girder tramway track rails and fastenings; (2) 2,100 tons of special section ditto; and (3) 1,400 tons slot rails and conductor tees. Specifications and forms of tender, £2 each section, returnable, from Mr. G. W. Humphreys, Chief Engineer, County Hall, Spring Gardens, S.W.

May 7th and 9th.—Electrical installations at (a) Elthorne Road Special School, Holloway, and (b) Wilton Road Central Elementary School, Hackney. See "Official Notices" to-day.

May 13th.—One 20-ton overhead band crane, for the Shoreditch sub-station. See "Official Notices" to-day.

The Highways Committee is to invite tenders from selected firms for two hydraulic accumulators and a pump for the third section of the central car repair depot.

**Mexborough.**—May 30th. Lancashire boiler, for the U.D.C. electricity department. See "Official Notices" to-day.

**Newport.**—April 26th. One 2,000-2,500-KW. steam turbo-alternator, surface condensing plant, one 600-KW. D.C. generator, and E.H.T. and L.T. switchgear, for the Corporation. See "Official Notices" April 11th.

**Norway.**—April 29th. Christiania Electric Works. Condensing plant for two 6,000-KW. steam turbines. Also two electrically-driven centrifugal pumps, to be tendered for by May 8th. A copy of the conditions has now been received from H.M. Consul at Christiania, and can be seen at the Board of Trade Commercial Intelligence Department, in London. "Elektricitetsvætskekspeiditionskontor, Raadhusgaten 19," Christiania. Local representation by a resident agent is essential.

May 1st.—Narvik Electrical Works. 200 metres of 600-mm. turbine pipes with intake machinery, 260-H.P. turbo-generator, two transformers, H.T. cables, &c. Specification, &c., from Dipl. Ingeniør Per Larsen, Hamar, Norway.

**Panama.**—The National Assembly has passed a law authorising the carrying-out of public works in various parts of the country. The works include the construction of electric lighting installations, telegraph and telephone lines, &c. A list of the works to be carried out may be seen at the Commercial Intelligence Branch of the Board of Trade.—*Board of Trade Journal.*

**Peterborough.**—May 6th. One 500-KW. D.C. steam turbine generating set and two steam boilers, for the Corporation. See "Official Notices" to-day.

**Rochdale.**—May 14th. Electrically-driven induction draught plant, for the Corporation electricity department. See "Official Notices" to-day.

**Salford.**—May 19th. Tenders invited for 10 car bodies and 10 Brill trucks. General Manager, 32, Blackfriars Street, Salford.

**Sheffield.**—May 5th. Excavations, retaining walls and extension to water service reservoir at Neepsend Power Station, including valves, pipework, &c., for the Corporation. See "Official Notices" April 18th.

**South Africa.**—DURBAN.—May 28th. Electric meter-testing equipment, for the Council. Copy of specification, &c., may be seen at Board of Trade Com. Intel. Dept. in London.

**South Shields.**—May 1st. Tramway stores for one or three years, for the T.C. Mr. W. T. Robson, manager, Dean Road.

**Spain.**—June 16th. "Direccion General de Obras Públicas, Ministerio de Fomento," Madrid. Concession for the construction and working of an electric tramway from L. to Tarragona. Deposit of 10,427 pesetas (about £385) to qualify. Local representation necessary. Particulars at the Commercial Intelligence Branch of the Board of Trade, London, E.C.

**Warrington.**—May 13th. Traction battery and reversible booster, for the Corporation. See "Official Notices" to-day. Advertising on Corporation tramcars. Tramways manager, Car sheds, Warrington.

## CLOSED.

**Admiralty.**—Messrs. Carls Frères (Associates of Consolidated Diesel Engine Manufacturers, Ltd.) have received an order from the British Admiralty for two reversible Diesel marine engines of 1,500 h.p., each. These engines will be of the two-stroke open marine type, fitted with crossheads, and of Messrs. Carls's latest design.

**Australia.**—MELBOURNE.—According to *Tenders (Mining and Engineering Review)*, a contract has been placed by the City Council with Messrs. Willans & Robinson for two turbo-generator sets, each of 1,000 kW. The turbines are of the Willans standard disk-and-drum type. The alternators are by Siemens, and are for 6,000 volts, 50 cycles, three-phase. The condensing plant is of the Willans standard augmentor type. The plant is to be erected at the Spencer Street power house.

The same exchange states that the Australian Metal Co., Ltd., have secured an order for the following plant, to be installed at the Bellbird Colliery, Hutton (N.S.W.) :—

Two Brown-T. Lindley engines, direct-coupled to two A.E.G. 256-kw. alternators, 2,200-volt, three-phase, 50 cycles, 375 a.r.m.; one eight-panel switchboard, with one Tirrell regulator panel; one 250-kw. A.E.G. motor-generator, operating at a distance of 1½ miles from the station, the motor being supplied with current at 2,000 volts; one endless-rope haulage gear, driven by two A.E.G. 150-h.p. 2,000-volt motors; one main and lay rope haulage gear, driven by one A.E.G. 160-h.p. 2,000-volt motor; one 300-h.p. A.E.G. variable-speed 2,000-volt motor, driving "Siropoco" fan of 400,000 cu. ft. per minute; three A.E.G. 30-h.p. 2,000-volt motors, driving screens; one A.E.G. 50-h.p. 500-volt motor, driving 6 × 10 Worthington pump; six A.E.G. 5-h.p. motors, driving 4-in. pumps. All cables, motor-panels, switchgear, are to be of A.E.G. latest design, specially suited for underground mining work. There will also be installed two 100-h.p. A.E.G. motors, and five A.E.G. static transformers, to transform from 2,000 to 100 volts. The consulting engineer for the colliery is Mr. J. H. Newby, and the mine engineer is Mr. Mathieson.

**SYDNEY.**—The contract for a 5,000 kW. turbo-alternator has been placed with the Australian Metal Co., Ltd. (Electrical Department), Sydney, at £21,235. The list of tenders was given last week.

**NEW SOUTH WALES.**—The *Australian Mining Standard* states that the Public Works Department has ordered a "Carrick" three-motor electric overhead travelling crane for Ubr's Point workshops, £566, from J. E. O'Toole & Co., Sydney; also an electric installation at Ubr's Point power station, £1,000, from the Aust. General Electric Co.

**Croydon and Dundee.**—A contract for traction tantalum lamps for the Dundee tramways for the ensuing 12 months has been received by Messrs. Siemens Bros. Dynamo Works, Ltd., who have also obtained a renewal of the contract for the supply of similar traction lamps to the County Borough of Croydon for the ensuing 12 months, together with the supply of "Wotan" drawn tungsten wire lamps for depot lighting, &c.

**East Ham.**—The T.C. has accepted the tender of Callender's Cable & Construction Co., Ltd., for main feeder cable.

**Edinburgh.**—The tender of the Bastian Meter Co., Ltd., has again been accepted by the Corporation for the supply of 2½-ampere meters.

**Greenock.**—The Corporation has accepted an offer of Halley's Industrial Motors, Ltd., for a motor wagon for the electricity department, for £700; also a tender of the British Westinghouse Co. for two A.C. motors for 750 kW. each, to be coupled to existing low-tension dynamos, for £2,288.

**Huddersfield.**—The Electricity Committee has accepted the tender of Messrs. E. Green & Son, at £866, for an economiser. The Committee has also accepted the tender of Messrs. Greenwood and Batley for a turbo-dynamo, to take the place of plant to be scrapped.

**Hungary.**—Messrs. Ganz & Co., of Budapest, have secured a contract for the construction of an electric tramway in the town of Kolozsvár.

**Government Contracts.**—The following tenders have been accepted during the past month by the Government Departments named :—

## ADMIRALTY.

Miscellaneous articles.—Chalcide Electrical Storage Co., Craigpark Electric Cable Co.  
Distributing boxes.—B.I. & Helsby Cables, Ltd., Chadbourn's (Ship) Telegraph Co., Clarke, Chapman & Co., Hawkers, Ltd., McGeoch & Co., E. F. Moy, Ltd., Player & Mitchell, Spagnoletti, Ltd.

## INDIA OFFICE.

Accumulators.—Pritchett & Gold.  
Boxes.—Siemens Bros. & Co.  
Cables.—Bolton & Sons and Hooper's Telegraph, &c., Works.  
Cells.—Tudor Accumulator Co.  
Motors.—Lancashire Dynamo, &c., Co.  
Switches.—Edgar Allen & Co.

## WAR OFFICE.

Dynamos.—J. H. Holmes & Co.

## POST OFFICE.

Telephonic apparatus.—Automatic Telephone Manufacturing Co., B.I. and Helsby Cables, Ltd., and Peel-Comer Telephone Works, Ltd.  
Wood arms.—Miller's Timber & Trading Co.  
Silence cabinets.—King & Scarborough.  
Telegraphic cable.—Siemens Bros. & Co.  
Telephonic cable.—B.I. & Helsby Cables, Ltd., and W. T. Henley's Telegraph Works Co.  
Dry cells.—Siemens Bros. & Co.  
Stoneware ducts.—Albion Clay Co.  
Telegraphic ironwork.—Guest, Keen & Nettlefolds, Ltd., Portland Bolt and Nut Co., and C. Richards & Sons.

Morse paper.—Waterlow & Sons.

Power plant and wiring.—Niton Wireless Station.—Westminster Engineering Co.

Telephone exchange equipment.—East Exchange, London, Western Electric Co., new Victoria Exchange, London, and Kilmarnock Exchange, Peel-Comer Telephone Works, Ltd.; City Exchange, London, (new version to Wireless Working) Western Electric Co.

CROWN SUPPLIES FOR THE COLONIES.

Underground telephone cable.—B.I. & Helsby Cables, Ltd.

Poles, &c.—Siemens Bros. & Co.

**Leeds.**—The Mircless-Watson Co., Ltd., of Glasgow, have recently secured a repeat order for a large surface condensing plant for the Corporation electricity works, capable of dealing with 130,000 lb. of steam per hour. The plant will be connected to a turbo-alternator, for which Messrs. Willans & Robinson have just received the order. The condenser of this installation is of a very special design, to suit the conditions of dirty water obtained for condensing purposes from the river Aire. This water contains a large amount of woollen material, which, along with mud, soon clogs up the ordinary type of condenser. The condenser is designed so that all the tubes can be cleaned out whilst the plant is in operation. The flow of the cooling water can be reversed without interfering with the running of the plant. The condenser is of the vertical type design, having 24,600 sq. ft. cooling surface. The total height of the condenser is 28 ft., and it weighs 85 tons.

**London.**—L.C.C.—The Highways Committee has accepted tenders for the supply of tramway parts, equipment, &c. for the year ending April 30th, 1914, from the following firms :—

Motor and generator spares.—British Westinghouse Co., Dick, Kerr & Co., and Manchester Armature Repair Co.

Contact roller, circuit breaker and other switch, &c., details, and magnetic brake spares.—British Westinghouse Co. and J. Kerr & Co.

Contact fingers and parts, segments, &c.—British Westinghouse Co., Dyer and Young, Estlin Bros., Edwin Showell & Sons, and Tramway Supplies, Ltd.

Pressed brass and steel articles.—Hadfield's Steel Foundry Co., Conveyor and Elevator Co., Peter Hoyer, and M. Mole & Son.

Electric cable, insulated and copper wire.—Midland Electric

Wire Co., Liverpool Electric Cable Co., W. T. Glover & Co., Hooper's Telegraph & India Rubber Works, and Saxonia Electrical Wire Co.

Copper bonds.—B.I. & Helsby Cables, Ltd.

Rubber details.—J. G. Ingram & Son, North British Rubber Co., and I.R., G.P. & Telegraph Works Co.

Moulded insulators (other than rubber).—Ebonest Manufacturing Co., Crystalline Manufacturing Co., and British Westinghouse Co.

Fibre articles.—J. Burns, F. A. Fill & Co., and Mosses & Mitchell.

Mica and micaite articles.—D. Jaroslaw and George Schulz & Co.

Insulators and porcelain for electric trackwork.—Bullers, Ltd., Doulton

and Co., and Taylor, Tunnicliff & Co.

Baking and air-drying insulating varnish.—Pinchin, Johnson & Co.

(three years).

Car furniture.—Edwin Showell & Sons, Player & Mitchell, Brush Electrical

Engineering Co., G. D. Peters & Co., and Gabriel & Co.

Machined bronze bearings.—Anti-Attrition Metal Co.

Machine-finished articles (brass, gun metal, &c.).—Edwin Showell & Sons,

Estlin Bros., Anti-Attrition Metal Co., Player & Mitchell, and Davis

and Timmins.

Machine-finished articles (iron, steel, &c.).—Wilkes, Ltd., British Westing-

house Co., Bayliss, Jones & Bayliss, E. H. Buntall & Co., Davis and

Timmins, F. W. Cotterill, Louis Hervé, John Holroyd & Co., Hobson

Bros. & Co., and F. W. Rowlands & Co.

Gears and pinions, wheels, radiators, worms, &c.—British Hele-Shaw Patent

Clutch Co., John Holroyd & Co., and F. W. Rowlands & Co.

Drop forged stampings.—Charles Bunn, Woodall & Co., Armstrong, Stevens

and Son, and Wilkes, Ltd.

Iron and steel forgings.—Male & Jordan, Hurst, Nelson & Co., Woodall and

Co., W. J. Ritchie & Co., Bayliss, Jones & Bayliss, Chas. Bunn, Wilkes,

Ltd., and East Perry Road Engineering Works, Ltd.

Spring.—Lion Spring Co., Geo. Baller & Co., Smith Bros. & Hill, Joseph

Steel & Sons, Tempered Spring Co., and West Bromwich Spring Co.

Machined iron castings.—Carroll Co., John Crowley & Co., H. Newton

Knights & Co., and Thomas Summerson & Sons.

Iron castings.—Brightside Foundry & Engineering Co. and Joseph William-

son & Co.

Machined malleable iron castings.—Bulley's, Ltd., Leys Malleable Castings

Co., and Brecknell, Munro & Rogers.

Malleable iron castings.—John Crowley & Co. and Bryden & Co.

Steel castings (machined and unmachined).—Thomas Firth & Sons, National

Steel Foundry, Ltd., Samuel Pease & Sons, Edgar Allen & Co., F. W.

Rowlands & Co., Hadfield's Steel Foundry Co., and H. R. Marsden, Ltd.

In their observations on the tenders, the Highways Committee

say that, with a few exceptions, they have accepted the lowest

tender in each case. For certain items, two or more firms, some of

them the present contractors, submitted the same price, and the

Committee have, in most of these cases, accepted the tender of the

present contractors. "The prices received for certain of the items

are unfavourable, and we submit a recommendation that the

tenders therefor should not be accepted." They recommend that

none of the tenders for the following be accepted :—

	Schedule.	No. of items.
T. 8 (contact fingers and parts, &c.)	.. .. .	23
T. 10 (moulded insulators, other than rubber)	.. .. .	4
T. 14 (baking and air-drying varnishes)	.. .. .	2 and 4
T. 18 (machine-finished articles—brass, gun metal, &c.)	.. .. .	15
T. 19 (machine-finished articles—iron, steel, &c.)	.. .. .	13
T. 22 (iron and steel forgings)	.. .. .	15
T. 29 (steel castings, machined and unmachined)	.. .. .	4

The Fire Brigade Committee recommends for acceptance the tender of "Cedes" Electric Traction, Ltd., for two electrically-driven motor escape vans, for £1,658, the company to be allowed to sub-let the supply of the batteries to the Tudor Accumulator Co., Ltd.

The Highways Committee received the following tenders for (1) the reconstruction, for electric traction, of the existing horse tramways from Highbury Station to City Road, *via* St. Paul's Road, Canonbury Road, New North Road and East Road; and (2) the reconstruction of the tramways from Chapel Street to Nile Street, Woolwich, and the construction of the authorised tramways from Catford to Southend, *via* Bromley Road. The tenders also contain provision for certain paving and other works outside the tramway tracks in connection with street widenings along the routes of the

trams from Highbury Station to City Road, and from Chapel Street to Nile Street. The improvement works to be done by the contractors along the latter route, however, form only a small portion of the total, the remainder of which will be executed by the Woolwich Metropolitan Borough Council on the Council's behalf—

(1) *Highbury Station to City Road tramways.*

	Tramway works.	Improvement works.	Total.
A. N. Coles	£45,772	£4,835	£50,107
John Mowlem & Co., Ltd.	48,589	4,799	53,387
Dick, Kerr & Co., Ltd.	50,736	4,781	55,517
G. Percy Trentham, Ltd.	57,084	4,672	61,607

(2) *Chapel Street to Nile Street, Woolwich, and Catford to Southend tramways.*

	Tramway works.	Improvement works.	Total.
A. N. Coles	£39,425	£1,069	£40,515
John Mowlem & Co., Ltd.	40,611	1,479	42,120
George Wimpey & Co., Ltd.	41,581	1,301	42,883
Dick, Kerr & Co., Ltd.	48,228	1,464	49,692
G. Percy Trentham, Ltd.	52,249	1,400	53,649

The lowest tender in each case is that submitted by Mr. A. N. Coles. The Committee say:—"We have given very careful consideration to the question of the steps to be taken to provide for the electrification of these three tramways in the shortest time possible, and with due regard to the work being executed to the satisfaction of the Council. It is probable that the work on the three routes will be in progress at the same time, and as the work from Highbury Station to City Road will have to be carried out in two portions, and is situated at a considerable distance from that to be undertaken south of the Thames, we feel that the Council's interests would best be served by entrusting the works to two contractors, instead of the whole of the works being done by one contractor. We accordingly propose that the reconstruction of the tramways from Highbury Station to City Road should be undertaken by Mr. A. N. Coles, and that the construction and reconstruction of the Catford to Southend and the Chapel Street to Nile Street tramways should be undertaken by John Mowlem & Co., Ltd., the firm submitting the second lowest tender."

The tenders received for the rewinding, &c., of 17 300-KW. and three 500-KW. motor-generators at tramway sub-stations were:—

Newton Bros.	..	(recommended)	£7,957
Manchester Armature Repair Co.	..	..	8,880
Dick, Kerr & Co., Ltd.	..	..	14,100
British Westinghouse Electric Co.	..	..	21,321

ISLINGTON.—The Guardians have accepted the tender of the General Electric Co. Ltd., for a supply of electrical fittings and sundries.

LEWISHAM.—The B. of G. on Monday were informed by the Works Committee that Messrs. W. R. Reynolds, whose tender had been accepted for the electrical installation at the workhouse and infirmary, had withdrawn as they had omitted to include the prices for lamps and fittings. Their tender was for the infirmary £479, and for the workhouse £449. In pursuance of the Board's instructions, they had accepted the tender of Mr. A. J. Hewens for the infirmary, his price being £749, and he had signed the contract. With regard to the workhouse installation, Messrs. Weston & Sons, whose price was £610, had written that they did not feel justified in taking the work on at the price quoted, £640, and made another offer. The Committee recommended that the tender of Messrs. Haycraft, Ltd., be accepted, for £759 10s.

Mr. J. Clemow inquired whether any communication had been received from Messrs. Tredgar & Co., whose tender was £668.

The Clerk said the firm had not been communicated with.

Mr. Clemow proposed that the report be referred back, with a view to Messrs. Tredgar being asked if they stood by their tender.

Mr. J. Weeks, in seconding, said there was a difference of close on £100 between the two tenders, and, in fairness to Messrs. Tredgar, they should have an opportunity of declining the work.

Mr. W. Wood said the desire of the Committee was to avoid "any more fooling about." The specifications were absolutely perfect.

Mr. Weeks replied that the specifications were sent out at 10 o'clock at night, and decided upon the next day. He was not surprised that the experts could not understand them.

The Board referred the matter back to the Committee for further consideration.

LYMINGTON (Hants.).—The T.C. has accepted the tender of the Lymington Electric Light & Power Co. for installing the electric light at the offices, at £65. The only other tender was from Messrs. F. W. Cook & Son, of Southampton, at £60.

MANFIELD.—The Mansfield Engineering Co. has been appointed to supply wiring sundries to the T.C. for the current year.

OBAN.—The T.C. Lighting Committee received tenders from Callender & Cable Co., Ltd., and the British Insulated & Helsby Cables, Ltd., for renewal of certain portions of defective cable. The offer of Callender & Cable Co. was accepted.

PAISLEY.—Messrs. Siemens Bros. have received a contract for a 500-KW. rotary converter for the electricity works, at £1,477. Five firms tendered.

SALFORD.—The Education Committee has accepted the tender of Messrs. Willoughby & Wilcox for wiring in the new laboratories and workshops, for the sum of £40. The Juvenile Employment Sub-committee has accepted the tender of Messrs. Davenport, Sparrow & Co. for electric lighting at the Employment Bureau. The Electricity Committee has accepted the offer of Messrs. J. Jewel & Sons, Birmingham, for the purchase and removal of the No. 1 engine and generator at the electricity station, for £800. The tenders of the following for the purchase of quantities

of waste turbine and crank chamber oil have been accepted:—Mr. F. W. Wollaston, 12 barrels, at 13s. per barrel; Mr. E. Spencer, 39 barrels, at 9s. per barrel.

SOUTH AFRICA.—Messrs. Siemens have obtained a contract for the yearly supply of "Wotan" drawn tungsten wire lamps to the Government of the Union of South Africa.

SWINDON.—The T.C. has accepted for the ensuing year the tender of the Reason Manufacturing Co., Ltd., for miniature and single-tube type electrolytic meters.

SWINTON AND PENDLEBURY.—The U.D.C. has accepted the following tenders in connection with the erection and equipment of the Broad Oak Park sub-station:—

W. Farnworth & Son.—Building, £48.  
General Electric Co.—Switchgear, £119.  
General Cable Manufacturing Co.—Supply main, £205.

WEST HAM.—The T.C. has accepted the offer of Messrs. Cory & Son to supply the following coal to the electricity works during a period of 13 months—5,917 tons of peas, 10s. 2d. per ton; 6,000 tons ditto, 13s.; 41,000 tons ditto, 16s. 3d.; 6,881 tons of rough, 10s. 2d. per ton.

## FORTHCOMING EVENTS.

Physical Society.—Friday, April 25th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments to Detect  $\beta$ -rays from Radium-A," by Messrs. W. Makower and S. Russ; and other papers.

Junior Institution of Engineers.—Friday, April 25th. At 8 p.m. At 89, Victoria Street. Paper on "Condensing Machinery," by Mr. J. Elliott.

"Northampton" Past Day-Students' Association.—Saturday, April 26th. At 8 p.m. At the Northampton Institute, E.C. Annual general meeting.

Institution of Civil Engineers.—Monday, April 28th. Students' meeting. At 8 p.m. Lecture on "Law in Relation to Engineering," by Mr. T. Frame Thomson.

Tuesday, April 29th. At 8 p.m. At the Institution of Mechanical Engineers. Annual general meeting.

Institution of Electrical Engineers (Newcastle Students' Section).—Monday, April 28th. Paper on "Cascade Connections," by Mr. H. V. Henniker.

(London).—Thursday, May 1st. At 8 p.m. Paper on "The Use of the Electrostatic System for the Measurement of Power," by Messrs. C. C. Paterson, E. H. Rayner and A. Kinnes.

Illuminating Engineering Society.—Tuesday, April 29th. At 7.30 p.m. At the Royal Society of Arts. Discussion on paper on "Standard Clauses for Inclusion in a Specification for Street Lighting," to be resumed.

Royal Society of Arts.—Wednesday, April 30th. At 8 p.m. Paper on "The Science Museum," by Mr. F. G. Oatlieve.

Society of Engineers.—Saturday, May 3rd. At 8 p.m. At the Holborn Restaurant. Bohemian concert.

Salford Technical and Engineering Association.—Saturday, May 3rd. Visit to the Economiser Works of Messrs. E. Green & Son, Ltd., Wakefield.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—Lieut.-Col. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, April 22nd.—"A" Company. Recruit training, 7 to 8 p.m.; company training, 7 to 10 p.m.

Tuesday, April 23rd.—"B" Company. Recruit training, 7 to 8 p.m.; company training, 7 to 10 p.m.

Thursday, May 1st.—"C" Company. Recruit training, 7 to 8 p.m.; company training, 7 to 10 p.m.

Friday, May 2nd.—"D" Company. Recruit training, 7 to 8 p.m.; company training, 7 to 10 p.m.

Saturday, May 3rd.—All Companies. Annual musketry at Purfleet Rifle Ranges. Trains leave Fenchurch Street Station, Midland Railway, Tilbury Branch, at 1.15, 1.35 and 2.15 p.m. Men arriving by later trains will be unable to fire. Rifles, &c., are provided for at the Ranges. Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj. For Officer commanding L.E.E.

FRENCH ELECTRICAL STEEL.—The production of steel in France by means of the electric furnace amounted in 1908 to 2,289 tons crude, and 1,235 tons finished. In the three years to 1911 the output rose to 13,850 tons and 8,898 tons respectively. As France is the birthplace of the electric furnace, this result may be regarded as only natural.—*La Revue Electrique*.

SCARCITY OF ENGINEERING APPRENTICES.—A correspondent writes:—"Attracted by the short hours now being worked, and the good wages being earned by colliery lads, many strong-built boys in central and south-east Lancashire are preferring the coal mine to the foundry or the cotton mill. It is stated that there is a growing scarcity of apprentices in the engineering industry in the Bolton district, one large firm of textile machinists offering increased wages in order to attract youths."

# THE ELECTRICITY WORKS OF TROLLHÄTTAN.

(Concluded from page 641.)

The large turbines were supplied by Messrs. Nylqvist and Holm at Trollhättan and Messrs. Boving & Co.'s branch works at Kristinehamn.

Each alternator is provided with an automatic circuit-breaker in the power station, from which armoured cables lead through the tunnel to the switch-house, where a duplicate set of bus-bars is provided. The power distributed locally at 10,000 volts is taken off these bus-bars, while a single set of 50,000-volt bus-bars can be connected to them through step-up transformers, with automatic circuit-breakers and oil-switches on both primary and secondary. Three extra-high-pressure lines are in use at present, including a double one to Gothenburg. Elaborate protection against lightning discharges is provided, including choking coils, horn arresters shunted by oil-resistances, series-connected

and the neutral point. The connections of the 10,000-volt generator are of bare copper bar carried on insulators; on the 50,000-volt switchgear, copper tubes are employed. Intermediate wiring is done with lead-sheathed and steel-armoured

multi-core cable, laid on shelves; the wiring for a group of apparatus belonging to a single unit, such as current transformers, relays, &c., is all embodied in one cable. Fire-proof divisions are provided between conductors of different phases, with a metal screen in front of them, and all oil-immersed apparatus are lodged in fireproof cells.

Views of the different types of bus-bars and switchgear are given in figs. 13 to 15.

The transformer primaries are delta coupled and the secondaries in star; the guaranteed efficiency of each at 3,000 K.V.A. ( $\cos \phi = 1$ ) and 10,000 volts is 98.5 per cent.

FIG. 7.—FEEDERS LEAVING POWER STATION.

FIG. 8.—INTERIOR OF TURBINE ROOM.

liquid resistances, roller lightning arresters, and water-jet dischargers. The transformer secondaries are also protected with inductance coils, and spark gaps between the phases

They were required to withstand a short circuit on the network with the whole station in parallel. The windings were tested with double the working voltage for a quarter of an

hour, and will carry continuously a load of 3,670 K.V.A. with a rise of temperature not exceeding 60° C. The oil tanks are made of boiler plate with welded joints, and are absolutely air and oil-tight. The cooling water is circulated through coils of copper pipe, 60 litres per minute being required for this purpose. The active part of each transformer weighs 16 tons, the tank and oil weighing 12 tons. Alarm devices are provided, which give warning of high or low level of oil, due to excessive temperature on the one hand, or leakage on the other. Direct-reading and distance thermometers are also employed, the latter communicating with the switch-room, where an elaborate system of signals worked by relays, with alarm bells and lamps, is installed.

A 60-ton travelling crane was provided in the power

FIG. 9.—WATER-COLUMN LINE DISCHARGER, AND PORCELAIN INSULATORS.

station, and a 42-ton gantry crane to lower the machinery from the railway track on the cantilever to a lower track on a level with the site of the power station—a height of about 30 m. (fig. 11). A special friction brake was provided on the latter, cooled by circulating oil forced between the friction disks; an electromagnetic brake was also fitted.

FIG. 10.—STATOR OF 11,000-K.V.A. THREE-PHASE ALTERNATOR.

The travelling crane is provided with a 10-ton crab in addition to the big one, as the latter will seldom be used, and the former works at a much higher speed.

Special porcelain insulators have been designed by the Almänna Svenska Electric Co. for use on the Trollhättan

undertaking. The ruling feature of these is the plain conical shape, with only one or two drip flanges near the ends; leading-through insulators are made of two such cones fixed together at their bases. The great advantage of the smooth exterior is that the insulator is unaffected by arcing-over, where ribbed types would be split by the heat of the arc. Examples are shown in fig. 9.

FIG. 11.—CANTILEVER GANTRY CRANE, 42 TONS.

The company state that the disadvantages of corrugations outweigh their advantages. The smooth insulators, when exposed to a moist atmosphere, are quickly dried by the slight leakage currents, and are less liable to become covered with a film of dirt and moisture than corrugated insulators.

FIG. 12.—PART SECTIONAL ELEVATION OF GENERATOR.

The potential gradient and electrostatic surface density are also uniform all over, and the mechanical strength of the plain conical shape is exceptionally great, the insulators being superior not only when subjected to heavy stresses, but also when undergoing shock and vibration during transport.

Cast-iron plugs are cemented into the top and bottom of the conical insulators, affording a convenient means of fixing the insulators and any apparatus that may be attached to them. One of the chief advantages of the smooth surface is the ease with which it can be kept clean; the economy of material and light weight, and the possibility of making large sizes in one piece, as the porcelain stands the oven well, are further points in their favour, tending to cheapness and ease of standardisation. In the case of leading-in insulators, the possibility of puncture has to be considered; this is guarded against by increasing the diameter of the base of the insulator. The arcing-over voltage for these smooth insulators is practically the same as for air; the presence of flanges, which produce non-uniform electrostatic density with resulting ionisation of the air, is found to reduce the arcing-over value in the older types of insulator. The arcing voltage being thus definitely known, the factor of safety can be closely determined, and in the case of the Trollhättan installation the makers have supplied insulators having a factor of safety of 10 for 10,000 volts, and 4.5 for 50,000 volts. Immersing the insulators in a cloud of steam reduced the factor of safety by 40 per cent., rather more than the reduction on flanged insulators, but, on the other hand, the smooth insulators dry themselves more readily and keep cleaner.

The main circuit-breakers are of the oil-immersed type, mechanically or electrically operated. Those which are

FIG. 13.—GROUND FLOOR OF SWITCH-HOUSE; 10,000-VOLT BUS-BARS AND DISCONNECTORS.

automatic are controlled by low-voltage relays, which are all of the same pattern and size. The oil-tanks are all arranged so that they can easily be lowered to expose the contacts for inspection; for the larger sizes special trucks are provided to facilitate this operation, as shown in fig. 17, with motor-driven lifting-frames. The electric operation of the switches is effected with direct-current solenoids, and the controlling switches are provided with special signalling and interlocking devices; normally each of the controlling handles stands at a middle or zero position, whether the circuit-breaker is closed or open, and no signal lamps are alight, but the operation of a circuit-breaker is at once signalled on the control board. If a breaker is closed on a short circuit, it automatically opens instantly, and cannot again be closed until the control handle has first been moved to the "off" position. Some of the oil circuit-breakers are provided with charging resistances on each pole, in series with the line, so that when switching on, the pressure is applied in

FIG. 14.—FIRST FLOOR OF SWITCH-HOUSE; 10,000-VOLT BUS-BARS.

two approximately equal stages. By this means the current rushes often experienced when switching-on a transformer are avoided, a precaution of special importance when low frequencies are employed. The resistances are also of advantage when charging long lines or underground cables. These resistances are put inside the apparatus.

Before adopting the design of the circuit-breakers, the first one was subjected to a mechanical test by switching it on and off 10,000 times. The circuit-breakers were also tested on loads of 20,000 K.V.A. In the 50,000-volt circuit-breakers, seen in the middle of fig. 17, the distance between phases is 90 cm.

All the oil circuit-breakers on the distributing system which are arranged for automatic overload release have time-limit relays; those in the power station and main sub-stations are of the Siemens-Schuckert induction motor type,

FIG. 15.—SECOND FLOOR OF SWITCH-HOUSE; 50,000-VOLT BUS-BARS.

which can only be worked with current from a separate source. For smaller switches the Almänna Svenska Electric Co. has developed a cheaper relay, which is released with current derived from the current transformer; this is of the solenoid type, and of specially strong construction, with separate graduated scales for regulating the tripping current and the time-lag respectively.

Choking coils are provided in all outgoing lines between the switchgear and the lightning arresters, as well as on the 50,000-volt side of the transformers; the latter also have reinforced insulation between the turns near the terminals. The lightning arresters are of the roller air-gap type, in series with carborundum rod resistances, and of the horn type, also in series with resistances. A continuous path to earth, to take off static charges, is provided by water-jet arresters, of which a set is shown in fig. 16; these are installed on the 50,000-volt mains. On the longest 10,000-volt lines the same purpose is served by the water-column in a glass tube shown in fig. 9. The neutral-point of the generators is earthed through a grid resistance designed to carry 15 times the normal current with one phase earthed, for a period of 30 seconds. The neutral point of the high-pressure side of the transformers is similarly earthed.

At present ten 10,000-volt lines leave the Trollhättan switch-house, of which six are overhead and the rest underground; all these supply power to consumers in Trollhättan and the vicinity. A single 50,000-volt line runs to Hakantorp, Skara and Sköfde, and a double one to Lilla

primaries, one transformer being spare. By means of a star-delta switch the secondaries can be connected either in star on the 10,000-volt bus-bars, or in delta on the 6,000-volt bars. Ultimately there will be 15 single-phase transformers in this sub-station, with five incoming 50,000-

FIG. 17.—OIL-SWITCHES FOR 10,000 AND 50,000 VOLTS IN SUB-STATION AT GOTHENBURG.

volt lines, and 24 outgoing 10,000-volt feeders. The automatic signalling system mentioned in connection with the generating station is fully utilised here also, there being 180 indicators, with lamps and alarm bells, connected with the transformer cooling devices, automatic circuit-breakers, &c. The Corporation of Gothenburg takes energy from the sub-station at 6,000 volts, and distributes it to power consumers in the town, in addition to that derived from its steam generating station.

The distance from Trollhättan to Gothenburg is about 80 km., and to Sköfde 100 km. Primary sub-stations are situated at all the points mentioned above, and there are several secondary sub-stations on the 10,000-volt mains.

FIG. 16.—WATER-JET DISCHARGERS FOR 50,000-VOLT LINES.

Edet, Nol, and Gothenburg, with a branch from Lilla Edet to Alingsås. At Gothenburg the pressure is lowered to 10,000 and 6,000 volts for distribution to consumers by overhead and underground mains. The main sub-station contains seven 3,000-k.v.a. single-phase transformers, forming two three-phase sets with star-connected

**Explosion of a Turbo-Dynamo.**—A serious mishap, of a nature fortunately rare in these days of powerful generators, occurred on March 8th last in the Essen power station of the Rheinisch Westfälischen Co. Shortly after 11 p.m., the No. 4 turbine—a Zoelly machine running at 1,000 R.P.M. and coupled to a 5,000-kw., 0.8 power-factor, 5,250-volt alternator with salient rotor poles—began to emit peculiar rising and falling sounds; meanwhile the output of the machine fluctuated widely. The set was at once unloaded, the main switch being opened when the output was reduced to 900 kw. The alternator then showed normal voltage, but, while the main stop valve was being closed, the whole machine "burst." Wreckage flew in all directions and wrought considerable havoc. One piece of the stator, weighing several tons, was thrown through the wall of the power house, and, having damaged the tramway track, ricocheted against and damaged a building on the opposite side of the street. Five of the poles, weighing about 2,000 lb., were hurled through the roof, while the remaining seven were found in various parts of the power house. One pole soared over the houses on the other side of the street and buried itself deeply in the ground, while two others were found well over 100 yards away near the coke ovens of the Victoria Mathias pit. The engine room was strewn with splinters of iron and wood after the disaster, but with the exception of an adjacent 5,000-kw. set which was set on fire, no serious damage was done to the remaining valuable plant in the building. The power house building and some of the adjacent property belonging to the company were, however, badly damaged, but fortunately no loss of life or injury to person was involved.

The cause of the disaster has not been determined, and it is not believed that any definite conclusion can be reached in this respect. The town fire brigade and the station staff, aided by employes from the neighbouring colliery, soon restored comparative order to the works, and it is worth recording that current supply was only interrupted for about five minutes.

## NOTES.

**New Units, Abbreviations and Symbols.**—The Elektrotechnischer Verein, the V.D.I., and other associated bodies, have recently published amended recommendations for the nomenclature and notation of mensuration, time, mechanical, heat, light and electrical units and magnitudes. Most of the abbreviations recommended are of obvious significance, a large number being already in general use, but among the arbitrary, or less easily intelligible ones, may be noted:  $\mu = 0.001$  mm.;  $\lambda = 0.001$  ml.  $\approx 0.001$  cc.; dt. (= dectonne) = 100 kg.;  $\gamma = 0.001$  mg. Time intervals are represented by h., m., s., written on the line, and instants of time are denoted by the same abbreviations set above the line (thus,  $4^h 50^m$ ). The dyne is too small a unit for use in practical work, hence a new unit of force, the *vis*, is introduced. The *vis* is that force which imparts 1 metre per sec. per sec. acceleration to a mass of 1 tonne: 1 *vis* ( $\approx 1$  v.) =  $10^6$  dynes, and is approximately equal to the weight of 100 kg. The corresponding work unit is the *vismetre* (vm.); and the power unit, 1 vm. per sec., is familiar under the name kilowatt. Again, 1 *bar* = weight of 1 grm. at  $45^\circ$  latitude; 1 kb. = weight of 1 kg.; 1 mb. = 1 megabar = weight of 1 tonne. It is clear that 1 v. = 102 kb. approximately; 1 kw.-hour = 3,600 vm.; 1 vm. = 1 kilo-joule  $\approx$  1 kj. (= 102 kbm. approx.); 1 barmetre = 1 bm. = 1 grm.-metre; 1 vm. per sec. = 1 kw. (= 1 G.P. = 1 Grosspferd). The Hefner C.P. is denoted by HK.; the Hefner-lumen by Lm.; the Hefner-lux by Lx. 1 microfarad is denoted by  $\mu$  F.; and the ohm by  $\Omega$ , and the megohm by  $M\Omega$ .

**Copper.**—Messrs. Merton's mid-monthly circular gives particulars of the stocks in England and France and afloat thereto from Chile and Australia on April 15th, 1913. These amount to 32,901 tons, an increase of 640 tons on the quantity registered on March 31st. While English stocks have increased 526 tons, and French 264, and the quantity afloat from Chile is 350 tons better than on March 31st, Australian shipments are 500 tons less, an amount nearly corresponding to the English gain. For the first fortnight of April the arrivals from North America are one-third above average. Spain and Portugal send a small quantity (668 tons) to England and France; but full average to other European countries. Chile shipments are average, and Australian very slightly below. Total deliveries, at 27,221 tons, are high, and denote an encouraging demand. During March American stocks were reduced by a considerable amount, 8,050 tons. The combined visible supply (excluding Holland and Germany), consequently lowered by a larger figure than has been recorded since April, 1912, viz., 11,935 tons. The world's supply (including Holland and Germany, and estimated in other ports) shows a decrease of 7,649 tons for March.

**Annual Concert.**—LONDON.—The staff of the Electrical Engineer's Department of the Great Eastern Railway Co. held their annual smoking concert at Cannon Street Hotel on Saturday, April 19th, and, with their friends, assembled in great force. Mr. H. W. Firth, M.Inst.C.E., presided, and was supported not only by several of the officers of the Great Eastern and other companies, but by several eminent gentlemen engaged in the electrical engineering world, amongst whom may be mentioned: Mr. Wm. Duddell, President of the Institution of Electrical Engineers; Mr. A. H. Walton, of the British Thomson-Houston Co.; Messrs. T. Stevens, John Wilson, J. Robertson, E. P. Grove, C. Busk, E. Barton, S. A. Parnwell, G. Keary, A. O. Shave, A. P. Parker, A. W. Polley, G. P. Parker, and C. S. Egerton. An enjoyable musical programme was interspersed with various toasts. Mr. E. P. Grove, of the London Underground Electric Railways, proposed the "Success of the Chairman, Directors and Officers of the Great Eastern Railway," remarking that, although his association with that company had been but of short duration, only dating from the extension of the Central London Railway to Liverpool Street, it had, nevertheless, been of a very cordial nature, and he could therefore honestly wish them every success. Mr. C. Busk, Continental traffic manager, suitably responded in a humorous speech. The next toast, that of "The Visitors," was submitted by Mr. F. W. Leake, who extended a very hearty welcome to all visitors present. Mr. Wm. Duddell, in reply, expressed the pleasure it gave them to be present, and dealt with electrical topics past and present. The toast of "The Chairman," which was received with great enthusiasm and musical honours, was very ably proposed by Mr. Robertson, of the Tilbury Railway, in response to which Mr. Firth thanked all for their kindness, expressed his gratitude for the loyal support he had received from the staff connected with his department, and stated that any success which had been achieved was due to one and all. He further remarked that he felt that the work of the department was being based on sound principles, and impressed upon the younger men the necessity of being interested in their work and endeavouring to make themselves thoroughly proficient in their various spheres. Mr. D. James proposed a hearty vote of thanks to the Committee. This was seconded by Mr. F. A. Kaffrell and responded to by Mr. J. W. Ball, hon. sec.

**Fatalities.**—HEBBURN.—A mysterious explosion occurred at Hebburn-on-Tyne on March 30th, by which a man named Collinson, and a woman named Gray, were killed, being blown through the ceiling of a house. The explosion was generally attributed to gas, but the evidence given at the resumed inquiry on April 17th suggested that the electric light service might be, in part at least,

responsible. The Northern Counties Electric Supply Co. was represented by Mr. Burton, Newcastle-on-Tyne, and amongst the experts present were Prof. W. M. Thornton, Professor of Electricity at Armstrong College; Mr. F. O. Hunt, Assistant Lecturer in Electricity at Armstrong College; Prof. J. A. Smythe, Lecturer in Chemistry at Armstrong College, and representatives of the local gas companies. Before resuming the taking of evidence, the jury inspected the electrical cable that had been taken from the site of the explosion.

Annie Collinson, daughter of the deceased man, said that about noon on the morning of the explosion she noticed a blue coloured smoke coming through the skirting board of the front room. She thought the smoke smelt like rubber burning. She told her father, who pulled the skirting board up and sent witness for water. The deceased woman, Mrs. Gray, her grandmother, then entered the room. Her father sprinkled water on the place, and just as she left the room to get more water she heard an explosion. In answer to questions, witness said she did not see any flame. There was a fire in the kitchen, but not in the front room.

John Hatcly, manager of the Ellison House Hotel, on the opposite side of Lyon Street to that in which Collinson's house was situated, said he was in the hotel cellar about the time the explosion took place, when the electric lights gradually went out, and he afterwards found that all the electric lights in the house were out. Shortly after the lights went out the explosion occurred. The electric supply was drawn from the main which ran along the front of Collinson's house.

Constable Robson and John George Bennett, who were first on the scene after the explosion, said that immediately inside the doorstep of Collinson's house they saw a flame, which was more noticeable near the window.

Inspector Riddell also spoke to the flame; it was a "gassy" flame. He was of opinion the explosion was caused by a fused cable. When the electric cable was opened he detected a smell similar to that which he found in the house after the explosion. The cable was covered with tiles, but he thought there was a small breach.

At this point the inquiry was adjourned for a week, in order that an expert examination might be made of the electric cable and gas mains.

**COATBRIDGE.**—The *Glasgow Daily Herald* reports that Robert Hall, 51, a bellman or engine-keeper, was killed while employed in Lochrin Ironworks. "He was engaged trimming an electric lamp in the smithy, and had got on to some iron bars instead of a wooden board which he was in the habit of standing upon. He fell among the iron bars in an unconscious state." Artificial respiration was resorted to, but without effect.

**ROCHDALE.**—An inquest was held at Radcliffe, near Manchester, on Monday, into the cause of the death of a joiner named Geo. Hampson, who was killed at Mount Zion Bleach Works, near Rochdale. Evidence showed that the works were burnt out a month ago, and were being rebuilt. A fencing was necessary to protect the workmen using the scaffold from the dangers of a 10,000-volt live wire. The clerk of works informed the Coroner that he had specially warned the deceased of the danger of the wire, telling him that it meant instant death. The evidence showed that the deceased must have got over the fencing, and beneath the wire, and in a moment of forgetfulness had allowed his head to come in contact with it. The jury returned a verdict of "Accidental death."

**Association of Electrical Station Engineers.**—A meeting was held at Manchester on April 17th, 35 gentlemen being present. The proceedings were opened by the chairman (Mr. J. W. Lanham), who in a brief statement gave an outline of the work already done by the branch, and for the benefit of the new members present, explained the general aims of the A.E.S.E. The main business of the evening was to elect the permanent committee. It was resolved that it should consist of 12 members, at least one being appointed from each district represented, three from Manchester, and one from a private plant. The last-named representative will not be appointed until a few more engineers from private plants have become members of the Association. Mr. F. Clarke was appointed assistant secretary. It was resolved that the next general meeting should take the form of a social evening, the first portion being allotted to a paper and discussion on the general status of the profession and the usefulness of an Association. The hon. secretary, Mr. J. W. Thomas, B.Sc. Tech., will read the paper. The date of next meeting will be duly announced, and further details can be obtained from the hon. secretary (Manchester Branch) A.E.S.E., 15, Lotherton Street, Harpurhey, Manchester.

A meeting of the Bradford Section of the Association was held on 16th inst., for the purpose of completing the organisation of the Section which was commenced in March. The chair was occupied by Mr. W. C. Ekin, senior charge engineer at the Bradford electricity works (chairman of the Section), and there was a good attendance. It was reported by Mr. Chas. H. Broadbent (the hon. secretary) that 30 applications for membership had been received, these being from engineers in Bradford, Dewsbury, Colne, Shipley, Rotherham, Barnsley and Keighley, and that other applications were pending. It is proposed, as soon as the Section has been got into full working order, to arrange for social events in the summer months and lectures for next winter. After the replies from London with regard to some of the resolutions passed at the previous meeting had been discussed, the question of a delegate to the Conference arose, and it was unanimously agreed that Mr. C. H. Broadbent should represent the Bradford Branch. A discussion then ensued on the subject of increasing the membership of the

branch, and it was pointed out that a large number of men in the Bradford district were a little perturbed with regard to the effect of joining the Association on their future prospects; but it was easily shown that the main object of association was to improve their prospects and better the general conditions. Mr. C. H. Broadbent, 129, Hartington Terrace, Lidget Green, Bradford, is the hon. secretary for Bradford and district.

**British Engineers' Association.**—A meeting of this Association was to be held at the Cutler's Hall, Sheffield, yesterday afternoon at which Mr. Douglas Vickers, the president, was to preside. He was to introduce the Association's Commissioner in China, Captain T. C. Fitzlugh, M.V.O.

**Re Foster Engineering Co., Ltd.**—In the Companies Winding-Up Court on Tuesday, Mr. R. H. Burman petitioned for the compulsory winding up of this company. Counsel said that Mr. Justice Swinfen Eady had allowed the matter to stand over, with a view to the parties coming to an arrangement, and counsel now asked leave to withdraw the petition or to have it dismissed, the company to pay the costs. The petition was dismissed, the company paying the costs.

**Institution and Lecture Notes.**—INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH LOCAL SECTION).—The annual report of the Committee states that the attendance at the general meetings remains unsatisfactory, the average attendance being barely 14 per cent. of the membership. Only two papers have been contributed from the Section. The past session was made memorable in the annals of the Section by the visit of the Institution to Glasgow during June last year. The membership of all grades now amounts to 390, an increase of 28. Commencing with January, 1914, the *Journal* will be published fortnightly during the session. The Council has in view a scheme for the better co-ordination of arrangements for selection and reading of papers in London and at the Local Sections. The office-bearers for the session 1913-14 will be as follows:—Chairman, Mr. J. A. Robertson; vice-chairmen, Mr. J. Lowson and Mr. T. Blackwood Murray; past chairmen (*ex-officio* members of Committee), Mr. Sam Mavor, Mr. F. A. Newington and Mr. W. M'Whirter; chairman of Students' Section, Mr. A. Page; ordinary members of Committee, Messrs. D. A. Starr, J. K. Stothert, J. F. Nielsen, W. L. Spence, M. B. Field, J. H. Bunting, J. S. Nicholson, E. T. Goslin and G. Stevenson; hon. secretary and treasurer, Mr. J. E. Sayers; assistant hon. secretary, Mr. W. F. Mitchell. Hon. sec. of Students' Section, Mr. J. W. Mowat.

(LONDON).—It is announced that the Institution does not hold a qualifying examination for admission as Student; but on and after June 1st, 1913, all candidates for election to the class of Students will be required to have one of the following qualifications:—

1. The Matriculation Examination of any University in the British Empire; or the Responsions Examination of the University of Oxford; or the Previous Examination of the University of Cambridge.
2. The Studentship Examination of the Institution of Civil Engineers.
3. The School-leaving Examination for the Scottish Education Department.
4. The Naval Cadet Passing-out Examination.
5. The Entrance Examinations for Woolwich and Sandhurst.
6. The School Examination (for School-leaving Certificate) or the Senior School Examination of the University of London.
7. The Oxford or Cambridge Local Examination. (A Senior Certificate, provided it covers English and Elementary Mathematics.)
8. The Oxford and Cambridge Higher Certificate (provided it covers English and Elementary Mathematics).
9. The Abiturient Examination of any German or Austrian Secondary School, or the corresponding examination of similar schools in other countries.
10. The Certificate of any other Educational Authority which may be recognised by the Council of the Institution, as equivalent for the purpose of admission to the class of Students.

(LONDON STUDENTS' SECTION).—The annual general meeting of this Section has been postponed from April 30th until May 7th. There are five extra-collegiate vacancies occurring on the Students' Committee, and nominations should be sent to the hon. secretary, Mr. E. T. Driver, 24, Bradgate Road, Catford, S.E., at the earliest opportunity. The next meeting will be held on Wednesday, May 7th, at 7.45 p.m., when Messrs. E. A. Richards and D. Dunham will read a paper on "Single-Phase Commutator Motors."

(BIRMINGHAM SECTION).—On Wednesday Dr. Giesbert Kapp read a paper entitled "On Phase Advancing," and gave a demonstration of his machine. The same paper was to be read in London yesterday.

(YORKSHIRE SECTION).—A paper was read by Mr. Sidney Simpson on "Prices Charged for Electric Power" at Sheffield on Wednesday, and a discussion followed.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS.**—At the monthly meeting of the West of Scotland Branch, held on Friday last at Glasgow, discussion was resumed on the paper read by Mr. James McCann, Carronhall Collieries, on "Coal-Cutting Machines: their Installation and Manipulation." Mr. Sydney F. Walker suggested that a motor-generator should be fixed in any convenient part of the pit to furnish current at 100 volts on the constant-current system. The 100-volt service would eliminate all chances of fatal shock, and the constant-current system obviated the necessity of a switch on the motor and any starting or regulating resistance. Everything was done by rocking the brushes, and this could be accomplished by gearing worked by a lever or wheel from

outside the motor case, the shaft of the wheel or the gearing passing through a gas-tight gland.

**THE SOCIETY OF ENGINEERS.**—On Monday, May 5th, at the Institution of Electrical Engineers, a paper on "Tidal Waters as a Source of Power" will be read by Mr. C. A. Battiscombe.

**CONCRETE INSTITUTE.**—Reports of the Reinforced Concrete Practice Standing Committee on "Cracks in Concrete," and "The Surface Treatment of Concrete," were read at the meeting on April 10th. The next meeting will take place on April 21th, when a report of the Science Standing Committee, entitled "A Standard Notation for Structural Engineering Calculations," will be presented.

**For Sale.**—The Paisley Corporation has for disposal one 300-kw. Ferranti steam alternator, five Ferranti rectifiers, and about 200 Wright's M.D. indicators. See our advertisement pages in this issue.

**Inquiry.**—Makers of the "Snap" patent lamp lock are asked for.

**Appointments Vacant.**—Shift engineer, for the Stretford U.D.C. Electricity Department (£2). Working electrical engineer and fitter, for the Axbridge Union (35s. +). Chief assistant electrical engineer, for the Watford U.D.C. (£150). Switchboard attendant, for the Borough Electricity Works, Lancaster (25s.). See our advertisement pages in this issue.

**"The Generators."**—The next dinner of the Generators will be held at the Trocadero, to-night (Friday).

**Thirty Years' Celebration.**—The Austrian Elektrotechnischer Verein, of Vienna, recently held a special meeting to celebrate the completion of the thirtieth year of its existence.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—A pleasant little function took place at the Whitehall Club last Tuesday, when a number of personal friends entertained Mr. H. H. COUZENS to dinner. The occasion was to mark the impending departure of Mr. Couzens to Canada, where, we understand, he will take up a very important position. Mr. John F. C. Soell acted as chairman. Mr. Blain, the tramways manager at West Ham, in proposing the health of the guest, referred in eloquent terms to Mr. Couzens's ability as an engineer and to his great capacity for friendship.

Mr. L. C. GILMORE, of the Maidstone Corporation electricity staff, has resigned, and joined the electrical department of Messrs. Drake & Fletcher, engineers, of Maidstone, who are extending this branch of their business.

Mr. R. SHORT, for several years second engineer in the employ of the Falmouth Electric Supply Co., has been presented by the staff with a pipe and case and tobacco pouch on the occasion of his departure to take up the position of chief engineer to North Berwick Electric Supply Corporation.

Mr. L. H. KING, electrical engineer to the Whitby U.D.C., has resigned, having accepted the position of station erection superintendent with the Marconi Wireless Telegraph Co. He commences his new duties in three months' time.

Mr. T. A. G. MARGARY, mains superintendent of the Islington municipal electricity undertaking, has resigned his position.

The Leeds Tramway and Electricity Committee has decided to recommend the appointment of Mr. CHARLES N. HEFFORD as manager of the electricity department. Mr. Hefford was formerly assistant engineer in the department, and has been temporarily filling the position of manager since Mr. Harold Dickinson went to Liverpool. The Committee recommends that his commencing salary be £600 a year.

Mr. B. W. GOTHARD, engineer of the Minehead Electric Supply Co., Ltd., has been appointed electrical engineer to the Aldershot Gas, Water and District Lighting Co.

In order to show their appreciation of the manner in which their electrical engineer has carried out his duties, the directors of the Stratford-on-Avon Electricity Supply Co. have increased the salary of Mr. JULIAN G. THAIN by £30, together with an allowance at the new rate on the salary he has received since he was appointed. It will be remembered that Mr. Thain was appointed in September last in succession to Mr. Falcke, who is carrying on private business at Mansion House Chambers, E.C.

The Taunton T.C. has appointed Mr. G. S. MCCLAREN as mains and meter superintendent.

On leaving Ilfracombe for Grantham (Urban Electric Supply Co.), Mr. W. J. CORSEY, who has been connected with the Ilfracombe E.L. Co. for several years, was presented by the engineer and manager, Mr. H. Stewart, on behalf of the staff, with a marble timepiece. He was also the recipient of marks of esteem from the members of the Ilfracombe branch of the C.E.M.S. and the Junior Imperial League. From the former he received a writing bureau, a badge of the society being affixed, and from the latter a silver hot-water jug.

MR. WILLIAM WYLD, M.I.Mech.E., M.I.E.E., borough electrical engineer and general manager of the Corporation Tramways, Birkenhead, has been appointed chief electrical engineer and manager for the borough of Hamstead. A native of Bishop Auckland, Mr. Wyld was educated at University College, Sheffield, where he studied mechanical and electrical engineering. He served his time to electrical engineering at Darlington, and his first appointment was as assistant in the Blackpool electricity works. From there he went as chief electrical assistant to Salford. Later, he moved to Wednesbury, and worked for the Patent Shaft and Axletree Co. He designed the electrical station there, and also fitted up the machinery for providing power and light. He was afterwards appointed electrical engineer at Doncaster, where he superintended the construction of the tramways. In 1904 Mr. Wyld went to Birkenhead, succeeding Mr. Fearnley, who went to Sheffield. On Mr. Bate leaving Birkenhead in 1907, Mr. Wyld was appointed to the dual position of electrical engineer and tramway manager, and he has been responsible for many important improvements in the Birkenhead undertakings. He is a member of the Liverpool Engineering Society, and was last year on the Council of the Tramways and Light Railways Association. In his new post, Mr. Wyld may rest assured that he will have the best wishes of everybody.

**General.**—At a *café chantant*, held last Monday at the Chiswick Town Hall, Mr. A. H. Stanley occupying the chair, the staff of the London United Tramways, Ltd., presented Mr. Z. E. KNAPP, who recently retired from the post of general manager to take up the position of chief engineer of the Underground Electric Railways of London, with an illuminated address and a gold watch, and Mrs. Knapp with a gold chain purse. In making the presentation, Mr. J. B. MacKinnon, traffic superintendent of the L.U.T., said the whole staff were eager to testify to the happy relationship that had existed since Mr. Knapp took office in 1910, and of the sense of justice, and the sympathy and generosity he had always displayed in matters affecting their well-being, and particularly with respect to the improvement in their conditions of employment. Mr. Knapp, in response, said the one change during his short period of office that gave him the greatest satisfaction was the introduction of the so-called "educational" system. The old method of disciplining men by suspension did not work well. Under the new method of merit and demerit marks a man was disciplined without the consequences reacting upon those who were dependent upon him. He had to thank the directors and the staff for all the consideration extended to him, and neither he nor his wife would ever forget their kindness, which had found a lasting expression in the handsome presentations that evening.

Congratulations to the Manchester Association of Students (in connection with the Institution of Civil Engineers) on the choice of its new president—MR. S. L. PEARCE, city electrical engineer of that city.

The *British Australasian* says that MR. G. T. MILNE, who takes the place of Mr. Hamilton Wickes as H.M. Trade Commissioner in Australia, has arrived in Fremantle.

**Obituary.**—MR. DACRE HELME.—We deeply regret to record the death, which occurred last Friday, following upon pneumonia, of Mr. Dacre Helme, borough tramways manager and electrical engineer at Nelson. Mr. Helme went to Nelson in 1904, having previously been associated with Messrs. Vickers, Maxim and Co., Barrow, and entered the service of the Corporation as a mechanical fitter and electrical engineer. When Mr. Henry was promoted, Mr. Helme was made chief assistant engineer, and on the tragic death of Mr. Henry in 1906, he was chosen chief electrical engineer and tramways manager. When Mr. Helme took over the concern, it was in a poor way financially, but, as a result of close study of the needs of the town and zealous efforts to cater for them, he had the satisfaction 12 months ago of announcing that the two departments had actually made a profit. Mr. Helme, who is described as a painstaking official, was a native of Hereford, and only 39. He leaves a widow and one son. The funeral took place at Little Marsden on Tuesday, and was attended by a large gathering, including the Mayor, Corporation officials and members of the Town Council.

MR. JOHN SAXBY.—We regret to learn from yesterday's newspapers that Mr. John Saxby, whose name has for many years been well known by reason of his inventions in connection with the interlocking of railway points and signals, passed away on Wednesday, at Hassocks, near Hayward's Heath. His firm, Messrs. Saxby and Farmer, Ltd., of Westminster, which has all along specialised chiefly in railway signalling inventions and work, is one of the oldest associated with British electrical industry. He was in his 92nd year.

MR. R. COATES.—The *Western Mail* reports a fatal accident having occurred on Saturday at Ystradgynlais, to Mr. R. Coates, manager of the electric light works of the Glangwae Electric Supply Co., Ltd. "No one witnessed the accident, but his body was discovered in the engine-house about 8.15 p.m. terribly mutilated, after having been whirled round by a fly-wheel. The unfortunate man's head was jammed in the machinery. Mr. Coates was 38 years of age, and he leaves a widow and four children."

An inquest was held on Tuesday. It was stated that deceased was at the works when he asked a man named George Harris to attend to the boilers. Harris proceeded to do so, and on returning found the manager's dead body near the fly-wheel badly mutilated and lying across the column. It was supposed that the deceased's clothing caught in the machinery, and that he was whirled to death. Dr. Walsh said that the body was badly injured, and before it could be extricated from the machinery it was found necessary to sever one of the hands. A verdict of "Accidental Death" was

returned, and the Coroner said he had written to the company suggesting that there should be more protection of the machinery.

MR. T. A. TISSEMAN.—The death occurred at Warminster (Wilts.), on April 14th, of Mr. Thos. Alfonso Tisseman, who, after serving his articles with Messrs. Crompton & Co., of Chelmsford, received the appointment of electrical engineer to Messrs. C. A. Vandervell & Co., of Acton Vale. Deceased, who had been ill for some time, was only 25 years of age.

J. R. HAZELDEAN.—The death has occurred of Mr. John Robert Hazelden, Tor Terrace, Newquay, electrical engineer, at the age of 57. Mr. Hazelden expired shortly after retiring to rest.

## NEW COMPANIES REGISTERED.

**G. St. John Day (Patents), Ltd.** (128,154).—This company was registered on April 4th, with a capital of £10,000 in £1 shares to take over from G. St. John Day, of Mumps Electrical Works, Oldham, the benefit of two patents relating (1) to electrical coupling devices, and (2) to improvements in the connection of cords or wires with electrical apparatus, and of two other inventions known as the "One-part Lampholder" and the "Mumps Lamp-holder." The subscribers (with one share each) are—G. St. John Day, 303, Park Road, Oldham, electrical engineer and contractor; J. Orme, 91, Queen's Road, Oldham, engineer; W. Chadwick, Haslemere, 89, Queen's Road, Oldham, solicitor. Private company. The number of directors is not to be less than two or more than four; the first are G. St. John Day, J. Orme and W. Chadwick, each of whom may retain office while holding 500 shares. Registered office, Mumps Electrical Works, Albert Street, Oldham.

**Premier Electric and Hardware Co., Ltd.** (128,630).—This company was registered on March 29th, with a capital of £2,000 in £1 shares to carry on the business of electricians, electrical engineers, generalists and stores of electricity for motive power, light and heat, hardware merchants, &c., and to acquire the business carried on at 9 1/2, Chesapeake, Golden's Green, as the Premier Electric and Hardware Co. The subscribers (with one share each) are—G. Cohen, 910, Chesapeake, Golden's Green, N.W., electrician; J. MacConnell, Old Serjeants' Inn Chambers, W.C., auditor. Private company. The first directors are not named. G. Cohen is first secretary. Registered by J. MacConnell, Old Serjeants' Inn Chambers, Chancery Lane, W.C.

**Electric Cookers, Ltd.** (128,070).—This company was registered on April 1st, with a capital of £5,000 in £1 shares (5,000 preferred) to take over certain inventions relating to electric cookers, &c., and to adopt an agreement with H. T. Harrison. The subscribers (with one share each) are—C. A. Battiscombe, 120, Victoria Street, S.W., civil engineer; H. T. Harrison, 11, Victoria Street, S.W., electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are C. A. Battiscombe (managing director) and H. T. Harrison. Registered by Jones, Son & Andrews, 64, New Broad Street, E.C.

**Reversible Turbines, Ltd.** (128,167).—This company was registered on April 4th, with a capital of £1,912 10s. in 1,750 "A" shares of £1 each, and 9,500 "B" shares of 1s. each, to acquire from W. G. Walker his invention for a reversible turbine and the benefit of patents or other protection in respect thereof. The subscribers (with one share each) are—H. W. McBean, 172, Wilbury Road, Letchworth, Herts., secretary; W. A. Stephenson, Loch Inch, Strathnam Park, S.W., secretary; A. E. Whitlock, 10, Horder Road, Fulham, S.W., clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Registered by M. L. Knight, Bromley, Kent.

**Castlecropper Tramway Co., Ltd.** (3,963).—This company was registered in Dublin on April 3rd, with a capital of £40,000 in £1 shares, to promote, construct, equip and work, by steam, electric or other power, a tramway or light railway in Castlecropper, Co. Kilkenny. The subscribers (with one share each) are—R. H. Prior-Wandesforde, D.L., Castlecropper House, Castlecropper; J. H. Marx, "Cockburn," Castlecropper, mining engineer. Private company. The first directors, to number not less than two or more than five, are R. H. Prior-Wandesforde, R. B. Gahan and J. H. Marx; qualification, £10; remuneration as fixed by the company. Registered office, Castlecropper, Co. Kilkenny.

**W. Leonard & Co., Ltd.** (128,187).—This company was registered on April 5th, with a capital of £500 in £1 shares, to take over the business of an electrical engineer carried on by W. Leonard Prangnell, at 4, Soho Street, W., as "W. Leonard & Co." The subscribers (with one share each) are—W. L. Prangnell, 4, Soho Street, W., electrical engineer; A. E. Rule, 4, Soho Street, Oxford Street, W., accountant. Private company. The number of directors is not to be less than two or more than five; the first are W. L. Prangnell and A. E. Rule, secretary. Registered office, 4, Soho Street, Oxford Street, W.

**National Engineering Co., Ltd.** (128,180).—This company was registered on April 5th, with a capital of £25,000 in 12,000 preference shares of £1 each, and 25,000 ordinary shares of 10s. each, to acquire from Otto Viola the business known as the National Engineering Co., for £19,000 (£6,500 in preference shares and £12,500 in ordinary shares), and to carry on the business of general and electrical engineers, &c. The subscribers (with one share each) are—A. Woder, 43, Addison Way, Hendon, N.W., engineer; E. Brown, 19, Alpertown Street, Paddington, W., engineer; W. Jebbitt, 80, Manor Street, Clapham, S.W., engineer; J. White, 46, Wharton Street, King's Cross Road, W.C., engineer; S. Gozzetti, 3, Harrington Road, Grove Park, Chiswick, W., engineer; D. Murphy, 139, Stanhope Street, N.W., engineer; W. Nichols, 512, High Road, Chiswick, W., engineer. Registered without articles of association. Registered office, 30-32, Seaton Street, Euston Road, N.W.

**Zephyr Ventilating Co., Ltd.** (128,319).—This company was registered on April 12th, with a capital of £7,500 in £1 shares, to take over the business of a ventilating and general engineer, carried on by H. C. H. Tarr at Zion Road, Lawrence Hill, Bristol, as the "Zephyr Ventilating Co." to acquire from J. S. Armstrong and H. C. H. Tarr a certain patent, to carry on business of manufacturers of wires, cables and electrical appliances, electric and general engineers, &c. The subscribers (with one share each) are—J. Liddell, 46, Queen Square, Bristol, manufacturers' agent; J. Armstrong, 9, Elmgrove Road, Bristol, sugar merchant. Private company. The number of directors is not to be less than two or more than six; the first are H. C. H. Tarr and J. Liddell; solicitor, J. McTurk, 31A, Corn Street, Bristol. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

**"Ceag" Electric Safety Lamp Co., Ltd.** (128,191).—This company was registered on April 7th, with a capital of £10,000 in £1 shares (£2,500 7½ per cent. cum. preference), to carry on the business of manufacturing, importers, and exporters of and dealers in electric lamps and all kinds of electric or mechanical accessories, tools, implements and articles, &c. The subscribers (with one share each) are—C. E. von Bernard, 63, Queensborough Terrace, W., gentleman; W. Strecker, 23, St. John's Wood Park, N.W., music publisher; Mr. J. Stoeck, 19, St. Dunstan's Hill, E.C., merchant. Private company. The number of directors is not to be less than two or more than five; the first are C. E. von Bernard, W. Strecker (chairman), M. J. Stoeck and T. H. Engelmann; remuneration of chairman £50 per annum. Registered by Gruessmann & Rouse, 85, Gracechurch Street, E.C.

## CITY NOTES.

## Lancashire Power Construction Co., Ltd.

THE directors' report for the year ending December 31st, 1912, states that the contract for a 3,500-kw. generating set for the Lancashire Electric Power Co. has recently been completed, and the set is now doing regular work. The lead of the Parliamentary Co. is, however, continuing to increase at such a rapid rate that still further plant is required; an order has, therefore, been placed with this company for a generating set with a normal full-load capacity of 1,375 kw., and this set is due for delivery in September next. In order to provide the necessary capital for this plant, and also for various extensions of the mains, it is proposed to make an issue of £100,000 of 5 per cent. prior lien bonds, making with the £50,000 issued in June, 1911, a total issue of £150,000.

The trading profit of the Lancashire Electric Power Co. for the year 1912 has amounted to £14,617. This figure would have been considerably larger but for loss of revenue and increased expenditure as a result of the coal strike. The company's supply was kept intact throughout the period of the strike, but the loss in output was very considerable, and it is estimated that the profits were adversely affected to the extent of £1,380. There was also a strike in a branch of the textile trade in the early part of the year, which also made itself felt on the output of the company. To the trading profit has to be added £757, being interest on the hire-purchase instalments, &c., making a total of £15,371; out of this debenture interest requires £1,500, debit balance written off £7,737, and there is to be carried forward £3,137. The debit balance which appeared in the 1909 balance-sheet of the company as £17,194 has now been eliminated. Notwithstanding the troubles referred to above, the company's business has continued to develop in a most satisfactory manner, as the following figures indicate:—

	1908.	1909.	1910.	1911.	1912.
Units generated ..	7,181,753	9,251,891	13,646,307	17,771,936	23,110,507
Max. load in kw. . .	2,690	3,830	4,600	5,520	6,730
H.P. connected ..	5,960	7,710	10,650	13,600	16,400
Receipts ..	£10,066	£16,294	£24,352	£32,726	£42,778
Expenditure ..	£14,421	£15,164	£18,467	£22,031	£28,156
Trading result ..	£4,865	£1,130	£5,885	£10,695	£14,617
	Loss.	Profit.	Profit.	Profit.	Profit.

The receipts from the low-tension general supply, which the company is operating in certain districts, continue to grow rapidly, and two more districts will be developed during the present year. The new contracts arranged for and which will come into operation this year are some of them of a most important description. Amongst others may be mentioned, as being of a public character, the agreements to supply electricity in bulk to the Corporation of Salford and to the urban district of Hindley, and the contract for the Lancashire and Yorkshire Railway electrification between Bury and Holcombe Brook. In the weaving trade the system of driving each loom by a separate motor (a system in which the company were pioneers) continues to make rapid progress, and two new mills at present in course of erection in the company's area, and which are to be supplied with electrical energy from the company's mains, are both being equipped in this manner.

The prospects for the current year are excellent, provided that no labour troubles occur to dislocate trade. The amount of work in hand at the commencement of the year, exclusive of the Salford contract, which had not then been entered into, and which is not likely to become effective before the autumn, was considerably in excess of the amount of work in hand at the commencement of 1912. It is true that the price of coal has risen some 20 per cent., but, owing to the provision of a coal clause in the company's agreements, this will not affect the company's profits to any serious extent. A marked improvement in the company's position as a result of the year's trading is, therefore, confidently anticipated.

DR. H. F. PARKSALL, chairman, presided on April 17th at Salisbury House, E.C., over the annual meeting, and in moving the adoption of the above report, he said that the balance-sheet, whilst satisfactory, might not show the progress of the business during the year, because that company was a holding company, and it was the progress of the Parliamentary Co., viz., the Lancashire Electric Power Co., which was of most interest. The connections of the Parliamentary Co. during 1912 totalled 2,102 kw., as against 2,107 kw. connected during 1911, and the work in hand, but not connected at the end of the year totalled 2,401 kw., as compared with 1,922 kw. at the end of 1911. Since the commencement of the year, the Salford contract had been arranged, and it was anticipated that the effect on this year's load would be to add 1,000 kw. or 1,500 kw. to the normal growth. The price had been very carefully worked out, and would bring a very substantial profit to the Lancashire Co., whilst it appeared to be an eminently satisfactory contract to the Salford Corporation. The units sold increased from 14,081,000 in 1911, to 18,815,000 in 1912, which was the greatest increase for one year that the company had ever experienced. The percentage increase was 33.6. During the same period the revenue increased from £32,150 to £42,776, while the trading profit increased from £10,695 to £14,617. The latter figure would have been considerably higher but for the coal strike, which lasted for six weeks, and which it was estimated affected the profits of the company to the extent of £1,380. All their contracts contained a clause to protect them against a general increase in the price of coal, but of course during the transition period they did not get the advantage of the clause. A further unsatisfactory feature was the breakdown of one of the generating machines, but the cost of repairing this had been borne out of the revenue account. There was also a strike in the weaving trade, which also, to a small

extent, adversely affected the returns. The units sold from the low-tension system increased from 202,731 to 318,839, or rather over 50 per cent. The capital expenditure had been considerable owing to the power station extension, the total expenditure for the year being £63,844, of which approximately £45,500 was spent on buildings and plant at the power station; £3,795 on sub-station equipment; £8,985 on high-tension mains; and £5,500 on provisional orders. He did not see why the result during the present year should not be as good, as the amount of work in hand was greater than they had a year ago, whilst last year also they had no such important business as the Salford contract to look forward to.

MR. F. E. GRIPPER seconded the motion.

MR. CROSSWAY asked whether it was possible to have a profit and capital account of the Parliamentary Co.

The CHAIRMAN explained that they were the holding company, and found the money for the construction work of the Parliamentary Co., and the latter company issued securities to the holding company for the work done by them. This was the turning point of the company, because the Parliamentary Co. now being solvent, they would be free to pay dividends.

The report was adopted.

The CHAIRMAN said the Parliamentary Co. had several important supply contracts with people like the Lancashire and Yorkshire Railway Co., which might increase very rapidly, and so in order to be prepared they proposed to issue the balance of the prior lien bonds, £50,000 had already been issued, and there were £100,000 unissued. He had received an offer to take up the bonds, and most of the present holders of prior lien bonds whose consent was necessary to the new issue and to the terms, thought the proposed arrangement would be a fair one, because the additional money would enable the company to earn a very substantial profit. He mentioned the matter, but it would have to be brought before a special meeting to be called.

ANSWERING MR. CROSSWAY, the CHAIRMAN said that any shareholder could have the bonds on the same terms as the group who were prepared to take them up.

The retiring directors and auditors were re-elected.

## Re Durham Collieries Electric Power Co., Ltd.

SITTING for the disposal of company's business, Mr. Justice Neville, on Tuesday, April 22nd, heard a petition by the Durham Collieries Electric Power Co., Ltd., a summons in the debenture-holders' action of Poole v. The Company, by which the Court was asked to sanction a conditional agreement for sale of the company's assets to the Newcastle Electric Supply Co., Ltd., and the distribution of the purchase price amongst the debenture-holders of the Durham Co. Mr. H. E. Wright, who appeared in support of the application, said that the sale the Court was asked to sanction, was of the whole of the Durham Co.'s property and undertaking for 10,000 fully-paid shares of £5 each, and the scheme was for the distribution of those shares upon a certain basis amongst the holders of the debentures in the Durham Co. The Durham Co. had issued both debentures and prior lien bonds, and the Newcastle Co. held a large proportion of both, but, with regard to the prior lien bonds, the Court would not be troubled, as in so far as they were not held by the Newcastle Co., it was part of the agreement that that company should pay them off. Some £8,500 were held as collateral security for a debt of £3,500, but the whole of that was to be satisfied as part of the arrangement. The trustee for the debenture-holders made some claim for remuneration, and although that was not provided for by the agreement, he had a letter from the Newcastle Co. that they would pay what was demanded. The total debenture issue was £193,280, a large part of which were held by the Newcastle Co. and surrendered as part of the purchase consideration. In 1912, the Durham Co. went into voluntary liquidation, a receiver was appointed in the debenture-holders' action judgment pronounced, and a certificate obtained. The agreement for sale was conditional on the sanction of the Court being obtained, and, on its being completed, the Court was asked to sanction a distribution of the 10,000 ordinary shares amongst the existing debenture-holders in the Durham Co. *pari passu*. To avoid having fractional certificates where the amount of debentures held would not permit of an even allotment, the trustees were to have power to sell and distribute in cash. The proposal was approved at the meeting by a large majority of debenture-holders the amount of £141,510 voting in favour and only one (the holder) for £200 voting against, Mr. Spens on behalf of the holder of debentures to the amount of £1,370 now opposed the application. He was not prepared then, he said, with evidence, but asked for an adjournment, so that he might ask that the Durham Co. might be wound up compulsorily. The ground was that for years this company had been worked by the Newcastle Co. for their own benefit.

HIS LORDSHIP said that the opposition on that ground came too late, and sanctioned the sale and distribution at purchase price, as proposed, subject to the debts to be discharged by the Newcastle Co. being specified in the order.

**West India and Panama Telegraph Co., Ltd.**—A dividend of 1s. per share on the ordinary shares is announced.

**Cuba Submarine Telegraph Co., Ltd.**—Dividend on ordinary shares for the half-year ended December, 1912, at the rate of 6 per cent. per annum.

### North Metropolitan Electric Power Supply Co.

THE directors' report states that, for the year ended December 31st, 1912, the revenue amounted to £142,962, an increase of £10,087 over 1911, and the expenditure was £71,628, being £10,918 in excess of the previous year, of which £7,483 is due to the increased output, referred to below, and the balance to the higher price of coal. The balance at the credit of the account is £71,334. This, together with interest and dividends receivable and the amount brought forward, makes a total of £80,773. After providing for mortgage, loan and debenture interest, transferring £2,000 to the reserve fund, and placing £25,000 to depreciation account, the directors propose to pay the dividend on the 6 per cent. cumulative preference stock and a dividend at the rate of 6 per cent. per annum, together with a bonus at the rate of 8s. per fully paid share, on the ordinary shares, leaving £1,820 to be carried forward. The capital expenditure during the year amounted to £50,670, making the total £66,018. In June, 1912, a further issue of 6 per cent. cumulative preference stock was offered to the ordinary share and preference stockholders and taken up. The third instalment of 25 per cent. was called up in February, 1913, and the final instalment is payable this month. The directors propose at an early date to make a further issue of 5 per cent. mortgage debentures. The total number of units sold was 29,231,099, an increase of 2,776,607 units, or 10½ per cent. The supply of electricity was maintained without cessation throughout the period of the coal miners' strike, although some weeks after the commencement of the strike, the company thought it desirable to urge economy in the use of the supply for traction purposes, and by authorised distributors and the larger power users. The output and revenue were, in consequence, adversely affected, and the costs for the year show an increase owing to the higher price of coal. The building and plant extensions in connection with the Brimsdown power station are nearly completed, whilst the Willesden power station extensions are still proceeding. Considerable extensions of the Hertford power station will be made at an early date in order to meet the demand for electricity for power purposes in that district. A supply of electricity has been commenced in the district of Hadley, and during the present year arrangements will be made to extend the supply to East Barnet. The total connections to the mains of the North Metropolitan Electrical Power Distribution Co., Ltd., the capital of which is held by this company, have increased by 139 per cent., and a dividend at the rate of 6 per cent. has been paid by that company in respect of the past year.

### Indian Electric Supply and Traction Co., Ltd.

THE annual meeting of this company was held on Monday at the offices, Orient House, New Broad Street, E.C., Mr. John B. Stone presiding.

THE CHAIRMAN, in proposing the adoption of the report, said that as they were aware, the £48,296 of 3-year debentures fell due for repayment on December 31st last. The majority of the debenture-holders who subscribed to assist the company at a critical period were not prepared to renew. It became necessary, therefore, to arrange for an issue of long-dated debentures to repay these and to provide further funds for development. He was glad to say that the board were successful in placing an issue of £60,000 20-year debentures, and the company was, therefore, free from anxiety in this respect. Referring to the progress of the undertaking, he was glad to say that the sales of current had risen from 813,204 units to 1,189,892, and the gross receipts were £13,572, as against £10,974 last year. The connections to the mains expressed in the equivalent of 33-watt lamps were 45,507, as against 28,739 in 1911. The demand for current for power purposes increased at a greater rate than that for lighting, and must continue to do so in a city such as Cawnpore, and considerable expansion in this direction might be looked for in the current year. They might also expect some extension of the municipal lighting. The cost of generating had risen from 1'03d. to 1'07d. per unit, owing to the increased cost of coal. Contracts for a large proportion of their requirements for 1914 had been arranged. The profit was about £500 less than was anticipated, due to the higher cost of coal, and certain expenses connected with the debenture issue, which the board had decided should be charged against revenue. The sales department showed a profit of £906, as against £600 in 1911. The expansion of the business had justified their proceeding with the installation of condensing plant, and this was in course of erection, and with the economiser which was being shipped, a substantial saving in coal consumption should be effected. They were also erecting a plant for cooling the water for condensing, and a brick chimney, which had been found advisable for the increased boiler power. These additions and improvements would cheapen the cost of production, and their effect should be felt in the latter part of this year. The new plant included a fifth boiler, which was being erected, and a 600-KW. generating set. The latter was purchased from the Government, after it had run efficiently for a few weeks at Delhi during the Durbars. They estimated that there was a saving of over 30 per cent. on this purchase as against the same plant being bought at home, shipped to India, and thence taken by rail to Cawnpore. The tramway earnings of 5d. per car-mile compared with 4'62d. last year, but costs were 4'90d. against 4'02d. Of the increase 15d. was due to track rent. The board had hoped that in view of the unremunerative nature of the tramway enterprise, the municipality might have remitted the track rent, and the latter had partly met the company by reducing the amount from Rs. 5,598 per annum to Rs. 2,451, which sum was included in the accounts.

The chairman expressed the board's appreciation of the work of the staff in Cawnpore and the improved results that had followed.

MR. SCOTT MOSCHIEFF, in seconding the motion, said that when he first met the shareholders of the company in 1909, the board had to report a loss of £9 on the year's working. The revenue in that year from the sale of current and from the working of the tramways was £6,750. They now came before the shareholders with a revenue of £17,435, and the £9 loss had been converted into a profit of £8,432. Those figures showed that there was a great deal of life in the company, and that was what he told them four years ago. In 1909 their output amounted to 131,060 units sold to the public. It was now nearly ten times that amount, but the revenue per unit had fallen from 4'65d. to 2'33d. That fall in the price really was a good sign, because it indicated a large increase in the company's business as suppliers of power. He had told them in the past that they looked to a great increase in the business in Cawnpore from the supply of power, not only for large mills, but for medium sized industries in the city. The figures received from Cawnpore for last year's increase showed a total of 451 H.P. in motors connected to the mains, and only half of that was accounted for by one large mill; the balance was divided among flour mills and engineering works, oil mills, &c. It was important to notice that they kept spreading out amongst those various industries, and that was a strong feature about the business. Another matter which had occupied the attention of the board last year had been the improvement of their plant in Cawnpore. Up till recently they had been crippled in this respect, owing to insufficiency of funds, and they had been forced to adopt a very conservative policy. Last year they had the benefit of a visit to England of their chief engineer, and, although he was home on holiday, he devoted a good deal of his time to getting out the scheme for introducing the condensing plant, to which the chairman had referred. They looked forward to considerable benefit from the use of that plant, although it would not be in active use until the latter part of this year.

The report was adopted.

### United River Plate Telephone Co., Ltd.—The

directors' report that the gross receipts in sterling for the nine months to December 31st in the River Plate were £400,068. Deducting expenses in Argentine and London, debenture interest and dividend on preference shares, and adding interest on investments, transfer fees, &c., and the sum of £5,492 brought forward from the previous year, there remains an available balance of £110,574. The estimated revenue charge required to provide systematically for future renewals of plant has, as before, been added to the item maintenance in the profit and loss account, and credited to reserve for renewal of plant, and all special replacements carried out during the period covered by the accounts have been debited to this reserve. The directors recommend that a dividend be paid for the nine months at the rate of 8 per cent. per annum, free of income-tax, that £2,000 be placed to the staff's provident fund, £30,000 to the reserve fund account, and that £5,804 be carried forward. To provide for the steady and gratifying growth of the business a new issue of 54,000 ordinary shares will be made forthwith to the ordinary shareholders at the price of £5 10s. per share.

### I.W. Electric Light and Power Co., Ltd.—The

annual meeting was held recently at Ryde. Mr. F. E. Gripper presided, and it was reported that the equivalent of nearly 10,000 additional lamps had been connected during the year, the largest increase being at Newport and Cowes. The profit from sale of current had increased by £500. After paying interest on debenture stock and the dividend on the preference shares there was a balance of £9,300, £1,685 more than last year. The directors recommended that £3,500 be placed to reserve for the renewal of plant and £1,000 to the ordinary reserve account. They also recommended that a 2 per cent. dividend be paid on the ordinary shares, requiring £2,000, and that £2,779 be carried forward.

**Montreal Light, Heat and Power Co.**—The directors have declared a dividend of 2½ per cent. (at the rate of 9 per cent. per annum) for the quarter ending April 30th.

**Stock Exchange Notices.**—The Committee have ordered the undermentioned securities to be quoted in the Official List—

Calgary Power Co., Ltd.—Further issue of £48,800 5 per cent. 30-year first mortgage bonds of £100 each (Nos. A 4,112 to 4,600).  
Empire District Electric Co.—£3,921,000 first mortgage 5 per cent. sinking fund gold bonds of \$1,000 each (Nos. 1 to 2,921).

**Electrolytic Alkali Co., Ltd.**—At the meeting held at Liverpool last week, there were some opposition to the resolution for voluntary liquidation, but after lengthy discussion it was carried on a poll.

**Brazilian Traction, Light and Power Co.**—A dividend of 1½ per cent. is announced.

**Kaministiquia Power Co.**—The directors have declared a dividend of \$1½ per share (at the rate of 5 per cent. per annum) for the quarter ending April 30th.

**Held Over.**—Owing to heavy demands upon our space this week, we are compelled to hold over several reports of companies until next week.

### Direct United States Cable Co., Ltd.

THE directors' report for the year ended March 31st, 1913, states that the reserve fund account shows a balance of £487,474, as compared with £509,128 at March 31st, 1912, a decrease of £21,656, which is accounted for by expenditure in connection with the repair of the main cable in mid-Atlantic in June, 1912. The directors regret that the main cable has been again interrupted in deep water in mid-Atlantic. The cable ship *Dacia* has recently left London for the position, and will at once proceed with the repair. Three quarterly interim dividends of 2s. each per share (less income-tax), amounting to £34,301, have been declared and paid during the year, and a final dividend of 2s. per share (less tax) is now proposed, making a total distribution of 4 per cent. for the year. After providing a further £10,000 as provision for depreciation of investments, the balance of revenue, £20,104, is transferred to the reserve fund account.

The annual meeting takes place on April 29th.

### Anglo-Argentine Tramways Co., Ltd.

THE annual meeting was held on Monday at Winchester House, E.C., Mr. J. B. Concannon presiding.

THE CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 653), after referring with regret to the death of Mr. Hector Monnon, one of the directors, said he was pleased to say that the business of the company continued to progress. They operated 330 miles of single track, as against 333 in the previous year. The number of passengers carried was 316,260,077, being 17,105,242 in excess of those carried in 1911. The gross receipts for 1912 were £2,778,302, an increase of £146,466. On the expenditure side, wages were £55,360 more, due mainly to their cars having run an additional 1,757,000 miles, and partly to higher wages and shorter hours. Cost of materials increased by £17,737, owing to heavier work on maintenance, and taxes, consequent upon increased receipts, were £20,792 more. On the other hand, they had the pleasing fact that, whilst the cost of current per unit was very high, owing to dearer coal and freight, and although their cars ran 1,757,000 more miles, they had been able, thanks to improved methods, to effect a considerable reduction in the number of units consumed, resulting in the charge under this head showing a decrease of £6,702. With normal prices for coal and its freight to Buenos Ayres, the saving would have been about £39,400. The net increase in expenditure worked out at £85,093 and the increase in gross profit at £61,373. The large total of £455,471 was expended upon maintenance and renewals during the year under review, necessitated by the board's policy of keeping up the property in a high state of efficiency. The amounts at credit of net revenue, including £10,946 carried in from 1911, after placing £135,000 to credit of depreciation funds, was £954,261. The annuity payable to the City company, debenture charges, dividends on preference shares, and the various sinking funds, absorbed £755,922, leaving a balance at credit of net revenue account of £209,306. An interim dividend of 4 per cent. had been paid upon the ordinary shares, and they now recommended a further dividend of 4½ per cent., making 8½ per cent. for the year, as against 7½ per cent. for 1911, leaving a balance of £9,254 to be carried forward. It was gratifying that they were in a position to propose an increased dividend on the ordinary shares, more particularly as the prior charges in 1912 showed an increase of £28,365 over those for 1911. The investments stood at £316,279, which was the cost price. On the other side they had an investment depreciation reserve fund of £9,131. Since the latter account was created, he regretted to say that there was a further depreciation amounting on December 31st last to about £12,000. They had not had to realise any of those investments, all of which were of the class that used to be described as "gilt-edged." Should they have occasion to sell, their ordinary reserve fund, which amounted to £66,013, would, of course, be available to meet the further depreciation, if any. A shareholder had written commenting upon the item £814,173, "discount and commission on issues of debenture stocks," figuring on the asset side of the balance-sheet, and suggested that it should be written off out of the profits. This, as he explained at the meeting two years ago, was being done by operation of a sinking fund. £515,292 of the amount represented the difference between the sale price and par of the 4 per cent. debenture stock, and £146,630 the bonus given to the old 6 per cent. debenture stock on their converting into 4½ per cent. debenture stock. Already £98,832 of these two stocks had been purchased in the market and extinguished. The balance of this item amounting to £253,330 refers to the 5 per cent. debenture stock, the sinking fund for the redemption of which would commence in 1916. The whole of the 4 per cent. debentures which involved an annual charge against revenue of £178,626 would be extinguished 22 years before the expiration of the concession, and the 4½ per cent. and 5 per cent. stock would be paid off a few years before that event. For the current year the receipts up to the 15th inst. showed an increase of £60,267, whilst the net profits to March 31st had also increased by £25,169. On the other hand, the debenture service for this year would absorb an addition of about £70,000. On the whole although many of the services continued to be adversely affected by the construction of the subways, they anticipated satisfactory results for the complete year, and they looked forward with interest and confidence to the opening of the first subway section towards the end of this year. In view of the general manager's statement, which was embodied in the report, he need not detain them much longer, but he must refer to the possibility of competition from motor-omnibuses. He should not have thought it necessary

to do so but for the fact that reference had been made to the subject in some of the newspapers, prompted, no doubt, by the success attained by motor-omnibuses in London. Now the conditions in London were quite different from those prevailing in Buenos Ayres. In London, as they all knew, the tramways did not penetrate the most important business centres either in the city or in the West End, whereas the omnibuses did, and very good use they made of the advantage both from their own and the public point of view. In Buenos Ayres, however, practically every street leading from the suburbs to the business and shopping centres of the city was traversed by tramways, and everyone acquainted with Buenos Ayres was aware that those streets were so narrow and congested that there was not sufficient space for their cars to pass each other, so that the cars inward and outward bound had to run over parallel streets. The problem of relieving this congestion was always occupying the attention of the municipal authorities, and it seemed very unlikely that they would permit the introduction of omnibuses, but assuming that they did, he was pretty confident that they would not compete successfully with their surface cars, and they certainly could not with their combined surface and subway systems. In conclusion, he might add that he was not aware of an omnibus company in this or any other country which was profitably worked in competition with a tramway company whose services tapped all the available sources of traffic.

MR. T. FRANK THOMSON, in seconding the motion, said it was interesting to notice how the extraordinary development of the city transportation of Buenos Ayres had followed the development of the tramway system. There had not been a retrograde step in the development of tramways in the city since their first introduction. As regards the question of motor-omnibus competition, there was no parallel between Buenos Ayres and London. London was one of very few cities in the world where up to a point omnibus travel was universal, and it was only within recent years that tramways had been used to any appreciable extent in London. In other big cities of the world it was exactly the reverse. For instance, in New York, the people had acquired the tramway habit and they held to it, and there was only one avenue where motor-omnibuses ran. In Buenos Ayres, the tramways were the first system of transport, having commenced running in 1868, and there never had been any other system, and as the chairman had said, the roads were too narrow to allow of it.

MR. HAMILTON, K.C., remarked that he was in Buenos Ayres last September and went over the whole of the company's system, and he agreed with the chairman and the vice-chairman that motor-bus competition was entirely out of the question. No sane body of people would provide the necessary money for such a service, as the streets were entirely occupied by their tramways—in fact, the streets were so narrow that he doubted whether motor-buses would be able to get down them. He would like to know whether it was proposed to enable a further issue of capital, and if so, what form it was likely to take.

THE CHAIRMAN, in reply, said that at present they had one and a half million of unexpended capital, but with the heavy work they were doing on the subways that would not last very long. They had not settled anything definite yet, but they were considering with the Continental directors the advisability of postponing a further issue of debenture for a year or two, and placing instead the balance—one and a half million of the ordinary share capital. The report was adopted.

### Official Announcements re Companies. — The

following companies will, unless cause is shown to the contrary, be struck off the register within three months, and will accordingly be dissolved:—

British India Mica Co., Ltd.  
Chameleon Signs, Ltd.  
Dynelectron Syndicate, Ltd.  
Electrical and Mechanical Exhibition, Ltd.  
Electric Coin-Freed Motor Dimming Syndicate, Ltd.  
Electric Tramways Trust, Ltd.  
"Guaranteed" Oil Fitters, Ltd.  
Hirst Magneto Co., Ltd.  
Illuminating Engineering Co., Ltd.  
Laboratories, Ltd.  
"Le Radiant," Ltd.  
Morris-Hawkins, Ltd.  
Motor-Hiring Syndicate, Ltd.  
S. P. (Schochawer Patents) Syndicate, Ltd.  
Schreiber Electric Battery Co., Ltd.  
Scientific and Technical Publications, Ltd.  
Sonic Water-Power Syndicate, Ltd.  
Simplex Industrial Producer Gas Plants, Ltd.  
Smoke Destroyer Co., Ltd.  
Technical Inventions, Ltd.  
Vulcan Dynamo and Motor Co., Ltd.

### City Electric Light Co., Ltd. (Brisbane). — The

directors' report for the half-year ended January 31st, 1913, states that after making additions to the reserve fund, dividend equalisation fund, franchise and purchase sinking fund, accident insurance fund and renewal replacement and contingencies account, there remains a credit balance of £7,148, which, with the balance brought forward, makes £9,092 to be disposed of. The directors recommend that a dividend be paid of 3 per cent. on the preference shares and of 6½ per cent. on the fully-paid ordinary shares, and of 6½ per cent. on the contributing shares. These dividends, together with the dividend duty, will absorb £7,639, leaving £1,453 to be carried forward. The directors have decided to issue on or before April 30th next 40,000 contributing shares paid up to 10s. per share. These will be issued to the shareholders in proportion to their present holding, and will represent about 28 shares to each 100 shares now held.

### Indo-European Telegraph Co., Ltd.

THE directors in their report for 1912 state that the company's negotiations with the Postmaster-General, and with the Imperial German Telegraph Administration previously referred to, are now far advanced. The agreements with those administrations, when concluded, will place at the disposal of the company the much-desired additional cross-Channel cable wire, and will, at the same time, embody an extension of the company's working agreement with the Postmaster-General. The company's new cable wire will be connected with a new land wire throughout the whole length of the company's system, which will shortly be completed. The Imperial Russian Government have informed the company that, in view of the fact that the company's present concession from that Government does not expire until 1925, negotiations for an extension of the same should be deferred for the present. Having regard to the ever-increasing importance of radio-telegraphy, the directors have acquired a controlling interest in the Galletti wireless system, a new and independent system of much promise. Important experiments to establish its value are now in progress, and the necessary funds for this, and for the acquisition of the controlling interest above referred to, have been provided by the company. The sum thus provided is represented by the holding of £32,200 of the capital of Galletti's Wireless Telegraph and Telephone Co., Ltd. (a company formed and controlled by this company), which stands in the balance-sheet at its par value of £32,200. In view, however, of the risks which must attend the development of an entirely new system, the directors propose to make provision out of the year's profits for the whole sum of £32,200 represented by this investment. As a result of the recent extension of the concessions from the Russian and Turkish Governments for the working of the Black Sea Cable (Odessa-Constantinople) the half interest held in that cable by this company (which stood in the balance-sheet at the value of £25,000 under the heading "investments in other telegraph companies") is now directly vested in this company, which assumes responsibility for half the working and maintenance expenses. The designation of the investment has accordingly been altered to "half interest in the Black Sea (Odessa-Constantinople) Cable." The company having taken over in respect of its half ownership of the cable its share of the already existing reserve fund for maintenance, the directors are enabled to constitute in the balance-sheet a "Black Sea Cable maintenance fund" to the amount of £15,000, which is represented by investments on the other side detailed under Schedule D. The company's revenue from message account and other sources, as shown in the revenue account, amounts to £183,411, as compared with £172,427 for 1911, showing an increase of £10,984. The expenses are, on commercial and general account, £58,820, and on maintenance account £32,155, making a total of £90,975, as against £86,087 for 1911, showing an increase of £4,887. The revenue account, therefore, shows a balance of £92,437, which sum is carried to profit and loss account, 1912, and after deduction of income-tax paid is reduced to £87,024. To this is added the balance brought forward of £12,144, making a total of £99,168. Deducting £10,813 provided for depreciation of the company's securities to date and the interim dividend of £10,625 already paid, there remains a balance available for distribution of £77,730. The directors now propose to declare a dividend for the six months ending December 31st, 1912, of 17s. 6d. per share (making with the interim dividend already paid 6 per cent. for the year) and a bonus of 20s. per share, both free of income-tax. They propose further to make the provision of £32,200 in connection with the Galletti purchase and experiments above referred to, carrying forward £13,655. They also propose to make a special distribution to the shareholders of £12,750, equivalent to 15s. per share, out of interest upon certain investments and advance accounts. This distribution also will be free of income-tax. The directors have sustained a severe loss in the death of their esteemed friend and colleague, Mr. Ludwig Delbrück, so long associated with them as a director. The position will shortly be filled by another gentleman, preferably representing Berlin interests. To their great regret also they have lost the services, through retirement for reasons of health, of Mr. Geo. Plate, who represented Bremen interests on the board.

### Calcutta Tramways Co., Ltd.

THE directors' report, as given in the *Financier*, states that the gross receipts and the working expenses for 1912 were as follows:—Receipts.—Calcutta, £208,427; Howrah, £8,606; total, £217,033. Working expenses.—Calcutta, £115,380; Howrah, £6,786; total, £122,166. Revenue balance.—Calcutta, £93,046; Howrah, £1,819; total, £94,866. The balance forward from 1911 accounts £3,918, and bank interest £18, bring the total to £98,903. Deduct interest on debenture stock and dividend on preference and ordinary shares paid, £44,775, leaving an available balance of £54,028, which the directors propose to deal with by the payment of a final dividend of 5s. per share, making  $7\frac{1}{2}$  per cent. for the year, £34,402, adding to the depreciation fund £15,000, and carrying forward £4,626. The depreciation fund at the commencement of the year stood at £64,136. After adding thereto £1,704, interest on investments, and £15,000 proposed to be allocated, as above, and deducting £9,158 written off for renewals and additional expenditure on power house plant during the year, the fund will stand at £71,682. The steady and continued growth of the business, aided to some extent by the abnormal traffic during the period of the Royal visit at the beginning of the year, has produced a further record in traffic receipts, which amount to £215,271, against £200,384 for

1911, or an increase of £14,887. The expenditure shows an increase of £7,780, principally due to increased mileage run, and to the complete overhaul of the power station. Part of the cost of the latter, represented by certain additions to the plant to increase the efficiency of the station, rendered necessary by the growth of the traffic, has been charged to the depreciation reserve fund. The Howrah lines have also shown considerable improvement, as, with practically the same mileage, they show an increase in traffic receipts of £1,205, the increase in expenditure being £385, principally due to permanent way repairs.

### Oriental Telephone and Electric Co., Ltd.

THE directors' report for the year ended December 31st last states that, including £23,715 brought forward from December 31st, 1911, and after deducting the interim dividends of 3 per cent., paid November 1st last, on both the preference and ordinary shares, and making the necessary provision for redemption of the debenture stock and other charges, as shown in the net revenue account, the amount to be dealt with is £57,054. The directors recommend that this sum be appropriated as follows, viz.:—A final dividend of 3 per cent. (less income-tax) for the year on the preference shares, £1,500; a final dividend of 7 per cent. (free of income-tax) on the ordinary shares, making 10 per cent. for the year, £12,552; transfer to reserve account, £5,000; staff pension fund, £2,000; carrying forward £36,002. All the company's exchanges, together with those of the affiliated companies, continue to show improved revenues. The Bombay Telephone Co., Ltd., has further increased its dividend from 9 to 10 per cent., whilst the Telephone Co. of Egypt, Ltd., the Bengal Telephone Co., Ltd., and the China and Japan Telephone and Electric Co., Ltd., have paid their previous rates of 10, 6 and 5 per cent. respectively. In addition to the extensions at Madras, referred to in the last report, considerable extensions and improvements have been made during the past year at Rangoon and in Mauritius, and are now in full working, promising good results. In order to provide better and permanent quarters for the increasing business in the island of Mauritius, the company recently purchased a freehold plot of land in the town of Port Louis, upon which a substantial building is in course of erection, which is expected to be completed by the end of the current year.

The annual meeting is called for April 30th.

### Anglo-American Telegraph Co., Ltd.

THE directors' report for the year ended March 31st, 1913, states that three quarterly interim dividends of 15s. per cent. on the ordinary stock, and £1 10s. per cent. on the preferred stock, were paid on May 1st, August 1st and November 1st, 1912, absorbing £157,500, and the directors on February 1st last paid the final dividend for the year ending December 31st, 1912, amounting to £1 10s. per cent. on the ordinary stock, £1 10s. per cent. on the preferred stock, and £1 10s. per cent. on the deferred stock. These payments absorbed altogether £262,500, being the rent paid by the Western Union Telegraph Co. for the year, equal to 31 per cent. on the ordinary stock, 6 per cent. on the preferred stock, and  $\frac{1}{2}$  per cent. on the deferred stock. The balance at credit of revenue account includes £1,621 bank interest, &c., received during the year, and now amounts to £67,246. The present articles of association are quite obsolete and new ones have been prepared. These accord with present-day law and requirements, and contain provisions which are desirable now that the company has leased its cables to the Western Union Telegraph Co. The rights of the stockholders with regard to dividends and voting and in a winding-up have not been interfered with. The new articles will be submitted at the extraordinary general meeting immediately at the close of the annual meeting on April 29th.

### STOCKS AND SHARES.

Tuesday Evening.

STOCK Exchange markets for the time being seem to have got into smoother waters. The long-deferred fall in the Bank Rate took place last Thursday, and it is expected to be followed by a further reduction this week, provided, that is, that the political outlook abroad does not cloud over again. It is recognised, however, that the Bank of England directors, in not putting down the rate a full point, intended to give the financial world a hint that they did not regard the prospect as entirely pacific; but if the step is taken this Thursday, most people will regard it as a weighty opinion that the war in the Near East is over for all practical purposes.

The latest untoward development abroad is the straining of relations between Japan and the United States. Trouble has been brewing for some time between the two peoples, according to private information, and for the moment it looks as though there might be a rupture of peaceful feeling, unless the Americans care to placate their Western neighbours.

Home Railway Stocks failed to derive immediate benefit from cheaper money, but the market looks stronger now. The Under-

ground list is quiet. Districts dipped to 39½, but recovered to 40. Metropolitan are ½ down. Central London Ordinary and Preferred each put on a point, and the Deferred stock maintained its improvement of last week. Underground Electric shares are ½ easier, though the "A" remain at 11s. 6d. The immediate result of the reduction of the Bank Rate was an upward march in some score or so of Home Railway prior charge stocks, in which movement there participated, to the extent of a point or so. Metropolitan 3½ per cent. Preference; both the District Debenture stocks, and the four City and South London Preference issues. There is a general impression that this improvement will go still further. Underground Electric 6 per cent. Income bonds eased off to 93, and London Electric 4 per cent. Preference stock at 76 is a point down.

It is worth noticing, as having a possible bearing upon railway stocks as a whole, that the Scottish railway issues have shown extreme strength this week, upon the assumption that the companies in the North will be shortly revising their fares in the upward direction. It is understood that the English companies will follow their example before long; indeed, they may be said to have started this already in a mild way, but if there should be a concerted movement, as authorised by the recently-passed Railways Act, there may be better days in store for the Home Railway market, until labour stirs up fresh strife. The British Electric Traction issues continue to fall. Yorkshire 4½ per cent. Debenture stock at 83½ is a point higher.

The Electricity Supply market has little change to disturb its customary placidity. Metropolitan were back to 3½, but this fall of ½ is more than counterbalanced by a rise of 5s. in Smithfields, which carried up the price to 1½. County First Debenture stock lost a point upon the offering of a small parcel in the market the other day.

The Manufacturing group is quiet, a rise of 30s. in Telegraph Constructions being the principal feature. Since the recent increase in the dividend to 20 per cent., there has been a persistent demand for the shares, while the Debenture stock at 97½ is also slightly higher. Babcock & Wilcox eased off to 3½ upon the appearance of the report, which, however, should have had an opposite effect upon the price of the shares, for it makes excellent reading, and the dividend is increased to 16 per cent.—equivalent to 32 per cent. upon the capital before this was doubled by the distribution of bonus shares last year. Some people appear to dislike the creation of the proposed Second Preference shares, but as the Company will have no difficulty in placing these, it will be getting the money at 5 per cent., and should be able to earn a great deal more than this upon the new capital. These new Preference shares, by the way, constitute an excellent investment, the security for them being admirable.

In the Telegraph department, Indo-Europeans, after their substantial advance, reacted 10s., but remain a good market. Investors are on the look-out for Telegraph descriptions which pay well, and offer a reasonable chance of enhanced value. Commercial Cable Debenture stock again rose 1½. Anglo-American Telegraph Preferred continues to harden. Eastern Extension shares put on ½, and Globe Preference are a similar fraction to the good. The Telephone list is also firm. Monte Videos are 1½ higher, Oriental Preference rose ½, and Telephone of Egypt Debenture stock is ½ up. Reuter's eased off to the extent of ½, and American Telephone stock went back a point, which was picked up by the Company's Collateral Trust bonds.

The Canadian-Latin group is remarkable chiefly for a recovery of 8 points in Montreal Light, Heat and Power shares, which restored the quotation to 233½. The price is run up and down by comparatively small demand and supply; sometimes it moves without any stock changing hands at all. Another quarterly dividend of 2½ per cent. is just announced. Kaministiquia shares went back to 132½ on the declaration of the quarterly dividend of 1½ per cent.—certain holders had been expecting the distribution to be raised to the rate of 6 per cent. per annum this time.

The Mexican division is what the newspapers call "marking time." Mexico Trams at 110 are the turn higher, but the 5 per cent. bonds are ½ down, while in the Light and Power issues there have occurred no changes worth mentioning. Electrical Development of Ontario bonds at 95 show a rise of 1½, and there is a better tone in the market for Rio bonds of both classes. British Columbia stocks are harder, as it was expected would be the case so soon as the time expired for selling the rights to the new issues. Brazil Tractions dropped to 101 in consequence of a severe fall in Brazil Railway shares.

Part of the improvement in the Anglo-Argentine Tramways group has oozed out of the Debentures. The new scrip, by the way, is now quoted as fully-paid, and can be bought at 99, at which the yield is £5 1s. on the money. According to the accounts published last week, there is a surplus, after meeting all the Debenture interest, of about £350,000, so it is somewhat surprising that the Debenture stocks should be dull. Calcutta Preference regained their small fall of last week, and Lisbons hardened upon the declaration of the dividend, to which reference was made here in our previous notes.

The Rubber market has fallen into stagnation again, and prices are, on the whole, dullish, though the commodity is somewhat firmer. Armament shares are disposed to droop, in consequence of the new issues which are being made by Armstrongs and Vickers. Lively dealings are taking place in the latter on the basis of 5s. to 5s. 6d. premium for the renunciation letters. Amongst the few Stock Exchange markets to show pronounced animation, that for Copper shares stands out prominently. Copper, the metal, is expected to go much higher; but, inasmuch as the statistics are of so variable a quality, it is difficult for outsiders to gauge a position which is so largely capable of manipulation by speculators in some of the American centres.

## MARKET QUOTATIONS.

It should be remembered, in making use of the figures appearing in the following list, that in some cases the prices are only general, and may vary according to quantities and other circumstances.

Wednesday, April 23rd.

## Oldham, Ashton and Hyde Electric Tramway, Ltd.

The directors' report for 1912 states that the total revenue was £34,579, and the expenditure (including £1,600 for debenture interest and £1,000 placed to provision for renewals account) was £27,791, leaving a net profit of £6,788, plus £180 brought forward. There is to be placed to reserve fund £1,250; dividend, 5 per cent. per annum on the cumulative preference shares, absorbs £2,500; dividend on the ordinary shares at the rate of 7 per cent. per annum for the six months ended December 31st, 1912, making, with the interim dividend 6 per cent. for the year, £3,000; leaving to carry forward £218. During the past year £975 has been expended on capital account. The increase in the traffic receipts of £1,905, following on an increase of £1,202 for 1911, is principally due to better trade. £4,000 has been charged through the revenue account to renewals account, as compared with £2,000 for 1911.

## EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING MARCH, 1913.

THE March returns of electrical business which we publish here-with, exhibit as regards the exports record-breaking figures, and as regards the imports, a small increase over those of the previous month.

Thus, the exports during March reached the highest total so far recorded by us, viz., £991,303, this being due, however, to the inclusion of a huge telegraphic export to Ceylon valued at over £450,000, and bringing the telegraphic export for the month up to over half a million pounds in value.

It is interesting to note that the highest export value previously recorded by us was approximately £874,000 in March, 1910, while in March last year a total of some £821,000 was recorded. In the case of this month's figures, it is satisfactory to note that even excluding the large telegraphic total, the balance representing the

usual run of business amounted to over £480,000 in value—a very high total, which included over £168,000 worth of machinery, £96,000 worth of telephonic material, and £91,000 worth of cables the latter section, however, comparing with some £106,000 worth in the previous month, and showing the only marked decrease as compared with the February figures.

The imports reached £253,112 in value, as compared with £236,079 in the previous month, increases in value being fairly general in all sections except those representing glow and arc lamps. The re-exports at £23,723 were fractionally higher than in February. Ceylon naturally heads the list of purchasers this month, but probably of more general interest are the high figures recorded for Argentina, New South Wales, Canada, India, Japan, &c., due to normal trade.

## Registered Exports of British and Irish Electrical Goods from the United Kingdom.

TOTAL EXPORTS: £994,303.

TOTAL RE-EXPORTS: £23,723.

TOTAL IMPORTS: £253,412.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

# IMPORT TRADE STATISTICS OF SWITZERLAND.

THE following figures of the imports of electrical and similar goods into Switzerland in the year 1911 are taken from the recently issued official trade statistics; the figures for 1910 are added for purposes of comparison, and notes of increases or decreases are given. Attention should be called particularly to the predominant position of German trade as contrasted with the practically insignificant British share in most lines:—

NOTE.—25 francs = £1.

## MUNICIPAL ELECTRICITY IN SHANGHAI.

WE have received from Mr. T. H. U. Aldridge, the electrical engineer to the Shanghai Municipal Council, an interesting report on the work of the electricity department for the year 1912.

From this it appears that the revenue for the year was 761,490 taels (tael = 2s. 6d. approximately); the balance to net balance 238,425 taels; and the net profit 62,318 taels, after allowing a sum of 50,000 taels for special depreciation on the Fearon Road generating plant. A sum of 24,476 taels was also included under revenue payments, being expenditure on interest and salaries in respect of capital works in connection with the new Riverside station, which will not be in regular use for some months. The cost of the Fearon Road generating station is to be written off during the next seven years, and this will, of course, reduce the net surplus for some years to come; the department has, moreover, during the past five or six years reinvested profits to the extent of 500,000 taels in the purchase of new plant and is in a strong position financially.

To turn to engineering details, the plant capacity at Fearon Road was 6,400 kW., of which 1,200 kW. was direct-current plant for traction supply. The maximum load was 6,000 kW., a 48 per cent. increase on the previous year, and was largely due to the great number of new lighting consumers, mostly Chinese, connected during the year, although, of course, also due to power and heating supplies increasing.

The units sold and accounted for were 12,130,537, including nearly 5½ million for private lighting, 940,000 for public lighting, 118,585 for heating and cooking, 2,300,000 for power, and 2,860,000 for traction. The total for the previous year was 8,300,000 units, and the estimated total for the present year is 20 million, an enormous jump which shows plainly the astonishing development in electrical matters in Shanghai.

The load factor was 23½ per cent., or practically unchanged from the previous year, and the coal per unit sold was 5 lb.

The new Riverside generating station will be brought into use during the year, adding some 4,000 kW. of plant capacity to help the estimated maximum load of 8,300 kW. next winter.

For the winter of 1914 a load of 11,300 kW. is anticipated, and it is, therefore, proposed to add, this year, four more boilers, two additional 5,000-kW. turbo-alternators, and additional trunk feeders between the new and old stations.

During the year 102 miles of overhead cable were erected, and 13½ miles of three-phase cable laid; nine new sub-stations were built, three of them designed to accommodate 1,000 kW. each, and the aggregate transformer capacity installed is now 7,500 kW.

The public lighting now includes 292 arc and 833 metal-filament lamps, the latter varying from 60 to 400 c.p. The total service connections at the end of the year were 6,870, 2,200 being added during 1912, and the report points out that the fact that lamp connections show an increase of only 26 per cent., is an indication that electric lighting is cheap enough in Shanghai now to attract the poorer class of Chinese consumer. The small consumer is relatively profitable in Shanghai owing to the comparatively cheap overhead distribution and service costs.

Bearing on this point the report says:—"It is noteworthy that a large class of consumer which is now being secured is found amongst those who, until using electricity, have been lighting their premises with oil lamps." "The transition from oil to electricity . . . is found in what might be called the poorer classes of Chinese shops as well as the better ones." "Electricity as an advertising medium is at last being fully recognised by the Chinese. . . . Then, again, a great number of houses in native alleys are being connected, from which source an enormous demand for electricity is anticipated in the near future."

Electric heating and cooking apparatus are hired out by the department at a small monthly rental, and in this direction great progress is being made, the year's connections amounting to 293 kW., bringing the total connections to 674 kW.

Naturally, it is in the direction of power supply that the greatest progress has been made, and the report adds, "It is nothing to what we may expect within the next few years."

"Already in Shanghai there is a very large field for the electrification of mills and factories . . . and there is every likelihood of large mills being erected, . . ."

During the year, 1,254 h.p. of motors were added, making a total of 305 motors of over 3,000 h.p. now connected. Many of the older rice mills have substituted electric driving, while new ones commence by installing the electric drive. One sub-station already supplies over 500 h.p. for this purpose. In July last a cotton mill containing 10,000 spindles was connected to the mains and is electrically driven throughout. Contracts have been signed for other cotton mills for 1,200 h.p., and negotiations are pending for over 2,500 h.p. for other mills. Indeed, one has only to note that the power units increased from 760,000 in 1911 to 2,300,000 in 1912 to judge of the developments in this direction.

The report also refers to the opportunity for introducing the electric vehicle in Shanghai, to which Mr. Aldridge is now giving his attention.

Units sold and motor h.p. connected. Maximum load curve. SHANGHAI ELECTRICITY SUPPLY.

In conclusion, we reproduce one or two curves which speak volumes for the great progress being made in electricity supply in Shanghai; it is not too much to say that this state of affairs is due more than anything to the enterprise of Mr. Aldridge, the Council's electrical engineer, who, despite the difficulty of location, has succeeded in placing this Chinese city on an equal footing in electrical matters with the best municipal electrical undertakings at home.

PROCEEDINGS OF INSTITUTIONS.

Electric Supply in London.

By FRANK BAILEY, M.Inst.C.E.

(Abstract of paper read before the SOCIETY OF ARTS, April 9th, 1913.)

(Concluded from page 663.)

We have now dealt with the electrical supply works, and may turn, for purposes of comparison, to the other supplies of public utility—gas and water.

The position of the various gasworks and distributing centres is shown by the diagram. The position of the gas companies, according to Field's analysis of accounts for the year 1911, is given below.

	Nominal capital.	Sale of gas, 1,000 cb. ft.
Commercial Co. ...	£2,606,065	£3,295,000
Gas Light and Coke Co. ...	29,154,146	25,485,000
South Metropolitan Co. ...	8,325,340	12,604,000
South Suburban Co. ...	831,363	1,455,000
Wandsworth and Putney Co. ...	548,262	1,161,000
	£41,465,176	44,000,000

All these companies are not subject to any powers of purchase, and have unlimited tenure, holding a practical monopoly in their respective districts, but under terms of statutory supervision and limitation of dividends by the operation of a sliding scale, which form the most ideal protection for the public and the best encouragement for business enterprise.

The supply of water is similarly obtained from a number of sources, and distributed from many reservoirs. In 1904, the Metropolitan Water Board acquired by purchase the undertakings of the

original eight water companies for the sum of 47½ million pounds, and now supply about 82,000,000 thousand gallons per annum.

It will thus be seen that the capital expended at the present time on electrical undertakings is approximately one-half of that spent on gas and water respectively.

The system of mains adopted throughout London is one of the most perfect examples to be found in any city, although it is not the cheapest. Lead-covered cables, insulated with oil-impregnated paper, are generally employed, and these cables—of which there is now more than 20 years' experience—actually improve with age; so long as the lead covering remains undamaged, there appears to be no limit to the useful life of the cable. Dr. Ferranti was the first advocate and maker of this type of cable in the form of concentric conductors, and thus earned the title of the pioneer of electrical transmission.

The brilliance of the tungsten lamp, accompanied by the low cost of obtaining increased candle-power, has raised the standard of domestic illumination and created a demand for more light. An electric supply is now essential to secure the greatest convenience in carrying out the ordinary domestic work of the home. Electric

GAS WORKS IN THE LONDON AREA.

radiators, chiefly of the luminous type, have brought comfort to many offices in the City of London. Electric ozonisers have proved their utility in purifying bad air and water. The electric vehicle may also become more generally used in this country. The increasing use of the electric motor for all purposes is a convincing proof of its advantages.

The following details taken from individual typical examples may be interesting:—

	Kilowatts connected.	Cost of supply per annum.
Printing (Newspaper) ...	1,036	£1,812 2 6
" (General) ...	56	119 7 11
Box makers ...	9	80 0 10
Chemists ...	92	221 11 4
Brewers ...	39	153 10 6
Paint factory ...	108	253 2 11
Soap makers ...	110	68 15 9
Glass " ...	18	118 16 0
Blouse " ...	13	89 6 4
Wood wool makers ...	166	623 8 6
Packing case " ...	52	214 17 10
Tailors ...	63	159 15 5
Biscuit factory ...	265	419 2 6
Confectioners ...	174	569 11 9
Rubber factory ...	222	219 16 5
Sawmill ...	79	302 8 2
Spice factory ...	69	371 4 4
Cabinet maker ...	87	302 15 2
Ironfounders ...	150	877 14 2
Vinegar brewery ...	15	201 14 10
Marble masons ...	101	294 2 0
Tobacco manufacturers ...	22	138 3 5
Cold store ...	164	922 2 9
Flour mills ...	51	158 15 11
Ink " ...	48	235 2 10

The average cost for each kilowatt connected in the representative cases given in this table works out at £2 15s. 8d. per annum, or per horse-power, say, £2 1s. 6d. per annum. Had this horse-power been obtained from the old-fashioned engine, with the losses in shafting, belting, and steam pipes, starting up the plant and keeping the boilers warm all night, and the additional labour required, the cost would have been from £6 to £8 per annum, with further costs for continual repairs and all the annoyance of running steam plant taking up more room than it was worth.

We now come to the important question of street lighting. The development and perfection of the motor vehicle has resulted in an increased speed of street traffic, with many advantages though with some danger. Quicker transit has added to the prosperity of those who formerly suffered loss of time by blocks in the traffic; the delivery of goods is facilitated; and the expensive widening of

many streets is no longer necessary, as by doubling the speed it follows that twice the amount of traffic can be accommodated. To maintain safely this increased speed during hours of darkness a higher standard of artificial illumination has become necessary. A motor vehicle approaching at a speed of 20 miles an hour covers nearly 10 yards in one second, and, travelling without noise, leaves only the power of vision to protect the pedestrian. The adequate illumination of all thoroughfares will reduce the necessity of each vehicle carrying a searchlight and sidelights, or practically forming a travelling lighthouse.

The electric lighting of Cheapside is, like that of many of the main thoroughfares in the City of London, carried out by flame arc lamps, centrally suspended from steel ropes stretched across the street and placed at a considerable elevation in order to secure freedom from shadow and glare.

Improved street lighting is receiving consideration by the various borough councils in London, and their engineers and surveyors have recognised the value of better illumination, not only to ensure the safety of night street traffic, but also to improve adjoining property and to assist the police.

The London County Council now possess powers of purchase of the company undertakings in 1931, and after that date at recurring periods of 10 years—with the exception of the City of London where the Corporation have a prior right which expires in 1914. The terms of purchase are "the then value of all lands, buildings, works, materials and plant, suitable to and used for the purposes of the undertaking, provided that the value of such lands, buildings, works, materials and plant shall be deemed to be their fair market value at the time of the purchase, due regard being had to the nature and then condition of such buildings, works, materials and plant, and to the state of repair thereof, and to the circumstance that they are in such a position as to be ready for immediate working, and the suitability of the same to the purposes of the undertaking . . . but without any addition in respect of compulsory purchase or of goodwill."

These terms were practically based on Sec. 43 of the Tramways Act, 1870, and evidently provide for a fair market price for an undertaking in working order. The recent award in the arbitration proceedings to ascertain the sum to be paid by the Post Office for the acquisition of the National Telephone Co., may therefore be referred to with some interest, particularly as the terms of purchase were on the same lines, though with variations much in favour of the electrical supply undertakings. The Telephone Co. claimed £18,325,435, were awarded £12,515,264 (subject to certain adjustments which are at the moment *sub judice*), and had provided reserve funds which reduced their capital expenditure to £12,473,627.

The total capital expended by all the companies up to the end of 1912 will be found in the table given below, under the various items which appear in the standard form of accounts.

It should be noted that the Willesden works of the Metropolitan Electric Supply Co., being outside the boundary of the County of London, are not subject to purchase by the London County Council.

#### SUMMARY OF TOTAL CAPITAL EXPENDITURE OF ALL ELECTRIC SUPPLY COMPANIES IN LONDON, 1912.

	Amount expended, Dec. 31st, 1912.
Land and buildings ... ..	£3,162,555
Plant and machinery ... ..	3,935,310
Tools and appliances... ..	40,124

Preliminary expenses ... ..	487,181
	<hr/>
	£14,613,196

under the terms as quoted above, but may be purchased by agreement. The Bow works of the Charing Cross and City Co. are also subject to purchase under special conditions.

If we consider that money has to be found by the companies to provide for the necessary capital outlay required to develop further such an important industry, and that the Act of 1908 authorises the London Council to advance money only for three years prior to 1931, it will be seen that for the next 15 years the interests of shareholders will require close attention, and that works of development will require strict economy, coupled with immediate return of some profit, to avoid a loss of capital to those who have encouraged and practically founded a new industry.

As regards conditions of supply and rates of charge, we sometimes hear suggestions that other cities either show more progress or obtain their light or power at a lower cost.

The average price in London for the year 1910, given in the statistics issued by the London County Council, was 8½d. per unit for lighting and 1½d. for power, or a general average of 9½d. per unit, including meter rents.

I have ascertained from Chicago (population 2,250,000) that in the year 1912 they sold 141,752,000 units for lighting at an average selling price of 5½ cents, say, 8d.; and 86,875,000 units for power at an average price of 3½ cents, say, 2d. The total sale of 228,627,000 units gives an average of, say, 2½d. per unit.

In the case of Berlin (population 2,072,000) the municipality granted a monopoly, under strict control, to private enterprise on terms of paying 10 per cent. of the net receipts, to be increased to 25 per cent. when the dividend exceeds 6 per cent. At the end of 30 years from the date of the concession the municipality may purchase the undertaking at its full then value, but without goodwill; and terms are also provided for earlier determination on payment of substantial premiums on the then value. The four original works—Markgrafenstrasse (1885), Mauerstrasse (1886), Spandauerstrasse (1889), and Schiffbauerdam (1890)—were limited by an agreement to an output of about 21,000 kw., and rapid development compelled the erection of the first transmission works at Moabit, followed in 1899 by the Oberspreewer power house, which supply many of the suburbs; and in 1910 the Rummelsburg works were erected.

The rates of charge in Berlin are:—For lighting, 40 pfennige per kw.-hour, with a minimum charge of 100 kw.-hours per annum, say, 4½d. per unit. For power, 16 pfennige, with a minimum charge of 400 kw.-hours per annum, say, 1½d. per unit. In addition, there are charges for fixing and hire of meter and for the cost of the house connection, with a further charge for the compulsory inspection of wiring at the rate of 4 per cent. on the actual cost of the installation. The total sale for the year 1911-12 was as follows:—

	Units.	
Lighting ... ..	54,260,000	Maximum demand, 94,570 kw.
Power ... ..	75,650,000	
Railways ... ..	69,850,000	
Bulk ... ..	23,610,000	
Total ... ..	223,370,000	

Paris (population 2,847,000) commences a new and sole concession on January 1st, 1914, to the Compagnie Parisienne de Distribution d'Electricité, under interesting conditions, and in the meantime the six old companies are preparing to be absorbed, and two new power works—one of 50,000 kw. at St. Ouen, near St. Denis, and the other of 25,000 kw. at the Moulineux—are now in operation. The conditions include payment of 10 per cent. per annum of gross receipts, nominally as a rental for the portion of the distributing system which now belongs to the municipality, with a sliding scale increasing this rent, the minimum annual payment being £120,000. The lease terminates in 1940, when all property will be taken over by the municipality without payment, and power is reserved to acquire the undertaking in 1924 on payment of the balance not then provided by the statutory sinking fund. The authorised rates of charge are 4½d. per unit for lighting, and 2½d. for power.

The experience of Buenos Ayres is interesting, as this important town of 1,500,000 inhabitants was formerly supplied by a number of companies, who allowed the prosperity following their pioneering work to fall into other hands. The Allgemeine Co., of Berlin, assisted by the Deutsche Bank and the Berliner Handelsgesellschaft, formed the German Overseas Electrical Co., which started the Compania Alemana Transatlantica de Electricidad in 1898, and obtained certain rights from the municipality for an indefinite time to lay electric cables throughout an important district. New works in the Calle Paraguary of about 5,000 kw. were started in 1899; and the next year the Cia. Generale d'Electricité were absorbed, to be followed by the River Plate Co.; the Boca works of the Anglo-Argentine Tramways Co., Ltd.; the Edison works of the Primitiva Gas Co.; and, finally, in 1905, the works of the Cia. de Traction y Electricidad "La Capital" were taken over. The Boca works were enlarged by the addition of steam turbines to a total capacity of 30,000 kw.; and in 1910 a large power house at Dock Sud was completed, and now contributes a total capacity of 40,000 kw., with further extensions in hand. It is probable that the value of the shares in the old undertakings was not realised until control had passed into the hands of the exploiting company, and by adopting steam turbines the undertaking was soon prosperous. The terms of the concession provide for repayment of capital by the municipality less an allowance for depreciation, and this accounts for the fact that much of the old plant is still visible, and it may also lead to a renewal of the lease rather than to acquisition by the municipality on such onerous terms.

We can now see that no large city in other countries entrusts its electrical supply to municipal enterprise, and debates on the subject in various languages always repeat the arguments with which we are familiar. The final question of municipal trading *versus* controlled monopoly has been settled with advantage to the various municipalities, by allowing them some return on the profits; by limitation of dividends on a sliding scale, in which the consumer benefits; and by conditions of tenure.

The present and future prospects of the company undertakings in London provide some possibility of undesirable speculation; the uncertainty of a purchase clause may encourage pessimist rumours to depress the property, to be followed by equally good reasons for a convincing boom to the delight of the speculator. We have seen the interpretation of a similar, though weaker, purchase clause, and shareholders may be well advised to remember Buenos Ayres, and to place some confidence in the justice of the ultimate arbitrator.

The local authority undertakings in London have overcome many of the difficulties thrust upon them. Losses are met by special levies included in the rates, and profits provide some controversy as to their disposal. Contracting work, such as wiring buildings, &c., is objected to by the trade, and the expenses of advertising are not always allowed by the authorities. The technical and other officers work under the disadvantage of continual change in

administration; but, in spite of difficulties of all kinds, the electrical engineers of the Borough Councils have generally not only made their plant work, but have obtained the thanks of their customers, credit for themselves, and appreciation from their Councils, although the latter is not always expressed in a convincing manner.

In conclusion, may I be allowed to express a hope that the next paper on the subject—to be read, say, 20 years hence—will prove that the substantial progress made up to the present time was a sure indication of further great developments and the more extensive use of electrical supply. The difficulties of the past few years have created an army of skilled engineers, who have developed powers of resource, and the ability to look ahead; and, as they are mostly still young, they will, I hope, live to realise that they assisted to create an industry which, while increasing the luxury of the rich, reduces the poverty of the poor, and brings prosperity to the nation.

The CHAIRMAN (Mr. A. A. Campbell Swinton) opened the discussion by commenting upon the interesting and exhaustive character of the paper. There could be no doubt that the author was, of all men, best equipped for writing such a paper. The speaker recalled that in 1887, when he first came to London, he met the author for the first time; the author was at that time putting up an underground generating station just outside Whitehall Court, which was now, he believed, used as a sub-station. Since that date Mr. Bailey had been continuously in the electric supply industry of London, and was the first station engineer to apply steam turbines, showing admirable courage in so doing. The speaker had had considerable experience of steam turbines—an experience which, in fact, antedated the time referred to. He believed that the first steam turbines used in London, which still existed, although no longer in use, were two very small turbines employed in connection with the lighting of Lincoln's Inn Hall. In May, 1890, there had been installed under the speaker's supervision, some steam turbines for supplying electricity to New Scotland Yard, and these turbines were still at work, and the entire lighting and power—a considerable amount of printing and other work was carried on there—were supplied by these radial flow turbines, which had been running for 23 years. One of these turbines had been opened up last year, and despite the fact that its interior had not been inspected for 10 years, nothing was amiss, and it was put together again. Turning to the future of so great an industry, the aspect of affairs, was not without seriousness. What would happen, he would ask, for some years before the London County Council made the contemplated purchase? There would probably be great difficulty in finding capital, towards the close of the present companies' period of holding, for extensions; that was one of the evils of eventual municipal purchase upon the terms arranged for in the Electric Lighting Act. People would cease to find money for investment in a concern liable to be bought up at a very low price within a few years, and, in the speaker's opinion, the last Electric Lighting Act had not adequately provided for the difficulty which would arise in a few years' time.

Mr. W. M. MORDEY congratulated the author upon having given a second paper after a lapse of some 23 years, and hoped that, at the end of a similar period, he would give the survivors of the present audience the third paper to which he had referred.

Mr. JAMES H. ROSENTHAL said it was stated in the paper that the Babcock Co. had done much service in perfecting the chain-grate stoker, to which he would add that Mr. Bailey had himself contributed quite as largely to the development of that detail. He had had experience in foreign stations, municipal and other, nearly all over the world, and he did not consider that municipal stations were in any way better than those managed by companies. Probably municipalities would find it no less difficult than companies to raise money, for which reason he doubted whether the County Council would take advantage of their purchasing powers.

Mr. W. C. P. TAPPER said that the author of the paper had been chairman of a Committee of Engineers representing both companies and local authorities, appointed to consider the question of the future supply of London and to report on the matter. Of this Committee the speaker had been a member. He approved of the principle of central control, which must take place sooner or later. Whether, however, that central control would be effected by the London County Council or by some large company, he could not say. One difficulty would arise from the fact that the London County Council, although able to take over the complete systems of the companies, could not take over those of the local authorities; neither could any single large company do this. Assuming, moreover, that legal difficulties were removed, it would seem that the first matter to be settled would be the requisite standardisation of the system of generation. He thought it likely that a three-phase 50-period system at 6,000 volts pressure would be adopted by reason of its convenience for generating direct current, while should higher voltages be required for long distances, step-up transformers could be resorted to. He did not agree with the view that the whole of the 38 stations should be further developed. A good many of the existing stations had water facilities, in the way of canal or river, and might be developed up to their economical limits. When these were fully occupied, six or seven of the better-placed stations should be selected for further development. Extension should then be confined to such stations, the remainder gradually becoming distributing stations. The steam plant of existing stations could be run at peak load until such time as it paid to scrap it. Such an arrangement would serve for many years to come, and could be easily handled by a central authority. The question of purchase should be of interest to the consuming public as well as to supply engineers. The case of the Water Board, how-

ever, showed that public interest was sometimes aroused too late. When the Act constituting the Water Board was under consideration the consuming public took very little interest in the matter, with very unfortunate results. The purchase price in the case of the Water Board was too high, and a similar danger was likely to exist with regard to the electric supply industry in 1931. It was very important that consideration should be given to the payment of a reasonable purchase price at the proper time. From the tables given by the author, it appeared that the price charged by local authorities was less than in the case of companies; that should in no way discredit the companies, as these had done all the pioneer work.

MR. LEON GANTER said that the future prosperity of electric lighting was bound up with the study of scientific methods of illumination, and considerable progress was now being made. He had recently visited many of the chief Continental and American cities, and he believed that if the lighting of the City were completed on the present lines it need not fear comparison with any of them.

MR. A. H. LAW said that Sir Charles Parsons had always appreciated the enterprise displayed by Mr. Bailey at the time when the first steam turbine was installed at Manchester Square; without that enterprise, the progress of the steam turbine might well have been delayed. With regard to the power supply of London even if concentration were not advisable, some form of communication would appear to be useful, so as to enable the different companies to keep down their capital cost. He believed that some such idea occupied Mr. Bailey's mind when he installed the single-phase 100-period alternators, as he had then requested the designers to consider the possibility of future adaptation to three-phase 50-period work.

MR. G. W. MASCOUD anticipated that within the next 20 years the supply of electricity and its application in workshops, &c., would be trebled. As an illustration of the advantage of electricity over steam, he would say that, in changing from steam to electric power, there had been a saving of 35 per cent. in expenditure. The old steam engine had been replaced by a large motor, but in the first stage it had been necessary to couple the motor to the existing shafting, and it was found that the energy absorbed by the shafting and belting was about 35 per cent. of the whole. The displacement of boilers and engines added 50 per cent. to the productive plant.

MR. BAILEY, in reply, said it had been a source of satisfaction to him to be able to bring up to date the figures which he had given 23 years ago.

### Standard Clauses for Street Lighting Specifications.

By A. P. TROTTER.

(Abstract of paper presented at a meeting of the ILLUMINATING ENGINEERING SOCIETY on April 15th, 1913.)

A JOINT Committee consisting of members of the Institution of Electrical Engineers, the Institution of Gas Engineers, the Institution of Municipal and County Engineers and the Illuminating Engineering Society in 1911 commenced the consideration of a draft specification for street lighting, and it was provisionally agreed that the specification should be based on illumination, the standard of comparison to be the minimum horizontal illumination at a height of 3 ft. 3 in. above the ground level. Several members of the Committee objected to the choice of illumination instead of candle-power, and it was agreed that the present author should prepare a statement supporting the former, while Mr. H. T. Harrison should prepare a statement of objection to it. An attempt will be made to present and to amplify the two statements and to discuss the general subject in as impartial a manner as possible.

During the last few years, a real necessity for better street lighting has arisen, owing to the increasing speed of motor traffic. Neither the gas nor the electrical engineer is afraid of competition; on the contrary, they thrive on it, and the public gains more than anybody.

Illumination depends on the quantity of light falling on or received by a surface. It has nothing to do with the colour or reflecting power of a surface. A surface facing a source of light of 1 c.p. and at a distance of 1 ft. from it, or 16 c.p. at 4 ft., or 100 c.p. at 10 ft., receives unit illumination, and this is called 1 foot-candle.

The brightness of an unpolished surface depends on two factors—the illumination, and the proportion of light which the surface can reflect. A dark grey surface reflecting 5 per cent. of the light falling on it may have exactly the same appearance as a pale-grey surface reflecting 25 per cent. if the former receives five times as much illumination as the latter. The quality called brightness (or surface-brightness, to distinguish it from the intrinsic brightness of a self-luminous or translucent body) is, therefore, a product of the two factors illumination and the coefficient of diffused reflection.

If the illumination is up to a certain specified standard, it does not concern the public whether it is produced by a few lamps of large candle-power or by more lamps of less candle-power, or whether tall or shorter posts are used, within certain limits. The lamps must, of course, be so arranged that they are free from glare, and must be placed to the satisfaction of the surveyor, so that they do not interfere with the traffic or with the amenities.

One of the objections, from a contractor's point of view, to the illumination basis of a specification is that it gives him some trouble in calculating and designing the scheme. He considers that, so long as the lamps give the specified candle-power, his responsibilities should end there, and the purchaser must arrange the lighting to suit the needs of the case.

On the other side is the municipal or county engineer or surveyor

Experienced men of this profession have studied the needs of their district, know what the contractors can provide, and understand how to use it when they have got it. But we find that while each man knows his own job, he sometimes has a difficulty in appreciating the needs of a totally different district, and cannot generalise, or even explain the principles on which he successfully designs his street lighting.

It seems better that the lighting authorities should settle what it is they want to buy, and, having specified it, leave details to the competitive skill and wider experience of contractors. What, then, are these authorities "out to buy"? Not lamps, not candle-power, but illumination. So long as there is as high illumination in the main streets as the town can afford, and as much in the side streets as the ratepayers desire, candle-power *per se* does not concern them, and need not greatly trouble their engineers or surveyors.

Another objection to the illumination basis arises from the impression that it is easier to measure candle-power than illumination. The draft specification which will be found in Appendix A recognises several classes of illumination, the lowest having a minimum of 0.01 foot-candle on a horizontal plane 3 ft. 3 in. above the ground. While these classes are of importance so far as quality is concerned, they cover only about 20 per cent. of the street lighting of this country. It is proposed that the balance of 80 per cent. shall be measured by candle-power. The most enthusiastic supporters of the illumination basis agree that there are instrumental difficulties in measuring very low illuminations.

There is also an instrumental difficulty in measuring illumination which falls on a horizontal screen at a large angle of incidence. The draft specification does not provide that the screen shall be horizontal. If desired, it can be inclined to face any lamp, or, in other words, to receive the direct ray at zero angle of incidence.

In the case of that class of street lighting which constitutes by far the largest proportion, and particularly in the extreme case such as the lighting of a country road, the lamps serve mainly as beacons. The illumination on the ground or on any other surface is only useful in the immediate neighbourhood of each lamp. Candle-power is obviously, then, the basis. It is an advantage that the light shall be thrown to a distance, and it is therefore proposed that the candle-power shall be measured in the direction of the thoroughfare, at an angle of  $10^\circ$  below the horizontal. This means that the ray strikes the ground at a distance from the post measured along the street 5.67 times the height of the lamp. As it is convenient to make the measurement at 3 ft. or 4 ft. from the ground, this must be subtracted from the height of the lamp. With a 20-c.p. lamp 12 ft. high, a photometer 4 ft. high will receive the  $10^\circ$  ray if it is placed 45 ft. 4 in. from the post. The illumination on a photometer screen facing the lamp will be 0.0094 foot-candle. For the more brilliant, though less frequent classes of lighting, where there is no difficulty in measuring the illumination produced, there are several reasons for adopting this as a basis instead of candle-power. The first one has already been mentioned. The public wants light, not lamps. Another reason is that this allows the fullest scope for invention, economical spacing, and minimum cost. A third is that if more than three or four lamps contribute the lighting of any part of a street, the resulting effect cannot be obtained by measuring the candle-power of each lamp from that position. The addition of these candle-powers gives no indication of the lighting of the spot in question, unless it is reduced by calculation to the resulting illumination. Nor does the measurement of the illumination on a screen facing each lamp in turn help matters, since it never faces them all at the same time. But if a horizontal screen is set up at this spot it receives illumination from each lamp, and the illuminations are automatically added together, and may be measured simultaneously.

The two advantages of the horizontal plane are that: (1) if the illumination on it is sufficient, that on the other planes must be better; and (2) the illuminations received from all neighbouring lights add themselves together and give one single quantity which may be measured by one single observation. The economy of time and saving of calculation is enormous.

When the lighting of a street is judged, as the specification recommends, by the minimum illumination, the labour is again largely reduced. It is found in practice that it is very easy to find the minimum illumination, and this extends over a considerable area.

An objection to the horizontal plane measurement is that it takes account of reflected light from buildings. Experiment shows that in ordinary West End London streets, with painted stucco, the difference, as measured on the photometer, is extremely small, and is generally beyond the practical limits of error.

Reflected light from the sky is of greater importance. This must be reckoned with in accurate candle-power photometry by narrowing the field of view, and it is one of the reasons why illumination photometry must give place to candle-power measurements when the light is feeble.

For these and other reasons a considerable majority of those who have given attention to this matter agree that the illumination received on a horizontal plane is the best measure of the lighting of a street.

A photometer for use in a test-room may be graduated directly in candle-power, but an instrument to be used in the streets at various distances from the source of light must be graduated in foot-candles. The reading, multiplied by the square of the distance in feet, gives the candle-power.

Take a case from the table in Appendix A: A lamp 12 ft. high, the photometer set up 3 ft. 3 in. from the ground, and 50 ft. from the lamp-post (fig. 1). As we do not want to know the actual distance of the lamp from the photometer, but the square of that distance, we take  $(12 - 3.25)^2 + 50^2 = 2,577$ . Let the illumination measured on the photometer screen directly facing the light

be 0.029 foot-candle. Then the candle-power of the lamp is  $0.029 \times 2,577 = 75$ .

The illumination which would be received on a horizontal screen is less than 0.029 in the same proportion that the height of the lamp is less than the slant distance from the lamp to the screen. The slant distance, the square root of 2,577, is 50.77. The ratio  $8.75 : 50.77$  is 0.1725, and this, multiplied by 0.029, is 0.005, the

FIG. 1.

illumination required. Or the angle of incidence may be calculated or measured. It is easier to measure it to  $1^\circ$  than to level the photometer to that accuracy. To calculate it, find the tangent. This is the ratio of the horizontal distance to the height;  $50/8.75 = 5.71$ . The angle is about  $80^\circ$ , and the tables give the cosine 0.1725, the ratio required. Another lamp 50 ft. away doubles the illumination, making 0.01, for which the table is calculated.

This is a case in which the illumination on the horizontal plane would be difficult to measure with some photometers if there were only one lamp, on account of the feeble illumination, 0.005, and the large angle of incidence; an error of  $1^\circ$  makes 10 per cent. difference at this angle. But when the illumination received at the midway point from the two lamps is measured, the reading 0.01 should give no difficulty, and a slight inclination of the photometer towards one lamp is balanced by its inclination away from the other. Some calculation is needed to find the candle-power, more is required to deduce the illumination from it, but none whatever is necessary if the illumination is measured directly on a horizontal screen.

Assuming, then, that for the higher classes of street lighting the illumination received on a horizontal plane 3 ft. 3 in. above the ground is to be the basis of the estimation of the lighting, we have to consider how this has to be treated.

In all these classes some attempt is made towards uniform distribution. The mean value suggests itself as the one to be considered, but if this is investigated it will be found to involve a considerable amount of calculation.

FIG. 2.—PART OF ST. JAMES'S SQUARE.

A little consideration shows that, while the mean illumination of a street may be up to a reasonable standard, it may have alternations of dazzling brilliance and dismal darkness. This proposal may therefore be discarded.

Some have suggested that the average between the best and the worst parts should be taken; but the area of the former always exceeds that of the latter, and the ratios extend in practice over such wide limits that this comparison will not serve.

The most satisfactory test appears to be the simple minimum illumination. Any excess of light may be regarded as a voluntary benefaction from the lighting authority or an unavoidable concession by the contractor. The draft specification provides that the height at which it is proposed to place the centre of light of each type of unit above the street surface is to be given in the schedule to the tender. This gives the lighting authority an opportunity to control excessive light.

The surveyor members were asked to visit some streets for the purpose of judging what kind of classification would be possible. In the first place, they excluded the lighting of thoroughfares of a special character, where the lighting is more than is usually necessary for ordinary traffic. They thought that for any public lighting

purposes streets might well be grouped under three headings:—  
(a) First-rate main lines of thoroughfare; (b) auxiliary roads and relief main roads; (c) side and unimportant streets.

It appeared desirable that this purely qualitative classification should be checked by quantitative measurements, and Mr. K. Edgecumbe, Prof. J. T. Morris, and the author undertook to make a series of tests on the basis suggested by the draft specification, namely, the minimum illumination on a horizontal plane 3 ft. 3 in. from the ground, as well as the maximum illuminations.

About 88 photometric measurements were made, besides measurements of distance and angle, at 31 places. A Trotter photometer was used. No difficulty was found in comparing lamps of different colours.

The work began in St. James's Square at about 7 p.m.

Fig. 2 shows the positions of the first four sets of measurements, A, B, C, and D.

The highest maximum was found in Baywater Road near Victoria Gate (2·28 foot-candles), and this was 67 times the minimum, giving a larger ratio than in any other street measured on that evening. The ratio of maximum to minimum in Harley Street was 18, being less than in any other of the streets measured. The lighting of the Borough of St. Marylebone is so uniform that no lower illumination could be found in that district.

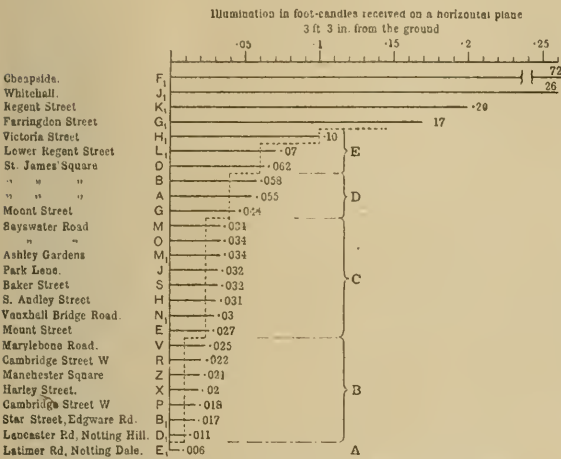

FIG. 3.—RESULTS OF PHOTOMETRIC MEASUREMENTS.

By inadvertence, the class letters are not the same as those suggested in the specification. A represents the lowest class, viz., minimum below 0·01 foot-candle. B is from 0·01 to 0·025. C is from 0·025 to 0·04. D is from 0·04 to 0·06. E is from 0·06 to 0·1.

The results of these photometric tests—which are set out together with others in fig. 3—are rather remarkable when they are compared with the report of the surveyor members. It shows that they so accurately classified the streets by eye that, when the measurements of minima are arranged in order, they fall exactly in the classes. The class (a) has an illumination on a horizontal plane 3 ft. 3 in. from the ground, not less than 0·025 foot-candle. The minimum illumination in class (b) varies from 0·025 to 0·015, and in class (c) it falls below 0·015.

This agreement is noteworthy. It shows that the judgment by eye by experienced men is in accordance with careful photometric tests; that photometric tests of illumination are not mere scientific experiments, but confirm quantitatively in definite figures the judgment of the eye; and, lastly, that the surveyor members seemed to have been unconsciously influenced by the minimum illumination in each case, for the maximum illuminations show no sort of agreement. Another result of these tests is to show that the ratio of maximum to minimum illumination is not a matter of importance, and it was agreed by the Committee that this point, which had appeared in the first preliminary draft, should be dropped. If the measurements had been made at the centre of the road they would have been slightly higher, because the minimum places were not always in the middle of the street.

On discussing the proposed classification there appeared, at first, to be a difficulty in dealing with those cases of brilliant street lighting which were not included in the report by the surveyor members. It was decided to invert the order, and to begin with the most extensive, and therefore very important class, in which the minimum is below 0·01 ft.-candle, which will be measured by taking the candle-power of the lamps. This class was not designated. The other classes are as follows:—

- A. Minimum at least 0·01 ft.-candle
- B. " " " 0·025 " 3
- C. " " " 0·04 " "
- D. " " " 0·06 " "
- E. " " " 0·1 " "

This leaves some 20 letters available for such higher classes of illumination as the progress of civilisation may call for, classes which electric light and gas engineers will be happy to provide when invited.

A table originally calculated by Mr. Haydn T. Harrison to show the candle-power required to produce a minimum illumination of

0·01 foot-candle on a horizontal plane 3 ft. from the ground, midway between two lamps of a given height and distance apart, is given as a graph in fig. 4. The lamps are supposed to give equal candle-power in all directions. The graph shows the economy of placing the lamps as high as possible, subject to practical considerations. Tall lamps in a narrow street waste much light on the walls of the houses.

When the Committee had reached this stage they were asked to consider a draft specification which, while incorporating some of the principles on which the majority seemed to be agreed, directed that the surveyor should fix the position and height of all lamps, and adjudicate on refracting lenses and reflectors. It was suggested that candle-power should be measured at two angles—20° and 50° with the horizontal. This was fully discussed at several meetings, and attempts were made to reconcile or to amalgamate the two somewhat different drafts.

It was finally agreed to put forward a draft of "Standard Clauses for Inclusion in a Specification of Street Lighting."

These clauses were accepted by the Council of the Institution of Electrical Engineers. The Council of the Institution of Municipal and County Engineers suggested some useful drafting amendments. The Council of the Illuminating Engineering Society accepted the

FIG. 4.—GRAPH OF TABLE PREPARED BY MR. HAYDN T. HARRISON, giving the candle-power necessary to produce a minimum illumination of 0·01 foot-candle on a horizontal plane 3 ft. 3 in. above the ground, the lamps being at various distances apart.

clauses as a draft and tentative specification. The Institution of Gas Engineers, while fully appreciating the valuable work which had been done, regretted that they could not agree with the fundamental basis of the suggested specification, namely, the stipulation of illumination with a stated foot-candle minimum measured on the horizontal plane.

The Joint Committee, in these circumstances, were reluctant to take any further steps until an attempt had been made to review the problem and to give an opportunity for a full debate upon it.

Meantime the author has been invited to contribute a paper before the Illuminating Engineering Society dealing with some aspects of street lighting. It occurred to the Council that the platform of the Illuminating Engineering Society might be utilised for an open discussion on the tentative specification prepared at a joint meeting of the four bodies interested. This proposal met with the unanimous approval of the Joint Committee. The present paper is the result.

**Accident.**—A telephone foreman lineman, named T. H. Birch, whilst repairing a wire at the rear of Scitcliffe Hall, Todmorden, last Saturday week, slipped on some rocks and fell a distance of 25 ft. into a brook. He suffered a fractured collar-bone and breast bone, and a pair of pliers in his pocket penetrated 2 in. into his body. His workmate, Henry Forrest, unable to reach the injured man, climbed the telephone pole, and, by means of his pocket instrument, telephoned to the exchange station at Todmorden for help. On the arrival of the ambulance and doctors they had to lower a stretcher to the water, where the injured man still lay, by means of ropes. In the rescue operations Forrest was disabled by a boulder which became dislodged.

## THE ELECTRICAL TRADES BENEVOLENT INSTITUTION.—FESTIVAL DINNER.

ON Wednesday last week the festival dinner of the Institution was held at the Trocadero Restaurant; Mr. George Sutton presided, and about 120 supporters of the Institution and guests were present. Unfortunately, a considerable number of gentlemen were prevented from attending, and sent messages of regret, including Lord Vaux, Sir E. Spencer, Sir J. Wolfe-Barry, Dr. Ferranti, Mr. Rutherford, Mr. Hirst, Mr. Duddell, Mr. Kingsbury and Mr. Garcke.

After the loyal toast, the president rose to propose "The Electrical Trades Benevolent Institution," remarking that he was anxious to secure the autographs of those gentlemen who had not already supplied them. The toast, he said, was the real business of the evening; it was a pleasure to meet old friends, but the main purpose of their being there was to do honour to the toast. It was but a young Institution, and the funds were very small; they wanted to make those funds very much larger. They were in their seventh year, and the funds amounted to only £4,000—a sum that was not worthy of the electrical industry in 1913. Mr. Garcke at the annual meeting told them that there were 500 millions sterling of British capital invested in the industry in the United Kingdom, and nearly 500,000 persons were employed. A large proportion of the latter, it was true, were outside the scope of the Institution, but there was a large number left within it. Many of them knew the difficulty of collecting funds for a charitable society, even in a country famous for generations beyond all others as a philanthropic nation; and since the State had added philanthropy to its functions, it was enormously more difficult to raise funds. But the National Health Act and Old Age Pension Act, good or bad as they might be, had not done away with the necessity for the work of that Institution, which was needed just as much as ever. The objects of the Institution, as set forth on its note-paper, were "to grant pensions and dispense temporary relief to deserving and necessitous persons who are or have been engaged in the electrical trade in the United Kingdom as employers, managers, teachers, or on the engineering, designing, drawing, sales or office staff, or in other similar capacities, or to their dependents"; they left out those who were more directly interested in the State Acts. The primary object of the Institution was to grant pensions—but no pension could be granted from a capital of £4,000, though a great deal of good had been done by small grants of money. His experience showed that it was much easier to get money from those who had not a great deal to spare than from those who were well-to-do. The directors of prosperous firms were often afraid lest they should do with other people's money what they ought not to do, and thought they had no right to contribute; he entirely disagreed with that view. Some companies did grant sums of money; their names appeared on the published lists, but the shareholders never did, and never would, object to the board of directors doing what was right in this respect. Again, some large firms had their own provident funds, and said that they looked after their own people—let others look after theirs. But it was only the large firms that could have their own provident funds, and this Institution had been created to look after the employés of the small firms. Small donations were essential to the Institution, but the backbone of such a society must be the list of members. The Committee could measure their liability if they had a big membership list; but who could measure the good the Institution could do if they gave it the funds? The poor derelicts of the industry who had gone to pieces on the rocks—who was going to help them? He would ask his hearers to use all their persuasive powers to enroll members for the Institution. The *Times* had said that the men who controlled the electrical industry had no understanding of the arts of popular persuasion, and looking at the funds one might agree; but he did not believe it, and he wanted them to show that they had it by getting a large accession to the membership. If employers would become annual subscribers of even a small amount, they could recommend their employés to become members, and at the next festival dinner they would meet under vastly more favourable circumstances.

Mr. A. Bruce Anderson, vice-president, supporting the president's appeal, said that hitherto he had been engaged in pleading the cause of men who were able and willing to work, but could find no work to do; but the claims of those who were not able to work could not be denied. He had been asked to bring to their notice a form of bequest, and a form of application for membership, and to draw their attention to the privileges of subscribers. If they paid £1,000, they could nominate a person for a pension of £40. Of the three great virtues, faith, hope and charity, the greatest was charity; they were all in need of it, but that form of charity for which the chairman appealed in such sincere and earnest terms was the easiest to supply, and he hoped there would be a generous response.

At a later stage the president announced, amid applause, that the contributions received in connection with the dinner amounted in all to the sum of £854 6s.—almost exactly double the amount subscribed last year.

Mr. E. Byng, proposing the health of the president, said no one deserved better of them than he; they had only to look at his list to see how hard he had worked all the year. The speaker did not think the support the Institution received from the electrical trades was at all worthy of the industry, which was stingy and improvident. No one knew how soon he might need help from the

Institution. If the staff of every municipal station subscribed only £5, the result would be an income of about £3,000 a year. He was sincerely moved by the president's remarks, and would offer a donation of £100 on condition that nine others would do the same within three months. Mr. H. Hirst had promised to give £100, and the president had already given that amount, so only seven more were needed; let them endeavour to find the seven, and the result would be £1,000 to the funds. Mr. Sutton, acknowledging the toast, said that if he had been of somewhat little service to the Institution he had been rewarded; he hoped his service had not ended with that dinner. He was especially pleased that his health had been proposed by the son of his old friend; they ought to take advantage of his excellent offer, and set a good example for next year.

During the evening a capital programme was performed, the artistes including Miss Ada Forrest, Mr. T. E. Gatehouse, Mr. Falkner Lee, and Mr. Archie Naish, with Mr. Charles Bassett at the piano, and the festival was in all respects very satisfactorily celebrated.

The following is a list of donations and subscriptions received or promised before the Dinner. The subscriptions are marked with an asterisk:—

### CHAIRMAN'S LIST.

Nash, E. A.	1 1 0	Hawes, F. B. O.	1 1 0

Further contributions were received during the dinner, of which a list will be given later.

## BRITISH TRADE IN THE RUSSIAN FAR EAST.

WHILE we are so busily engaged upon schemes for foreign trade expansion, we need to be reminded occasionally that there are vast tracts of territory which, if we have not actually overlooked them, we have to all appearances treated as not being worth our while—at any rate in their present undeveloped state. We have had put before us particulars of a scheme under which it is hoped that British firms will shortly devote themselves aggressively, and with considerable profit, to one of these vast fields. We refer to Siberia, where the opportunities for British engineering and other manufacturers seem to be very great. We hope to give fuller particulars in our next issue, but in the meantime we may quote here from one of the latest Consular reports issued regarding that part of the world.

The ELECTRICAL REVIEW has previously drawn attention to the fact that British firms are rather neglectful of the opportunities for trade extension which exist in the Russian Far East. The position recently has remained pretty much what it always was, with, perhaps, a slight tendency towards improvement. The number of travellers representing British firms has certainly shown an increase, and instead of following the previous practice of dashing through Vladivostok on the way to or from some other country, and spending a few hours, or at the most a couple of days, in the district, those who came had generally sufficient time at their

disposal to get a reasonable grasp of the local commercial conditions and the prospects of trade. In this connection the British Consul at Vladivostok in a recent report points out that such travellers as were in a position to visit Eastern Siberian centres appeared to carry away the impression that there does really exist there a market for British goods, and that, if any effort is ever to be made to take advantage of it, the present is the time to make it. Among other orders placed at home recently, may be mentioned brick-making machinery, crucible steel, lathes, and workshop equipment, motor-boat engines, refrigerating machinery, &c. British portable engines continue to hold their own, and the import of corrugated iron and flat sheets, always important, is increasing in volume.

The Amur Railway, which is making rapid progress, and should be completed except for the bridge over the Amur at Khabarovsk in 1915, is opening up a large area hitherto untouched; the Russian Government is taking in hand quite a variety of important undertakings, including the proper equipment of Vladivostok Harbour, with extensive electrical installations, the dredging of the approaches to the Amur, and very large building operations for the naval and military departments in various parts of the country; the colonisation authorities are improving the means of communication, and the settlement on the land of peasants from European Russia is progressing under more satisfactory conditions than has been the case in the past. What is more important still, Russian labour is being introduced in place of Chinese on all works depending upon Government, and is being encouraged on private enterprises. On all sides are visible signs of the fixed policy of Russia to develop the Amur Province and populate it with her own people. In addition the exploitation of the natural resources of the country encouraged by a liberal and sympathetic attitude on the part of the administration, is finding the capital which is essential to it.

The purchasing power of the community is, therefore, increasing; it will be interesting to see whether British manufacturers will maintain their aloof and distrustful attitude towards it or whether they will make some serious effort to establish themselves in a market which they have been content hitherto to leave untouched.

It should be at once said that the despatch of an occasional traveller will not effect this object, nor will the distribution of the most alluring catalogues be of much avail. British firms must be actively and efficiently represented on the spot, and until this is done no real improvement in the position can be hoped for. They must bear in mind that German trade has gained predominance here by starting from small beginnings when the Russian occupation was in its infancy, and that it has grown up with the country; that the large German stores having Vladivostok as their centre of operations were founded 40 or 50 years ago, are thoroughly familiar with the wants of the inhabitants, and have accustomed them to the use of German goods; that they have a perfect acquaintance with the language, have opened branches in the various centres as their growing importance seemed to justify it, and have trained and capable technical staffs. Being on the spot and organised so as to gauge the financial stability of their clients, they can—what is all-important here—give credit where circumstances justify it and have a hold over purchasers which distant firms can never obtain.

The foregoing will hardly sound encouraging to firms desirous of working up business in Vladivostok, but no good object can be achieved by minimising the disadvantages under which they must labour if desirous of making an effort to repair the indifference of the past. The lines on which such an effort should be made, in the opinion of the Consul, have been sketched in the course of correspondence between the Consulate and the Commercial Intelligence Branch of the Board of Trade, where further information might be obtained.

An important point to be remembered, particularly in the case of machinery, is that packing of goods for delivery to Vladivostok should be very carefully executed. Cargo for Vladivostok, unless sent *via* Shanghai by fast steamers, is generally three months or more on the way, and has, more particularly in the winter months, to go through extremes of temperatures. Bright parts of machinery must, therefore, be protected and thoroughly coated with anti-rust composition. Hay and straw must not be used, and parts must not be left loose in cases, but must be carefully secured. Great care is recommended in despatching, so as to ensure that no portions or fittings of machinery be omitted, since it is generally impossible to replace anything here, or, if supplies can be obtained, they are very dear. Another point worthy of attention while on the subject of machinery is the importance of sending in good time full specifications and working plans. When supplying boilers, certificates of factory tests must always be sent, and it must be remembered that the requirements of Russian law must be studied and complied with.

**Building Trades Exhibition.**—In addition to the firms mentioned in our last issue as showing at this exhibition, which closes to-morrow at Olympia, MESSRS. C. JENNINGS & CO., of Bristol, have on Stand No. 164, Row H, an exhibit of woodwork, fretwork, screens and arches, doors in various designs, stairs, windows, "Treadark" block flooring, and electric light casing.

**Strikes.**—On Monday last week the labourers and semi-skilled workers at the Preston Works of MESSRS. DICK, KERR & CO., LTD., came out on strike in respect of a dispute regarding wage advances. New terms were offered by the firm on the following day and accepted, work being resumed on Wednesday.

It is announced that a strike at the works of the Hoffman Manufacturing Co., at Chelmsford, which had affected 1,800 men and girls, was settled on Tuesday night. Men over 21 years of age, with six months' service, are to be paid a minimum of 5d. per hour.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**GERMANY.**—The Board of Trade desires to call the attention of manufacturers and shippers in this country to the fact that in accordance with the German regulations for the importation of merchandise by rail, goods so entering Germany (even goods in transit) are now required to be accompanied—apart from the ordinary consignment note—by a special declaration, in duplicate, on a form prescribed, which is to be filled up, both in French and German, by the sender of the goods, and in which (among other particulars) the nature of the goods has to be entered with the terms of the descriptions used for such goods in the German Customs Tariff. The net weight of the goods has also to be given in respect of parcels containing goods subject to different rates of duty. The fact that this special declaration is being sent must be noted by the consignor on the consignment note. A copy of the form of declaration prescribed may be seen by persons interested at the offices of the Commercial Intelligence Branch of the Board of Trade, at 73, Basinghall Street, E.C.

**HOLLAND.**—The Dutch Customs Authorities have decided that zinc bars for battery cells only cut to measure, but not prepared for use in any other manner, are to be admitted free of duty. Lubricating apparatus for the automatic greasing of machines is also to be admitted free of duty.

**ST. LUCIA.**—In accordance with the Canada—West Indies agreement the Government of St. Lucia have decided to put into operation a preferential tariff in favour of British goods, the preference to be given to amount to one-fifth of the duty leviable on foreign goods. The date of coming into force will be fixed subsequently.

**ITALY.**—The Italian Customs Authorities have decided that dry batteries for small electric hand lamps are to be dutiable at the rate of 30 lire per 100 kg. (25 lire = £1, kilogram = 2.204 lb.).

**VENEZUELA.**—The Venezuelan Commercial Code provides that the contents of packages of goods shipped to Venezuela must be declared on the Consular Invoice by giving the name of the article, the material of which it is made, and the quality or condition which distinguishes it from any other article of the same name covered by a different class of the tariff. The Code also provides that if these particulars are not set out in the Consular Invoice the importer will be fined a sum of from £5 to £40 at the discretion of the Director of the Customs House where the goods were imported. Duty is also levied on such cases under the highest class of the tariff under which articles of the kind can be assessed for duty.

In a dispatch from H.M. Minister at Caracas, which has recently been received at the Board of Trade, it is pointed out that in cases in which a fine is imposed by the Custom authorities, there is no remedy unless the consignee at once petition the Venezuelan Minister of Finance, on stamped paper, urging a remission or reduction of the fine on the ground of there having been no intent to defraud the Customs. When such a petition is lodged, a nominal fine equivalent to £1 may be substituted for the fine originally imposed.

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

In our "Legal" columns of last week and this week will be found the report of an appeal case in which the interpretation of the Home Office Regulations is brought into question.

The facts of the case are, briefly, as follows: At the Finchley sub-station of the North Metropolitan Electric Power Supply Co., the cleaning of certain resistances was being carried out on March 25th, 1912, by a young man named Shapcot, who was, as directed by Rule 28 of the above-named Regulations, working under the direction and supervision of another man, who was of mature age, and whose name was Styles. Shortly after starting this work, Shapcot's wrist came into contact with an insufficiently insulated conductor, the potential of which was 6,000 volts above earth, and he was killed.

On June 26th, 1912, the company was convicted, at the Highgate Police Court, of having committed breaches of Rules 18 (*d*) and 28 of the Regulations. Proper screens not having been provided, as required under Rule 18 (*d*), the Bench inflicted a fine of £25, with £5 5s. costs: and on the ground that Shapcot was not a competent person over 21 years of age, but was, notwithstanding, employed to do work where technical knowledge or experience was required in order to avoid danger, a fine of 40s., with nominal costs, was imposed.

The company appealed against both convictions, feeling that in the first instance the fine of £25 was far too heavy—"a savage penalty," as their counsel expressed it—and that in the second instance there should not have been any conviction at all. Their ground was that, if the decision of the Highgate Bench was allowed to stand, it would appear to be illegal to employ any youth under 21 years of age in a generating station or sub-station. The effect of any such interpretation of the Regulations—which have, of course, all the force of an Act of Parliament—might be unmistakably serious, for several reasons. One is that no person could begin to get works experience until he had come of age, which would place electrical work beyond the means of many; and another reason which has been put forward is that the poorer undertakings might suffer financially by reason of the higher cost of older men. We may parenthetically remark that, in our opinion, but little importance attaches to the latter contention; supply authorities, whether company or municipal, are notoriously bad payers, and the wage question, especially where juniors are in question, will not greatly affect them.

As in many other instances, the wording of the Regulation is not as clear as it might be. From Rule 28, which appeared in our report last week, it appears as if a competent person may be under 21 if the work is such that technical knowledge is required, unless that work be repairs, alterations, extension, cleaning, or "such" work. A cleaner, however, must be of age as well as competent, and

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's.)

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,  
4, Ludgate Hill, London, E.C.

must be accompanied by an authorised person. Not even an authorised person may do "such" work by himself. The object—worthy and laudable—of the Rules is the avoidance of danger, but their interpretation is not always easy.

It was contended, in reference to the screens, that a passage 2 ft. 6 in. wide, existing between the side which was dead and that which was alive on the occasion of the fatality, was a division within the meaning of the requirement, and counsel urged, not without some show of justification, that no amount of screening could prevent a man from going where he might be in danger, if he wished to go there. The contention, however, is specious. A passage is for people to walk along, and it is not part of its function to act as a means of preventing people from stepping across from one to the other side of it. And instructions, whether written or verbal, will not prevent rash persons from exceeding the limits of prudence. The argument is worthy to rank with that of the opposing counsel, who thought that the fact of his being killed was, to some extent, evidence of the man's not being competent.

The appeal came before a special sitting of the Middlesex Quarter Sessions, at Caxton Hall, on Monday, April 21st. The result, as our readers have already been informed, was that the fine of £25 was reduced to one of 10 guineas, and the second conviction was quashed. It was held that within the technical meaning of the regulation Shapcot was an authorised person.

We may say that, on the evidence, we agree with this decision. The young man appears to have had training which should have fitted him to carry out, especially under the supervision of Styles, who was an authorised person as defined by the Regulations, the work which he was on this occasion called upon to do. The question of age does not, and ought not to, enter into the matter. Had the cable with which he came into contact been dead, instead of alive, or had it been screened off effectively so that he could not, except by wilfully transgressing, have touched it at all, the young man would not have met his death. The Home Office never took steps to see whether its requirements were carried out, and Mr. Ram said in his evidence that the duty of complying with the Regulations was on the occupier. Quite so, but we do think that the Government could be a great deal more useful than it is in these matters, if advice were given as to what should be done, and if inspections were more thorough. The Board of Trade has to administer some of the means for securing safe operation, and the Home Office others of them. Then the Local Government Board has a say as to the spending of money (by municipalities) upon this, as upon other objects. Between the lot of them it is by no means an easy matter to be always sure of steering the right course, and Nemesis inevitably follows fast upon discovered error in respect of any of them.

We suppose it goes without saying that the chief officials of electricity undertakings invariably try to the best of their ability to carry out everything that is necessary for the safety of the people employed. Nobody wants men killed on his works. But it does not improve the situation if, after a fatality, the Home Office comes along and says:—"You should have done such-and-such things, although we are not bound to see that you do them; and, in any case, you ought not to have employed that person to do the work, because, although we have not told you what a competent person is, we do not consider that he was one."

It is well that on occasion means can be found to straighten out these tangles; but it were better by far if the making of the tangles could be altogether avoided.

#### The Electric Vehicle and the M.E.A.

SINCE the days when, at the Crystal Palace motor shows, it was not such a stranger as it is now at Olympia, we have frequently had occasion to refer to the advantages of the electric battery vehicle for certain classes of town work, for which it is particularly suited.

That its possible sphere of usefulness has certain economic limits at present will not be denied, but even so, an excellent case can be made out for its use in this country just as much as in the States, where cleanliness, and simplicity of control and maintenance, coupled with reliability, are important factors, and the journeys can be limited to, say, 50 or 75 miles at a time. Under such conditions the battery vehicle can defy all other forms of road traction, and under far less favourable circumstances it has apparently satisfied keen American business men in the matter of both cost and convenience. Take, as an example, the American Express Co., which has close on 300 electric trucks in use in various cities and towns, where the conditions vary widely—it is quite certain that no philanthropic motive induced this firm to adopt the electric in preference to, say, the petrol car for this service. But the fact that of the 20,000 "electrics" in use in the States, some 6,000 are of the commercial type, and that in a country where practically a million motor-cars of all kinds are in use, is to us a sufficient answer to those, not always disinterested, people in this country, who will not stop to consider the possible utility of the electric vehicle.

The matter is one which, of course, directly affects central-station engineers, many of whom, it is only fair to say, fully appreciate the situation and would have welcomed the opportunity to help the movement forward if a good battery vehicle had been commercially obtainable in Great Britain in the same way as it has been for some time in the States. Mainly to this fact, no doubt, is due our backwardness, and we can therefore congratulate ourselves now that this state of affairs, so unworthy of us as an engineering people, is about to be remedied by the Arrol-Johnston Co., a third of whose new works in Scotland has been specially designed for the building of electrical battery vehicles. We trust that this firm, and any others who are able, will make the most of the occasion presented by the forthcoming June convention of the Municipal Electrical Association in London, where the reading of a paper on "Electric Vehicles," by Messrs. Seabrook and Watson, seems to offer an opportunity for practical demonstrations of electric vehicles to some hundreds of representatives of electricity supply undertakings, including engineers, and what is possibly more important in this case, chairmen of electrical committees.

Seeing is believing, and the sight of a few business and pleasure vehicles of the battery type on this occasion will bring conviction to the right people far more readily than an acre of reading matter culled from American sources.

It is somewhat surprising, when one comes to consider the matter, that our American friends have not given more attention to electrical vehicle business in English towns, in view of the good roads, cheap electricity, and absence of home competition in this country.

Had they taken advantage of the lethargic temperament of the British vehicle builder, and secure in the extended knowledge of the "electric" which they alone possessed, introduced the latter as energetically as their *confrères* have been introducing cheap American petrol cars, it is safe to say that our streets would not be, as they now are with slight exception, remarkable for the absence of electric battery vehicles.

#### A British Trade Proposal for Siberia.

As we briefly intimated in our last issue, a scheme has been prepared to enable British manufacturers to make a combined attack upon a market that they have so far neglected. Expert students of Siberia have deplored our apathy toward what is a vast and now rapidly developing territory, where engineering requirements are already large and will in course of time be enormous. Germany and the United States have been alive to the opportunity, and the traders of those two countries have secured engineering business to the tune of many millions a

year. Yet we have been repeatedly and credibly informed that there is a marked preference among the Russian peoples for British manufactures! The present engineering imports into Siberia are valued at about £15,000,000. As Russian factories are unequal to meeting machinery and allied needs for Russia, it is imperative that there must be importation, both for European Russia and especially for the widespread territory of Siberia, with its mining, agricultural and other industries. Probably few of our readers are aware at what a rapid rate progress is being made in Siberia. By too many of us it is regarded chiefly as a place of banishment and of terrible winter, but there is quite another and more correct aspect to be put before us if we will take pains to find out the real state of things. The Russian Government is taking energetic action to foster industrial development, population—by immigration and otherwise—is growing rapidly, imports are rising, the engineering imports being already nearly as large as those into Russia, and there are fine possibilities in respect to agriculture, timber, mining, and so forth. Though neither an engineering nor an electrical example we may cite an illustration—maybe it is somewhat exceptional—of what is taking place. Novo-Nikolaievsk (formerly Obi) seven years ago had a population of 100. To-day owing to the growth of the butter trade and agricultural interests, it is a thriving town of 33,000 inhabitants! This is more suggestive of gold-fever than of dairying. There are many rich mining areas that have scarcely been touched, and what is of considerable importance, the Russian Government policy is favourable to machinery importation.

Briefly stated, the reasons why British traders have not been so successful as their competitors in Siberia are these:—Absence of suitable representation, reluctance to give credit, distrust of Russian business, and excessive profit-seeking by middlemen. These points might each be elaborated here, but it is not necessary. Suffice it to say that the successful experience of other countries shows that on the whole the results attending the long-credit system have not been unfavourable, and that the secret of success lies in having the right men resident in the country, getting into touch with the actual buyers, learning and meeting the full requirements of the market. The country is too large for individual firms to hope to cover it efficiently without enormous expense, and in view of the present early state of developments such outlay would hardly be warranted in the case of electrical or small engineering firms single-handed. But we cannot afford to leave matters as they are, unless we are going to be content for so fine a field to be lost to British trade for many years, and perhaps permanently. Our hope, therefore, must be in a sort of amalgamation of interests, a number of manufacturers putting down so much money as an investment and acting in combination. This course has been recommended by the British Consul at Vladivostok, and by others who know the prospects as well as the state of competition.

Such a scheme has been drawn up by Mr. Arthur G. Marshall, of Westminster, to work under the title of the British Engineering Co., of Siberia, and it is now receiving preliminary consideration at the hands of several of our firms. The scope of its activities will embrace railway and light railway equipments, electric lighting plant and materials, engines and boilers, and all sorts of agricultural, mining and general machinery equipments.

The new company, when it gets to work, will have registered offices in London, with branches in Western Siberia at Omsk, at Vladivostok for Eastern Siberia, and at Ekaterinburg for the Ural mining district. With the carefully worked out details of the concern it is unnecessary to deal here; but firms who desire to obtain fuller information would do well to get into touch with Mr. Marshall, who has originated the proposal after study of the market at close quarters, and after engineering trading experience in various parts of the world. Any undertaking likely to assist British manufacturers legitimately to secure a fair share of trade in the world's vast territories which are awakening to the call of civilisation, has our best wishes for its success.

## ELECTRIC BATIK WORK.

[BY OUR BERLIN CORRESPONDENT.]

BATIK work has been practised from time immemorial by the natives of Java, and consists in producing patterns by means of liquid wax on a bright fabric, paper or the like, which is eventually dyed.

Such parts of the fabric as correspond to the pattern having been covered with hot liquid wax, the whole is dipped into a dye-stuff liquid, when the covered portions are unaffected, whereas the remainder is dyed uniformly.

After drying, the same fabric (which is now parti-coloured) can again be covered with a pattern which, by the Batik process, is preserved in the former colour, whereas the

FIG. 1.—ELECTRIC BATIK PENCIL IN USE.

background takes a darker hue, and the same operation can be repeated several times until the background has become quite dark.

After removing the wax by washing the whole piece of fabric with petrol (gasoline), the various colours are brought out most effectively on the dark background. Wonderful colour effects are thus obtained such as can be ensured by no printing process, the fabric being permeated entirely with colour, which is best appreciated on holding the fabric against the light.

The possibilities of Batik work are by no means so limited as would appear at first sight. The same process can, in

FIG. 2.—SPECIMEN OF BATIK WORK.

fact, be applied to wood stained in several hues (or engraved), as well as to metal dyed or etched by chemicals. Especially beautiful etchings can thus be produced on copper, brass, &c.

The instrument used by the Javanese in applying the wax is some sort of small funnel fixed to a handle, with a fine opening in which the wax is heated over a coal fire. Similar attachments, or else closed reservoirs terminating underneath in a point and small opening, are used in Europe where Batik work has been introduced. In connection with all these devices, the wax must, however, be re-heated from time to time (over an alcohol, gas or gasoline flame),

and cools rapidly during operation. This lack of uniformity in the temperature of the wax, of course, entails a number of drawbacks. While the liquid wax immediately after heating flows out very freely and is liable to produce too thick lines or even blots, the flow soon slows down as the wax cools.

In order to ensure an absolutely uniform temperature of the wax, a German lady, Frau Gertrud Lamprecht-Gewecke, of Nuremberg, has devised an electrically-heated Batik pencil. Apart from uniformity in the thickness of lines.

FIG. 3.—SECTIONAL VIEW OF ELECTRIC BATIK PENCIL.

this ensures considerably more rapid work (the continual re-heating being dispensed with) and far greater ease and accuracy.

The electric Batik pencil is represented in longitudinal section in fig. 3, *a* being a cylindrical wax-holder, to the lower part of which is screwed a mouth-piece *c* with a fine bore *d*. A fine sieve *e*, placed in the wax-holder above the mouth-piece, will retain any impurities of the liquid wax *f*.

The wax is heated by the heating coil *b*, the wires from which pass through the handle *g*, being connected in its interior with a flexible cord *i*, by means of which the Batik pencil can be joined up directly to a contact box for 110 or 120 volts (or through a series resistance to higher pressures). The Batik pencil can be used with continuous as well as alternating currents, its consumption being about the same as that of a small or medium-sized incandescent lamp.

## TRAMWAY CURVES.

By ARTHUR J. BOUSFIELD, A.M.I.Mech.E.

EVEN a cursory examination of the lay-out of some of the curves on street tramways reveals the fact that the question of super-elevation of the outer rail has been ignored, and that the rails are either horizontal or have the super-elevation in the wrong direction.

This is very often due to the Highways Department overruling the advice of the tramway engineer, and recent accidents and derailments show how serious this disregard of the laws of motion and gravity may be. When a car is swinging round a curve it tends to leave the rails and follow a straight line tangent to the curve at that point, the restraining force keeping it in a circular path being the reaction of the rail against the wheel flange. The measure of this force is the same as the centrifugal force due to the weight, direction and velocity of the car, and is given by—

$$cf = \frac{Wv^2}{32r},$$

where *W* is the weight of the car in lb.; *v* the velocity in ft./sec.; *r* the radius of curve in feet.

As the centre of gravity of a car is above rail level, this force has a twisting moment tending to overthrow the car. With a 10-ton car, having its c.g., say, 7 ft. above rail level, this amounts to 5,250 lb. ft., or, say, equal to the effect of two 1-ton screw jacks, one at each of the inside axle-boxes, trying to overthrow the car. To counteract this

force we must use the force of gravity by raising the outside rail; the weight is now acting on an inclined plane and in opposition to the twisting moment.

The super-elevation in inches necessary is given by—

$$G \frac{v^2}{2 \cdot 66 r},$$

where *G* = gauge in feet, *v* = velocity in miles per hour, *r* = radius in feet. With minus super-elevation, the wider the gauge and the higher the c.g., the greater the danger. Given correct super-elevation, the pressure and consequently the wear on the outer rail is reduced, and if the c.g. is raised without increasing the total weight, the pressure on the outer rail is still further reduced. This point should not be lost sight of in the design of locomotives, water-tank cars, &c.

The reduction in pressure on the outside rail due to super-elevation is often as much as 15 per cent. Super-elevation should not exceed 4 or 5 in. as cars moving slowly would be liable to leave the rail on the inside of the curve. Trouble with the Highways Department on account of interference with the crowning of the road and drainage can generally be met, when raising the level of the outside rail, by a judicious remetting or paving of the surface of the road over a sufficient area on that side of the road. It is surprising what can be done by stealing an inch here and there. When the necessary super-elevation cannot be obtained by this means, the speed of the cars must be reduced to a safe figure, but where there is minus or no super-elevation on a curve at the foot of a gradient, the curve is never safe, and the first car that gets out of control ever so little is in grave danger.

Another source of trouble in maintenance and derailment on curves is the practice of laying out all curves in arcs of circles. This is often necessary in this country owing to Board of Trade restrictions as to the minimum clearance between car and curb, but wherever possible curves should be spiral or parabolic, the radius of curvature increasing as the curve approaches the straight.

The length of the rectangular lines enclosing the curve should not be less than 48 ft. This easement of the curve avoids the nasty knuckle-joint effect at the entrance of the curve, and materially decreases the excessive wear at this point. Starting from a position at the centre of the curve, governed by curb clearance, the curve can be easily laid out in the well-known way of drawing a parabola by means of three road pins and two lengths of line.

Many engineers widen the gauge at a curve, and tables, presumably based on railway experience, are published regarding this in technical hand-books, but the writer is of the opinion that a tramway curve should be kept to the same gauge as on the straight, unless the wheel base length and radius of curve are abnormal.

Initial widening of the gauge at curves results in the car progressing round the curve in a series of short straight lines, and giving a jolt at each change of direction, resulting in well-defined and localised wear.

## THE HUMPHREY PUMP.

[COMMUNICATED.]

THE Humphrey pump having proved so great a success at Chingford, this great invention must take its place in the industrial world for what it is worth. What will it do for electricity? At the first blush its effect might appear to be in a direction inimical to electrical methods. It will oust the electrically-driven centrifugal pump in many cases where water-produced electricity is not the source of power, for what compound of steam or gas engine and electrically-driven pump can hope to compete in economy of initial cost or in running cost with a direct gas-driven pump using only 1 lb. or so of fuel per water horse-power?

But this very fuel economy will serve to make the pump an aid to electrical development. The big gas engine has its disadvantages, and some engineers object to it and do not consider it has a good and steady turning moment. With a Humphrey pump, a steady turning moment can be obtained

by the use of a turbine driven by a waterfall artificially produced by the gas pump. In this way the pump may be found to do more for the electrical industry than it will do against it.

The great pumps at Chingford are extremely interesting to watch when at work. There is an oscillating column of water in a high tower of about 14 ft. diameter at the water surface, and there is a dome-shaped gas chamber carrying four sets of spring opened or spring closed air and gas and exhaust valves. And there is some very light and simple mechanism which serves to lock these different groups of valves, which are automatic in their movements but for this controlling lock. All movements being slow and deliberate there is no noise, and yet at each explosion in the chamber about 12 tons of water are sent into the new reservoir. But the flow to the reservoir is steady and continuous, although it is the outcome of 10 to 12 additions per minute each of a dozen tons of water. The successive additions of masses of 12 tons are shown by the rise of water in the water tower, the four oscillations in which take place while all the time the steady flow goes on to the reservoir. The one end of the great oscillating mass of water is always moving forward and the other end is alternately moving in both directions, the water in the tower acting as a part of the gas engine and also as a flow equaliser.

A curious feature of the whole apparatus is its certainty of action combined with a certain casual sort of go-as-you-please motion, which could not obtain had the whole machine—if we may call it a machine—not been accurately worked out. This quality of the pump differentiates it from the gas engine, which has the disadvantage that accrues from every stroke of the piston being of equal length, thus compelling exhaust before expansion has been carried far enough. In the Humphrey pump, expansion is carried to such a point that the gas chamber is scavenged on the working stroke and the burned gases are placed next the exhaust valve. In this way there is a stratum of clean air between the charge and the residual exhaust, and there is also a stratum of clean air between the water piston and the burned air. With clean anthracite this may be a matter of no moment, but it adds a further safeguard where fuels of less purity are employed.

The Chingford pumps are not merely a witness to Mr. Humphrey's engineering genius, but a monument to the courage of Mr. W. B. Bryan, who acted on his convictions when he accepted this pump.

It is not too often that the engineer of a great undertaking has the courage of his convictions in respect of novel appliances. To such lack of courage, or of ability to realise when a novel appliance ought to be accepted, we may trace the ruin of too many men of genius in engineering affairs.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### The Preservation of Creosoted Poles.

If Mr. Wade will kindly do me the favour of reading my article again, he will not, I think, find himself in serious disagreement with the views expressed. I, too, am a strong advocate of creosoted poles, but there is nothing to be gained by claiming more for the creosoting process than is set forth in my brief contribution on the subject, which appeared in the ELECTRICAL REVIEW a fortnight ago.

Mr. Wade's suggestion of cutting notches and boring holes in poles *before* they are creosoted is more interesting than convincing. How could anyone state beforehand the number of notches that would be required, or whether a pole would require 2 ft. cutting off to maintain the symmetry of the line? These things could perhaps be arranged by a small contractor having a short telephone line to equip, but when a few hundred poles are involved, as is frequently the case on our English railways, a large stock has to be kept. These poles are demanded from the dépôt as and when required, after which they are armed on the ground.

Several years ago, the late Mr. Langdon wrote as follows:—"It is neither desirable nor necessary that the timber of telegraph poles should be completely charged with creosote." With these words I entirely agree—not because the deceased gentleman once said so, but because 20 years' practical experience has taught me that Mr. Langdon was quite right.

"Communicated."

### Prospects in Electrical Engineering.

As the advertiser referred to by Mr. Black in your last issue in connection with the above, permit me to remark that I have a suspicion your correspondent belongs to that type of engineer correctly described by himself in the ninth, tenth and eleventh lines of his letter, and has made poor progress in even that study, as he apparently is quite unable to discriminate between appointments having probabilities and those having possibilities; such being the case, it is not surprising he is dissatisfied; lack of perspicacity and jealousy of the other man usually reaps its own harvest.

H. L. Alderton.

Guildford, April 28th, 1913.

### Salaries and Wages.

By a printer's error you have printed the word "minimum" where it should have been "maximum," as underlined in red on the enclosed copy. Will you please correct this, as it is of vital importance to the value of the whole scale.

A. Hugh Seabrook,  
*General Manager.*

St. Marylebone Electric Supply,  
April 28th, 1913.

[We regret the error, which occurred on page 670 of our last issue; in the sub-heading "Minimum Wages for General Employment," the first word should have been "maximum." The correction is, as Mr. Seabrook points out, of vital importance.—EDS. ELEC. REV.]

Many members of the electrical profession will feel grateful to Mr. A. Hugh Seabrook for the trouble he has taken in giving a detailed account of the classification and maximum wages of the various grades of workers under the jurisdiction of the St. Marylebone Electricity Supply Committee.

This method of grading is a great improvement on those of numerous supply authorities, preferably municipalities throughout the kingdom, who promote men simply by seniority, *i.e.*, by the length of time men have been in their service, but which is, on moral principle, radically wrong.

In doing so they are merely copying the Government, and often give this reason as their justification: but, alas! the Government's policy is not always the wisest, and whatever reasons are put forward by them in commendation of this mode of procedure, it certainly should not be applied to central station engineers, with whom ability and brains are absolutely essential.

The principle is unjust, because it does not encourage a man to develop any initiative. Again, it is only fair where there are three men each in charge of a shift at a power station, and each have equal responsibilities devolving on them, that they should be paid equal wages.

There are numerous electricity supply works where one man receives a considerably bigger wage than another, though both undertake the same amount of responsibility, and yet the man who receives the least wage may be married, and have had a far wider engineering experience than the other, who besides, perhaps, being single, has not the same amount of ability.

I must point out that although the above applies to a very considerable number of electricity companies, I am dealing more particularly with the methods of municipal councils, who, there is not the slightest doubt, do their best in matters of management as far as their knowledge permits, yet who are nevertheless instructed and tacitly governed by the chief engineers, and

this is because they are ignorant on matters appertaining to the real working of the stations.

It should be the duty of the councils governing all municipal electricity supply undertakings, which are not supposed to be run as financial concerns, to pay a man not only a living wage, but according to the amount of responsibility he is required to undertake, before any attempt be made to relieve the rates, &c.

If a man be worth employment at all he is entitled to a living wage, but alas! how many well trained men there are in the central-station profession, who, it is little suspected by the general public and even the municipal council, have responsibility to the extent of thousands, and yet are eking out a mere subsistence.

I ask the question, if a chief engineer of an electricity supply works is worth, say, £20 per week, generally speaking, what are his charge engineers worth?

Although the answer to this question cannot be made with any mathematical accuracy, yet even a guessed amount would be considerably more than the latter receive for their work in many instances.

In conclusion, let us hope and trust that many municipalities and private companies will follow the example of the St. Marylebone electric supply—abolish the rotten method of promotion by seniority, and advance men according to their abilities, and pay them in proportion to the amount of responsibility they are required to undertake, then we shall have the right man in the right place, and everybody will be satisfied.

A. C. Black.

#### Nunits and Abbns.

I hope you will not often coin new words of this sort. There is no doubt that the craze for abbreviations is being carried too far, but by the law of survival of the fittest, the useles ones will die a natural death.

Few who have not seen "Milestones" will remember that "cab" is short for "cabriolet." Again, whoever talks of "a taximeter cab," when "taxi" is available?

It is told of an eminent professor that, hearing one of his staff mention the word "ammeter," he said severely, "Why do you say 'ammeter'?" You might just as well say 'vomiter!'"

A. K.

#### The Prevention of Accidents in Electric Lifts.

Referring to the article which appeared in the issue of the ELECTRICAL REVIEW of the 18th inst. under the above heading, I should like to say that, although there are many so-called "Safety Locks" for lifts on the market, I have not until the last few weeks seen a lift lock which is absolutely safe, inasmuch as they all depend for mechanical locking on the motion of the cage itself (distinction should be made between locking and latching). The action of practically all modern lift locks, with the exception of the one mentioned above, is as follows:—

When the gate or door is closed, the latch or hook portion on the gate engages with the locking mechanism in such a manner that a gate must be latched (not locked) before the electrical locking can take place. When this has been accomplished the locking mechanism is ready for the mechanical locking to be carried out, and this is done by means of a spring or gravity-controlled lever which is held out of the locking position by a striking plane on the cage while same is standing at a floor, and which lever is, when the cage has moved a certain distance from the floor, released and allowed to move into such a position that it mechanically locks the gate which cannot be opened until the cage arrives at that particular floor again. It is easily seen that such mechanism cannot be quite certain in action, as the spring or gravity-controller lever may very easily fail, and the cage could then move away from the floor, and the gate afterwards be opened when the cage was not opposite the opening. There are also various other faults which would entail a long description to enumerate.

The lock mentioned above which has within the last few weeks been placed on the market by a firm of well-known lift engineers, is the only one which successfully overcomes all the defects which have up to the present existed in lift

safety locks. With this lock, the gates or doors must be both electrically and mechanically locked (not merely latched) before any movement of the cage can take place, and the locking action depends in no way upon the motion of the cage. Also, the gate cannot be opened while the cage is passing the floor, but only when the control current has been cut off by the operator or the control gear, and the cage is opposite the floor at which it is desired to stop, thus preventing persons who are waiting for the lift at various floors stopping the cage as it passes the floor by opening the gate. This lock will, therefore, be seen to be unique in its action and absolutely safe.

I would suggest that it is high time that the question of safety locks for lifts should be considered seriously by those responsible for regulations regarding the safety of the public, and measures taken to prevent death traps being fitted to lifts under the name of "safety locks."

W. J. F. Cooper.

London, April 24th, 1913.

#### BONECOURT BOILERS.

AN interesting brochure has been issued by the Bonecourt Surface Combustion, Ltd., describing the Bonecourt boiler, which is fired with gas, and attains an extraordinarily high thermal efficiency, approaching 95 per cent. One of these boilers has been in use at

FIG. 1.—TEMPERATURE DIAGRAM FOR BONECOURT TUBE, FOR BOILING AT ATMOSPHERIC PRESSURE.

the works of the Skinningrove Iron Co. since November, 1911, and a repeat order has recently been placed with the makers. A boiler exhibited at Olympia in October last, was described in our pages at the time. A special type of boiler for outputs up to 11,000 lb. of steam per hour, and for working pressures up to 225 lb. per sq. in., has been designed for the company by Mr. Michael Longridge; the section and elevation of one of these are

FIG. 2.—BONECOURT BOILER, RECTANGULAR TYPE.

shown in the accompanying illustration (fig. 2), in which it will be seen that full advantage has been taken of the rapid transfer of heat from the flue gases to the water by reducing the length of the boiler to 3 ft., making the length the smallest dimension. Sections of the type shown can be joined together to make different sizes of boiler; for instance, three such sections make a boiler having an evaporation of 33,000 lb. per hour. The filling of the tubes, and the distribution of the heat flow, is illustrated in fig. 1; they are packed with lumps of refractory material, and at the entering

end of the tube a fire-clay nozzle is placed, which prevents combustion of the gaseous mixture until it reaches the refractory filling and keeps the active heat of combustion away from the metallic joints of the boiler. A pressure of about 20 in. w.g. suffices to force the gases through the tubes. The combustion takes place on the surface of the refractory lumps at the entering end of the tubes, and is complete in about 6 in.; the transfer of heat is so effectual that the gases leave the tube at a temperature not greatly in excess of that of the steam in the boiler.

The output can be controlled by throttling the flow or by varying the speed of the fan, and a reduction of one-third can be obtained with a trifling drop in efficiency. Further control is effected by shutting off the gas supply to groups of the tubes, which can be heated up again within about one minute, so that a very high degree of flexibility is attained.

One of the chief reasons for the efficiency of the system is the fact that complete combustion is secured with only 1 per cent. or 2 per cent. excess of air; the refractory lumps also break up the current of gases, producing a turbulent flow which ensures their repeated contact with the tube. Thus the efficiency of the heating surface is greatly increased, a normal evaporation of 20 lb. of water per hour per sq. ft. being attained with tubes 3 in. in diameter. When the tubes are of 3 in. diameter they need only be 3 ft. long, but tubes of larger diameter can also be used, their length being increased to meet requirements as to the final temperatures of the gases (as for superheating). With tubes of larger diameter, a higher rate of evaporation per sq. foot is obtained, some tests with 6-in. tubes 6 ft. long showing a normal evaporation of 28 lb. per sq. ft. per hour, or 40 per cent. higher than with tubes 3 in. in diameter. In either case the boiler can be forced to 80 per cent. overload with little loss of efficiency. Compared with other gas-fired boilers, a great economy of floor space is secured, the evaporation per sq. ft. of floor space being nearly four times as great as with water-tube boilers, and still better in comparison with the Lancashire type. The simplicity of the construction of the boiler is also greatly in its favour. A feed-water heater is constructed on the same principle, which reduces the temperature of the flue gases to less than 300° F.

The boiler is suitable for use with the incombustible waste gases from furnaces or gas engines, as well as with all kinds of combustible gas. In comparing it with a coal-fired boiler, allowance must, of course, be made for the gas producer, which can be of any efficient type.

Already the makers have received many inquiries from all parts of the world, for boilers to work in connection with coke-oven and other gas supplies, and with ammonia recovery plants, and there can be no doubt that the system will be of great utility in many applications.

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### "Polar" Propeller Fans.

THE WILSON-WOLF ENGINEERING CO., LTD., of Bradford, send us some particulars of their new "Polar" (registered) propeller fans, which they have just placed on the market for the 1913 season.

These fans are for direct-current circuits, being medium power fans, specially suitable for installation where the cost of the firm's well-known "Arctic" fans is not justified.

The "Polar" fans run at a slightly higher peripheral speed than the corresponding sizes of "Arctic" fans, and discharge about 10 per cent. less air, but on account of their higher speeds, they can be fitted with smaller motors, with a corresponding reduction in first cost. They are remarkably silent in running, but are only designed for dealing with free air conditions.

FIG. 1.—"POLAR" PROPELLER FAN.

A novel feature is that the blades are reversible; in order to change the direction of the discharge of air, it is only necessary to alter the direction of rotation, the fans being equally efficient in either direction. One standard construction is therefore suitable for any direction of discharge.

The rings are circular and can be quickly fixed (for vertical or horizontal discharge) in any position, while the motors, which are dust-proof, follow the firm's usual practice, and are fitted with combined thrust and journal ball bearings.

We illustrate one of these fans in fig. 1.

### A Large Sign.

A large electric sign, recently built for Messrs. Mann, Crossman and Paulin, the brewers, at Stratford, is said to be the largest of its kind erected in this country.

This sign, shown in fig. 2, is 100 ft. long and 42 ft. high from the bottom of the hoarding to the top of the figure; it stands 10 ft. out of the ground, so the total height is 52 ft.

Osram lamps are used for illuminating this sign, there being 100 32-watt, 250-volt, 176 10-watt, 105-volt, and two 17-watt, 205-volt lamps employed.

In the winter months the lamps are kept burning at least six hours a day, and during the summer months 3½ hours a day, a total

FIG. 2.—LARGE ELECTRIC SIGN.

of some 1,700 hours per annum. The lamps are exposed to all conditions of weather, and are said to have given every satisfaction.

The Borough Theatre Billposting Co. erected the sign, the electrical work in connection with which was carried out by the West Ham Electricity Department.

### The Frantz Suction Cleaner.

MESSRS. SCHOLEY & CO., LTD., of 151, Queen Victoria Street, E.C., are introducing a new suction cleaner which possesses novel features. The handle is made to actuate the switch; the flexible cord is looped up on hooks attached to the shaft; an observation glass is

FIG. 3.—UNDERSIDE OF NOZZLE, SHOWING BRUSH.

FIG. 1.—FRANTZ SUCTION CLEANER.

provided to enable the dirt to be seen on its way to the bag, which can be removed in a moment; the yoke or fork can be locked in any position for special work; in addition, there is a revolving brush in the nozzle, driven by an air-blast which issues from an outlet in front of the nozzle, the combination of blast, brush and

suction being, it is claimed, three times as effective as suction alone. The metal parts are mainly of aluminium, and the cleaner weighs only 9 lb. The usual appliances can be attached to it for cleaning walls, crevices, &c., and for blowing air into inaccessible corners. Fig. 4 shows the complete apparatus, and fig. 3 is a view of the nozzle from below, showing the brush.

#### Diamond Die Polishing.

Now that manufacturers of electric filament lamps are taking measures to meet the approaching season, their attention might be drawn to the patent multi-way diamond die-polishing machine, introduced last season by MESSRS. WERTHS & CO., of 41, Aldersgate Street, London, E.C.

We understand that some of the larger lamp works have already from 10 to 30 of these 10-way machines in use, and that the great economies they now effect in their die-polishing department are helping them considerably to bring their cost of production down to a very desirable figure.

This ingenious and automatic polishing tool is said to pay for itself in a short time by the mere saving in diamond powder, quite apart from the large and accurate amount of work it renders possible, and the protection and the keeping in shape of the draw-holes which it ensures. One polisher can easily attend to a number of these machines. The adoption of the multi-way machine seems worthy of the serious consideration of those lamp manufacturers who have so far retained their older equipment. Wire drawers, also, might reconsider their old diamond die-polishing methods, in view of the advantages claimed for the new machine introduced by Messrs. Werths.

#### X-ray Reflectors for Shop-Window Lighting.

The accompanying illustration shows an "X-ray" silvered-glass reflector, introduced by the B.T.H. Co., of Mazda House, Queen Victoria Street, E.C., for shop-window lighting. These lighting units are fixed close up to the ceiling of the window, immediately

FIG. 5.—B.T.H. X-RAY REFLECTOR FOR TWO MAZDA LAMPS.

behind the fascia board, and are arranged in a single evenly-spaced row. This arrangement gives a more uniform and diffuse illumination than could be obtained from lamps hung in the field of vision.

#### Silica Lamp Laboratory Outfit.

THE WESTINGHOUSE COOPER-HEWITT CO., LTD., have lately placed on the market a special laboratory outfit, which is being extensively adopted by business firms and others who are desirous of investigating and applying to commercial purposes the properties of ultra-violet rays. These rays are emitted in such quantity that it is necessary for operators who are using the outfits to protect their eyes and skin from the rays. Sufficient protection is provided by screening the lamps with a sheet of ordinary commercial glass. Amongst the properties of ultra-violet rays are the production of fluorescence in many substances; their bleaching effect, which makes their use of extreme value to firms who are desirous of testing fastness of colours in the products that they manufacture, and also of testing the quality of the dyes that they are using; and their remarkable power of sterilisation.

**An Electric Motor Dust Cart.**—A novel three-wheel electric motor dust cart has recently been put in service near Berlin. The vehicle, which was built by Messrs. Gebhardt & Harbort, of Schneberg, Berlin, is fitted with a small tip body, and is used for the collection of the refuse swept up in the streets. The motive power is supplied by a battery of 20 150-ampere-hour cells, which supplies current to an electric motor built integral with the single front road wheel; the motor is of the direct-current type, and drives the front wheel through reduction gearing. The vehicle can be driven in either a forward or backward direction, the reversal of the battery current being effected by means of a patented form of switch. The speed of the machine is between 15 and 19 miles per hour, and it is stated that a distance of no less than 90 miles can be covered on a single charge of the battery. An automatic device for sanding the streets is also provided on the vehicle, the distribution of the sand being effected by a small electric motor supplied with current from the main battery. In order to increase the sphere of utility of the machine, the refuse collecting body is made detachable, thus rendering the vehicle available for other classes of work.

### PARLIAMENTARY.

#### Chesterfield Corporation Bill.

THIS Bill, for a system of railless traction, came before a Select Committee of the House of Commons last week, the proceedings being very protracted on account of the opposition offered on behalf of the Midland and Great Central Railway Companies and the Derbyshire County Council.

MR. ROWLAND WHITEHEAD, K.C., who appeared for the Bill, said its object was to give the Chesterfield Corporation authority to run trolley cars and motor-omnibuses along certain routes which radiated out from the borough into adjoining districts. On certain of the routes they were asking for powers to run motor-omnibuses and railless trams, but it was not intended to run the two vehicles simultaneously. The object of getting omnibus powers for the trolley routes was that the Corporation might first test the routes from a passenger point of view, to ascertain whether they would be justified in going to the expense of installing railless traction. Regarding the opposition of the Midland Railway Co., that was on the question of bridges, and the Corporation would be quite ready to meet the company in regard to any specific bridge, and in order to meet the objections of the Great Central Railway Co., they had arranged to fix a weight limit for the vehicles of 6 tons, plus the load. The company also objected to the Bill on the ground that the proposed buses and trolley cars would unfairly compete with them, but he should ask the Committee to say that the extra facilities the Corporation proposed to give to people to travel to outlying districts would, in the end, benefit the railway company.

Evidence in support of the Bill was given by Mr. C. P. MARKHAM, the chairman of the Staveley Iron and Coal Co., and a member of the Chesterfield Town Council. Witness gave it as his opinion that it was very essential that the villages should be linked up with Chesterfield in order to give facilities for the outlying population to come into the town.

Replying to MR. TALBOT, K.C., for the Midland Railway Co., Witness said the Corporation did not intend to make a big start—they would feel their way in the matter, and as a commencement he suggested three motors. He did not expect there would be any considerable loss or any considerable profit on the undertaking; but it was put forward as a public convenience.

MR. ERNEST SHENTAIL, the chairman of the Corporation Tramways Committee, stated that he and his colleagues had visited Rotherham and examined the working of the trolley system. In his opinion, they had a much better outlook for such a system at Chesterfield than was the case at Rotherham.

In cross-examination by Mr. Ram, K.C., for the Derbyshire County Council, witness said he had heard that Rotherham only got its trolley system because it consented to pay a contribution to the county rates in respect of the county roads over which the cars ran.

Replying to the Committee, Witness said he did not agree with Mr. Markham that three cars would be sufficient to start with—he would certainly go in for more than that.

MR. ROBERT ACLAND, the engineer to the Chesterfield Electric Lighting and Tramway system, gave evidence as to the cost of the scheme, which, he said, had been prepared on his estimates. The cost for the erection of the necessary car-sheds, depôts and other buildings was put down at £2,000, and £33,780 was included in the estimates as the cost of overhead equipment and the construction of other works necessary for working and lighting the trolley vehicles. The cost of the trolley vehicles would be £6,400, and for the provision of motor-omnibuses and expenses in connection with their running, he had put down another £16,000. Personally, he felt confident that the scheme would be a financial success.

MR. C. J. SPENCER, the general manager of the Bradford City Tramways, said that they had the railless trolley system of tramways in operation in his City since June, 1911. At the request of the Chesterfield Corporation, he had examined the proposed scheme, and he agreed that the estimates of the previous witness in regard to capital expenditure were fair. His (Mr. Spencer's) estimates of the total capital expenditure for the nine routes proposed, came out at £53,948. He estimated that the annual receipts would amount to £28,210, while the annual capital charges and working expenses would amount to £26,513. He estimated for 12 motor-omnibuses and for 15 trackless trolley cars. He reckoned that there would be a surplus profit of about 3 per cent. per annum on the capital outlay.

Evidence in support of the Bill was also given by MR. A. R. FEAUNLEY, the general manager of the Sheffield Corporation Tramways, who said he agreed that the estimates put forward were reasonable and sufficient for the purposes of the scheme.

MR. TALBOT, K.C., addressing the Committee in opposition to the Bill on behalf of the Midland Railway Co., said it was monstrous that his clients, who were large ratepayers in the district, should have burdens placed upon them in order that a system might be built up which would be in direct competition with them.

MR. J. W. HOLTON, county surveyor, who gave evidence against the Bill on behalf of the Derbyshire County Council, said that the Chesterfield Corporation only had control of one-twelfth of the main roads over which the proposed trolley-cars would run, and of one-fifth of the district roads. It would be necessary to widen a good part of the main roads if trolley-cars and motor-omnibuses were to use them with safety, and the greater part of the cost would fall upon the ratepayers outside the district. In that event he thought it only just to the ratepayers of the county that any

excess cost which could fairly be shown to be due to trolley and bus traffic, should be paid wholly by those who benefited by it, and not spread over the county as a whole.

Cross-examined, Witnesses agreed that, supposing the Corporation did not proceed with the scheme, and it was carried out afterwards by a private company, the County Council would not be able to secure the widening of the roads, or get any contribution; he thought it was generally conceded that the present law was inequitable.

After hearing further evidence, the Committee found the preamble of the Bill proved, subject to the conditions that the minimum width of the roads should be made 17 ft. with a 4-ft. footpath. They also required a clause to be inserted in the Bill making the Corporation liable for damage arising out of the extraordinary use of the roads, such damage to be assessed at the end of three years by arbitration between the Corporation and the county.

### Hastings Tramways Bill.

LORD BATH'S Select Committee of the House of Lords commenced the consideration of the Hastings Tramways Bill on April 18th. The Bill was promoted by the Hastings Tramways Co., and the object was to allow of the double line of tramways passing along the sea front, which are now operated by the Dolter surface-contact system, to be worked by the overhead trolley system. The line is about 1 mile 6 furlongs in length, and the remainder of the 17½ miles of tramways are worked by the overhead system. Mr. Lloyd, K.C., Mr. Hutchinson, K.C., and Mr. Tyldesley Jones appeared for the promoters; Mr. Freeman, K.C., and the Hon. E. Charteris represented a number of owners and ratepayers; and Mr. Talbot, K.C., and Mr. R. Bury appeared for the Hastings Corporation.

Mr. LLOYD, for the promoters, said that the conduit system had been tried at Blackpool along the sea front and had failed there, for the same reason that it would fail at other seaside places. The sea beat over the front and filled the conduits, and sand and shingle also got in the conduits and interfered with the electrical connections. The company had spent £32,000 in equipping the line, and whether they reverted to the overhead system or some other, that expenditure would be largely nullified. He submitted that it was in the public interest that the present restriction should be removed, and that the company ought not to be hampered by the aesthetic considerations of a few frontagers.

MR. J. E. WALLER gave evidence in support of the Bill, and said he had satisfied himself that the conduit system was impossible in Hastings. It was true the conduit system was in operation in London, but wherever they could the London County Council put up the overhead system. At one time the conduit system was in operation at Blackpool, but after some years it became unworkable, and it had been replaced by the overhead system. He did not think the poles of the overhead system would be detrimental to Hastings, and he thought the lighting standards on the promenade could be replaced by combined standards for light and traction purposes.

A number of local witnesses were also called, and stated that they saw no objection to the overhead system along the sea front.

MR. TALBOT, K.C., addressed the Committee for the Corporation, and submitted that the opposition was not a sentimental one, but a matter of vital importance to the town. The Corporation had received overwhelming representations from the residents asking them to oppose the overhead system by every means in their power.

SIR M. FITZMAURICE was called by the Corporation, and said that as a result of his examination of the tramway along the Front, he saw no reason why the conduit system should not be workable there. He found the tramway generally in a bad condition.

After hearing a great deal of local evidence in opposition, the Committee rejected the Bill.

### Wimbledon and Sutton Railway Bill.

ON Tuesday last week, Lord Sanders's Committee of the House of Lords considered the Bill of the Wimbledon and Sutton Railway Co., which asks for extended time for purchase of land and completion of the railway, 5½ miles in length, between Wimbledon and Sutton.

MR. HONORATUS LLOYD, K.C., for the promoters, explained that the Act authorising the line was passed in 1910. At that time the promoters, who were a syndicate of local landowners, were unable to find the necessary capital, amounting to £350,000. An arrangement had since been made with the Metropolitan District Railway Co. to carry out the scheme and to raise capital to the extent of £550,000, with borrowing powers up to one-third. The Bill sought to extend the time for the construction of the railway to 1918.

After hearing evidence from MR. A. H. STANLEY in support of the measure, the Committee found the preamble proved.

## LEGAL.

### IMPORTANT APPEAL CASE re FACTORY ACTS.

(Concluded from page 676.)

MR. BODKIN said there were two convictions before the Court and separate questions raised in regard to each of them. The justices at Highbury in regard to the conviction under Regulation 18 imposed a penalty of £25 and costs upon this company, and on the other conviction they imposed a penalty of £2 and nominal costs. His submission was that a fine of £25 under the circumstances was a penalty which bordered almost upon a savage penalty. The reason for his saying that was that the particular method which had been adopted in regard to this switchboard ever since it existed was exactly the method which was being carried out on March 25th, and the company *bona fide* believed, and had strong grounds for believing, they were doing the work on lines that absolutely complied with the regulations of the Home Office. If they had been tried for the manslaughter of Shapcot, that was probably about what the penalty would have been. It was altogether out of proportion to the offence, if there was an offence. As to the conviction under Regulation 28, it appeared to be a mere matter of routine, but as a matter of fact it was a question of the most supreme importance, as he would show the Court. For nine years this station had been open, and the gentleman who complained had never been inside it. It was all very well to say that it was for the company to comply with the regulations, but if the Home Office officials went down and inspected, surely the process of cleaning was a process which was specifically mentioned in these regulations, and it would not be above the duty of a Home Office Inspector to say: "When cleaning is going on, what do you do?" But there was never a single suggestion, or the least attempt to assist, or the least hint as to what should be done, and the company all along continued to do this work in the way which they *bona fide* believed was in compliance with the regulations themselves. It was his submission to the Court that on March 25th the switchboard, which meant and included this particular room, was arranged so as to secure that the work might be carried out without danger, or, alternatively, if that was not so, that the conductors could be made dead in sections. Where the work absolutely was to be done the section was absolutely dead, so that Styles said he would not have had the slightest hesitation in clambering about in any part of it, and handling any piece of metal in it. There was a passage 2 ft. 6 in. wide existing between the dead side and anything which was alive upon the other side. In the regulations there was no definition of "division," and not a hint anywhere as to what it might be. Here they got a fixed corridor 2 ft. 6 in. wide, which he submitted was a division within the meaning of that regulation, fixed and permanent. The section on the right could be made dead, and, therefore, absolutely safe, and unless a person crossed that division to the left-hand side, there was nothing which involved danger. This was what these gentlemen of the highest skill and position connected with the engineering side of this great company believed to be a division within the meaning of the regulations, and it was provided for that express purpose of keeping the right side away from the left. He asked if that was not a reasonable construction of the regulation. Could it be said that the company were to be held responsible if a man disobeyed his orders when he went to a place where he was told to do his work in a certain way? His point was that they could not make the occupier of a factory liable when a man acted contrary to his duty and outside the scope of his duty, and in this case Shapcot ought never to have gone outside the section which had been rendered dead for his accommodation. Coming to the Regulation No. 28, he submitted that it was practically incomprehensible as it stood. In order to get a clearer idea of what it meant they had to get the definition of "authorised person," and it would be noticed that an authorised person was the occupier, or contractor, or a person appointed or selected by the occupier to carry out certain duties incidental to the generation and use of electrical energy. He supposed that "duties incidental" included cleaning and keeping up to a proper pitch the machinery and appliances which were used in connection with the generation of electricity. The definition went on further to say: "Such person being a person who is competent for the purposes of the regulation in which the term is used." But for his friend's opening statement he would have submitted that there was no evidence whatever before the Court that Shapcot was not a competent person for the purposes of the particular regulation in which the term was used. Styles's evidence was that he had known him for four months, and had seen him daily, and he had described him as a very cute man in his work. An authorised person need not be of full age. The reason for that was that under the regulations the responsibility was put upon the occupier or the contractor to select or appoint the authorised person. Regulation 28 dealt with repairs, alterations, extensions and cleaning, and an authorised person must be competent according to the skill and knowledge to do the particular kind of work which the regulation dealt with. His point was that under Regulation 28 Shapcot was an authorised person, and he did not cease to be an authorised person because he did cleaning work under Styles, who was also an authorised person. It was perfectly ridiculous to say an authorised person might be under 21 years of age, but that the moment they put an authorised person with another one he ceased to be an authorised

**Second and Third Readings.**—In the House of Lords, on April 23rd, the Crowborough District Gas and Electricity Bill, and Dundee Corporation (Improvements and Tramways) Bill, were read a second time. On 29th ult. the Richmond (Surrey) Electricity Supply Bill was read a second time. In the House of Commons, on 25th ult., the Herne Bay Gas and Electricity Bill was read a third time.

person and must be over 21 years of age. If, under Regulation 28, the authorised person need not be of full age, but if the competent person who was to work with him must not also be an authorised person; that was to say, if two authorised persons were not entitled to work together, then all the companies who carried on work of this kind would find the gravest possible difficulty in training and teaching those who were to go on in their profession as electrical engineers. The only way of training a man to be competent was to assign him to act with another competent man in different departments of the work until he fully comprehended the whole of it. Shapcot came as a youth to the company, and after being there a time, was examined by Mr. Hunt, the engineer, and promoted to another station, and then had a further promotion and came back to the Finchley station. In that way he was learning his profession, and in time would have got to the same position as Styles. He was set to do the work of cleaning under Styles, but he was an authorised person to do that work, and he did not cease to be an authorised person because a senior person was working with him. This was a matter of extreme importance, because young men came from school and college and entered these places to learn the practical part of their profession. This youth had arrived at the time when he was competent to do cleaning, and he was the authorised person to do it, and was none the less authorised because he had a more skilful mate to assist him. No person would have run any risk on the section in question if he had only done as he was told, and he submitted that the Court must look at every phase of the matter. If the Court considered his submission under Regulation 18 was not correct, then he submitted if the conviction was upheld that the penalty of £25 was not a proper penalty to impose on the company in view of all the circumstances.

After the luncheon interval, MR. BODKIN said if he had said anything too strong in regard to the Home Office, he hoped they would not forget the context with which he was dealing, which was that a word of suggestion or inquiry would have told the company what was the Home Office's view of the regulations, and that would have put them on their guard. He hoped nothing he had said would be understood to be derogatory to Mr. Ram's undoubted authority in this matter. That was not the view of the company or of himself in submitting their views.

MR. PERCY MAURICE HUNT, engineer-in-charge of the Finchley sub-station, examined by MR. BODKIN, said he had been at the station eight years. Shapcot had been there about 10 months, and was introduced by one of the staff. He understood that Shapcot had been at a technical college, and when he came to the company's employ, he examined him. Shapcot's duty was to assist the charge attendant. After a time Shapcot was promoted to Edmonton, and at the time he (witness) questioned him. Afterwards, as a further promotion, Shapcot came back to Finchley, and he examined him as to his knowledge, and was satisfied. That was about four months before the accident. Shapcot was assigned to work with Styles, and was fully qualified to do the work he was called on to perform. He had frequently seen Shapcot at work, and had made inquiries from Styles about him, and he regarded him as one of the best of their assistants. For the past 18 months the method of cleaning had been precisely as Styles described. He was aware of the regulations, and it was on his instructions that the method of cleaning was carried out. There was no need for Shapcot to have gone where he did to carry out his work. He regarded Shapcot as an authorised person for the purpose of this cleaning. It was within his knowledge that it was the practice of other companies to employ authorised persons with other authorised persons. He had worked on a high-tension system when 17 years old.

MR. GRAY: Do I understand that, so long as you tell your men not to do certain things or go to certain places, you consider you comply with the regulations, even although the places they go to are dangerous?—I cannot answer that "yes" or "no." If I considered the assistant had sufficient knowledge to undertake the work, I should instruct him to do that work, and at the same time I should consider he was authorised to do it.

I want to know whether you are of opinion that you comply with the regulations so long as you tell a man not to do certain things?—That is my view. I take upon myself the responsibility of giving these instructions.

Do I understand that, even if it is an easy and simple thing to make a particular place absolutely safe, you do not consider you need do so if you tell a man not to go there?—I do not agree that it is an easy thing to do.

You agree that, if it is an easy thing to do, it is your duty to make it absolutely safe?—Yes.

I suggest to you that, in this particular room, it was a perfectly easy and satisfactory way to make this current transformer absolutely safe by shutting off the isolating switch?—On that particular occasion, the answer is "yes."

Can you tell me, then, why it was not done?—Because it was an instruction that the pressure limits shall be cleaned every Saturday night. Our extra-high-tension switch arrangements with regard to feeders vary considerably. One Saturday night we may have a feeder in use, which on another Saturday night we have not, and therefore, for the purpose of this cleaning, it was necessary to instruct the men to carry it out in such a way that it could be carried out every Saturday night.

Is there any reason why you should not instruct Styles to use his judgment as to putting off that isolating switch?—I should object to issuing instructions which cannot be carried out always. I have to satisfy myself that the instructions are such that they can always be carried out. If I allowed the charge attendants to either do the cleaning or leave it under certain conditions, I should not consider it satisfactory.

Notwithstanding the serious danger which might result to the

assistants?—I think it is safer to lay the conditions down on which cleaning can be done in perfect safety.

In further cross-examination, witness said the system had always been the same in that station. He considered they complied with the regulations before they came out. He considered that the deceased went to the most inconvenient place he could for carrying out the work he had to do. In the ordinary working of the station they had a stand-by which could be used, and the whole of the section in which the deceased was working could be made dead, but this was not a simple matter to do. They had a lighting supply, and to make feeders dead would involve previous arrangement; but he admitted that it could be done, and in that case no accident could have occurred. This particular room was the most dangerous room in the station, and it was practically certain that anyone coming into contact with 10,000 volts would be killed. He could not possibly suggest why Shapcot went on to the oil cells.

Answering the CHAIRMAN, Witness said that, pending the settlement of the case, they were not carrying out this weekly cleaning. He only remembered one Home Office Inspector being in the station prior to the accident. The Home Office had never made any suggestions about this cleaning.

MR. A. H. POTT, chief engineer of the Metropolitan Tramways Co., said he was also in charge of the traction sub-station for the Power Co. The room in question was erected under his superintendence. The corridor separated the right-hand series of cells from the left. Had Shapcot obeyed instructions, it was possible for him to have done his work and have been in absolute safety. Mr. Hunt could not go and give a different set of instructions every time the cleaning was done, and it was better to have general instructions which would cover all conditions. He thought the less one was hampered with screens the better. He considered that the gangway was a permanent division. The company had never wished to do anything but what was perfectly right in regard to the regulations.

In cross-examination by MR. GRAY, Witness said that since the accident they had put a guard in front of the isolating switches, but that could not be called boxing them in. To box in these isolating switches would not be a easy thing, because they were not on the ground.

MR. E. T. RUTHVEN MURRAY, engineer-in-chief of the appellant company, said he knew the switchboard room, and knew the way in which the cleaning of the resistances was carried out. He thought that the less switching was done the better.

Cross-examined by MR. GRAY, Witness said he thought it was highly probable that Shapcot, thinking he knew all about the work, ran into a place of danger thoughtlessly.

MR. GRAY, addressing the Court, submitted that Shapcot was neither an authorised nor a competent person. Each witness had said that they would not go where the deceased went; and the obvious reason why he did so was in consequence of his not being competent. In such a room as he was working in there was danger in every place, and to be competent a person had to have more knowledge than that of merely being able to clean. He further submitted it was never intended that an authorised person was to be a lad of 17 or 18, who was brought in to do work under the eye of someone else. In the rules definite alternatives were laid down to minimise the chance of accident, but one of these alternatives was not that of merely telling a person not to do a thing. It could have been made quite impossible for a man to get on to the oil cells at all, but nothing was done. Respondents had now admitted that they had put guards round the isolating switches, and if that had been done before, the regulations would have been complied with. Whilst he agreed that the appellants did not mean to disobey the rules, yet he contended that they did not appreciate them properly and they had not done sufficient.

The CHAIRMAN said the Bench were unanimous in their decision. As regarded the conviction under Regulation 18, they were of opinion that the appellants should have opened the switch, which would reduce that point of danger. Therefore, in that case, they thought the appeal must be dismissed, but that the penalty should be reduced to £10 10s. With regard to the conviction under Regulation 28, they were of opinion that within the technical meaning of the regulation Shapcot was an authorised person, and in that case the appeal was allowed. They made no order as to costs.

#### WELSCHACH GAS CO. AGREEMENT.

JUSTICE BAILHACHE, sitting in the King's Bench Division, had before him the case of the Welsbach Gas Co. v. Ehrlich & Graetz, which came before his Lordship under an arbitrator's award in the form of a special case.

MR. COLEFAX, K.C., who appeared for the Welsbach Gas Company, said the matter had regard to an agreement of March 23rd, 1910, by which the Welsbach Co. undertook to take from Ehrlich & Graetz, who are a firm in Germany, manufacturing tungsten-filament lamps, a certain number of lamps. The vital clause in the agreement was that by which it was agreed that if there was a reduction in the selling prices of these tungsten lamps—which (said counsel) were supplied by other companies, although in this country they were controlled by a body called the Osram Co.—Ehrlich & Graetz should make certain allowances to the Welsbach Co. in respect of the stock of lamps supplied by Ehrlich & Graetz, and held at the date of the reduction by the Welsbach Co. Two such reductions, in fact, took place, in April and in August, 1911. Before August, 1911, the Welsbach Co. had, for the purpose of a

reconstruction, entered into an agreement, dated May 15th, 1911, by which it agreed to transfer its business, stock, &c., to a new company, and questions of law arose here as to the binding character of certain paragraphs of the agreement of March 28th, 1910, and as to whether it in fact terminated on December 31st, 1910, or three months later, as contended by Ehrlich & Graetz, or not. The determination of the allowances that were due to the Welsbach Co. would turn upon the Court's decision as to whether the vital clause was binding at the time of the two reductions, and his case was that it was. The question in effect was whether the Welsbach Co. were entitled to two sums of about £600 and £5,000. If the clause in regard to the allowances was operative when the first reduction was made, then his clients were entitled to the first amount, and if it was operative at the latter date, their claim to the further sum of money would arise.

The various agreements and documents were handed to his Lordship, who was informed that the new company were not parties to the arbitration.

Mr. COLEFAX said he represented the old company, and the question was what they were entitled to recover upon the true interpretation of the documents. He submitted that as the clause in question said in effect: "Whenever any reduction is made, then in respect to the stock held by the Welsbach Co. there shall be three payments by the Electrical Co.," it was an agreement that was subsisting at the dates when both these reductions were made.

Eventually, after hearing Mr. Morton Smith (for the other side) Mr. JUSTICE BAILHACHE decided that on the terms of the agreement Mr. Colefax's clients succeeded on the first item of £600, but in regard to the other item, which involved a point under the reconstruction, he could not secure judgment.

Mr. COLEFAX said he took it that his Lordship had held in effect that as regarded the second amount his clients could not sue, but that the rights as to that attached to the new company, and could not be dealt with in that application.

His LORDSHIP said that was so. He added that he thought Mr. Morton Smith's clients should pay the costs.

Mr. MORTON SMITH said that, as each party had succeeded, he thought there should be no costs. They had succeeded as to the biggest item, the £5,000 odd.

Mr. JUSTICE BAILHACHE, however, adhered to his previous decision.

#### VALDEMAR POULSEN PATENT EXTENSION.

IN the Chancery Division on April 24th, Mr. Justice Warrington heard an application in regard to the petition for the extension of the term of letters patent granted to Valdemar Poulsen relating to a dictating machine. The application was to fix a day for the hearing of the petition.

Mr. BYRNE, for the petitioner, said he understood from Mr. Cartmell, who appeared for the Board of Trade, that, for the convenience of the law officers of the Crown, the petition should not be taken this term. Perhaps the best course would be for his Lordship to mark the petition not to be taken before the first day of next sittings. They would try to arrange between now and the end of the present term to have the hearing fixed for some particular day on which the law officers could appear. Counsel also asked his Lordship to authorise the necessary arrangements to be made for the use of the electric current in the Court in the working of a model of the machine at the hearing.

His LORDSHIP: You can make such arrangements as are necessary. The petition was accordingly marked "not before the first day of next sittings" for hearing.

#### WESTFALLEN v. L.C.C.

ON April 24th, before his Honour Judge Gurner and a jury, in the West London County Court, William Thomas Westfallen, described as a switchboard attendant, and residing in Fulham, sued the London County Council for damages for personal injuries.

COUNSEL for the plaintiff stated that in December, 1910, his client, who was in the naval reserve, entered the defendants' employ at their Hammersmith sub-station, the supply for which came from the chief station at Greenwich. His duties from the first were those of switchboard attendant, under a charge engineer whose place he had for five weeks filled through that official falling ill. The rules of the L.C.C. were particularly strict as to the duties of these switchboard men. No. 1 was to the effect that "no work whatever, either cleaning or otherwise, is to be done in any sub-station or any high-tension feeder or switchboard without the authority in writing of the charge engineer on duty at the time; such authority must be given directly to the person or persons who are to do the work, and is not transferable." Another rule provided that "every charge engineer on duty at the time must himself see that the insulating plugs have been drawn, and that they are not replaced before everything is safe." He will be "held responsible for any accident which may occur while he is on duty, notwithstanding any instructions he may have given to other persons." Plaintiff, who was on night duty, on a morning in December last, was ordered by the charge engineer on duty to clean the switchboard, and after placing a pair of steps to enable the official to reach the higher cells over the transformer, opened the wire guard to start the cleaning. He did not observe whether the plugs had been drawn, but following

the practice which was usual, proceeded to dust. At once he received a shock of 3,800 volts, which threw him on the ground. The charge escaped by the middle finger of his right hand, which was burned to a cinder, and had to be amputated, and the great toe of his left foot, which was also burned. He received a terrific shock, and when picked up by the charge engineer, was found to have wounds on his forehead and on the occiput, from both of which blood was oozing. His injuries were dressed at the West London Hospital, and he was laid off duty for some time, but was now at work again. In consequence of this occurrence, the charge engineer had been reduced in station, and his pay had been curtailed.

Plaintiff gave evidence in support of this statement, and in cross-examination admitted that he had not looked to see if the plugs were drawn, because it was no part of his duty.

Counsel: Whether it was your duty or not, do you mean to say that you did not look to see if the plugs were drawn when you knew you might receive a shock of 6,000 volts and be killed?

Plaintiff: I only did what we had been in the habit of doing. The charge engineer previously had always drawn the plugs before we started to clean. He further said that during all the time he had been at the station he had only drawn the plugs once—the charge engineer usually attended to that.

REGINALD STANLEY GOOD, superintendent of the sub-station, said that in an account of the occurrence dictated and signed at the time, plaintiff said that in consequence of domestic worry he omitted to look to see whether or no the plugs were drawn.

Counsel for the County Council urged that there was contributory negligence on the plaintiff's part.

The jury found a verdict for the plaintiff, and assessed the damages at £135.

Judgment was entered for that amount, with costs.

#### FULLALOVE v. L.C.C.

ON April 24th Mr. Justice Lerratt entered judgment for £150 against the London County Council, as owners of the electric tramway system, in an action brought by a carman named Fullalove, heard in the King's Bench Division before a common jury. The man was driving a van on October 29th last in the Jamaica Road, Bermondsey, in the direction of the Tower Bridge, and in order to pass a stationary cart he had to go upon the tramline, when a tramcar came up behind him, striking the van in the rear with such force that the plaintiff was thrown into the road and the wheel of the van passed over his legs, breaking two bones of one of them. He remained in hospital for about a month, and subsequently for five weeks he was kept at a convalescent home.

## BUSINESS NOTES.

**Meter Approved.**—The B. of T. has approved of the Bat meter type H.T.R.—constant pressure two-wire c.c., deposited by the BAT METER CO., LTD.

**Patent Restored.**—An order has been made restoring Patent No. 19,296, of 1908, for "Improvements in or relating to coated iron or steel sheets" (Edwin Norton).

**Osrams in India.**—Among the Osram lamp-selling methods employed in India is the running of a motor-car by representatives of the General Electric Co. (India), Ltd., for business trips to mills and factories within a radius of 30 miles of Calcutta. We understand that there are more than 50 mills in the area, all having Osrams installed in considerable numbers. The car has the words "Osram Lamps" plainly printed on the sides, and there is an attaché case at rear containing the various types of lamps; the samples carried therein are stated to have been carried daily without change for nine months, and only one filament has broken.

**Lamlok Specialities.**—Among orders lately received by Mr. C. H. Jeffcoat for these specialities, was one for the equipment of 20 theatres of the "London Theatres of Varieties" and others from Great Eastern and Great Northern Railways, London Coliseum, Queen's Hall, Empire, Harrod's.

**Underfeed Stokers.**—The following is a list of some stoker contracts recently executed by the UNDERFEED STOKER CO., LTD.:—

Pernambuco Tramways, six "E" and six heater; Carlisle Corporation Electricity Station, one "E"; Burgh of Ayr Electricity Station, 2 "E"; Sd. Energia Electrica de Cataluna, San Adrian, Barcelona, 16 travelling grates; South-East Kent Electric Power Co., four "E"; Metropolitan Carriage, Wagon & Finance Co., four EF; Italian State Railways, two "E"; Gebrüder Sulzer (for Japan), two travelling grates.

**Book Notices.**—*The Motor Manual*.—Compiled by the staff of *The Motor*. London: Temple Press. Price 1s. 6d. net.—When a book has reached its sixteenth edition, and over a quarter of a million copies have been sold, it is of little use to consider its merits; the voice of the people has spoken. All we need do with the *Motor Manual*, therefore, is to say that the new edition has just been issued; it has been drastically revised, and rearranged in a more natural order, and additions have been made including over 100 new illustrations. The *Manual* is indispensable to the motorist.

"*Journal of the Institution of Electrical Engineers*," No. 218, Vol. 50. London: E. & F. N. Spon, Ltd. Price 5s.—The issue for April, 1913, contains the following papers: "A Single-phase Motor with Pole-Changing Windings," by J. S. Nicholson and B. P. Haigh; "The Aims and Works of the International Electrotechnical Commission," by Prof. S. P. Thompson; "Apparatus for Improving the Power Factor of A.C. Systems," by Prof. Miles Walker; "The Use of a Large Lighting Battery," by F. H. Whysall; "The Mechanics of Electric Train Movement," by F. W. Carter; "Change of Energy Loss, with Speed in Continuous-Current Machines," by Prof. W. M. Thornton; "Address to the Students' Section," by Dr. A. Russell.

"Liquid Air, Oxygen, Nitrogen," By Georges Claude. 1913. London: J. & A. Churchill. Price 18s. net.

"The Motor Manual." 1913. London: Temple Press, Ltd. Price 1s. 6d. net.

"Single-Phase Commutator Motors." By F. Creedy. 1913. London: Constable & Co., Ltd. Price 7s. 6d. net.

"Manual of Wireless Telegraphy and Telephony." By A. F. Collins. 1913. London: Chapman & Hall, Ltd. Price 6s. 6d. net.

"Transactions of the Illuminating Engineering Society." Vol. VIII, No. 2. February. 1913. New York: The Society. Price 75 cents.

"Sand Available for Filling Mine Workings in the Northern Anthracite Basin of Pennsylvania," by N. H. Darton; "Second Annual Report of the Director of the Bureau of Mines for 1912"; "The Cementing Process of Excluding Water from Oil Wells as Practised in California," by R. Arnold and V. R. Garfias; "Accidents from Mine Cars and Locomotives," by L. M. Jones. Washington: Government Printing Office.

**Bankruptcy Proceedings.**—JOHN MITCHELL and FREDERICK MITCHELL (lately trading as Fred. Mitchell & Co.), electrical engineers, 97, Stockport Road, Ardwick, Manchester, and 58, Ashton Old Road, Openshaw, Manchester.—The public examination of the above named debtors, was held at the Court House, Quay Street, Manchester, last week, when it transpired that the debtor, Frederick Mitchell, was formerly employed as a journeyman electrical engineer, and in March, 1908, purchased a business formerly carried on by Messrs. Cooper & Ormerod, at Stockport Road, Ardwick. He had no capital of his own, but his mother lent him £45. His brother, John, who afterwards came into partnership, also lent him £50. In 1912 they transferred the works to Ashton Old Road, Manchester. At first the business was fairly successful, the joint capital, after deducting liabilities having increased to about £300 in June, 1910. For 1911 and 1912 rough balance-sheets were prepared, but these were destroyed. Debtor did not know what the figures were, but they disclosed a reduced turnover. They afterwards undertook more work than they had capital to carry out, their contracts being mostly with speculative builders. In 1911 a number of actions were brought against them for non-payment of accounts, and they lost contracts through being unable to execute contracts in hand. Debtor attributed his failure to lack of capital, legal expenses and bad debts (£308). He had no private assets, and was now employed as an insurance agent. The debtor, John Mitchell, stated that he joined the business in June, 1911, and gave corroborative evidence. Debtors' joint liabilities were scheduled at £202, and their joint assets amounted to only £12, leaving a deficiency of £190. The examination was closed.

SAMUEL BROOKES (trading as the Netherton Tube Fittings Co.), Netherton.—May 9th is the last day for the receipt of proofs for dividend, by the trustee, Mr. A. M. Fairbairn, 1, Priory Street, Dudley.

A. G. ADAMSON, electrical engineer, Acton, lately Christopher Street, E.C.—Fourth and final dividend 2½d. in the £, payable April 30th, at 14, Bedford Row, W.C.

**Dissolution and Liquidations.**—MESSRS. A. SEAGE AND CO., manufacturing electrical engineers, of Cambridge Works, Hammersmith, W.—Messrs. A. Seage and W. M. Dodd have dissolved partnership. Mr. Dodd will attend to debts, &c., and will continue the business.

COMPAGNIE GENERALE ELECTRIQUE DE LA CHAMPAGNE, LTD.—This company is winding up voluntarily. Mr. J. T. McConville, 65, London Wall, E.C., is liquidator. A meeting of creditors is called for May 8th. Creditors should send particulars to the liquidator by May 23rd.

ELECTROLYTIC ALKALI CO., LTD.—This company is winding up voluntarily, as already announced. Mr. W. H. Alexander, 24, North John Street, Liverpool, is liquidator. A meeting of creditors is called for May 7th. Creditors should send particulars to the liquidator by June 9th.

ROSSENDALE BELTING CO., LTD., Manchester.—Winding-up order made April 21st.

ADAMS MANUFACTURING CO., LTD.—A meeting of creditors will be held at Winchester House, E.C., on Friday, May 9th.

MARSH, SON & CO., LTD.—This company is winding-up voluntarily, with Mr. R. W. Brown, 12, Old Square, Lincoln's Inn, W.C., as liquidator.

**Private Arrangement.**—LEONARD HIGGINS, electrician, trading as L. Higgins & Co., 339, Stockport Road, Longsight, Manchester.—The creditors interested herein were called together recently, when a statement of affairs was presented showing liabilities of £411, all of which were due to trade creditors. The assets were estimated to realise £83, from which had to be deducted £31 for preference claims, leaving net assets of £52, or a deficiency of £359. It was reported that the debtor started trading in partnership with a brother in April, 1903, when they had a joint capital of about £50. The partnership was dissolved in December, 1911, and since that date the debtor had traded alone. The dissolution was not gazetted, but all the creditors were notified of the change. Proper books of account had not been kept, and there was not a complete record of the cash takings. Proceedings had been commenced by creditors, and it was said that there were unsatisfied judgments. The debtor stated that he had carried out certain contracts on which he had lost money. After discussing the position, it was decided that, failing an offer of 4s. in the £ the debtor should be requested to file his petition.

**Trade Announcement.**—It is announced that the business of the late Mr. T. J. Serle, of MESSRS. T. J. SERLE & SONS, electrical engineers, of East Street, Taunton, will be continued by the family.

**Catalogues and Lists.**—MESSRS. H. W. BUTLER & CO., Craven House, Kingsway, W.C.—A serviceable little desk blotter has been received.

MESSRS. MICKELWRIGHT, LTD., Well Works, Alperton, Middlesex.—12-page illustrated price list of resistances for cinematograph and other service, "Wright" number indicators for music halls, theatres, &c., auto-transformers, dimming and battery charging resistances, &c.

MESSRS. DRAKE & GORHAM, LTD., 66, Victoria Street, Westminster, S.W.—32-page pamphlet (No. 201) giving numerous illustrations, brief particulars, and prices of various fittings for indirect and semi-direct lighting—with plain and mirror reflector bowls, silvered reflectors, moulded composition bowl fittings with silvered reflectors, alabaster bowls, Silurian and Equiluxo glassware, silk-covered opal dishes, Holophane glassware, and a number of "Hellenic" type fittings.

THE BRITISH WESTINGHOUSE ELECTRIC AND MANUFACTURING CO., LTD., 179, Wardour Street, London, W.—Several publications have been issued regarding their various manufactures for the electrical equipment of cinematograph theatres. One entitled "Pictures" contains reprints of regulations relating to the use of electricity, &c., in such theatres, and gives illustrated particulars of Westinghouse electrical equipments, and a long list of these entertainment houses that they have fitted up. The second is entitled "There's gold in it," and consists of a collection of testimonials from managers. A third "What Electricity can do for you," gives particulars and prices of "Auriga" drawn wire lamps, Holophane glassware, electric irons, toasters, kettles, radiators, fittings, &c.

THE STOLZENBERG FILE CO., LTD., 210-212, Bishopsgate, London, E.C.—Catalogue (48 pages) fully detailing, with effective illustrations, their Stolzenberg system of filing and office organisation. From among a number of applications of the system we may select for mention the use of the files as tender covers and as catalogue covers—a number of examples executed for electrical and engineering firms being shown.

MESSRS. SEEAR, PAGE & CO., 16 and 17, Devonshire Square, London, E.C.—Illustrated lists describing the "Maytag" electric washing machine. Copies will be sent to electrical contractors who are interested.

THE WILSON-WOLF ENGINEERING CO., Thornton Road, Bradford.—List giving descriptive particulars and list of prices of "Polar" propeller ventilating fans, also spare parts and speed regulators.

MESSRS. VERITYS, LTD., King Street, Covent Garden, London, W.C.—Folder No. 721 (four pages), detailing—with illustrations and prices—various lines of "Aston" knife switches, circuit breakers, fuses, lampholders and distribution boards, designed to comply with the Factory Act Regulations.

MESSRS. L. ANDREWS & CO., 2, Whitworth Street West, Deansgate, Manchester.—Price list of rubber valves, washers and sheets, asbestos, garden and delivery hose, &c.

MESSRS. LANDIS & GYR, LTD., 28, Denman Street, London, S.E.—Leaflet describing their switchboard meters for s.p., a.c. circuits and three-phase circuits with balanced loads. Dimension sketches and diagrams of connections are given.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—List No. 2,450 contains full description of, also tabulated price, dimensional and shipping data concerning, their potential transformers.

## LIGHTING and POWER NOTES.

**Abingdon.**—The promoters of the Abingdon Electric Supply Co., Messrs. Edwards & Armstrong, of Bristol, have deposited with the borough surveyor plans for a generating station to be erected in Wootton Road.

**Barton-on-Umber.**—A prov. order for electric lighting has been applied for, with the consent of the U.D.C., by Mr. F. Hopper, J.P., head of a well-known local manufacturing concern,

and a local company is being formed to carry on the undertaking. Already the buildings are being erected, and a contract entered into with Messrs. Crompton & Co., Ltd., for cables, plant, &c., at £10,270. The Urban Council has decided to take electricity for public lighting.

**Bexley.**—The U.D.C. has decided, in the event of a demand arising, to hire out electric cooking apparatus. The Council has also decided to allow members of the staff to canvass in their spare time for new consumers, at a remuneration of 3d. per point and 6d. for each cooker and heater connected to the mains.

The L.G.B. has forwarded sanction to a loan of £1,520 for E.L. purposes.

The Council has adopted the recommendation of the electrical engineer to encourage the use of arc lamps for private lighting, and offers to provide lamps, supply current, and maintain the lamps at prices ranging from £6 10s. to £9 per annum.

The Council has also adopted the following revised scale of charges for current:—Private houses for all purposes: A fixed charge of 2s. 6d. in the £ on the rateable value, plus a flat rate of 1½d. per unit net, or a flat rate of 6d. Shops and business premises: A fixed charge of £10 per k.w. per annum, plus 1½d. per unit net, or a flat rate of 6d. Outside shop lighting: A flat rate of 4½d. per unit net, with 400-watt lamps as the minimum size.

**Blackpool.**—On April 23rd, two new generating sets were formally started up, this being the seventh extension which has been made since the works were opened. A 1,500-kw. turbo-alternator has been supplied by the British Thomson-Houston Co., and is the largest lighting unit installed in the works. The addition of this 1,500-kw. unit brings the total plant capacity for lighting up to 4,300 kw. The other addition was a new 800-kw. turbo-generator for traction purposes, supplied by the Brush Co., which brings the plant capacity for tramways purposes up to 2,250 kw., while the total plant capacity of the works, including the two new turbos, is now 6,500 kw. The work has been carried out to the specifications of the electrical engineer, Mr. Charles Furness, who is to be congratulated on his successful efforts to bring the installation up to date, and on the inauguration of a forward commercial policy.

In connection with the inauguration of the new plant, the works were thrown open for inspection, and a cooking and heating exhibition was held. Some 2,000 visitors took advantage of the occasion, and we understand that many inquiries have resulted from the cooking demonstrations on the Tricity, Eclipse and Ferranti ovens.

**Brora.**—The village of Brora, noted as having the most northerly coal mine in the kingdom, is having its paraffin street lamps replaced with 30 electric lamps each of 25-c.p. A local supply company has the contract, and Messrs. Edmundsons are carrying out the scheme.

**Bushbury.**—The B. of T. has granted the Wolverhampton T.C. a prov. order, enabling it to supply energy within the parish of Bushbury, which is in the area of the Stafford R.D.C.

**Bushey.**—The U.D.C. has been informed that the Colne Valley Electricity Supply Co., Ltd., do not intend to proceed with the application for powers to supply electricity within the area of the Council. As this difficulty has been removed, the Council will proceed with negotiations with the Watford U.D.C. for a supply of current for the district, and a draft agreement is to be prepared.

**Canada.**—It appears that there is trouble in connection with the Hydro-Electric Commission's staff. A correspondent says that General Manager Sweeney was recently dismissed from his position at the instance of Chairman Ellis, of the Commission, and forthwith retaliated by trying, unsuccessfully, to get the chairman removed. Meanwhile Manager Sweeney's dismissal was followed by the resignation of 10 other officials—the head of every department in the service, including the chief engineer, the general superintendent, the distributing and operating engineers and others.

The city of Toronto is to submit by-laws to purchase the undertakings of the Toronto Electric Light Co. and the Toronto Electric Railway Co. The street railway concession has eight years to run, and it has been generally assumed that it would not be renewed. The price asked for these concerns is between 20 and 30 million dollars, and a Bill giving the Council power to complete the purchase has been rushed through Parliament although the Council is not unanimous as to the proposed purchase.

The Shawinigan Water and Power Co. has announced that it will add another 20,000 h.p. of plant to its No. 2 power house, which will give the company a capacity of 80,000 h.p.

The Toronto Hydro-Electric Commission (the municipal system) reports that on December 31st, 1912, there were 13,858 meters in use, 300,000 lamps connected, 33,824 street lamps in use, and a connected load of 54,655 h.p. with a peak load of 17,198 h.p.

**Chilworth.**—The South Stoneham R.D.C. has granted the request of the Southampton T.C. to be allowed to supply current to Chilworth Towers and to other property in that district.

**Continental Notes.**—**RUSSIA.**—According to the German Consul at St. Petersburg the Russian official notices contain the grant of a concession to an Englishman, Mr. C. H. Stuart, for the installation of electric generating stations in the Caucasus. These stations will be situated on the River Terek and Lake

Goktscha, and power to acquire land on mortgage for the erection of distribution mains is included in the concession. The details of the concession are: (1) the erection of a temporary hydroelectric station on the Terek, near the village of Gwilet of a minimum capacity of 15,000 kw., with transmission lines to Tiflis and Vladikavkas; (2) a permanent hydroelectric station on the Terek, near the Larz Post station of a capacity of 40,000 kw., to which the lines to Tiflis and Vladikavkas are to be connected; and (3) one or two permanent stations on Lake Goktscha in the region between the lake and the watermeet of the rivers Tarschala and Akstala of a minimum capacity of 40,000 kw., with mains at Tiflis. The concession is for a term of 75 years. At the expiry of this period the whole undertaking reverts to the Fiscus. After a lapse of 30 years the Government has the right to buy out the undertaking, subject to one year's notice. The concessionaire has the right to hand the concession over, with the approval of the Russian Government, to a Russian or foreign company.

The temporary station sites must be submitted to the Viceroy in 3 years, the permanent station on the Terek in 3½ years, and those on Lake Goktscha in 6½ years from the date of signature of concession, respectively, and the respective duration of the constructional work is to be 2½, 6 and 7 years from the day the Viceroy approves the plans. It is said that constructional work will begin this spring at the Terek hydro-electrical station.

The report for 1912 of the Société Electrique de Saint Petersburg, which has just been issued, shows that during last year the plant at the generating station of the company was increased by a 6,700-h.p. engine and dynamo and two new boilers. The mains of the company now extend 290 miles, an increase of 22 miles in the 12 months. Including the public lighting, current is now being supplied to lamps, motors, &c., equal to 299,784 hectowatts.

**BULGARIA.**—Some interesting trials have recently been made at the generating station in Sofia, of the Compagnie d'Electricité de Sofia et de Bulgaria, in the firing of the steam boilers with the residues from Roumanian petroleum. The tests have proved so successful, that all the boilers at the station have now been adapted to burn this fuel. A new steam turbine and generator of 2,200 h.p. has also recently been installed.

**SPAIN.**—Two new 1,000-h.p. gas engines utilising the waste gases from the blast furnaces are being installed in connection with the electric power station at the Baracaldo works of the Sociedad Altos Hornos de Vizcaya, at Bilbao. At the Sestao works of the same company it is proposed to adopt electric driving in connection with the various iron and steel rolling mills, and to this end a battery of Babcock & Wilcox boilers and two 3,000-kw. steam turbines and dynamos are being installed.

What is described as being the first electrically-lighted light-house in Spain has lately been completed at Cape Villaro, near San Sebastian. The lighthouse, which is 82 ft. high, is fitted with a small steam-operated generating plant to furnish the necessary current for the special arc lamp, the power of which is sufficient for the rays of light to be seen at a distance of about 32 miles. A petrol-vapour lamp has also been installed to act as a reserve in case of temporary failure of the electrical apparatus.

**BELGIUM.**—All the steam engines in connection with the collieries of the Société des Charbonnages du Hasard, at Trooz-Forêt, have now been discarded, the various plant being now entirely electrically operated.

**FRANCE.**—A new electricity generating station has lately been completed on the bank of the canal between Caen and the sea by the Société d'Electricité de Caen. The station, which has been designed for subsequent enlargement as the demand for energy increases, at present contains two 2,000-kw. steam turbo-alternators and an 800-kw. double-current turbo-generator, to give 800 kw. three-phase and 300 kw. continuous current. In addition to supplying current for lighting and power purposes in the town of Caen, the company is also already furnishing a supply to Cabourg and Trouville, and arrangements are in hand for supplying the town of Bayeux and other centres in Calvados.

**Cuckfield.**—The R.D.C. has decided to take no action with regard to the draft prov. order for electric lighting issued to the Mid-Sussex Electric Light and Power Co.

**Dromore.**—At a resumed B. of T. inquiry into a proposed electricity supply scheme for Dromore, the opposition of the gas interests and local ratepayers was heard. As regards the former, the witnesses included Mr. J. H. Abady, the well-known gas expert, as well as Mr. Pye, engineer to the Chichester Gas Co.; and, altogether, most strenuous efforts were made to persuade the inspector that Dromore gas at 5s. 3d. per 1,000 cb. ft. is much superior to electricity at the proposed price, 6d. per unit.

**Dover.**—Sanction has been received from the L.G.B. to the borrowing of £300 for the purchase of transformers.

**Dudley.**—Complications are not unlikely to arise in connection with the sale of the Corporation's electricity undertaking. The draft agreement provides that after the transfer the Corporation shall continue to be responsible for the repayment of the loans, the purchasers, however, providing the wherewithal as the loans become due. The annual charge under this head amounts to about £5,000. The question of security has been raised, and it is now believed that an Act of Parliament may be required before the purchase, which was to date from March 25th, 1912, can be carried through. It may be added that the works are now being

carried on by the intending purchasers, with an electrical engineer specially retained by the T.C. to safeguard its interests. The question, it is expected, will come before the T.C. at an early date.

**Erith.**—The U.D.C. has decided to take no further steps with reference to the offer of the Woolwich B.C. to supply energy in bulk, it being considered that no advantage would be derived from such a supply.

**Glasgow.**—It is reported that the various police boxes in the city are to be fitted up with electric hot-plates to enable constables on night duty to make themselves a cup of tea or other hot drink. The boxes are also to be fitted with an electrical arrangement whereby the superintendents at the various stations can switch on a red light when they wish to communicate with the man on the beat.

**Harrogate.**—Mr. George Wilkinson, the borough electrical engineer, has presented a report to the Electricity Committee, on the possible development of heating and cooking by electricity and its effect on the Corporation's electric supply undertaking. He estimates that a consumer using electricity for cooking and heating would use 10 times as much current as for lighting, and on that basis, if half the consumers in Harrogate adopted electrical cooking and heating, the total number of units sold would increase from 862,673, the present number, to over 4,000,000 per annum. With a view to encouraging the electric cooking, he suggested the following scale of charges:—A fixed charge of 1s. per quarter per 30-watt lamp (or the equivalent) installed, each light point to be rated at 30 watts minimum. A fixed charge of 2s. 6d. per quarter per kW. installed in cooking plant and electric radiators, &c. A flat rate of 3d. per unit for all electricity consumed, the tariff to be subject to 5 per cent. discount for prompt payment of account. The conditions to be imposed are as follows:—(a) That the establishment shall be entirely and exclusively illuminated by electricity; (b) that every lamp be assessed for the fixed charge excepting the bathroom, w.c. and boxroom lamps, and one lamp in the basement (where there are cellars); (c) that cooking and heating plant is installed equal to at least four times the total capacity of the electric lamps.

**Ham (Surrey).**—The Twickenham and Teddington Electric Supply Co., Ltd., has applied to the B. of T. for consent to use overhead lines from Twickenham to Ham for the purpose of supplying current under the E.L. Order, 1904, at a pressure of 3,000 volts.

**Hull.**—The Electricity Committee has had under consideration the proposed heads of agreement for the taking in of Hesse into the area of supply of electricity. The agreement included the payment by the Hull Corporation of £462 to the Hesse authority, towards the cost of obtaining a provisional order. It was resolved that the proposed agreement and terms be set out on the minutes, and that the matter be decided upon at the next meeting of the City Council.

**India.**—TATA HYDRO-ELECTRIC SCHEME.—We recently referred to the progress which this company is making with its power scheme, in connection with which we are given to understand that the total capacities of the motors and transformers to be applied to the textile mills and flour mills in the Bombay district, which are to derive their power from the mains of the above company, will exceed 36,000 H.P., and 40,000 K.V.A. respectively. At the present time, 27 textile mills and two flour mills are to be electrified, and the whole of their equipment is being manufactured by the British Westinghouse Co. It includes, besides motors and transformers, the complete control gear for each mill. We hope to be able to give a detailed list of the mills and their equipment at an early date, when the final points regarding the equipment are settled. The Westinghouse Co. are to be congratulated upon securing such an important section of the Tata Co.'s electrification scheme.

**Itchen (Hants.).**—The U.D.C. has been informed that the B. of T. has granted its application for a prov. order for electric lighting, and the necessary deposits are to be made.

**Japan.**—Our contemporary, *Elettricità*, of Milan, announces that the municipality of Tokio has discussed a project to borrow, approximately, £6,000,000 for electrical installations, and has decided to contract an immediate loan of £1,400,000 and the balance next year.

**Leicester.**—The Borough Education Committee has decided to expend £1,700 on electric lighting and new machinery for the additions to the industrial schools at Desford.

**Lisnaskea (Co. Fermanagh).**—At a meeting of the Fair and Markets Committee, matters in connection with the scheme for the lighting of the town by electricity were further considered. It was decided to form a company with a capital of £1,000.

**Liverpool.**—At a meeting on Friday, last week, of the Corporation Tramways and Electric Power and Lighting Committee, it was decided, on the casting vote of the chairman (Alderman F. Smith), to abolish the Electrical sub-Committee. The latter was only formed at the commencement of the present municipal year, five months ago, it being felt that the growth of the electricity undertaking had been such that it ought to be dealt with by a separate sub-Committee. At the time of its inauguration there was

considerable party feeling displayed over the appointment of chairman, several names being submitted and rejected, and ultimately Mr. W. J. Bailes was elected.

**London.**—METROPOLITAN ASYLUMS BOARD.—In view of the general adoption of metal-filament lamps at its institutions, and as the expenditure on such lamps might possibly exceed the limit laid down by the L.G.B., the managers consider that lamps of this description should be obtained direct from the manufacturers, and they have accordingly made application to the L.G.B. for its sanction to this proposal.

**Luton.**—At the last meeting of the T.C., the electrical engineer submitted a long report on proposed extensions to the electricity station and plant, which had been rendered necessary owing to the increased demand for current. The existing buildings, the report states, are filled to the utmost extent with plant, and it would, therefore, be necessary to erect a complete additional station as an extension to the existing one. Having gone carefully into the matter, the engineer thinks it would be unwise to extend the station on exactly the same lines as hitherto, because by so doing, it would limit the ultimate capacity of the station to about 9,000 kW., and there is every reason to believe that the rapid growth of the undertaking will continue. He advises, therefore, that the engine room be extended a distance of 63 ft. in one span, and that the roof be raised to a height of 25 ft. under the travelling crane so as to allow for the larger units that it will be necessary to install in the future. This, he thinks, will be sufficient to accommodate the two 1,000-kw. sets required at present, a 500-kw. converter, a new E.H.T. switchboard, and space for a further 5,000-kw. unit in the future. It will also be necessary, the engineer continues, to extend the boiler-house to accommodate two additional water-tube boilers, and as there is at the present time no provision for the storage of coal, he advises an extension of the boiler-house for approximately 85 ft.; also a new chimney shaft of sufficient capacity to deal with the maximum number of boilers it would be possible to install in the future, at the extreme end of the new boiler-house. The coal bunkers will be erected over the boilers with a holding capacity of about 1,500 tons. This scheme, the engineer points out, will enable a further extension to be carried out to the engine room at a minimum cost, which will accommodate an additional 10,000 kW., and by adding a wing to the boiler house an additional four boilers could ultimately be installed which would bring the maximum capacity of the station up to about 19,000 kW. Based upon preliminary tenders, the engineer estimates the cost of these proposals as follows: Buildings and chimney shaft, £6,787; coal bunkers and coal-handling plant, £7,555; boilers, economiser and feed pump, £6,555; two 1,000-kw. turbo-alternators and condensing plant, £9,500; one 500-kw. converter, £1,443; switchboard and connections, £1,100; cooling tower, pipework, travelling crane and details, £3,356; sub-station and converting plant, £3,000; provision for mains required during the next two or three years, £5,000; total, £44,296. When the actual tenders are placed, this estimate, the engineer states, will be somewhat reduced. Comparing the capital cost per kW. installed with that which has already been carried out, the cost of the existing station, excluding feeders, distributing mains, services and meters, amounts to £18.75 per kW. installed, while the proposed extension, excluding mains and distributing plant, but including the accommodation provided for future plant will be £18 per kW., and when the additional plant is installed for which provision is made in these proposed buildings, the total cost of this new station will be reduced to just over £8 per kW. installed, which, the engineer thinks, is an extremely low figure. Concluding, he advises that, immediately, application be made to the L.G.B. for the amounts required. The Electricity and Tramways Committee reported having given careful consideration to the engineer's report, and stated that it was strongly of opinion that, having regard to the future requirements, any lesser scheme than that proposed by the engineer will not be economical, bearing in mind the restricted site, and the anticipated rapid increase (based on past experience) of the demand for energy. It accordingly recommended the adoption of the engineer's report, and that application be made to the L.G.B. for sanction to the borrowing of £44,296, the estimated cost of the works.

Alderman Wilkinson, chairman of the Committee, in moving the adoption of the report, said that the question had been brought about by the marked success and tested usefulness of the undertaking generally to the inhabitants, and to the large consuming trading public. In the early days of the undertaking it was anticipated that electricity for motive power would be largely sought for by the staple trade, and he believed it was now a fact that those who had not equipped their factories in this way were very considerably handicapped. With regard to the proposed expenditure on mains, &c., the demand for current from the Stanley Street, Regent Street, and Chapel Street neighbourhood had become such that the mains there needed strengthening. It was also proposed to take a H.T. main to the neighbourhood of the Skefko Works, and to establish a transforming station to which current would be sent at a high voltage, and there be reduced to the normal working voltage. The recommendation, after the matter had been thoroughly considered in Committee, was unanimously carried.

The assessment on the electricity undertaking has been reduced from £6,000 gross and £3,000 rateable to £3,500 and £1,500 respectively.

**Mid-Sussex.**—The B. of T. has granted a prov. order for electric supply to the Mid-Sussex Electric Light Co., for the Hayward's Heath district, in which town the generating station will be. The local authorities concerned have secured purchasing clauses in the order.

**Plymouth.**—The electrical engineer has submitted to the Lighting Committee of the B.C. that, in view of the growing demand for electricity, additional machinery should be provided as soon as practicable. He recommends that a turbo-generator shall be installed, together with the necessary auxiliaries, and that a larger cable shall be substituted for the existing No. 3 feeder, a portion of the cable displaced to be used as a short feeder at Prince Rock; also that an additional distributor and interconnector be laid from Mutley Plain to Lipson Road and Tothill Avenue. He estimates the cost of the proposed plant at £5,500, and cost of the alterations and additions to pipework, switchgear and cables at £2,000. The report was approved, and tenders are to be invited for the necessary machinery.

**Portsmouth.**—As a result of the heavy storm on Tuesday evening, which caused flooding in parts of the town, both the tramway and electricity services were interfered with, the latter failing in the central part of the town.

**Rawtenstall.**—The borough electrical and tramways engineer having reported that new plant will be necessary at the electricity works at an early date, the Committee has instructed him to prepare a statement showing what plant is required, and a Sub-Committee has been appointed to consider the matter.

**Stalybridge.**—It was reported at a meeting of the Stalybridge Joint Tramways and Electricity Board, on April 24th, that the L.G.B. had sanctioned further borrowing powers of £39,255 for electricity purposes.

**Summerseat (Lancs.).**—Messrs. J. Hoyle & Sons are installing a hydro-electric plant at their spinning mill, including a 265-H.P. Boving turbine working on a head of 25 ft. This plant will supplement existing steam plant.

**Swinton.**—No decision has yet been come to by the Swinton and Pendlebury Council regarding the particular system of electric street lighting to be adopted for the contemplated extensions. A deputation has just visited Rawtenstall to inspect the system in use there.

**Trowbridge.**—The first report and balance-sheet of the Trowbridge Electric Supply Co., Ltd., has just been issued. In their report the directors state that the period under review is the first complete year in the working of the undertaking, and the progress made is most satisfactory. The result of the year's working shows a profit of £196, and a disposable balance of £205, which the directors recommend should be dealt with as follows:—To 5 per cent. interest on preference shares (already paid), £49; to depreciation reserve fund, £100; to general reserve fund, £50.

**U.S.A.**—According to an American contemporary, a transmission line some 275 miles long is to be built by the Pacific Light and Power Co. from a new plant about 60 miles east of Fresno, to Los Angeles. This line will be designed for a pressure of between 150,000 and 175,000 volts. It is claimed that climatic conditions are such in this section that 200,000 volts or more may be used on future transmission systems.

**Walthamstow.**—The question of extending the supply to Highams Park is being considered in connection with the proposed supply to Woodford.

**Weaverham.**—The B. of T. has granted a prov. order for electricity supply to the Weaverham Electricity Supply Co., Ltd., of Northwich, the area of supply comprising the parishes of Weaverham-cum-Milton, Acton, Cuddington and part of Oakmere.

**Wick.**—This town, the centre of the Scotch herring fishing trade, is shortly to have an electric supply. Messrs. Edmundsons, who are already responsible for the undertakings in several towns in Scotland, are the promoters of the scheme.

## TRAMWAY and RAILWAY NOTES.

**Airdrie.**—A conference has been held at Airdrie between members of the Corporation and members of the Glasgow Corporation Tramways Committee, with reference to a scheme for the linking up of the Glasgow line from Baillieston to Coatbridge.

**Ashton-under-Lyne.**—There is a profit on the tramways for the past year of £3,000, which is the largest amount recorded since the inception of the undertaking 10 years ago. Last year there was a profit of £2,000.

**Australia.**—A New South Wales wheat farmer is reported to have introduced a mammoth wheat harvester at Molong, which comprises three strippers and a winnower. It is driven by three electric motors deriving energy from a generator on an oil tractor which draws the machine along.

**Birmingham.**—The Tramways Committee has considered the report of Mr. Baker, the general manager, on the question brought before the Committee by a deputation, headed by the Bishop of Birmingham, of allowing tramway employees facilities for attending Divine service on Sunday mornings. It was decided to communicate with the Bishop, stating that a large majority of the men do not appear to have an aversion to working on Sundays, the work being considerably lighter than on week-

days. In any case, however, men who are desirous of attending Divine service can do so by notifying their depot inspector, when arrangements can easily be made, as the duties are always most popular, and there would be no difficulty in finding substitutes.

**Blackpool.**—Mr. C. Furness, general manager of the tramways, reported to the Tramways Committee on Thursday, last week, that the estimated income for last year was £62,000, but the actual income had been £71,166 which was a record for the tramway department. The previous year's income was £65,310. The total working expenses were £39,682, and the disposable balance £18,331, compared with £10,653 in the previous year, also a record. The reason for the increased revenue was the fact that during the year the number of cars was increased. The revenue from the circular cars alone was £7,902, an increase of £1,857, the passengers carried by those cars numbering 595,800. The receipts per car-mile were 2s. 8½d. The total number of passengers carried during the year was 11,321,148, an increase of 981,429, the receipts per car-mile being 1s. 4½d. It was proposed to contribute £5,000 to the relief of the rates, and place the balance of £13,331 to the permanent-way renewal fund. The year's receipts for electricity were £40,333, and the disposable balance was £6,226, which would have been greater but for the fact that the cost of coal was £3,000 more.

**Continental Notes.**—GERMANY.—After preliminary labours extending over several years, the A.E.G. scheme for the construction of an electric railway between Gesundbrunnen and Rixdorf (Neukölln) has advanced a further stage towards realisation. The project received the sanction of the supervising authorities a year ago, the contract between the company and the Berlin City Council was passed in February, 1912, and now the final step has been taken as the Minister of Public Works has presented the concession for the Prussian Royal consent. As in the case of the existing Berlin elevated and underground railway, the new railway will also be partly high level, and partly built below the street surface. The concession is for a period of 90 years, although the municipal authorities will have the right of acquisition at the expiration of 30 years, and at succeeding terms of five years. The municipal authorities will have a share in the gross receipts per mile of line, and the share percentage will rise in proportion to the growth in the gross receipts per mile. It is estimated that the construction of the railway will occupy a period of seven years, and the expenditure is computed at £4,250,000. One half of the capital will be raised by the issue of ordinary and preference shares in a new company to be eventually formed, and the other half will be provided by the floatation of a loan, the interest on which will be guaranteed by the municipal authorities. In expectation of the Royal consent, the A.E.G. has already made preparations for commencing the work in the near future by the issue to a financial syndicate of A.E.G. bonds amounting to £1,500,000, which sum is required for the expropriation of property and other preliminary works. The bonds bear interest at the rate of 5 per cent. for the first five years, when the rate will fall to 4½ per cent., and the A.E.G. will be recompensed for this outlay by the new railway company at a later date. The issue has been taken over by the syndicate at the price of 97½ per cent., and the subsequent issue to the public will be at par value. The railway scheme is the largest individual undertaking which the A.E.G. has hitherto embarked upon.

The lower house of the Prussian Diet has passed a Bill authorising the spending of £1,250,000 on preparations for the electrification of the Berlin City Circular and Suburban Railways. It was originally intended to electrify all the lines at a cost of £2,500,000. It was mentioned that electric traction would save £300,000 per annum over steam traction, and that to meet the liabilities due to the new work, a revised tariff would be introduced, to bring in £400,000 more a year.

**ITALY.**—The Provincial Council at Parma has just given its assent to a scheme, which will have the effect of developing the electric tramway system of that city and its suburbs considerably.

The lines in the city now in the hands of the National Italian Railway and Tramway Co. and the lines to Zibello, Busseto, Soragna, Borgho S. Domino, Rocca, Bianca Mano, Noceto, Medesano, Langhirano, Traversetolo and Montechio, upon all of which steam cars are now run, will be taken over and worked electrically, although the freight service will still be worked by steam. Beyond this two new lines are to be laid down. The cost of this re-organisation is estimated at over £900,000.

**FRANCE.**—The municipal authorities of Paris have recently put in service a new motor dust cart, the feature of which is that it is drawn by an electric *avant train* or motor fore carriage, which can be readily detached from a full vehicle and attached to an empty one.

A concession has lately been granted for the construction and working of an electric railway between Morez (Jura) and Saint Cergues, near the Swiss frontier.

The last horse tramway in Paris has just been electrically equipped, viz., the Pantin-Opera line, on which an electrical service was inaugurated last week.

**Dalkeith.**—The T.C. has unanimously decided to support the scheme for the Lothians railway, a Bill for which is again to be presented in Parliament. With a view to meeting some of the former objections, the scope of the scheme is being extended, and it is proposed to lay down a railway all the way from Arncliffe Collieries, Gore Bridge, Midlothian, along by Thorniebank, following up by Smeaton, and continuing *via* Monktonhall to the Forth.

**Glasgow.**—Some time ago a special Committee was appointed to report upon the provision of an additional supply of power at Pinkston power station, and at a recent meeting has recommended that two additional turbo-alternators be obtained

for the station, one of 5,000 kw. and the other of 2,000 kw., and that the general manager be instructed to prepare the necessary specification and form of tender and obtain offers for the erection of the alternators; and in the meantime to advertise for sale one or more of the reciprocating engines at Pinkston power station.

The general manager has been instructed to get 1,000 additional bell punches from the Bell Punching and Printing Co.

**Halifax.**—The Tramways Committee has declined to accede to the request of residents of the district to extend the tramways from the present terminus at Skircoat Green to Dudwell Lane. The outlay for a double line would be £1,700 and for a single line £1,100, and the Committee considers that an adequate return for such expenditure is not possible.

**Keighley.**—Two B. of T. representatives—Major J. W. Pringle and Mr. A. P. Trotter—visited Keighley on Thursday, last week, and inspected the railless trolley system which has been constructed by the Corporation. The route is from Ingrow tramway terminus through Cross Roads to Hebden Road, Haworth, and powers have been obtained to run through Oxenhope. The total length of the new section is 1 mile 1,400 yards. Messrs. Clough, Smith & Co., of London, under the direction of the Cedes Electric Traction Co., Ltd., have erected the overhead gear, and a "Cedes-Stoll" car was used for the inspection. The cars are to carry 28 passengers each.

**London.**—In connection with a recent Southwark inquest, attention was drawn to the convenience of the existing electric ambulance service, and the jury, in returning their verdict, unanimously expressed the opinion that electric ambulances should be provided throughout the metropolis, and requested that their views should be forwarded to the various authorities concerned.

**Manchester.**—The agitation for an all-night tramway service in Manchester has recently been revived, and last week a deputation representing various organisations affiliated with the Manchester Trades and Labour Council appeared before the Tramways Committee to urge the institution of an all-night service. The deputation also suggested that the time was ripe for the introduction of a system of halfpenny fares. The Committee is to give consideration to the questions raised by the deputation.

**Nelson.**—The report of the year's working of the electricity and tramways department shows that the income of the tramways is the largest so far attained, the total profit being £1,888, or £1,437 more than estimated. The through service of cars to Colne and Trawden has again proved beneficial, though an important defect is pointed out in there being only a single line. The laying of a double set of lines, the report adds, will need to be considered in the near future.

**Newcastle-on-Tyne.**—The new tramways routes from Jesmond Road to Chillingham Road and to the borough boundary at Benton, and also to Newburn, will be opened this month. A prov. order has been received for laying the new lines from Westgate Road to St. Nicholas Square and the High Level Bridge, the intention being to carry passengers from the end of the bridge to different parts of the city.

**Rawtenstall.**—At the T.C. on Thursday, Alderman Coupe (chairman of the Electricity and Tramways Committee) regretted that the tramways had made a loss on the year's working of £526, largely accounted for by the heavy cost of repairing the track, upon which £1,250 had been spent during the year. Traffic receipts had increased from £24,311 to £25,700. It was proposed to allocate £1,500 from the rates in aid of the tramways. The electricity department had had a successful year, the profit amounting to £2,642, against £2,358. The income was £10,494, or £1,368 in excess of the previous year. He said that, other tramways of about the same route mileage, the average journeys were 89, and the revenue 7s. 11d. In Rawtenstall, the figures were 156 and 16s. 7d. In earning capacity, however, Rawtenstall was practically the lowest, the average earnings on 33 similar-sized undertakings being £3,800 per route-mile per annum, whereas Rawtenstall's was only £2,100, while, in the larger towns, the average was £7,600 and the maximum £17,300. That meant that Rawtenstall had an insufficient population, even with the high earnings per head, to make the tramways pay their way. As to the electricity department, the capital expenditure at the electricity works per unit sold was one of the most favourable in the country. The generating costs were amongst the lowest in the country, and lower in many cases than in some of the very large towns.

At the same meeting of the T.C., the financial arrangement with Bacup Corporation in regard to the tramway was approved, and it was resolved that, in pursuance of the Rawtenstall Corporation Act of 1907, the sum of £30,742 be lent to the Bacup Corporation for tramway purposes at 3½ per cent. per annum.

**Salford.**—The B. of T. has appointed Mr. Robert Hammond referee to settle the price to be paid by the Corporation for electrical energy supplied by the Eccles Corporation in respect of a portion of the tramways.

**U.S.A.**—The company operating in Cleveland, Ohio, has found it necessary to introduce a variation of the P.A.Y.E. system on its cars. In the morning the entering cars, which pick up passengers along the route, are operated on the pay-as-you-enter plan. In the evening, however, with traffic conditions reversed, with a view to speeding up the loading of cars, a pay-as-you-leave arrangement is adopted, the passengers paying as they get off at different points on the route. Under these conditions it is stated that a car can be loaded with 100 people in 70 seconds.

The Brooklyn Rapid Transit Co. is now building 100 centre entrance cars of a similar type to the one introduced experimentally

last year, and referred to by us. The type is described as a double-end straight-sided body with low-step passenger entrance, and two exits in the centre of the car, and arranged for collection of fares as the passengers enter. The doorway containing the entrance, and an exit on either side, is 6 ft. 6 in. wide, the sill being 14 in. above the rail; the car floor on either side of the entrance platform is 10 in. higher, and slopes upwards towards the ends. Two 10-H.P. motors are fitted, and the car seats 58 passengers.

## TELEGRAPH AND TELEPHONE NOTES.

**A Large Telephone Cable.**—In his recent annual report, Mr. Theo. N. Vail, president of the American Telephone and Telegraph Co., referred to a new type of cable, providing 900 pairs (1,800 wires) in the space formerly required for 600 pairs. The conductors will be No. 22 B. & S. gauge; thickness of lead sheath, ½ in.; diameter overall, 2½ in.; approximate weight per ft., 9½ lb. —*T. and T. Age.*

**Imperial Wireless System.**—On Wednesday last week the Select Committee on the Marconi contract continued the examination of Mr. Rose, solicitor to the Poulsen Co., who said that their object in fighting against the Marconi contract was to secure the opportunity of establishing a trans-Atlantic service. Major Archer-Shee, M.P., repeated his statement that he had never held any financial interest in the Poulsen Co., and denied that he had been concerned in any conspiracy to blacken the character of Ministers.

Mr. Granville, formerly nominal editor of the *Eye-Witness*, gave evidence regarding articles written for that paper by Mr. Cecil Chesterton, and said that the latter, with Mr. Belloc, had for motive an attack upon Jews, as Jews.

On the following day Mr. A. R. Orage, editor of the *New Age*, was examined, and afterwards Mr. Hilaire Belloc, who disclaimed any enmity towards Jews, but refused to answer questions regarding articles in the *Eye-Witness*.

Mr. A. A. Campbell Swinton was called, and said that in April, 1910, he made tests of the Poulsen system over a distance of nearly 1,000 miles, and reported thereon to Mr. Charles Kerr, as an absolutely independent expert. He had never had any shares in any wireless company. Up to the time of the disclosures in the *Matin* case he had not believed it possible that Ministers had dealt in Marconi shares of any description; he had thought they were all far too clever to do so foolish and dangerous a thing.

Mr. E. T. Powell, editor of the *Financial News*, was next examined, and stated that the City believed that a powerful syndicate, including people in high positions, was responsible for the whole of the Marconi operations. It was reported that an account at a bank was opened on behalf of the syndicate and reached about £70,000, but that a person attempted to withdraw the whole amount in small notes, as though desiring to conceal the dealings with the notes. A large business was done in English Marconi shares by way of Hamburg.

On Monday, when pressed by the Committee, Mr. Powell stated that he had heard the name of Mr. Winston Churchill mentioned in America as one of three Ministers who had dealt in the shares, but said he believed the rumour to be absolutely false. He had also heard, but had no evidence, that Mr. Godfrey Isaacs might have been responsible for starting the rumours with regard to Ministerial dealings.

Mr. Winston Churchill appeared before the Committee, and when asked whether he had had any dealings in Marconi shares, protested vehemently against the "very insulting charge," which implied that he had kept silence while his colleagues came forward and disclosed their position, and was supported by nothing but tittle-tattle. He had never had any interest in any telegraphic shares.

Mr. Powell's examination was concluded, and Mr. C. H. Palmer, acting editor of the *Financial Times*, was called.

The Committee adjourned until Wednesday.

Both in the Committee and in the House of Commons, a movement is on foot to bring the investigations of the Committee to an early end. Yesterday the report of the Technical Committee was to be presented.

**New Cable.**—The section of the Eastern Telegraph Co.'s new London—Hong-Kong cable between Penang and Colombo has been laid by the *c.a. Colonia*.

The Malta section to Alexandria has already been laid. The new cable will cost about £1,500,000, and will be the largest cable ever laid. It now takes about 2½ hours to transmit a 20-word message from Bombay to London, and a further hour or hour and a half for the message to be sent from Colombo to Bombay. By the new cable, on a message from Colombo to London, a saving of 3 hours and 50 minutes will be effected in transit, while on a message sent to Bombay there will be a saving of 2 hours and 20 minutes. This great saving of time is due to the fact that by the new system a message is mechanically transmitted from section to section of a cable and is not relayed by hand until it reaches its ultimate destination, thus avoiding or reducing to a minimum the chances of mutilation in retransmission. Under the present system a message has to be deciphered and retransmitted at Lisbon, Gibraltar, Malta, Alexandria, Aden and Bombay. —*T. and T. Age.*

**Post Office Progress.**—On Thursday last week Mr. Herbert Samuel, on the Post Office vote, referred to the reductions which had been effected in cable rates, including cheaper week-end telegrams at one-fourth the old rates, and cheap Press rates, which had resulted in an immense increase of cable traffic. The Pacific Cable Board reported that in three years the traffic had doubled. He regretted the delay in establishing a chain of Imperial wireless stations, due to the investigations of the Select Committee on the Marconi contract, but sites had been provisionally selected in England, Egypt, India and South Africa, and were being selected in East Africa and the Straits Settlements. The small coastal stations in this country showed an increase of traffic of 15 per cent., and new stations were being erected.

The department on taking over the National Telephone Co.'s undertaking found that heavy arrears of construction had accumulated, pending the transfer; in London, 30,000 subscribers had to be transferred to different exchanges, and there was great difficulty in securing a sufficient amount of skilled labour, while the stormy weather had caused almost unprecedented damage to overhead wires, calling off about 3,000 men who would otherwise have been employed in connecting up new telephone subscribers and developing the system. In London, since the transfer, the staff had been increased by 25 per cent., and the wages paid were 15 per cent. higher, on the average, than under the company. Complaints had been reduced by 50 per cent. compared with the early part of last year; 162,000 miles of additional wires had been laid down, and 20,000 new subscribers had been connected. In the whole country £1,000,000 had been spent on the improvement of the exchange system, apart from the trunk system, and a larger sum would be spent this year. Last year, 98 new exchanges were opened, and this year 220 more would be opened, several being on the automatic system. The trunk traffic showed an increase of 9 per cent., and the London trunk wires were being increased from 520 to 700. A new loaded telephone cable was being laid between England and Ireland; similar cables had been laid to France and Belgium, and the Continental traffic showed a very remarkable increase. The rates to France would be reduced 50 per cent. from July. Communication would be opened with Switzerland, and, if possible, with Germany. Rural party-lines were being taken up quickly; 1,000 subscribers were connected, and 500 were being connected. The telephone call offices in villages had been increased to 2,000. Nine local advisory committees had been formed, and 12 more were being formed. A Departmental Committee was dealing with the revision of rates of charge. Various reforms had been made in connection with the postal and telegraphic services. A tube railway would be constructed for Post Office purposes alone, six miles in length, from Paddington to Whitechapel, costing £1,000,000. The wages of the telephone operators and clerks had been raised, but the electrical staff had not benefited equally, and steps had been taken to remedy this grievance. In the whole country the Post Office employed 233,000 people.

**Submarine Bells.**—The North-German Lloyd have decided to equip their steamers with submarine bells of a similar type to those fitted to light ships.

**Telephone Progress in Europe.**—According to the *Revue Pratique de l'Electricité*, France stands much behind both Germany and England in the matter of telephone facilities. In Germany in November last there were about 1,200,000 telephone stations, that country occupying second rank among the nations of the world in this respect, but falling far behind the United States, which is easily first with 10,000,000 stations. France takes fifth rank only with 250,000, being behind Canada with 300,000, and England with about 700,000. The first automatic telephone network installed in Europe was set up at Hildesheim, in Hanover, in 1908, the old system of Strowger being used. At the present time there are 12 networks in operation. The semi-automatic system is also employed, notably at Dresden, Leipzig and Posen. Fresh installations of both systems are under way, the German Postal Department being very favourably disposed towards them. In France the first trials of these systems are only now being made, the former system at Nice and Orleans and the latter at Marseilles and Angers. As regards the telephone charges, those ruling in Germany are very much lower than what are current in France. They are fixed, not according to population, but to the number of subscribers to a particular network. According to statistics compiled in July last, Berlin, with a little over 2,000,000 inhabitants, possesses 139,428 stations, whereas Paris with nearly 3,000,000 inhabitants has only about 95,000. The equipment installed, both public and private, is about the same in both countries, but the "money-in-the-slot" system is totally unknown in France. The charge in Germany is 0'10 mark (about 1d.), which compares with the 2d. exacted in this country. The use of the slot system is being extended in Germany as in this country, it being installed in hotels, restaurants, hairdressers' shops, &c., for the use of their customers.

**Time Service.**—The Post Office has issued particulars of the improved and extended time service which is now offered to the public. The Greenwich time signal will be transmitted once daily to master clocks at distributing centres, from which hourly signals will be transmitted to subscribers, who will provide their own wiring and clocks. The charge is £6 per annum for a single subscriber, £3 each to a pair of subscribers, and £2 each to three or more subscribers on one circuit within a radius of 2 miles from the distributing centre. Under the new system 20 circuits from the Central Telegraph Office suffice for the whole country, instead of 200 circuits formerly required.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—May 14th. Generating plant for Darwin Radiotelegraph Station, Northern Territory. See "Official Notices" April 11th.

**VICTORIA.**—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

May 16th.—One 15-ton overhead travelling crane, for the Melbourne City Council. See "Official Notices" to-day.

June 2nd.—20,000-volt H.T. switchgear and L.T. switchgear and accessories, for the Melbourne Suburban Railways. See "Official Notices" to-day.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

**TASMANIA.**—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

**QUEENSLAND.**—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" April 11th.

August 27th.—Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

**Austria.**—May 8th. The Austrian State Railway authorities at Tarnow are inviting tenders for an installation of electric lighting at the railway station at Tarnow.

**Barnes.**—May 19th. Feeder and distributor cables, for the U.D.C. See "Official Notices" April 25th.

**Barrow-in-Furness.**—May 7th. Electric light installation at the workhouse, for the B.G. See "Official Notices" April 25th.

**Belfast.**—May 19th. Circulating-water pump, for the Corporation Tramways and Electricity Committee. See "Official Notices" April 25th.

**Belgium.**—May 13th. The municipal authorities of Wekenraedt (province of Liège) are inviting tenders for the concession for the public and private electric lighting of the town.

**Bootle.**—May 13th. Boiler and pipe coverings for Marsh Lane electricity works. Borough Electrical Engineer's Office, Pine Grove.

**Canada.**—WINNIPEG.—May 15th. City Light and Power Department. Two three-phase generators of 5,000 kw. for direct connection to 6,800-h.p. water turbines; also spare parts. Chairman, Board of Control. Deposit, £205. Particulars, Board of Trade Com. Intel. Department in London.

**Cleckheaton.**—May 10th. Slack coal (1,500 tons) for the U.D.C. electricity works. Mr. J. B. Linfield, Clerk.

**Felixstowe and Walton.**—May 5th. One 150-kw. Diesel-driven D.C. generating set for the U.D.C. See "Official Notices" April 18th.

**France.**—The French State Railway authorities (Bureaux du Service Electrique, 4E, Rue de Rome), Paris, are at present inviting tenders for the supply of 15 electric capstans (continuous current) for the railway coal depot at Levallois and the goods station at Batignolles, Paris.

**Glasgow.**—May 9th. Cables, meters and arc lamp carbons for a year, for the Corporation. See "Official Notices" April 25th.

May 26th.—Two steam turbo-alternators, with condensing plant (5,000 kw. and 2,000 kw. respectively), for the Corporation Tramways Department. See "Official Notices" April 25th.

**Grimsby.**—Pipework, extension of Klein cooling towers, conduits, seven-way D.P. distribution board and motor-driven rotary air and water extraction pumps and circulating pump, for the Corporation. See "Official Notices" to-day.

**Hoylake and West Kirby.**—May 5th. One 400-kw. alternator and triple-expansion Belliss engine, and evaporative condensing plant, for the U.D.C. See "Official Notices" April 18th.

**Italy.**—May 13th. The Italian State Railway authorities in Rome are inviting tenders for two sets of engines and dynamos for the Rimini railway works. It is specifically stated that foreign firms may compete for the contract.

**King's Lynn.**—May 5th. One 400-kw. steam dynamo with condensing plant and pipework, for the Corporation. See "Official Notices" April 18th.

**London.**—May 7th and 9th. Electrical installations at (a) Elthorne Road Special School, Holloway, and (b) Wilton Road Central Elementary School, Hackney. See "Official Notices" April 25th.

May 13th.—One 20-ton overhead band crane, for the Shoreditch sub-station. See "Official Notices" April 25th.

The Highways Committee is to invite tenders from selected firms for two hydraulic accumulators and a pump for the third section of the central car repair depot.

**Manchester.**—May 8th. Steelwork for foundations of 15,000-kw. turbo-generator, engine house, floor extensions and air ducts and cast-iron floor plates. Forms of tender, &c., obtainable from Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester. Deposit £1 1s.

**Mexborough.**—May 30th. Lancashire boiler, for the U.D.C. electricity department. See "Official Notices" April 25th.

**Peterborough.**—May 6th. One 500-kw. D.C. steam turbine generating set and two steam boilers, for the Corporation. See "Official Notices" April 25th.

**Plymouth.**—The T.C. has decided to invite tenders for a year's supply of coal for the electricity works. Particulars from the Electrical Engineer.

**Rathmines and Rathgar.**—May 19th: Electrically-driven jet condensing plant, for the U.D.C. See "Official Notices" to-day.

**Rochdale.**—May 14th. Electrically-driven induced-draught plant, for the Corporation electricity department. See "Official Notices" April 25th.

May 21st.—Boiler feed pumps, for the Corporation Electricity Committee. See "Official Notices" to-day.

**Rotherham.**—May 6th. Twelve 26-ft. lengths of British standard tram-rails, section No. 4, for the T.C. Mr. E. B. Martin, Borough Engineer.

**Salford.**—May 19th. Tenders invited for 10 car bodies and 10 Brill trucks. General Manager, 32, Blackfriars Street, Salford.

May 9th.—New switch house. Specifications, &c., obtainable from Borough Electrical Engineer, Electricity Works, Frederick Road, Pendleton.

**Sheffield.**—May 5th. Excavations, retaining walls and extension to water service reservoir at Neepsend Power Station, including valves, pipework, &c., for the Corporation. See "Official Notices" April 18th.

**South Africa.**—The *African World* states that orders for electrical machinery and material will shortly be forthcoming at Wellington, and Umkatsa and Cape Province, where the ratepayers have approved electric lighting schemes to cost £10,000 and £7,000 respectively.

**Spain.**—The Minister of Marine invites tenders from foreign manufacturers for two long-distance wireless telegraph installations which are required for the two cruisers *Extremadura* and *Ivo de la Plata*, as well as two wireless telegraph experimental stations for the Spanish "School of Application."—*Board of Trade Journal*.

**Walthamstow.**—May 28th. Natural draught cooling tower, for the U.D.C. Electricity Department. See "Official Notices" to-day.

**Warrington.**—May 13th. Traction battery and reversible booster, for the Corporation. See "Official Notices" April 25th.

May 13th.—Feeder pillars and high and low-tension cables, for the Corporation. See "Official Notices" to-day.

## CLOSED.

**Australia.**—An Australian contemporary states that the municipal electric supply plant at Gawler (S. Australia) is to be added to shortly, Messrs. McLean & Co. having received a contract for a Gardner suction gas engine, Cambridge gas producer and a 65-kw. Sterling alternator, for £1,767.

**Bexhill-on-Sea.**—The T.C. has accepted the tender of Messrs. Crompton & Co., Ltd., for a new switchboard, at £329.

**Blyth (Northumberland).**—Messrs. Reside & Co., Ltd., Brighouse, have received the contract for the complete electrical installation at the new Government buildings.

**Canada.**—The directors of the Cedar Rapids Power Co., Montreal, have awarded the contract for the completion of the hydro-electric development works of the company to Fraser, Brace and Co., of New York. The price involved is \$3,000,000.

**Croydon.**—The T.C. has accepted the tender of Callender's Cable & Construction Co., Ltd., for cables for a year.

**Dewsbury.**—The tender of the Union Cable Co. for one mile of electric cable, for £158, has been accepted by the Corporation.

**Dover.**—Subject to the usual sanction, the T.C. has accepted the tender of Messrs. Dick, Kerr & Co., Ltd., at £2,893, for the construction of tramways in connection with the proposed pier scheme.

**Heston and Isleworth.**—At the U.D.C. meeting last week, Mr. Shuff, on the presentation of the report of the Electricity Committee, directed attention to the fact that it recommended acceptance of the tender of the Union Cable Co. for cables, notwithstanding that the figures quoted by that firm were in the aggregate £400 in excess of those submitted by the Electrical Engineering and Equipment Co. Mr. D. Bonnett said the second firm named was a foreign firm, and its goods were manufactured abroad. The tender recommended was by an English firm, and it was considered better to give the contract at home, as the Council would then be able to exercise better control over the supply. Mr.

Shuff pointed out that £400 was a considerable difference, and thought it did not matter whether the firm were English or foreign so long as it could be depended upon. Furthermore, it was due to the ratepayers that the lowest tender should be accepted, and he moved, as an amendment, that the Council accept the tender of the Electrical Engineering and Equipment Co. Mr. Bonnett said the Council should understand that the tender was at so much per mile, and the Committee did not know how much they would ultimately require. It would certainly be an advantage to have the work done in this country, as the chairman and engineer could test it readily. Mr. Meyers was of opinion that for the reasons stated it was better to place the contract with an English firm. He doubted whether in the end the difference would be more than £50. The amendment was lost by 12 votes to 4, and the tender of the Union Cable Co. was then accepted.

**Huddersfield.**—The Electricity Committee has accepted the following tenders:—

E. Green & Son.—Economiser.  
W. T. Henley's Co., Ltd.—Cable.  
A. Crowther.—Lead piping.

**India.**—The whole of the recent contract for supplying the silent chain drives required for the equipment of the new shops of the Bombay, Baroda and Central India Railway has been awarded to the Westinghouse Brake Co., Ltd., makers of the Westinghouse-Morse silent rocker-joint chains.

**London.**—STEPNEY.—The following tenders were received by the B.C. Electricity Committee for two 5,000-kw. turbo-alternators, with condensers, accessories and switchgear, for extensions at the Limehouse generating station. The various prices quoted by certain of the tenderers include turbines of their own manufacture coupled to various makes of condensing plants and alternators. (Alternative tenders not to specification are excluded.):—

Escher, Wyss & Co. (recommended).—At 1,500 r.p.m., £38,081.  
Dick, Kerr & Co., Ltd.—At 1,500 r.p.m., £41,215.  
Richardsons, Westgarth & Co., Ltd.—At 1,500 r.p.m., £41,223, £42,500, £43,208, £43,249, £43,937, £44,696, £45,345.  
Williams & Robinson, Ltd.—At 1,500 r.p.m., £41,089, £41,788, £42,590, £43,369, £43,580, £44,390, £45,910, £49,130; at 3,000 r.p.m., £43,670, £44,860.  
Bellis & Morcom, Ltd.—At 1,500 r.p.m., £43,195, £46,265, £46,573.  
Brush Electrical Engineering Co., Ltd.—At 3,000 r.p.m., £48,500.  
Howden, J., & Co., Ltd.—At 1,500 r.p.m., £41,665, £42,329, £43,749, £45,415, £45,679.  
Parsons, C. A., & Co., Ltd.—At 1,500 r.p.m., £45,591, £46,482, £46,643, £47,494; at 3,000 r.p.m., £41,495.  
British Westinghouse Elec. & Mfg. Co., Ltd.—At 1,500 r.p.m., £47,627.  
British Thomson-Houston Co., Ltd.—At 1,500 r.p.m., £47,750.  
Maschinenfabrik Oerlikon.—At 1,500 r.p.m., £50,091, £50,480.

The Committee recommends the acceptance of the tender of Messrs. Escher, Wyss & Co., at £38,031.

**L.C.C.**—The Highways Committee hopes to report on the tenders for two 8,000-kw. steam turbo-generators on May 6th.

The Stores and Contracts Committee has accepted the following tenders:—

Portland cement for the tramways department.—J. Byford & Son, Ltd. (£277), and the Empire Portland Cement Co., Ltd. (£5,070).  
Clean river ballast for tramways department.—W. Cory & Son, Ltd. (£760).  
H. Covington & Sons, Ltd. (£897), and T. Scholey & Co., Ltd. (£1,729).

**HOLBORN.**—The B.C. has accepted the tender of Messrs. Marryat and Place, at £77 10s., for installing electric light at the High Holborn public convenience, at present lighted by gas. Tenders were also received from Barlow Bros. & Co., H. J. Cash & Co., Ltd., Duncan, Watson & Co., Rashleigh, Phipps & Co., and James Willats and Son.

**Luton.**—The T.C. has accepted the tender of Messrs. Macintosh & Co., Ltd., for an annual supply of vulcanised bitumen insulated cables.

**Walthamstow.**—The U.D.C. has accepted the following tenders for annual supplies:—

Cables.—Union Cable Co., Ltd.  
India-rubber-covered wires.—Liverpool Electric Cable Co., Ltd.  
Box compound.—Dussek Bitumen Co.  
Chatterton's compound.—Sun Electrical Co., Ltd.  
Pure rubber tape.—Wm. Geipel & Co.  
Compound and black adhesive and white linen tape.—Siemens Bros. & Co., Ltd.  
P. and B. tape and paint.—R. W. Blackwell & Co., Ltd.  
Lead sleeves for joints and leading sealing ends.—Callender's Cable Co., Ltd.  
Cut-outs and counterweight sets, opal shades, lead blocks and enamelled iron shades, key switchholders and opal shades, gear wheels and armature coils.—British Westinghouse Co., Ltd.  
Tinned copper fuse wire.—London Electric Wire Co. and Smiths, Ltd.  
Zinc rods, porous pots and glass jars.—G. Braulik.  
Dry cells and sal ammoniac.—Fryke & Palmer.  
Carbons for open arcs, 18 mm. and 12 mm., metal and non-metal-cored carbons.—Brazon Electrical Co., Ltd., for Conrad carbons.  
Do., 13 mm. and 9 mm.—H. G. Mayer & Co., for Schiff & Co.'s carbons.  
Carbons for enclosed arcs.—H. G. Mayer & Co., for Schiff & Co.'s carbons; Siemens Bros. Dynamo Works, Ltd., for Siemens carbons.  
Ordinary meters, prepayment meters for pennies and shillings.—Chamberlain & Hookham, Ltd., and Ferranti, Ltd.  
Prepayment meters for pence.—Ferranti, Ltd.  
Hour meters.—Electrical Co., Ltd.  
Incandescent lamps.—Electrical Manufacturing and Supplies Co., Ltd.  
Pinion wheels, trolley beads, trolley head bushes and trolley globes.—J. W. Rowlands & Co.  
Trolley wheels and brass terminals.—The Anti-Friction Metal Co., Ltd.  
Rubber sleeves, galvanised span wire and controller fingers.—Imeson and Finch.  
Rubber cap and trolley boots.—Brecknell, Munro & Rogers, Ltd.  
Steel tires.—John Brown & Co., Ltd.  
Soldering fluid, china bridge fuses, steel conduit, brass arc lamp hooks, insulated hoses, steel conduit, &c., and staples, Sinclair insulators, chimney brackets, roof brackets and pole sets, incandescent lamps, phosphor-bronze.—General Electric Co., Ltd.  
Switches, ceiling roses, &c., dust shot, fuse wire, lead, bell wire.—Edison and Swan Co., Ltd.  
Braided silk and workshop tlex, compound for glands, jointing material.—W. T. Henley's Telegraph Works Co., Ltd.

**Macclesfield.**—Messrs. Hick-Diesel Oil Engines, Ltd., have secured a contract from the New Electricity Co. of Macclesfield, Ltd., for two 240-h.p. Diesel engines.

**Sweden.**—In addition to three large hydraulic turbines supplied to the Trollhättan Works, recently described in our pages, Messrs. Boving & Co., Ltd., have received from the Swedish Government an order for three turbines for the new installation at Elfkärleby, which will ultimately have an output of more than 100,000 h.p. Each turbine will develop 15,000 h.p., with a head of 16 m., and will consist of two pairs of wheels on a common horizontal shaft, passing about 3,500 cu. ft. of water per second. The turbines, which will be by far the largest of this type built in Europe, will be constructed at the company's works at Kristinehamn.

**Tyldesley (Lanes.).**—The U.D.C. has accepted the tender of Messrs. Simplex Conduits, Ltd., for metallic-filament lamps for street lighting.

**Woolwich.**—The B.C. has accepted the tender of the General Electric Co., Ltd., at £5,351, for a 1,500-kw. turbo-alternator, complete with turbine by Willans & Robinson, and condensing plant by the Rees Roturbo Co., Ltd. 18 tenders were received.

### FORTHCOMING EVENTS.

**Society of Engineers.**—Saturday, May 3rd. At 8 p.m. At the Holborn Restaurant. Bohemian concert.

**Salford Technical and Engineering Association.**—Saturday, May 3rd. Visit to the Economiser Works of Messrs. E. Green & Son, Ltd., Wakefield.

**Institution of Electrical Engineers (Newcastle Section).**—Monday, May 5th. At 7.30 p.m. At the Armstrong College, Newcastle. Paper on "Phase Advancing," by Dr. G. Kapp.

**(Students' Section).**—Wednesday, May 7th. At 7.45 p.m. At the Institution, Embankment, W.C. Annual general meeting.

**(Birmingham Section).**—Wednesday, May 7th. At the University, Birmingham. Annual general meeting.

**(Dublin Section).**—Thursday, May 8th. At 8 p.m. Meeting at the Royal College of Science, Dublin.

**Faraday Society.**—Wednesday, May 7th. At 8 p.m. At the Institution of Electrical Engineers. The following papers will be read:—"A Redetermination of the Elastic Modulus of Aluminium," by F. J. Brislée, D.Sc.; "The Density of Aluminium," by F. J. Brislée, D.Sc.; "On the Potential due to Liquid Contact" (Part III), by A. C. Cumming, D.Sc., and Elizabeth Gilchrist, B.Sc.; "Note on the Electrolytic Determination of Copper in Solutions containing Nitric Acid," by Elizabeth Gilchrist, B.Sc., and A. C. Cumming, D.Sc.; "New Experiments on Colloids," by T. A. Coward; "Overvoltage," a communication from Prof. J. W. Richards.

**Concrete Institute.** Thursday, May 8th. At 7.30 p.m. At Denison House, 296, Vauxhall Bridge Road. Paper on "Stability of Brick Chimney-Shafts," by Mr. H. Cane.

**Royal Institution.**—Saturday, May 10th. At 3 p.m. Lecture on "Humphrey Internal-Combustion Pumps," by Mr. H. A. Humphrey. (Lecture I.)

**Physical Society.**—Friday, May 16th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments to Detect  $\beta$ -rays from Radium A," by Drs. W. Makower and S. Russ.

### THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

**Monday, May 5th.**—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate of E.P., and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

**Tuesday, May 6th.**—"B" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate of E.P., and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

**Wednesday, May 7th.**—All Companies. Annual musketry at Purfleet.

**Thursday, May 8th.**—"C" Company. Drills, &c., as for May 5th.

**Friday, May 9th.**—"D" Company. Drills, &c., as for May 5th.

**Saturday, May 10th.**—Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.  
For Officer commanding L.E.E.

### NOTES.

**The "Point Fives."**—A meeting of the "Point Fives" was held at the Great Northern Hotel, Bradford, on Friday, April 18th. Mr. Thomas Roles in the chair. Messrs. W. G. Pickavance, of Wrexham (February, 1913, Norwich system, plus  $\frac{1}{2}$ d.); Harold Gray, of Accrington (April, 1913, Norwich system, plus  $\frac{1}{2}$ d.); and S. E. Fedden, of Sheffield (April, 1913, Norwich system, plus  $\frac{1}{2}$ d.), were duly elected members of the Association. Mr. F. W. Purse, who is going to Carlisle, could not be formally elected, as he was not at the time of the meeting in charge of an undertaking conforming with the articles of association, but it was decided that he should be invited to attend the special meeting on May 23rd. Mr. Allen, of Carlisle, will cease to be an ordinary member when he takes over his duties at Wolverhampton, but he was unanimously elected an honorary member for 12 months, to give him time to introduce a 5d tariff in Wolverhampton.

The Chairman gave a valuable and interesting address, a report of which will be given later; this was followed by a long discussion, and arising therefrom, it was decided that a special meeting should be held at the Institution of Electrical Engineers on Friday, May 23rd, to consider the following matters:—(a) Standardisation as far as practicable of electric cookers; (b) Standardisation of the rateable value plus  $\frac{1}{2}$ d. per unit tariff for domestic supplies.

The next ordinary meeting will be held on Tuesday, June 17th,

in London, during the I.M.E.A. Convention week (Mr. Blackman, chairman). It was decided that this should be an open meeting, which anyone interested in the objects of the Association could attend. There will be the usual dinner at 7.30 (tickets 3s. 6d., morning dress), followed by the chairman's customary five minutes' address, and then a discussion. Messrs. Bowden, Blackman, and the hon. secretary, were appointed a Sub-Committee to make the necessary arrangements. All who wish to attend this meeting should send in their names to the Hon. Secretary, 19, York Place, Baker Street, London, W., as early as possible, and then the Sub-Committee will make further arrangements as to the place of meeting, &c.

With regard to electrical publicity, it was decided that owing to the moribund state of the Electric Supply Publicity Committee, the Association must, for the time being, make its own arrangements for its members' requirements, and a sketch by Messrs. J. Miles & Co., 68 70, Wardour Street, London, W., was approved, to be enlarged for poster purposes and reduced for postcards; 1,000 posters are available and 10,000 postcards. The members of the Association are to have the first call on these quantities, but after that Messrs. Miles & Co. are entitled to dispose of any which are available to anyone who asks for them. The price of the posters is 28s. per 100, plus 7s. 6d. for over-printing name and address, and the postcards 16s. per 1,000; printing on reverse side extra. Applications to be sent to the hon. secretary, who will notify Messrs. Miles & Co. to complete the order.

Although no resolution was passed, it was felt strongly that this question of publicity was one which the electrical industry could not afford to neglect any longer, and a lead was looked for from the Industrial Committee of the Institution of Electrical Engineers as to what must be done in this direction.

**Storms and Telephones.**—An idea of the disastrous effects of the March storms in the United States on overhead lines may be gathered from the illustrations which we reproduce herewith from the *Telephone Engineer*—out of a large number of extraordinary views. In February the Chicago Telephone Co. and the Central Union Telephone Co. lost 2,500 poles in northern

Illinois, and the wires were coated with ice in some cases 2 in. thick, to say nothing of branches of trees. Just before Easter many of the lines that had been put right went down again, as the figures show. The lower view is of a "tangle of toll lines, trolley wires and electric light wires" in Chicago; the other illustrates the fantastic positions that may be assumed by broken poles, of which our contemporary gives many examples.

The *Electrical World* states that owing to the Ohio and Indiana floods about 100 miles of cable, 300 miles of wire and 2,000 men were used by the Western Union Telegraph Co. in making temporary repairs. It is estimated that the damage to the property of the Western Union Co. will amount to over \$250,000.

**Annual Dinner.**—BOURNEMOUTH.—Some 50 persons sat down at the Gervis Hall Restaurant, Bournemouth, on Monday last week, at the staff dinner of the Bournemouth and Poole Electric Supply Co., Ltd. Mr. A. H. Sanderson, chairman of the company, presided. Mr. W. D. Brightman, secretary of the company, proposed "The Directors," and the chairman replied. The dinner was cooked electrically, and Mr. Sanderson mentioned in the course of his remarks that they had cooked the dinner for 50 with only 24 units. A 16 lb. 6 oz. sirloin of beef weighed 13 lb. when cooked, and a saddle of mutton (14 lb.) weighed 11 lb. 3 oz.—showing surprisingly little loss. Dr. Hosker, a director, proposed "The Staff," and in doing so said that the joints if cooked by coal or gas would have lost 1 lb. more each, or speaking of cost, 1s. per joint. Mr. E. L. Ingram, the chief engineer, replied. He said that electric heating and cooking was going ahead by leaps and bounds, and like a rolling stone it was gathering force as it went. The other toasts were "The Guests," replied to by Mr. Crosbie (Ferranti, Ltd.), and the chairman.

**New Electric Restaurant.**—On Wednesday evening last, the Brompton and Kensington Electricity Supply Co. held a dinner at its new electric restaurant at 251, Earl's Court Road, S.W., to celebrate the inauguration of the latter. About 30 guests took part in the proceedings, which included the inspection of the equipment, which is designed to cook for from 150 to 200 diners at a time.

**Club Concert.**—The second annual Bohemian concert of the G.E.C. Athletic Club will be held to-morrow (Saturday) evening, at 7.30 p.m., at the Talbot Restaurant, London Wall. During the evening the Davis Challenge Cup, which has been won by the G.E.C. football club, will be presented.

**Institution and Lecture Notes.**—LONDON ASSOCIATION OF FOREMEN ENGINEERS.—On Saturday the Association held their sixtieth anniversary banquet at the Cannon Street Hotel. The company present numbered close upon 300, and among those supporting the Chairman, Mr. Alfred Herbert, were Sir H. F. Donaldson, Rt. Hon. C. Scott Dickson, Sir R. A. Hadfield, Prof. J. D. Cormack, and delegates from kindred associations in Leeds, Middlesbrough, Newcastle, Woolwich, Birmingham and Glasgow.

After the loyal toasts had been honoured, the Chairman, in proposing that of "Prosperity to the Association," remarked that it offered a great many advantages; the first of its objects was philanthropy; next, education by means of papers, discussions and visits; thirdly, the bringing together of men in fellowship and freedom of speech, and giving one the opportunity of learning another man's point of view.

Mr. J. Harrington, secretary, in responding to the toast, said they prided themselves on the fact that every member was a picked man: they had a splendid organisation, the resources of which were entirely at the disposal of engineering employers, for whose help they were deeply grateful. A list of donations to the super-annuation fund, amounting to over one hundred pounds, was read.

Mr. Eggleston, President of the Association, in proposing the toast of "The Chairman," mentioned that 20 years ago the firm of which the chairman was the head employed only 20 men—now it numbered considerably over 2,000.

The toast of "The President" brought a very successful evening to a close.

**ASSOCIATION OF MINING ELECTRICAL ENGINEERS.**—The last meeting of the Yorkshire Branch was held at Sheffield on Saturday last. A paper on "Cable Jointing and Junction Boxes, &c." by Mr. C. Jones, was read. The paper stated that cable manufacture had been brought to a great pitch of perfection, and faults with the cables owing to inherent defects were few. A successful cable system depended upon the quality of the cable joints and the manner in which the cable ends terminated and were sealed. The following were elected to office for the ensuing year: President, Mr. H. H. Jenkins (Sheffield); vice-presidents, Messrs. F. E. Armstrong (Sheffield), D. Bowen (Leeds) and W. Maurice (Sheffield); secretary, Mr. J. A. McLay (Leeds).

The monthly meeting of the EAST OF SCOTLAND BRANCH was held on Friday last at Dunfermline. Mr. J. McCann, Carronhall Colliery, submitted a paper on "The Installation and Manipulation of Coal Cutters."

On April 12th Mr. H. Painter, B.Sc., F.C.S., lectured before the BOURNEMOUTH NATURAL SCIENCE SOCIETY on "The Life and Work of Lord Kelvin."

**The B.E.A.M.A.**—We are informed that the following firms have recently become members of the Association:—

Alley & MacLellan, Ltd.  
Peter Brotherhood, Ltd.  
Dowsing Radiant Heat Co., Ltd.  
Electrical Apparatus Co., Ltd.  
George Ellison.  
J. H. Holmes & Co.  
Premier Accumulator Co., Ltd.  
Wandsworth Electrical Manufacturing Co., Ltd.  
Whipp & Bourne.

The firm of Jaeger Brothers has become an associate member.

**Village Lighting.**—A correspondent informs us that in a Yorkshire village some of the residents have been experimenting with low-voltage electric lamps fed from Leclanché cells, with which 3 or 4 C.P. can be obtained—not a bad substitute for a small oil lamp in a small room. The eagerness of the people to get rid of the nuisance of oil lamps may be inferred from the fact that one of them said he would willingly spend £25 to obtain electric light. It may be that, with metallic-filament lamps, electric lighting

with primary batteries in a small way can be accomplished without inordinate expense, although the Leclanché battery is not suitable for the purpose; but it will only mean exchanging one mess for another. The incident, however, emphasises the fact—which has been well shown in our columns—that there is a real demand for electric light in villages.

**Appointments Vacant.**—The I.C.C. Highways Committee proposes to appoint a superintendent of the central cable repair depot of the tramway department on the permanent staff at £300 per annum. The present superintendent, a member of the temporary staff, has resigned. Assistant electrical engineer (first grade) for the Electric Light Department, Lagos, Southern Nigeria (£350); assistant mains engineer, for the Dover Corporation (£100). See our advertisement pages in this issue.

**A Large Order for Electrical Motor Vehicles.**—The General Electric Co., of Schenectady, U.S.A., has secured an order for 29 commercial electric motor vehicles from the New York Railways Co. The machines range in capacity from 10 cwt. to 5 tons.

**Inquiries.**—The makers of the Britelite lamp, and also of corrugated steel transformer cases, electrically welded, are asked for.

**Fatalities.**—HEBBURN.—The inquiry into the explosion at Hebburn-on-Tyne on March 30th, by which Annie Gray, 66, and George Alexander Collinson, 43, were killed in a house in Lyon Street, was resumed by Deputy-Coroner R. A. Shepherd, on April 24th. The inquest had been adjourned to permit of an investigation of the condition of the electric cable which had been laid in front of the house, and a section of the cable, lying in a charred wooden trough, was placed before the jury.

W. T. Newlands, agent for the owner of the house, stated that immediately after the explosion he went to the house, and noticed a blue flame burning underneath the window. He endeavoured to extinguish it by means of water, but could not, but succeeded by putting wet lime on it. On the same afternoon he saw a man employed by the Northern Counties Electricity Supply Co. trying to light lamps in the neighbourhood, but they would not light. On the following morning he returned to the house and experienced a smell as of burnt india-rubber and pitch. This he smelt again, but more strongly, when the cable was taken out.

H. Paterson, surveyor to the Hebburn Urban Council, said that as the wrecked houses were dangerous, he ordered them to be pulled down. When he saw the result of the explosion he concluded that it had been underneath the ground floor. He could find no trace of coal gas, but he found a smell that he recognised when the cable was taken out. When the cable was exposed it was found to have been fused, and part of the cable was burned out; the wooden trough was charred.

W. Bates, an electrical engineer of Ashington, who was employed by the Northern Counties Co. when the cables were laid in 1902, said the contract was carried out by Callender's Cable Co. The cables were generally laid near the house walls. In answer to the Deputy Coroner, witness said he thought when the cables were laid, and before they were completely covered with bitumen, they were strained so that one lay on top of the other, instead of side by side, and they were consequently too near the surface.

C. Vernier, mains engineer of the Newcastle-on-Tyne Electric Supply Co., said he had carried out work valued at over a million pounds, and had had 13 years' experience of cable laying. The negative cable in question had fused for about 6 ft., and the neutral cable for a small space. The cable had probably been pulled tight enough to bear on the sharp edge of the mitted joint in the troughing. In an examination of the cable in question, he saw indications of the bitumen being charred at a very high temperature. He did not think that the bitumen gas given off would cause an explosion merely through contact with the air. It was somewhat difficult to account for the igniting of the gas. It could hardly have been fired by the arc, because, in that event, the explosion would have occurred outside the house too. It was possible, as an explanation, that the fumes given off by the burning bitumen would, in the very high temperature that would be set up, ignite and cause the explosion. He would be surprised to know that the quantity of bitumen charred would give off sufficient gas to cause so violent an explosion. The copper had been vapourised, and very little could be found. From the facts before him, he could not find any explanation but that the explosion was due to the fusion of the cable. In reply to questions, witness said that, if the cables had been laid in the middle of the road, there would not have been the same likelihood of an explosion, but similar explosions might occur where they had the same chain of circumstances. The company were considering the question of the position of the cables.

The jury returned a verdict that the deceased met their deaths as the result of injuries received in an explosion of bitumen gas generated by the fusing of an electric cable.

The force of the explosion was so great, that Mrs. Gray and Collinson were blown through the ceiling of the latter's house into the house above.

**Association of Electrical Station Engineers.**—An open general meeting was held at Salisbury House, London, E.C., on April 24th, to receive the hon. secretary's report of progress and for organising purposes. About 80 gentlemen attended.

The chairman (Mr. Chas. F. Wade) opened the meeting with a short statement of the aims and objects of the A.E.S.E. for the benefit of those who had not attended previous meetings. The hon. secretary (Mr. W. J. Ebben) then gave an account of the history of the Association from its inauguration in the columns of the ELECTRICAL REVIEW to the present date. He stated that although the Asso-

clation was only formed in London during January this year, already successful branches had been formed at Dublin, Manchester, Bradford, Grimsby, Birmingham, Liverpool and Glasgow, and there was every prospect of a branch being formed at Middlesbrough during the coming month. Branches had not yet been formed for the Newcastle-on-Tyne and South Wales districts, although there were enough members in these districts to form successful branches, as up to the present no one had been found willing to undertake the position of local secretary. Some difficulty had been experienced owing to electrical stations being so scattered, but it was pleasing to note, though engineers of a good number of outlying stations could not attend meetings at the various centres they were quite willing to join the Association, and in the majority of cases the whole of the technical staff had made application for membership. All applications for membership were being dealt with as quickly as possible, in the first place by local committees and finally by the London Committee. He also stated that a sub-committee had been appointed to make a rough draft of rules, &c., which were to be submitted to the branches for approval and finally ratified at a conference of delegates representing the whole of the United Kingdom. This conference was to meet as soon as practicable.

After a short discussion on the secretary's report, the question of a decided policy for the Association, to be embodied in the rules, was raised, which produced a very lively and lengthy discussion, and it was resolved that, owing to the importance of this question, it should be further discussed at the next general meeting. All those present who were not already members put down their names as prospective members, and from statements made by several gentlemen present, a great influx of members is to be expected at once in the London Section.

A vote of thanks was given to the hon. secretary for his "spade work" on behalf of the A.E.S.E., and Mr. Ebben, in reply, stated that he hoped all present would endeavour to obtain members, as numerical strength was of the utmost importance. The next open general meeting was arranged for Thursday, May 22nd, at the same time and place as above.

A meeting was held at the Y.M.C.A., Glasgow, on April 23rd, to continue the organisation of the Glasgow and West of Scotland Branch. The routine business of the Branch having been transacted, future arrangements were discussed, and it was resolved that another meeting be called as soon as the date of the London Conference is fixed, when representatives will be appointed to attend. It was also resolved that all other meetings should be of a social character. Mr. A. W. Lamont, 52, Quarry Street, Hamilton, is the hon. sec. for the Glasgow Branch.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—The Birkenhead Corporation Electricity Committee has resolved to recommend the appointment of Mr. G. P. SHALLCROSS as electrical engineer at a salary of £400 per annum, in succession to Mr. Wm. Wyld.

In consequence of his appointment as city electrical engineer at Carlisle, Mr. F. W. PURSE has handed in his resignation as chief electrical engineer to the Watford undertaking, and it will take effect as from May 31st. To fill his place, the Committee has appointed Mr. A. W. BARHAM, at present chief assistant, at £250 per annum. Mr. Barham has been granted the same privileges as were allowed to Mr. Purse in connection with pupils and free supply of electricity. Applications are invited to fill the position of chief assistant.

Mr. H. F. STREET, general manager of the tramways undertaking at Southampton, has resigned this position owing to the enormous increase in his dual work, and he is from October 1st next to devote the whole of his time to the electricity undertaking, his salary to remain at £600 a year.

Mr. W. T. GREEN has been recommended for appointment to the position of assistant manager of the Leeds electrical department in succession to Mr. Chas. N. Hefford, who has been appointed manager. Mr. Green has been chief clerk of the department. The salary connected with this position is £450.

Mr. HUGH H. McLEOD, engineer to the Mountain Ash Electricity Works, has resigned.

The Whitby U.D.C. Electricity Committee has recommended the appointment of Mr. J. W. PIGGOTT to take charge of the Electricity Works. Mr. Piggott is at present the mains superintendent, and his promotion is consequent on the resignation of Mr. L. H. King from the position of manager.

Mr. FRANK TIMMS, late of Messrs. Armstrong, Whitworth and Co., Ltd., has been appointed to the position of installation engineer and canvasser, under the Tynemouth Corporation Electricity Department.

Mr. C. A. NICKSON, of Manchester, has been appointed clerk of works in connection with the proposed new generating station at Bolton.

The Nelson Corporation has appointed Mr. G. F. TAYLOR as electrical engineer and tramways manager, in succession to the late Mr. Dacre Helme. Mr. Taylor, who went to Nelson in 1901, was assistant to Mr. Helme.

**Tramway Officials.**—The members of the electrical and tramways department, East London, South Africa, met in the Club Room on the evening of March 28th, to wish farewell to Mr

H. D. DOUGLAS, rolling stock and permanent way superintendent, on his leaving the department for Melbourne, Australia. Mr. J. Mordy Lambe, town electrical engineer and tramways manager, presided. Mr. Lambe referred to the work of Mr. Douglas, especially the laying of new tramway tracks. He stated that Mr. Douglas was the first to build a tramcar in South Africa. On behalf of the combined department, Mr. Lambe presented Mr. Douglas with a gold Albert and a medallion suitably inscribed. Before the concert the Kafir boys of the car-shed presented Mr. Douglas with a silver-mounted pipe.

The Glasgow T.C. at its next meeting is to be asked to approve of the following increases of salaries of head officials in the tramways department:—MR. JAMES DALRYMPLE, general manager, £1,000 to £1,250; MR. L. MACKENSON, traffic superintendent, £600 to £625; MR. JOHN FERGUSON, chief engineer, £600 to £625; MR. E. T. GOSLIN, electrical engineer, £550 to £600; and MR. J. K. WILSON, secretary and treasurer, £400 to £450.

Mr. H. B. HARRIS, engineer in the Croydon Corporation tramways department, has resigned.

Mr. J. FREDERIC JONES, M.I.E.E., joint manager of the Madras electric tramways, has been granted six months' leave of absence, and expects to arrive in London about May 26th.

**General.**—MR. GEO. B. CROCKATT and MR. G. H. M. FOWLER have left the Reason Manufacturing Co., Ltd., of Brighton, with whom they have been associated for many years in the respective capacities of sales manager and works manager.

Mr. CLAUDE W. HILL has removed to St. Augustine's Mansions, Vincent Square, Westminster, S.W.

It is announced that the RIGHT HON. C. B. STUART WORTLEY, K.C., M.P., has been appointed chairman of the board of the London and Suburban Traction Co., Ltd.

The *Times* contains the following announcement:—"The marriage arranged between Gundred Eleanor, only daughter of Alexander Pelham Trotter, and HORACE COURTHOPE BECK, youngest son of the late Joseph Beck, will take place on Friday, May 30th."

At Addiscombe, Cheshire, on April 21st, the marriage took place of MR. LEES CALVERT, A.M.I.E.E., and Miss Grace L. Heather, youngest daughter of Mr. Henry Heather, of Reigate.

MR. ROBERT MAULE is retiring from the directorate of the Edinburgh and District Tramway Co., after serving over 10 years.

**Obituary.**—FRANCIS B. BADT.—We regret to learn from the pages of the *American Electrical Review* that Mr. F. B. Badt died at Chicago on April 12th. Mr. Badt went to America in 1881—ten years previously he served in the Franco-Prussian War, and was decorated by the Emperor. His career in the States began with the U.S. Electric Lighting Co. of New York, and later he entered the service of the Western Electric Co., the United Edison Manufacturing Co., the Thomson-Houston Co. and the General Electric Co., and in 1894 he took up the post of general manager of the Siemens & Halske Electric Co. of America. Three years later he started an engineering business of his own. An inventor of many devices, and an expert in patent cases, he was also a frequent writer for the technical Press and the author of a series of handbooks, some of which had a considerable sale on this side of the Atlantic. Mr. Badt was 64 years of age. The editors of this journal keenly feel the loss of one whom they were privileged to count among their personal friends.

MR. JULIUS ZIMMERMANN.—The death took place, under tragic circumstances, on Thursday, April 24th, of Mr. Julius Zimmermann, for 20 years director of G. Straus & Co., Ltd., of 211, Upper Thames Street, E.C. The business is being carried on as heretofore under the sole management of Mr. Charles Frank, who, since the start of the company, has had the charge of the electrical department.

MR. W. S. LEECE.—The death took place on April 24th, of Mr. Wm. Samuel Leece, traffic manager of the tramways at Douglas, Isle of Man. He was 44 years of age.

MR. A. DANSON.—The death is announced of Mr. Alfred Danson, who had for some time held a responsible position in the Birkenhead Corporation Electricity Department.

MR. JOHN TROTTER.—We regret to record the death, at the age of 59 years, of Mr. John Trotter, who had been chairman of Crompton & Co., Ltd., for a good many years. The deceased gentleman was a deputy governor of the Union of London and Smiths Bank.

MR. T. JAMES.—The death occurred last week of Mr. Thos. James, who had for some years been in business as an electrician in Oak Street, Llangollen. He was only 35 years of age.

The friends of Mr. W. EVERETT GIBSON (of Dick, Kerr & Co., Ltd.) will regret to learn that his wife passed away on April 25th. Mr. Gibson may be assured of their and our sincere sympathy in his bereavement.

## CITY NOTES.

### Calcutta Tramways Co., Ltd.

THE ordinary general meeting of the shareholders of the above company was held on Thursday last week at 1, Queen Victoria Street, E.C., Mr. E. C. Morgan presiding.

The CHAIRMAN, in moving the adoption of the report (see ELECTRICAL REVIEW, page 695), said that referring first to the capital account they would see that there had been added the sum of £66 for ground, representing the deposit paid on the purchase of a small freehold plot of land at Shambazar, for the purpose of providing a turning loop to facilitate working, and £3,719, the cost

of a new high-tension cable, to meet the demands of the increasing traffic. Those two items, aggregating £3,785, brought up the amount over-spent on this account to £41,398. With regard to the revenue, another record had been made in traffic receipts, the increase over last year amounting to nearly £15,000. Although the Royal visit was responsible for some of this, it was to the steady growth and expansion of the business, following on the increasing popularity of the service, that they mainly attributed the result. The largest proportion of the aggregate increase in expenditure was under the power expenses, due to outlay under various heads, and including the cost of a thorough overhaul of the whole plant. Included also under this heading was the cost of the removal from Howrah, and the installation at Nonapokur, of their largest Diesel engine, which was not required at Howrah, and which was of considerable service to them in reinforcing their Calcutta plant. In addition to the amount expended in thoroughly overhauling the power house plant, the whole of which had been charged against revenue, certain expenditure had been incurred in additional plant for the purpose of adding to the general efficiency of the plant as a whole. This additional cost had been written off against the reserve account, to strengthen which an extra £5,000 had been set aside this year, making the total contribution £15,000. One of the beneficial effects of this expenditure would be seen in the substantial decrease in the fuel costs. The small increase in traffic expenses was, of course, owing to the increased mileage run, whilst the increase under maintenance and repairs was principally due to the provision of a new cross-over road, in the erection of a public shelter at esplanade, store buildings, &c., and of additional flat wagons, and a motor-car. The result, after debiting fixed charges, was an available balance of £54,028, which the directors were proposing to deal with, by the payment of a final dividend at the rate of 10 per cent. per annum, making  $7\frac{1}{2}$  per cent. for the year, placing £15,000 to reserve, and carrying forward £4,626. The Calcutta Improvement Trust was still considering various schemes for the general improvement of the city, but they understood that no definite work had yet been decided upon. The directors, at the request of the staff, had agreed to the establishment of a provident fund upon the basis of the company contributing an amount in proportion to the contributions of the employees. The directors felt sure that the shareholders would agree with them in thus bearing testimony in a tangible form to the good work of their very able managers and staff, which had produced such excellent results and conducted to the friendly relations which now existed between themselves and the Calcutta authorities. With the system in first class order, and a capable organisation maintaining a thoroughly efficient service, they looked forward with every confidence to the continued prosperity of the company.

SIR HENRY KIMBER, Bt., M.P., seconded the motion.

Replying to a SHAREHOLDER, the CHAIRMAN said he was not a prophet, and he could not say whether the increased dividend would be permanently paid. He could say, however, that the line was steadily progressing, and that last year's results were not of the nature of a "spurt."

The report was adopted.

### National Telephone Co., Ltd. (in liquidation).

THE report of the Liquidator to the shareholders of his acts and dealings, and of the conduct of the winding-up, for the period from January 26th, 1912, to January 25th, 1913, states that the winding-up resolution became effective on January 25th, 1912. At midnight on December 31st, 1911, the property, &c., of the company sold to the Postmaster-General had been handed over to him, upon terms providing (*inter alia*) for payment of interest on the amount of purchase money from time to time unpaid at the rate of 3 per cent. per annum, until June 30th, 1912, and thereafter at the rate of 5 per cent. per annum. The most important work in the liquidation has been the preparation of the company's claim against the Postmaster-General, and its proper presentation before the Railway and Canal Commission. On February 9th, 1912, the company made formal application to the Court to settle and determine the amount of the purchase money. On June 10th, 1912, the hearing commenced, and it continued for 72 days, concluding on December 12th, 1912.

It was agreed that in the first instance the evidence should be directed solely to the value of the company's plant, which formed the chief part of the items composing the claim. During the progress of the case, and in response to intimations from the Court, it became necessary to endeavour to agree—

(a) The basic costs of the labour, material and freight in respect of plant, without regard to other necessary charges more or less founded upon them. These costs were ultimately agreed at £10,239,345.

(b) The value to be allowed for lands and buildings and all other items (except plant) included in the claim. This was agreed at £2,055,468.

There was then left to the Commission to determine what were the proper additional charges to be allowed to the company incident to the construction of its plant, and what sum should be deducted for depreciation.

On January 13th, 1913, the majority of the Commissioners awarded the company the net sum of £12,515,264 and costs. One of the Commissioners was of opinion that this sum should be reduced by £247,189, the amount allowed by his colleagues for the cost of raising capital.

On February 3rd, 1913, the Postmaster-General gave notice of his intention to appeal against so much of the judgment of the Commission as awarded to the company £247,189 for the cost of raising capital and £150,000 for the cost of obtaining subscribers' agreements. A cross motion of appeal by the company has since been served upon the Postmaster-General. The appeal and cross appeal have not yet been heard, and await the decision of the House of Lords upon a preliminary question raised by the company whether or not the judgment is subject to appeal.

Of the total amount awarded, viz., £12,515,264, the following payments have been made by the Postmaster-General, together with certain sums representing interest:—

January 29th, 1912, cash	£3,000,000
July 29th, 1912, 3 per cent. Exchequer bonds	4,000,000
February 7th, 1913	3,000,000
	<u>£10,000,000</u>
Leaving a balance of	£2,515,264

From the payments received from the Postmaster-General, and from the company's assets, the liquidator has been enabled to pay off the amounts due to the holders of debenture stocks and the nominal amounts of the capital to the holders of the first, second and third preference shares. There has also been paid the nominal amount of the capital to the holders of the preferred stock, together with a premium of 5 per cent. payable under the special resolutions creating such stock. As against the balance of £2,515,264 still unpaid, the Postmaster-General claims to be entitled to set off the rentals for unexpired terms and other sums due from the company, amounting in the aggregate to a sum of upwards of £1,700,000. Cross accounts between the Postmaster-General and the company are now the subject of careful investigation. A number of statements are annexed to the liquidator's report, one of these (/) the statement of affairs as at January 25th, 1913, being given below:—

### STATEMENT OF AFFAIRS, JANUARY 25TH, 1913.

LIABILITIES.	
Sundry creditors, including Postmaster-General...	£1,748,049
Provision for loss on realisation of Exchequer bonds	350,000
Deferred stock	3,725,000
Estimated surplus—	
As per realisation account	137,470
	<u>£5,960,519</u>
ASSETS.	
Postmaster-General—	
Balance of purchase money	£5,515,264
Postmaster-General—	
Estimated balance of interest on purchase money	226,381
Estimated value of other assets	2,000
Accrued interest on bankers' deposits	235
Balances at bankers to meet unrepresented warrants	8,709
Cash in hand and on deposit with bankers	207,929
	<u>£5,960,519</u>

In order to determine the rights of the various classes of stock and shareholders, proceedings have been taken at the expense of the company before Mr. Justice Swinfen Eady, but no final decision has yet been given. With the sanction of Mr. Justice Swinfen Eady a payment to holders of deferred stock, equal to 15s. in the £ of their respective holdings, has been made.

No provision is included in this statement of affairs for further costs incident to the appeal, for other proceedings now pending, and for the winding-up of the company, but it is anticipated that these will be met by the taxed costs to be paid by the Postmaster-General under the order of the Railway and Canal Commission.

### Oldham, Ashton and Hyde Electric Tramways, Ltd.

THE annual meeting was held on April 23rd, at Electrical Federation Offices, Kingsway, W.C., Mr. Emile Gärcke presiding.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 696), the CHAIRMAN said that the past year had been the best that the company had ever had. The traffic receipts which amounted to £33,375, exceeded those of 1911 by £1,900, and those of 1907, which was the best previous year by £600. Practically in every respect the position showed improvement. The number of passengers carried—six million, compared with 5,700,000; the average receipts per passenger were 1'32d., as against 1'31d.; the average expenditure per passenger was 8'4d., compared with 8'8d., and the proportion of expenses to receipts had been reduced from 67 per cent. to 63 per cent. The cause of that general improvement was the prosperous condition of the various trades throughout the district. They had also benefited by other people's misfortunes. The curtailment of the local train services during the coal strike caused a large number of people to travel by the tramways. As far as it was possible to forecast the outlook for 1913, if they might take the opening months of the year as a criterion, it was hopeful, and they looked forward to at least as good results as for 1912. Out of the larger profit they had placed £4,000 to provision for renewals account, as against £2,000 last year. An interesting feature in the balance-sheet was the fact that the capital subscribed, together with the reserve fund, now equalled the capital expenditure. The life of the track, in the opinion of the company's engineer, had been greatly improved and lengthened by the work which had been carried out by means of the Woods-Gilbert rail planer. By the use of that apparatus they would be able to get several years' further life out of the rails, and thus postpone capital expenditure for renewal.

MR. J. VINCENT KITCHENER seconded the motion, and the report was adopted.

### Rangoon Electric Tramway and Supply Co., Ltd.—

For 1912, a dividend of 5 per cent. is to be paid on the ordinary shares, £751 being carried forward.

### Direct United States Cable Co., Ltd.

THE meeting of this company was held at Winchester House, E.C., on Tuesday. Mr. C. E. Gunther presided, and before moving the adoption of the report, he alluded in suitable terms to the sudden and quite unexpected death of their late chairman, Mr. E. M. Underdown. Up to the end Mr. Underdown was engaged upon the affairs of the company, as only two days previously he had accompanied their secretary down the Thames to inspect the ship that was leaving to repair their main cable. His death came as a great blow to his colleagues on the board. He was associated with that company almost from its inception. He joined the board on the reconstruction of the company in 1877, and had been chairman since 1896. Probably there was no man who had a more complete knowledge of the problems affecting the handling and working of cables than Mr. Underdown possessed, and his great experience in that direction, and in legal and commercial matters, had been of the utmost value to the company at all times, and in particular was it of the greatest assistance when the difficult and protracted negotiations were in progress with the Western Union Telegraph Co. two years ago, which resulted in the lease that was now in existence. He went on to express sincere sympathy with the family in their great bereavement.

Continuing, the CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 691), said that dealing first with the revenue account, they would see that they had received the rent provided for under their lease with the Western Union Co.; and, in addition, they received income from their investments amounting to £19,453. That provided for a dividend at the rate of 4 per cent. for the year and writing off £10,000 as a further provision on account of market depreciation of investments, which had been rendered necessary on account of the great fall in the prices of the better class securities. The balance of revenue was transferred to the reserve fund as usual, viz., £20,104. They might remember that when they met last year their main cable was interrupted, and it cost nearly £40,000 to complete that repair. The total expenditure in connection with the maintenance of cables for the year amounted to £42,240, to meet which they had had to draw upon their reserve fund. He regretted also to have to inform them that the main cable was again interrupted, and they were faced with an expenditure that might, and probably would, exceed the cost that they had to meet last year for maintenance, and as this would very seriously deplete the amount of the reserve fund, the board felt that it was in the best interests of the shareholders that they should on that occasion not pay any bonus in addition to the dividend of 4 per cent. The only item he need refer to in the balance-sheet was that of cable on hand, which amounted to £72,489, which was very much in excess of the amount usually appearing under this head. It was due to the fact that they had had to manufacture a length of 500 miles of new cable, which possibly, though they hoped it would not be so, would have to be inserted in connection with the repair upon which they were now engaged. He might say, with regard to these interruptions, that never before in the history of the company had two deep-sea interruptions in the main cable taken place so close together as these two, and they trusted that it would be many years before they were called upon to meet such heavy expenditure again. The fact, however, that these interruptions did occur, and the knowledge that their repair called for the expenditure of such large sums of money, rendered it imperative that the reserve fund should be kept at as high a figure as possible.

MR. JOHN VARLEY seconded the motion, which was unanimously adopted, no questions being asked.

### Indo-European Telegraph Co., Ltd.

THE meeting of this company was held at the offices, 18, Old Broad Street, E.C., on Tuesday, Mr. J. H. Tritton presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 695), said he turned naturally to the question which had been occupying their close attention now for some time, viz., that of a considerable addition to their capacity for carrying traffic. This addition was more than ever necessary. Traffic tended to increase, and, moreover, was carried year by year at increasing speed. This was partly due to the demands of the senders, and partly to the improvements constantly being made in telegraph apparatus. There was, however, in spite of the vigilant supervision of their lines, no corresponding means of overcoming the constantly-present danger of interruptions, which, however short they might be, had a serious effect on their traffic whilst they continued. The object of the directors had been to add one complete wire throughout the system, and he was glad to say that the arrangements for this addition were very nearly complete. The British and German Governments had agreed to lay a new cable across the North Sea, and this, when accomplished, would set free a conductor in one of the existing cables for the use of the company. They would then have three wires, one in each of three cables, separated by considerable distances, and it was most unlikely that they would then be subject to a total interruption caused by all cables being disabled at the same time. As negotiations for the concurrent extensions of their working agreement with the Postmaster-General, and of their concession from the Imperial German Government, were still pending, it was not advisable to make any definite announcement at present. With a natural desire to simultaneously obtain extensions of all their concessions, application was also made to the Russian Government. Having regard, however, to the fact that their present Russian concession still had some 12 years to run, they received the perfectly reasonable and not

unexpected reply, that it was too early as yet to take the matter into definite consideration. He wished to make it perfectly clear that whatever extensions they might or might not obtain, their concessions were secure in any case to 1925, and, further, nothing stood in the way of the achievement of their immediate object viz., the addition of a wire to their system from London right through to Teheran. If, as they hoped, the new North Sea cable was laid within a few months the other sections of the new wire would be ready to be linked up with it. Turning to traffic results, their main traffic, viz., that with India, showed a steady and gratifying increase, and there had naturally been an abnormally heavy Turkish traffic. The other traffics were well maintained. Deferred telegrams as a class also showed a considerable increase, and appeared adequately to fulfil the purpose for which they were introduced. Traffic prospects for the year 1913 were also fairly good, but he must again sound a warning note. The company had heavy fixed charges in respect of outpayments to its concessionary Governments—fixed charges because a reduction of tariff did not necessarily mean that their outpayments would be reduced in proportion. He thought that in the near future the directors would have to face further reductions. He must remind them that telegraph companies were more subject to criticism, perhaps, than any other public concern, and, provided that they were in a prosperous condition, the public thought they had a right to insist upon lower rates. That company had shown in the past its readiness to meet legitimate demands for reductions, and they were ready to do so in the future, provided they were not jeopardising the interests of the shareholders. He would remind them, however, that, as far as code telegrams were concerned, and these formed 90 per cent. of the total, their customers got very good value for their money, and, he believed would admit this fact if asked. The shareholders had, no doubt, read with considerable interest the paragraph in the report dealing with wireless telegraphy. They would remember that it was necessary to extend the scope of the memorandum and articles of association of the company. The memorandum of association was drafted 45 years ago, and was drawn up for a specific purpose, viz., to work a system of telegraphs over wires within fixed limits. This so restricted the directors that it became most advisable to place a revised and extended memorandum of association before the shareholders. It received their approval and the sanction of their concessionary Governments and of the High Court. One of the earliest advantages reaped by the company was to free the hands of the directors, so that they could examine critically any proposals that might be submitted to them in connection with wireless telegraphy, with the result that they eventually took over the Galletti patents for wireless telegraphy and telephony. The directors were convinced that in taking this step they acted in the best interests of the company. He need scarcely tell them that the directors had had the benefit of the opinion of experts upon this system, both from the scientific and the patent point of view, and these opinions were considered satisfactory. Reviewing, briefly, the relation of wireless to its elder sisters in telegraphy, he said that telegraphy without wires, cables or conductors of any kind would represent financially everything most desirable in communication over long distances. The science had, however, hitherto, in spite of years of experimental work, not reached a stage at which the tangible conductor might with safety be discarded in favour of the ether, no known system having been found to overcome certain difficulties of transmission. In the Galletti system, however, the directors had been offered one that had new and self-evident advantages in the theory on which it was based. Those advantages were, of course, in many respects of a technical nature, and were at the moment more or less confidential, the system being still in the experimental stage, but the chief claims made by the inventor for the system were that by its use a much larger proportion of the power used was made available in the aerial at the transmitting end, and therefore at the receiving end also, than by any other system. The current used was direct current, and the view held by most experts to-day was that transmission by direct current was preferable to alternating current. From a business point of view the Galletti system appealed to the directors for two reasons. Its main patents were such as to give it a perfectly independent position amongst contemporary wireless systems; and, further, the inventor was willing to transfer his control over the system to this company, both of which, of course, were very important considerations. An agreement was therefore entered into with Mr. Galletti by the directors on behalf of the company, in virtue of which Mr. Galletti transferred all his patent rights in his system to a company formed and controlled by this company, viz., "Galletti's Wireless Telegraph and Telephone Co., Ltd.," the consideration being that this company should find the working capital necessary to establish the system on a basis of commercial utility. Further, the company had entered into an agreement with Mr. Galletti whereby he gave his services to the company for a specific period. The liability of this company to find the above-mentioned working capital was limited under the agreement to £34,000, of which £32,200 had been found up to the end of 1912. Some further moderate expenditure during 1913 would be necessary to complete the experiments. The directors proposed to pay a visit to Switzerland during the next few days for the purpose of witnessing a demonstration of telegraphy and telephony by the Galletti system over distances short to begin with but which would be extended as experiments progressed. In Switzerland there were two stations fully equipped, and working would be shown in both directions. The telegraphic signals would be transmitted and recorded by the Wheatstone automatic system. They fully expected that Mr. Galletti would be ready to demonstrate his long-distance experiments at the same time. A transmitting station had been installed by the company at

Leschaux, some 60 miles distant from Geneva, but on French territory, where Mr. Galletti would experiment with high power with the object of reaching very distant stations. He would like to mention that the directors acknowledged with gratitude the kind assistance of the British and French Governments in carrying out experiments. Turning to the accounts, the revenue from message receipts showed an increase of £10,934. The combined commercial and maintenance expenses showed an increase of £4,387. This was due under both headings mainly to a certain increase of remuneration to the staff due, in Russia and Persia particularly, to the increased cost of living, and to the continuing replacement of their instrument batteries by accumulators. Depreciation on the company's investments during the year under review absorbed the sum of £10,813. The directors now proposed the usual final dividend, absorbing £14,875, and a bonus of 20s. per share requiring £17,000, both free of tax. They also proposed to provide out of profit the sum of £32,200, represented by the Galletti investment, which would thus stand in the next balance-sheet free of cost to the company. They again recommended a special distribution out of interest upon certain investments and advance accounts of 15s. per share, free of tax, carrying forward £13,655 to the credit of 1913.

MR. C. HOLLAND seconded the motion, which was carried unanimously.

### British Westinghouse Electric and Manufacturing Co., Ltd.

THE directors report that for the year ended December 31st, 1912, the accounts show continued progress, and indicate that the company has had a good share in the general trade improvement. Competition is still very keen in the electrical and allies industries, but the prices obtained are slightly better than in the previous year. The gross profit amounts to £157,871, from which fall to be deducted:—Depreciation on works, machinery, plant, &c., £43,450 (in addition to £6,300 provided for redemption of prior lien debentures for the year), expenses on surplus land and buildings £3,033, interest on 6 per cent. prior lien debentures £13,650, interest on 4 per cent. mortgage debenture stock £49,654, leaving a balance of £48,081. From this balance has to be deducted the amount required for the prior lien redemption fund £6,350, proportion of expenses of issue of prior lien debentures £660, leaving a net profit for the year of £41,074, as against £20,708 last year. Adding to this the balance brought forward from 1911, £25,825, there is a balance of £66,899 to the credit of profit and loss account, which it is proposed should be carried forward. The accounts would have shown a still more satisfactory result but for the coal strike, the inconvenience from which was felt throughout the year. On the credit side of the balance-sheet the item "Underground Electric Railways Co. of London £95,681," is still held in suspense, as the loss, whatever the amount may finally prove to be, has not yet been ascertained. The company's appeal to the House of Lords, referred to in the last report, was successful, and the matter has been referred back to the arbitrator for further consideration. As is the usual practice, a substantial amount has again been charged against revenue for the maintenance of works and plant, in addition to which £49,750 has been applied to depreciation. Orders received during the year, for both the home and export markets, show an appreciable increase over those of 1911, and the directors state that the business of the current year similarly shows an increase over that of the corresponding period of 1912. Mr. C. A. Park, managing director, resigned his position in December, and a successor has not yet been appointed.

The meeting is called for Monday, May 5th, at Hamilton House, Victoria Embankment.

### North Metropolitan Electric Power Supply Co., Ltd.

THE annual meeting was held on April 23rd at Electrical Federation Offices, Kingsway, W.C., Mr. E. Garcke presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 693), said he was glad to be able to congratulate the shareholders that, notwithstanding the anxious time they had passed through in connection with the coal strike and other troubles of the same kind, they were able to report further continuous progress of the company, and to recommend a dividend on the ordinary shares of 10 per cent. for the year, as compared with 9 per cent. for 1911. At the meeting last year, he referred to the serious condition of affairs which the coal strike was producing, and told them that the cost of production was likely to be abnormally high. He was sorry to say that those anticipations as to increased expense of production had been fulfilled. On the other hand, he was glad to say that they were able to maintain a continuous supply, and any increase in the rates was avoided. The revenue was adversely affected by the strike. For a period of about 10 weeks no coal was delivered to their stations under their ordinary contracts and they were compelled, towards the end of the period, to arrange with the Metropolitan Electric Tramways Co. to reduce their tramway service, and they also had to request the various authorised distributors who took bulk supplies from them to restrict their demands as far as possible. Such, however, was the inherent possibility for expansion in the district, that notwithstanding those circumstances, the output increased very much in the same ratio as had been the case in preceding years. Last year they sold 29 million Board of Trade units, which, compared with about 26 million in 1911, an increase equivalent to 10½ per cent. The revenue for the year

amounted to £143,000, as compared with £132,800 for 1911, an increase of about £10,000, or about 7½ per cent. Unfortunately, the expenditure showed an increase of £10,900. Of that increase about £7,500 might be said to be due to increased output, so that the abnormal increase of expenditure amounted to about £3,500, primarily due to the higher price of coal, and also to some extent to increased rates and taxes. Those adverse conditions had come to an end, and he hoped that during the current year they would be able to show further progress in their output, accompanied by an increased net profit. Last year they received 6 per cent. on their investments in the North Metropolitan Electrical Power Distribution Co., as compared with 5 per cent. in 1911. That company received electricity in bulk from them, and distributed it in various growing districts in the North Metropolitan area. The net revenue had been debited with £2,000 in accordance with the trust deed to secure the debentures, and £25,000 had been placed to the credit of the depreciation account which now amounted to £78,850. The amount required for the dividend on the preference shares was larger than in the preceding year, because a further issue of preference shares was made last year. The capital expenditure during the year had amounted to £50,670. He might remind them how very consistently the business of the company had expanded. In 1905 the output was 5 million units, the next year 8 millions, the following year 11 millions, the next 14 millions, then 16 millions, then 21 millions: in 1911 it was 26 millions, and last year, as he had already told them, 29 millions. That was a pretty steady and satisfactory expansion of the business, and having regard to the industrial developments that were taking place in the large area over which they had tenure, the board had reason to feel very sanguine in regard to future prospects.

SIR ERNEST SPENCER seconded the motion, and the report was adopted.

An extraordinary meeting was then held. The CHAIRMAN proposed a resolution to the effect that of the amount which the company were authorised to borrow, a sum not exceeding £42,500 be raised by the issue of further mortgages to rank *pari passu* with the existing mortgages issued by the company. He said he had told them how rapid had been the progress of the company, and the increase of the business naturally involved extensions to the power houses. A large extension was almost completed at Brimedon, and at Willesden the extension was well in hand. In order to cope with the demands, it was also necessary to extend the Hertford station almost immediately, and further arrangements would have to be made at St. Albans in the near future.

SIR ERNEST SPENCER seconded the proposition, which was adopted.

**Prospectus.**—*The Electrical and Industrial Investment Co., Ltd.*—The list was to close on Wednesday in an issue at par of £85,180 4½ per cent. first debenture stock, and £92,955 5½ per cent. second debenture stock in this company. The trustees of the debenture-holders are the Electric and General Investment Co., Ltd. At December, 1912, the company held investments of the net book value of £462,671. Of this amount, 26·74 per cent. represents holdings in electric power and traction (combined) undertakings; 24·28 per cent. tramways and omnibuses; 18·97 per cent. electric lighting and power; 10·03 per cent. railways; and the remainder is in commercial and industrial, oil, financial, tea, coffee, and rubber, telegraph and telephone, and other classes. Nearly 80 per cent. of the total are in the form of debentures, debenture stocks, preference shares and stocks, &c., the remainder being ordinary shares and stocks, loans and syndicates, &c. The revenue account for the first seven months ended December last showed a profit of £11,325, after paying all administration expenses. The company entered into agreements at June, 1912 with the liquidators of the City of Birmingham Tramways Co., Ltd., for the purchase and sale of the assets and property of the latter, and with the B.E.T. Co., Ltd., whereby that company guaranteed the subscription of 180,000 ordinary shares and 60,000 preference shares in consideration of an option. Our readers are familiar with the objects of the company. At the meeting reported in our issue of February 21st, 1913, the chairman, Mr. E. Garcke, said it was intended to raise a little further capital by the issue of 4½ per cent. debenture stock, and so reduce the average cost of their capital.

**Cuba Submarine Telegraph Co., Ltd.**—The report of the directors for the half-year ended December 31st, 1912, states that the total receipts for the period were £19,074 and the expenses £7,085, leaving £11,988, plus £7,743 brought forward, making £19,731 to be dealt with. £2,000 has been placed to the pension fund, and £2,000 added to the general reserve fund, which now stands at £94,000. The dividend on the preference shares will absorb £3,000, and leave £12,731, out of which the directors recommend the payment of a dividend at a rate of 6 per cent. per annum on the ordinary shares, free of income-tax; the balance, £7,931, being carried forward. Following the suggestion made at a recent meeting for holding the general meetings annually instead of half-yearly, the board have decided to adopt that course, which is in accordance with the articles of association. The company's financial year will run from January 1st to December 31st; the yearly meetings being held in April or May and an interim dividend being payable in October.

The meeting is called for May 7th.

**Calcutta Electric Supply Corporation, Ltd.**—The number of units delivered to consumers during the four weeks ended March 28th amounted to 890,782, compared with 854,021 units in the corresponding four weeks of 1912.

**Stratford-on-Avon Electricity Co., Ltd.**

THE report for 1912 states that, after writing off £200 to reserve and depreciation account and building sinking fund, the net revenue account shows an available balance of £558, which the directors recommend should be appropriated as follows: Directors' fees, £50; 3½ per cent. dividend, £257; carrying forward £251.

Year.	Units generated.	Units Light- sold.	Ing. Power.	Heat- eng. works.	Used on counted lamps.	Unac- counted for.	R.C.P. lamps con.	Max. load p.f.d.	Avg'o price ob'd.
1911	192,411	149,366	52,489	79,395	10,522	89,085	10,100	16,858	2.783.
1912	192,473	131,777	74,340	40,895	10,081	48,000	12,661	12,150	3.90d.

**Metalite, Ltd.**

THE adjourned ordinary general meeting of shareholders of this company was held on Tuesday at the office, Christopher Street, Finsbury, Mr. J. T. Bentley presiding.

THE CHAIRMAN said he had to apologise for the absence of their chairman, Mr. Stewart, who had suffered a family bereavement during the last few days, and who was in Scotland attending the funeral. He had also to inform them that Mr. Joseph Metcalf, his other co-director, had been lying on a sick bed for some weeks, and was quite unable to attend the meeting. They would remember that at the adjourned meeting held there on February 24th it was further adjourned to that day in order that the company's accounts should be completed and audited and presented to the shareholders. However, the directors had found that impossible owing to the fact that a Receiver for the first mortgagees, namely, the bank, had been appointed, and the directors had no funds in hand belonging to the company to discharge the same, and the auditors and others were not prepared to complete the accounts without a cash payment, which the directors did not feel justified, in the present stage, in advancing. They had devoted the whole of their attention, first, to making suitable arrangements with the bank to avoid a sale of the company's assets, which had been done, some of the debenture-holders coming forward to advance the necessary amounts. In the second place, they had devoted their energies to evolving a scheme of recapitalisation, which the directors considered was absolutely essential if the company was to be resuscitated and ultimately to become successful. It was hoped that that scheme might have been put before them informally that day, but, of course, in the absence of the chairman, that could not be done. All shareholders would, however, in a very short time receive copies of the proposals, and an extraordinary meeting would be called with a view to carrying the proposal into effect or otherwise, as the shareholders might deem fit. Meantime, they had been able to arrange with the second and the third series debenture-holders not to press their claim for principal and overdue interest, so that no further complications were likely to arise in putting forward such a scheme. Being single-handed that day, he was afraid he could say nothing further on the matter just at the moment, except to again assure them that the scheme, out of the many that had been placed before the directors, was, in their consideration, the best; and although in the nature of things it had to be somewhat drastic, at the same time it was the soundest proposal, in the directors' opinion, that gave them any likelihood of success under the circumstances. He concluded by moving that the meeting stand adjourned until Friday, May 30th.

MR. LEE said he would formally second the resolution, as it seemed to him that there was nothing else to do. It was a very unfortunate position. He had tried to get a little information about the matter only that morning, but in the absence of the chairman he did not see that they could do anything but consent to the adjournment.

The resolution was carried with one dissident.

**Gravesend and Northfleet Electric Tramways, Ltd.**

THE twelfth ordinary meeting of the above company should have been held on Monday, at the offices of the Electrical Federation, Kingsway, W.C., but it was postponed.

THE report for the year ended December, 1912, states that the total revenue amounted to £11,668, as compared with £11,554 for 1911. After deducting all expenses chargeable to revenue, including repairs and maintenance, and £1,800 for debenture interest, there remains a balance of £2,603, plus £567 brought forward, making an available balance of £3,170. Out of this the directors propose to place to reserve £600, to renewals fund £600, one half-year's preference dividend, completing the full dividend on the 6 per cent. cumulative preference shares to June 30th, 1907, £1,200, carrying forward £770. In the preceding year £1,000 was placed to a joint reserve and renewals fund (which has now been divided into two separate accounts), and one half-year's dividend on the preference shares was paid; £6 10s. has been expended on capital account during the year, the amount of that account standing at £119,601.

The passengers carried numbered 2,800,401, as compared with 2,816,099 in 1911; average receipts per passenger '96d. (against '95d.). Mileage open 6'47 route miles; 18 cars.

**La Plata Electric Tramways Co., Ltd.**—The report states (says the *Financier*) that the total receipts on revenue account for the year to December 31st amounted to £53,179, and the expenditure to £43,397, leaving a balance of £9,782. After providing for debenture stock and other interest (£2,799), and writing off the whole of the balance of defalcations account and expenses in connection with a special investigation of the books for the past three years—viz., £2,513—there remains £4,468, which, with £23 brought forward, leaves a balance available of £4,492. The directors recommend a dividend at the rate of 6 per cent. per annum on the preference shares, covering the period from July 1st to October 31st, 1911. This will absorb £3,893, and leave £548 to be carried forward.

**Victoria Falls and Transvaal Power Co.**—The Times states that the net earnings of this company, including those of the Rand Mines Power Supply Co., for the quarter ended March 31st amounted to £105,259.

**Callender's Cable and Construction Co., Ltd.**

THE directors' report for the year ending December 31st, 1912, shows that there is a balance at the credit of profit and loss of £97,088, plus £58,531 brought forward, making £155,620. From this must be deducted interest on debenture stock, £13,500; dividend on preference shares, £10,000; appropriation for depreciation of buildings, plant and machinery, £8,691; appropriation for depreciation of office furniture, £230; expenses incurred by this company in connection with the formation of Callender's Share and Investment Trust, Ltd., £5,200; making together £37,624; leaving an available balance of £117,995. It is proposed to pay a dividend on the ordinary shares at the rate of 10 per cent. per annum, less income-tax, being 10s. per share (whereof 5s., less income-tax, was paid on November 1st, 1912, and 5s., less income-tax, will be paid on May 15th), £17,500; pay a bonus of 5s. per share, less income-tax, on May 15th, £8,750; and to carry forward £91,745. The operations of the company for the past year have again produced results which are highly satisfactory, the profit on the year's operations exceeding that of 1911 by more than £20,000. This result has been arrived at in spite of the heavy, and in many respects useless expenditure, forced on the company by the two great strikes of the year, that of the coal miners in the Spring, and that on the River Thames last Autumn. Both seriously interfered with the company's operations, and entailed wasteful expenditure of several thousands of pounds. The strike on London River threatened at one time to close down the company's works, but, thanks to the arrangements which had been made in advance, to the excellent facilities which the company has for handling materials, and to the energy of those in the service of the company, less inconvenience was caused to customers than might have been anticipated. Considerable trouble, owing to labour unrest, has been experienced in the engineering department during the year. The difficulties have now been arranged, and this department is in full work, and has important unexecuted orders in hand. The general trade of the company continues to expand both at home and abroad. The shops are full of orders, and inquiries for future work point to the likelihood of continued good business. This applies not only to underground mains, such as the company has manufactured for many years past, but to telephone cables now made at Erith, and to the rubber tyre business carried on in conjunction with this company by the Anchor Cable Co. at Leigh, Lancashire. The increase in output during last year, especially for the Colonies and abroad, rendered it necessary to provide further capital, and the directors decided to raise that money by means of a subsidiary company, which has now been formed under the title of Callender's Share and Investment Trust, Ltd. Full details of the arrangements with the Trust Co. were contained in the prospectus of that company. This company incurred expenses in connection with the formation of the Trust Co. amounting to £5,200, and the whole of this amount is written off the profits of this year. As usual, all machinery, plant and appliances at the factory, and on outside contracts at home and abroad, have been maintained in the highest state of efficiency, and the cost of so doing has been debited against the year's accounts. The Anchor Cable Co., Ltd., has also experienced a highly satisfactory year's working, and the profits (which have been in excess of those of any previous year) have enabled its directors not only to maintain the dividend of 15 per cent., but to increase the amount of its carry forward. The other undertakings in which this company is interested are all making satisfactory progress. The directors express their deep regret at the death of Mr. Henry Drake, which occurred in February last. Mr. Drake's connection with the Callender Cable business dated from its commencement in 1872. He was chairman of this company from its formation until last year, when, owing to failing health, he found it necessary to relinquish that position. His colleagues wish to put on record their recognition of the valuable services which he rendered to the company for so many years.

The meeting is called for May 8th.

**Anchor Cable Co., Ltd.**—The directors' report for the year ending December 31st, 1912, states that the profit amounted to £16,359, plus £5,488 brought forward, making a total of £21,847. From this must be deducted—interest on debenture stock £2,250, depreciation on plant and machinery £2,750, written off investments £1,489, leaving an available balance of £15,358. It is proposed to pay a dividend of 15 per cent., absorbing £8,719, and to carry forward £6,639. The business of the company is making steady progress, both in this country and abroad. In the course of the year the directors called up £5 per share on the 1,500 partly paid ordinary shares. This call has been paid in full, so that all shares issued are now fully paid. The plant and machinery have been maintained in first-class order, and all costs of so doing have been charged against the year's account.

## Cork Electric Tramways and Lighting Co., Ltd.

THE directors' report for the year 1912, states that the receipts were £67,576, and the expenses £35,596, plus £1,555 brought forward, making £23,536, less interest on debentures £4,600, leaving £18,936. Of this amount, £8,163 was paid on July 1st and January 1st, for the half-yearly dividends on the 5 per cent. cumulative preference shares; £6,500 added to reserve for depreciation and renewals; £1,561 written off, as per revenue account, and the balance is to be disposed of by paying 3 per cent. dividend on the ordinary shares, £3,450, and carrying forward £1,262.

The lighting and power business again shows satisfactory progress, agreements for 140 connections being concluded during the year. The additional connections represent a total gain of 252 kW., as against 162 kW. in 1911. The total lighting and power receipts were £1,238 in excess of the previous year. The revenue is still being affected by the extended use of metallic-filament lamps, but additional consumers have been obtained as the result of their introduction owing to their economy and the excellent light given. The traffic receipts show a decrease of £827, this being mainly attributable to the wet summer of last year. The early closing of the shops on Wednesdays has also resulted in loss of revenue both in lighting and traffic receipts. The expenses were very heavy—£2,270 in excess of the previous year—the increase being mainly due to the enhanced price of coal and heavier maintenance charges for the lighting and power cables. The Cork Corporation have wood paved certain streets, and in order to meet the Corporation and fall in with city improvements the company have been put to extra expense in relaying portions of the permanent way which would not otherwise have been necessary. The three reserve items appearing in the 1911 accounts, viz., premium on shares issued £2,952, premium on debentures issued £211, and depreciation and insurance £28,978, in all £32,141, have been transferred to a reserve account for depreciation and renewals. The directors have written off £1,561 as per revenue account and transferred £6,500 to reserve for depreciation and renewals, as compared with £1,753 and £6,500 respectively for the previous year. Cable renewals have been carried out at Cork and Queenstown during the year at a cost of £2,201. This expenditure has been charged against the reserve account. The capital expenditure during the year has been mainly expended on house services, cables and public lighting. No shares or debentures have been issued during the year.

Year.	Traction.				Lighting and power.		
	Miles open.	Passengers carried.	Average fare.	Car-mileage.	No. of cars.	No. of (equivalent) 8-c.p. lamps customers connected.	
1909	9.99	5,349,041	1.06d.	864,228	35	2,013	129,156
1910	9.99	5,704,071	1.07d.	859,173	35	2,181	129,403
1911	9.99	5,866,523	1.07d.	891,417	35	2,389	155,683
1912	9.99	5,695,103	1.06d.	898,153	35	2,529	163,774

The annual meeting was held on Monday at the office, 83, Cannon Street, E.C., Mr. A. R. Monks presiding.

THE CHAIRMAN, in proposing the adoption of the above report, said that dealing first with the balance-sheet, it would be seen that the share and debenture capital remained as at December 31st, 1911. The three reserve accounts appearing in the 1911 balance-sheet had been consolidated, and they had now the one account, "Reserve for depreciation and renewals." This reserve had been increased by £6,500 out of the past year's revenue and debited with the expenditure on renewing cables at Cork and Queenstown, £2,200, which gave a net increase of £4,300 for the year, leaving the reserve at £36,440. Sundry creditors and outstandings amounted to £6,322, as compared with £3,602 at December, 1911—a reduction of £2,280. On the other side, the capital expenditure, after deducting the amounts written off house services, wiring consumers' premises, &c., showed a net increase of £1,455, which was almost entirely expended on connecting up the additional private and public lighting business secured last year. The large amount against work in progress was mainly for additional power station plant. To meet the increasing demands they were installing a further 900-kw. generator set, which they hoped would be in operation next autumn. He might say in this connection that all the available space in the power house had been occupied with plant, so that they were removing one of the original 200-kw. sets so as to provide space for the new set. The capital expenditure for this old 200-kw. set would be written off in the accounts for the current year. Sundry debtors and outstandings £14,261, compared with £14,749 at December, 1911, a reduction of £488. Taking the revenue, the gross receipts for the year showed an increase of about £400. The traffic receipts were disappointing, being £827 less than in 1911, but this was mainly attributable to the very wet summer they had last year—in 1911 they had exceptionally fine weather. Lighting and power receipts were £1,238 in excess of 1911, which was a satisfactory increase, taking into consideration the effect of the extended use of metallic-filament lamps and the early closing of shops on Wednesdays. The expenses were heavy, being £2,270 in excess of the previous year. Traction expenses were lower, but there were increases of £1,250 for the power house, £900 lighting, and £170 for general expenses. Considerable repairs were carried out on the permanent way, and their expenses in this connection would have been lower had it not been for the Corporation deciding to wood-pave certain of the main streets. In order to meet the Corporation, they relaid portions of the permanent way which, in the ordinary way, would not have been carried out for a few years. They also renewed last year seven car bodies, making 15 renewed out of revenue to the end of 1912. The increase in station expenses was mainly for coal and maintenance of plant. As higher prices were ruling for coal, their expense under this head were likely to be heavy again this year. The bulk of the

increase in lighting and power expenses was for maintaining cables. In general expenses, they had £93 for the new charge under the National Insurance Act, which would cost the company in future about £200 per annum.

MR. W. B. H. MARTINDALE seconded the motion, and the report was adopted.

## Constantinople Telephone Co.

THE report of the Société Anonyme Ottomane des Téléphones de Constantinople (as printed in the *Financier*) states that unfortunately the inception of the company corresponded with the outbreak of the war between Turkey and Italy, and for the whole period of the company's existence the general conditions have been so disturbed as to militate very considerably against the progress of the construction of the company's plant. Considering these difficulties, satisfactory progress has been made, although the date of the opening of the service will be later than that originally planned. Intimation has been given to the Turkish Government from time to time as the various interruptions of work occurred, due to causes beyond the company's control. One of the first problems that had to be dealt with was that of securing sites for the three large exchange buildings at Stamboul, Pera and Kadiköy, and the company has now purchased sites eminently suitable to the general design of the system. Good progress has been made with the buildings, and it is hoped that shortly the installation of the exchange equipments will be begun by the Western Electric Co. and the French Thomson-Houston Co., who are jointly responsible for this work. In the early part of 1912, the company made a contract with the British Insulated and Helsby Cables, Ltd., for building underground conduits and pole routes, and supplying and laying the necessary cables, and notwithstanding the various delays which have occurred from time to time, chiefly owing to the war, a large portion of this work has been completed. On December 31st, 1912, there were constructed 84 km. of underground duct, and 17 km. of pole route; 18 km. of cable had also been installed, containing 3,600 km. of circuit. Early in 1912, the general manager organised a contract department for the purpose of securing subscribers, and in spite of the disturbed business conditions at Constantinople, orders had been obtained on December 31st for 2,999 stations. The number of orders secured exceeds the original expectations of the directors as to the development to that date, and as the work of securing new orders still proceeds at a satisfactory rate, having regard to the existing conditions, it is confidently anticipated that the business of the company will be substantially in advance of preconceived ideas. It will be necessary, in the course of a short time, to issue further capital, and resolutions to this effect will be submitted to the shareholders in general meeting. The new capital, when authorised, will be issued as and when required for construction purposes. In order to be in a position to undertake the work should the Turkish Government decide to establish telephone systems in other towns through private enterprise, the board propose to ask for powers for obtaining and working telephone concessions in other parts of the Ottoman Empire.

## Metropolitan Electric Tramways, Ltd.

THE directors' report for the year ended December 31st, 1912, states that the revenue, including £35,000, the dividend and bonus receivable upon the company's investment in the North Metropolitan Electric Power Supply Co., amounted to £518,025. After adding the balance brought forward from 1911, and deducting all expenses chargeable to revenue, including an addition of £26,780 to the reserve for reconstruction and renewals, there remains a balance of £57,375 available for dividends and further reserves, and the directors recommend that of this there be placed to reserve account, £10,000; dividend on the preference shares for the year, £25,000; dividend on ordinary shares at the rate of 5½ per cent. (including interim dividend of 2½ per cent. paid in October, 1912), £21,771; leaving to be carried forward, £604.

The reduction of capital, resulting from the conversion of the issued deferred shares into ordinary shares under the scheme confirmed by the shareholders last August, has received the sanction of the Court. The reduction amounted to £235,612, and has been applied to writing off preliminary expenses (£92,661) and writing down capital expenditure by £142,950. £5,377 4½ per cent. debenture stock, and £2,500 5 per cent. debenture stock was bought and cancelled last year under the provisions of the trust deeds. At December 31st last, the issued debenture and share capital was:—

Debenture capital—£765,719 in 4½ per cent. debenture stock; £247,600 in 5 per cent. debenture stock.  
Share capital (as reduced)—£500,000 in 5 per cent. cumulative preference shares of £1 each, fully paid; £395,832 in ordinary shares of £1 each, fully paid; 78,601 in new ordinary shares of £1 each, fully paid (resulting from the conversion of £314,016 deferred shares), ranking for dividend as from January 1st, 1913, and in all other respects *pari passu* with the 395,832 ordinary shares.

The directors regret to report that the profit derivable from the operation of the tramways and light railways shows a decrease of £24,348. The figures are as follows:—

	1911.	1912.
Traffic receipts ...	£460,514	£460,544
Working expenses...	307,294	331,642
	£153,250	£128,902

This unsatisfactory result is attributable to the heavier competition from motor-omnibuses. In order to meet this increasing competition and to maintain the company's hold upon the traffic in the districts served by the tramways, the directors found it necessary to augment the car services, and while this policy has

enabled the company to maintain its receipts, the working expenses are higher by £21,348, and the receipts per car-mile have dropped from 10'5d. to 9'63d. It is anticipated that the alliance entered into with the London General Omnibus Co. at the close of the year will bring about the co-ordination of the omnibus and tramway services in the company's area and a consequent improvement in the company's revenue.

The purchase by the L.C.C. of the company's tramway between Finsbury Park and Manor House was completed in August last, and thereupon the through running arrangements referred to in the last report came into operation. The satisfactory results obtained from the first through service worked jointly by the L.C.C. and the company have led to a further agreement, under the terms of which through running will be extended to all routes of the Council and the company converging at Manor House Junction.

The scheme for the consolidation of the company's interests with those of the London United Tramways, Ltd., became binding in December last. The directors anticipate that the consolidation of the interests of the two tramway companies will effect substantial economies in administration and a reduction of working expenses generally.

The company is promoting a Bill in the present session of Parliament to authorise the installation of the railless traction system over a route connecting the company's tramways in Wood Green and Tottenham with the light railways belonging to the Walthamstow Urban District Council. The new system will, if sanctioned by Parliament, take the place of the light railway authorised by the Tottenham Walthamstow Light Railways Order, 1906, and will also open up a new area which at present is not served by the company's system.

The board of the North Metropolitan Electric Power Supply Co., in which the company holds 30,000 fully paid and 10,000 £5 paid ordinary shares of £10 each, have declared a 6 per cent. dividend upon the ordinary share capital, together with a bonus at the rate of 8s. per fully-paid share. The power supply business continues to show a satisfactory expansion; the total number of units sold during 1912 amounted to 29,231,099, an increase of 10·5 per cent. over the figure for the preceding year. A supply of electrical energy has been commenced in the district of Hadley, and during the present year arrangements are to be made for supplying the East Barnet area. The North Metropolitan Electrical Power Distribution Co., Ltd., which takes electrical energy in bulk from the power supply company in Barnet, Enfield, Hertford and St. Albans, has had a successful year, and has paid 6 per cent. upon its ordinary share capital, the whole of which is held by the power supply company.

The annual meeting was held on April 23rd at Electrical Federation Offices, Kingsway, W.C., Mr. E. Garcke presiding.

The CHAIRMAN, in proposing the adoption of the above report, said that the year had been a very eventful one in the history of the company. The five chief events had been, first, the coal and the transport workers' strikes; secondly, the conversion of the deferred shares of the company into ordinary shares; third, the motor-omnibus competition which they had had to meet; fourth, the arrangement made with the Underground Railway Co. of London, which effected an amalgamation of the Metropolitan Co. with the London United Tramways Co., and secured a working arrangement with the L.G.O. Co.; and fifthly, the question of the through running of tramcars from and to their system to and from the L.C.C. tramway system. The mere enumeration of those heads would convince them that the directors had had a very busy time with the affairs of the company during the past year, for they would see that the condition of affairs had been quite abnormal. The whole work, however, had been immensely interesting, because the situation had been exceptionally difficult, and they were especially grateful to the shareholders for the support they had given to the proposals which the board felt it their duty to make. On the other hand, the directors were able to congratulate the shareholders on having acted upon their advice. There could be no doubt about it that, if the shareholders and the board had not acted unitedly in those various delicate and difficult negotiations, the company would not have come out of the crisis as well as it had. They had reduced the dividend on the ordinary shares from 6 per cent. to 5½ per cent., but he might now confess that that result was better than he expected, in view of the competition between the motor-omnibuses. They would be struck, in the revenue account, by the similarity between the traffic receipts for the two years—they were £260,500 in each year. Although they obtained the same receipts in the two years, last year they carried more passengers and ran more car-miles; that was to say, they took less money per car-mile, and received less per passenger; in other words, they had to do more work and get less profit. They had to do that in order to maintain their hold on the traffic. Last year power and running expenses were £18,500 higher, and maintenance and renewals were £8,000 more. He was pleased to say, however, that insurance was £3,000 less, and that economies had been effected in other directions, but the fact remained that it had cost them about £24,000 more to earn the same income on their tramways as in the preceding year. That unfortunate feature was due almost entirely to the motor-omnibus competition. If it had not been for the improved dividend they had received from the Electric Power Co., and to the fortunate circumstance that they were able to collect under the head of sundry receipts some profits which had accumulated, the payment of an ordinary dividend of 5½ per cent. would have been out of the question. He thought the directors were entitled to take credit for foresight and prompt action in regard to the situation in which the company found itself when confronted with increasing motor-omnibus competition. At a relatively early stage they decided to provide motor-omnibuses of their own, so as to meet competition by competition of the same kind. The result was

quite effective, and at the special meeting last December he explained the course of events which had taken place, and which had resulted in the formation of the London and Suburban Traction Co., so as to establish a unity of interests between the Underground Railway Co., the London General Omnibus Co., the M.E.T. Co., and the London United Tramway Co. An important development as affecting the travelling public had been the arrangement made with the L.C.C. for the running of through cars. They anticipated that before many months were over through running would be established on all the routes converging at the Manor House. Those through running arrangements, unfortunately, involved additional capital expenditure, for they had to equip their cars for the conduit system. The capital expenditure had been as much as £111,000. Of this amount £25,600 had been spent on additions to and improvements of their rolling stock, and about £75,000 had been invested in debenture stock of the M.E.T. Co., and in preference shares of the London United Tramways, now exchanged into shares of the London and Suburban Traction Co. All the formalities were now nearly completed, and they hoped very soon to have the shares and the debentures of the new company officially quoted on the Stock Exchange. As to the prospects of the new company making sufficient profits to maintain and improve the dividend which the shareholders had received in the past, sufficient time had not elapsed since the formation of the new company to enable him to say very much more than he said at the special meeting last December. He could, however, assure them that the prospects were good, although he feared they would take somewhat longer to realise than they had anticipated. The negotiations which were proceeding with a view to the reduction of the competition between motor-omnibuses and tramways and for the co-ordination of the general traffic facilities were very complex and difficult, and while all the parties concerned were apparently doing their utmost to bring about less competitive conditions, the protection of the respective interests required a careful study of the facts and figures before they came to decisions which might have far-reaching consequences. The profits of the London and Suburban Traction Co., to which most of them were now looking for their dividends, were dependent upon the earnings of the London United Tramways and the M.E.T. Tramways and Light Railways, on the North Metropolitan Electric Power Supply and Distribution Co.'s, and last, but not least, upon the working of the 350 motor-omnibuses belonging to the M.E.T. Co., and an interest in 22 further motor-omnibuses owned by the Gearless Motor Omnibus Co. One important outcome of the amalgamation of interests was that the M.E.T. omnibuses, as they were put into service, took their place in the general omnibus system of London without any competition or hostility. Unfortunately it took a good deal of time to get those buses delivered and put into service. So far they had only succeeded in getting 100, but more were being delivered and passed by the police every week, and in the course of this year they hoped to have a very substantial addition to the fleet. It would be obvious that the revenue this year from that source would not be so much as it would be in subsequent years. The remaining profits of the London and Suburban Co. would be derived from investments in the Electric Power Supply and Distribution Co.'s, and those profits should be not only progressive, but they appeared to be assured. He could not speak of the future prospects by mentioning figures—those of them who had converted their holdings into shares of the London and Suburban Co. would, in due time, be informed of the position and prospects—but having presided for 11 consecutive years over those meetings, he could not say good-bye to the shareholders without expressing the conviction that they did the right thing to form the new company and amalgamate the various interests, and that those shareholders who made the exchange would not have cause to regret their action.

SIR ERNEST SPENCER seconded the resolution, and the report was adopted.

### Willans & Robinson, Ltd. and Redwood.

The directors have issued their accounts for the half-year ended December 31st, 1912, showing, after allowing £3,265 for depreciation, £5,176 for debenture interest, and £372 for the upkeep of the Queen's Ferry Works, a profit of £154. This improved trading result is mainly due to the increased volume of work referred to in the last report. During the opening months of the present year a large volume of further orders has been obtained and at somewhat better prices, a result largely attributable to the improved position of the company in anticipation of the rearrangement of capital and its attendant advantages. The directors therefore have every reason for hoping that the improving tendency as shown by the half-year's accounts will be maintained and augmented. The revised articles of association, as approved by the shareholders at the January meetings, were confirmed by the High Court on the 4th ult., and took effect from that date.

The meeting is called for May 6th at Cannon Street Hotel, E.C. The directors are raising additional preference capital, to which existing shareholders are entitled first to subscribe.

**River Plate Electricity Co.**—The net revenue for the year 1912 amounted, says the *Times*, to £41,175, as against £37,200; the dividend on the ordinary stock is 10 per cent., the same as for 1911; £18,000 is again placed to general reserve; £30,000 of the premium received on the issue of ordinary shares is also carried to general reserve, making that fund £145,000; and £10,416, as against £7,659, is carried forward.

### Johnson & Phillips, Ltd.

THE eighth annual general meeting was held on Thursday last week at Winchester House, E.C., Mr. Robert W. Blackwell presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 654), said that the accounts were a distinct improvement upon those of the past four years. The gross profit for 1912 amounted to £28,324, an advance of £9,924 over the figures for 1911. The sum of £6,000 had been first charged to revenue for maintenance of buildings and plant—that being the same as was taken in 1911, but a considerable increase over the amounts apportioned under this head during the previous years of the company's existence. Adding to the profit the balance brought forward from last year, they had to deal with a total of £29,357. From that they had to deduct directors', trustees' and auditors' fees and the £13,000 which they were required to devote annually to the service of the first debenture debt, which two items were as usual. Interest on the second debentures was somewhat higher than last year, as the total issue of £50,000 had now been outstanding for a considerable period. There was also the cost of issuing the £50,000 of second debentures, £2,006, which represented the difference between the face value of the issue and the net result to the company therefrom. They had allotted £2,500 more to depreciation on machinery and plant than last year, and they had written £1,306 off patents, licences, &c., which reduced that item to £10,000, a most reasonable figure. After those payments there remained a balance to carry forward of £3,315. While he freely admitted that the report was by no means all that the shareholders might properly desire, he would say that in his humble opinion the property of the company was steadily improving in value, and its business was regularly increasing along safe and conservative lines. The turnover had somewhat increased, and it was satisfactory that the improvement had been shared by every department of the works. So far as the present year was concerned they had got good orders, and their shops were running fairly full. The sundry creditors and bills payable at the date of the balance-sheet amounted to £84,299, while there was owed to them £125,931. The stocks and work in progress figured at £135,362, and they had £15,367 cash in hand. The stocktaking had been done on thoroughly safe lines. During the year they had added £3,077 to the capital account, as against £9,000 in 1911, which represented certain new machinery. Moreover they had done a great deal during the year to bring the works into a more up-to-date condition. The present state of affairs showed that they were on the way towards better things, but naturally they must husband their resources and build up for the company a strong financial position.

Mr. T. DENCE seconded the motion.

Replying to a SHAREHOLDER, the CHAIRMAN said it was a little difficult to explain shortly just why the company fell into more or less bad days. At the time the company was floated trade went very badly for about three or four years, and all similar companies had very troublesome times except those who had at their command a large amount of practically liquid capital. As a consequence of their not having sufficient capital, the business fell off. They also had to remember that very large sums of money had been invested by many individuals in the cable trade in the equipment of manufacturing plants of the very greatest possible efficiency, and they were able to meet those bad times with the assistance of the good times they had previously enjoyed. Johnson & Phillips had to struggle through as best they could. All along they had been greatly handicapped by the conditions under which the first debentures were placed—the £13,000 per annum which they had to place at the service of the first debenture debt had always been a load upon the company. The directors had to face the fact that they must build up the company out of its own resources, and they had been struggling for some years past, and not without success, to bring the whole plant of the concern up to where it should be, and to conserve such an amount of money as would strengthen its position, and enable it to meet competition successfully.

The report was then adopted.

### STOCKS AND SHARES.

Tuesday Evening.

DISHEARTENING and disappointing are two of the terms which were heard most frequently in the Stock Exchange this week, in connection with the latest developments abroad. It had been really thought that the situation admitted of peaceful solution, and certainly nobody was prepared for King Nicholas and Essad Pasha to go log-rolling as they have done. The immediate result was to lower prices practically all round the Stock Exchange, rather from protective purposes than on account of any rush to sell. Austria's action precipitated a slump on this (Tuesday) afternoon, and the House, at the time of writing, is very doleful.

The Home Railway market felt the full force of the imbroiglio, which it was ill prepared to stand, because of a bull account that had been reared in certain of the speculative issues. Prices promptly turned tail. Metropolitan fell 1, and so did Districts, these two escaping comparatively lightly in the *malaise*: while the Central London Ordinary and Deferred stocks both braced up, though the improvements, of course, came before the foreign political news grew grave. The firmness continues amongst prior charge stocks. District Debenture at 139 is a point up, and various other small rises—scarcely sufficient to be marked in the nominal quotations—have occurred.

The accident last Saturday morning on the District, whereby traffic was badly impeded for several of the busiest hours of the day, gave rise to speculations as to what would happen if anything similar happened to one of the Tube lines, where there is less room to move than there is even on the District Railway. Metropolitan Electric Tramway shares are  $\frac{1}{2}$  down; but no further falls have occurred in British Electric Traction issues.

The news from Mexico is read as being somewhat alarming, and most of the stocks and shares connected with that country have given way during the past few days. Nervousness is not mitigated by the difficulty of obtaining authentic information with regard to what is actually going on. Mexico Tramway Seconds have given way, and the Common shares fell  $\frac{1}{4}$ . Mexican Electric Light bonds fell 1, and Mexican Light and Power Common shed 3. The Company's bonds, with Monterey 5's, weakened a little. The stocks of nearly all the railway companies operating in Mexico have been offered with liberality. At the same time, it is stated in some quarters that the disturbances in Mexico are being fomented for reasons not entirely disconnected from finance; but any irresponsible rumour about Mexico does duty nowadays to affect the markets in Mexican securities.

Most of the few changes which have occurred this week amongst foreign railway and tramway issues are due to the marking of the prices *ex-dividend*. Brazil Traction, for instance, are *ex*  $\frac{1}{2}$ , but are 2 points lower in addition. British Columbia Deferred is *ex* 4, Columbo bonds 2 $\frac{1}{2}$ , and so forth, allowing for which, the real changes are insignificant. Rio Tramways bonds and Sao Paulos are both being bought for investment. The Anglo-Argentine division keeps steady, apart from a decline of  $\frac{1}{8}$  in the Company's Second Preference shares. Northern Light and Power bonds have been marked up 5 to 20.

Amongst English Electricity Supply prices the principal changes are confined to  $\frac{1}{2}$ . County Preference gained this fraction, which was lost, however, by Charing Cross Preference and Kensington and Knightsbridge Ordinary. County First Debenture regained its small fall of last week, and Metropolitan First Debenture stock rose 1, though the Seconds lost a like amount. The market in the shares is extremely quiet.

Advance particulars were circulated early in the week of a forthcoming issue of £700,000 5 per cent. Consolidated Debenture stock by the Consolidated Gas, Electric Light and Power Company, of Baltimore, at the price of 96. Underwriters were offered 2 $\frac{1}{2}$  per cent., and there was a rush on their part to take advantage of it. The prospectus showed last year's profits to have covered the Debenture interest 10 times over.

The Telegraph market is quiet, with small falls in Amazons, Direct United Cable, Indo-Europeans, and West India and Panama Ordinary, though the Second Preference shares of the last-named are  $\frac{1}{2}$  up at 104. Cuba Ordinary rose  $\frac{1}{2}$  on the dividend declaration. American Telephone stock at 133 is again easier, in sympathy with the depression prevailing in the American railroad market, which, so far, has little for which to thank the advent of the new President. Indo-Europeans went back to 60, although the report is a good one. The company is experimenting with a new wireless system.

National Telephone Deferred stock fell to 17 $\frac{1}{2}$ , but hardened to 20 $\frac{1}{2}$  upon the publication of the figures showing how much money will be left over for division amongst proprietors of this stock. Marconis, after active passages, settled down to the neighbourhood of 4 $\frac{1}{2}$ , the market being a dullish one. Sellers came in of Canadians and Americans. Marconi Preference fell  $\frac{1}{2}$ . Oriental Telephones are firm upon a satisfactory report. The Constantine Telephone Company, according to its report, is getting along as well as can be expected, all things considered. The £5 Preference shares are quoted at 4 $\frac{1}{2}$  middle.

Babcock & Wilcox Ordinary are *ex* 1s. 9d. dividend, allowing for which the shares show a rise of a few pence. Callenders rose  $\frac{1}{2}$ , but Henleys Preference at 4 $\frac{1}{2}$  display a small fall. The principal rise in this department has been secured by India-Rubber shares, which spurred to 11 $\frac{1}{2}$ . British Westinghouse Debenture stock rose 1 on the publication of the report for the year 1912. Castner-Kellners have hardened to 3 $\frac{1}{2}$  on substantial support from the provinces. The rubber share market is dull, the heavy supply of the raw stuff every fortnight at Mincing Lane being the main reason for the depression.

### Stock Exchange Notices.—The Committee have appointed special settling days as under:—

Thursday, May 16th.—Water Softeners (France), Ltd.—25,000 vendors' shares of £1 each, fully paid (Nos. 55,001 to 78,250).  
Water Softeners, Ltd.—120,000 vendors' shares of £1 each, fully paid (Nos. 62,501 to 182,500); and a further issue of 17,600 shares of £1 each, fully paid (Nos. 182,601 to 200,000).

And ordered the undermentioned to be quoted in the Official List:—

British Columbia Electric Railway Co., Ltd.—Further issue of £750,000 4 $\frac{1}{2}$  per cent. perpetual consolidated debenture stock.

**Eastern Extension, Australasia and China Telegraph Co., Ltd.**—The directors announce a dividend for the quarter ended December 31st of 2s. 6d. per share, together with a bonus of 4s. per share (or 2 per cent.), free of tax, making a total distribution of 7 per cent. for 1912.

**Craigpark Electric Cable Co., Ltd.**—Net profit for year ended March, 1913, £7,437. A dividend of 5 per cent. is to be paid on the ordinary shares.

## GAS AND OIL ENGINES FOR ELECTRIC SUPPLY STATIONS.

By A. N. RYE.

From time to time a number of articles have appeared in the technical Press dealing with the generation of electricity by gas and oil engines.

Certain of these articles have dealt with private supplies, and have been of considerable interest, but the conditions of public supply are so different from private supply that it is by no means certain that a type of machine which has been satisfactory in one case will be equally satisfactory in the other case: for instance, the question of reliability is of so much more importance to a public supply than to a private plant.

The articles dealing with gas and oil engines for public supplies have, in many cases, been of the nature of estimates, and many engineers are not satisfied that the figures put forward can be obtained in actual practice.

Under these circumstances engineers may be interested in the results obtained in a central station depending almost entirely upon gas and Diesel engines, and where both classes of engines are run in the same power house by the same staff and under the same conditions.

The public supply of electricity in the Island of Guernsey is undertaken by the Guernsey Electric Light and Power Co., Ltd., the supply was started in 1900 from a small station at Les Amballes, equipped with the plant usually installed about that date, *i.e.*, Belliss engines, Babcock boilers, surface condenser, economiser, battery, &c.

At a later date a demand for power developed in the granite quarries at a distance of about  $2\frac{1}{2}$  miles from the generating station: as this load increased it became impossible to deal with it from the Les Amballes station, and a new power station was built at St. Sampson's in the centre of this load, and the Les Amballes station was continued principally to supply the lighting demand in and around the town of St. Peter Port.

The first plant installed in 1904 at the new station at St. Sampson's consisted of two gas-driven sets nominally of 180 kW. each, together with pressure gas producers and a battery of 1,200 ampere-hours, 420 volts, capacity. Later in 1908 another set of 220 kW. was added. Early in 1911 a Diesel driven set of 165 kW. was installed, and in

December, 1912, another similar set was put down. At the old station at Les Amballes, certain steam plant was dismantled in 1911 and two Diesel-driven sets, each of 135 kW., were installed. Under normal conditions the whole of the load at both stations is carried by the gas and oil-driven plant, the steam plant being used only as a reserve during repairs to the more economical, but less reliable, internal combustion engines.

It will be seen that no engines were installed during 1912, except the last set at St. Sampson's, and this was not running until 1913; consequently in the following figures all the results are from engines which have run at least one year, and the majority for a longer period.

During 1912 the gas and oil engines generated 1,865,236

units, of which rather more than half was generated by the oil engines; consequently both classes of plant had to run for long hours.

Very careful monthly records were kept of the performance of each class of plant, and the accuracy of these figures is proved by the fact that the total of the invoices for coal and

oil for the year exceeds the sum of the monthly figures by less than  $2\frac{1}{2}$  per cent., and this difference is probably due to small losses in storage, &c.

The figures in Tables I, II and III, being abstracts from the monthly records, are worked out on the units generated, the units sold not being available each month.

In comparing the performances of the different types of engine, there are certain points to be taken into consideration.

In the case of the gas engines, it must be remembered that two of these engines are more than eight years old; in 1911, they had got into a bad state of repair, with worn pistons, worn liners, &c., and it was decided to thoroughly overhaul all the gas engines and gas plant. This work was not completed until July, 1912, and the high fuel consumption of

the first three months of 1912 is entirely due to the condition of the plant, and should be neglected when making comparisons. If, then, the months of April, May and June, are compared, it will be seen that there was practically no difference in cost per unit for fuel between the gas and oil engines, but later in the year, although the cost of coal increased, the cost of oil increased in a much greater ratio, and for the months of October, November and December, the gas engines were very decidedly cheaper in fuel cost. This difference in cost is even more marked at the moment of writing, so much so that the Diesel engines are being run as little as possible, and the gas engines as much as possible. This preference for the gas plant is entirely due to the enormous increase in the cost of fuel oil, which has gone up 75 per cent. in price in less than two years.

In Tables II and III, if the "lb. of oil per unit" column is examined, the wonderfully even running of the Diesel engines will be noticed.

Table III shows this to most advantage, because the load factor of these engines is more nearly constant from day to day, and also because the engine in Table II has developed

Under 'favourable circumstances, these machines are economical, but it must not be forgotten that there are other expenses besides the fuel bill, and the fuel bill of the internal-combustion engine must show a handsome saving to justify the use of this class of plant.

Of the two, the Diesel engine appears to have certain advantages for central-station work, but, as long as the market for oil is subject to such severe fluctuations, the use of this engine is likely to be restricted to special cases.

The most useful field for the internal-combustion engine appears to be in small central stations; as the size of the station increases, the advantages of this type of plant decrease, until a point is reached where internal-combustion engines can only pay in exceptional circumstances, and at the present date this point appears to be reached when a station under average English conditions is of sufficient size to use steam turbines of 1,000 kW. or larger.

The results in Guernsey have fully justified the installation both of gas and Diesel engines, the great saving in the fuel bill being more than sufficient to balance the increased costs in other directions.

## THE DEPUTATION.

[COMMUNICATED.]

"You might arrange to meet the 10 o'clock train on Wednesday and show the deputation from Mudcombe over the destructor." Such were the instructions from headquarters, which brought me to the railway station to scan with anxious eyes the mass of humanity which poured off the train. But there was no need for anxiety; the deputation stood self-confessed; five men in shiny top hats, who walked down the platform as if they owned the place. I approached the group and addressed the gentleman at the head of the procession, who proved to be the Chairman of the Committee, and I was duly presented to the Mayor, the vice-chairman, an Alderman, and, as an after-thought, to the fifth individual, who was the engineer.

At the station entrance they looked round as if expecting some conveyance, but I explained that the destructor was less than five minutes' walk away; however, it took longer than that, because a public-house lay on the route, and, after a hasty consultation, they adjourned within, all except the vice-convenor, who said he would stay outside with me. I assured him that it was not necessary, but he said that he had had a drink already that day, and I soon found that if he had no thirst for liquor he had an insatiable thirst for information, mostly, however, of a useless character. He told me that they had been delegated to visit the principal combined refuse destructor and power stations in the country to find out the best and most economical method of disposing of town's refuse, and wanted to know if at our installation we destroyed it by burning or in some other manner. I told him we burnt it, and that as far as I knew there was no other method of dealing with it. "Oh, yes," he said, "in one of the towns we visited they compress it in hydraulic presses and sell it." I gently suggested that he must be thinking of the tins which were recovered from the refuse, and which were compressed to reduce the bulk, but he stuck to his point that it was the refuse that was compressed, though he could not explain why that destructor should be taken to a power station.

When we arrived I understood the reason for his hopeless ignorance, for at the destructor door a gust of wind smothered them with a cloud of fine dust such as a destructor alone can produce, and he decided that he would remain outside to rearrange his notes while the others had a look round. Later on, when I crossed the yard, he was standing beside the screened clinker bin and called me over to ask how much a ton we paid for it; I said "ninepence," thinking he meant to ask how much we sold it for, but he transfixed me with a glittering eye and said, "Don't tell me, young man, that you can buy coal at 9d. a ton; you mean 9d. a hundredweight." I explained that the stuff wasn't coal, but clinker—the residue left in the furnaces after the refuse was destroyed—and that we crushed and screened it and sold it for building material at 9d. a ton;

he didn't seem convinced, and wanted to see the coal that we mixed with the refuse to make it burn. I assured him that no coal was used, that ordinary refuse was quite capable of burning alone, but by that time he was sure that I was a stranger to truth, and looked at me in a manner which showed that he, at any rate, had no doubt that my future was warmly provided for.

I mollified him to some extent by expressing a deep interest in the investigations which he and his party were carrying out, and asked as a great favour that he would send me a copy of their report. He promised to do so, but it has not come to hand, and I fear that I shall now never have the enjoyment that I have looked forward to for months, of reading that report on destructors.

The other members of the deputation were also interesting characters in their way. The chairman seemed anxious to do his duty; he examined everything and wanted everything explained to him. When any of the explanations seemed to him to be important, he would say: "Dear me! How interesting! You might say that over again, very slowly," and then he would start and write it down word for word in longhand.

On several of these occasions the Alderman would break in and say, "Do hurry up, Jenkins, and let's get out of this beastly place: the dust makes my throat awfully dry." I felt a sympathy for the man, and offered him a drink of water, but he seemed to think I was making fun of him, and when the Mayor, who overheard me, laughed, he was quite hurt, and went outside, probably back toward the railway station.

The Mayor, on the other hand, took his duties very lightly. He handed me a list of typewritten questions, and asked me to fill in the answers while he spent his time in dodging out of the way of dust and smoke.

I don't know who drew up the questions, but half of them were silly and the other half were useless, as far as supplying information was concerned; of course, it was easy to see the force of Question 1, which asked for the name of the town; but why Question 2 should ask if you have a refuse destructor beat me; then, when Question 3 wanted to know if it was used in conjunction with a power station, and the deputation was visiting combined plants only, I began to understand why the man preferred to hand the sheets over to be filled up rather than ask the questions.

When the subject of destructors had been exhausted, the remains of the deputation took a walk round the engine room, while I went to the desk to fill up the Mayor's sheets; the chairman of the Committee was just explaining to him, when I left them, that electricity was produced by rubbing copper and vulcanite together; they were standing beside a commutator, and I expect he was vaguely recalling some of his earlier lessons in frictional electricity, and trying to impress the Mayor with the insight which he had into the work of the department. The engineer, who was within hearing, made no comments, but he looked interested.

The deputation were going on to another town in the afternoon, but were not to visit the destructor till the following day, so they borrowed the telephone to ring through and book seats at a pantomime for that evening.

The entry in the visitors' book was characteristic of the deputation—"We are very pleased with our reception, and with all that we saw."

## PROCEEDINGS OF INSTITUTIONS.

### Faraday Society.

#### GENERAL DISCUSSION ON COLLOIDS.

FOR some years past it has been the practice of the Faraday Society to devote one meeting a year to a general discussion on some physico-chemical subject of special current interest. The subject chosen on the present occasion was "Colloids and their Viscosity," and the discussion took place in the presence of a crowded audience, on the afternoon and evening of March 12th last. As usual, the proceedings opened with the reading of papers by some of the most distinguished exponents of the various aspects of the subject, and the Society is to be congratulated on having induced so many eminent foreign investigators to come to London in order to present in person their contributions to the discussion.

In the absence of the President through indisposition, the chair was taken by MR. EMIL HATSCHKE, himself one of the foremost workers in this field of physical chemistry, and the set speakers were as follows:—

DR. WOLFGANG OSTWALD, of Leipzig: "The Importance of Viscosity for the Study of the Colloidal State."

PROF. VICTOR HENRI, of Paris: "The Measurement of the Size of Colloidal Particles and the Relation of Size to Viscosity."

PROF. WOLFGANG PAULI, of Vienna: "The Viscosity and Electrochemistry of Protein Solutions."

PROF. H. FREUNDLICH, of Brunswick: "On the Rate of Coagulation of  $Al(OH)_3$  sols as measured by the Viscosity Change."

MR. EMIL HATSCHKE: "The General Theory of Viscosity of Two-phase Systems."

Those who took part in the discussion which followed included Dr. S. B. Scheyver, Dr. W. Ramsden, Dr. P. Schidrowitz, Prof. J. W. McBain, Prof. T. Turner, Mr. F. P. Worley and Dr. C. J. Martin. Space will only permit us to indicate in briefest possible outline the scope of the discussion.

We will preface our remarks by stating that a so-called colloidal solution is one in which the solute is in an exceedingly fine state of suspension, too fine to be visible excepting, in some cases, by means of some special contrivance like the ultra-microscope, but still of such dimensions and state that a colloidal solution can always be regarded as consisting of two phases—the solvent or "continuous" phase and the colloidal suspension or "disperse" phase. Colloids can be roughly sub-divided into substances which are not normally in the colloidal state, but can be induced into it by special treatment, such as gold, silver, ferric hydroxide, and other inorganic substances, and those which dissolve at once to form colloidal solutions, organic bodies like gelatine, albumin, starch, agar, &c. In the case of the former type of colloidal solutions, the viscosity differs little from that of water; and hence it is inferred that the "disperse" particles are in a solid state. The viscosity of organic colloidal solutions is mostly very considerable, and the inference is that the "disperse" phase here consists of liquid particles. An albumin sol would thus consist of a dilute solution of albumin, in which are dispersed globules of a much more concentrated solution. This distinction at once suggests how much may be learnt about colloids from a study of so typical a characteristic as their viscosity and its changes, and the study is likely to throw light not only on the constitution of colloidal solutions, but even on that of molten solids and crystalline liquids, usually supposed to be homogeneous. It was this aspect of the subject which was dwelt on by Dr. Ostwald. Mr. Hatschek described the mathematical treatment by which he has obtained formulae for the viscosity of the two types of colloidal systems, assuming one to consist of suspensions of undeformable spheres, and the other of two liquids, freely deformable, in which the disperse phase occupies the larger part of the volume, and assumes a polyhedral structure. An interesting deduction is that the viscosity of the former type of solution is independent of the size of the particles in suspension. Prof. Pauli showed how viscosity measurements have thrown light on the state of ionisation of protein solutions, and he pointed to further possibilities in the study of the constitution of starch, lecithin and other emulsions. It is well known that the first class of colloids referred to above, which consist of minute solid particles in suspension, are precipitated or coagulated by the addition of an electrolyte to the solution by the ions of the electrolyte disturbing in some way the electrical equilibrium of the colloidal suspension. Profs. Freundlich and Ishizake contributed to the discussion a study of these coagulation phenomena, as they occur in an aluminium hydrate colloidal solution, and they ascribe the coagulation to the fact that the minute colloidal particles do not absorb equal numbers of ions. These fluctuations give rise to differences in the charges, and consequently to coagulation.

Direct practical applications of the subject were dealt with in the course of the discussion, chiefly by Dr. Schidrowitz, who spoke on the relationship between the viscosity of rubber and its quality, as shown by vulcanisation tests, and Prof. T. Turner, who drew attention to the importance of the study of viscosity in connection with the properties of metals and alloys. The viscosity of several metals in the fluid state had been found to be only a few multiples of that of water, but as the metals cooled and solidified, of course their viscosity increased. There was a striking resemblance in their behaviour to that of colloidal solutions of the second class, the discontinuous phase corresponding with the less fusible portion of the metal, which first solidified, while the continuous phase was the mother liquor. Prof. Turner pointed out that the fact that when metals which had been cast were first rolled, their density increased, but by further rolling it tended to decrease, had a parallel in the behaviour of colloids, and a very interesting field for further inquiry was thus opened up.

### Physical Society.

At the meeting held on Friday, April 11th, a paper "On Errors in Magnetic Testing due to Elastic Strain," by MR. A. CAMPBELL and MR. H. C. BOOTH, was read by MR. CAMPBELL.

In magnetic tests on sheet material, considerable errors may occur if the sheets or strips are tested while in bent form. These errors, which are in general agreement with the known effects of compression and tension, were investigated experimentally with one or two forms of magnetic circuit similar to those sometimes occurring in practice. In one method a single length of the strip was bent into ring form, with ends clamped together. This was wound with flexible primary and secondary coils, and tested for permeability and hysteresis, while in the condition of temporary

strain. The temporary strain was then annulled by changing the circular form into a square by sharp bends at four places. The magnetic tests were repeated, and usually a considerable alteration was observed. For example, a silicon-iron ring, 0.3 mm. thick and 50 cm. in diameter (the size used in Richter's method of testing hysteresis and eddy-current losses) showed a decrease of 40 per cent. in the permeability for  $H = 1$ , due to the bending. The hysteresis loss was increased by 19 per cent. In another method, the ends of two strips were clamped in yokes, and tests were made with different amounts of bending. It was found that temporary strain had considerably greater effect on the permeability than equal permanent strain had.

A "Note on Cathodic Sputtering" was read by DR. G. W. C. KAYE. The paper gives an account of the volatilisation of an aluminium cathode in a discharge tube containing helium. The sputtered deposit on the glass indicates that, under the conditions which prevailed, the disintegration was restricted to the edges of the cathode and did not occur elsewhere. Accordingly, the complete outline of the cathode (made by rolling a sheet of aluminium into a nearly complete cylinder) was traced out by the deposit on the walls of the tube. The size of the particles depended chiefly upon the nature of the gas in the tube. The method had been considerably used for preparing extremely high resistances, though the film had to be annealed first. He believed the thinnest films did not accurately obey Ohm's law. The adherence of the film varied with the metal. Gold adhered to glass well, but platinum was easily rubbed off till it had been heated to redness.

A paper on "Vibration Galvanometers with Unifilar Torsional Control" was read by MR. A. CAMPBELL. The author exhibited a moving-coil vibration galvanometer, in which a novel principle is used to obtain the fine adjustment of the control torque requisite for accurate tuning. He has found that in a phosphor-bronze strip under tension the torsional rigidity is considerably increased as the tension is raised. If unifilar (strip) suspensions are used in a vibration galvanometer (whether of moving-coil or moving-iron type) the tuning can be done in just the same way as with bifilar suspension. In the moving-coil instrument, minute hooks on the ends of the strips engage in contact hooks at the top and bottom of the coil, which is easily detachable. With a mirror of 15 sq. mm. area, at 100 cycles per second, a sensitivity of 50 mm. at a metre per micro-ampere can be obtained, the effective resistance being about 700 ohms.

### Standard Clauses for Street Lighting Specifications.

(Discussion on paper by MR. A. P. TROTTER, presented to the ILLUMINATING ENGINEERING SOCIETY, April 15th, 1913.)

IN opening the discussion, MR. A. P. TROTTER stated that the subject was admittedly controversial, and the object of the paper was rather to stimulate discussion than to indicate conclusions. The field to be covered was so extensive that the nature of the illuminant and its fittings, &c., was left out of consideration by the specification. What had been sought was a specification which would permit certain results to be reproduced by following written instructions, and which would enable borough surveyors and others to determine whether a certain installation was to be regarded as satisfactory or otherwise. The first question to raise discussion in the Committee was whether the C.P. number, spacing and height of lamps should be specified, or whether the illumination to be received should be specified, and the attainment of this result left to the competitive skill of contractors. It had been objected that an illumination specified by its minimum value would be a low illumination, but only in very brightly-lighted streets was a low diversity factor obtained. In ordinary streets, the diversity factor was high, hence the adoption of the minimum illumination as criterion would not involve low illumination. A strong argument in favour of a specification by illumination was that the classification by minimum horizontal illumination agreed with the findings of the eye, and the fundamental aim of street lighting was to produce illumination agreeable to and sufficient for the needs of the eye. It was desired that a specification should be framed which would be acceptable for use all over the country; hence the discussion should be conducted in an unprejudiced and broad-minded manner.

MR. W. H. PATCHELL (chairman of the Joint Committee) said that the Committee had not been able to arrive at definite conclusions in certain respects, and had been faced with three alternatives: the coercion of the minority; the modification of the specification; or the education of people up to the present specification. In the hope of achieving the latter aim, the present discussion had been arranged. The most striking feature in the Committee's work was the surveyors' report, and its corroboration by tests. The curves in the paper showed that the surveyors realised exactly what they wanted, and were able to judge when they had got it, but hitherto it had been very difficult to specify street lighting in such a manner that the desired results could be ensured. This difficulty the specification was intended to remove. Views of the police authorities and motor-drivers had been collected by the Committee.

MR. F. W. GODENOUGH (chairman of Council of the Illuminating Engineering Society) said that the society's aim was to study illumination, and to raise its standard; in the present connection, the sole object was to ascertain what would be a satisfactory specification, enabling the public to secure the type and result of illumination required. Did the draft specification lead to this result, and, if not, in what respects should it be amended?

MR. H. T. HARRISON agreed with the author that lighting authorities "should settle what it is they want to buy, and, having specified it, leave details to the competitive skill and wider experi-

ence of contractors." What it was required to buy was illumination, yet, up to a few years ago, the light provided by a street lighting equipment was never considered, and even now it was common to specify simply that so many lamps should be placed on so many posts along so many yards of street. His only objection to the basis of minimum illumination was the difficulty of measuring very low illuminations, and this was admitted and provided for in the specification by the clause permitting the minimum horizontal illumination to be arrived at by calculation. The intelligent use of the specification would result in the best possible allocation of the total expenditure permissible and would secure the best arrangement of the lamps. In moderately lighted streets, lamps of low C.P., placed, say, 50 ft. apart marked out the curb line and rendered pedestrians easily visible. What was so objectionable to motor and other traffic was high C.P. lamps placed far apart, and this was obviated by the specification, which fixed the minimum illumination permissible. Street lighting specifications had been framed in other countries, and had generally depended on the fixing of a certain minimum illumination at a certain height above the ground. There were several reasons why this height should be 1 m.; first, this height was the most convenient for photometric purposes; secondly, it was roughly half-way between the ground level and that of pedestrians' faces, and these were the two planes it was desirable to illuminate well; thirdly, if the illumination was satisfactory at 1 m. from the ground, it would be more than satisfactory at ground level, since a considerable volume of low-angle light which reached the latter escaped measurement at 1 m. above ground. The third reason, though rarely cited, was perhaps the most important; 0'01 ft.-candle, 1 m. above ground, frequently corresponded to 0'02 ft.-candle on the ground level. He preferred to measure candle-power, and thence calculate illumination, because 90 per cent. of his work had been conducted in streets lighted by 50 or 100 C.P. units. To measure the illumination received from such lamps at 100 ft. distance was to court inaccuracy, hence he measured the C.P. (in the appropriate direction), at 20 ft., and calculated the 100 ft. data. This procedure was still permissible under the proposed specification, which, all things considered, he thought the best possible.

MR. R. WATSON (gas manager, Doncaster; member of Joint Committee, representing Institute of Gas Engineers) said that some lighting authorities favoured appraisal of street lamps by their polar distribution of candle-power, but no great objection had been raised in the Joint Committee to street tests of illumination and the acceptance of the minimum illumination basis. There was, however, difference of opinion as to the manner in which the minimum illumination should be computed. The draft specification proposed that street illumination should be appraised and expressed in horizontal foot-candles, but those members representing the I.G.E., and at least one municipal representative did not consider that this basis afforded any true guide to the actual illumination received and used by people in the street. Nor did they consider that these values equitably represented the comparative merits of lamps of different polar distribution or different heights and location. For "certain reasons," the electrical industry had always practised horizontal-plane measurements, and, owing to inadequate representation in the Committee, the views of those representing the gas lighting profession were not reflected in the draft standard clauses. In the speaker's opinion, the illumination which municipalities were, or should be, "out to buy" was of direct-ray character, hence the C.P. of any lamp or its direct-ray foot-candle equivalent at the point of minimum illumination was of great importance. Persons and vehicles, &c., were seen and avoided by aid of direct-light falling upon them or by their silhouette against lamps behind them; vehicle drivers were not particularly interested in ground illumination—still less in the horizontal-plane illumination 3 or 4 ft. above ground; one could conceive of nothing but direct light being of service in avoiding collisions in cross traffic. Apart from the view that the horizontal plane method of appraisal did not apply to the chief uses of street illumination, Mr. Trotter admitted that with 80 per cent. of the lighting of the country, it could not be used at all; in these cases, candle-power measurements were to be adopted—i.e., the appraisal and expression of the illumination obtained were to be virtually in direct foot-candle values, and the desired uniformity of methods was as far away as ever. The specification legislated for only 20 per cent. of the lighting of the country and demanded computation by methods as to which there was still fair diversity of opinion at home and abroad. American gas and electric authorities appraised street lighting by the light received on a screen perpendicular to the light ray. The German Association of Gas Engineers did not support a minimum illumination specification, but favoured the stipulation of candle-power for contracting purposes. The German Electrical Association, as a result of a comparison between horizontal and vertical plane methods, required a statement of maximum, minimum and mean illumination. Horizontal plane computation did not make possible a fair comparison of lamps with different heights, location and polar distributions. To ensure well-distributed and diffused illumination, it might be deemed advisable to use closely-spaced lamps of moderate height. Evidence of the value of such a scheme would be obtained by direct-ray testing, but, by the horizontal plane method, the obliquity of the light on the test screen would lead to very low readings, and higher lamps, while not giving the illumination desired, would yield higher figures. Owing to the varying importance of the cosine factor, there was little difference between horizontal and direct-ray measurements in the vicinity of lamps, but the values midway between lamps were quite different—which seemed to suggest that the horizontal method was inconsistent. Table I in the paper

showed a diversity factor as high as 67 in one case—a diversity of which the eye was not conscious, because it used direct rather than horizontal plane illumination. In the recent gas-electric comparisons in Manchester, several witnesses had agreed that, so far as the eye could judge, the illumination was equally good in both cases; horizontal plane tests were required to suggest any difference. So far as concerned reflection effects, the direct-ray instrument (comparison screens side by side) was more likely to yield true results than the horizontal-plane photometer (screens in and out of box). Prof. Morris had furnished data comparing (a) measurement of illumination from several lamps on a horizontal test screen (0'0188 foot-candle); (b) measurements of direct light received from the several lamps, and subsequently reduced to the horizontal basis and added (0'0147 foot-candle). The discrepancy between the two cases was 22 per cent., and the experiment suggested how difficult it was to get reliable data with a horizontal test screen. The higher readings of direct-ray instruments tended towards the elimination of errors due to personal equation, colour troubles, and the instrument and its usage. Some advocates of the horizontal method of computation preferred to take direct-ray readings and reduce to the horizontal plane basis. He believed he voiced the opinion of the great majority of members of the I.G.E.; they asked that, at least, clauses be included giving the alternative of reading the specification as dealing with minimum illumination computed and expressed in direct-ray foot-candle values.

MR. J. G. CLARKE (Gas Light and Coke Co.) said that he had had experience with horizontal illumination photometers, but disagreed with horizontal illumination as a basis of specification. Hitherto contract and public lighting specifications had been based on candle-power values which could be defined exactly and enabled an exact understanding to be reached. Horizontal illumination measurements were useful, but it was not possible to specify horizontal illumination as accurately as normal illumination at a certain angle (i.e., candle-power). He denied that there was any mathematical complexity in working with candle-power values; all the necessary calculations could be effected by slide rule, and were preferable to the extended exploration frequently required to determine the point of minimum illumination in a street before the value of this illumination could be measured. Curves were exhibited to show that the point of minimum illumination was sometimes on the footpath and sometimes in the road. When it had been found, the absolute value of the illumination was so low that not more than 10 per cent. accuracy could be secured in its measurement; if the minimum horizontal illumination specification were retained, the position in which illumination was to be measured should be specified in order that a perambulatory search might be avoided. Reflection from walls was often an important factor, particularly if the walls were glazed; shop lighting also interfered with the measurement of minimum illumination, and compelled observations to be taken after shop hours. The strongest argument in favour of the horizontal minimum illumination specification was the agreement between the classifications provided by it and the surveyors' report. However, the separation of the groups of streets was not well defined—a slight change of illumination in one direction left a street in Class A, say, whereas an equal change in the opposite direction changed its classification. Probably effects of diffusion, glare and vertical wall illumination (in addition to horizontal illumination), affected the judgment of the surveyors in making their classification. As regards the height of the test surface, it seemed only fair to proportion this to the height of suspension of the lamp, otherwise lamps giving low angle illumination were penalised. In streets, the lighting on a vertical plane determined the ease with which pedestrians could be seen. The arguments in favour of direct-ray specification and measurement were (1) greater accuracy, (2) equal justice to all systems, (3) expedition, (4) more precise definition of terms, (5) applicability to all systems of lighting, and hence the possibility of a uniform specification requiring no alternative methods of measurement. Diffusion was a more important factor, and the speaker had obtained favourable results in preliminary tests with a shadow density instrument arranged as shown in the accompanying diagrammatic sketch. A tube T, about 35 in. square, was provided with an observation mirror M and a stationary screen S of any

translucent material having no pronounced grain. A movable perforated screen G, actually of fine gauze, was carried by a graduated rod R and was adjusted till the shadow cast on S by the received illumination L disappeared. The smaller the displacement  $d$  required to make the shadow vanish, the more perfect the diffusion of the illumination observed.

MR. FRANKLIN THORPE said he felt that the direct ray specification and test was better than that of horizontal illumination, and he endorsed the arguments advanced by the last two speakers. He trusted that in the final specification account would be taken of the character and equality of the lighting effected as well as of the actual illumination. The candle-power of the lamps used was not a good criterion, owing to the importance of the distribution curve. Even if the M.H.-s. C.P. were considered, it was difficult to secure consistent results when the distribution curve became asymmetric, as

was the case, for instance, in some rectangular gas mantles with which he was experimenting, (the edges being placed across the street in order to reduce the present loss of light incident on side walls). In such cases, Mr. Trotter's method had to be employed, but the speaker would like to see direct-ray substituted for horizontal illumination measurements. In his opinion, Mr. Harrison's table in the paper afforded the best possible argument in favour of direct-ray measurements. For example, a minimum horizontal illumination of 0.01 foot-candle was produced by 33.7-c.p. lamps at 10 ft. height and spaced 70 ft., or by 32.6-c.p. lamps at 36 ft. height and 100 ft. spacing, but it was absurd to contend that the illumination produced was similar in the two cases—as was the practical effect of the specification. The direct-ray test showed a 7:1 distinction between the two cases. The height of the photometer did not affect the conclusion reached by direct-ray measurements, but was of prime importance in the horizontal illumination method since it penalised low lamps—for instance, with 100 ft. spacing, 62-c.p. lamps hung 14 ft. high provided 0.01 ft.-candle minimum horizontal illumination, but 95-c.p. lamps were required to conform to the specification if the height of suspension were only 10 ft.

MR. K. EDGECUMBE (member of Joint Committee representing the Institution of Electrical Engineers) stated that he had long been in favour of specifying street lighting by the horizontal illumination to be produced, and this opinion was confirmed by reading the present paper. It had been objected that horizontal illumination measurements were purely physical, and took no account of the physiological aspects and effects of the illumination. The very merit of the proposed basis of specification lay in the fact that it gave results in absolute concord with the classification arrived at by experts who purposely allowed every physiological effect to sway their judgment. It might be quite satisfactory to work on a direct-ray basis, but it was indisputable that minimum horizontal illumination was a reliable criterion of the eye-value of the illumination as a whole. It had been contended that direct candle-power measurements offered the advantage of simplicity in application, but Mr. Trotter—who was in a position to speak with authority—said that there was no difficulty in measuring so low a horizontal illumination as 0.006 foot-candle, and that he would prefer to measure it directly. It did not seem to be generally realised that the specification left the observer free to measure candle-powers and calculate horizontal illumination if he so desired—whether the illumination was less than 0.01 foot-candle or not. The horizontal illumination at a certain point in a certain plane was a definite quantity, but the direct-ray illumination falling on this point had different and unrelated values according to the direction of observation selected. Yet another alternative was the Westminster specification; this controlled the c.p., height and spacing of lamps, the angle at which measurements were to be made and, as a guard against freak lamps, necessitated the proviso that only horizontal reflectors should be used. It was needlessly complicated and was analogous to examining the pedigree of a sheep when what was wanted was a mutton chop!

MR. J. DARCH emphasised the fact that the public was concerned in obtaining illumination, not lamps. Where street lighting was so deficient that the lamps merely acted as "beacons," the effect was actually to make it more difficult to see (owing to the pupillary contraction produced). Only that lighting could be regarded as good which was visually and physiologically efficient and, in the speaker's opinion, the specification ought to take into account glare and physiological effects. The specification did nothing to discourage the exposed powerful lamps now so commonly used, and this was an omission which should be rectified, since contractors and the public were likely to accept the findings of the Joint Committee as a complete and final pronouncement on street lighting desiderata. He suggested that to Clause (3) should be added a statement to the effect that where properly screened lamps were used, 33 per cent. lower illumination than otherwise required, should be permitted. This would give a direct incentive to improvement, and the advantage gained would actually be far greater than the concession granted. A shielded 60-c.p. lamp produced better results than a 200-c.p. lamp bare, but similarly arranged in other respects. Bright moonlight corresponded to about 0.01 ft.-candle, and produced a pleasing illumination, yet a street lighted by present methods, and in which this minimum horizontal illumination was produced appeared gloomy, owing to glare and the effect of pupillary contraction. The latter trouble was not reduced by arranging a row of low c.p. lamps in the street. Most dazzle was produced by the most distant lamps (distance, *per se*, not diminishing their brilliance), and this fact facilitated the arrangement of suitable screening. In many cases, shop lighting overwhelmed the street lighting proper, and it was desirable that legislation should prohibit exposed lamps in or outside shop windows; as long as shopkeepers obstructed bare high c.p. lamps, so long must street lighting remain unsatisfactory. Street illumination in the future would be effected by diffuse reflection from house fronts, breaking away from the utterly mistaken, if natural, evolution of modern street lighting standards from medieval lantern arrangements.

The CHAIRMAN here announced that the discussion would be resumed on April 29th.

### Self-Synchronising Machines.

By DR. E. ROSENBERG, M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, London, April 10th, 1913; also at Manchester and Birmingham.)

If the synchronous motor is to be used on consumers' premises, for doing useful work, it must be able to start easily and

develop an appreciable starting torque. One of the most useful fields of application for the self-starting synchronous motor is for motor-generators. Here a comparatively small starting torque is required unless a heavy fly-wheel is coupled to the motor-generator. If, however, the synchronous motor has to drive a pump or compressor, even with unloading valve, the required starting torque is considerable.

(a) *Modified Induction Motor.*—The synchronous motor works as an induction motor during starting, and it can be used either as a slip-ring or as a squirrel-cage motor. For this purpose we can either make such changes in the induction motor as will enable it to run after starting as a synchronous motor, or we can take the synchronous motor and make such additions as will enable it to start as an induction motor. The ordinary wound rotor of an induction motor can be excited, after full speed is reached, with continuous current. In order to obtain stability and overload capacity, however, it is essential to increase the air-gap and get a ratio of magnetising ampere-turns to armature ampere-turns somewhere in the neighbourhood of two, while, with the ordinary induction motor the ratio is somewhere in the neighbourhood of one-third.

A synchronous motor is liable to hunt if supplied with currents of certain periodic irregularities. It is an absolutely necessary precaution to supply the synchronous motor with dampers which, if sufficiently strong, prevent hunting even with considerable irregularities of the critical periodicity. If we arrange a three-phase rotor in the manner shown in fig. 1, we have a polyphase rotor winding used for continuous-current excitation, serving also as a three-phase damper.

The stator is provided with "star-delta switch" to reduce the starting current, which otherwise would greatly exceed the full-load current owing to the large air gap. The rotor has a three-phase winding; and two of the slip-rings are connected direct to the terminals of the three-phase starter. The other slip-ring can be connected direct to the third terminal of the starter by pushing the lever of the "field rheostat" to the position marked "starting position." If the lever is, on any of the other contacts, the exciter and the field rheostat are inserted between the third slip-ring and

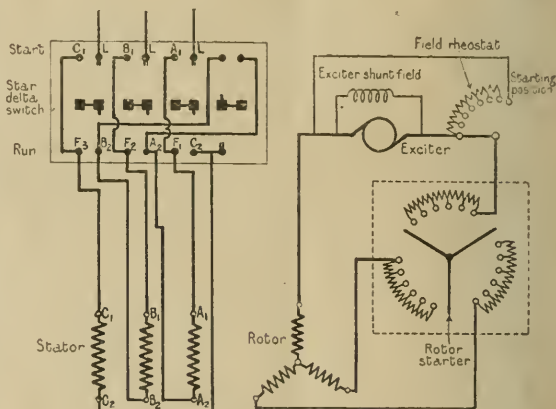

FIG. 1.—DIAGRAM OF CONNECTIONS FOR A SELF-STARTING SYNCHRONOUS MOTOR WITH DISTRIBUTED ROTOR WINDING ARRANGED IN THREE PHASES.

starter. For running, the starter is short-circuited. The exciting current flows into the third phase and is split at the star point. The two other phases each carrying one-half of the current. It is not absolutely necessary to cut the exciter out during starting, especially if a large starting torque is not required.

(b) *Salient-Pole Motor.*—By far the more general and more advisable method for the design of a multipolar synchronous self-starting motor is to use the standard salient-pole magnet wheel with the standard field coils on each pole, and to provide in or near the surface of the pole tips a squirrel cage for starting. With laminated pole-tips, slots are provided and bars of copper or some alloy inserted. Either the bars on all the poles are then connected through rings on both sides of the pole wheel, or only the bars belonging to each individual pole are connected by a copper or bronze collar going round the pole face. If solid pole-shoes are used, a special squirrel cage is not required, the solid pole-shoe in itself presenting a path for the currents induced from the stationary armature.

Two 300-kw. frequency changers built by the British Westinghouse Electric and Manufacturing Co., Ltd., each consist of a 14-pole motor for 60 cycles coupled to a 6-pole generator for 25.7 cycles. The rotor of the 60-cycle motor (fig. 2) has laminated poles fitted with a squirrel cage. The rotor of the 25.7-cycle generator has solid cast steel poles and no other damper. It is quite easy, as tests have shown, to start the set either from the 60 or the 25-cycle side.

Such a machine can be started with the field coils open or short-circuited. If the pole-shoes were laminated and no damper existed, the voltage of an open-circuited field winding, which is wound for, say, 100-voltage excitation, would be many thousand volts, even if the stator is only supplied for starting at a fraction of the normal voltage. The action of the dampers, however, reduces the open-

circuit field voltage to a considerable extent. A quicker start can be obtained with the field coils open-circuited than with the field coils short-circuited. A voltage of 25 per cent. is approximately the minimum which can be used for starting the set.

The starting of the motor itself can be understood fully by applying the rules for the starting of squirrel-cage motors. For a given stator voltage the torque is, within certain limits, proportional to the rotor resistance. The squirrel-cage must bring up the rotor as an induction rotor to a certain speed near enough to synchronous speed to enable the synchronising power of the machine to accelerate the rotor from this point to synchronous speed.

If a cylindrical rotor with distributed winding is not excited, no synchronising power occurs in any position of the rotor beyond a small hysteresis torque. As the hysteresis torque is very small, a machine with smooth cylindrical rotor does not pull into synchronism without excitation. Machines with salient poles show a different behaviour.

Rotary converters are frequently started, like squirrel-cage motors, from low-voltage tappings on the transformers. In general, the procedure is the same as that described for synchronous motors, but there are two or three aggravating conditions. There is a commutator with brushes always short-circuiting a certain part of the armature winding, and the field winding is not excited from an

external source, and as with a properly designed rotor this current can produce a torque far in excess of the starting friction it will without any barring, start and bring the rotary up to speed very quickly. A current of this value is not sufficient to destroy the residual magnetism of the rotary converter. The field circuit of the rotary converter remains connected across the continuous-current brushes, and the rheostat is preferably put into such a position as to reduce the inductive resistance slightly below the value required for normal no-load excitation, as is done, for instance, with ordinary continuous-current shunt wound machines in order to allow quick excitation. As soon as it approaches synchronism, the machine will therefore excite itself like any other continuous-current machine. This gives on the slip-rings an alternating current of a frequency which at first is slightly different from the transformer frequency.

Assuming that the rotary has excited itself to full voltage, then immediately before slipping into synchronism the voltage on the starting motor will vary from zero to double slip-ring voltage, and as the current flowing through the starting motor has, of course, some influence on the rotary converter, the continuous-current voltmeter will show violent fluctuations. Immediately the rotary has slipped into synchronism, this voltmeter will be steady; the voltage can then be adjusted, and the main single-pole switch which short-circuits the starting motor can be closed. The rotary would be in synchronism before the switch was closed, and being excited to full voltage, the closing of the switch causes neither a heavy rush of current nor any sparking at the commutator.

Across the main low-tension switch an indicating lamp can be fitted, as shown in fig. 3. This lamp will flicker before synchronism is reached, and will be dark after the rotary has slipped into synchronism. Attendants who are used to the old method of synchronising become more easily accustomed to the new method if they see the working of the indicating lamp. In general, however, the continuous-current voltmeter gives full indication of synchronism.

A three-phase rotary converter is started in series with a three-phase squirrel-cage motor. It is possible to keep the field switch open during starting, which will allow the rotary to approach synchronism in an even shorter time than with a closed field switch.

Various tests with 50-cycle rotaries of 200 to 1,000 kw. gave as the time necessary for starting and synchronising 30 to 50 seconds, the current not exceeding at any moment of the starting period one-third of the full-load current. By connecting the windings of the starter motor in a different way, and allowing a starting current of 50 to 60 per cent., it was possible to start in 15 to 20 seconds. Such a current, however, may destroy the residual magnetism, and, therefore, it is necessary in such cases to use the field switch, and to close it at the moment when the polarity of the unexcited machine is such as to ensure building up in the right direction.

FIG. 2.—ROTOR OF SELF-STARTING SYNCHRONOUS MOTOR.

outside source, but generally from the continuous-current brushes of the rotary converter. Commutating poles are frequently added, which fill part of the space between the main poles, their tips not being fitted with dampers like the tips of the main poles.

The brushes of rotary converters which are started in this way are very liable to spark, and it is necessary to reduce the ratio between the brush thickness and the distance of brush arms to a considerably lower value than would be required to obtain good commutation when working with continuous current on the commutator. The most violent sparking occurs as a rule when approaching synchronism.

It is not permissible to fit dampers on the tips of the commutating poles as is done on the main poles. When working in regular service with continuous current, the commutating pole should vary its flux as quickly as possible with the changes in the line current to provide the proper commutating field for every momentary value of the armature current. If a damper were fitted to the pole-tip this would prevent sudden changes of the flux, and would make the commutating pole sluggish, and the machine would therefore have a tendency to flash-over with sudden changes of load.

In order to prevent the machine from running at half speed it is necessary to provide during starting a damping winding on the commutating poles, and this is achieved in the simplest way by short-circuiting the commutating-pole winding during starting and opening the short-circuit before switching the machine on to the continuous-current mains.

When the machine locks into synchronism it may show either the right or wrong polarity. Therefore pole-changing devices are always provided for rotaries started in this way.

The sparking on the brushes is as a rule the more objectionable the higher the output and the frequency of the rotary.

A new method introduced by the author allows self-synchronising of the rotary converter with small armature current, prevents sparking on the brushes, and prevents the reversal of the field of the rotary converter. A starting motor is connected in series with the slip-rings of the rotary converter. As a starting motor, an ordinary squirrel-cage polyphase motor is nearly always used, but the explanation of the method is perhaps simplest by assuming a single-phase rotary converter and a single-phase commutator motor for starting (as in fig. 3). There are no starting tappings on the main transformer. One low-voltage terminal B of the transformer is connected direct to one slip-ring B of the rotary converter, while the other terminal A has a straight connection through a single-pole main switch, and another connection if the main switch is open, through the single-phase starting motor. A small switch is shown in series with the single-phase motor, but is not essential.

If the high-tension switch of the transformer and the switch of the starting motor are closed, the main low-tension switch being open, the current will flow through the starting motor into the rotary converter. The starting motor limits the current to a fraction of the full-load current of the rotary, say 30 per cent. The starting motor takes practically the full voltage of the trans-

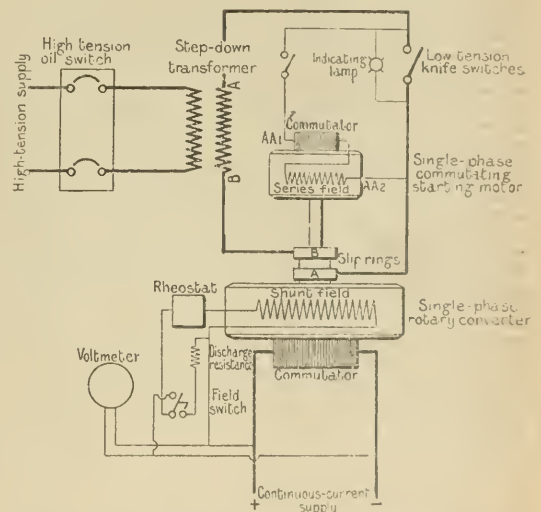

FIG. 3.—DIAGRAM OF CONNECTIONS OF SELF-SYNCHRONISING SINGLE-PHASE ROTARY CONVERTER WITH STARTING MOTOR.

The series connection of starting motor and synchronous machine can, of course, also be used for synchronous motors. For high-tension synchronous motors a low-tension starting motor presents advantages. For this purpose an indirect series connection by means of a series transformer can be used.

There is no objection to using on the direct-coupled starting motor a smaller number of poles than on the main motor. The starting motor then brings the set up to full speed much more quickly, and if the exciting circuit is closed with the proper resistance, the synchronising action of the machine will prevent the starting motor from running through the synchronous speed. If the exciting circuit is not closed, the starting motor will run up to a higher speed, but a later closing of the exciting circuit will soon reduce the speed and cause synchronising.

## DISCUSSION AT MANCHESTER.

PROF. MILES WALKER said that the one thing against the rotary converter was that if anything went wrong with the power station, so that there was a general shut down, it took a long time to get rotaries into commission again. Dr. Rosenberg had now provided a method of starting which was just as easy as with the induction-motor. In a few years' time, more than 90 per cent. of the D.C. power generated in the world would be supplied through rotary converters. Dr. Rosenberg stated that in the synchronous motor it was essential to increase the air gap and get a ratio of magnetising ampere-turns to armature ampere-turns somewhere in the neighbourhood of two, while with the ordinary induction-motor the ratio was somewhere in the neighbourhood of one-third: this gave the reader the impression that the size of the winding on the machine, in order to supply this magnetising current, must necessarily be very much greater on the synchronous machine than on the induction-motor. It must be remembered that in an induction-motor there was in the rotor the working current and the magnetising current from the stator, and the working current was, say, three times the magnetising current, requiring a certain amount of copper. In some experiments made some 18 months ago it was found that, in order to get perfectly stable running, it was necessary to have a current 50 per cent. greater than in the induction-motor. He believed the time would come when no one would be allowed to put in a low power-factor motor except by paying extra for the power consumed.

MR. A. E. MACKENZIE said there was no doubt that it was advantageous to have a machine which could be put on load very quickly. He had seen a large Westinghouse machine started up from rest and ready to put on the line in 30 seconds. To station engineers who had seen their staff struggling from 5 to 15 minutes to bring up a machine, it was something of a revelation.

MR. J. S. PECK said this new system seemed to overcome most of the objections which were raised against the old methods of starting. In looking at the diagrams it appeared ideally simple, but it had required very careful study to dimension all the various elements of the starting motor and the rotary converter so as to get the best results.

MR. HOLLINGSWORTH said he had noticed the difficulty, due to the excitement of the men in the station after a breakdown, in getting the machines into commission again. There was another and a greater field for rotary converters, not in the supply undertakings, but in the works' sub-stations, where they were operated by men in the employ of the consumer.

MR. W. CRAMP asked if, with the additional advantages described, the price of the rotary converter would go up above that of the motor-generator. Certain power station engineers not only demanded that the power factor must not fall below .9, but on an undertaking by the consumer to bring the power factor to unity, they would pay the extra cost of the machinery. It was not clear why a large air-gap should be necessary for synchronous motors. How would the cost of the synchronous motor, with its starting devices, compare with that of the induction motors?

DR. ROSENBERG, in reply, said that in an induction motor they had not a given number of ampere-turns, but in a synchronous motor there was a constant number of ampere-turns. If they could vary the excitation of the synchronous motor for no load, full load and overload, the number of ampere-turns for a small current would not be so high, but in order to get stable running, they must have a large number of ampere-turns. With a salient pole rotor, the mean length of a turn was considerably less than on a cylindrical induction rotor. He agreed that they should try and improve the power factor, and sub-stations which were formerly driven by induction-motors were now being gradually converted to synchronous machines. The question of power-factor in connection with small motors should not be carried too far; they had gained such an enormous advantage in all mills and small workshops due to the simplicity of the induction motor and its operating gear, that it would be a pity to injure this by pressing the synchronous machine with the higher price and the more skilful attendance required for it. A 50-H.P. synchronous motor with exciter would cost at least 50 per cent. more than an induction motor of the same size; perhaps 100 per cent. more. If motors of 300 or 400 H.P. were taken, however, the difference in price would be very little, and it was therefore the larger sizes that should be considered.

## DISCUSSION AT BIRMINGHAM.

MR. F. FORREST said that the self-starting synchronous motor described by the author was too complicated a machine for use on consumers' premises, and there could be very few cases where its adoption for works driving would be advisable or necessary. The induction motor, fitted with a phase advancer, was a much simpler machine for this purpose, and possessed practically all the good operating features of the synchronous motor. The high-pressure self-synchronising motor was likely to find its chief use in connection with motor-generator sets in sub-stations on transmission systems of comparatively high-frequency (50 periods or over). Experience in the past had proved that, on the whole, the synchronous motor was a more reliable machine than the induction motor, chiefly because its stator windings were not subjected to the sudden stress and concentration of potential across the end turns which occurred when an induction motor was switched straight on to the high-pressure supply. In large sub-stations it must be possible, in case of mishap on the A.C. starting apparatus, to get the machine into service by starting up from the D.C. side and therefore synchronising apparatus must be installed as a stand-by to the author's arrangements. The time required for starting and

synchronising rotaries of 1,500 kW. capacity, using induction starting motors was only about one minute, so the author's method did not save much time. The triple-pole switch in the low-pressure A.C. circuit to the slip-rings required with the author's method of starting was a possible source of trouble, especially with large machines, and this switch would not be required with a rotary synchronised in the usual manner.

DR. M. L. KAHN said that Dr. Rosenberg was to be congratulated on his excellent idea of connecting the starting motor of a synchronous machine in series with the main machine, instead of putting it in parallel as had been the usual practice. If a rotary or a synchronous motor with direct-coupled exciter was run up to speed with the field winding connected across the brushes on the commutator of the rotary or exciter, it would excite itself as soon as it was within a certain range of full speed, say 25 per cent. below full speed. The frequency of the voltage induced in the synchronous machine was then considerably below the frequency of the supply, and the slip was greater than the maximum slip at which the machine would pull into synchronism. The voltage on the stator terminals of the induction motor was the resultant of the supply voltage and the voltage of the synchronous machine, which were of different frequency. The resultant voltage would, therefore, vary considerably. As the torque of an induction motor varied approximately with the square of the impressed voltage, the starting torque of the set would also vary considerably. The frequency of the terminal voltage of the induction motor was the resultant of the frequency of the supply system and the frequency corresponding to the speed of the synchronous machine. For the case stated above, the supply frequency might be 50, while the synchronous machine might only have a frequency of 37. All this must have a considerable influence on the starting of the set.

MR. F. J. MORFETT said that the uses of synchronous machines were, as the author pointed out, decidedly limited, but there appeared to be a field for them in such directions as driving centrifugal pumps, fans, and even line shafts, if arrangement were made to start on light load by means of fast and loose pulleys, clutches or similar devices. In view of the decided advantage to supply authorities, they ought to offer preferential terms to consumers who were prepared to install synchronous machines. He had seen one of the self-synchronising rotary converters in operation, and was struck by the simplicity obtained.

MR. W. E. MILLS (Birmingham Corporation) pointed out that although the self-synchronising motor possessed several features which were appreciated by supply authorities, especially those suffering from bad power factors, it had a very limited use on consumers' premises. The consumer certainly would not pay the extra cost of such machines. Owing to their limited use it was impracticable for supply authorities to give special rates. In Birmingham, an application had been received from a user who proposed to improve the power factor by installing an 80-KW. synchronous machine. The effect of such a machine on a system supplying over 30,000 kW. would not in any way justify a reduction in the price of energy.

## DISCUSSION IN LONDON.

MR. R. ORSETTICH said unfortunately commercial engineers often over-estimated the capabilities of designers, and made misleading statements; he welcomed the author's clear expression of opinion on the starting of synchronous motors. Synchronous machinery had come to the front very much recently, but self-starting synchronous machines had not been much adopted. The synchronous motor was at a disadvantage as regards starting current, compared with the induction motor, and the latter was more suitable for high speed. The author had only mentioned two methods of starting rotaries, but there were four or five; it was strange that the method of starting by an independent motor so generally used here, had not been mentioned, as it was somewhat similar to the author's method. He (the speaker) found the alternating current method of starting quite simple and reliable, and it was a standard method with some firms in America.

MR. A. H. SEABROOK congratulated the author on his system. He (the speaker) was aware of the disadvantages of A.C. starting of rotaries by means of transformer tapplings, and welcomed any scheme for automatic starting. His Council had ordered four 1,000-KW. sets of this type, with Miles-Walker power-factor correctors attached.

PROF. MILES WALKER said ordinary methods of starting, though perfectly simple, were apt to fail in times of stress. The author's method was perfectly automatic; the machine came up with the right polarity the first time, and took only a small current from the line, as compared with starting by means of transformer tapplings. The curves given were valuable as showing how much current was taken in starting synchronous machines.

MR. F. P. WHITAKER read a long contribution on the subject, criticising some of the author's conclusions and advocating the use of an induction motor with one pair less of poles for starting, as being a more efficient method.

MR. H. W. BOSWORTH said very few English firms had given much attention to self-starting synchronous machines, although his firm (Lancs. Dynamo Co.) had built several in sizes up to 1,000 H.P., and their experience was directly opposed, as regards type of machine, to that suggested by the author. His firm believed that the cylindrical rotor with distributed winding gave the best results, and it allowed of high speeds. They had such machines running at speeds up to 3,000 R.P.M., which was much higher than one could get with salient pole machines. For ordinary industrial purposes, with A.C. starting, there appeared to be no need for the complication of an auto-transformer starter. Generally they found it was not possible to get the best results by using

standard induction motors and alternators; specialised design was required. He agreed with the author that the possibilities of such plant had been overlooked.

DR. S. P. SMITH could not quite see how trouble with surging in the squirrel-cage starting arrangement was overcome; the only way seemed to be to synchronise properly, necessitating a separate starting motor; then it seemed rather more K.V.A. would be required for starting.

MR. W. E. BURNAND suggested that in the case of a single-phase job, if a commutator motor or self-starting induction motor were used the expense would be considerable.

DR. ROSENBERG briefly replied to the discussion.

## WATER DIVINATION.

ON Thursday, April 3rd, a party met at Waterloo, by virtue of an arrangement made by our contemporary, the *Sanitary Record*. The destination was kept secret to the last; it was Guildford. The object was to obtain light on the methods of the users of twigs and similar objects in the search for water. We are informed by one who was present at the *séance* and subsequent luncheon, that the several twigmen behaved after the manner of their kind. By what mysticism can a twigman diagnose water vertically below a point and 222 ft. down, such point halfway between two boot-toe drafts on the ground drawn by a rough swing of the leg? Why the third 2, or allowing the third, why not 222'2?

The Guildford *séance* seems only to have intensified the scepticism which exists about this "dousterswivldom" of divination.

Our informant regards the Guildford pantomime as a huge failure on the diviners' part. They had every chance, and could show nothing. If there is a terrestrial influence which affects the nerves of certain of the elect, it is certainly an influence that arises from many sources. Possibly it is some form of radioactivity, for are not clays radioactive, and have not diviners "found" water where only have been proved depths of dry clay far beyond the diviner's 222? Divination, if true, would be always true. If not, of what value is it when a dozen of its votaries, separately tested, do not agree? The truth is that, in any water-bearing area, it is of no consequence where a borehole is put down. In the upper chalk, for example, absolute failure is very rare in known water-bearing areas, for a borehole is almost sure to cut a fissure or to cut a flint bed which is cut by a fissure. Water reaches the borehole by one way or the other. Our informant, who is a hydrogeological expert, says that he will back his opinion with £10, that a borehole put down at a point 3'349 ft. west-north-west of the S.E. leg of the editorial chair of this journal to a depth of 350 ft. below ground level will yield over 1,000 gallons per hour. Moreover, he will stand by this for all the electrical journals in London.

Now it is just such meticulous accuracy foisted on clients that proves his contention that divination is a fraud. He says that people who require water are themselves much to blame. If an engineer and hydrogeological expert says to a client that he may choose for his well just the spot most suitable, if the area, as a whole, is known to be water-bearing, that client will prefer the advice of the twig holder who stumbles about the ground with a twitching face and sweating brow and finally selects a spot between two boot-toe marks. In truth, it does not pay to use geological knowledge, and it does pay to play the necromancer. And will it be believed that the Local Government Board now actually allows the costs of water divination? At one time the fools who employed them were surcharged. Now the L.G.B., which still believes in the efficacy of a 14 days' continuous pump test of a well, adds divination to its beliefs!

We believe a report is forthcoming by the deputation above referred to. It is high time that the daily Press ceased to give its support to the unwarranted pretensions of these dowisers. It is strange how country gentlemen, sensible in other matters, will persist in their beliefs in face of the fact that in a single plot of land half a dozen twigmen will find water at different places, and no two agree.

**Iron Smelting in Norway.**—H.M. Consul at Christiania reports that the Aktieselskabet Hardanger Elektriske Jern og Staalverk, a company formed for the electric smelting of iron near Odda, has resolved to discontinue the undertaking on account of the cost of production, and to let the works to a French syndicate, which proposes to manufacture some kind of fertiliser. The works of this company were the first electric iron-ore smelting works in Norway, and their closing will probably prove a serious blow to the further development of the industry in that country; indeed, one company whose electric smelting works are not yet completed is said to be holding its scheme in abeyance for the time being.

The Aktieselskabet Bandak Electrolytiske Kobberverk—formed to refine copper ore at the Aamdal mines by the Hyblinette process—has decided to close its works from April 13th, owing to an insufficiency of ore in the mine, though the actual refining process is said to have been successful. The local Press states that the company intends to re-erect the copper-extracting works on the coast near the Christiania Fjord, and work is expected to be begun during the coming summer.—*Board of Trade Journal*.

## FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

### AMENDMENTS.

**AUSTRALIA.**—The Australian Commonwealth Customs authorities have decided that trolley frogs used in overhead wire electric tramway systems are to be dutiable as malleable iron castings galvanised, at the rate of 1½d. per lb. The "Crag" electric safety lamp for miners is to be admitted free of duty.

**UNITED STATES.**—The Board of Trade has just published a return showing, in the form of a comparative statement, the existing rates of duty and the rates of duty proposed under the new tariff now under consideration.

**HOLLAND.**—The Dutch Customs authorities have issued the following decisions as to the duties to be levied on certain electrical goods:—

Collector brushes and collector brush-holders, collectors, armatures and pole cases for dynamos and electromotors, imported separately	free
Coils for dynamos and electromotors, which cannot be definitely distinguished from coils for other electric machines	5 % ad val.
Dynamo of small capacity, used like a magneto, also suited for generating current, for charging accumulators and for driving electro-motors	free
Machine for pasting gutta-percha on leather for vamps of boots (the heat required for making the two substances adhere to one another being generated by electricity)	free

**DUTCH EAST INDIES.**—The Board of Trade reports decisions that portable telephone apparatus, testing apparatus for galvanic batteries, and steel wire covered with copper intended for use as electric conducting wire, are to be admitted free of duty into the Dutch East Indies.

**LEEWARD ISLANDS.**—As a result of the Canada-West Indies Treaty, the Government of the Leeward Islands proposes to establish preferential rates of duty in favour of British goods as compared with foreign. The date of coming into operation of this preferential tariff will be notified later.

## NEW PATENTS APPLIED FOR, 1913.

**Reorganisation of Paris Tramways.**—As already noted in these columns, the reorganised Paris tramway system will be chiefly supplied from generating stations at St. Denis and de Vitry, but the present compressed-air station at Billancourt will also be equipped with 13,500-volt, 25-cycle, three-phase generators. Ring mains will be carried between the three stations and sub-stations will be connected along the sides of the distributing triangle thus formed; this arrangement, which is one of the characteristic features of the scheme, ensures maximum security of supply. The section of the trolley line wires is 67 sq. mm. in Paris, and 87 sq. mm. in the outer areas. The axial conduit system has been preferred to the lateral conduit owing to the easier replacement of the running rails, which are independent of the former system. Further, the slot width of a lateral conduit must be equal to the groove width (35 mm.), of an ordinary rail, whereas this width can be reduced to 25 mm. (sufficient to admit the plough-arm) in the axial system. Provision has been made for 1,100 vehicles—representing an outlay of close upon £1,000,000—including 350 motor-cars carried by two axles on a 11 ft. 10 in. wheel base; 200 motor-cars on bogie trucks with unequal wheels; 100 motor-cars with specially short wheel base (10 ft. 9 in.); and 450 trailer vehicles on equal-wheel bogies. The cars will be electrically lighted and heated, and a few metal-flame lamps, supplied by a small battery, will provide emergency lighting on each car should the main current supply fail for any reason. The Vilette-Place, Nation and Autouil-St. Sulpice routes are already electrically operated, and part of the old accumulator system has been converted to trolley working, and is now operated more rapidly and economically than before.

MARCONI CONTRACT: ADVISORY COMMITTEE'S REPORT.

THE proceedings of the Select Committee on the Marconi contract have recently been subject to considerable criticism, and suggestions for a speedy conclusion of its labours have been freely offered. The time has not yet arrived for an impartial judgment, and the circumstances with which it has to deal are so exceptional that in the end some justification may be found for an unusual method of procedure. But whatever opinions may be held of recent sittings, credit must be given to the Committee for a recognition, at an earlier stage, of its limitations and a desire to obtain competent assistance. At the meeting on January 13th, it reported that it was unable to deal adequately with the technical features of the contract and desired the appointment of a scientific Committee, which should report thereon. The Advisory Committee, as we recorded at the time, consisted of Lord Parker (chairman), Mr. Duddell, Dr. Glazebrook, Sir Alexander Kennedy and Mr. Swinburne, with Mr. E. H. Rayner as secretary.

The appointments were made by the Postmaster-General. The terms of reference were: to consider and report on the merits of the existing systems of long-distance wireless telegraphy, and in particular as to their capacity for continuous communication over the distances required by the Imperial chain. It will be seen that the terms of reference are somewhat narrow, and it would have been possible to comply with them strictly and submit a report which would not be of much practical value under all the circumstances. But the eminent scientific members have evidently not overlooked the fact that science is "organised common sense," and the distinguished judicial member of the Committee has apparently borne in mind that it is not possible to answer every question by a simple affirmative or negative, and be sure that justice results. The provisions of the agreement are regarded as outside the terms of reference to the Advisory Committee, but the latter safeguards its position by stating: "but nothing we have said in this report must be taken as expressing our approval of such provisions." The common sense which recognises that the Committee's duties had relation to a really practical question characterises the report as a whole. The Committee took evidence upon known systems, and advertised with a view to ascertain whether there were any new inventions or improvements, the consideration of which might be useful. But apparently there are no budding systems of a retiring nature, or if so, their inventors are still hiding their lights under bushels, for the advertisement led to no useful result. Evidence was taken from representatives of the various systems, such evidence being given in private, and treated as confidential. A brief description of the plant required in terms which even a House of Commons Committee could understand leads to the remark that "the term

THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

1913 EDITION.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

'system of wireless telegraphy' is not really apt," because the major portion of the buildings and plant could, with minor modifications, be used equally well with any high-frequency generator or other patented device. It is pointed out that each company or firm uses apparatus protected by its own patents, and has to avoid the use of apparatus protected by patents belonging to other companies or firms. Considerable attention is given to the matter of patents, as might be expected from a Committee whose chairman has had so wide experience of patent law. Some qualification may be necessary for the statement that "the existence of a patent may seriously interfere with the normal development of an industry," but with its application to the purpose under consideration, no fault will be found, for it is pointed out that a competent engineer, if asked to erect and equip the wireless chain in the most efficient manner, might desire to combine apparatus whose combination would be difficult if not impossible because of the existence of patent rights. And then follows a statement which has been made by critics of the contract, that the Government is not fettered by considerations arising out of patent rights, but can use any patent on fair terms under the 1907 Act.

The Committee has examined the various "systems" and describes in general terms their principal features. The companies or firms controlling these "systems" were invited to give practical demonstrations. It was in regard to these practical demonstrations over the required distance that evidence was lacking from all except the Marconi Co., but whilst recording the facts, the Committee thinks it right to state that, according to the information given, it was in several cases impossible to arrange for the demonstration within the short period which could be allowed for the purpose. Moreover, the Committee records the reported achievements of each system so far as evidence was produced, and does not lose sight of the possibilities or the good features attending each. Wireless telegraphy, in its opinion, is in a condition of rapid development, and the members commit themselves to the expression of opinion that this development will, in all probability, involve the ultimate substitution of continuous oscillations for spark discharges. But, leaving description or forecast, and dealing with facts and demonstrations, the Committee report that, according to its investigation, "the Marconi system is at present the only system of which it can be said with any certainty that it is capable of fulfilling the requirements of the Imperial chain," which is the answer to the "in particular" phrase of the terms of reference. But again the Committee wisely avoids the possibly misleading effect of such an answer if unqualified, for the qualification immediately follows in the words: "but this must not be taken to imply that, in our opinion, the Marconi Co. must necessarily be employed as contractors for all the work required for the Imperial chain."

The confidence which was felt in the *personnel* of the Committee on its appointment will only be strengthened by its report, the trend of which may be said to confirm the official view as to the superior facilities possessed by the Marconi Co. for carrying out the contract, but so far from being so impressed with that superiority as to make onerous terms with a company perhaps unduly confident of its superior position, the Committee thinks that in some respects it might "be better for the Government themselves to undertake the construction and equipment of the necessary stations, acting for that purpose under the best technical and scientific advice which can be obtained, and employing the most suitable contractors for the various portions of the work or plant." At the same time, recognition is given to the fact—or as the Committee expresses it, "it may be said, and is no doubt the fact"—that the Marconi Co. alone has had

the practical experience in putting down stations, organising traffic and staff, and in coping with the difficulties that arise in a new industry, "and the value of such experience may well outweigh other considerations if rapid installation and immediate and trustworthy communication is desired." The value to be attached to such experience is of the essence of the controversy on the contract. That such exceptional experience at the moment should be paid for by a royalty upon the gross receipts for a long term of years gave rise to one of the foundation criticisms. The official evidence before the Select Committee indicated that the agreement contained ample provision for the termination of the royalty period. On the other hand, the omission of any reference to the possible earlier termination of the royalty in the circular to the shareholders was justified by the managing director, who held the view that in practice the royalties would continue. The Select Committee will probably be saved a great deal of trouble in determining this part of the contract by the report of the Advisory Committee. After recounting various features of wireless systems which are under development, or in a transition stage, the Committee expresses the opinion that it is "undesirable that in constructing and equipping the stations of the Imperial chain, the Post Office should be pledged to the continued use of any apparatus now used in any so-called system, or be subject to any penalty by way of continued royalties or otherwise for the disuse of any apparatus which may be installed in the first instance." It considers it imperative in any contract that may be entered into that complete liberty of action in this respect should be reserved. All the stations should be constructed with a view to possible and probably rapid developments of the art, and two should be used at once as experimental stations, in which suggested improvements may be thoroughly tested. Not content with suggesting that stations should be available for testing, the Committee goes further and dwells on the necessity of the department of the Government working the industry being willing to make such tests. There follows a paragraph which in character with the general tone of the report prevents any misunderstanding of a previous statement. "We have already referred," it says, "to the possibility that the existence of patents may fetter the normal development of an industry. A Government monopoly may stop its growth altogether, and is almost sure to do so unless the Government department which works the industry is ready to welcome and test any new invention and improvement, to adopt and use it if the test be satisfactory, and to pay for it on fair terms if adopted." On a subject so controversial as the Marconi contract, it is not impossible to conceive that some may regard such an *obiter dictum* as outside the terms of reference to the Committee. We should not be disposed to argue that point, but we should say that it is due to the practical common sense of the Advisory Committee that we have a report (appropriately dated from the Royal Courts of Justice) that will be of real assistance in determining the practical solution of a question which involves the progress of science as well as of public and private rights.

#### The Coming Position in Turkey.

NATURALLY enough, the trade of Turkey has been greatly interfered with for some time past, and exports from the United Kingdom during 1912 were lower than in either of the two preceding years. Our imports from Turkey, on the other hand, were the highest on record since 1897, the chief increases being in barley and raisins. In the annual report of the British Chamber of Commerce of Turkey there are given numerous detailed figures which are likely to be of interest to anybody who wants accurately to gauge the position of affairs. The Chamber says that without making rash prophecies regarding the future of the country and the territories likely soon to become part of the Balkan States, both belligerents "may yet surprise the world with their powers of recuperation." It is noteworthy that during the war there have been few cases of

suspension of payment in Turkey, and financial houses have experienced little loss. "The Government has kept its financial obligations with scrupulous exactitude, and has never for a moment broken faith with the creditors of the State." We reprint from the report the appeal of the Chamber to British manufacturers and traders to assist in securing a greater British hold on the market:—

It would please us to see our countrymen look this way and take a part in the developments that must take place as soon as peace is restored. Turkey, as well as the Balkan States, are bound to undertake public works of all kinds in order to promote the well-being and the security of these territories, sadly lacking in the elementary necessities of modern civilisation. We hope that Great Britain will not lag behind or fail to profit by the opportunities which will present themselves to capitalists and industrialists.

Earlier in the same report there is a warning to "home firms" not to be content with representation by "undesirable agents." The Chamber has itself in cases recommended important firms to make changes, having found that though their goods are appreciated on the market, they are doing unsatisfactory business "through incompetent or unscrupulous agents." Unfortunately, the Chamber has occasionally been appealed to respecting such matters when it has been too late, serious mischief having been done. We congratulate the Chamber on the growth of its membership (from 303 to 356) during 1912, following upon an advance from 244 to 303 in the previous year. Further comment upon some of the effects of the disturbed state of the country was made last week in the report of the Constantinople Telephone Co., the closing sentences of which show that the company is already taking appropriate measures for securing other concessions for establishing telephonic communication elsewhere in the Ottoman Empire. It is almost superfluous to suggest the wisdom of taking equally prompt and far-seeing action respecting other kinds of electrical and engineering undertakings and work in the same country.

#### Constantinople Railways.

It is of interest, in connection with the above comments, to note that a company has now been formed in Constantinople

under the title of the Société Ottomane des Chemins de Fer Métropolitain de Constantinople for the purpose of working the concession granted to the group headed by the Deutsche Bank for the construction and operation of an underground network of railways in the Turkish capital. The ordinary share capital amounts to £1,400,000 divided into 70,000 £20 shares, all of which have been subscribed and a first instalment of 10 per cent. has already been paid. As the undertaking is expected to involve an expenditure of £2,800,000, it may be assumed that the difference between this amount and that of the ordinary capital will be raised by the issue of bonds. The directors include representatives of the German Orient Bank, the Imperial Ottoman Bank, the Hungarian General Credit Bank, the Société Centrale pour l'Industrie Electrique of Paris, the Société Financière de Transports of Brussels, the Electric Light and Power Investment Co. of Berlin, &c. In addition to the main line, the concession places upon the holders the obligation to construct three branch lines, and the former has to be completed within  $4\frac{1}{2}$  years. The company will have to pay to the city authorities a sum of £806 per annum per mile of railway in operation and a further sum is payable for the expenses of the Imperial commissariat. The concession is for a period of years extending to 1933, but the Government reserves the right of acquiring the undertaking at any time after the expiration of 30 years.

Apart from this enterprise, it may be remembered that a concession has also been granted to the firm of Lenz & Co., of Berlin, in association with the A.E.G. for the construction of the so-called Bosphorus electric railway. As the two railways would compete with each other over a short distance, negotiations are in progress with a view to bringing about a mutual understanding so as to obviate any rivalry.

#### "Local Representation Necessary."

READERS who, either as a matter of general interest or in search of business opportunities, make a study of the mass of contract information that we put before them in the course of a year will have observed somewhat

frequently how they are debarred from tendering unless they qualify by "local representation." From the point of view of the country calling for the work, the limitation thus imposed upon outsiders may be perfectly reasonable, and it is useless girding at it. We have got to fall in with it whether we like it or not, or else lose the chance of doing business with Government Departments and public undertakings in certain countries. The stipulation is imposed by Scandinavian authorities and by Spanish, but, as though with a desire to prevent a desirable tenderer from dismissing the matter precipitately, there is a hurriedly added clause indicating that such local representation need not be personal, but may be through a native agent.

There are often business possibilities justifying the appointment of such agents, where a branch would not appear to be warranted. But it is not only European countries that impose such limitations as we have indicated above. Our own Colonies are increasingly impressing upon us the need for efficient representation "on the spot," and in some cases they actually insist upon it. The reasonableness of being right there to secure business has been realised by a number of our British electrical firms, but it may be that those who have failed to adopt the advice when it has been given by Consuls, trade experts, and by our humble selves, may find it easier to repent in presence of Colonial and foreign compulsion.

The *British and South African Export Gazette* has something to say on the matter, basing its observations upon the announcement by the Durban municipality expressly stipulating for local representation by tenderers for electric meter-testing equipment. Our contemporary points out that there is no lack of choice among the many South African firms of high repute, and a suitable qualifying arrangement might be made with one of these in the absence of ability to have one's own branch. We have many times regretted the shortness of time allowed for firms to tender for Colonial contracts, and we believe that there has been some improvement, but as time goes on will it be reasonable to expect public authorities to inconvenience themselves by allowing longer than is actually necessary? The demand for attendance on the spot must, it seems to us, increase rather than decrease, and we have got to see that our representation is up to such a standard of efficiency that it will make the clinching of bargains possible without reference home, and in face of foreign competitive methods. But we have said this *ad nauseam*—yet we must say it again.

#### Consulting Engineers in Germany.

THE position of consulting engineers in Germany cannot be a very happy one, if credence is to be attached to a statement made in the Prussian Diet in the course of the proceedings on April 19th, in connection with the second reading of a Government Bill to authorise the conversion to electric traction of the Berlin City and Circle railways. As is known, the Bill had previously occupied the attention of a commission, whose proceedings were private, although an official report in a brief form was issued at the termination of each day's sitting, summarising the general course of the deliberations. The commission called for and heard expert evidence on the proposals for electrification of the railways in question, but the names of the witnesses have not been disclosed. The reason, according to the statements made in the Prussian Diet by Herr von Pappenheim, is quite simple, although showing a surprising state of affairs. When the experts were examined by the commission, and were asked to intimate their opinions, they almost invariably expressed the wish that the attitude they assumed should not be allowed to be made public, and that their names should also be withheld, as they feared that they would have to suffer injury in the further progress of their science and profession from those at the back of the Government scheme. Commenting on this statement, a Berlin newspaper remarks that affairs have thus so far advanced in the electrical industry that experts outside of the large undertakings apprehend personal disadvantages if they express opinions which differ from the business interests of these undertakings!

## NOTES FROM CANADA.

[FROM OUR OWN CORRESPONDENT.]

THE Calgary Power Co. is developing another water-power on the Bow River at Kananaskis Falls; it is intended that this shall be run in parallel with the existing plant at Horseshoe Falls. The output of the new plant will be about 12,000 H.P., under a 70-ft. head, as there will be two 6,000-H.P. turbines coupled to two 5,100-K.V.A. 12,000-volt three-phase generators.

The town of Kamloops, B.C., has decided to spend £50,000 on a hydro-electric plant, and £13,000 in improving and extending the electric lighting system.

The Industrial Commissioner of Ottawa has just issued a map showing, among other things, the water-powers within a radius of 60 miles of the city; these are estimated to be capable of developing a minimum (at low water) of 2,300,000 H.P., and it is stated that 150,000 H.P. is at present developed.

The Toronto newspapers have lately been full of discussion of the question as to whether the city should buy the Toronto Street Railway Co. and the Toronto Electric Light Co., both of which are owned by the Mackenzie & Mann interests. A short length of municipally owned tramway has already been in operation for a few months, and other sections now under construction will be ready before long.

The idea of purchasing the Street Railway Co.'s equipment is with a view to the unification of the city's transport facilities, which, owing to the rapid growth of Toronto, fall far short of providing an efficient service for the thousands of persons wishing to use the trams; this results in the cars being dangerously overcrowded to an extent which would not be tolerated for a moment at home.

The Ontario legislature passed a Bill a few days ago, empowering the Hydro-Electric Power Commission to investigate and report upon the cost of constructing and operating electric railways in any locality where power is supplied by the Commission.

Municipal corporations may be authorised to enter into an agreement with the Commission (1) for the construction, equipment and operation of an electric railway, to be operated by power supplied by the Commission; (2) for its construction by the Commission, and for its operation by the municipality; (3) for its construction and operation by the corporation or corporations, and in either case for the supply of electric power by the Commission, which body will control rates, character of service, equipment, and location of lines. The whole burden of cost will fall on the municipalities interested.

It will be remembered that some weeks ago these "Notes" contained the information that the representatives of a number of towns had met together and passed a resolution calling upon the Hydro-Electric Power Commission to investigate and report upon the subject of electric railways for the Province. The foregoing is the outcome of that resolution. There can be no question that such light radial lines as are contemplated would be a very great boon if they could be made a commercial success. The small towns and villages desire to have better communication with the big cities, both for pleasure and profit; the big cities, especially Toronto, are greatly in need of such communication, in order that the produce of farmers and market gardeners may be more expeditiously and cheaply brought thereto. Owing to bad roads, at certain seasons of the year it is practically impossible for many farmers and others to get their produce into the large markets, while, on the other hand, prices in those markets are excessive, owing to the shortage thus caused. The radial railways would benefit the whole community.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

## Prospects in Electrical Engineering.

In reference to Mr. Alderton's reply to my letter of the 11th ult., kindly allow me to state that the same is a mean, cowardly, and illogical attack. Mean because it is all assumption without any reasonable ground, cowardly because my letter does not allude to any personal grievances in particular, and illogical because in the lines to which he refers I deal with two classes of individuals and obviously cannot be likened unto both, and, again, because in his argument he assumes his premise, then takes it for granted and draws his conclusion, which is absurd.

In regard to my lack of ability to discriminate between appointments having probabilities and those having possibilities, I suggest this is merely "bluff," but, in any case, although his advertisement is made use of as a typical example, my remarks are applicable in numerous other instances.

If Mr. Alderton will only take the trouble to read intelligently my second letter in this week's issue of the REVIEW on the above subject, especially the last paragraph, he will observe that I am not the type of engineer he, for the sake of argument, assumes me to be.

A. C. Black,

Hon. Sec., A.E.S.E. (Liverpool District).

Bootle, May 5th, 1913.

## Long-Scale Instruments.

Referring to Mr. Davies's letter which appeared in your issue on April 18th, I am sorry he did not confine himself to history. He writes, however, in what he believes to be the cause of justice, and then proceeds to discredit my patents.

Where the inferred injustice lies, it is somewhat difficult to see, and also why he is interested in taking up the cudgels on behalf of the other firms who, he states, are "manufacturing these instruments," as they have the same channels open to them as my firm for making known their goods.

But who are these others whose cause Mr. Davies champions? Readers will acknowledge that until my company introduced long-scale instruments for direct current they were comparatively unknown.

As for himself, Mr. Davies has no cause to feel aggrieved, since he has had 20 years' start in which to develop his instrument, and with all the knowledge at his disposal, it is surprising that his instrument is not now the most popular instead of being of mere historic interest.

It is also interesting to note that Mr. Davies did not deem it worth while to continue his patent for more than six years. The Thompson patent which he quotes was also allowed to expire in nine years; therefore, had these patents been all that could be desired, it is strange it was left to me to produce the first commercial and practical instrument.

Mr. Davies, in his letter, refers to his statement in the *Philosophical Magazine* for August, 1899, that he had "arranged for the active use of even three sides of the coil," but he omitted to mention that in the same article he stated "but it has the rather serious disadvantage of being complex in design and—I am afraid—difficult to build."

I am more than surprised that Mr. Davies, with all his experience, should fall into such a blunder as to look upon the gap in my instrument as a constructional necessity. Furthermore, it is to be regretted that he did not choose from amongst my patent drawings a more representative sketch of my instrument, especially as he appeals to engineers to observe the gap, which he did not reproduce in his illustration.

As for the attack on my patent claims, what I claim and what I do not claim are open for anyone to read who cares to consult the patent specifications, so I do not propose to

**Strike.**—A Leicester newspaper says that the strike of electricians there for higher wages is causing little inconvenience to the trade, as sufficient men are at work to keep things going. It is said that only 28 employees are out. Another paper said last week that five local firms and 70 men were affected, and that firms outside the E.C.A. had agreed to the advance from 8½d. to 9d. per hour.

discuss the "dignity of the chimneys" here; there are other places where they can be argued to greater advantage.

In conclusion, perhaps I may be pardoned for adding that several eminent engineers and instrument makers who have seen my instrument, have been sportsmen enough to admit that I have succeeded where others, including themselves, have failed.

### Static Charges in Textile Mills.

I should be much obliged if any reader could give me some information regarding a method of neutralising electric charges which are formed on silk or woollen materials during the process of manufacture. I believe apparatus has been brought out for dealing with this trouble in paper mills. Names of firms manufacturing apparatus for this purpose would also be esteemed.

Static.

### Omnibus Lighting.

I am operating some direct-current petrol-electric motor-omnibuses of the Tilling-Stevens type, in which the dynamo varies from a minimum of 15 v. to a maximum of 350 v. I should like, if possible, to be able to get the lighting on the vehicles from the dynamo, rather than have to put in a small one of the usual car-lighting type.

I shall be glad to learn if any of your readers know of a system that is adapted for this purpose. Of course, I do not expect the lighting to be done without a small storage battery, which would have to be connected in some way with the main supply.

Enquirer.

### The "Point Five" Meeting (M.E.A. Convention Week), June 17th.

I have been asked to make it quite clear as to the persons entitled to attend the above meeting. On behalf of the Association, I would like to say that it was the wish of our members at the Bradford meeting that any persons interested in pushing the use of electricity for domestic purposes would be welcomed, whether technical men or laymen. Manufacturers will be specially welcome.

In order that the Committee may make arrangements for the place of meeting, it is necessary that all who propose to attend should let me know not later than May 22nd.

A. Hugh Seabrook,

Hon. Secretary.

London, W., May 2nd, 1913.

### Report of Royal Commission on University Education.

One would have thought that engineering was a sufficiently important subject to have a faculty all to itself, for even music has a separate faculty. At present engineering is a sort of excrescence of Science. The Commissioners propose that it should be mixed up with something else, and the compound called "Technology," so that if this should ever come to pass some of our distinguished engineers will be able to state that they have the D.Ts. (i.e., that they each possess the degree of Doctor of Technology)!!! "which," as Euclid would have said, "is absurd," and being absurd, it cannot be. Therefore let us have a separate faculty for the important subject of engineering, and let the degrees be B.E. and D.E. (Bachelor and Doctor of Engineering), which would be understood by the man in the street.

A. S. E. Ackermann, B.Sc. (Engineering).\*

\* Note our present clumsy degree! The abbreviation (save the mark!) is official.

## IMPERIAL WIRELESS SYSTEM: REPORT OF THE ADVISORY COMMITTEE

The Committee appointed by the Postmaster-General consisted of:—The Right Hon. the Lord Parker of Waddington (chairman); W. Duddell, Esq., F.R.S.; Dr. R. T. Glazebrook, C.B., F.R.S.; Sir Alexander B. W. Kennedy, F.R.S.; and J. Swinburne, Esq., F.R.S., with E. H. Rayner, Esq. (secretary).

The Report, which is dated April 30th, 1913, is abstracted below:—

Immediately after our appointment we took measures to ascertain what systems of wireless telegraphy there were in existence, and by whom such systems were controlled. These systems appear to be the following:—(1) The Marconi, controlled by the Marconi's Wireless Telegraph Co., Ltd.; (2) The Telefunken, controlled in this country by Messrs. Siemens Bros.; (3) The Poulsen, controlled in this country by the Universal Radio Syndicate; (4) The Goldschmidt, controlled by the Anglo-French Wireless Co.; and (5) The Galletti, controlled by the Galletti's Wireless Telegraph and Telephone Co.

It appears, however, that the Admiralty, while in the main making use for communication between His Majesty's ships and shore stations and between ship and ship, of apparatus similar to that employed by the Marconi Co., claim nevertheless to have introduced important improvements. These improvements may be of some materiality; for the Admiralty desire that each station in the proposed chain shall be capable of communicating with His Majesty's ships. It should be considered, therefore, whether any system adopted by the Post Office for the purposes of the Imperial chain ought not to be capable of being worked in conjunction with the Admiralty appliances, especially as to the wave-lengths to be employed.

We have heard evidence on 11 days. We have also personally visited and inspected the several stations and works mentioned in the Second Schedule to this Report.

The term "System of Wireless Telegraphy" is not really apt. Each company or firm engaged in working a wireless station uses apparatus protected by its own patents and has to avoid the use of apparatus and devices protected by the patents belonging to other companies or firms. The main differences in the apparatus and devices at present in use centre in the high-frequency generator; but there are other apparatus or devices protected by patents, such as special aerials, different types of automatic high-speed transmitters and of receivers and recorders. Any company or firm which makes use of apparatus or devices which others are precluded from using because of the existence of some patent may claim to have its own system of wireless telegraphy, but the term "system" is misleading, inasmuch as by far the major portion of the buildings and plant could with minor modifications be used equally well with any high-frequency generator or other patented device.

The existence of a patent may seriously interfere with the normal development of an industry, for it tends to prevent the general use of the means best adapted for securing the end in view. It may well be that a competent engineer, if asked to erect and equip in the most efficient manner a chain of wireless stations such as the Post Office contemplates, would desire to combine apparatus, the combination of which is difficult if not impossible because of the existence of patent rights. In this connection we desire to lay stress on the fact that the Government is not fettered by considerations arising out of patent rights, but can use any patent on fair terms under Sec. 29 of the Patents and Designs Act, 1907.

Subject to the above criticism on the use of the word "system," the existing systems of wireless telegraphy may be divided into two classes according to the type of high-frequency generator used. In the first class, the production of high-frequency currents depends on spark discharges giving groups of oscillations and therefore intermittent trains of ether waves. In the second class, the generator produces oscillations which for practical purposes may be treated as continuous, and therefore as giving continuous ether waves.

To the first class belong the Marconi and Telefunken systems, and to the second class the Poulsen, the Goldschmidt and possibly the Galletti systems.

The Poulsen high-frequency generator is a modification or development of the singing arc fed by direct current.

The Goldschmidt high-frequency generator is a dynamo, giving an alternating current of a fundamental frequency of the order of 10,000 periods per second. The frequency is increased by the use of suitably tuned oscillation circuits, each successive circuit adding the fundamental frequency of the machine.

The Galletti generator involves a series of spark gaps arranged to operate in a cycle, so that the discharge of each causes, and is immediately followed by, the discharge of the next in the series, the sequence of discharges being so rapid that the resulting oscillations may be viewed as practically continuous.

Though at present making use of generators depending on spark discharges producing groups of oscillations, both the Marconi Co. and the Telefunken Co. are developing and experimenting with generators of their own, producing continuous oscillations. The Marconi continuous high-frequency generator consists essentially of a rapidly rotating contact-maker in a direct-current circuit, with special dispositions of other circuits to give continuous oscillations in the aerial. The Telefunken continuous high-frequency generator consists of an alternator constructed to give as high a fundamental frequency as may be convenient in the first instance, the frequency being doubled or quadrupled by a polarised transformer method. In making use hereafter of the term Marconi system or Telefunken system, we do not include either of these generators.

In order to test the efficiency of the various systems to which we have referred for the purposes of the Imperial chain, we invited the companies or firms by which these systems are controlled to give us practical demonstrations thereof, if possible on a commercial scale, and if possible over distances of 2,000 miles and upwards. Except in the case of the Marconi system we did not, however, obtain any demonstrations on a commercial scale, or any demonstration over a distance of even 1,000 miles. It is right, however, to state that, according to the information given to us, it was in several cases impossible for the companies concerned to arrange for the demonstration as desired within the short period which we could allow for the purpose.

In order that we might test the Marconi plant at Clifden, the Postmaster-General permitted us to avail ourselves of the services of a small staff of skilled operators, who stayed there for a complete week, keeping continuous watch on the actual commercial working between Clifden and Glace Bay, and reporting to us very fully. These reports, for which the Committee acknowledge their indebtedness to Mr. S. E. J. Burrow and his assistants, contain full and valuable evidence as to the commercial working of the plant now in use.

We then went to Clifden, and the Marconi Co. put the station at our disposal. Through the courtesy of the Canadian Government, we were represented at Glace Bay by Mr. C. P. Edwards, general superintendent of the wireless service of the Canadian Government, who had the assistance of one of his operating staff. Mr. Edwards was provided with a number of sealed messages by our secretary, and he was instructed to open and superintend the transmission of these when and as requested by the Committee at Clifden, and to take charge of similar messages sent from Clifden to Glace Bay, and to send them by post to the secretary. Mr. Edwards made reports and comments from time to time during our visit, and dispatched a detailed account to us later.

The Marconi Co. use at their Clifden station a high-frequency generator, in which condensers charged from the high-tension batteries are discharged by projections which are fixed on a rapidly rotating wheel, and which pass close to metal disks on each side of it. Each discharge produces a group of high-frequency oscillations in a primary circuit, according to the company's usual practice. We observe that, for the purposes of the Imperial chain, they proposed to charge the condensers from an alternator through a high-tension transformer, as is their practice elsewhere, including the long-distance station at Coltano. This method is, in our opinion, preferable.

At Clifden the Marconi Co. use their directive aerial; and they have a second separate station for receiving from Glace Bay without being disturbed by the simultaneous sending at Clifden. They demonstrated duplex working while we were at Clifden and Mr. Edwards was at Glace Bay, all interference of the outward waves being eliminated, though the strength of the received signals was somewhat reduced.

The Marconi Co. is, we are satisfied, working on a commercial scale between Clifden and Glace Bay, a distance of about 2,300 miles, though at present the number of messages transmitted either way is not so great as to require duplex working or high-speed transmission. We were, however, present when messages were transmitted automatically at the rate of 60 words (of five letters) a minute, and we see no reason why this rate should not be considerably increased if it becomes necessary. The communication is practically continuous, though there are, no doubt, periods when the signals become very weak, and even occasional periods when no signals can get through. Periods of this nature are due to natural conditions, and will be incident to the working of any system. During such periods communication can, in our opinion, be ensured only by the use of great power in the aerial. We understand that for this reason, and having regard to the increased power required for high-speed transmission, the Marconi Co. proposed to employ for the Imperial stations practically double the power now used at Clifden. Even so we think there may be periods when communication is impracticable, especially in tropical regions where atmospheric disturbances may be expected to cause more difficulty than over the Atlantic.

With regard to the Telefunken system, which, like the Marconi, is largely used, its practicability on a commercial scale for distances of 2,000 miles has not yet been proved. Experiments are now being made between Nauen and Togo, a distance of 4,000 miles, and the results indicate that communication over this distance is already possible at night.

With regard to the Poulsen system, we are satisfied that it is practicable for short distances. The Poulsen arc has been tried between San Francisco and Honolulu, a distance of about 2,100 miles, but as to its practicability over this distance we have no evidence except that which was in the possession of the Post Office long before our appointment. The results obtained do not appear to have been very satisfactory. In our opinion the power used was insufficient. No one tendered any evidence on behalf of the company which is working between San Francisco and Honolulu, and the firm controlling the system in this country was apparently in ignorance of how it is now working in America. We have recently been informed of important experiments between Arlington and the U.S.S. ship *Salem* and between Arlington and Gibraltar, using both the arc and spark transmission; but full details are not yet before us. We conclude that if the Poulsen system is to be so developed as to be practicable for commercial purposes over distances of 2,000 miles or upwards, the arc will have to be constructed so as to supply the aerial with higher power, or use will have to be made of a more sensitive receiver.

Similarly, with regard to the Goldschmidt system, it is no doubt successful over short distances, and the only thing required to make it practicable over long distances is a machine of the necessary

power. When the Goldschmidt station near Hanover and the corresponding station on the other side of the Atlantic are complete and in working order, we expect that communication between them will be established by the use, either alone or in conjunction with improved receiving apparatus, of the Goldschmidt machine which we inspected at the station near Hanover, and which was admirable both in design and workmanship.

Though continuous waves may be somewhat more efficient than intermittent trains of waves, and though the strength of the received signals may probably be increased by the use of improved receiving apparatus, we are of opinion that having regard to the experience of the Marconi Co., and in view of the demand likely to arise for high-speed transmission, it would be desirable in the first instance to insist on high powers for the Imperial chain whatever system be adopted. At present, with the exception of the Goldschmidt machine at the station near Hanover, we have seen no continuous high-frequency generator capable of putting into the aerial as much power as is put in by the Marconi Co. at Clifden for their trans-Atlantic service. We may add that both the Poulsen arc and the Goldschmidt machine are admirably adapted for high-speed transmission. Though we have not seen transmission by either at a higher speed than in the case of the Poulsen arc 70, and in the case of the Goldschmidt machine 60 words a minute, we have no doubt that these speeds could be increased. We have had no evidence as to the practicability of the Galletti system even over short distances.

We report, therefore, that according to our investigation the Marconi system is at present the only system of which it can be said with any certainty that it is capable of fulfilling the requirements of the Imperial chain, but this must not be taken to imply that, in our opinion, the Marconi Co. must necessarily be employed as contractors for all the work required for the Imperial chain. Indeed, in some respects it might, we think, be better for the Government themselves to undertake the construction and equipment of the necessary stations, acting for that purpose under the best technical and scientific advice which can be obtained, and employing the most suitable contractors for the various portions of the work or plant. On the other hand, it may be said, and is no doubt the fact, that at the present moment the Marconi Co. alone has had practical experience of the sort of long-distance work required, including experience in putting down stations, in organising the traffic and staff, and in coping with the difficulties that arise in a new industry, and the value of such experience and organisation may well outweigh other considerations, if rapid installation and immediate and trustworthy communication be desired.

Further, in our opinion wireless telegraphy is in a condition of rapid development, and this development will in all probability involve the ultimate substitution of high-frequency generators producing continuous oscillations, for high-frequency generators dependent upon spark discharges which produce groups of oscillations. Continuous oscillations should allow of more accurate tuning and greater selectivity, and may be better adapted for use in conjunction with improved receiving apparatus. The need of high-frequency generators producing continuous oscillations has long been felt by telegraph engineers, and has led to the various devices for the generation of continuous high-frequency oscillations to which we have already referred.

The only continuous high-frequency generator we have yet seen tried with success over long distances is the Marconi continuous high-frequency machine to which we have already referred. For the purpose of witnessing trans-Atlantic experiments with this machine we paid a second visit to Clifden and experiments were made with it in our presence. Using it Mr. Marconi, on the 26th and 27th of April, 1913, sent from Clifden to Glace Bay messages prepared by us for the purpose, such messages being at our request at once repeated from Glace Bay by means of the company's ordinary plant and correctly received at Clifden. The power put into the aerial by this machine for the purpose of the experiments was not sufficient for commercial purposes, but there seems no reason why higher power should not be obtained.

These experiments, in our opinion, warrant the belief that all or any of the devices for the generation of continuous waves to which we have referred may, at no distant date, be shown to be capable of successful use for the purpose of long-distance wireless telegraphy. Many engineering firms are also engaged in designing high-frequency alternators, and it seems probable that various other devices suitable for long-distance wireless telegraphy may shortly be available. Again, there is some evidence that the design of the aerial is in a transition stage. At present there are engineering difficulties in building perfectly satisfactory aerials for the longer waves which appear to be most appropriate to long-distance telegraphy. Aerials, especially high aerials, are frequently blown down or damaged by wind.

The directive aerial used in the Marconi system has the advantage of not requiring very great height and of giving preference in the desired direction. Its use in connection with the separate receiving station comparatively close to the transmitting aerial makes duplex working practicable. We see no reason why this form of aerial should not be capable of use with any form of high-frequency generator. Moreover, the development of the aerial may facilitate the use of still longer waves for long-distance work, and this may profoundly affect the problem of the high-frequency generator, by rendering possible the employment of simple alternators for the production of the frequency required, high though it must still be.

Receiving plant may take many forms. Thus the first receiver may be a crystal contact or some discharge valve on the lines of the Fleming valve, and this may work any one of various kinds of relay; and the record may be made by a Morse ink, by photo-

graphy, by a phonograph, by simple telephone or otherwise. There is a wide field here for experiment and development.

Having regard to these facts, it is, in our opinion, undesirable that in constructing and equipping the stations of the Imperial chain the Post Office should be pledged to the continued use of any apparatus now used in any so-called system, or be subject to any penalty by way of continued royalties or otherwise for the disuse of any apparatus which may be installed in the first instance. It is, we consider, imperative that in any contract which may be entered into, the Post Office should reserve complete liberty of action in this respect. Further, the stations should be constructed and equipped with a view to the possible and probably rapid development of the art, and we think it would be wise that at any rate two of the stations should be used at once not only for commercial purposes, but as experimental stations in which the various high-frequency generators heretofore referred to, and also any suggested improvement in any part of the apparatus, should as far as possible be thoroughly tested. This would involve the employment of a highly-trained staff with an engineer of special knowledge and of high standing at their head, but the information thus obtained would be invaluable for the construction and equipment or the improvement in the design of the stations.

Even when all the stations are constructed, equipped and in working order, we do not think it would be wise to cease using some of the stations for experimental purposes. We have already referred to the possibility that the existence of patents may fetter the normal development of an industry. A Government monopoly may stop its growth altogether, and is almost sure to do so unless the Government department which works the industry is ready to welcome and test any new invention or improvement, to adopt and use it if the test be satisfactory, and to pay for it on fair terms if it be adopted. For the purpose of testing, examining and, if necessary, further developing any new invention or suggested improvement in wireless telegraphy, a trained staff with an engineer of special knowledge and standing at its head will be necessary. Under the guidance of such a staff and engineer we see no reason why the Post Office wireless stations should not be ultimately equipped with apparatus far more efficient than that now used in any so-called system, more especially as the Post Office will be able to combine, in spite of existing patent rights, apparatus or devices which, because of the existence of such rights, cannot now be combined by anyone else.

We desire to add that the provisions of the agreement, now the subject of inquiry by a Select Committee of the House of Commons, are not, in our opinion, within the terms of our reference; but nothing we have said in this report must be taken as expressing our approval of such provisions.

#### SCHEDULE I.

*Part I.—Names of Witnesses heard on behalf of the Companies or Firms interested.*

Dr. R. Goldschmidt (Goldschmidt).  
Dr. J. Erskine Murray (Goldschmidt and Poulsen).  
Mr. Rappis (Galletti).  
Mr. G. Marconi (Marconi).  
Mr. Hird (Telefunken).  
Prof. Pedersen (Poulsen).  
Mr. Campbell Swinton (Poulsen).  
Prof. Silvanus Thompson, F.R.S. (Poulsen).

*Part II.—Names of Witnesses invited by the Committee to give evidence.*

Vice-Admiral Sir Henry B. Jackson.	Commander Loring, R.N.
Commander W. R. W. Kettlewell, R.N.	Mr. H. A. Madge.
Lieut. D. W. Roe R.N.	Mr. J. E. Taylor.
Lieut. J. A. Slee, R.N.	Sir Oliver Lodge.

#### SCHEDULE II.—Stations and Works Visited.

Admiralty Station, Whitehall.  
Admiralty High-Power Station, Harsen.  
H.M.S. *Vernon*.  
Goldschmidt Station, Slough.  
Marconi Station, Clifden, Ireland.  
Messrs. Bergmann's Works, Berlin.  
Messrs. Lorenz's Works, Berlin.  
Telefunken Station, Nauen.  
Poulsen Works, Copenhagen.  
Poulsen Wireless Station, Lyngby.  
Goldschmidt Station, Neustadt, Hanover.  
Post Office Station, Cullercoats.

## LEGAL.

ALLIS CHALMERS CO. v. THE FIDELITY AND DEPOSIT CO., OF MARYLAND.

In the King's Bench Division, Mr. Justice Phillimore, on May 1st, concluded the hearing of this action, brought by plaintiffs, manufacturers of electrical machinery, and carrying on business in the United States, London, Paris and elsewhere, against the defendant company, of Old Broad Street, E.C., the plaintiffs seeking a declaration that a fidelity guarantee bond for £1,000 was valid. Liability was repudiated by the defendants in regard to the bond.

Mr. H. E. Duke, K.C., and Mr. Lalley represented the plaintiffs, and Mr. L. Sanderson, K.C., and Mr. McCardie represented the defendants.

MR. DUKE stated that at the commencement of 1911 the plaintiffs established in Paris a separate office, and appointed as manager there Mr. A. C. Lochenies. Towards the close of 1911, having regard to large contracts the plaintiffs undertook, Mr. Keen, the plaintiffs' manager in Europe, considered it prudent to obtain a fidelity guarantee bond for Mr. Lochenies. In a communication to the defendants, they applied for a £1,000 bond. The defendants on March 5th wrote that the application for a bond for the £1,000 had been accepted by them at a premium of £6 5s., and that on the plaintiffs advising them that the rate of premium was accepted, the bond would be prepared and forwarded. Mr. Keen had occasion to go to America on a short visit, and the plaintiffs' London accountant asked the defendants in a letter to permit the question to remain open pending Mr. Keen's return. On April 18th that gentleman returned to London, and on that day his representative paid the premium and received the bond, which was dated March 8th. At the time the premium was paid (said counsel) there was a suspicion that Mr. Lochenies had left Paris. Mr. Keen went to Paris, and found that Mr. Lochenies had disappeared with the proceeds of a draft for a considerable sum. Mr. Keen wrote to the defendants, who replied alleging that they had been imposed upon, and were under no liability. Counsel proceeded to argue that the bond was issued on March 8th, and that, therefore, the defendants were liable in regard to it.

MR. SANDERSON, for the defendants, contended that the risk covered by the policy did not commence to run until the premium was paid, and that, as Mr. Lochenies had disappeared with money belonging to the plaintiffs before the payment was made, the defendants were not liable.

At the close of the evidence and legal arguments, MR. DUKE incidentally expressed regret that his learned friend on the other side should have thought fit to criticise the attitude of Mr. Keen.

HIS LORDSHIP (emphatically): I may say that there is not the slightest reflection on Mr. Keen, in my opinion.

After an adjournment HIS LORDSHIP held that the plaintiffs had made out their case, and granted the declaration asked for, with costs.

#### DISTRICT IRON AND STEEL CO., LTD., v. ARMORDUCT MANUFACTURING CO., LTD.

In the King's Bench Division on Saturday, May 3rd, Mr. Justice Channell had before him an action brought by the District Iron and Steel Co., Ltd., of Smethwick, Birmingham, against the Armorduct Manufacturing Co., Ltd., whose works are at Witton, near Birmingham. The plaintiffs claimed the balance of account due in respect of a class of steel known as "Strip" supplied to the defendants, and the Armorduct Co., in addition to asserting their right to a cash discount of 2½ per cent., counterclaimed a rebate with reference to anterior transactions relating to close-joint iron and steel tubes. In the latter connection, reference was made to a circular sent out in March, 1907, informing buyers of such tubes that they would be paid a deferred rebate in respect of orders given to firms who had signed the circular. Such payment was to be conditional upon the purchasers confining their orders for the tubes to members of the Association that was formed, and to their being in no way interested in the manufacture of the tubes otherwise than as proprietors, partners, directors or shareholders in one or more of the firms and companies in question. It was stated, in evidence, that the defendants, who manufacture electrical appliances, bought the "Strip" steel for the purpose of manufacturing these tubes, and his Lordship, holding that this was in violation of one of the terms of the circular, gave judgment in favour of the plaintiffs on both claim and counterclaim, with costs.

#### OSRAM LAMP WORKS CO., LTD., v. THE ELECTRICAL MANUFACTURING CO.

In the Chancery Division on Friday, May 2nd, before Mr. Justice Eve, this motion was again mentioned by Mr. Tomlin for the defendants. Counsel stated that he had agreed with Mr. Gray for the plaintiff company, that subject to his Lordships' sanction, the matter should stand over generally.

HIS LORDSHIP: Very well.

#### STRETTFORD U.D.C. v. GORTON, LTD.

In our issue of December 20th, 1912, under the heading "Feeder Pillars Again," we recorded a breakdown in connection with Stretford electric supply system. This occurrence had its sequel in the Manchester Assize Courts on May 1st, when the Stretford U.D.C. claimed damages in respect of injuries to property (a feeder pillar damaged to the extent of £122), by a runaway horse belonging to Messrs. John Gorton, Ltd., carriers, defendants in the action. For the plaintiffs it was contended that the driver of the vehicle should not have removed the bit from the horse's mouth, as thereby control of the animal was lost. For the defence it was shown that it was the proper thing to remove the bit for the horse to drink. Veterinary surgeons were called by both sides on this point, and ultimately the jury gave a verdict for the defendants.

## BUSINESS NOTES.

**Patent Notices.**—Patent No. 9,145, granted in 1911 to Chas. Rudolph for "Improvements in unions or couplings with bayonet joints," has been revoked.

**Book Notices.**—"The National Form of Building Contract." By W. Valentine Ball and W. H. Hope. 1913. London: *The Local Government Journal*. Price 6s.

"Introductory Electricity and Magnetism." By Carl W. Hansel. 1913. London: W. Heinemann. Price 2s. 6d. net.

"The Railway and Travel Monthly for May is a special Argentine number. It contains a number of illustrated articles on the Central Argentine Railway, and on some of our great British railways, a number of the pictures being excellently produced in colour.

**Bankruptcy Proceedings.**—CHAS. MUSKER, electrical, &c., engineer, 1, Northumberland Avenue, W.C.—An application for an order of discharge was made on May 2nd to Mr. Registrar Brougham at the London Bankruptcy Court. Mr. W. P. Bowyer, Official Receiver, reported that the applicant failed in September, 1912. Proofs of debt amounting to £6,364 had been tendered by creditors; the assets, valued by the bankrupt at £450, had realised £31, and a further £100 was likely to be received. In 1889 the bankrupt and a brother commenced business in partnership as C. & A. Musker, electrical and hydraulic engineers, at Bootle and sold the undertaking in 1895 to a limited company, of which they became managing directors. In 1901, in order that further capital might be raised, a new company, entitled C. & A. Musker (1901), Ltd., was formed, which took over the business, acquired further machinery and erected new buildings at Tuebrook, Liverpool, the applicant and his brother continuing to act as managing directors of the concern. In June, 1909, a Receiver for the debenture-holders was appointed, by whom the bankrupt was employed until September, 1911, when the works were closed. He attributed his insolvency to the failure of the last-named company, to the depreciation of his share interest therein, and to his household and personal expenses having exceeded his income. As offences the Official Receiver reported (1) insufficiency of assets to equal in value 10s. in the £ on the amount of the unsecured liabilities; and (2) contributing to the bankruptcy by unjustifiable extravagance in living. On those grounds the learned Registrar imposed a further suspension of two years. Order entered accordingly.

CECIL WRAY, electrical and mechanical engineer, Bradford.—May 21st is the last day for the receipt of proofs for dividend. Trustee: Mr. W. Durrance, 12, Duke Street, Bradford.

C. S. NORTHGOTE, electrical engineer, Streatham.—May 23rd is the last day for the receipt of proofs for dividend. Trustee: E. W. J. Savill, 132, York Road, Westminster Bridge Road, S.E.

**French Wire Lamps.**—The Société Française d'Incandescence par le Gaz, of Paris, states that the company derived advantage from the working of its new electric lamp "O. R.," for the first time during 1912. This lamp is provided with a pressed filament, which is claimed to possess the advantage of a longer life than lamps having drawn-wire filaments, although the latter types are cheaper.

**Electric Clocks.**—With reference to a notice on electric clocks at the Ghent Exhibition, the MAGNETA TIME CO., LTD., of Chiswick, write:—"We wish to point out that your reference to this matter under "Business Notes," in your issue of the 25th ult., is liable to misconception. The chief postal buildings of London are equipped with the Magneta system, the dispatch of home and foreign mails depending thereon. We enclose a complete list of these installations, and in order that there may be no misapprehension, the following will convey a correct idea of the magnitude of this work. Taking a 12-in. dial as one unit, the aggregate of units for Government Magneta installations has reached 2,600 (two thousand six hundred), and, in view of the history of electric clocks, it may not be out of place to mention that although the first of these installations has now been at work some eight years,

the running of this mass of Magneta apparatus has not cost the Post Office one penny for maintenance, or charges of any kind, up to this date. We felt these remarks were strongly called for, as the note might be read as the appropriation by others of the prestige which solely belongs to the Magneta system."

The list enclosed with the letter mentions the new G.P.O. (King Edward Building), London, and 15 other very important post offices and public works.

**Holland.**—The Dutch Customs authorities have lately given a decision to the effect that commutator brushes and brush-holders, armatures and pole cases for dynamos and electric motors, imported separately, "are to be classified as parts of factory machines" and admitted free of import duty.

**Water Turbine Contracts.**—MESSRS. BOVING & CO., LTD., report having received the following orders for water turbines, pipe lines and pumps during the past month:—

Mount Lyell Mining and Railway Co.—4 impulse wheels of 2,000 h.p. and three of 180, under a head of 1,000 ft., through the General Electric Co., of New York. Also, direct from the company, two pipe-lines of 750 and 550 mm. diameter and 2,900 ft. long.

Sagami Hydro-Electric Co., Japan.—3 Francis turbines of 3,750 h.p. and one of 180 h.p. under a head of 41 metres.

Porco Tin Mines.—1 impulse turbine of 150 h.p. under 210 metres head, and a pipe-line 1,180 metres in length, 15 in., 12 in. and 10 in. diameter.

Compañia Ingeniera Exportadora, Mexico City.—1 Francis turbine of 75 h.p. Borough of Napier, N.Z.—1 Victoria turbo-pump 415 g.p.m. 325 ft. head, and one 830 g.p.m. and 170 ft. head, coupled to Lancashire Dynamo motors.

Also repeat orders for a Victoria mining pump from Messrs. Kilburn Brown to deliver 750 g.p.m. against 573 ft. head, and from the Great Western Colliery to deliver 417 g.p.m. against 745 ft. head.

**A Modern Aladdin.**—MR. H. W. LEONARD, of the General Electric Co., Ltd., Publicity Department, in the character of "the modern Aladdin with the wonderful (Osram) lamp" secured first prize at a fancy dress carnival at Birmingham, on the 26th ult.

**Austria.**—The Elektrotechnische Verein Brunn is the name of a new association, which has just been formed at Brunn, Bohemia.

**Electric and Copper Works in Chile.**—It is stated that the Siemens-Schuckert Works have secured an order of the value of £500,000 in connection with a scheme for the mining of copper ore in Chile. It appears that the New York metal firm of Guggenheim have acquired copper mines in the Chilean Cordilleras, and propose to work them. As a scarcity of water exists in this mountainous district, it is intended to employ electric power, which is to be transmitted from the coast. For this purpose a steam power station is projected in one of the coastal towns; the capacity is to be 60,000 h.p., and oil fuel is to be used for firing the boilers, in conjunction with turbo-generators. The power is to be conveyed to the mines at a pressure of 100,000 volts by means of overhead conductors, the distance being about 124 miles, and it is to be used in connection with the working and smelting of the ore and the production of electrolytic copper. The installation of the long-distance transmission line will be undertaken by the firm of Guggenheim, who are large producers of copper, whilst the transformers and distributing network, &c., at the mines will form the subject of future contracts. It is said that the Siemens-Schuckert Works have obtained the order for the generating station and plant in competition with the General Electric Co., the Westinghouse Co. and the A.E.G.

**Catalogues and Lists.**—MESSRS. SCHOEN BROS., 29 and 30, Cock Lane, Snow Hill, London, E.C.—New four-page leaflet, giving illustrations, brief particulars and prices of a variety of apparatus for wireless telegraphy for experimental and demonstration purposes, which they hold in stock.

MESSRS. T. HARDING CHURTON & CO., LTD., Atlas Works, Water Lane, Leeds.—New catalogue (No. 30) (20 pp.), containing detailed description with illustrations, of polyphase induction motors, starters and controllers for same, with tabulated data and prices. Representative characteristic curves appear of 15-H.P. three-phase and 50-H.P. two-phase motors, showing high efficiency maintained over a long range of load, and a high power factor. Single-phase induction motors are also described and priced. Messrs. Harding Churton report that their works have for some considerable time been exceedingly busy, working continuously day and night.

MR. HARRY MOSS, 116, Horton Grange Road, Bradford.—Leaflet showing a patent electric window heater.

MESSRS. SIMPLEX CONDUITS, LTD., 116, Charing Cross Road, London, W.C.—Leaflet illustrating and pricing (their inspection electric hand lamps for motor-cars.

MESSRS. W. T. HENLEY'S TELEGRAPH WORKS, CO., LTD., Blomfield Street, London Wall, London, E.C.—A new telephone cable catalogue of nearly 140 pages has been issued. It is divided into three sections as follows:—(1) Underground telephone and telegraph cable; (2) aerial telephone and telegraph cable; (3) miscellaneous cables, accessories, and subaqueous cables. In view of the company's long and varied experience of the manufacture of such cables, the publication, with its specifications, tests, illustrations and general information, naturally possesses considerable interest for telephone engineers. Full specification and details are given of all the various types of cable used, which include—in addition to the usual lead-sheathed single, twin, multiple twin and quad. type, dry core telephone cable and screened telegraph cables—various types of rubber insulated cables and wires used for both indoor and outdoor work, also flameproof switchboard cables and wires, together with tests and notes describing the purposes for which each type of cable is designed. Information is given with regard to the important question of jointing, and prices of all necessary jointing materials are included. Particulars

of various types of subaqueous cables have been included, and the question of loading cables is dealt with; we understand that the tests shown in the catalogue are put forward as being consistent with an economical and practical cable. Lower capacity tests can be given, but such would necessitate an increase in diameter, and a consequent increase in cost. For convenient reference, class numbers and code-words are given for all types. Owing to the firm's large foreign business in telephone cables, they have found it necessary to give dimensions in both the English and metric systems, and for the convenience of foreign clients have included a table of money conversions.

**MESSRS. DANIEL ADAMSON & CO.,** Dukinfield.—Illustrated descriptive circulars of their patent Adamson-Davies tubular extension for Lancashire or Cornish boilers. Particulars of tests are tabulated.

**BRITISH ECONOMICAL LAMP CO., LTD.,** 9, Old Bailey, London, E.C.—Two illustrated and priced leaflets give particulars of the "Totolite" crystal glass reflector fittings—concentrating, expansive, intensive and extensive types; also of Belco arc fittings for high c.r. lamps, for inside and outside lighting.

**MESSRS. O. ELLEFSEN & CO.,** 26A, Silver Street, Bedford.—Pamphlet (12 pages) describing and illustrating Ellefsen's new patent low-water alarm and feed regulator for steam boilers.

**THE STERLING TELEPHONE AND ELECTRIC CO., LTD.,** 200, Upper Thames Street, London, E.C.—Publication No. 203 gives prices of, and illustrated information regarding, "Primax" automatic interphones.

**MESSRS. DAVID ROWELL & CO.,** 33, Old Queen Street, Westminster, London, S.W.—12-page pamphlet giving an illustrated description of the Barrol system of ventilation for schools and churches.

**Dissolutions and Liquidations.**—**MARSH, SON & CO., LTD.,** 167 and 169, Wardour Street, Oxford Street, London, W.—A circular has been issued by the managing director to the effect that for some time past the business has been carried on at a loss, and the company is being wound up voluntarily. Mr. Marsh adds that he is the sole debenture-holder and hold debentures for £9,200, which are a first charge over all the assets of the company. The assets in question, when realised, will not be sufficient to pay off all these debentures in full. He is very desirous that all the creditors of the company should be paid, and he does not therefore propose to take advantage of his position as debenture-holder, but intends to apply the moneys received by him in respect of his debentures in payment of the debts of the company. The liquidator, Mr. R. W. Brown, who is well acquainted with the business, will realise the assets to the best advantage, and Mr. Marsh says that he hopes that the amount realised will be sufficient to enable him to pay all the creditors in full. "If, for any reason, another liquidator should be appointed by the creditors, I must hold myself at liberty to reconsider the course which at present I propose to adopt." A meeting of creditors is to be held on May 15th at the Holborn Restaurant.

**CARNEY & PEARNS, LTD.**—This company is winding up voluntarily with Mr. B. H. Brook Eldridge, 52, Brown Street, Manchester, as liquidator.

**WALBURN & MILLS,** electricians and motor engineers, 92, Wharf Street, Sowerby Bridge.—Messrs. E. Mills and J. B. Walburn have dissolved partnership. Mr. Walburn will attend to debts.

**INGHAM, BARRIE & CO.,** consulting and contracting engineers, Highbury Chambers, Newport.—Messrs. O. Ingham and J. S. Barrie have dissolved partnership. Mr. Barrie will attend to debts, &c.

**LANE & CO.,** builders and electrical engineers, 1, Gage Street, Bloomsbury, W.C.—Messrs. E. Lane and A. Purrier have dissolved partnership. Mr. Lane will attend to debts.

**Trade Announcements.**—**MESSRS. DORMAN & SMITH,** switchgear and fittings manufacturers, of Ordsal Electrical Works, Manchester, have made arrangements to be represented in Scotland by Mr. David Alexander, of 43, Mains Street, Waterloo Street, Glasgow, at which address samples of their fittings and switchgear, more especially such apparatus as is used in ships and collieries, may be inspected. Telephones: Central 4394, Argyle 587; Telegrams: "Ohmic, Glasgow."

**MESSRS. BERRY, SKINNER & CO.** announce that their agency, which has until recently been in the hands of Mr. David Alexander, of 43, Mains Street, Waterloo Street, Glasgow, has now been transferred to Mr. J. Hally Craig, of 45, Hope Street, Glasgow, to whom all local inquiries should be directed.

**THE EASTERN ELECTRIC AND TRADING CO.,** of Karachi, intend to stock large quantities of electrical accessories, as electric supply (D.C. 220 volts) will soon be available there. Fans, metal-filament lamps of all candle-powers (no carbon lamps will be used, and drawn-wire lamps are preferred), fittings, wires and cables, and accessories of all kinds will be required, and manufacturers are invited to send samples.

**MESSRS. ELECTRICAL INSTALLATIONS, LTD.,** have taken additional offices at 28, Martin's Lane, adjoining their existing premises, 27, Martin's Lane, Cannon Street, E.C., owing to growth of business.

**THE BRITISH THOMSON-HOUSTON CO., LTD.,** announce that the address of their Middlesbrough office was altered from Wednesday, 7th inst., from Maritime Buildings to Prudential Chambers, Albert Road, Middlesbrough. The telephone number remains unaltered—(No. 814).

**MESSRS. FRIEND, WILTON & CO.** have removed from 17, Quay Street, Cardiff, to 8, Westgate Street, Cardiff.

**Private Arrangements.**—**GEORGE ASHFORD** (trading as Whitcombe & Co.), electrical engineer, Newhall Hill, Birmingham.—The creditors interested herein were called together last

week when a statement of affairs was presented showing liabilities of £547, all of which was due to unsecured creditors. There was a fully-secured creditor for £99, who held securities valued at £100. The assets were returned at £261. It was stated that the debtor started trading at his present address in September, 1911, with a capital of about £80, his own savings. Shortly afterwards he was joined by another man who brought no capital into the concern. Last August the partner retired, and another man then put into the business £185 in cash and a debenture for £100 in the New York Telephone Co. The debenture was said to be worth its full face value, and was held by the bank, who were returned as fully-secured creditors. The present position was attributed to losses on contracts, and it was stated that a considerable loss had been made in connection with a picture palace. In that connection a debt of £50 was due to the debtor. The debtor was also said to be interested in a patent unpuncturable tire, which it was believed would be a success. He was in negotiation with one of the large tire companies for the sale of the patent, providing a 500-mile trial run was first made on it. A deed of assignment had already been executed, and after a short discussion it was decided to confirm the deed, and to adjourn the meeting.

## LIGHTING and POWER NOTES.

**Accrington.**—The Electricity Sub-Committee has been deputed to deal with an application from Alliance Mill, Baxenden, for a supply of energy for power purposes, and has also been asked to deal with the question of opening an electricity showroom in some other situation, in lieu of the present showroom.

**Barrow-in-Furness.**—At the T.C. meeting on Monday, recommendations of the electrical engineer were approved providing for the whole of the arc lamps in Bridge Road being replaced by clusters of four 100-watt metal-filament lamps, and those on Walney Bridge being replaced by 100-watt metal-filament lamps, the carcasses of the arc lamps on the bridge being adapted to take these lamps. It was reported in regard to the electricity works extensions that the contractors had delivered and practically completed the erection of the water-tube boiler and chain-grate mechanical stoker ordered in December last. It was agreed to approve the installation of cleaning apparatus by the British Vulcan Soot Cleaner Co., Ltd., Edinburgh, at a cost of about £80. During this week a series of demonstrations of electric cooking by means of "Tricity" cookers are being given in the Technical Schools, under the auspices of the Barrow Corporation.

**Basingstoke.**—The T.C. has been informed that its application for a prov. order for electric supply has been granted by the B. of T.

**Bedworth.**—The question of having the parish publicly lighted by electricity has been discussed by the Parish Council, which has asked the Leicestershire and Warwickshire Electric Power Co. if it will tender for the lighting in competition with the gas company.

**Birmingham.**—Elsewhere in this issue we give some details of the proposed new power station at Nechells, and electrical extensions in the city. The Finance Committee has reported on the proposals, and offers no objections on financial grounds. It, however, draws attention to the fact that sums of £5,380 for substations, and £46,546 for mains had been expended prior to the approval of the Council being given to the scheme, and regards this as undesirable practice. The Committee also appears to view with concern the effect of the last revision of charges, and points out that the erection of these new works will involve the necessity for regular, systematic and adequate contributions being made in every succeeding year to provide for the contingency of obsolescence. It may be mentioned that the electricity department has a reserve fund of £80,458, and a renewals fund of some £32,000.

**Blackburn.**—The Electricity Committee has adopted the report of the electrical engineer on the scheme for the erection of new electricity works; the Gas Committee offers land at Greenbank as a site for the new station, subject to suitable terms being arranged.

**Blackpool.**—The Corporation electricity department for the past year had a net surplus of £13,179, compared with £6,240 in the previous year. The income was £40,333, against £35,454 in 1912, and £3,633 more than the estimate. The working expenses amounted to £20,928, against £16,347. The reserve fund now stands at £9,508. The aggregate of the works output for the past 12 months was 4,109,983 units—an increase of 544,229. Of the increase, 333,138 was due to private lighting, showing that the public are adopting electric lighting more generally. There were 239 new consumers during the year.

**Bognor.**—The U.D.C. has asked the Gas Co. to submit a scheme of electric lighting for the sea front in substitution for the present gas lighting.

**Bridlington.**—It is estimated that the net profits on the electricity undertaking for the year ended March 31st, 1913, will amount to £1,376.

The Electricity Committee has decided to apply to the L.G.B. for sanction to borrow £3,000, £1,500 being in respect of mains and £1,500 in respect of services.

**Bradford.**—The Corporation Electricity Committee has recommended the extension of mains from the Dudley Hill transforming chamber along Tong Street to Montserrat Mills, at a cost of £2,191, and a similar extension from Victoria Street to Lumb Lane Mills, at a cost of £520.

The engineer has been directed to proceed with the work of changing the system of supply in the Manchester Road district, south of Bowling Old Lane, from direct to alternating current.

**Brighton.**—With a view to increasing the capacity and improving the efficiency of the Southwick generating plant, the T.C. has had under consideration a proposal by Mr. Christie, the borough electrical engineer, to replace one of the original turbine plants by a Richardsons-Westgarth turbine driving a 3,000-kw. Siemens alternator, speed 3,000 R.P.M. With condensing plant the cost is estimated at some £7,600. Alterations to pipework, foundations, switchgear, &c., will cost £900. The displaced plant will, it is proposed, be sold, and the cost of the above work be met out of revenue and reserve.

**Chester.**—The Corporation has adopted the proposed battery scheme, to cost £11,550, reported on by the city engineer Mr. S. E. Britton, and recently described in these notes.

**Chester-le-Street.**—The L.G.B. has sanctioned an expenditure of £410 by the Guardians in carrying out the scheme for lighting the workhouse, &c., by electricity.

**Clones.**—The Urban Council has discussed the terms under which Mr. Chas. Ferguson is to be permitted to carry out an electric lighting scheme in the town. The Council will have the option of purchasing the works after 10 years.

**Continental Notes.**—ITALY.—La Società per Imprese Elettriche, of Rome, has secured a contract from the Officine Elettro-Chimiche Dottori Rossi, of Legnano, for the establishment of a plant near Rome, for the electric production of nitric acid from the atmosphere. The plant to be at first put down will be of 5,000 kw., provision for doubling it at a later date being made.

**Coventry.**—The Electric Light Committee has passed the accounts for the year ending March 31st last, showing an available balance of £16,294. It was decided to recommend the City Council to apply £4,500 to the relief of rates and £11,000 in payment of new machinery, &c. (in lieu of raising a loan), and to carry forward the balance of £194. The Committee will also recommend an increase of the salary of Mr. G. Tough, electrical engineer and manager, from £550 to £650 per annum; also that the flat-rate charge of ½d. per unit for current for lighting purposes be reduced to 3½d.

**Delabole (Cornwall).**—At the annual meeting of the Parish of St. Teath it was decided to light Delabole by electricity. At a public meeting of the electors, Mr. R. Pearce, who was in the chair, reviewed the position, after which it was decided to obtain the necessary powers.

**Derby.**—The T.C. has applied to the L.G.B. for a loan of £11,950; for mains £7,500, services £700, motors £3,000, and transformers and switchgear £750.

On May 2nd, a L.G.B. inquiry was held into the application of the T.C. for a loan of £13,500, needed principally for additional generating plant. There was no opposition.

**Dundalk.**—Last week a L.G.B. inquiry was held into an application by the Council for a loan of £5,000 for extensions of the electric lighting scheme in the town. From the evidence it appeared that the Council had already obtained a loan for electric lighting of £20,000. Owing to the increasing demand for electricity £5,000 more was needed. The amount received for energy sold during the year was £1,729, showing a net profit of £600. The inspector stated that he was glad to know that this much-debated scheme had been so successful.

**Eccles.**—The Public Lighting and Electricity Supply Committee has made a recommendation that Devonshire Road be lighted by electricity.

**Edinburgh.**—Treasurer MacLeod, in submitting the draft provisional estimates for the year from May 15th, 1913, to May 15th, 1914, said, with regard to the estimates by the Electric Lighting Committee, the estimated surplus was only £220. The policy of the Committee was to frame its estimates so as to come out practically square at the end of the year. The estimated revenue was £142,660, which was counterbalanced by expenditure of £80,265 and interest and sinking fund contributions of £62,175. Under this head was noted the great increase in the coal bill, which was estimated at £30,840, as against the actual in 1911-12 of £20,041. The revenue for the same year was £131,678, so that while the revenue had only increased 8 per cent, the coal bill had gone up 50 per cent in the same period, without any increased charge to the consumer. The capital expenditure for the coming year includes an item of £11,360 for extension of electric light works. Dealing with the rates and the likelihood of an increase, Mr. MacLeod said he was confidently looking forward to a surplus from the electric light account, which might be applied to reduce the amount required from the rates. Councillor McMichael, in the discussion which followed, said, in his opinion, the Council had a right to expect very substantial relief from the electric light undertaking. Mr. Stevenson, replying, considered it complimentary to the success of the cooling towers when they found that, although their coal bill alone had increased £6,000, the cost to the consumer remained unaltered.

**Ellesmere Port and Whitby.**—The B. of T. has granted a prov. order for electric light to the U.D.C.

**Falkirk.**—An interesting function took place last week when an addition to the generating station was formally inaugurated. Space has been provided for additional turbine plant of 2,700 h.p. Up till 1911 the supply was entirely on the low-pressure direct-current system. In 1910-11, in order to meet the power requirements of the large industrial concerns of Falkirk, the plant was extended, and the extra 112 alternating current three-phase system adopted for the supply of the burgh. The 1910-11 extension consisted of a steam turbo-generator of 670 h.p., a new boiler, and about ½ miles of mains. Owing to the rapidity with which the demand for power purposes grew, a further 670-h.p. turbine was installed for the winter of 1912-13. Transformer sub-stations are in operation at Falkirk Ironworks, Etna Foundry, Crown Brass Works, Sunnyside Foundry, Camelon Main Street, and Union Road; and Cros's Chemical Works, Camelon. During the last two years nearly 1,000 h.p. of electric motors has been connected to the Corporation system. The Falkirk Iron Co. has nearly 500 h.p. of motors being supplied from the Corporation mains, and the demand for electric power from this consumer alone is already more than equal to the demand for electric lighting purposes from the whole of Falkirk.

**Gargrave (Yorks).**—A proposal is on foot for lighting this village, in the Craven district of Yorkshire, by electricity. The supply station, it is proposed, will be at the High Mill, owned by Mr. Joseph Mason. Messrs. Crompton & Co., Ltd., are to carry out the work of installation if the proposed scheme is successfully launched.

**Harwich.**—Last week Dr. C. H. Liebbrand addressed a meeting of the ratepayers on the subject of electricity supply for Harwich and district, explaining his scheme for centralising electric supply at the seaside resorts of Lowestoft, Clacton, Walton and Felixtowe.

**Henley.**—The Reading Electric Supply Co. having applied to the R.D.C. for consent to supply current to premises at Sunning and Shiplake, the Council has decided that "under present conditions" permission cannot be given in respect of Shiplake, and with regard to Sunning a decision has been deferred, the Council intimating that if the company desired to supply electricity in districts outside its area it should proceed by prov. order.

**Hereford.**—The L.G.B. has sanctioned the conversion of the pumping plant at the waterworks from steam to electricity.

**Hull.**—The T.C., on May 1st, decided, by 21 votes to 18, not to purchase the prov. order for electric supply obtained by Hesse U.D.C., for £462.

**Keighley.**—A L.G.B. inquiry was held last week into the application of the Corporation for powers to borrow £7,000 for purposes of the electricity undertaking. The electrical engineer (Mr. Harry Webber) said the money was required for the purchase of a new turbo-alternator; the contract had been placed provisionally. The estimated profit on the year's working was about £1,000, there having been a large increase in sales, chiefly in respect of power. The outstanding borough loans, it was stated, now amount to £100,640, and the department had received rate aid to the extent of £12,130. The new turbine would cost £5,827, and other requirements would bring the amount to £7,000. The inspector suggested that the application should be increased by £200, as if an outstanding debt on economiser tubes were deducted, the total amount at present asked for, would be insufficient.

**Kendal.**—The T.C. has applied to the B. of T. for permission to erect overhead wires in various parts of the district for the supply of current at a pressure of 220 volts.

**Leyburn.**—The local gas company is putting down electric plant at its works to supply in the locality, and has applied to the Council for permission to use overhead wires.

**Liverpool.**—Sanction has been received from the L.G.B. to the borrowing of £40,000 for the provision of mains.

**London.**—HAMPSHIRE.—A very careful series of tests carried out by Mr. H. H. Conzena, with the object of improving the electric street lighting in the Hampstead district, has resulted in the Council deciding to adopt similar fittings to those designed and erected by Mr. Haydn Harrison in the borough of St. Marylebone and elsewhere. In certain important streets new posts are to be erected at a distance of 30 yards apart, the height of the light source being increased so as to produce a satisfactory minimum horizontal illumination, as described in the draft Standard Street Lighting Specification, which has lately been the subject of a paper read by Mr. A. P. Trotter. Mr. Harrison has been instructed to proceed with the work immediately, so that the illumination of the Hampstead streets will be much improved before the autumn.

HACKNEY.—The L.C.C. has sanctioned the borrowing of £53,100 in connection with the extension of the undertaking. Sites in Lauriston Road and Dalston Lane are to be purchased for the erection of sub-stations.

MARYLEBONE.—The L.C.C. has sanctioned the borrowing of £42,500 for the electricity undertaking. This is for the provision of two 3,000-kw. turbo-alternators with condensing plant; four 1,000-kw. converters; switchgear and feeder cables. The plant capacity at the B.C.'s station next winter will be 17,400 kw., and the maximum load is expected to reach 10,300 kw., giving a

reserve of 7,100 kW., apart from battery plant, which represents some 1,500 kW. The Finance Committee (L.C.C.) has been advised that this margin is not excessive. The loan periods sanctioned are 15 years for the turbine plant and switchgear, and 25 years for mains.

**BERMONDSEY.**—A loan of £2,035 is to be taken up from the L.C.C. in connection with the undertaking.

**Lytham.**—The draft of the Lytham Electric Lighting Order has been received by the Council, and contains a special clause protecting the Blackpool, St. Anne's and Lytham Tramways Co. against having to take a supply of current from Lytham during the existence of the company's agreement with St. Anne's Council. This agreement lapses in June, 1917. The other clauses are of usual nature.

**Manchester.**—The scheme for improving the lighting of the central streets of the city was to come before the City Council on Wednesday. The capital cost spread over three years will be £15,000 for electricity and £18,000 for gas.

**New Zealand.**—The contract for the erection of the power house at Lake Coleridge has been let to Messrs. Taylor Bros. and Mooreland, of Christchurch, the price being £15,636.

**Northwood and Ruislip.**—The B. of T. has granted a prov. order for electric lighting to the Northwood Electric Light and Power Co., Ltd., for supplying current to certain parishes in the area of the Watford and Rickmansworth R.D.Cs. The B. of T. dispensed with the consent of the Watford R.D.C. to the company's application.

**Nottingham.**—There is a gross profit of £39,319 on the working of the electricity department during the year ended March 31st last. After allowing for repayment of loans, interest on consolidated stock, sinking fund, &c., there remains a net profit of £10,890, of which £8,000 is to be appropriated in aid of the general district rate, and £2,890 transferred to the reserve fund. The amount realised during the year from the sale of current amounted to £93,579; from rent of meters, £1,931; and from public lighting, £732. \* The number of units generated totalled 13,599,812, and the quantity sold was 12,602,306, as against 13,563,732 and 12,577,326 in 1911-12. The engineer, in his report on the year's working, states that extensions of mains amounting to 1'32 miles have been made during the year, and the total length of distributing mains at March 31st was 63'05 miles. There has been an increase of 234 in the number of applications for a supply of electricity, the consumers at the end of the year, 4,415, showing largest increase since 1906. The adaptability and convenience of electric motors is shown by another large increase in their number. The 191 additional motors aggregating 480 H.P., which have been connected to the mains, bring the totals to 1,540 motors and 5,690 H.P. During the 12 months 3,909,847 units were sold for lighting, 2,931,363 for power, and 5,761,096 for traction. The units used for lighting show an increase for the first time since 1908, when metallic-filament lamps began to be used; 23'65 per cent. of the units used for private lighting were at the flat rate of 3½d. per unit, which has been in operation nine months; 60'51 per cent. of the units for private lighting charged on the maximum demand system were at the reduced rate of 1½d. per unit. There has been an increase of 1s. 9d. per ton in the cost of coal, and the total additional cost for the eight months the increase has been in operation, is £3,099. It is estimated that the consumers who have adopted the flat rate have benefited to the extent of £2,395.

**Nuneaton.**—The Trades Council has passed and forwarded to the T.C. a resolution urging the Corporation "to make electricity a more utilitarian product for lighting, cooking, heating, &c.," in order that it may replace gas in the homes of working men.

**Port Glasgow.**—The B. of T. has granted the Electric Lighting Order promoted by Port Glasgow T.C., in favour of Greenock Corporation entering the burgh to supply the ship-builders and others with electricity.

**Rishton.**—The D.C. has agreed to the Accrington Electricity Committee supplying electricity at Rishton Paper Mills, subject to the supply being discontinued at a time to be agreed upon. The Accrington Electricity Committee has accepted these conditions, subject to the insertion of a clause fixing the minimum period at seven years.

**Salford.**—On May 1st there was held a L.G.B. inquiry into the application of the Corporation for sanction to borrow £35,900 for the purposes of the electricity undertaking. The town clerk said that £25,000 out of the £35,000 was required to cover the anticipated expenditure during the next few years on mains and service cables. Mr. H. Hawkins (electrical engineer) said an arrangement had been made to take a bulk supply from the Lancs. Electric Power Co., and in connection with this the laying of mains would cost not less than £8,000 during the first 12 months. In addition to that, the ordinary anticipated expenditure on continuous-current mains would be at the rate of about £4,000 per annum. During the second year there would have to be a further outlay in connection with the provision of extra-H.T. three-phase mains, which would cost something like £6,000. There would also be an expenditure of about £4,000 for the ordinary continuous-current mains during the second year. The total expenditure for three years would be about £25,000. In answer to the Inspector, Mr. Hawkins said the generating station capacity was 9,250 kW., and the maximum demand was just under 9,000 kW. There was no opposition to the application.

**Sevenoaks.**—The Sevenoaks Electricity Co. has, owing to a difficulty arising, asked the U.D.C. to consent to the withdrawal of the purchase clause in the agreement with respect to the E.L. scheme. The Council has decided not to dispense with a purchase clause, and has submitted a draft clause to the B. of T., with a view to it being inserted in the proposed prov. order.

**Shipley.**—A L.G.B. inquiry was held on the 30th ult. into the application of the Council for powers to borrow £5,700 for electrical plant. It was explained that the requirements were for cable-laying and providing equipment for supply of H.T. current. The Council was unable to meet demands by means of the existing plant. Complaints had been made by consumers that satisfaction was not being given, and owing to agreements made by the Council with textile and other manufacturers, and for other reasons, the Council felt obliged to proceed with the works without waiting for the sanction of the L.G.B., and the work was now practically completed. No opposition was offered to the application.

At the last meeting of the Electricity Committee it was reported that there were at the present time 701 lighting consumers on the Council's mains. An application had been received asking terms for the supply of electricity temporarily for power purposes at Lower Holme Mills.

**South Africa.**—A CAPE TOWN HYDRO-ELECTRIC PROPOSAL.—For some time the question of augmenting the water supply in the Cape Peninsula has been under consideration, there being apparently a barely sufficient supply of that necessary commodity available at the present time. In this connection a correspondent sends us some particulars of a tender which has been submitted to the Mayors and Councillors of the Peninsula municipalities by Messrs. A. and C. Struben for the supply not only of water but also of electricity, the water being obtained from the Steenbras River, 35 miles from Cape Town. The total cost of the scheme is £520,000, of which water supply accounts for £270,000, and electrical supply for £250,000. The tender provides for the supply of 5,000,000 gallons of water per day and 12,000,000 kW.-hours of electricity per annum to Cape Town, and by the diversion of adjoining waters these quantities could be doubled. Thus the scheme proposes to dam the Steenbras River, and so form an artificial lake several miles in length at an elevation of 1,115 ft. above sea level. The dam would contain 3,000 million gallons of water, taking a depth of 75 ft. From the reservoir a 2,540-ft. tunnel passes under a hill to two 33-in. diameter steel pressure mains leading to a preliminary hydro-electric generating plant, situated 280 ft. above sea level, and designed to use 5,000,000 of the total of 15,000,000 million gallons of water delivered daily, while the remainder would be used in a second power station, 50 ft. above sea level. The tail water from the first scheme would be purified and delivered to the Council's waterworks, while the lower station would discharge into the sea, unless the water were required for agricultural purposes. The upper station is proposed to contain 1,400 kW. and the lower one 6,400 kW. of plant; both stations would supply through the lower one, where the current would be stepped up to 40,000 volts pressure for transmission over duplicate three-phase overhead mains a distance of 35 miles to a receiving station in Cape Town. The estimates of working cost are of considerable interest, as the total annual charges, including interest at 4 per cent., and depreciation at half that rate, amount to £47,310, whereas the revenue derived from the sale of water at 6d. per 1,000 gallons, and of electricity (12,000,000 units) at ½d. per unit, totals £52,375. These prices are for water and electricity delivered. Last year the Cape Town Corporation generated 4,000,000 units in its own plant, requiring over 9,000 tons of coal, or an average coal cost of 6d. per unit, so that the scheme which, of course, looks towards the industrial developments of the future and the electrification of local railways, appears to be of considerable interest.

**Stalybridge.**—The Council is installing four 3,000-kw. Curtis-Rateau turbo-alternators at its power station, which will then have plant installed of 19,000-kw. capacity.

**Stroud.**—Some years ago a private company proposed an electric lighting scheme for Stroud and district, and the U.D.C. obtained a prov. order for its own protection. The order was renewed year after year, and eventually allowed to lapse, this transaction costing the ratepayers £500, and proving a bar to progress. Now another private company is in the field, with a scheme for electric supply for the town of Stroud and district, and both the U.D.C. and the R.D.C. have consented to waive any objection they might have to the proposal on certain conditions, which have been agreed to, but the B. of T. has objected to the conditions which the promoters of the scheme have entered into with the R.D.C., and states that the order must either be given up so far as the latter is concerned or else the Council must withdraw its conditions. This means that the R.D.C. will be struck out from the Electric Light Order, which will be confined to the area of the Urban Council. The latter authority has obtained the insertion of a clause in the prov. order providing for option of purchase in 21 years, it being understood that with the granting of powers the promoters would forthwith proceed to carry the same into effect. It is not anticipated that the R.D.C. will agree to withdraw its conditions, and the clerk is in correspondence with the B. of T. on the subject.

**Tyneside.**—Efforts have recently been made to exploit the pit heaps on the sites of disused collieries near Coxhoe, as much good coal is known to exist in them. The rubbish from South Kelloe heap is being loaded into trucks and hauled to the Carville power station, where some 400 or 500 tons are being sent each week. The waste is also being used for firing at local brickworks, and its use will eventually clear large areas of land at present disused.

**U.S.A.**—According to the *Wall Street Journal*, Los Angeles is the most highly-developed electrical city in the world. It is said that 98 per cent. of all habitable dwellings are wired for electric supply, and that there is a meter for every 4½ inhabitants.

**Watford.**—At the last meeting of the B. of G. it was stated that the installation of electric light at the workhouse had resulted in £74 being saved in one quarter, compared with the previous cost of gas.

**West Bromwich.**—According to reports issued on the 2nd inst., the sales of electric energy during the year ended March 31st amounted to £17,618, which is an increase of £1,121 upon last year. For private lighting there is an increase of £136, and for motive power an increase of £1,100, but for traction there is a decrease of £115.

**West Ham.**—The Corporation Electricity Supply Department has arranged for electric cooking demonstrations and lectures to be given by Mr. F. S. Grogan at the Town Hall, Stratford, from May 19th to 22nd, at 3.30 p.m. and 7 p.m. each day.

**Worthing.**—Acting on the report from the electrical engineer, Mr. G. Porter, the Electricity Committee of the T.C. has decided that provision should be made as soon as possible for additional plant and buildings to meet the increasing demand upon the machinery, and authority has been given for the preparation of the necessary plans and estimates, with a view to the Committee reporting to the Council at an early date.

## TRAMWAY and RAILWAY NOTES.

**Aberdeen.**—The "Pay-as-you-enter" system of cars has been adopted by the Corporation on the Woodside section. The T.C. contracted for 10 cars, which have been constructed by a local firm at a cost of between £800 and £900 each. At the inauguration ceremony, Mr. R. Stuart Filcher, the manager, was heartily congratulated on his enterprise in introducing the cars. The innovation, which appeared to work quite smoothly, created great interest.

**Accrington.**—The year's working of the Corporation tramways undertaking shows the total receipts to have been £27,822, an increase of £1,601. The total working expenses were £15,455, or £340 less than last year. The balance to net revenue account was £12,367, as compared with £10,426 in the previous year, an increase of £1,941. The gross profit was £4,553, and the net profits £1,194.

**Belfast.**—At the monthly meeting of the Corporation last week, the minutes of the Tramway and Electricity Committee contained Mr. Mance's annual statement on the tramways. Alderman Finnigan said that it was thought that there would have been a larger revenue, but, on the whole, it was a satisfactory one. The forecast of profits was £260,000, but expenses had gone up, and instead of amounting to £135,000, they were £143,000. The nominal net profit was £16,000. There was an increase of £2,500 in sundry wages, and the late wet summer lost them £5,000. Recently a lot of the old cars had been converted into up-to-date cars.

**Bingley.**—Last week, a L.G.B. inquiry was held into an application by the Council, for powers to borrow £19,930 for street and highway improvements in connection with the scheme for the extension of tramways from the present Nab Wood terminus of the Bradford system, for which the Bingley Council has obtained powers. There was no opposition.

**Blackpool.**—The tram-fares question has been settled for another year: there was an agitation for 1d. fares on the Promenade, and Mr. Chas. Furness, the manager, pointed out that during 21 weeks last year, the tramway systems of Blackpool and Bournemouth each carried about 7½ million passengers; at Bournemouth, where there were 1d. stages, the receipts were £45,840, while at Blackpool, principally through the 2d. minimum on the Promenade, the receipts were £54,794. Mr. Furness pointed out that the difference of £8,954 in favour of Blackpool made all the difference between profit and loss, and enabled them to face the loss of £10,000 incurred in maintaining the tramway service during the winter, for whilst the average weekly winter receipts in Bournemouth were £1,600, they were only £600 at Blackpool. He estimated that the adoption of 1d. stages during the season would mean a loss of from £7,000 to £10,000. It was stated that as from 80 per cent. to 90 per cent. of the tramway receipts were contributed by visitors during the summer, it would be folly to make any change which would result in adding to the ratepayers' burdens. Therefore no change was made.

**Bolton.**—The revenue account and balance-sheet of the tramways undertaking for the year ended March 31st, 1913, has just been presented to the Tramways Committee by the borough treasurer. The Committee approved the accounts, and resolved to transfer £13,500 towards the relief of the rates, as compared with £10,500 last year. The reserve fund now stands at £55,901.

**Bury.**—Mr. W. Clough, the general manager of the tramway undertaking, in his annual report, states that the gross traffic receipts amounted to £67,525, as compared with £66,074

for the previous year, an increase of £1,451. The figures for the year 1911-12 were, at the time, regarded as the maximum because several exceptional factors had contributed to the result. To have exceeded the result of that record year was extremely satisfactory. The gross receipts were allocated as follows:—Bury sections, £14,167; Radcliffe sections, £13,892; Heywood sections, £7,226; and Salford sections, £2,239. There was a net surplus on the Bury sections of £9,572, to which had to be added the net surplus of £1,252 from the Radcliffe tramways, making a total net surplus of £10,824. Of this amount, £6,252 had been contributed to the borough rates, £3,572 carried to reserve and depreciation fund, and £1,000 used to commence an insurance fund against third-party claims.

**Continental Notes.**—**RUSSIA.**—La Societé des Tramways de Kischinev has taken over the municipal tramway system in the town of Kischinev, and, under a 45 years' concession, is converting the same to electric traction, as well as constructing several new lines. It is expected that the work of conversion will be completed by October next. The necessary electrical energy will be supplied from the municipal electric power station.

**Dewsbury.**—The Batley Corporation having intimated its inability to undertake the construction of a line of tramway in Dewsbury Gate Road, the Dewsbury Electricity and Tramways Committee has decided to notify the intention of the Corporation with respect to a physical junction between the Shaw Cross and West-borough tramways to the Yorkshire (Woolen District) Tramways Co. and the National Electric Construction Co., and inquire if, under the circumstances, they are prepared to submit to the Committee amended proposals for dealing with the matter.

**\* Doncaster.**—The R.D.C. has decided to support the Mexborough and Swinton Railless Tramways Bill, which has met with strenuous opposition on the part of many of the smaller townships of South Yorkshire. The support has been given on an undertaking that clauses will be inserted for the protection of the Doncaster Council.

**Jarrow-on-Tyne.**—A letter from the Jarrow and District Electric Traction Co., stating that the directors are being pressed to provide improved travelling facilities between Jarrow and South Shields, has been received and considered by the Corporation Tramways Committee of South Shields. The company expresses the opinion that the time is opportune for the renewal of through running over the Shields tramways, and asks whether the Corporation is prepared to discuss the matter. The Committee has decided that the Corporation is not prepared, in view of its previous experience, to discuss the question of running powers.

**Keighley.**—At a meeting of the T.C. last week, the chairman of the Tramways Committee moved that, instead of continuing to insure the motor-omnibuses against damage and the Corporation against third-party risks, £200 per annum should be set aside and paid into the existing tramway insurance fund. Outside insurance, he said, had cost £365 in two years, and only £62 had been received on account of claims. The local tramways insurance fund had been formed through the laying aside of 1s. 6d. per 100 miles run, and the fund now stood at £965. The motion was adopted.

The Corporation has received official sanction to the running of a service of railless cars from Ingrow for the next three months.

**Liverpool-Ormskirk Electric Railway.**—May 1st marked the inauguration of a full electric train service between Liverpool and Ormskirk, made possible by the completion of the electrification extension from Town Green to Ormskirk. The provision of the new storage battery station at the latter town enables practically a half-hourly service to be maintained, and only through steam-trains to and from the north will run on this portion of the line in future. It is expected that the quickened service will prove beneficial to the Ormskirk district as a residential centre.

**London.**—I.C.C.—The Highways Committee, in view of the alterations to be made at the Greenwich generating station and the shortage of plant, has made arrangements with the London Electric Supply Corporation to purchase up to 2,000 kw. at £3 per kw.-year, and 3d. per unit, for a period of not less than nine months. This represents a charge of £13,750 as compared with £11,870 if obtained from the Council's own plant.

**Manchester.**—A report has been prepared by a Special Sub-Committee of the Corporation Tramways Committee upon the question of the congestion of tramway traffic. Attention has been concentrated solely upon what may be described as the passenger transportation problem—how best to meet the demands of the travelling public between the central parts of the city and the various suburban districts. The report states that the problem is of so important a character, affecting so vitally not only the future of the tramway undertaking, but that of the city generally, that the Sub-Committee suggested that full information should be obtained from all available sources. The Sub-Committee deemed it necessary that the general manager and the permanent-way engineer should be instructed to visit other cities, both in this country and abroad, and the Tramways Committee adopted a recommendation in this sense, but the City Council subsequently referred the matter back for further consideration. The Sub-Committee was more than ever convinced, after further consideration, that the procedure originally suggested was absolutely necessary, and it again recommends that the two officers named be instructed to visit the following cities at as early a date as possible, and that they be

directed carefully to study the various methods of passenger transportation adopted.—London, Glasgow, Paris, Berlin, Hamburg, Vienna, New York, Boston, Chicago, Philadelphia and Toronto. The Sub-Committee points out that delay is serious, because the traffic demands are so great that the Tramways Committee is forced to provide new rolling stock, and the outcome of the proposed inquiry may be that some modification in the existing types of rolling stock may be suggested.

In regard to the allocation of £100,000 to the relief of the rates from the Corporation tramways undertaking, the Finance Committee of the Corporation has pointed out to the Tramways Committee that, on the basis of 5 per cent. on capital expenditure, the tramways department should contribute £103,117 in rate relief. The Tramways Committee is protesting against the contribution of any greater sum than the £100,000 shown in the annual estimates, declaring that the effect of such a policy will be to cripple the development of the undertaking, and to prevent the granting of further improved facilities to the travelling public.

**Newcastle-on-Tyne.**—At a conference of the Institution of Municipal and County Engineers, Mr. J. McKellar, of Newcastle, contributed a paper on the tramway extensions of the city. He mentioned that there were about 60 miles single track, and they had cost about one and a quarter millions. With the exception of the first 20 miles, which were constructed under contract, all the work had been carried out departmentally. The present trolley system came into operation in December, 1901, and almost all the original rails and other material were still in use, evidence of the quality of the work. The only renewals carried out so far were about 500 yards on each side of two very steep gradients (worn out owing to the action of the magnetic brakes) and three of the original junctions. During the present year it was proposed to relay about two miles of route and seven junctions.

**Nottingham.**—The tramways undertaking shows a net profit of £24,775 for the last year, which is to be apportioned as follows: In aid of general district rate, £19,000; to reserve and renewals fund, £4,775; to reserve for removal of centre poles suspense account, £1,000. Traffic receipts during the 12 months amounted to £164,755, while advertisements brought in £2,200. Energy for power and lighting accounted for £30,005 of the total expenditure, which amounted to £108,273.

**Swansea.**—A deputation representing the Corporation, which has been to Halifax, Leeds and other places with the object of inspecting the working of tramways on steep gradients in order to decide on the best means of traction up Mount Pleasant, Swansea, has returned, and its members express themselves satisfied that a system of ordinary electric traction with overhead wires, recommended by Mr. Sellon, the Corporation's consulting engineer, will meet every requirement of efficiency and safety. There is a likelihood that the adoption of a central rail may be recommended as an additional precaution.

## TELEGRAPH and TELEPHONE NOTES.

### An International Wireless Telegraph Company.

An interesting development in international co-operation is afforded *Télégraphie sans Fil*, with a share capital of £90,000, divided into by the formation in Brussels of the *Société Internationale de 4,500 shares of £20 each*. The principal interests in the company are represented by Marconi's Wireless Telegraph Co. with 1,500 shares, the *Gesellschaft für Drahtlose Telegraphie*, of Berlin, with 1,500 shares and the *Banque d'Outremer*, of Brussels, with 800 shares.

**Australia.**—The Postmaster-General has stated that for three consecutive nights the operator on Macquarie Island, in the vicinity of the Antarctic Circle, has been able to maintain regular communication with the wireless stations at Port Moresby and Thursday Island—a distance of considerably over 2,000 miles.

**Blind Telephone Operators.**—In the United States trials have been made with blind girls as telephone operators, with remarkable success. It is stated that they carry out their duties more accurately than girls who are in possession of sight.

**Crete.**—It is proposed to enlarge the telegraph and telephone networks in the island of Crete at a cost of 105,000 fr. The orders for the material and instruments will be placed by the Greek Government.

**Imperial Wireless System.**—On Wednesday last week, Mr. F. Straker, assistant general manager of the London and South-Western Bank, was examined by the Select Committee on the Marconi contract regarding the statement of Mr. Powell, that a large syndicate had been operating in Marconi shares, which he denied *in toto*. Mr. Godfrey Isaacs banked with them, and opened a special account in connection with the American shares. There was no request for small notes. The total amount credited to the special account was about £150,000; £53,000 was withdrawn by Mr. Isaacs and paid to Marconi's Wireless Telegraph Co., the balance being cabled to New York in payment for the shares.

Mr. H. T. Campbell, broker to the Marconi Co., was recalled, and gave evidence regarding the dealings in shares. Mr. Godfrey Isaacs afterwards explained the transfer of moneys from his bank account to that of the company.

After the close of the public sitting the Committee considered the desirability of presenting a special interim report on the questions affecting Ministers and others, and came to the conclusion that the time available before the rising of the House was not sufficient to enable it to do so. It was resolved that the evidence in regard to this part of the inquiry be concluded before the Whitehall recess, and that at the first meeting after the recess the Committee should proceed forthwith to the preparation of an interim report.

In the House of Commons the Prime Minister refused facilities to discuss a motion that the Committee be instructed to report on or before June 2nd.

On Monday Sir Albert Spicer, assisted by Mr. C. W. Knox examined the pass-books of Mr. Lloyd George and Sir Rufus Isaacs. The report of the Technical Committee appears elsewhere in this issue.

The Select Committee refused an application submitted by Mr. Maxse for a further hearing. A further sitting was held on Wednesday, when Mr. Marconi gave evidence.

**India.**—An automatic telephone system, which was recently inspected by numerous officials of the Government of India at Delhi, is to be introduced at Simla next cold weather.—*Indian Engineering*.

**L.C.C.**—The Post Office has given notice that the charges made to the Council under agreement with the National Telephone Co., for the services of the telephone operators at the private exchanges at the county hall and the education offices, have been revised. Under the existing arrangement the cost of the services of the operators, for which a charge of £598 a year is to be made in future, amounts to £401 a year, so that the increased cost to the Council will amount to £197 a year.

**London Fire Alarms.**—London is to be provided with a more modern system of fire alarms than those now in use, which are reported to be not of the best type. An officer of the fire brigade is to visit America for the purpose of inspecting and reporting upon the systems of fire alarms in use in the large cities.—*Daily Telegraph*.

**Poulsen System of Wireless Telegraphy.**—It is announced that the Canadian Government has introduced a Bill to ratify an agreement between the Dominion and the Universal Radio Syndicate for the establishment of wireless communication between Canada and England, on the Poulsen system. The company claims to be able to transmit at the rate of 80 words a minute, and to work day and night over a distance of 2,000 miles. The British station will be at Ballybunnion, Co. Kerry, and it is said that the system will be in operation in August next. Code messages will be taken at 8d. a word, ordinary messages at 4d., and Press messages at 2d. Code messages will not be given priority over private ones.

**The Telegraph Service.**—The Controller of the Central Telegraph Office has addressed a letter to the staff, stating that the service is in a state of transition, and urging the members to revise their methods and accelerate their procedure, in view of the growing competition of the telephone.

**Telephonic Communication Between Vienna and Dalmatia.**—About a year ago it was decided to establish telephonic communication between Vienna and Dalmatia, and the line—now completed—passes through Istria and over a number of islands in the Adriatic to the Dalmatian coast. The total distance from Vienna to Zara (Dalmatia) is about 510 miles. The overhead lines are of 5-mm. bronze wire, and the total length of the submarine sections of the line is 37 miles. The Krarup (distributed loading) construction was adopted in preference to the Pupin system of loading, owing to the numerous changes from submarine to overhead construction; the submarine cables were supplied by the *Norddeutsche Seekabelwerke* (Nordenham), whose tender was the lowest received. The cables contain four cores, each comprising a round central copper conductor surrounded by three strip conductors (total section 5½ sq. mm.), overwound with three layers of 0.2 mm. soft iron wire, and covered with a special gutta-percha mixture to 8.4 mm. diameter. The conductors are stranded in pairs, which are then also stranded together. A brass tape covering is provided as protection against the teredo, while the armour consists of 24 galvanised iron wires of 5.7 mm. diameter on the deep sea, and of 207 1-mm. wires on the coastal, sections of the cable. No cable ship being available, the cargo steamer *Pera* was adapted to the work of laying the cable, which was effected without mishap, though the sirocco raged during part of the laying period.

On the completion of the line, it was found that communication between its ends was very satisfactory despite the considerable leakage from the overhead lines, which leakage was particularly severe on the islands owing to the collection of thick salt deposits on the insulators and posts. The two pairs of conductors in the submarine cables were free from mutual induction, so that no cross-talk was experienced. Before laying the submarine cable the two pairs of cores were placed in series for experimental purposes, and it was found that satisfactory communication could be effected through the 75 miles effective length of submarine cable thus obtained and 395 miles of landline. Recently satisfactory speech transmission has been secured between Vienna and Sarajevo (875 miles), although the overhead lines in Bosnia are only 3 or 4 mm. in diameter.—*E.T.Z.*

**Wireless Station Burned.**—The wireless station at Cape Race was destroyed by fire on Monday.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Australia.**—VICTORIA.—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

May 16th.—One 15-ton overhead travelling crane, for the Melbourne City Council. See "Official Notices" May 2nd.

June 2nd.—20,000-volt H.T. switchgear and L.T. switchgear and accessories, for the Melbourne Suburban Railways. See "Official Notices" May 2nd.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

TASMANIA.—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" to-day.

QUEENSLAND.—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" April 11th.

August 27th.—Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

WESTERN AUSTRALIA.—May 28th. Condensing plant, pump and piping, for a Government power station at Perth. See "Official Notices" to-day.

July 9th and 30th and August 6th.—Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

SOUTH AUSTRALIA.—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

**Barnes.**—May 19th. Feeder and distributor cables, for the U.D.C. See "Official Notices" April 25th.

**Belfast.**—May 19th. Circulating-water pump, for the Corporation Tramways and Electricity Committee. See "Official Notices" April 25th.

**Belgium.**—May 16th. The Direction des Ponts et Chaussées in Brussels (52, Boulevard du Regent) is inviting tenders for an installation of electric lighting in the Public Park at Laeken. Particulars may be obtained from the Engineer, 15, Rue des Augustins, Brussels.

**Birkenhead.**—May 19th. Corporation Electricity Department; tenders for washed slack or washed small coal, for 12 months, commencing July 1st, 1913. Electrical engineer, Mr. W. Wyld, Craven Street.

**Bootle.**—May 13th. Boiler and pipe coverings for Marsh Lane electricity works. Borough Electrical Engineer's Office, Pine Grove.

**Bradford.**—May 15th. The Education Committee invites tenders for electrical work and fittings at the Belle Vue Boys' Secondary School and the School for Deaf and Cripple Children, Lister Lane. Tenders to the Director of Education, Town Hall.

**Bulgaria.**—May 21st. The District Administration of Finance in Sofia is inviting tenders for a double electrically-operated winding cage with all accessories, for the State Collieries at Pernik.

**Derby.**—May 23rd. One 750-kw. motor-alternator, for the Corporation. See "Official Notices" to-day.

**Germany.**—May 21st. The Prussian State Railway authorities at Königsberg are inviting tenders for two 30-cwt. electrically-operated coal-loading cranes.

**Glasgow.**—May 26th. Two steam turbo-alternators, with condensing plant (5,000 kw. and 2,000 kw. respectively), for the Corporation Tramways Department. See "Official Notices" April 25th.

**Grimsby.**—Pipework, extension of Klein cooling towers, conduits, seven-way D.P. distribution board and motor-driven rotary air and water extraction pumps and circulating pump, for the Corporation. See "Official Notices" May 2nd.

**Leeds.**—May 19th. Economiser chamber at the generating station, Whitehall Road; extension of engine room flooring at generating station, Whitehall Road. Specifications, &c., from 1, Whitehall Road, Mr. C. N. Hefford, engineer.

**London.**—May 9th. Electrical installation at Wilton Road Central Elementary School, Hackney. See "Official Notices" April 25th.

May 13th.—One 20-ton overhead band crane, for the Shoreditch sub-station. See "Official Notices" April 25th.

L.C.C.—May 28th. Electrical installations at Lewisham Bridge and Fairfield Road (Bow) elementary schools. See "Official Notices" to-day.

Applications are invited from persons and firms wishing to be included among those from whom the Council invites tenders for the supply of stores and the execution of general maintenance contracts. See "Official Notices" to-day.

MILE END.—Two 30-kw. and one 15-kw. compound engines and dynamos, for the Guardians (from municipal authorities only). See "Official Notices" to-day.

**Malta.**—May 22nd. Arc lamp carbons. Receiver-General and Director of Contracts, Valletta. Forms, &c., from Crown Agents for the Colonies, Whitehall Gardens, S.W.

**Manchester.**—May 13th. Electric light installation at Withington Workhouse. Specification and particulars obtainable from Mr. F. H. Overmann, architect, 49, King Street, Manchester.

**Mexborough.**—May 30th. Lancashire boiler, for the U.D.C. electricity department. See "Official Notices" April 25th.

**New Zealand.**—CHRISTCHURCH.—May 22nd. City Council. Two 500-kw. converters and switchboard panels. Tenders, c.i.f. Lyttelton, to office of High Commissioner for N.Z., 13, Victoria Street, S.W. Specification, &c., at Board of Trade C.I. Department in London.

**Norway.**—May 14th. Norwegian State Telegraph Department. Copper wire, insulators and soldering tin. Local representation. Copies of the specifications may be seen at the C.I. Branch of the Board of Trade, London.

**Peterborough.**—The Council is about to invite tenders for two steam boilers and a steam turbine and generator.

**Paris.**—May 13th. Tenders are invited for the electrical high-tension equipment to be established at the sub-station at Meudon-val-Flenry. Particulars, Bureaux du Service Electrique (2-m. Division), 43, Rue de Rome, Paris.

May 17th. Supply of 200,000 liquid pile elements, in four lots. Particulars, Direction de l'Exploitation Téléphonique, 103, Rue de Grenelle, Paris.

**Plymouth.**—May 13th. Steam coal (8,500 tons), for the Corporation Electricity Department; Mr. E. G. Okell, Borough Electrical Engineer, Prince Road (returnable deposit of £1).

**Rathmines and Rathgar.**—May 19th. Electrically-driven jet condensing plant, for the U.D.C. See "Official Notices" May 2nd.

**Rochdale.**—May 14th. Electrically-driven induced-draught plant, for the Corporation electricity department. See "Official Notices" April 25th.

May 21st.—Boiler feed pumps, for the Corporation Electricity Committee. See "Official Notices" May 2nd.

**Salford.**—May 19th. Tenders invited for 10 car bodies and 10 Brill trucks. Tramways General Manager, 32, Blackfriars Street, Salford.

**South Africa.**—STELLENBOSCH (CAPE PROVINCE).—June 4th. The Municipality is requiring tenders for buildings, generating plant, cables, public lighting, meters, &c., in connection with the electric lighting scheme. Specifications from Prof. Bohle, South African College, Cape Town.

**Spain.**—May 23rd. The municipal authorities of Montilla (province of Cordoba) are inviting tenders for the concession for the electric lighting of the town during a period of 20 years.

**Walthamstow.**—May 28th. Natural draught cooling tower, for the U.D.C. Electricity Department. See "Official Notices" May 2nd.

**Warrington.**—May 13th. Traction battery and reversible booster, for the Corporation. See "Official Notices" April 25th.

May 13th.—Feeder pillars and high and low-tension cables, for the Corporation. See "Official Notices" May 2nd.

### CLOSED.

**Australia.**—SYDNEY.—The *Australian Mining Standard* records the acceptance of the following tenders by the Municipal Council:—

Feeder Cables.—B.I. & Helsby Cables Ltd., £276; Noyes Bros., £3,353; Henley's Telegraph Works Ltd., £4,018.

Underground Cables.—B.I. & Helsby Cables Ltd., £11,721, and the following as per schedule tendered: Siemens Bros., Western Electric Co., Henley's Telegraph Works, Noyes Bros.

Motors.—British Westinghouse Electric Co., Gardner, Wearn & Co., Union Electric Co., Australian General Electric Co., Australian Metal Co., Siemens Bros., all as per schedule tendered.

The same contemporary records the following results:—

P.M.G.'s Department, Adelaide:—

82 tons H.D. copper wire, 106 tons galvanised iron wire.—R. Johnson, Clapham & Morris, Ltd.

P.M.G.'s Department, Melbourne:—

Bells, induction coils and fuses, I.R., G.P. & T. Works Co. 38 miles paper-insulated cable, Australian Metal Co. Bells, fuses, telephone apparatus, switchboards, &c., J. Bartram & Son, Pty., Ltd.

P.M.G.'s Department, Perth:—

About 9 miles lead-covered, paper-insulated telephone cable (£8,899), Imperial Electrical Engineering Co., Perth. Telegraph cable (2,165 ft.), B.I. & Helsby Cables, Ltd.

According to *Tenders*, the Home Affairs Department has ordered the steel frame for power generating station, Federal capital site, at £6,345, from Messrs. Johns & Waygood, Ltd., Melbourne, and one Green's patent economiser, for Federal capital, at £1,292, from Babcock & Wilcox, Ltd.

**Barrow.**—The Council, on Monday, decided to relieve Messrs. Ship Carbons, Ltd. from their contract for supplying yellow-flame carbons, and agreed that the tender of Messrs. Engineering and Arc Lamps, Ltd., be accepted. In regard to the supply of copper wire and carbon-filament lamps, it was decided to inform Messrs. Thos. Bolton & Sons, Ltd., and the Radium Electric Co. that the Electricity Committee regret that they cannot make any alteration in their tenders, and that they be requested to supply such goods as may be ordered in accordance with their tenders.

**Belfast.**—The Corporation, last week, accepted the tender of Messrs. Babcock & Wilcox, Ltd., at £2,805, for an additional boiler, superheater, mechanical stoker and pipework for the electricity works.

**Belgium.**—The municipal authorities of Schuerbeek, Brussels, last week opened tenders for the supply and installation of 11 transformer boxes in connection with the electric lighting undertaking. Six concerns—four Belgian, one French and one German—competed for the contract, the lowest tender being that of the Société A.E.G. Union Electrique, of Brussels.

**Bexhill-on-Sea.**—The T.C. has sealed an agreement with the Tudor Accumulator Co., for the maintenance of the batteries for 10 years.

**Blyth.**—The tender of Messrs. Resive & Co., of Brignouse, has been accepted for the E.L. installation at the new Government buildings at Blyth.

**Bolton.**—The Corporation Tramways Committee has accepted the tender of Messrs. Milnes, Voss & Co. for ten additional top covers for double-deck cars.

The Electricity Committee has accepted the following tenders:—

W. Gornall.—Reservoir construction in connection with the new generating station.  
Bertram Thomas.—Sub-station equipment.  
S. Talbot & Sons.—Two chimney stacks.  
B. I. & Helsby Cables, Ltd.—Wires and cables.  
F. & J. Webster.—Castings.

**Bradford.**—The Corporation Electricity Committee has accepted the tender of Messrs. Ferranti, Ltd., to supply E.H.T. switchgear required for the transformer chamber at Montserrat Mills, for £215. The Committee has authorised an alteration in the supply in the Manchester Road district, south of Bowling Old Lane, from direct current to alternating current, involving the provision of new cables, relaying of single-core cables, &c., at a cost of £450.

The following tenders have also been accepted:—

Bertram Thomas.—Three-phase A.C. and D.C. switchgear required for new sub-stations at Thornbury and Odsal, £2,075.  
Underfeed Stoker Co., Ltd.—Two Underfeed stokers for boilers at Valley Road Works, £75.  
Babcock & Wilcox, Ltd.—Two chain-grate stokers for boilers, £80.  
Taylor Bros., Ltd.—50 nickel-chrome-steel tramcar axles, £4 5s. 9d. each.

**Bridlington.**—The Electricity Committee has placed an order with the Brimsdown Lamp Works, Ltd., for lamps for a year, at prices quoted.

**Bristol.**—The Electrical Committee reported to the Council, on Tuesday, that it had entered into the following contracts for 1913-14:—

W. Lucy & Co., Ltd., fuse boxes .. ..	£104
Bykes & Suggen, Ltd., joint and junction boxes .. ..	480
Oliver Arc Lamp, Ltd., yellow flame arc lamp carbons ..	301
Sloan Electrical Co., Ltd., open-type arc lamp carbons ..	371
Ferranti, Ltd., D.C. meters .. ..	363
British Westinghouse Co., Ltd., A.C. meters .. ..	1,069

**Brighton.**—The T.C. has accepted the following tenders:—

R. Charlsons, Westgarth & Co., Ltd., turbine (3,000 h.p.m.) coupled to a Siemens 3,000-kw. alternator, complete with waterspray filter, air pump, and augmentor condenser with 200 sq. ft. of cooling surface, £7,291.  
Greenwood & Batley, Ltd., for a De Laval motor-driven turbine pump, with switchgear, at £276.

**Broadstairs and St. Peter's.**—The U.D.C. has referred the following tenders for the installation of electric fire alarms to a Committee for consideration:—

Stuart & Moore.—Without telephones, £190 10s., and £12 per annum for maintenance; with complete telephone apparatus £213, and maintenance £14 a year.  
Siemens Bros.—£139, exclusive of fixing and wiring.  
Walter Electrical Manufacturing Co., Ltd.—£223 complete.  
Mr. G. Longfield.—£152, exclusive of wiring and maintenance.

**Buenos Ayres.**—Two engines of 240 B.H.P. each for the Provincial Electric Lighting Co., of Buenos Ayres, have been ordered from Messrs. Hick-Diesel Oil Engines, Ltd.

**China.**—The *Indian and Eastern Engineer* states that there has recently been formed in the little city of Fatsan, near Canton, a company to undertake the supply of electric lighting and power. A British firm, the General Electric Co. of China, Ltd., has secured the principal contract in connection with the installation. The generating plant which the G.E. Co. is to supply will consist of three three-phase high-tension A.C. generators with an overload capacity of about 200 kw., driven by crude-oil Bolinders engines. The plant, which will go from Witton, will arrive in July and should be ready for starting by the end of the year. "Much difficulty has been encountered in the choice of a suitable site for the power station. Fatsan lies very low, and to avoid the possibility of occasional flooding, it has been found necessary to raise the ground on which the building is to be erected some 5 ft."

**Coventry.**—The Corporation has accepted the tender of the Brush Electrical Engineering Co. for five double-deck tramcars with four-wheeled trucks.

**Dewsbury.**—The Electricity and Tramways Committee has accepted the tender of the Union Cable Co., of Dagen Deck, for 1 mile of electric cable.

**Doncaster.**—The Electricity Committee recommends the acceptance of the following tenders for six new cars—The United Electric Car Co., Ltd., for car bodies, with top covers, at £456 each. The Peckham Truck Co. for pendulum trucks, at £290 each and Dick, Kerr & Co. for electrical equipments, at £241 each.

**Dukinfield.**—Messrs. C. Benyon & Co., a local firm, have received the contract for installing electric light at the Primitive Methodist New Sunday School, Foundry Street.

**Eccles.**—The Electricity Supply Committee has accepted the tender of Messrs. F. Danks, Ltd., Oldbury, for a Lancashire boiler for the electricity works for the sum of £410.

**Germany.**—Messrs. Nagel & Kamp, of Hamburg, have secured a contract from the Finance Deputation, of Hamburg, for the supply and erection of four electric cranes, at a cost of £4,015.

**Glasgow.**—The Clyde Navigation Trustees have agreed to accept the following tenders for the material required for the erection of 10 electric capstans at Renfrew:—

Motors.—Laurence Scott & Co., Ltd., at £360.  
Iron castings.—Fullerton, Hodgart & Barclay, Ltd., at £208.  
Steel castings.—Carnegie Steel Castings Co., at £116.  
Controllers and resistances.—British Westinghouse Co., Ltd., at £262.

**Holland.**—Messrs. Cassirer & Co., of Charlottenburg, Germany, have secured a contract from the Provincial Administration authorities at Groningen for the supply of 68½ miles of electric cables, for the round sum of £24,000.

**Keighley.**—The Electricity Committee has accepted the tender of Messrs. Hird Bros. & Co., at £139, for work in constructing a concrete foundation for a new 2,000-kw. turbo-alternator.

**Liverpool.**—The T.C. has accepted the following tenders for supplies to the Electricity and Tramway Departments:—

British Thomson-Houston Co., Ltd.—Two 6,000-kw. turbo-alternators.  
Joshua Henshaw & Sons.—Alterations at the Lister Drive electric power station.  
Pearson Hughes & Co., Ltd.—1,000 pairs of drivers' and conductors' winter trousseis.  
British Westinghouse Electric and Manufacturing Co., Ltd.—Three sets of rotary converters and accessories.

**London.**—L.C.C.—The following were the tenders received during the election interval and the Easter recess for the electric lighting of the Avery Hill Training College Hostels:—

H. J. Cash & Co., Ltd. .. .. .	£1,180
Pinching & Walton .. .. .	1,159
Tredegar & Co. .. .. .	1,209
Williams & Bach .. .. .	1,240
G. E. Taylor & Co. .. .. .	1,366
W. C. Tackley & Co., Ltd. .. .. .	1,426
G. Weston & Sons, Ltd. .. .. .	1,463
Malcolm & Allen, Ltd. .. .. .	1,517
(Architect's estimate, £1,068.)	

The Fire Brigade Committee is accepting the tender of the "Cedes" Electric Traction, Ltd., for a petrol-electric motor chassis required for converting a holed turntable long ladder into a petrol-electric motor appliance, at £850. The company will sub-let the motor engine to the Aster Engineering Co., Ltd.

The following tenders were received by the Highways Committee for two 8,000-kw. turbo-generators and auxiliaries, required for the Greenwich generating station:—

Name.	Maker of generator.	Amount of tender.
Escher, Wyss & Co., Zurich .. .. .	Siemens .. .. .	£48,012
British Westinghouse Electric, &c., Co., Ltd. .. .. .	British Westinghouse, &c., Co. .. .. .	50,592
Willars & Robinson, Ltd. and Red. .. .. .	Siemens .. .. .	50,560
Richardsons, Westgarth & Co., Ltd. .. .. .	Brown, Boveri .. .. .	51,610
Fraser & Chalmers, Ltd., Erith .. .. .	Brown, Boveri .. .. .	52,989
Willars & Robinson, Ltd. and Red. .. .. .	General Electric .. .. .	53,710
Willars & Robinson, Ltd. and Red. .. .. .	Dick, Kerr .. .. .	53,720
Fraser & Chalmers, Ltd. .. .. .	Siemens .. .. .	54,330
Richardsons, Westgarth & Co., Ltd. .. .. .	Siemens .. .. .	54,621
Jas. Howden & Co., Ltd. .. .. .	Siemens .. .. .	55,342
Richardsons, Westgarth & Co., Ltd. .. .. .	General Electric .. .. .	58,269
Fraser & Chalmers, Ltd. .. .. .	General Electric .. .. .	58,269
Brush Electrical Engineering Co., Ltd. .. .. .	Brush .. .. .	60,500
C. A. Parsons & Co. .. .. .	C. A. Parsons .. .. .	64,830
British Thomson-Houston Co., Ltd. .. .. .	British Thomson-Houston .. .. .	70,224
Belliss & Morcom, Ltd. .. .. .	Siemens .. .. .	70,770

The Committee reports upon these offers as follows:—"The above prices are subject to an increase or decrease resulting from a bonus or penalty on steam consumption, such bonus or penalty being at the rate of £500 per tenth of a pound of steam less or more than 12.75 lb. per kw.-hour at full load. The estimate of the chief officer of tramways was £62,500. Having regard to the very great importance of obtaining the best possible type of plant for the generating station, the chief officer of tramways consulted an expert as to which of the tenders would be most satisfactory from the Council's point of view. Sir Alexander Kennedy was asked to advise on the matter, and he has carefully examined each of the tenders received. As the result, Sir Alexander Kennedy, after discussing the matter with the chief officer of tramways, has advised that the second lowest tender, that of the British Westinghouse Co., amounting to £50,532, should be accepted. One of the most important considerations involved in coming to a decision as to the tender to be accepted is that of steam economy, and the figure submitted by the British Westinghouse Co. is 12.44 lb. of steam per kw.-hour at full load, which, we are advised, is satisfactory. The corresponding figure offered by Messrs. Escher, Wyss & Co. is 12.82 lb. per kw.-hour, subject to an allowance of 3 per cent. either more or less. On the assumption that both sets of figures were obtained in actual operation, the extra steam required by the two Escher, Wyss turbines would represent an additional expenditure for coal of about £1,500 a year at present prices. We accordingly propose that the

tender of the British Westinghouse Co. should be accepted. An additional provisional sum of £4,000 for transformers will be included in the contract. The company stipulates that certain modifications shall be made in the clause usually inserted in the Council's contracts as regards the submission to arbitration of any disputes arising thereunder. We are of opinion that the clause, as amended, is substantially in agreement with the standard clause in the Council's usual form of contract."

It is proposed that the tenders for additional water condensing pipes, &c., be opened during the Whitsuntide recess, and that the chairman or vice-chairman have authority to accept the lowest satisfactory one.

The tender of Messrs. A. Ransome & Co., Ltd., for a pedestal type rounding machine for the third section of the central car repair depot, at £66, is recommended for acceptance.

**WATER BOARD.**—The following tenders have been accepted by the Metropolitan Water Board:—

General Electric Co., Ltd.—Various electric fittings for Hampton Station, £41; ditto, for Surbiton Station, £44; one power panel and fittings, £39. Simplex Conduits, Ltd.—Tube ends, switchboxes, lampholders, &c.

**MARYLEBONE.**—The tender of Messrs. Parsons has been accepted by the B.C., at £230, for a new spindle for a turbine at the generating station. The tender of Messrs. Blackmore & Co. has also been accepted for the supply to the Electricity Department of 120 tons of Baddesley beans at 15s. 11d. per ton.

**ASYLUMS BOARD.**—The Metropolitan Asylums Board has accepted the tender of Mr. H. J. Godfrey, at £322 10s., for wiring certain portions of the Grove Hospital.

**HAMMERSMITH.**—The Electricity Committee proposes to enter into a contract with the Main Colliery Co., of Neath, for free burning coal, similar to that supplied under the existing contract, for one year, at 17s. 6d. per ton. This is 10d. per ton advance.

**SHOREDITCH.**—The Lighting Committee report that during the annual overhaul of engines at Whiston Street, while No. 2 Wallsend engine was dismantled they received an offer from Messrs. Allen and Simmonds, Ltd., of Reading, to bore out the valve chambers and provide a full set of eight valves for £299, also making and fitting a 2½-in. diameter self-contained Bull piston ring, fitted with Allen "patent" frictionless rings and springs complete for H.P. cylinder, and a 5½-in. ditto for L.P. cylinder, also boring out L.P. cylinder of above engine, for £156. Messrs. Allen & Simmonds, Ltd., guaranteed to reduce the steam consumption to 19½ lb., which was equal to an efficiency of nearly 10 per cent. better than when the engine was new, and the improvements effected will be sufficient to return the whole cost within a few months. The Committee, therefore, ordered the work to be put in hand.

**G.P.O.**—The G.P.O. contract with the General Electric Co., Ltd., for the supply of Osram lamps has been extended for a further period of six months.

**LEWISHAM.**—The B. of G. on Monday again considered the tenders for the electric installation at the workhouse. The Works Committee reported that a letter was written to Messrs. Tredegar inquiring if they were willing to execute the work for £668, the amount quoted in their tender. In reply, Messrs. Tredegar referred to the Guardians' proposal to accept their tender for part of the work only, but their estimate was based on the assumption that they should receive the order for both the infirmary and the workhouse. If, as they understood, the Guardians proposed to accept only one part of the estimate, viz., the workhouse, they would require an increase of 5 per cent. on the price originally quoted to cover the increased cost of supervision and establishment charges. This would make their tender £701. The Works Committee reported that they were of opinion that as Messrs. Tredegar were not willing to adhere to their original tender, and now increased their price after publication of the amounts of the tenders submitted to the board, the tender of Messrs. Haycraft & Son, Ltd., Brockley, be accepted for £759. Mr. W. Ross submitted that the board ought to accept the lowest price, that of Messrs. Tredegar. Mr. A. O. Weeks pointed out that if the tenders for the two institutions were added together Messrs. Tredegar were not the lowest. Mr. H. M. Clemow inquired why they should spend £59 of the ratepayers' money in this way. A proposal to accept Messrs. Tredegar's revised tender was defeated, and the board, by 18 votes to 9, accepted the tender of Messrs. Haycraft.

**FULHAM.**—The B.C. has accepted the offer of Messrs. Phillips and Co., Ltd., for the supply of 1,450 tons of Kirkby nutty black steam coal, at 13s. per ton.

**Leyton.**—The U.D.C. has accepted the tender of Messrs. Siemens Bros. Dynamo Works, Ltd., at £780, for the supply of a spare lighting armature, and at £795 for a spare traction generator armature. The tender of the General Cable Manufacturing Co. has also been accepted, at £456, for one mile of 2 sq. in., half-mile of 0.25 sq. in., and half-mile of 0.125 sq. in. cable. Other tenders were received from the following:—

Union Cable Co., Ltd.	£144
R. R. Todd	451
Electrical Engineering and Equipment Co.	451
Standard Cable Co., Ltd.	467
Pirelli, Ltd.	477
Johnson & Phillips, Ltd.	498
General Electric Co., Ltd.	501
B.I. and Helsby	501
Siemens Bros. & Co., Ltd.	504
Glover & Co., Ltd.	505
Callender's Cable Co., Ltd.	507
W. T. Henley's Telegraph Works Co.	516

**Luton.**—The tender of Mr. A. J. Pitkin, Luton, has been accepted for the electric light installation at new club premises being erected in Dunstable Road.

**Peterborough.**—The T.C. has accepted a tender by W. T. Henley's Telegraph Works Co., Ltd., for cable for Westgate, at £567.

**River Plate.**—The Minister of Public Works has accepted the tender of the Sociedad Gasmotoren Fabrik Deutz for the electric light installation in the Reformatory at Marcos Paz, at \$19,702.

Messrs. Siemens Bros. have obtained the contract for all the switchgear at the power house that the Western Railway Co. are building in Dock Sud in connection with the electrification of their suburban lines.—*Review of the River Plate.*

**Salford.**—The following tenders have been accepted by the T.C.:—

British Westinghouse Electric Co., Ltd.—Extra high-tension three-phase switchgear with control board, £1,765.  
General Electric Co., Ltd.—Two Aron meters.  
Siemens Bros. Dynamo Works, Ltd.—Two induction meters.  
British Electric Transformer Co., Ltd.—Three compensator transformers, £299.

The following tenders have also been accepted for annual supplies to the Electricity Department:—

W. T. Glover & Co., Ltd.—1-R. cables, £150; multiple core cables, £300.  
Wm. Geipel & Co., Ltd.—India-rubber cables, £200; twin 11-xible cable and plain white tape.  
Joho Bassett.—Tin and lead, £150.  
Albion Clay Co., Ltd.—Stoneware conduits and pipes, cable protectors, &c., £70.  
W. H. Kays, Ltd.—Bitumen, £240.  
W. T. Henley's Telegraph Works Co., Ltd.—Rubber strip, £72.  
Bell's United Asbestos (Northern Agency).—Asbestos packing, millboard, &c., £20.  
Grove Asbestos Works Co., Ltd.—Rubber insertion, &c.  
L. Andrew & Co.—Flake graphite, mica, rubber gloves, rubber caps, £24.  
T. Hart.—Cotton driving rope, £36.  
J. Cookson, Ltd.—Tarred twine, c.  
Bell Bros.—Crank chamber oil, £393.  
M. Wells & Co.—Turbine oil and charcoal refined cylinder oil, £110.  
Stern Sonneborn Oil Co., Ltd.—Black oil, £50.  
Baxendale & Co.—Wrought-iron tubes and fittings, £60.  
F. A. Ellis.—Fire bricks, fire clay, &c., £22; cement, £52.  
North British Rubber Co., Ltd.—Rubber overshoes.  
Lancaster & Tonga.—Brass, &c., fittings.  
Brunner, Mond & Co., Ltd.—Soda ash, £44.  
Hall & Pickles.—Iron and steel bars, plates, &c., £16.  
W. Higgins & Son.—Chamber bricks, 45s.

**Sheffield.**—The Corporation has accepted the tender of the Brush Electrical Engineering Co., for 25 double-deck tramcars with top covers and four-wheeled trucks.

**Swindon.**—The Wilts. C.C. has accepted the tender of Messrs. Lott & Son for installing the electric light at the police buildings at Swindon, at £149.

**Winchester.**—The City Council has accepted a tender by Messrs. A. Reyrolle & Co., Ltd., for a new switchboard for the electricity works, for £824.

## FORTHCOMING EVENTS.

**Royal Institution.**—Saturday, May 10th. At 3 p.m. Lecture on "Humphrey Internal Combustion Pumps," by Mr. H. A. Humphrey. (Lecture I.)

Saturday, May 17th. At 3 p.m. Lecture on "Humphrey Internal Combustion Pumps," by Mr. H. A. Humphrey. (Lecture II.)

**Institution of Electrical Engineers (Yorkshire Section).**—Wednesday, May 14th. Meeting at 7 p.m. At the University, Leeds.

**Association of Electrical Station Engineers (Manchester Section).**—Thursday, May 16th. At 7 p.m. At the Crown Hotel, Manchester. Paper on "The Status of Electrical Station Engineers and the Need of an Association," by Mr. J. W. Thomas.

**Salford Technical and Engineering Association.**—Thursday, May 16th. Whit-week tour in Wales.

**Physical Society.**—Friday, May 16th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments to Detect  $\beta$ -rays from Radium A," by Drs. W. Makower and S. Russ.

**Junior Institution of Engineers.**—Friday, May 16th. At 30, Victoria Street, S.W. Discussion on "Electrical Propulsion of Ships," introduced by Mr. W. P. Durnall.

**The B.A. Meeting.**—Sir Oliver Lodge, the president of this year's meeting at Birmingham, will deliver his address on the evening of Wednesday, September 10th, in the Central Hall, Corporation Street. One of the evening discourses will be delivered on Friday, September 12th, by Sir H. H. Cunynghame, on "Explosions in Mines and the Means of Preventing Them." The Town Hall will be the Reception Room, and the various section rooms will be in the surrounding buildings. On the Saturday there will be many excursions, places to be visited including Stratford-upon-Avon, Warwick Castle, Stoneleigh Abbey, Kenilworth Castle, Bromsgrove, Hartlebury Castle, Tewkesbury, Worcester, the Forest of Arden, Malvern, &c. The honorary secretaries (the Council House, Birmingham) will issue a list of hotels and lodgings in due course.

Newcastle proposes to invite the Association to meet there in 1916.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION)

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, May 12th.—Headquarters will be closed.

Tuesday, May 13th.—Headquarters will be closed.

Wednesday, May 14th.—All Companies. Annual course of musketry at Purfleet rifle range. Railway tickets will be sent to those notifying headquarters of their intention to attend.

Thursday, May 15th.—"C" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

Friday, May 16th.—"D" Company. Ditto.

Saturday, May 17th.—Annual musketry as for Wednesday, May 14th. Headquarters will be opened for regimental business from 10 a.m. till 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjlt.  
For Officer commanding L.E.E.

### NOTES.

**Wanted—Six Hundred Pounds.**—Our readers are already aware that at the annual festival dinner Mr. E. G. Byng offered to give £100 to the funds of the Electrical Trades Benevolent Institution if nine other firms or gentlemen would do the same within three months from April 16th. The £100 which Mr. Sutton had already given was to be counted as one of the nine; Mr. H. Hirst, through Mr. Sutton, promised a like amount; and Mr. Garcke's promise brings the total up to £400 out of the required £1,000.

It has been thought that some of our generously disposed readers would be willing to follow the splendid example set by these gentlemen and ensure that the conditional offers are fulfilled by making or influencing six other offers. We hope that in later issues it will be possible for us to fill names into the six spaces now standing vacant below:—

1	Mr. E. G. Byng	...	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	...	£100
5	*	...	...	...	...	...	
6	*	...	...	...	...	...	
7	*	...	...	...	...	...	
8	*	...	...	...	...	...	
9	*	...	...	...	...	...	
10	*	...	...	...	...	...	

**Electricity from the Air.**—A Manchester paper announces that Councillor J. W. Cook, who has just returned from a tour in America, has acquired some of the patent rights in a marvellous invention, which he came across in the course of his travels. The inventor collects electricity from the air, after the style of Benjamin Franklin, but with an apparatus which is obviously a vast improvement on the primitive kite, for it consists of the following parts:—

"The electrical absorbers or accumulators, which are composed of zinc plates and magnetised steel, or may be composed of peculiarly treated and magnetised steel only; the compound-rectifying exciter transformers; the automatic governor, circuit breaker, or lightning arrester; and the tower. The switchboard ammeter, voltmeter, switch and insulations complete the list of parts.

"The wiring of the machine is not unlike that of any electrical machine except that no copper wire is used until the point is reached where the electric energy is ready to be delivered for use. The compound-rectifying exciter transformers perform the function of preparing the ambient elemental electric forces, after being gathered by the accumulator for use. These compound-rectifying exciter transformers are susceptible of being adapted to the varying requirements found to exist under various climatic conditions, so as to increase the voltage and lower the amperage, or increase the amperage and lower the voltage as desired. The real secret and technical points of this part of the invention, as well as the accumulators, will be given to the world at large as soon as the last applications for foreign patents have been accepted."

It is clear that we have here a discovery of fundamental importance, destined to revolutionise the electrical industry. That theory has not been neglected is evident from the following statement:—

"The success of this invention, like that of all dynamos, depends upon the natural law that electricity produces magnetism, and magnetism produces electricity. The inventor, however, claims to have made a new application of this natural law, which will completely revolutionise electric science and necessitate a re-writing of electrical text-books."

It is quite usual for inventors of revolutionary devices to upset the text-books; epoch-making discoveries of this kind are almost necessarily contrary to the laws assumed by ordinary scientists to

be universally true, such as gravitation and the conservation of energy, but considerations such as this cannot be allowed to hamper progress.

"The inventor authorises a statement that his machine produces a continuous direct current, and is protected against surplus charges such as lightning, by a circuit-breaker or lightning arrester which safely delivers surplus charges of electricity to the earth; that he has proved that electricity and lightning are one and the same thing, as believed to be the case by Benjamin Franklin, that lightning has been tamed and made to serve man."

Franklin is to be congratulated upon the vindication of his pet theory, which at least survives the wreck of the text-books; and we pay respectful homage to Councillor Cook, our coming multi-millionaire, who will in the future control the shafts of Jupiter Tonans and create a corner in domesticated lightning.

**Point Five Publicity.**—The accompanying illustration shows the poster which has been got out by the "Point Five," as mentioned in our last issue, in the absence of a suitable design from

what they call the "moribund" Electric Publicity Committee. Simplicity is the key-note of the design, which clearly implies that the lady of the house is doing the cooking herself.

**Concert.**—The annual prize distribution of the Devon (Fortress) R.E. Electric Light Companies was held in connection with a smoking concert at Mutley Barracks, Plymouth. Colour-Sergeant-Major Pearks presided, and was supported by the commanding officer (Major W. E. P. Bastard) and other officers. "The Officer Commanding and Officers" was given by Sergeant Rowe. Major Bastard, replying, remarked that they had heard so much about the Territorial Force recently, that some of them had begun to wonder where they were, and if they were anywhere at all. There had, however, been a lot of exaggerated statements made, and he doubted whether the force was in such a parlous state as some would have them believe. They were up to strength, if not over, in the Works Companies, which did not accept any but exceptional men and those particularly wanted. He wished the Electric Light Companies were up to strength. They had had a nasty knock in not being able to take men from the dockyard. A delightful musical programme was enjoyed.

**Cold Light.**—Some time ago we commented on an invention of Prof. C. F. Dussaud, which was shown before the French Academy of Science, under the aegis of Prof. Branly. Last week the working of the system, which is called "Cold Light," was demonstrated at the offices of Messrs. Louis Schloss & Co., London, in its application to cinematographs, projection lanterns, lighthouses, and other lighting uses. The fundamental idea is rest; the inventor claims that by running metallic-filament lamps at an excessive voltage, say, 100 per cent. above normal, for very short intervals he is able to secure an extremely high efficiency, and a powerful light from a small lamp, without causing the bulb to grow hot and without destroying the filament. This is effected either by interrupting the current flowing to a single lamp or group of stationary lamps, or by fixing several lamps on a revolving disk with a contact-maker which causes each lamp to light in succession whilst passing a fixed point. In the latter case, the lamps appeared as a ring of light, thus proving that the filaments had not time to grow cold between-times. In the case of the cinematograph, a single lamp is used, which is alternately lighted and extinguished, and the film is moved during the extinction, so that the revolving shutter ordinarily used to cut off the light of the arc lamp while the film is moved is dispensed with.

In the case of the projection lantern, three lamps are mounted on a revolving frame: one lamp is lighted for the exposure of a view, and may remain alight, we were told, for as much as 1 or 2 min. On changing the view, the operator also changes the lamp by rotating

the frame, and thus each lamp will burn (at excess voltage) for one minute out of three, or two out of six.

The life of a lamp thus used is said to be about four hours in the aggregate, which, of course, corresponds to a continuous display of pictures lasting 12 hours. A lamp taking 25 watts under these conditions was shown to be as effective as an arc lamp taking 10 amperes at 100 volts, of which perhaps 500 watts was expended in the arc.

When the system is used for lighthouse, with revolving beams, a large lamp is used, with a revolving screen, and during part of the revolution the lamp is extinguished, giving the bulb a chance to cool. It is claimed that, thanks to the coolness of the source of light, small lenses can be used close to the lamp, thus effecting a very great economy in cost. A lamp intermittently lighted about 50 times a second, while fed with current at 100 per cent. above normal voltage, and fixed in a suitable reflector, gives a splendid light. We understand that the system is being adopted by numerous theatres and restaurants in France, and by the French Government.

The demonstration was mainly qualitative, and not quantitative, and we are not in a position to give reliable data as to the efficiencies, temperatures, &c. We formed the opinion, however, that the essence of the matter was the use of an excessive voltage, and that interruption of the current was of little consequence. Lamps thus over-run can be kept cool in various ways. Of course, the efficiency of any incandescent lamp when heavily over-run is extremely high, and while the life under such conditions must necessarily be brief, there is certainly a valuable lesson to be derived from these experiments. It is this: It may be a highly economical plan to use metallic-filament lamps for cinematographs, projection lanterns, searchlights, photographic projectors, and all such purposes for which long-continued illumination is not necessary; to run them at an excessive voltage and corresponding candle-power, and replace them when burnt out—instead of using arc lamps.

The fact that an intermittency so high as 50 per second is used in some cases, equal in effect to an alternating current at 25 cycles per second, shows that the intermittency has no material importance; and this is emphasised by the fact that sometimes the rate of intermittency is only once in three minutes. Hence the over-voltage is the only essential feature of the "system."

**Electrical Workers' Wages.**—A letter has been forwarded to the Bolton Electricity Committee by the secretary of the Electrical Trades Union making application on behalf of members in the employ of the department for an advance of 1d. an hour on the present rate of wages. The fittings superintendent was requested to obtain further information and report to the next monthly meeting of the Committee.

**Appointment Vacant.**—Engineering representative for power business, for the Sales Department of the Bristol Corporation (£160). See our advertisement pages in this issue.

**Fatalities.**—NEWCASTLE-ON-TYNE.—An inquiry was opened on 3rd inst. at Newcastle Royal Infirmary, before Deputy-Coroner R. E. B. Lisle, into the circumstances attending the death of Frederick Dennis Hasdell, 32, an electrician, employed by the Newcastle-on-Tyne Electric Supply Co., who lodged at Whickham, and died on 2nd inst. Mr. Hasdell was in charge of the Newcastle Co.'s sub-station at Blaydon Haughs, and it is understood that he and a man named Robert Winde were engaged in testing the low-tension switchboard, when suddenly there was what was described as "an explosion." The place was filled with smoke, and Mr. Hasdell and Winde were both burned. The former, indeed, rushed out with his clothes on fire. Help was speedily obtained, and the injured men were attended by Dr. McAleenan. Mr. Hasdell was found to have received extensive burns about the face and body, and he was conveyed by Dr. McAleenan and a constable to Newcastle Infirmary in a motor-car, but he died within a few hours. Winde was burned about the arms and hands. Owing to the accident, some of the local works were temporarily stopped. At the inquiry the Deputy-Coroner said that the only witness who could give evidence as to the accident was at present injured himself, and it would be some time before he would be sufficiently recovered to attend—probably three weeks before the man got the bandages off—so he proposed to adjourn the inquiry for six weeks, to June 18th.

TULLAMORE.—An inquest was held on April 30th, into the death of Laurence Carroll, employed by Mr. Norman Robinson, Dublin, in putting up electric lighting wires at Dew Park residence, Tullamore. Deceased fell from the top of a telephone pole.

JARROW.—On May 1st, an inquest was held concerning the death of a labourer, Thomas Tinley, 46. According to the evidence, he was assisting to lay an electric cable across some posts and three chimneys at Palmer's rolling mills, when he fell 34 ft. from the top of a pole and was killed. George Sanderson, electrician, said that he thought Tinley's feet slipped while he was lifting the cable into position. It was impossible for him to get a shock. George Furlong, a labourer, stated that if deceased lifted the cable over the insulator it would go over the arm and drag him over if he retained his hold. The pole was 14 in. out of line, and in such circumstances they generally used a piece of rope to prevent the cable going over the arm. Deceased did not use the rope. A verdict of "Accidental death" was returned.

LONDON.—An inquest was held on 2nd inst. into the death of Edward J. Peake, 31, a painter employed by a firm of contractors, who was killed by coming into contact with a live wire on the L.B. & S.C. Railway, at Queen's Road Station, Camberwell. He was on a plank, a few feet above the overhead wire, painting a signal bridge. The foreman denied that he told the men to paint

the bridge in the afternoon; he meant them to paint the signal posts, and not the bridge, as that should have been dealt with when the current was off. The medical evidence showed that the man's left leg was partly charred, and that the current had entered there. Death was due to shock following the burns; both arms were burnt. He was surprised that the man had not been killed outright with a 6,500-volt shock. Peake died the day after the accident. The jury, in returning a verdict of "Accidental death," added a rider that there had been negligence on the part of the man's employers in not supervising the work in a proper manner. The deceased left a widow and six children, all under 7 years of age.

**Football.**—The Bertram Thomas Employes' Football Club has just finished a very successful season, and has had a most auspicious wind-up by an extraordinary run of successes in "The Eccleshoro' Workshop Competition." Over 60 workmen teams entered this competition, including the following engineers and electrical engineers. Messrs. Bertram Thomas's employes met the following teams, which they succeeded in defeating as shown:—

1st Round.	Schemp's Employes	Won	1-0
2nd "	Elkanah Armitage Employes	Drawn	0-0
3rd "	"	Won	1-0
4th "	British Westinghouse C.E. Dept.	"	1-0
Semi-Final	Mandleburgs Rubber Works	"	1-0
Final	Nasmith Wilsons' Employes	"	1-0
	S. Kershaw & Sons	Drawn	0-0

The final tie took place on Wednesday evening, the 30th ult., and we are informed, was an extraordinary match in all respects. The result, after full time was played, being a draw with no score, an extra 15 minutes was played, with the same result, then a further extra 10 minutes was played, with still the same result; and a further five minutes was played without any score taking place. Darkness had then set in, so that it was impossible to play any longer, and as this was the last day of the football season it is impossible for the match to be replayed; so the two clubs have agreed to be joint holders of the cup for the next four months, and to play off for the right of holding the cup and taking the first medals in September next.

A special word of praise is due to the players of Messrs. Bertram Thomas's E.F.C. for their long-sustained effort throughout competition, and for their most excellent defence in keeping 11 opponents out throughout the seven matches which they played, particularly when it is mentioned that they knocked out the last year's holders, Messrs. Nasmith Wilsons, and the Westinghouse team, who are also past holders of the trophy. The committee and secretary of the above club have worked untiringly during the season.

The St. Helens Cable and Rubber Co.'s Rugby football team won the Warrington workshops' challenge cup on Saturday last. The opposing side in the final round was Pearson & Knowles Ironworks, but we are credibly informed that as the St. Helens backs "were principally from the C.T.S. cable department, they were well able to withstand the mettlesome onslaught of their opponents." Thirty clubs competed, and the odds were 3 to 1 against St. Helens in both the semi and the final ties. The event was celebrated by a dinner and a music-hall show for the victorious team, who also won gold watches presented by the Warrington Football Club.

**Imperial College of Science and Technology.**—The fifth annual report of the Imperial College for the year ended August 31st, 1912, was issued recently. The total number of students under instruction during the year was 928, as compared with 887 in the previous year. Of this number 779 were full-time and 149 part-time students.

**The Wireless Telegraph Report.**—A correspondent writes as follows:—The report called for by the Postmaster-General on the merits of long-distance wireless telegraphy has been presented to Parliament by the Committee. There is no cause to question the ability of those appointed to consider this subject from a technical point of view, but the report perhaps would have been more useful if a telegraph man—and there exist such as know telegraphy in all its branches, commercially and technically—had formed part of the Committee, and clause 17 of the report, given here, might then have contained more commercial details:—  
"Clause 17. The Marconi Co. is, we are satisfied, working on a commercial scale between Clifden and Glace Bay, a distance of about 2,300 miles, though at present the number of messages transmitted either way is not so great as to require duplex working or high-speed transmission. We were, however, present when messages were transmitted automatically at the rate of 60 words (of five letters) a minute, and we see no reason why this rate should not be considerably increased if it becomes necessary. The communication is practically continuous, though there are no doubt, periods when the signals become very weak, and even occasional periods when no signals can get through. Periods of this nature are due to natural conditions, and will be incident to the working of any system. During such periods communication can, in our opinion, be ensured only by the use of great power in the aerial. We understand that for this reason, and having regard to the increased power required for high-speed transmission, the Marconi Co. proposed to employ for the Imperial stations practically double the power now used at Clifden. Even so, we think there may be periods when communication is impracticable, especially in tropical regions where atmospheric disturbances may be expected to cause more difficulty than over the Atlantic."

It does not seem quite plain what is meant by "working on a commercial scale," and we think, says the writer, that when the cost of wireless installations is separated from the manufacture a

the expenditure on maintenance and working and capital charges is placed against the receipts, it will be found there is a considerable deficit in many, if not nearly all, wireless installations, and therefore, what we require set out, if we are to understand the actual facts, as to working on a "commercial scale," is the above information in plain figures and not general terms.

With regard to the communication being "practically continuous." To enable this to be understood in anything less than the general terms used, there would, we think, have to be a trial extending over a whole year and during the various seasons, and a daily record would have to be made.

It is well known that any speed can be sent, and, at times, received, but this is not telegraphy.

**Lightning Storm.**—Considerable damage was done last week by a violent storm which raged in various parts of the country. At Hull a man was blinded by a flash of lightning. Telephone services were disorganised, and buildings seriously damaged, by lightning, but the accompanying floods caused by the deluge of rain gave rise to the worst consequences.

**Victorian Railway Electrification.**—The *Australian Mining Standard* gives the following latest information regarding the above scheme, and the contracts in connection therewith:—

"The following contracts have been let by the Victorian Government for the manufacture and supply of plant and rolling stock in connection with the intended electrification of the suburban railways:—(a) Steel work for power station buildings and sheeting of roof, also complete equipment for one boiler house, Messrs. Babcock & Wilcox, £258,220; (b) turbo-alternators and transformers, four 10,000-kw. sets, Messrs. C. A. Parsons & Co., £122,235; (c) sub-station equipment—this is a schedule of rates contract, and the Commissioners undertake to order from contractors, Siemens Dynamo Works, Ltd., within one year, plant to the extent of 60,000 kw., at an estimated cost of £168,000; (d) electrical equipment for cars, 400 each for motor and trailer coaches, the General Electric Co., of New York, £678,180. The Commissioners also hold options, operative for two years, under these contracts, for the second boiler house, two additional generating sets, 15,000 kw. of sub-station plant, and car equipment for 100 motor and 50 trailer coaches, which form the balance of the scheme as provided for in the report submitted by Mr. Merz. As it is imperative that foundations, conduits, &c., shall be ready before the end of this year, Mr. Merz is pushing on with the preparation of plans, and he has informed the Railway Commissioners that he hopes to be able to despatch them during May. After that, the plans for other branches of the work will be pushed on with, and further details are now being prepared by the departmental officers to enable Mr. Merz to carry the work through as expeditiously as possible. It is expected that the power station will be practically complete by the end of next year; and that the first line to be converted, that between Sandringham and Broadmeadows, will be electrically operated by May or June, 1915."

**Institution and Lecture Notes.**—ASSOCIATION OF MINING ELECTRICAL ENGINEERS (WEST OF SCOTLAND BRANCH).—At a joint general meeting of this branch and the Scottish Branch of the National Association of Colliery Managers in Glasgow on Saturday last, Mr. W. H. Telfer, general manager of Neilsons and Clyde Coal Co., read a paper on "Power Transmission in Mines." Mr. Telfer considered that fairly large collieries or groups of collieries requiring generating plant of 400 kw. and upwards, ought to have their own plant.

**ROYAL INSTITUTION.**—In a lecture on "Polarised Light" recently, Dr. T. M. Lowry pointed out the exceptional merits of the mercury arc as the source of light in optical investigations, the pure yellow, green, and violet rays being particularly prominent in its spectrum.

**IRON AND STEEL INSTITUTE.**—At the annual general meeting of the Institute last week, the Council reported that 108 new members were elected during the year 1912, and that the total membership at the end of the year was 2,119. The total receipts for the year were £6,483, and the expenditure £5,793, leaving a balance of £690. The invested funds of the Institute amounted to £13,213. The Carnegie Gold Medal was awarded to Dr. J. Newton Friend, Worcester, for his research work on the corrosion of iron and steel. A Carnegie scholarship award of £100 was made to Mr. W. H. Patterson (Birkenhead), to enable him to continue his investigations on the constitution and combustion of fuels. The Bessemer Medal was awarded to Mr. Adolphe Greiner, general director of the steel works of Messrs. John Cockerill, Seraing, Belgium, who was responsible for the introduction into Belgian iron and steel practice of the basic processes, and had been to the front in the utilisation of blast furnace and coke oven gas.

The annual dinner of the Institute was held on Thursday evening at the Hotel Cecil. Mr. Arthur Cooper, president, occupying the chair. About 450 persons were present.

**SOCIETY OF ENGINEERS (INCORPORATED).**—At a meeting of the Society on May 5th, a paper on "Tidal Waters as a Source of Power" was read by Mr. C. A. Battiscombe, the object of the paper being to draw attention generally to the commercial possibilities of hydro-electric installations in the British Isles, more particularly with regard to the use of the tides. The author points out that the head of water available for actuating turbines cannot exceed one-third of the range of minimum tides. The form of installation required for a continuous output of power is then discussed. An outline is given of the arrangements proposed for the constant maintenance of a working head, by means of a chamber for the turbines, connected by valves to the tidal way and to three reservoirs in which the tidal water may be impounded, with a description of the

proposal of sequence of flow between the tidal way and the reservoirs. It is claimed that the utilisation of the tides for power purposes presents few engineering difficulties as far as principles are concerned, but that the real difficulty lies in the question of cost, and therefore in the choice of the site and in the design of the structural details. It is submitted that not only can the tides be utilised as a constant source of power, but that, taken in conjunction with the power that could be derived from fresh-water rivers, their utilisation would be a great gain to the commercial and industrial interests of the United Kingdom.

The Society held a Bohemian Concert at the Holborn Restaurant on May 3rd, when a varied musical programme, arranged by Mr. Charles Capper, was listened to with much pleasure by the large audience of members of the Society and their friends.

**INSTITUTE OF METALS.**—The annual autumn meeting of the Institute of Metals will this year take place in connection with the Ghent International Exhibition, the dates fixed being August 28th, 29th and 30th. Among many important papers to be communicated will be the report of the Corrosion Committee. Gentlemen desirous of attending the Ghent meeting should send in their forms of application for membership to the Secretary of the Institute, Caxton House, Westminster, S.W., not later than July 31st.

**INSTITUTION OF CIVIL ENGINEERS.**—At the annual general meeting, held on April 29th, the result of the ballot for the election of officers was declared as follows: President, Mr. Anthony George Lyser, M.Eng. (London); Vice-Presidents, Mr. B. H. Blyth, M.A. (Edinburgh); Mr. J. Strain (Glasgow); Mr. G. R. Jebb (Birmingham); Mr. A. Ross (London). Amongst the other Members of Council are Mr. J. A. F. Aspinall, M.Eng.; Col. R. E. B. Crompton, C.B.; Mr. Basil Mott (London); Mr. Dugald Clerk, F.R.S.; and Mr. Edward Hopkinson, M.A., D.Sc.

**INSTITUTION OF CIVIL ENGINEERS (STUDENTS).** The thirty-eighth annual dinner took place at the Trocadero Restaurant on Wednesday, last week. Mr. R. Elliott-Cooper (President of the Institution of Civil Engineers) presiding.

**INSTITUTION OF ELECTRICAL ENGINEERS.**—The following are the names of the authors, and titles, of the papers which will be discussed at the joint meeting to be held in Paris, with the Société Internationale des Electriciens, from May 21st to 24th:—"High-Tension Continuous-Current Traction," by M. Gratzmuller; "Single-Phase Traction," by M. Latour; "The Electrification Schemes of the Chemin de Fer du Midi," by M. Julian; "The Electrification of the Paris Suburban Lines of the State Railway," by A. N. Mazon; "Railway Electrification Problems in the United States," by H. Parodi; "Petrol-Electric Motor-Trains," by J. B. Damoiseau; "Long-Distance Transmission of Electric Energy (Continuous-Current)," by J. S. Highfield; "Long-Distance Transmission of Electric Energy (Three-Phase Current)," by H. Leblanc; "Automatic Telephony: Application of Mechanical Devices to the Assistance of Manual Operating in Telephone Exchanges," by W. Slings.

**I.E.E.—MANCHESTER SECTION.**—The report of the Committee shows that the number of members at the close of the session was 812, an increase of 27 over the figures of last year. For the session 1913-14, the chairman will be Prof. E. W. Marchant; vice-chairmen, Dr. E. Rosenberg and Mr. P. P. Wheelwright; ordinary members of Committee, Messrs. C. C. Atchison, C. J. Beaver, K. M. Faye-Hansen, H. J. Hawkins, E. L. Hill, E. M. Hollingsworth, G. Layton, A. E. McKenzie, B. Thomas, Prof. Miles Walker, B. Welbourn, F. H. Whysall; past chairmen, Messrs. J. S. Peck, Wm. Cramp, and A. A. Day; hon. secretary and treasurer, Mr. Julius Frith, The Homestead, Victoria Park, Manchester; assistant secretary and treasurer, Mr. A. L. Green, 8, Westminster Avenue, Manley Park, Manchester. The report of the Students' Section, which numbers 197 members, shows an average attendance at meetings of 42. Mr. H. A. Carney is vice-chairman, and Mr. A. T. Robertson hon. secretary.

**ROYAL INSTITUTION.**—The annual meeting was held on May 1st, Sir James Crichton-Browne, treasurer and vice-president, in the chair. The annual report of the Committee of Visitors for the year 1912, testified to the continued prosperity and efficient management of the Institution. Thirty-nine new members were elected in 1912. The Duke of Northumberland is president for the ensuing year; secretary, Mr. Alexander Siemens; and the managers include Sir William Crookes and Mr. A. A. Campbell Swinton. Among the visitors are Mr. Dugald Clerk, Mr. R. Kaye Gray, Mr. H. R. Kempe, Mr. C. E. S. Phillips, and Dr. W. N. Shaw.

**Wages During Sickness.**—A vigorous conflict is proceeding between the Leeds and Bradford Chambers of Trade and the National Shop Assistants' Union in regard to the Chambers' proposal that assistants shall sign a printed agreement relieving the employer of the newly discovered Common Law liability to pay full wages during absence through sickness. Negotiations have been fruitless. The Chambers insist on maintaining their position and the Shop Assistants' Union have sent special agents into these districts to persuade assistants to join the Union. These agents are addressing public meetings on the question wherever they can get the opportunity, and are threatening to compile and publish a black list of tradesmen who insist on the signing of the agreement.

**London Chamber of Commerce.**—The annual meeting of the Chamber was held on April 24th. The annual report, in dealing with the Electrical Trades Section, states that at the first meeting of this Section attention was given to the important municipal trading test of "The Sheffield Corporation *versus* Davidson," in which an injunction was obtained restraining the Sheffield Corporation from carrying on the business of supplying electric light fittings and electric bells in competition with other contractors in the city. The Sheffield Corporation afterwards

sought Parliamentary powers to carry on the business of making electric fittings and wiring premises. The Section approved of the objections of the Electrical Contractors' Association to this interference with legitimate private enterprise, and supported the opposition in Parliament. A circular letter was issued to interested members asking for financial support to the Parliamentary opposition, and a sum of 50 guineas was obtained, partly from the funds of the Municipal Trading Committee and partly from other subscribers.

Dealing with the International Congress on the application of electricity held at Turin in 1911, the report states that Mr. Leon Gaster, who had been appointed as the Section's representative, reported fully as to the proceedings, and that a resolution had been adopted urging the appointment of an International Commission to consider all methods of lighting and technical problems connected therewith.

The Section endorsed the action taken by the Institution of Electrical Engineers, in opposition to the proposed removal of certain exemptions granted to the electrical industry under Sections 54, 55 and 56 of the Factory and Workshop Act, 1911, on the grounds that such exemptions were necessary owing to the circumstances of the employment and the requirements of the public, and authorised the chairman to take all necessary steps in support of the Section's views. The views of the industry were, to some extent, covered in the report of the Committee which, though recommending the withdrawal of the exemption, suggested that the case of electrical stations might be met by a special provision allowing the employment of boys of 16 years between 6 a.m. and 12 midnight for a specified period. Other matters mentioned in the report were the Second Census of Production and the Light Railways Bill.

**Fire Prevention.**—The British Fire Prevention Committee's Testing Station, near Regent's Park, which has been recently extended and altered, was reopened on Wednesday, when high-temperature fire tests with fire-resisting glazing (Luxfer electro glazing), and with fire-resisting party wall doors (Chubb's reinforced concrete doors), were carried out.

**Birmingham Electric Club.**—At a meeting of the Club, on Saturday, two interesting papers were read, one by Mr. Fennel, on "Purchased *versus* Home Generated Power," and the other by Mr. F. W. Foster, on "Direct *versus* Alternating Current for General Works Power."

**A Dead-Short Romance.**—She was a sweet 17 (S.W.G.), single as yet. In feature amperious, in form she was flexible. Her dress, taped and braided, was a double cotton-covered overall. Such was the alluring specification of Miss Milly Meter.

He was middle aged—35/40—and, temporarily stranded far from ohm by a volt-face of fortune, had become a conductor. Never a great feeder, a continuous diet of currents had made him more wiry than ever. But still he did his jute-y; he was essentially a V.I.R.—good Latin for a Man.

They met. She tendered a copper (100 per cent. M.S.) for her fare. He, in a state of high tension, dropped it. Both went to earth to recover it. Their heads made contact, and their hands. She responded to his ami-cable pressure, without resistance; was she not his twin soul?

The rest was easy. Over a three-cores lunch compounded of czer-kerit and gutta-percha, he proposed; and she, after a show of refusal, did the usual coy consent trick. Their lips short-circuited. (That's the bit u men—yon sentimental men—were waiting for Watt.) A short en-gauge-ment, and they were married, spliced, joint in holy matrimony; and lead thereafter a life of bliss. You see 'em, eh?—H. R. T.

**The Neon Lamp.**—In a paper read before the Société Internationale des Electriciens, an account is given of an experimental research upon the neon lamp with other "luminescent" lamps, and the curious fact is brought out that the candle-power of this lamp cannot be determined. The difficulty arises from the red colour of the neon light, that being a colour for which the sensibility of different observers' eyes varies enormously; the candle-power measurements ranged between values in the ratio of no less than 1 to 3, and there was no particular value round which the observations were grouped. On the other hand, all the observers were agreed on the increase of visual acuity with high intensities of illumination with neon light; and as regards fatigue of the eye, the neon tube was the best of all the light sources tested.

**A Large American Sign.**—A mammoth electric sign has been erected on the roof of the Majestic Building in Milwaukee, Wis. The sign will consist of the single word "Gimbels," to advertise the department store of that name. The sign is 150 ft. long and 54 ft. high; each letter is 34 ft. high. The total weight is about 16 tons, 10,000 ft. of copper wire were used in wiring the letters. The total candle-power installed is about 32,000, and the cost of operation is estimated at \$10,000 annually.—*Elec. World.*

## OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

**Central Station Officials.**—The Hammersmith Electricity Committee having considered applications for additional increases in salaries from a number of officers in the electricity

department, recommends that the maximum of Mr. H. R. WATTS, meter assistant, be increased to £175 per annum, to be reached by two annual increments of £12 10s. each; that the maximum of Mr. T. A. TAYLOR, mains superintendent, be increased to £175, to be reached by two annual increments of £12 10s. each; that Mr. T. H. MEACOCK, wages clerk (Class 5), be promoted to Class 4 at a salary of £100, rising by £5 to £130 per annum; and that no action be taken on the other applications.

The Islington B.C. last Friday appointed Mr. W. E. BRADSHAW, of the Charing Cross, West End and City Electric Supply Co., Ltd., to the position of mains superintendent, recently rendered vacant by the resignation of Mr. T. A. G. MARGARY.

The Dublin Corporation had before it on Monday a recommendation of the Electric Supply Committee, that the salaries of the City electrical engineer, Mr. MARK RIDDLE, be increased from £750 by annual increments of £50 to £1,000; that of Mr. L. J. KETTLE, deputy electrical engineer, from £400, by annual increments of £50, to £600; and that of Mr. GILBERT ARCHER, chief distribution engineer, from £350, by £25 per annum to a maximum of £450 a year.

It is stated that the appointment that is being taken up by Mr. H. H. COZENS, late of Hampstead, is that of general manager of the Toronto electric system, under the Toronto Electric Commissioners.

Mr. J. H. KIRK, shift engineer at the West Bromwich Corporation Electricity Works, is leaving in order to take up a similar position in the Chiswick power station of the London United Tramways. On behalf of the staff at West Bromwich he has been presented with a suitably inscribed silver cigarette case.

Mr. W. H. WOODS, on leaving the Weardale power station, was presented by the staff of the Cleveland and Durham Electric Power, Ltd., with a non-magnetic centre second stop watch and a fountain pen. Mrs. Woods was presented with a gold brooch.

Mr. T. W. MACKAY, late shift engineer with the Cleveland and Durham Electric Power, Ltd., has been appointed to a staff position with the Hong-Kong Electric Lighting Co.

The Colne T.C. has decided to increase the salary of the electrical engineer, from £300 to £325 per annum.

**Tramway Officials.**—At a meeting of Southport Tramways Committee on May 1st, Mr. B. ANDREWS, formerly manager of Southend Corporation Tramways, and manager to the Malta Tramways Co. for three years, but latterly engaged with a firm of engineers in Otley, was appointed manager of the Southport Tramways at £200 per annum. There were 106 applicants, and Mr. Andrews was chosen from five selected candidates.

MR. EDGAR HARRY COCKSHOTT, formerly chief engineer of the London United Tramways Co., Ltd., has been appointed to the position of assistant engineer to the London Underground Electric Railways Co., Ltd.

**General.**—MR. E. GARCKE was, on Monday, elected a member of the Royal Institution.

MR. ALFRED W. BEUTTELL has removed to 203, Victoria Street, London, S.W.

MR. GEORGE C. HAMILTON, of Knutsford, a member of the firm of Messrs. Drake & Gorham, has been adopted as the Unionist candidate for the by-election in the Altrincham division, caused by the resignation of Mr. J. R. Ketby-Fletcher, M.P.

MR. ANDREW WILKINSON has just taken up the position of works manager to the Anti-Attrition Metal Co., Ltd., Glengall Works, London, S.E. Mr. Wilkinson for the past five years has been in the service of the London County Council as works superintendent of their tramway repair depôts.

The staff of Messrs. Crompton & Co., Ltd., at the Arc Works, Chelmsford, has presented a cabin trunk, a Gladstone bag, and an inscribed silver cigarette case, to Mr. A. DOWSETT, who, after 13 years' service on the staff, is leaving to take up an appointment on an Atlantic liner.

**Indian Engineering** states that Mr. J. H. CARDEW, electrical engineer, Oudh and Rohilkhand Railway, is permanently transferred to the North-Western Railway as electrical engineer of that line. He will have charge of the electrical department of the Oudh and Rohilkhand Railway, in addition to his own duties, until further orders.

The Right Hon. LORD CASTLETOWN, of Upper Ossory, K.P., C.M.G., Chancellor of the Royal University of Ireland, has been appointed chairman of the Governors of Faraday House Electrical Training College, in succession to the late Earl of Crawford, K.T., F.R.S.

**Wills.**—MR. JAMES TANGYE, one of the founders of Tangyees, Ltd., left £13,161.

MR. HENRY DRAKE, chairman of Callender's Cable and Construction Co., and of the Anchor Cable Co., Ltd., left £69,634.

MR. WILLIAM BULLOUGH, of Messrs. Howard & Bullough, Ltd., Accrington, left £187,835 gross, and net personally £183,652.

MR. GEO. MATTHEY, F.R.S., of Johnson, Matthey & Co., Ltd., left £305,252 gross, and net personally £301,067.

**Obituary.**—We tender our deep sympathy to Dr. J. T. BOTTOMLEY, LL.D., F.R.S., upon the death of his wife—daughter of the late Chas. R. Blandy, Esq., of Madeira—which occurred on Tuesday last, after a few days' illness.

## THE BROMPTON AND KENSINGTON ELECTRIC RESTAURANT.

ONE more proof that electric cooking in this country has at last been roused from its coma, and is henceforth to be regarded as a serious commercial proposition, is to be found

THE BROMPTON AND KENSINGTON CO.'S ELECTRIC RESTAURANT  
IN EARL'S COURT ROAD, S.W.

in the admirable equipment of the premises in Earl's Court Road (a few doors from the District Railway Station), which the Brompton and Kensington Accessories Co. has, during the past few months, converted into a fine electric restaurant, the main hall of which is illustrated here with the mezzanine or gallery room in the background.

No pains have been spared to make the premises worthy of their high destiny, and the architects, decorators, and furnishers, are to be complimented upon their intimate acquaintance with, and realisation of, the conditions and surroundings best securing the comfort and convenience of tired and hungry humanity. In addition to the main hall and mezzanine, there is provided a snug tea room and a telephone cabinet. Adjacent to the dining hall there is an inquiry office and a sale room, so that those who have consumed food of one description or another—varying from the portly steak to the daintiest of tea cakes—in full sight of some of the gleaming “armour plated” ranges which

have cooked their viands, and which are still cooking—as the red signal lamps and nothing else testifies—these persons may at once take the first steps towards becoming “consumers” in the best sense of the word, and realising in their own homes those advantages of which they have lately had tangible proof.

On April 30th we were guests of the chairman and directors of the company on the occasion of an inaugural banquet comprising nine excellent courses. Every dish was cooked exclusively by electric heat, and by the time these lines are published, the restaurant will be opened to the public, and, the refrigerating plant being completed, “electric ices” will be added to the menu.

Among the guests participating in what was a no less historical than enjoyable ceremony, were Messrs. A. B. Anderson, H. H. Berry, S. Beeton, R. A. Chattock, J. Christie, F. A. Cortez Leigh, J. C. L. Coward, K.C., W. F. Davies, R. S. Downe, J. S. Highfield and A. H. Seabrook. At the conclusion of a meal, during which, to judge from the snatches of conversation which reached us, golden opinions were formed which will lead to very brisk cooking business in the near future, the toast of “The King” was received with enthusiasm, and Mr. Coward rose to propose “Success to the New Enterprise.” The speaker recalled those occasions on which he had been compelled by professional engagements to criticise the policies and methods of the company in whose house he now found himself a guest. Under these circumstances, he was pleased to find that his beer had not been poisoned! On one occasion when he had promoted an electric tramway Bill, Lord Ravensworth had stigmatised as preposterous and intolerable the suggestion to have two naked conductors alongside the track. As development had been wide and rapid since those days, so he felt sure it would be henceforth from the epoch marking function at which they were present that night. In replying to this toast, Mr. H. R. Beeton (chairman of the Brompton and Kensington

THE MAIN RESTAURANT, SHOWING GRILL AND MEZZANINE.

Electricity Supply and Accessories Companies), remarked that 25 years ago he had made so many statements and

prophecies (in connection with the inauguration of the Brompton and Kensington electricity supply), which time had proved incorrect that he proposed to be extremely reticent on this occasion. One of the extraordinary statements to which he had lent his name in the past was that electric lamps gave no heat. Gas had been routed from the lighting field, but was at present entrenched in the field of cooking. During recent years the cost of electrical energy had been reduced 75 per cent., and in the near future electric cooking would far exceed electric lighting in importance as a central station load. The reliability of electrical apparatus had been proved beyond doubt, and the persistent ingenuity of gas-cooker designers had paved the way for rapid developments in electrical apparatus. He regarded the present restaurant undertaking as a sober, serious business proposition, and when the L.C.C. entered into its inheritance he believed that the Brompton and Kensington Accessories Co. would be in a position to continue its business independently, thus ensuring continued prosperity to the shareholders.

A short but excellent musical programme followed, and the guests were then free to wander where they would from the luxurious public rooms to the gleaming kitchens on the first and ground floors and to the hot water pit, the refrigerator

main kitchen, which is part of the restaurant (being situated on the first floor and approached through a plate-glass door), the ordinary visitor will be welcomed at all times, and will thus be able to appreciate the convenience and extreme cleanliness appertaining to an electric service.

Another feature of the restaurant is a supply of current on every table, and visitors may, if they wish, carry out small cooking operations with toasters, chafing dishes, &c.

Each table is provided with one or more bell pushes, by which a signal lamp corresponding with the table is lighted up in the service room, and remains lighted until the particular table is attended to.

The electrical equipment has been supplied by various manufacturers to the design and specification of the Accessories Co., and is based on experience gained at the "Queen's Head" Electric Restaurant, Earl's Court, last summer, and the results obtained on the company's own and consumers' premises during the past three years,

which have enabled them to produce apparatus which is suitable for the purpose in view, and able to stand up to its work under everyday conditions.

In the main kitchen is provided one large cooking suite having a loading of 70 kW., controlled by 58 switches; there are nine ovens in the lower part, of various sizes and loadings for different cooking operations. At the extreme right,

ELECTRIC COOKING RANGE.

THE ELECTRIC KITCHEN.

THE TEA ROOM.

THE BROMPTON AND KENSINGTON CO.'S ELECTRIC RESTAURANT.

room and the transformer chamber in the basement. The neat black and bright metal work and the spotless paint and woodwork lent to the strictly utilitarian parts of the premises a distinctly naval atmosphere.

The restaurant has a seating capacity of from 90 to 95 persons. The lighting, cooking, bread baking, ventilating, heating of the building, water heating, refrigerating, cleaning, signalling and time service are all accomplished electrically. In the

there are two steamers for vegetables, fish, puddings, &c., and immediately adjoining, ovens for baking all varieties of bread and rolls required in the restaurant. At the left hand side there is a large fish fryer, adjoining which is a grill and toaster. On the main hob are fitted 12 boiling plates of various sizes and loadings. Running along the top of the suite are switch indicator lamps, and immediately underneath are hot cupboards for silver.

The other equipment in the main kitchen comprises an electrically-heated coffee roaster, electrically-driven meat chopper and coffee grinder, bain marie, fish kettle, stock pot, egg boilers, &c.

The hot water in the kitchen and scullery on this floor is supplied by a "Cooper" water heater.

VIEW OF THE MEZZANINE, B. AND K. ELECTRIC RESTAURANT.

In the main restaurant is fitted a large double griller, together with a carving table and hot cupboards, and hot plates are fitted throughout the establishment, so that hot dishes may be served hot, and not warm.

One of the basements is fitted as a messroom, where the restaurant staff, numbering about 18, will have their meals served and cooked. The installation here will be shown under ordinary working conditions to visitors. There is also on the first floor a small model kitchen fitted with the usual pattern of domestic stove.

Another basement contains refrigerating plant for supplying the cold chamber and making ice, and a 100-gallon "Cooper" heater supplying hot water for general purposes.

The ventilating arrangements comprise duct-work by means of which the air is drawn in from outside—cooled in

25-KW. EXCITER SET, FUSAN ELECTRICITY WORKS (see page 772)

summer and warmed in winter—and delivered to the restaurant through gratings, being afterwards exhausted by means of fans situated on the roof of the building.

The arrangements for metering all the circuits through the building are very complete and will enable accurate data to be obtained.

The illumination of the various apartments has been carefully studied, and in addition to the ordinary pendants and table lighting, some concealed lighting has been introduced. The company has, moreover, imported from New York a couple of typical "White Way" lamp columns, each carrying five globes, for exterior pavement illumination, as shown in one of our views.

With a view to carrying out its restaurant scheme, the company's premises in Earl's Court Road have been quadrupled in size.

The adjacent basements have also been acquired, and recently the company purchased the premises of the Earl's Court Motor Garage Co.,

which adjoin and run parallel at the back, comprising over 5,000 sq. ft. superficial area.

These premises will be used as a depot and workshops for the cooking and heating business in the company's area, for development work generally, and the charging of electric vehicles.

In conclusion, we are indebted to Mr. R. S. Downe, the

VIEW IN THE GENERATING STATION, FUSAN ELECTRICITY WORKS, SHOWING ALTERNATORS (see page 772).

In the servery at the back of the main restaurant are the electrically-heated urns for the purpose of supplying tea, coffee, &c.

The loading of the whole electrical equipment is approximately 140 kW., and this is supplied from two sub-stations on the premises, each containing two 50-kw. transformers, which also feed into the adjoining network.

company's general manager, for his courtesy in giving us the fullest information; we may add that his own and his company's extensive knowledge of electrical cooking requirements is at the fullest disposal of any who may be interested in the matter.

## NEW ELECTRICITY WORKS AT FUSAN, KOREA.

By J. DOUGLAS COLLIER.

THE port of Fusan, situated at the S.E. corner of Korea, is becoming important in view of its position relative to Japan,

electricity plant with entirely new machinery, and a description of the latter may be of interest, as the new generators are gas-engine driven for parallel operation.

The two main sets have a capacity of 300 kW. each, at 3,500 volts, three-phase, 50 cycles, speed 188 R.P.M., and consist of four-cylinder premier gas engines with direct-coupled Bruce Peebles alternators, the rotors of which are directly mounted on the engine fly-wheels placed between the cylinders, which are in pairs. The cranks are arranged to obtain an impulse every half revolution.

Starting is effected by compressed air, working on two cylinders, and a compressor, belt driven from a 2-B.H.P. vertical gas engine, has been installed for this purpose.

There are two separately driven exciters, one of 25-kw. capacity coupled direct to a single-cylinder gas engine running at 220 R.P.M., and the other, a motor-generator, having an output of 23 kW., driven by a three-phase, 3,500-volt, 50-cycle, 750 R.P.M. squirrel-cage induction motor, supplied from the main sets. The exciters are flat compound wound for 125 volts; the capacity of either machine is sufficient to excite three 300-kw. units, allowance being made for the installation of an additional set in the future.

The switchboard, which has been manufactured by Messrs. Ferranti, Ltd., is of white Silician marble, and comprises two generator panels, one exciter panel and one A.C. motor panel, also four three-phase feeder panels.

In addition to the usual instruments, each A.C. panel is fitted with a Ferranti three-phase adjustable overload time-limit relay to work the tripping gear of the oil switches, which are operated from the exciter circuit. All the H.T. switches are fitted with red and green signal lights; the synchronising gear is of the usual synchroscope type; a three-phase static-type ground detector with water resistance cut-outs is installed in accordance with official regula-

THE MAIN SWITCHBOARD, FUSAN ELECTRICITY WORKS.

and recently has become the terminus of the alternative route between Japan and Europe by the Trans-Siberian Railway, the other route being *via* Vladivostok. The population numbers about 55,000, of whom 25,000 are Japanese and the remainder Koreans.

The original electric lighting plant was installed about ten years ago: it consisted of four direct-current generators belt-driven from steam engines, having a total capacity of 180 kW., all of American make.

Following the annexation of Korea by Japan in August, 1910, a Japanese company, known as the Kankoku Gas and Electric Co., was formed to buy out the old electric light company. This company has recently installed a combined gas and

FOUR-CYLINDER GAS ENGINES, FUSAN ELECTRICITY WORKS.

tions. Spark-gap type lightning arresters, with choking coils, are provided for each feeder, all these being mounted on a separate framework on the wall at the back of the switchboard.

The engine circulating water is supplied by a two Peebles-Gwynne centrifugal pumps driven from the exciters.

As regards crane equipment, the engine room is provided with a 10-ton hand-operated crane by Messrs. Higginbottom and Mannock.

The distribution is carried out by means of overhead lines with weather-proof covering, carried on wooden poles. Single-phase oil-cooled pole-type transformers are used, having a ratio of 3,500/110 volts, the latter being the usual voltage of supply for lighting and small motors in this part of the world.

For the present, the engines are being run on gas having a calorific value of about 600 B.T.U. net per cubic foot, supplied from the town's gas plant; but as the ordinary lighting and heating load on the latter increases, it is intended to install a producer gas plant for the engines at a later date, and provision as regards piping and valves has been made accordingly.

The machines described operate in parallel successfully, and the load may be regulated on either generator to a nicety.

The plant has been supplied and installed by the contractors, Messrs. L. J. Healing & Co., London and Yokohama, in accordance with the specification of Mr. I. Naito, engineer, Tokyo Gas Co., who has acted as consulting engineer to the Kankoku Gas and Electric Co.

## NEW COMPANIES REGISTERED.

**Thompson Bros. (Blackburn), Ltd. (128,198).**—This company was registered on April 7th, with a capital of £3,000 in £1 shares, to take over the business of motor and electrical engineers, motor car dealers and agents, &c., carried on by Walter and William Thompson as "Thompson Bros." at Preston New Road, Blackburn. The subscribers (with one share each) are:—Walter Thompson, Norwood, Somerset Avenue, Wiltshire, electrical and motor engineer; Wm. Thompson, 50, Carnarvon Road, Blackburn, motor engineer. Private company. The number of directors is not to be less than two or more than five; the first are Walter Thompson and Wm. Thompson; qualification, £100. Solicitor, J. Taylor, 41, Ainsworth Street, Blackburn. Registered office, 15, Preston New Road, Blackburn.

**Simms Motor Units, Ltd. (128,437).**—This company was registered on April 16th, with a capital of £20,000 in £1 shares, to carry on the business of manufacturers and proprietors of and dealers in magnetos, magneto parts and accessories, motors, motor and other carriages, boats, flying machines, cycles, &c., and to adopt an agreement with F. R. Simms. The subscribers (with one share each) are:—H. Dock, 14, Regent Street, S.W., clerk; J. A. Maynard, 14, Regent Street, S.W., clerk; A. Cleave, 59, Cambridge Road, Anerley, S.E., clerk; J. H. Jones, 37, St. Stevens Terrace, South Lambeth, S.W., clerk; H. G. Hancock, 28, Olive Street, Romford, clerk; R. Pudgen, 96, Mildenhall Road, Clapton, N.E., clerk; E. Percy, 14, Regent Street, S.W., clerk. Minimum cash subscription 25 per cent. of the shares offered to the public. The number of directors is not to be less than two or more than five; the first are F. R. Simms, W. M. Rolph, and R. Scruby; remuneration, £50 each per annum and a percentage of the profits. Registered by John B. and F. Purchase, 14, Regent Street, S.W.

**Models, Ltd. (128,331).**—This company was registered on April 14th, with a capital of £10,000 in 400 preference shares of 25 each, and 8,000 ordinary shares of £1 each, to carry on the business of manufacturers of mechanical and constructional models, including locomotives, railways, steam and small internal combustion engines, aeroplanes, &c., and to adopt an agreement with the Models Development Syndicate, Ltd. The subscribers (with one share each) are:—A. F. Brough, 66, Mildred Avenue, Watford, draughtsman; J. Crussell, 60, Leavensden Road, Watford, apprentice; W. Cox, 85, Fleet Street, E.C., printers' manager; R. Reis, 169, Fordwych Road, Cricklewood, secretary; R. M. Sutcliffe, "Escudene," Cavendish Road, Sutton, Surrey, traveller; Evelyns B. Evans, 57, Bartholomew Road, Camden Road, N.W., clerk; H. E. Ryman, 42, Springfield Road, Walthamstow, mechanic. Minimum cash subscription, £1,000. The number of directors is not to be less than three or more than nine; the first are K. Cochrane-Holroyd, A. W. Bond and F. Tibby; qualification (except first directors), £150; remuneration (except managing director), not less than £25 or more than £75 each per annum. Registered by R. Reis, 169, Fordwych Road, Cricklewood, N.W.

**Lodge Fume Deposit Co., Ltd. (128,743).**—This company was registered on May 2nd, with a capital of £9,000 in £1 shares, to carry on the business of manufacturers of and dealers in certain appliances used in connection with an invention for the production of continuous high potential electrical discharges applicable for the deposition of dust, fume, smoke, fog and mist and for other purposes, with the exception of such purposes as those for which the Agricultural Electric Discharge Co., Ltd., is licensed. The subscribers (with one share each) are:—F. H. Bretherton, Belgrave House, Gloucester, solicitor; G. Newman, Sutton House, Howard Street, Gloucester, commercial agent; W. F. Newman, 85, Park End Road, Gloucester, traveller. Private company. The number of directors is not to be less than two or more than seven; the first are Lionel Lodge and Noel Lodge, both of Marlemont, Birmingham, and W. F. Newman, 85, Park End Road, Gloucester; qualification 500 shares; remuneration as fixed by the company; solicitors, Champney, Fream & Corke, Gloucester. Registered by Jordan & Sons, Ltd., 10-7, Chancery Lane, W.C.

**Reflecting Glass Letter Co., Ltd. (128,751).**—This company was registered on May 2nd, with a capital of £5,000 in £1 shares, to carry on the business of glass workers, sign manufacturers, electricians, &c., and to adopt an agreement with A. Stule and C. Persson. The subscribers (with one share each) are:—M. Selby, 46, Tudor Road, Hackney, N.E., clerk; N. C. Meredith, 69, Tasman Road, Clapham, S.W., clerk. Private company. The number of directors is not to be less than two or more than seven; the subscribers are to appoint the first; remuneration, £25 each per annum (£25 extra for chairman). Registered office, 6, Eldon Street, E.C.

**Stolz Electrophone Co. (1913), Ltd. (128,419).**—Registered April 17th, by Owen, Jones & Co., 88/90, Chancery Lane, W.C. Capital £20,000, in £1 shares. Objects: To carry on the business of manufacturers, repairers and letters on hire of and dealers in electrophones, side to the deaf, and aural instruments generally, and to adopt an agreement with the Stolz Electrophone Co. (London), Ltd. The signatories (with one share each) are:—A. Hawdon, York Hill, Loughlin, Essex, clerk; C. Boyle, 76, Blenheim Road, Stratford, clerk; Miss A. G. Jones, South Norwood Hill, S.E.; Miss G. M. Mead, Maythorn, Chaplin Road, Wembley, L. M. Godfrey, 1, Hertford Road, East Finchley, N., clerk; Miss W. R. Nalson, 11, Cumberland Road, Acton, W.; W. J. Kaley, 74, Mashbury Road, West Kensington, W., secretary. Minimum cash subscription, 20,000 ordinary shares. The first directors (to be not less than three or more than seven) are Mr John E. Thrill, Kt. (chairman), 64, Leigham Court Road, Hitherston; Lord Rosemead, Wycombe Lodge, Betchill-on-Kes; F. Clarke, 7, Westons Road, Lancaster Gate, W.; and J. Holt, 95, Fleet Street, E.C.; qualification, £100; remuneration, £200 each per annum (chairman, £52 10s. extra). Registered office, 95, Fleet Street, E.C.

**Redglo, Ltd. (128,550).**—This company was registered on April 21st, with a capital of £1,000 in £1 shares, to acquire from H. S. Martin certain patent rights for improvements in electrical heating and radiating apparatus; also to take over the business of a mechanical and electrical engineer carried on by him at 31A, Great Ancoats Street, Manchester. The subscribers (with one share each) are:—H. S. Martin, 31A, Great Ancoats Street, Manchester, electrical engineer; L. S. Taylor, 610, Royal Liver Building, Liverpool, consulting engineer; P. Hutchinson, 610, Royal Liver Building, Liverpool, consulting engineer. Private company. The first directors are H. S. Martin, L. S. Taylor and P. Hutchinson. Solicitor, O. Harley, 1, Water Street, Liverpool. Registered by T. T. Hull & Son, 22, Chancery Lane, W.C.

**E. Beekwith & Co., Ltd. (128,599).**—This company was registered on April 23rd, with a capital of £500 in £5 shares, to carry on the business of electrical engineers and contractors, founders, mechanical, steam, gas, petrol, motor and sanitary engineers, manufacturers of agricultural implements, &c., and to adopt an agreement with H. E. Beekwith, F. T. Porter and W. H. Sugden. The subscribers (with one share each) are:—H. E. Beekwith, 45, Luton Road, Barking, electrical engineer; F. T. Porter, 154, Ripple Road, Barking, electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are H. E. Beekwith and F. T. Porter; qualification, £50; remuneration as fixed by the company. Registered office, 3, Chester Terrace, Longbridge Road, Barking.

**Preston Portable Battery and Lamp, Ltd. (128,626).**—This company was registered on April 28th, with a capital of £2,000 in £1 shares, to adopt an agreement with J. E. Preston for the acquisition of an invention for improvements in galvanic batteries. The subscribers (with one share each) are:—A. C. Warwick, 68, Denman Road, Peckham, S.E., law clerk; W. Sullivan, 49, Dunmow Road South, Leyton, N.E., law clerk. Private company. The number of directors is not to be less than two or more than five; the first are W. E. Morum (chairman), J. E. Preston, H. Vellerville, and A. W. Pask. Registered by H. Dade & Co., 14, Queen Victoria Street, E.C.

**New English Glass Manufacturers, Ltd. (128,746).**—This company was registered on May 2nd, with a capital of £12,000 in £1 shares, to carry on the business of glass manufacturers and workers, mirror manufacturers, bottle makers, makers of electrical appliances, &c. The subscribers (with one share each) are:—A. F. Prince, 190, High Street, Dudley, licensing officer; S. Pearson, 6, Charles Street, West Bromwich, bottle manufacturer. Private company. The number of directors is not to be less than two or more than six; the first are to be appointed by the subscribers; qualification, £100; remuneration as fixed by the company. Solicitor, J. D. Harward, Stourbridge. Registered by Waterlow Bros. and Layton, Ltd., Birch Lane, E.C.

**Structural Patents, Ltd. (128,754).**—This company was registered on May 2nd, with a capital of £10,000 in £1 shares (5,000 pref.), to carry on the business of electric, mechanical, constructional, marine and general engineers, shipbuilders and repairs, founders, &c., to acquire the rights under Patent No. 8,277, of 1904, granted to J. Lilliehook. The subscribers (with one share each) are:—T. E. Samuels, 23, Bramston Road, Harlesden, N.W., clerk; D. Macaulay, 3, Lambton House, Fortess Road, N.W., secretary. Private company. Table "A" mainly applies. Registered by Jordan & Sons, Ltd., 116-7, Chancery Lane, W.C.

**CORRECTION.**—In our issue of April 26th, page 691, the name of a new company was incorrectly given as *Electric Cookers, Ltd.* It should have read *Cylindric Cookers, Ltd.*

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**General Electric Tramways Co., Ltd.**—A memorandum of satisfaction of debentures, dated June 30th, 1896, securing £15,000, has been filed. Statement under Sec. 12 of 1907 Act, old charges outstanding on July 1st, 1908; now first registered:—4 per cent. first mortgage debentures, dated June 30th, 1896, securing £15,000.

Particulars of £15,000 debentures, created February 12th, 1913, filed pursuant to Sec. 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £11,000. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Fraser & Chalmers, Ltd.**—Particulars of £100,000 debentures, created February 6th, and secured by trust deed dated March 14th, 1913, filed pursuant to Sec. 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £50,000. Property charged: The company's undertaking and property, present and future, including uncalled capital and certain freehold and leasehold lands at Erith. Trustees: Exploration Co., Ltd., 11, Cornhill, E.C.

**Egerton & Co., Ltd.**—Capital, £2,000 in £1 shares. Return dated February 19th, 1913. 1,511 shares taken up. £1,511 paid. Mortgages and charges: Nil.

**Borland, Hagedorn & Co., Ltd.**—Particulars of £120 debentures created March 1st, 1913, filed pursuant to Sec. 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Reform Lighting Co., Ltd.**—Debenture dated March 26th, 1903, to secure £2,750 charged on the company's undertaking and property, present and future, including uncalled capital. Holders: J. T. Zimmermann and Mrs. C. A. Zimmermann, St. Moritz, Villiers Avenue, Sarbiton.

**Cambridge Electric Tramways Syndicate, Ltd.**—Capital, £5,000 in £10 shares; return dated March 6th, 1913, 107 shares taken up: £20s. 4d. per share called up on 90 shares, £10 on 10 shares, and nothing on seven shares, £911 12s. 1d. paid. Mortgages and charges: Nil.

**United Sherardizing, Ltd.**—Charge created by Receiver, on company's property, present and future (in priority to debentures), dated May 13th, 1913, to secure not more than £150. Holder: W. J. Halsey, 23, Queen Anne's Gate, Westminster, S.W.

**Banbury and District Electric Supply Co., Ltd.**—Particulars of debentures for an amount not exceeding half the issued capital of the company, created December 2nd, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £1,500. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

A memorandum of satisfaction in full on March 26th, 1913, of debentures, dated December 30th, 1910, securing £1,600, has been filed.

**City of Buenos Ayres Tramways Co. (1904) Ltd.** (S2,214).—Capital £1,240,000 in 45 shares. Return dated February 27th, 1913; all shares taken up; £1,240,000 paid. Mortgages and charges: £174,000.

**South London Electric Supply Corporation, Ltd.**—Issue on April 1st, 1913, of £1,400 debentures, part of a series of which particulars have already been filed.

**Paignton Electric Light and Power Co., Ltd.**—Issue on April 7th, 1913, of £500 debentures, part of a series of which particulars have already been filed.

**Pearson & Cox, Ltd.**—Particulars of £750 debentures, created February 11th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £175. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Northampton Electric Light and Power Co., Ltd.**—Issue on March 28th of £6,515, and on April 1st, 1913, of £100 debentures, parts of a series of which particulars have already been filed.

**Electrical Power Storage Co., Ltd.**—Issue on April 10th, 1913, of £5,000 debentures, part of a series of which particulars have already been filed.

**Brown & Parsons, Ltd.**—Particulars of £1,000 debentures, created March 14th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £625. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**British Mica Co., Ltd.** (72,187).—Capital, £5,000 in £1 shares (2,000 pref.). Return dated March 17th, 1913; 2,006 ord. and 629 pref. shares taken up; £1 per share called up on 629 pref.; £629 paid; £2,000 considered as paid on 2,000 ord. shares. Mortgages and charges: Nil.

**Bastian Meter Co., Ltd.** (53,304).—Capital, £20,235 10s., in 8,000 preference shares of £1, and 68,942 ordinary shares of 6s. each. Return dated March 6th, 1913, 2,011 preference and 39,572 ordinary shares taken up, 5s. per share called up on 4,272 ordinary and £1 on 2,011 preference shares, £3,062 10s. paid, including £310s. paid on forfeited shares, £3,850 considered as paid on 35,400 ordinary shares. Mortgages and charges: £2,450.

**Bastian & Partners, Ltd.** (77,601).—Capital, £2,500 in £1 shares. Return dated December 31st, 1912, all shares taken up, £907 paid, £1,593 considered as paid. Mortgages and charges: £3,325.

**Cambridge Electric Supply Co., Ltd.** (31,457).—Capital, £10,000 in £10 shares. Return dated March 11th, 1913, 9,423 shares taken up, 9s. per share called up, £24,807 paid. A list of allotments (filed March 27th) shows a further 363 shares allotted for cash at £1 premium. Mortgages and charges: £30,000 first debentures, also one debenture, with the Capital and Counties Bank, Ltd., to cover £15,000.

**Switchgear & Cowans, Ltd.**—Particulars of £3,000 "B" debentures, created December 11th, 1912, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908; the amount of the present issue being £250. Property charged: The company's property, present and future, including uncalled capital. No trustees.

**Rawlings Bros., Ltd.**—Issue on April 11th, 1913, of £1,437 debentures, part of a series of which particulars have already been filed.

**Mexican Fuel and Power Co., Ltd.**—Issue on April 8th, 1913, of £850 debentures, part of a series of which particulars have already been filed.

**I. Frankenburg & Sons, Ltd.** (67,889).—Capital, £250,000 in £10 shares (12,500 pref.). Return dated February 7th, 1913; 11,323 ord. and 10,010 pref. shares taken up; £10 per share called up on 1,823 ord. and 10 pref.; £18,830 paid; £95,000 considered as paid on 9,500 ord. and £100,000 on 10,000 pref. Mortgages and charges: £15,000.

**Key Engineering Co., Ltd.** (76,459).—Capital £5,000 in £1 shares (7 defd.). Return dated November 7th, 1912 (filed April 10th, 1913; 4,070 ord. and 7 defd. shares taken up; £4,077 paid. Mortgages and charges: £3,500.

**Electric Wiring and Fittings Co., Ltd.** (29,676).—Capital, £5,000 in £1 shares; return dated February 24th, 1913; 1,382 shares taken up. £1,375 paid, leaving £7 in arrears. Mortgages and charges: Nil.

**Hove Electric Lighting Co., Ltd.** (36,942).—Capital, £100,000 in £5 shares (6,000 pref.); return dated April 2nd, 1913, all shares taken up; £100,000 paid. Mortgages and charges: £44,600.

**Hart Accumulator Co., Ltd.** (60,059).—Capital, £110,000 in £1 shares (20,000 pref.). Return dated April 2nd, 1913; £7,060 ord. and 7,059 pref. shares taken up; £1 per share called up on 31,352 ord. and 7,059 pref. shares; £38,411 paid; £55,708 considered as paid on 55,708 ord. shares. Mortgages and charges: Nil.

**Electrical and Industrial Investment Co., Ltd.**—Acknowledgement of indebtedness, dated April 18th, 1913 (given under trust deed dated August 12th, 1912), to secure £80,000 debenture stock, ranking *pari passu* with £100,000 debenture stock issued under trust deed, charged on company's undertaking and property, present and future. Trustees: Electric and General Investment Co., Ltd., 1-2, Great Winchester Street, E.C.

**X. L. Electric Co., Ltd.**—Debenture, dated April 1st, 1913, to secure £303, charged on company's undertaking and property, including uncalled or unpaid capital. Holder: Capt. C. Werner, Ewell Castle, Ewell, Surrey.

**Ackroyd & Best, Ltd.**—Issue on March 20th, 1913, of £100 debentures, part of a series of which particulars have already been filed.

**Imperial Light, Ltd.**—Issue on April 12th, 1913, of £1,000 debentures, part of a series of which particulars have already been filed.

**Electromobile Co., Ltd.**—Issue on April 23rd, 1913, of £459 debentures, part of a series of which particulars have already been filed.

## CITY NOTES.

## Rangoon Electric Tramway and Supply Co., Ltd.

THE directors' report that the amount of debenture stock available for future issue is £28,342. During the year to December 31st the company's cars travelled 1,462,285 miles, against 1,447,118 miles in 1911, an increase of 15,167 miles, and carried 10,633,328 passengers, against 9,569,922, an increase of 1,063,406; the receipts were Rs. 890,340, as compared with Rs. 842,033, an increase of Rs. 48,306, or 5.73 per cent. In the private lighting and power department the gross receipts for current supplied of all descriptions amounted to Rs. 4,80,232, as compared with Rs. 3,89,710 in 1911, an increase of 23.23 per cent.; the working expenses were 45.10 per cent. of the receipts, as against 46.13 per cent. for the previous year. The gross receipts of the house wiring and supply department amounted to Rs. 1,64,571, against Rs. 1,78,671 in 1911; although a slight decrease is shown in the total takings, the profit was Rs. 2,846 in excess of 1911, due to an improved system of working in this department and the increase in the demand for electrical articles of daily utility. The report, as given in the *Financier*, says that the general improvement thus shown is due, first, to the cessation of the economic disturbances that were severely felt in Burma during 1911, and, secondly, to a healthy expansion observable in the company's operations. The gross profits were £56,793. Interest on debenture stock absorbed £8,950; provision for redemption of debenture stock, £5,481; depreciation on meters, uniforms, &c., in Rangoon, £973; transfer to reserve for renewals, £12,500; transfer to special reserve account for cables, &c., £3,000; fees for directors, managing director and trustees, and expenses in London, £2,218; leaving £23,872, plus amount brought forward, £728, making £24,601. Deduct preference dividend to December 31st, 1912, £15,000; leaving available for dividend on ordinary shares, £9,601. The directors recommend a dividend on the ordinary shares of 5 per cent., for the year, free of income-tax, absorbing £8,850, and carrying forward £751.

## Willans &amp; Robinson, Ltd. and Reduced.

MR. J. C. PEACHE (chairman) presided on Tuesday, at the Cannon Street Hotel, E.C., over the ordinary general meeting of this company.

In moving the adoption of the report (see page 735), the CHAIRMAN said they met that day under the revised articles of association. Since the original interests of the shareholders were now represented by the "B" preference stock, the result of the half-year's working was of interest to them chiefly in regard to its bearing on the ability of the company to meet the dividend obligations on that stock. The result for the half-year was a small profit of £154, not in itself a subject for congratulation, but it was an encouraging indication for the future. This improvement was in the main due to the increased business obtained towards the end of 1911 and during the year 1912, thus keeping the shops more fully employed than had been the case for some time past, and making possible an increased output in the half-year now being considered, with the accompanying marked improvement in the accounts which that half-year showed. In regard to the future, the progress made since January 1st pointed to a continuation and extension of this improvement. A further satisfactory volume of orders had been obtained, and the output of the works continued to be good. The Diesel engine business was extending in a most satisfactory manner, and this extension had been especially marked since the opening of the present year. It was too early to speak of the effect of reconstruction on the actual work of the business, for until the confirmation of the Court was obtained last month, no step could be taken in bringing the new connection into operation, and beyond the taking up of the agreed proportion of ordinary share capital, the incoming parties had not as yet been in a position to actively foster the business, although small orders had already been received from that source. The reconstruction had, however, indirectly been of material benefit to the company. As an example, he might mention that two important contracts running into some £50,000 had recently been obtained, the orders being placed with the company, subject to the reconstruction scheme passing the Court. That was to say, had the reconstruction scheme failed to go through the company would have lost these two important contracts. This fact emphasised the urgent need there was of the reconstruction. There was every indication that the dividend requirements of the "B" stock would be met as they fell due, and, indeed, the directors had reason to believe that the obligations on the "B" stock would be more than covered—a matter of especial interest to the shareholders in that the "B" stock was also entitled to one-tenth of surplus profits. In the circular accompanying the report and accounts, the directors had called the shareholders' attention to the issue of £80,000 "A" preference capital, with its attendant right to acquire ordinary shares. This "A" stock was offered, in the first instance, to W. & R. shareholders, and the offer was an advantageous one. The issue ranked next to the debenture issues, and a reserve fund equal to one year's dividend on both the "A" and "B" stock had to be created and maintained before the ordinary shares received more than a nominal dividend; also the total of the "A" capital being limited to £30,000, there should be no difficulty in meeting the dividend requirements. He should remind them that this issue of "A" capital carried with it the right to take up 20 per cent. of the 1s.

ordinary shares. These ordinary shares were entitled to all surplus profits after the dividends on the two preference stocks had been met. W. & L. shareholders thus had the opportunity of securing an interest in the prosperity which there was every reason to hope would fall to the lot of the company in the future. The present meeting—though held under the revised articles—must be looked upon as a transition meeting, since it dealt with a period coming under the previous constitution. Meetings in the future would be held annually instead of half-yearly, and the next meeting, which would be held in the spring of 1914, would deal with the first complete year's accounts of the reconstituted company.

Mr. F. R. DAVENPORT (managing director), in seconding the motion, said he would like to endorse what Mr. Peache had said regarding the improvement shown in the last half-year. The additional work produced and invoiced in that period was the fruit of orders secured in the previous six or 12 months. Most of these orders, he need hardly say, were obtained with no little difficulty in view of their weak position, but the pursuit of these in the face of such difficulty was now bringing its reward. The contracts and orders more recently secured were of an improved character, and he had every reason for thinking that the current year's output would be a good one, and would yield a return on the reduced capital, which would be satisfactory. Steam turbine plants for the production of power on a large scale would remain the company's principal product, but the Diesel oil-engine trade was steadily increasing, and the policy of releasing themselves from the position of manufacturing a limited number of engines for another party to sell, which they would recollect prevailed for some time, had proved itself to be a good one. Contracting direct with the customer as they did now, they were establishing an excellent record for reliable and accurate work, so essential in Diesel business, which could not fail to be an advantage in the future. At present they confined themselves to the land issues of the engine, but were ready, if conditions warranted it, to start the building of certain marine types, for which, in years to come, there would be a great demand. Apart from these two most staple lines of production, they were extending the range of their manufactures and looked forward to including in that range business due to the "interests which animate the reconstruction scheme." In conclusion, he would remind them that the greatest asset they possessed to-day was the renewed confidence on the part not only of those they sold to, but also of those they bought for, without which no business could succeed; and it followed from the scheme of capital arrangement which the shareholders recently agreed to. He very much hoped that the present shareholders would avail themselves of the opportunity of taking up a portion of the new capital, so as to share in the improved outlook for the future.

The report was adopted without discussion, and the auditors having been re-elected, the proceedings terminated.

### National Telephone Co. (in Liquidation).

A GENERAL meeting of the members of the above company was held on May 1st at Hamilton House, Temple Avenue, E.C., Mr. George Franklin (the liquidator) presiding.

The CHAIRMAN said it appeared to him that the usual practice of calling shareholders together and merely telling them what had been done would not be sufficient in a company of the size and importance of that, and, therefore, they had circulated the report and accounts. Dealing with the first complete year of the liquidation from January 26th, 1912, to January 25th, 1913, the principal items were the receipt of the three millions in cash on account of the purchase money and four millions in Exchequer bonds, which only realised £3,718,419. Their interest from the Postmaster-General's investments realised an amount of £575,808. The receipts from those amounts enabled them to discharge the entire amount of the debenture stock, the three kinds of preference shares and the preferred stock. It also enabled them to pay the premium of 5 per cent. on the preferred stock, and there had been arbitration and liquidation expenses amounting to £113,000. On January 25th last £8,709 of dividends remained uncollected by the owners, and he was sorry to say that £5,500 still remained uncollected. Coming to the realisation account, the total assets were £17,421,393. They had to deduct from that the reserve funds which the company had provided amounting to £4,645,944, and there were special reserves and other provisions which the company had made, but which were not required, which amounted to another £305,131, so that they had a total of £4,951,075 of reserves to deduct from the total assets. That left them with £12,470,318, as against the amount of the award by the Railway and Canal Commission of £12,515,264. If they added to the amount of the award the sum realised from investments, sundry debtors, and cash in hand, they were able to carry forward a balance of £674,755. To that should be added certain receipts by way of interest from the Postmaster-General, both interest paid and interest which they hoped was still to be paid, and the estimated value of other assets not yet recovered, making up a total of £990,539. From that they proposed to take off arbitration and liquidation expenses paid amounting to £71,600, and the estimated balance of disbursement by the Postmaster-General on behalf of the company up to January 25th last, estimated at £30,000, making a total of £101,600. Then came the premium of 5 per cent. on the re-payment of the preferred stock, £111,250; and interest on debentures, £8,638. The loss on the realisation of the Exchequer bonds amounted to £281,580, and the further estimated loss on bonds yet to be realised amounted to £350,000, giving a total of £631,580. The estimated surplus available, subject, of course to the liquidator succeeding in

the appeal of which notice had been given by the Postmaster-General, was £137,470. Referring to the loss on the Exchequer bonds, he said that by the purchase agreement of 1905 the Postmaster-General had the option of paying three-fourths of the purchase-money awarded by the arbitrators in the form of what were called terminable annuities. The annuities were exchanged into Exchequer bonds because they believed they were a more marketable form of security than the annuities would have been, and the present position was entirely due to the fall in the value of Government securities since the date of the purchase agreement. In 1905 the highest price of Consols was 90½, and the lowest to-day the price of Consols was 71½. The Postmaster-General had been constantly urged that he ought not to exercise his option under the agreement because of this injustice to the company. They contended that the award meant value, and, in the second place, it was contrary to the intention of the agreement when made, because, if Government securities, instead of diminishing so rapidly in value as they had done, had risen in value, they felt sure that the Postmaster-General would certainly not have exercised his option, and given them those Exchequer bonds. With the Postmaster-General it had been a case of "heads I win and tails you lose." However, the Postmaster-General had insisted on the exercise of his option, but he had consented in response to representations to the issue of those Exchequer bonds which were a more marketable form of security. He might tell them that nearly 17 per cent. of the award was swallowed up by that loss. He had heard comments as to the discrepancy between the large sum which the company claimed, and the amount which was awarded. If they took the total plant value comprised in what were known as headings 1 and 4 of the company's claim, they had an estimated sum of about £11,300,000, against the amount awarded by the Court for plant value, £10,239,845. If they took the overhead charges—and it was there where the company had greatly suffered—the claim amounted to £8,964,851, whereas the sum awarded was £3,335,974. As to depreciation, the company allowed £2,633,245 on their total claim, and the Court awarded a depreciation of £3,115,523 upon the amount awarded. They had a total claim of £20,924,700, and the total amount awarded by the Court was £12,515,264. The company's claim was equal to £37 5s. 6d. per station, including land and buildings, and the amount awarded was £22 5s. 11d. per station. In the House of Commons the Postmaster-General congratulated Parliament that the arbitration was over, but he had evidently forgotten that he himself had given notice of an appeal on certain points. After 31 years of existence a great business, with a gross income of nearly £4,000,000 a year, had passed over to the State. The shareholders, during the company's life, had never received more, and had often received less, than 6 per cent. per annum, and in the end, so far as they could see it now, the capital only might possibly be all that would be repaid to the shareholders. It was not an encouragement to invest in enterprises where the State had the right to purchase. He was quite sure that the company and its officers had no occasion for reproach. At the outset, the State insisted that the telephone was a telegraph, of which it had a monopoly. The State having granted a licence, and the company having provided the capital and ventured upon the enterprise, it had been subjected to the monstrous injustice of competition, the payment of an exorbitant royalty, and the refusal of proper privileges wherewith to carry on its business, which was the business of the public. The history of the company was of one continuous struggle against iniquitous restrictions, taxation, oppression and difficulties. The chairman, in concluding, said that there was no resolution to propose to the meeting, but he would be pleased to answer any questions.

In replying to shareholders, the CHAIRMAN said that, with reference to a distribution on the deferred shares, that depended upon the result of the appeal of which the Postmaster-General had given notice. When that was decided, they could proceed to make up the accounts.

**Stock Exchange Notices.**—Applications have been made to the Committee to appoint a special settling day in—

Letters Patent Insurance Co., Ltd.—22,148 ordinary shares of 1s. each, full paid (Nos. 1 to 19,548 and 294,549 to 297,148).  
London and Suburban Traction Co., Ltd.—1,411,409 ordinary shares of £1 each, fully paid (Nos. 1 to 1,411,409); 1,018,178 5 per cent. cumulative preference shares of £1 each, fully paid (Nos. 1 to 1,018,178); and £144,441 4½ per cent. first mortgage debenture stock.

And to allow the following securities to be quoted in the Official List:—

Central London Railway.—£1,423,839 guaranteed assented ordinary stock, £469,976 guaranteed assented preferred stock, and £869,499 guaranteed assented deferred stock, in lieu of similar amounts of ordinary, preferred and deferred stock.

Pennsylvania Water and Power Co.—\$8,495,000 capital stock in shares of \$100 each.

**Craigpark Electric Cable Co., Ltd.**—The accounts for the year ended March, 1912, show a net profit of £7,437, plus £191 brought forward, making £7,628. The directors recommended that there be placed to depreciation off buildings and machinery, £1,800; dividend on 47,500 6 per cent. preference shares, £2,850; dividend on 37,500 ordinary shares, at 5 per cent., for the year, £1,875; balance of cost of new issue of preference shares, £183; balance to be carried forward (subject to payment of directors' fees for the past year), £920. The directors report the continued steady expansion of the company's business. All departments are fully employed, and the number and value of orders in hand are satisfactory. The stocks have been carefully gone over by the managing director, and are certified by him as being correct.

The meeting is called for May 12th at Glasgow

### Chiswick Electricity Supply Corporation, Ltd.

THE directors' report for the year ended December, 1912, says that the returns from the undertakings owned by the Corporation at Chiswick and Aberystwyth show good progress, and the increase in the number of consumers added during the year is satisfactory. During the year £2,634 has been expended on capital account for machinery, mains, services, &c. £615 has been written off for depreciation, and it is proposed to place a further £535 to depreciation reserve fund account, making a total contribution for the year, £1,150.

At December.	Number of consumers.	Revenue.	Profits.	Total liabilities on share and loan account.
1909	1,875	£15,129	£7,592	
1910	2,081	£15,404	£7,534	
1911	2,287	£16,338	£7,863	£142,500
1912	2,413	£18,322	£7,902	

The profits for the year, after paying sinking fund premium and trustees' fees, were £7,903. Out of this, interest on first mortgage debenture stock, amounting to £3,600, has been paid, leaving a balance of £4,303 to the credit of the net revenue account. The increase in the revenue for the year is £1,984. As influencing the profits, the account for repairs has been rather heavy, owing to an accident to one of the engines at Chiswick, while depreciation has been written off amounting to nearly twice as much as in the previous year. At Chiswick the cost of coal per unit has been higher than in the previous year, for the reasons that the price of coal was greater, and was very high during the strike, and that at the higher output a larger proportion of the units has to be generated non-condensing. As the result of experience with the Diesel engine at Aberystwyth, the directors have for the extensions required at Chiswick placed a contract for the supply and fixing of a similar type of engine, from the use of which considerable economy in fuel is expected to result. The results of the year's working will enable a dividend of 6 per cent. for the year to be paid. This dividend the directors propose to pay to the West London and Provincial Electric Supply Co., Ltd. Sir T. Brook-Hitching, who has occupied the position of chairman since the formation of the company, has resigned that position on account of ill-health, but he has consented to remain a director. Mr. Harry Kahn was elected chairman.

### United River Plate Telephone Co., Ltd.

THE annual meeting took place in London on April 29th, Mr. Geo. Franklin presiding. The chairman referred with very deep regret to the death of Sir Irving Courtenay, who was their chairman for over 26 years. The board had nominated him (Mr. Franklin) to fill the office. He hoped in that position, with the continued confidence of his colleagues on the board, and of the shareholders, to be able to do something to keep the company no less prosperous in the future than in the past. It was with regret also that he announced the death of Mr. C. H. Menzies, of the Local Committee out in Buenos Ayres. Regarding the company, he was very much impressed with the extraordinary growth of its business, and of the prospects before it at the present time. The truth was that they had outgrown the habiliments of their youth. Their articles of association were insufficient, likewise their capital plant and machinery. They had outgrown everything. The telephonic business in Buenos Ayres had increased so rapidly that they had been forced on several occasions to enlarge their plant. The accounts, as arranged at the last annual meeting, were made up to December 31st, instead of March 31st, which meant they only applied for a period of nine months. The revenue for that period from subscriptions had amounted to £400,068, as against £351,744, in the proportionate period of the previous year, which meant an increase of £48,324. The expenses in River Plate and in London amounted to £281,465, as compared with £244,038 for the same period of the previous year, or an increase of £37,427, but there was an increased profit for the period of £10,897. The increase in expenses was largely due to the enhanced cost of living in Argentina, consequent upon which wages and salaries had had to be increased. They had also incurred extra expense by placing the wires underground and by substituting one type of plant for another. During the period under review, the capital account had been increased by the amount of last year's issue of shares (40,000 shares), and the reserve for renewal of plant had been increased by £99,750, notwithstanding the writing off of special charges for replacement of the type of plant he had mentioned, and capital expenditure during the period had been increased by £270,767, of which £250,325 was in respect of plant, and £20,442 on account of real estate and buildings. There was an increase of the stock of meters of £38,000, due to the general expansion of the business, and to the difficulty of getting telephone material quickly from the manufacturers, whereas the frequent delays in the Argentine Custom house made it necessary to keep larger stocks against emergencies. A dividend at the rate of 8 per cent. per annum was again recommended. £30,000 had been added to the reserve fund account, which would make that fund total £237,792. It was also decided to put £2,000 to the staff provident fund. It was also anticipated during the present year to extend the scope and usefulness of that fund. He would like to mention that just recently a serious fire was started in one of their principal exchanges, but was quickly extinguished by the chief engineer, who was somewhat badly burned. It showed that the company was possessed of a right loyal staff, who did not at any time shrink from their duty. That being the case, he thought they ought to do as much for the Staff Provident Fund as possible. Since 1903 the Argentine had

steadily progressed. In that year the imports amounted to £26,000,000, but last year they reached £73,000,000, and the exports had increased to even a greater extent. He mentioned those facts as the prosperity of the company was locked up in the prosperity of the country. With the right kind of emigrant, the Republic ought to keep on advancing on the road of progress; 10 years ago their plant and real estate figured in their balance-sheet at about £450,000, but now it stood at something like £2,000,000. He would like to mention, however, that their exchanges were just about reaching their full limit or capacity. Any further progress would have to be accompanied by an increase in their plant. One thing, however, which affected them somewhat was the shortage of operators, in spite of the fact that they had a school attached to the works where they trained young people to become operators, eventually drafting them into the company's exchanges. Another thing which seriously hampered them was the fact that the Government out there would only grant fresh options on the understanding that those options reverted to the possession of the Government with all appurtenances, after 30 years' use, without any payment to the company whatever. They trusted, however, to get a modification of that decree, otherwise the company would be mulcted in some very heavy losses in a few years' time. This year the board had decided to ask the shareholders for a small premium of 10s. per share, which sum would be transferred to the reserve fund for the purpose of increasing the future earning power of the company. He hoped the shareholders would agree to that proposition. It would leave a fair margin of profit for them. It brought a sum of £27,000 to their reserve, which would be invested in land and buildings and plant. That would render their financial position very strong in spite of all the difficulties which he had enumerated. A new issue of 54,000 ordinary shares would be forthwith made to the ordinary shareholders at the price of £5 10s. per share.

MR. KEITH seconded the adoption of the report.

MR. T. CRAWLEY said he noticed in the papers the other day that the municipal authorities were inviting tenders for the construction of telephone tubes underground and underground tunnels for other purposes. He wanted to know if that would affect the future of the company. He should also like to know whether the company's service compared favourably with the London Telephone Service.

THE CHAIRMAN said that the authorities had been inviting those tenders for many years, and if nothing else came of it, as in the past, they had nothing to fear. On the other hand, if more underground tunnels were constructed, the company would not be slow to take advantage of them.

Replying to MR. LOWE, the CHAIRMAN said he did not think they had much to fear in the way of competition from other companies, if they kept up their progressive methods.

MR. LONG, chairman of the Monte Video Telephone Co., said he had the pleasure some time ago of staying in Buenos Ayres, and during that stay made an inspection of the company's exchanges, works and other buildings. He also had many occasions to use the service, and he had to say he found it most satisfactory. He could not help being struck with the methodical way in which things were managed, and the shareholders had every cause to congratulate themselves.

A vote of thanks to the staff was carried with acclamation.

MR. PARKER, the manager in Buenos Ayres, in thanking the meeting for the vote, said it was reported in the papers recently that a severe storm had destroyed a large number of the telephone apparatus, but he would like to say it was not their company which was affected, as most of their cables were underground.

A vote thanks to the chairman, proposed by MR. KINGSBURY, concluded the business of the meeting.

**Singapore Electric Tramways, Ltd.**—The directors' report for the year ended December 31st, 1912, states that in October, 1912, the capital was reduced to £100,000 by reducing the nominal value of each share from 20s. to 5s. The accounts (says the *Financial News*) show an excess of revenue over expenditure of £34,439, the profit for the year, after charging debenture interest, depreciation, and royalty paid, being £5,358. Compared with the year 1911, tramway revenue shows an increase of £1,446. The lighting and power receipts continue to improve, being 17 per cent. higher than in 1911, and 59 per cent. higher than in 1910. The ratio of total expenses to total receipts in Singapore for the year is 52.66 per cent., or, taking only tramway working and tramway receipts, 57.25 per cent. The directors report that, after lengthy negotiations with the Municipal Commissioners of Singapore, the company has been able to secure an extension of the arrangement under which it supplies current for lighting and power purposes. A reduced scale of charges has been agreed upon, and it has been decided that the residential district of Tanglin shall be added to the present area now served by the Municipality. The contract is to be extended for 10 years from the date electric current is supplied to this new area.

**R. S. Stokvis & Zonen, Ltd.**—The directors propose to pay a dividend of 15 per cent. on the ordinary shares for 1912, to transfer to special reserve fund £13,531 and £17,045; managing directors' commission, £7,416. There will be carried forward £22,071.

**Prospectus.**—*Consolidated Gas, Electric Light and Power Co. of Baltimore.*—The list was to close on Wednesday in an issue of £700,000 5 per cent. consolidated mortgage debenture stock at 96.

### Oriental Telephone and Electric Co., Ltd.

THE annual meeting was held on April 30th, at the Great Eastern Hotel, E.C., Mr. B. St. John Ackers presiding.

The CHAIRMAN, in proposing the adoption of the report, said the directors were pleased to be able to report another prosperous year and a satisfactory increase in the business of the company. They had given their unremitting attention to that business for many years past and watched its progress closely, so that they considered themselves on this occasion in a position to recommend a higher dividend, making 10 per cent. for the year. The board had of course always felt that, with the yearly improving position of the company, the shareholders were fairly entitled to receive from time to time, as far as prudent, the benefit of increased profits; but, as he pointed out in a previous address, the directors, before giving effect to any desire they might entertain to distribute part of such increased profits among the shareholders, must be reasonably satisfied that there would be no going back. Acting on that principle, they had gradually accumulated considerable funds which were available at very short notice. They had in addition recently increased the company's holding of Consols to £20,000, and increased also the amount of their stores for sale purposes, besides spending a large amount on profitable new construction, whilst the company's investments in the affiliated companies, which were all in a highly prosperous condition, were, as they knew, very valuable. The revenues from their own exchanges, as well as those from the affiliated companies, had, during the last five years, not only maintained the increases shown annually, but had each year exhibited an increase over the previous year, and there was every evidence of these conditions continuing on their present moderate but very steady scale, so that the directors had come to this decision with every confidence in the future. It would be noticed that they had written down the total capital expenditure very considerably—below, in fact, the value placed upon their numerous installations by their different managers—and having regard to those installations being kept up in the highest state of efficiency, there would really be very little further to write off for some years to come. That condition of efficiency applied equally to their affiliated companies, so that the directors had felt justified in revising at the same time the very low valuation they placed upon their investments in these companies many years ago, and they would accordingly find their value increased in the balance-sheet to what was still a very low figure. As regarded the company's house property, he need hardly say that every care was taken to maintain this also in thorough repair and in the best possible condition. He took that opportunity again to refer to the ability and zeal with which the staff at home and abroad had worked to bring about the results which they showed, and for this the thanks of the shareholders and the board were justly due. The directors had decided the question of dealing with the pension fund by commencing investing the allotted sums in the names of two of their body to hold in trust on behalf of the company for the purpose of applying the interest to the payment of certain pensions to duly qualified members of the staff whenever the necessity for such pensions should arise. They had recommended £2,000 for this fund for the past year, raising it to £5,000, and they proposed to add substantial amounts every year.

MR. THOMAS LLOYD seconded the motion, which was adopted.

### Anglo-American Telegraph Co., Ltd.

THE ordinary general meeting of this company was held on April 29th, at Winchester House, E.C.

MR. F. A. BEVAN, who presided, said that they received a fixed amount annually for the use of their cables from the Western Union Telegraph Co. They had, therefore, no questions to deal with as regards increase or decrease, and he had not to tell them anything about the management or expenses of the company. That was all carried on by the Western Union Co., who did not furnish them with any figures at all, but were very prompt in paying the annual rent of £262,500. The credit side of the accounts showed as regards the renewal fund that they had come to an arrangement with the Western Union Co. whereby the cost of new cables was borne by the Anglo Co., but all renewals and repairs to those cables were met by the Western Union. On that account the Western Union Co. were creditors to the extent of about £20,000, which would have to be taken from the company's renewal fund. The Western Union, however, were bound to keep all their cables in good repair during the term of the lease. In the revenue account the shareholders would notice that a sum of £1,621 appeared in the form of bank interest. That arose by reason of the deferred shareholders only receiving their dividend at the end of the year. The Western Union Co. paid to them the full quarter's dividend, which they could not distribute to the deferred shareholders until the end of the year. Therefore, a certain amount of interest accrued in respect of that sum, with which he hoped in course of time the company would pay a bonus to the deferred shareholders. Since they made the arrangement with the Western Union, and during the past year especially, efforts had been made by the Press, aided by the Postmaster-General, to reduce the rates of telegraphic messages chiefly by a ring system. What the result would have been he did not pretend to know, but although there might have been an increase in the number of messages, at the same time a loss might have been made. It, therefore, seemed to him that the directors were wise, and the shareholders also, in agreeing to the arrangement with the Western Union. It was much more easy for the Western Union

to bear any loss in that direction which might have accrued owing to a reduction of tariffs. Another thing they had to consider was whether an amalgamation of the deferred and preferred stock would be beneficial to the company. The directors were favourably disposed to amalgamating, but he understood several of the large preferred shareholders were opposed to the scheme. There was an argument on both sides. It would, however, be undoubtedly an advantage for them to have only one class of stock to deal with. He could not help noticing at that meeting that several familiar faces were gone. Sir Charles Burt, who was one of their most valuable directors, had passed away, and Sir Gerald Fitzgerald also. He should also like to mention that Mr. Carson had retired from the position of manager. That was a fact to be deplored. That gentleman had thrown his whole heart into the work, and had always given them of his best. Mr. Wells, who was secretary for a great many years, had also retired, likewise their old friend, Mr. Smith (the accountant). The old people passed away, but still the company went on as successfully as ever, and he trusted that when they had passed away the old Anglo-American would still be flourishing, occupying the proud position of being the first company to carry messages under the sea.

MR. BENSON seconded, and the motion was carried.

At the extraordinary general meeting held afterwards, the CHAIRMAN proposed a resolution adopting new articles of association. He said that the old articles were prepared many years ago, and were some of the first made under the Companies' Act. They were now quite obsolete, and the new conditions in connection with the arrangement with the Western Union made it imperative that certain alterations should be carried out.

The motion was carried.

**Anglo-Portuguese Telephone Co., Ltd.**—The accounts for the year 1912 record a healthy state of affairs. Contrasting the profit and loss account with that of 1911, the income for the year at £62,919 marks an increase of £5,874, but the operating and other expenses at £37,723 are £6,205 higher. Notwithstanding this factor, the directors are in a position to recommend a final distribution at the rate of 5 per cent. per annum, making 8 per cent. for the year, which was the rate for 1911, and which enables them to carry forward £5,609, which is slightly in excess of the sum brought into the account from 1911. A satisfactory feature of the accounts is the gradual increase in the amount of subscriptions received or charged in advance, less royalty and rents paid in advance, which appears as a liability in the balance-sheet at £25,859, and which, of course, represents the proportion of subscriptions unearned at the close of the financial year. If the present rate of increase both as regards the revenue and the reserves be maintained, the position is distinctly encouraging. The reserves total £75,000, which includes £12,500 appropriated from the year's accounts.

**West London and Provincial Electric Supply Co., Ltd.**—The directors' report for the year ended December, 1912, says that the company derives its revenue from the dividends on the shares of the Chiswick Electricity Supply Corporation, Ltd., which it owns, from the fees charged for managing the affairs of that Corporation, and from commission for acting as engineers in respect of additions to the Corporation's plant and machinery. The report of that company appears elsewhere. The 6 per cent. on shares in that company will be received in due course by this company, whose accounts show a balance to the credit of the profit and loss account of £3,485. The directors propose to pay a dividend on the cumulative preference shares at the rate of 6 per cent. per annum for 1912, and to pay interest at the rate of  $\frac{1}{2}$  per cent. per annum on the funding certificates for the year ending 1911, carrying the balance forward. Sir T. Brooke-Hitching, who has occupied the position of chairman since the formation of the company, has resigned that position on account of ill-health. He has consented to remain a director. Mr. Harry Kahn was elected chairman.

**Alderley and Wilmslow Electric Supply, Ltd.**—The directors report for the year ended December 31st, 1912, that the total lamp connections have increased from an equivalent of 22,866 to 24,898 S.C.P. lamps. The result of the year's working shows a profit of £2,846, which, with £184 brought forward, makes £3,031, and after paying £1,766 interest on debentures and loans, there remains a balance of £1,245, of which the directors recommend that £800 should be put to reserve fund, and the balance, £445, carried forward.

**Vera Cruz Electric Light, Power and Traction, Ltd.**—The directors report that the net profits in Mexico for the year 1912 amount to £31,785, an increase of £3,901. After providing for London office expenses and bond and other interests, there remains a balance of profit of £16,744, plus £1,514 brought forward, making £18,259. From this there is transferred to depreciation and general reserve account £5,000; dividend on the share capital for 1912 at the rate of  $\frac{2}{3}$  per cent., £8,750; carry forward, £4,509. The contract with the Puebla Tramway, Light and Power Co. for the supply of power, referred to last year, has been settled on satisfactory terms, and it is anticipated that power will be available before the end of 1913.

**Kent Electric Power Co.**—Notice appeared in the *London Gazette* on May 2nd of the company's intended application to Parliament this session for powers to rearrange the capital, convert shares, repeal or amend certain Acts, and other matters.

### Colombo Electric Tramways and Lighting Co., Ltd.

THE eleventh annual meeting of the above company was held on Wednesday at the offices, St. Emet's Place. The meeting was private. The report for the year ended December, 1912, which was adopted, stated that there was a total net profit in Ceylon for the year, after deducting all current expenses, amounting to £38,041. During the year 2,456,290 units were generated, as against 2,328,032 for the previous year, the cost per unit being slightly less. The tramways receipts show a further marked improvement. The total number of passengers carried amounted to 9,881,969, as against 9,114,633 for the previous year. The lighting branch of the company's business continues to show satisfactory progress. In consequence of the steady growth of the lighting branch, and also extension to the tramway track, orders have been placed for additional machinery and rolling stock. The appeal to the Supreme Court respecting the ferry service has not yet been decided. The total available profit, after providing for debenture interest and all expenses, and including the balance brought forward, amounts to £36,506. Out of this the directors have transferred £15,000 to general reserve and renewal fund, which had been dealt with by writing off £1,000 from the track renewal account, and £4,000 from the mains and plant account, leaving the general reserve and renewal fund at £35,000. The directors recommended a dividend of 10 per cent. on the share capital, free of income-tax, amounting to £13,084, leaving £8,422 to carry forward. The directors placed on record their appreciation of the work of the staff.

### British Westinghouse Electric and Manufacturing Co., Ltd.

THE thirteenth annual meeting was held on Monday at Hamilton House, Victoria Embankment, E.C., Mr. J. Annan Bryce, M.P., presiding.

THE CHAIRMAN, in proposing the adoption of the report (see *ELEC. REV.*, p. 732), said that dealing first with the debit side of the balance-sheet, the capital authorised and issued remained as before. The item, 6 per cent. prior lien debentures, was reduced by £6,300 in respect of 63 debentures drawn on December 13th, 1912, for repayment on January 1st, 1913, in accordance with the provisions of the trust deed, making in all £28,800 redeemed to date out of the profits of the company; 4 per cent. mortgage debenture stock remained as before, viz., £1,241,353. Prior lien redemption account represented the liability for the repayment of 63 debentures on January 1st of this year, plus a small balance carried forward to this year's account. Interest accrued to date on prior lien debentures and 4 per cent. mortgage debenture stock included three months' interest to December 31st, 1912, on the former and six months' interest on the latter, both of which had since been paid. Sundry creditors and credit balances, £199,387, including £49,431 reserve against maintenance on uncompleted contracts, stood at practically the same figure as last year, which was satisfactory having regard to the increased business. Advantage had been taken wherever possible by using their cash resources to obtain special cash discounts for payments before due dates. The reserve for employers' liability had been increased to £10,000, at which figure the board proposed to maintain it in the meantime. He might repeat what he said last year, that, owing to the care exercised in their shops, they had hitherto been singularly free from accidents of a serious nature. Turning to the credit side of the balance-sheet, the item "patents and goodwill" remained as before. Some of their patents had lapsed and some had been abandoned, but new patents had been acquired, the expenses connected with which had been defrayed out of revenue. For the sake of simplification they had this year, with the approval of the auditors, amalgamated the two items of works, machinery, plant, &c., starting with £1,672,677, the total of the two items shown in the 1911 balance sheet. The reserves of £51,912 which appeared in last year's accounts and which were the accumulation of several years, had been appropriated to various items comprised in the total sum mentioned of £1,672,677, and the amount put to depreciation in the present accounts, viz., £49,750 represented the amount written off for this year only, as previously there had been charged to revenue account a large sum for upkeep and maintenance of buildings and plant. Stock and material on hand, &c., £641,985, compared with £622,264, showing a slight increase over last year due to the expansion of business. Completed work on contracts, £249,310, compared with £292,024, showing a difference of £42,714. The smaller amount outstanding was satisfactory. In regard to the Underground Electric Railways Co. of London arbitration account, £95,681, the decrease of £23,916 was approximately accounted for by the result of the appeal to the House of Lords, under which the Railway Co. returned to them the amount of the original award, thus leaving them in the same position as before the award was given. The amount outstanding was still considerable, the exact value of which, to them, must depend upon the result of the further reference to the arbitrator. Sundry debtors—less reserve, £237,193, was some £56,000 odd in excess of last year owing to the increase of the business. Ample reserve was made for bad and doubtful debts which, considering the volume of business, constituted but a very small percentage. Shares and debentures in other companies were slightly less than last year owing to certain depreciations having been made with regard to some of the minor items. Bills receivable, cash at bankers and on loan amounting altogether to £115,677, compared with £61,711 last year, showing an increase of £53,959. This increase was partly due to better terms of payment and the careful attention paid to collections. Coming to the profit and loss account, the trading profits of 1911

amounted to £126,144, as compared with £112,539 in 1910. In 1912 they amounted to £157,871, or an increase of £45,332 over 1910, and £31,727 over 1911. This result was encouraging. The prospects for the current year were so far promising. Orders received this year were in advance of those booked up to the same time in 1912. The first three items on the debit side were the same as last year. Expenses on surplus land and buildings had been reduced from £4,254 to £3,033. This reduction was mainly due to the fact that they were now fully occupying the steel foundry building for the manufacture of other products. Amount written off works, machinery, plant, &c., £43,450, was £12,582 more than was devoted to this purpose last year. The net profit for the year, £41,074, showed an increase over the same item last year of £20,366, and compared as follows with recent preceding years:—December 31st, 1908, loss £6,521; December 31st, 1909, loss £799; December 31st, 1910, profit £12,437; December 31st, 1911, profit £20,708. There had thus been a continued steady improvement. Towards the close of his remarks last year, he alluded to the effects of the coal strike. Owing to this strike, their output was very considerably hampered. Their own supply of coals was adequate, but many of their suppliers were not in the same position, and it was really not until towards the end of the year that they returned to normal conditions of output. But for the strike and the additional cost of production caused by insurance payments and rise in wages, their results would have been considerably better. Although with this year's profit, and the amount brought forward, there was now available £66,899, the directors did not propose to recommend any distribution. In the first place they did not yet know what the loss would be in respect of the item "Underground Electric Railways Co. of London." Secondly, they did not consider that even with the reduction of capital effected in 1907, the assets had been written down to an amount adequate in the case of an undertaking such as theirs. While, therefore, they were undoubtedly in a better position than last year owing to the success of their appeal to the House of Lords, the board was still of the opinion that it would be wise to reduce the capital. As he said last year, the interests of the preference shareholders would not suffer in any way by such reduction.

MR. E. A. GOULDING, M.P., seconded the motion. He said it was clear from the lucid statement of the chairman that the company was in an improved position, and they had to recollect that it was under the chairmanship of Mr. Bryce that that had been brought about. The shareholders had been very patient, and he believed, if they exercised that patience a little longer, they would be rewarded in the success of the company. He saw a bright future before it, for all the difficulties had been faced and met instead of being covered up.

Replying to a shareholder, the CHAIRMAN said he did not think Mr. Lyttleton, the arbitrator, had yet fixed a date when he would deal with their claim against the Underground Railways Co. They would have to wait the result of that award before they proceeded to do anything further in the way of cutting down the preference shares. He would remind the holders of those shares that it really did not matter what their nominal value was. The question was—what was the value of the shares in the market, and what dividends would be paid on them? If the nominal amount was reduced it would become much more easy to declare what appeared to be a reasonable dividend.

MR. BIRKS said that as one who had attended every meeting of the company, he rather expected that the chairman would have spoken in a more cheerful tone as to the future. If there was to be any further reduction in the capital he thought it ought to be made in the ordinary shares. He would like to know what was likely to influence the policy of the board in regard to the reserve funds.

THE CHAIRMAN said he did not see how it was going to hurt the preference shareholders if their shares were further cut down, so long as they received their interest. It did not matter to them whether the ordinary shares were similarly dealt with. Those shares belonged almost entirely to the American company, which also held a majority of the debentures and the preference shares, so it would be necessary to get their consent before they could do anything. They must remember that the American company came to their assistance and subscribed very large sums to pull the company through its troubles, and therefore they deserved consideration.

MR. BULL asked whether there was any chance of a working combine between the different electrical companies in this country. He said he knew of another large company which was doing as much business as it possibly could, but yet could not pay a dividend on its ordinary stock.

THE CHAIRMAN said it was very difficult to say whether there was any possibility of bringing about any general arrangement between the various electrical firms in the country. They had tried for years to avoid cutting prices, but it was a very difficult thing to bring about a general arrangement of that kind.

The report was adopted.

### City of Buenos Ayres Tramways Co. (1904), Ltd.—

The directors have declared a dividend of 1s. 3d. per share, less income-tax, for the quarter ended March 31st.

**Tramways and General Works Co., Ltd.**—A dividend of 16½ per cent. (1s. per share), free of income-tax, has been declared for the year to March 31st.

**Chloride Electrical Storage Co., Ltd.**—The directors have declared a dividend of 10 per cent., free of tax, on the ordinary shares for the year. £8,407 is carried forward.—*Financier*.

### La Plata Electric Tramway Co., Ltd.

Mr. W. F. HAMILTON (chairman) presided on April 20th at Winchester House, E.C., over the fourth annual general meeting.

In moving the adoption of the report, he said the board regretted that the result of the working of the tramways for 1912 was so disappointing, although the total receipts on revenue account amounted to £53,179, being an increase of £3,126 as compared with the receipts of the previous year. The expenditure increased from £35,380 to £43,397, leaving a balance only of £9,782. The board had decided to write off out of this sum the whole of the defaulters' account, and the expenses in connection therewith, and to recommend the payment of four months' dividend on the preference shares, covering the period from July 1st to October 31st, 1911, and to carry forward £598, to next year. As the 170,000 preference shares issued to the public were not fully paid up until August 1st, 1911, the dividend was 1'65d. per share. The decrease in their profits was large, but it was almost entirely due to causes of an exceptional nature, some of which could not happen again. During the whole year the weather at La Plata was very bad and deprived them of traffic which, in the normal course of things, would pass over their tramways, and there was a loss of £1,385 on their horse tramway to Ensenada. In addition to these causes, alterations were made in their routes as further portions of tramline were electrified, which entailed the running of much unprofitable mileage, and the great delay in the completion of the Ensenada section necessitated the payment of interest during a considerable part of the year on unproductive capital. All works of construction by their contractors were now entirely finished. Two short extensions to the Digne remained to be carried out, but they had till June, 1914, to do this in, and the work would be done in the most economical manner under the supervision of the manager. One of the first improvements effected by their new manager, Mr. Valentine Brown, after his arrival at La Plata, was to take advantage of the opening of the Ensenada section, to so modify the service of the tramways as to secure the best results, both for the company and the public. He had also completely reorganised the La Plata office, and the board were pleased to inform the shareholders that in Mr. Brown they had a very capable and experienced manager. The board were of opinion, judging by the reports they had received from the manager, and the result of the first quarter of the year, that the profits of the working would probably not be less than £20,000. Several shareholders had written to the company with regard to the other system of electric tramways in La Plata, but this other system did not compete with their own so far as regarded the Ensenada section and the Tolosa section—which were both very profitable—and also the Los Hornos and Cemetery sections, whilst in La Plata itself their lines ran in opposite directions. When he was at La Plata recently it was agreed between himself and the proprietors of the other tramways, that in making extensions competing lines should, as far as possible, be avoided. Their relations with the Government and the municipal authorities continued to be excellent. The present position of the action against their late local auditor was that appearance in the action had been entered on behalf of two of the defendants. The delay in the proceedings had been entirely due to the fact that the remaining defendant was travelling in South America, and it had been difficult to effect service of the writ upon him for that reason. The company had passed through troublesome times, and they had had many difficulties to contend with, but the prospects were favourable; and with the growth of La Plata and Ensenada, which was bound to continue, they might reasonably look forward year by year to increased profits.

Mr. W. T. WESTERN seconded the motion.

Answering Mr. VAN RAALTE, the CHAIRMAN said he had gone very carefully into the question of the working expenses per car-mile, and they were not extravagant, but, of course, with an increase of receipts, the working expenses would diminish proportionately.

The report was adopted.

### Lisbon Electric Tramways, Ltd.

THE directors report a net profit of £102,745 for 1912, plus £4,466 brought forward, making £107,212. From this £35,000 has been placed to depreciation reserve, and £5,000 to the credit of exchange reserve account. Out of the available balance of £67,212 the usual preference dividend, amounting to £25,533, has been paid. On November 1st the directors paid on the ordinary share capital an interim dividend of 3 per cent. net, amounting to £19,029, and now recommend the payment of a final dividend at the same rate, making 6 per cent. net for the year 1912. £3,637 has been carried forward. The operations during the year were again affected by strikes. On May 29th a strike occurred amongst the tramway employees, owing to the men insisting on the reinstatement of certain of their number who had been discharged for insubordination. This strike lasted until June 24th, when the bulk of the cars were again in operation. The damage to the plant was trifling. Since that date the service has been continued without interruption. It is estimated that the total stoppage of the tramway during the strike resulted in a loss of about £20,000 in traffic receipts, but, owing to the satisfactory traffic during the remainder of the year, this loss has been mostly made up, and the net decrease on the year, compared with the previous year, amounts to £7,000. The exchange ruling during the year has been less favourable than in the previous year, the average rate being 18½d.

as against 49'11d. After prolonged negotiations with the municipality of Lisbon, a contract was eventually agreed upon with that body, and finally signed in January last, for the reconstruction and electrification of the lines of the Nova Companhia dos Arsenos Mechanicos de Lisbon, in which system this company has a considerable interest.

**Brisbane Electric Tramways Investment Co., Ltd.**—The directors announce that the revenue account for 1912, including £6,574 brought forward, shows an available balance of £82,006, which, says the *Financier*, the directors have dealt with as follows:—Debtenture stock interest, £19,068; preference dividend, £17,656; an interim dividend of 1s. per share on the ordinary shares, £18,000. Out of the remaining balance of £27,281 the directors recommend that £5,500 be added to the reserve fund, bringing it up to £10,000; that a balance dividend of 4s. per share, free of income-tax, be paid on the ordinary shares (making a total dividend for the year of 8 per cent.), and that £3,781 be carried forward. After the above appropriation the renewal and other reserve funds of both companies will amount to £113,000, with an aggregate of balances carried forward of £8,909.

### STOCKS AND SHARES.

Tuesday Evening.

By another of those violent *coltes-face* to which the Stock Exchange is becoming accustomed, markets swung round completely this week, on the news that King Nicholas had consented to evacuate Scutari. The Stock Exchange humorists at once declared that he had closed his "bear" of Canadas and Rio Tintos, regardless of the consequences of so obvious a slander. This little joke, however, was one outcome of the much happier frame of mind that prevailed all round the markets, and the "bear" points were forgotten as prices rushed up generally.

The Electricity sections took the alteration in sentiment with the same quiet philosophy that they displayed through the previous slump. Changes on the week are mostly in the upward direction, so far as those securities are concerned in which there is any sort of speculative account, while the possibility of money growing easier, if the situation in Central Europe is really better, all round the investment markets.

On May 1st a number of stocks and shares quoted in the Stock Exchange daily Official List were removed from its pages in consequence of there having been no bargain recorded in them for a period of 16 months. Amongst those which were deleted in this way were several which appear week by week in our lists, such, for instance, as Dublin United Tramways Preference and Newcastle-on-Tyne Electric Preference. The paucity of general interest is our excuse also in removing them from their accustomed places. It will not be difficult to fill up the gaps with some of the other stocks and shares constantly added to the lists of those connected with the electrical industry.

English electric supply issues present their usual quota of something less than half-a-dozen changes on the week. Charing Cross and City Preference eased off to 4, but South London are up 1, and Edmondson's 6 per cent. non-cumulative Preference have again come into demand, showing a rise of ½d. at 2½, while the Ordinary at 10s. are likewise better. South Metropolitan 4½ per cent. Debtenture stock gained 2 points at 99, and the improvements recorded last week have been maintained.

Members of the Stock Exchange were amongst the audience at the demonstration given last week of the Cold Light, invented by Prof. C. F. Dussaud. Full particulars appeared in some of the papers, and the Stock Exchange men agreed that it was extremely interesting, likely also to exert a far-reaching influence over the electricity supply industry when the Cold Light developments have been carried further into commercial use. At the present time, they are not regarded as of sufficient immediate consequence to have much effect upon quotations for the supply companies' shares.

The Home Railway market was one of the principal gainers by the improved political news. Prices shot up in very vivacious fashion, assisted by the announcement that the scale of charges, both for passengers and goods, was to be increased in many directions. Of the Tube stocks, Metropolitan jumped 1½ and Districts ½ to 52½ and 39½ respectively, but the prices of both had been acutely depressed just previously. The only change in City and South London stocks was a point rise in the 5 per cent. Preference of 1903, and Central London did not move. Important improvements are already being made on the systems of both these last-named lines, accelerated services being one of the principal achievements of the new control. Great Northern and City Preferred fell 1s. 8d. to 2½; but East London were a better market, moving up to 9½. Underground Electric shilling shares eased off nominally, though, as a matter of fact, the actual price remains about 11s. 9d., while the £10 Ordinary rose 1s. 8d. The 6 per cent. First Income Debtenture stock shows a loss of a point at 110. In the British Electric Traction group a fall of ½ in the 5 per cent. Perpetual Debtenture lowered the price to 90, and the Preferred at 84½ is a point down. Bath Tramways Debtenture continues to dwindle.

The Telegraph market is firm on the whole, although there are one or two falls. Direct Spanish Preference rose  $\frac{1}{2}$ , "China" shares  $\frac{1}{2}$ , and Commercial Cable Debenture  $\frac{1}{2}$ . West India and Panama shares, on the other hand, fell to 24 upon the appearance of the report, which, after all, must be regarded somewhat in the nature of an interim one, inasmuch as the company is not expected to benefit largely until the Panama Canal is open. The dividend for the year remains at  $1\frac{1}{2}$  per cent., and the price, after being dull, as just mentioned, braced up to  $2\frac{1}{2}$  later on. Reuters new shares hardened to 11, and Anglo-Portuguese Telephone Debenture stock rose  $\frac{1}{2}$  to 102 upon the publication of a report that was read as being very satisfactory.

The features of the week, however, have been Marconi shares and National Telephone Deferred stock. Marconis put on good fractions, both as regards the Ordinary and Preference, thanks to the appearance of the report of the Technical Committee, which is looked upon as evidence that the Marconi Company possesses the best wireless system now in existence. Prices of shares in the subsidiary companies hardened with those of the parent, Canadians being particularly active at 16s. 9d., after dipping to 14s. 10d. On Tuesday, however, the market became duller again. National Telephone Deferred rose to 21 upon further consideration of the figures to which reference was made here last week. Speculation in the stock revived languidly, but amongst actual holders there is profound discontent at the way in which they have been paid off through the operation of the Post Office purchase. If the Postmaster-General happened to be the Member of Parliament for stockholders in the National Telephone Company, we venture to think that his seat at the present time would not be one of the most secure to be found in the constituencies.

News from Mexico continues to be read with a certain nervousness, but the falls in the prices of Mexican securities have been stayed. Mexico Light and Power Preference is a point down, but this stock was unaffected in the slump last week. The Common shares are  $\frac{1}{2}$  higher. Mexico Trams Common shares and the First Mortgage bonds are both lower. Monterey Fives fell a point. Other issues connected with this group show a firmer tendency. Brazilian Traction at 97 $\frac{1}{2}$  is unchanged. The market went dull on expectation of a 10-million-dollar issue of Preferred shares. Rio Tramway bonds lost their trifling improvement of last week. Toronto Power Debenture hardened to par middle, and Electric Light of Cochabamba bonds have also improved. Vera Cruz Debenture stock was unaffected by the issue of a report this week which showed the company to be making good progress. The Anglo-Argentine Tramway division is steady. Calcutta Trams are  $\frac{1}{2}$  higher. The Baltimore Gas and Electric Debenture prospectus, particulars of which were given here last week, duly appeared on Monday; it must be said that the stock looks a cheap and good investment.

In the Manufacturing division, Callenders and Henleys are both better, but beyond these movements there is little to chronicle. Edison & Swan First Debenture eased off to 62. The rubber share market participated in the better tone shown by the Stock Exchange as a whole on Monday, and prices revived to some extent. With one exception, shares in the copper mining concerns went up gaily, and the prophets are as confident as ever that the metal itself will further improve.

**Ernest F. Moy, Ltd.**—The directors report that during the year ended December 31st, 1912, a profit of £677 was earned, which, together with £262 brought forward, makes £939 to be dealt with. The directors propose a 6 per cent. dividend on the ordinary shares (less income-tax) £480; 6 per cent. dividend on the preference shares (less income-tax) £85; income-tax on profit, £39; balance to be carried forward, £335.

**Calcutta Electric Supply Corporation, Ltd.**—The directors have decided to recommend a final dividend on the ordinary shares at the rate of 10 per cent. per annum for the six months ended December 31st last, making 8 1/2 per cent. for the year. Such dividend will be payable on 16th inst.

**Eastern Telegraph Co., Ltd.**—The directors recommend the payment of a final dividend of £1 5s. per cent. and a bonus of £2 per cent., both free of income-tax, making, with previous payments on account, a total distribution of 7 per cent. on the ordinary stock for the year ended December 31st, 1912.

## TRADE STATISTICS OF SOUTH AFRICA.

THE following statement, showing the imports of electrical and similar goods into the Union of South Africa during the year 1912, has been taken from the recently issued official trade statistics. The figures for 1911 are added for purposes of comparison, and notes of any increases or decreases are given.

	1911.	1912.	Inc. or dec.
	£	£	£
<i>Detonators.</i> —

## PROCEEDINGS OF INSTITUTIONS.

### On Phase-Advancing.

By DR. GISEBERT KAPP, Past President I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, April 24th, 1913; also at Birmingham and Newcastle.)

If the current sent out from a power house has a lagging component, this may be compensated and the power factor brought to unity by connecting to the circuit some apparatus taking a leading current. A well-known form of such apparatus is an over-excited synchronous motor, and it has also been suggested to use an electrostatic condenser for this purpose. Whichever apparatus is used, the improvement takes place from the generator up to the point of attachment, but not beyond. The apparatus must therefore not be installed in the power house, for there it would only relieve the generators of wattless current, and not the line. Apart from this imperfection it can easily be shown that this method is wasteful both in capital outlay and in running cost.

To compensate for a power factor of 0.8 by a rotary condenser, the cost of the electrical plant will be increased by 60 per cent. over a generator designed large enough for this power factor—and the cost of the steam plant and the expenses for power will both be increased by about 4 per cent. Obviously it is a wrong policy to install the phase advancer side by side with the generator.

The same reasoning applies to an electrostatic condenser. The losses would probably be a little smaller, but to save 20 per cent. of generator volt-amperes we should have to put in 75 per cent. of condenser volt-amperes, obviously the reverse of a commercial proposition. We may thus dismiss at once the idea of installing any kind of phase-advancing apparatus in the power house, and turn to the only practical plan of putting such apparatus at the end of the line or on the customer's premises.

Here we may distinguish two cases. First the reduction of the phase angle of the installation as a whole without any change in the power factors of individual motors or other consuming devices; and secondly, the increase of the power factor of individual motors. The former plan is too expensive for general adoption and can only be justified if the cost of the line has a preponderating influence. It is the only possible method where the consuming devices are squirrel-cage motors, arc lamps, induction furnaces, and similar appliances; and then it becomes a question whether it will be more profitable to put in a phase advancer or to lay an additional line and install additional generators if the plant must be extended.

If the phase advancer is a synchronous motor it requires, an exciter, starter and synchroniser. The cost of such a machine with its adjuncts would hardly be less than £2 per K.V.A. capacity, and every additional kilowatt set free for sale is obtained at a capital outlay of from £7 to £10. The financial position is not improved by replacing the dynamic machine by an electrostatic condenser. In the discussion on Prof. Miles Walker's recent paper, Mr. A. W. Ashton quoted £2.8 per K.V.A. as the cost of condensers, and this was afterwards corrected to £1.9 for a frequency of 50. For power transmission a lower frequency is desirable, and then the cost of condensers is proportionately increased. The static condenser can therefore in point of cost hardly compete with the dynamic condenser.

In the case of phase advancement applied to individual motors, as the dynamic condenser is not only used as a phase advancer but is also doing useful work as a motor, its cost must not be entirely debited to advancing the phase.

Phase-advancing by an idle running motor may or may not be a commercial proposition; phase-advancing by a loaded motor certainly is, especially for the power company, since their share of the cost can only amount to a part of what it would be if they had to do the phase-advancing by an idle-running motor on their own account, instead of getting a customer to help them. At the same time, they get the full benefit of a smaller phase angle over the whole system, which enables them to sell more power without having to lay down additional plant.

The over-excited synchronous motor has constancy of speed and a high overload capacity, which distinguish it favourably from the ordinary induction motor; but it is also distinguished unfavourably from the induction motor by the necessity of starting appliances being provided, including a synchroniser.

Some types of synchronous motors have been developed which do not require synchronising, and in which the starting appliance is

fairly simple. Of these types two may be mentioned: one has been perfected by the Lancashire Dynamo and Motor Co., and the other by the late Mr. Danielsen, of Vesteras, Sweden.

The Lancashire Dynamo and Motor Co.'s arrangement is shown in fig. 1. The outer circle represents a three-phase stator, and the inner circle a wound rotor. This rotor may be excited from a small dynamo *e*, and then it becomes the continuous-current field magnet of a synchronous motor, the stator being the armature. At starting, however, the rotor is not excited, but its winding is closed over the

FIG. 1.

resistance shown, and then the rotor winding acts as the secondary circuit of an induction motor. The machine is started in the usual way by gradually reducing the resistance until the contact *a* has advanced to *b* and the whole of the starting resistance is short-circuited. The machine then works like an ordinary induction motor. If now the resistance is again inserted, and, at the same time, the exciting circuit of *e* is closed, the rotor becomes a continuous-current magnet and jumps into step. By the time the contact *a* has been completely withdrawn from the starting resistance the rotor is over-excited, and the machine, whilst giving power mechanically, acts as a phase advancer.

In the Danielsen arrangement (fig. 2) the three lines, *a*, *b*, *c*, represent the phases of the rotor of an induction motor. Phase *a* is shown by a thicker line to indicate that it has twice the copper section of the other two phases; *s* is the starter, and the contacts corresponding to the phases *b* and *c* are permanently connected. The contact corresponding to *a* is connected to the joined contacts over a small continuous-current series exciting dynamo *e* mounted on the motor shaft. During the starting period the connections to the dynamo are short-circuited, and the brushes are placed on the axis of the field so that the machine cannot excite.

The motor is started as an induction motor in the usual way, and when up to speed, i.e., when the whole of the starting resistance is short-circuited, the exciting dynamo is inserted by opening the switch above mentioned. It will then be traversed by the rotor current, which has the very low frequency of the slip. Hence the self-induction of the exciter does not interfere with the working of the machine as an induction motor.

If now the brushes are shifted into their working position the machine begins to excite not only itself, but also the rotor of the motor, transforming it into a continuous-current magnet. The current enters at phase *a* and passes out by the other two phases in parallel. This is the reason why the copper section of phase *a* is twice that of the other phases. The machine jumps into step and becomes a synchronous motor. The excitation is adjusted by shifting the brushes on the exciter.

A machine intended to act purely as a phase advancer is 24.5 per cent. larger than a machine intended to act purely as a motor and taking the same current.

If the machine is to act both as a phase advancer and as a motor, in an example given the cost of the motor is £120, of which £70 must be debited to it in respect of its being a motor and £50 in respect of its being a phase advancer. If this cost were borne by the power company it would mean that by the expenditure of £50 it purchases a market for an additional 25 kW. of saleable power. This is at the rate of £2 per kW. If, on the other hand, the customer is to pay the £2 per kW., he will expect a recompense in the shape of a lower tariff or a discount on the general tariff. This discount need not be large. Phase-advancing by a loaded synchronous motor thus becomes a commercial proposition.

It is possible to obtain phase advancement by injecting a leading E.M.F. into the secondary of an induction motor. This must necessarily react on the primary and thus reduce the original lag in it; and if carried beyond the requirements of the individual motor it may even produce a leading component of the current taken by the motor and so improve the power factor of the system as a whole.

A small natural slip is of far greater importance than a large natural power factor. If, then, an engineer is called upon to design a motor to work with a phase advancer, he should aim at a small natural slip, even at the cost of a somewhat reduced natural power factor; he will thereby get a cheaper motor and also a cheaper phase advancer, so that the cost of the set capable of giving unity power factor need not be greater than the cost of a motor designed to work alone. But in the latter case the power factor cannot be much over 0.9; so that the unity power factor is practically obtained without extra expenditure.

This theoretical conclusion is borne out in practice. In my laboratory at the Birmingham University is a Brown-Boveri induction motor of 25 H.P. fitted with a Scherbius phase advancer. At full load the set has unity power factor, and its efficiency is 88 per cent. The synchronous speed is 1,000 r.p.m., and the weight is 800 lb. The figures, 1,000 revolutions, 25 H.P., and 800 lb., agree fairly well with good English practice for induction motors having at full load a power factor of 0.9, so that in the case here cited the improvement of power factor is indeed obtained without any increase in material.

The Scherbius phase advancer, as well as that which Prof Miles Walker has recently brought to the notice of this Institution, belongs to what may be called the rotational type, because the leading E.M.F. is produced by the rotation of an armature in a magnetic field. There is, however, another principle which can be applied to phase advancement, viz. the free oscillation of an armature in a continuous-current field. To distinguish such a machine from the rotational type I call it a vibrator.

M. Leblanc was the first engineer to call attention to both the rotational and the vibrating principles of phase advancement, and he has patented an apparatus under the name "recuperator," in which the vibrating principle is used to produce phase advancement. The "recuperator" consists of a copper disk swinging within an annular unipolar field. The current flows through the disk radially between a rubbing contact at the centre and a mercury-trough contact at the circumference. To keep the field from oscillating, a second and fixed disk is placed parallel to the oscillating disk within the polar cavity, and so connected that the current flows through the two disks in opposite directions.

When the author designed his vibrator he was not aware of M. Leblanc's recuperator, but he willingly acknowledged M. Leblanc's priority in having been the first to draw attention to the fact that phase advancement may be produced by making use of the physical principle that a leading E.M.F. is generated in an alternating-current conductor allowed to swing freely in a continuous-current field.

Any continuous-current armature if traversed by an alternating current of low frequency will tend to vibrate, but with a machine of the usual proportions this tendency is too weak to be practically utilised. In order to get a serviceable phase advancer the armature must be bipolar, of small diameter and great length, the air-gap must be as small as mechanically possible, and the saturation of

FIG. 3.

teeth and core must be very high, not only because a strong field is desirable, but also to avoid unbalanced magnetic attraction, which, with a small air-gap, would be unavoidable if the teeth were only moderately saturated. The leading E.M.F. injected by the vibrator is given by the formula—

$$e_s = \frac{0.1}{m} \left( \frac{\phi}{\tau} \right)^2 \frac{1}{\omega}$$

where *m* = the mass of the armature in units of 9.81 kilograms reduced to its circumference,  $\phi$  = the continuous-current field in megalines,  $\tau$  = distance from wire to wire on the armature,  $\omega$  =  $2\pi f$ , the angular speed corresponding to the slip frequency *f*, and *i* the current in amperes.

This formula may with sufficient approximation be also written thus—

$$e_s = 0.1 \frac{(\phi z)^2}{G D^3 \omega}$$

where *z* = the number of active conductors, and  $G D^3$  = the fly-wheel effect of the armature in kilogram-cm.<sup>2</sup>.

The output of each vibrator armature in volt-amperes is *e*, *i*, and this is given by—

$$V A = 3.8 (\phi \Delta)^2 / G \omega$$

where  $\Delta$  is the current density in effective amperes per centimetre of armature circumference.

It will be seen that the magnitude of the injected E.M.F. is pro-

portional to the ratio of current and slip frequency. Since this ratio decreases only slightly as the load decreases, the injected E.M.F. does not fall off proportionately with the load, but at a much lower rate, with the result that the effect of the phase advancer is relatively greater at low loads, and this is just what is wanted.

It is especially at low loads where there is greatest need for improving the power factor. This effect will be seen in fig. 3, which represents test results obtained with a vibrator made by the Sandycroft Foundry Co. (I am indebted to Mr. Hunt for these curves.) At one-quarter load the power factor is already 0.87, and at half-load it is unity, maintaining this value up to full-load and beyond.

Fig. 3 gives also the primary and secondary currents and the speed, both with and without the vibrator. It will be noticed that the effect of the vibrator is to decrease the primary current considerably and to increase the secondary current slightly; this means, on the whole, a smaller copper loss in the motor.

A photograph of this phase advancer is reproduced in fig. 4. The three pairs of field cores and the common yoke frame are in one casting without any joints. The only machining required is the boring of the polar cavities and the facing-up of the surfaces to

FIG. 4.

which the bearing brackets are bolted. The armature shafts are carried in ball bearings. The resistance of each armature hot is 0.048 ohm, and when the three armatures are mesh-coupled they can deal with a slip-ring current up to 120 amperes. The current in each armature is then 70 amperes, and the ohmic loss in the winding 3.35 volts, to which must be added the loss by contact resistance of the brushes. This is small, since it is possible to use copper-carbon brushes. There is no sparking. When the current has crest value the armature is at rest, and when the armature has maximum speed and the frequency of commutation has maximum value the current is zero. At intermediate points there is some reactance voltage of commutation, but this is extremely small—only a fraction of a volt. The armature is  $4\frac{1}{2}$  in. in diameter and its core  $8\frac{1}{2}$  in. long. The vibrator was tested with a 60-H.P. Hunt cascade motor having six pairs of windings. As the vibrator has only three armatures it could only deal with half the secondary circuit of the motor. The improvement in power factor was nevertheless very marked. The power factor was raised at half-load from 0.72 to 0.91, and at full load from 0.81 to 0.93.

The author is not able to give results from actual practice with a vibrator fitted to a large motor, because a small vibrator made by the Sandycroft Foundry Co. for the 60-H.P. Hunt cascade motor is as yet the only representative of this type of machine in this country. A Continental firm is making one for a 450-H.P. motor, but it has not yet been finished. The author has, however, made a design for a vibrator to be applied to the 800-H.P. motor of which particulars were given in Prof. Miles Walker's paper, and he finds that each of the three armatures would be 13 cm. in diameter and the length of core 33 cm. The armature resistance would be  $72/1,000$  ohms, and a flux  $\phi = 3.45$  megalines would be obtained with a magnetomotive force of 6,700 ampere-turns. At full load the injected E.M.F. is 23 volts. The excitation requires an expenditure of 700 watts, and the losses in the copper and iron, in brush friction, and in contact resistance, come to 1,300 watts, making a total expenditure of 2 kW. for the vibrator, against which must be set the reduction of losses in the motor due to the better power factor.

Fig. 5 gives the predetermined power-factor curve. The power factor of the 800-H.P. motor would with this vibrator be brought to unity at one-quarter load; at half load it would be 0.9 with a leading current; at full load it would be 0.95 with a leading current; and at twice full load it would again be unity. Above this output the current lags with a power factor of 0.92 at treble

load, when the limit of stability is approached. The weight of the vibrator is, as near as can be estimated, 18 cwt., and the floor space occupied is 18 in. by 3 ft., the vibrator standing 3 ft. high.

Whether a rotary or a vibrating machine be used as a phase advancer, the power to drive it is in either case very small, and will generally be more than covered by the reduced losses in the motor. The efficiency of any given motor, whether it works with or without a phase advancer, will therefore not be appreciably altered. There may, however, be a gain in the yearly energy efficiency, as the use of a phase advancer enables one to do with a smaller motor, since the overload capacity is increased. A smaller motor has smaller

FIG. 5.

losses, and consequently the customer of a power company using his motors with a phase advancer attached will effect a certain saving in his bill for current even if the power company does not grant a special discount for his taking current at a high power factor.

Now how does the case stand with the power company? The cost for electrical energy generated and transmitted is made up of several parts, of which, however, only two need here be considered. One is the actual cost of generation, including a certain percentage of loss in transmission, and the other is independent of the amount of energy generated, but depends only on the cost of the plant which must be installed to provide the service. Part of the plant, such as the prime-movers, is only very slightly affected by the power factor; but the electrical plant, including the line and step-down transformers at the customer's end, is materially affected by it. The cost of the electrical plant is determined not by the true power, but by the output defined in volt-amperes; consequently it is only fair that a customer who takes his power adulterated by a large proportion of  $\sin \phi$  should in his payment for current recompense the company for the extra plant capacity necessary for the generation and transmission of wattless current. The customer should therefore not only pay for the true kilowatt-hours he takes but also something for the K.V.A.-hours.

This reasoning is the basis of a system of metering invented by Prof. R. Arno, of Milan. He and Signor Conti, the engineer to several Italian power companies, investigated the cost of generation and transmission as affected by power factor, and they found that the cost may with sufficient accuracy for practical work be taken as proportional to the sum of two-thirds of the watt-hours plus one-third of the volt-ampere-hours. Having settled this as a basis for charging Prof. Arno set to work to design a meter which would register according to this formula; and he has also indicated a way in which any meter may be adapted to register two-thirds of the watt-hours and one-third of the volt-ampere-hours.

In meters of the electrodynamic type where the moving system is a little armature traversed by a current in phase with the E.M.F. and the field is produced by the main current, a small lag is given to the armature current. In meters of the induction type where the moving system is a disk revolving under the combined influence of a shunt and main field, a small lag beyond  $90^\circ$  is given to the shunt field. The angle of lag in either case is so chosen that at the predominant power factor the meter registers according to Prof. Arno's formula. Thus for installations mainly supplying light the lag of the shunt current behind the E.M.F. is  $5^\circ$  in dynamometric meters and  $95^\circ$  in induction meters. The meter will then register with a negligible error at any power factor between 1 and 0.85. For installations consisting mainly of motors, the lag is  $14^\circ$  for electrodynamic and  $104^\circ$  for induction meters. The extra lag of  $14^\circ$  may be produced by a slight alteration in the compensating coil of the shunt field.

Prof. Arno states that meters so adjusted may be used in cases where the power factor varies from 0.5 to 0.9. For large consumers where great accuracy in the metering is essential, two meters side by side may be installed, one registering kilowatt-hours and the other K.V.A.-hours. The charge to be made to the consumer can then be calculated on the two-thirds and one-third basis, or on any other basis which may more nearly fit the special conditions of the power company's plant.

It is of interest to inquire what saving a customer may effect in his current bill if he uses a phase advancer. Take a large customer using large and small motors with an aggregate power of 1,000 kW. and a power factor of 0.75. Since only the large motors can be fitted with phase advancers, it will scarcely be possible to raise the power factor to unity, but a value of 0.95 may be obtained if large motors aggregating 700 to 800 kW. are so fitted. With a load factor of 34 to 35 per cent., the yearly consumption will be 3,000,000 kW.-hours,

With 0.75 power factor, the Arno meter would register 34 million units; but after fitting phase advancers, the meter would register only 3.053 million units. With current at 0.5d. per unit this makes a difference of about £600 in the bill for current.

This, or something approaching this figure, represents the saving to the power company, owing to their having to supply very little wattless current. If, then, this saving is divided between the company and the consumer the latter gets £300 as a return for his capital outlay on phase advancers. To provide such apparatus for motors aggregating 800 kw. would cost between £300 and £400, so that the phase advancers would prove an excellent investment for the customer, and be still more profitable to the company. The latter not only reduce their working expenses by £300 a year, but they also may increase their sale of current by taking on more consumers to the extent to which their plant has been liberated from wattless current.

### Clauses for Street Lighting Specifications.

THE CHAIRMAN (Mr. F. W. Goodenough) opened the resumed discussion on Mr. A. P. Trotter's paper before the ILLUMINATING ENGINEERING SOCIETY, on April 29th. He said that in his opinion, a specification on which street lighting tenders were to be invited should be:—(1) Framed on a basis easily comprehensible by members of local authorities; (2) Based on a standard intelligible to the average man in the street; (3) Of quite general application; (4) Not open to any interpretation which, while complying with the specification, gave absurd lighting; (5) Definite. Nothing should be left to the discretion of the contractor. It should be possible to open tenders, and at once classify their data for comparison. There should be no question as to whether arrangement A or B suggested by different contractors was the better, otherwise the whole idea of the specification was defeated; (6) The provisions for making the tests upon which the contractor was to be liable to penalty for deficient lighting should secure a reasonable accuracy of result and the method of testing should be specified closely. The speaker maintained that no average councillor could understand such a term as "0.025 minimum horizontal foot-candles," but most persons had a tolerably accurate idea as to the relative value of lamps of various candle-powers. Candle-power specification was contemplated by the present specification for 80 per cent. of the streets and roads in the country, and, in his opinion, the procedure in all cases would be to determine how many lamps, of various candle-powers, arranged at various heights and distances apart, would light adequately various classes of streets and then specify on this basis. Local authorities wished to obtain *effect*, but they must really buy the cause thereof and this should be specified. Were the candle-power of lamps and the height and distance of posts not specified, requirements (4) and (5) would probably not be satisfied. It was a mistake to ignore all but the minimum illumination; Mr. Edgcombe six years ago said that minimum illumination was a scientific criterion, but aesthetic results had also to be taken into consideration, and high average was desirable even though the lighting was not very uniform. What was wanted was a bright and pleasing street appearance; obvious facts and considerations were ignored by the "scientific" basis adopted by the specification. In support of his arguments, the speaker quoted communications received from various foreign correspondents.

He considered that no one closely acquainted with street lighting photometry would be willing to accept a margin of less than 25 per cent. to provide against errors of observation and local disturbing influences in taking low minimum illumination readings. Apart from errors of observation, there would be a possibility of over 20 per cent. discrepancy if the alternative method of computation, by adding horizontal components, were employed. Authorities must be prepared to allow a margin of 33 per cent. from the contract minimum, or contractors must provide that excess to guard against possible penalties. Quoting Dr. Louis Bell—in a street lighting contract involving £50,000 or £100,000 per annum, a difference of 2 or 3 or 5 per cent. in the measured illumination was a very serious matter, and dependence upon measurements known to vary within at least this range would simply lead to exasperating litigation. The speaker submitted that the draft specification failed in every essential point to meet the requirements of a standard specification for street lighting. To produce a specification of real practical value with a truly scientific basis, the Joint Committee should abandon the "Unit of Measurement" clause and substitute one providing for rated candle-power of lamps determined by direct readings at specified angles, in a specified direction, with a specified relationship between readings at the widest and narrowest angles; and should provide a schedule showing by what number and arrangement, height, spacing and placing of lamps of specified candle-power, the illumination of streets in various classes could be (because it had been) obtained. A practical, equitable, comprehensible and comprehensive specification would be welcomed by all suppliers as well as all users of illumination.

PROF. J. T. MORRIS explained that he had placed all his test data before the Committee, but there had been no time to check those readings, which showed the discrepancies to which reference had been made by various speakers. In order of descending illumination:—In streets having minimum horizontal illuminations of 0.030; 0.023; 0.021; and 0.017 ft.-candle; the discrepancies between the sum of calculated minimum horizontal illuminations and measured values of the actual minimum horizontal illumination were:—3 per cent.; < 1 per cent.; 9 per cent.; and 20 per cent., but the absolute discrepancies were only:—0.001; < 0.001; 0.0015; 0.004 ft.-candle. The lower the illumination, the greater

the absolute discrepancy, hence the percentage discrepancy rose rapidly, but, provided the horizontal illumination was not less than 0.02 ft.-candle, the difference between measured and calculated values was not greater than 0.0015 ft.-candle and improvements in photometers would probably produce yet better agreement in future. Foreign illuminating engineers of high repute seemed to be against the adoption of minimum horizontal illumination as a sole basis of specification. Could they not adopt the minimum in conjunction with either the average horizontal illumination or the mean hemispherical candle-power of the lamps used? Just as the uniformity of illumination in the L.E.E. theatre was depressing, so would be uniform minimum horizontal illumination along a street. The specification as it stood would encourage uniformly low street illumination, and some such modification as that suggested appeared desirable.

MR. J. W. BRADLEY (city engineer, Westminster, communicated). As one who had controlled street lighting specification and contract work for many years on a C.P. basis, and had had much experience in surface illumination measurements, the writer preferred candle-power as a basis of specification. The C.P. height and general polar distribution of lamps should be specified, and the engineer should reserve control over the lantern and globes, &c. The contractor had then a definite basis on which to work. Specification by minimum illumination would involve the contractor in difficult problems. It was desirable that as few lamp-posts as possible be used, considering the obstruction they offered to the public, and, in important streets, a sufficient vertical depth must be adequately illuminated. The approximate number of lamps ought to be specified, and tenders should quote a price per position for each class of lamp. The location of standards must be entirely in the hands of the engineer; there were innumerable factors governing the position in which posts should be erected, and were a contractor allowed to place lamps where he would, so long as he illuminated to a satisfactory degree a plane 3 ft. 3 in. above street level, endless disputes would be raised between ratepayers, local authorities and contractors. The writer believed he was the first to specify in a lighting contract a definite amount of measured light as a basis for tendering, and after many years' experience of public street illumination, carried out under contracts based on the measurements of direct C.P. and with the knowledge of the working of such contracts in respect of both gas and electric lighting, he could definitely state that these contracts had proved satisfactory in every way; they had lapsed, and been again re-entered upon by the previous contracting parties—a fact which testified to their fairness and ease of working. The principal points in this specification were:—5s. penalty per day per lamp of deficient C.P.; lamps to be not less than 22 ft. (large units) or 12 ft. (small units) from the ground level; each lamp to give at least 90, 180, 1,800 or 3,000 C.P. as directly measured by an approved photometer placed at ground level, the C.P. being arrived at by averaging two readings in any position with regard to the light under test (readings at 20° and 50° to horizontal); light to be steady white or yellowish-white; the design of lamp pillar, winding gear, reflectors, &c., to be approved by the city engineer; the onus of testing (for maintenance purposes) to lie with the contractor.

MR. FRANK BAILEY declared himself a strong supporter of the specification. Appendix A offered an alternative to those who disagree with a minimum horizontal illumination specification, and too little attention had been paid to this section in reading and discussing the paper. Many of the objections raised by gas engineers indicated insufficient acquaintance with the object and scope of Appendix A.

MR. E. ALLAN (Vice-President, Institution of Gas Engineers) said there could be no doubt that the minimum horizontal illumination in Bow Street (lighted by high-slung centre suspended arcs), was good, but the general lighting effect was very poor. A specification was wanted which should be suitable for all undertakings, and he suggested that some other basis of comparison than minimum horizontal illumination should be added.

MR. ROGER SMITH pointed out that there were two distinct types of specification: that adopted by architects and constructional engineers, in which every detail of the work required was fully specified, and the whole responsibility of results lay with the designing engineer—and that by which general machinery was often specified—the desired result being stated, and the means and obtaining of this result being left with the contractor. There were various types of specification between these extremes, but it seemed to him that to specify all the details of the plant and the result to be secured violated every canon on which a specification should be based. When details of equipment were specified, a certain result might be expected, but must not be specified. The Joint Committee had chosen to follow the second alternative, and trust the contractor to select the means of securing a specified result; apparently gas engineers were not prepared to place such trust in contractors. During the past seven years he had designed all his railway lighting installations on the basis of minimum horizontal illumination 4 ft. from the ground, and in future his plane of measurement would be 1 m. from the ground. Under the conditions of his work speed was all-important, and he believed that specification of minimum horizontal illumination resulted in a great saving of time. The horizontal was the only plane on which a good criterion could be obtained by a single measurement, the results of which took in those on other planes of reference by implication. If one result alone was to be specified, that must be horizontal illumination. In street lighting the contractor was justified in taking advantage of light received by reflection, and from other lamps: account could only be taken of these components by horizontal illumination measurements. A certain maximum horizontal illumination (with plus and minus limits), should be specified in addition to the minimum horizontal illumina-

nation, and some restriction should be placed on the intrinsic brilliancy of the luminous source: at present, much of the powerful lighting in London streets was positively dangerous.

Mrs. COOPER said that many of the objections to the specification rested on misconceptions. Horizontal illumination could be measured accurately, and if it was adequate the illumination of other planes was in practice satisfactory; illumination limits were first reached on the horizontal plane. In his opinion, the average town councillor knew no more about candle-power than about foot-candles; actually there was no reason why he should be familiar with either. Specification by candle-power was difficult in cases where dioptric or other special globes or reflectors were used; in case of very powerful units; and in cases where a number of lamps were mounted in separate globes carried by radiating arms on one post (as in "White Way" lighting units). Minimum horizontal illumination measurements offered no real difficulties and took account of every factor concerned. Glare had not been dealt with in the specification. The lighting in a street might be raised from Class A to Class E by simply increasing the candle-power of the lamps tenfold, but then glare would probably be serious, and the specification ought to discriminate between such and legitimate practice. In his opinion, it was the illumination on the street level which was of importance; not only was this illumination higher, and hence easier to measure than that on the metre plane, but also the latter penalised lighting systems in which low posts were employed. No specification should be adopted which systematically penalised any particular lighting system without cause.

Mr. ABADY considered that the specification was wrong from end to end; that it bristled with inconsistencies, was far removed from anything likely to be of use to anybody, and was unworthy of serious discussion. The minimum horizontal illumination basis was admitted to be inapplicable to 80 per cent. of the streets in the country, and the estimation of horizontal illumination by summation of calculated components did not even approximately agree with the actual horizontal illumination. The specification of a minimum illumination connoted a search for the minimum—a tedious operation, and one leaving much to the discretion of the photometrist. Minimum illumination was not a basis of comparison and minimum horizontal illumination was the nadir of inutilty. To make tests 3 ft. 3 in. above ground level was not fair to lamps on low posts. Horizontal illumination, whether minimum or maximum, was useless as a basis of comparison between systems, but if it was to be considered at all, it must be that on the street surface. Lighting problems could not be dissociated from the source itself or from the surface illuminated. Everything was seen by reflected light, and the amount of the latter depended on the nature of the surface as much as on the lamps lighting it. In the cases mentioned by Mr. Cooper, in which candle-power was difficult of specification, there was no difficulty in measuring the normal illumination received in a certain direction—the conversion of this normal illumination to candle-power was a purely arithmetical operation. The speaker supported Mr. Goodenough's suggestions. Local authorities did not want to buy minimum horizontal illumination. The specification permitted 2° error in the determination of the angle of incidence of a direct ray; this might lead to 20 per cent. error in the results in certain cases. The range of illumination in the street "class" was too great; a 50 per cent. variation of illumination in one direction might leave a street in the same class, while a few per cent. change in the other direction would alter its classification.

Mr. J. S. DOW outlined the views and arguments expressed in communications received from a number of members abroad:—

DR. L. BLOCH (Berlin) agreed with horizontal plane measurements, but preferred average to minimum illumination as a basis for specification. Were minimum illumination the sole consideration, electric lighting would be in a particularly favourable position. At least, the mean and maximum horizontal illuminations should be specified in addition to the minimum.

DR. L. J. TERNEEDEN (Amsterdam) wrote that in addition to horizontal-plane measurements, the minimum illumination should be determined in a vertical plane perpendicular to the direction of street traffic.

DR. H. STRACHE (Vienna) wrote that horizontal illumination alone was not a sufficient basis of specification.

PROF. S. A. RUMI approved of Mr. Trotter's suggestions; in Italy contracts usually referred to candle-power rather than to illumination.

DR. L. BELL (Boston, U.S.A.) thought that the suggestions for the draft specification of a standard contract were sufficient to secure good results. For most purposes measurements of illumination on a vertical plane would give a better indication of the practical value of an illumination scheme than would horizontal plane measurements.

MR. L. B. MARKS (New York) said that minimum illumination was an insufficient basis of specification. Intrinsic brightness was often a matter of prime and determining importance.

DR. C. H. SHARP (New York) said that in streets to be illuminated brightly at all points, specification of the minimum should ensure good illumination, though it might not compare correctly different systems. In the majority of streets, however, specification of minimum illumination or the C.P. at 10° below the horizontal furnished an insufficient criterion. The delivery of a sufficient flux of light and its proper distribution might be ensured respectively by specifying the average and minimum illumination over the area. The flux-of-light method of computing average illumination was being used very generally and offered no special experimental difficulties. The illumination measured should be that on the street surface.

MR. P. S. MILLAR (New York) considered minimum intensity an unsatisfactory basis of rating for a street lighting system. The

real value of a scheme depended on the maximum and perhaps the average as well as the minimum illumination.

MR. L. GASTEIS said that the irreconcilable opposition of the Gas Members of the Joint Committee had led to the arrangement of the present discussion, and it was and had been throughout intended that, after the discussion, the draft should be taken back into committee for amendment or amplification. He did not think it necessary to impose rigid penalty clauses; there were other means whereby the interests of the public were fully safeguarded.

In his reply, MR. A. P. TROTTER spoke of the unique constitution of the Joint Committee. As the representatives of the several institutions were unanimous among themselves, and as voting had been by institutions, no injustice seemed to have been done. The matter to be discussed was not methods of street lighting but a means of describing it when obtained. In his opinion, the specification afforded a very practical solution to this problem. Some of the participants in the discussion must have stopped reading the paper before they arrived at the specification. In practice no survey was required to locate the point of minimum horizontal illumination; it could almost be located by eye—only a few confirmatory observations were needed. He attached the utmost importance to the agreement between the surveyors' classification and that reached by the minimum horizontal illumination measurements. The surveyors must have allowed for reflected light from house-fronts and for the value of direct ray illumination at crossings; but the fact remained, simple horizontal illumination measurements led to the same classification. Admittedly, direct ray illumination was and horizontal illumination was not of importance in street lighting; yet, so early as 1883, Sir Wm. Preece had recognised that horizontal illumination was the quantity to measure—not because it was most useful, but because it allowed of an accurate description of the lighting with minimum trouble. Even were direct-ray measurements made, it was only necessary to use a table of cosines to reduce the results to the horizontal plane for comparison. He was willing to add a direct-ray clause to the specification if it could be shown how comparisons were to be effected and how direct-ray illuminations were to be added. Direct-ray was greater than horizontal illumination and was easier to measure in this respect, but the horizontal was the only plane on which all illumination was added automatically. There seemed to be no reason why a Town Council should understand foot-candles or C.P.; all they need do was to ask for light similar to that in such and such a street. The specification was intended to aid technical men ordering and providing illumination. The approximate height and location of lamps must always be determined by the surveyor, but the details of illuminating schemes should be left to the contractor, otherwise the responsibilities of borough surveyors would be enormously enhanced, and progress in good lighting would be seriously retarded. For instance, the keen competition between gas and electricity had undoubtedly led to more rapid and extensive improvement than would otherwise have been attained in lighting. The absurdities feared by some of the gentlemen who had spoken would not be realised; for instance, the cost of abnormally tall posts would prevent their adoption. The cost of the only lighting units which could provide it would prevent dismal "flat" illumination. Mr. Harrison's table was based on a formula, and should not be used outside the limits demarcated by the horizontal lines shown in the various columns. Sec. 8 had been specially inserted to provide a safeguard in respect of "glare." By simply specifying minimum illumination, the purchaser inevitably received a bonus of light. The draft specification contained certain illumination clauses, but much of it was intended for candle-power work. Dr. Bunter had shown it to be possible to make accurate measurements of very low horizontal illumination. Only in extreme cases were candle-power measurements imperative; for the latter the specification made full provision, though it was primarily intended for those cases in which good lighting was desired. Frankly, he shirked the calculations involved by average illumination specifications. Mr. Bradley's views deserved careful consideration, but it should be remembered that a system which proved admirable in a certain district with which a surveyor had grown thoroughly familiar by long association might prove quite unsatisfactory for general use; the Committee certainly aspired to the formulation of a specification suitable for international use.

In a letter addressed to us, Mr. Kenelm Edgcumbe says that as he had already spoken in the discussion on Mr. Trotter's paper when Mr. Goodenough alluded to some opinions expressed by him six years ago, he had no opportunity of replying. Mr. Goodenough appeared to think that because Mr. Edgcumbe was now in favour of the proposed draft specification, he had changed the views he held in 1907. Nothing could be further from being the case. He was then, and was still, absolutely convinced that the horizontal illumination was the only satisfactory criterion of street lighting.

The point which Mr. Goodenough seemed anxious to make was that in 1907 Mr. Edgcumbe held that it was the average horizontal illumination which counted, whereas, in 1913, he was found to be in agreement with a specification which took the minimum horizontal illumination as the criterion. He was still strongly of opinion that the average illumination was of importance. At the same time, he was not in favour of making a statement of either the maximum or average obligatory in a street-lighting specification, and this for the following reasons:—

1. The measurement of the average illumination over a given area is a matter involving a large amount of work—certainly much more than could possibly be devoted to it by the engineer in supervising the execution of a lighting contract.

2. To specify the maximum illumination is open to the very

serious objection that "freak" spots would have to be guarded against.

3. Most important of all, experience has shown, as is made abundantly clear by Mr. Trotter in his paper, that the minimum illumination does, under present conditions of lighting, give a criterion which is in entire accord with that made by eye by experienced judges.

With regard to Mr. Goodenough's query as to his opinion of a "dimly lighted street" as compared with a "brightly lighted one," it was entirely a question of the amount of money which the purchaser was prepared to spend, seeing that Clauses 7 and 8 of the proposed specification gave the engineer complete control in this respect.

He would like finally to bring Clauses 5 and 11, as well as those just cited, to the notice of Mr. Goodenough and the other speakers, who seemed to have derived so much exhilaration from the mental gymnastics involved in working out all the possible and impossible combinations of height, spacing and candle-power, giving the same horizontal illumination.

If the infinite number of such combinations, all giving the same result, meant anything at all, surely it was that it was better to specify the result rather than the ingredients which went to make it up, more especially since the capabilities of one of the chief ingredients, namely, the lamp, could not possibly be so well known to the purchaser as to the supplier.

## BIRMINGHAM'S PROPOSED NEW POWER STATION.

AN interesting report is that which was presented by the Birmingham Electric Supply Committee at the quarterly meeting of the City Council on Tuesday last, on the question of the proposed new power station at Nechells. From it we gather that sanction to the purchase of land and to the sum of £500,000 being raised for the scheme was given by the Council in 1911, and approved in the Corporation Act of 1912. The city is at present supplied from three generating stations:—

Summer Lane ...	Capacity 25,500 KW.
Water Street ...	Capacity 3,040 KW.
Chester Street, Aston Manor ...	Capacity 4,550 KW.
Total ...	33,090 KW.

The capacity of the Summer Lane Station, as originally designed, was 22,000 KW., but as advantage has been taken of the developments in generating machinery since that date, and more laud has become available, the ultimate capacity of this station will be increased next year to 36,500 KW., and contracts for the final instalment of plant up to this capacity have recently been placed. Although it would be possible to substitute larger generating plant in place of that already installed in the engine house, there is no

plant are considerable; it will consequently be more economical to supply any further demand in the area served by this station from Summer Lane, or from the Nechells power house. To ensure continuity of supply in case of breakdown there should be a margin of 20 per cent. of spare plant, and it will be seen from the table on the next page that it is necessary to make further provision by the winter of 1915-16.

The Nechells power house will supply current at 5,000 volts, 25 cycles, to the whole of the area of the greater city, via Summer Lane or the sub-stations, and also direct to high-tension consumers.

THE "GREATER BIRMINGHAM" AREA, SHOWING THE EXISTING AND PROPOSED GENERATING AND SUB-STATIONS.

The ultimate capacity of the station will be 100,000 KW., the first portion being designed to accommodate plant of 25,000 KW. capacity. It is proposed to install 15,000 KW., of which two-thirds will be available by the winter of 1915-16.

A private canal basin will be provided, only a portion of which will be first constructed. A railway siding will also be built, and this will be employed for conveying material and machinery to the site, and for subsequently dealing with a portion of the coal and ash traffic.

The main coal store will be in the open on the wharf, and there will also be an auxiliary coal store on a piece of vacant land adjoining the entrance to the site. The total capacity of these coal stores is 10,000 tons of coal. For the ultimate capacity of the station there is further space available for coal storage purposes capable of accommodating 50,000 tons.

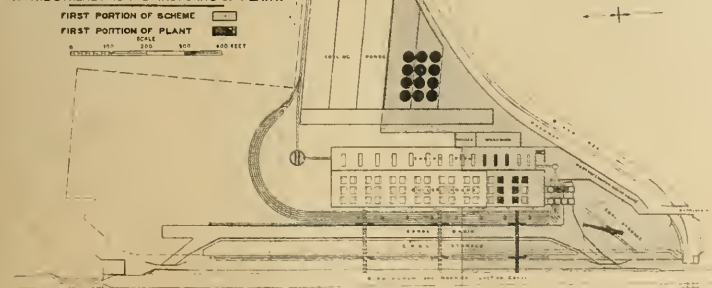

The coal will be handled by means of transporter cranes, which can be used for the double purpose of filling or emptying the stores, and for feeding the conveyors which will be used to supply the coal bunkers over the boilers. These conveyors may also be fed from railway trucks which can tip the coal direct into them.

It is proposed to install at the outset three 5,000-KW. turbines. Later on a larger type, probably of 10,000 KW., will be installed. An overhead electrically-driven crane, capable of lifting a maximum weight of 60 tons, will be provided.

In the boiler house, marine type water-tube boilers, fitted with superheaters and overhead economisers, will be erected. It is proposed to use short iron chimneys, and to control the draught by means of motor-driven fans on the Prat system. Seven boilers will form the first equipment to provide steam for the three generating sets.

For removing the ashes from the boilers it is proposed to adopt a

CITY OF BIRMINGHAM ELECTRIC SUPPLY DEPT.  
BLOCK PLAN OF SITE OF NECHELLS GENERATING  
STATION SHOWING IN COLOUR THE FIRST PORTION  
OF THE SCHEME AND THE FIRST UNITS OF PLANT.

THE PROPOSED NECHELLS POWER STATION, BIRMINGHAM.

room for the necessary corresponding increase in the boiler equipment.

While it is intended to continue to supply from the Water Street station during the winter months, any increase of the plant there is out of the question.

The Aston Manor station has reached the limit of its present capacity, and the difficulties in the way of increasing the generating

new system operated by air suction. Large totally enclosed ash receiver drums are installed, from which the air is exhausted by motor-driven exhausters. The drums are connected to pipes which run under the ashpits beneath the boilers, and a rush of air is thus continually maintained through these pipes. The ashes are dropped out of the ashpits into a small movable crusher, thence through openings into the pipes, and drawn by the rush of air into the receiver drums. The latter are emptied into barges, carts, or railway wagons. The basement of the boiler house is in this way kept quite free of all dust and from the corrosive fumes given off from the ashes when slaked.

Year.	Plant capacity of all stations in kw.	Maximum demand in kw.	Spare plant available, kw.	Percentage of plant capacity.
1909-10	20,540	15,260	5,280	25.7 %
1910-11	22,040	17,156	4,884	22.2 %
1911-12	28,590	24,081	4,509	15.7 %
1912-13	33,090	27,775	5,315	16.06 %
1913-14	39,090	32,950	6,140	15.7 %
1914-15	44,090	37,450	6,640	15.06 %
1915-16	54,090	43,150	940	2.1 %
1915-16	54,090	43,150	10,940	20.2 %

\* From 1911-12 Aston Manor is included.

† The figures in cols. 3, 4 and 5 are estimated for 1913-14 and onwards.

‡ Without Necells.

§ With Necells.

A switch house will be constructed over the entrance cartway to accommodate the whole of the switchgear required for controlling the generating plant, the out-going feeder cables and the various lighting and power circuits within the station.

on hire at date is 894, and the horse-power 5,749. The total expenditure on this account to date is £23,070.

The units sold for L.T. power for the 12 months ended March 31st, 1906, when the scheme was sanctioned, and the units sold during the 12 months ended March 31st, 1913, were as under:—

	Units.	Revenue.
Twelve months ended March 31st, 1906 ... ..	1,490,506	£10,266
Twelve months ended March 31st, 1913 ... ..	17,626,743	£70,427

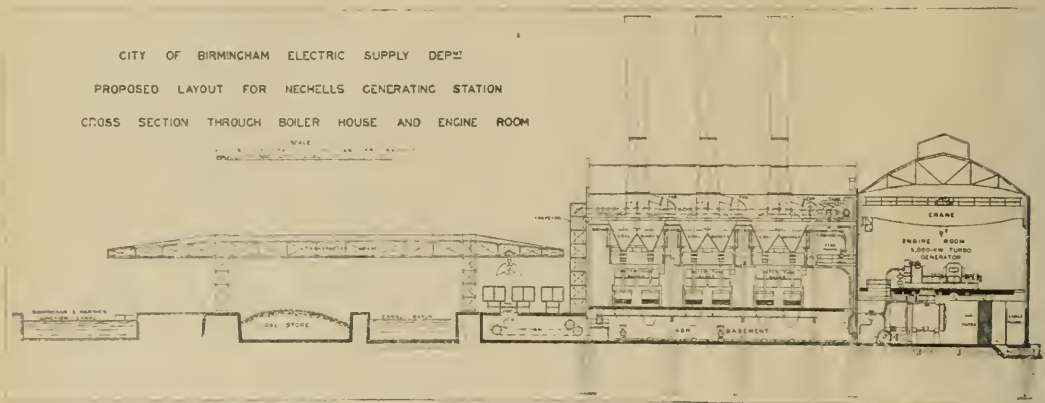

The Committee considers it desirable to continue the scheme on its present lines, and recommends the borrowing of the sum of £20,000 to cover the expenditure in excess of the original loan and prospective expenditure on the same account.

*Loan for Service Connections, Extra-High-Tension Switchgear, and Transformers on Consumers' Premises.*—In 1909, the Council sanctioned a loan of £149,350 for the general purposes of the electric supply undertaking; this included a sum of £23,000 for services, high-tension consumers' switchgear, and transformers on consumers' premises. The expenditure against this loan to date is £29,996.

The following table shows the increase in the number of consumers and in the output of electricity since the date mentioned above:—

	March 31st, 1909.	March 31st, 1913.
Number of consumers ... ..	3,903	7,435
Units sold for low-tension lighting and power ... ..	10,796,024	25,288,679
Units sold for high-tension power ... ..	1,827,794	16,908,474
Total units sold ... ..	12,623,818	42,197,153

It is proposed to borrow a further sum of £30,000 to cover excess and future expenditure under this head.

THE PROPOSED NECHELLS POWER STATION, BIRMINGHAM.

Workshops, offices and stores will also be provided adjoining the engine house.

Large cooling ponds will be arranged on the vacant land adjoining the engine house, divided up into sections, so that any section can be emptied for cleaning purposes. Over these ponds will be installed cooling towers for cooling the whole of the circulating water required in the station. It is proposed to use the effluent water from the filter beds of the Birmingham, Tame and Rea District Drainage Board for circulating in the condensers, and an ample quantity is available on the site. A first instalment of 12 cooling towers will be sufficient for the initial requirements of the station.

The Committee states that it is satisfied that at present and for some time to come, turbine plant is the best that can be adopted; this decision has been arrived at after examining proposals for gas-driven plants by home and foreign makers.

The Committee unanimously asked the Council to approve the plans and estimates presented. The latter include the following sums:—

Necells, land and buildings ... ..	£132,500
" plant and machinery ... ..	156,000
Sub-station equipment ... ..	50,000
Underground mains ... ..	161,500
	<b>£500,000</b>

A loan for sub-station equipments of £11,300 was sanctioned by the L.G.B. in January, 1911. This has been expended, as well as an additional £5,380 included in the sum estimated above to cover a period of five years. The last mains loan, amounting to £94,000 (in 1909), has been expended, as well as £46,546 additional, included in the amount mentioned above, which will meet the cost of trunk cables and ordinary requirements for two years.

*Loan for Provision of Motors for Hire and Hire-Purchase.*—In 1906, Council sanctioned a scheme for supplying motors upon hire and hire-purchase terms, and a loan of £20,000 was authorised. The scheme has been widely adopted; the total number of motors

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### The "Lynton" Radiator.

This radiator has been designed by Mr. Lynton of the Charing Cross and City Electricity Supply Co., especially for hiring out purposes. We understand that one of the chief difficulties of supply companies in this direction is the cost of maintenance.

FIG. 1.—"LYNTON" RADIATOR.

This point has been carefully studied in the radiator illustrated; all repairs, should they be necessary, can be done on the spot by the company's workman, and there is no need for the radiator to be returned to the workshop.

Only one lamp is fitted in the front of the radiator, and this is claimed, by the special arrangement of the reflectors, to give almost the effect of two. MESSRS. VERITY, LTD., of King Street, W.C., have the sole rights of manufacture of the "Lynton" radiator, and they will be pleased to forward a sample to any engineer who is interested. The heating elements at the back have a special arrangement for affixing the company's seal to prevent tampering.

#### The "Tress" Illuminated Signs.

We recently visited the offices of the TRESS CO., 4, Rathbone Place, W., to examine their electrically illuminated signs, of which they make a great variety, as well as a wide range of fittings, apparatus and accessories for cinematograph theatres, photographers and other trades. In addition to illuminated letter signs, transparencies, &c., of the familiar types, the company are just introducing a novel sign, which is totally different to any that we have yet seen, and is extremely effective. The accompanying illustration shows one of these devices in the form of a double-sided hanging sign, which to all outward appearance is like others of its kind; when in operation, however, the large illuminated letters gradually diminish in size, keeping their correct proportions and constant spacing, until they finally disappear altogether; they then

FIG. 2.—"TRESS" CONTRACTING AND EXPANDING LETTER SIGN.

reappear on a diminutive scale, and gradually regain their maximum dimensions, when the cycle is repeated. The effect is exceedingly striking, and inexplicable to the uninitiated observer; it is obtained by an ingenious device on the same principle as the iris diaphragm, but it is impossible to detect the method of operation. The letters and background may be of any colours in strong contrast, and are effective by day as well as when they are illuminated. The mechanism is driven either by clockwork or by a small motor, taking a trifling amount of power. The sign has been eagerly welcomed by contractors and others. The company will retain the manufacture in their own hands, supplying only to the trade. There is, of course, no limit to the variety of patterns in which the sign can be made, including interchangeable letter signs.

Apart from signs, the Tress Co. do a very extensive business with the trade in seats, programme boards, arc lamps and rheostats of their own make, a ticket-issuing machine with an electric tell-tale, and electrical and photographic supplies in general.

#### An Electric Staff-Kitchen.

Some three months ago the SIMPLEX Co. equipped, in connection with their office staff dining club in Birmingham, an electrically-operated kitchen. The time is yet early to have secured any very

FIG. 3.—SIMPLEX ELECTRIC KITCHEN.

exhaustive figures as to cost, but the experience gained is proving exceedingly useful, and clearly demonstrating that electric cooking can more than hold its own from every point of view. Some 40 meals are prepared per day, consisting of soup, at least two

kinds of joints, a choice of sweets, coffee &c., and, in addition, some 60 tons per day, many of which are of the variety known in certain localities as "high."

The records of cost so far secured may be regarded as distinctly satisfactory, in view of the fact that they include the heating of all the "washing-up" water (no small item), and that the cook has had no previous experience of the electrical method, and has yet to remember that a switch is designed for cutting off the current when it is not wanted. The average cost per person per meal has proved to be a fraction over 3d., with current at 1d. per unit.

The kitchen is being used to test articles of standard manufacture in actual practice, rather than to obtain results from the use of a large elaborate cooking range.

So far, there has been complete freedom from breakdown of the actual elements, the only mishap being a broken connection to the grill on a cast-iron oven. A view of the kitchen is given in fig. 3.

## PARLIAMENTARY.

### Rhondda Tramways (Railless Traction) Bill.

SIR IVOR HERBERT'S Select Committee of the House of Commons last week and this week considered the Bill promoted by the Rhondda Tramways Co. for power to construct about 5 miles of railless trolleys, to start from their existing tramways and go through the parish of Llantrisant. Mr. Vesey Knox, K.C., and Mr. Tyldesley Jones represented the promoters, and Mr. Hutchinson, K.C., and Mr. Rhys Williams were for the Llantrisant Rural District Council, who opposed.

MR. VESLEY KNOX, K.C., in opening, stated that the tramway company had spent about £390,000 on their tramways, and in comparison with that the railless traction scheme was a very small undertaking, for it was estimated to cost only £20,000. If the powers sought were granted, it was proposed to give a half-hourly service, with a maximum fare of 5d. and a minimum fare of 1d. The roads were suitable for such a service, and would require no widening, but if the Committee came to the conclusion that the company ought to contribute to the upkeep of the roads, then he asked that such contribution should not exceed 1d. per car-mile.

MR. WATTS MORGAN, agent for the Rhondda district of miners, stated that 40 federation lodges in the district, representing 38,000 miners, had signed petitions for the Bill. At present it was impossible to get to some of the mines without going over the mountains.

A considerable amount of evidence was given regarding the effect which the construction of the proposed tramways would have in bringing about the opening up of new housing districts, the CHAIRMAN having intimated that this would be a leading factor in the settlement of the general principle of the Bill.

MR. NESBIT, manager of the Rhondda Tramways, gave evidence in favour of the proposals, and in cross-examination said that when the proper time came, the Rhondda Urban District Council would take over the undertaking in its area at a price fixed at the time the agreement was made with it, but, of course, the fixed price would not apply to the extensions.

MR. STANLEY, engineer, gave evidence on the plans and estimates and expressed the opinion that whilst an ordinary tramway would be commercially impracticable in the district, he was satisfied that the route was suitable for railless traction. The probable receipts were estimated at £5,740 and the working expenses at £3,927, leaving a profit of £1,813, out of which, however, provision would have to be made for depreciation.

MR. WALTER, engineer, also gave evidence in support of the scheme, and, replying to the CHAIRMAN, said he considered that the roads ought to be free to every class of vehicle, or, in the alternative, all should share alike with the cost of repairs. The railless trolley system had not been long enough in existence to furnish reliable data as to its effect on the roads.

The case for the promoters having closed, MR. G. MORGAN, formerly surveyor to the Llantrisant District Council, was called for the opposition, and expressed the opinion that the road proposed to be used was unsuitable on account of its surface, its gradients and its narrowness. He believed, if the system was allowed, the cost of maintaining the road would increase by £1,000 a year.

In cross-examination, witness said he did not wish to see the Bill thrown out, as it would give more facilities for transport, but he wanted reasonable protection for the local authority.

Other evidence in opposition having been heard,

MR. HUTCHINSON addressed the Committee for the Llantrisant Rural District Council, and intimated that his clients did not want the Bill thrown out. If, however, the Bill was to proceed, the promoters ought to give reasonable accommodation for the traffic, and he characterised the proposal to run six cars as ridiculous. In order to deal with the passengers 16 cars would be necessary. He contended also that the road ought to be widened at the expense of the promoters.

The Committee considered the matter in private, and the CHAIRMAN subsequently announced that they had taken into consideration the figures given in evidence, viz., £4,231, which it was calculated would provide an 18-ft. roadway and a 6-ft. footway. The Committee considered that safety would be secured by a 17-ft. roadway and a 4-ft. footway. They had come to the conclusion that the road authority must be held responsible for the adapting of the road, but they would put upon the company the liability of one-third of such capital charge, not exceeding in any case one-third of £4,000. With regard to the maintenance, they had decided

that a proportion of the annual charge should be put upon the promoters, but such a charge was not to exceed three-eighths of a penny per car-mile. Subject to agreement on these points the Committee declared the preamble proved.

**Porteacawl Gas and Electricity Bill.**—Lord Donoughmore's Committee on Unopposed Bills has passed the preamble of this Bill, which dissolves and reincorporates the company, and gives power to them to erect a generating station and supply electricity.

**Kent Electric Power Bill.**—The House of Lords has agreed to allow an additional provision to the Kent Electric Power Bill to be introduced this session.

**Brighton Corporation Bill.**—This Bill came before the Earl of Kintore's Select Committee of the House of Lords on Monday. Several matters were dealt with in the Bill, including a clause for the transfer of the powers of the Brighton, Hove and Preston General Omnibus Co. for the running of a system of railless trolley tramways between Brighton and Rottingdean. The borrowing powers sought in the Bill in regard to the railless trolley system were £19,000. There was no opposition to this part of the Bill, the preamble of which was declared proved.

**Westgate and Birchington Gas and Electricity Bill.**—The Unopposed Bills Committee of the House of Commons has passed the preamble of this Bill, which authorises an increase of capital to the extent of £45,000.

**Southport Corporation Bill.**—A Select Committee of the House of Commons, presided over by Mr. W. Middlebrook, has passed the preamble of the above Bill, which deals with a large number of matters affecting the administration of the borough, and, amongst other things, gives power to run trolley vehicles. The Committee sanctioned a loan of £3,500 for the electrical equipment of trolley vehicles, with 20 years as the period for repayment, and £2,250 for trolley vehicles, repayable in 10 years.

**Chesterfield Corporation Railless Traction Bill.**—Sir Ivor Herbert's Select Committee of the House of Commons has fixed the following periods for the repayment of loans authorised under the Bill:—Erection of car-sheds, depôts and buildings, £2,000, 25 years; overhead equipment for trolley vehicles, £33,780, 20 years; trolley vehicles, £6,400, 10 years; motor-omnibuses, £16,000, five years.

## THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

# 1913 EDITION.

H. ALABASTER, GATEHOUSE & CO.,

4, Ludgate Hill, London, E.C.

THE reader has long been familiar with criticism of the inefficiency of the British Consular service considered from the standpoint of trade, and with the demand for a Minister of Commerce. It is thought that, however admirable the Consul may be as a diplomatic official and a gentleman, he is not always a success as a representative of British manufacturers—ability, opportunity and inclination, one or all, may be lacking. The Government has been urged to spend money with a more liberal hand upon a reorganised Consular service, upon Commercial Attachés—now too few—and upon special Trade Commissioners. For what has been done in recent years by way of improvement in these directions and for the increased usefulness of the Board of Trade Commercial Intelligence Department, we must, of course, be grateful, and for the announcements of the past week we are especially so seeing that they are an indication that now that the Government has, in a sense, got other matters out of the way, it is willing to do something in response to suggestions from those responsible for the commercial affairs of the nation. Of course, we must not expect to get all that we ask for—there is to be no Minister of Commerce known as such, nor is there to be a million a year allocated for more efficient British governmental trade representation in the various quarters of the globe where it is needed. But, thanks to the sitting of a Royal Commission on the Civil Service, we are to have a Second Secretary of the Board of Trade, and thanks to the consideration of the Foreign Office, there is a prospect of closer co-operation resulting between the Commercial Attachés already in office and the Chambers of Commerce.

Sir H. Llewellyn Smith, the Permanent Secretary to the Board of Trade, in his evidence given last autumn before the Royal Commission already mentioned, expressed the view that the danger of the Board lay in its size, and he appeared to favour the appointment of a deputy or colleague to relieve the congestion in the department, preferring that course to a sub-division of the whole office. The President of the Board now announces the appointment of a Second Secretary—Mr. G. Stapylton Barnes, C.B., who is at present Comptroller-General of the Labour Department. The Labour Department of the Board is to be sub-divided, with responsible directors for Labour Exchanges and Unemployment Insurance, and for labour statistics.

It will be recalled that before ever such things as Labour Exchanges and Insurance were brought within the region of practical politics, it was strongly held in industrial and trade circles that the Board was overburdened with duties which ordinarily would hardly come under the category of trade, to the exclusion of pressing matters which were of direct trade concern. What the commercial world will, no doubt, be interested to know, is whether the present re-arrangement will merely lead to relief of the kind mentioned, or will be followed by an enlargement of interest in trade affairs, thereby in some measure satisfying the desire for a Ministry of Commerce.

The second announcement to which we allude relates to proposals which have been put before the Associated Chambers of Commerce by the Foreign Office. These pro-

posals, according to the *Times*, have for their object a closer co-operation between H.M. Commercial Attachés and the Chambers of Commerce, and Sir Edward Grey recommends them for favourable consideration.

We fear that Consular officials and manufacturers have been strangers to each other and to each other's doings far too long. The reasons may be many. Trade may be *infra dig.* to some men still, but that attitude is to-day a sheer absurdity, and should not exist: firms may have lost confidence in Consular representatives, though there again unjustifiable prejudice has not been lacking. The many other reasons need not be stated now, we believe they are familiar enough, but one thing that we must say on this point is that when, in our own experience, any desire has been shown by manufacturers to place Trade Commissioners in possession of specialised information that would assist them in watching over British Trade interests in other countries, they have not been slow to take advantage of the opportunity.

What Sir Edward Grey is now stated to believe is that better results could be obtained if our commercial attachés "were to receive some guidance from British manufacturers and merchants interested in foreign markets," and, as a first step in that direction, he suggests a standard classification of the trades and industries of this country which can be uniformly adhered to in official reports. A second suggestion is that leading questions be drawn up by experts in regard to all the principal industries in the country, especially those affected by foreign competition. It is not proposed that this classification shall extend to matters of detail, and it is thought that a certain number of the more important branches might be grouped under a few broad headings, one of which is: "Machinery.—Electrical Motors, Dynamos, &c." An official of the Board of Trade Commercial Intelligence Department has prepared a set of questions (relating to the woollen and worsted trades) as a model, and it is believed that, if similar sets could be drawn up for other leading industries, they would prove of the greatest assistance to our national representatives abroad in conducting investigations and preparing reports.

Now, if there is any trade which, from the mouths of its more militant members, has expressed itself as suffering seriously under foreign competition, it is the electrical. Therefore it will be desired that the electrical engineering industries shall co-operate in preparing information for the "guidance" of Commercial Attachés. And if there is any journal which has shown an eagerness for Consular officials to be fully and accurately informed regarding the abilities of British manufacturers, it is the ELECTRICAL REVIEW. One part of our effort in this direction has been the sending of this journal regularly to a large number of Consular offices abroad, and the conduct of a voluminous correspondence with many hundreds of them urging the interests of British electrical firms upon their attention. Between three and four years ago, in a series of articles on this and other trade questions, we went so far as to suggest that those destined to go abroad as expert trade representatives of this country should be made intimately acquainted with our great national engineering and other industries by touring among them and seeing them. We might like them to be engineers, but where that is not possible we would have men with minds trained to conduct expert observations and freely imbibe just the right kind of information relating to technical industries. Nothing in the way of official documents, statistics, records, and so forth—essential as these are for purposes of reference—could make so forceful an impression as seeing things at first hand. Of course all our Consuls could not be brought home to make provincial expeditions for their education, but in the case of new appointments and of officials visiting this country the principle might be adopted and carried out on a small scale. The idea running through this suggestion is the same as that prompting the proposal of Sir Edward Grey—the better equipment of our Consuls and others in responsible positions for the furtherance of our trade interests outside these islands.

The ELECTRICAL REVIEW, of course, heartily welcomes the new movement, and it notes that the Council of the Associated Chambers of Commerce has agreed to advise the Foreign Office on the classification and compilation of sets

of suitable questions, and to appoint committees to deal with each request as received.

We yield to none in our admiration for the activities of the Chambers of Commerce in some directions, but we may be excused if we question how far these Chambers, either through their central organisation or locally, can be fairly regarded as able to speak for the electrical and other engineering industries. There are electrical organisations which could indicate broadly and with accuracy what electrical firms want to know, and these, if so inclined, might be allowed to co-operate with the Chambers in order to ensure that this matter should be put on a proper footing for the future.

#### Foreign Trade in April.

THE official figures as published last week show that, compared with the month of April last year, there was an advance of 2½ millions sterling in imports and of over 10 millions sterling in exports. In the total exports the items coal and iron and steel together show an advance of more than £6,000,000. It has to be remembered that the coal strike was in progress last year, and the working days were fewer, as Easter came in April in 1912 and in March this year. The electrical and machinery figures are as follows:—

Imports.		Month of April, 1913.	Increase or decrease.	Four months, 1913.	Increase or decrease.
Electrical goods and apparatus, excluding machinery and insulated wire ...		£	£	£	£
Machinery ...		131,806	+ 12,255	506,145	+ 24,667
Machinery ...		678,239	+ 96,184	2,512,131	+ 297,593
Exports.		Month of April, 1913.	Increase or decrease.	Four months, 1913.	Increase or decrease.
Electrical goods and apparatus, excluding machinery and insulated wire ...		£	£	£	£
Machinery ...		376,029	+ 123,490	1,916,285	+ 473,008
Machinery ...		3,344,594	+ 786,828	11,934,657	+ 1,564,421

#### The I.E.E. in Paris.

ON Tuesday next a large party of members of the Institution of Electrical Engineers, together with a considerable number of ladies, will journey to Paris, to meet their *confères* of the Société Internationale des Electriciens—a body which was founded in 1883 after the first international electrical congress, held at the Paris Exhibition of 1881, and which has since maintained its reputation as one of the most eminent societies of its kind in the world. No similar visit has taken place since the Paris Exhibition of 1900, and as vast changes and developments have taken place in the interim, in the supply of electricity to Paris and the electrification of many of the railways and other means of transit, there will be much to see and many useful lessons to be learnt from the achievements of our French friends.

Some idea of the progress that has been made in France in recent years, in connection with the electrical industries, may be gathered from the article by M. Dary, which is commenced in this issue; we print also an abstract of an article in the *Technique Moderne*, describing recent works erected by the company which has taken over the supply of Paris from its six predecessors. But it is not only in the capital that France has gone ahead; her vast natural resources in the shape of waterfalls are being rapidly developed, especially in the south-east, where they are fed by the glaciers, to which the felicitous title of "white coal" has been given. The ice, however, is better than coal in that it is perpetually renewed, and thus this source of power is inexhaustible.

As usual, a full programme has been arranged—too full, in all probability; but that is the invariable rule on these occasions, and in any event, those who prefer to do so can "skip" items. We are certain that our friends of the Société will give the visitors a thoroughly good time, and we rejoice to think that they will fraternise not merely as a matter of form, but with that cordiality which is born of a sincere and unreserved goodwill. The visit cannot fail to strengthen the bonds of friendship between the two nations, and especially between these two great engineering Institutions.

## THE ELECTRICAL INDUSTRY IN FRANCE.

By GEORGES DARY.

The last few years have witnessed a marked business revival in France, which has extended generally to all industries and to the electrical industry in particular. Five years ago, in a series of articles in these columns, we were under the painful necessity of drawing attention to the lack of enterprise in connection with new industries that was then prevailing in France; what may be regarded as a general condition of debility and trepidity combined with a constant feeling of hesitation, prevented even those usually associated therewith from encouraging the promotion of serious undertakings, thus greatly hindering the development of the electrical industry. We were, however, also able, in concluding the series of articles mentioned above, to foreshadow the great forward movement the industry was bound to make at an early date, thanks to the perseverance of courageous pioneers, who, in spite of systematic official obstruction, and the difficulty experienced in securing anyone to take a financial interest in the schemes proposed, valiantly continued their way towards the desired goal. To-day their victory would seem to be complete, for the proofs we are able to offer in connection with the same are both numerous and varied.

In fact, from a financial point of view, the native fears which the French investor still held with regard to industrial undertakings have disappeared, and to this exaggerated fear quite a *rolle face* has succeeded, almost without a period of transition, thus admirably demonstrating the character of the French for unreserved enthusiasm. The capitalist and the small investor have neglected Government stocks in order to buy shares or debentures in industrial undertakings, collieries, industrial financing companies, electrical undertakings, mines of all kinds, and the value of the shares is steadily advancing and with a regularly increasing market, the last batch of hesitating investors has been drawn in. On the other hand, too, and as an inevitable result, industrial undertakings which were already commencing to show renewed life, have developed an enormous activity as a consequence of the influx of capital and credit, with the result that there is just now quite a revival in industrial undertakings in France, the existing position, as compared with the past, being indeed exceptional.

From the point of view of outward appearances, the situation is extremely striking. In Paris the numerous lines of the Metropolitan, or underground railways, are approaching completion, and the number of passengers is increasing daily; then there is the extension and reconstruction of the large railway stations of Mont Parnasse and Saint Lazare; the electrification of the suburban railway lines, the increase in the number of trains, and the construction of new, better equipped, better lighted, and better heated bogie carriages. The improvement of the electrical distribution service, the reduction in the charges for energy, and the general use of metallic-filament lamps, which brought about a sudden increase in the number of consumers, have forced the electricity supply companies to greatly increase the plant at their generating stations. The Compagnie Générale des Omnibus de Paris has seen itself compelled to suddenly and totally transform itself, by getting rid of all its horse-drawn 'buses and replacing them, on all the different services, with speedy motor-'buses. Next, there has been the introduction of thousands of motor taxi-cabs, the relatively low tariffs charged for the use of the same having brought about the disappearance from the streets of the old horse-drawn cabs which continued to make a struggle for existence. The net result of all this is that within a space of two years life generally in Paris has become much more intense, and the traffic so heavy that the latter, according to recent statistics, now exceeds that of London.

In provincial France the industrial revival is no less marked. There is the frequent formation of new undertakings which, looked at from an electrical point of view, have as their object for the most part, the exploitation and utilisation of new waterfalls in the generation of electrical energy and the distribution of the same for lighting and power purposes in neighbouring towns. Furthermore, new electric railways

are being constructed, while existing railway companies are adopting electric traction on sections of their lines. Finally, there are many huge projects which are being either considered, are being got ready for execution, or are in course of being carried through, such as tunnels through the Pyrenees, the utilisation of the water power of the Upper Rhone river with the view of supplying electrical energy to Paris, &c. From among this large number of new installations and projects, we shall select the most characteristic, the most striking from each class, from an electrical point of view, with the object of bringing home to readers the reality of the unexpected progress that has been achieved.

We shall, therefore, summarise the new electrical distribution systems in Paris, the projected utilisation of the River Rhone, the electrification of the Paris suburban railways, and the modernisation of the tramways, the new Franco-Spanish electric railway in the Western Pyrenees, and, finally, the latest examples of central stations in the Pyrenees and in South-Western France.

If we examine the actual position of the electricity supply of Paris, we find that the transitory *régime* which commenced in 1908 will come to an end at the termination of the present year. In other words, the six old concessionaires which divided Paris into as many sections, and which, in their dealings with the Paris Municipality, are represented by the Comité de l'Union des Secteurs Electriques Parisiens, will come to the end of the period of their concession on January 1st, 1914. What may be termed the definite *régime* will then commence, and will continue until June 30th, 1940; during this term of years, the work of supplying Paris with electricity will be entrusted to the Compagnie Parisienne de Distribution d'Energie Electrique. The contract may be determined by the Paris Municipal Council on June 30th, 1921, or at the end of any subsequent two years, subject to two years' notice being given. By the agreement, the Compagnie Parisienne has to establish two generating stations to meet the demands of consumers, one in south-west Paris (Issy), and the other in north Paris (Saint Ouen). Both stations are in communication with the railway system, and are located on the banks of the River Seine. The capacity of each plant must be 25,000 kw. as a minimum. The northern station may be extended, at the wish of the Paris Municipal Council, to 50,000 kw., the Municipality also reserving the right to meet future increased demands by utilising current transmitted from hydro-electric plants at a distance, in place of extending the northern generating station. In any case, the two plants above mentioned must be ready to supply current by January 1st, 1914, the guarantee to this end deposited by the concessionaires being £80,000.

The agreement arrived at between the company and the Paris Municipality may be summarised as follows:—The transitory period from 1908 to 1913 was agreed to in order to give the new concessionary company time to re-establish the supply system, and to place its service on a satisfactory basis. The company, therefore, proceeded with the establishment of the two plants above mentioned. The northern one, at Saint Ouen, has a capacity of 75,900 kw., and the south-western one, at Issy-les-Moulineaux, a capacity of 25,000 kw., 10,000 kw. generating sets being, as far as possible, employed.

According to the agreement, the company will have a monopoly as regards lighting, but not for the supply of current for power purposes, in which department competition is very probable, as there is already a proposal to form a company, with a capital of £2,000,000, for the supply of electrical energy for power purposes, in workshops and industrial establishments, at a lower price than is charged by the Compagnie Parisienne. The suburbs of Paris would also be supplied with current for power purposes by other companies. A scheme is under consideration, too, in the Nord Department of France for the establishment of generating stations for the supply of current to a considerable area, extending right up to the gates of Paris. One of these stations will be established at Creil, another at Laon, and it is also proposed to transmit electrical energy from generating stations established directly in connection with collieries in the Nord and Pas de Calais Departments.

Returning, however, to the work which is being carried out by the Compagnie Parisienne in readiness for the supply

from January 1st next, an inspection of the plans shows that the reorganisation and extension of the system have been prepared with a view of obviating the considerable expense which would have attached to the complete unification of the system, and of avoiding the opening of trenches in all the different thoroughfares, with the object of reducing to a minimum the disturbances to the supply service and the dislocation of traffic. The programme of work, which is on the point of completion, comprises three distributing areas or zones: First, the centre zone—densely populated and with a heavy consumption of energy: supplied with continuous current on the three-wire system. Secondly, the left bank and western zone—population relatively thinly distributed and only moderate current consumption: supplied with single-phase alternating current at 3,000 volts pressure. Thirdly, the north-east, east and south-east zone—comparatively thinly populated: supplied with two-phase alternating current at a pressure of  $2 \times 110$  volts.

It may here be mentioned that the two-phase current is generated at a pressure of 12,300 volts, and that in view of the wide distribution area it was necessary to establish a number of sub-stations, or to alter those already existing.

For the first zone, supplied with continuous current, the establishment of 11 sub-stations was provided for, where the high-tension alternating current is transformed to low-tension continuous ready for direct use by consumers. The equipment at these sub-stations has been so arranged that it can, up to January 1st, 1914, be supplied with current from the existing Secteur generating stations. Six existing sub-stations have already been suitably altered to meet the new conditions—viz., the Bondy, Trudaine, Saint Roch, Mauconseil, Sévigné and Clichy-Puteaux sub-stations. The other five newly established are those known as Bergère, Pasquier, Temple, Voltaire and Saint Antoine.

The second zone, supplied with alternating current at 12,300 volts pressure, comprises four new sub-stations, where the initial voltage is reduced to 3,000, which in turn will be transformed down to 110 volts by means of transformers installed in the consumers' premises. These sub-stations, two of which—Mnette and Sevres—are already completed, while two, Gobelins and Les Ternes, are nearly ready, will share the load on the phases of the primary two-phase network connecting them to the supply stations.

Finally, the third zone will comprise five coupling centres, intended to divide up the high-tension current from the generating stations between 120 transformer stations, where the voltage will be reduced to  $2 \times 110$ . The five centres are Doudeauville, Lumière, Menilmontant, Charonne and Daumesnil.

The supply mains will comprise:—(1) The primary mains connecting the generating stations with the sub-stations and coupling centres, having a length of 281 miles; (2) the feeders connecting the sub-stations with the conductors supplying the consumers, about 188 miles of which are already laid; and (3) the conductors supplying consumers' installations, and which, already in existence, have been converted to either the three or five-wire system.

As regards the tariff for electricity supply, which is on a basis of 7d. per kw.-hour for lighting and 3d. for power purposes, this is to be reduced to 3d. for lighting and 2d. for power.

The question may here be asked: Whether, with the numerous additions of electric tramways, or the new and numerous electric lines connected with the metropolitan and suburban railways, the thousands of new consumers of current for lighting and power purposes, the generating plants provided for by the agreement will be sufficient to supply Paris with electrical energy. The question may fearlessly be answered in the negative. As a matter of fact, with the Metropolitan Underground Railways complete, a supply of 100 million kw.-hours will be required: the tramways and other services will require an equal amount; the suburban railway system will need 125 million kw.-hours: for power purposes in Paris, 200 millions: for lighting in Paris, 60 millions, and for lighting in the suburbs, 100 millions, or a total of 685 million kw.-hours; that is to say, double the present consumption in Paris. It will therefore be impossible for the generating stations in the French capital to provide for this enormous consumption. Consequently recourse will have to be had to an outside

supply of electrical energy, which, generated at a distance, shall be cheap, and transmitted to Paris by overhead conductors. The utilisation of the water-power of the River Rhone is a scheme that meets the case, and which has resulted in the project of which details are appended.

The utilisation of water-power is being so much regarded as the future source of electrical energy, that for some time past the most competent authorities have been drawing up statistics with regard to the hydraulic resources possessed by France, just as a business man who is contemplating starting a new undertaking counts up his available capital. France, from this point of view, is a rich country, for, according to figures issued in 1910 by the Ministry of Agriculture, there is a total of utilisable water-power available of no less than 9,200,000 h.p., divided approximately as follows:—Northern Alps, 2,000,000 h.p.; Southern Alps, 2,600,000 h.p.; Vosges and Jura, 1,800,000 h.p.; Centre and Pyrenées, 2,800,000 h.p.

By scanning the following extract from the work recently published by M. de la Brosse as to the capacity of the hydro-electric stations that have been established in the Alps, readers of the REVIEW will be able to gather an idea of the amount of hydraulic power in France that has so far been utilised and the enormous quantity that is still available:—

<i>Rivers and Streams.</i>	<i>h.p.</i>
Drause ... ..	1,100
Arve ... ..	54,880
Fier ... ..	3,400
Guiers ... ..	14,760
Rhone, Yonage ... ..	22,000
Isère and tributaries ... ..	260,000
Drôme ... ..	670
Lez ... ..	90
Durance ... ..	93,000
Argens ... ..	3,800
Siagne ... ..	8,600
Loup ... ..	3,200
Var ... ..	8,350
Roya ... ..	275
Total ... ..	474,125 h.p.

The purpose for which this power is utilised is approximately as follows: Metallurgical industries, 210,000 h.p.; power and lighting distribution, 155,000 h.p.; chemical works, 60,000 h.p.; paper mills, 30,000 h.p.; traction, 10,000 h.p.; and flour mills, &c., 8,000 h.p.

As regards the project to utilise the water-power of the Upper Rhone below Geneva, which was accepted by the Government in September, 1911, this was drawn up by Messrs. Harlé, Blondel and Mähl. It is not the first scheme, nor yet the only one, as, for some years past, the subject has occupied many minds, but has long been regarded as an idealist's dream. The great progress that has been made by electrical science has, however, converted the dream into a possible reality, which, it is hoped, will shortly be put into execution.

At the present time there only exists a single very modest plant, at Bellegarde, near G'nissiat, where it is contemplated to establish the projected barrage, or dam. The Société de Bellegarde had also drawn up a similar project of transmitting electrical energy to Paris, and proposed to utilise about 270,000 h.p. We shall, however, not deal with the last-named scheme, but will occupy ourselves with the one which has been officially accepted and which has the greatest chances of success.

As it emerges from Lake Geneva, the River Rhone finds itself confined in a deep valley, into which it rushes as a veritable torrent. The flow there is considerable, the Lake serving as a reservoir, and to regulate its volume. Messrs. Harlé, Blondel and Mähl propose to establish a dam at G'nissiat, 246 ft. in height, which will convert the upper valley into a lake, having an area of, approximately, 940 acres, a length of about  $14\frac{1}{2}$  miles, and a capacity of over 1,765,500,000 cu. ft. The hydraulic power available would range between 80,000 and 350,000 h.p. The establishment of the plant would also solve the question of the navigation of the Rhone as far as Geneva, by means of a series of dams and a branch canal, which would encompass the generating station.

In order to ensure the stability of the dam, it will be necessary to go down to solid rock, which has been found at a depth of 88½ ft. The stream of water being 11½ ft. deep, the foundations will have to extend to a depth of just over 100 ft. On the other hand, the solid character of the banks will enable the ends of the dam to be strongly incorporated therewith. The generating station to be established at the foot of the dam is designed for an average capacity of 240,000 kw., divided into 24 sets of 10,000-kw. turbines. It is hoped, however, to reduce the number of sets to 16 by increasing the capacity of each to 15,000 kw. The turbines will run at 250 revolutions per minute, and will drive three-phase, 12-pole alternators giving current at 12,000 volts pressure. For transmission purposes, the voltage of the current will be raised to 120,000 in a transformer sub-station, located at a point 252 ft. above the generating station, and at a distance of about 720 ft. The continuous-current exciters (750 kw. at 160 volts) will be coupled to vertical-spindle turbines. The generating units will be divided into independent groups. All the controlling gear

FIG. 1.—RHONE-PARIS TRANSMISSION LINE.

for the general running of the generating station will be operated from a distance. The cables leaving the alternators will be provided at their ends with oil circuit-breakers. The staff at the generating station will be able to cut off the current, but not to re-establish the circuit, this being reserved to the central establishment.

Three distinct services will be provided for—the 120,000-volt service for Paris; one of 30,000 volts for the Departments in the neighbourhood of the station; and a 12,000-volt one for electrochemical establishments.

Four lines, transmitting a total of 100,000 kw., will connect G nissiat with Paris. Each of the lines will comprise three cables. They will be divided into two groups, and, in the distance of about 220 miles, three distributing centres are provided for, as shown in the accompanying map (fig. 1)—one near Louis-le-Saulnier, the second between Semur and Dijon, and the third between Joigny and Troyes. These centres, separated by a distance of about 60 miles, will furnish a supply to well-populated industrial districts.

The transmission lines will be supported on steel columns at distances of from 492 to 656 ft. It is hoped to utilise aluminium conductors of 20 mm. diameter, and, with an initial voltage of from 100,000 to 120,000, the loss at Paris is estimated at 20 per cent. The Har l-Blondel-M hl scheme will cost about £4,000,000, and it is expected that it will be possible to supply energy at a reduction of 20 per cent. on the tariff established under the new 1914 r gime.

(To be continued.)

## ELECTRIC LAUNDRY IRONS.

By G. H. ELLIOTT, A.M.I.E.E.

I AM greatly interested in the correspondence relating to troubles encountered with electrically heated irons in laundries and other workrooms, since I have had considerable experience with this class of apparatus.

The cord trouble, I believe, is more a matter of proper suspension than any other thing, and where what I call the "floating cord system" is adopted, as in the laundries of Messrs. John Barker (where, as stated in Mr. Carr's letter on April 25th, the irons have run for two years without trouble of any kind), of Messrs. Eastman & Son (where 300 electric irons are in use), and in many other workrooms with which I am acquainted, the trouble with the cords is negligible. This system is shown in the accompanying illustration. A little wooden ball is hung by a fine twine from the ceiling over the centre of the ironing table. The fixed wiring is taken to a ceiling rose on the wall, or on a suitable support about 4 ft. above the level of the table. The flexible cord is taken from this rose, through a hole in the ball, and drops thence to the iron. The ball should be free to swing over a distance at least equal to half the travel of the iron. Then, as the iron is moved about the table, the ball swings in unison with it, and the cord floats without strain, and will be found to have a really long life. Where the head room is limited so that the ball cannot swing freely, it is an advantage to hang the ball on a light spiral spring in order that the desired amount of motion may be given. The hole in the ball should be a snug fit on the cord, and the cord adjusted so that there is no loop or kink between it and the iron; a loop is a certain source of trouble.

It is my experience that the cord should be as light and flexible as possible. Nothing is better than good vulcanised twin 70/40. A great fault with most electric irons is the wire cage and bush that is attached to the connector. In workrooms the cord has always to withstand a very consider-

FLEXIBLE SUSPENSION FOR LAUNDRY IRONS.

able amount of bending and straightening, and this is bound to fatigue the material after a greater or less time, even with proper suspension. Where a cage is fitted, the bending takes place at the top of the cage, especially when a bush or knob is fitted there; since the two poles are twisted closely together at this point, there is a grave risk of a "short" between the two—one cord in breaking is quite liable to fire across to the other and create serious trouble. In the connector usually fitted to the "Hot-Point" iron this shorting is avoided by keeping the two poles well apart at

the trouble point. A cord grip, consisting of a steel bar with fibrous insulating collars, is fitted near the top of the connector. The two cords coming from the sockets are passed under this bar, and are gripped between the insulating collars and the porcelain body; the braiding itself, or preferably a cotton whipping wound over the braiding, is gripped, and there is no strain on the copper. The porcelain above the cord grip has two holes or tubes formed in it, and the weakest spot on each cord is located within these tubes. Then, if the cord is allowed to remain in use so long that it wears out and breaks, any arc that may be formed occurs

DETAILS OF CORD GRIP.

inside the tube and is damped out, the two poles are kept well apart, and serious trouble is a most improbable event. "Ironical" mentioned trouble caused by poorly designed connections between the terminal pins and the elements. In the irons I am best acquainted with, these connections are made by forming a three-wire loop of the actual heavy gauge wire of the elements themselves, and securing this loop under big hexagon nuts. I understand that this arrangement is quite free from trouble.

I should greatly appreciate seeing a few more records of running cost published. Factory owners have a tendency to multiply the nominal wattage by the number of working hours per week and to declare that electric irons are ruinously expensive. The actual figures, I believe, are strongly in favour of electric irons. For instance, a report from the New York Edison Co. was published in this paper a week or two ago, giving the average consumption of irons in tailoring factories at 350 kw.-hours. This is an amount that is, I believe, much appreciated by central-station engineers, and at 1d. per unit it is quite capable of bearing comparison with gas. Should any readers of the ELECTRICAL REVIEW have similar figures, I believe that many other engineers would be pleased to see them.

### ROYAL SOCIETY CONVERSAZIONE.

ON Wednesday last week the conversazione of the Royal Society took place at Burlington House, the guests being received by the president, Sir Archibald Geikie. There was not a large proportion of electrical exhibits, partly, perhaps, because marked attention is being devoted to apparatus for use in aeronautical investigations. For instance, Mr. M. O'Gorman showed a collection of seven instruments to indicate or record the speed, path and distance traversed by aircraft, to measure the pull on a wire without disturbing it, &c., some of these being electrically operated. The Cambridge Scientific Instrument Co., Ltd., showed a yaw indicator, and the National Physical Laboratory an apparatus for the rapid determination of the lifting power of samples of hydrogen.

Prof. J. T. Morris exhibited a new instrument for an allied purpose—the measurement of the velocity of wind—in this case applied to the distribution of velocity round a circular rod at right angles to a current of air produced by a fan in a wooden trunk. The device consists of a Wheatstone bridge made up with alternate arms of platinum and manganin, the wires being stretched axially along the rod. At normal temperature the bridge is out of balance; a current is passed through it, and a calibrated indicator takes

the place of the usual galvanometer. The change in temperature and resistance of the platinum wires is a measure of the velocity of the air which cools them, and can be determined by the reading of a milli-voltmeter. Another method of using the instrument is to vary the current so as to bring the bridge into balance for a given velocity; the square of the watts used in the bridge wires is then nearly proportional to the velocity of the wind. With this apparatus the movement of air can be determined quite close to and all round an obstruction, and it is not necessary to find the direction of the wind before a measurement can be made—as in the case of the Pitot tube.

Mr. F. W. Jordan exhibited the sensitive convection radiometer and thermo-galvanometer, which he described before the PHYSICAL SOCIETY a few months ago;\* this instrument indicates the strength of a convection current of air in a partitioned chamber, set up by very feeble sources of heat; a deflection of 5.4 mm. is obtained on a scale 1 m. from the mirror with  $10^{-6}$  calorie per second. As shown at the Conversazione, it was measuring the heat evolved by a minute quantity of radium.

Prof. J. Norman Collie and Mr. H. S. Patterson showed experiments bearing upon their recent observation of the presence of neon and helium in hydrogen, after the passage of an electric discharge through the latter at low pressure.

A novel instrument was exhibited by the UNDERFEED STOKER CO., LTD., in the shape of a pocket  $\text{CO}_2$  thermoscope, with which the percentage of carbon dioxide present in flue gases can be determined in a few seconds, and to a high degree of accuracy. The principle employed is that of absorption of the  $\text{CO}_2$  with caustic soda, the resulting chemical reaction giving rise to an evolution of heat which is proportional to the quantity of  $\text{CO}_2$ . The apparatus consists of a cylinder fitted with a piston, by means of which

SECTION OF  $\text{CO}_2$  THERMOSCOPE.

a measured quantity of gas can be drawn from the flue or chamber to be examined, two thermometers, and cartridges containing pulverised caustic soda. It is shown in section in the accompanying figure, where A is the cylinder, C an outer jacket, B the testing thermometer, and G the cartridge. An auxiliary thermometer D enables a correction to be made for the temperature of the instrument by regulating the stroke of the piston with the scale S engraved on the piston rod, so that the correct volume of gas is always drawn in.

\* ELECTRICAL REVIEW, November 15th, 1912.

To use the instrument, a sample of gas is drawn into the cylinder, and the tap *t* is closed; one of the little cartridges is pricked at each end to enable the gas to flow through it, and is attached to one end of a rubber connection, the other end *K* of which is connected to the nozzle of the tap. The cartridge is inserted into the hollow bulb *F* of the thermometer, and after adjusting the zero of the movable scale *E* to the top of the mercury column, the piston is pushed in, driving the gas through the cartridge. The percentage of CO<sub>2</sub> present is then read off directly on the scale *E*, which can be seen through a slot *D*. It will be seen that the process is extremely simple, and can be carried out by any intelligent person without skill in manipulating chemical apparatus.

The CAMBRIDGE SCIENTIFIC INSTRUMENT CO., LTD., showed the "Apophorometer," an instrument designed by Prof. J. Joly, for easily obtaining sublimates at high temperatures. It consists of a thin ribbon of platinum; the substance to be tested is placed on the ribbon in the form of a pinch of powder, and the ribbon is enclosed between two watch glasses. On passing a current through the ribbon and gradually increasing its strength, the various sublimates are driven off in turn, and by noting the current in each case the temperature of the ribbon, previously calibrated, can be ascertained. By this means, the analysis of complicated minerals is greatly facilitated. Other exhibits were a barometer with a dial instead of a vernier, and an electrical device for recording the amount of opening of the stomata on a leaf.

The most interesting exhibit was that of the Sperry Gyro Compass, in which the gyroscopic element is suspended from a stranded wire, the top of which is held in a frame surrounding the sensitive element and made to follow it by a system of electrical contacts controlling a motor. The system comprises a master compass which is placed in a well-protected position in the ship, and repeater compasses which are operated by the master compass in various parts of the ship. The gyrostat is driven by three-phase currents, and takes up its definite position in about four hours from the time of starting the motor.

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

### The Prevention of Accidents in Electric Lifts.

I am afraid that Mr. W. S. F. Cooper's acquaintance with electric lifts is somewhat limited. If he will make inquiries he will find that combined electrical and mechanical locking gear has been successfully applied to the gates of lifts for several years past.

With an electrically-controlled lift nothing is easier than to put the electric portion of the lock on each landing gate, and frequently also on the cage gate, in series with the controller, so that current cannot be given to the motor until every gate contact has been made, or, in other words, until every gate has been closed.

Hydraulic lifts can be protected in a similar manner by arranging the electric locks in series with a solenoid rope gripper fixed on the top of the cage. Whenever the cage is at any floor, and the landing gate open, the gripper grips the rope and prevents its being operated until it is released by the closing of the gate.

Mechanical locking alone is insufficient protection, for, as a rule, it means that the cage can be moved from the landing with any gate open.

A. R. Leaver.

London, S.W., May 7th, 1913.

### The Preservation of Creosoted Poles.

I am obliged by the reply of "Communicated" to my letter, and fear I read his article, which appeared in yours of the 18th, rather hurriedly. I quite agree with this. I take it

he does not think that a normal injection of creosote into wood makes it brittle, which was all I took exception to. I have no doubt that in the case of some large users it is impossible to arrange for notching and boring before creosoting, but we find that most other large users, as electrical contractors, power companies, &c., do endeavour to plan their lines out, and have such work done, as far as possible, before creosoting.

Christopher Wade.

Hull, May 6th, 1913.

### Village Lighting.

I read with interest your note on "Village Lighting," especially as I have just successfully equipped a country residence in the Dukeries with 12-c.r. lamps fed from portable batteries. The cost (initial) is very low, and maintenance runs about .5 of a penny per hour. This may interest your correspondent.

John Morley.

Mansfield.

### Combined Luminous Radiators and Convectors.

I notice in the current issue of the ELECTRICAL REVIEW a description of the "Lynton" radiator, in which an electric heating lamp and heating elements are employed, and this is claimed to be a new type of radiator.

I would call your attention to enclosed Patent No. 15,591 of 1902, which covers a combination, in one frame, of the use of electric heat lamps and non-luminous heating elements. The Dowsing Radiant Heat Co., Ltd., have manufactured these combined radiators for the past 10 or 12 years, and they have proved very successful.

Radiators of this description would infringe my patent, and I may say that all necessary legal proceedings will be taken by my company to uphold their rights.

For the benefit of those who may not be acquainted with this patent, the claims are as follows:—

1. An electric stove comprising in one casing one or more electric glow lamps and one or more heating resistances, adapted to be connected either separately or otherwise to a source of electric current substantially as described.

2. An electric stove comprising electric glow lamps, and a resistance coil or coils disposed respectively in front of or behind a reflector, and adapted to be connected either separately or otherwise to a source of electric current, substantially as described.

3. An electric stove comprising in one casing, one or more electric glow lamps, and one or more resistance coils, adapted to be connected either separately or otherwise to a source of electric current, opening in the casing and passages leading therefrom to the heating resistances and lamps substantially as described.

May I add that this combined form of electric radiator, which we call our Radio-Convactor, is of very great value, as the good points of both types of radiators are included in this design.

The Dowsing Radiant Heat Co., Ltd.,

H. J. DOWSING, Managing Director.

London, W., May 9th, 1913.

### Mareconi Advisory Committee's Report.

I am not interested in any wireless scheme, but it strikes me as odd that no mention is made of the fact that Australia has not adopted the system favoured by the British Government; and yet the Australian system is effective over long distances. The same remark applies to the systems in use in Germany, France and in the United States; and, as an outsider, I cannot see wherein the so-called "Marconi" system is superior. There are thousands of capable amateurs who now receive signals from every part of the world, and the number of senders would also be very large if licences could be obtained. So there cannot be any great difficulty in the business!

Anti-Humbug.

London, May 12th, 1913.

[It is to be regretted that our correspondent was not invited to sit on the Advisory Committee in the first instance, instead of being obliged to take the initiative: his "facts" might have been useful to the members. They are certainly new to us.—EDS. ELEC. REV.]

## BUSINESS NOTES.

**Consular Notes.—Congo.**—The British Consul in the Congo, in a recent report, states that wireless telegraphy had been established between the following places up to June 30th, 1912:—Stanleyville and Lisala, 275 miles; Stanleyville and Lova, 132 miles; Lova and Kindu, 110 miles; and Kindu and Kongolo, 184 miles. Brazzaville, the capital of French Equatorial Africa, is in communication with Lisala, 610 miles further up the Congo, and even with Stanleyville, 740 miles distant. Kindu and Lova stations succeeded in communicating with Moanza on Lake Victoria, 453 miles distant. Atmospheric conditions on the Congo are not favourable to wireless telegraphy, the air being often highly charged with electricity, and the strong sunlight affecting the passage of the ether waves. Stations with wave lengths under 1,200 yards fail after 6 a.m., and only succeed at night. Two stations, Lova and Kindu, with wave lengths of 1,700 yards, however, have been found to operate equally well during the day. It is proposed to establish a high-power wireless station at Lusambo in the Kasai, which, owing to its central position, will be able to communicate with all the other Congo wireless posts. Stations are also contemplated at Niangara on the Upper Uele River. The powerful British station at Aden, able to send messages 2,000 miles, will be able to communicate with Niangara, and that with Stanleyville, Brazzaville and Boma, thus effecting communication across the Continent. Wireless communication between Boma and Banana is steadily maintained, and Banana can communicate with Swakopmund. Connection with Coquilhatville, the terminus of the up-river land telegraph line from Boma and Stanleyville, has not been satisfactorily established so far on a regular basis, but is likely to be soon effected.

Steady progress is being made in pushing forward telegraph service. All the various new railways under construction carry the telegraph along as they proceed. A second line is being laid between Leopoldville and Coquilhatville to facilitate the service. Elizabethville and the frontier at Sakania have been linked, and a line is to be run from the former to the Star of the Congo mine. The Katanga line is connected with the telegraph network of South Africa, and international communications are assured by an agreement with Rhodesia. On January 18th, 1912, a convention was signed with Portugal for the erection of a line between Matadi and Noqui—five miles. Noqui, a Portuguese Angola port in the Congo, is connected with Loanda, where the Eastern Telegraph Co. is linked by cable with the world *via* St. Vincent or Tenerife. Connection with Lindu is also available by way of Brazzaville and Pointe Noire, the rate being 5s. 8d. per word to the United Kingdom. Telephone services connect Boma, Matadi, Thysville, Kinshasa and Leopoldville. Installations connecting these places cost £10 per annum. Rates are 1s. 6d. to 2s. 6d. for five minutes' conversation. Telegraph receipts rose from £1,680 in 1910, to £2,129 in 1911. The colony has adhered to the International Telegraph Convention concluded at St. Petersburg on July 10th-22nd, 1875, and to the Radiotelegraphic Convention, of Berlin, of November 3rd, 1906, and was represented at the last Conference held in London in June, 1912.

**Russian Far East.**—The British Consul at Vladivostok reports that a central electrical power station has recently been opened there, and supplies light for streets and houses, and power for industrial purposes. An electric tram system 4 miles in length is now completed.

**Paraguay.**—Reporting recently on the trade of Paraguay, the British Consul at Asencion points out that whereas the imports from most of the principal supplying countries showed an increase in 1911, as compared with 1910, the total imports from the United Kingdom appear to have suffered a relatively heavy decline, viz., from £539,115 in 1910, to £370,040 in 1911, a difference of £169,075, which is to be accounted for mainly by the falling-off in the imports of railway material. On the other hand, the German imports show a total increase of £135,255, which is made up of food stuffs, textiles, fancy goods, drugs, hardware, and articles imported free of duty. The imports from France and the United States also show a relatively large increase. That British trade is not (so far as can be gathered from the available figures) on the increase is, however, not surprising; it is, on the contrary, somewhat remarkable that it maintains its present level, because in the whole Republic there are only two British importing firms. It may be regarded as a tribute to the quality of British goods that they are largely imported by foreign houses and foreign agents, but at the same time the conclusion is irresistible that the British share in the total import trade might be still larger if a larger number of British houses were established in this country. Many more travellers and representatives are said to have been sent to Paraguay during the last year or two from other European countries such as Germany, France, Italy, &c., than from the United Kingdom: the British firms are also said not to give such easy terms of credit as the foreign ones.

In cases where goods are brought from samples, some Continental firms are said to send out larger assortments (which, other than those of textiles, are bought by the importers, subject to a large discount) than is customary with British firms, thereby facilitating a selection and affording a more precise indication to the exporter of the class of articles desired in this market. These small points are mentioned because Continental competition appears to be likely to grow still keener than at present. The German community is said to be continually increasing its numbers. They are occupied in trade and in many other ways, having apparently satisfied themselves that Paraguay offers a good field

for their enterprise and activity, in relation to which the above quoted figures form a useful commentary. The United Kingdom imports practically no products of Paraguay, presumably because there are no British firms in the country exporting hides, tobacco, &c., like the German and Spanish firms. British trade-mark owners would do well to observe that the Paraguayan law has no cognisance of the fact that a mark may have been registered elsewhere, and consequently anyone, without adducing proof that he is the rightful owner or the owner's representative, may register any mark that has not already been registered in Paraguay, and by doing so he acquires the sole right to the use of it. The importer of goods bearing a mark that is not registered in Paraguay may therefore find it necessary in his own interest to register the mark.

**Dissolutions and Liquidations.**—THE ADAMS MANUFACTURING CO., LTD., Balfour House, Finsbury Pavement, London, E.C., and Bedford.—Pursuant to Sec. 188 of the Companies' (Consolidation) Act, 1908, a largely attended meeting of the creditors of the above was held on the 9th inst., at Winchester House, Old Broad Street, E.C. It was reported that the shareholders of the company had passed a resolution to the effect that it could not continue its business by reason of the liabilities, and that it was advisable that the concern should be wound up voluntarily. A further resolution was passed appointing Mr. Lewis Hardy, of Messrs. Hardy and Moritz, C.A., 8, Bream's Buildings, Chancery Lane, E.C., to act as the liquidator of the company. Mr. Hardy submitted a statement of affairs showing the position as at April 22nd last, the date of the resolution for voluntary liquidation. The statement disclosed ranking liabilities of £30,094, of which £15,382 was due to creditors on open account, and £2,058 in respect of bills payable. The bank were shown as unsecured creditors for £11,912, and in addition there were unsecured cash creditors for £742. There were also fully secured creditors for £2,728, who held as security a charge on the freehold factory of the company. The assets were returned at £52,326, from which had to be deducted £641 for preference claims, and £15,731 owing on debentures. The net assets were thus reduced to £35,954, and as regarded the unsecured creditors a surplus was shown of £5,860. The assets were as follows:—Stock-in-trade and work on hand at estimated cost £23,000, machinery and tools as per books £8,967, trade fixtures and fittings as per books £3,403, patents and patterns as per books £2,975, freehold factory £8,699, less mortgage of £2,728—£5,970, shares in public company £145, book debts (good) £7,740, doubtful and bad debts £464, expected to produce £100, and cash in hand £24.

Mr. Hardy reported that the company was formed in 1906. At the outset it was purely an automobile business, but subsequently an electrical side was started. He was appointed to act as the Receiver of the company on April 11th last. Eleven days later the shareholders passed the resolution in favour of voluntary liquidation, and with a view to saving expense, they also appointed him to act as the liquidator of the company. Since his appointment as Receiver, he had been carrying on the business, and there was plenty of work in hand. Some good work was being done at the factory, and there were numerous orders coming to hand. He was quite satisfied that he was carrying on the business at a profit, and was doing his utmost to safeguard the interests of all concerned. He did not consider it right that a Receiver should merely study the interests of the debenture-holders, and he was, therefore, also looking after the interests of the unsecured creditors. Mr. Waller asked if any of the debentures had been issued recently, and Mr. Hardy replied that the debentures were all issued more than two years ago. No debentures had been issued since 1911, and the consideration for their issue was cash advanced. Mr. Lea inquired if the directors of the company were also the debenture-holders, and he was told that three directors of the concern held the majority of the debentures. Mr. Lea stated that on the file of the company at Somerset House was a copy of a balance-sheet for 1911, which contained a very peculiar note by the auditors. The note stated that property had been purchased for £27,000 and shares issued, but there had been some irregularity in the issue of the shares, and for the purposes of the balance-sheet, neither the property nor the shares were brought into account.

Mr. Hardy replied that he knew nothing about the matter, and the solicitor also said he could not give any explanation.

Mr. G. G. Poppleton said that the stock-in-trade and work in hand formed a very considerable portion of the assets. He asked what was the value of the stock, and how the value of the work in hand was arrived at. Mr. Hardy said he understood that the work in hand was valued at about £3,000, while the stock was worth about £20,000. In answer to Mr. Figgins, who asked what the assets were likely to realise at a forced sale, the chairman said that the stock and other assets had not been taken at inflated prices. At a forced realisation he understood that the whole of the assets would realise from £25,000 to £30,000. The claim of the bank amounted to £11,912, and they held no direct security from the company, but were guaranteed by the directors. He understood that the bank were fully secured for the whole of their claim. Asked what the stock consisted of, he replied that it was a very varied stock, and was in good condition. Some £13,000 represented electrical stock.

Replying to further questions, the chairman said that the directors had never received any fees. The managing director was entitled to a salary of £1,200 a year, but in respect of the last 12 months there was about £500 due to him. The directors were really creditors of the company.

Mr. Poppleton expressed the opinion that the unsecured trade creditors could not expect to receive payment in full. Capital to the extent of some £54,000 had been issued and there was now a

surplus, so far as the creditors were concerned, of only £5,000. In other words, nearly £50,000 had to be accounted for since the formation of the company in 1906. He asked what had been the results of the trading. Continuing, he said he would also like an explanation of a circular which had been issued, which stated that the liquidation and receivership did not disturb the business, and that it would go on just the same under the same management. Did that mean that the trade creditors were to be paid in full?

The chairman replied that he had not had sufficient time to prepare the figures asked for, and at the present moment he was unable to give details as to the past history of the concern. The opinion was expressed by Mr. Poppleton that the liquidator ought to be in a position to tell the creditors what happened when the company was formed, and what its transactions had been since. He asked what assets were taken over by the company, and the chairman replied that he could not give the particulars.

A creditor expressed the opinion that unless there was a very careful realisation, these interested would come off badly. Mr. Hardy represented the debenture-holders, and it was advisable that the creditors should nominate someone to act as joint liquidator, who would represent their interests. The creditor suggested that the Rotax Motor Accessories Co. should be nominated to make the necessary application to the Court for the appointment of a joint liquidator to act with Mr. Hardy.

After a short discussion the resolution suggested was carried by a large majority, and the solicitor for the company then stated that there was every chance of the business being realised to advantage. Application might shortly be made to the Court with reference to the disposal of the business. He had advised the liquidator not to answer certain questions, as there might be some persons present who desired to bid for the business. A Committee of the principal creditors was also elected.

ADAMSON, RAMSBOTTOM & CO., LTD.—A meeting of creditors was called for May 15th at 6, Castle Street, Liverpool; Liquidator, Mr. B. Cookson.

PATENT BRAKE BLOCKS, LTD.—A meeting is called for June 10th at 8, Old Bank Buildings, Chester, to hear an account of the winding up from the liquidator, Mr. W. Conway.

WESTERN ELECTRIC CO. (AUSTRALIA), LTD.—A meeting is called for Norfolk House, W.C., on June 13th, to hear an account of the winding up from the liquidator.

OUTSHOORN ELECTRIC LIGHT AND POWER CO., LTD.—A meeting is called for June 12th at 71A, Queen Victoria Street, E.C., to hear an account of the winding up from the liquidator, Mr. E. West.

ROSSENDALE BELTING CO., LTD.—First meetings of creditors and contributories are called for May 23rd at the Official Receiver's Offices, Byron Street, Manchester.

**Trade Announcement.**—MR. R. B. BEATTIE, of Burnley, has opened a branch shop at 5, Orchard Road, St. Anne-on-the-Sea, and he desires to receive lists from makers of heating and cooking apparatus and electric light fittings.

**France.**—La Société Dynamo Phare Eyquem is the name of a new company which has just been formed at Levallois-Perret (85 and 87, Rue Chaptal), with a capital of £18,000, to manufacture the car electric lighting dynamo of that name.

**"Deleoblast."**—THE DAVIS ELECTRICAL CO., of 17, Moor Street, Charing Cross, London, W., are supplying the "Deleoblast" frosting process for lamps, for which they make a number of claims.

**Catalogues and Lists.**—THE ELECTRICAL CO., LTD., 122-124, Charing Cross Road, London, W.C.—Priced leaflet relating to "Goliath" holders for H.C.P. metal lamps, also a priced card relating to their frosted radiator lamps. Both of these lines are carried in stock.

MR. O. N. BECK, 11, Queen Victoria Street, London, E.C.—Illustrated list describing the "Triplex" valve, line drawings being given to show several schemes of connections for these valves.

MESSRS. TURNERS & MANVILLE, LTD., Houghton House, Lloyd's Avenue, London, E.C.—Twelve-page pamphlet dealing with their "J. M." dry batteries, "T. & M." adhesive tapes, and "T. & M." fireproof and "Niagrite" tapes. Prices are given.

MESSRS. EVERSHED & VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.—Four new catalogues have just been issued in uniform style containing fully-illustrated matter with tabulated prices, and connection and other diagrams. The ground covered may be understood generally from the following:—No. 113 (28 pp.) is devoted to Murday recorders, and contains interesting particulars of new types; No. 117 (36 pp.) deals with portable electrical instruments, and gives particulars of the firm's ammeters, voltmeters and wattmeters; No. 118 (24 pp.) is devoted to Foster practical pyrometers, a new type of instrument, suited particularly for engineers; and No. 120 (32 pp.) is the new edition of the firm's catalogue of "Megger" testing sets.

MR. CHAS. E. MILLER, Reade Street, New York, U.S.A.—Catalogue No. 25, giving illustrations and prices of a host of apparatus and supplies for motor-cars, motor-boats and cycles.

MESSRS. BRUCE PEEBLES & CO., LTD., Edinburgh.—Specification sheet No. 59 details and shows the Peebles standard turbo-alternators. The enclosed type, which is the standard arrangement of all their turbo-alternators, excepting the two smallest sizes, is shown. A separate specification sheet details the exciters.

MESSRS. PHILLIPS & TURNER, 71, Broad Street, Birmingham—12-page preliminary list of general electrical accessories—bell material, lampholders, distribution boards, switches, hand lamps, &c.

THE CAR AND GENERAL INSURANCE CORPORATION, LTD., 1, Queen Victoria Street, London, E.C.—Illustrated (colour) booklet, giving some interesting old pictures showing very early motor-

vehicles running on public thoroughfares. Copies will be sent to any interested reader.

BRITISH THOMSON-HOUSTON CO., LTD. Rugby—List No. 2,440, fully describing and illustrating, and showing prices of, their four different forms of current transformers.

MESSRS. PASS & SEYMOUR, INC., Solvay, New York, U.S.A.—Two bulletins effectively dealing with their "Sturlock" device for preventing stealing of electric lamps, also their electric advertising signs.

MESSRS. ISAAC STOREY & SONS, LTD., Empress Foundry, Cornbrook, Manchester.—Twenty-page fully illustrated catalogue dealing in detail with Scott's patent air compressors.

MESSRS. WHITTAKER & CO., 2, White Hart Street, E.C.—Catalogue of scientific and technical books, 1913.

**Ghent Exhibition.**—MESSRS. GENT & CO., LTD., Faraday Works, Leicester, are exhibiting at Ghent a full range of apparatus as supplied by them to the British G.P.O., comprising secret and C.B. interphones, the "Borough" and "Nugent" water level indicators and recorders, water level alarm contacts, &c.

**Bankruptcy Proceedings.**—T. A. FLATHER, electrical engineer, lately at Park Electrical Works, Leeds.—Application for debtor's discharge to be heard on June 9th, at the County Court House, Leeds.

BERNARD MUSGRAVE, director of a limited company, Howick, near Preston, lately Astley Bridge, near Bolton.—Application for debtor's discharge to be heard at Bolton on June 11th.

FRED. SHAW, electrical contractor, Hull.—May 29th is the last day for receipt of proofs for dividend. Trustee: Mr. G. H. Acheron, York City Bank Chambers, Lowgate, Hull.

E. J. CROSER (Crosier, Stephens & Co.), engineer and merchant, Newcastle.—A third dividend of 6d. in the £ is payable May 26th. Trustee: Mr. J. A. Gardner, 145, Pilgrim Street, Newcastle-on-Tyne.

**Exhibitions.**—The *Times* states that movements are on foot for holding a Universal Oil Exhibition, at Earl's Court, in March, 1914, and an International Exhibition in Manchester, from May to October, 1914.

**E.M.B. Resistances.**—We are informed that the ELECTRO-MECHANICAL BRAKE CO., LTD., are doing a large business in their "E.M.B." unbreakable, jointless and rustless grid type resistances. Orders have recently been received for the Corporations of Leeds, Manchester, Oldham, Newcastle, Leicester, Birmingham, Blackpool, L.C.C., West Ham, &c., and a number of well-known firms and railways, making 2,500 resistances of this type in use or on order.

**Book Notices.**—The Anglo and South American Publishing Co., Ltd., of London, is about to publish an "Encyclopedia of South America" in four large quarto volumes, copiously provided with coloured maps and other illustrations, under the general editorship of Mr. W. H. Koebel. This will be followed a few weeks later by a "South-American Year Book."

"Cab Signalling," summary of a lecture delivered to the London Section of the Permanent Way Institution on February 15th, 1913 by W. H. Dammend. From the Author.

*Engineering Directory of Advertisers.* No. 56, April, 1913. London: "Engineering," Ltd.

**Electric Clocks.**—We have received the following communication from the SILENT ELECTRIC CLOCK CO., LTD., of Goswell Road, E.C., in reply to the letter published on page 756 of our last issue:—"In your current issue we observe a communication from the Magneta Time Co., in which exception is taken to a paragraph in your issue of April 25th, mentioning that electric clocks manufactured by the Silent Electric Clock Co. are being exhibited at Ghent Exhibition 'of the standard pattern as supplied to H.M. Post Office.' While we have no desire to in any way belittle the admirable work achieved by the Magneta Time Co., we think that they overlook the fact—when giving their list of installations in postal buildings—that their system was supplied to the Office of Works, who formerly supplied fittings and furniture, including clocks, to all Government buildings. The Magneta Co. are, therefore, contractors to the Office of Works. Now we have supplied electric clocks to the Post Office direct. No doubt the Post Office exhibit at the Ghent Exhibition is confined to those firms who are contractors to that Department, and does not include exhibits from contractors to other Departments. We apologise for troubling you in so small a matter, but we feel that we must protest against any (even indirect) suggestion that we had tried to appropriate another firm's prestige."

## LIGHTING and POWER NOTES.

**Algeria.**—An electric power plant is being installed in connection with the iron ore mines at Rouina, belonging to the Société des Mines de Fer de Rouina; it will comprise two Diesel engines and alternators, of a total of 250 H.P., one set being held in reserve. The station will mainly supply current for the Mermet workings, where an electric crane, capable of lifting 50 tons of ore per hour, from a depth of 164 ft., two large Solzer pumps, and an air compressor, are being installed.

**Bangor.**—The City Council's electricity undertaking shows a loss of £624 on the last year's working; it was suggested that the price per unit be increased by 1d.

**Basingstoke.**—The T.C. on May 8th instructed the surveyor to prepare plans for an E.L. station to be erected in Rectory Meadow.

**Birmingham.**—The City Council has approved of the report of the Electric Supply Committee, authorising it to proceed with the new power house at Nechells, the equipment of substations, the provision of underground mains, &c., (referred to at length in our last issue), and instructing the Finance Committee to borrow £500,000 in respect thereof.

**Brighouse.**—In his annual report, Mr. A. Aspinall, engineer and manager of the electricity department, states that the revenue account shows an increase as compared with the previous year, of £613.

**Broadwater.**—The Worthing T.C. is making a canvass in order to ascertain what demand there is at Broadwater for electricity, with a view to the cables being extended to that parish.

**Burton-on-Trent.**—The Gas and Electricity Committee has decided to invite members of the Council to visit the gas and electricity works on May 30th, on which occasion the new electrical plant will be brought into use.

**Bury St. Edmunds.**—The B. of G. has referred to a Committee the question of having the old and new workhouse premises lit by electricity.

**Canterbury.**—The T.C. has decided to install at the electricity works a Harris-Anderson water-softening plant with a capacity of 3,000 gallons, at an estimated cost of £300.

**Continental Notes.**—FRANCE.—Great progress is being made with the establishment of the new central electricity station of the Société Nantaise d'Éclairage et de Force par l'Électricité at Nantes. The plant, which has a capacity of 17,000 kW., is expected to be completed during the coming summer.

ITALY.—La Società Ligure-Toscana d'Electricità, of Leghorn, is putting down a new 3,000-H.P. steam turbine and alternator at its central station in Leghorn; a new hydro-electric station of 10,000 H.P. capacity is also being established on the River Serchio. A 30,000-volt transmission line is also being established between Pescia and Prato to connect the company's system with that of the Società Mineraria ed Elettrica della Valdarno, with which concern a contract for the supply of any surplus energy available at nights and on fine days has been entered into.

**Dudley.**—At the T.C. meeting last week, Councillor Ballard directed attention to a statement which had been made that negotiations in respect of the sale of the electrical undertaking were being delayed owing to some difficulty which had arisen. He asked if that was correct, and how long it would be before the negotiations would be completed? Councillor Hughes said it was perfectly obvious that the negotiations were delayed, or they would have been completed. As to when they would be concluded nobody knew, but the matter was a purely legal one.

**Dundee.**—The Corporation electricity department has just finished a most successful year, having generated considerably over 10,000,000 units, which is a big increase over the previous year's output.

**Easington.**—At a special parish meeting last week, it was agreed to adopt the Lighting Act, and to carry out a scheme for public and private lighting, the idea being that the Easington Coal Co. will supply the necessary energy.

**Emley (near Wakefield).**—The U.D.C. has decided that the Yorkshire Electric Power Co. be asked to reopen negotiations for the lighting up of the village.

**Fife.**—The whole of the running staff of the generating and sub-stations of the Fife Electric Power Co. recently resigned their positions, owing to a number of grievances culminating in a demand that the shift engineers should work 12-hour shifts (81 hours per week) at bare "time" rate during the annual holiday period, there being no spare men. The case being put before a director of the company, he denied all knowledge of any dissatisfaction amongst the men, and promised to bring the whole matter before the rest of the directors at their meeting next week. He persuaded the men to provisionally withdraw their resignations, and promised that no action would be taken by the management or directors in the meantime.

**Heckmondwike.**—The annual report of the Council's electricity undertaking shows an increase during the year in units sold of 163,872, or 12 per cent. Notwithstanding the high price of coal during the strike, the fuel cost per unit was only 31d., as compared with 36d. in the previous year. The cost of energy purchased from the Yorkshire Power Co. was 75d., as against 62d. per unit from the Council's own plant. The total income increased by £931, and the sum taken to profit and loss account increased from £850 to £1,873, and the balance on this account to meet capital charges was £10,258, whilst the sinking fund balance stands at £8,161.

**Hereford.**—The T.C. has received from the L.G.B. sanction to loans of £500 for mains, £600 for pumping machinery, and £950 for cables, the two latter being in connection with the electrical pumping at the water-works.

**Hertford.**—The North Metropolitan Electrical Power Supply Co. has applied to the R.D.C. for consent to the supply of energy within the district under the company's 1907 Act; the Council has deferred its decision for a month.

**Heysham.**—The U.D.C. has given consent to Morecambe T.C. supplying current to premises in the town under an order to be obtained from the B. of T. The Council has also asked Morecambe Corporation at what price per unit it will supply electricity for lighting Sandilands Promenade.

**Honiton.**—The T.C. has accepted the tender of the Electric Supply Co. for a portion of the public lighting at £7 15s. per 150-c.p. lamp per annum.

**Hull.**—The E.L. Committee is again submitting to the Council its proposal regarding the supply of electricity to Hessle, which was defeated at the last Council meeting.

**Ilkley.**—The District Council is considering a scheme for including in the town some portion of Middleton, a township across the river, and for obtaining powers for an extended electric lighting scheme for Ilkley and district, including Middleton, as Ilkley already possesses powers to supply the latter with gas and water. At a meeting last week the District Council approved a report of Mr. Geo. Wilkinson, the electrical engineer to the Harrogate Corporation, on a scheme of electric lighting to cost £18,000.

**Leeds.**—At a meeting of the City Council last week, reference was made to a resolution of the Tramways and Electric Committee promising to defer further consideration of the question of instituting a scheme of motor hiring, in order to give time for a trial of the scheme submitted by Mr. H. S. Ingleby. Mr. D. B. Foster, in moving the rejection of this resolution, maintained that it was an attempt to prevent the development of direct trading by the Corporation. The amendment was seconded by Mr. G. H. Pearson. Alderman H. Brown, in opposing the amendment, said that whilst they were all desirous of extending the use of electricity in the city, the Corporation meant to see that whilst the tradesmen should have motors, those tradesmen engaged in the manufacture of the electric motors could supply them. Alderman Penrose-Green also opposed the amendment, and said they had no right to take away the trade of hard-working electricians. Alderman Hepton said that whilst he was in favour of municipal enterprises in monopolies, he did not think it would be wise at present to adopt the system of hiring out motors. Electrical apparatus was being constantly improved, and they might find themselves with a mass of old stock on hand. The amendment was defeated, and the minutes approved.

**Leyburn.**—The U.D.C. on May 9th decided to consent to overhead lines being used at Leyburn for electricity supply by the local gas company.

**Llanfairfechan.**—At a meeting of the U.D.C. last week, the question of the feasibility of lighting Llanfairfechan with electricity was re-opened, and a committee was appointed to go into the matter.

**London.**—The Westminster City Council's contracts with the Charing Cross and Metropolitan Electric Supply Co., and the St. James' and Pall Mall Co., for the supply of energy to the Council's buildings, are to be continued for a further period of 12 months from June 24th next.

**POPLAR.**—At the meeting of the B.C. last week, the Electricity Committee reported having had under consideration a proposal of the electrical engineer that an oil fuel apparatus should be provided for use at the generating station. This apparatus, the Committee stated, had been specially designed to meet the demands of power stations, for use over peak loads, and to meet any sudden demands caused through increased load, or in case of breakdown due to fan motors failing. If fitted to the new Babcock boiler with underfeed stokers, the normal evaporation rate of 36,000 lb., approximately, could be increased to 53,000 lb., without the abnormal increase in coal consumption necessitated by forcing the boiler. The Committee recommended that this apparatus with the necessary tank, pump and pipe connections be provided at an estimated cost of £133. This was agreed to.

**HANNERSMITH.**—The mains are to be extended to Messrs. Waring's factory, which it is expected will be electrically driven, and require some 200 kW. The Electricity Committee has had under consideration the question of enforcing penalties for delay by Messrs. Richardsons, Westgarth & Co. in completing their turbine contract of 1911. The Committee felt that in view of the satisfactory work carried out by the contractors, the Council might reasonably forgo the imposition of penalties.

**Manchester.**—The scheme for the improved lighting of the streets has now been confirmed by the City Council; the streets in which electric lighting will be installed are as follows: Peter Street, Oxford Street (excluding St. Peter's Square), Oxford Road, Wilmslow Road to Fallowfield, Deansgate from Quay Street, Great Ducie Street to Waterloo Road, Cross Street, Corporation Street, Cheetham Hill Road to Queen's Road, Oldham Street, High Street, Shudehill, Withy Grove, Market Street, St. Mary's Gate, Stretford Road. The total length of the streets allocated to electric lighting is 13,621 yards, and to high-pressure gas lighting is 13,550 yards. Plans are now in course of preparation with a view to an early commencement of the constructional work, which will be spread over a period of three years.

The Corporation Gas Committee has instructed the chairman and engineer to visit certain Continental towns for the purpose of

inspecting certain installations, and also "to make an inspection of large gas engine plants in view of the likelihood of an extensive use of gas for the generation of electricity."

**Middleton.**—The working of the electricity undertaking of the Corporation for the past year has resulted in a loss of about £1,800.

**Morley.**—The electricity undertaking made a gross profit of £1,528 during the past year, and after meeting financial charges there was a deficit for the year of £116, as compared with last year's deficit of £783.

An exhibition of cookery by electricity is to be held during the week commencing June 2nd, by Messrs. Gillespie and Bealca, the T.C. supplying current for the period.

**Oldham.**—Arrangements have been made between the Electricity Committee and the Royton U.D.C. in regard to a supply of electricity to Royton. Should the U.D.C. obtain at its own expense a prov. order for the supply of electricity within its district, the Committee would be prepared to take a transfer of such order upon terms and conditions to be arranged and give a supply upon the same terms and conditions as electricity is supplied in the borough of Oldham.

The Electricity Committee reports a profit of £1,043 on the past year's working against £664 last year.

At a meeting of the Electricity Committee last week, it was reported by Mr. Newington (Electrical Engineer) that during the past year there had been an increase in the units sold of about 10 per cent. for lighting and 47 per cent. for power. There were 6,463,416 units sold, against 5,992,476 in the previous year.

**Olton Broad.**—The U.D.C. has asked the Electricity Co. on what terms it would be prepared to undertake street lighting for a year from September 29th next.

**Penmaenmawr.**—The U.D.C. has decided to write asking the North Wales Electric Power Co. whether it is willing to provide a supply of electricity for public purposes in the district.

**Pontefract.**—The Yorkshire (West Riding) Electric Tramways Co., Ltd., has applied to the B. of T. for permission to erect overhead lines at Pontefract for the transmission of energy at a pressure of 10,000 volts for the purpose of supply under the Electric Light Orders of 1907 and 1912.

**Preston (near Stockton-on-Tees).**—The P.C. is negotiating with the Cleveland and Durham Electric Power Co. for the lighting of the parish by electricity. The company has made a survey of the district, and if sufficient private consumers are secured, the scheme will be carried out.

**Redditch.**—The question of the financial position of the electricity undertaking came up for discussion at the Council meeting last week, when it was decided to appoint a new works manager at £300 per annum.

**Rotherham.**—The electrical engineer (Mr. E. Cress) in his report upon the undertaking for the 12 months ended March 31st last, draws attention to the remarkable reduction in the cost of operation, as against any figure that had hitherto obtained, particularly when the high cost of fuel and the increased cost of materials generally are taken into consideration. The cost of generation, 541d. per unit, he considers as distinctly good when compared with the results obtained by towns of a similar character to Rotherham. The reduction in costs is due to the increasing power load, and the adoption of turbine machinery instead of continuing with reciprocating plant. The increase in the units sold was as follows:—Tramway department—(a) 1912, 1,414,449; (b) 1913, 1,568,247; (c) per cent. increase, 10.87. Power—(a) 1,118,912; (b) 1,596,142; (c) 42.65. Lighting—(a) 370,292; (b) 451,198; (c) 21.85. The total receipts obtained amounted to £21,823, as against £18,860 in 1911-12, but the average price per unit sold had decreased from 1.558d. to 1.448d. Notwithstanding the latter, the net profit carried to appropriation account increased from £3,376 last year, to £5,179, which represents a percentage of 6.47 per cent. on the total capital expenditure to date of £79,921. The accumulated renewals fund at March, 1912, stood at £12,737, representing 18 per cent. on the capital expenditure for that year.

**Rhondda.**—A L.G.B. inquiry was held on the 7th inst. into the application of the Council to borrow £23,400 for the electrical undertaking and £38,500 for a refuse destructor. The proposed expenditure was opposed by the local colliery and railway interests. An agreement has been entered into by which the energy produced by the destructor plant between 6 a.m. and 3 p.m. will be sold to the local power company, who will resell electricity to meet the Council's requirements between 3 p.m. and 6 a.m.

**Salford.**—One of the members of the T.C. has given notice of a resolution asking for the appointment of a committee to make inquiries as to the general lighting of the borough.

**St. Helens.**—The T.C. has applied to the B. of T. for an order to supply current to Messrs. W. Neile & Sons' ironworks at St. Helens Junction, which is outside the borough, and for permission to give the supply by overhead lines.

**St. Margarets.**—The Dover T.C. has decided not to proceed at present with the proposed extension of overhead mains to St. Margarets, a village some five miles from the town. The estimated cost of the extension is £1,500.

**Sheffield.**—The Extensions, Works and Stations (Electricity) Sub-Committee of the Corporation has just issued a report upon the method which should be adopted to carry out the powers given the Corporation under its Act of 1912. So far as the sale of electrical fittings through a contractor carrying on his business independently of the Corporation is concerned, the report states that a conference was held between local electrical contractors and the Sub-Committee when, after a deal of discussion, the deputation expressed the opinion that a scheme based upon the lines of the Bristol scheme might be acceptable to the contractors. Accordingly, a scheme on these lines was prepared and submitted for consideration to a meeting of the contractors who, in a letter to the town clerk, stated that from evidence taken, the Bristol traders were unanimous in their condemnation of the scheme which was only in operation by the goodwill of the Corporation, and the opinion was expressed in the letter that it was not possible to frame a scheme which would not contravene the judgment the local traders had obtained by the Chancery action of February last, and the subsequent provisions agreed in the 1912 Bill, and upon which action and Bill they had been compelled to expend so much time and expense. Continuing, the letter stated that in the opinion of the traders, the only practical and impartial interpretation of the Act is (1) If the Corporation desires, it has the right to keep a showroom for exhibits only, but not in any way to use it for trading, either directly or indirectly; and (2) a printed list of all contractors should be kept or delivered occasionally with bills for current, or in any other method it thinks desirable to extend the business, and in which it will have the full co-operation of all electrical contractors. In conclusion, it was stated that the contractors having given ample time for the consideration of the above matters are not now agreeable to any continuation of Corporation trading by the electrical supply department in any form other than allowed by the 1903 and 1912 Bills, and the judgment obtained. Having considered this letter, the Sub-Committee states that it is still considering the way in which to carry on the work of the department, and will shortly submit a recommendation dealing therewith.

**Stockport.**—The T.C. has rejected a claim for £463 made for damage done by fire, by a local firm, on the ground that the conflagration was caused by the fusing of cables placed through the premises affected without any earthing. The Council denies liability for the fire.

**Swansea.**—At a meeting of the Tramways and E.L. Committee, Mr. Alex. Sinclair, the chairman, said the net profit of the undertaking for the past financial year was about £2,000, as against £3,600 for the previous year. The revenue had increased satisfactorily, but the financial results were lower by reason of the coal strike, the higher price of fuel, advances in wages, increased interest and sinking-fund charges, and reductions in prices to consumers, who had been allowed a rebate of 2½ per cent. all round. He thought the net result most satisfactory, in the circumstances. The question of lighting the new Swansea Asylum with electricity was raised, and it was suggested that, if this were done, the whole of the Sketty area might be taken into consideration. For such purpose, the consent of the outlying authorities would have to be obtained. The town clerk was asked to report on this aspect of the matter. Arising from a request from the Housing Committee, the electrical engineer, Mr. Prussmann, reported on the lighting of the 300 workmen's dwelling the Corporation proposes to erect on Town Hill. He suggested that six lights be installed in each of the smaller houses, for which a sum of 1s. 2d. should be added to the weekly rent, this amount to include installation, the supply of electrical energy, and the supply of one metallic-filament lamp per annum; the six lamps to average not more than 32 c.p. per lamp. The chairman strongly recommended the adoption of the proposal, which would be the first of its kind in Swansea, and it was agreed to.

**Swinton.**—The electrical engineer has submitted an estimate of the cost of electrically lighting Cromwell Road and Warwick Street, and the matter has been referred to a Sub-committee of the Council.

**Torquay.**—The electrical engineer has prepared a model showing the proposed scheme of illumination of the Winter Gardens. Prices are to be obtained from firms for carrying it into effect.

**Tunbridge Wells.**—Application is to be made to the L.G.B. for sanction to the borrowing of £3,100 for the purpose of mains, sub-station pillars, transformers and house service. Notice has been given the Tunbridge Wells Gas Co. of the Council's intention to convert a further 50 gas lamps for electric lighting in the streets in which cables are already laid.

**Wakefield.**—The city electrical engineer, having reported that the question of extension of plant and mains, to ensure continuity of supply next winter, should be taken into consideration, the matter is to be dealt with at a special meeting of the Electricity Committee.

**Walsall.**—The Electric Lighting Committee has received a protest from the Local Tradesmen's Association against the increase in the charge for electricity for lighting purposes from 4d. to 5d. per unit.

**West Hartlepool.**—At last week's T.C. meeting it was reported that the new generating station would be in working order by the next meeting of the Council.

**Wimbledon.**—The Council has offered to supply energy for power purposes, at 1½d. per unit, to the site of the L. & S.W. Ry. Co.'s new railway power house off Durnsford Road, for the use of the contractors, &c.

**Workshop.**—At the last meeting of the U.D.C., the clerk reported upon the financial position of the Council. With regard to electric lighting, it was explained that the total income (including £1,226 charged for street lighting) was £6,271. The expenditure on the revenue account was £3,165, and after allowing £100 for machinery, £160 for reserve stock of coal, and £2,382 for repayment of loan and interest, the net profit was £139. Surprise and regret was expressed at the small profit, and considerable discussion took place. Several members urged that in future the energy supplied for public lighting should be charged for by meter, and not at a fixed charge of £15 per annum per arc lamp, and £3 per incandescent lamp. The chairman having pointed out that there were abnormal items of expenditure during the year, the matter was referred to the Committee, together with a proposal to substitute underground cables in certain streets instead of overhead wires.

**Wrexham.**—The T.C. has decided to supply electricity for three months for a showroom, and to provide a youth to assist therein, to a firm who have offered to open a showroom for electrical devices and to canvass for electric wiring and fittings; the firm desired the Corporation also to pay the rent of the showroom, but the Council declined to do this.

## TRAMWAY and RAILWAY NOTES.

**Aberdeen.**—The Corporation's first week's experience of pay-as-you-enter cars on the Woodside route has been entirely satisfactory. Compared with the corresponding week in 1912, when ordinary cars were in service, there was an increase of over £57 in the receipts, of 11,275 in the number of passengers carried, and of 403½ in the number of miles covered.

**Aldershot and Farnborough.**—The Light Railways Co. has applied to the B. of T. for an extension of time until June 4th, 1914, for commencing and completing the works under the 1909 order.

**Birmingham.**—The receipts from the working of the Corporation tramways during the year ended March 31st last amount to £574,248, an increase of £140,200 over the previous year. Against the total income for the 12 months (£581,566) there is an expenditure of £370,178, which works out at an average of 6'764d. per car-mile, as against 6'907d. in 1912. Of this total, £160,277 or 2'929d. per car-mile went towards traffic, and £100,725 or 1'840d. to power expenses. According to the report of the Tramways Committee, there is a net profit of £101,352, after meeting interest and sinking-fund charges and charging the expenses of promoting the Birmingham Corporation Bill, 1912, and the Halesowen Light Railway order, amounting to £5,896. From this sum the Committee proposes to place £45,000 to reserve fund, which will then amount to £220,368, and to transfer the surplus of £56,352 to the borough fund. Referring to the receipts, the Committee attributes the large increase partly to the receipts from new tramways, and partly to the fact that the receipts for a full 12 months' working on the Bristol Road, Pershore Road, and Handsworth lines have been brought into account, as against only nine months the previous year. As regards rolling stock, the Committee states that in connection with the new tramways authorised by the Birmingham Corporation Act, 1912, now in course of construction in the Hagley Road, and the tramways about to be constructed in the Warwick Road, and Stratford Road (from College Road to Hall Green), it is necessary to purchase 40 new tramcars, and in order to augment the existing tramway services it recommends that 75 new cars be purchased at a cost of £83,000, including spare electrical equipment and incidentals. The question of constructing tramways from the Selly Oak tramway terminus through Northfield to the city boundary at Longbridge has also been under the consideration of the Committee, which is actively engaged in preparing a scheme for this purpose, which it hopes will be ready for submission to Parliament next year. The Council already possesses power to provide a service of omnibuses in prolongation of any tramway route in the city, the extension of which is contemplated by the Corporation. The Committee expresses the opinion that it is desirable that in accordance with this section, a service of omnibuses should be immediately instituted, and recommends the purchase of 10 suitable buses for this purpose at a cost not exceeding £10,000, to include spare parts and other equipment.

**Black Country.**—Towards the close of last week there was grave danger of the employees on the South Staffordshire and East Worcestershire Tramways coming out on strike, in which event the whole Whittetide traffic would have been dislocated, but happily, wiser counsels prevailed. A short time ago a memorial on behalf of the men, claiming increased wages for all grades and better conditions of employment, was presented to the British Electric Traction Co., and subsequently representatives of the men interviewed the leading officials of the company, who promised a definite reply within 10 days. The notice of the men expired on Friday last week, on which day a letter was received from the company intimating that their decision had been postponed until this week. This aroused considerable indignation amongst the men,

who, at first, seemed determined to strike, but eventually decided to take no drastic action until the receipt of the company's decision. If, however, that should not prove conciliatory, the temper of the men is such that the tramway services in the Black Country may be peremptorily suspended.

**Bolton.**—At a meeting of the T.C. on May 7th, it was suggested that the amount of £13,500, which was being allocated from tramway profits in relief of rates, was excessive, and that £10,000 was ample. Ald. Miles said if he told them what the Committee could have given to the relief of rates they would be surprised. The rates had a perfect right to the money allocated. The minutes of the Tramways Committee which had relation to the allocation of £13,500 were then approved.

**Bournemouth.**—At the last meeting of the Council, the general manager of the Corporation Tramways (Mr. Bulfin) presented his annual report for the financial year ending March 31st, 1913. The total receipts and revenue for the year amounted to £96,720, being an increase of £4,323 on last year's result, which up to this date was a record, the receipts per car-mile being 12 33d., in place of 12'022d. in the previous year. The working expenses, exclusive of capital, amounted to £52,640, being a decrease on last year's expenses of some £2,190, and, having regard to mileage run, established a record for the system, the percentage of working expenses to receipts working out at 54'83 per cent., as against 59'83 per cent. in the previous year, and the working expenses per car-mile were reduced from 7'13d. to 6'71d. The large advance in receipts was mainly due to the alteration of the services on the side routes, the revenue being increased by some £900 at a reduced car-mileage of over 4,000; the adoption of the bonus scheme for the best takings on all routes, which made the staff more keenly alive to intending passengers, and the advantage of two Easters occurring in the one financial year. The working expenses showed a decrease under each of the separate headings with the exception of power, a slight increase here being due to the higher price of coal. The total sum spent in renewals was £2,470. The capital and loan charges for the year amounted to £34,000, making the total costs £86,640, and leaving a net balance of some £10,080 to be carried to the renewals fund. As regarded the coming financial year, the general manager pointed out that the reduction of hours to the traffic staff and the increase in wages granted to the other employees meant an extra cost of some £1,500 a year; the increased cost of coal and materials an additional £1,000; no Easter occurring in the coming year meant a loss in receipts of some £1,500, making a total extra charge to the undertaking of £4,000. It was hoped the revenue from Sunday cars, advertisements in cars, and charges on parcels might make good this extra amount, but, in order to maintain the undertaking in its present financial position, it was absolutely necessary that no further concessions of any kind should be granted.

**Burnley.**—The Tramways Committee has made a recommendation that the centre poles on the local tramway system be removed, and replaced by side poles, with wire suspensions, at an estimated cost of £775.

A Sub-committee of the Tramways Committee is to meet a deputation from the Rawtenstall Tramways Committee to consider the question of establishing better communication between Burnley and Rawtenstall.

**Bury.**—The report of the general manager of the tramways states, in addition to the information given last week, that in order to provide the extra number of cars required at the week ends, and, if possible, to avoid the use during inclement weather of cars which are not fitted with top-deck covers, it has been decided to purchase four additional 56-passenger double-deck single-truck cars, fitted with top covers, similar to those already in use, with the exception that the staircase and platform have been re-designed, so as to allow the ends to be covered in for the better protection of the motormen, in case the Corporation eventually decides that this is to be done.

**Continental Notes.**—**FRANCE.**—The light railway system in the Valenciennes district belonging to the Société Economique du Nord is about to be electrified, and at the same time greatly extended; at the present time the line is mainly a single one, which is the cause of much delayed traffic. Under the new scheme a double line is to be constructed and all level crossings suppressed. The necessary electrical energy for the line will be supplied from a new power station which is being established near Valenciennes by the Société d'Electricité de Valenciennes-Anzin.

**GERMANY.**—A new company has just been formed in Berlin with a capital of £5,000 and the title Die Automobil Droschken-Gesellschaft "Elektric" to start a new service of electric taxicabs in the German capital.

**RUSSIA.**—The horse tramways in the town of Tasikent have now all been converted to electric traction, the last horse having just been taken off the service. There are at present 9½ miles of line in operation, and 10 miles more have yet to be built. The company has applied to the municipal authorities for a concession for the supply of electrical energy for public and private lighting and power purposes in the town.

**SPAIN.**—La Société des Tramways de Barcelona has entered into a contract with the Compagnie Barcelonaise d'Electricité for the supply of all the energy for its different tramway lines in Barcelona as from January 1st, 1914. The necessary electrical energy will be supplied from the large hydro-electric power stations which the last-named company is establishing in the Upper Pyrenees.

**SWITZERLAND.**—Plans have been prepared in respect of a proposed narrow-gauge electric railway between Arzier and St. Cergue, and to La Cure and Morez. The line would be about 25 miles long, about 8 miles of which would be in French territory.

**NORWAY.**—Work is well in hand on the conversion of the railway between Christiania and Drammen, a distance of about 33 miles, from 3 ft. 6 in. to the standard gauge, and also to electric traction. As far as Sandviken, 8½ miles, a double line will be laid. The question whether the necessary energy shall be taken from privately-owned companies, or whether the Government will establish its own power station, has not yet been decided. As regards the rolling stock, 17 electric locomotives of from 320 to 800 H.P., and 11 combined locomotives and carriages of 300 H.P., have been ordered. The latter are intended for use with a trailer on the Christiania-Asker section of the line, which has a length of about 14 miles.

**SWEDEN.**—Good progress is being made with the electrification of the railway between Kiruna and the Norwegian frontier. The construction of the transformer stations is now proceeding, and it is expected that the line will be ready for operation before the close of the present year.

**Douneaster.**—The Electricity and Tramways Committee has considered the doubling of the tramway track in the Market Place, and also, as an alternative, the laying of a new track along Silver Street, in order to link up the lines in Sunny Bar and High Street, but after a resolution and an amendment, both of which were lost, it was eventually decided to recommend nothing being done in regard to either proposal before the July meeting of the T.C.

**Dunfermline.**—What was described as an indignation meeting was held last week to consider the failure of the Dunfermline and District Tramway Co. to extend its tramway system to the western boundary of the burgh. A resolution was adopted urging the T.C. to offer strenuous opposition to any application for additional powers within the burgh which the company may make.

**Edinburgh.**—The Colinton Tramways Co. has unanimously approved of the terms of a draft prov. order for an extension to Fountainbridge, Edinburgh.

**Greentland (near Halifax).**—The U.D.C. has resolved that the scheme for the running of the tramways from Elland to West Vale *via* Long Wall be further considered in committee.

**Heywood.**—For the year ending March 31st, 1913, there is a loss on the tramway undertaking of £809. The profit and loss account shows a debit balance of £2,036. The Finance Committee has been recommended to apply a sum equivalent to a rate of 2d. in the £ towards the tramway deficiency, and the balance, amounting to £1,058, is to be carried forward to next year's working account.

**Huddersfield.**—The suggested extension of the Huddersfield tramways from Birchencliffe to West Vale, Elland, is likely to come to a successful fruition, as it is now thought that all financial and other difficulties with the Elland Council have been got over; in fact, some of the members of the Elland Council are to go to London to give evidence in favour of the Huddersfield Corporation's Parliamentary Bill.

**L. & Y. Railway Electrification.**—Last week the heads of several of the departments of the Lancashire and Yorkshire Railway visited Bury to inspect the newly-erected equipment for the electrification of the line from Bury to Holcombe Brook. It is understood that the electrically-driven trains are expected to be in use in two months' time.

**Leeds.**—A resolution was submitted at the last City Council meeting to put into operation 3d. fares on all the Corporation tramway routes. Half-penny fares are in use on some routes, and as the question of fares is to be reconsidered, the matter was not pressed.

**London Tramways Assessment.**—With reference to the circular notice issued by the L.C.C., asking the various Borough Councils to reduce the assessment on the County Council's tramways in their respective boroughs on the ground "that the hereditament had been reduced in value in consequence of the falling-off of the receipts from the tramway undertaking due (among other things) to competition from motor-omnibuses," Camberwell B.C. has decided to insert the assessment of the lines in the borough in the June Provisional Valuation List, at a nominal reduction of £1 rateable value.

**Manchester.**—Consideration has recently been given to the question of the price to be charged for electrical energy supplied for tramway purposes, and a scale has been approved by the Electricity Committee and Tramways Committee respectively. Under this scale the charge to be made by the Electricity Committee to the Tramways Committee for energy supplied for traction purposes, and also for lighting and power purposes at the ca.-sheds and car works, will be at the rate of 1d. per unit, based upon the price of coal at 11s. per ton; the charge for energy will, however, be increased or decreased at the rate of .002d. per unit in respect of each 1s. per ton increase or decrease. The charge mentioned will apply so long as the consumption for traction does not exceed 30,000,000 units per annum. If and when that is exceeded the supplies for all purposes, over and above 30,000,000 units, will be charged for at the prevailing rate which the electricity department charges to large industrial power users under similar conditions of supply. The arrangement is to be in force for a minimum period of three years, but either Committee

has the option of determining the agreement in the event of the City Council altering the basis upon which the contributions from the profits of the undertakings to the relief of the rates are made, thereby increasing the amount of such contributions.

The Corporation Tramways Committee has instructed the general manager to submit a report upon the suggestions recently made by a deputation which urged the adoption of half-penny fares and an all-night service of cars.

At the City Council on Wednesday last week, Councillor Clyne asked if the agreement of Mr. J. M'Elroy, the tramway manager, did not preclude his devoting any time to tramway work for other undertakings. He had acted as arbitrator in a tramway matter concerning Bradford and Leeds, and for eight days' services he was said to have received £165. Dr. Chapman said the Committee gave its permission as it was necessary that the arbitrator should be a gentleman connected with a municipal undertaking. The payments were high, but the bulk went to the special lawyer engaged to draw up the agreements. Councillor Clyne expressed himself satisfied with the answers given.

**Nelson.**—The B. of T. has sanctioned the running of a goods wagon on the tramways between Nelson and Padisham, and Burnley and Harle Syke, for a further period of six months.

**Newport.**—So far the rearrangement and increase of the tramway fares at Newport have benefited rather than hurt the concern. The first week of the changed fares showed that there was a total of 162,218 passengers and of £701 in takings, as compared with 156,852 passengers and £631 in takings in the corresponding week of last year.

**Rochdale.**—A threatened strike of tramway employees has been averted. The trouble arose in consequence of the suspension of a motorman, who declined to turn out for a fresh spell of duty when requested to do so by an inspector. The Tramways Committee heard his explanation last week, and subsequently it was announced that the Committee, whilst regretting the man's act of insubordination, and also that he did not seek an interview with the manager, had decided to annul the effects of the week's suspension, and pay him the week's wages which he missed. The men expressed satisfaction with the decision.

**Rotherham.**—The manager reports an increase of £6,858 in the total receipts of the tramways department, as against the previous year, the actual figures being £42,714, as against £35,856, an increase of 19½ per cent. This increase, he states, is largely due to the extension of the Broom Road and Dalton sections, and to the additional feeding value to the former of the Maltby trolley bus system. The receipts per car-mile are on a paying basis on each section except the Broom section, and there is no doubt that on a full year's working, the receipts per car-mile on this section will prove to be a satisfactory figure. The number of car-miles run were 772,610, as against 720,132, and the number of passengers carried increased from 7,813,922 to 8,774,539. The cost of repairs to permanent way during the year amounted to £1,262, and to cars £3,332. The gross profit of £13,966 compared with £10,642 obtained in the previous year, and represented £34d. per car-mile, as compared with 32½d. for the previous year. After deducting the usual allowance for redemption of debt and contribution to sinking fund and interest, the net profit was £5,787, as against £3,723 in 1911-12.

**South Shields.**—At a meeting of the T.C. on the 7th inst., Alderman Wylie, in moving the adoption of the Tramway Committee's report, stated that the new system of penny fares had proved a great success, and, in the opinion of the manager, had met the convenience of the public better even than had been expected. Now the traffic was divided between two routes, instead of being largely restricted to one, and there had been a great levelling-up of the traffic. The increase of receipts had been very satisfactory, and the increase of the number of passengers carried had been as follows:—Ordinary adult fares, 14½ per cent.; children's fares, 15 per cent.; penny workmen's fares, 55 per cent.; and in 2d. workmen's fares, as against 3d. fares, 240 per cent.

**Swansea.**—The T.C. has decided to apply to the Light Railways Commissioners for an order to construct three lines of railways in the borough, which will join the existing tramways at various points.

**U.S.A.**—After numerous tests of an experimental locomotive which will develop 5,000 H.P. for short periods, the New York Central Railway has placed an order for nine similar locomotives with the General Electric Co. The new engines will weigh 100 tons, or 15 tons less than those now in use; this weight is carried on four two-axle bogie-trucks, and every axle will carry a motor, no gearing being employed. The motors are electrically connected permanently in parallel in pairs, and the pairs can be connected in series, series-parallel and parallel. In order to obtain flexibility, the locomotive is built up of two 22-ft. trucks, hinged together at the centre, and each mounted on two two-axle bogies. The cab, which is 33 ft. long, is mounted on the centre pins carried on these trucks. The locomotives are designed to haul a 1,600-ton train at 60 miles per hour continuously, developing 1,400 H.P., but, as previously stated, they can develop 5,000 H.P. for a short period.

**Wakefield.**—The City Council has decided to oppose the Morley Corporation Bill, unless the promoters give an assurance to amend the Bill so as not to be able to construct a railless trolley system on any part of the route over which the Yorkshire (West Riding) Electric Tramways Co. has power to construct light railways.

**Warrington.**—Last week it was reported that the Corporation tramways had had a record year, the profits having increased from £2,456 to £2,981. The reserve fund now amounts to £10,000, and the system has paid £6,000 towards the reduction of the rates, including £1,500 in the latest returns.

**Wigan.**—The profit on the past year's working has been £1,178 compared with a loss in the previous year of £4,189.

## TELEGRAPH and TELEPHONE NOTES.

**Imperial Wireless System.**—On Wednesday last week the report of Mr. G. W. Knox and the chairman on their examination of the pass-books submitted by Sir Rufus Isaacs and Mr. Lloyd George was received by the Select Committee on the Marconi contract. No items were found relating to dealings in Marconi shares, except those already explained to the Committee.

Mr. Marconi then made a long statement, reviewing the history of wireless telegraphy from the date of his first experiments in 1895. He said that he first received signals across the Atlantic by day on December 12th, 1901, and official messages were transmitted on December 16th, 1902. A news service was commenced in March, 1903, but was discontinued on account of increasing difficulties as the spring advanced. At every stage he experienced the necessity of increasing the power of the plant employed. In 1905 he patented his horizontal directional aerial, which at once brought about a most marked improvement in the strength of signals; it was from this point that real progress in long-distance work was dated. He had used wires laid on the ground for war purposes in Tripoli, but that method was not suitable for commercial work. To achieve equal efficiency without the horizontal aerial, a mast two or three times as high as the Eiffel Tower would be necessary. In October, 1907, a service of Press messages was inaugurated between England and America, and in 1908 commercial service was commenced, and had never been discontinued except when the station at Glace Bay was destroyed by fire. In October, 1910, messages were transmitted from Clifden to an Italian ship over a distance of 3,473 miles by day, and from Clifden to Buenos Ayres at night, 5,849 miles. Communication was carried on between Coltano and Massana, 2,238 miles, and between San Francisco and Honolulu, 2,078 miles, the former span including 1,599 miles over land surface, partly in the Tropics. He had been responsible for the equipment on over 1,000 ships, and four stations working over 2,000 miles, as well as 20 stations having ranges of over 1,000 miles. His present long-distance system included several patents which he considered as important as the "four sevens" patent, and these, together with his experience and that of 200 able engineers, and an expenditure of £360,000 on experimental work, constituted the right for his company to ask what he considered very reasonable terms for the long-distance stations required by the Government. His system had been developed without the assistance of the Government. He could not agree that the system used by the British Admiralty materially differed from his own system; he had inspected the installation on a British warship in September, 1911, and stated that the system there installed was the Marconi system pure and simple. He was employing a continuous-wave system at Clifden without any sparks whatever; it was wrong to say that the Marconi system was a spark system. Automatic working was not new; he had used it in his trans-Atlantic service, and was prepared to transmit and receive automatically on that service. If the Poulsen system were adopted for the Imperial stations, every installation on board British ships would have to be altered before it could receive messages from the long-distance stations. His company never sought to purchase the Poulsen patents. He totally disagreed with much of the evidence given by Mr. Taylor, of the Post Office, and statements by Sir Henry Norman. The U.S. Government had a number of Marconi stations at work and under construction, and the Marconi Co. had important agreements with the French Government. Sir H. Norman had said he believed there was no experience of working 2,000 miles largely over tropical lands; yet Sir Henry had visited the Coltano long-distance station, and had been informed there that it communicated with Massana, which was well within the tropics. He had never speculated in the shares of his companies. No syndicate ever existed in connection with any of the shares of any of the Marconi companies. Neither he nor his company was responsible for the fluctuations of the prices in the market. Mr. Marconi protested against the reflections which had been made upon his company and himself for having innocently entered into a contract with the Government; he resented the inquiry into the affairs of his company, which had no relation to the contract, particularly the transactions in America related by Mr. Isaacs, whose evidence he endorsed, and he regretted that the services which his company and he had for so many years rendered to the nation should not have been deemed worthy of higher consideration. He objected to the use of his name as a by-word in party politics. He considered that his was the only company that was capable of fulfilling the requirements of the Imperial chain. The long delay had been very hard on his company, which had engineers waiting to do the work; the price of materials had gone up and the circumstances had changed.

The Committee adjourned for the Whitsuntide recess.

**Japan.**—A sum of £300,000 is allotted in this year's Japanese Budget for the provision of new telephone apparatus. It is stated that over 12,000 applications for the installation of the telephone are awaiting attention.

**Long-Distance Wireless.**—On May 9th the wireless station at Nauen, near Berlin, succeeded in establishing communication with the station at Sayville, Long Island, near New York City, a distance of over 4,000 miles.

**Poulsen System.**—It is stated that Mr. A. S. Baxendale is the chairman and managing director of the Universal Radio Syndicate, which has purchased the patents controlling the Poulsen system of wireless telegraphy; the other directors are Messrs. Rommell, Barton and Gandil. Dr. Erskine-Murray has been appointed consulting engineer to the syndicate. Messrs. Werner, Beit & Co., Messrs. Kleinwort, the Imperial Tobacco Co., and Sir Robt. Jardine are said to be interested in the system as shareholders.

**Telephone Rates.**—The Postmaster-General hopes to be able to make an announcement on the subject of the revised scale of telephone rates before the end of June.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdare.**—May 29th. Cables, street work, junction boxes, incandescent fittings for street lighting, meters, &c., for the Council. See "Official Notices" to-day.

**Australia.**—VICTORIA.—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

May 16th.—One 15-ton overhead travelling crane, for the Melbourne City Council. See "Official Notices" May 2nd.

June 2nd.—20,000-volt H.T. switchgear and L.T. switchgear and accessories, for the Melbourne Suburban Railways. See "Official Notices" May 2nd.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" to-day.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" to-day.

TASMANIA.—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" May 9th.

QUEENSLAND.—May 21st. Copper wire and accessories, for the P.M.G.'s Department. See "Official Notices" April 11th.

August 27th.—Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

WESTERN AUSTRALIA.—May 28th. Condensing plant, pump and piping, for a Government power station at Perth. See "Official Notices" May 9th.

July 9th and 30th and August 6th.—Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

June 11th. Metal-filament lamps, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

SOUTH AUSTRALIA.—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

NEW SOUTH WALES.—July 9th. Switchboards, for the P.M.G. See "Official Notices" to-day.

**Austria.**—May 23rd. The Austrian State Railway authorities at Stanislau are inviting tenders for an installation of electric lighting and for a number of electric lifts at the new railway station buildings at Stanislau.

**Barnes.**—May 19th. Feeder and distributor cables, for the U.D.C. See "Official Notices" April 25th.

**Belfast.**—May 19th. Circulating-water pump, for the Corporation Tramways and Electricity Committee. See "Official Notices" April 25th.

**Belgium.**—May 20th. The municipal authorities of Schaerbeek, Brussels, are inviting tenders for a low-tension network of mains in connection with the electric lighting undertaking. Particulars from the Service de l'Electricité, 30, Rue de la Roche, Schaerbeek.

May 24th.—The Belgian telegraph authorities in Brussels (La Salle de la Madeleine) are inviting tenders for telephonic apparatus for central-battery operation at the headquarters in Antwerp.

**Bulgaria.**—May 29th. The District Administration of Finance in Sofia is inviting tenders for the supply of two boilers, two steam engines, three dynamos and an electric motor, with accessories, for the Bulgarian State Collieries at Pernik.

**Colchester.**—May 27th. Steam coal for a year (about 5,000 tons) for the Corporation electricity department. Mr. W. Frisby, Borough Electrical Engineer, 36, Osborne Street.

**Croydon.**—May 29th. Electric lighting of the fire station and library, Thornton Heath, for the Corporation. See "Official Notices" to-day.

**Derby.**—May 23rd. One 750-kw. motor-alternator, for the Corporation. See "Official Notices" May 9th.

**Douglas (Isle of Man).**—May 19th. Good steam coal (about 190 tons) double screened for the cable tramways. Mr. A. Robertson, town clerk.

**Dundee.**—May 30th. Steam and feed piping, steam feed pumps and hot-well tank, &c., for the Corporation electricity department. See "Official Notices" to-day.

**Glasgow.**—May 26th. Two steam turbo-alternators, with condensing plant (5,000 kw. and 2,000 kw. respectively), for the Corporation Tramways Department. See "Official Notices" April 26th.

**Grimsby.**—Pipework, extension of Klein cooling towers, conduits, seven-way D.P. distribution board and motor-driven rotary air and water extraction pumps and circulating pump, for the Corporation. See "Official Notices" May 2nd.

**Leeds.**—May 19th. Economiser chamber at the generating station, Whitehall Road; extension of engine room flooring at generating station, Whitehall Road. Specifications, &c., from 1, Whitehall Road, Mr. C. N. Hefford, engineer.

**London.**—L.C.C.—May 28th. Electrical installations at Lewisham Bridge and Fairfield Road (Bow) elementary schools. See "Official Notices" May 9th.

Applications are invited from persons and firms wishing to be included among those from whom the Council invites tenders for the supply of stores and the execution of general maintenance contracts. See "Official Notices" May 9th.

June 3rd.—High and low-tension cables for Tramways Department. See "Official Notices" to-day.

MILE END.—Two 30-kw. and one 15-kw. compound engines and dynamos, for the Guardians (from municipal authorities only). See "Official Notices" May 9th.

ROYAL MINT.—May 19th. 50 tons of copper in ingots. See "Official Notices" to-day.

METROPOLITAN ASYLUMS BOARD.—June 4th. Extension of internal telephone system and installation of signal bells at the Western Fever Hospital, Fulham, S.W. See "Official Notices" to-day.

**Malta.**—May 22nd. Arc lamp carbons. Receiver-General and Director of Contracts, Valletta. Forms, &c., from Crown Agents for the Colonies, Whitehall Gardens, S.W.

**Manchester.**—May 20th. (a) Canopy trolley standards; (b) steel fishplates for tramway rails; (c) steel tie bars for tramway rails; (d) pitch for paving purposes, for the City Tramways Committee. Mr. J. M. McElroy, General Manager, 55, Piccadilly.

**Mexborough.**—May 30th. Lancashire boiler, for the U.D.C. electricity department. See "Official Notices" April 25th.

**New Zealand.**—CHRISTCHURCH.—May 22nd. City Council. Two 500-kw. converters and switchboard panels. Tenders, c.i.f. Lyttelton, to office of High Commissioner for N.Z., 13, Victoria Street, S.W. Specification, &c., at Board of Trade C.I. Department in London.

**Portsmouth.**—June 11th. Wiring for electric light installation at Workhouse Infirmary extensions, &c., Milton. See "Official Notices" to-day.

**Rathmines and Rathgar.**—May 19th. Electrically-driven jet condensing plant, for the U.D.C. See "Official Notices" May 2nd.

**Rochdale.**—May 21st. Boiler feed pumps, for the Corporation Electricity Committee. See "Official Notices" May 2nd.

**Salford.**—May 19th. Tenders invited for 10 car bodies and 10 Brill trucks. Tramways General Manager, 32, Blackfriars Street, Salford.

Wiring of new secondary school, Pendleton, for the Education Committee. See "Official Notices" to-day.

**South Africa.**—STELLENBOSCH (CAPE PROVINCE).—June 4th. The Municipality is requiring tenders for buildings, generating plant, cables, public lighting, meters, &c., in connection with the electric lighting scheme. Specifications from Prof. Bohle, South African College, Cape Town.

Two 40-kw. Diesel engines and dynamos, pipework, battery, feeders, aerial cables, street lamps, &c.

**Spain.**—May 24th. The municipal authorities of Tabanera de Cerrato (Palencia province) are inviting tenders for the concession for the electric lighting of the town during a period of eight years.

May 29th.—Tenders are being invited by the municipal authorities of Almeria for the concession for the electric lighting of the town during a period of 15 years.

Tenders have just been invited by the municipal authorities of Urda (province of Toledo) for the concession for the electric lighting of the town during a period of 12 years.

**Walthamstow.**—May 28th. Natural draught cooling tower, for the U.D.C. Electricity Department. See "Official Notices" May 2nd.

## CLOSED.

**Barrow.**—The B. of G. has accepted the tender of Mr. Drysdale, Barrow, amounting to £670, for the electric lighting of the workhouse.

**Belgium.**—Six German and two Belgian concerns competed for the contract, last week, for the supply of armoured high-tension cables required by the municipal authorities of Schaerbeek, Brussels, in connection with their electric lighting undertaking. The lowest tender was that of the Société des Ateliers de Constructions Electriques, of Charleroi.

**Birmingham.**—The Corporation has placed a contract with the Electro-Mechanical Brake Co., Ltd., of West Bromwich, for 40 Maley electro-mechanical brakes of a new design for maximum traction bogie trucks, after test of a trial brake. This is the second large order placed with the same company by the Corporation.

**Blackburn.**—The Corporation has placed a contract with the British Westinghouse Electric and Manufacturing Co., Ltd., for a turbo-generator for the electricity works.

**Cheltenham.**—The T.C. has accepted the tender of the British Westinghouse Co. for the new condensing plant at the electricity works, at £1,000.

**Doncaster.**—The Electric and Tramways Committee has recommended the acceptance of the following tenders in connection with the supply of new tramcars:—

United Electric Car Co., Ltd.—Car bodies, with top covers, at £456 each.  
Peckham Truck Co.—Pendulum trucks, at £90 10s. each.  
Dick, Kerr & Co.—Electrical equipments, at £284 10s.

**Dover.**—The T.C. has received the following tenders for 4,000 tons of coal (washed nuts) for the electric light works:—

W. Cory & Son.—17s. 9d. per ton.  
Featherstone Colliery Co.—17s. 4d.  
Settle, Speakman & Co.—Queenboro' washed nuts, £1 1s.; and Pearl slack, 18s. 10d.  
Myers, Rose & Co.—18s. 3d., with alternative prices ranging from 17s. 5d. to £1 0s. 2d.  
Main Colliery Co., S. Wales.—19s. 7d.  
Mowll & Co. (Dover).—Washed steam smalls (Hagmore), 16s. 11d.; Hastings steam smalls, 16s. 11d.; and another kind, 17s. 5d.

A truck load of Mowll & Co.'s coal, at £1 1s. 5d. per ton for the sample, is to be tried, and if satisfactory, that firm's tender is to be accepted; otherwise, the contract is to be placed with the Featherstone Colliery Co., last year's contractors, at 16s. 2d. per ton.

**Eastbourne.**—The T.C. has received the following tenders for the supply and erection of a coal conveyor at the electricity works:—

Rownson, Drew & Clydesdale. (accepted)  
R. Dempster & Sons, Ltd.  
Walton & Clough, Ltd.  
Mechan & Sons.

Babcock & Wilcox, Ltd.  
F. Dennis & Co., Ltd.  
G. Robson & Co.  
Strachan & Henshaw, Ltd.  
Spencer & Co., Ltd.

The T.C. also received tender from the following for flame arc lamps for public street lighting:—

Electrical Co., Ltd. (accepted)  
Engineering and Arc Lamps, Ltd.  
Maxim Lamp Works, Ltd.  
Siemens Bros. Dynamo Works, Ltd.  
Oliver Arc Lamp Co., Ltd.  
Jandus Arc Lamp and Electric Co.

G. Braulik.  
Johnson & Phillips.  
Ridings Arc Lamp Co., Ltd.  
Union Electric Co., Ltd.  
Electrical Engineering and Equipment Co.

The question of the sale of the old lamps and transformers has been deferred.

**Finchley.**—At the last meeting of the U.D.C. the following tenders were received for the supply of a new oil engine for the electricity works:—

(1) Cole, Marchant & Morley, Ltd.	£2,650
(2) Williams & Robinson, Ltd.	2,857
(3) Burmeister & Wain, Ltd.	2,850
(4) Swiss Loco. and Machine Works	2,950
(5) R. Hornsby & Sons, Ltd.	3,051
(6) Consolidated Diesel Engine Co.	3,123
(7) Hick Diesel Engine Co., Ltd.	3,147
(8) Ditto (alternative for horizontal engine)	3,235
(9) M.A.N. Co. (vertical)	3,391
(10) Mirlees, Bickerton & Day	3,925

The Electricity Committee reported that tenderers Nos. 1, 2, 3, 6 and 9 had not agreed to any system of deferred payments; tenderers No. 4 offered an engine at 200 revs. per minute in place of a maximum of 180 as specified. They recommended that the tender of Messrs. Hornsby be accepted, their price, on a system of deferred payments (one-third on delivery, one-third 12 months after delivery, and one-third 18 months after delivery), being:—Engine, £3,428; generator, £834; bedplate, £65. In the discussion which ensued.

Councillor Nicholls asked if it was a fact that the reason for not accepting the lowest tender, £2,650, was that that tenderer would not supply an engine on the deferred-payment system. Councillor Syrett replied that machinery was a matter that required other consideration than figures. The Committee had to take into consideration the efficiency of the machine and economy in working. The engineer was satisfied that the engine recommended was the cheapest, taking everything into consideration. Councillor Batcher asked what was the spot cash price for the machine. It did not seem a very great business proposition for a Council like theirs to buy an engine on the hire-purchase system. Councillor Syrett replied that the spot cash price was £3,051 and the Council would have to pay £3,218. The principle had already been adopted by the Council. On two occasions the Council had sanctioned the purchase of an oil engine out of revenue. The only other method was by loan, for which the sanction of the L.G.B. must be obtained. That meant unnecessary delay and expense, besides adding to capital. The Council would have to pay 6 per cent. under the deferred-payment system. It was not at all unusual to buy machinery on the lines proposed. The Committee would have preferred to pay cash if it had the revenue, but it had not £4,000 to its credit. After it had paid off the final instalment, the revenue account would be in as good a condition as ever. The Committee's recommendation was eventually carried by six votes to four.

**Glasgow.**—The following contracts have been entered into for the ensuing 12 months by the Tramways Committee:—

Steel car wheels.—John Baker & Co., Ltd., and Hadfield's Steel Foundry Co., Ltd.

Steel tires.—Brown Bayley's Steel Works, Ltd.

Steel axles.—Glasgow Railway Engineering Co., Ltd.

V.I.M. cables.—Siemens Bros. & Co., Ltd., and B.T. & Helsby Cables, Ltd.

Chilled iron brake blocks.—Miller & Co., Ltd.

Fireclay goods.—Glenboig Union Fireclay Co., Ltd., and Currie & Co., Ltd.

Spring.—Geo. Turton, Platts & Co., Ltd., and L. Sterne & Co., Ltd.

Steel tool, &c.—Ibbotson Bros. & Co., Ltd., and L. N. Ledingham & Co.

Wrought-iron tubes, &c.—Stewart & Lloyds, Ltd., and Scottish Tube Co., Ltd.

Cotton waste, &c.—Wm. Wiseman & Son, R. & W. Cuthbertson, and Jas. Paxton & Co.

Ordinary contracts closed included:—

Scrap copper, field coil, armature coils.—F. W. Harris.

Brass.—G. Bill-Gozard.

Lead-covered cable.—Tinsler & Allison.

Rubber cable.—Ballardie, Holden & Co.

Zinc and dry cells.—R. M. Easdale & Co.

Rubber.—John Wilson.

Cast-iron stopping place sign-posts and brackets.—J. & A. Law, Ltd.

The Electricity Committee recommends the acceptance of the following for 12 months:—

C.I. joint boxes, section pillars, &c.—Carron Co., Ltd.; Falkirk Iron Co., Ltd.; McDowell, Steven & Co., Ltd.

Fireclay bricks.—Heathfield & Cardowan Co., Ltd.; Glenbuing Union Fireclay Co.

Wooden troughing and cover.—Robinson, Dunn & Co.

Malleable iron tubes and fittings.—Scottish Tube Co.

The T.C., at its next meeting, will be asked to approve of the following:—

It having been reported that the electrical engineer had completed an electric lamp for constables, which had been thoroughly tested and had given entire satisfaction; that the necessary plant for recharging the lamps had been fitted up, and that, to substitute electric lamps for oil lamps at present in use, 850 would be required, authority be granted to said engineer to obtain offers for additional lamps (100 being already in use), that official submitted six offers, and the sub-committee, having considered the same, agreed to recommend that 100 lamps be obtained from each of the following firms, viz.:—Messrs. Watson & White, Messrs. Ross & Co. and Messrs. Peto & Radford (per Messrs. Colin Scott & Co.).

**Hereford.**—The T.C. has accepted the tender of Callender's Cable and Construction Co., Ltd., for cables, at £833; and that of the Rees Roturbo Manufacturing Co., Ltd., for pumps and motors, at £415.

**King's Lynn.**—The T.C. has accepted the following tenders:—Messrs. Browett, Lindley & Co., Ltd., one 400-kw. high-speed steam engine, £1,289; steam, exhaust and feed pipes, foot-plates, &c., £427; the Rees Roturbo Manufacturing Co., Ltd., one rotary jet condensing plant, £305; the Phoenix Dynamo Co., Ltd., one 400-kw. dynamo, £500; total, £2,521. The Committee also accepted the tender of Mr. W. F. Smith, of King's Lynn, amounting to £778, for the erection of an additional boiler house.

**Lancaster.**—The T.C. has accepted the tender of Messrs. Milnes, Voss & Co. for two top-deck covers for tramcars, at £120 each.

**London.**—HAMMERSMITH.—The B.C. is to enter into a contract with the Main Colliery Co. for an annual supply of free burning coal to the Electricity Department, at 17s. 6d. per ton.

BATTERSEA.—The B.C. has accepted the tender of the Rees Roturbo Manufacturing Co., at £955, for additional pump-house plant at the generating station.

SOUTHWARK.—The following tenders have been received by the B.C. for machinery required in connection with the plant extension at the electric lighting station:—

#### CONDENSING PLANT AND COOLING TOWER.

	Condenser.	Cooling tower.
Klein Engineering Co. . . . .	£4,136	—
Worthington Pump Co. . . . .	3,570	—
Rees Roturbo Co. . . . .	3,895	—
Isaxo Storey . . . . .	3,180	—

Whip & Burne . . . . .	—	—	725
Electric Construction Co. . . . .	—	—	62
Bertram Thomas . . . . .	—	—	517
Ferranti, Ltd. . . . .	—	—	827
Union Electric Co. . . . .	—	—	691

The Electric Light Committee recommends the acceptance of the following tenders:—

General Electric Co., Ltd.—Two 1,500-kw. turbo-generators and rotary converters, £7,980 and £10,030 respectively.

Bertram Thomas.—Switchboard, £517 (provisionally).

Davenport Engineering Co.—Surface condensing plant and cooling tower, £5,418 and £2,187 respectively.

Babcock & Wilcox, Ltd.—Boiler plant, £6,147.

The Committee stated that, as would be observed, it had not recommended the acceptance of the lowest tender in each case, but, acting on advice, had selected those firms whose machinery was best suited to the work of the station. The recommendations were agreed to.

**Manchester.**—The Corporation Tramways Committee has accepted the following tenders:—

R. Johnson, Clapham & Morris, Ltd., Manchester.—Block tin.

Normanton & Son, Ltd.—Roofing over of the avenues at the Hyde Road car works.

B.I. and Helsby Cables, Ltd.—Tramway rail bonds.

F. Smith & Co., Ltd.—Copper trolley wire.

British Mannesmann Tube Co., Ltd.—Steel tramway poles.

Naylor Bros., Ltd.—Span wire brackets.

The following tenders have been accepted by the Corporation Electricity Committee:—

Reavell & Co., Ltd.—Air-compressing plant for boiler tube cleaning.

W. T. Henley's Telegraph Works, Ltd.; Messrs. Siemens Bros. & Co., Ltd.; I.R. & G.P. and T. Works Co., Ltd.; and Charles Macintosh and Co., Ltd.—Paper-insulated and rubber-insulated cables.

**Morley.**—The T.C. has accepted the tender of Messrs. Bedford & Co. for 1,000 tons of pea slack for the electricity works.

**Rochdale.**—The Corporation Gas and Electricity Committee, on May 7th, placed contracts for 60,000 tons of coal. The prices showed a very substantial increase over last year's figures, when £2,777 more was paid on this account than in the previous year. On the contracts now placed there is an average advance of just over 1s. 1d. per ton, or an aggregate increase of over £3,250.

**Rugby.**—The tender of Mr. S. P. Marsh, Rugby, has been accepted for the electric light installation at New Empire Picture House, now in course of erection in Henry Street.

**Salford.**—The Electricity Committee has accepted the following tenders:—

Lancaster & Tonge.—Brass and gun-metal castings.

British Electric Transformer Co., Ltd.—Three compensator transformers for the meter house, in connection with the bulk supply of electricity, £239 each.

W. T. Glover & Co., Ltd.—Extra-high-tension cable.

Bell Bros.—Crank chamb r oil, 1s. 2d. per gallon, value £988.

M. Wells & Co., Manchester.—Turbine oil, 1s. 5d. per gallon, value £110.

Stern, Sonnenborn Oil Co.—Black oil, 11d. per gallon, £50.

Baxendale & Co.—Wrought-iron tubes and fittings, £60.

L. Andrews & Co.—Mica, rubber gloves, &c., rubber caps, £21.

N. British Rubber Co., Ltd.—Rubber overshoes, 2s. per pair, £2.

Wm. Geipel & Co.—I.R. cables (£200), twin flexible cable (£17), plain white tape (1s. 6d. per lb., £12).

W. T. Glover & Co., Ltd.—I.R. cables (£1 0), multiple-core cables (£300).

John Bassett.—Tin and lead (£150).

Aibion Clay Co., Ltd.—Stoneware conduits, stoneware pipes, cable protectors and bearers (£70).

W. H. Keys.—Bitumen (£4 8s. 6d. per ton, total £240).

W. T. Henley's Telegraph Works Co., Ltd.—Rubber strip (7s. 6d. per lb., £72) and black bitumen compound adhesive tape (£8).

T. Hart.—Cotton driving rope (£40).

**Worcester.**—The City Council has accepted the tender of Messrs. Hough & Jacobsen, Birmingham, at £273, for supplying to Hylton Road electricity station induced-draught fan, ducts, dampers, platform, &c.

**Sheffield.**—The City Council has accepted the following tenders:—

Willans & Robinson, Ltd. Turbo-alternator, £24,119.  
 Stirling Boiler Co., Ltd.—Three water-tube boilers, mechanical stokers, superheaters, economisers, pipework and other accessories, £25,208.  
 Longbottom & Co.—5,000 tons steam coal for the electricity department.  
 Edmund Taylor.—Excavations, retaining walls and extensions to waterway at Neepsend power house site, £10,718.  
 United Electric Car Co., Ltd.—25 double-deck top-covered extended canopy cars, £630 per car, plus 5 per cent. for contingencies.  
 British Thomson-Houston Co., Ltd.—16 G.E. 20 motors for above cars, £105 each; also 15 D.C. controllers for ditto, £23 15s. each.

**South Africa.**—The *African World* states that Germiston municipality has now decided the tenders for the railless traction system, the successful contractors being:—

Hubert Davies & Co.—10 Cedes-Stoll cars, £11,460; overhead fittings, £1,328; and poles, £5,899.  
 Connocks S.A. Motor Garage—Tower wagon, £875.  
 Telegraph Manufacturing Co. (Colonial), Ltd.—Electric mains, £4,061.  
 S. Sykes & Co.—Motor converters, £1,272; and spare stator, £450.

All are Johannesburg firms.

**Tunbridge Wells.**—The following tenders have been accepted by the T.C. for an annual supply of coal to the Electricity Department:—

Myers, Rose & Co.—Bwila large, 26s. 2d. per ton.  
 Main Colliery Co., Ltd.—Dynevor Duffryn, 26s. 8d.  
 Harris, Hardman & Co., Ltd.—South Hetton, 19s. 8d.  
 Wm. Cory & Sons, Ltd.—Shirebrook nutty slack, 18s. 7d.

**Walsall.**—The following tenders have been accepted by the T.C.:—

E. Green & Son.—Economiser, £623.  
 Callender's Cable Co., Ltd.—Laying alternating-current main, £601.  
 British Westinghouse Co., Ltd.—Sub station equipment, £167.  
 Johnson & Phillips, Ltd.—Ditto, £16 10s.  
 Walsall Electrical Co., Ltd.—Overhead telephone wires, £11.

**Winchester.**—The T.C. has accepted the tender of Messrs. Wise & Lansdell, Ltd., for the erection of new offices and stores at the electricity works, at £1,697.

**York.**—The T.C., on May 9th, accepted the tender of Callender's Cable and Construction Co., Ltd., for high-tension cables, at £2,137; and that of the Brush Electrical Engineering Co., Ltd., for four tramway cars, at £2,960.

## FORTHCOMING EVENTS.

**Physical Society.**—Friday, May 16th. At 8 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Some Experiments to Detect  $\beta$ -rays from Radium A," by Drs. W. Makower and S. Russ.

**Junior Institution of Engineers.**—Friday, May 16th. At 89, Victoria Street, S.W. Discussion on "Electrical Propulsion of Ships," introduced by Mr. W. P. Durnall.

Wednesday, May 21st. At 8 p.m. At the I.E.E. Paper on "Heat Accumulators and their Use in Exhaust Steam Turbine Plants," by Mr. A. Allison.

Friday, May 23rd. At 89, Victoria Street, S.W. Discussion on "The Organization of an Engineers' Employment Bureau," introduced by Mr. S. M. Hills.

May 14th. At 3 p.m. Visit the King George reservoir at Chingford.

**Institution of Electrical Engineers (Newcastle Students' Section).**—Monday, May 19th. At 7.50 p.m. At Armstrong College. Annual general meeting.

May 20th—24th. Visit to Paris.

**Royal Society.**—Thursday, May 22nd. Annual Bakerian Lecture, by Sir J. Thomson, F.R.S.

**Concrete Institute.**—Thursday, May 22nd. At 4.30 p.m. Annual general meeting. At 8 p.m. Annual dinner.

**Royal Institution of Great Britain.**—Friday, May 23rd. At 9 p.m. Discourse on "The Secret of the Permanent Magnet," by Prof. S. P. Thompson.

Saturday, May 24th. At 3 p.m. Lecture on "Radioactivity: the Alpha Rays and their Connection with the Transformations," by Prof. E. Rutherford.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—LIEUT.-COL. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, May 19th.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 6th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

Tuesday, May 20th.—"B" Company. As for "A" Company.

Wednesday, May 21st.—All Companies. Annual course of musketry at Purfleet rifle ranges. Railway tickets will be sent to those notifying headquarters of their intention to attend.

Thursday, May 22nd.—"C" Company. As for "A" Company.

Friday, May 23rd.—"D" Company. Ditto.

Saturday, May 24th.—Headquarters will be opened for regimental business from 10 a.m. to 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adjt.  
 For Officer commanding L.E.E.

## NOTES.

**Wanted—Six Hundred Pounds.**—Our readers are already aware that at the annual festival dinner Mr. E. G. Byng offered to give £100 to the funds of the Electrical Trades Benevolent Institution, if nine other firms or gentlemen would do the same within three months from April 16th. The £100 which Mr. Sutton had already given was to be counted as one of the nine; Mr. H. Hirst, through Mr. Sutton, promised a like amount; and Mr. Garcke's promise brings the total up to £400 out of the required £1,000.

It has been thought that some of our generously disposed readers would be willing to follow the splendid example set by these gentlemen and ensure that the conditional offers are fulfilled by making or influencing six other offers. We hope that in later issues it will be possible for us to fill names into the six spaces now standing vacant below:

1	Mr. E. G. Byng	...	...	...	...	...	£100
2	Mr. G. Sutton	...	...	...	...	...	£100
3	Mr. H. Hirst	...	...	...	...	...	£100
4	Mr. E. Garcke	...	...	...	...	...	£100
5	*	...	...	...	...	...	...
6	*	...	...	...	...	...	...
7	*	...	...	...	...	...	...
8	*	...	...	...	...	...	...
9	*	...	...	...	...	...	...
10	*	...	...	...	...	...	...

**Walking Race.**—We are informed that the second annual London to Southend-on-Sea 41½ miles Amateur Walking Race, promoted by the Hackney Walking Club, a club which was formed as a result of the Electrical Trades London to Brighton Walking Race in 1911, took place on Whit Monday, and was the means of bringing to light two excellent novice walkers in S. C. Haynes, of the Associated Fire Alarms, Ltd., and C. H. Malivoire, of the Crypto Electrical Co., who finished first and second respectively. The event, for which no entrance fee was charged, was most interesting throughout, for the first three positions were ever in doubt right to the finish, so close together at times were the leading men. Eight entered, six started, and five finished, Swann, of Southend, retiring at 20 miles, suffering with cramp in the legs. Result:—S. C. Haynes (Associated Fire Alarms, Ltd.), 7 hr. 54 min. 9 sec., first; C. H. Malivoire (Crypto Electrical Co.), 7 hr. 57 min. 16 sec., second; J. H. Williamson (Manchester), 7 hr. 59 min. 25 sec., third; A. Weston (Clapton), 8 hr. 56 min. 50 sec., fourth; W. J. Spayne (Upper Tooting), 9 hr. 22 min. 6 sec., fifth. The record for the course (6 hr. 47 min. 37½ sec.) is held by Mr. A. R. Edwards, late of the May-Oatway Fire Appliances, Ltd. It is probable that a London to Brighton, or 100 kilometres race, may be held in September.

**Copper.**—Messrs. Merton's circular giving statistics for April 30th shows further reductions in visible supplies during the month. English stocks are less by 763 tons. French stocks are less by 311 tons. Stocks in England and France, and afloat from Chile and Australia, stand at 30,437 tons, a reduction of 1,824 tons on the quantity for March 31st.

Total European stocks, including Rotterdam, Hamburg and Bremen, and estimated stocks in other European ports stand at 45,828 tons, a reduction of 1,746 tons on the quantity for end of March. European arrivals from North America were considerable at 33,628 tons, the average being 27,600. Spain and Portugal to England and France were low; to other countries average. Chile shipments were average, Australian low at 2,950 tons (average for past 12 months 3,750 tons). Deliveries, at 45,932 tons, are fairly high, the two preceding Aprils showing 43,000 and 39,000 tons.

American stocks for the end of March were 46,550 tons, or 8,050 tons lower than on February 28th. The world's visible supply on the same date was 91,624 tons, a reduction of 7,649 tons on the quantity for February 28th.

Returns made by the American Copper Producers' Association, quoted by the *Times* of 9th inst., show a decrease in stocks during April of 12,800 tons, the largest decrease for any month since January, 1910, when the drop was 19,000 tons. The total deliveries during April were 73,000 tons, the largest recorded. Of these, home consumers took 35,000 tons, and export 38,000. The production during April amounted to 60,000 tons, less than in March, when it was 60,800 tons.

Commenting on the general situation, a writer in the *Financier* of May 9th points out that the statistical position, combining with a more favourable situation in Europe, is in favour of higher prices. The same article refers to a combination formed to maintain the price of iron, and says that a "somewhat similar combination has taken place with regard to copper." The buyer, however, is hampered by dear money. The general conclusion is that, however the various adverse conditions on this side may affect commercial concerns, the political atmosphere in the States should continue to improve, and with it activity in industries. Naturally, as the largest copper producer, America must strongly influence the market.

**Electricity in the U.S. Navy.**—The Navy Department has recently established an electrical school at the Navy Yard at Brooklyn for the training of marines for electrical work. It is estimated that in a crew of one thousand men on a modern war vessel over 40 skilled electricians will be found.

**Parliamentary.**—**METROPOLITAN ELECTRIC TRAMWAYS (RAILLESS TRACTION) BILL.**—Sir Ivor Herbert's Select Committee of the House of Commons has found the preamble of the above Bill proved; the Bill gives the company power to establish a system of railless traction from Finsbury Park, eastward through Tottenham to a junction with the Walthamstow tramway system, and also contains clauses for the sale or transfer of the undertaking to the Middlesex County Council, which is the tramway authority for the county. The chief opposition came from the Lea Navigation Conservancy Board, in regard to the bridge over the Lea at Tottenham, but matters were adjusted between the parties.

In the House of Commons, on May 6th, the Northern Counties Electricity Supply Bill was read a third time, and in the House of Lords, on May 5th, the following Bills passed third reading:—Wimbledon and Sutton Railway Bill, London Electric Railway Bill, the Metropolitan District Railway Bill, and the Porthcawl and District Gas and Electricity Bill.

**Accident.**—John Stead, of Halliwell Street, Milnrow, was engaged in repairing an electric wire at the premises of the Milnrow Spinning Co., when a pair of pliers fell on to the wires. The flare caught Stead in the face and burned him badly about the eyes. After being treated by a medical man he was removed to the Rochdale Infirmary and detained.

### What Canadian Correspondents think of Canada.

—A young man (non-electrical) who went out to Canada some 10 years ago and has had to rough it, experiencing serious privation, in a brief personal note writes from Alberta:—"Am glad to hear that . . . has emigrated to this part of the world, for this is certainly some country. I came to . . . first in 1910, when there was but one house here and that a log building. To-day there are over 2,000 inhabitants, all fairly prosperous. We have a large stone school-house, two banks, two hotels, a newspaper, a town hall, a fire brigade, four churches, a "co-op," and one policeman. I will send you a copy of our local paper to make you laugh. The ridiculous items, the dogmatic tone of the leaders, the misspells, are common to every paper in the country, and yet each person seems to have had a fair education. Art and literature are at a discount, but science is at a premium. The kids play with miniature aeroplanes, wireless telegraphs, motors, internal combustion engines, &c.; the boys we used to play with—hoops, tops and marbles—are quite unknown."

A friend, who went over from British electrical engineering work to one of the leading cities of Canada some three years ago, delivers himself thus:—

"I am still not enamoured of this country, and would fain return to dear old England if a chance should arise. Do you think that any home firms doing, or desirous of doing, business with Canada, would have any opening at home for a man with Canadian experience, a knowledge of Canadian ways, methods and character? Beyond the mere fact that I earn my living here, there is nothing which tempts me to stay—perhaps both my wife and I are too fond of the Old World to settle down here well; we are fond of historical scenes and old associations which have no existence here; besides, there are few people here who have any ideas at all beyond making money. A knowledge and love of music, painting, sculpture, literature, &c., are very rare indeed, and few people can talk about anything except their own 'shop.'"

Another correspondent, who went out to Canada from England five years ago, after many years' experience with municipal electrical and tramway systems as charge engineer, installation inspector, &c., as well as in machine shops, both in electrical and general mechanical engineering, writes from Alberta:—

"I never, in all that time, sought association with the Institution of Electrical Engineers, as I found so many fellows with scarcely knowledge enough to put up a ceiling rose, pluming themselves with A.I.E.E. on their visiting cards, and I got disgusted at the face of it all, particularly as I found other men whose experience and learning made them stand high in their profession, little caring whether they were known as M.I.E.E.'s or not. However, five years in Canada has changed all that, for out here, where brains and learning are at a discount, and the biggest bluffer gets the most pay, I have come to the conclusion that the only way to make headway is to cram your abilities down people's throats, and make them see that you are 'Someone great.' I have had quite a few jobs since I came out here, and seen examples of electrical work that would make your hair stand on end, yet the salaries paid to the men that did them would make many a 'chief's' mouth water.

"As this place develops they will want a lighting scheme laid out for the town, and a tramway system when the place grows to warrant it, besides large mining plant. I have built a little office, and am selling farm machinery and doing repairs, while I hold my 320-acre farm eight miles away. It's pretty hard work, but I hope the reward is coming, and if I can just have the A.M.I.E.E. as a bit of extra weight at the end of my club, I believe I can drive it into the heads of some of those ignorant financiers that there's a man on the spot capable of doing the work as well as, if not better than, anybody they can get from Montreal or New York.

"With good wishes for the continued success of the ELECTRICAL REVIEW."

Another correspondent (also non-electrical) writing from Vancouver eight months after his arrival, says:—

"After eight months you can imagine me as quite an 'old timer,' long enough out to feel quite at home, and imbued with the infectious optimism that surely permeates and enters into the heart of the man who steps out of the more confined atmosphere, into a Land of Promise. It is a thing that I have never ceased to

wonder at, the spirit of hope that prevails, a man will quit his job, be absolutely 'up against it,' and yet look smiling; he may be sweeping roads one day, a dry-goods clerk the next, and getting tired of that, try his hand at farming; and so the glorious uncertainty goes on, ending, perhaps, by his 'striking good,' and earning enough to take a trip home to the Old Country; returning, of course, to start the same experience all over again.

"For my own part, having a definite end in view, I am running no such risks, but holding to my present situation with the —. They are a fine firm, and treat me well; and I hope to gain the necessary experience from them to enable me, when I can manage it, to strike out on my own account.

"Like most 'green ones' just out, I was tempted to buy a small portion of B.C. (33 x 120), but so far, have not been able to sell again, yet sharing the everlasting hope of all others who dabble in Real Estate, hope to realise at an unheard-of profit, and live happily ever afterwards.

"The short time that I have been here has been a busy time as regards the building that is going on in and around Vancouver; the place is growing at a remarkable pace. The B.C. Electric Railway, who own the tram system, are extending in every available direction. They have the 'Pay-as-you-enter' system, but the overcrowding at certain times of the day is a sight for the gods. As long as you can get at least one foot on, or hang on at the back, you may ride.

"From the door of my little bungalow I have a grand view of the mountains, snow-topped, and every morning on my way to work I have only to 'look up' to receive an inspiration.

"We Englishmen out here have to drop the Old Country way of talking to a great extent, and it is a case of coming to Rome and doing as Rome does. The average Canadian has no love for the man from England unless he is prepared to be as 'one of them,' and I must say, without conceit, they have treated me very kindly and will always do so as long as I let the impression remain in their minds that 'England belongs to Canada; and not Canada to England!'"

**Institution and Lecture Notes.**—**INSTITUTION OF ELECTRICAL ENGINEERS.**—The Council has awarded two Salomons Scholarships of the value of £50 each, one to Mr. Grahame George Dawson, of University College, London; and one to Mr. Robert Burleigh, of the City and Guilds (Engineering) College, South Kensington; and a David Hughes Scholarship of the value of £50 to Mr. John Harsant Lee, of King's College, London.

The Institution Premium, value £25, has been awarded to Mr. A. E. Hadley, for his paper, "Power Supply on the Rand"; the Ayrton Premium, value £10, to Mr. F. H. Whyall, for his paper, "The Use of a Large Lighting Battery in connection with Central Station Supply"; the Fahie Premium, value £10, to Mr. A. J. Aldridge, for his paper, "Practical Application of Telephone Transmission Calculations"; the John Hopkinson Premium, value £10, to Dr. E. Rosenberg, for his paper, "Self-Synchronising Machines"; the Kelvin Premium, value for this year £21, to Messrs. C. C. Paterson, E. H. Rayner and A. Kinnes, for their paper on "The Use of the Electrostatic System for the Measurement of Power"; the Paris Premium, value £10, to Mr. J. S. Peck, for his paper, "Earthed & Unearthed Neutrals on Alternating-current Systems"; an Extra Premium, value £10, to Mr. M. Solomon, for his paper, "Yellow Flame Arcs"; and an Extra Premium, value £5, to Dr. A. C. Michie, for his paper, "The Formation of Deposits in Oil-cooled Transformers."

Students' Premiums, value £10 each, have been awarded to Mr. H. R. Constantine and to Mr. J. Hacking; and £5 each, to Messrs. C. H. Goulden, S. N. C. K. Whitehead, P. Grice and A. T. Robertson.

On Friday, May 30th, at 8.30 p.m., or immediately after the conclusion of the annual general meeting, called for 8 p.m., a paper on "Practical Application of Telephone Transmission Calculations," is to be read by Mr. A. J. Aldridge.

**VICTORIAN INSTITUTE OF ELECTRICAL ENGINEERS.**—The report of this Australian Society for the 1912 session shows satisfactory progress. Seven papers were read on various subjects, including the licensing of wiremen, storage battery practice, electrical cooking and heating, the Diesel engine, and so on. A premium of five guineas was awarded to Mr. Victor Nightingall for his paper on "Electric Cooking and Heating." There is a balance of £148 in hand.

The question of amalgamation with the New South Wales Association was referred to by the president of the Victorian Institute at the annual meeting of the latter body at Melbourne. Mr. J. H. T. Brearley, in reviewing the year's work, said there was now a large section of the New South Wales Association desirous of bringing about amalgamation and the formation of an Australian Institute. The annual report stated that the membership of the Institute was now 165. Mr. W. J. Newbigin was elected president for 1913; Prof. Payne and Mr. W. H. Alabaster were appointed vice-presidents; Mr. A. E. Pepper was chosen as honorary treasurer.

**LIVERPOOL AND DISTRICT AMATEUR WIRELESS ASSOCIATION.**—The usual fortnightly meeting of this Association was held at the Creamery Café, 56, Whitechapel, on May 8th. We are informed that there was a crowded attendance, and a number of new members were nominated. The meeting was a free and easy one; the members had been invited to bring some pieces of apparatus for exhibition and discussion, and this request was well responded to, making a very interesting display. There was also Morse code practice, elementary and advanced. The next meeting will be held at the same Café, on Thursday, May 22nd, at 8 p.m. Communications to Mr. Samuel Frith, 6, Cambridge Road, Crosby, Liverpool, the hon. secretary.

**TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION.**—The Congress of this Association takes place at Blackpool on June 12th and 13th. The papers announced are:—"Possibilities for Increasing Profits on Interurban Lines," by Mr. E. H. Edwards; "Tramways—a Résumé," by Mr. F. Bland; "Railless Traction and Motor-Buses," by Mr. H. England; "Standard Rules for Motor-men and Conductors," by Mr. A. V. Mason.

**ROYAL INSTITUTION.**—On Saturday, May 24th, Prof. Rutherford commences a course of three lectures on "Radioactivity":—(1) "The Alpha Rays," (2) "The Origin of the Beta and Gamma Rays," (3) "The Radioactive State of the Earth and Atmosphere." The Friday evening discourse on May 23rd will be delivered by Prof. S. P. Thompson, on "The Secret of the Permanent Magnet."

**THE CONCRETE INSTITUTE.**—A paper by Mr. Harold Kane, entitled "The Stability of Brick Chimneys," was read at the meeting on May 8th. The annual general meeting of the Institute will take place on May 22nd.

**Appointments Vacant.**—Assistant station superintendent at Edinburgh (£200); switchboard attendant for Bray U.D.C. (20s.); electrician, for Abertillery U.D.C.; electrical engineer (£120 +), and electrician attendant (£40 +), for the County Asylum, Rainhill, near Liverpool; manager, for the Redditch electricity works (£300). See our advertisement pages to-day.

**The National Physical Laboratory.**—The annual meeting of the general board of the National Physical Laboratory was held recently at the rooms of the Royal Society, when the report and accounts for the year 1912 and the statement of work for 1913 were presented and approved for transmission to the President and Council of the Royal Society. In former years this meeting has usually been held at Teddington during the month of March, and has been combined with an inspection of the Laboratory by the members of the board. In consequence of a change in the financial year, the annual inspection will in future be held at a later date. This year it is to take place on Thursday, June 26th, when the Right Hon. A. J. Balfour will open the new buildings recently erected.

These buildings complete a scheme initiated in 1909 to provide laboratories for metallurgy and optics, with administrative offices, at an estimated cost of £30,000, exclusive of equipment; of this sum the Treasury undertook to provide £15,000 provided the remainder were forthcoming from other sources. In 1910 the late Sir Julius Wernher generously presented £10,000 for the erection of the metallurgy laboratory, and on learning lately that the actual cost had exceeded the sum available by £936, Lady Wernher kindly defrayed the deficit.

To secure the further sum necessary for the completion of the scheme, and to obtain funds for the equipment of the buildings, an "Additional Funds Committee," of which the late Sir William White was chairman, was appointed during 1912. In its report this Committee states that the Royal Commissioners for the Exhibition of 1851 generously gave a donation of £5,000 to the building fund, thus completing with the gift from Sir Julius Wernher the £15,000 required to meet the Treasury grant.

General help towards the equipment has been received from many sources, including a number of the city companies. The Committee, however, points out that considerable sums are still necessary to provide adequately the equipment which is essential for the proper development of the work.

The Report of the Laboratory for the year 1912 contains as usual matter of great technical interest, with which we hope to deal on a future occasion.

**Water-Tube Boilers in Canada.**—In the last few years some of the leading firms of boiler makers in the Dominion have turned their attention to the manufacture of water-tube boilers, chiefly of the Heine, Atlas and similar types with water legs built up of wrought-steel plates and stays. Recognising the increasing demand for the sectional type and the numerous inquiries received for this pattern, a large and well-established firm in Western Ontario has entered the field with a boiler somewhat similar to the "Continental" type, as described in our issue of November 6th, 1908, but with this difference, that the forged-steel headers are made either with internal hand-hole plates or with the hand-holes flanged outwards, to suit the requirements of any particular customer, and the cross box is forged solid out of a steel plate instead of being riveted together. To carry out this work new plant was installed, a large and powerful hydraulic press being purchased in the United States, but the supplementary hydraulic machinery and other special appliances have been made by the firm in their engine works. The general design of the plant and details of the header-making and other machinery were prepared by Mr. A. Venning, late of the Water-Tube Boiler Co., London, who is at present residing in Preston, Ontario. We understand that other firms abroad are also considering the manufacture of this pattern of boiler, recognising the superiority of its design and working qualities.

**The "Yorke" Wiring System.**—Many of the principal castles and country houses of Scotland, and not a few further south, are fitted with electric light on a system peculiar to the contractor who installed it, some 10 to 15 years ago—the late Mr. R. F. Yorke, of Glasgow and Stirling.

All of them—about 50 altogether—are run either by water-power or by an oil engine. The plant as a whole does not call for particular notice, though in most cases it has points seldom met with nowadays. For instance, where oil engines are used they are started by motoring the dynamo; and the battery is generally

fixed up at the house, away from the plant, two switchboards being used. More distinctive was the practice Mr. Yorke usually adopted of charging the two halves of the battery in parallel, and discharging it in series. The resultant working pressure appears to have been rather a matter of chance, 60, 75 and 90 being the voltages most usual.

It is, however, his wiring system which presents the most unusual and interesting features. Briefly, it may be considered as a clumsy but quite effective forerunner of modern metal-sheathed single-wire systems, inasmuch as its chief feature was an earthed return, without the complicated special fittings and switchgear which at that date formed essential parts of all concentric systems. It was simplicity itself, consisting of a single insulated wire or cable of suitable capacity run throughout in compo tubing. Each length of tubing was carefully soldered to the next, so as to ensure perfect electrical continuity. But it was not entirely relied upon for the earthed return, being supplemented by a bare copper wire, run sometimes inside and sometimes outside the tubing. This copper wire was, as a rule, single and smaller than the insulated conductor, the compo tube being supposed to make up the difference in current-carrying capacity of the two. It was connected at suitable points—such as behind fuseboards—to an earplate, to which the compo was also soldered, and served as a convenient means of connecting up to the earthed terminals of switches and fittings, which were standard throughout.

The net result was a simple and efficient installation, cheaply erected and durable; its only disadvantages, as compared with modern systems, were a certain clumsiness and poor mechanical protection. The tubing, too, being of compo, would be liable to melt should arcing be set up as the result of a fault on the inner conductor, and might thus be a source of fire danger under certain conditions. Developed, however, in accordance with modern experience, it certainly has in it the basis of an ideal system for the class of work for which it was designed.—H. R. T.

## OUR PERSONAL COLUMN.

*The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.*

**Central Station Officials.**—MR. PAGE having obtained another appointment, the Worcester Corporation was recommended by its electrical engineer to promote the other members of the staff with the following salaries: MR. H. H. SMITH, from £125 to £150, rising by annual increments of £10 to £180; MR. H. BAYNHAM, £91 to £104; MR. J. ADDYMAN, £78 to £91, rising to £104 in six months; MR. R. POWELL, £65 to £78; MR. R. F. SEWARD, just appointed at £65. Mr. Clarke (the chairman of the Committee) said that the successful issue of the undertaking was nearer than many of them thought. Mr. Fairbairn said the salaries were no more than should be paid by any self-respecting Corporation. The recommendations were carried with one dissentient only. Mr. Page was chief assistant.

The E.L. Committee of the Coventry T.C. has recommended the Corporation to increase the salary of the electrical engineer and manager, MR. G. TOUGH, from £550 to £650 per annum.

The Whitby U.D.C. on May 6th confirmed the appointment of MR. J. W. PIGGOTT as electrical engineer at £130 a year, rising to £150.

The Gillingham (Kent) T.C. has renewed the agreement with the borough electrical engineer (MR. CHALMERS) at the present salary of £300 a year, his commission on the gross profits to be increased from 1 per cent. to 1½ per cent.

The Crewe T.C. has appointed MR. W. M. TRUMP, of the staff of the Midland Electric Corporation, as charge engineer at the electricity works, vice MR. A. H. Smith, who has taken up an appointment with Salford T.C.

MR. COLBECK, assistant mains engineer at the Dover Corporation Electricity Works, has resigned.

MR. NAYLOR, who held the appointment of chief assistant at Nelson has been appointed electrical engineer in place of Mr. Helme who recently died. MR. R. H. THOMPSON has been appointed station superintendent and MR. J. STANWORTH mains superintendent.

The Wakefield T.C. have increased the salary of Mr. J. VABOY, mains engineer, from £140 to £150 per annum, and advanced the commission of the Commercial Manager, MR. S. W. GARSIDE, from 3d. to 1d. per 30 watts of additional supply secured.

The Glasgow electricity department has recommended the following increases of salary:—MR. W. W. LACKIE, chief engineer, £1,000 to £1,100; MR. ARCH-PAGE, chief assistant, £600 to £650; and MR. R. B. MACCALL, chief clerk and accountant, £375 to £400.

MR. E. W. POWERAKER, senior switchboard attendant of Walthamstow Council Electricity Works, has been appointed fourth engineer-in-charge to the Ilford Council undertaking.

**Tramway Officials.**—At a meeting of the Southport Town Council last week a recommendation was brought forward that MR. B. ANDREWS should be appointed manager of the Corporation tramways undertaking, and that the services of the deputy tramways manager, MR. T. J. KENDREW, should be dispensed with. An amendment was moved that Mr. Kendrew should be appointed tramway manager, and this was carried by 23 votes to 16.

The staff and employes of the Cork Electric Tramway Co. last month presented a marble clock to MR. J. PERIEN, traffic super-

intendent, on the occasion of his marriage. The presentation took place in the Men's Recreation Room at the power house, being made by Motorman Kelleher. Mr. George Davies presiding.

**General.**—The staff of Messrs. Ackroyd & Best, Ltd., miners' safety lamp makers, electrical engineers and ironfounders, have presented Mr. S. REID, A.M.I.E.E., with a marble clock on the occasion of his marriage.

MR. C. H. ARMSTRONG has severed his connection with the Reason Manufacturing Co., Ltd., of Brighton, with which firm he has for some time past held the position of their representative in the Lancashire district.

MR. A. W. MAKOVSKI, electrical engineer of Reigate, has been elected chairman of the Reigate Chamber of Commerce.

MR. F. BORDESSA, of the technical staff of the British Insulated and Helaby Cables, Ltd., who is leaving for British Columbia, has been presented by his colleagues with a dressing case.

MR. LOUIS DUNCAN, consulting engineer, has removed from 55, Liberty Street, to 50, Church Street, New York, and has associated himself with Messrs. S. Marsh Young and H. A. Pressey, under the firm of Duncan, Young & Pressey, Inc.

MR. PAKENHAM W. BEATTY has resigned his position as manager of the River Plate Electricity Co.'s lighting undertaking and of the Eléctrica del Norte lighting and tramway undertaking in Tucuman, Argentine, having been appointed chief engineer of the Compania de Tramways Lacroze de Buenos Aires, Limitada. It may be remembered that the River Plate Co. (whose doings are reported in our "City Notes" to-day) and the Eléctrica del Norte in Tucuman, amalgamated with the object of being in a stronger position to meet the competition of the recently inaugurated Hydro-Electric Co., of Tucuman.

MR. ERNEST A. HILL has resigned his position of advertising manager to the Foster Engineering Co., Ltd., and has commenced business at 24, Stanton Road, Wimbledon, as an advertisement writer and agent.

**Obituary.**—We desire to express our deep sympathy with Mr. L. M. Waterhouse, managing director of Messrs. Simplex Conduits, Ltd., on the death of his wife, which occurred last week.

## CITY NOTES.

### Hong Kong Tramway Co., Ltd.

THE directors' report states that the accounts for the year to December 31st show a profit of £19,302, plus £3,918 brought forward, making £23,220. Of this the interim dividend paid upon November 23rd absorbed £2,031, and the board have allocated to the reserve for depreciation and renewals £10,000. The *Financial* states that the board now recommend the payment of a final dividend for the six months at the rate of 10 per cent. per annum, free of income-tax, making  $7\frac{1}{2}$  per cent. for the year, and that £7,127 be carried forward. In spite of the boycott (to which reference is made later) there was a considerable increase in the traffic receipts during the year, but the result is affected to a considerable extent by the favourable rate of exchange. In the directors' report on the year 1910 reference was made to the charge of an additional cent for every five-cent fare paid in Chinese copper coins, in consequence of the loss which was being sustained on subsidiary coinage. On July 1st, 1912, such action was followed up by refusing to accept copper coinage at all, the Government having brought in an ordinance prohibiting its circulation. No trouble whatever was experienced by the company in connection with this action. The shareholders were informed by circular dated January 21st, 1913, as to the further action taken in November last against Chinese subsidiary silver coin, which unfortunately resulted in the boycott of the cars, estimated by the manager to have been in full force from November 23rd, 1912, to January 21st, 1913. The boycott, which was considerably influenced by political action, was but slowly suppressed. It is impossible to say to what extent the company is still feeling the after-effects, but the board are advised that the receipts are now being affected to a small extent only by that cause. The company's action in the matter was initiated by the Hong Kong Government, and during the period in which the boycott was in full force the Government strongly supported the company. It is difficult to gauge accurately the extent of the loss of receipts, but it is considerable, and representations have been made to the Government for compensation additional to the \$30,000 already agreed by them. It is hoped that such representations will result in the payment of satisfactory compensation.

### Rangoon Electric Tramway and Supply Co., Ltd.

MR. FRANK TOBIN (chairman) presided on May 7th at the annual meeting held at the offices, 3, Great Winchester Street, E.C.

In moving the adoption of the report (see *ELECTRICAL REVIEW*, page 774), the CHAIRMAN said the accounts were most satisfactory, and during the year there had been a healthy expansion and growth in every single department of the business. This was the more gratifying, because in 1911, owing to the economic disturbance and bad state of trade in Rangoon, there was a certain check to their prosperity. The profits for that year were larger than they had previously been, but at the same time there was a diminution in traffic takings, and generally

the growth and expansion stopped. They began to emerge from that state of depression in the early months of 1912, and since then there had been a pleasing increase of revenue not only from the tramway, but also from the light and power services. In following and judging the monthly traffic returns, they must remember that the tramway was practically working with the same capital as was expended on it five years ago, and the increases shown were increases on the same amount of working capital. This was not, however, quite the case with regard to the light and power. They were constantly extending their business, and expending new capital on mains and equipment, and on connecting up new sources of revenue, so that the increased income which they derived from these two services, was what they should naturally expect in any case, owing to the larger amount of capital which was being employed, and which was becoming from month to month productive. In 1912 their revenue from all sources had been £110,000, as compared with £99,300 in 1911, and as they had been able to keep their working expenses again within 60 per cent. of their takings, the net result had been a profit of £56,793, as compared with £60,700. During 1912 they had expended £15,000 on capital accounts, of which only £1,000 was used on the tramway, mainly for new cars, while over £7,000 was spent on laying down new mains, and over £5,000 on substations and their equipment, and on buildings. The laying of mains meant that they had business in sight, and the capital employed very quickly became productive. The demand for the supply of light and power was a constantly increasing one, and the demand would continue without doubt from year to year, and as a consequence fresh capital outlay would be required. They were in Rangoon to supply the service of the city, and would extend their connection wherever it was required, so long as they could satisfy themselves that the capital expended would bring in adequate and proper profit to the company. For several months they had been studying recommendations for extensions in Rangoon which were absolutely necessary, and which they were satisfied would bring in a proper profit for the company. The outlay they had in sight would amount altogether to about £10,000. They had unissued about £28,000  $\frac{1}{4}$  per cent. debenture stock, and also about 70,000 ordinary shares available for issue. For some years they went without a dividend on those shares, but now they were paying 5 per cent., and without venturing to prophesy as to the future, they felt satisfied that the outlook for those shares was so good that they ought not to sacrifice them at a low price. Hence, to meet their capital expenditure they had come to the conclusion that it would be best to issue 5 per cent. terminable debentures, which would be wiped out in the course of time.

MR. J. HALLIDAY seconded the motion, and the report was adopted.

On the motion of the CHAIRMAN, a dividend of 5 per cent. was declared on the ordinary shares.

**Neuhausen Aluminium Co.**—The dividend proposed by the Aluminium Industry Co., of Neuhausen, is at the rate of 20 per cent. for 1912, this comparing with 14 per cent. in the previous year, on a nominal share capital of £1,040,000, of which 50 per cent. is paid up. In addition, the reserve fund, which exceeded £82,000 at the end of 1911, is to be raised to the statutory amount of £104,000. It has been suggested at different times that as the shares are only partly paid a fund should be formed out of the profits in order to gradually provide for the payment of the shares in full. The directors have again had this question under consideration, and now propose to make a beginning by making an allocation of £24,000 to the share payment fund. It is calculated that the fund will reach 10 per cent. of the share capital by the end of 1914.

**Continental.**—FRANCE.—A new company has just been formed in Paris (90, Boulevard de Menilmontant), with a capital of £3,000 and the title *La Société du Dynamo Fareloc*.

The balance-sheet of *La Compagnie Continentale Edison*, of Paris, for the last financial year, shows a net profit of £146,348, as compared with £154,420 in the preceding 12 months.

*La Compagnie Française pour l'Exploitation des Procédés Thomson-Houston*, of Paris, reports a net profit of £171,978 for the last financial year.

*La Société Française des Cables Electriques, système Berthoud Borel & Co.*, of Lyons, reports a net profit of £10,788 for the last financial year.

**BELGIUM.**—*La Société des Constructions Electriques de Charleroi* reports a net profit of £38,338 for the last financial year.

*La Société Belge pour la Fabrication des Cables et Fils Electriques* of Brussels, reports a net profit of £9,294 for the last financial year, out of which a dividend of 7 per cent. is being declared.

**GERMANY.**—The Berlin-Hagen Accumulatoren-fabrik Gesellschaft is declaring a dividend of 25 per cent. for the last financial year.

The Felten und Guillaume Carlswerk Gesellschaft, of Mulheim is declaring a dividend of 8 per cent. for the last financial year, as compared with only 6 per cent. for the preceding 12 months.

**RUSSIA.**—*La Société Russe d'Electricité A.E.G.*, of St. Petersburg, is declaring a dividend of 9 per cent. for the last financial year, as compared with only 8 per cent. for the preceding 12 months.

**HOLLAND.**—The report of the Philips Glowlamp Works, of Eindhoven, the manufacturers of the Philips incandescent lamps, shows a profit of £81,120, out of which a dividend at the rate of 10 per cent. per annum is being declared.

(Continued on page 817.)

# THE BETULANDER AUTOMATIC TELEPHONE SYSTEM.

In telephony, as in other branches of electrical engineering, finality is never attained. It is not a matter for surprise,

the highest power of 10. During this operation the levers return to their zero positions in the same order, so that the subscriber can, so to speak, see his call being sent to the exchange by the instrument, which in this process is entirely automatic. It will be noticed that the number is completely set before any impulses are sent out; an error in setting any one of the levers, therefore, can be corrected at any time before lifting the telephone, without necessitating a fresh start, and without calling up a wrong number. The rate at which the impulses are sent is also independent of the subscriber, being controlled by a centrifugal governor. The moment the last impulse has gone, the subscriber either is through to the called subscriber, and can hear the bell ringing with the aid of his receiver, or is receiving the "busy-back" signal from the exchange. We give in fig. 1 a view of the subscriber's instrument, with cover removed, so as to show the impulse senders separately, the governor being visible on the right-hand side of the latter. This instrument is suitable for

therefore, that a new automatic telephone system, possessing novel and interesting features, should have been intro-

a 100-line exchange, but by adding more levers it can be adapted for anything up to a 100,000-line exchange. These

FIG. 1.—SUBSCRIBER'S TELEPHONE AND ACTUATOR.

duced, and we have pleasure in placing a description of it before our readers. Strange as it may seem, in connection with so complex a problem as the substitution of a machine for a human operator, the most marked characteristic of the Betulander system is its comparative simplicity. It may be called the "straight-line" system of automatic telephony, for practically all its operations take place in straight vertical lines; the principle by which the number wanted is arrived at is that of successive selection, and the process may be carried on absolutely without limit, so far as the mechanism is concerned, the number of subscribers connected to an exchange being limited only by other considerations.

Briefly, the subscriber sets a number of levers on his instrument to the digits representing the number wanted; he then lifts the telephone, and by this movement a set of impulse senders is allowed to come into operation, one after another, transmitting to the exchange consecutive groups of impulses, beginning with the set corresponding with

A. B. C.  
FIG. 2.—PRE-SELECTOR, UNITS SELECTOR AND GROUP SELECTOR.

levers can be added to existing instruments with but slight modification.

Passing on to the exchange, there are here provided four

relays for each subscriber, no matter how large the system may be. Three of these relays receive the subscriber's instrument (which is called the "actuator"), when he originates a call, and the fourth is used when he is called, connecting the ringing current to his line. Condensers are also provided, and these, with the relays, perform the usual functions in a central-battery system. The sets of relays and condensers are assembled together in blocks of 10, serving 10 subscribers, and no extra sets are needed; additions can be made at any time, as the number of subscribers increases.

For finding the wanted number, a series of "selectors" is provided. These devices are extremely interesting; they are all very much alike, the principal parts being identical, and they all move in a vertical plane only. On large systems three patterns are used, which are illustrated in fig. 2. The selector consists of three electromagnets, two of which are assembled in a common sheath, but have separate magnetic circuits; each of these is connected to a line wire, and

receives the impulses sent out by the actuator, through the subscriber's line relays. These magnets operate and

FIG. 3.—DIAGRAM SHOWING THE METHOD OF CALLING SUBSCRIBERS ON THE BETULANDER SYSTEM.

FIG. 4.—PANEL OF SELECTORS.

release the selector by an ingenious arrangement of pawls working against a ratchet. The function of the third electromagnet will be explained later. The selectors are mounted in an iron frame in groups of ten, but each can be taken out and replaced by a spare one in a moment by any person of ordinary intelligence, being held in position by a spring clip; all the necessary connections are automatically made in the act of replacing the selector.

The arrangement of the fixed contacts over which the selector works, called the contact field, is one of the most ingenious features of the apparatus, the field consisting simply of continuous lengths of bare wire, suitably supported, or in some cases metal segments. It will at once be seen that this device greatly reduces the number of soldered connections required, and is so simple and accessible that faults are practically impossible. The selector carries wipers, which make contact with these wires, stepping from wire to wire in accordance with the impulses received. The third electromagnet mentioned above is operated from a local circuit through the contacts of one or other of the first two magnets, and serves mainly to tilt the selector frame, so that the wipers do not touch the wires as they pass over them until the appropriate wire in the contact field is reached, thus preventing unnecessary wear and ensuring secrecy. In fig. 4 is shown a panel, from which a pre-selector and a units selector have been removed, while fig. 5 illustrates part of a panel of group selectors. In the case of very small systems, the contact fields can be arranged so that the central exchange is reduced to one set of relays and one selector per subscriber, as shown in fig. 6, representing a complete switchboard for 10 stations.

We have mentioned that there are three types of selector; the first is the "pre-selector" (fig. 2A), with which each subscriber's circuit is provided. The moment the subscriber's telephone is lifted the pre-selector automatically selects the first

disengaged junction leading to a "group selector"—dropping down instantly to the idle line and stopping there. Normally there are 10 junction lines per 100 subscribers, represented by 10 wires in the contact field of the "pre-selector," and any number of these junctions can be equipped with group selectors, according to the requirements of the service. It is considered that 10 per cent. provides an ample margin, 6 or 7 being usually sufficient. The subscriber's actuator and relays are thus extended through the pre-selector to a group selector (fig. 2c), which receives the first series of impulses sent out by the actuator—the pre-selector having been automatically locked in position and disconnected, so that it is not affected by subsequent impulses.

To each group selector there is allotted an auxiliary selector (fig. 2A) in each of the 10 following groups, the function of which is to find an idle junction and selector in the next group; the last-named selector receives the second series of impulses sent out from the actuator, and picks out the corresponding group, and the same sequence of operations continues until the final or units selector (fig. 2B) has found the line wanted, when, if the line is free, the signalling relay is actuated and the ringing current is sent on the line of the called subscriber, until the latter replies, or the caller (who can hear the ringing) replaces his telephone on the rest.

If the line, however, is engaged, the units selector, directly it reaches this line, instantly returns to normal, causing all the selectors in the series also to return to the normal position, and the subscriber receives the "busy" signal. When either of the telephones is placed on its rest, the whole of the selectors used in the connection are immediately restored to normal.

In order to make clear the operations described above, we show in fig. 3 the apparatus which would be employed in establishing communication between two subscribers in a system designed for 1,000 lines, but, for the sake of clearness, only 200 lines are shown on the diagram. The maximum traffic is here assumed to require 10 per cent. junction lines or "trunking," but the six selectors shown hatched would usually suffice. In the figure, two subscribers' instruments are represented by Nos. 238 and 645, and it is assumed that the latter, after setting the levers on his actuator to the figures 2, 3 and 8, lifts his telephone from

This instantly selects the first idle line of the group of trunk lines assigned to the group of subscribers to which

FIG. 5.—PART OF A PANEL OF GROUP SELECTORS.

No. 645 belongs—in this case, assumed to be the second—and puts the connection through, therefore, to the second in the hundreds group of selectors F, which receives the first series of impulses from the actuator and steps up to the third position, representing the third hundred (200—299). This extends the connection to the group of auxiliary hundreds selectors at G, to which all subscribers between the numbers 600 and 699 have access when calling for any number between 200 and 299. The auxiliary selector instantly finds an idle trunk—say the fifth—leading to a tens selector in the group H, which receives the second series of impulses sent out by the actuator, and steps up to the fourth position (controlling the numbers 30-39). The connection is now extended to a units selector—the fifth in the group J—which is operated by the last set of impulses, and steps up to the wanted subscriber's line. The complete path of the connection is shown by a dotted line, and similarly the course of a call for No. 645, originated by No. 238, is shown by a heavy line.

Summarising the leading features of the system, it is claimed that its simplicity and flexibility allow the equipment to be provided in exact agreement with the actual number of subscribers' lines; the apparatus is readily accessible at all times, and in every part, without interfering with the working, and it can be extended indefinitely without modification of the general design; as the actuator is completely set up before any

FIG. 6.—COMPLETE BETULANDER AUTOMATIC SWITCHBOARD FOR 10 STATIONS.

the switch hook. An impulse is then transmitted over the line A to the relay set B belonging to the calling subscriber, which in turn operates his pre-selector C.

interfering with the working, and it can be extended indefinitely without modification of the general design; as the actuator is completely set up before any

impulses are sent to line, delays on the part of the calling subscriber do not affect the exchange, and therefore the selectors are engaged for the minimum time; they are also instantly released on the conclusion of a conversation, or if the line is found to be busy, thus setting free the junctions and enabling an unusually low percentage of trunking to be

## THE COMMERCIAL PRODUCTION OF OXYGEN AND HYDROGEN.

THE commercial uses of both oxygen and hydrogen have extended enormously during the last few years, particularly in connection with engineering work, for the purpose of cutting steel and iron by means of the oxy-hydrogen and oxy-acetylene flames and for autogenous welding.

For such purposes as these purity of the gas is essential, as the presence of even small percentages of inert gases, such as nitrogen or chlorine, greatly reduces the efficiency of the operation.

Many firms could with obvious advantage produce oxygen and hydrogen on their own premises, given suitable apparatus, and effect a saving over the usual procedure of purchasing such gases in cylinders.

Apparatus for this purpose, constructed by the International Oxygen Co., Newark, N.J., has been adopted in some of the largest works in America, notably by the General Electric and Westinghouse Companies, the Edison Battery Co., and in the Brooklyn Navy Yard. The company has placed on the market simple equipments of various capacities suited to the industrial needs of manufacturers; these consist of a series of electrolytic cells, each generating 7 cb. ft. of hydrogen and  $3\frac{1}{2}$  cb. ft. of oxygen per kw.-hour. Each cell requires 300 to 400 amperes at 2 volts.

A, oxygen offtake; B, hydr. gen offtake; C, indicator and pressure equaliser; D, positive electrode terminals; E, negative electrode terminals; F, filling cup; G, hydraulic joint; H, diaphragm; I, insulating supports.

I.O.C. OXYGEN-HYDROGEN GENERATOR.

employed, rarely exceeding 6 or 7 per cent. The energy consumed is small, and the ringing device only runs whilst ringing, being self-starting. Skilled attendance is not necessary, as any of the selectors can be exchanged for spare ones with ease, and the arrangement of the contact fields reduces cabling and faults to the minimum.

An exchange on the Betnlander system for 100 lines has been installed at Marconi House, Strand, London, where it will be used to control the local circuits; for this purpose it will be increased to a capacity of 200 lines. The simplicity of the apparatus, and the small space occupied, are striking features of this board. We understand that the Marconi's Wireless Telegraph Co., Ltd., has acquired the patents for every country except Sweden, where the system originated, and has appointed Mr. C. B. Clay, formerly Metropolitan Superintendent to the National Telephone Co., as manager of the department. Every effort is being made to expedite the manufacture of the apparatus, and we have no doubt that a good deal will be heard of the system in the near future. An exchange controlling 1,000 stations, installed at No. 38, Rue de l'elletier, will be open for inspection during the visit of the I.E.E. to Paris next week.

We are indebted to Mr. Clay and his assistant, Mr. Ward, for facilities to inspect the installation and to prepare this brief description of the system.

I.O.C. GENERATORS INSTALLED AT THE WORKS OF THE INTERNATIONAL OXYGEN CO.

AN INSTALLATION OF OVAL TYPE I.O.C. GENERATORS.

The construction of the I.O.C. cell is shown diagrammatically in one of our views; an outer iron tank serves as the negative electrode and a perforated inner iron tank, suspended from the cover, as the positive electrode.

An asbestos sack or diaphragm suspended from an hydraulic joint or water seal, encloses the inner electrode, dividing the cell into two compartments, so that the oxygen generated on the walls of the inner tank is kept separated from the hydrogen formed on the walls of the outer one.

As a further check against mixture of the gases the asbestos sack, when impregnated with alkali solution, forms an effective barrier between the two gases.

A solution of caustic potash and water forms the electrolyte; this is introduced into the hydraulic joint through a filling cup, and distributed in the two compartments, the joint automatically regulating the working of the cell.

The oxygen and hydrogen in passing from their respective compartments to the gas mains pass through indicators and pressure equalisers; the latter indicate at a glance how the cell is working, and equalise the gas pressure in each compartment, also they protect the cell from the effect of excessive pressure in the discharge mains, and should the latter become clogged, allow the gases generated in the cell to escape into the atmosphere.

The makers claim that the I.O.C. apparatus will produce pure gases—99.5 per cent. in the case of the hydrogen and 98.5 per cent. or more for oxygen—without other manipulation than the addition of distilled water daily to make up for the liquid decomposed.

As an example of the saving in cost obtained by the apparatus, we gather that in the case of a works using 1,000 cb. ft. of oxygen daily, the I.O.C. plant would supply this for \$6 per day, taking energy at  $\frac{1}{2}$  d. per unit, while the chlorate of potash method, or cylinder oxygen, would figure out at \$25 per day.

In the case of large installations, such as the company's own plant at Newark, N.J., the cells arranged in rows, are connected to gas-holders, the contents of which may be drawn off, metered and compressed for bottling if required.

Our views show the latest oval pattern cell turned out by the company, which has placed its English business in the hands of Messrs. Arthur Lyon & Co.

## NEW COMPANIES REGISTERED.

**British Sherardisers, Ltd.** (128,789).—This company was registered on May 5th, with a capital of £10,000 in £1 shares, to acquire any interest in the process known as "Sherardising" or any process for covering iron, steel or other metals with a coating of zinc or other metallic substances, &c., and to adopt an agreement with H. M. Delacour, as receiver and manager of United Sherardising, Ltd. The subscribers (with one share each) are:—H. M. Delacour, 58, Norbury Crescent, Norbury, S.W., mechanical engineer; W. J. Halsey, 25, Queen Anne's Gate, S.W., solicitor. Private company. The number of directors is not to be less than two or more than five; the first are W. J. Halsey and H. M. Delacour; qualification, one share; remuneration (except general manager), £100 each per annum. Registered office, Bythe Road, Willesden Junction, N.W.

## OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

**Charing Cross, West End and City Electricity Supply Co., Ltd.** (29,122).—Capital, £2,100,000 in 25 shares (130,000 pref., 130,000 ord., 80,000 cum. pref., and 80,000 cum. ord.); return dated March 18th, 1913; 80,000 pref., 80,000 ord., 80,000 cum. pref., and 70,000 cum. ord. shares taken up; £5 per share called up on 80,000 pref., 80,000 ord., and 80,000 cum. pref.; £1,200,000 paid; £350,000 considered as paid on 70,000 cum. ord. Mortgages and charges: £1,037,178.

**Clarke, Chapman & Co., Ltd.** (39,045).—Capital, £200,000 in 10 shares (7,000 pref.); return dated March 14th, 1913; 12,736 ord. and 6,985 pref. shares taken up; £10 per share called up on 3,536 ord., £2 10s. on 200 ord., and £10 on 4,485 pref.; £80,210 paid; £90,000 considered as paid on 9,000 ord., £25,500 on 2,550 pref. and £1,600 on 200 ord. Mortgages and charges: £100,000.

**Cunningham, Ltd.**—Particulars of £1,000 debentures, created April 23rd, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Javal Patents, Ltd.**—Particulars of £1,000 debentures, created April 9th, 1913, filed pursuant to Sec. 93 (3) of the Companies' (Consolidation) Act, 1908, the amount of the present issue being £200. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

**Lancashire United Tramways, Ltd.** (87,044).—Capital, £200,000 in £1 shares. Return dated March 13th, 1913. 152,978 shares taken up. £7 paid. £194,871 considered as paid. Mortgages and charges outstanding, £605,500. Deferred debenture stock issued, having no charge over the assets of the company, £38,300. Note: Deb. stock to the nominal amount of £20,000 included in the above £605,500 is issued as security for advances up to £15,000.

**Ferranti, Ltd.**—A memorandum of satisfaction in full on December 31st, 1912, of trust deed dated June 18th, 1907, securing £20,000, has been filed.

**Kensington and Knightsbridge Electric Lighting Co., Ltd.** (26,193).—Capital £250,000, in 50,000 ord., 10,000 first pref., and 10,000 second pref. shares of £5 each. Return dated March 13th, 1913. 21,800 ord., 10,000 first and 10,000 second pref. shares taken up; £5 per share called up on 15,994 ord., 10,000 first pref., and 10,000 second pref.; £110,840 paid; £25,160 considered as paid on 5,032 ord. Mortgages and charges £115,050 in respect of debenture stock issued by this company in conjunction with Notting Hill Electric Co. Ltd., £227,500.

**Newmarket Electric Light Co., Ltd.** (14,450).—Capital £90,000 in £10 shares. Return dated March 31st 1913; 2,658 shares taken up £25,580 paid. Mortgages and charges: £14,260.

**New System Private Telephone Co., Ltd.** (73,732).—Capital £10,000 in £1 shares. Return dated March 24th, 1913; all shares taken up £8,000 paid; £2,000 considered as paid. Mortgages and charges: £2,000.

**Egham and Staines Electricity Co., Ltd.**—Issue on April 30th, 1913, of £100 debentures, part of a series of which particulars have already been filed.

**Veritys, Ltd.**—Mortgage dated April 28th, 1913, to secure £800, charged on freehold land and premises at Nechells, Birmingham, &c. Holders: J. N. Brown, C. F. Brown and A. J. Williams.

Also mortgage dated April 29th, 1913, to secure £200, charged on same property. Holder: Annie M. Gowan.

**Tyer & Co., Ltd.**—Charge on freehold property in Metcalf Street, East Nelson Street, and land adjoining, all in Carlisle, dated April 14th, 1913, to secure all moneys due from the company to London, County and Westminster Bank, Ltd., 41, Lothbury, E.C. The charge is given by the company to the bank as collateral security for an overdraft not to exceed £7,000, which is already secured by debentures for that amount, registered March 11th, 1913.

## CITY NOTES.

(Continued from page 812.)

### Elmore's German and Austro-Hungarian Metal Co., Ltd.

The directors' report for the year ending December 31st, 1912, says that the accounts, beyond the increase of the amount standing to the debit of profit and loss account, show but little alteration. On the debit side there is a small decrease, £7,729, as against £8,021 in 1911. The receipts were greater by £872 than the actual expenditure, but including debenture interest, the net loss is £5,195, such loss being due to the non-receipt of dividends from the "Metall" Co. The loan account with the Metall Co. is increased by £764, and now stands at £45,144.

The accounts of the Metall Co. show a considerable improvement, the gross profit being larger by M. 103,073 than in 1911, and after making full allowance for depreciation, the net result of the year's working is a profit of M. 1,639, as against a loss in 1911 of M. 67,992. The improvement is due partly to decreased cost of production, and partly to the increased prices obtained during the last three months of the year, owing to the re-constitution of the Copper Tube Syndicate in Germany. The weight of finished goods sold was somewhat greater than in the previous year. The cessation of the price war will, it is believed, result in a steady improvement in the earning capacity of the company, and there has been a considerable increase in the selling price obtained for the company's goods. Apart from the low selling prices obtained during the year, syndicate expenses amounted to M. 26,333, a charge which it is anticipated will not be incurred again. In addition to the decrease in the cost of production, general expenses are less by M. 13,557 than in 1911. Interest, however, shows an increase of M. 12,694. This is partly due to the high price of copper which ruled during the year, and partly to the high Bank rate. The amount due to Messrs. Sal Oppenheim, Junr., & Co. has been reduced by M. 91,643, and sundry creditors by M. 22,612, while the total value of copper, stores and book debts show an increase in value of M. 220,313. As against this, however, bills payable show an increase of M. 275,539. The directors are unable to report any substantial progress in connection with the Mertens process, but the sales of rollers during the first three months of the present year were considerably more than for the same period last year.

Mr. JOHN MACFARLAN presided on May 5th, at the offices, Finsbury House, E.C., over the annual meeting. He said that the directors were sorry that the results of the year's work were so small. They had, however, some satisfaction in knowing that the causes which prevented a more successful result were causes over which they had no control, and which were not in any way due to the failure of the company to produce good work, or a sufficient quantity. Taking the lowest price obtained in any year previous to the dissolution of the old syndicate, compared with the prices obtained during the last four years, they found that the price war had caused a loss of profit of M. 1,383,539, or say £69,000. This was no exaggeration, and it was very disappointing to the directors, because at that time they had completed the large extensions which were deemed necessary, and were in a position to produce larger quantities at a reduced cost, and then, when it was hoped that the benefits arising from such extensions would mature, the price war commenced. He desired to draw the attention of both the debenture-holders and shareholders to the inherent financial stability and strength of the company, which enabled it to experience such a large loss of profit and at the same time increase its sales from, say 1,360 tons in 1908 to 1,935 tons in 1912, and to

expend over £20,000 on additions to land, buildings, plant, &c., during the same period. A new syndicate was formed on August 1st last, but at that time they had in hand a large number of contracts and orders to execute, so that it was not until quite late in the year that they began to reap the benefit of increased prices. Their expenditure upon additions to land, buildings and plant last year represented a comparatively small sum, less than the amount written off by way of depreciation, viz., £3,100. Notwithstanding this small expenditure, their sales for the 17 weeks of the present year showed an increase of more than 10 per cent. over those for the same period last year at considerably better prices. They had an abundance of work on hand. It was a source of great regret that the profit made by the Metall Co. last year was not sufficient to permit that company to declare a dividend, so that the interest due on January 1st last to the debenture-holders of the Austrian Co. could be paid, but with the improved condition of matters, it was only reasonable to believe that dividends would be forthcoming in the future. With regard to the Mertens process, some progress had been made, and they were selling an increased quantity of rollers, but nothing like the amount they should be selling. The business was a very important one for the Metall Co., and Mr. Preschlin, their works' manager, was doing his best to bring about a complete understanding amongst the parties interested. The directors had just returned from a visit to the works at Schladerm, which they found to be in excellent order. They saw two new improvements in the manufacture, which promised to give valuable results in the near future in the direction of further reducing the cost of production.

MR. J. HEAL seconded the motion.

MR. BARKWORTH criticised the figure taken as the value of the patents, and also that taken as the holding in the Metall Co., and said it seemed to him that they had lost the whole of their share capital in the Austrian Co. In view of that would it not be well to wipe out these items and write the capital down accordingly?

THE CHAIRMAN said they had some very valuable patents in connection with Mertens process. They had patents in 22 countries. Times were hard, and they could not deal with their holding in the Austrian Co. now. They would have to wait for more favourable times for that.

The report was adopted, and the retiring director was elected.

THE CHAIRMAN said he thought they could look forward to better times now, as in every way things were looking up. They were not so hampered for want of cash. The members of the board held 23,000 debentures as well as their preference and ordinary shares, and he thought they could see their way to pay some interest next July.

### Potteries Electric Traction Co., Ltd.

THE directors report that the capital expenditure during 1912 was £2,559. The total receipts amounted to £117,101. The traffic receipts, £100,646, showed a decrease of £506, as compared with the previous year, due to the unrest in industrial circles during the early part of the year. After deducting all expenses chargeable to revenue, including £11,524 for debenture and other interest, there remains a balance of £35,189, as compared with £35,100 for 1911. Adding the balance of £681 brought forward, there is a balance available for distribution of £35,870, which the directors recommend should be applied as follows:—Depreciation—reserve account, £2,000; renewals account, £12,500; dividend 5 per cent. per annum on the preference shares, £12,250; dividend 3½ per cent. per annum on the ordinary shares, £8,575; carry forward, £545. The depreciation and reserve account will then stand at £21,000, and there will be a credit balance on the renewals account of £13,869. During the year £17,486, as compared with £18,040 in 1911, has been expended on the improvement, renewal and repair of the permanent way.

The annual meeting will be held on May 19th.

	1911.	1912.
Miles open—Route miles	31 68	31 68
Number of passengers carried	19,819,027	19,575,568
Average receipts per passenger	1 22d.	1 23d.
Average working expenditure per passenger	7 1d.	7 1d.
Proportion of expenses to receipts	58 %	57 %
Number of cars	110	110

### Calcutta Electric Supply Corporation, Ltd.

THE directors' report for the year 1912 states that 12,043,398 units were sold, compared with 10,566,038 units in 1911. The number of consumers connected at December 31st last was 7,030, compared with 6,383 in 1911, an increase of 647, and the equivalent connections in 33-watt lamps show an increase of 92,726. The results for the past four years are as follows:—

Year.	Con- sumers.	Equiv. con- nections in 33-watt lamps.	Units sold.	Gross revenue.	Net revenue.
1909	5,078	452,272	7,856,383	£127,576	£67,024
1910	5,695	528,938	9,440,005	£137,998	£85,597
1911	6,383	616,721	10,566,038	£151,905	£95,697
1912	7,030	709,447	12,043,398	£173,907	£110,168

Exchange is calculated at 1s. 4d. per Rupee.

The profits for 1912 amount to £110,169, which, with the balance brought forward from 1911, and interest received on money at deposit, makes a total of £114,989. The directors have invested an additional £10,053 on account of the reserve fund, increasing the investments to £50,561. Some of the investments, in common

with many gilt-edged securities, have depreciated in value, and the board have accordingly written off £1,500 from the cost price. After deducting the interim dividend at the rate of 7 per cent. per annum paid on the ordinary shares in November, 1912; the dividends paid and accrued on the preference shares; the £1,500 for depreciation of securities, and the other items set out in the net revenue account, there remains an available balance of £68,903. The directors recommend that £35,000 be placed to the credit of the depreciation and renewals account; that £5,000 be added to the reserve fund, and that a final dividend be paid on the ordinary shares for the second half-year, at the rate of 10 per cent. per annum, making 8½ per cent. for the year, which will leave £2,862 to be carried forward after providing for the directors' extra remuneration of £2,500. The reserve for depreciation and renewals will thus be increased to £114,311, and the reserve fund, with the addition of £1,988 from dividends on investments, &c., will stand at £91,088. The high-tension station at Cossipore was opened in July last, and is now practically complete. The amount expended up to December 31st last has been divided up under the proper headings in the capital account. The demand in Calcutta for electrical energy continues steadily increasing, and the result of the working for 1912 must be considered satisfactory. The directors regret to report the retirement, on April 30th of this year, of the agent and manager, Mr. F. Rawson, C.M.G., who has efficiently occupied that position since January, 1908. Mr. R. E. Winkfield, chief engineer, has been appointed agent and chief engineer. Major-General Mahon, one of the directors, has visited Calcutta, and furnished the board with a valuable report upon the working of the company.

Units generated, in kw.-hours	15,369,028
Units sold—Public lamps	7,425
By special contract	726,507
By meter for lighting	3,681,511
By meter for power	7,627,585

### River Plate Electricity Co., Ltd.

THIS company held its annual meeting on Monday, May 5th.

The report for the year ended December, 1912, showed continued progress. The net revenue, after providing for administration expenses, bad debts and all necessary depreciations, amounted to £51,176, plus £7,659 brought forward. Deducting interest on 5 per cent. debenture stock, £10,000, there is a surplus of £48,835, out of which a dividend at the rate of 6 per cent. for the year upon the preference stock absorbs £7,500, a dividend of 10 per cent. for the year upon the ordinary stock, £12,000, interest at the rate of 10 per cent. on the instalments upon the new shares absorbs £890, addition to general reserve, £15,000, income-tax reserve, £2,000, further remuneration to directors, £1,029, carry forward, £10,416. With the above-mentioned £15,000 from revenue and £30,000 transferred from premium account hereafter mentioned, the general reserve will stand at £145,000. In addition, £8,450 has been charged against the year's revenue for depreciation of plant, increasing that reserve to £44,872, and bringing, with the carry forward of £10,416, the total reserves of the company to over £200,000. Though there have been delays due to the non-delivery of plant contracted for in this country, good progress is being made with the extensive additions to the new generating station at Ensenada, and it is anticipated that by the early autumn of the present year the new plant will be finished and put into commission. This will enable the generation of light and power to be wholly conducted at Ensenada, from which added efficiency and considerable economies will result. The important work of placing the company's cables and electric connections underground in the leading streets and squares of the city of La Plata has been started, and it will be completed and the company's generating station at La Plata dismantled well ahead of the time stipulated for in the contract with the Government of the province of Buenos Ayres. On their part the Government propose largely to increase the public arc lighting in the central districts of La Plata. The arrangement between the Electrica del Norte and this company for joint working at Tucuman is now in operation. The Hydro-Electric Co. of Tucuman has been running in competition since early in November, and for some time past non-commercial rates of charge for light and power have prevailed. This company and the Electrica del Norte will continue to make competitive rates at Tucuman so long as may be necessary to retain their business.

30,000 new ordinary shares of £1 each were, in May last, issued to the stockholders at a premium of £1 per share. The shares were fully subscribed and in due course allotted. The full premium of £30,000 received has been added to the general reserve. The shares will be converted into ordinary stock immediately. The fourth payment on account of the amortisation of the 5 per cent. obligations of the German Trans-Oceanic Electric Co. (Series 1) held by this company, viz.:—£1,900, was duly made on April 1st, 1912, reducing the amount outstanding to £142,900.

MR. M. W. MATTINSON, K.C., presiding at the meeting at Capel House, 62, New Broad Street, E.C., said that the net profits for the year ending December 31st, 1911, amounted to £47,200, whilst those for the year ending December 31st last amounted to £51,175. During the last nine years their net profits had grown from £20,000 a year to £51,000, whilst, during that time, the addition to their capital liabilities was only £55,000. This satis-

factory position was due to the large amount of undivided profits which had been carried to the reserve fund and applied to the extension of the business. The available profits for the year enabled them, after meeting all prior charges, to recommend, for the fifth year in succession, a dividend of 10 per cent. on the ordinary share capital, to add £15,000 again to the reserve fund, and to carry forward £3,757 more, bringing up the carry forward to £10,416. They had distributed less than their available profits, and their conservative policy in this regard needed no apology. The result of their policy was that they were in a very strong position, and could face the competition in Tucuman with the confident assurance that it was well within their powers to sustain it as long as might be necessary. The chairman proceeded to deal with the items in the profit and loss account, and said the revenue from the La Plata, Ensenada and Tucuman stations had increased by £5,773, which was eminently satisfactory in view of the circumstances of the year, which, apart from the growth of business in La Plata and Ensenada, were not favourable. All the extra profit was made at La Plata and Ensenada, for the competition at Tucuman, although it only commenced in the middle of November, affected the net results of the station for the whole year. The conditions were also unfavourable in respect of the price of coal, which last year cost them a considerable sum, and would also cost them extra this year, although next year he was confident there would be a material alleviation. In addition, during the whole of the year they had the cost of running two stations instead of one, and this would also continue during the greater part of the present year; although here again, barring unforeseen circumstances, it would come to an end in the autumn. There had been a steady growth of business, both at La Plata and Ensenada, which had fully realised their expectations, and in addition the modern turbine plant erected at Ensenada had justified their calculations as to economy of production. Interest from investments was down by £461, which was due to the failure of the La Plata Tramways Co. to pay its preference interest. The cause was well known, being due to defalcations by the company's cashier. The La Plata Tramways Co., however, was a sound concern with excellent prospects, and its earnings were steadily growing, and before long the arrears on the preference shares would be paid, as well as dividends on the ordinary capital, in which they were also interested. Their miscellaneous receipts, outside of the profit of their generating stations were equal to over 80 per cent. of the debenture interest—a proportion likely to be still further improved in the future. Dealing next with the balance-sheet, the Chairman pointed out the considerable increase in the item of stations, which was mainly represented by the expenditure during the year on the large extension at Ensenada; the making of extensions for customers, and the provision of arc lamps for the Government. If they added the items set apart this year, and the amount carried forward, they had total reserves of over £200,000. There was a further considerable reserve in the appreciation of the value of their real estate at La Plata and Ensenada, and he thought he was justified in saying that they were not in an unfavourable position for a company with an ordinary capital of £150,000. As regarded the future, there would be further economy when they shut down the station at La Plata and worked only from Ensenada. The growth of La Plata was justifying the most hopeful prognostications of those who believed in it. Apart from their business in private lighting, they were looking to a material growth in public lighting business and traction and power. The Government of the provinces of Buenos Ayres were adding largely to the public lighting. The two tramway companies they served were also steadily extending, whilst a large number of freezing and other establishments were being promoted at Ensenada, which would require large quantities of power, and at present there were negotiations on the subject. Until the completion of their extensions at Ensenada they could not have attempted large supplies, but when, as would be the case in the autumn, they had established 9,000-KW. turbine plant, they would be able to take on bulk business unthought of a few years ago. It was too early to say what would be arranged, but he was not unhopeful of seeing a considerable amount of business obtained, and, in any case, with their extensions they would be able to serve the industries of Ensenada and La Plata with power on terms as satisfactory as in any other town in the Republic. The chairman next dealt at considerable length with the position of affairs in Tucuman, and pointed out that on the private business they were making a loss. Their competitor, the Hydro-Electric Co., had a big organisation for a business which was comparatively trifling in extent, and obviously they must be making a still greater loss. On the other hand, the arrangement made by their company with the Electrica del Norte was working most satisfactorily and was benefiting both concerns, and they had now also a share in the profits of the Santiago station and in the tramway system of Tucuman, which was also non-competitive. This latter remark might be difficult to reconcile with the statements made in the prospectus issued by the Hydro-Electric Co., in 1912, in which it was stated that that company had a valuable electric tramway concession within the city of Tucuman and suburbs, "a considerable proportion of which was already constructed." He knew nothing one way or the other about the concession; but, as a matter of fact, in April, 1912, there was not a single yard of electric tramways in Tucuman or its suburbs belonging to the Hydro-Electric Co., and even now there were no electric tramways in the city or suburbs which did not belong to the Electrica del Norte. Another interesting factor in the Tucuman problem was that of oil fuel, and in this connection the most interesting development might be imminent. Last year he told them that a Diesel engine would be a much more economical producer of current

than a costly hydraulic system situated many miles away transmitting over long distance lines, and with transforming plants at the points of distribution. The difficulty was that oil fuel was not available in Argentina at remunerative prices, but, as they knew, there had been an enormous increase in the output from the Mexican oilfields and the Mexican Co. were arranging for the transport of oil in bulk to Argentina. They were in correspondence with the company on the whole subject, and sooner or later there would be fuel available from that source. He had also read lately that large deposits of oil had been found in the province of Salta, which immediately adjoined Tucuman, and if this was so, the supply would be really a local one. There would be no question of scrapping their steam plant if they got the oil fuel, for it could be kept for spare and auxiliary purposes, and then they would be able to quote a tariff which would be more to the benefit of the inhabitants than any advantage they derived from cutting rates at the present time. In the meantime, he supposed, the competition must continue, and so they had earmarked the £15,000 placed to reserve as a Tucuman contingency fund, and this, so long as was necessary, would be resorted to to meet any losses at that place. They were confident that by doing this they would maintain their position over the next few years, apart from the fact that the growth at La Plata and Ensenada was likely to meet any such losses at Tucuman.

MR. R. MILLER seconded the motion, and the report was adopted.

**Shanghai Electric Construction Co., Ltd.**—The directors report that the accounts for 1912 show a profit of £24,727, against £14,139 for 1911. Including the sum brought forward, the amount available is £28,028. There has been transferred to reserve for renewals account £8,500, and there has been applied in reduction of the preliminary expenses account £1,554, leaving £17,974. The directors recommend a dividend of 5 per cent. for the year, less income-tax, leaving to be carried forward £1,974. The percentage of loss by exchange on subsidiary coinage was higher in 1912 than 1911, but has recently shown a tendency to decrease. The loss under this head for the year was £23,937, and is almost equal to  $\frac{1}{2}$  per cent. on the capital. The sanction of the Municipal Council of Shanghai has been obtained to a new type of motor-car, and the rolling stock is being increased this year by 15 motor-cars and 10 trailers, raising the total numbers to 80 and 40 respectively. In addition, further facilities have become necessary to meet the growing traffic, and an application to the Municipal Council to introduce a system of railless electric traction has resulted in the sanction of a preliminary installation in Fokien Road. It is anticipated that such a system affords the best means of dealing with traffic in thoroughfares which are too narrow for tramways, and that, as the initial expense of laying a permanent and costly roadbed is avoided, the financial result should prove profitable to the company. The power agreement, under which the company purchases electrical energy from the Council, became due for revision as regards rates in March, and negotiations for a reduction in price are in progress. Through running was inaugurated on June 19th last, on which date the lines of this company and of the French Tramway Co. were linked up *via* South Chekiang Road Bridge, and on August 18th through running over the reconstructed Bund Bridge commenced. Increased traffic has resulted, but the full benefit of the through running cannot be obtained until an increased service of cars and through tickets are provided for.

**Mexborough and Rawmarsh Construction Syndicate, Ltd.**—The directors' report, given in the *Financier*, states that the net revenue account of the Mexborough and Swinton Tramways Co., after providing £91 for depreciation on furniture, fittings, plant and tools, and on motors, &c., on hire, and writing £201 off stock, is £5,043, plus £152 brought forward. After providing £1,500 for reserves for the tramway and lighting undertakings, there is a balance of £3,695, out of which the syndicate will receive £3,501. The balance to the credit of the syndicate's profit and loss account for the year to December 31st is £3,522, to which has to be added £172 brought forward, making a total of £3,695. The directors recommend the payment of a dividend of 2 per cent., free of tax, amounting to £3,500, and that the balance of £195 be carried forward. The decrease in the traffic receipts of the Mexborough and Swinton Tramways Co., as compared with those for 1911, is a result of the national coal strike, mining being the chief industry in the district served by the tramways. The traffic receipts to May 5th of this year show an increase of £776 over those for the corresponding period of last year. The revenue and expenditure of the lighting undertaking were also affected by the coal strike, the increased cost of fuel alone amounting to £328. The tramway company's consulting engineers having advised that the present plant is inadequate to deal with present and future requirements of the company, the directors have decided to instal additional plant, involving a capital expenditure of about £5,000. Considerable economies in working costs should be effected by this installation.

**Brazilian Traction, Light and Power Co., Ltd.**—There has been published in the daily Press a copy of a circular sent out to shareholders, calling a meeting for May 23rd at Toronto, at which a resolution will come forward to create an issue of \$10,000,000 par value of 6 per cent. cumulative preference shares (100,000) for the purpose of meeting the requirements of the Rio de Janeiro Tramway, Light and Power Co. and Sao Paulo Tramway, Light and Power Co., of both of which the company is the principal shareholder.

### Nairobi Electric Power and Lighting Co., Ltd.

THE meeting of this company was held on May 7th at the office, 50, Mark Lane, E.C., General Sir Stanley Edwardes, K.C.B., presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELEC. REV., page 452), said that the capital expenditure on works now stood at £32,368, an increase during the year of £3,001. The property account stood at £513, an increase of £238, due to the purchase of a town stand on which the company's new offices and stores were to be erected. Stocks on hand and in transit at £3,363, were only a trifle higher than at the end of the previous year. On the other side of the account, the share capital had increased to £23,000 by the issue to the vendor of the balance of the purchase price payable to him. The increased capital expenditure of over £2,200 had been partly met by the issue of a further £2,000 debentures, and the balance had been provided out of revenue. Passing to the revenue account, the principal item of sale of current amounted to £5,400, an increase of £1,044, this being nearly 20 per cent. increase. The other items of receipts also showed satisfactory increase, making the total £7,607, which was £1,811 more than in the year before, or 31 per cent. increase in gross receipts. The expenses naturally showed some increase in an expanding business, but in the past year they had had to face some abnormally heavy expenditure. The directors expected that for the present year they would have a substantial further increase of gross receipts, with a smaller expenditure than for 1912. No sum had yet been set aside for depreciation. The plant had been efficiently maintained out of revenue, and, in view of the fact that the company held properties acquired in its early days, before the great increase in local values of the past two or three years, which properties were estimated to have a realisable cash value considerably exceeding the amount of depreciation on machinery and plant, the directors were of opinion that the position of the company was quite sound in this respect. The result of the year's working was a net profit of £2,643, and, after wiping out the adverse balance remaining in revenue account at the end of the previous year, there was left available a net balance £1,456. There was a contingent liability of the dividends on the cumulative preference shares, and the directors duly declared and paid in January last by way of an interim dividend, the preference dividends for the years 1906 and 1907, during which years the shares were being taken up and paid for. This absorbed £532, thus leaving a balance of £923 still available for dealing with. The directors had decided that while the available balance was more than sufficient to pay the preference dividend for another year, it would strengthen their financial position to defer the payment of such a dividend for a short time.

The HON. R. C. BAYLDON seconded the motion, and the report was adopted.

### Great Northern Telegraph Co., Ltd., of Denmark.

THIS company held its meeting on April 26th at Copenhagen. The chairman (Commodore E. Suenson, D.R.N.), in his account of the working during the year 1912, said that, in spite of the disturbances nearly all over the world caused by war and political or social conflicts, commencing in 1911 with the revolution in China and the war between Italy and Turkey, and followed in 1912 by the sanguinary struggle between the allied Balkan States and their common enemy, &c., the company's telegraphic system had worked quite normally, thanks to its distant situation from the principal theatre of events. During the year 10 of their cables in Europe had been interrupted 12 times, whilst six in Asia had been subject to 15 interruptions. Their cable steamers had been less engaged in repairing their cables than during the previous year, and they had also had less to do for other administrations. Of the *H. C. Orsted* had been occupied in Europe for 62 days, of which 15 were for the account of other administrations, against 165 and 32 respectively in 1911; and the *Store Nordiske* and *Pacific* in the Far East for 230 days, of which 68 were for other administrations, against 281 and 120 respectively.

The movement which had manifested itself in Outer Mongolia and also in Tibet for a separation from Chinese domination had fortunately, so far, not seriously affected the transmission of their traffic between Europe and the Far East, either by the Kiachta route, which traversed the whole of Mongolia, or by the Wladivostock route, which on Russian territory skirted the whole of the frontiers of Mongolia and Manchuria. On the contrary, the authorities of those countries seemed to take special interest in protecting and maintaining the lines, and in conserving their discreet and neutral service. The company's negotiations with Japan regarding future relations with that Empire after the expiration of the company's exclusive privileges, were resumed in July last after a suspense of several years. These negotiations had kept the company fully occupied both in Japan, at Tokio, and here in Europe, because the wishes and proposals of Japan made it necessary for this company to obtain the consent of several of their concessionary Governments, and also the concurrence of other Government and private administrations interested in the transmission of the traffic with Japan and with other countries in the Far East. All these negotiations had necessarily taken a considerable time, and they were further delayed by the death on July 30th last of the Emperor of Japan.

In spite of all these obstacles they had by means of mutual concessions, succeeded in arriving at an understanding with the Imperial Administration embodied in "Heads of Agreement," which were signed at Tokio on December 28th, 1912, the date of

expiration of their exclusive privileges, and shortly afterwards approved by the Imperial Government.

The stipulation of these "Heads" fixes in principle the solution of all questions in dispute, and also the future relations between Japan and the company in a sufficiently clear and detailed manner so as not to leave any doubt as to their definitive interpretation.

The main points are the following:—

1. The company loses its exclusive privileges in Japan without any compensation whatever.

2. The perpetual rights of the company with resulting duties and obligations will be embodied in a new document in conformity with the terms of the old concessions.

3. It was of great importance to Japan to arrange for the laying of a Government cable between Nagasaki and Shanghai for the transmission of telegrams written in Japanese Kana characters, and for Government telegrams exchanged terminally between Japan and Shanghai. They also desired to use the existing Japanese cable between the island of Formosa and Poochow, which had hitherto carried only terminal Formosan traffic, for the transmission of all telegrams from and to the whole of the Japanese Empire.

Although the realisation of these wishes would constitute an infringement of the privileges granted by China to the company until 1930, and shared by the Eastern Extension Co., they had with the approbation of the Chinese Government agreed to the wishes of Japan, but, in order to avoid too serious a competition between all the interested parties, subject to the condition that a joint purse arrangement be made for the next 18 years for the division of the receipts between Japan, China and the company, in an impartial manner to be fixed beforehand.

4. Lastly, the sacrifice which would most seriously affect the financial interest of the shareholders was: Large and numerous tariff reductions varying from 20 to 67 per cent. of the old rates for the different classes of Japanese correspondence. These reductions were the more perceptible because it would be impossible to grant several of them to Japan without also granting them to China and other countries in the Far East. In 1870 and 1871 these countries, simultaneously with Japan, were brought by the company into telegraphic communication with the rest of the world, and they had honoured the company with the same confidence and hospitality as they had enjoyed in the Empire of the Rising Sun.

There was another Great Power which through its honoured and respected organs manifested its salutary influences everywhere, viz., "The World's Press," for whose benefit they desired to make considerable tariff reductions in the hope that its telegraphic correspondence with the Far East would lead to a more intimate and intelligent mutual knowledge and a more cordial understanding between the peoples of the East and the West.

The introduction of the aforementioned reduced rates would result in a very considerable, and as yet indeterminate, decrease in their telegraphic receipts. The board, nevertheless, accepted it with equanimity, thanks to their reserve and other funds. It was an advantage that the reductions would probably not come into force for another month or two, because the losses of the first 12 months under the new régime would thereby be distributed over two financial years of the company.

Another, and a still greater advantage, was that the financial receipts of the year 1912 had been considerably better than those of the preceding year, in which the loss of the Norwegian concessions caused a perceptible decrease in the receipts. During the last year the receipts had risen afresh, thanks to the extraordinary events of the year which, without interfering with the stability and working of the lines, had created an almost prodigious increase in the telegraphic correspondence. The receipts had been large enough to enable them to propose an increase of the bonus by 2 per cent., or a total distribution of 20 per cent. for 1912, in spite of the large loss of revenue which they expected to have shortly. Shareholders were, however, recommended not to draw conclusions too lightly as to the future from the increased bonus this year, the prospective losses being, as previously stated, impossible to estimate at present.

The chairman went on to refer to the placing of an exceptional dotation of £16,600 to the pension fund, as a well-merited appreciation of the fatiguing work of the employees. Traffic receipts had increased by about £57,850, but of this £19,680 was due to the fact that the loss on exchange of the previous year of £7,160 had this year been changed to a gain of about £12,250; interest had decreased by £670, whilst sundries had decreased by £3,500. The total expenses had increased by £9,520. Participation in other telegraph undertakings had decreased by £16,480, representing the amortisation of the advances made to the Chinese Administration. The board had thought it necessary to write off about £69,400 in consequence of the decreased value of investments through the universal depreciation of gilt-edged securities during the last few years.

### Singapore Electric Tramways, Ltd.

THE ordinary general meeting was held on Tuesday at the offices, 19, St. Swithin's Lane, E.C., Sir Frank A. Swettenham presiding.

The CHAIRMAN, in proposing the adoption of the report (see ELECTRICAL REVIEW, page 776), said that during the past year £3,900 worth of debentures had been paid and cancelled, thus reducing the total debenture liability to £326,500. The tramway undertaking stood at £678,757, as against £689,055 at the end of 1911. A small expenditure of £1,828 had been incurred on capital during the year in respect of additions to buildings, plant, workshop equipment, &c. The cash and loans stood at £39,717 as against £27,072 in the previous year. The traffic receipts had increased by £1,446, and sales of energy to the Government and the municipality by £1,865. The working expenses had risen from £42,613 in 1911 to £43,916, due almost entirely to the increased cost of fuel. The profit of £5,358 reduced the debit balance on the profit and loss account to £3,824. The reduction of the debit balance, which at December 31st, 1908 stood as high as £16,200, and in 1911 and 1912 was reduced by £5,055 and £5,358 respectively, was conclusive evidence of the progress which the company was making, and they hoped that the next accounts would show not only that the debit balance had disappeared, but that its place had been taken by a credit.

Whilst the passenger receipts and the number of passengers carried had increased, the general manager had been able again by carefully studying the traffic requirements, to reduce the car-mileage. That was a satisfactory feature as considerable wear and tear of rolling stock was avoided and working expenses were consequently reduced. The increase in the number of passengers carried was 398,080 as against an increase in 1911 over 1910 of 344,155. The decrease in car-mileage was 29,698 miles following a decrease in 1911 of 75,402 miles. The passengers carried per car-mile were 6.71 in 1912 and 6.42 in 1911 and receipts per car-mile were 7.44d. in 1912 as against 7.30d. in 1911, whilst the expenses per car-mile had advanced slightly—from 4.03d. in 1911 to 4.12d. Considering only the tramway undertaking the expenses represented 57.25 per cent. of the receipts, but the total Singapore expenses represented only 52.66 of the total Singapore revenue, compared with 54.96 per cent. and 52.64 per cent. in 1911. The Singapore tramway ordinance of 1902 fixed the maximum charges to be made for energy by the company, but they had found it to be in their interests to charge considerably lower rates and to give special terms in exceptional circumstances. With the rapid advance in the application of electricity all over the world since the ordinance was granted, it became necessary on nearing the last quarter of their ten years' period of supply, to consider the possibility of competition or of the municipality laying down its own plant. The company, therefore, approached the municipal Commissioners in regard to a renewal of the contract, and after very lengthy negotiations an extension had been granted. The municipality had decided to add to its field of electrical supply the residential districts of Tanglin, and it had granted them an extension for ten years from the date of the current first being supplied to that district. A reduced scale of charges had been agreed upon, and whilst the new scale would naturally not yield the same amount of profit as the old, it was hoped that the increased output would counteract the reduction in price. The traffic receipts for 1913 already showed an increase over the corresponding period of 1912 of £18,944, or over 9 per cent., equal to an increase of £997 per week. That increase in 19 weeks compared very favourably with the progress of 1912, for the increase during the whole year only amounted to £10,697. He thought the shareholders would agree that they had good reason to be satisfied with the work done by the general manager and his assistants in Singapore.

SIR CHARLES PETRIE, J.P., seconded the motion.

MR. BLES said he thought that an expenditure of £43,000 to secure a profit of £22,000 was altogether too large a proportion. He considered that too much was being spent on ticket inspectors, and he also thought there should be a reduction in fees paid to the board.

The CHAIRMAN, in reply, said that the expenses of the company compared with its revenue were about as moderate as could be found anywhere—in fact, he thought they were extraordinarily moderate, in view of the condition under which the work was carried on. If they were to spend less on inspection, they were advised that the receipts would immediately decline. With regard to the directors' fees, that point had been raised at previous meetings, and in consequence, one director resigned. The affairs of the company were now in a much better condition than they were some years ago, and he could assure them that the management of the concern gave the board a good deal of anxious thought and consideration. If the shareholders wished to reduce the fees, they would have an opportunity of doing so by refusing to re-elect the retiring directors.

The report was adopted, and the retiring directors, Sir John Anderson and Mr. F. Baynes, were unanimously re-elected.

### West India and Panama Telegraph Co., Ltd.

THE meeting was held on May 7th, at Winchester House, E.C., under the presidency of Mr. W. B. Kingsford.

In moving the adoption of the report, the CHAIRMAN said that the amount to the credit of revenue was £38,508, a decrease of £2,098, as compared with the corresponding half year in 1911. The traffic receipts were £1,805 less. They attributed that decrease mainly to the reduction of the rates to which he referred at the last meeting. There had been rather a short sugar crop in the islands, which also accounted for some part of the decrease. The expenses compared favourably with the corresponding period, being about £2,500 less. They used 18 miles less cable in repairs than during the previous half-year, and they also hired their repairing steamer for a few days to the Cuba Submarine Co., and they sold a quantity of cable core, thus reducing the expenses attending the maintenance of cables from £9,103 to £6,429. In the working expenses at stations there was a new item of £86, share of pension fund at a joint station. That arose from the fact that the Cuba Submarine Co. recently established a pension fund for the benefit of their staff in Cuba. The station from Santiago to Cuba was worked jointly by the West India Co. and the Cuba Co., and therefore they felt bound to share equally in the expense of the pension fund at that station. The West India and Panama Co. was almost the only telegraph company which did not have a pension fund. The directors regretted that that was so, but they felt that to establish a fund on the lines of other companies would be too costly a matter for them to entertain. They thought, however, that a plan for granting allowances to the London staff on retirement after 40 years' service could be arranged without in any way increasing the present expenses of the London office. He felt sure that such a proposal would have the cordial approval of the shareholders, and they proposed to ask their sanction to the same at the next meeting. The development of the oil industry in Trinidad was being watched by them with much interest. They understood that

a powerful syndicate had recently been negotiating with one of the principal oil companies in Trinidad to obtain an interest in its property, and that the necessary arrangements had now been concluded. The successful development of that almost new industry could not fail to be beneficial to the commerce of Trinidad and, incidentally, to their company. A Danish company was formed some few months ago to undertake the work of deepening the harbour at St. Thomas, and carrying out other extensive improvements there in order to give better anchorage and wharf facilities for large steamers. The work had been commenced, and when it was finished, they might reasonably hope that those largely increased shipping facilities would tend to the creation of additional business, as the headquarters of the company were at St. Thomas.

MR. HENRY HOLMES seconded the motion.

The CHAIRMAN, in reply to questions, said that, at present they were not inclined to entertain the notion of extending wireless communication between the islands. At present they had wireless connection between Trinidad and British Guiana. With regard to any projected amalgamation, he had never mentioned the subject at any of their meetings, as they had never been approached by any other company with any proposals to that end. Of course, if any favourable opportunity should arise for entering into an amalgamation, or of doing anything else for the improvement of the company, they would only be too glad to enter into the question.

The report was adopted.

### South Metropolitan Electric Tramways and Lighting Co., Ltd.

—The directors report that the total revenue for the year to December 31st from all sources amounted to £61,941, compared with £59,222 for the preceding year. The expenses, according to the *Financial*, were £36,144, compared with £35,054 for 1911. The net revenue was therefore £1,631 more than in 1911. After deducting all expenses chargeable to revenue, including payments to local authorities under agreements and interest upon the debenture stock of the company, and after setting aside £3,000 to the renewals fund, there remains a surplus of £15,492, plus £604, brought forward. The directors propose to place to reserve £5,000; to pay a dividend at the rate of 6 per cent. per annum on the preference shares for the year, £10,174; leaving to be carried forward £922. The gross receipts from the tramways and light railways were £45,141, a decrease of £388, and the working expenses amounted to £24,509, an increase of £127. There was a decrease of £491 in traffic receipts for the year, which is attributable to the unfavourable weather, and to the fact that the Festival of Empire was held at the Crystal Palace in 1911. The gross receipts for the electricity supply section (including the amount represented by the sale of energy to the tramways) amounted to £14,124, and the working expenses to £7,184. The total number of units sold during the year, including 192,736 supplied to the tramways, was 920,316, as compared with 836,122 in 1911. The number of units sold for lighting and power purposes was 727,580, an increase of 86,255 units, or over 13 per cent. The number of consumers at December 31st was 1,535, as compared with 1,355 at the corresponding date of the previous year, an increase of over 13 per cent. The receipts for 1912 exceeded the receipts for 1911 by £1,340, whilst the working expenses were £751 in excess of those for 1911. Most of this increase in expenses was due to the increased output, but a considerable portion was attributable to the higher cost of fuel and the rise in price of all other materials. The Cheam Parish Council has accepted the company's tender for lighting of certain streets in Cheam (where cables are already laid) for a period of five years. A proposal is submitted to the shareholders that they should exchange their holdings for shares in the London and Suburban Traction Co., Ltd.

**Craigpark Electric Cable Co., Ltd.**—The tenth annual meeting was held in Glasgow on Monday, Mr. W. S. Brown presiding. The chairman, in moving the adoption of the report (see *ELEC. REV.*, page 775), said that the profits for the year had been far better than the profits for the previous 12 months, which was due to the company doing a much larger trade upon the occasion under review. They had had, however, many difficulties to contend with, fuel had been very expensive, and there was a heavy increase in expense through the Insurance Act, and on other matters. The works were well employed at present, in fact they had never had so many orders upon their books. Some of the shareholders were aware that they had a golf-ball business as a subsidiary section of their concern. Owing to the high prices of rubber, it was not worth taking part in for some time, but they had put a new ball on the market, and experts had spoken highly of it. They intended to make this a more important part of the business as a dividend-earning section.

**Lima Light, Power and Tramways Co., Ltd.**—The directors report that the total profits obtained during 1912 were £p.175,156: less—bond service, £p.62,904; interest and discount, £p.7,795; European expenses, £p.1,762; provision for bad and doubtful debts, £p.2,805; provision for extraordinary renewals, £p.1,000; leaving a net profit of £p.98,890. There is to be placed to reserve and redemption fund, £p.25,994; a dividend of 4 per cent. requires £p.53,996, leaving a balance of £p.18,900, out of which an additional dividend of 1 per cent. is recommended in respect of 1912, carrying forward £p.2,026.

**Auckland Electric Tramways Co., Ltd.**—The directors have declared an interim dividend of 7½d. per share, free of income-tax, on the ordinary shares for the half-year ended December last.

### Sunderland District Electric Tramways, Ltd.

THE report of the directors for the 12 months ended October 31st, 1912, states that during this period the property was in the hands of the Receiver, who controlled the outgoings. After providing for interest on the prior lien bonds, the first and second mortgage debentures, and the expenses of the receivership, the accounts show a loss on the past year's working of £1,176, bringing the aggregate loss to date up to £18,065. In consequence of the coal strike in the early part of last year, the traffic receipts show a decrease of £483; but, on the other hand, a saving was made in working expenses, which averaged 61'22 per cent. of the gross receipts, as against 64'68 per cent. for the previous year. Since the close of the year on October 31st, the scheme of arrangement referred to in the last report has been carried into effect, and the board has again assumed the entire management and control of the company. The new prior lien bond money has now been received, and the old prior lien holders have been paid off. The balance of the money provided under the scheme, together with that handed over by the Receiver, is sufficient to provide the new cars required and to make other needed improvements. Certain additions and alterations have been made to plant, machinery and permanent way, which should still further reduce operating expenses. For the 26 weeks for the current financial year, the traffic receipts show an increase of £2,175 over the corresponding period of last year, and the general position of the undertaking may be regarded as much more satisfactory than it has been for some years past. Messrs. Charles Eves and Albert Counter, who were appointed directors in accordance with the arrangement made with the new prior lien holders in December last, offer themselves for re-election.

The revenue account on the debtor side shows the following:—Expenses at Sunderland, power, £2,489; operating, £6,050; repairs and renewals, £3,972; management expenses (including salaries, rents, &c.) £2,630; a total of £15,141. Trustees' fees (prior lien bonds and first and second mortgage debentures), £273; directors' fees (May 1st, 1910, to October 31st, 1912), £773; there is a balance carried down of £9,849. On the credit side, traffic receipts are £23,778; advertising parcels, &c., £648; sundry sales, £126; royalties receivable (annual royalty under agreement and royalty on current supplied), £1,586; and other small items make a total of £26,349.

### Cuba Submarine Telegraph Co., Ltd.

MR. GEORGE KEITH presided over the meeting of the company held on May 7th at 58, Old Broad Street, E.C.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 732), the CHAIRMAN said that the monthly traffics, as a whole, compared favourably with those of the corresponding period of the previous year, notwithstanding the reduction which had taken place in some of their through rates during the year. The rainy or slack season in Cuba generally began with June, but last year the exceptionally dry and favourable weather enabled the milling of the sugar canes to continue much longer than usual, which accounted for the increase shown in the July traffic. The total in December also showed an increase, due principally to interruptions in other lines, which brought them traffic outside their usual business. The traffic of the other months was somewhat short of what it was in the preceding year. As regarded the revenue account, there was an increase of £520 in the traffic, while interest showed a decrease of £136 in consequence of the sale of some of their securities to meet the cost of laying the Cape Cruz-Santiago cable. The total revenue, including transfer fees, amounted to £19,073, or £383 more than in 1911. Altogether the total expenditure amounted to £7,085, or £586 more than in 1911. The result of the year's business gave a profit balance of £11,988, out of which £2,000 had been added to the pension fund and £2,000 carried to the general reserve. After providing for a dividend on the preference shares, the directors recommended the payment of the usual dividend at the rate of 6 per cent. per annum on the ordinary shares, and increasing the balance carried forward by £188 to £7,931. In the balance-sheet the general reserve fund now stood at £94,000 and the pension fund at £4,115, which included the interest accrued on the same. The investments, less reserve for depreciation, remained the same as last year. Their market value had considerably depreciated since the commencement of the Balkan war, but it was hoped when peace was finally arranged they would appreciate and make it unnecessary to increase the depreciation reserve. This year business generally in Cuba and the West Indies continued prosperous, and the traffic passing over their cables up to the present was satisfactory, although not quite up to what it was for the corresponding period of last year, which was very exceptional. In these days of low rates the amount earned per message was gradually falling, and they had to do a great deal more work for the money received. Their cables were all in a perfect working condition. It was, however, with much regret he had to mention that their Cienfuegos building was completely wrecked in February by the terrific explosion at a store on the opposite side of the street. One messenger was killed, and four of their staff were seriously injured. Fortunately their manager escaped with a severe shock and was able to resume charge immediately after the disaster. Business at Cienfuegos had since been carried on in a temporary office, but steps were being taken to fit up a new building in the place of the old one. In conclusion, the chairman said that he hoped the proposal to hold only one meeting during the year would meet with the shareholders' approval, because he thought that dealing with the year as a whole would give the shareholders the opportunity for comparing the progress made.

MR. C. W. PARISH seconded the motion.

In replying to a SHAREHOLDER, the CHAIRMAN said that the damage done to the station at Cienfuegos was covered by insurance.

MR. LIDDON said he noticed that their shares had been quoted very much lower than usual for some time, and he asked the chairman if he could give any explanation of that.

The CHAIRMAN said it was impossible to explain the fluctuations in shares on the market. The reduction of the rates naturally reduced the amount received per message.

The report was then adopted.

### Eastern Telegraph Co., Ltd.

THE directors report that for the six months ended December 31st, 1912, the revenue amounted to £753,326, from which are deducted £273,246 for the ordinary expenses, and £82,904 for expenditure relating to maintenance of cables, sundry differences in exchange, and income-tax payable abroad, leaving £397,176, plus £52,418 brought forward, making a total available balance of £449,593. After providing for income-tax payable in England, interest on mortgage debenture stock, and dividends on the preference stock, which in all absorb £83,212, there remains £366,382, out of which the directors have placed £160,000 to the general reserve fund, and have paid an interim dividend of 1½ per cent. on the ordinary stock, amounting to £50,000. The directors now recommend a final dividend on the ordinary stock of 1½ per cent. and a bonus of 2 per cent., amounting together to £130,000, both payable on May 21st, free of income-tax, and making, with the three previous payments on account, a total distribution of 7 per cent. for the year ended December 31st, 1912. It is proposed to carry forward £26,382 to the next account. As foreshadowed at the last general meeting, it has been found necessary to increase the carrying capacity of the cables east of Suez, and the board has, therefore, decided to carry out important renewals to one of its Red Sea and Aden-Bombay sections. An additional cable will also be laid between Suez and Aden, and application has been made for landing rights for a cable between Aden and Colombo, to join the new cable from Colombo to Penang which has lately been laid by the Eastern Extension Co. A contract has been placed with the Telegraph Construction and Maintenance Co., and instalments of cost amounting to £65,100 have been charged against the general reserve fund. The present articles of association which have been in force for many years are out of date in some respects. New articles of association will be submitted for approval at the general meeting on May 21st.

**Eastern Extension, Australasia and China Telegraph Co., Ltd.**—The directors report that the gross receipts for the half-year to December 31st, amounted to £379,445, against £359,596 for the corresponding half-year of 1911. The working expenses, including £19,774 for maintenance of cables, absorb £154,779, against £159,232, leaving £224,666. From this is deducted £3,766 for income-tax payable in England and £15,048 for interest on debenture stock, leaving £205,851 as the net profit for the half-year. After adding £56,684 brought forward, there is an available balance of £262,535. One quarterly interim dividend of 1½ per cent. has been paid for the half-year, and it is now proposed to distribute another of like amount, making, with the interim dividends paid for the first half-year, a total dividend of 5 per cent. It is also proposed to pay a bonus of 4s. per share, or 2 per cent., making a total distribution of 7 per cent. for 1912. £100,000 has been transferred to the general reserve fund and £27,535 carried forward. The general reserve fund has been debited with £50,000 as a further provision on account of investment fluctuations, bringing the total provision against depreciation up to £200,000. In pursuance of the policy indicated by the chairman at the last general meeting, of strengthening the company's cable capacity in the Far East, contracts have been entered into with the Telegraph Construction and Maintenance Co. for the manufacture and laying of new cables between Colombo, Penang, Singapore and Hong-Kong. The first section was completed a few days ago, and the expenditure on this account up to the end of last year (£86,704) has been charged against the general reserve fund. The other sections are expected to be completed in the early part of next year.

**Western Telegraph Co., Ltd.**—For the half-year ended December 31st, 1912, the directors report that the revenue was £438,888, and the working expenses £176,474. After providing £16,373 for debenture stock interest, and £8,361 for income-tax, there remains £237,679, plus £33,517 brought forward, making £271,196. First and second interim dividends, amounting to £62,379, have been paid, and after transferring £140,000 to the general reserve fund, £25,000 to the provision on account of investment fluctuations, and £10,000 to the land and buildings depreciation fund, there remains £33,817 to be carried forward.

**Cuban Telephone Co.**—The directors report that the income for 1912, including £292,640 brought forward, was \$1,064,658: \$50,000 is transferred to surplus account. After meeting working expenses and other charges, there is a credit balance of \$498,379. Four quarterly dividends of 1 per cent. each were paid on the common stock.

**Simmonds Bros., Ltd.**—A petition to the Courts to confirm reduction of capital from £50,000 to £29,505, will be heard on May 27th.

### Callender's Cable and Construction Co., Ltd.

SIR J. FORTESCUE FLANNERY, Bart., M.P., presided on May 8th, at Hamilton House, Victoria Embankment, E.C., over the seventeenth annual general meeting of the company.

The CHAIRMAN, in moving the adoption of the report (see ELEC. REV., page 733), first referred to the loss sustained by the company in the death of the late chairman, Mr. H. Drake. The number of the board had been decreased not only by the death of Mr. Drake, but by a previous loss, and the directors were considering the question of replacing these losses. He was pleased to present a report and balance-sheet which he believed would be considered very satisfactory, and which would have been even more so but for labour troubles. Just a year ago there was the coal strike, affecting practically the whole of the mining industry throughout the country. This strike, whilst embarrassing the operations of all manufacturers at the time, had resulted in a permanent increase in the cost of coal, which must in the end prove an international disadvantage in raising the cost of what was the very life blood of the manufacturing interests of Great Britain. Six months ago there was a strike, which, whilst less national in its character, affected the company very seriously. He referred to the strike of lightermen upon the Thames. Their works at Erith were very advantageously situated upon the banks of the river. They had a wharf which had excellent appliances for the reception of their raw materials sea-borne, and for the discharge into ships of their manufactured finished products. Greatly to their advantage, the bulk of their trade was sea-borne trade, so that they were affected in the most serious manner by the stoppage of the traffic. The thanks of the shareholders were due not only to the managing director, but in this connection to the subordinate officials, for the very special and successful efforts they made to minimise the loss and inconvenience during the strike, the result being that, serious as was their loss, still it was much less than it would have been but for the efforts of these officials. Then they had another labour difficulty of a more direct kind. They employed a large number of engineering workmen at their Erith factory, and he was sorry to say there was a dispute between them and the company, which lasted, however, for only a comparatively short time. Long ago it had been amicably settled, and that day he was able, with the utmost satisfaction, to report that their relations with their employees in all their works, both in the South and in Lancashire, were excellent. The employees had regular employment and a standard rate of wages, and every advantage that could reasonably be expected, and they looked forward to a continuance of the good understanding between employees and employer so far as they were concerned. Last year they turned out more work than in any preceding year in the history of the company. Some was at competitive prices, leaving little or no margin of profit, while some was at competitive prices which did leave a profit. The result, taking it all round, was that they had had a better year than ever before. At the Erith Works they manufactured heavy cables, and in Lancashire they manufactured rubber goods and did lighter work generally. They had transferred the plant for the manufacture of telephone cables to Erith, because they wanted more room in the Lancashire works for their extending trade, and they had charged the cost of this to revenue. They had enlarged the works in Lancashire. These works were very favourably situated in respect to canal transport and otherwise, and they were thoroughly well satisfied with what had been done in connection with them. The policy of maintaining all their plant out of revenue, which had always characterised the company, had been again carried out during the past year. The enlarged trading of the company had necessitated more capital, and the board were very unwilling to increase the direct burden on revenue by issuing more shares or debentures; they therefore formed a subsidiary company, known as Callender's Share and Investment Trust, Ltd., the object of which was to convert into available liquid capital, to be used in the company's trading operations, part of the money invested by the company in past years in securities which had been held since. He was glad to tell them that this investment proved a most attractive one, and the whole of the capital was readily absorbed. The result of the year's operations showed a balance to the credit of profit and loss of £97,000, as compared with £77,000 in the previous year, which with the £58,000 brought in from 1911, gave them £155,000 to deal with. After deducting the debenture interest and preference dividend and depreciation, they were left with a balance of £117,000, as compared with £84,000 a year ago, and it was proposed to pay a dividend of 10 per cent., and a bonus of 5s. per share, and to carry forward £91,745. The question arose as to whether a part of this £91,000 should be put to reserve, but they knew that when money was put to reserve, it was locked up, whereas if they carried it forward it was equally a good reserve, but remained liquid, and available generally for the purposes of the company. Therefore, in view of the extending trade of the company, they thought it wiser to carry the money forward. There was no need to go through the figures in the balance-sheet, and he need only say that owing to the larger trade the company had done there were increases in most of them. They had had during the year the most skilled and indefatigable attention to the interests of the company by Mr. T. Callender, the general manager, and his two associates, Mr. Petersen and Mr. James Callender. The managing director made a journey to India in the interests of the company's business, and whilst they were sorry to lose him at home during that time, yet he left behind him very efficient substitutes in the two colleagues he had named. As only four months of the present year had elapsed, it was too early for them to be certain of the results which would accrue in 1913, but, so far as they could judge,

their prospects were excellent. They were full of orders received from customers at home and in the colonies, and he hoped that the balance-sheet they would present 12 months hence would be as good as the one he put before them that day.

Mr. T. CALLENDER, in seconding the motion, said that, in looking back on the past year, they found it was one in which they had had a great deal of trouble and a great deal of anxiety, but also, fortunately, a very large amount of work. Their factories never were fuller of work than in 1912. They started this year under very excellent circumstances, as the factories were full. They had as much work as they could do at present, and there was every prospect of that excellent condition of things continuing for some time at least. From their knowledge of the trade, and the experience they had of the views of their customers at home and abroad, they thought that, unless some serious political disturbance took place or some great labour trouble occurred, the output of 1913 would be good; and he hoped, when they met next year, they would have an excellent report to lay before the shareholders. So far as their business was concerned, they were extending on every side, and were always opening up some new agency or department. A few minutes before coming there, he was in consultation with one of their engineers, who only returned the previous day from Switzerland, where he had been testing cables which the company had supplied, and this was the first occasion on which any English company had done any such work in that country. Their progress had also been considerable in various parts of Germany, Belgium, Spain and elsewhere on the Continent. Their overseas business in the Colonies and in South America was also large and increasing, and they were leaving no stone unturned to bring their products before electrical consumers everywhere. He considered it of sufficient importance to go himself to India and spend some weeks meeting those at the head of affairs with whom they were in the habit of dealing, and he was thoroughly well satisfied with the results of his journey. There was very little to tell the shareholders, because such history as they had made was told in the profit and loss account, the reading of which should give satisfaction to every shareholder. As usual, they had dealt most liberally with the replacement of machinery, and an increased business necessarily meant more wear and tear and added to the cost of repairs. During the year the large staff, both at home and abroad, had been of the utmost assistance, and had worked in the most loyal way, and no company could be better served.

The report was adopted without discussion, and the retiring director and auditors were re-elected.

### West Coast of America Telegraph Co., Ltd.—The

directors' report for the year ended December 31st, 1912, states that the gross receipts amounted to £53,737, as against £53,891 in 1911. The working expenses were £39,646, as compared with £39,689 for the previous year. After providing £6,000 for the interest on the 4 per cent. debentures and £800 for the interest on the 4 per cent. income-bonds, there remains £7,291, plus £1,182 brought forward, making a total of £8,473. Of this £5,000 has been placed to the general reserve fund, and the directors recommend a dividend of 2½ per cent., free of income-tax, amounting to £2,813, leaving £660 to be carried forward.

### Stratford-upon-Avon Electricity Supply Co., Ltd.

—Mr. G. M. Bird presided at the annual meeting recently, and, in moving the adoption of the report (see ELEC. REV., page 733), he said that the income from current was £123 in excess of that of the previous year, and from other sources £30 more. Expenses were up by £75. The units sold for lighting and heating showed a considerable advance, but the power units were somewhat down, as the principal consumers, the mill-owners, had no necessity to use it owing to the heavy rains of the season. With a dry summer, however, this would come on again. Their coal contract was higher, and they had had a slight breakdown to one of the engines—both of these items would somewhat increase the expenses of the current year. The report was adopted.

### International Railphones, Ltd.—The

*Times* states that at the annual meeting of this company, held on 21st ult., it was resolved to offer at par the balance of the unissued capital, amounting to 1,746 shares, to the existing shareholders *pro rata* to their present holdings. An agreement has been made regarding the working of the patent rights for Germany.

### Thomas Tilling, Ltd.—In

their report for 1912, the directors mention that during the year they acquired a preponderating interest in the business of W. A. Stevens, Ltd., motor manufacturers and engineers, who are the patentees of the electrical portion of the "Tilling-Stevens" motor-omnibus.

### London and Suburban Traction Co., Ltd.—An

extraordinary general meeting is called for May 21st, at the Holborn Restaurant, at which a proposal will be put forward for increasing the capital from £3,250,000 to £3,600,000, by the creation of 200,000 new preference shares and 150,000 ordinary shares of £1 each.

### Bahia Tramway, Light and Power Co.—A

meeting has been called for June 5th, at Winchester House, E.C., at which there will be put before the debenture-holders particulars of the proposed sale of the company's undertaking to the Bahia municipality.

## Anglo-Portuguese Telephone Co., Ltd.

Mr. HERBERT ALLEN (chairman) presided on Friday, at 48, Cannon Street, E.C., over the general meeting of this company.

In moving the adoption of the report (see ELECTRICAL REVIEW, page 777), the CHAIRMAN said that last year he expressed the hope that the meeting would be held a little earlier, but sickness amongst the staff at Lisbon delayed the making up of the accounts. This was the twenty-sixth annual meeting over which he had presided, and in looking over the records he found that each year had invariably shown an advance on its predecessor. For 1912 the gross revenue amounted to £62,919, an increase of £5,874 over the previous year. Their gross profit amounted to £25,195, and their ratio of expenses to receipts was a trifle over 57½ per cent., which, he believed, compared favourably with that of other similar undertakings. The number of new subscribers connected during the year was 1,283, which was more than double the number of withdrawals, and gave them a net increase of 671 subscribers. This showed that the business in the past year had been very active, and there were no signs up to the present of any falling off in that activity. As the result of the increased revenue, the Portuguese Government obtained £1,780 more in royalties. The total number of calls for the year was 17,993,503, which, at 1d. per message, would equal about £75,000, but as their subscriptions and installation charges were only £60,000, it worked out at an average of about 1½d. per message. Many of them in this country would be glad if they could feel that their telephone messages only cost them on an average about 1d. They had to be thankful if they got a call at any price sometimes. Unofficially, he would say that if they gave Portugal such a telephone service as the British public had to put up with, they would have been kicked out years ago, and very properly so. However, he did not ask his colleagues to endorse that sentiment. Whilst the increase in the company's business must be considered satisfactory, it must be admitted that the conditions of the country during the period under review were not satisfactory. At the end of January there was a great deal of agitation amongst the working classes, and an attempt made to organise a general strike. It was not altogether successful, but it resulted in the closing of many factories, and the tramway service in Lisbon was brought to a standstill. The Government placed Lisbon under martial law, and for six days they had to have troops to guard the exchange. The working of the exchange during the whole period was very active, and was so satisfactorily carried out that a special vote of thanks to the company was passed by the Portuguese House of Parliament in February. Could they imagine anyone getting up in the British House of Commons and proposing a vote of thanks to the Government for the British telephone service? They had expended £12,670 on capital account on the reconstruction of some of the more important trunk lines of Lisbon and in the laying of 4½ miles of underground cables, which was an expensive matter at first, but led to great economy in the long run. In Oporto also, they made considerable additions to the underground cables. Owing to the large increase in the company's business of late, there had been a certain amount of inconvenience arising from want of space in the central exchange, and after careful consideration it had been determined to erect an additional exchange in the northern part of Lisbon. A site had been obtained from the Municipality, and building operations had commenced. Turning to the revenue, the gross profit for the year was £25,195, and adding £5,382 brought in from last year, they had £30,577 to deal with. Of this, debenture interest and sinking fund absorbed £3,600, and income-tax £868. It was proposed to add £12,500 to reserve as last year, bringing the fund up to the respectable sum of £62,500. This was the sixth year in succession in which they recommended the payment of 8 per cent. dividend, and this on the ordinary share capital of £100,000, would absorb £8,000, and thus leave £5,609 to be carried forward. On the whole, he thought they might congratulate themselves on the progress and stability of the business, and if they never did worse than in 1912, they would not have much to complain of. They were largely indebted to their able staff in Lisbon and Oporto, who deserved their hearty thanks.

Mr. F. W. KERR seconded the motion.

Mr. HIBBERT congratulated the board on the successful year, and said the amount now placed to reserve was a large one. Some time ago the board gave the shareholders a little bonus, and he suggested whether they might not distribute £25,000 to the shareholders in the way of shares.

The CHAIRMAN said the little bonus Mr. Hibbert referred to was 3½ per cent. Having regard to the fact that their concession was not interminable, they had to be prudent. If the board thought it prudent to distribute any of the reserve fund they would do so, but their first business was to keep the finances of the company sound.

The motion was then carried, and the chairman was re-elected a director.

**Stock Exchange Notices.**—The Committee has ordered the undermentioned securities to be quoted in the Official List:—

General Electric Co. (of New York)—\$1,000,000 5 per cent. gold debenture bonds (London issue), Nos. T1 to 2,700 of \$1,000 and OT1 to 2,600 of \$500 each, in lieu of the scrip, together with \$6,000,000 5 per cent. gold debenture bonds (issued abroad), Nos. T2,701 to 8,600 of \$1,000 and OT2,601 to 3,000 of \$500 each.

La Plata Electric Tramways Co. Ltd.—£100,000 5 per cent. 1st mortgage debenture stock.

**Castner-Kellner Alkali Co., Ltd.**—The directors announce an interim dividend at the rate of 18 per cent. per annum for the six months ended March, 1913.

## STOCKS AND SHARES.

Tuesday Evening.

At the time of writing, as the newspapers say, the principal influences in Stock Exchange markets are holiday ones. The House has scarcely recovered from its Whitsun rest, and as the settlement of the account takes place this week, fresh business has not developed up to the present to any great extent. Now that there is a definite chance of the Bank Rate coming down still further, the demand for investment securities is again a feature; and even those new issues which are left to a great extent in the hands of the underwriters command attention from bargain-hunters who are on the look out for discounts.

The Home Railway market is somewhat pressed upon by the fact that the bull account in certain of the popular stocks has come into prominence owing to the settlement this week. Apart from this consideration, there is a fairly general opinion that the outlook promises well, so far as can be seen. The labour trouble in Wales appears to have simmered down; and the month of May, so prolific as a rule in labour agitations, is proceeding quietly enough this year. Prices are on the firm side, and after the holiday there was a strong disposition to put prices better. Metropolitan went back a little with the Steam stocks, and Districts eased off to 39½, both of them recovering later on. Nothing fresh has transpired in the Underground group, speculation even in the 1s. shares of the Underground Electric Railways Company having come to something of a stop. British Electric Traction issues remain dull, and although there are no further falls to record, there is also no improvement from the recent steady decline.

The Latin-Canadian group shows considerable firmness. Reliable information from Mexico repeats that a great deal of the recent "news," purporting to come from that country, had its origin in New York. But still, time will be required to allay the nervousness and anxiety caused by the late troubles of Mexico, and evidently there remains unsettlement on an extensive scale. The investor is picking up 1st mortgage bonds of Latin-Canadian companies, while for the time being he is rather ignoring the common shares. The Brazilian Traction, Light and Power Company, as we mentioned briefly last week, is taking powers to issue \$10,000,000 6 per cent. Cumulative Preference shares, convertible into Ordinary shares, the issue to take place at par, Canadian terms, on or before June 1st next; and a meeting to arrange for this will be held in Toronto next Friday week.

The issue of 5 per cent. Debenture stock by the Consolidated Baltimore Gas and Electric Company was taken up by the public to the extent of about 50 per cent., and dealings started on the basis of 1½—1 discount, there being ready buyers at the lower price, which, considering the excellence of the security, is natural enough. By the way, another well-covered security is the 5 per cent. 40-year First Mortgage Bonds of the Jardim Botânico Tramway Company, which carries the full guarantee of the Rio Tramways. The price of the bond is 96 middle, with coupons due on January 1st and July 1st. The Rio Company's First Mortgage bonds, with interest payable on the same dates, stand 6½ points higher.

After their recent bout of mild excitement, Marconi shares have subsided into quietude again, with prices tending to re-act. The effect of Technical Committee's report seems to be wearing off; and with the hint of competition from another direction, the "bulls" of Marconi are not particularly courageous. The old shares eased off to 4½; while Canadians, which rose to 16s. 9d., fell back nearly a florin, Americans and Spanish also being easier, after exhibiting a flicker of strength.

The telegraph market is supported by several good reports. One of these came last week from the Great Northern Telegraph Company, the principal feature of which was a warning note that the proprietors must not take the increase of 2 per cent. in the dividend as being permanently assured, having regard to the reductions in tariffs to the Far East which will have to be made before long. The Company, however, is in an exceedingly strong position, and it is hoped that the 20 per cent. will be maintained. Anglo-American Deferred came to market this Tuesday afternoon, and the price went back. Direct United States Cable shares have weakened also. West India and Panama Ordinary improved with other speculative issues, but the first Preference shares reacted to 10½. The Eastern group continues very firm.

United River Plate Telephone shares are now quoted at the rights to apply for the new issue, and on this the quotation moved down to 7½, which, allowing for the value of the rights, shows practically no net change. The new shares are quoted at 1 premium, and business is being done for cash in the allotment letters. Anglo-Portuguese Telephone 5 per cent. Debenture stock put on another two points. National Telephone Deferred has scarcely moved. The rise in Reuter's new shares went a trifle further, the price now being 11½ middle.

The English Electricity Supply division is firm, the feature being a rise of 1½ in Edmondsons' Debenture stock to 84. County of London Preference hardened to 12, while Edmondsons' shares at 11s. 3d. are ½ higher. The Electric Supply Corporation has just issued its report, showing quiet progress. Edison & Swan partly-paid shares are easier at 3s. 9d.

British Westinghouse Preference rose a point, and manufacturing shares, as a whole, are a good market. Rubber shares have taken a distinct turn for the better in consequence of a sharp rise in the price of the raw stuff which came unexpectedly and found the bears unprepared for it. Gossip says it is going better still, just as gossip, when the price was flat a week or two ago, was lugubrious over the outlook.

## NEW WORKS OF THE CIE. PARISIENNE DE DISTRIBUTION D'ÉLECTRICITÉ.

ON March 21st, 1907, the Union des Secteurs de Paris was first given official recognition, and on January 1st, 1914, the Cie. Parisienne de Distribution d'Electricité absorbs the six existing supply companies. The onerous conditions on which its concession has been granted include payment of 10 per cent. per annum of the gross receipts (nominally as rental for that part of the distributing system belonging to the municipality), with a sliding scale increasing this rent, the minimum annual payment being £120,000. The whole property will be taken over by the municipality in 1910 without payment, or in 1924 on payment of the balance not then provided for by the statutory sinking fund. The authorised tariffs are 1'8d. per unit for lighting and 2'9d. for power.

FIG. 1.

A further condition stipulated was that two generating stations be erected, one in the north, the other in the south-west of Paris, both being on the banks of the Seine and interconnected electrically. These works are now practically completed, and from a detailed description in *La Technique Moderne*, we draw the following particulars.

### USINE NORD (NORTHERN STATION).

This station, situated at St. Ouen les Docks, covers an area of 3'21 acres, and is at present of 50,000 KW. rated capacity; the ground occupied and the KW. capacity will be doubled by the extensions ultimately contemplated. The special features of the various divisions at the station are as follows:—

The works are connected to the Seine by a viaduct terminating on a pier which carries a coal and ash-handling equipment. Coal and ashes are taken to and from the boiler house by an electric loco, capable of hauling 100 tons at 5½ M.P.H. on the level, and provided with a drum winch at one end. Each boiler house is provided with a double set of bunkers, each of which contains three coal divisions and accommodates 5,000 tons of fuel. The coal and ash bunkers are filled and emptied by a system of conveyors, transporters and motor hoppers (see fig. 1). Conveyors and electric transporters are used to distribute coal from the bunkers as required. A system of water pipes is laid to enable the bunkers to be flooded in case of spontaneous combustion.

**Boilers.**—Two groups of boilers, separated by a lane 33 ft. in width, comprise respectively 10 Belleville, 10 Babcock and 20 Babcock boilers. The groups of 20 are arranged in rows of five on either side of a firing aisle and the feed-purifying plant is between the two boiler houses each of which is 145 ft. square. Each boiler provides 22,000 lb. of steam per hour (or 31,000 lb. on overload), at 228 lb. pressure per sq. in. and superheated to 620° F. to 700° F. The economisers are placed above each boiler and, like the latter, are totally enclosed by steel plates lined with diatomite and refractory bricks. The flues (5 mm. sheet lined with diatomite and refractory brick) from each set of boilers are led to a common stack mounted over the firing aisle. The smoke stacks (four in number), are of reinforced concrete 16 ft. 5 in. in internal diameter and rise 186 ft. above the grate level.

The feed pumps for the Belleville boilers at Usine Nord are of the horizontal multi-cellular five-disk Neumann centrifugal type, coupled to motors.

Low and medium-pressure pumps are installed to supply reserve tanks and to clean the circulating water galleries.

**Circulating Water Supply; Pump Room.**—Below the pier on the river front is an intake chamber for the circulating water supply; this chamber is protected by a coarse grill of stationary trapezoidal bars, cleaned by a special rake, and by two movable galvanised iron screens of fine mesh. The latter are driven electrically, and, when raised, pass through a pressure jet of water which cleans them. The intake conduits can be shut off from the intake chamber in case of need. The incoming water passes into two large chambers below the pump room whence it is drawn by the circulating pumps. After leaving the condensers the water flows into two chambers parallel to the first and returns to the Seine through a quadruple subterranean gallery. Reservoirs above the pump room contain the water required for general works purposes.

**Power House.**—The power house (182 ft. × 85 ft.) is spanned by two 50-ton electric travelling cranes and accommodates eight 10,000-15,000 KW. turbo-alternators and three 750-KW. converter sets for station and auxiliary supply. Further particulars of this equipment are promised for a later date.

**Switch House.**—The switch house (33 × 45 ft.) opens out from the power house, into which the main control balcony projects, with the alternator and feeder-control panels in arcs of circles. The two main switchboard storeys are surrounded by oilies, and the outgoing high-tension sub-station feeders are carried in galleries below the switch house. The eight turbo-alternators at present installed are connected to 32 outgoing feeders through two sets of bus-bars, so arranged that either of the two groups of alternators can supply all the feeders if required (see fig. 2). Normally, the two sets of bus-bars are disconnected by a remote-control isolating switch. Each alternator is protected by a continuous-flow liquid pressure discharger and a reverse current cut-out connects the machine to a special group of bars, thus forming a "bridge" of

machines, which can be connected to one or other of the two main bus-bar systems by maximum cut-outs with time relays.

The high-tension feeders, each of 4 × 100 sq. mm. section, are connected to the bus-bars in groups of four. Each feeder is provided with maximum cut-outs, and the bridge connections for each group of four feeders contain two further maximum cut-outs. Between each feeder and earth is connected a Wurtz arrester, with carborundum resistances in series. The alternator cut-outs are designed for 800 amperes and the feeder cut-outs for 200 amperes; a double break (16 in.) is arranged on each pole, so that each cut-out (8 ft. 6 in. × 3 ft. 3 in. × 10 ft. 9 in.) comprises four distinct unipolar elements.

The low-tension station circuits are supplied at 210 volts from the four 750-K.V.A. converters and two 3,000-ampere-hour accumu-

FIG. 2.

lators. In conjunction with the latter is used a double 2,000-ampere 22-step horizontal regulator, electrically-controlled from the low-tension board.

The alternator excitation may be controlled by hand or by automatic Rutin regulators. A maximum voltage relay is included in each regulator circuit, to prevent an indefinite increase in the alternator voltage should a cut-out operate, and a maximum current relay is also provided to suspend the action of the regulator in case of short-circuit.

To enable load tests on the alternators to be made, a special system of bus-bars is provided, to which each machine can be connected (as shown in fig. 2), and thus placed on a water load capable of absorbing 15,000 K.V.A. at 12,300 volts. No feeder is connected to the main bus-bars till it has been subjected to full working pressure by a variable transformer connected to the feeder-test bus-bars.

### USINE SUD-OUEST (S.W. STATION).

This station is at Isy les Moulineaux, occupies a site of 5'3 acres in area, and is of 25,000 KW. present, and 50,000 ultimate capacity. As regards its general arrangement and the provision made for water supply and distribution, the works much resemble the Usine Nord. Coal and ashes are carried between the station and a 130 ft. × 46 ft. quay on the Seine, by a bucket conveyor installed in a subway below the Rue Bara. Ten Belleville and ten

Babcock boilers flank two firing aisles in a single boiler house, and the power house (220 ft.  $\times$  85 ft.) contains three turbo-alternators and three 500-converter sets.

*Station Buildings, Foundations, &c.*—In both stations the buildings are almost entirely of reinforced concrete construction, and some of the main beams carried by the steel skeleton pillars are 4 ft. 3 in. in height. The circulating water galleries have concrete walls, more or less strongly reinforced according to the size of the gallery and the load carried.

The foundations of the main building pillars, alongside the circulating water galleries, were subject to a very much higher

FIG. 3.

FIG. 4

pressure (2.3 tons per sq. ft.) than those of the galleries, hence the foundations had to be independent, though so closely contiguous. It was originally intended to carry the foundations on piles, but the urgency of the work forbade adoption of this method—in anticipation of the use of which, reinforced piles had already been made. Footings 4 ft. 6 in. in width were placed in excavations at the side

FIG. 5.

of the galleries; each footing carried one column and, to distribute evenly the concentrated load of the latter, cut-down piles were arranged as shown in fig. 4.

An alternative arrangement would be to place the three distributing pillars vertically, as in fig. 3, but, in such a case, the unequal resistance of the underlying soil might ultimately remove all load

FIG. 6

from, say, pillar A. The pillar C would then be unable to offer any useful support, and the whole load would be concentrated on B, probably disastrously. On the other hand, in the case represented by fig. 4, should A fail, the pillars B, C, would still offer their maximum support, the resultant reaction being in the direction O D. The general flooring of the works would be able to supply the horizontal reaction required to establish equilibrium (this reaction being small owing to the small inclination of C), and the load on B, C, would be increased about 50 per cent., as compared with a treble loading of B in the case represented by fig. 3.

At the Usine Nord, the boiler houses and silos stand on a good gravel, capable of carrying heavy loads, but for safety the bearing pressure was limited to 2.25 tons per sq. ft. To distribute the pres-

sure from the less heavily-loaded pillars, ordinary foundation plates were used, but those pillars more heavily loaded were mounted on a special footing, designed by Considère & Pélard, which has recently been employed in the naval yards at Havre and the magazines at Alexandria. Using the ordinary type of foundation, those boiler house pillars carrying 625 tons would have required foundation plates 270 sq. ft. in area formed of heavy radial ribbing, cross-connected by a secondary reinforcement and resting on a common foundation block. This type of foundation is costly in materials and labour, and, in it, load is concentrated on the reinforcing members, and the high shearing stresses set up require the use of numerous stirrups.

The Considère & Pélard foundations actually used consist of hollow reinforced cones (fig. 5) resting on mounds of virgin earth trimmed to shape and covered with a preliminary thin layer of cement, the function of which is to preserve the underlying earth from deformation during the subsequent stages of erection. On the mound thus prepared is laid a set of rings (or a conical spiral terminating in large hooks), which is tied to rods running up the cone (see fig. 6). The whole reinforcement is then embedded in concrete and the pedestal itself is complete.

The inclination of the generating lines of the cone to the horizontal being less than the angle of friction, the reaction of the underlying soil is vertical (D A, fig. 5, where D represents an element of the pedestal cone). This reaction resolves into a compression D B taken up by the concrete and a horizontal component balanced by the tension in the circular or spiral bars. The concrete is nowhere subjected to shearing, or any other stress than pure compression, along the generating lines of the cone, and the circumferential reinforcement is subject to pure tensile stresses which do not destroy its adherence to the cement. It is claimed that these foundations effect from 20 per cent. to 35 per cent. economy as compared with ordinary foundation plates.

## PROCEEDINGS OF INSTITUTIONS.

### The "Point Flves."

THE following is an abstract of the chairman's address at the meeting held at Bradford on April 18th, 1913:—

In Bradford considerable headway has been made in connection with the heating and cooking supply, more especially the former, and this has been almost solely due to the fact that a tariff under which current may be obtained by domestic consumers for such purposes at  $\frac{1}{4}$ d. per unit, has been in existence since July 1st, 1910. Electric heaters are extremely popular with consumers who have adopted the special domestic tariff, and a small number of complete electric cooking outfits are in use. No scheme, however, is in existence under which consumers can obtain such outfits on hire, as the types of cookers which have up to the present been put on the market have not proved altogether suitable for local requirements, more especially in connection with the baking of bread. For this reason, also, consumers have not been recommended by the department to purchase such cookers outright. In view of the prices at which heaters can now be obtained it appears to be hardly necessary to inaugurate a hiring scheme in order to popularise their use.

Up to March 31st last, the total number of private residences in Bradford in which electricity was in use was 918, and out of this number the occupiers of 471, or 51.3 per cent., had adopted the Special Domestic Tariff of 15 per cent. per annum upon the net rateable value of the premises occupied, plus one-halfpenny per unit for all current consumed as registered by meter, no charge being made for the hire of the latter. When giving consideration to the framing of a special charge for domestic purposes, the accounts of all the private house consumers connected to the mains were totalled, and particulars of the rateable value of each of the premises obtained. It was then found that if the whole of such consumers were charged at the rate of 3s. in the £ on their net rateable values, plus  $\frac{1}{4}$ d. per unit for all current used, the total revenue obtained from them would be practically the same as was then being obtained under the flat rate of  $\frac{1}{4}$ d. per unit, less 2½ per cent. discount for prompt payment. The effect of such a tariff on consumers individually was, of course, found to vary considerably. It was, however, generally found that the consumers who would benefit by the new tariff had wired their houses for electric light throughout, whereas those who would not benefit by the rate had only wired the best rooms. It was extremely satisfactory to find that on inauguration of the rate, not only was it adopted by consumers who would immediately benefit, but a number of consumers who would only benefit by adding to their installations also made application to be charged on the new system.

The feature which seems to have proved most attractive to such consumers and to consumers who have since been obtained, is that it is possible to ascertain definitely within a few shillings the exact amount of one's bill for electric lighting, as it is impossible for the amount to vary to any considerable extent by reason of carelessness on the part of members of the household in leaving lights burning at times when rooms are not in use. Practically all the consumers who have adopted the rate have very considerably increased the illumination of their premises, and in many cases the increase has been as great as 100 per cent. This has had the effect of removing the reproach which was often flung out to the effect that houses in which electric light was in use were illuminated very much worse than those in which incandescent gas was the illuminant.

## PARTICULARS OF INSTALLATIONS, ACCOUNTS, &amp;C., OF VARIOUS CONSUMERS IN BRADFORD.

Lamps installed.		Other apparatus.		Total kw.	Rateable value.	Accounts for year ended December 31st, 1912.			Remarks.
No.	kw.	Nature.	kw.			Units.	Rate.	Amount.	
27	1'10	1 cooker: 4 1,000-watt radiators, 1 vacuum cleaner, on 8 10-ampere plugs	10'0	11'10	30	— 3,940	15 % ½d.	£1 10 0 8 4 2	
								£12 14 2	= '77d. per unit.
22	'97	1 cooker, 2 radiators, 2 6-lb. irons, 1 boiler, on 6 10-ampere plugs	13'8	14'77	31	— 1,162	15 % ½d.	£2 6 6 2 8 5	For half-year ended Dec. 31st, 1912, only.
								£4 14 11	= '98d. per unit.
17	'79	1 iron	'66	1'45	(21)	153	4d.	£2 11 0 0 1 3	Less discount.
								£2 9 9 0 11 5	Hire of meter.
								£3 0 2	= 4'72d. per unit.
19	'776	1 4-light radiator: 1 8-lb. iron, 1 sewing machine motor	2'26	5'036	18	— 112	15 % ½d.	£2 14 0 0 17 2	
								£3 11 2	= 2'07d. per unit.
23	1'24	Radiators, convector, hot-plate, &c.	3'45	4'69	25	— 1,936	15 % ½d.	£3 15 0 4 0 7	
								£7 15 7	= '96d. per unit.
THE LOWEST ASSESSED RATEABLE VALUE CONSUMER:—									
0	'43	1 4-light radiator	1'15	1'58	7½	— 373	15 % ½d.	£1 2 6 0 15 7 0 2 6	Added to June half-years/c., to bring amount to cover minimum charge.
								£2 0 7	= 1'30d. per unit.

Up to December 31st last the total capacity of the heating and cooking apparatus which was known to have been connected to the Bradford mains exceeded 1,000 kw., and there are undoubtedly very considerable numbers of radiators, irons, &c., in use on the system which are not included in the above figures, but only appear in the department's books as 5 or 10-ampere plugs.

With all respect to my fellow-members of "The Point Fives," who have adopted a special flat rate of ½d. per unit for heating and cooking purposes, I submit that the majority of consumers (at any rate, of those in Bradford) supplied on the "Norwich" system with ½d. per unit as the running charge, are in a far more favourable position than if they were charged at one price for energy used for lighting purposes and on a ½d. per unit flat rate for heating and cooking. They have the advantage of only having one meter and one system of wiring, and can increase the candle-power and number of lamps in use to any desired extent without incurring a much larger charge for the additional energy required.

The percentage to be paid on the net rateable value as a standing charge must be worked out separately for each supply area, as it is quite within the bounds of possibility that 10 per cent. on a particular house in one area may represent a considerably larger sum than 15 per cent. in another area, for a house of exactly similar size. In London or Glasgow, for instance, the rateable value of a comparatively small flat would, I feel sure, exceed that of a fair-sized house in Bradford, although the light required in such a flat would be considerably less than in the case of a house.

The following statement gives particulars regarding the maximum demands and consumptions for the half-year ended December 31st, 1912, of 28 consumers charged on the rateable-value system, on whose premises demand indicators have been fixed. The net rateable values of these consumers' residences vary from £16 10s. to £150:—

Kilowatts of connections...	107
Combined maximum demands as per indicators	74 kw.
Units used during half-year ended December 31st, 1912	22,543
Average units per consumer for half-year	805
Average units per kilowatt installed for half-year	211
Load factor	6'95%
Average price per unit	1'65d.
Equal to a charge of £2 18s. 4d. per annum per kilowatt, plus ½d. per unit.	
Average price per unit if charged on maximum-demand rate of 7d and 1d.	4'26d.

## Economies in the Use of Electric Power.

By W. E. MILNS.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS, at Birmingham, February 26th, 1913.)

TECHNICAL knowledge is necessary in order to secure efficiency and economy. The electric motor is not suitable for every class of work, and in certain cases it should not be recommended, for commercial reasons. Technical knowledge and practical experience are required to determine these cases. The commercial canvasser who,

lacking any technical knowledge, possesses those qualities of salesmanship which enable him to get motors into consumers' premises, is a dangerous person to employ.

The author cannot too strongly emphasise the importance of technical advice in arranging an electric drive. Considering the many types of electric motors and the great variety of control gear, it is a pity that the shunt motor with an ordinary starting switch is apparently used on every possible occasion. Technical knowledge is also essential in handling alternating-current work.

The heaviest item in a manufacturer's expenses is usually the wages bill. The power arrangements should therefore be designed to affect the wages account rather than the power account. A well-thought-out power scheme will often increase the output for the same wages bill (this is equivalent to a reduction in a wages bill); and it will also cut down the manufacturer's expenses by saving material, reducing the floor space occupied, and minimising wear and tear and other maintenance charges. To design a successful power scheme for a works, the engineer must have some knowledge of the trade or manufacture carried on in those works. The works manager or works engineer is a most valuable ally, and much information can often be obtained from him.

The author does not advocate that the most efficient mechanical arrangements should be installed regardless of cost. The sub-division of shafting and the individual driving of machines will occasionally reduce current consumption, but the capital cost of such arrangements cannot always be justified. It is sometimes cheaper to consume a little more current and save capital outlay than to introduce expensive mechanical alterations. Each case must be decided on its merits.

Too much importance is attached to the cost of power, and it is also difficult to get a manufacturer to realise the many considerations which are put forward when comparing estimates for the cost of driving. The power user is usually told that, say, a 10-H.P. gas engine takes 20 cb. ft. of gas per horse-power-hour. On a 60 hours per week basis, this works out at 10,000 cb. ft. of gas, which, if charged at 1s. 6d. per 1,000 cb. ft., equals 15s. On the other hand, the customer is told that a 10-H.P. motor consumes approximately 1 unit per horse-power-hour, which is equivalent to 500 units per week. Taking current at 1d. per unit, he is thus shown that the electric motor would cost 41s. 8d., against 15s. for a gas engine.

Such comparisons are considered seriously by a man who has been fairly satisfied with gas engines, and who is entirely ignorant of electric driving. Of course, one may usually point out the gross unfairness of such comparisons, which omit a number of very heavy charges. It can also be shown that the saving in shafting losses reduces the horse-power-hours, and that the splitting up of drives reduces the number of running hours, and all the other practical arguments of the superiority of electric motors over gas engines can be brought forward. It is, however, in most cases difficult to put an exact value on these advantages, and the power user asks for more definite figures than a theoretical calculation based on either his maximum possible output or his estimated average load.

A method of estimating the cost of driving based on figures actually obtained from existing manufacturers' installations gives

a more common-sense and accurate comparison, and the figures can be backed by the evidence and results obtained from several years' working on various drives.

For the benefit of power users and engineers engaged in developing power loads, the author gives some figures obtained from the analysis of power costs in various trades. The figures given show the number of units used per annum per horse-power installed, the figure being the average of a number of manufacturers in the same class of business. The installed horse-power is such as is usually found in a factory where a little margin is allowed for development and extra load.

#### ELECTRICAL ENERGY USED IN VARIOUS TRADES.

Trade.	No. of units per annum per H.P. installed.	Trade.	No. of units per annum per H.P. installed.
Bakers and confectioners ...	427	Leather-workers ...	730

Jewel-case makers ...	893	Whip manufacturers ...	95
Jewellers ...	775		
Lamp manufacturers ...	1,331		
Laundries ...	421		

Actual comparisons of the cost of gas, steam and electric driving on the same work are given below. These figures have been obtained from manufacturers who previously used steam power and afterwards electricity, the work done in no case being less with electric driving than in the case of steam driving.

Horse-power installed.	Cost of driving by steam.	Cost of driving by electricity.
1,387	£6,000	£4,000
200	1,680	1,476
80	750	504

The following figures have been obtained from installations previously driven by gas plant operated with gas from town mains:—

H.P. installed.	Cost of driving by gas.	Cost of driving by electricity.
25	£130 0 0	£104 0 0
5	33 9 0	23 9 7
40	156 0 0*	144 6 10

\* Suction gas plant.

The following interesting example is from a large pen factory, the owners of which have taken very careful tests on the cost of steam, town gas, suction gas and electricity. The H.P. installed was 250. The cost of steam driving with Corliss compound condensing engines is £9 10s. per H.P. per annum; with gas from the Corporation mains, at 1s. 5d. per 1,000 cb. ft., £7 4s. 2d. per H.P. per annum; and with suction gas, £4 17s. 3d. per H.P. per annum. The cost of electric driving with current at 1d. per unit came to £3 13s. 9d. per H.P. per annum.

The above typical examples take into account maintenance, wages and repairs, while the example from the pen factory also takes into account interest, depreciation and all other charges.

Another method of comparison which will appeal to a manufacturer with an elementary knowledge of engineering is to obtain load curves for the steam engines by means of continuous recorders, or from electric motors by means of recording ammeters, and to submit such curves to a power user.

The owner of a rolling mill, which was steam driven, assured the author that the large number of rolls on his engine resulted in a practically steady load, so that the engine was worked at a very high efficiency throughout its run. He argued that under such conditions electricity could not compete with steam engines on the ground of cost. A continuous indicating diagram, however, showed that his load varied from 70 to 215 H.P.

Speed curves are also of considerable value. The steam engine falls to its lowest speed at the money-earning period. The fall of speed in the electric motor is much less than with the steam engine, so that the output and revenue are much increased. Diagrams may also be used to emphasise the saving in floor space.

The manufacturer too often considers the uses of electricity from a power standpoint only. The many other uses which can be made of the supply are often of considerable convenience and value to him. Efficient lighting has a direct influence on output. Evidence of this is found not only in the lighter trades, in pen factories, in the jewellery district, &c., but also in the heavier work of rolling

mills, casting shops, &c. Again, the uses of electricity for small portable apparatus are often of considerable value. Electric heating, welding, smelting, &c., offer peculiar advantages in certain trades.

In conclusion, the advocate of electric driving need not hesitate conscientiously to put forward his schemes. He stands for a system which all arguments and experience have proved to be so far the most ideal and perfect power in use.

A further and last argument, which, unfortunately, is rarely taken into consideration, is that the conditions of labour and employment in electrically-equipped factories are usually far superior to those found in works utilising any other form of power.

#### DISCUSSION.

MR. N. B. ROSHER explained a method of checking the power costs adopted by a firm with which he was connected. They took the ratio of the total expenditure on power and fuel to the total sales. Thus in 1907, when the works were entirely driven by gas engines, the ratio was '83; but in 1910, when the conversion to electric driving had been completed, the ratio dropped to '74, or a decrease of approximately 12 per cent., due to electric driving, and this notwithstanding the fact that a considerable increase had taken place in the number of machines driven by power. About six months ago a sheet metal rolling mill driven by a horizontal condensing steam engine was converted to electric driving. The saving in running costs since the conversion had been so great that the whole of the electrical outfit, including cost of foundations, &c., would be paid for in two years by the saving effected.

MR. W. FENNEL said he had found the best means to convince a sceptical power user of the economy of electric driving to be a trial, taking one part of the works which could be easily isolated. In two cases he arranged for the hire, with option of purchase, of the equipment of quite large works, one of them taking about 400 H.P. He took the risk of cost of service, &c., and of temporary wiring. In both cases he convinced the intending consumers that electric driving would save them money. With regard to the damage done by irresponsible and unskilled arrangements, they made it a point at Wednesbury to get in touch with works users in the early stages, and in those cases where the work was not in the hands of specialists, they gave advice and kept more or less control of the arrangements from start to finish. He always made it clear that he took no moral responsibility for results where he was not consulted.

#### Faraday Society.

##### GENERAL DISCUSSION ON THE CORROSION OF IRON AND STEEL.

AT their April meeting, the Faraday Society met at Manchester, combining forces with the Local Section of the Society of Chemical Industry. A group of papers was presented dealing with the electrochemical aspects of the corrosion—and its prevention—of iron and steel, and a long and interesting discussion followed the reading of the papers.

MR. BERTRAM LAMBERT, M.A., put forward "An Electrolytic Theory of the Corrosion of Iron," which is claimed to be a simple and natural development of the ideas of Faraday on electrolysis. Everybody knows that commercial zinc dissolves freely in diluted acid, because the impurities in the metal set up ever so many minute voltaic cells, in which the zinc is the positive element, and so goes into solution through the action of the innumerable local currents. Pure zinc or amalgamated zinc—which is supposed to have an "electrochemically" homogeneous surface, will not go into solution, because no electrolytic action is possible. Iron, according to this conception, behaves in an exactly similar manner, and if the conditions are such that an appreciable current can pass between two electrically different (i.e., different in their solution pressures) parts of the iron, the more electro-positive portions will dissolve away; this dissolution is a necessary preliminary to rusting. The conditions just referred to require the presence of oxygen dissolved in the water, for in oxygen free pure water the current that passes is almost infinitesimal, and the amount of iron dissolved can hardly be detected. The reason for this is, that the local current set up in the iron causes a film of hydrogen to be deposited on the more electro-negative portions, introducing an enormous resistance into the circuit. When oxygen is present, the hydrogen film is depolarised, and the current, therefore, persists and the solution of iron continues. That this explanation of the necessity for the presence of oxygen is a true one is borne out by what happens when a piece of commercial iron is dipped into a solution of pure copper sulphate in a vacuum. Here it is copper and not hydrogen that is deposited on the more electro-negative portions of the iron, and so the action is able to proceed until all the iron goes into solution or all the copper is removed. Mr. Lambert regards it as well-established that all that is necessary for the rusting of commercial iron is the presence of pure water and pure oxygen, and the carbonic acid theory which states that this, or some other acid, must always be present, must be abandoned in favour of the electrolytic theory, in face of the experimental evidence now supporting this hypothesis. The following experiments of Mr. Lambert must carry conviction on this point. He has prepared chemically pure iron that can be exposed to the action of tap-water and air for an indefinite time without showing signs of rust, and the same specimens would not replace copper from copper sulphate or nitrate solutions. Some of these specimens were, after careful drying, then subjected to pressure in a polished agate mortar by an agate pestle, and they were again put into water and exposed to the air

They rusted in the course of a few hours, rust forming first at the edges which had not been pressed by the agate, while the pressed portions remained quite bright. This is exactly what would be expected if the electrolytic theory is true, for the strained and unstrained portions of the iron will be two different modifications electrically considered, having different solution pressures, and so local currents will be set up when the metal is placed in water or copper sulphate.

The actual formation of rust is a secondary chemical action on the iron that has gone by electrolysis into solution in the form of ferrous ions. These ferrous ions combine with the hydroxyl ions present in the water to form undissociated ferrous-hydroxide.

Then the oxygen in solution plays a second part, and converts the ferrous hydroxide into some hydrated form of ferric oxide, which is rust—

The behaviour of pure iron towards copper chloride or in dilute alkali chloride solutions is strangely anomalous, and at present altogether inexplicable. Specimens which remain unaltered in the sulphate or nitrate are immediately attacked by copper chloride and will corrode in quite dilute salt solutions, and this curious behaviour cannot be accounted for by the presence of a protective film of oxide or hydride on the iron. The matter is being further investigated by Mr. Lambert.

Very interesting is Mr. Lambert's suggestion—plausible, although as yet unsupported by experimental evidence—that substances which protect iron from corrosion have the power, in some way or other, of destroying or reducing the electrical differences which always exist in commercial forms of iron—that they have a passivating effect—and that the substances, like the chlorides of the alkali metals, which stimulate corrosion, do so by increasing these electrical differences. This would explain the remarkable behaviour of pure iron towards copper chloride and alkali chloride solutions.

MR. J. I. CRABTREE, M.Sc., read a paper on "The Nature of Over-voltage." Apart from the intrinsic interest of this peculiar phenomenon to the electro-chemist, Mr. Crabtree shows how direct a bearing the subject has on the question of corrosion, as will be explained presently. The over-voltage of a metal may be regarded as the excess of the anodic or cathodic decomposition voltage of a dilute acid with an electrode of that metal over that for platinised platinum, or as the excess of the back E.M.F. set up at the electrode after polarisation over that set up by a platinised platinum plate under identical conditions. Mr. Crabtree's method of determining this back E.M.F. is by alternately polarising an electrode in decinormal  $\text{H}_2\text{SO}_4$  for 30 minutes, and then measuring its single potential difference (against a "normal" electrode) by means of a potentiometer. The over-voltage is not a constant for any given metal, but it varies with such factors as the time of application of the polarising current, current density, thickness and physical condition of the surface of the electrode, depending to an unknown degree on the presence of some foreign bodies, such as colloids and alkaloids, in the electrolyte, and, of course, above all on the nature of the metal. The values for the cathodic over-voltage of the commoner metals are in the following order of magnitude:—

Over-voltage is, in all probability, closely connected with the transformation of the gas evolved at the electrode from the ionic to the molecular state, and it may be a measure of the difference between the rate of production of ions and of their combination to form neutral gaseous molecules or groups of molecules. Nerst supposes that this ionic combination can only take place within the electrode, which possibly acts as a sort of catalytic agent. This may explain why the over-voltage for metals like platinum and nickel, which easily occlude gases, is so low, although other factors would also come into play. Generally, therefore, it may be said that over-voltage is proportional to the power of the metal for affecting the velocity of the reaction—

Perhaps the ions, after being discharged, pass into a condition of unstable equilibrium, and give rise to a back E.M.F.

If the electrolytic theory of corrosion put forward by Mr. Lambert, as outlined above, be correct, the relation of over-voltage to corrosion will be obvious. The effect of over-voltage will be either to assist or retard the deposition of hydrogen or oxygen on the surface of the metal, thus directly affecting corrosion, or it will set up a back E.M.F., which will diminish the local currents that are the cause of corrosion; or, finally, it may assist or prevent the solution of the metal. Thus, a metal will only go into solution in an acid if its over-voltage is less than the difference between the E.M.F. of the metal and the back E.M.F. of hydrogen. If the over-voltage is large, no solution of the metal can occur; this is the case with amalgamated zinc, where the mercury is the cause of the high over-voltage. With galvanised iron, to take another example, very little solution of iron takes place, because the latter assumes the high over-voltage of its zinc covering.

PROF. W. W. HALDANE GEE delivered a lecture, illustrated by experiments and lantern slides, on "Electrolytic Methods for Preventing the Corrosion of Metals." The principle underlying all these methods is to make the metal to be protected a cathode, either by attaching to it a more electro-positive metal, or else by means of an external current. The use of zinc in boilers is the best known example of the first method. Unfortunately its efficacy is somewhat impaired by a lack of exact experimental data with regard to the resistance of boiler waters and the effective voltages brought into play at temperatures of 150-200° C. The zinc con-

sumption would appear to be much larger than it need be, in some marine boilers it is as great as 100-600 lb. per annum. This is equivalent to a constantly flowing current of 17 to 26 amperes, and Prof. Gee points out that currents of such magnitude can be produced much more cheaply from dynamos, and devices are now in use in which an external source of current is employed. Mr. Elliott Cumberland, for example, places iron anodes in the water of the boiler, which is made cathode, using a small motor-generator to supply current, and the method has been found effective in removing scale as well as in preventing corrosion. Prof. Gee has found that the current densities necessary for the protection of iron and copper from the corrosive action of fresh or salt water are quite low, so that the cost of anodes would be the chief item of expense. Messrs. Harris and Anderson have applied electrical currents for the prevention of the corrosion of condensers. They find a condenser with a cooling surface of 1,025 sq. ft. requires only 2 volts and 2 amperes, and the special anodes used by them cost from £3.5s. per 1,000 sq. ft. per annum. The use of electrical currents may also be applied in chemical works to prevent the corrosion of metallic screens and vessels by acid liquids.

### Phase Advancing.

(Discussion on paper by DR. G. KAPP before the INSTITUTION OF ELECTRICAL ENGINEERS. For abstract of paper see page 784.)

#### DISCUSSION AT BIRMINGHAM.

MR. R. A. CHATTOCK said that the apparatus appeared to be so simple and reasonable in cost that it would probably be to the interest of the supply undertakings themselves to install it in connection with large motors on their supply. In Birmingham the transforming machinery in the sub-stations, consisting of rotary converters, was used for correcting the power factor, and in this way about two-thirds of the system was run at a power factor approaching unity. The system of metering described was a very interesting one, but it would be very difficult to explain this to a consumer, and to convince him that he was paying correctly for his units.

MR. A. M. TAYLOR referred to Dr. Kapp's suggestion that if the central station would give a rebate to a consumer of 10 per cent. off the fixed charges, it would provide the consumer with the recompense which would warrant his incurring the extra capital expenditure to install phase-advancers. Dr. Kapp held that the Power Co. had no other expense to incur than that for fuel and water, and that as it gained new consumers without any further capital outlay, it was strongly to its interest to give the required discount. There was a fallacy in this reasoning, because in most cases the engineers of supply stations had already discounted for the power factor of their generators, and there was not the margin on the steam side, amounting to an extra 25 per cent., which Dr. Kapp's premises would involve. The conditions under which the station therefore obtained the new load were not very materially better than those under which it obtained its existing load, and in addition, the 4 per cent. loss on the consumer's motor had to be paid for from somewhere. Dr. Rosenberg, in his recent paper, stated that in order to improve the power factor from .707 to .8, the losses in a synchronous condenser able to give 250 k.v.a. would amount to 10 per cent. of the rating of the condenser. Dr. Kapp, however, appeared to allow that 4 per cent. would be sufficient.

MR. N. SHUTTLEWORTH said that the question of power-factor improvement was being forced upon central station engineers, because of the rapidity with which existing cables were becoming overloaded, and the only remedy, in many cases, to save duplication was the adoption of a phase-advancing device. The author had given the costs per extra saleable kW., first, with synchronous motors running light, and, secondly, with loaded synchronous motors used also for the purpose of power-factor improvement. The relative costs were £7 to £10 per kW., and £2 per kW. respectively. The speaker was able to add to these figures the costs of phase-advancers for the same duties; the variation was from 15s. to £2 per extra saleable kW., the cost depending upon the size of the motor to which the advancer was applied. The cost per k.v.a. reduction in the wattless component of the power supply varied from 8s. to 25s. per k.v.a. correction. There was a limit to which the phase advancer could be pushed, if unnecessary expense was to be avoided. To cause the main motor to draw leading current at 0.8 power factor, it was necessary to increase the rotor current more than 60 per cent., and to increase the size of the advancer in a still greater ratio. Generally speaking, the leading power factor on any one motor should not be lower than 0.9 for good results.

MR. E. A. WATSON said he was very much struck with the Scherbius phase advancer described in the paper as a machine which had no stationary part, with the exception of the brush gear. He did not quite agree with Prof. Kapp that the driving motor supplied the losses due to windage, friction and hysteresis. The windage and friction losses certainly were supplied mechanically, but he did not see how the hysteresis or eddy-current losses could be. No mechanical torque could be exerted on the revolving member without a corresponding equal and opposite torque being exerted on a fixed one. Any hysteresis loss, if supplied by the driving motor, implied the presence of a mechanical torque acting on the shaft, and this must be accompanied by an equal and opposite one acting on some fixed portion of the machine. As the only fixed portions were the brush gear and, to some extent, the surrounding air, it was not quite clear how this could exist. He was inclined to think that the true explanation was that these losses were supplied electrically through the windings of the advancer itself. One of the chief points of Prof. Kapp's arrange-

ment appeared to be that, although the vibrator only had to inject a small E.M.F. into the circuit, this was, as it were, magnified by the motor itself in approximately the ratio of 1/slip, and produced a vastly greater effect at the stator terminals.

DR. M. L. KAHN said that the excitation of a synchronous motor required only a few per cent. of its output, and the excitation current was conveyed to such motors by short low-voltage leads. In the case of induction motors connected to a high-tension power transmission, the excitation had to be provided from the main station at the full voltage of the supply; with a power factor of .8 the K.V.A. required for excitation were 75 per cent. of the kilowatts of energy transmitted, and the line losses were increased by 53 per cent. above the losses through the pure watt current. The arrangement invented by Prof. Kapp reduced the K.V.A. required by excitation approximately in the ratio of slip to full speed, as the excitation was not supplied to the stator with the full voltage, but to the rotor with a voltage of the order of the slip voltage. This exciting current was conveyed to the motor by short low-tension leads. One could see from this that by Prof. Kapp's arrangement the K.V.A. required for excitation, and the distance the exciting current had to travel, had been reduced to a small fraction of the values which were necessary in the case of ordinary induction motors. The induction motor was thus brought in line with the synchronous motor, as far as the excitation was concerned—the phase advancer taking the place of the exciter—without the disadvantages of low starting torque and synchronising difficulties. Moreover, the apparatus invented by Prof. Kapp required, if anything, less attention and was less likely to get out of order than the exciter of a synchronous machine. In considering the cost of the apparatus, one must take into account that the size of the induction motor could be materially reduced if a phase advancer was added, for the following reasons:—(1) The stator had only to carry the watt current, and the heating in this part was materially reduced; (2) the overload of a motor of a given size was increased by attaching a phase advancer; (3) the increase of rotor current due to the exciting current in the rotor did not affect the design materially, as the rotor of an induction motor usually worked well below the heating limits. Considering the case of a 1,300-B.H.P. induction motor wound for 8,000 volts, 50 periods, 272 R.P.M., with a power factor of .82, which was made some years ago, it was found that by designing the machine for use in connection with a phase advancer, the diameter of the machine could be reduced 15 per cent., and the weight of the punchings could be reduced from  $7\frac{1}{2}$  to  $5\frac{1}{2}$  tons. This saving of material was effected without increasing the loading of the material, i.e., the loss per pound of material. The losses in the motor itself were slightly reduced, which made up for the losses in the phase advancer, so that the total energy consumed was not increased. For small motors, the conditions were not so favourable, but in the case of motors above 200 H.P. the phase advancer offered a very attractive proposition.

MR. R. ORSETTICH said that it was very seldom realised that small motors running at slow speeds had generally a power factor below .8, especially as they were mostly run below their full load rating. The result was that mines, collieries, and works plants found that after a time it was necessary to lay new cables in order to cope with the increased current expected from the power consumed. In plants of this kind the phase compensator explained by the author would be of great advantage. Large corporation plants were not affected to the same extent. A phase advancer either of the Scherbius or the Kapp type enabled an ordinary standard motor to be installed, with the only difference that no short-circuiting gear could be used, as the slip rings had to carry the current of the compensator. Both compensators had the disadvantage of requiring commutators, through which the rotor current must pass. The Scherbius compensator was usually driven by a separate small motor, and this corresponded approximately to the expenditure of a small separate exciter, which had to be fitted to the induction motor when using the Kapp compensator. It was quite possible to put up an induction motor of the standard type, fitted with a small exciter and an independent phase compensator of the Kapp system, against the cost of supplying a synchronous motor of the standard type, fitted with a starting motor and a small exciter. The price of a synchronous self-starting motor was much higher.

DR. SUMNER stated that Mr. James Swinburne was the first to suggest using a magnetic vibrator as an A.C. load taking a leading current. Dr. Kapp's device was made possible commercially because he utilised the low frequencies of the rotor currents. It could be shown that the number of volt-amperes per phase taken by the Kapp vibrator was given by the formula—

$$VA = (A/r)^2 / \omega,$$

where  $A$  was the rotor current in amperes passing into the vibrator armature;  $r$  the voltage generated in this armature if run at constant speed (one radian per second);  $i$  the moment of inertia of the armature; and  $\omega = 2\pi\sigma f$ , where  $f$  was the circuit frequency and  $\sigma$  was the slip. The numerator of the fraction was a constant for a particular armature, since the allowable current  $A$  was inversely proportional to the number of conductors determining the voltage  $r$ . Hence, to increase the volt-amperes it was necessary to keep the values of  $i$  and  $\omega$  small. The importance of the smallness of the slip frequency  $\sigma f$  was two-fold. It not only increased the capacity of the armature in volt-amperes, but also reduced the number of volt-amperes needed for compensation.

MR. A. R. EVEREST said there was a large field for devices which would overcome the low power factor inherently associated with certain classes of load. It was somewhat surprising to find the self-starting synchronous motor regarded as a comparative novelty. In the United States they had been building self-starting machines for some years past. Dr. Kapp mentioned two British firms now

building such machines, and the British Thomson-Houston Co., Ltd., also built self-starting synchronous motors, having even better starting characteristics (in torque per ampere) than the corresponding sizes of squirrel-cage induction motors. They were started under the same conditions of load as the squirrel-cage motors, and with the same device to reduce the applied voltage at starting. No synchronising was required, as the motor pulled into step when the field was excited. Such machines were well suited for use with a surplus of excitation, so as to draw leading current and neutralise a bad power factor arising elsewhere.

#### DISCUSSION IN LONDON.

MR. W. M. MORDEY, who opened the discussion, regretted that the author had dismissed so briefly the use of electrostatic condensers as phase correctors. He had personally been attracted by the subject, and mentioned the paper he contributed to the Institution bearing on the matter in 1909. Now that condensers were so cheap it appeared that there was some chance of using them in this way. The Walker advancer cost about £2 per K.V.A., and he believed that proper condensers could now be obtained at a figure comparable with the apparent cost of the author's apparatus—say, 10s. per K.V.A. The apparatus described appeared greatly to increase the slip, and this might be a serious disadvantage in some cases. The efficiency (88 per cent.) of the Brown-Boveri motor appeared to be low, and might have affected the results. The figure attributed to Mr. Ashton—£19 per K.V.A. for static condensers—was much higher than he (the speaker) had found some years ago.

MR. A. W. ASHTON said it was three years since the first electrostatic condenser was used in this country on a practical scale—for improving the power factor of an arc lamp circuit in North London; within the last year three larger orders had been carried out by the B.I. and Helsby people for pressures of 550 volts, 50 periods, and for 7,000 volts, which showed that this type of condenser was not altogether out of the running. No breakdown had come to the notice of the makers; the condensers were, of course, largely confined to 50-period circuits. The condenser could be applied close to the apparatus having a poor power factor and was suitable for comparatively small motors. Looking over the cost of installing the phase-advancer, given in the paper, he thought the consumer would have to have 10 per cent. discount before he obtained any advantage, taking into account losses and repayment of capital.

MR. W. H. BOSWORTH thought the author's conclusions were rather unfair to the rotary condenser; he had over-estimated its size. In practice a machine used as a phase advancer and motor came out about 45 per cent. larger in capacity than a machine used as a motor alone, though the excess did not mean excessive cost on account of the higher speeds. This compared with 19 per cent. given by the author. The description of the Lancashire Dynamo Co.'s self-starting machine was not quite accurate; the latest starter was operated by one hand-wheel and interlocked switches. The combination of a phase advancer and motor cost more than a self-starting motor alone in his experience, and the latter machine seemed more suitable for ordinary commercial use. He congratulated the author on having drawn attention to the commercial possibilities of the subject.

MR. F. CREEDY said the Miles-Walker machine could be used for artificially reducing slip to zero, or making it a negative slip. Small slip was important, and he believed a much smaller slip could be obtained by employing a wound stator. He asked why attention was always given to the series type of machine; a shunt machine could improve the power factor at no-load.

MR. J. T. IRWIN suggested that the vibrator could be made to have a larger mechanical movement by employing a spring control or air buffers for bringing the armature back to the mean position.

PROF. KAPP, in replying, said he was glad to hear that condensers were commercially used. He did not disparage their use, but they could not improve the load conditions of a motor by using them. He agreed that there must be additional loss with the phase advancer and motor, two machines, but the saving in copper loss would, he thought, pay for the power used in the advancer. The efficiency of the condenser had not been stated (Mr. Ashton here mentioned a loss of not more than 3 per cent.). It was a barbarous thing that they should chase thousands of amperes through the mains without getting anything for it. The objection to increased slip was not so serious if suitable cases were considered. As to the saving of weight, a speaker at Birmingham said there was a difference of 2 tons in favour of a 350-H.P. motor and advancer as against a motor without it. The movement of the vibrator was too great to make use of Mr. Irwin's suggestion.

#### Standard Clauses for Street Lighting Specifications.

REPLYING to Mr. Edgumbe's letter (p. 788), Mr. F. W. Goodenough notes that he is still strongly of opinion that the average illumination in a street is of importance, and says this means that we have only got to arrive at some practical means for relating our specification to that average for us to get nearer the goal of agreement upon a standard specification. But first it is necessary to dispel the idea that minimum horizontal illumination is the only factor necessary to specify in an illumination contract. Mr. Trotter laid great stress upon the fact that the classification of streets made by the surveyors, as the result of an inspection of their lighting by night, was in agreement, to a considerable extent, with a classification of the same streets according to minimum horizontal illumination measurements. As Mr. Edgumbe endorses Mr. Trotter's remarks in his letter, Mr. Goodenough wishes to point out the radical unsoundness of the argument, and to ask the surveyors to give careful consideration to the matter. If, the lighting of the streets which the

surveyors inspected had been planned and carried out by contractors working to the specification as drafted, then it might well have been urged (though it still would not have been true) that lighting of a certain grade of value would always be produced in a street if a certain minimum horizontal illumination were specified. But that was not the case, and that is where the radical fallacy of the argument lies.

The lighting of the streets surveyed was designed and carried out on the usual plan of deciding, by experience and by experiment, what number of lamps of a certain description, placed on columns of a certain height, would give the kind of illumination that was desired or could be afforded in those streets. Those lamps on those posts at certain distances apart produced the illumination of the streets which the surveyors classified as A, B, C or D, according to their impression of that illumination on inspecting the streets. But that impression was produced by the following factors in combination:—The apparent brightness of the lamps; the height of the lamps above the street; the distance of the lamps apart; the maximum illumination in the street; the gradation of maximum down to minimum illumination in the street.

All these factors, not the last one only, go to make up the good, bad or indifferent lighting of a street. If in two streets you have about the same number of lamps of similar power on columns of similar height, you will get about the same maximum, average and minimum horizontal illumination. By a different number of lamps of different power on columns of different height, you can get the same minimum horizontal illumination, but a different maximum and a different average illumination—a differently lighted street altogether, such as no surveyor would class with the others.

Is it not, then, obviously illogical to say that to ensure that a street shall be lighted up to a certain standard, it is only necessary to specify the minimum illumination which the contractor is to give, leaving it to him to give what maximum and average illumination he chooses?

We must get it clearly into our minds that minimum horizontal illumination is only one of the effects produced "under present conditions of lighting," which were not built up on a specification with minimum horizontal illumination as its basis. Once we have all got to the point of agreeing that a standard specification of street lighting must have regard to the general result produced, and not to one factor alone of the several which form the whole, there will not be any serious difficulty in arriving at a practical form of specification.

Mr. Goodenough would consider that a specification had sufficient regard to the maximum and average illumination of a street if it laid down within reasonable limits what relation should exist between the candle-power measurements of lamps (of given height at defined distances apart) at three specified angles below the horizontal—say, at 10°, 20° and 50°, taken in the line of maximum illumination—with a clause providing that measurements taken at similar angles in any other direction should not be less than a specified percentage of those taken in the direction of maximum illumination.

Such a specification would not entail a heavy amount of work upon the engineer having supervision of the contract; it would sufficiently guard against "freak" spots of lighting, and it would overcome many of the objections raised against the draft specification.

**The Dayton Flood.**—Our contemporary, the *Electrical Review* and *Western Electrician*, of Chicago, relates experiences of electrical men during the recent terrible floods. Mr. Frank M. Tait, president of the Dayton Power and Light Co., who is also president of the National Electric Light Association, was a prisoner on the second floor of his home for two days, and grave fears were at one time entertained for his safety. He reports: "Both power plants under 12 ft. of mud and water for 50 hours." Some of the company's employees were "prisoners in the plant while the water covered everything." They told of having kept alive on the fruit that floated in from a neighbouring market and the rain which they caught in their hats. Vice-President J. W. Lieb, jun., vice-president of the New York Edison Co., describing the Dayton plant as he found it on the day after the water receded from the streets of the city, said:—

"After trudging a mile and a half over the wreckage, we reached the power house at 8 o'clock. There wasn't a soul in sight, and everything was covered with mud. Mud, mud, mud and slime a foot thick was over the generators, the switchboards, the motors, the engines, and a line of dirt showed where the water had reached the operating room, 13 ft. above the floor level. High up on the main steamline extended a walkway, and there, the only living thing in sight, perched a dog. Onions! The place was filled with them. They were thicker in the mud than raisins in a raisin cake. Twelve feet above the floor, on a generator frame, there were two crates full of sprouting red onions, while the whole top of the switchboard was lined with them. The dog was chewing one when we arrived, and from that we named him 'Onion.' But the place was an awful sight—sickening and discouraging. The mud nearly reached our knees, and in some places water still stood a foot deep on the floor. After a good look at the boiler room, still filled with water, we got out to hunt our friends, so we could start the task of clearing the wreckage and muck and get things going. This was no small task, and it took nearly 30 hours before the work of drying out could be started."

## NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

### Adams Lift Controller.

Fig. 1 shows a new controller for lifts and hoists, which is being introduced by the ADAMS MANUFACTURING CO., LTD., of Bedford.

The controller for a small electric lift or hoist is as important as the motor itself, as on it depends the correct operation of the whole gear, and failure of even one small part is liable to upset the whole apparatus, while it is run by persons usually quite ignorant of electrical matters.

The lift controller illustrated is arranged for rope operation, the pulley for the rope being mounted on the spindle projecting from the top of the apparatus. It consists essentially of a box containing the necessary starting resistance. On the front of the

FIG. 1.—ADAMS LIFT CONTROLLER.

box is mounted one of the new "Z" type automatic starters, which consists of a number of contact fingers which are brought into operation by the solenoid, and so arranged that the motor-starting resistance is gradually short-circuited and the motor brought up to speed. An adjustable dashpot controls the rate at which this part of the apparatus works. On top of the box is mounted a drum-type reversing switch which, by the operation of the rope, makes the circuits for the motor to revolve in the required direction, and then energises the solenoid on the "Z" type starter. The makers claim that it is an ideal controller for small reversible motors.

### A Dutch Oven Type Cooker.

We have received from MESSRS. SIMPLEX CONDUITS, LTD., 116, Charing Cross Road, W.C., some particulars of their dutch-oven type "Plexsim" cookers.

FIG. 2.—PLEXSIM DUTCH-OVEN, OPEN.

These have been designed particularly for small householders, and will appeal to station engineers who favour hiring schemes on account of their low first cost and loading.

The small oven (14 in.  $\times$  14 in.  $\times$  15 in.) takes a maximum of 600 watts, and will cook up to 7-lb. joints; the larger one (21 in.  $\times$  21 in.  $\times$  22 in.) has a total loading of 1,200 watts, and takes joints up to 12 lb. weight. With the assistance of one or two extra hot-plates or self-contained utensils, it is claimed to carry out all the functions of the ordinary cast-iron stove.

Our views, figs. 2 and 3, show the arrangement of this cooker, for which it is claimed that heat losses from radiation and from the opening of the oven are to a great extent avoided owing to the construction adopted, and that this economises in energy consumption.

The explanation given is that the opening of the door or hood induces a partial vacuum behind the upright partition at the back of the shelves, and that in fact the heated air is retained in the hood.

FIG. 3.—PLENSIM OVEN CLOSED.

We gather that the cooking temperature is reached within 5 minutes of switching on, and, moreover, that the apparatus has undergone exhaustive trials in the firm's own kitchen in practical use.

The oven is arranged for heat regulation, and is fitted with inside grids, two shelves and a drip tin. Temperature regulation is effected by a one-piece connector.

The elements are of the incandescent type, and actually roast; they are guaranteed for 12 months, and are readily renewable in a few minutes at home.

#### Inspection Lamp for Motor-Cars.

MESSRS. SIMPLEX CONDUITS, LTD., of Garrison Lane, Birmingham, have recently introduced the inspection hand lamp, shown in fig. 4, in its cheapest form, for motor-car and similar work.

FIG. 4.—INSPECTION HAND LAMP.

The lamp shown is made in brass, with suspension hook and cord grip at the top, and has a substantial guard. Another pattern dispenses with the guard, the lamp being enclosed in an outer strong glass globe and provided with a solid handle and legs to

stand the lamp upright; the latter pattern can also be supplied with a guard over the outer globe. The lamps are supplied for 1, 6, or 8 volts, and 3 yd. of flexible cord are provided.

#### Static Discharger Panel.

A compact and serviceable panel has been introduced by MESSRS. A. REYROLLE & CO., of Hebburn-on-Tyne, for use separately or in conjunction with their enclosed sheet-steel switchgear, including multi-disk type spark gaps in series with isolating switches and

FIG. 5.—REYROLLE STATIC DISCHARGER PANEL.

FIG. 6.—REAR VIEW OF G.E.C. STANDARD HIGH-PRESSURE "MISTAKE-PROOF" CONTROL PANEL, WITH A DOOR OPEN.

current-limiting resistances. Fig. 5 shows the arrangement of the spark gaps and isolating switches. The resistances are of an oil-

immersed type, and the containing tank shown is arranged for lowering if required.

The panel illustrated is suitable for use on 3,000-volt three-phase systems. Other standard designs can be obtained for voltages up to 20,000, one form being made suitable for plugging into the solid type armoured switchgear.

G.E.C. "Mistake-proof" Switchboards.

A new line of "mistake-proof" panels has recently been designed by the GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, London, E.C. In this design there are several noteworthy features. The isolating links and bus-bars are contained in a separate compartment situated at the top of the cubicles, and are partitioned off from the main cubicle by solid metal barriers, thus making it impossible for anybody accidentally to come into contact with live metal; cleaning and adjusting can therefore be carried out in absolute safety. The isolating links are firmly locked in position during the time the panel is in commission; they are operated from the front of the board, this doing away with the necessity of opening the doors to isolate the cubicle. The interlocking of the various pieces of apparatus is arranged in such a way that it is impossible to open or close the circuit with the links; this can only be done with the oil switch, a point of great importance. Neither marble nor slate enters into the construction of the board, the bus-bars, terminals and isolating links being supported on porcelain insulators. The framework and panels are of boiler plate, rendering the whole fireproof. No special foundations are required, and this, together with the fact that the whole of the gear is concentrated in the panel, reduces the erection cost to a minimum. A view of the panel is given in fig. 6, showing the arrangement of the interior.

LEGAL.

GARDINER v. LONDON UNITED TRAMWAYS, LTD.

ON May 7th before Mr. Justice Bucknill and a special jury in the King's Bench Division, an action was concluded in which Mr. C. E. S. Gardiner, consulting engineer and expert in oils, residing at St. Margaret's-on-Thames, sued the defendant company to recover damages for personal injuries sustained through the alleged negligence of the defendants' servants, while he was riding on the top of one of their electric cars in High Street, Brentford, on April 22nd, 1912, in the direction of Hampton Court.

The plaintiff's case was that he had his hand on the handrail, and as another car passed, his hand was struck by something, the fist torn, and the wrist very seriously injured. The plaintiff also said that the line in the roadway was defective, and that the cars were oscillating considerably. The defendants denied negligence, and said plaintiff was guilty of contributory negligence by having his hand extended over the rail in disregard of a public warning to passengers as to the risk of doing so. Plaintiff denied that he had his hand extended beyond the rail.

The jury awarded the plaintiff £500 damages; judgment was entered accordingly against the defendant company, with costs, and a stay of execution was refused.

POULSEN PATENT.

IN the Chancery Division, on May 8th, before Mr. Justice Warrington, Mr. Austen Cartmell again mentioned the petition for the extension of the period of a Poulsen patent. He said the Solicitor-General was not able to name any day for the hearing of the petition, and he asked his Lordship to allow it to be mentioned at the beginning of next sittings.

His LORDSHIP assented.

AUSTIN v. L.C.C.

MR. CHAS. AUSTIN, comedian, in an action tried by Mr. Justice Lush in the King's Bench Division, was on May 8th awarded £120 damages against the London County Council in respect to damage to a motor car which was sandwiched between two electric tram-cars in Camberwell New Road one foggy night last October.

BRITISH VACUUM CLEANER CO., LTD., v. JAMES ROBERTSHAW AND SON, LTD.

MR. JUSTICE SARGENT, in the Chancery Division on Friday, May 9th, delivered his reserved judgment in this action, by which the plaintiffs sought to restrain an alleged infringement of their patent, granted to Hugh Cecil Booth in 1901.

The plaintiffs' case was that the defendants were advertising a domestic vacuum cleaner that was capable of being worked by electric or other motor power, which apparatus was an infringement of their patent. The defendants pleaded anticipation and non-infringement.

His LORDSHIP said that with regard to anticipation, two patents by Harvey, one of 1893 and one of 1894, were relied on, but, in his opinion, neither of these covered the patent sued upon. They were for the removal of dust and not for its extraction. With regard to non-infringement, Messrs. Robertshaw said they made

no high-power machines, and any machine that did not give a 5-lb. pressure per sq. in. did not come within the ambit of the plaintiffs' patent. He could not hold that the plaintiffs' patent was so limited. Moreover, he was not satisfied that the defendants' "Ideal" machine when attached to the domestic electric supply which would enable it to be moved nearer the work to be done would not give a 5-lb. pressure. He must hold, therefore, that the plaintiffs succeeded, and there must be an injunction asked, with an inquiry as to damages.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

NEW AMERICAN TARIFF.

THE Board of Trade have now issued a complete copy of the new tariff Bill, recently introduced by the United States Government, together with a copy of the existing tariff which it is proposed to revise, showing a comparison of the present and proposed duties. The following are extracts of particular interest to readers of the ELECTRICAL REVIEW; the complete tariff may be obtained from Messrs. Wyman & Sons, Fetter Lane, E.C., and the cost is 1s.

Mica and manufactures of mica, or of which mica is the component material of chief value	Present duties.	Proposed duties.
Mica, ground ... ..		30 % ad val.
Mica, ... ..		15 % ad val.
The existing classification is—		
Mica, unmanufactured or rough, trimmed only.	5 cents. per lb. & 20 % ad val.	
Mica, cut or trimmed, mica plates or built up mica, and all manufactures of mica or of which mica is the component part of chief value	10 cents. per lb. and 20 % ad val.	
Carbon unmanufactured, not specially provided for	20 % ad val.	15 % ad val.
Porous carbon pots for electric batteries	20 % ad val.	15 % ad val.
Wire of iron or steel or other metal, except gold or silver, covered with cotton, silk or other material, and all flat wires and steel in strips, not thicker than No. 15 wire gauge, and not exceeding 5 in. in width, whether in long or short lengths, in coils or otherwise, and whether rolled or drawn through dies or rolls, or otherwise produced; telegraph, telephone and other wires and cables composed of metal and rubber, or of metal, rubber and other materials; iron and steel wire coated by dipping, galvanising or similar process with zinc, tin or other metal	Partly 40 % ad val. and partly 35 % ad val.	20 % ad val.
Electrodes for electric furnaces, electrolytic and battery purposes, brushes, plates and discs; all the foregoing, composed wholly or in chief value of carbon	30 % ad val.	25 % ad val.
Carbons for electric lighting, wholly or partly finished:		
Made entirely from petroleum coke	35 cents per 100 ft.	15 cents per 100 ft.
If composed chiefly of lampblack or retort carbon	65 cents per 100 ft.	40 cents per 100 ft.
Steam engines, locomotives and machine tools	30 % ad val.	15 % ad val.
Articles or wares not specially provided for in the tariff under the section of "Metal and manufactures thereof" (N.B.—This heading applies to a very large number of machines and metal manufactures):		
If composed wholly or in chief value of iron, steel, lead, copper, nickel, pewter, zinc, aluminium or other metal, and whether partly or wholly manufactured	45 % ad val.	25 % ad val.
Manufactures of india-rubber or gutta-percha	35 % ad val.	10 % ad val.

Of the proposed new regulations under the tariff, the following is one of the most important:—"That a discount of 5 per cent. on all duties imposed by this Act shall be allowed on such goods, wares and merchandise as shall be imported in vessels built in the United States, and which shall be the property of a citizen or citizens thereof."

## NEW PATENTS APPLIED FOR, 1913.

(NOT YET PUBLISHED.)

Compiled expressly for this journal by Messrs. W. P. THOMPSON & Co., Electrical Patent Agents, 285, High Holborn, London, W.C., and at Liverpool and Bradford, to whom all inquiries should be addressed.

## PUBLISHED SPECIFICATIONS.

Copies of any of the Specifications in the following list may be obtained of Messrs. W. P. THOMPSON & Co., 285, High Holborn, W.C., and at Liverpool and Bradford; price, post free, 9d. (in stamps).

1912.

- ELECTRIC STORAGE SYSTEMS. C. F. KETTERING. 3,791. February 16th. (May 22nd, 1911.)
- TRANSFORMATION OF DIRECT CURRENTS. Akt. Ges. Brown, Boveri & Cie. 6,660. March 16th. (March 17th, 1911.)
- COMBINED INTERCOMMUNICATION AND PARTY LINE TELEPHONE SYSTEMS AND THE LIKE. Sterling Telephone and Electric Co. (Telephon Fabrik Akt.-Ges. vorm J. Berliner.) 6,690. March 16th.
- ELECTRIC ARC FURNACES. E. C. R. MARKS. (Patent Purchasing Co.) 8,791. April 13th.
- TELEPHONY. S. G. BROWN. 9,179. April 18th.
- ELECTRIC CABLES. Western Electric Co. (Western Electric Co.) 9,509. April 19th.
- SYNCHRONOUS DYNAMO-ELECTRIC MACHINES. E. ROSENBERG. 9,644. April 23rd.
- DIRECTION "TELL-TALK" OR INDICATING APPARATUS. J. C. CLARKE and CHADBURN (Ship) Telegraph Co. 9,673. April 24th.
- AUTOMATIC WIRELESS ALARM. S. D. WILLIAMS. 9,882. April 26th.
- PHASE COMPENSATION OF DYNAMO-ELECTRIC INDUCTION MACHINES. Akt.-Ges. Brown, Boveri & Cie. 10,115. April 29th. (April 29th, 1911.)
- ELECTRIC FLAME ARC LAMPS. F. W. E. SCHUER. 10,496. May 3rd.
- SUPPORTING OF INSULATORS FOR ELECTRIC CONDUCTORS. E. C. R. MARKS. (Rainett.) 10,605. May 7th.
- CARVING OF METAL-SHEATHED ELECTRIC CABLES THROUGH BULKHEAD AND SIMILAR PARTITIONS. Metal Jointing Co., Ltd., and T. HARDEY. 10,989. May 8th.
- MANUFACTURE OF METALLIC FILAMENTS FOR INCANDESCENT ELECTRIC LAMPS. J. A. SCOLLAR and Dick, Kerr & Co. 11,455. May 14th.
- LUVS OF ACCUMULATORS. J. C. WOOD. 12,713. May 30th.
- ELECTRIC SWITCHES FOR MULTIPLE-UNIT CONTROL SYSTEMS. P. S. TURNER. 13,740. June 12th.
- RECEIVERS FOR PRINTING-TELEGRAPH SYSTEMS. G. S. HILTZ. 14,831. June 25th.
- ELECTRIC BRAKES FOR TRAMWAY AND LIKE VEHICLES. P. S. TURNER. 15,023. June 27th.
- TELEGRAPHIC APPARATUS. H. KNUDSEN. 15,591. July 3rd.
- ELECTRIC SWITCHES. British Thomson-Houston Co. and J. M. WALLACE. 15,776. July 5th.
- KEYBOARD-CONTROLLED ELECTRIC ILLUMINATIONS FOR ADVERTISING AND THE LIKE. J. W. COOK. 16,765. July 18th.
- METHOD FOR THE PRODUCTION OF FILAMENT HOLDERS FOR METAL-FILAMENT ELECTRIC INCANDESCENT LAMPS. M. BAUM. 16,865. July 19th.
- MAGNETIC SPEEDOMETERS. J. K. STEWART. 17,492. August 2nd.
- ELECTROMETERS AND APPLIANCES FOR INDICATING AND MEASURING VARIATIONS IN ELECTRIC POTENTIAL, ESPECIALLY IN EARTH POTENTIAL, AND A METHOD OF APPLYING THE SAME FOR METEOROLOGICAL PURPOSES. A. H. MAURICE. 18,065. August 6th.
- MOTOR-ACTUATED EXTENSIBLE LADDERS FOR FIRE ESCAPES AND THE LIKE. "Codes" Electric Traction, Ltd., and E. CHIFFORD. 20,244. September 6th.
- ELECTROMAGNETICALLY-OPERATED SWITCHES PARTICULARLY ADAPTED FOR CONTROLLING ELECTRIC MOTORS. E. SCHATNER. 20,247. September 6th.
- ELECTRICAL PROTECTIVE APPARATUS. S. de STELANI. 22,129. September 28th.
- OSCILLATING SPRING CONTACT FOR OPERATING ELECTRIC BELLS AND SUCH LIKE APPARATUS. F. BURR, jun. 22,311. October 1st.
- TIME LAG DEVICES FOR ELECTRIC SWITCHES AND OTHER APPARATUS. M. J. RAILING, J. STRACHAN and H. J. COSTES. 22,509. October 3rd.
- ELECTRICAL BOO TESTER. H. B. GARNHAM and A. E. GARNHAM. 22,603. October 4th.
- ELECTRIC DISCHARGE APPARATUS. Q. MAJORANA. 23,024. October 9th.
- PARALLEL WORKING OF SYNCHRONOUS MACHINES. E. C. R. MARKS. (Akt.-Ges. Brown, Boveri & Cie.) 24,097. October 22nd.
- MEANS FOR SETTING THE TIMING GEAR OF ELECTRICAL IGNITION SYSTEMS. J. E. STURGEON. 26,443. November 18th.
- CIRCUIT ARRANGEMENTS FOR THE RECEPTION OF SIGNALS TRANSMITTED BY MEANS OF ELECTROMAGNETIC WAVES. O. IMRAY. (Compagnie Generale Radiotelegraphique.) 28,070. December 5th.
- ELECTRIC CURRENT TRANSFORMERS. E. C. WESCOTT. 28,967. December 16th.

1913.

- HOT-WIRE ELECTRICAL MEASURING INSTRUMENTS. Siemens Bros. & Co., Ltd. (Siemens & Halske Akt.-Ges.) 943. January 13th.
- ELECTRIC VULCANISERS FOR TIRES. B. KISHAZY. 1,579. January 20th.
- ANTISETTLE GUARDS FOR TELEPHONE MOUTHPIECES. C. V. FULLER. 4,704. February 24th. (February 28th, 1912.)
- TELEPHONE SYSTEMS. Sterling Telephone and Electric Co., Ltd. (Telephon Fabrik Akt.-Ges. vorm J. Berliner.) 7,693. March 1st. (Divided application on No. 6,580 of 1912, March 16th.)

**Tramway Accidents.**—In the Parliamentary Papers, Mr. Watt asked the Secretary for Scotland whether, before instituting any Commission to consider means of reducing the number of accidents in the large cities of Scotland, he proposed to wait for requests for such Commission from the Town Councils of such cities; whether he was aware that the tramcars of such Corporations were permitted to run up to 16 miles per hour, as e.g. in Glasgow; that this regulation precluded the Corporations from insisting on the 10-mile limit of motor-cars; and that these facts caused unnecessary risk to the public; and whether he would introduce legislation limiting the speeds of vehicles in towns in Scotland? Mr. McKinnon Wood replied that he was not satisfied as to the need of special inquiries into the matters to which he referred, though he was, of course, prepared to consider requests from Town Councils or other quarters. He must not, however, be taken as assenting to the implications conveyed in the question.

THERE is a community of interests of manufacturers and users in the electrical industry, as in all other industries, and any standardisation rules for electrical machinery can, therefore, scarcely be considered as entirely satisfactory unless they are the result of what has been so well termed sympathetic co-operation between the purchaser and the producer. Such being the case, the rules provisionally adopted by the British Electrical and Allied Manufacturers' Association, published in this issue, and which represent much strenuous labour on the part of the Committee of the Association appointed for that purpose, can only be regarded as an expression of the reasoned views of the manufacturers on this subject of deep interest to us all. Doubtless the rules will be most useful in preparing tenders, and they should, moreover, prove of material assistance to the Engineering Standards Committee in the revision of their Report No. 36, Standards for Electrical Machinery, now out of date. As the B.E.A.M.A. is officially represented on the Standards Committee, it is just a question as to whether the possibility of confusion which may arise from the issue of the rules, at the present juncture, might not have been entirely obviated if a few words by way of explanation had been added to the somewhat enigmatical preface. The economic advantages of standardisation have become increasingly recognised of late years, more especially in this country, but it would be a little unfortunate if every Association were to issue a set of rules on its own account.

At the same time, competition both at home and from abroad, makes it most desirable not only that the cost of production should be reduced, but that a uniform and satisfactory basis of rating electrical machinery should once and for all be established, with no more delay than is necessary for all parties concerned to be duly consulted.

The I.E.C. has recently brought together many eminent electrical engineers of various countries, our own included, who are discussing this very subject, and if they succeed in arriving at a satisfactory solution, as we sincerely hope they will, much simplification in commercial transactions will result, with consequent benefit to both home and foreign trade. Our esteemed contemporary, the *New York Electrical World*, in its issue of May 10th, calls attention to the revised rules of the Verband Deutscher Elektrotechniker, remarking that the German rules give evidence of considerable progress over the superseded rules, and of the increasing possibility of being able to look forward to the time when one set of standardisation rules for electrical machinery will be recognised universally. There appears, in fact, to be a very general desire on the part of the Standardising Committees of the different countries to do their best to bring their national rules into line, as far as possible, with the suggestions put forward by the I.E.C. The present views of the British manufacturers, however, as expressed in these provisional rules, appear to differ considerably from the inter-

## THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AEGEAT, LONDON." Code, A B O.

Telephone Nos.: Holborn 933; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, 19s. 6d.; Canada, £1 1s. 8d. (\$5.30). To all other countries, £1 10s.

national proposals in such fundamental points as the limits of temperature permitted and the method of measuring them. This question of permissible temperature is so intimately connected with that of the method of rating, to say nothing of the influence of the time element in regard to the capabilities of a machine, and the method suggested by the makers for dealing with this subject is so complicated, that considerable enlightenment and simplification will be necessary if the recommendations are to find acceptance with consulting engineers and users generally.

The unsatisfactory and incomplete character of the report on British Standards for Electrical Machinery has been drawn attention to on more than one occasion, but it should be remembered that the B.E.A.M.A. was not in existence when the subject of the report was under consideration. Now, however, the problem is, happily, much simplified, and although many divergent interests may still exist and necessitate a certain amount of compromise in order to be reconciled, we are sure that, with the present rules of the Association as a basis, the issue may safely be left in the hands of the Engineering Standards Committee to be dealt with in a thoroughly impartial and satisfactory manner.

## CHINA.

THE smashing of idols in ancient temples, the lopping off of pigtails—a Manchu heritage, and therefore to be banned—and the encouragement of a wiry crop in place thereof, an appeal to the nations of Christendom for prayer, and the conclusion of negotiations for a 25 million loan! Here we have indications of the astounding changes that are taking place in parts of the great Chinese Empire. They almost take our breath away with their suddenness. The new sentiment may not be unanimous, and there may be many troublesome days in store—has not Sun Yat Sen very grave suspicions as to the purposes upon which Yuan Shih-k'ai and his satellites intend to spend those Christian millions when they get them?—yet they are the outward expression of a very deep-rooted and wide-spread desire to throw off the yoke and get into line with other nations. The educated minds of China have not lived in the States and among Western nations, nor observed the progress of Japan, without learning how far behind they are, considered from the point of view of civilisation. How well the lesson has been learned is observed in the thoroughness with which it has been disseminated far and wide promoting the desire to move forward. We have mentioned the throwing off of the yoke, but the bit and bridle of reactionary forces and of internal jealousies, rivalries and strife will prevent the leap forward being too hasty. Japan may to-day be engaged in thorny controversy with the States respecting the ownership of Californian land by Japs, but China, at any rate, is not quite yet in a position to frighten Europe with its Yellow Peril fear. For the present, yes, and for a long time to come it will be the case, China will need our help. We are going to send it in part in the form of millions of money, but we have got to do it in other ways too. We heard of an enterprising little American, who, on finding his way into one of the old musty temples last year or the year before, pulled himself up to his full height, waved his hand round toward the 500 idols and remarked to an English missionary present:—"We're going to clear out the

whole bally lot of 'em!" Well, there is nothing like being ambitious when there is opportunity, and while we, of course, wish well to any such movement, we are here more immediately concerned with the necessity for the British manufacturer saying with an equally determined, but, perhaps, more diplomatic air: "We are hoping to bring our things into China, so that the people of this vast Empire may, with the aid of British manufactures, take fuller advantage of the enormous resources that await development." We do not doubt that the money now asked for will be found, and we should like an assurance that a fair proportion of it will be spent with us again; but that is not the British method, and so we have got to scramble with the other manufacturing and exporting nations of the world, initiative, enterprise, quality, and so forth all entering into the game. We are not going to win our way in China all at once, nor are any of our competitors. They have a great reverence for the past in that country, and their estimation of the value of time is altogether different from ours, so that it will be long before they adopt our old saw about "Procrastination," or the slogan, "Do it now!" They are not going to be driven by anybody, and this, to our mind, is one of the redeeming features of the situation considered from the British trade standpoint.

But it would be a suicidal policy for the British trader to fall into line with the Chinese and say, "any time will do." If they are not in a hurry, and have no respect for undue haste, the truth remains that the awakening that has been proceeding, has created a need, which is fully recognised by the many thousands of modernised minds, for facilities characteristic of civilised countries, and those who are at hand, ready and willing to supply that need, will stand to gain.

They must have railways, and they talk of the construction of 60,000 miles in a record time, seemingly belying in this their reputation for slowness, and, if their dreams or anything like them are carried into effect, "foreigners," be they British, American, or German, will all be required to co-operate, and industrial nations may look for busy times, for only a small proportion of the equipment can, so far, be provided from within. This slowness characteristic, after all, has to be considered in a comparative sense. Where population is counted by hundreds of millions, and a few millions more or less killed in the course of a revolution are of little account, and Chinese life is so prodigal that little store is set by it, what would it trouble the Empire, if it had the money, to put a million or so labourers to work on railway construction? The individual rate of working may not compare with ours, but in the bulk the pace would be rapid. When they have determined that the correct time and opportunity have arrived for moving, there will be no mistaking the movement. What will follow railways is a big subject, and we have ventured to indicate it in the merest outline in these pages on several occasions. What is a railway for but to promote movement of people and of goods? Give China ready money enough to keep the peace and to construct railways and telegraphs, and she will herself go a long way toward the development of her resources; the cultivation of all sorts of trade and traffic will lead to the release of wealth, and the progress of civilisation will encourage her people to take enlightened views as to industry and industrial occupations, and forces now dormant will reach unparalleled proportions. But in and through all of this, it is imperatively necessary that British prestige be kept well to the fore, that respect for British firms and British manufactures be strengthened, that the leading men, both in and out of Government circles, be inspired with the fullest confidence in us, that the creation of German and American sympathies be not permitted without some counter-influence being strongly at work from British authorities, Governmental, financial and trading.

When competitors rub shoulders in entering the "Open Door" to a ripening harvest field, a modern equipment and a diplomatic but determined carriage and gait will do more for British industry than a Ruth-like gleaning after the labourers of Boaz have gathered in the bulk of the crops.

We have frequently referred to what has been done at Hong Kong University in the hope of building up British engineering reputation at that important centre of Chinese

educational influence and of distribution, and we mention the matter again on another page to-day—we hope the latest appeal may not pass unheeded by our electrical manufacturers. We have also referred to the promotion of the British Engineers' Association and its activities, and we wish this organisation every success. But it can only rise to the occasion with fullest efficiency if the present propaganda work among firms in the provinces lead to a large increase in its membership. It asks for the co-operation of the entire British engineering industry, which will mean that it will have a commensurate financial backing, without which it cannot efficiently cope with so vast and difficult a field any more than the Chinese can pay debts, keep the peace, or build railways without loans. Meetings have lately been held at Sheffield and at Manchester, at which the objects of the Association have been well stated, and a number of additional firms have joined. We propose to revert to the arguments used in a later issue. Meantime, we can only imagine that it is because our people have not yet fully grasped that in China there is what may prove to be "the biggest market the world has ever known"—to use the words of Captain FitzHugh, the Association's Commissioner in China—that they have not more readily accepted the invitations to co-operate with an organisation which aims in various ways at strengthening the British trade position there.

<b>60,000</b> <b>Employés;</b> <b>Profit on Sales,</b> <b>£1,630,000,</b> <b>per annum.</b>	DURING the past few months we have had through our hands the annual reports of many of our electric manufacturing companies, and though here and there we have, with disappointment, read of unsatisfactory results, these have been ex-
---	--

ceptional, and due to labour troubles. In the majority of cases there was plenty of work to do, and better profits were earned, while the outlook suggests a continuation of satisfactory manufacturing activity for, at any rate, some time to come. But in all these doings we are only able to think in tens or hundreds of thousands, and the reader may be pardoned if he feels that he has been entertained with comparatively small affairs when he contemplates the gigantic proportions of the business conducted by some of the Continental and American industrial electrical trust organisations whose operations and results we record from time to time. The position in this country is very different from that obtaining in the United States, with its vast territory and larger population, and all that those two things mean, and with its fiscal policy—now undergoing a change—that we do not, of course, refer to the results secured by a Brobdingnagian American concern as in any way indicating what ought to have occurred in the British Isles with their naturally more limited home demand. We give the information that follows rather as a matter of interest showing the success of our American cousins in their own sphere, while it may also be suggestive of what *may* happen in the course of years in Canada—whence our own and other people are flocking in their hundreds of thousands. The General Electric Co., of Schenectady, and other centres in the United States has, of course, a hold on many interests, and it has grown remarkably, in spite of its early tribulations, as anybody who has watched its progress for 20 years and more, as we have done, will have noticed. It has, apparently, quite outgrown its difficulties, and being very strong financially, as well as very active in certain foreign markets, nothing seems now to be able to hinder its progressive course.

Twenty years ago, the company's plants stood at well under £800,000 value in the books. During the intervening period, £11,600,000 has been expended for such purposes, and £7,470,000 has been written off, leaving the book value of the plants at December last at £4,911,000.

The past year's outlay on patents and patent matters was £108,000, and this has been charged to profit and loss,

leaving the patent account standing at one solitary dollar. What a deep sigh reaches us from much nearer home!

The number of employes in factories, offices, and subsidiary companies is now in excess of 60,000, and excluding three departments dealing in lamps, there were 466,895 orders handled in the year 1912.

Presumably, the holders of stock to-day are reaping the benefit of the company's financial measures in early years, for last October there was a stock dividend of 30 per cent. paid out of surplus, "for the purpose of recomping the stock-holders in part for dividends passed or reduced during the years 1893 to 1902." This distribution was in addition to the 8 per cent. dividend for the year. The total stock issued now stands at just over £20,000,000.

The figures relating to the year's operations are remarkable, but it may be mentioned that the businesses of the Fort Wayne Electric Works, the Sprague Electric Co., and the National Electric Lamp Co. are now merged into the G.E. Co., and their transactions appear in the report for the first time. These circumstances also account for the increase in the factory floor area from 8½ to 12 million square feet in two years. The value of orders received during 1912 was £20,600,000, and the "amount of sales billed" was £14,000,000. Profit on sales was £1,630,000, with £1,000,000 income from other sources. After the reduction of interest, &c., and dividends paid, there was available to carry to the surplus account for the year a very respectable sum, i.e., £1,280,000. As the surplus previously stood at close upon £6,000,000, this item, after paying the special stock dividend, which absorbed between £4,000,000 and £5,000,000, still figures at £2,400,000.

Notwithstanding the above magnificent showing, President Coffin remarks that competition has continued to increase in severity during the year, "with the result that the percentage of profit realised from the sales of apparatus has materially diminished."

One passingly wonders who are the courageous competitors who can compel so big a concern to lower its prices. Clearly, in the States as in Germany, the building up of huge concerns does not stifle the undercutter nor do away with smaller enterprises when there is a large field. Still, we would not grumble at competition if we could make 8 per cent. per annum and a supplementary stock bonus of 30 per cent.

This excursion among American millions is useful by way of a change, and we must console ourselves with the less imposing figures characteristic of our large number of smaller, though not necessarily, on that ground, less satisfactory, manufacturing concerns.

We believe that there may be a better chance for British electrical manufactures even in the States before long. Some say that the chance now is better than we know. It would be interesting to see some States' selling prices placed in parallel columns against those of as nearly as possible similar British articles.

It may not have pleased some people to see the order for the Victorian railway electrification train equipments go out of this country; but then we may set off against this the ordering here of big turbo-generator sets for service in the States. "Exchange is no robbery."

The General Electric Co., of America, not only manufactures on a colossal scale, but it has stocks and bonds in other undertakings to the tune of close upon £5,000,000, and it is not difficult to see that these undertakings, in addition to yielding a fine return by way of dividends, also bring much business to the Schenectady and other factories. The same sort of thing has also been observed in Germany, but who will use the word success in regard to our largest efforts of a somewhat similar kind in the United Kingdom? Perhaps, however, we may take courage from the memory that even Schenectady had its nine lean years (1893 to 1902) and hope to think our profit in millions in future years. A point that must not escape us, however, is that those "lean" years in the States were our "fat" years, for we were then busy with new tramways and electricity works. On the other hand, our electrical industry 15 or 20 years ago really *was*, in a comparative sense, in its infancy. To-day we are told that it has a capital of 500 millions invested in it, and remembering that fact we are humiliated to have to continue to ask for £100 six times over for the Electrical Trades Benevolent Fund.

## REVIEWS.

*The Law of Electric Lighting, Power and Traction.* By the late JOHN SHIRESS WILL, K.C. Fourth Edition by W. E. TYLDESLEY-JONES, Barrister-at-Law. London: Butterworth & Co. Price 27s. 6d.

To adapt an old simile to modern requirements, a large number of kilowatts have passed through the cables since the third edition of the late Judge Will's book made its appearance. It may be said of the fourth edition, for which Mr. Tyldesley-Jones is responsible, that under his capable editorship the book has grown in wisdom. If it has grown as much in wisdom as it has grown in weight, it will be of enormously added value to the profession.

That the law relating to electricity is fully deserving the serious attention of commentators will be appreciated when one remembers the advances recently made in the application of electricity to the varied needs of a prosperous nation. During the period which has elapsed since the last edition of this work these developments have been very remarkable. As Mr. Jones points out in the preface, the capital involved in electric supply and electric traction undertakings has now assumed enormous proportions. Local authorities in London and the provinces have been authorised to raise loans amounting in the aggregate to £45,704,059 for the purpose of such undertakings, and to borrow £45,903,038 for electric traction, whilst the total capital of electric supply companies exceeds £52,532,000, and of electric traction companies £165,516,000.

During the same period of 10 years important developments have taken place in the law regulating the supply and use of electricity. The Electric Lighting Act, 1909, has been passed, giving effect to many of the recommendations made by the Joint Committee presided over by Viscount Cross in 1898, and enacting, with regard to all electric supply undertakings, provisions which had previously been frequently inserted in the special Acts of particular undertakers.

It is to Mr. Jones's treatment of this new measure that one naturally turns in order to estimate his work at its true value, in view of the fact that his comments must in the nature of things be wholly independent of the views of any of the former editors of the work.

We may say at once that the notes to the various sections of this Act are admirably clear and concise, and are well calculated to aid the non-legal reader to understand its provisions with considerable ease.

The contents of the work may be thus briefly described. An introduction deals in a descriptive form with the Electric Lighting Acts as a whole; licences; provisional orders; electric supply undertakings in the County of London; Power Acts, and Factory Acts. The body of the work contains the statutes in force relating to electricity, with numerous notes and comments; a suitable form of provisional order, power Bill, &c., and rules and regulations, forms of account, &c.

A most useful feature of the work is to be found at pp. 309-313, where the Editor has set forth certain special clauses which are sometimes inserted in a provisional order or confirming Act. These are collected from various provisional orders now in force. What is known as the Bermondsey clause—providing for revision of prices so as to balance revenue and expenditure—is here set out at length. Another most useful form is the Somerset and District Electric Power Act, 1903.

An exhaustive index completes a work which, in its new form, can be heartily commended to the notice of the electrical and legal professions.

*Der Elektrizitätszähler Seine Wirkungsweise, Konstruktion und Praktische Handhabung.* By R. ZIEGENBERG. Berlin: Hermann Meusser. Price 10 M.

This book gives a comprehensive view of present day electricity supply meter practice and is evidently the work of an expert who is able to lay stress on the essential differences between the numerous types, instead of merely collecting a series of uncritical descriptions.

The whole ground, including the important question of cost, is covered, but, owing to the moderate dimensions of the book, a good deal of compression has been found necessary. The information given, however, is sufficient for readers having some practical experience of meters.

The first two chapters deal with electrical measurements generally and with direct-reading ampere, volt and watt meters. The remaining six chapters are devoted to electricity supply meters proper, and deal, respectively, with (1) the various principles available for electrical energy measurements; (2) detailed descriptions of the more important modern meters for D.C. and A.C. work; (3) special tariffs and the meters used with them; (4) the manufacture, testing and checking of meters; (5) legal regulations in Germany affecting the use and maintenance of meters; and finally (6) practical points affecting the installation and reliability of meters, with a useful table giving the most common faults to which meters are liable and the methods of curing them.

The book should be a useful one both for students and those in charge of meters.

*Foundations and Machinery Fixing.* By F. H. DAVIES. London: Constable & Co., Ltd. 1912. Price 2s. net.

In these days when the fixing of engines is thrown, by some firms, upon the responsible shoulders of a bricklayer's labourer, a book on machinery fixing should attract attraction. Fixing machine foundations to-day is done by the aid of a spirit level, a few wedges and a lot of slushy grout. The more elderly of us were brought up to fix metal upon solid stone. Foundation plates were rubbed to and fro on the stone surface, tested by level, the blackened rubbed stone dressed down at the higher ends, or corners, the bedplates again let down and rubbed and levelled, and the stone dressed again and again until at last the plate was level all ways, and the stone was pretty well iron-blackened all over. Concrete and cement have simplified and cheapened the art—perhaps improved the job—but is it quite fair that engine builders, because cement is used, should decline their fixing responsibilities as they do to-day? The author of the book before us is of the new school, and says that stone scarcely merits consideration, and he is quite right to-day, for heavy Ashlar masonry has gone out of use, and it is better to devote space to concrete and its mixing, and to grout and the manner of its putting in.

The author begins with actual construction of foundations. It would be interesting just now to know what is the pressure per square foot of the foundations of St. Paul's dome.

Is it the 3 to 4 tons here tabulated for gravel, or the 4 tons for London clay? St. Paul's has stood for 250 years, and these more heavily loaded parts have sunk, possibly, 4 or 6 in. more than adjacent parts with consequent shear through vaultings. After all, it is not so much the pressure per square foot which matters, as the equality of pressure on every pier, and the avoidance of lateral escape of compressed material. Sand, held in, cannot be crushed, but a sand foundation can be wrecked by a child.

Foundations weigh, we are told, from one and a half to five times the weight of the machine they carry. Such extremes as this, derived from actual practice, are, if good samples in the cases they are drawn from, only a proof that the design of foundations cannot be taught, but must be the result of experience and engineering intuition. Actual examples are given in tables which, however, say nothing of the earth beneath the foundation. There are no fewer than 13 such tables of steam and gas and oil engine foundations.

The author speaks up for sharp sand as opposed to sand much water-worn. Opinion to-day is, however, much less inimical to water-worn sand. It has often the merit of being much cleaner than pit sand, and is usually sound stuff to which good fine-ground cement flour will adhere firmly. The rule for cement mixture is deficient.

The water to fill up a given measure full of the heavy aggregate is the measure of the sand to be used, and the water necessary to fill up a measure of dry sand is the minimum volume of cement to be used with that sand, and this volume should be increased at least 10 per cent.

It may be true that sand is not essential to the making of concrete and that it is only employed to save cement. But the

same could be said of the broken stone—the aggregate generally. A foundation might be made entirely of cement, but the cost would be greater. Actually the aim is to use so much cement that every bit of stone or sand shall be separated from any other bit by a thin wash of cement. The best concrete would be that made by tumbling the heavy aggregate with cement sufficient to dust it all over, doing the same with the dry sand and all the rest of the cement; then tumbling the whole, slowly adding the necessary water. Hand-mixing rarely extends to more than three turns over dry followed by other turns over with water in some bulk—a mistake. Concrete should be machine mixed, water being added in fine spray. Really well-mixed concrete may be merely damp enough to flush up wet on the surface when rammed.

In brick-built foundations it does not really matter that the cement joints should be as thin as  $\frac{1}{4}$  in. It is probable that with a well-wetted brick that will not perish the cement mortar, a half-inch joint is better, for it is a good brick that will not fail sooner than the cement joint. A brick-in-cement wall is monolithic if properly built, and the grouting not skimped, and a half-inch joint will better let in the grout than a thinner space.

Nor in hoop iron bonding does it now seem necessary to tar and sand the hooping. If free from grease the plain iron, if rusted to a clean surface free from scale, will stick to, and be protected by, cement mortar. On the subject of vibration, the author shows his hand in favour of allowing a moving machine to move with its foundation under vibratory influences. And why not? Mount an engine on a foundation with a spherical base and keep the block free laterally, and there would be no transmitted vibration. But could the block be prevented from walking away? Probably a layer of thick felt would admit of the equivalent effect of a spherical base surface and also provide against walking off. If a thing is vibrating, it is at least useless to try to stop it by lateral struts. A foundation on cannon balls will prevent lateral transmission of vibration, but the to-and-fro pitching which sets up pumping in a wet soil can only be met by allowing the whole mass to rock. Pure up-and-down movement of vibration cannot, however, be countered unless by a sufficient interposed elasticity of springs, cork, felt, or other agent. This is quite a good book.

*Wireless Telegraphy.* By H. T. DAVIDGE. London: Percival Marshall & Co. Price 6d. net.

The series of booklets to which the present volume belongs has already established a high reputation which should be further raised by Mr. Davidge's work. The author succeeds in presenting a simple and accurate explanation of the fundamental features and methods of wireless telegraphy while adhering to scientifically and technically correct terms. The preliminary chapter follows the usual lines of reviewing earlier systems of wireless communication, enumerating certain of the properties of ether as utilised in wireless telegraphy, and stating the relationship between velocity, frequency and wave length; the chapter closes with an account of the chief properties of Hertzian waves.

Chapter II deals with Essential Apparatus, and describes the construction and applications of condensers in conjunction with inductance coils; the calculation of the natural frequency of an oscillating circuit (pure capacity and inductance), and the phenomenon of damping. This leads to an elementary consideration of tuning—the mechanical analogy of the tuning fork being cited. The characteristic properties of high-frequency currents and the principle of the electric transformer are also considered.

In connection with Sending (Chapter III), power measurements, the induction coil, and improved forms of contact-makers are briefly considered, and the arrangement of small and large transmitting circuits and aërials is described and diagrammatically illustrated. With reference to the half-tone blocks of aërials, in this and in most other "wireless" works, we would suggest that the aërial wires should be inked over before the block is made; usually their course is barely visible on the original print, and it is quite exceptional to see any trace of them on the block made from the latter.

In the well-known equation:  $n \times \lambda = 300 \times 10^6$ ,  $n$  represents the frequency in cycles per second and  $\lambda$  the wave length of the oscillation in meters, but why not adopt the more convenient form:  $n, \lambda (n, \lambda) = 300$ , in which  $n$  represents the frequency in kilocycles (key.) per second, and  $\lambda$  represents the wave length in km. (a most convenient unit for all practical purposes)?

The receiving chapter deals with coherers and magnetic, electrolytic, and crystal detectors briefly and clearly, but without going into constructional details or instructions and without considering improved forms of the various detectors; space limitations, of course, forbid such full treatment, but it would have been well to have included particulars of one or two of the receiving sets which have been specially designed for use on fishing vessels and in receiving time signals, &c.

In Chapter V, the characteristic features and relative advantages of the Telefunken, Poulsen and Lepel systems are very briefly stated and, in Chapter VI, the author passes on to station working. Under this heading are described a number of accessories and refinements used in modern wireless station circuits; these notes are continued in the next chapter where are considered recent improvements in tuning and directive working and the effects of daylight and the nature of the surfaces over which the radiations pass. The other miscellaneous points dealt with include secrecy of working, regulations for wireless communication at sea, time signals and wave meters. The final chapter deals very briefly with the requirements and elementary arrangements of wireless telephony and its circuits. The production of the work is excellent, and the author has wisely arranged for the Morse code to be printed clearly on a fly-leaf which can be detached for mounting.

*An Elementary Course of Magnetism and Electricity.* By C. H. DRAPER. London: Blackie & Son. Price 2s.

This little book forms Section VII of the author's *Course of Physics*, and is issued separately for convenience of use. It claims to be a course "suitable for those commencing the subject," and is "intended chiefly for the laboratory." And so, to justify its first claim, we find it providing in the first chapters a variety of simple experiments up to and including the mapping of magnetic fields. Then, after warning us that "the exercises in this chapter are of a less elementary character," we are introduced to the mysterious conception of magnetic moments and their comparison by an approximate method; and although we eventually arrive at the Law of Inverse Squares in the last chapter on Magnetism, we are even then only permitted to verify it approximately!

Electrification by friction, electrical machines, and condensers, are treated in a similar manner, the last paragraph on this subject containing the first mention of electric lines of force and the electric field.

Early in the chapter on Voltaic Cells, the author finds it necessary to insert an illustration of a terminal. We would suggest that the draughtsman would have been better employed in improving the perspective of fig. 413.

The chapters on Resistance and Ohm's Law are straightforward and much more satisfactory than the rest of the book, but even in these the diagrams are in many cases little better than useless. The diagrams are, in fact, the worst feature of the book, and setting aside the fact that the electric telegraph is not exactly a suitable topic for a laboratory book, the diagrams illustrating this subject deserve severe criticism. We feel sure that fig. 409 could be found in many electrical books over 20 years ago, and equally sure that the "Telegraph Circuit" of fig. 410 would puzzle the most precocious schoolboy who attempted to discover its meaning.

Such a book may prove useful to some people, but we venture to think that most teachers of electricity will not be impressed by it.—P.K.

**Amendment of Patent.**—MESSRS. KORTING AND MATHIJSSEN A.G. have applied for leave to amend the specification of letters patent No. 22,342 of 1904, for improvements in arc-lamp electrodes. (*Ill. Off. Journal*, page 697.)

## CORRESPONDENCE.

*Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.*

## The Mutual Protection of Engineers.

Recently in the experience of the staff of a large electrical manufacturing firm in the Midlands, an occasion has arisen demonstrating the urgent necessity for an organisation for the mutual protection of the engineers associated with such firms.

The situation has arisen as a result of the amalgamation of such firms under the British Electric Manufacturers' Association. This body, forming the nucleus of a gigantic trust, has for its purpose objects other than the control of prices. By their agreement it is, for instance, possible for them to prevent an engineer, who may have displeased those in authority, from obtaining employment in any constituent firm.

The realisation of this power has resulted in the proposal of a programme for curtailing the privileges and material compensations of our profession, as follows:—Extension of hours of employment of staff; reduction in holidays of staff; abolition of payment during holidays; reduction in status of staff engineers.

The precise instance referred to above as emphasizing the disabilities under which engineers are labouring, related to the treatment of the staff by the management on the occasion of the introduction of a system always resisted by English engineers.

Both the shops and the offices were similarly affected, but while an explanation was afforded to the shops, their co-operation invited, and a bonus offered as a compensation, not only were none of these extended to the office staff, but when a diffident petition was submitted to the management expressing their views, it was ignored and unanswered.

The strong feelings aroused by this high-handed treatment were recognised by the management, who offered a belated explanation of the introduction of the system to which objection was taken, but plainly intimated that the difference in the treatment given to the staff and the shops was because of the fact that in the former case they had to reckon with individuals only, whereas in the latter there was a strong and united body of men to deal with. This is a question the solution of which lies in the hands of the younger members of our profession.

It is not suggested that anything in the nature of trade unionism should be aimed at, but rather societies of the nature of the Law Society or the Medical Association. Such a society would not necessarily adopt an attitude of hostility to the managers of the Trust, but would protect individual members from any harsh and arbitrary abuse of the power with which such managers are vested.

You would be doing a real service to the profession by opening your columns to a discussion on the matter, and so assisting in the initiation of a movement which will be as far-reaching as it is inevitable.

It is quite possible that a new Society is unnecessary, since the Engineering Institutions, in which we hold controlling power, might be induced to extend their functions sufficiently to consider the material interests of their members.

Only an Engineer.

May 16th, 1913.

## The Prevention of Accidents in Electric Lifts.

I am obliged by Mr. A. R. Leaver's reply to my letter, but apparently he does not appreciate the difficulties which must be overcome before a lock can be constructed which is really safe, and, because I have had every-day experience with lifts for a good many years past, I disagree absolutely with his statement that combined electrical and mechanical locks have been successfully applied to lifts for several years past.

I agree with Mr. Leaver that it is a matter of simplicity to connect the electric portion of the lock with the controller in such a manner that the motor cannot be started unless all the gates or doors are closed, and this is, naturally,

the first idea which would occur to one when locking gear is required for a lift. But what about the mechanical portion of the locking operation? Neither mechanical nor electrical locking is sufficient by itself, and difficulties arise when an attempt is made to combine these actions so that the following conditions are fulfilled:—

1. Cage cannot move until the gates are both mechanically and electrically locked.

2. No gate can be opened unless the current has been cut off from the controller.

3. No gate can be opened unless the cage is opposite the floor.

The second condition is most important, for, as pointed out in my previous letter, it very often happens that intending passengers are waiting at various floors for the lift, who, by opening the gate, stop the cage when same arrives opposite their particular floor. Suppose, for example, the case of an automatic push-button lift (fitted with the ordinary modern locking gear) which has been called by a person at the bottom floor, and also suppose that, as soon as the cage has commenced to move, it is also required by another intending passenger who is waiting at the floor above. If the person on the upper floor uses the lift much he will soon find out that he can, by keeping pressure on the gate or door, open same as the lift passes, stop the cage by this means and appropriate same to his own use, instead of waiting until the person who first called the lift to the bottom floor has been served. Of course, this sort of thing may go on indefinitely in the case of a busy lift. The accident a short time ago in which the Duc de Lorge met his death, is one instance of the manner in which the proper operation of a lift provided with ordinary locking gear (such as Mr. Leaver appears to advocate) can be interfered with.

If your correspondent will refer to Patents 2,766 of 1905, 20,444 of 1910, 13,183 of 1911, and 26,802 of 1911, which fairly represent modern practice, he will find that in all cases the mechanical locking action can only take place after the cage has moved a certain distance from the landing. This locking action is accomplished by means of a spring-controlled lever, which can easily fail owing to the spring breaking or weakening, corrosion, or lack of lubrication, and in at least two of the above-mentioned locks, if the gate is not completely latched, the mechanical locking cannot take place, in which cases the lift could move away with the door not mechanically locked. As very often the lift door has the appearance of an ordinary room door, it can be seen how easy it is for a stranger to mistake the lift door for the proper room door, and, when the lock has failed, open the door and walk down the lift well.

Patent No. 2,766, of 1905, referring to doors fitted with switches and automatic catches operated by striker on cage, points out the various difficulties (such as making the electric locking and latching actions simultaneous) which must be overcome, but even in this patent the danger of the mechanical-locking lever failing has not been successfully obviated.

With due respect to Mr. Leaver's own experience with electric lifts, I venture to say that, judging from his remarks on the subject of locks, his experience has evidently not been sufficient to enable him to understand the various problems which arise in the design of lift safety locks, and which have only very recently been completely solved by but one type of lock.

W. J. F. Cooper.

London, May 19th.

Having inspected some hundreds of lifts by different makers, and having made a special study of the several locks used thereon and their failures, I have come to the conclusion that the absolutely safe combined electrical and mechanical automatic gate lock is yet to be invented. All automatic locks of this type have this vital failing, that on the gate being closed the control circuit is completed with the gate only latched, not positively locked, the locking device coming independently into action after the car has moved some distance away from the landing. Now these locking devices are generally operated by means of springs or by a gravity arm, and it is self-evident that

there is an element of danger here, for, should the springs break, as I have known them to do, or should the working parts not work freely for want of lubrication or through some other cause, the gate remains free to be opened when the car is away from that landing, and as your correspondent, Mr. W. J. Cooper, states, "is a veritable death trap." This is particularly so in the case of push-button lifts, where oft-times the lift wells are totally enclosed and the car cannot be seen from the outside. A person naturally under these circumstances, on finding that the door opens, steps into the well hole instead of the car, which should have been there, and the result is death or serious injuries. What is wanted is a combined electrical and mechanical lock which will positively lock (not latch) the gate before the control circuit is closed, the switch and locking device being so constructed as to be dependent on each other, so that if either should fail there is no possible chance of starting the lift away from the landing until the lock has been repaired. Seemingly this ideal lock cannot be made, for on reading a certain lift engineer's patent lock specification recently, I found it stated that the locking and closing of the control circuit cannot be done simultaneously. That being the case, I am under the impression that there is not existing an absolutely safe lock for lift enclosures.

W. H. Carroll.

London, E., May 19th, 1913.

### Electric Lighting Fittings.

With reference to the many catalogues and lists recently published, illustrating and advocating indirect systems of lighting, do you not think that this is a case of misdirection of energy? Why in these competitive days do we want to go round the corner, as it were, to illuminate instead of directing light to where it is wanted by the shortest route?

Surely it is possible to design some form of screen to protect the eye from the glare of naked light, and at the same time to direct the rays in the required direction. Indirect fittings certainly bring back pleasing memories of school days, of evening prowls with what we termed our moth trap (consisting of a large saucer of treacle with a night light spluttering in the middle of it), but in these strenuous days of "candle feet" and "as the inverse square of the distance," indirect lighting seems very much like running half a mile in the opposite direction and sprinting back in order to be in time to catch a train.

Why waste energy, either physical or electrical, in pushing against the competition of other illuminants an obsolete and notoriously inefficient form of lighting, which is bad enough when both ceiling and reflectors are clean, but when the dust settles, is hopeless?

H. A. W.

### Water Divination.

Your recent article on the "Dowsers" was somewhat crushing, but there are some big men on the other side. The late Sir Edward Fry, F.R.S., more than once successfully employed them to locate suitable sites for wells, and the late Marquis of Salisbury also gave evidence in their favour. The German Emperor believes firmly in their power after seeing how they were able to locate coins hidden underneath the carpets.

In 1909, the German Colonial Secretary officially "blessed" the divining rod of Herr Von Uslar, who had been extremely successful in showing where water could be found in German South Africa. He indicated 600 sites, borings were made in 163 of these, and, as a result, 117, or 79 per cent., were successful.

The late Sir Henry Harman had similarly good cause to believe in them. Acting on scientific advice, at Horsham he spent over £1,000 in sinking wells, without any success. He then called in the "Dowsers," who indicated a spot where water could be found at less than 20 ft. A well was sunk, with the result that an immense supply was found at 15 ft. only.

Bohemia's health resort, Podiebrad, came into existence through the "Dowsers'" success in finding a lost well.

These are only a few instances on the other side, which, perhaps, explain why the Local Government Board also

show their faith in the water divining by allowing payments to be made for their services.

W. B. S.

[Despite the illustrious names arrayed against us, we are unabashed. The results of the recent tests showed that, as the Committee said: "Whatever sensitiveness to underground water may exist in certain persons, of which some evidence has been given, it is not sufficiently definite and trustworthy to be of much practical value. Moreover, the lack of agreement with each other shows that it is more a matter of personal mentality than any direct influence of the water. The diviners, as a rule, confine their attention to small streams of water, and as there are few places where these cannot be found they may well show a large percentage of success."

An examination of the diagrams given in the *Sanitary Record* clearly shows that the "indications" recorded by the diviners were absolutely baphazard, and bore no relation to any physical feature of the land whatever. People who can repose any trust in such performances must be lacking in the sense of humour.—EDS. ELEC. REV.]

## LEGAL.

### GLASGOW TRAMCAR ACCIDENT CLAIM.

A GLASGOW woman, who alleged that she was descending from the top of a car when it was suddenly started and she was seriously injured by being thrown to the bottom of the stairs, sued the Corporation, in the Court of Session, for £1,000. After the pursuer's evidence had been heard, the defenders tendered a sum and full expenses in settlement of the pursuer's claim. This tender was accepted.

### BATTERSEA BOROUGH COUNCIL v. THE COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD.

THIS case on Tuesday came before the Court of Appeal, composed of the Master of the Rolls, Lord Justice Kennedy and the President of the Probate, Divorce and Admiralty Division, upon the appeal of the plaintiffs from the refusal of Mr. Justice Joyce, in the Chancery Division, to grant, upon the application of the plaintiffs, an injunction to restrain the defendant company from laying their electrical mains and conduits in Wandsworth Road, Nine Elms Lane, Battersea Park Road, York Road, or any other road, street or place within the Metropolitan Borough of Battersea.

It appeared from the statement of Mr. HUGHES, K.C., in support of the appeal, that the company, having already made connections between the various areas of supply and between those areas and their two generating stations at Clerkenwell and Wandsworth, now proposed to lay a further main between their area at Southwark and a portion of their Wandsworth area, this proposed main to run from their generating station at Wandsworth to a sub-station at Southwark in accordance with (as defendants alleged) the provisions of Sec. 4, Sub-sec. 2, of the London Electric Supply Act, 1908, which provided that "an authorised undertaker or a specified company may also, by means of electric mains, make a connection between any two or more areas which that authorised undertaker or specified company is authorised to supply, or between any such area and generating station of that authorised undertaker or specified company." The learned counsel contended that the natural meaning of Sub-sec. 2 was to give to the defendants power to make a connection where there was none existing already, but that did not give them the right to make any number of connections. The defendants did not claim that the proposed connection was a necessity, and the sub-section only gave them the right to make necessary connections.

MR. SYLVAIN MAYER followed on the same side.

MR. TYLDESLEY JONES (with him Sir Alfred Cripps, K.C.), in support of the decision of Mr. Justice Joyce, said that if his learned friends on the other side were right, it meant that a company would have to lay all the mains they would ever require at first, and that if the company had ever made a connection between two areas, their powers had gone, and the result was that they could not afterwards connect up their generating station with their different areas. He submitted that that was not the proper construction of the sub-section, and that the decision of Mr. Justice Joyce was right.

The parties agreed to treat the motion as the trial of the action.

In giving judgment, the MASTER OF THE ROLLS said that the case turned upon the true construction of Sec. 4, Sub-Sec. 2, of the London Electric Supply Act, 1908. Having stated shortly the facts of the case, he said that Parliament evidently seemed to have thought that it was for the permanent advantage and benefit that where there were various electric companies having separate areas, that they should be able to unite and operate, subject to the consent of the Board of Trade. Was it possible to say that under Sec. 4 there could be only one connection made? Making a con-

nection did not seem to him to mean the erection or construction of a particular tube or conduit. He thought it meant to connect up and do that which the agreement might authorise you to do and not once for all. He thought the learned Judge was right in the view he had taken, and that the relief the plaintiffs sought to enforce could not be sustained. For these reasons he was of opinion that the appeal failed, and as the parties had agreed to treat the motion as the trial of the action, the action would be dismissed with costs.

Lord Justice Kennedy and the President concurred.

## BUSINESS NOTES.

**Diesel Engines at the Ghent Exhibition.**—In the Belgian Electrical Section at the Ghent Exhibition, MESSRS. CAREL FRERES, of that town, display, in addition to a 2,500-H.P. steam engine, three examples of the Carel-Diesel engines, a 100-H.P. four-cycle engine, a 1,500-H.P. reversible six-cylinder engine, and a 1,000 H.P. two-cycle four-cylinder engine, the last-named being coupled to a generator, and used in connection with the electric lighting of the Exhibition.

**Electric Cooking.**—MESSRS. GILLESPIE & BEALES, sole wholesale selling agents for the "Tricity" cookers are prepared on behalf of their principals and manufacturers, the British Electric Transformer Co., Ltd., to enter into correspondence with electricity supply undertakings for the purpose of arranging cooking demonstrations of the "Tricity" cooker, which demonstrations would be given by Mr. F. S. Grogan. Messrs. Gillespie and Beales would be pleased to hear from those engineers who are desirous of taking advantage of this means of introducing electric cooking on their system, and to place their experience at the disposal of those who communicate with them.

Under the title of "Motor-Car Troubles: Their Symptoms and Their Cure," Messrs. Harper & Bros. are shortly issuing a pocket-book for motorists, by H. W. Slauson, M.E.

We have received a copy of the second edition of No. 1 of the *Asteroid*, the official organ of the B.T.H. Social Club. The publication is the *Donuts' Magazine* under a new name, this change following upon a discontinuation of its former name by the Donuts' Society. The new name is adopted because the aim of the magazine is to act as "the connecting link which will complete a well-ordered system of social activities" in B.T.H. circles. Furthermore, the B.T.H. telegraphic address is "Asteroid." There is a good deal of interesting matter relating to club and such-like doings, with some versification, sketches, and, of course, a pretty considerable spice of humour. Mr. T. H. Relton is the editor.

**Price Reduction.**—MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., announce reductions in prices of rubber insulated wires and cables, owing to the fall in the market price of rubber.

**British Trade in British Guiana.**—A report to the Board of Trade from its correspondent in British Guiana points out that greater quantities of machinery and wire for electric lighting come from the United States than from the United Kingdom. The Electric Light Co., in Georgetown, was started, and is maintained, by Canadian capital, and it is possible that purchases of their electric light plant are made in the States as a matter of convenience, especially as there is a varied and cheap supply of such articles to select from in that country. It may be, however, that some of the articles credited in the trade returns to the United States are really of Canadian origin, consigned through New York.

Speaking generally with reference to British efforts to extend trade in British Guiana, it cannot be said that British commercial travellers handle their samples to the utmost advantage. Travellers frequently represent upwards of six houses each, and, consequently, carry a numerous variety of samples, with many of which they are not infrequently entirely unacquainted. On the other hand, travellers from the United States specialise, so to speak, and each traveller carries with him the lines with which he is thoroughly conversant. It naturally follows that such intimate knowledge, well applied, helps to secure orders which might otherwise be lost.

Freight rates naturally have a direct effect on the selling price of imported goods. Great Britain's only competitor in British Guiana which has an advantage in freight rates is the United States, and, from inquiries made amongst importers, it would appear that freight on most goods from the United States averages 12 cents per foot, as against 21 cents per foot from the United Kingdom. Reducing these rates to a basis of value so far as it is possible to do so, it is reckoned that the Americans have an advantage in freight rates equal to an average of about 1 per cent. of the value of the goods. The rates of exchange are also in favour of the United States bills being obtained on New York at  $\frac{1}{2}$  per cent. discount, whilst a bill on London is at a premium of  $1\frac{1}{2}$  per cent.

American manufacturers, it is understood, seldom or never make any charge for packages or packing, and the absence of these charges, even if it does not in all cases reduce the landed cost of the goods from that country, removes a cause of irritation to importers who object to seeing these small extra charges on invoices. Complaints are also made that the majority of British houses do not pay sufficient attention to detail and to keeping their catalogues and price lists up-to-date, the Americans and Germans being ahead of them in these respects. Most British firms are said to supply the same catalogues year after year with very few, if any, additions thereto, whereas the American and German firms are always issuing new and up-to-date lists profusely illustrated with drawings, photographs, &c., and containing minute descriptions of even the smallest articles.

Another matter in which the British manufacturer is said to show to disadvantage as compared with foreign firms, is in the manner in which certain articles are prepared for sale. Goods imported from America and Germany are, as a rule, very attractively got up, so that given two articles of the same kind and selling price, the smart and attractive appearance of the foreign made one will usually result in its being taken in preference to a less attractively got up article of British manufacture.

On the whole, British trade would be assisted by the sending of fewer catalogues and more commercial travellers. The value of the catalogue as an advertising medium is quite realised, particularly in certain lines of business, and no doubt it yields profitable results, but as a method of creating openings for British trade it is overdone, and a smart traveller with a good knowledge of his business, will do more to extend British trade in a week than advertising by catalogue will do in 12 months. American and German manufacturers will, as a rule, go to quite a lot of trouble to suit their customers' tastes, and their obliging disposition not infrequently secures for them a certain amount of trade which otherwise might have remained with British firms. It is mostly in the cheaper classes of goods that Britain is losing ground. Where quality is a prime consideration she can still hold her own, but in nearly all the Crown Colonies and Protectorates situated within the tropical belt, cheap articles find a ready sale, so that the British manufacturer cannot afford to despise the production of cheap and low grade quality even although he may feel disinclined to engage in such a trade.

**Kobe Tramways.**—The completion of the delivery of an order for 42 Warner trucks by the "M AND G" TRUCK AND ENGINEERING CO., LTD., makes 42 systems upon which the Warner axle has been fitted to date, including, we understand, no fewer than 10 lines in the United States. The first British passenger coach fitted by the same firm for the Warner International and Overseas Engineering Co., Ltd., has just been completed and successfully run for Whitsun traffic to, we are informed, the entire satisfaction of the railway company's engineers.

**After the Fire.**—The works of MESSRS. ENGINEERING AND ARC LAMPS, LTD., Sphere Engineering Works, St. Albans, Herts, are now in full running order again after the disastrous fire, which did damage to the tune of more than £3,600, on March 8th. One photograph before us shows how extensive was the damage, while a second shows part of the works with all its repairs completed. The company manufactures here its well-known arc lamps and accessories, but it also undertakes the production of repetition work, stampings, spinnings, &c.

**Electric Clocks.**—The following further communication has reached us from THE MAGNETA TIME CO., LTD.:—"Referring to the communication from your correspondents in this week's issue of the ELECTRICAL REVIEW, until quite recently the Office of Works has issued official tenders for the supply of electric time

systems for the Post Office. Since the termination of that arrangement we have naturally been receiving the official orders and communications from the Stores and other departments of the Post Office. However, we are well content with the fact that all the chief postal distributing centres of London, including the galleries containing that huge mass of telegraph instruments at the central telegraph station, are equipped with Magneta, and we think your correspondents will understand that we are not very deeply concerned with the particular routine which the Government adopt in ordering their apparatus, or even the colour of the official form embodying the order. We mention this as we have both kinds on our files, and it may be interesting to note that the official orders of the Office of Works are on light buff paper, and those of the Post Office on white."

**The Lighting of York Minster.**—One of the most interesting of recent installations of Osram lamps for ecclesiastical authorities is that in the choir of York Minster. The installation of electric light has been so arranged that it enables the beautiful

THE CHOIR AT YORK MINSTER.

carving of the stalls, and the delicate tracery of the walls and vaulting, to be seen in all their pristine beauty, and at the same time preserves them from deterioration caused by deposits formed from other illuminants.

**Bankruptcy Proceedings.**—J. G. M. HILTON, electrical engineer, Birmingham.—Receiving order made May 15th on a creditor's petition.

**Lists Wanted at Catumbella.**—The manager and engineer of the Lobito, Benguela and Catumbella Electric Light and Power Co., Ltd., Post Office Box 25, Catumbella, Portuguese West Africa, asks us to state that he will be pleased to receive price-lists, catalogues, pamphlets, &c., from manufacturers of installation, lighting and power house accessories, E.H.T. line materials, &c.

**Catalogues and Lists.**—ST. HELENS CABLE AND RUBBER CO., LTD., Warrington.—New illustrated list (24 pages) of electrical cables and safety insulating appliances. In addition to particulars of the patent cab tire sheathed cables, several items are described, including patent electric vulcanisers, specially designed for jointing and repairing C.T.S. cables; insulating shoes of a novel type, the wear being easily apparent, and the buckle allowing for various sizes of feet to be used in the same shoe; insulating gloves with cab tire facing, also rubber switchboard matting with cab tire facing. A couple of photographs are included, to show the firm's considerable business with colliery cables of Dialite and cab tire sheathed types. Prices for rubber-insulating cables, including the C.T.S. type, were reduced on May 10th by about 7½ per cent.

**THE SCHNIEWINDT ELECTRIC CO.,** Staniforth Street, Birmingham.—Postal card, drawing attention to the Schniewindt resistance material.

**MR. JOHN JARDINE,** Dearing Street, Nottingham.—Sheet No. 63 (B Department) gives illustration and particulars of a new pattern of cast-iron pulley.

**THE BRITISH ALUMINIUM CO., LTD.,** 109, Queen Victoria Street, London, E.C.—New illustrated circulars; one relating to connectors for stranded aluminium conductors, and the other showing the use of aluminium feeders for railway electrification.

**MESSRS. WALLACH BROS., LTD.,** Royal London House, Finsbury Square, London, E.C.—New edition of their catalogue (56 pages) entitled "Blue Book of Safety Appliances." It contains fully illustrated particulars of smoke helmets, respirators, eye and hand protectors, rescue apparatus, first-aid equipments and cabinets, saw guards and other devices.

**THE SUN ELECTRICAL CO., LTD.,** 118 and 120, Charing Cross Road, London, W.C.—Folder No. 243 gives illustrated particulars and prices of their stoneware electric heating apparatus. Folder No. 244 shows and describes the "Rawplug" method of fixing screws in plaster, brick, metal, and in any substance in which a hole can be drilled or jumped. These plugs are manufactured in a large variety of sizes. Instructions for using are given. Details and prices of their buckle clips for use in conjunction with Rawplugs for fixing tubes and cables are also included. The Sun Co. are manufacturers of the Buckle clips and wholesale distributing agents for the plug referred to.

**MESSRS. SIMPLEX CONDUITS, LTD.,** London and Birmingham.—Folder relating to a "demon in the house," which upon further inquiry proves to be the kitchen range. The letterpress aims at assuring the reader that none of the drawbacks of the said range are found in the "Plexsim" electric cooker, nor will the latter perplex him or disgust him as does the other "elaborate and costly abomination." Contractors and central station engineers can have supplies of the folder bearing their names and addresses.

**THE GENERAL ELECTRIC CO., LTD.,** 47, Queen Victoria Street, London, E.C. Leaflet No. 1,688 gives illustrations with brief particulars and prices of a number of artistic and novel electric bell pushes in silver, glass, &c.

**MESSRS. SIEMENS BROS. DYNAMO WORKS, LTD.,** 38 and 39, Upper Thames Street, E.C.—Two new price leaflets No. 215,6 showing a nickel-plated electric toaster; and No. 215,7 illustrating and pricing new designs of electric water-heaters, saucepans, &c., with renewable elements.

**Trade Announcements.**—**THE CRYPTO ELECTRICAL CO.,** of Berninodsey Street, London, S.E., announce that their works will be closed for stock-taking on Friday and Saturday, 30th and 31st insts.

**MR. PAUL FREDK. OTTO** has taken over the business of Messrs. Lindsay & Co., electrical engineers, of Rose Place, Liverpool.

Expansion of business in the South-Western district has led **MESSRS. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.,** to open a new branch at 56, Victoria Street, Bristol, where large stocks will be held. Mr. E. H. Brown, for more than 12 years in the sales department at the company's head office, is manager of the new branch. Mr. T. J. Hudson will in future devote his attention entirely to the South-Eastern district.

**MESSRS. WM. McWHIRTER & SON** have greatly extended and re-organised their works in Glasgow, and these are now under the direct management of Mr. A. S. McWhirter and a technical staff. The firm have recently opened new works at Wharf Street, Cardiff, where a complete modern plant has been installed. The works are situate on the Glamorganshire Canal, and close to the railways and docks. Mr. A. C. McWhirter is managing the Cardiff branch. It is 30 years ago since the firm opened their first works in Glasgow. They now confine themselves almost exclusively to electrical and mechanical plant repairs.

Increasing business has led **MESSRS. S. BILL & CO., LTD.,** to take larger premises at 146, Queen's Road, Aston, Birmingham, and all communications and goods should be sent there. The new premises are equipped with up-to-date appliances for the manufacture of electric switches, fuses, and other electrical accessories, also cabinet work for motor-car, telephone and electrical purposes.

**Dissolutions and Liquidations.**—**GILBERT ARC LAMP CO., LTD.**—With reference to the notice appearing in our issue of April 25th, we are asked to state that this liquidation is merely a formal matter, the whole of the assets and liabilities of the company having been taken over by Messrs. Engineering and Arc Lamps, Ltd., of St. Albans.

**H. A. HARVEY & CO., LTD.**—Mr. D. L. Honeyman, 18, St. Swithin's Lane, E.C., was, on 9th inst., appointed by the Court receiver and manager on behalf of the debenture-holders of this company.

**ELECTROCARS, LTD.**—A meeting will be held at 3, Great St. Helens, London, E.C., on June 16th, to hear an account of the winding up from the liquidator, Mr. J. E. Denney.

**LINDSAY & CO.,** electrical and mechanical engineers, 95, Rose Street, Liverpool.—Messrs. H. L. Crauford and P. F. Otto have dissolved partnership. Mr. Otto will attend to debts and continue the business under the same style.

**GEM DYNAMO BRUSH CO., LTD.**—This company is winding up voluntarily, with Mr. J. W. Massey, 46, Cherry Street, Birmingham, as liquidator. A meeting of creditors is called for June 2nd.

**SAMUEL HARTFORD & CO., LTD.**—Mr. F. H. Thornton, 51, North John Street, Liverpool, was on April 4th appointed receiver on behalf of the debenture-holders.

## LIGHTING and POWER NOTES.

**Argentina.**—For the past few years the Compania Alemana Transatlantica de Electricidad has been reducing the price of current for lighting purposes in private houses in accordance with the terms of its contract, the price for 1913 being 29 cents paper per kw.-hour. It has not, however, reduced the price for current for heating purposes, &c., in private houses, the rate for this being 28.4 cents, which is a fraction more than half a cent under the lighting tariff. As this company is pushing the application of electricity for heating purposes in houses, the *Review of the River Plate* suggests the advisability of a lower rate for heating.

**Balearic Isles.**—A central electric lighting station has just been completed and put in operation in the little town of Campos, in the Balearic Isles.

**Barnsley.**—In the annual report of Mr. E. A. Barker, borough electrical engineer, figures are given which show that there was an increase of 257,236 in units sold in 1912-13, as compared with a year ago. The following figures are also given (the figures in parenthesis being those for 1911-12):—Consumers connected 1,142 (1,063); equivalent 8-C.P. lamps 91,427 (85,870);

new consumers, 79 (92); motors on mains, 159 (148); equivalent S.C.P. lamps, 24,120 (20,960); public arc lamps, &c., 110 (110); public incandescent lamps, 724 (707); units sold, 2,055,570 (1,716,245). The average price paid for coal was 8s. 10d. per ton (6s. 3d. per ton), whilst the amount of coal used to generate 1 unit of electricity in 1913 was 6·27 lb. (8·58 lb.).

**Bexley.**—The U.D.C. has applied to the L.G.B. for a loan of £450 for the enlargement of the battery, and £575, part of the cost of reconstructing the H.T. switchboard. The balance of the cost of the latter work (£275) will be charged to the revenue of the year in which the work is completed.

**Birmingham.**—The accounts of the electricity undertaking for the year ended March 31st last showed a gross profit of £136,363, as against £150,295 in the previous year. After meeting all the charges for interest and sinking fund, there remains a balance of £27,634. Of this sum £6,000 has been carried to the renewals fund, leaving a surplus for the year of £21,634, which it is proposed to give in aid of the improvement rate. This sum represents a little more than was paid to the improvement rate in the previous year. The surplus for the year ended March 31st, 1912, amounted to £21,581. The total expenditure for the year under review amounted to £170,482 (£138,430 previous year), of which £98,049 represents the cost of generation, £21,367 the cost of distribution, and £21,182 the cost of management. Of the total income (£306,815, as against £288,725, previous year), £300,596 resulted from the sale of current, £203,755 representing lighting and power meter sales, and £98,687, the value of the units sold for traction purposes. In addition to the £300,596, £5,507 resulted from the hire and hire-purchase of motors, arc and incandescent lamps and other apparatus. The total number of units sold during the year amounted to 63,250,492, as against 40,190,547 in the previous year, of which 42,197,163 were for lighting and power, and 21,053,339 for traction. The average price per unit sold was 1'16d. The Electricity Committee reporting on the year's working, states that the financial result for the year has been affected by several causes. First, the reduction in rates of supply, which took effect from April 1st, 1912, has naturally reduced the revenue substantially; while there is no doubt that the output has been increased in consequence of the reduction in charges, the amount by which the receipts have been reduced being approximately £30,000. In addition, the effect of the coal strike on the quality and price of the coal purchased during the year cost the department about £9,400. Increased wages to workmen, over and above normal advances, cost about £1,200, and service connections £4,100, making a total of £44,700. As regards the result of the reduction in rates, the Committee states that it is obvious that this is felt most severely in the first year of operation, but, from past experience, it is satisfied that the increased output in the next year or two will more than compensate for the fall in revenue. The output for private lighting and power has shown a substantial increase, the units sold being 26·3 per cent. higher than in the previous year. The money value for this supply shows an increase of 1'25 per cent. There is an increase in the output for the tramway supply of 29·4 per cent., and an increase in the money value of 15·8 per cent. The revenue account has been debited with a charge of £2,351 in respect of new meters, and £5,076, the cost of service connections, which is now entirely borne out by the department, and not partially charged to consumers, as in previous years. The net increase in lamp connections (lighting only) is 21,173 60-watt lamps, and in motors connected 12,344 H.P., or 9,208 kw. These increases compare very favourably with previous years. The total length of new mains laid during the year has been 85,367 yards.

**Blean (Kent).**—The B. of G. on May 15th appointed a Committee to consider the advisability of having the workhouse premises lighted by electricity, which, it is considered, could be generated at very little cost.

**Bolton.**—In connection with the new electric power station at Back-o'-th'-Bank, the L.G.B. has sanctioned the borrowing of £24,344 for buildings, £26,266 for turbo-alternators, &c., and £16,238 for boilers, economisers, and steam pumps.

**Bridlington.**—The sanction of the L.G.B. has been received for the borrowing of £4,400 for 17 years, and £600 for 30 years, for extensions to the electricity works.

**Burnham (Somerset).**—The U.D.C. has approved of the proposal of Dr. Purves, of Exeter, to form an Electric Supply Co. with a capital of £5,000, instead of £10,000, as originally intended.

**China.**—According to the *Indian Textile Journal* the negotiations for the lighting of Wuchang city by electricity have been completed, an exclusively Chinese company having been formed with Government assistance for this purpose. The complete power station plant will be supplied by Messrs. Siemens China Electrical Co., and will include, to start with, two 400-H.P. three-phase generating sets which will supply by means of a network of overhead lines. The power plant will be laid out to accommodate turbines at a later date, and will be run entirely under Chinese supervision.

**Continental Notes.**—AUSTRIA.—The Siemens-Schuckert Co., of Vienna, is reported to have purchased the central electric lighting station at Soborten, near Tepitz, Bohemia, for the sum of £40,000, with the view of considerably extending the same.

FRANCE.—The central station at Vasquehal, of the Société Electrique du Nord de la France, which is supplying current for lighting and traction purposes to an area of over 200 miles, and which has a

capacity of 34,000 H.P., is to be further extended to 52,000 H.P. Orders for two new steam turbines and generators, each of 6,000-kw. capacity, have just been placed with the Compagnie Electro-Mécanique.

ROUMANIA.—La Société d'Electricité de Ploeshti, which owns the concession for the supply of electricity for lighting purposes in Ploeshti, has applied for the concession to construct and work a system of electric tramways in the town.

RUSSIA.—La Société des Tramways et Eclairage Electriques de Vladicaucase in its report for 1912, states that the year witnessed the greatest development in the company's electric lighting undertaking since its establishment, the number of clients increasing during the 12 months from 755 to 938. Current is now being supplied to 20,101 incandescent, and 109 arc lamps, as also to 77 electric motors. Owing to the great increase in the cost of petroleum, electric lighting is now being adopted by small householders, and with a view of meeting the increased demand, a new Diesel engine and generator is to be installed at the generating station.

SPAIN.—Good progress is being made with the establishment of the new hydro-electric stations of the Barcelona Traction, Light and Power Co., Ltd. The plant at Seroa, which will have a capacity of 56,000 H.P., is expected to be completed by the end of the present year, while one of 81,000 H.P. that is being established on the River Pallaresa, will, it is anticipated, be completed in 1914.

**Eltham.**—The Avery Hill Training College hostels are to have an E.L. installation at a cost of £1,139.

**Felixstowe.**—The Suffolk Electricity Supply Co., in co-operation with the U.D.C., has arranged to supply current for lighting and heating to tents on the beach at a fixed charge of 10s. for the season, the charge for connecting up being 5s. Some 250 sites for tents have been let this year by the U.D.C.

**Fife.**—At the Blairenbathie Colliery, Kelty, a large electric installation is being rapidly pushed forward.

**Galashiels.**—It has been decided not to make the local electrical supply a municipal scheme. Support will, however, be given to the proposed local company on the understanding that a satisfactory arrangement is made as to the maximum charges for public and private light and power. Terms will also be stated on which the undertaking can be acquired by the T.C.

**Hastings.**—At last Friday's meeting of the T.C., it was decided to light the unfinished west arm of the Harbour works with electricity. A watertight fitting is to be erected at the end to hold three 80-watt lamps, the whole cost being estimated at £150. At present the lighting by oil lamps costs, with labour, £43 a year, and by laying a submarine cable and installing the electric light, the annual cost will be reduced to about £12. The Harbour works, it may be explained, are derelict. The Commissioners have no funds, and the Corporation illuminates the works for the protection of the fishery. Both the B. of T. and Trinity House have refused to take up the matter.

The B. of T. has granted an order to the T.C. authorising the Corporation to supply current to property at Ore, which is outside the borough.

**Hebburn-on-Tyne.**—In regard to the recent explosion at Hebburn-on-Tyne, by which two lives were lost, the Council has resolved to call the attention of the B. of T. to the matter, and to request it to hold an inquiry into the circumstances of the explosion, and the general conditions and method of laying cables in the district, and to ascertain whether any, and if any, what steps should be taken or regulations made to ensure the safety of the public. The Northern Counties Electricity Supply Co. gave the Council notice that it intended to lay H.T. cables underground from Ellison Street along Lyon Street into the Hebburn "C" Pit, and the Council resolved that, so far as its approval may be necessary, it does not approve of laying the said cables unless they are lead-sheathed and in earthenware troughs.

**Hendon.**—The R.D.C. has sealed an agreement with the Colne Valley Electric Lighting Co. for the supply of current in part of the Council's area. It is hoped that a supply for Pinner will be available this year.

**Henley-on-Thames.**—The Reading Electric Supply Co. has decided to ask the B. of T. to override the decision of the R.D.C., which has refused consent to the company supplying electricity to houses at Shiplake. At a meeting of the Council on May 13th, the clerk expressed the opinion that the B. of T. would not accede to the company's request.

**Horsham.**—A L.G.B. inquiry was held on May 16th into the application of the U.D.C. for a loan of £2,000 for the provision of a refuse destructor at the electricity works. It was stated that the Council was likely to profit from the use of refuse as fuel, and that the destructor would be dealt with as adjunct to the electricity works. The value of the refuse to be dealt with from a fuel point of view was placed at £435 per annum. There was some opposition on the ground that the destructor would be a nuisance.

Ilford.—The engineer has been instructed to report on the electrical equipment required in connection with the Council's proposal to install a refuse destructor. In connection with the removal of the centre columns in High Road, the electrical engineer reporting upon the sample fittings he had erected near the Broadway, states that it is impossible to see the effect of these lamps until after 11 o'clock in the evening, in consequence of the number of private lamps in the neighbourhood, which are kept

alight to that time. The Electricity Committee has deferred the consideration of the report until it has had a chance of inspecting the fittings.

**India.**—**BOMBAY MILL INSTALLATIONS.**—In connection with our recent note regarding the motor and transformer equipment for the textile and flour mills in the Bombay district, which are to derive their power from the mains of the Tata Co., we are now enabled to give further particulars of the valuable contract which has been secured by the British Westinghouse Co. The motors are all of the Westinghouse slip-ring protected type, suitable for double drive, and for three-phase current, at 2,000 volts and 50 periods. There are at present a total of 207 motors of this type on order, the sizes ranging from 50 H.P. to 500 H.P. The motor speeds are 290 R.P.M. and 365 R.P.M., there being several of each horse-power capacity at each speed, coupled direct to the line shafting in the great majority of cases without the intervention of countershafting. The motor switch pillars are of the Westinghouse ironclad type "S" pattern, which are so largely used in mining and other industrial work in this country, and starting is affected by liquid controllers. The transformers are Westinghouse three-phase oil immersed self-cooled units, and reduce the supply pressure from 6,000 volts to 2,000 volts for the motors. They number 61 in all, and are of four sizes, thus: 22 of 500 K.V.A., 11 of 600 K.V.A., 21 of 700 K.V.A., and seven of 900 K.V.A. The mills in which the above-mentioned equipment is to be installed are as follows:—Pearl, Finlay, Simplex, Naigum, Swan, Bombay Cotton, Jamshed, Nahomdnahy, Pabahey, Crescent, Fazulbhooy, David No. 1, and 2, Down, Standard, Phoenix, Gold Mohur, Jubilee, Crown, Western India, Apollo, Ripon, Dharamsey, Hope, Alliance, Matildas Goculdas, New City of Bombay, Colaba, New Great Eastern, Sun, Bombay Flour, Merchants Flour, and Union Flour. These particulars give some idea of the importance of this immense scheme for mill electrification, to which we hope to refer in detail at an early date.

**Ipswich.**—The report of Mr. Ayton, the Corporation electrical engineer, on the working of the electricity department for the year ended March 31st last, discloses a loss of £1,708, due more than anything to bad luck. The total revenue amounted to £21,733, and working expenses to £16,899, leaving a balance of £7,833 to meet financial charges. Interest and sinking fund amounted to £7,908, and, in addition, £1,633 capital charges on new plant, &c., was met out of revenue, leaving a balance on the wrong side as mentioned. This was made good from the reserve fund, which is reduced to £815. The department's bad luck arose from the coal strike, which it is estimated cost an extra £1,000, and, unfortunately, troubles with the recently installed turbine plant deprived the department of its assistance, and reconstruction work involving the running of the plant non-condensing also told its tale. Two turbine units are now running satisfactorily, but the capital charges for the year were increased by them, although they were not then in use. The units sold for all purposes were 2,606,119, as compared with 2,050,885 in 1911-12; power units jumped from 763,183 to 1,247,077, the motor H.P. increasing from 1,903 to 2,299. The power station capacity increased from 1,511 to 3,511 kW. Mr. Ayton draws attention to the necessity of having a hiring scheme in operation, in order to develop electric heating and cooking; also he refers to the possibilities of the electric vehicle and the advantage to the undertaking of encouraging its use.

**Japan.**—The Tokio Electric Bureau have lately issued a report for the 20 months from August, 1911, when the electric lighting and tramway undertakings in the city were municipalised, and during that period a profit of £546,052 was made.

**Johnstone.**—Messrs. Strain & Robertson, the engineers to the Clyde Valley Electrical Power Co., have notified the T.C. that at the expiration of one month they propose carrying out certain operations within the burgh. The Council has considered the proposal, which involves the laying of cables below the roadways, and decided to object to the plan. Other questions with reference to the future negotiations ament electric lighting were remitted to the Electricity Committee for further consideration.

**Kettering.**—The U.D.C. has applied to the L.G.B. for a loan of £1,600 for a new feeder cable, &c., and has decided to install at the electricity works a water softening plant, dealing with 1,500 gallons per hour, at a cost of from £160 to £170.

**Ledbury.**—The U.D.C. has decided not to offer any objection to a prov. order for electric supply being applied for by Messrs. Edwards & Armstrong, provided that plans for the generating station and the cable routes are submitted for approval.

**Leeds.**—The annual report of the working of the electricity department for the year ended March 31st last, shows a great development in the supply, due mainly to the growing power load, the increased output being 5,288,940 units, or over 29 per cent. The revenue amounted to £124,597 (an increase of £9,751), and the expenditure was £109,088 (an increase of £10,307), and the surplus profit £15,508 (a decrease of £556). The reduced surplus is, however, more than accounted for by an increase of £1,885 in capital expenditure out of revenue. The total output sold was 23,130,512 units, as compared with 17,841,572 in 1911-12; this included 5,086,774 units for lighting, 895,247 units for street lighting, 14,152,395 units for power and heating, and 2,996,096 units for traction. The power units sold increased by 25 per cent., the H.P. of motors connected having risen from 17,291 to 22,096. The heating apparatus supplied increased from 380 to 683 kW. The revenue per lamp installed decreased from 4s. 5½d. to 4s. 3½d.,

but the maximum price for lighting was reduced from 4d. to 3½d. per unit in October, 1912; the revenue per motor H.P. installed also fell from £2 11s. 6d. to £2 10s. 9d. The maximum load on the generating plant increased from 9,560 kW. to 10,715 kW., the capacity of the plant remaining at 15,440 kW. Two additional 7,500-kw. turbines will shortly be added, bringing the plant installed up to 30,440 kW. The working expenses per unit remained stationary at 4½d. per unit, but the cost of coal in 1913 was 17½d., as against 14d. per unit in 1912, the excess having been saved on other items.

The report refers to the increased price of coal and increased working expenditure, which more than counterbalanced the revenue increase; notwithstanding this, the capital charges being spread over a much greater number of units, resulted in the total cost per unit sold being 20d. less than a year ago. An interesting analysis of capital expenditure allocates to the generating station, £413,558, or 37.9 per cent.; to mains, transformers, &c., £626,656, or 57.5 per cent.; and to cost of provisional order, discount on stock, premiums, &c., £50,403, or 4.6 per cent., of the total expenditure.

The Roundhay and District Lighting Co. has offered to sell its undertaking to the Corporation, and negotiations are proceeding.

**London.**—**HAMMERSMITH.**—The B.C. has requested the Electricity Committee to consider and report upon the desirability of establishing a showroom in connection with the electric light undertaking of the Council for the purpose of demonstrating the uses of electricity, and particularly in the establishment of such a showroom in the proposed extended Town Hall.

**BERMONDSEY.**—The electrical engineer advises the strengthening and connecting up of the feeders in seven roads, also the laying of additional distributors, to cope with the next winter's demand. The cost of the work is put at £8,682, which is to be raised by loan and taken up as required.

**Lowestoft.**—The T.C. has received from the L.G.B. sanction to a loan of £3,000 for mains and £2,000 for house services.

**Nelson.**—The T.C. has resolved that application be made to the L.G.B. for sanction to borrow the sum of £4,000, estimated to be required during the next three years for mains and services.

**Newport (Mon.).**—With reference to the experiments which are being carried on for the lighting of a portion of Caerleon Road, the Gas Co. has written the Council offering to supply gas, light and extinguish, repair lantern, paint and generally maintain two-light inverted burner lamps for £5 14s. per lamp per annum, the first cost of the lamp with its burners and fittings complete being £2 0s. 9d. and the illuminating power 320 candles. The company, in the letter, also quoted for higher candle-power lamps. The borough electrical engineer reported that 11 incandescent electric lamps, each of 300 C.P., and one 500-C.P. lamp could be supplied for a payment of £70 per annum, as against the gas company's proposed charge of £68 8s. Having regard to the fact that the Corporation has the necessary supply ready to hand, application is to be made to the B. of T. for permission to use overhead cables for the supply of current to such lamps, and the Newport Gas Co. is to be asked to discontinue the lighting of the lamps in the road in question from and after September 29th next.

**North China.**—The Peking Chinese Chartered Electricity Undertaking is just now in a state of great prosperity owing to the settling down of the country after the revolution. Mr. Sillar reports the addition of from 7 to 10 new consumers every day, and with the three new Senate chambers and the opening of the Forbidden City for the use of the President and Cabinet, the supply has more than doubled in the last six months. President Yuan Shih Kai has alone installed about 4,000 lights, and Mr. Sillar, who was formerly chief at Colchester, is one of the lucky few who has a pass into the Forbidden City, which is classed by all who have seen it to be the finest Imperial palace in existence.

**Peterborough.**—On May 14th Mr. T. C. Ekin held an inquiry into the application of the T.C. for a loan of £7,000 for extensions to the generating plant—£3,850 for a 500-kw. steam turbine and generator with condenser; £1,450 for Lancashire boilers and setting; £960 for mechanical stokers; £170 for foundations for turbine and condenser; £150 for piping; £220 for switchboard additions; and £170 for contingencies. There was no opposition.

It was stated that Messrs. Barford & Perkins, engineers, required 300 H.P., of which 100 H.P. was to be installed now; the G.N. Railway also required a supply of power. The city engineer (Mr. J. C. Gill) said he hoped there would be another of the large works coming on the mains, and they hoped to get an extension of power business with small consumers. He should like to purchase a number of motors and hire them out, but he understood that the T.C. could not use its surplus for that purpose. The Inspector thought the Council had the necessary powers, and could adopt such a scheme if it wanted.

**Pontefract.**—The B. of G. has decided to obtain expert advice on the electric light arrangements at the workhouse with the object of carrying out improvements and alterations which will result in economy.

**Portslade (Sussex).**—In reply to inquiries, the U.D.C. has intimated that the question of electric light is receiving attention, but that there does not appear to be a possibility of a supply of electricity for the district at present.

**Skye.**—A large electrical installation is being carried out on the Island of Raasay, off Skye, on the West Coast of Scotland. This island was recently acquired by Messrs. William Baird & Co., ironmasters, and the extensive deposits of iron ore are to be worked. Electricity is being used for the purpose of operating the service railway, cranes, boring tools, and for lighting.

**Stalybridge.**—The Corporation has approved of plans of extensions, &c., at the generating station, Park Road, for the Stalybridge Joint Electricity Board.

**South Africa.**—The Cape Town city electrical engineer has decided, owing to the very large demand for free wiring installations, to temporarily suspend the application of the system, so that the department may be able to cope with the additional work of connecting up the new consumers. In addition to this work, the department is also extremely busy in rearranging the supply to the consumers recently taken over from the Cape Peninsula Lighting Co. Some of the suburbs are being entirely rewired with overhead cables. It is expected that the new alternating-current supply will be in use in Mowbray and Observatory early in May.

**Torquay.**—The General Purposes Sub-Committee of the T.C. has under consideration the question of installing electrical cooking apparatus at the new Town Hall.

**Trowbridge.**—The U.D.C. has referred to a Committee a letter from Mr. Ronald C. Taylor, asking for powers to supply current for power to mills in the town at 1d. per unit, as the local electric supply company is not able to give a supply at the price.

**Watford.**—The B. of T. has granted a prov. order to the U.D.C. enabling it to supply current to the parishes of Abbots Langley and Watford Rural.

**West Hartlepool.**—This Corporation is the first municipal authority to adopt a system of generating electricity from waste steam obtained from outside sources. Its new power station contains two turbo-generators, each of 1,500 kw. These are supplied with exhaust steam from the six blowing engines, which are served by 16 boilers. After passing through the condensers, the water will pass through a Lea recorder back to the boilers at the ironworks. To supply the condensers with cold water, three cooling towers have been erected, each capable of cooling 115,000 gallons of water per hour. The total cost of the new scheme is £38,795, the plant alone having cost £30,000. In return for the use of the exhaust steam of the Seaton Carew Iron Co., the company will receive a supply of electric current free. The coal bill for the old station was about £4,000 a year, and it is expected there will be a great saving by the new scheme. The old station will be maintained as a stand-by.

**Whitehaven.**—The *Whitehaven News* recently contained a report of a debate in the local T.C. on the question of increasing the salary of Mr. Sankey, the borough electrical engineer. The Committee proposed to give him a bonus on the profits, but an amendment was carried referring the matter back, apparently on the ground that the nature of the bonus had not been settled. Alderman Walker said he understood that the Committee was unanimous that Mr. Sankey should receive increased remuneration, and another member thought the proposal as it stood might involve an injustice to the engineer—the exact nature of the bonus not having been settled. A bonus scheme based on sound lines is, undoubtedly, an incentive to increased business, and the Council might do worse than obtain information from Marylebone on the subject.

**Whitstable.**—Negotiations have been carried on by the promoters of the E.L. Co. and the U.D.C., for the company to undertake the public lighting. The Council was offered 2 per cent. of the gross profits of the undertaking if it gave the company the whole of the street lighting, and on the Council deciding to grant half the lighting to the company, the promoters replied that under those circumstances they could give the Council only 1 per cent. of the gross profits. The Council has decided to adhere to the original offer of 2 per cent. if any of the public lighting is undertaken by the E.L. Co.

**Wolverhampton.**—The Corporation Electricity Committee has been authorised to arrange for an electrical exhibition at the forthcoming floral fête, at a cost not exceeding £200.

**Wrexham.**—There is a profit on the electricity undertaking for the past year of £482.

**Yarmouth.**—The L.G.B. is to be asked to sanction the borrowing of £3,840 for the purpose of substituting electricity for gas for street lighting purposes. The scheme provides for the conversion of all the remaining gas lamps in the borough, 105 of which are to be carried out during the present financial year.

It is intended to install at the electricity works two superheaters, at a cost of £400.

On May 15th a L.G.B. inquiry was held respecting the application of the T.C. for a loan of £11,590 for electricity purposes. There was no opposition.

## TRAMWAY and RAILWAY NOTES.

**Argentina.**—According to the *Review of the River Plate*, the Concordia Tramways Co. has resolved to electrify its system.

**Australia.**—The city underground railway, which the Government intends to construct to relieve the congestion of traffic in Sydney, will be a three-line loop railway around the city, with connections to the eastern and western suburbs, and to North Sydney. Three lines will leave the great metropolitan Redfern Station on the northern side, and, falling in a grade of 1 in 40, pass wholly underground on the western side of the city, with stations under the principal city thoroughfares, to one of the city gardens known as Wynyard Square, in the vicinity of the Sydney General Post Office, where the first section will terminate.—*British Australasian*.

An electric motor street-watering cart has lately been put in service by the Melbourne City Council.

**Ashton.**—The manager of the tramways has reported to the Tramways Committee upon the question of removing the centre standards in the Stalybridge and Manchester Roads. He expressed the opinion that, inasmuch as the trolley wire would, under ordinary circumstances, last at least two years, it was inadvisable to incur the expense—£1,100 or £1,200, exclusive of the cost of new trolley wire and fittings—at present. The Committee felt that the suggestion for the removal of the centre standards was worthy of consideration, and decided that the matter should be raised again nearer the end of the life of the trolley wire.

**Bradford.**—Through the trolley of a tramcar coming off the wire last week, and the wire breaking and coming into contact with a car, considerable damage was done to the vehicle owing to its catching fire. There were few passengers on the car at the time of the occurrence, and, fortunately, no one was injured, though traffic was disorganised for some time. The broken wire was repaired, but upon another trolley being put on to it, it again broke, and a second car caught fire, the conductor and a passenger having a narrow escape. The cause of the mishaps is attributed to the fact that the tramlines in Toller Lane are "up," and the temporary rails are about 6 in. higher than the permanent way, causing greater pressure on the overhead wires.

**Continental Notes.**—**ITALY.**—So frequent have the labour troubles become with the employés of the Société des Tramways Napolitains, of Naples, that a novel departure has been made by the municipal authorities of the city with the view of putting an end to the difficulty. With this object, they have established a school where the police are being trained to drive electric tramcars, so that they may be in a position to assist in keeping the public service working. It is stated that no less than 300 policemen are now sufficiently trained to be entrusted with the driving of electric cars, should there be a further strike. The new departure is stated to have already had a beneficial effect on the attitude of the employés.

**SAXONY.**—It is reported that the Saxon State Railway authorities have decided on the electrification of their lines, and that in connection with the project several important collieries in Saxony have already been acquired by the State.

**Douglas.**—At a meeting of the T.C. last week, a member moved that all free passes held by aldermen and councillors in connection with the borough tramways be withdrawn. He declared that the inordinate use made of the passes interfered with the earning power of the tramways. The chairman of the Tramways Committee seconded the motion, but it was strongly opposed, and was lost by 13 votes to 4.

**Dundee.**—There was a lively debate at a meeting of the Corporation Tramways Committee following a report by Mr. Peter Fisher, the manager, on losses incurred on certain tramway routes. With regard to the High Street and Craig Pier route, on which there was an apparent loss of £600 per annum, the manager pointed out that if they stopped running to-morrow, they would not save one penny, so far as the wages were concerned. It was reduced practically to the price of electricity, and the saving would be so small that he would not advise discontinuance now. Later, Mr. Fisher told a councillor that he was not to put words in his mouth, and to his reply, the manager retorted "you are not to make a fool of me." Ultimately, Mr. Fisher's advice was accepted.

**Egypt.**—La Société des Tramways du Caire has applied to the Egyptian Government for a concession to construct and work a system of suburban electric tramways in the Province of Ghizeh, with the object of connecting Cairo with a series of populous villages at present without any system of communication. The system would extend to a distance of about 44 miles.

**Edinburgh.**—The members of the Corporation deputation who visited England to inspect and report on self-propelled cars, submitted their views at a meeting of the Tramways Sub-Committee of the T.C. The deputation visited London, Coventry and Morecambe, and were favourably impressed with the cars in operation in these places. It is understood there will be a recommendation for a trial of the system, in order to meet the difficulty that has arisen in Edinburgh. The report will be submitted to a full meeting of the Tramways Committee.

**Ilford.**—The tramways manager has presented his report upon the advisability, or otherwise, of the Council adopting a universal 1d. fare over the whole of the tramway system. The consideration of the question has, however, been deferred. The Council's agreement with East Ham Corporation for the lease, upon certain terms of the Ilford Hill track, and which expires on the 25th inst., is to be continued, subject to six months' notice on either side.

**Japan.**—A proposal was made some time ago in the Tokyo Municipal Assembly for the construction of two underground railways, one running between Jida-machi in Kojimachi-ku, and Mejiro in Koishikawa-ku, under the control of the Johoku Electric Railway Co., and the other leading from Takamawa, Minami-cho, Shiba-ku, to Chayacho Asakusa-ku, *via* Ginza, and Ueno, under the control of the Tokyo Underground Railway Co. The Special Committee appointed by the Municipal Council for the investigation of the project has reported that although it approved the projects in principle, they must be rejected for the present, as they would interfere with the unification of the municipal systems of communication.

**London.**—An important question affecting the future of the tramway service in West London was raised at the Acton U.D.C. meeting on Monday. The clerk reported that the Parliamentary agents of the London United Tramways, Ltd. (Messrs. Stanley and Co.) wished to direct the Council's attention to the provisions of the Bill by which the London County Council sought power to enable it to work, when acquired from the company, such portion of the tramways in Hammersmith as the Council had not already powers to work. The London United feared that if the power was unconditionally conferred upon the L.C.C., it might result in the cutting of the tramway traffic at the county boundary, *i.e.*, the Askew Arms and Young's Corner, and so, amongst other things, cause very grave inconvenience to the travelling public. The company was, therefore, endeavouring to make the L.C.C.'s power of working the tramways, if granted, subject to an obligation to maintain the existing through-running facilities, and it was suggested that the Acton U.D.C. might be willing to support the opposition to the Bill on these lines. The Council decided to reply that its chairman, Councillor Boissonnade, J.P., would be willing to give evidence on behalf of the company in opposition to the L.C.C. proposals, having regard to the public interests involved, and to the fact that if the Bill, as drafted, became law, the Council was apprehensive of the breaking of the present through service of cars and the cessation of the through fares and booking arrangements.

**Luton.**—A further lease of the Corporation Tramways to Messrs. Balfour, Beatty & Co., Ltd., has been approved.

**Milnrow.**—At a meeting of the Tramways Committee last week, a letter was read from Mr. J. S. D. Moffet, general manager of the Rochdale Tramways, stating that the cost of the cars purchased in connection with the Milnrow tramways was £500 in excess of the amount provided for in the estimate. The L.G.B. is to be asked for permission to increase the borrowing powers for cars by £500.

**Plymouth.**—Mr. C. R. Everson, general manager of the Corporation tramways, in his annual report upon the working of the undertaking, states that the number of passengers carried for the year had increased by 438,725. This increase was due to the exceptionally fine weather experienced throughout last summer. Traffic receipts had increased by £1,855. The number of units used this year was 122,405 less than last year, although 6,641 more miles were run, showing that the motor-men had exercised more care in operating their cars. Traffic receipts totalled £37,083, and other receipts £2,087; the total revenue was £39,170. Working expenses accounted for £24,081, leaving a gross profit of £15,090. Other charges totalled £12,062, the net profit for the year in aid of the rates being £3,027. He was pleased to state that the improved trolley head he designed, which received their approval with instructions to fit it to the cars, had resulted in an absolute freedom from accidents from this cause. During the year they had renewed 2½ miles of overhead work, and seeing that the gauge of the wire was larger and the fittings improved, he hoped they would be relieved of serious cost on these sections for some years. The total sum expended on permanent way repairs and renewals for the past six years amounted to £23,375.

**Southampton.**—The B. of T. has sanctioned the doubling of the tramway track in Shirley Road, and instructions have been given the general manager to carry out the work by direct labour. Tenders are invited for a supply of tramway points and tires. The receipts of the tramway undertaking for the year ended March 31st last amounted to £64,185, which represents an increase of £336 on the previous year. There was an increase of 46,892 in the mileage run, and an increase of 127,135 in the number of passengers carried. The amount of current consumed totalled 1,964,804 units, which, at 1½d. per unit, represents an expenditure of £12,280. Compared with the previous year the current consumed shows an increase of 125,383 units, but the cost of the units during that year amounted to 171 more than in the year under review, owing to the fact that the charge for current was then at 1½d. per unit. The receipts per car-mile show a decrease of 263d. over last year.

**Tynemouth.**—The Tynemouth Traction Co. has written the Corporation expressing a hope that the negotiations for the extension of the tramways to Preston Village might result in the construction of that route at an early date, when the whole system of electrical distribution would have to be reconsidered. A reply is to be sent to the effect that the Council is waiting for the company with regard to the proposed extension.

**Wishaw.**—A conductor on the tramways at Wishaw, in an attempt to put a trolley pole back on the wire, was dragged off the car and suspended in mid-air. Before assistance could be rendered the rope broke and he fell heavily to the ground, his injuries necessitating removal to a hospital.

## TELEGRAPH and TELEPHONE NOTES.

**New Cable for Central and South American Telegraph Co.**—The Central and South American Telegraph Co. recently contracted with the Norddeutsche Seekabelwerke, Nordenham, Germany, for the manufacture and laying of 771 nm. of cable, to be laid between Panama, Republic of Panama and Santa Elena, Ecuador. The Norddeutsche Co.'s cable steamer, *Stephan*, with the cable on board, sailed from Nordenham, April 7th, and was expected to arrive at Panama about May 20th.

The laying of this direct cable from Panama to Santa Elena will materially expedite the telegraph traffic to and from Peru, Chile and Argentine, and is a preliminary step in providing additional facilities for the anticipated extension of the Central and South American Telegraph Co.'s lines from Argentine to Santos and Rio de Janeiro, Brazil, which extensions, it is expected, will be completed within a year. This will provide an all-American cable route to Brazil, which Mr. James A. Scrymser, president of the Central and South American Telegraph Co., has endeavoured for many years to accomplish.

On her homeward trip the *Stephan*, it is expected, will take soundings between Buenos Ayres and Santos and Rio de Janeiro, covering the route on which the proposed cables are to be laid.

The average time of transmission between New York and Buenos Ayres, "*via* Colon," is now about 16 minutes, and it is expected, on the completion of these Brazil extensions, that the average time between New York and Rio de Janeiro will not exceed 20 minutes. —*Telegraph and Telephone Age.*

**Wireless in the Antarctic.**—Continuous communication is now maintained between Sydney, *via* Hobart and Macquarie Island, and Dr. Mawson in his winter camp in the Antarctic. Dr. Mawson receives nightly wireless signals from Macquarie Island, the Government stations at Wellington (New Zealand), Melbourne, Hobart, and Pennant Hills, from warships and from shipping along the south coast.

## CONTRACTS OPEN and CLOSED.

### OPEN.

**Aberdare.**—May 29th. Cables, street work, junction boxes, incandescent fittings for street lighting, meters, &c., for the Council. See "Official Notices" May 16th.

**Australia.**—VICTORIA.—May 30th. High-tension switchgear with remote control, for the Melbourne City Council. See "Official Notices" March 28th.

June 2nd.—20,000-volt H.T. switchgear and L.T. switchgear and accessories, for the Melbourne Suburban Railways. See "Official Notices" May 2nd.

June 11th.—Switchgear and instruments, for the Melbourne City Council. See "Official Notices" April 25th.

June 24th.—H.D. copper wire, telephone parts and telephones, for the P.M.G. See "Official Notices" to-day.

July 1st. Telephone instruments and submarine cable, for the P.M.G. See "Official Notices" to-day.

July 8th.—Common-battery switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

July 8th.—Rubber-covered wire, batteries, telephone switchboards, measuring instruments and telephone instruments, for the P.M.G. See "Official Notices" to-day.

TASMANIA.—June 9th. Telegraph and telephone material for the P.M.G.'s Department. See "Official Notices" May 9th.

QUEENSLAND.—August 27th. Five sections of common-battery multiple switchboard, for the P.M.G.'s Department. See "Official Notices" to-day.

September 10th.—Nine sections of trunk line switchboard, for the P.M.G. See "Official Notices" to-day.

WESTERN AUSTRALIA.—May 28th. Condensing plant, pump and piping, for a Government power station at Perth. See "Official Notices" May 9th.

July 9th and 30th and August 6th.—Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

June 11th. Metal-filament lamps, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telegraph and telephone instruments, for the P.M.G. See "Official Notices" to-day.

July 23rd.—Telephone switchboards and parts, for the P.M.G. See "Official Notices" to-day.

July 30th.—Cable switchboard, for the P.M.G. See "Official Notices" to-day.

PERTH, W.A.—CORRECTION.—In our last issue, in our advertisements, by a printer's error, we gave the closing date for the item "Metal-filament Lamps, Schedule 274," as July 11th. This should have read June 11th. Will tenderers please note?

SOUTH AUSTRALIA.—July 16th. Telegraph and telephone material, for the P.M.G.'s Department. See "Official Notices" to-day.

NEW SOUTH WALES.—July 9th. Switchboards, for the P.M.G. See "Official Notices" to-day.

Bedford.—June 20th. About 10,870 tons of hard or soft coal, for the Corporation electricity works. Mr. Charles Stimson, town clerk.

Colchester.—May 27th. Steam coal for a year (about 5,000 tons) for the Corporation Electricity Department. Mr. W. Frisby, Borough Electrical Engineer, 34, Osborne Street.

Croydon.—May 29th. Electric lighting of the fire station and library, Thornton Heath, for the Corporation. See "Official Notices" May 16th.

Derby.—May 23rd. One 750-KW. motor-alternator, for the Corporation. See "Official Notices" May 9th.

Devonport.—June 2nd. Cables, wires and meters for 12 months for the Corporation. See "Official Notices" to-day.

Dundee.—May 30th. Steam and feed piping, steam feed pumps and hot-well tank, &c., for the Corporation Electricity Department. See "Official Notices" May 16th.

France.—June 5th. The French State Railway authorities (Service Electrique, 1<sup>re</sup> Division), 43, Rue de Rome, Paris, are inviting tenders for a number of electric tractors for working the engine turntables at the various railway stations on the system.

Glasgow.—May 26th. Two steam turbo-alternators, with condensing plant (5,000 kW. and 2,000 kW. respectively), for the Corporation Tramways Department. See "Official Notices" April 25th.

Halifax.—June 6th. One natural draught chimney type water cooling tower, for the Electricity Department. See "Official Notices" to-day.

Hoyle and West Kirby.—May 27th. Coal (3,000 tons washed peas or slack) for the U.D.C. electricity works for a year. Mr. Chas. J. Turner, electrical engineer.

Hungary.—May 28th. The municipal authorities of Aranyosmarót are inviting tenders for the establishment of a central electric lighting station in the town.

London.—L.C.C.—May 28th. Electrical installations at Lewisham Bridge and Fairfield Road (Bow) elementary schools. See "Official Notices" May 9th.

June 3rd.—High and low-tension cables for Tramways Department. See "Official Notices" to-day.

METROPOLITAN ASYLUMS BOARD.—June 4th. Extension of internal telephone system and installation of signal bells at the Western Fever Hospital, Fulham, S.W. See "Official Notices" May 16th.

ST. PANCRAS.—June 9th. Welsh and other steam coal for the Electricity Department. Apply E.L. Department, 57, Pratt Street, N.W.

Mexborough.—May 30th. Lancashire boiler, for the U.D.C. Electricity Department. See "Official Notices" April 25th.

Oldham.—May 31st. Extra-high-tension switchboard for the Corporation. See "Official Notices" to-day.

Portsmouth.—June 11th. Wiring for electric light installation at Workhouse Infirmary extensions, &c., Milton. See "Official Notices" May 16th.

Rawtenstall.—June 10th. One 1,500-KW. turbo-alternator complete with condenser, for the Corporation. See "Official Notices" to-day.

Rotherham.—The question of renewing and doubling the tramway track in Fitzwilliam Road is under consideration. Tenders are invited for the supply of rails required in connection with the renewal of the tramway track in High Street.

Salford.—Wiring of new secondary school, Pendleton, for the Education Committee. See "Official Notices" May 16th.

Spain.—The municipal authorities of San Juan de Palamos (province of Gerona) have just invited tenders for the concession for the electric lighting of the town during a period of ten years.

The Times of 16th inst. contains lengthy advertisements intimating to "foreign manufacturers" that they are invited to tender for the establishment of certain wireless telegraph stations in Spain.

Swansea.—June 6th. Installation of electric light and bells at the new training college, Glamor, for the Education Committee. See "Official Notices" to-day.

Walthamstow.—May 28th. Natural draught cooling tower, for the U.D.C. Electricity Department. See "Official Notices" May 2nd.

## CLOSED.

Admiralty.—The Admiralty has recently accepted a tender from the Dussek Bitumen Co. for "Trinitite" compound for use in H.M. battleships, dockyards, &c.

Ashton-under-Lyne.—The Corporation has accepted the tender of the Bastian Meter Co., Ltd., for the supply of 10 ampere-meters.

Ashton-under-Lyne and Lowestoft.—Messrs. Chamberlain & Hookham, Ltd., have received the contract for two-rate meters from Ashton-under-Lyne, and also the contract for car meters from Lowestoft.

Barrow-in-Furness.—The T.C. has accepted the tender of Messrs. Drake for stoking plant, at £4,100, and for a generating plant, including gas engine, at £550.

Bedford.—The T.C. has accepted the following tenders:—

British Thomson-Houston Co., Ltd.—125 meters.  
British Westinghouse Co., Ltd.—25 meters.  
Dick, Kerr & Co., Ltd.—Lamps (one year).  
Siemens Bros. & Co., Ltd.—Cables.

Belgium.—Twelve concerns—five German, four Belgian, two French and one Austrian—last week submitted tenders to the Belgian Telegraph Authorities in Brussels for the supply of 1,200 metres of sub-river cable and 240 metres of submarine cable. The lowest offer was that of the Rheydt Kabelfabrik, of Rheydt, Germany.

Bishopstawton (Devon).—Messrs. Thomas & Son, of Bishopstawton, have received, through Messrs. Lord & Shand, electrical engineers, of Plymouth, an order for supplying and fixing a Blackstone oil engine for an electric light installation at the Hall for Mr. C. H. Chichester, at Bishopstawton.

Bolton.—The contract for installing electric light at St. Margaret's new church has been let to the Bolton Corporation Electric Fittings Department.

Burnley.—The E.C. has accepted the following tenders:—

British Thomson-Houston Co.—Supply of motors and starters required by the department for the ensuing year.  
Superheater Units, Ltd.—Supply of two superheaters.

Farnborough (Hants.).—The U.D.C. has accepted the tender of Messrs. Hughes & Stirling, Ltd., for a refuse destructor, at £2,006.

Glasgow.—A contract has been placed with Messrs. E. Bennis & Co., Ltd., for four Bennis chain-grate stokers, each 8 ft. wide, for the Corporation electric tramway station.

Government Contracts.—The following tenders have been accepted during the past month by the Government Departments named:—

### WAR OFFICE.

Electric cells (pairs).—Atlas Carbon and Battery Co., Ltd.; J. C. Fuller and Son, Ltd.; J. R. G. P. and Telegraph Works Co., Ltd.; Siemens Bros. and Co., Ltd.  
Telephones, &c.—Automatic Telephone Manufacturing Co., Ltd.; British L.M. Ericsson Manufacturing Co., Ltd.; Spagnoletti, Ltd.

### INDIA OFFICE: STORE DEPARTMENT.

Wireless apparatus.—Marconi's Wireless Telegraph Co. Cable.—W. T. Henley's Telegraph Works Co.  
Insulator cups.—Taylor, Tunncliffe & Co.; Bullers, Ltd.

### CROWN AGENTS FOR THE COLONIES.

Battery material.—Siemens Bros. & Co., Ltd.  
Insulated cable.—Callender's Cable and Construction Co., Ltd.  
Telephone cable.—B. L. & Helsby Cables, Ltd.  
Insulators.—Bullers, Ltd.  
Telegraph poles.—J. Spencer, Ltd.; Siemens Bros. & Co., Ltd.  
Telephone switchboards, &c.—Siemens Bros. & Co., Ltd.

### POST OFFICE.

Telephonic apparatus.—Automatic Telephone Manufacturing Co., Ltd.; British L.M. Ericsson Manufacturing Co., Ltd.; Gent & Co., Ltd.; Peel-Comer Telephone Works, Ltd.; Western Electric Co., Ltd.  
Silence cabinets.—M. Hunter & Sons.  
Telegraphic cable.—Callender's Cable Co., Ltd.  
Telephonic cable.—B. L. & Helsby Cables, Ltd.; Callender's Cable Co., Ltd.; Connolly Bros., Ltd.; Western Electric Co., Ltd.  
Stoneware ducts.—Albion Clay Co., Ltd.  
Insulators.—Bullers, Ltd.; Doulton & Co., Ltd.; Taylor, Tunncliffe and Co., Ltd.  
Telegraphic ironwork.—Bullers, Ltd.; T. W. Lynch, Ltd.  
Cable distribution plugs.—Siemens Bros. & Co., Ltd.  
Copper wire.—T. Bolton & Sons, Ltd.; B. L. & Helsby Cables, Ltd.; Elliott's Metal Co., Ltd.; R. Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co. (inc. in the London Electric Wire Co. and Smiths, Ltd.); J. Wilkes, Sons & Mapplebeck, Ltd.  
Copper-covered wire.—Union Cable Co., Ltd.  
Electric light plant at Waterloo P.O.—Johnson & Phillips, Ltd.  
Power plant, &c.—St. Just's Wireless Station, Cornwall.—Edmundsons' Electricity Corporation, Ltd.  
Telephone exchange equipment at Llanelli, Kingston Exchange Extension and Information Desk, Hampstead.—Western Electric Co., Ltd.

### H.M. OFFICE OF WORKS.

Lift at H.M. Stationery Office.—Aldous & Campbell, Ltd.

Great Yarmouth.—The T.C. has accepted the tender of Messrs. Myers, Rose & Co. for 2,000 tons of hard steam coal for the electricity works, at 17s. 6d. per ton, f.o.r., and that of Messrs. E. Foster & Co. for 1,000 tons of slack, at 14s. 5d. per ton.

**Hastings.**—The T.C. has accepted the offer of the Main Colliery Co., Ltd., for a further supply of from 3,500 to 4,000 tons of Welsh through-and-through smokeless steam coal.

**Hford.**—Subject to the approval of the L.G.B., the U.D.C. has accepted the tender of Messrs. Heenan & Froude, Ltd., for a refuse destructor, at £12,065.

**Ipswich.**—The T.C. has accepted the tender of Messrs. Cockledge & Co. for constructional steel work and roofing for extensions to the tramway car shed, at £606.

**Leeds.**—The following tenders have been accepted by the Corporation:—

British Westinghouse Elec. Co., Ltd.—Two 1,500-kw. rotary converters for Crown Point Station, at £5,295 each.  
Electro-Mechanical Brake Co., Ltd.—50 new type section insulators, at 3s. each.  
British Thomson-Houston Co., Ltd.—Three-phase sub-station switchgear, as required, up to a total of 12 sets, at £45 15s. per set.  
British Electric Transformer Co., Ltd.—Two sets of two to three-phase transformers, at £624 per set.  
Waywoods, Ltd.—Electric passenger lift at Central Entrance to Market Hall, at £302.

**Lincoln.**—For the Corporation electricity station, Messrs. Bennis & Co., Ltd., are to supply two of their chain-grate stokers, 5 ft. 4 in. wide × 9 ft. 2 in. long.

The tender of Messrs. George Robson & Co. has been accepted for coal elevating and conveying plant for the electricity works.

**Manchester.**—The Corporation has placed a contract for fitting Bennis-Miller-Bennett new chain-grate links to the frame of a chain-grate already installed at the electricity works, with Messrs. E. Bennis & Co., Ltd.

**Rotherham.**—The T.C. has accepted the tender of the Daimler Co., Ltd., for the supply of three motor-omnibuses for the Tramway Department, at £822 per bus.

**Portsmouth.**—The T.C. has accepted the tender of Mr. John Griffiths for small coal for the tramway undertaking, at 19s. 1d. per ton.

**Sunderland.**—The Cable Accessories Co., Ltd., have just secured a contract with the Corporation to supply a further 100 street lighting brackets and fittings.

**Walsall.**—The Electricity Committee of the T.C. has accepted the tender of Messrs. E. Green & Son for an economiser, at £623.

**Wednesbury.**—The Mechanical and Electrical Engineering Co.'s head office, Walsall, has secured the contract for the electrical equipment of the Metallurgical Schools at Wednesbury, for the Staffordshire Education Committee.

**Wolverhampton.**—The Corporation has accepted the following tenders:—

British Westinghouse Co.—Four converters, at £2,950.  
Electric Construction Co., Ltd.—Two switchboards for sub-stations, at £108 and £209 respectively.  
Reynolds & Co., Ltd.—Extra-high-tension switchgear for Commercial Road station, at £2,000.  
The Lorrain Steel Co.—Special work, £1,128.

**Worthing.**—The Corporation contract for additional cells required for the extension of the storage battery at the electricity works, has been placed with the Hart Accumulator Co., Ltd.

## FORTHCOMING EVENTS.

**Junior Institution of Engineers.**—Friday, May 23rd. At 89, Victoria Street, S.W. Discussion on "The Organisation of an Engineers' Employment Bureau," introduced by Mr. S. M. Hills.

**Royal Institution of Great Britain.**—Friday, May 23rd. At 9 p.m. Discourse on "The Secret of the Permanent Magnet," by Prof. S.P. Thompson.  
Saturday, May 24th. At 8 p.m. Lecture on "Radioactivity: the Alpha Rays and their Connection with the Transformations," by Prof. E. Rutherford.

Thursday, May 29th. At 3 p.m. Lecture on "Recent Chemical Advances; Chemistry in Space," by Prof. W. J. Pope.

Saturday, May 31st. At 8 p.m. Lecture on "Radioactivity: The Origin of the Beta and Gamma Rays and the Connection Between Them," by Prof. E. Rutherford.

**Institution of Electrical Engineers.**—Friday, May 30th. At 8 p.m. Annual General Meeting. Paper on "Practical Application of Telephone Transmission Calculations" by Mr. A. J. Aldridge.

**Physical Society.**—Friday, May 30th. At 6 p.m. At the Imperial College of Science, South Kensington, S.W. Paper on "Electro-Thermal Phenomena at the Contact of two Conductors with a Theory of a Class of Radio-Telegraph Detectors," by Dr. W. H. Eccles.

## THE ELECTRICAL ENGINEERS (LONDON DIVISION).

Commanding Officer—Lieut.-Col. H. M. LEAF.

The following orders have been issued for the current week:—

Monday, May 26th.—"A" Company. Infantry drill, 7 to 9 p.m.; technical instruction for all members on the 14th rate, and for all candidates for higher rating, 7 to 9 p.m.; musketry instruction, 9 to 10 p.m.

Tuesday, May 27th.—"B" Company. As for "A" Company.

Wednesday, May 28th.—All Companies. Annual course of musketry at Purfleet rifle ranges. Railway tickets will be sent to those notifying headquarters of their intention to attend.

Thursday, May 29th.—"C" Company. As for "A" Company.

Friday, May 30th.—"D" Company. Ditto.

Saturday, May 31st.—Annual course of musketry for all Companies at Purfleet rifle ranges.

Members are reminded that this is the last date on which they can fire their annual course to make themselves efficient, and should apply early for their railway tickets.

Headquarters will be opened for regimental business from 10 a.m. to 12 noon.

(Signed) P. H. CAMPBELL, Capt. R.E., and Adj. For Officer commanding L.E.E.

## THE I.E.E. VISIT TO PARIS.

[SPECIAL DISPATCH.]

PARIS, Thursday morning.

THE party of members of the Institution of Electrical Engineers which is now here for the joint meeting with the Société Internationale des Electriciens, numbers 150, including ladies. The journey from London was a pleasant one, at the end of which members distributed themselves at various hotels.

On Wednesday morning, in glorious weather, President Berthelot opened the Congress at 9.30 o'clock at the Conservatoire des Arts et Métiers. One section of the party then proceeded to explore the Conservatoire Museum, while the remainder discussed six papers on electric traction, of which the titles and authors were given in our issue of May 9th, page 767, the speakers being Messrs. Mazin, Roger Smith, Hammond and Bochet. In the afternoon, part of the company went down the Seine by steamboat to Sevres porcelain factory, the excursion proving delightful in every way; another company visited the magnificent works at Saint Denis of the Société d'Electricité de Paris, with its 120,000 kw. of plant, also the works of the Triphasé Co. at Asnières. In the evening of Wednesday the banquet given by the Société was held at the Palais d'Orsay, covers being laid for 360. Speeches of considerable interest were delivered by M. Berthelot and Mr. Duddell, and an excellent entertainment was afforded, the principal feature calling for mention being a cinematograph demonstration with Gaumont speaking films; noted artistes also took part.

This (Thursday) morning the Congress was resumed, with M. Marcel Deprés in the chair, the papers by Mr. J. S. Highfield and M. H. Leblanc on long-distance transmission receiving attention; visits are arranged for this afternoon.

To-morrow there will be a reception at the top of Eiffel Tower, with Mr. Duddell as chairman.

**Appointments Vacant.**—Head of Electrical Engineering Department, Birmingham Municipal Technical School (£300); lecturer in mechanical and electrical engineering at the Municipal Technical Institute, Belfast (£180); fitter-driver, for Severalls Asylum, Colchester (35s.); electrical engineer (£200) for the Aylesbury U.D.C.; assistant for sales department (£130), chief representative in publicity department (£130), and engineering representative in publicity department (£117), for the Sheffield Corporation. See our advertisement pages in this issue.

**Athletic Sports.**—The fifth annual athletic sports and Corps Championships and inter-company competitions for the "Le Rossignol" challenge cup of the London Electrical Engineers (Territorial Force) were held on Wednesday evening at Stamford Bridge Athletic Grounds, Fulham Road, S.W.

**Accident.**—It is reported that in a collision between two motor-cars at Aberdeen last Saturday night, William Ross, a "foreman electrician," who was in one of the cars, was seriously injured.

**The Question of Sunday Labour.**—The Electricity Committee of Hammersmith B.C. has decided that, in the case of all employés whose duty necessitates Sunday work, arrangements be made to give them one whole day's holiday per week. Also that the wages of employés be increased, fitters and turners in future to be paid at the rate of 9½ per hour, and labourers, fitters' mates, and blacksmiths' mates at the rate of 7d. per hour.

## NOTES.

**A Forecast.**—Is it a fact, or have I dreamt it, that, by means of electricity, the world of matter has become a great nerve, vibrating thousands of miles in a breathless point of time.—Nathaniel Hawthorne—*The House of the Seven Gables*.
